Although arriving late to the European scramble for North America, France for a time claimed the largest portion of today's United States and Canada, stretching from Newfoundland to Louisiana and including the Great Lakes and Mississippi Valley. However, New France failed to attract a large population and, by 1750, France was near losing much of its territory to an ascendant BRITISH NORTH AMERICA.

In 1524, Italian explorer Giovanni di Verrazano was hired by France's King Francis I to find a passage through North America to Asia, a route that, after many nations failed to find this "Northwest Passage," was eventually confirmed to be mythical. However, Verrazano did bring back information about Atlantic coastal regions from Carolina to Nova Scotia. A decade later, seeking gold and the elusive sea passage to the Orient, Jacques Cartier, who may have been part of Verrazano's expedition, commanded three voyages. He sailed into the St. Lawrence River, planting a cross bearing the king's coat of arms to claim a region that included sites

A late 17th-century French map of “Canada ou Nouvelle France.” Although the territory of New France dwarfed that of the other colonizing powers in North America, there were few French citizens willing to come to the New World.

that became Québec and Montreal. Returning in 1541, Cartier and his crew established the tiny and short-lived colony of Charlesbourg-Royal, near Montreal, causing tension with the Iroquois and other local tribes. Scoury and fierce winter weather soon ended the colonial experiment. After a series of exploratory trips, Cartier returned to France carrying what he believed were gold

and diamonds; his booty proved to be iron pyrite (fools’ gold) and common quartz.

Although Crown-sanctioned explorations faded after Cartier’s inauspicious final voyage, fishermen from France (and many other European countries) maintained a robust presence in North America as did traders in furs who dealt with local native tribes. It was

these opportunities that reawakened French interest in North America.

NEW FRANCE BEGINNINGS

Samuel de Champlain was a map maker employed by a fur-trading company, not a military man, but his leadership abilities during renewed French explorations in the early 1600s made him New France's "father" and its first governor. In 1608, Champlain and his associates chose a location on the St. Lawrence River at Québec as their fur-trading settlement. Champlain forged alliances with many Indian tribes, including the Huron of the Great Lakes, and also championed the idea of more permanent French settlement along the St. Lawrence. In 1633, two years before his death, Champlain was appointed New France's governor by Cardinal RICHELIEU, top minister to King Louis XIII.

Eastern Canada was not the only focus of French interest in North America. As fur traders penetrated deeper into the continent in search of the best pelts and cooperative native suppliers, their efforts led to further exploration and land claims. In 1673, Canadian-born Louis Jolliet and French Jesuit missionary Père Jacques Marquette used information from natives to trace the oceanward course of the Mississippi River in hopes, soon dashed, that it flowed into the Pacific Ocean. Father Marquette, who was a missionary to tribes in what is now Michigan, died soon after this exhausting expedition on the banks of a river later named the Père Marquette in his honor. Jolliet, who had early on given up the priesthood for fur trading, later explored Hudson Bay and mapped the Labrador coast.

Four years after this Mississippi expedition, French-born René-Robert Cavelier, sieur de LaSalle, who had relocated to New France in 1667, pushed French territorial claims yet further. Arriving at the huge river's mouth in 1682, LaSalle claimed the vast Mississippi Valley for France, naming this territory Louisiana, for King Louis XIV. LaSalle's ambitions, fueled by greed and possible mental illness, did not stop there. Promising to claim Spanish Mexico for France, the adventurer ran out of supplies and was murdered in 1687 by his own hungry men. Born into a wealthy Montreal family, Jean-Baptiste Le Moyne, sieur de Bienville in 1701 became acting governor of France's new southern claims and for 40 years fought to keep his small French colony safe amid Indian, Spanish, and British hostility. In 1718, Bienville spearheaded the creation of New Orleans as an administrative center and port.

Unlike the British in their early colonial years, France did not have excess population at home and provided

little incentive for its citizens to brave a stormy Atlantic and face a harsh climate and often-hostile Native population in the New World. Early on, the tiny French presence in Canada was 80 percent male and consisted mainly of fishermen, fur traders, and Franciscan and Jesuits priests. Known by the Indians as the "Black Robes," the priests intended to convert Indians to Catholicism. An early religious mission, called Sainte-Marie, among the Hurons, was built in 1615. Located on Ontario's Wye River, by 1639, it was home base for 13 priests. When fighting broke out in 1648 between the Huron and their Iroquois enemies, the priests set fire to their mission, fearing its desecration.

From 1627 to 1663, a centralized commercial company created by Cardinal RICHELIEU struggled to squeeze profits out of New France, succeeding only with furs. There were barely 3,000 colonists in 1663, when King Louis XIV intervened, making New France an official French province. Troops were sent to protect settlements with fortifications, and to project French power to native tribes and European rivals. A royal shipment of 850 prospective brides, known as *filles du roi*, or "the king's young women," helped to stabilize the colony and assure natural increase in its population. By 1700, New France had 19,000 white inhabitants.

Under this new regime, St. Lawrence River estates were set aside for nobles and military officers. A near-feudal setup, it was called the *seigneurial* system. New France's *habitants*, or ordinary settlers, mostly farmed land owned by some two hundred seigneuries granted by the Crown. This tenant farming system of rents and allotments outlasted French control (and the French monarchy), surviving into the 19th century.

Although agriculture would occupy the energies of the great majority of French Canadians, the *voyageurs*—fur traders who traveled to French outposts like Detroit (founded in 1701 by Antoine de la Mothe Cadillac) and Prairie du Chien (Wisconsin)—had a more romantic image. Generally, voyageurs were licensed by the authorities; their rivals were the so-called *coureurs de bois*, unlicensed traders who aggressively explored the farthest reaches of French America, including New Orleans, in pursuit of valuable furs, especially beaver pelts, and markets for their animal skins and other goods.

CHALLENGES TO FRENCH

Compared to the British and Spanish in this era, French colonists treated Native Americans with great respect. Friendly relations with local Indian tribes were crucial to French success in the fur trade; colonists were

also well aware that their numbers were too small to deter major attacks. From the Indian viewpoint, the fact that Frenchmen were not arriving in huge numbers assured some tribal leaders that they could coexist with these interlopers.

On the other hand, good intentions on both sides did little to spare the Indians from deadly smallpox and other European diseases. Jesuit pressure on Indians to adopt Catholicism, along with European clothing and behavior, although attracting quite a few converts, was generally met with suspicion. There was a significant level of intermarriage, mostly between French men and Indian women, creating a group known as *Métis*. The Huron and other Great Lakes and eastern tribes began forging strong alliances with the French in 1615, but wars with the powerful Iroquois Confederacy, allies of Britain, punctuated the history of New France.

New France's huge landholdings were a noose that encircled Britain's Atlantic Seaboard colonies, leading to a number of altercations between the two European superpowers, both at home and in North America. The 1713 Treaty of Utrecht that ended the 12-year-long WAR OF THE SPANISH SUCCESSION gave Britain dominion over a large sector of eastern French Canada including the rich agricultural lands of Acadia and destroyed much of France's overseas trade. By the time war again broke out in 1754, the population of British North America was 20 times larger than New France's and France's grip on North America was near its end. When French emperor Napoleon I sold Louisiana to the new United States in 1803, New France was a memory, although its French Canadian and Cajun cultures would survive and flourish.

New Netherland

This Dutch colonial outpost existed along the Hudson River from 1609 to 1664. A relatively small and ineffectual colony, it was known for its trade and diversity. It was eventually captured by the English and became the colony of New York.

Peter Stuyvesant prepares to defend New Amsterdam against the English fleet, seen in the background.

Following its independence from Spain in the 1570s, the Netherlands began constructing a worldwide empire due in large part to its powerful navy and savvy traders. In one of the country's first colonial ventures, Dutch merchants in 1609 financed Henry Hudson to explore North America and Hudson discovered the river that bears his name.

In 1614, the Dutch established their first permanent settlement at Fort Nassau, later relocated and renamed Fort Orange (present-day Albany). This northerly settlement never grew very large and existed primarily to trade with Iroquois Indians for furs. In 1625, the DUTCH WEST INDIA COMPANY established New Amsterdam on Manhattan Island to control access to the Hudson River. This southerly settlement soon attracted a variety of settlers to farm.

New Netherland was beset by a series of problems for most of its history. Relations with Native Americans were generally poor. Fort Orange was largely dependent on the Iroquois for its survival, while colonists in the south drove Algonquians from their lands and fought four wars in 20 years with them. Of more pressing concern, however, were the colony's mismanagement and ineffective leadership. The colony never produced a profit for its investors, while its most effective governor was the autocratic Peter Stuyvesant (1647–64), who barred the colonists from participating in their own governance.

Because of these problems, New Netherland had trouble attracting colonists. The Dutch West India Company did offer patroonships, large land grants with manorial rights, to anyone who took 50 settlers to the colony.

However, Kiliaen Van Rensselaer was the only person to take up the company's offer seriously. Lacking Dutch settlers, New Netherland opened its borders to dissenters from New England including ANNE HUTCHINSON as well as emigrants from Belgium, France, Scandinavia, and Germany and African slaves. As one visitor noted of New Amsterdam: "There were men of eighteen different languages." Very quickly the Dutch became a minority in their own colony. Ethnic diversity invited religious differences and although Stuyvesant attempted to privilege the Dutch Reformed Church, the company insisted upon a policy of religious toleration. Puritans, Quakers, and Lutherans were common in New Netherland, and Jews received greater religious freedom than anywhere else in America.

Ultimately, New Netherland suffered the most from foreign competition. A Swedish colony on the Delaware River proved a distraction to the Dutch and, in 1655, Stuyvesant engineered a military takeover of New Sweden. However, Dutch hegemony proved short-lived as in 1664 an English fleet under the command of Richard Nicolls arrived off New Amsterdam. Although Stuyvesant attempted to mount a defense of his colony, "a general discontent and unwillingness to assist in defending the place became manifest among the people." On August 27, Stuyvesant surrendered New Netherland to Nicolls, who granted the colonists generous terms, including the preservation of their property rights, inheritance laws, and religious liberty.

JOHN G. MCCURDY

New Spain, colonial administration of

In order to administer their vast holdings in the New World, the Spanish Crown devised an exceedingly intricate bureaucratic system intended to exert royal authority, to protect its economic and political interests, to maintain order and stability, and to prevent the formation of cohesive interest groups that might challenge royal authority. In theory, all political and legal authority in Spain's overseas holdings ultimately derived from the Crown.

This system of what has been called "Hispanic absolutism" stood in sharp contrast to the situation in BRITISH NORTH AMERICA, where various forms of local authority, including colonial and town assemblies, mingled with and effectively limited the exercise of royal authority. Not so in Spain's dominions, at least in theory, although in practice there quickly emerged substantial self-rule. Nor was there any legal or functional separation of executive, legislative, and judicial branches of government. While some bodies were more concerned with judicial matters, others with legislative and executive, effective distinctions among these functions did not exist. Nor was there a clear separation between royal and ecclesiastical authority, though in theory the Crown was the supreme authority in the colonies in consequence of the Patronato Real (Royal Patronage), which derived its legal basis from papal bulls of 1501 and 1508. HABSBURG Spain's political culture was highly legalistic and placed a premium on the generation of paperwork, demonstrated by both the quality of the paper (still crisp after more than four centuries) and its quantity, most housed in the massive Archive of the Indies in Seville.

A key characteristic of the byzantine administrative hierarchy that governed Spain's New World holdings was the functional overlapping of jurisdictions, as discussed later. Some have proposed that the confusion and conflicts thus generated were part of an intentional strategy of "divide and rule" on the part of the Crown, a mechanism meant to ensure that subordinate administrative bodies would squabble among themselves, thus permitting the Crown to stand above the fray and act as the ultimate arbiter whenever serious conflicts arose. If this was not an intentional strategy—and opinion is divided on this point—it nonetheless worked in practice to that effect.

HIERARCHICAL STRUCTURE

At the pinnacle of authority stood the king. Directly subordinate to him in the royal chain of command was the Council of the Indies (Consejo de Indias), established in 1524, modeled on the Council of Castile, and exercising supreme executive, legislative, and judicial authority in the day-to-day running of the American "kingdoms." The Council of the Indies, which comprised a dozen or so members, drafted and issued laws, interpreted laws, and nominated appointees to secular and religious offices, all subject to the king's final approval. "Its tendency was meticulous and bureaucratic. It operated through lengthy, deliberative sessions surrounded by massive quantities of reports, laws, opinions, briefs, and other types of contemporary record."

Within the colonies, the highest royal authority was the viceroy, conceived as the direct representative of the Crown in the colony. Viceroys were responsible for enforcing law, collecting revenues, administering justice, and maintaining order—virtually everything having to do with governing the viceroyalty. The viceroyalty was the largest administrative unit.

Until 1717, all of Spain's American holdings fell under the jurisdiction of two viceroyalties: the VICEROYALTY OF NEW SPAIN (created in 1535, capital Mexico City, embracing all of Southwest North America through Central America to Panama, with much of Central America under the jurisdiction of the Kingdom of Guatemala), and the VICEROYALTY OF PERU (or New Castile, created in 1542, capital at Lima, embracing all of South America not claimed by Portugal). In 1717, a third viceroyalty, that of New Granada (Venezuela, Colombia, and Ecuador), was carved out of the Viceroyalty of Peru, and in 1776, a fourth, the Viceroyalty of La Plata (Argentina).

Partially subordinate to the viceroy were the *audiencias*, established before 1550 in Santo Domingo, Mexico City, Guatemala, New Galicia (in New Spain), and Panama, Lima, and Bogotá (in Peru), with more added later, and with much shifting of boundaries, jurisdictions, and status over the next 250 years. Judicially subordinate only to the Council of the Indies, the *audiencias* served as a kind of appellate court and legislative body, subject to royal approval. Described as “the most durable and stable” of the many branches of colonial government, *audiencias* were composed of the colonies' most prominent men: ecclesiastics, captains-general, *encomenderos*, merchants, landowners, and others, appointed by the council and king.

The boundaries between viceregal and *audiencia* authority were never clearly delineated, resulting in much disagreement between them. A similar situation obtained for local officials subordinate to the *audiencias* and viceroys, most notably *alcaldes mayores*, *corregidores*, and *gobernadores*, among whom leading authority Charles Gibson has discerned “no appreciable functional distinction.” Each exercised administrative, judicial, and some legislative authority within its districts. *Alcaldes* were superior to *regidores*, while municipal councils (*ayuntamientos* and *cabildos*) were generally associated with *corregidores*. Municipal councils were the only form of collective self-governance in the Spanish American colonies. There was nothing akin to colonial assemblies of British North America, for example. All authority was vested in individual officials and corporate bodies directly subordinate to royal authority. The other major cor-

porate body charged with overseeing Spain's New World colonies was the House of Trade (Casa de Contratación), founded in 1503 and located in Seville, which was to trade, commerce, and finance what the Council of the Indies was to politics, law, and governance. The Crown, through its Seville-based mercantile guild (*consulado*), worked to maintain a royal monopoly on a wide variety of goods, from precious metals to tobacco to many other export commodities. But despite the Crown's efforts to maintain a relationship of MERCANTILISM with the colonies, in everyday practice smuggling, contraband, and similar efforts to avoid royal monopolies and royal controls became very common.

ABSOLUTIST SYSTEM

At no level of government did there exist any degree of democratic decision making. In theory, the system was absolutist: All authority flowed from the top down, and nothing but compliance from the bottom up. In practice there existed a substantial degree of local self-governance by individual authorities, and considerable deviation from royal laws and decrees, most commonly expressed in the phrase *obedezco pero no cumplo* (“I obey but I do not fulfill”). In other words, officials universally acknowledged the Crown's supreme authority while very often balking at the enforcement of specific laws, usually premised on the belief that it was necessary to respond sensibly and pragmatically to realities on the ground. Selective enforcement of the New Laws of 1542, intended to place limits on the institution of *ENCOMIENDA*, ranks among the most prominent examples of this strong tendency to disobey or only selectively enforce royal laws and decrees.

Scholars continue to debate the consequences of this structure and style of colonial governance for postcolonial Spanish America. Key questions include the long-term implications of the institutionalization of endemic conflict among various branches of government, with the many claimants to political authority vying for supremacy, as expressed in the abundant lawsuits, appeals, and related forms of litigation that marked the entire colonial period. Another concerns the cultural legacy bequeathed by the structural tendency toward disobedience to royal authority and the formation of a political culture in which practical deviation from the letter of the law became the norm. Another key area of investigation focuses on the ways in which subordinate individuals and collectivities, particularly Indian communities, learned to use this elaborate legal structure to defend and advance their interests, as they did throughout the colonial period.

Some scholars argue that the Spanish American tradition of vesting local authority in individual officials, combined with the absence of substantial collective authority and democratic institutions, over time generated a political culture that emphasized executive authority far more than legislative or judicial authority, provoking sharp conflicts and diverse syntheses with republican and representative forms of governance and Enlightenment notions of citizenship in the postcolonial period, with many variations in time and space.

MICHAEL J. SCHROEDER

New Spain, Viceroyalty of (Mexico)

For 300 years (1521–1821), the Viceroyalty of New Spain, the richest and most important political jurisdiction in Spain's American holdings, expanded from its original boundaries in central Mexico south and west to the Pacific Ocean; south and east to include the Yucatán Peninsula, Florida, the Caribbean, northern South America, and Central America to contemporary Panama (the latter in a jurisdictional subdivision called the Kingdom of Guatemala); and north to include significant portions of what later became the U.S. Southwest. At the political, economic, and demographic center of this vast colony was the BASIN OF MEXICO, at the heart of which lay Mexico City, built atop the ruins of the AZTEC capital of Tenochtitlán.

CONSEQUENCES OF COLONIAL RULE

Three hundred years of colonial rule bequeathed to New Spain an enduring legacy whose consequences remain amply apparent in Mexico and Central America today. Most fundamentally, the new colonial order created new social and racial hierarchies, with Spaniards dominant, Indians subordinate, and, as time passed, *mestizos* (“mixed-race” Spaniards and Indians) occupying a widening middle ground.

During the first century of colonial rule, the colony's major social institutions can be identified as the following: the colonial state and its byzantine administrative apparatus; the Roman Catholic Church, both its “regular” and “secular” branches; *ENCOMIENDA*;

Indian communities; and the patriarchal family. From around the mid-1600s, *HACIENDA*, generally accompanied by debt peonage, displaced *encomienda* as the principal institution governing land-labor relations between Spaniards and Indians, largely in consequence of steep population declines among Indians resulting from the ravages of epidemic diseases, which effectively rendered *encomienda* obsolete.

SECULAR CHURCH'S POWER GROWS

During the same period, the so-called secular church (the ecclesiastical hierarchy emanating from Rome, with the pope at its head) grew in power relative to the regular church (composed of quasi-independent missionary or “mendicant” orders such as the Franciscans, Dominicans, Augustinians, Jesuits, and others, each governed by specific *reglas* or rules). This growing power of the secular church, densely entwined with the colonial state, was especially apparent in the most densely populated core regions, while the missionary orders remained strong in the colony's peripheral zones, such as Yucatán, the northern deserts, and elsewhere.

The overall trend of the colonial period was for the regular church to initiate the process of conversion in peripheral areas, and, over time, as populations grew and the state extended its reach, to cede ecclesiastical authority to the encroaching secular church. Far from a monolithic institution, the colonial church was wracked by division and conflict, both within and between its major branches. By the end of the colonial period, the Roman Catholic Church, both regular and secular, was not only one of the colony's most important social institutions, but also far and away its largest landowner.

Contrary to a popularly held view, surviving Indian communities in New Spain and elsewhere retained various forms of collective (or “corporate”) landownership throughout the colonial period. This too became a crucial colonial legacy, especially evident in liberal efforts to privatize landownership in the decades after independence in 1821, efforts fiercely resisted by both the church and Indian communities.

INDUSTRY

The Basin of Mexico became and remained the colony's breadbasket and major source of grain, meat, and other foodstuffs, as well as domestic industry such as *OBRAJES*, with expanding market relations especially important in the fertile and well-watered zones north and west of Mexico City. In the 1540s, the discovery of large depos-

its of silver northwest of the Basin of Mexico, centered on the province of Zacatecas, provided the colonial state with a steady supply of silver bullion, fueling a price revolution in Iberia and the rest of Europe and transforming the regional colonial economies of Zacatecas, Guanajuato, and other mining regions.

By the mid-1600s, the sprawling colony sank into what one scholar dubbed “New Spain’s century of depression,” though the nature and extent of that “depression” remain the subject of scholarly debate. Compared to the thriving colonies of BRITISH NORTH AMERICA and elsewhere, however, New Spain did experience a prolonged period of relative economic stagnation. The imperial state’s efforts to redress its colonies’ relative economic decline, launched after the WAR OF THE SPANISH SUCCESSION (1701–13), are known collectively as the Bourbon Reforms, named after the ruling dynasty that assumed power in Spain after the fall of the Habsburgs.

In a process similar to that unfolding elsewhere in the Americas, as time passed, the “creoles” (or *criollos*, i.e., Spaniards born in the Americas) became an increasingly important and powerful group, despite its relatively small size—a gradual shift that by the late 1700s led to a growing sense of American identity and the first stirrings for independence from Spain. Indian and “mixed-race” rebellions and uprisings occurred throughout the colonial period, but most remained local and regional and focused on redress of specific grievances relating to colonial governance or perceived abuses by individual authorities.

DEMOGRAPHICS

The demographic makeup of the colony changed markedly over time, from its initial overwhelming preponderance of Indians and tiny number of Spaniards, to steep Indian population decline, to increasing number of *mestizos* and others of “mixed race,” Africans, and a small but growing number of creoles. New Spain’s population at the end of the colonial period is estimated at around 6 million—around 50 percent Indian, 30 to 40 percent “mixed race,” 10 to 20 percent Spanish and creole, and less than 1 percent African.

In sum, 300 years of colonial rule left a profound and lasting legacy across New Spain, in every realm of society. Grappling with the nature of that legacy remains one of the most challenging and central tasks facing scholars of postconquest Mexico and Central America.

MICHAEL J. SCHROEDER

Newton, Isaac

(1642–1727) *mathematician*

Isaac Newton was born in 1642 at Woolsthorpe, near Grantham, Lincolnshire, England, three months after his father, yeoman farmer Isaac, died. Newton’s mother, Hannah Ayscough, married the Reverend Barnabas Smith and left Newton with his grandparents at age three. He grew up to hate his stepfather and never psychologically recovered from his mother’s abandonment. By the time Smith died in 1653, Newton’s personality had been forged; he became distrustful, hesitant in dealing with others, and emotionally unstable; these would be lifelong traits.

Newton attended day school in the nearby village and the Kings’s Grammar School at Grantham. He worked on his mother’s farm at age 14 but returned to school in 1660 to prepare for entrance to Trinity College at Cambridge University in 1661. His mother refused to pay his tuition so Newton served as a subsizar, who performed a variety of jobs for fellow students. Newton did not distinguish himself at Cambridge, but he privately studied and mastered the esteemed works of RENÉ DESCARTES and Euclid.

Dr. Isaac Barrow, Lucasian Professor of Mathematics at Cambridge, became his mentor and brought out Newton's genius.

AVOIDING THE PLAGUE

Newton returned to his mother's farm to avoid the plague rampant in Cambridge from 1665 to 1666. Without access to his books, Newton discovered differential calculus, which he called "direct and inverse method of fluxions," and expansions into infinite series. He used common arithmetical elements to make them universals. Newton also queried the nature of gravity but realized his experiments required more work and left the problem until 1685.

Upon his return to Cambridge in 1667, Newton was shown the work of Nikolaus Mercator (1620–87), who had recently published *Logarithmotechnia*. This contained some of the methods Newton had used while experimenting on the farm. Newton showed Barrow his own ideas, and this work was published as *De analysi per aequationes numero terminorum infinitas* in 1711. After painstaking experiments in 1668, Newton discovered the spectrum, which he deduced was white light made up of colored lights when exposed to a transparent medium. This idea led Newton to perfect a reflecting telescope in 1668; it was six inches long and could magnify 30 times. Prior to Newton's telescope, only refracting telescopes were used.

Barrow resigned from Cambridge, and Newton obtained the Lucasian Chair in 1669 at age 27 after he earned a master's degree. He presented lectures on optics that were not published until 1728. By this time, Newton's work was noticed by such scientific luminaries as Robert Hooke, Christiaan Huygens, James Gregory, and Sir Christopher Wren among others. Newton became a fellow of the Royal Society in 1671. Controversy erupted over claims by Hooke, who was a powerhouse at the Royal Society, that he was first to invent the "pocket tube" (telescope) in 1664. Gregory the Scot claimed he had discovered calculus. Newton removed himself from the controversy and only published his work *Opticks* in 1704 after Hooke died.

Newton suffered a mental breakdown in 1675; it took him four years to recover. He then found mathematical proof of planetary ellipses around the Sun. Hooke had also realized these laws but failed to prove them. Edmund Halley (1656–1742), the astronomer and mathematician, met with Newton in 1684. Halley urged him to publish his findings and financed the book entitled *Philosophiae naturalis principia mathematica*, better known as *Principia*, which included his three

laws of motion. The third book of *Principia* appeared in 1687 and turned the natural sciences upside down.

Newton's theories were taught at Edinburgh by his disciple David Gregory and Cartesian theory was dropped at Cambridge and Oxford; the French would not accede to Newton's theories until 50 years later. Newton grew tired of life at Cambridge, so he embarked on a career of public service in 1687. He became a member of Parliament for Cambridge University in 1689. He had another nervous breakdown in 1696. Upon recovering, Newton accepted the job of warden of the Mint in London. He was promoted to master in 1699 and revised Britain's coinage. Newton was reelected to Parliament in 1701 but soon lost interest in the position. He became president of the Royal Society in 1703, a position to which he was reelected for 25 years. He was a tyrannical and autocratic president who had favorites and made life torturous for those who dared to disagree with him. Queen Anne knighted him in 1705.

CONTROVERSIES

Newton was engaged in two major scientific controversies. The first was from 1705 to 1712 with Astronomer Royal John Flamsteed (1646–1719), whose notes Newton conspired to publish against Flamsteed's wishes. The second was from 1704 to 1724 with Gottfried Wilhelm von Leibniz (1646–1726), a German mathematician. Leibniz claimed he had discovered calculus before

Reproduction of rough sketch by Isaac Newton showing a reflecting telescope and its components

Newton. It has been proved that Newton discovered calculus first but did not publish it, while Leibniz did. Leibniz and Johann Bernoulli (1667–1748), who mastered calculus, sent Newton problems they believed no one could solve in months, yet he solved them within hours.

As Newton aged, he spent time rewriting his notes. He had written over 1 million words on fourth- and fifth-century C.E. church history and on the Bible that were never published. His focus was to date biblical events using his mathematical calculations. Newton died in London on March 31, 1727, after suffering through numerous infirmities and various illnesses. He received a magnificent funeral and is buried in Westminster Abbey, London.

ANNETTE RICHARDSON

northwestern South America, conquest of

Before the Spanish invasions of the early 16th century, the indigenous peoples of the Caribbean littoral of northern South America were divided into a number of polities and a host of ethnolinguistic groups. Their states and material culture were not as advanced as those in highland Peru or Mexico, so the native peoples of this variegated land had no large cities, used stone tools, produced fine gold work and pottery, and cultivated potatoes, quinoa, maize, beans, squash, and many fruits and vegetables, combined with hunting, gathering, and fishing. Native populations are estimated to have been in the millions. One major population center was in the mountain valleys surrounding present-day Bogotá and extending northeast to the coast near present-day Caracas, the homeland of the Muisca or Chibcha peoples,

divided into two large confederations. Other villages, settlements, and communities were spread across the region.

The first European contacts with the region came in 1498 when the third expedition of CHRISTOPHER COLUMBUS skirted the Venezuelan coast. Over the next two decades, Spanish encounters with the local inhabitants consisted of slave raiding and trading expeditions. The most important consequence of these early encounters was the implantation of deadly European diseases, which rapidly spread west across Colombia and south into the Andes, causing millions of deaths. By the late 1520s, only a few small permanent settlements had been established between the isthmus of Panama and the mouth of the Orinoco River. In 1528, CHARLES V contracted with the Wesler banking house of Ausburg for exploration and settlement of the mountainous region of Venezuela and Colombia. After six expeditions inland, the Wesler incursions found no large cities and very little gold.

Nor did they find any towns, while committing many abuses against the natives. In 1548, the Crown cancelled the contract. In 1530, two years after the Wesler agreement, Diego de Ordaz, a former captain of HERNÁN CORTÉS, received royal authority to explore the Orinoco Basin, whose mouth lay far to the east of the northern Andes. His expedition of some 600 Spaniards also ended in failure.

In 1535, the discovery of golden objects in native tombs prompted further Spanish interest in the region. Several expeditions followed. The most important was led by Gonzalo Jiménez de Quesada, who in 1536 led his 800-strong force up the Magdalena Valley. By the time he reached the Chibcha settlements, fewer than 200 of his men survived. Subjugation of the zone took more than a year, as native arrows, slings, and clubs once again proved no match for Spanish horses and steel. Combining warfare and threats with diplomacy and subterfuge, by 1538 Quesada had largely subdued the Chibcha. The loot proved substantial: some 150,000 pesos of gold, hundreds of emeralds, and other precious objects, divided unevenly among Quesada and his men, the governor of Santa Marta, and the Crown.

Toward the end of the Chibcha campaign, two other expeditions converged on the zone: a Wesler-financed expedition led by Nikolaus Federmann and the remnant of the Andean force of Sebastián de Benalcázar, leader of the Quito expedition under FRANCISCO PIZARRO in the CONQUEST OF PERU. Quesada called the region New Granada and founded a

town, Santa Fé de Bogotá, on the site of the former Chibcha capital. Meanwhile, most of the interior lay unexplored. A final series of expeditions took place in the 1540s and 1550s, most in search of the mythical kingdom of El Dorado. The year 1541 saw three such efforts: one headed by Gonzalo Pizarro, another by Hernán Pérez de Quesada (brother of Gonzalo Jiménez de Quesada), and a third by Philip von Hutten, the last of the Welser explorers.

Benalcázar followed in 1543. All ended in failure. One result of this string of failed expeditions was the journey and journal of Francisco de Orellana, one of Gonzalo Pizarro's lieutenants, who floated down the Amazon River to its mouth. A final expedition in 1559 under Pedro de Ursúa ended in mutiny and a failed rebellion against the Spanish Crown under commoner Lope de Aguirre. Caracas was founded in 1567, while the region did not become a viceroyalty (the largest colonial-era political jurisdiction, as in Mexico and Peru) until the Crown created the Viceroyalty of New Granada, with its capital at Santa Fe de Bogotá, in 1739. Throughout the colonial period, Spanish, Dutch, and English settlements in the region were limited mainly to the Caribbean littoral and the northwestern Andes, while vast areas of the interior remained terra incognita and outside the orbit of European control.

Nurhaci (Nurhachi)

(1559–1626) *Manchu tribal chief, dynastic founder*

Nurhaci was given the posthumous title Taizu (T'ai-tzu), which means “grand ancestor,” because of his role in lifting his people from obscurity and giving them the military and political organization that would culminate in his grandson's becoming the first emperor of the Qing (Ch'ing) dynasty in China.

The people who later called themselves Manchus were Jurchen nomads descended from the Jurchens

who founded the Jin (Chin) dynasty that ruled northern China between 1115 and 1234. Early in the Ming dynasty (1368–1644), the Jurchens lived in southern Manchuria amid agricultural Han Chinese. The Ming government divided the region into three commanderies (provinces), encouraged agriculture among all the population, and held the tribal chief of the non-Han people accountable to the commanders appointed by the court. The Ming government also fixed tribal territories and controlled the succession of the chiefs, who rendered tribute at court at regulated intervals. As Ming power weakened in the late 16th century, so did its control over the tribes, enabling the Jurchens to consolidate into a tribal-feudal state.

Nurhaci was a minor tribal chief in the Jianzhou (Chienchow) commandery. He knew Chinese and traveled to Beijing (Peking) on tribute missions. Early in his career he waged war against and defeated other Jurchen chiefs expanding his power. In 1599, he had a new alphabet created for writing Jurchen (the Jin had created a writing system that died with the dynasty). In 1601, he created a “banner system” for organizing his military, loosely based on the Ming frontier military system called the *wei*, which militarized the Jurchens into a war machine. All Jurchen men were grouped into eight banners, which Nurhaci, his relatives, and allies commanded. The banners also functioned as rudimentary administrative units that controlled taxation, conscription, and mobilization. Its members farmed in peacetime, and its men were called up to arms when needed. With success in war, conquered lands were granted to the banners and the original cultivators became serfs to the banners; however the land allotments were not granted in cohesive units to prevent regionalism. Thus the banner system also became the nucleus of a bureaucratic state. Because the captives became bondservants and serfs, bannermen were able to focus on military duties.

In 1616, Nurhaci announced the creation of a state called the Later Jin, proclaimed himself its “heaven-designated emperor,” and renounced allegiance to the Ming. He was successful in capturing important cities in Manchuria, including Liaoyang and Shenyang (Mukden), where he established his capital and welcomed defecting and captured Ming officials to join his government. Nurhaci was wounded in an unsuccessful battle against the Ming in 1626 and died as a result later that year.

Nurhaci was a talented leader who transformed his tribal people and organized them into a frontier state, in part by adopting Chinese techniques and methods

of administration. He capitalized on the problems of a weakening Ming dynasty to build the foundations that would enable his descendants to rule all China.

JIU-HWA LO UPSHUR

Nzinga Mbandi

(1580–1663) *African military strategist and leader*

Between 1623 and 1663, Nzinga Mbandi, the Muhongo Matamba of what is modern-day Angola, led her people in major revolts against the Portuguese and served alternately as a valuable ally and a fearsome enemy to neighboring kingdoms. Nzinga, who was also known as Jinga, Singa, and Zhingá, was an excellent military strategist. Her sisters served as commanding officers in Nzinga's army, which also included a number of other women warriors. Several women also served in Nzinga's cabinet. Above all, Nzinga was a pragmatist who knew when to attack and when to ally herself with stronger forces.

The Muhongo Matamba was fiercely protective of her own territory, but she was also willing to suspend battling with neighboring monarchs over disputed territory when she deemed it necessary to join forces. Despite her loyalty to her own people, Nzinga had no compunctions in advancing the slave trade by selling other Africans from remote areas. Nzinga unsuccessfully joined forces with the Dutch to try to oust the Portuguese from southern Africa.

PORTUGUESE INVASION

In 1576, the Portuguese invaded Luanda, a remote but strategically important area of southern Africa, and began extending their reach into surrounding areas. Initially the Ngondo people repelled the Portuguese advance but were ultimately overwhelmed by brutal Imbangala warriors who attacked from the rear. The

Imbangala, like the Portuguese, viewed the Ngondo as an obstacle to establishing of a trade route on the coast and to the wealth generated by foreign trade. Over the following century, the Mdongo continued to lose ground, but the rise of Queen Nzinga in 1663 proved to be a turning point in the history of the area.

Using her gift for military strategizing that had been fostered by observing the military advances of her neighbors and the guns and gunpowder procured through her trading partners, Nzinga retreated from the contested area and traveled inland, where she laid claim to Matamba, which was in a vulnerable state after the death of its sovereign. In Matamba, Nzinga founded a new state and extended her territory into nearby Luanda in the KONGO. She subsequently announced ownership of *ngola a kiluanji*, but the right to rule both this area and Luanda continued to be hotly contested. Nzinga developed Matamba as a major trading center, focused on long-distance slave trading. To cut down on competition, she also blocked the trading route that had developed in Kasanja in Luanda.

In the past, Queen Nzinga had paid tribute to the Kongo kingdom in exchange for European goods. By the end of the 16th century, however, Nzinga broke all ties with the Kongo and began exchanging gifts with *ngola a kiluanji* out of her desire to establish a more direct slave-trading route to the coast. At the same time, Nzinga gave the *kambole*, her chief consort, permission to launch a series of campaigns that broadened the reach of her kingdom. In response to a new conflict between Luanda and *ngola a kiluanji*, the ever-practical Nzinga chose to support *ngola a kiluanji*. Her support included dispatching her considerable forces to Mbaka, where they succeeded in routing the Portuguese. By 1591, Nzinga and *ngola a kiluanji* had strengthened their position against the Portuguese by joining forces with Caculo, a neighboring warlord. However, as the war progressed, Nzinga determined that her interests were better served by selling slaves directly to the Portuguese via the chiefdom of Ndembu. By 1641, Nzinga was exporting 12,000–13,000 slaves a year. She also became extremely adept at siphoning off slaves bound for other trading routes.

DUTCH AND PORTUGUESE DEALS

In 1641, Nzinga joined forces with Garcia II, who had declared himself the king of Luanda, and with other neighboring kingdoms to repel a Dutch invasion. Over the course of the next year, however, Garcia decided that the Portuguese constituted a greater threat to independence and determined to oust them

by allying himself with the invaders. Ultimately, however, the Dutch undercut Garcia and his African allies by negotiating a treaty with Portugal. This treaty fell apart after several local revolts broke out, but the Dutch continued to seek cooperation with Portugal, which controlled essential access to slave trading routes.

As long as the Dutch had controlled Luanda, Nzinga's slave-trading route had been blocked, despite repeated efforts to establish trading relations with the Europeans. Consequently, Nzinga again allied herself with Garcia, even though both claimed ownership of Matamba and *ngola a kiluanji*. In fall 1643, in an effort to bypass the Portuguese blockade of her slave trade, Nzinga led a troop of some 80,000 bowmen into the Kongo kingdom along the upper Dande.

With the aid of the Ndembu and 100 Dutch troops, Nzinga overwhelmed the Kiteshi Kandambi, who attempted to stop her. Aghast at her encroachment, Garcia lobbied the Dutch for help in preventing Nzinga from laying claim to additional territory. Ultimately, however, he came to believe that Nzinga's goodwill was more important than that of the Dutch, who had signed a new treaty with the Portuguese.

In 1645, Nzinga's forces were defeated by the Portuguese, who followed up their triumph by invading Luanda. Queen Nzinga subsequently announced

that she was old and tired of making war. She set out to rescue Barbara, her sister and heir, who had been imprisoned in Luanda. Nzinga's efforts to negotiate her sister's release were unsuccessful, and she threatened to settle the issue by military force. Instead, a shaky alliance was negotiated. Twice over the next few years, Nzinga further extended her territory by invading neighboring kingdoms and enslaving their inhabitants. She died three years later at the age of 83.

***obrajes* in colonial Latin America**

Obrajes (roughly, workshops) were key enterprises in the developing economies of Spain's American colonies, principally as sites where wool, cotton, and other fibers were carded, spun, and woven into textiles. While indigenous peoples had woven cloth for millennia, the *obraje* was an exclusively Spanish imposition.

From modest beginnings in the 1530s, *obrajes* developed over time into quasi-industrial enterprises, some with several hundred laborers, mostly Indian, under their roofs. Working conditions were typically harsh, with long hours, poor ventilation, frequent physical abuse, and low or nonexistent pay (Indian labor and tribute were required under *ENCOMIENDA* and related institutions). Most *obrajes* were thus more akin to penal sweatshops than to workshops, as conventionally understood.

The earliest known descriptions of *obrajes* date to the late 1530s in NEW SPAIN (Mexico). By the early 1600s, from 98 to 130 *obrajes* were scattered across central New Spain, clustering around the urban centers of Puebla, Mexico City, Texcoco, and Tlaxcala. By 1600, most *obrajes* averaged around 50 laborers, making the total number of workers engaged in *obraje* production in New Spain around 6,000, though there was a spectrum from large to small; the latter were often called *trapiches*. Scholars have traced the origins of private or non-state-mediated Spanish-Indian labor relations (i.e., non-*encomienda*, non-*REPARTIMIENTO*)

to such early colonial period *obrajes*—labor frequently supplemented by prisoners and convicted criminals.

Captured English sailor Miles Philips was sentenced to work in an *obraje* in Texcoco around 1570. “We were appointed by the Vice Roy to be carried unto the town of Texcuco . . . in which towne there are certaine houses of correction and punishment for ill people called Obraches . . . into which place divers Indians are sold for slaves, some for ten years, and some for twelve.” Philips's companion, Job Hortop, described his experiences carding wool in Texcoco's *obrajes* “among the Indian slaves.” Their descriptions of “Indian slaves” corresponded with Spanish custom and law, in which *obraje* laborers were frequently called slaves.

The development of *obrajes* was encouraged by both the Crown and the highest levels of colonial government, with authorities such as New Spain's first viceroy, Antonio de Mendoza, actively promoting sheep herding, wool production, and manufacture of cheap cloth within the colonies. By the late 1600s, *obrajes* had become an important pillar of the colonial economy in New Spain and elsewhere, generating textiles and other goods mainly for internal consumption. In the 17th and 18th centuries, opposition to royal support for *obrajes* by Spain's textile manufacturers mounted, though it remained insufficient to retard the growth of colonial production and exchange.

Similar developments unfolded in colonial Peru. As in New Spain, *obrajes* emerged in the decades after the conquest with official encouragement and support,

especially around Quito, which by the early 17th century had become South America's leading textile manufacturer. *Quiteño* cloth, prized for its high quality, was produced by both indigenous "community *obrajes*" that employed ancient techniques for carding, spinning, and weaving wool (some housing upward of 200 full-time workers) and smaller, privately owned *obrajes* similar to those in New Spain. Overall, *obrajes* illuminate key aspects of colonial Latin American history, including land and labor relations, the intersections of Spanish and Indian worlds, and the role of the state in promoting specific types of production and exchange within the colonies.

MICHAEL J. SCHROEDER

Oda Nobunaga

(1534–1582) *Japanese general*

Oda Nobunaga overthrew the Ashikaga Shogunate and took control of half of Japan, becoming the virtual dictator in the 1570s. He ended a number of civil wars that had been waged throughout Japan, but his early death ensured renewed fighting.

Oda Nobunaga was born in 1534 in Owari Province in Honshu. His father was a government official who served under the Ashikaga Shogunate and became wealthy. After his father's death when he was 17, he grew the family landholdings and made himself lord of Nagoya Castle, which became his first headquarters, where he raised and trained a loyal band of military retainers. Oda began his conquests in 1555. Meeting with success, he decided to lead his men to reunify Japan.

Nobunaga's first aim was to secure his flanks from attack, and he formed an alliance in 1562 with Matsudaira Motoyasu, who later became TOKUGAWA IYASU, that secured his heartland of Owari, a fertile region of Japan, with Nagoya as an important trading city. Next he moved his army toward Kyoto, the imperial and shogunal capital. Nobunaga used new military technology, including the arquebus and muskets, to great advantage.

In 1568, Nobunaga started to involve himself in Kyoto politics, first by supporting the new shogun Ashikaga Yoshiaki. He would later oust him in 1573, thus ending the Ashikaga Shogunate. To protect his position, Nobunaga then built the mighty Azuchi Castle on Lake Biwa.

With the reins of government in his hands, Nobunaga was determined to make important changes. One of his first acts was to remove road tolls, to help increase domestic trade and diminish the wealth and control of the local *daimyo* (nobles) who collected them. Another of his targets was the powerful Buddhist Tendai sect, headquartered at Enryakuji. Nobunaga was successful and destroyed most of the Enryakuji monastery. Another Buddhist sect, the Ikko sect, however, proved to be more of a problem. Nobunaga began to battle them from 1570. After bitterly fought campaigns, he finally prevailed in 1580, capturing their headquarters near OSAKA and massacring the rest of the remaining defenders.

Nobunaga was a harsh and vengeful ruler who forced many of his opponents to commit suicide. But he was generous to his supporters and rewarded them with confiscated farms and land previously owned by the temples. Nobunaga was friendly toward Christian missionaries and allowed Jesuits to build a church in Kyoto. His motives included the belief that Christianity would erode the influence of the Buddhist sects.

By 1582, Nobunaga had defeated many of his opponents, had unified much of the country, and had nearly half the provinces of Japan under his rule. On June 21, 1582, Nobunaga was ambushed while at Honnoji, a temple of the Nichiren sect located near Kyoto, by Akechi Mitsuhide, an aggrieved vassal. Oda Nobunaga began the work of establishing a unified government in Japan after power had slipped away from the declining Ashikaga Shogunate. His career was cut short, but his goals were continued by his greatest general, TOYOTOMI HIDEYOSHI.

JUSTIN CORFIELD

Omani empire in East Africa

The Omani empire in East Africa was based on the Swahili coast, which extended from present-day central Somalia to Cape Delgado in southern Mozambique. It included a number of islands and archipelagos in the Indian Ocean. There were more than 400 urban settlements of varying sizes. The trading networks within the interior extended from 20 to 200 miles. The trade provided a valuable intermediary between the African interior and the vast Indian Ocean trade. This lucrative trade had been disrupted by the arrival of the Portuguese after 1498. The non-Muslim Portuguese had interfered with the Muslim Swahili trading connections without offering security. Consequently they were attacked by the Turks by the coast and the Jagga and Zimba from the interior.

Treasure hunts for gold and silver and slave-hunting expeditions disrupted the interior trade just as Portuguese opposition to Islam disrupted the Indian Ocean aspect of the trade. In the early 17th century, the cities sought liberation from Portugal and called in the Omanis from southeastern Arabia. The Omanis were a good fit as they had been trading partners with the Swahili city-states for centuries, were fellow Muslims, and used the Arabic alphabet, as did the Swahili. They had also been threatened by the Portuguese, who sought to control their strategic position of the Straits of Hormuz at the entrance of the Persian Gulf. Thus they were glad to arrive in the 1640s to attack the Portuguese. Between 1640 and 1730, they conquered all of the Swahili cities from Somalia to the border between Tanganyika and Mozambique. By 1730, Zanzibar had emerged as the most important Swahili city and the Omanis and an Omani governor were established there.

But though the Omanis came as allies and liberators, they remained as conquerors through appointing representatives in each city. Over the next half-century, the Swahili cities grew tired of Omani taxes and there were periodic revolts. There were temporary overthrows of Omani representatives, but these would be put down. The only city to regain authority was Mombassa under the Mazrui family. They were partially protected in their harbor by Fort St. Jesus, the fortress built by the Portuguese for their military headquarters.

During the 18th century, old trade patterns reemerged under Omani rule due to increased demand for slaves, the availability of capital from places such as India to finance trade, and the willingness of Africans in the interior to take slaves and ivory to the coast. There were effects of the new emphasis on slaves, which replaced the earlier trade in gold (with Zimbabwe) and copper (from Katanga). The international trade for slaves made Omani sultans rich; it also turned communities against each other. Former African trading partners of the Swahili raided each other (encouraged by Omanis to take persons to sell as slaves). Some of the smaller Swahili settlements disappeared as they were not defensible against voracious slave traders. Overall, the Swahili city-states did not regain the wealth that they had experienced during the golden era of 1300–1500.

Internally the people began to identify with Omani conquerors. Inside Swahili cities Omani soldiers of fortune expropriated large tracts of land although many were actually ethnic Baluchis. Many upper-class Swahili found it advantageous to intermarry with Omanis and even claim Arab ancestry. These internal changes plus the participation of wealthy coastal people in the interior slave trade and the owning of slaves from the interior created a chasm between the coast and the interior that persists to this day. By 1800, the Omani empire in East Africa faced new challenges as the English and French established themselves off East Africa in the Comoros and Madagascar (French), as well as Mauritius and Seychelles (English).

NORMAN C. ROTHMAN

Oñate, Juan de

(c. 1550–c. 1624) *Spanish explorer*

On April 20, 1598, Spanish captain-general Don Juan de Oñate approached the Rio Grande, then known as

Inscription Rock: A message written in Spanish by Juan de Oñate as he was passing through what is now New Mexico in April 1606 during the first determined attempt by Spain to colonize the region explored by Francisco Vázquez de Coronado more than 50 years before, in 1540–42

the Río del Norte, the River of the North. Oñate led an expedition that represented the first determined attempt by Spain to colonize the region explored by FRANCISCO VÁSQUEZ DE CORONADO more than 50 years before, in 1540–42. Oñate led a large expedition consisting of more than 100 families, almost 300 single men, numerous wagons, and 7,000 cattle. An advance detachment was led by Oñate's nephew, Captain Vicente de Zaldívar. Unlike many other explorers who were *peninsulares*, those who were born in Spain, Oñate himself was a *criollo*, a Spaniard born in the New World.

Oñate was born to Cristóbal de Oñate and Catalina de Salazar in about 1550. He made an important marriage, which certainly aided his rise to power and influence. His wife was a descendant of both the conquistador HERNÁN CORTÉS and the Aztec emperor

MOCTEZUMA II. Oñate and his wife had a son and a daughter together.

On September 21, 1595, Oñate was awarded a contract by King PHILIP II of Spain to explore the region north to the Rio Grande and settle what became New Mexico, but numerous delays forced his departure to be held back until 1598. The cost of the expedition was entirely Oñate's, with the king's receiving a percentage of the wealth expected to be generated by the new colony. So on April 30, 1598, Oñate in a formal ceremony took possession of the region in the name of King Philip II. The most important part of Oñate's expedition was the military contingent, probably led by Capitan Zaldívar, since he held the position of sergeant-major of the Oñate forces. The main weapon of the Spanish soldiers was the matchlock musket. Crossbows like the ones used by the Spanish in Cortés's CONQUEST OF MEXICO in 1519–21

were still in use by the Spanish but were apparently left behind in Mexico City when Oñate embarked on his march north. However, in the heat of Mexico and the Southwest United States, many Spaniards wore cotton padded armor adopted from the AZTECS (MEXICA), which gave good protection against the arrows the hostile Indians used against them. Curiously enough, Spanish troops carried heart-shaped shields called *adargas* well into the 18th century. Sidearms were long Spanish rapiers and for the cavalry, a pair of matchlock pistols.

Coronado had experienced some fierce fighting with the Pueblo Indian tribes of the Rio Grande valley, and Oñate was fully conscious that his entrance could be marked by combat with the native inhabitants. Therefore, he followed strict military discipline throughout his expedition. After they reached the North Pass on the River (El Paso del Norte), they faced a trip of some 60 miles through a region so arid and hot that ever after the Spanish would call it El Jornada del Muerte (Route of Death). Once among the Pueblo Indians Oñate used the feast of Saint John the Baptist on June 24 to stage a sham battle with the intention of intimidating them with his Spanish cavalry and infantry.

NEW MEXICO ESTABLISHED

Apparently, Oñate's show of force worked, because on July 28, without interference, he established New Mexico's first capital at the pueblo of San Juan de los Caballeros of the Tewa tribe, which he named in honor of the men who had ridden north with Coronado years before. Ultimately Oñate began the construction of San Gabriel as a more permanent capital, perhaps feeling uneasy about the dangers of a surprise attack at night if he remained in the Tewa village.

Although Christianization of the Indians was always noted as a reason for Spanish expeditions, the vast treasures that Cortés had found in Mexico and FRANCISCO PIZARRO in Peru guaranteed that the search for gold and silver would always be a paramount reason for any expedition, and Oñate's was no different. He was determined, however, to keep all exploration and mineral discovery under his own personal control and carried out severe punishments against those who disregarded his orders. With the nearest Spanish forces hundreds of miles to the south, such strict discipline would be the only thing that would keep such an expedition together and safe while surrounded by potentially hostile Indians.

Oñate's grim emphasis on discipline soon proved to have been justified. In December, Juan de Zaldivar, Vicente's brother, and some soldiers accepted the hospitality of Chief Zutucapan at the pueblo of Acoma. Once

they were settled in their quarters, Zutucapan sprang a trap, and Zaldivar and some 10 Spanish were slaughtered. In January 1599, Oñate sent Vicente on a punitive expedition against Acoma, his infantry and cavalry supported now by two pieces of Spanish artillery known as culverins. When the Acomans refused to submit, Zaldivar attacked. Although he was heavily outnumbered, his artillery slaughtered the Acomans. Captives were taken before Oñate, whose punishment was severe.

With the danger from hostile Indians behind him, Oñate spent more time in an illusory search for gold and silver mines. In December 1600, he embarked on a long expedition. His search for riches took his attention from the settlement of the colony and many people who were disillusioned with his rule returned to Mexico, then called NEW SPAIN. Although his search for gold and silver proved fruitless, he became the first Spaniard since Coronado to explore as far north as Kansas to the settlement that Coronado knew as Quivera.

At some point, his love of exploration eclipsed his lust for gold. Even as disgruntled former colonists were spreading rumors of vice and brutality against him, Oñate undertook a final journey of exploration as far as the Gulf of California. Although ordered back by the new king, Philip III, in 1607 to face charges, Oñate remained until Sante Fe was built. When in 1608 a new governor was sent to replace Oñate, he finally returned to Mexico City.

Osaka

Osaka is situated on both banks of the Yodo River and along the eastern shoreline of Osaka bay. Osaka's old

A Japanese print titled *Steel Bridge at Higashibori, Osaka* shows the city that developed along both banks of the Yodo River. The city of Osaka gained prominence in the 16th century when it became a popular Buddhist religious center.

name was Naniwa. According to legend it was founded by Jimu, the first legendary emperor of Japan, who landed in Osaka bay in 660 B.C.E. In 313 C.E., Emperor Nintoku made Osaka his capital. Various other emperors in subsequent times, such as Kotoku in 645 and Shomu in 724, also resided in Osaka. However, the city of Osaka gained prominence in the 16th century when it became a popular Buddhist religious center.

TOYOTOMI HIDEYOSHI built the castle of Osaka on the site of the great Buddhist monastery and made it his headquarters as he dominated Japan in the late 16th century. Osaka also rose to economic prominence as the city, along with Kobe and Yokohama, became the main trading links with Korea and China. Osaka became even more important under the Tokugawa Shogunate and was established as the commercial capital of Japan.

Christianity was first preached in Osaka by Father Gaspar Vilela in 1559. By 1564, five churches were erected in Osaka City and its periphery. Between 1577 and 1579, the number of Christians in Osaka were estimated at between 9,000 and 10,000, which grew to an estimated 25,000 by 1582.

MOHAMMED BADRUL ALAM

Ottoman Empire (1450–1750)

The Ottoman Empire was a centralized absolute regime ruled from the top by the sultan. As in other nomadic and Islamic empires, the Ottomans never developed a legal procedure for accession and this was to be a source of instability and weakness. The first sultans were among the most able sons of the sultans, and rival brothers were sometimes executed. By the 1600s, the oldest male members of the family were selected as sultans. Thus the sultanate passed among brothers or nephews and other possible heirs were kept under “house arrest” in various palaces.

The Ottoman Empire was a Sunni Islamic state, and although the sultans ultimately took the title of caliph, the Sheikh al Islam was the major religious authority of the state. In keeping with Islamic practice,

there was no separation of religious and secular law in the early Ottoman Empire and the Shari'a was recognized as the law of the empire. The Sheikh al Islam issued fatwas, legal opinions based on Islamic law, on matters ranging from the theological to the practical. Qadis, or Muslim judges, served in the provinces and local towns and muftis were appointed to give legal pronouncements if asked by the qadi. Religious education was conducted in madrassas throughout the empire and the office of the *waqf* (pl. *awqaf*) oversaw religious endowments, many of which had been given by devout Muslims as *zakat*, or alms. Waqf endowments included hospitals, schools, retirement homes, public fountains, and soup kitchens.

POWER HIERARCHY

Politically, the vizier was the second-most powerful figure after the sultan. During the 18th century, when the sultans were weak or inept, the viziers, particularly the able and honest KOPRÜLÜ FAMILY, managed the vast bureaucracy and government. Early sultans governed through the imperial *divan*, or council, but ultimately the vizier oversaw the *divan*. A huge number of bureaucrats including scribes, translators, and clerks administered the day-to-day operation of the far-flung empire.

The sultans appointed *valis*, or governors, to rule over each province. To prevent governors from becoming too powerful, their terms in office were usually short; two years was the average. The constant administrative changes often led to inefficiency and corruption. As a rule of thumb, the Ottomans exercised more direct authority in the provinces closest to the center of power in Istanbul; remote provinces, far from the center of power, enjoyed considerable autonomy and local families or officials often were the real sources of power. Because remote regions such as Kuwait and Yemen often only gave an annual tribute to the Ottomans, it was sometimes unclear whether they were actually part of the empire. Unless protracted revolts broke out or people refused to pay taxes, the Ottomans generally interfered little in the daily lives of their subjects.

Militarily, the JANISSARIES composed the elite forces. They were conscripted through the *devshirme* system whereby young Christian boys from the Balkans were taken as slaves, converted to Islam, and trained as professional soldiers or administrators whose sole loyalty was to the state. As the sultans became weaker, the Janissary corps became politically powerful and on occasion overthrew sultans to replace them with individuals of their own choice. The cavalry or *sipahis*, free-born Muslims, were given land as payment.

Ownership of such land grants was sometimes hereditary. There were also a large number of conscripted footsoldiers.

TAXATION

The collection of taxes was a perennial problem and the Ottomans developed a system of tax farming, or *iltizam*, in which *multazim*, tax collectors, were hired to collect taxes throughout the empire. This system led to considerable abuses, and often unfair tax burdens were placed on the poorest peasants, who lacked the resources or power to avoid payment or to buy off the tax collector. Peasant farmers were often informally tied to the land, much of which was owned by old feudal families who retained their wealth under the Ottomans.

Religious minorities, Christians, Jews, and Armenians, lived under the millet system. They paid an additional tax but maintained their own schools, controlled their local communities, and settled legal disputes among their members. The Ottoman Empire was remarkably tolerant of minorities, who enjoyed considerable upward mobility and economic freedom. Members of ethnic and religious minorities could and did rise to high positions, including that of vizier or physician to the sultan. Only the position of sultan was reserved for members of the House of Osman.

Agreements of capitulation were signed with foreign powers such as the French. Under the capitulations foreign merchants and others were granted rights to conduct business within the empire and were exempt from Ottoman taxation and laws. When the empire was strong, the capitulations were not a problem, but as the empire declined, the millet system and capitulations became sources of foreign economic and political interference.

LIFE AS A SULTAN

The sultan and his household ruled from the Topkapi in Istanbul. Topkapi was a sprawling complex of vast audience halls, throne rooms, living quarters for the harem, pleasure gardens and fountains, and a kitchen large enough to provide daily meals for 2,000 people.

The harem included the sultan's wives, concubines, eunuchs, and the queen mother or Valide Sultan. Early sultans, like their counterparts in Europe and Asia, often married the daughters or sisters of defeated foes or wed to cement political and military alliances. By the 16th century, sultans generally did not marry and SULEIMAN I THE MAGNIFICENT'S marriage to his beloved Hurrem (Roxelana) was highly unusual. Women of the harem, particularly the Valide

The concubines' (secondary wives) rooms at Topkapı, built by Mehmed II the Conqueror. The distinctive architectural style is reflected throughout the ancient buildings of the Ottoman Empire.

Sultan, exerted considerable political power during the 18th century. They often conspired for their favorite sons to become the sultan. Although early sultans received firsthand training leading military forces and administering Ottoman provinces, by the 17th century royal princes were educated totally within the palace. Their lack of outside experience and isolation within the harem made them poorly equipped to rule. Seventeenth-century sultans were often spoiled and self-indulgent with little or no awareness of the problems or corruption within ruling circles.

Ottoman Turkish was the language of the ruling elite and government. But as the language of the Qur'an, Arabic enjoyed a special place and was spoken as the first language by the Arabs who composed the majority of the population. The Ottomans eagerly assimilated the artistic forms and cultures of those they ruled and often synthesized a wide variety of

artistic forms into new, vibrant ones. A lavish court life with patronage of the arts evolved. As with most nomadic societies the Ottomans had a rich tradition of textiles and Ottoman artisans were known for their luxurious textiles, carpets, enameled tile work, and armor.

OTTOMAN EXPANSION

Following the collapse of Timurlane's empire, Sultans Mehmed I (r. 1413–21) and Murad II (r. 1421–51) began the process of the reconquest and consolidation of the Ottoman Empire. Mehmed enjoyed the support of the old Ottoman *ghazi* fighters and used that military support as the foundation for reestablishing Ottoman control over much of Anatolia and parts of the Balkans. He was contemplating an attack on Constantinople, the famed Byzantine capital, when he died. His young son Murad failed in his attempts

to take Constantinople but through force and clever diplomacy succeeded in establishing Ottoman control over western Anatolia; he also established an Ottoman navy based at Gallipoli while securing an uneasy peace with King Ladislaus of Lithuania and Poland in 1444. He then abdicated to lead a life of spiritual contemplation.

His son, MEHMED II, had been well trained for the sultanate and promptly began careful preparations to take Constantinople. In 1453, after a protracted siege, the city fell to the Ottoman forces and Mehmed entered the city as the new ruler. Known as Istanbul to the Turks, the city became the new Ottoman capital and a vibrant center for trade and culture. Mehmed II the Conqueror expanded Ottoman control into the Balkans and launched attacks against the Venetians as well as into the Crimea and Iran.

By 1468, he had broken the obdurate Karaman opposition around Bursa and moved into the Black Sea region as well. In 1475, the Tartar khans in the Crimea bowed to Ottoman control. The Ottomans now controlled territory from the Balkans to the vital Dardanelles Straits to the Crimea and the Black Sea and the Anatolian coast along the Mediterranean. At the time of Mehmed's death, Ottoman forces were poised to attack Otranto in southern Italy, but with the succession of a new sultan they were called home in 1481, and the attack was never resumed.

Mehmed's two sons, Jem and Bayezid, struggled over succession to the throne but key military forces supported Bayezid, who outmaneuvered his brother for the sultanate. Bayezid II (r. 1481–1512) continued raids into Hungary and along the Black Sea while attacking Venice in 1499. Following a peace in 1503, the Ottoman navy emerged as the dominant force in the eastern Mediterranean. Bayezid also entered into a protracted and ultimately futile series of conflicts with the rival SAFAVID DYNASTY in Iran.

In 1512, as the Safavids threatened Ottoman territories, the ailing Bayezid turned over the throne to his able son Selim. Known as "the Grim," Selim I (r. 1566–74) had extensive military experience and moved quickly against the Safavids under Shah Ismail, who scorched the earth as he retreated from eastern Anatolia around Lake Van.

Selim then turned his army against the MAMLUKS in Syria and Egypt. Previous Ottoman attacks on the Mamluks had failed, but by the early 16th century, the Mamluks had been seriously weakened by the perpetual rivalries among their leaders and the loss of lucrative trade to the Portuguese navy and merchants, who had

established maritime trading posts in key African and Asian ports.

EGYPT

In 1516, Selim defeated the Mamluks in northern Syria near the city of Aleppo; he appointed Ottoman governors to administer the northern regions close to Anatolia but local leaders remained powerful in southern Syria. The cities of Aleppo and Damascus were the main power bases in Syria.

The last Abbasid caliph, al-Mutawakkil, who had been living under Mamluk protection, was captured and taken to Istanbul. He died in 1543, thereby formally ending the Abbasid line of the caliphate. Selim also confronted the Mamluks outside Cairo. After a short struggle, Cairo fell and in 1517 all of Egypt came under Ottoman control.

However the Ottomans retained the Mamluks as titular rulers of Egypt under Ottoman suzerainty. The Ottoman sultan now controlled territory from the Balkans to the Nile including the Muslim holy cities of Mecca and Medina. The sultans adopted the title *caliph* but it held little real meaning. However, the Ottomans believed themselves to be the protectors of the Islamic world and of the annual pilgrimage (Hajj) to the Hijaz in Arabia.

When Selim died, his only son, Suleiman, inherited an empire at the peak of its power and wealth. Suleiman ruled for 46 years and continued his forebears' traditions of military conquest. After taking the island of Rhodes from the Knights of St. John, who escaped to the island of Malta, and the city of Belgrade, Suleiman moved to confront his major enemy, the HABSBURG DYNASTY of Austria and the HOLY ROMAN EMPIRE. To counter Habsburg power, Suleiman entered into alliances with the French rulers, who viewed the Habsburgs as impediments to their territorial ambitions. Similarly, the Venetians wavered back and forth between alliances with the Habsburgs to counter Ottoman expansion and with the Ottomans to counter Austrian power.

At the BATTLE OF MOHÁCS in 1526, Suleiman won a major victory that was followed by Ottoman forces' occupying the cities of Buda and Pest in Hungary. The Ottomans also fought Russia over territories in the Balkans and Black Sea. In 1529, Suleiman led the Ottoman army deep into Austrian territory and laid siege to Vienna. However, he failed to take the city before winter and as Ottoman troops refused to fight during winter months, he was forced to retreat without taking the city. The Ottomans took Baghdad in 1554 and again in 1639 from their Safavid rivals. Mesopotamia (present-day Iraq) was largely controlled from Mosul in the north and by various

Mazelik in the south. Suleiman died in 1655 while on yet another campaign into Hungary.

Although the Ottoman Empire was the major land power of the age, it was also a major naval power. In 1533 Khair ad Din (c. 1475–1546) became admiral in chief of the Ottoman navy. Khair ad Din and his brothers had been notorious privateers in the Mediterranean and entered into the Ottoman service in the early 16th century. Known as Barbarossa, “Red Beard,” Khair ad Din defeated the Austria fleet of CHARLES V, the Holy Roman Emperor, at the Battle of Preveza in 1538, thereby establishing Ottoman ascendancy throughout the eastern Mediterranean.

NORTH AFRICA

Algiers and Tunis in North Africa were incorporated into the Ottoman Empire and thousands of loyal Ottomans were settled in Algiers as further protection against Spanish incursions. Although the Spanish were able to establish outposts along the northern Moroccan coast, the Moroccan SA'DID DYNASTY used gunpowder armaments to repel both Ottoman and Spanish attacks; thus Morocco never became part of the Ottoman Empire. When Khair ad Din died, his son Hasan Pasha was made bey, or ruler, of Algiers.

In North Africa, the Ottomans exercised loose control over the territories through appointed pashas, Janissary forces, and local beys and deys, who frequently competed with one another for actual political power. In Tunis during the early 18th century, an Ottoman cavalryman established the Husaynid dynasty, which, although it paid lip service to Ottoman suzerainty, was largely independent. It lasted into the mid-20th century, when Tunisia became an independent nation.

Although the Ottoman navy failed to take Malta, it was ascendant throughout most of the Mediterranean in the 16th century. However, in 1571 unified Christian European forces were victorious over the Ottoman navy at the Battle of Lepanto. Based in Egypt and in Basra in present-day Iraq, Ottoman ships extended their reach to Yemen and Aden in the southern Arabian Peninsula and even raided along the Indian coast. Suleiman's son SELIM II (reigned 1566–74) conquered Cyprus in the eastern Mediterranean and his successor Murad III (reigned 1574–95) continued Ottoman territorial gains until 1683. At its fullest extent in 1683, Ottoman territory included all of the Balkans and much of Hungary in Europe, the entire Black Sea coast and Crimea in the north; the western shores of the Caspian Sea in the east; the eastern Mediterranean coast and islands, the Arab provinces of greater Syria (present-day nations and territory of Syria, Lebanon,

Israel, Palestine, and Jordan), Iraq, and most of Arabia including the holy cities of Mecca and Medina; and in the west Egypt and North Africa (present-day Libya, Tunisia, Algeria) to the borders of Morocco. During the 18th century, a series of weak sultans contributed to a decline of Ottoman strength and to the gradual end to their military victories.

OTTOMAN DECLINE

The long decline of the Ottoman Empire was caused by a variety of internal and external factors. During the 17th century, a series of inept sultans failed to provide dynamic military and political leadership of their able predecessors. Corruption and inefficiency grew with few if any attempts at necessary reforms. The cultural and political life of the empire began to ossify. Externally, European rivals grew in political, military, and economic power. New Portuguese-controlled sea routes to India were formidable competition to the overland trade routes controlled by Muslim states, especially the Ottoman Empire.

The increase of trade over sea routes developed during the age of exploration by European powers, thereby contributed to the emergence of Europe as the dominant world force by the 19th century. The discovery of vast amounts of gold and silver in the Western Hemisphere also increased the revenues flowing into European treasuries. This new wealth enabled European rulers to mount increasingly well-armed military forces. Silver flooded into Ottoman territories and caused a drop in the value of Ottoman exchange as well as major inflation. As Ottoman conquests ceased, the treasury was no longer replenished with booty and goods from defeated foes.

The Ottomans also gradually lost the military technological edge they had previously held. In addition, protracted wars with the rival Safavid Empire in the east sapped vital economic and military reserves.

A series of weak, inept sultans increased the political weakness of the empire and made it difficult for it to respond with dynamic reforms or responses to the internal and external challenges. Sultan Ibrahim (reigned 1640–48) was so quixotic and self-indulgent that the Janissaries and Sheikh al Islam deposed him in favor of his young son, Mehmed IV (reigned 1648–87). To preserve the throne for her son, Mehmed's mother interfered and secured the appointment of the able and efficient Mehmed Koprülü as vizier. During this era, the Koprülüs were largely responsible for running the government and for initiating some reforms that helped to preserve the empire.

The so-called long war between the Habsburgs and the Ottomans from 1593 to 1606 was an early indication of Ottoman military decline. The Ottomans retained most of their holdings in the Balkans, in spite of local revolts, but the Ottoman sultan was forced to recognize the Habsburg ruler as a fellow emperor. The Ottoman military decline was marked by the loss to the so-called Holy League of Austria, Poland, and Venice during the Balkan Wars of 1683–97. The Ottomans again laid siege to Vienna in 1683 and for a short time it appeared the city might surrender. Then Polish forces came to the rescue and defeated the attacking Ottoman army. This marked the last attempt by the Ottomans to take the city. Subsequently, the Habsburgs pushed the Ottomans south of the Danube and Venice took portions of Greece and the Adriatic coast, while the Russians attacked in the Crimea. The defeated Ottomans were forced to sign the Treaty of Karlowitz in 1699 whereby all of Hungary, including Transylvania in present-day Romania and the northern Balkan territories of Croatia and Slovenia, were ceded to Austria. Large portions of the Dalmatian coast were taken by Venice but regained by the Ottomans in 1718.

Although the Ottoman Empire was severely weakened by the mid-18th century, its decline lasted longer than the entire histories of most world empires and the empire would not finally collapse until the 20th century.

JANICE J. TERRY

Ottoman-Safavid wars

The protracted conflict between the Ottomans and the Safavids was based on territorial and religious differences. Both great empires sought to control vast territories in present-day Iraq, along the Caspian and their mutual borders. As Sunni Muslims, the OTTOMAN EMPIRE also disagreed with the Shi'i Safavids over basic religious tenets and practices, similar to the disputes between various Catholic and Protestant powers in Europe.

In 1514, the Ottoman sultan Selim I, father of SULEIMAN I THE MAGNIFICENT, declared a holy war against the Safavids, whom he considered heretics. Armed with cannons, the Ottoman army defeated Shah Isma'il, the founder of the SAFAVID DYNASTY, and occupied much of northern Persia (present-day Iran). Suleiman continued the fight against Shah Tahmasp I (reigned 1524–76), but Tahmasp retaliated with a policy of “scorched earth,” making it impossible for the Ottoman forces to live off the land, as was usual for invading armies at the time. Tahmasp also struck an alliance of convenience with the Habsburgs, a major enemy of the Ottomans.

The Ottomans succeeded in taking Tabriz in northern Persia, but, stretched beyond his limits, Suleiman reluctantly signed a treaty with the Safavids in 1555. The Safavids managed to retain control over northern Persia and territory along the Caspian Sea but lost Iraq to the Ottomans. Following Suleiman's death, Shah ABBAS I managed to regain temporary control over Baghdad and Basra in Iraq, but after Abbas died, the Ottomans retook the territories. The subsequent 1639 peace treaty between the two rival empires established borders that are almost identical to those shared by present-day Iraq and Iran. The two great powers remained enemies but no further warfare broke out.

Over the course of their rivalry, both empires achieved major military victories and suffered military defeats, but neither was able to defeat decisively the other. Their futile warfare undermined the economic and military power of both and was a major factor in their long declines.

Panipat, Battles of

There were three battles fought at Panipat, located 70 miles northwest of Delhi, the strategically important city in northern India and capital of many dynasties. The first one was in 1526 between Ibrahim Lodi, Afghan ruler of the Kingdom of Delhi, and BABUR from Ferghana in Central Asia via Afghanistan. The second battle was fought between AKBAR's (grandson of Babur) forces and those of the grandson of Sher Shah (who had driven HUMAYUN, son of Babur, from India). The third battle took place in 1761 when the Afghans under Ahmad Shah defeated the Maratha Confederacy.

FIRST BATTLE OF PANIPAT

A fugitive from his birthplace Ferghana, Babur led an army variously cited as 12,000 or 25,000 men from Afghanistan into India and met Ibrahim, ruler of the Lodi dynasty (originally from Afghanistan) that ruled north-central India. Ibrahim headed a much larger army reputedly 100,000 strong with either 100 or 1,000 elephants. At Panipat, Babur prepared for battle by lashing together 700 carts with leather thongs to form a barricade and placing his matchlock men behind them. Just as Ibrahim's charging troops were stopped at the barricade and mowed down by the gunfire of Babur's men, they were set upon on both flanks by arrows from Babur's cavalry. In the ensuing rout, 20,000 of Ibrahim's men died, he among them. Babur ordered Ibrahim buried where he fell; his tomb still stands at the site. That after-

noon Babur sent his eldest son, Humayun, to the Lodi capital at Agra to secure its treasures while he marched to Delhi, where he proclaimed himself emperor, founding the MUGHAL (Mogul, Moghul) dynasty in India.

SECOND BATTLE OF PANIPAT

Akbar died in 1530 soon after establishing the Mughal Empire in northern India. His son and successor was Humayun, whose heavy drinking and opium eating habits rendered him unfit to rule. Driven out of India by an able general of Afghan origin, Sher Shah, he found refuge in Persia. It was only after Sher Shah's death and with his descendants fighting among one another for the succession that Humayun was able to return to India in 1555, with Persian aid, to restore his fortunes. He died a year later. On November 5, 1556, Akbar, Humayun's 13-year-old son, and his mentor, Bairan Khan, met the forces of Hemu, a powerful Hindu general, at the second Battle of Panipat. Hemu was injured, captured, and executed. With that victory Akbar entered Delhi. This battle resurrected the fortune of the Mughals in India.

THIRD BATTLE OF PANIPAT

Mughal emperor AURANGZEB (r. 1658–1707) was a devout Muslim and persecutor of Hindus. Hindus of the Deccan rallied around a charismatic leader named SHIVAJI who was proclaimed king of the Marathas in 1674. His movement continued to gain momentum after his death in 1680, reaching its zenith in the mid-18th century when the Marathas Confederacy controlled

lands extending from Hyderabad in the south to Punjab in the north. But the quest for a restored Hindu empire in India came to an end in 1761 when the Marathas were badly defeated by Afghan forces under Shah Durani at the Third Battle of Panipat. Although the Afghans retreated from India, the Maratha Confederacy never recovered. The British East India Company was the beneficiary and gradually supplanted the by-now-defunct Mughal Empire and the warring Indian factions.

JIU-HWA LO UPSHUR

Peasants' War

The Peasants' War in Germany was a series of conflicts among the various princes in Germany and those who worked under them during a time of both economic and religious change in Germany. The best known and documented conflict surrounds Thomas Müntzer and the revolt in the region of Thuringia in Germany.

The early 1500s was a time of many changes in Germany. In general, the economy was good, and the peasant farmers were able to provide for themselves and their families reasonably well. There was little central authority in Germany, and each region was ruled by a prince, who had varying amounts of authority and power. This power was tested in small rebellions by the peasants and townspeople, often with negotiated settlements rather than wholesale slaughter as a result. Peasants were the lowest members of society and had few rights. Generally they worked mines or farmed land and raised livestock belonging to a prince or nobleman, could not marry without permission, did not own any land, and were taxed heavily. At much the same level were plebeians, or commoners, townsmen who worked for craftsmen or merchants at subsistence levels or were unemployed.

Various religious movements were also having influence on the peasants. Since the time of the bubonic plague with all of the attendant death, there was a rising expectation of the end times prophesied in the book of Revelation in the Bible. Throughout the previous century, small movements and figures rose, prophesy-

ing that Christ's return was imminent. A very different religious movement, the REFORMATION, began in 1517 in Wittenberg, Germany, when the young monk MARTIN LUTHER nailed his 95 Theses to the castle church door. In his early writings, Luther spoke moderately to both prince and peasant, but many peasants took encouragement from his challenge to the centralized authority of the Roman Catholic Church, advocating a strong role for the local congregation. Their hope was that the local town or trade association would also be strengthened, especially over against the princes.

At the same time, the Reformation heightened the end-time expectations. In 1522, Luther himself had to come out of hiding at Wartburg at great personal risk to deal with the three Zwickau prophets: Thomas Dreschel, Mark Thomas Stübner, and Nicolas Storch. The three men were agitating the citizens of Wittenberg with their Anabaptist leanings and prophetic visions. Luther succeeded in having them sent out of the city, but that would not be the last time he would have to deal with them.

Conflict between peasant and prince was not unusual. In the early 1520s, there were riots of peasants and other classes in Switzerland, Austria, and Germany. Causes were many—for example, in the summer of 1524 revolt broke out in Stühlingen in southern Germany over the countess's command to gather snail shells on which to wind her yarn. But the major spark that set off significant battles came in 1524 when Thomas Müntzer returned from Zwickau and Bohemia and began his preaching in the Thuringian city of Allstedt in central Germany.

Müntzer, a former Roman Catholic priest who had wrestled with his faith, had become Lutheran soon after the Reformation began in 1517. In 1520, he ended up in Zwickau and there met Niklas Storch, a weaver with apocalyptic expectations of Christ's imminent return. Persuaded by Storch's convictions, Müntzer soon became the preacher in a church attended by many of Storch's coworkers. Storch had been proclaiming that the end times were near, that the righteous would soon begin to rise up against the unrighteous (seen as those in authority) and commence the last days prophesied in the book of Revelation. Müntzer, as a priest and educated man, was able to fill out Storch's theme. While popular with the masses, such preaching caused the leading townspeople to clamp down on the church, ending with a revolt of the plebeian weavers and others, and Müntzer and Storch's ejection from the city in 1521. While Storch, Stübner, and Dreschel went to Wittenberg, Müntzer went on to nearby Prague until

he was also expelled from the city. After two years of wandering and preaching, he ended up in Allstedt and there became a popular preacher amongst the peasants and others.

Müntzer's preaching began to alarm those in authority. In July 1524, Duke John, a prince of Saxony, traveled to Allstedt and ordered Müntzer to preach a sermon. Müntzer, eager to have the opportunity to persuade a prince, thundered against the evil and ungodly, saying, "So don't let them live any longer the evildoers who turn us away from God. For a godless man has no right to live if he hinders the godly." When Luther heard of this, he wrote an attack against Müntzer addressed to the princes. Müntzer responded with two tracts addressed to the people, the latter of which was called *The most amply called-for defense answer to the unspiritual soft-living flesh at Wittenberg*. This was a clear call to social revolution and prepared the way for what was to come. The patient Duke John summoned Müntzer to Weimar, telling him to cease his preaching and not leave Allstedt. Müntzer's response was to leave Allstedt, eventually ending up in the nearby city of Mühlhausen.

In Mühlhausen, a man named Heinrich Pfeiffer had been agitating the poorer citizens to take control of the city. Joined by Müntzer and eventually Storch, the agitation increased to a fever pitch. In March 1525, Müntzer began proclaiming that the new league of peasants should march out to war against the godless. In response, bands of peasants began sacking convents and monasteries, but there was no organized effort until May 1525, when the peasants had organized themselves into an army of approximately 8,000. By that time, at the request of Duke John, a nearby prince, Philip of Hesse, had arrived with a small army to deal with the problems in Thuringia. Müntzer marched out to aid the peasants with a band of 300 men and on May 15, the army of Philip of Hesse attacked and quickly routed the peasant army, eventually killing nearly 5,000 of the peasants. For his part in it, Müntzer was tortured and beheaded along with Pfeiffer (Storch escaped but was soon captured and killed).

This was not the end of the Peasants' War. There were no other battles so significant, but it is estimated that some 100,000 peasants and plebeians were killed in the next several years as the various revolts were put down by the princes. The religious overtones were significant in the Peasants' War. They were not the principal cause, but rather the match that ignited the fires of the war. The peasants and plebeians were caught in a time of significant transition. As noted earlier, the

peasant class was actually rising in economic stature but was still living in significant poverty in comparison to the middle and upper classes of Germany.

The Reformation gave a broader vision for the equality of the people before God, but it was only the more radical elements that proclaimed a classless society. Luther, himself an advocate of the common people, still perceived the various occupations as God-given and did not advocate a classless society. In the final analysis, the Peasants' War was one of many such struggles that are endemic to a society in transition. There is a certain irony that the princes who were most moderate toward their people ended up having to put down more ruthlessly the uprising, but the very moderate stance they took encouraged the hope of those promoting revolution.

BRUCE D. FRANSON

Penn, William

(1644–1718) *colonial leader*

William Penn, a Quaker, founded the English colony of Pennsylvania in 1681. He envisioned his colony as a "holy experiment" where people of different faiths could live in harmony.

Born in England, William Penn grew up in wealth and privilege. His father, Admiral William Penn, afforded him a university education, several large estates, and important connections to England's elite. In 1667, Penn became a member of the Society of Friends, a religion founded 20 years earlier by George Fox. The Friends, called Quakers by their detractors, abandoned formal religious services and sought the "Inner Light" by which God revealed himself to each individual. The Quakers suffered persecution in England, but after his conversion, Penn began to use

his wealth and influence to advocate the tolerance of all Protestants in England.

In 1676, Penn looked to America to put his ideas of religious liberty into action when he and several other Quakers became trustees of West New Jersey. However, problems with the charter and the large number of trustees thwarted Penn's hopes to create a religious refuge. Accordingly, Penn petitioned King Charles II for a land grant of his own. To cancel the debt of £16,000 that he owed to Penn's father, the king granted Penn 45,000 square miles of land west of the Delaware River, to be named Pennsylvania (Penn's Woods). According to the 1681 charter, Penn was made sole proprietor, meaning he could organize Pennsylvania as he wanted so long as it did not violate English law.

Penn dispatched the first settlers in October 1681. This party asserted Penn's authority over the European colonists and Lenni Lenape (Delaware) Indians already living in the region. They also established the colony's capital of Philadelphia. Penn arrived in late 1682. From the start, Penn encouraged a variety of Protestants and Europeans to settle in the colony. At his behest, the nascent Pennsylvania legislature in December 1682 issued a law granting full rights of citizenship to all freemen who declared "Jesus Christ to be the son of God" and "saviour of the world." Penn also insisted that his colony have no tax-supported religious establishment, not even for Quakers. This and the economic opportunities available in Pennsylvania caused the population to reach 11,000 in 1690.

Despite Penn's success at religious toleration, his tenure as proprietor was unsteady. He returned to England in 1684, leaving behind incapable governors, and in 1693, a schism led by George Keith divided the colony's Quakers. The Crown suspended his charter from 1692 to 1695 "by reason of the great neglects and miscarriages" caused by Penn's absence. Penn returned in 1699 but found his colonists contentious and uninterested in paying him quitrents on their lands. Frustrated, Penn left two years later but not before issuing the Charter of Privileges, which granted the colonists considerable latitude in crafting their own laws. The unprofitability of Pennsylvania and Penn's penchant for extravagance landed him in debtor's prison in 1707. In 1712, he suffered a debilitating stroke, leaving his wife, Hannah Callowhill, to manage the colony in his stead. After Penn's death in 1718, the proprietorship passed to his sons.

JOHN G. MCCURDY

Pernambuco (Recife, Brazil)

Pernambuco is a state in the northeastern part of Brazil and is the closest South American land to Europe. This area of about 38,585 square miles with a population close to 8 million in the late 20th century was the first area of South America occupied by the Portuguese. Its geography consists of a coastal plain and a dry semi-arid plateau. Pernambuco was originally a captaincy or province. For centuries, Brazil's main exports were the sugar and cotton of this province, making the area important in Brazilian politics. The name *Pernambuco* derives from a tree valued for its lumber, brazilwood, and the red dye it produces. The Native Americans of the area prized the red dye and made their weapons from the tree. The Brazil tree is now endangered, although its wood is still used to make violin bows.

The first European settlers from Portugal called the area Nova Lusitania, meaning "New Portugal," and a capital was established called Olinda. It was a prosperous area, despite a high incidence of malaria. The production of sugar and cotton required large numbers of slaves from Portuguese colonies in Africa to supplement the Native American laborers. The prosperity of Recife caused English adventurers to capture and plunder it in 1595.

Throughout the history of the area, landowners have formed an oligarchy that has maintained its own armies and strictly controlled the lives of those who work their lands. Education of the people was never a priority and transportation developed for the convenience of the landowners, not the people at large. Resentment of this toward the Portuguese-born officials grew in this area among the wealthy.

In 1630, the forces of the Dutch West India Company captured Pernambuco and other Portuguese colonies. They moved the capital to Recife on the coast of Pernambuco at the mouth of two rivers. This low-lying area reminded the Dutch of their homeland. Canals and bridges were built and Recife became known as the Venice of South America. By 1640, Pernambuco sent 24,000 tons of sugar to Amsterdam. The Dutch prince Maurice of Nassau traveled to the area to govern it. Under the Dutch regime many mercantile buildings and homes were built in Recife in the Dutch style.

During the period of Dutch control, the first synagogue in the Americas was built in Recife, Pernambuco. At one time during this period, the Jewish population in Recife was larger than the Jewish community in Amsterdam, Holland. The Jewish presence in Pernambuco disappeared when the Spanish Inquisition of the Catholic Church came to the area with the return of Portuguese power. Many Jews from Recife fled to New York City, then New Amsterdam. Others fled to the interior of Brazil, where they practiced their religion in secret. In 2000, the Jewish population of Recife sponsored an excavation to uncover the remains of the first synagogue built in the Americas in Recife.

The Dutch remained in power only until 1649. The Dutch forces were ousted not by the armies of the Portuguese monarchy, but by the local peoples themselves. The Mascate War took place in 1710 between the business class of Recife and the wealthy owners of the sugar mills around Olinda. Later Pernambuco was the location of a revolution, which briefly set up a Republic of Pernambuco in the 19th century. Though the republic lasted only two months, the flag of the republic remains the state's flag.

NANCY PIPPEN ECKERMAN

Peru, conquest of

Following on the heels of the Spanish CONQUEST OF THE CARIBBEAN, CONQUEST OF MEXICO, and CONQUEST OF CENTRAL AMERICA, the conquest of Peru was a long, complex, and bloody process marked by recurrent civil wars among factions of Spaniards and fierce Native resistance against Spanish efforts to subjugate them. The conquest's beginnings in 1532 with the first Spanish incursions into the Andean highlands are easier to mark than its ending, which is conventionally dated to 1572 with the destruction of the remnant Inca state of Vilcabamba and the execution of the last Inca, Tupac Amaru. Some scholars maintain that the conquest was never fully completed, as Peru's indigenous peoples resisted

Spanish domination throughout the colonial period, sometimes in armed rebellion, more often in less violent and more subtle ways, including the retention of many cultural and religious beliefs and practices. Few would disagree that the conquest of Peru represents one of the bloodiest chapters in the history of the Americas.

In the early 1520s, with the conquest of Central America well under way and a launching-off point at Panama City on the Pacific side of the isthmus, the Spanish were poised to turn their attention to the Pacific coast of South America. The first exploratory expedition was in 1522 under Pascual de Andagoya, who sailed 200 miles south along the Colombian coast in search of a people called the Viru or Biru, a name later corrupted to *Perú*. Further expeditions followed. In November 1524, FRANCISCO PIZARRO, DIEGO DE ALMAGRO, and the priest Hernando de Luque sailed as far south as the Port of Hunger along the Colombian coast before turning back. A second Pizarro-Almagro expedition sailed two years later and discovered tantalizing hints of an advanced civilization in the interior. Pizarro returned to Spain to seek royal authority for an expedition of conquest. His arrival coincided with HERNÁN CORTÉS'S return from his dazzling successes in Mexico, which whetted the appetite of the Crown and drew many adventurers to Pizarro's side. On July 26, 1529, the queen granted Pizarro the authority he had sought, along with the title governor and captain-general of Peru. Almagro was named commandant of Tumbez, a lesser title that sowed the seeds of future conflict between the two men. Pizarro and Almagro returned to Panama and launched their third expedition on December 27, 1530.

After a slow and cautious beginning, on November 8, 1532, Pizarro began his march into the Andean mountains. By this time, much of the Andean population had been ravaged by virulent European diseases, especially smallpox, that had spread overland from Central America and northern South America years before the Spanish set foot in the Andes. By weakening the Inca Empire, these diseases proved to be one of the Spaniards' most important allies. Pizarro's turn into the mountains could not have been more propitiously timed. The recent death of the Inca Huayna-Capac from an unknown disease had created crisis of dynastic succession and civil war among the Inca, leading his sons Huascar and ATAHUALPA to contend for supremacy. Huscar headed the CUZCO faction of the Inca royal family; Atahualpa, the Quito faction.

By stunning good fortune, Atahualpa's 7,000-strong army was camped in the mountain valley of CAJAMARCA, near Pizarro's line of march. Pizarro and his 150 men boldly marched straight into the valley. After some initial

friendly interactions with the Inca, Pizarro launched a surprise attack on November 16, 1532, and slaughtered the Inca's entire force. As was the case throughout the Peruvian campaign, Inca weaponry proved no match for Spanish steel, armor, and horses. The arquebus, the most sophisticated firearm in the Spanish arsenal, played little role in the conquest. Swords, pikes, and horses proved their most valuable weapons. Time after time, small numbers of Spaniards proved able to defeat vastly larger native armies.

With the Inca Atahualpa now his prisoner, Pizarro demanded a huge ransom of gold and precious objects for his release. Over the next eight months, trains of native porters carted massive amounts of treasure into Cajamarca. Meanwhile, convinced that the Spaniards represented no threat to the empire, Atahualpa arranged for the murder of his brother Huascar, thus eliminating his brother's claim to the Inca throne. Pizarro had no intention of honoring his part of the bargain. On July 26, 1533, after a month of melting down and distributing the loot among his men, he executed Atahualpa. One of the signal events of the conquest, Atahualpa's execution remained a key moment in divergent Spanish interpretations regarding the morality of the conquistadores' actions. Almagro's force of 150 men arrived soon after the division of spoils, of which they received a small share. The unequal distribution of loot generated lasting animosities between the Almagro and Pizarro factions.

By this time, Pizarro's scouts had probed the vulnerabilities of the Inca capital in Cuzco. Recognizing the need for a puppet Inca to invest political legitimacy into the Spaniards' anticipated domination of Peru, Pizarro arranged the crowning of Huascar's younger brother, Tupac Huallpa, as Inca. It was a pattern repeated numerous times in the coming years. Meanwhile, Francisco Pizarro's brother Hernando returned to Spain with the Crown's requisite "royal fifth" of the treasure. News of the events spread quickly throughout Spain and Europe. Recruiting drives for additional soldiers saw great success, while also planting the seeds of future conflict between Spaniards who had profited from the initial successes and fresh arrivals whose hunger for treasure would go unfulfilled.

Back in Peru in August 1533, Francisco Pizarro, Almagro, and their men began their march toward Cuzco, 750 miles south along the Inca road. En route, in October, the puppet Inca Tupac Huallpa died. After numerous battles in which the vastly outnumbered Spanish roundly defeated their Inca attackers, Pizarro's force of several hundred men entered Cuzco on November 15, 1533. Two days earlier the same day that Pizarro burned alive

the leading Inca general Chalcuchima, a second puppet Inca presented himself—Manco Inca, son of Huayna-Capac. In Cuzco on November 16, 1533, one year after executing Atahualpa, Pizarro appointed Manco Inca as Inca. In December, he was officially crowned. Presenting themselves as liberators, backers of the Cuzco faction in the civil war, the Spaniards quickly took over the city's most important buildings and palaces.

From this point, divisions among and between Spaniards combined with a series of mass Indian uprisings against the invaders. Almagro, still stinging from the paltry share of treasure received in Cajamarca, was sent south into Chile in search of further riches. PEDRO DE ALVARADO, fresh from his successes in Mexico and Central America, arrived in Ecuador in February 1534 and headed toward Quito.

Hoping to head off Alvarado's unauthorized invasion, Pizarro's captain Sebastián de Benalcázar marched on Quito, took the city, and defeated the remaining Inca armies in the north. With looted treasure he bought off Alvarado, who returned to Guatemala, though many of his men remained. Soon after, in January 1535, Francisco Pizarro founded a new capital city on the coast, Ciudad de los Reyes, later known as Lima, a corruption of its indigenous name.

Meanwhile, disillusioned by the invaders' avarice and violence, Manco Inca escaped from Cuzco and in early 1536 led a mass uprising against the Spanish, laying siege to Cuzco with some 100,000 troops. The siege faltered as the rainy season began and his army began drifting away. Manco Inca retreated into the jungle fastnesses of Vilcacamba, where a rump Inca state resisted Spanish incursions until its final destruction in 1572. Soon after Manco Inca lifted the siege of Cuzco in early 1537, Almagro's expedition returned from Chile, exhausted and empty-handed. Open civil war soon erupted between the Almagro and Pizarro factions. Almagro was defeated in the Battle of Las Salinas near Cuzco in 1538, after which Hernando Pizarro executed him, but the war raged on under Almagro's son, also named Diego de Almagro. In 1541, the Almagrists killed Francisco Pizarro, while a year later Pizarro loyalists under the king's newly appointed governor Cristóbal Vaca de Castro defeated and killed Almagro the younger.

That same year of 1542 the Crown issued its New Laws, designed to limit the abuses of the *ENCOMIENDA* system and prevent the *encomenderos* from becoming an independent aristocracy beyond royal control. Bridling against these new restrictions on their authority, many *encomenderos* gravitated toward Gonzalo Pizarro, who violently opposed the New Laws. After killing

An aerial view of the Incan city Machu Picchu, high above the mountains in Peru. Machu Picchu was constructed around 1450, at the height of the Inca Empire, and was abandoned less than 100 years later as the empire collapsed under Spanish conquest.

the king's viceroy Blasco Núñez de la Vela in 1546, Gonzalo Pizarro effectively ruled Peru until royalist forces captured, tried, and executed him in 1549. The new viceroy, Pedro de la Gasca, effectively stanching further major challenges to royal authority.

Meanwhile, enormous deposits of silver were discovered in Potosí in 1545, which soon became one of colonial Peru's main economic pillars. By this time, most Indians had acceded to Spanish authority, though numerous pockets of resistance endured through the 1550s and 1560s, most notably the rump state of Vilcabamba. In 1572, the new viceroy Francisco de Toledo finally found and crushed Vilcabamba. On September 24 of that year, in the central square of Cuzco, Toledo oversaw the execution of the last Inca, Tupac Amaru. His execution effectively ended this first phase of organized armed resistance against Spanish domination, though more covert forms of resistance continued for nearly 300 years, while a new round of rebellions, inspired by the first and led by Tupac Amaru II, erupted in the 1780s.

It is not known how many Indians died during the 40 years between the executions of the Incas Atahualpa and Tupac Amaru, though the most conservative estimates range from 3 to 5 million, from a preconquest population of around 7 to 9 million. As elsewhere, the combination of warfare, atrocity, forced labor, enslavement, and disease caused a precipitous demographic decline, from which populations did not begin to recover until well into the 18th century. As the conquests of the Caribbean, Mexico, and Central America that preceded it, the conquest of Peru represents one of the most horrifically violent and destructive episodes in the history of the world.

MICHAEL J. SCHROEDER

Peru, Viceroyalty of

The largest and second most important political jurisdiction in Spain's American empire after the VICEROYALTY OF NEW SPAIN, the Viceroyalty of Peru came into being in 1542 during the civil wars that wracked the Andes during the CONQUEST OF PERU. Originally comprising all of South America west of the demarcation line established in the TREATY OF TORDESILLAS in 1494, the viceroyalty extended from Panama in the north to Patagonia in the south, and from the Pacific Ocean eastward to a longitudinal meridian at roughly 44 degrees west, excluding parts of northern South America (contemporary Venezuela), which were under the jurisdiction of New Spain. In the late colonial period the Crown carved two new viceroyalties out of the Viceroyalty of Peru: New Granada (1739) and Río de la Plata (1777).

Following the civil wars of the period of conquest, and the major reforms of Viceroy FRANCISCO DE TOLEDO in the 1570s, Peru emerged as a major source of silver bullion, especially from the "mountain of silver" at Potosí. As elsewhere in the Americas, Spain imposed across the Peruvian Andes a rigid castelike race-class hierarchy in which subordinate Indians, toiling under a modified version of the preconquest *mita* labor system, provided labor and tribute to Spanish civil and ecclesiastical authorities, and to native *kurakas*, or community chieftains, who occupied an ambiguous middle ground between the Spanish elite and the masses of Indian laborers.

The violence of conquest and its aftermath prompted a millenarian nativist backlash in the 1560s: the Taki Onqoy movement. Aiming to expel the despised invaders and reestablish a pan-Andean indigenous state, this popular rebellion reproduced many of the divisions and fractures of preconquest indigenous society and was crushed by the 1570s. Popular memories of Taki Onqoy endured throughout the colonial period, however, reerupting in a different form in the major Andean rebellions of the 1780s.

As elsewhere in the Americas, demographic declines in colonial Peru were very steep, though on the whole

of a lesser magnitude than those in New Spain (though, as elsewhere, the numbers will never be known with any degree of precision). From an estimated population of 9 million in 1520 for the Andes as a whole, the number of surviving Indians is estimated to have dropped to 1.3 million by 1570, and 600,000 by 1630. Following a major series of epidemics in 1718–20, the population hovered at around this number to the mid-1700s, climbing gradually thereafter. In a characteristic pattern, highland dwellers on the whole experienced a lesser population decline than inhabitants of the more disease-prone lowland valleys of the Pacific Coast.

Despite the ravages of warfare, forced labor, forced conversion, disease, and the violence of colonial rule, Peru's indigenous peoples and communities displayed a remarkable resilience, retaining many features of their preconquest cultures and lifestyles. Despite prodigious efforts, Spanish authorities were never able to extirpate the religious beliefs and practices of Peru's Indian peoples, while Quechua, Aymara, and related tongues remained the dominant languages among the vast majority. Centuries-old traditions of planting, harvesting, cooking, eating, herding, weaving, and, in general, conceiving of and acting in the world endured through nearly three centuries of Spanish colonial rule and after, as remains plainly apparent to the present day. The English-language historiography on colonial Peru, like that for colonial Mexico, is exceptionally rich.

MICHAEL J. SCHROEDER

Peter I the Great

(1672–1725) *czar of Russia*

The rise to power of Peter the Great was fraught with death and uncertainty, but his reign as czar greatly strengthened Russia in regard to its acquisition of territory in the Baltic and Black Sea regions, and the modernization of Russian society. Czar Alexei (1645–76) and his

wife, Natalia Naryshkin, did not believe their son Peter would drastically change the course of Russian history when he was born on May 30, 1672.

The death of Czar Feodor III (1676–82) created a problem for the continuation of the Romanov dynasty in Russia since Fedor left no heirs; the debate developed concerning Ivan or Peter as successor. Ivan was Fedor's brother, but Ivan, who was 16 years old, was mentally and physically handicapped. Peter was the half brother of Ivan and had the support of many of the boyars and the patriarch Joachim, since this healthy 10-year-old offered stability to the Russian throne.

The Zemsky Sobor, an assembly of boyars, was assembled and voiced its support for Peter, but Sophia, Feodor's sister, refused to allow Peter to be crowned as czar and attempted to incite the Streltsi, a regiment of guardsmen, to turn against Peter. On May 15, 1682, the Streltsi, upon hearing rumors that Ivan and a number of boyars were murdered, rebelled and stormed the Kremlin.

The Streltsi swore their loyalty to the Romanov family after Ivan Naryshkin and Doctor Van Gaden were brutally murdered. These two individuals were killed because the Streltsi believed they played a role in the presumed death of Ivan. Following these murders, the Streltsi decided that Ivan and Peter would corule Russia, with Ivan acting as the senior czar and Sophia as the regent over both czars. The double coronation ceremony was held on May 26, 1682.

Sophia's control over the Russian government quickly deteriorated with mounting tension between Sophia and Peter as Peter tried to assert his authority over her. In August 1689, Sophia called up some of the palace guards to protect her from a suspected attack from supporters of Peter. This intensified the situation, because a number of people loyal to Peter believed that these guards were called up to attack him. Peter fled for refuge to the Monastery of the Holy Trinity, where he rallied a sizable force. Sophia, fearful of Peter's increasing strength and of her declining support, capitulated.

Peter's mother, Natalia, was selected to replace Sophia as the regent of the czars, but her regency was short, as she died in 1694. Ivan died shortly later in 1695, leaving Peter as the czar of Russia, and in a position to pursue his own policies.

MILITARY MIGHT

Peter's first interests were against the Crimean Turks, as Peter was anxious to acquire access to the Black Sea so that Russia could trade with Europe throughout the whole year. The battle against the Turks at Azov in 1695

Peter the Great of Russia greatly strengthened Russia with acquisition of territory in the Baltic and Black Sea regions.

was a failure despite the fact that Peter assembled an army of approximately 31,000 men to attack Azov, and another 120,000 men to fight near the Dnieper River. The reason for the failure was that the Turks could still ship supplies to Azov via water transport. Peter decided to correct this oversight in his strategy and collected money from monasteries and boyars to build a Russian naval fleet. The second attempt to take Azov in June 1696 with an army of 80,000 soldiers and a fleet was successful.

With the campaign against the Turks a success, Peter decided to focus his attention toward the West. In 1697, Peter and an entourage of 250 Russians toured Europe to examine Western knowledge and technology. Peter was impressed with the wealth Holland was able to acquire through its trading access and commercial fleet. This wealth left such an impression on Peter that he was determined to emulate this success by constructing his own commercial fleet. He wanted to give Russia a window to the West via trade and to acquire more European technology to strengthen Russia. Peter also wanted to import

Western culture to Russia; he forced the nobles to shave their beards, changed the Russian calendar to conform to the European calendar, and made the Russian New Year conform to the European New Year.

In fact, the historian Paul Bushkovitch has credited Peter with introducing modern culture and political thought to Russia. Peter was also able to create a stronger state by making the Eastern Orthodox Church subservient to the Russian government. The money Peter seized from monasteries and the reformed tax system helped Peter to build an academy to improve the education system in Russia. Peter was also able to bring order to the Russian social hierarchy by formulating the Table of Ranks in 1722, which determined an individual's status in Russian society.

MOVING WEST

Instead of pursuing Russian expansion to the south against the Turks, as previous Russian foreign policy dictated, Peter moved west, initiating hostilities against Sweden. The Great Northern War against Sweden dominated much of Peter's reign. In order to defeat the Swedish, Peter built a large army based on the same model as his Preobrazhenskii regiment, which had Western-style uniforms, training, and promotion through the ranks based on merit instead of birth. Poland sent a declaration of war to the Swedish government in January 1700, and Denmark quickly followed suit. These two countries gave Peter allies in a war against Sweden, initiated when the Russian government declared war against the Swedish government on August 20, 1700. Unfortunately for Peter, the Danes sued for peace on August 20, 1700, leaving Russia and Poland to fight against the Swedish empire without this valuable ally.

As this alliance between Poland and Russia developed, Charles XII of Sweden reviewed his plans to protect his empire. Unfortunately, he was not able to recognize the major threat to his country's boundaries. The Swedish strategy during the Great Northern War consisted of concentrating the main bulk of their forces against the Polish armies while Charles relied upon a token force to limit the Russian advance in the east. It is true that the Swedes quickly attacked and defeated a Russian force at Narva on November 30, 1700. At this battle, a small Swedish force of 10,000 soldiers was able to overwhelm a Russian force of 40,000 men and seize the battlefield. Despite this victory, the Swedes did not follow up their attack with further pressure against the Russians. The Swedish strategists preferred to concentrate their war effort against the Poles. It took the Swedes eight years to launch their second invasion into Russian territory.

Following his victory at Narva, Charles maintained a Swedish force of 15,000 men to protect his Baltic possessions. This force proved to be inadequate in the defense of the eastern portion of his empire against the armies of Peter. In January of 1702, Peter gained some momentum with his victory over the Swedes at Errestfer. This battle had major consequences for the Swedish war effort since its army lost 3,350 soldiers. This Swedish defeat was compounded by another Swedish rout half a year later. This defeat cost the Swedish army a significant number of soldiers and provided the stimulus Peter needed in order to expand into the Baltic area. Peter was able to strengthen Kronstadt after the capture of the fortresses of Nyenskans and Nöteborg. Peter was determined to hold on to his acquisitions in the Baltic region and give Russia closer ties with the rest of Europe by founding St. Petersburg in 1703, which became the future capital of Russia. It is important to note that the Russian armies acquired more than territorial gains from this Baltic campaign. Through these military victories, the Russians were able to acquire more experience and confidence, as well as increase the size of their army.

When Charles XII finally turned his attention toward the Russian front, Peter had already established himself on the eastern coast of the Baltic Sea. The eight-year gap between the two Swedish invasions of Russian territory provided Peter with a reprieve in which he could strengthen his armies. The number of cavalry regiments increased from two in 1700 to 34 regiments at the time of Charles's return. As Charles advanced through the Ukraine, Peter was obliged to follow a scorched earth policy in order to stall for time and demoralize the invading Swedes. Vicious methods were employed to deprive the Swedes of anything of use as the town of Dorpat was destroyed after the inhabitants were forcibly moved eastward and Russians were forbidden to provide Swedish troops with provisions.

SWEDISH DEFEAT

On May 11, 1709, the Swedish army unknowingly began a siege that would lead to the capitulation of the Swedish government 12 years later. The Poltava battle accurately foreshadowed the decline of Swedish power in the affairs of the Baltic as this battle cost the Swedish army 9,700 soldiers. This is a significant number of men compared to the 4,545 casualties the Russian army endured. The consequences of this battle were further devastating to the Swedes. On July 1, 1709, fully 20,000 Swedes surrendered to the Russian armies at the town of Perovolochina. The Russians were

unable to capture their royal opponent as Charles XII, who abandoned a significant portion of his army, fled south to the OTTOMAN EMPIRE.

Poltava is recognized by scholars as a battle that not only changed the course of the Northern War, but completely altered the balance of power in northeastern Europe. It must be noted the governments of Western Europe were anticipating not only the destruction of the Russian army, but the further expansion of Swedish influence into eastern Europe. The consequences of the Battle of Poltava ended any hope of imposing Swedish influence on the Russians. Not only did the Swedes lose a substantial portion of their army, but the old alliance against them was strengthened. In this respect, Peter shifted from a passive role during the first alliance into a more active role. Peter, who encountered Augustus on the Vistula River, agreed to help his former comrade reclaim his throne since he was deposed following the Swedish victory over the Poles at Kliszow in 1702. Peter attempted to make the Polish throne more secure to the family of Augustus by making the Polish monarchy a hereditary position. This illustrates the massive degree of power Peter now possessed in the internal affairs of the Polish government. The Danes, already allied to Augustus, wished to restore the old balance of power in northern Europe.

INVASION OF FINLAND

Peter was able to use his gains in the Baltic to their fullest potential as he launched an invasion of Finland in order to strengthen his position at the upcoming peace negotiations with the Swedish government. The Russians won a remarkable victory against the Swedish at Storkyro in March 1714. This land victory was followed by a Russian naval triumph over the Swedish navy at Gangut. In 1718, the Swedish government faced another threatening situation: Charles XII died during a battle in Norway. Ulrika, Charles's sister, faced increasing pressure resulting from Peter's invasions of the Swedish heartland. The Russians were also enlarging the size of their Baltic fleet at an alarming pace. These threats compelled the Swedish government to end the war against the Russians. The Russians were able to gain a significant degree of power in the Baltic region from the Treaty of Nystadt.

The agreement between these two powers allowed the Russians to take possession of several islands, the territories of Livonia, Estonia, Ingermanland, and a section of Karelia. The Russians were given significant influence in Baltic affairs since they kept the fortress of Viborg. More important, the Russian czar was regarded

as an imperial monarch by the Prussians and the Dutch. Even the Swedes and other western Europeans eventually acknowledged this title.

Peter's death on January 28, 1725, brought uncertainty to the succession of a new ruler for two reasons. Peter did not have a male heir to succeed him, and he failed to nominate his successor before he died. Peter's only son and heir to the throne, Alexei, died on June 26, 1718, as a result of the torture inflicted on him for his rebellious attitudes. Alexei was an outspoken critic of Peter's reforms and feared the wrath of his father, resulting in his flight to Austria in 1716. Despite the fact that he was plotting against his father, Alexei was eventually persuaded to return to Russia and was imprisoned in the Peter and Paul Fortress, where he later died. His wife, Catherine, was nominated to succeed Peter since she had the support of a number of Peter's advisers and the Imperial Guard.

BRIAN DE RUITER

Philip II

(1527–1598) *Spanish monarch*

Despite the fact that Philip II was the ruler of the Spanish Empire when its influence in the world was at its peak, his record as a monarch was not entirely successful. The birth of Philip on May 21, 1527, in the city of Valladolid was a welcome joy to his parents, CHARLES V and Isabella of Portugal. His parents had a significant impact on his upbringing as his father taught him at an early age how to govern the realm, while his mother's piety played

a large part in Philip's life. Although Philip was a very devout individual, his interest in the occult was evident in his collection of hundreds of books on this subject.

In the 16th century, Spain was one of the most powerful countries in Europe. Charles V ruled over a sizable empire as he controlled Spain, Sardinia, Naples, Sicily, the Netherlands, land in central Europe, and colonies situated in the Caribbean and South and North America. Control of this large territory was difficult to manage, and when Charles V stepped down as the Emperor of the HOLY ROMAN EMPIRE in 1558, he chose two people to rule the Habsburg lands—his brother Ferdinand and his son Philip. Philip received the largest bulk of the empire, as he acquired Spain, the Spanish colonies in the Caribbean and North and South America, Sardinia, Naples, and the Netherlands, in comparison to Ferdinand, who acquired Habsburg territories in central Europe. Philip acquired the kingdom of Portugal and its colonies following the death of the Portuguese King Manuel I in 1580 because Manuel failed to produce a male heir. Philip inherited this kingdom because his mother was one of Manuel's daughters. Philip spent much of his life trying to attain unity and protect his empire rather than extend his absolute rule over the areas he controlled. The empire was too large for Philip to attain absolute rule as is evidenced by the fact that his control of the empire was ineffective outside Madrid.

Despite the division of Habsburg possessions in Europe, Philip was still left with a significant area of territory to govern and had the potential to add further territories to Habsburg possessions. Philip married MARY I of England in 1554; the marriage could have brought England into the possession of the Habsburg family but failed to produce a child. The accession of Elizabeth I to the throne of England in 1558 changed the dynamics of Spanish-English relations. Elizabeth was a Protestant, who supported the Dutch in their fight for independence against the Spanish and endorsed English piracy against Spanish ships. Philip sent a powerful naval armada to remove the "heretic" Elizabeth from power, but English ships were able to destroy a number of ships, while dangerous weather forced a number of others to crash into rocks off the coast of Scotland and Ireland. This defeat was a massive blow for the Spanish fleet as at least 70 of the 130 ships that participated in the invasion were destroyed. This massive blow to the Spanish navy forced Philip to give up his plans of removing Elizabeth from power.

Philip spent a great deal of time trying to secure Habsburg possessions in Italy against the encroachments of France by signing the Peace of Cateau-Cambrésis in

1559. After securing Italy, Philip was able to concentrate more on the threat that the OTTOMAN EMPIRE posed to the western Mediterranean and to southern Spain. From 1559 to 1577, the Spanish navy was engaged in frequent fighting against the Ottoman navy.

The southern coast of Spain was vulnerable against Ottoman naval incursions as a result of the weakness of the Spanish navy in that region and a rebellion initiated by the Moriscos, who were Christian Moors, over taxation. The naval war between the two empires climaxed in 1571 at the Battle of Lepanto, where the Spanish navy decisively defeated the Ottomans, ending the Ottoman threat to southern Spain.

RELIGION AND POLITICS

It is difficult to assess the degree in which religion played a role in Philip's foreign policy, and historians have been debating this question for years. Religion was a major focus in the life of Philip II as is evidenced by the fact that he undertook many administrative reforms in the church in Spain by creating an archdiocese at Burgos, creating seven dioceses, and cutting off over 300 monastic houses in Spain from their religious orders in Europe, giving the Spanish government more influence in their affairs.

Philip attempted to create a fair political and judicial administration in order to win the hearts of his loyal subjects and the fear of criminals. He intervened in the judicial and government systems as little as possible, and only when he believed that injustices were committed against his people. Philip even put class distinctions aside as he punished the aristocracy when he believed they violated the law. This is not to suggest that Philip II was without prejudices; he attempted, after all, to expel the Jewish population from Lombardy.

Philip endured many tragic events in his personal life, including the death of his wives, Maria of Portugal, Mary I, Elizabeth of Valois, and Anne of Austria. Philip was also forced to live with the death of his son Don Carlos. The relationship between Philip and Don Carlos was characterized by incessant friction, and it is possible that Don Carlos supported Dutch leaders who were becoming dissatisfied with Spanish rule. Philip imprisoned his son in 1568, and he died six months later, possibly on the orders of Philip. Philip was not always eager to marry, but diplomatic ties and the need for an heir to the throne prompted the king to take four wives. This need for a male heir became acute following Don Carlos's death. The problem concerning a male heir was solved as Anne gave birth to a boy, Philip III, on April 14, 1578, who became the king of Spain following his father's death in 1598.

Philip was not a popular monarch among his people. He preferred to spend most of his day alone and avoided the public as much as possible. Despite the fact that Philip ruled over a large empire, his military was too weak to defend much of it, and his administration too ineffective to rule it. Historians have critiqued the rule of Philip II, with varying conclusions. Some point to his securing of the western Mediterranean from Turkish incursions and unification of Portugal and Spain as major achievements while others look to his foreign and domestic policies to show that Spain was weak at the time of his death. Epidemics and famine led to a decline in population while declining trade and a weakening industrial and agricultural base crippled the empire as the Castilian peasants were forced to pay over a third of their income in taxes to the government.

BRIAN DE RUITER

Philippines, Spanish colonization of the

The Philippines is an archipelago of more than 7,000 islands in Southeast Asia. It contains a great deal of diversity in ethnicity and social organization. Prior to the arrival of the Europeans, there were very few credible accounts of life on the archipelago and, consequently, what is known about precolonial Philippines depends on postcolonization sources. Prior to Spanish rule, the Philippines consisted of small-scale communities with little connection to any larger state.

Junks had been traveling to the islands from China for centuries and some islands and ports had roles in the international spice trade. The southern islands of the Philippines had become partly Islamized since the 15th century from Brunei to Mindanao and the Sulu islands.

Both Spain and Portugal had become active in the Southeast Asian region by the late 15th century, attract-

ed by the valuable spice trade, access to the markets of China, and the possibility of converting souls to Christianity. Relations between Spain and Portugal were regulated by the TREATY OF TORDESILLAS in 1494, which divided lands outside Europe between the two powers. This division was further regulated by the Treaty of Saragossa in 1529, which fixed the exact line in the Pacific at 17 degrees east of the Moluccas Islands. A Spanish explorer, FERDINAND MAGELLAN, arrived a Cebu (part of the chain that became the Philippines) across the Pacific from the Western Hemisphere in 1521. In 1565, the first permanent Spanish settlement was established on Cebu. Manila was established in 1571; it became the capital of Spanish-ruled Philippines.

The spread of Spanish influence occurred quickly and peaceably, since there were few large communities able to resist the superior technology and organization, except for the Islamized states in the south, especially Mindanao. None of the desired spices were found in the Philippines. The colonization was, consequently, of only limited success from the Spanish perspective and the local cultural heritage partly replaced by European Christianity and agriculture and other economic activities were reorganized and surplus was exported to Spain. Spanish appointed governors replaced the indigenous rulers.

Local exports to Spain, however, were very secondary to Chinese-made goods that Chinese merchants took to Manila, as they had been doing since the end of the first millennium C.E. These goods, primarily silk textiles, tea, and porcelain, were in great demand in Europe, with the result that Manila became the gathering place of Spanish galleons that would sail in convoy annually to ports on the Pacific coast in southern Mexico, whence they would be carried across the isthmus by Mexican porters to Veracruz, a port in the Gulf of Mexico, and loaded onto ships for transport across the Atlantic to Spain. Thus the Philippines were more important to Spain as a gathering place for goods made in China and secondarily from Japan than for its own products.

As a result of Spanish rule until the end of the 19th century, the Philippines is the only Asian country with a majority Catholic population.

JOHN WALSH

piracy in the Atlantic world

Not long after the Spanish colonies in the Americas started to generate massive wealth, pirates started to attack the ships, taking the gold, silver, and other treasures from the Americas to Spain and later from Brazil to Portugal. In addition to attacking ships, some of the

A 1741 engraving of Henry Morgan, notorious Welsh pirate and buccaneer who plundered Spain's Caribbean colonies

more daring buccaneers, such as FRANCIS DRAKE, went as far as attacking ports.

While some of the early raiders were freelance pirates, the cost of maintaining a ship and the ability to find a friendly port meant that many were privateers. These were French, Dutch, and more particularly English sailors, who operated in the Caribbean and in the Atlantic on behalf of their government, who had issued them a “letter of marquee,” allowing them to attack enemy shipping in times of war.

Often the news of the end of a particular conflict took a long time to reach remote outposts and as a result attacks often still took place in peacetime. Some pirates also regularly exceeded their “letters of marquee” and attacked any ships they came across. Although privateers could use the excuse of attacking enemy ships in time of war, many modern historians are more understanding of their actions given the appalling Spanish treatment of the indigenous population of the Americas, from which they gained much of their gold and silver.

The initial attacks on Spanish ships sailing across the Atlantic led the Spanish to establish a treasure fleet from the 1560s. This involved a large number of ships, including many men-of-war, sailing together taking manufactured goods to the Americas and returning with gold or more often silver. By this time, the English, French, and Dutch had established settlements in the Caribbean, which their privateers used as bases in their attacks on the Spanish. The English buccaneer Francis Drake managed to capture some of the Spanish treasure fleet in 1580 and sacked the ports of Santo Domingo and Cartagena in the Caribbean in 1585, and later that year attacked and sacked the port of Cádiz in Spain. This led to the Anglo-Spanish War of 1585–1604, which turned many of the English pirates into privateers, weakening the Spanish merchant navy and providing a large source of profit for English and Dutch traders.

While Francis Drake operated ostensibly for patriotic reasons, the Spanish denounced him as a pirate, and by the early 17th century, there were large numbers of pirates operating in the Caribbean. Many used isolated European settlements around the West Indies, with a few operating from their own bases in isolated bays. A few places, such as Port Royal in Jamaica, became famous haunts of the pirates, growing rich but also becoming exceedingly dangerous places, gaining the reputation of being one of the “richest and wickedest” cities in the world. Other places used by pirates included the islands of Antigua and Barbados.

The THIRTY YEARS' WAR, which lasted from 1618 until 1648, led to renewed Protestant-Catholic conflict in Europe, which led to fighting in the West Indies, and British as well as Dutch ships attacked those belonging to Spain and France. It was during this period that English privateers and pirates started to use the Mosquito Coast of Nicaragua to establish bases, which allowed them to attack Spanish ports and Spanish ships with ease.

From 1660 until 1720, the so-called golden age of piracy, pirates again operated as privateers. This period saw some sailing under the famous "Jolly Roger" flag, with attacks by English pirates on both Spanish and French ships. There were also English attacks on the Dutch; the island of Saint Eustatius, a Dutch sugar island, was attacked by pirates and British soldiers on many occasions, changing hands 10 times during the 1660s and early 1670s. French pirates also started operating freely from their ports on the island of Hispaniola (modern-day Haiti and the Dominican Republic). Sir Henry Morgan, a Welsh buccaneer, sacked the Spanish town of Portobelo in Panama, which had been well garrisoned.

Morgan later destroyed Panama City in 1671 but was arrested by the British, as the attack violated a treaty between England and Spain. At his trial in London, Morgan was able to prove he had no prior knowledge of the treaty and was released, knighted, and appointed lieutenant governor of Jamaica. Other pirates such as Edward Teach, "Blackbeard," became infamous not only for his savagery but for his outlandish appearance. He was killed in combat in 1718. There were also female pirates such as Anne Bonny, originally from Ireland, and Mary Read from London, who were captured and tried in 1720 in Jamaica, with both escaping execution. The career of these two female pirates, which started when the former joined the crew of "Calico Jack" Rackham, and the second a ship captured by him, was related in many published books of the period.

After 1720, stronger European garrisons throughout the Caribbean caused a massive decline in the number of pirates operating in the region. At the end of the War of the Spanish Succession, the 1714 Treaty of Utrecht allowed the British to sell African slaves in the Americas, and many of the former pirate crews found that they were able to operate legitimately as slave traders. The nations involved in Caribbean trade decided to eliminate the pirate threat to their lucrative trade routes. In 1720, two famous pirates, Charles Vane and "Calico Jack" Rackham, were hanged at

Captain William Kidd was hanged in 1701 in London. Kidd was a victim of a larger British force in colonial waters.

Port Royal, and two years later some 41 pirates were hanged there in a single month.

Without the ability to seek refuge in places such as Port Royal, although some pirates continued operating through to the 1750s, they had access to fewer and fewer ports. This coincided with the European powers' massively strengthening their hold on their West Indian possessions, and it became far more likely that pirates would be caught. As a result there was

a decline in piracy, with the former pirates having to find work in the slave trade, legitimate shipping, or the lumber industry, cutting logwood and later mahogany in what became British Honduras (modern-day Belize). The romantic image of the pirates was nurtured by many writers, such as Daniel Defoe, who wrote *A General History of Pyrates* (1724), which described the lives of many of the more famous individuals, and much later Robert Louis Stevenson in *Treasure Island* (1883); a small number of pirates published their own accounts. The subject of pirates and piracy remains popular in today's novels, plays, and films.

JUSTIN CORFIELD

Pizarro, Francisco

(c. 1476–1541) *Spanish conquistador*

Ranking with HERNÁN CORTÉS as one of the most ruthless and effective of all the Spanish conquistadores, Francisco Pizarro was the principal force behind the CONQUEST OF PERU and subjugation of the Inca Empire in the 1530s. Along with his brother Gonzalo and half brother Hernándo, Francisco successfully suppressed a rebellion launched by his erstwhile partner in conquest DIEGO DE ALMAGRO in 1537–38, only to have disgruntled Almagrists acting under the nominal authority of Almagro's mestizo son, Almagro the Younger, slay him in his palace in Lima on July 26, 1541.

An illiterate swineherd as a youth and the illegitimate son of a minor nobleman, Francisco Pizarro was born in Trujillo, Estremadura, Spain, around 1476. He arrived in the Americas in 1510 and participated in the expedition across Panama led by Vasco Núñez de Balboa that led to the European discovery of the Pacific Ocean in 1513. After the first two exploratory expeditions along the Peruvian coast, in 1528, Pizarro returned to Spain to seek the Crown's sanction (*capitulación*) for an expedition of conquest. He received it,

Francisco Pizarro was the force behind the conquest of the Incas. He was slain in Lima, Peru, on July 26, 1541 (depicted above).

along with the title of governor and captain-general of Peru, to the dismay of Almagro, who received a much less exalted title. One of his most memorable and consequential acts was in July 1533 when he decided to execute the Inca ATAHUALPA in CAJAMARCA to the chagrin of King CHARLES V, provoking an outcry among Spaniards.

He is also credited with founding numerous towns, including the colony's capital city along the coast, Ciudad de los Reyes (City of the Kings, founded on January 6, 1535), which by the late 1500s had become known as Lima, a corruption of its indigenous name; CUZCO (1534); the coastal city of Trujillo (1535); and San Juan

de la Frontera, later known as Huamanga (1539). He was also responsible for allotting Indians in *ENCOMIENDA* and *REPARTIMIENTO* to reward his followers and supporters, a tactic he also used to buy off potential adversaries, including members of the Inca royal family such as Manco Inca's half brother Pallu, to whom he granted a *repartimiento* of more than 5,000 Indians in 1539. This was the same year that the Crown granted him the title of marquis and his own coat of arms, which depicted a chained Atahualpa reaching into two chests laden with treasure.

His most consequential political error, in the judgment of many scholars, was to sow the seeds of the Almagrist war by his own extreme greed and his niggardly allotments to Almagro, whose supporters slew him in 1541. His many descendants ranked among the richest and most powerful members of Peru's colonial society. An imposing statue of the legendary conquistador astride his steed can be found in the town of his birth, facing the palace built by his brother Hernando.

MICHAEL J. SCHROEDER

Plassey, Battle of

ROBERT CLIVE of the British East India Company was the winner of the Battle of Plassey, 70 miles north of Calcutta in 1757. At the head of 1,000 English and 2,000 Indian (*sepoys*) soldiers and with eight pieces of artillery, he routed the 50,000 soldiers and 50 Frenchmanned cannons of his opponent Siraj-ud-Daula, the governor, or nawab, of Bengal. This victory established British primacy in Bengal.

With the MUGHAL (Mogul, Moghul) EMPIRE in India in rapid decline in the 18th century, Great Britain and France became competitors for control of the subcontinent. Their rivalry was played out by employees of their respective East India Companies and when the WAR OF THE AUSTRIAN SUCCESSION (1740–48) and Seven Years' War (1756–63) pitted Britain and France on opposing sides, India became a theater of war. France won the first

round when its agent in India Joseph Dupleix captured the British outpost Madras in 1746 and then extended French influence in the Indian state of Hyderabad.

However Dupleix was outmatched by a brilliant young Briton named Robert Clive, who decided to expand British power to the Bay of Bengal and the Ganges River delta during the Seven Years' War. First he took revenge on the unpopular Mughal governor of Bengal, Siraj-ud-Daula, for the death of many Britons in the infamous "Black Hole of Calcutta." He recaptured Calcutta in 1756, then moved upriver and captured the French fort at Chandernagore in the following year. In the next phase of the conflict, the French supported Siraj-ud-Daula, whose oppressive rule had alienated his Muslim noblemen, including the powerful Mir Jaffa. On the other hand Britain had the support of Bengali businessmen and bankers. These rivalries culminated in the Battle of Plassey, June 23, 1757, which pitted Clive's 1,000 European soldiers and 2,000 Indian sepoy (no cavalry) and eight cannons against Siraj-ud-Daula's 50,000 combined infantrymen and cavalry and 50 cannons manned by French soldiers. Mir Jaffa's neutrality and Siraj-ud-Daula's flight in the midst of battle caused demoralization and the rout of the latter's army. Clive lost only 22 European soldiers; fewer than 50 were wounded.

Clive's victory was a turning point in Indian history. French influence was eliminated from Bengal, and at the end of the Seven Years' War, from all of India. Britain's client Mir Jaffa was invested the new governor of Bengal by the Mughal emperor in Delhi, who in turn granted landholder's rights of 882 square miles around Calcutta to the British East India Company. Clive remained in Bengal for two years to organize the new administration. In 1759, the Mughal emperor granted land tax rights of all Bengal and Bihar provinces to the British East India Company and made Clive the highest-ranking noble of the Mughal Empire.

The British government made Clive baron of Plassey. Events that developed after Clive's victory at the Battle of Plassey would change the British East India Company from a trading company to a governing power and draw Britain to conquer the whole of India. Thus the Battle of Plassey was a historic turning point, and its principal participant Robert Clive an empire builder.

JIU-HWA LO UPSHUR

Popul Vuh

In 1908, Lewis Spence, one of the foremost scholars of myth and religion of his day, said of the Popul Vuh, “There is no document of greater importance to the study of the pre-Columbian mythology of America than the Popol Vuh. It is the chief source of our knowledge of the mythology of the Kiché [the modern accepted form is the *Quiche*] people of Central America, and it is further of considerable comparative value when studied in conjunction with the mythology of the Nahuatlacâ, or Mexican peoples.” *Popul Vuh* means “Record of the Community” and is literally translated as “Book of the Mat,” perhaps because the earliest versions were delivered orally as people sat together on their woven mats. The Popul Vuh is one of two sacred texts of the Mayan Indians of Mesoamerica, Central America, and Mexico that have survived. While the Popul Vuh belongs to the Quiche Maya of Guatemala, the CHILAM BALAM was written among the Maya of Yucatán in Mexico.

Mesoamerican history has been divided into distinct periods by historians and archaeologists for purposes of study. These are the Preclassic Period of history (2000 B.C.E. to 300 C.E.), the Classic Period (300 C.E. to 900 C.E.), and the Postclassic (900 C.E. to 1520 C.E.), the year before HERNÁN CORTÉS crushed the last major indigenous kingdom, the AZTEC Empire, thus ending the rule of Mexicans. The Aztec capital of Tenochtitlán, today’s Mexico City, succumbed to Hernán Cortés in 1521. The Mayas of Yucatán defied Spanish conquest until 1528, when they were defeated by PEDRO DE ALVARADO, perhaps the most brutal of Cortés’s conquistadores.

The Popul Vuh can be dated from after the Classic Period among the Maya. The Mayan people existed in two communities, one in the northern Yucatán and the other in the Guatemalan highlands. The Chilam Balam owes its origin to the Mayas of Yucatán, and the Popul Vuh to those in Guatemala. Today, although their kingdom has long since vanished, the Quiche Maya still exist in Guatemala as a definable tribe proud of the Popul Vuh, despite a brutal government campaign against them. Indeed some historians of Mesoamerica maintain that Guatemala was in fact the first home of

the Maya people. What most scholars agree about is that the area influenced by the Maya was great.

In the aftermath of the Spanish conquest, there was a massive destruction of ancient Aztec and Mayan texts by the missionaries who accompanied the Spanish in their conquest of Mesoamerica. Having seen the human sacrifice on a large scale by Aztec priests in the temples in Tenochtitlán (many victims were captive Spanish they had known), they determined such a culture could only be demonic and thus consigned the Mayan and Aztec books, or Mesoamerican Codices, to the flames. Diego de Landa, who became the bishop of Yucatán, burned 27 hieroglyphic manuscripts in 1562; despite the criticism de Landa received as a result of his actions, historians believe that other missionaries probably followed suit. Three Mayan codices were known to have survived in Paris, Madrid, and Dresden, Germany.

However, both the Popul Vuh and the Chilam Balam appear to owe their survival to the direct intervention of missionaries who felt that the cultures that had been conquered were worthy of preservation. After the conquest, missionaries set about to teach sons of the Maya and Aztec nobility Spanish to help them preserve their ancient culture in writing. It is Francisco Ximénez, who came to Guatemala in 1688, who played a pivotal role in the discovery of the Popul Vuh. For a time after Ximénez’s death, it appeared the Popul Vuh had been lost, but it was recovered in library of the University of San Carlos in Guatemala. Researchers learned that Ximénez had placed it in his convent’s library, and it passed to the university library in 1830.

The Popul Vuh itself is a fascinating document that belongs in the category of creation myths, in which people record their understanding of the creation of the world. Dennis Tedlock, editor of a recent edition of Popul Vuh, records that its writers begin “their narrative in a world that has nothing but an empty sky above and a calm sea below. When the gods of the sky and earth meet, ‘they conceive [of] the emergence of the earth from the sea and the growth of plants and people on its surface.’ After three failed attempts, the gods are successful in creating the first real human beings out of corn, a symbol of the importance of corn in all the indigenous cultures of North, Central, and South America.” First, four men are created, and then four women to keep them company on the earth. “From these couples,” Tedlock explains, “come the leading Quiche [Maya] lineages. . . . Other lineages and peoples also come into being, and they all begin to multiply” to populate the face of the earth.

Potosí (silver mines of colonial Peru)

The extensive silver mines of the mountain of Potosí (in the highlands of contemporary Bolivia, at an altitude of 4,800 meters) proved among the most important sources of wealth in all of Spain's New World holdings, fleetingly filling the coffers of the Spanish treasury for more than two centuries while relegating thousands of Indian laborers to a hellish work existence. Silver ore was serendipitously discovered at Potosí by an Indian *yanacona* (servant) named Diego Gualpa in 1545. Within a few years there had commenced a vast silver rush, which peaked in the 1590s, after which silver production underwent a gradual decline, though the mines continued to be worked throughout the colonial period. In 1545, the population of Potosí and its environs stood at around 3,000. Thirty-five years later, in 1580, the numbers had swelled to around 120,000, and by 1650 to around 160,000, making the remote mining center one of the largest urban concentrations in the world.

Crucial to the stupendous growth of Potosí and its mining economy was the introduction of the mercury amalgamation process in 1572. Before this, Indian laborers had employed the pre-Columbian *huayra* technique for refining silver, which harnessed the highlands' high winds to facilitate the smelting process. The first mercury mines at Huancavelica were discovered in 1559; others came into operation soon after. In 1571, after numerous trials, the Spanish perfected the techniques for refining Potosí's silver ore with Huancavelica's mercury, prompting Viceroy FRANCISCO DE TOLEDO to gush that the union of the two mines would create the world's greatest marriage. Illustrative of the enormous quantities of wealth extracted from colonial Peru's "mountain of silver," the Spanish writer Miguel de Cervantes's Don Quixote changed the phrase "worth a Peru" (describing FRANCISCO PIZARRO's plunder during the CONQUEST OF PERU) to "worth a Potosí."

Official figures show a quadrupling of silver exports to Spain from Potosí from 1571–75 to 1581–85 (from

4.6 million to 19.1 million pesos), to a peak of around 5 million pesos annually in the 1590s. By 1650, the number had dropped to around 3 million pesos annually, after which it continued to decline until the early 1700s, when the mining economy underwent a gradual resurgence, though it never reached its former heights. Potosí's burgeoning mining economy also had important local and regional ripple effects, sparking the growth of commerce, agriculture, and specialized craftwork in surrounding communities, and in regional economies as distant as Río de la Plata, Chile, and northern Peru.

Working conditions in the mines were exceedingly brutal. "Some four years ago," wrote the Spaniard Domingo de Santo Tomás to the Council of the Indies in 1550, in a typical description, "to the complete perdition of this land, there was discovered a mouth of hell, into which a great mass of people enter every year and are sacrificed by the greed of the Spaniards to their 'god.' This is your silver mine called Potosí." Another Spaniard, Rodrigo de Loaisa, described the typical weeklong stint in the mines: "The Indians enter these infernal pits by some leather ropes like staircases . . . Once inside, they spend the whole week in there without emerging, working with tallow candles. They are in great danger inside there . . . If 20 healthy Indians enter on Monday, half may emerge crippled on Saturday." According to another Spaniard, Alfonso Messia, Indian laborers descended hundreds of feet into the mines, "where the night is perpetual. It is always necessary to work by candlelight, with the air thick and evil-smelling, enclosed in the bowels of the earth. The ascent and descent are highly dangerous, for they come up loaded with their sack of metal tied to their backs, taking fully four or five hours step by step, and if they make the slightest false step they may fall seven hundred feet." The great silver mines of Potosí thus became symbolic not only of fabulous wealth, but of Spain's oppression and exploitation of Indian laborers, and Indian resilience and survival in the face of the extreme brutality of colonial rule.

MICHAEL J. SCHROEDER

Powhatan Confederacy

The Powhatan Confederacy, which included approximately 30 different Algonquian-speaking tribes at the height of its power, developed on the Eastern Seaboard of North America in present-day Virginia. Powhatan, who was the leader of this confederacy in the late 16th and early 17th centuries, maintained control from his main residence in Werowocomoco on the York River. Before the English settled at JAMESTOWN in 1607, the Powhatan Confederacy was the strongest force in the area. Powhatan kept control by marrying the daughters of defeated chiefdoms in an attempt to link their families to his family and appointing a family member to the position of chief. To minimize the risk of tribes within the confederacy combating one another, Powhatan organized a hunting expedition in the Piedmont to incite conflict against the Monacan and Manahoac tribes.

Despite the fact that there was some degree of cooperation between the Powhatan and the English colonists, mutual suspicion destroyed the relationship between the two races. The English colonists thought

very highly of Powhatan. Despite the desire to use the English as allies, Powhatan was still suspicious of their intentions and attempted to contain their settlement; he was also concerned that the English might ally with his enemies. In order to contain the English settlement of Jamestown, Powhatan used the Paspahugh to create conflict with the English settlers.

The English soon adopted another policy to deal with the Powhatan—kidnap their children to force the Powhatan into a more subservient position. In 1613, the English captured Powhatan's daughter Pocahontas and took her back to Jamestown, where she converted to Christianity and assumed the name Rebecca. Powhatan accepted the fact that the English had captured his daughter and tried to reach some peace settlement by offering her to the English.

The peace settlement Powhatan arranged with the colonists improved relations between the Powhatan and the English colonists. Pocahontas accepted the English way of life by dressing in European fashions, marrying an Englishman named John Rolfe in 1614, and giving birth to a child. She left her father to travel to England, where she succumbed to disease in 1617. Her father died in 1618 and was replaced by his brother Opechancanough, who changed the dynamics in the relationship between the Powhatan and the English colonists.

The major point of contention between the Powhatan and the English arose over ownership of land as the English colonists needed a significant area of land to grow TOBACCO. The fact that more English colonists continued to arrive in Virginia strengthened the resolve of Opechancanough to strike at the English before their numbers became too great. The first major attack took place on March 22, 1622, and resulted in the death of approximately 347 colonists. The English retaliated by organizing offensives against Powhatan towns and destroying their crops before the harvesting period.

The Powhatan Confederacy, suffering from starvation, participated in peace negotiations with the English colonists. In 1623, at the closing stages of the peace talks, 250 natives met with the leaders of the English colony in what they believed was a cordial meeting, but the English poisoned the drinks of the natives and killed the delegation. This led to further reprisals by the Powhatan, who organized a massive offensive on April 18, 1644, which resulted in the deaths of more than 400 colonists.

At this point, it was a losing battle for the Powhatan as there were too many colonists for them to overcome. The resistance of the Powhatan to English imperialism sustained a further blow when Opechancanough was

Illustration detail from a map of Virginia of 1612 showing Powhatan in the royal wigwam wearing a crown of feathers

captured in 1646 by the English and shot by a disgruntled colonist while in prison.

The Powhatan Confederacy suffered greatly from English colonization, as frequent warfare and epidemics dropped the population from 24,000 Algonquians when the English settled Jamestown in 1607 to 2,000 Algonquians in 1669. The final dispersal for the Powhatan Confederacy occurred with the Treaty of Albany in 1722, which protected the Powhatan from Iroquois attacks, allowing the Powhatan to disperse into various groups.

BRIAN DE RUITER

printing press, Europe and the

Before 1450, books were produced by scribes who laboriously copied an existing book by hand. Between 1455 and 1500, the printing press, containing movable type using manufactured paper, revolutionized book production. By 1500, hundreds of printing presses throughout Europe had produced more than 6 million books, roughly equivalent to the total number of books produced in the prior 15 centuries.

This revolution was begun by an ordinary man named Johann Gutenberg (c. 1400–1468). Gutenberg had a printing shop in Mainz, Germany. Though often called the “inventor of movable type,” Gutenberg did not invent any of the major parts of the printing process but took the concepts and engineered a solution that touched off a rapid growth in printing.

Prior to the printing press, books were made at great expense by hand. Only kings, universities, large churches, or monasteries could afford the price of a book. The rising merchant class and lower nobility created a demand for a more economical book. The components of the printing process had recently become available. Paper production had begun in Italy, taking rag stock, mixing it into pulp, then pressing it in a felt press. Paper cost about one-sixth the price of vellum (calf- or sheepskin). The

printing press was already in existence for block prints of artwork, or other hand-crafted printing. Oil-based ink that would work well for transfer to paper was in existence. The concept of movable type (individual letters or characters that could be put into a holder) had been invented by the Chinese centuries before and had slowly made its way over to Europe.

The genius of Gutenberg was in the careful perfection of a printing system. Gutenberg adapted a press to hold a form containing metal pieces. He manufactured more than 300 different symbols including capital letters, lowercase letters, numerals, large block letters, and ligatures (two or more letters attached together). He perfected the ink to work on paper stock acquired from Italy (an oil-based ink that would not smear, nor bleed through the paper). He devised a system of rolling the ink onto the type form and finally printing it onto paper. Each page would be individually prepared by a skilled typesetter, and then many copies of that page would be printed by the press operator. Gutenberg first produced some small works (a Latin grammar), but then with business partners Johann Fust and Peter Schöffer providing funding, Gutenberg undertook to produce a copy of the Bible in Latin beginning in 1450. By 1454 or 1455, the first edition was complete. The Gutenberg Bible uses a typeface that appears hand-printed, since it was produced to compete with hand-printed bibles (at a much lower cost). The Bible would then be decorated (beginning letters colored by hand), and other annotations (or rubrications) added.

Books printed with this new printing press were enormously popular. By 1458, there were several other printers in Germany and Switzerland. By 1475, hundreds of printers with their printing presses were producing editions of books throughout Europe. By 1500, more than 40,000 editions of various works had been produced by printing presses. While advancements were made to speed up the process of producing and ordering the movable type, the fundamentals of the printing press did not change till the 20th century with the advent of electromechanical printing and finally computer-based printing.

MARTIN LUTHER first nailed his Ninety-five Theses on the castle church in Wittenberg in 1517, 60 years after the invention of the printing press process by Gutenberg. Luther intended to raise an academic debate among the region’s theologians. Instead he ignited a storm of controversy that swept Europe in the rapid communication of his theses through the printing press. Within weeks of his posting the Ninety-five Theses, printers in Wittenberg and other places were selling copies as a short pamphlet, distributing it throughout Germany

and even other countries in western Europe. Luther was a prolific and popular writer. Just over a year later in 1519, he received a note from a printer Basel named Johannes Froben: “We sent six hundred copies of your collected works which I published to France and Spain. They are sold in Paris, read and appreciated at the Sorbonne. The book dealer Clavus of Pavia took a sizable number to Italy to sell them everywhere in the cities. I have sent copies also to England and Babant and have only ten copies left in the storeroom. I have never had such good luck with a book.”

Many of Luther’s shorter works were published as pamphlets, easily accessible to merchants, lesser nobility, and others who could read. The printing press enabled the rapid spread of Reformation.

The advent of the printing press produced other societal changes. With books more accessible, the system of instruction at the university level changed. Prior to the printing press, a professor would read from a single book (often the only copy at the university) and the students would take notes. With the printing press, great works by authors of past eras were published more broadly, bringing the Renaissance era to full fruition. The work of scientists such as COPERNICUS and ISAAC NEWTON were published, bringing both debate and further development to science. It also increased the desire of those in power to control what was published in their country or church. The first Index of Forbidden Books was published by King HENRY VIII of England in 1526, and the Catholic Church’s Index of Prohibited (or Forbidden) Books was published in 1559 and revised constantly thereafter.

BRUCE D. FRANSON

Pueblo Revolt

Also known as Popé’s Rebellion, the Pueblo Revolt took place in 1680 and freed the Pueblo Indians of Spanish control for 12 years until the Spanish reconquered the area in 1692. The revolt was organized by the medicine

“The Sentinel”—a Pueblo scout, peering from behind a large rock formation, serves as a lookout.

man Popé from the Tewa Pueblo. The revolt began on August 10, 1680, and by August 21 the Pueblo Indians had captured Santa Fe and Popé had made himself the new ruler. Unfortunately for the Pueblos, Popé proved to be as harsh a ruler as the Spanish and when he died in 1688, the Pueblos were in a constant state of civil war, which the Spanish used to their advantage. The Spanish return to the area started in 1689 with the capture of Zia Pueblo and ended with the capture of Santa Fe in 1692. Over the next four years, the Spanish consolidated their hold on the Pueblos, who again submitted to Spanish rule.

In the early 1670s, the Pueblo Indians formed an alliance with their hereditary enemies the Apache against the Spanish in the American Southwest. They then conducted raids against the Spanish that eventually forced them to stop sending supply convoys to their frontier outposts. Then in 1672, the Spanish governor arrested 47 lesser Pueblo chiefs, hanging three. One of the chiefs arrested was Popé, who after several years in prison was released and went into hiding in Taos. From there he started to organize a rebellion in secret. He had originally targeted August 13, 1680, for the start of the rebellion but, concerned that the Spanish had found out about the rebellion, he moved the date up to August 10. Even though the Spanish had found out about the rebellion, the Pueblos were still able to gain an element of surprise.

Attacks were launched on the three major missions (Taos, Pecos, and Acoma) as well as the lesser missions and the HACIENDAS (large ranches), destroying them and killing the inhabitants. Popé and his army moved against Santa Fe on August 15, killing settlers and missionaries as they went. The garrison of 50 men was able to hold out for four days with the help of the cannon they had. Santa Fe was captured on August 21 with Popé making himself the new ruler of the area. Spanish governor Antonio de Otermin and 2,500 settlers fled down the river in order to escape the Pueblo Indians.

Unfortunately for the Pueblos, Popé proved himself to be no better a ruler than the Spanish. He taxed and abused his people for the next eight years until he died in 1688. Even with Popé's death the Pueblos continued in a state of chaos and civil war that only opened the way for the Spanish to return. The Spanish started their reconquest of the Pueblos with the capture of Zia Pueblo in 1689. Then in 1692, governor Don Diego de Vargas retook Santa Fe. Over the next four years, the Spanish put all the Pueblos back under their rule.

DALLACE W. UNGER, JR.

Puritanism in North America

Puritanism in North America is an extension to American shores of the challenge to the religious orthodoxy of England. With settlement came theology. *Puritanism* itself can be a diverse term and not one associated with a particular church or denomination. Most Puritans were radical Protestants who arose following the Reformation in the late 16th century and who rebelled against some or all aspects of the Elizabethan religious sentiments of this period.

Influenced by the Calvinist theology of Protestantism found in Europe, Puritans felt that the existing Anglican Church's practices and structures were corrupted and in need of "purifying" in order to purge the church of kings, idolatry, and popery. Their call was

for strict biblical interpretation, and the creation of a "priesthood of all believers."

Puritan believers should follow a clear moral path, which stressed God's direct and total command of mankind's place on earth. This belief system saw the individual directed by the grace of God, and as such, the believer must be obedient, disciplined, humble, and always grateful for God's blessings. To support such a system ceremonies should be simple, church decorations kept to a minimum, superstition should be confronted, education and Bible reading for all encouraged, clothing for priests and church members simple and free from adornment, and high personal morality practiced as a matter of faith. In time there would grow opposition to work or pleasure being taken on the Sabbath, drama, gambling, some forms of music, and even poetry if deemed sinful or erotic.

CHURCH STRUCTURE

It was the Puritans' challenge to church authority that brought conflict with the state, a factor that would lead to government persecution and the need to migrate to the New World to establish religiously inspired colonies on the Puritan model. The Church of England was an episcopal hierarchy whose head was the monarch. This was the church of vestments, pomp, ritual, ecclesiastical courts, and the liturgical order of the BOOK OF COMMON PRAYER. It was this structure that permitted the perceived church decadence that the Puritans objected to. Arguments for the presbyterian organizational model emerged in the 1570s, followed by the Congregationalist approach, which gave power to each congregation to organize themselves and choose their own church leaders. This latter model would come to dominate the church organization in New England and other colonies north of Virginia.

The Puritan struggles against the church and state did not win victories in the early 17th century and had to await the turbulence of the English Civil War in the 1640s to gain an upper hand, but only a temporary one, which ended with the Commonwealth and the Restoration of 1660. It was this failure to change conditions that led the Puritans to found American colonies as "Beacons on the Hill" for others to follow. It was the Separatists who had given up reforming the Church of England who first established a permanent American colony. Sailing on the *Mayflower* and led by William Bradford and his Pilgrim followers, these Separatists established the Plymouth Plantation in Massachusetts in 1620.

By 1630 other non-Separatist Puritans established themselves in MASSACHUSETTS BAY COLONY, which became the hub for the spread of varieties of Puritanism

throughout what became New England. Numbers grew rapidly, reaching approximately 20,000 in 1640 and more than 100,000 by 1700. Splits also occurred within the Puritan ranks leading to the establishment of other Protestant colonies such as Rhode Island in the 1640s, which followed a Baptist tradition.

Other Protestant offshoots such as the Society of Friends or Quakers, which shared some Puritan tenets, settled in Pennsylvania, as did other Protestant settlers from Germany and Sweden, such as the Moravians and Lutherans, who founded other communities along the Eastern Seaboard.

The Puritan impact with its Calvinistic commitment to predestination, an acceptance of conversion as essential to spirituality, and belief in an elect membership within each church carried political dimension, which influenced governance in the major Puritan colonies. Some have argued that this mixture of church and state created a theocracy, particularly in Massachusetts Bay. Religious toleration, which was denied them in England, where they were viewed as dissenters, was not translated into general practice in their new lands.

As the decades progressed, difficulties arose as to how the power of the elect could be transferred to their descendents. The Half-Way Covenant was one device, but in time, particularly with political change in England following the GLORIOUS REVOLUTION in 1688, greater toleration of those deemed the nonelect developed both inside and outside the Puritan colonies by the 18th century.

Puritanism in North America helped make the successful settlement of prosperous English colonies a reality. Puritan belief in covenants, individual voices, simplicity, education, and morality would have a lasting effect on the development of democratic views and traditions, which, in turn, would have a major and lasting influence upon American life.

THEODORE W. EVERSOLE

Puritans and Puritanism

In the 16th and 17th centuries, English Puritans were Calvinists in theological allegiance. They believed in the supreme authority of God and the evangelical truth of the Bible, emphasized the predestinated salvation of the elect by God's grace alone, strove to rehabilitate depraved human souls by living a saintly life out of gratitude of God's grace, and preferred organizing of electoral and congregational communities according to the providence of God to earthly authority. The Puritans shared a strong antipapal and anti-Catholic sentiment but disagreed as to how to construct a heavenly kingdom on earth.

The English Puritans distinguished themselves from other Protestants of the same period by their absolute conviction that all human beliefs, institutions, and actions ought to be rigorously verified by the literal meaning and syllogism of the Bible. The complicated interactions among the Puritans, the Anglicans, and the Catholics had significant impact upon the direction of the CHURCH OF ENGLAND and the emerging modern English nation during the Tudor and Stuart periods.

QUEEN ELIZABETH'S ROLE

At the beginning of Queen ELIZABETH I's reign (1558–1603), the exiled English Protestants, victims of the Marian restoration of Roman Catholicism, returned from the Continent, where they had experienced a "purer" Christian worship than that was prescribed in the BOOK OF COMMON PRAYER sanctioned by the English parliament of 1552. Some of their leaders believed that the Elizabethan Church of England retained "impure" Catholic elements in its liturgical formation. A minority of radical Puritan clergy also wanted to replace the Anglican episcopacy with the Calvinist congregational structure and presented their demands in the Admonitions to Parliament in 1572. The document never reached the floor of Parliament because it displeased the queen. Nevertheless, Puritan Nonconformists, those who refused to use the Book of Common Prayer in their congregations, began to emerge.

The Puritans, in general, did not threaten the queen's regime; neither did they openly break with JAMES I (r. 1603–28) at the beginning of his reign. In the Hampton Court Conference of 1604, the king authorized the production of the King James Version of the Bible, which pleased all Protestants, including the Puritans. Nevertheless, the king vehemently defended his divine right and refused to make any concession to the Puritan Nonconformist demands; some Puritans grew discouraged about their reform efforts and began to separate

themselves from the Church of England. Those separatists would soon migrate to the New England colonies. There, they established their Congregationalist churches and spread their beliefs, work ethics, and way of life. In the next two centuries, American Puritanism significantly impacted American political and social structures.

In England, the Puritans became revolutionaries under CHARLES I (r. 1628–49), when the fear of Catholic restoration, complicated by other social, political, and religious factors, pushed England into civil war (1642–60). Between 1643 and 1647, many Puritan teachings and rituals were incorporated into the Westminster Confession and Catechisms sanctioned by the Long Parliament, which enhanced the Puritan influence against the Stuart king, but they were strongly opposed to the ideas of the church-state relationship embodied in those documents. After the parliamentary New Model Army, composed mostly of the Puritan volunteers, defeated and executed the king in 1649, OLIVER CROMWELL, the Puritan general and Lord Protector, experimented with a Puritan-styled Commonwealth during the Interregnum (1649–60). Cromwell's moderate and tolerant policies were disrupted by fellow Puritan radicals: the diggers, the levellers, and the officers and soldiers who followed the apocalyptic prophecy of the fifth monarchists.

STUART RESTORATION

During the Stuart Restoration (1660–88), CHARLES II (r. 1660–85) reestablished royal authority and the Church of England. From 1661 to 1665, Parliament passed a set of laws to restrict the nonconformist Puritans and Catholics, known as the Clarendon Code. The

code required the Puritans to conform to the Anglican Church and its supreme governor, the king, and to use the Book of Common Prayer in public worship. It also prohibited their gatherings of more than five persons and their being within five miles of a city.

In 1672, the Test Act excluded about 2,000 nonconformist Puritans from holding public office. These prejudicial and persecutory policies became moderated in the GLORIOUS REVOLUTION (1688–89), when the Puritans began to be able to live under the laws prescribed by the Act of Toleration in 1689. Some of the discriminating mechanisms against the Puritans remained effective in different legal forms until the early 19th century.

After the Glorious Revolution, the English Puritans gradually faded away from the center of English parliamentary politics, which began to be dominated by two contentious parties, the Tories and the Whigs. In the American colonies, the Puritan movements declined after the American Revolution.

WENXI LIU

Qing (Ch'ing) dynasty, rise and zenith

The Qing (1644–1911) was China's last imperial dynasty and the second of nomadic origin that ruled the entire Chinese world. Its success is due to capable and wise founders and their long-reigning immediate successors, whose admiration for Chinese culture led them to assimilate rapidly, and to retain most of the existing government institutions with few modifications. The dynasty remained prosperous and dynamic until the end of the 18th century.

The Qing is also called the Manchu dynasty. The Manchus were nomads descended from the Jurchen tribal people who lived in northeastern China (Manchuria). They had conquered and ruled northern China under the Jin (Chin) dynasty (1115–1234) but had retreated to their original homeland when the dynasty ended. They forgot their short-lived written language and reverted to a life of hunting, fishing, and raising livestock. Manchuria was part of the MING DYNASTY (1368–1644) and became an area of mixed residence of Jurchen and other nomadic tribal people amid the sedentary Han Chinese. Jurchen and other tribal people were responsible to Ming officials in Manchuria and went to Beijing (Peking) at stipulated times to render tribute to the Ming court.

The decline of the Ming dynasty coincided with the rise of strong leaders among the Jurchens, the first a minor tribal chief named NURHACI, who began significant reforms and innovations that would lead his people

to power. They included the creation of a written language and the militarization of all Jurchens into a banner system whereby all males were organized into fighting units and given land to farm and administer. As a result of successful campaigns, the defeated people became serfs, liberating the bannermen into full time warriors and administrators. Nurhaci created a state called the Later Jin, which his son ABAHAI changed to Qing (which means "pure") 1635. Abahai also changed his people's name from Jurchen to Manchu. Continuing his father's ambitious policies Abahai expanded the banner system to include units of Mongols and Han Chinese, conquered most of Manchuria, subdued Korea and forced it to change allegiance and tribute relations from the Ming to Qing, and began attacking Ming territories near the GREAT WALL OF CHINA. Abahai died in 1643 and was succeeded by a young son, but his work was continued by his capable brother DORGON, who acted as regent.

FORMATION OF A NATIONAL DYNASTY

A great stroke of luck catapulted the frontier Manchu state to a national Chinese dynasty. In 1644, rebel bandits attacked and captured the Ming capital, causing the emperor to commit suicide. In the ensuing confusion WU SANGUI (WU SAN-KUEI), a Ming frontier general guarding the eastern extremity of the Great Wall, requested Manchu assistance to drive out the rebels, with which Dorgon happily complied. After liberating Beijing and while Wu's forces chased the rebels to their destruction Dorgon placed his nephew on the vacant

Ming throne and proclaimed the Qing as a national successor dynasty to the Ming. He won over many people in northern China by burying the last Ming emperor and empress with honor, restoring order, and keeping most of the Ming institutions and officials in place. Ming loyalists resisted in southern China and warfare continued until 1683, when Taiwan, the last Ming loyalist bastion, was captured.

Dorgon died in 1651 and his nephew the emperor Shunzi (Shun-chih, r. 1644–61) continued his policies but had little impact because of the brevity of his reign. Then came three great emperors: KANGXI (K'ang-hsi, r. 1662–1722), YONGZHENG (Yung-Cheng, r. 1723–35), and Qianlong (Ch'ien-lung, r. 1736–1796). These three reigns totaled 134 years, during which traditional Chinese culture enjoyed its last great flowering and Chinese power attained great heights.

CAPABLE RULERS

Kangxi was seven when he ascended an as yet insecure throne. A remarkably intelligent, ambitious, and hardworking boy, he freed himself from the tutelage of his regents at age 13 and began his personal rule, which was noted for its success in war and peace. Frugal in personal habits and in administration he repeatedly reduced taxes and permanently fixed them at a low level. He also took a personal interest in agricultural improvements, introducing early ripening strains of rice to promote food production. He advocated vaccination against smallpox, a dreaded childhood disease that he had recovered from, and quinine (called Jesuit bark) against malaria. He also took several tours of inspection to be personally acquainted with his realm. He worked long hours personally reading and responding to reports and memorials of officials and conscientiously fasting before reviewing capital cases, showing respect for life and the awesome responsibilities that were vested in him.

He finished the work of suppressing Ming loyalist revolts and the formidable revolt of the Three Feudatories. He campaigned against the Mongols and negotiated a treaty with Russia that defined part of the borders between the two empires and put part of Outer Mongolia under Qing control. He also installed a friendly cleric as the Seventh Dalai Lama, thus extending Qing authority over Tibet.

Although personally friendly with Jesuit missionaries, some of whom were his teachers and employees, he rejected the papacy's attempt to claim authority over Chinese Catholics and definition of what rites Chinese Catholics should follow. The defeat of the Jesuits' position on Chinese rites by their opponents in the Catholic

curia ended over a century of cultural exchange between China and Europe.

Kangxi was both a keen student and a patron of the arts and learning. He sponsored numerous projects that included the compiling of a multivolume history of the Ming dynasty, a comprehensive dictionary, and other publications. His court was filled with literary men and artists. Although his last years were clouded with problems of finding a worthy successor among his many sons, Kangxi's long reign ended with the Qing dynasty firmly established. To many of his subjects, he approached the ideal ruler.

Emperor Yongzheng (r. 1723–1735) was Kangxi's fourth son and his successor. Because he was already 44 when he ascended the throne, his reign was a short one. Like his father, Yongzheng was able, conscientious, and hardworking. He focused on making his government efficient by weeding out incompetence and corruption and making all officials accountable. The civil service, recruited on merit through exams, enjoyed high morale under his reign. He concentrated military power in his own hands and personally commanded all the Manchu banner units, sidelining the Manchu tribal and clan chiefs and imperial princes. Although he did not personally command campaigns, Yongzheng continued to consolidate his empire's borders with expeditions against the Mongol tribes that had not submitted, and by a second treaty with Russia that completed the drawing of borders between the two empires. Yongzheng's legacy was a more efficient and tightly controlled empire than the one he inherited and one that was institutionally stronger.

Yongzheng was followed on the throne by his fourth son, then aged 24 and well prepared for his role, who reigned as Emperor Qianlong, a keen student of history. His paragons were Taizong (T'ai-tsung, r. 627–47, statesman and general) and his grandfather Kangxi, and he abdicated in 1796 so that his reign would not be longer than that of his revered grandfather. Qianlong excelled in war, personally leading some campaigns. Under him Qing arms finally reduced the troublesome Olod Mongols and Turkic tribes, extending Chinese control into Central Asia as had the great Han, Tang (T'ang), and Yuan (Mongol dynasty) dynasties. Peace and prosperity prevailed, education and culture flourished, and the civil service exams recruited capable men to serve the government.

As had his grandfather, Qianlong made numerous tours of inspection throughout his realm, and as had both his predecessors, he lavishly patronized the arts, including many Jesuit artists and architects who gathered at his

court. He was also an avid collector, who added a vast array of arts to the imperial collection. A great literary project that distinguished his reign was the compilation of the *Complete Library of the Four Treasuries*. It contained more than 36,000 volumes consisting of 10,230 titles divided into four categories: the classics, history, philosophy, and belles-lettres. Seven complete sets of the compilation were printed and deposited in different libraries throughout the realm. However the emperor also had an ulterior motive in sponsoring this project—to weed out works that were hostile to the Manchus. Qianlong's reign both saw the culmination of Qing greatness and was the forerunner of dynastic decline because of corruption during his later years. He abdicated in 1796 but continued to wield power until his death in 1799 even as his son was nominally in control.

The long and successful reigns of three great and ambitious emperors took the Qing dynasty and China to the height of power and prosperity. While the monarchs were of nomadic Manchu origin, they had almost totally assimilated to and identified with Chinese culture. The Manchu written script, proclaimed as one of two official languages of the empire (together with Chinese), was soon relegated to the background. All of the three rulers considered themselves cultured Chinese rulers and patrons of the arts. Despite certain favoritism shown to Manchus in the highest ranks of government, Chinese occupied the bulk of the civil service positions and most gradually became reconciled to Manchus for sharing and honoring their culture and traditions. However splendor bred complacency that led to degeneration. By the beginning of the 19th century, changing world conditions and the accumulation of domestic problems would lead to rapid decline of the Qing dynasty.

Qing (Ch'ing) tributary system

The Chinese tributary system dated to the Han dynasty (202 B.C.E.–220 C.E.). It reflected the Chinese worldview that China was the center of the civilized world, and that all lands desiring relations with China must be tributary states. The Qing (Ch'ing) tributary system was inherited from its predecessor MING DYNASTY (1368–1644) with additions and modifications.

The basis of the tributary system was acceptance of Chinese cultural superiority. Non-Chinese or barbarians, if willing to travel to court and perform the prescribed rituals, could be accepted into the Confucian sphere of states. Rulers or envoys of vassal states offered tribute or gifts and received in return the Chinese emperor's seal of recognition and return gifts, generally much in excess of the tribute. There were four main functions of the tribute system. First, it maintained the preeminence of China among the peripheral peoples. Second, it was a political means of self-defense. Third, it was a means of trade. Fourth, it was a way of conducting diplomacy.

Through early Ming China's strength on land and sea it became the suzerain of many tributary or vassal states. They included Korea, the Ryukyu Islands, Annam (Vietnam), Burma, Siam, and a host of other states in Southeast and Central Asia from Bengal to the Philippines to Samarkand. The Reception Department, a bureau of the Chinese government, regulated the size, frequency, and reception of the tribute missions that depended on each's importance to and distance from China. For example Korea paid tribute four times a year; Annam once every two years; Siam every three years; and Laos and Burma every 10 years. While in China, all expenses of the tribute missions were paid by the Chinese government. Regulations also governed the number of merchants and amount of trade allowed to accompany each tribute mission.

As the Ming dynasty declined, the newly established, and as yet regional Qing or Manchu dynasty set up an office called Lifanyuan (Li-fan Yuan) or Court of Colonial Affairs in 1638. Its mission was to manage affairs relating to Mongolia, Tibet (including dealing with the Dalai Lama), the Western Regions (present-day Xinjiang [Sinkiang]), and Korea. It kept track of titles and defined the domains of Mongol chiefs to prevent tribal wars and regulated the Mongols' relations with their spiritual leaders in Tibet. After 1644, its functions were enlarged to supervising the semiabsorbed tribal peoples of southwestern China in Yunnan, Guizhou (Kweichow), and Sichuan (Szechuan) provinces.

In short the Lifanyuan dealt with frontier peoples and ethnic minorities in the Qing empire outside the Chinese style of civil administration.

Europeans who traveled to China via sea during the Ming dynasty encountered this system of international relations. Although Western nations were not formally enrolled among the tributary states because of their great distance from China, envoys from Portugal, the Netherlands, and Russia were received at the Qing court as tribute ambassadors. Between 1655 and 1795, 17 missions from Western nations were received by the Qing monarchs, and all except the last, the British ambassador Lord Macartney, performed the kowtow before the emperor. This style of international relations between China and Western nations ended in 1842 after Great Britain defeated China in the First Anglo-Chinese War, although it persisted between China and its traditional vassal states until the late 19th century.

Quietism

Quietism refers to a Christian movement that was characterized by a mystic approach to God, consisting of an absolute passivity combined with a spiritual tranquility. It began in Spain and extended into Italy and France. Condemned as erroneous by various church leaders, it nevertheless had many adherents, including nobility in all three countries.

While there were other quietist movements and proponents throughout the centuries, the originator of the Quietist movement was a pious Spanish priest named Miguel de Molinos. Molinos was born in 1628 and grew up poor. His intellectual brilliance gained him admission to Jesuit schools, eventually earning a doctorate in theology. Molinos was a popular preacher in Valencia and gained a following throughout Spain and Italy that included many future leaders.

He radiated a confidence and spiritual authority that were combined with an expressed humility, declaring that "his one desire was to be annihilated for Jesus and condemned by all."

In 1675, Molinos published a book titled *Spiritual Guide* to express his views. He wrote of the tranquility of the soul absorbed in God, dead to all other thoughts and feelings. One should have no desires, and even expressions of outward piety (devotion to Mary or the saints) were harmful. This mystical, inward way was the way to life in God. Initially his book was positively received, in part because Pope Innocent XI and several cardinals were impressed with Molinos as a preacher and a godly man.

MOLINOS ARRESTED

In 1685, Molinos was arrested and put on trial by the Spanish Inquisition. Accused of heresy, he never protested against his accusers but rather agreed with them readily and quickly recanted all his errors (giving a certain ironical proof of his views that the inward soul was far more important than the outward). He was sentenced to imprisonment in a monastery in 1687 and spent the last nine years of his life in quiet prayer and contemplation.

By the time of Molinos's arrest, his writings and views had spread to France. A French Barnabite priest named Father Lacombe had studied and popularized Molinos's works and eventually met a wealthy French widow named Jeanne-Marie Guyon. Madame Guyon had married young but almost immediately expressed regret that she had not become a nun. She was a voluble and intense individual, full of mystical experience, claiming to have been given an "invisible ring of mystical marriage" by the Child Jesus.

When Father Lacombe met Madame Guyon around 1680, the two began a spiritual journey that attracted many devout disciples, both men and women. For a time, both stayed in the French city of Thonon, where Madame Guyon lived at an Ursuline convent. Madame Guyon had a crisis in 1683 when she became convinced that she either was carrying the Child Jesus or was the pregnant woman referred to in the book of Revelation. This served only to intensify the circle of the devout. Eventually around 1685, the two traveled to Paris, where many noble women were added to the circle of their devotees. When Molinos was arrested in Italy in 1685, the archbishop of Paris had Father Lacombe arrested as well on account of his "scandalous behavior." While charges of misconduct against Lacombe were never conclusively proved, he spent the rest of his life in prison, by some accounts becoming increasingly insane.

Madame Guyon was also confined to a convent for a time but never repented of her views. She was eventually released through the influence of some of her noble friends. Around 1686, Madame Guyon met the young pious bishop FRANÇOIS DE SALI GRIDE AND DE LA MOTHE FÉNELON, who quickly became convinced of the genuineness of her spirituality. Bishop Fénelon became a promoter of a less radical form of Quietism, one characterized more by indifference than the total passivity promoted by Molinos and Madame Guyon.

All was relatively quiet until the elderly Archbishop Bossuet, long a defender of the faith, was asked to look into the views of Lacombe and Guyon. Because of Guyon's continued popularity with many members of the French court, she was never condemned publicly but rather agreed to retract her views. In 1696, Bossuet sent a written work to Fénelon for his comment and approval. In it Bossuet condemned once again the views of Guyon. Rather than agreeing, Fénelon wrote and published a work of his own that defended the centrality of religious experience.

Some historians view the controversy as unnecessary, as the two theologians were not so far away from

agreement. Nevertheless, the controversy boiled over, as Bossuet appealed to the king for justice against Fénelon, who refused to debate the elderly theologian. Eventually Fénelon appealed to the pope in Rome, offending King LOUIS XIV, who, while unable to remove Fénelon from his office, forbade him to be present at the royal court. In 1699, under pressure from Rome, Fénelon repudiated his views.

After Madame Guyon's death in 1717, Quietism itself slowly died away. Yet it left its mark on the church in France, Spain, and Italy, and later evangelical Protestants.

BRUCE FRANSON

race and racism in the Americas

Beginning in the years after conquest, Latin America and the Caribbean experienced a societywide, centuries-long coming together of European, African, and indigenous American populations. The precise nature of that coming together varied according to time, place, and circumstance, generating a complex and shifting mosaic of racial categories, boundaries, and identities. In BRITISH NORTH AMERICA, in contrast, Native American were on the whole excluded from the dominant Anglo society, while Africans were included in that society while relegated to its lowest rung. This latter trajectory led, over time, to a largely dichotomous conception of race—a racial universe consisting of blacks (or Negroes) and whites, along with other categories (Indians, Asians, and others) but no substantial intermediate categories (save “half-breeds” and similar epithets designating white-Indian mixes). By the 1800s, this dichotomous conception of race coalesced in the United States into the “one drop rule,” in which a single drop of “Negro blood” made a person Negro.

French North America followed a different trajectory, with French traders along the St. Lawrence River, in the Great Lakes region, and in the Mississippi River valley mixing and intermarrying with native peoples to a much greater extent than in British North America. The resulting “mixed” racial categories, generically termed the Métis (equivalent to the Spanish term *mestizo*), can be taken as emblematic of the different ideas

and practices of race and racism in French and British colonial North America.

In Latin America and the Caribbean, in contrast, there evolved very different cultural understandings and social practices of race that there, too, varied widely across time and space. In general, racial categories here ranged across a spectrum from dark skinned to light skinned and were defined by more than skin color. Hair texture, nose shape, facial architecture, upbringing, social class—the latter exemplified in the popular locution “money whitens”—and many other factors combined to determine a person’s precise location in the complex and fluid grid of racial categories. Spaniards in particular were especially concerned with maintaining their *limpieza de sangre* (purity of blood), a concern routinely expressed in law and custom. The irony was that such “purity of blood” never existed. In fact Spaniards and Iberians in general around the year 1500—sometimes called the “*mestizos* of Europe”—could trace their genetic heritage to centuries of biogenetic mixing in consequence of Iberia’s geographic location as a land bridge between western Europe and North Africa—a population that combined northern and western European, North African, trans-Mediterranean, and sub-Saharan African “racial strains.”

Race, virtually all modern scholars agree, is a social construct, a cultural imposition that exhibits only the most tenuous connection to biology or genetics. Biogenetic diversity is a fundamental feature of the species *Homo sapiens*. Yet as biologists, anthropologists,

and the scientific community in general universally agree, there does not exist, “out there in the world,” an objective biogenetic reality that corresponds to historically developed, “commonsensical” conceptions of “race.” Among the most common facts cited in support of this argument is that there exists far more biogenetic diversity within a given “race” (say, Africans or Caucasians) than between “races.” A frequently invoked distinction in this regard is between “genotype” and “phenotype.” The latter, comprising various visible markers such as skin color, hair texture, and so on, bears no substantial relation to the former, which consists of an individual’s (or, more broadly, an organism’s) genetic makeup and heredity.

These and related contemporary understandings of “race” did not exist in the period covered in this volume. Instead there emerged across Latin America and the Caribbean highly elaborate and varied racial categories meant to pigeonhole any given individual’s racial background and characteristics. In addition to *mestizos* (Indian-Spanish), *mulattos* and *pardos* (African-Spanish), and *zambos* (African-Indian), there emerged in Spanish America, in different times and places, hundreds of more precise categories: *castizo* or *quadroon* (mestizo-Spanish), *octoroon* (quadroon-Spanish), *quintroon* or *sextroon* (octoroon-Spanish), *Morisco* (mulatto-Spanish), *cholo* (mestizo-Indian), *quinterona* (Spanish-mulatto), and many more. Toward the end of the colonial period, such efforts to pinpoint racial categories faltered, leading to increasing use of the generic term *castas* to refer to mixed-race peoples generally.

In Portuguese Brazil the most salient categories were *mamelucos*, *mestiços*, and *caboclos*. The greater propensity for Portuguese men (and to a lesser extent, women) to mix freely and intermarry with indigenous and African populations, and with their “mixed-race” offspring, eventually led, after independence, to a Brazilian national myth of “racial democracy”—the notion that racism did not exist in Brazil. The fallacious nature of this myth is the subject of an expansive literature. In fact, in Brazil as elsewhere in the Americas, there existed a very strong correlation between social class and social race. Darker skin and more Indian or African phenotypes were most commonly associated with lower social class and lesser social privilege, lighter skin and more European physiognomy with higher social class and greater social privilege.

Intricate gradations of racial categories did not mean an absence of racism, but rather different forms of race and racism in different parts of the Americas—not only in Spanish, Portuguese, and British colonies, but

in French and Dutch colonies as well. In virtually every sphere, from major social indices such as employment and life expectancy, to popular media such as television and film, the legacies of those distinctive heritages of racism remain profoundly apparent to the present day.

MICHAEL J. SCHROEDER

Rajputs

Rajputs (literally, “children of kings”) are members of a Hindu aristocratic caste (*kshatriya*, or warrior) settled mainly in northwestern India, who may have Central Asian origins. The Rajputs have been influential in the political history of India since the eighth century. By late 15th century, they were engaged in battles against the Turko-Afghans of the Delhi Sultanate, and by the mid-16th century they came under control of the Mughals (Moguls, Moghuls). In 1527, BABUR won the Battle of Kanua over a confederacy of Rajputs led by Rana Sanga, ruler of Mewar in Rajasthan, despite having a much smaller army. With the death of Rana Sanga and many other leaders in this battle, there was little hope for Rajput resurgence.

The Battle of Kanua inaugurated a long relationship between Rajputs and Mughals. Babur ruled for four years and died in 1530. His son HUMAYUN was not as powerful a leader and was forced into exile in Persia. However, Humayun’s son AKBAR extended power and geographical dominance of the Mughal Empire. Akbar began the custom of taking Rajput Hindu wives, without expecting them to convert to Islam. The diverse Mughal dynasty would employ Persians, Arabs, locally born Muslims, Rajputs, Brahmans, and later Marathas in its administration. Akbar and subsequent leaders’ marriages to Rajput women positioned some Rajputs as members of the ruling Mughal elite and they were integrated into the Mughal Empire in northern India. Many regional Rajput leaders maintained their autonomy but had to pay taxes to the Mughal government.

The reciprocal relationship between the Mughal emperors and the Rajputs was threatened in the mid-17th century, as a result of SHAH JAHAN's four sons' wars of succession of their father. The Rajputs remained loyal to Shah Jahan and fought against his rebel sons. When AURANGZEB won, they would suffer the consequences.

Aurangzeb was an ardent Muslim and he recast the previously diverse administration to favor Muslims exclusively. As a result, the Hindu Rajputs were ostracized politically, economically, and socially.

A later ruler, Jahandar Shah, attempted to repair relations with the Rajputs after 1715. The once strong relationship between the Rajputs and Mughals was never revived to the same level as during the early years of the Mughal dynasty.

STEFANY ANNE BOYLE

Raleigh, Sir Walter

(1554–1618) *English mariner, courtier, and writer*

Sir Walter Raleigh was an English adventurer and early promoter of colonization. He organized the Roanoke colony in 1585, England's first settlement in America.

Raleigh was born in Devon in the west of England, a younger son of a poor but distinguished family. He was registered at Oriel College, Oxford, from 1568 to 1572 but spent most of this time in France fighting for the HUGUENOTS. Returning to London, he studied law at the Inns of Court and published poetry. In 1578, his half brother Sir Humphrey Gilbert obtained a patent to colonize North America and Raleigh accompanied Gilbert in search of Spanish treasure. While this voyage was a disaster, it whetted Raleigh's appetite for colonization. In 1580, he led an army to England's first colony, Ireland, and put down a rebellion with brutal force. Such actions attracted the attention of Queen ELIZABETH I and Raleigh quickly became a royal favorite. The queen bestowed on Raleigh vast estates in Ireland,

Sir Walter Raleigh escaped execution for 15 years until King James I finally had him put to death.

lucrative patents and licenses, and various government offices. She knighted him in 1585.

In 1583, Gilbert died while trying to establish a colony in Newfoundland, and the following year, Queen Elizabeth granted Raleigh exclusive license to colonize America. Immediately, Raleigh dispatched an exploratory expedition to the Outer Banks of North Carolina, an ideal location for looting Spanish fleets. Receiving favorable reports of America, Raleigh dispatched his cousin Sir Richard Grenville to the Roanoke islands to erect a colony named Virginia after the virgin Queen Elizabeth. However, the colonists angered local Native Americans and decided to abandon Roanoke less than a year after their arrival. In April 1587, Raleigh dispatched a second group to America, but shortly after they arrived England engaged the SPANISH ARMADA and all contact with the colony was cut off until 1590. When a relief vessel finally got through, there was no trace of the colonists. Although Raleigh failed to erect a permanent settlement, he continued to advocate American colonization,

writing in 1602, “I shall yet live to see it an English nation.”

After Roanoke, Raleigh turned his attention elsewhere. In 1592 he married one of the queen’s ladies-in-waiting, Elizabeth Throckmorton, who bore him a son, Wat. He led an expedition of Guiana in 1595 and launched an attack on Cádiz a year later. Raleigh’s dedication to Queen Elizabeth sat poorly with the monarch’s successor, King JAMES I, who remarked upon meeting the adventurer, “I have heard but rawly of thee.” In 1603, the king charged Raleigh with conspiring with the Spanish. Convicted, Raleigh was sentenced to death but lived in the Tower of London for the next 12 years and wrote the antimonarchical treatise *History of the World*. Still frustrated with Raleigh, the king allowed him to make a second attempt at claiming Guiana for England. When the expedition failed and Raleigh’s men mutinied, the king enforced Raleigh’s conviction from 15 years earlier. A hero at his death, Raleigh told his reluctant executioner, “This is a sharp medicine, but it is a sure cure for all diseases.”

JOHN G. MCCURDY

reducciones (congregaciones) in colonial Spanish America

In response to steep demographic declines and a shared desire to exercise greater control over dwindling Indian populations, from the 1550s, Spanish colonial administrators and ecclesiastical authorities devised and implemented the institution of the *reducción*, or *congregación* (similar settlements, usually founded by religious orders, were called *aldeas* in Portuguese America). In essence a *reducción/congregación* was an Indian village or settlement, either newly established or expanded from an existing population center, into which Indians from specified outlying districts were compelled to move. The inhabitants of such settlements were typically called *congregados*.

Taking various forms in different parts of Spain’s American empire, *reducciones* originated from a number of related impulses: to forestall rebellion by ensuring that no substantial Indian populations remained

outside the sphere of Spanish surveillance and control, to facilitate conversion to Christianity, to furnish a readily available labor force, and to empty Indian-occupied lands for private ownership.

Typically laid out in the grid pattern characteristic of the Spanish colonial town, over time most *reducciones* failed to adhere to Spaniards’ idealized conceptions of hierarchically ordered urban space. Instead Indian dwellings and *barrios* (neighborhoods), in *reducciones* as elsewhere, tended to emerge disordered, with the “central square” in many postconquest Indian settlements often becoming little more than an empty lot adjacent to the church, and with social status bearing little relation to the location of individuals’ dwelling places.

This was generally less true in *congregaciones* founded as religious missions by “regular” (missionary) orders, most prominently the Dominicans, the Franciscans, and later, the Jesuits. Most commonly established in peripheral regions such as NEW SPAIN’S northern frontier, YUCATÁN, the Peruvian hinterlands, Paraguay, and the Brazilian *sertão* (backlands), such missionary *congregaciones (aldeas)* typically comprised an outer wall, affording protection against external attacks, and an inner compound.

Within the compound, the largest and most imposing structure was invariably the church, surrounded by workshops, granaries, stables, and similar structures, with dwelling places ringing the periphery. Bent on civilizing and Christianizing the Indians, the friars in such settlements typically endeavored to instruct their charges in a variety of crafts and industries, such as agriculture, stock raising, beekeeping, hide tanning, viticulture, and others.

The many variations on these general themes, however, along with the tremendous diversity of Spanish and Portuguese resettlement schemes, and the even greater diversity of Indian communities and lifestyles in different parts of the Spanish and Portuguese empires, meant there was no ideal type to which all *reducciones* conformed. Yet the same set of overarching impulses that led to their formation—especially the desire more effectively to control Indian labor, which in turn entailed Indians’ conversion to Christianity—and the concomitant desire of Indian individuals and communities to exercise as much autonomy as possible without directly challenging colonial rule tended to generate broadly similar sets of outcomes in the diverse regions of the Americas where *reducciones* were imposed.

MICHAEL J. SCHROEDER

Reformation, the

In the 16th-century Reformation, spiritual traditions gave way to scientific views on religion, society, and philosophy. Europe witnessed a fermenting of great ideas stimulated by the Renaissance. A new urban middle class ascended, with its Protestant ethics of capital accumulation, and the old order of Europe changed. The Reformation had far-reaching consequences for the church, society, and the economy.

HUMANISM IN EUROPE changed intellectual inquiry beginning in 1400 by encouraging people to think in terms of reason instead of faith. Medieval Christianity was becoming outdated and human interests began to predominate. The concept of chance rather than Providence became the hallmark of the age of Renaissance humanism.

The affairs of the secular world rather than of the divine world became primary. Among the thinkers of this era were Desiderius ERASMUS OF ROTTERDAM (1466–1536), NICCOLÒ MACHIAVELLI (1469–1527), FRANCESCO GUICCIARDINI (1483–1540), Rudolphus Agricola (1443–85), and John Colet (ca. 1467–1519). The printing industry played an important role in educating people. Knowledge was disseminated at a faster rate after the invention of the printing press by Johann Gutenberg (1397–1468).

COMMERCE CLASHES WITH CHURCH

In the political arena, the decay of the HOLY ROMAN EMPIRE and the development of central governments had a profound effect on the feudal order, which changed with the rise of a new middle class. The geographical discoveries made by explorers altered European understanding of the world and led to a vast extension of commerce. The traditional wealth of landholdings found a rival in commercial wealth. The time was ripe for a careful reexamination and reconstruction

A lithograph from 1830 shows Martin Luther directing the posting of his *Ninety-five Theses* to the door of the Wittenberg church in 1517.

of old institutions and the greatest one, the Roman Catholic Church, was no exception.

The Roman Catholic Church was marked by abuses and widespread corruption. The papacy had been discredited by immoral Alexander VI and the warlike JULIUS II. Desire for worldly possessions and political power became the norm for clergy. The sinecures, selling of indulgences, and pluralism further discredited the church. Independent nations did not like the interference from an external sovereign like the pope and sought ecclesiastical independence. The pioneering reform movements against the church began with John Wycliffe (1320–84), who was declared a heretic. He advocated freedom of individual conscience. Another reformer, John Huss (1317–1415) from the University of Prague, translated Wyclif's works into Czech, was condemned by the Council of Constance (1414–18), and was executed. GIROLAMO SAVONAROLA (1452–98) endeavored to effect moral reformation in Florence and was also slain. Erasmus of the Netherlands, professor of divinity at Cambridge in 1511–13, lampooned the papacy and the monasteries.

DEBATE OVER RELIGIOUS REFORM

The onset of the 16th century witnessed debate over religious reforms, and from the second decade, the undisputed leader of the Reformation was MARTIN LUTHER (1483–1546), whose posting of the 95 Theses on the door of the Wittenberg castle church on October 31, 1517, challenged papal abuses and sale of

indulgences. The princes supporting Luther hoped that his actions would undermine Rome's authority over Germany. Luther did not believe that purchasing indulgences would spare a soul from purgatory, and he did not believe that a person could be saved by his own deeds. He protested the rituals of the church, emphasizing that sacraments were essential for salvation. For him, it was God's mercy that allowed for salvation, not institutions and sacraments. The printing press spread the message of Luther quickly, and his ideas created havoc in Europe.

The placid Pope LEO X (1513–21) sought a solution to the problem of the Reformation and called Luther to present his case after excommunicating him in 1520. Luther began his journey to Worms on April 2, 1521, and was welcomed in towns that he passed through. The church and the powerful Holy Roman Emperor, CHARLES V (r. 1519–56), a supporter of the Roman Catholic Church, wanted Luther to retract his statements. At the Imperial DIET OF WORMS, Luther stood firm in his belief and proclaimed that he could not submit his faith either to the pope or to the council, and his conscience was submissive to God's will alone. He was allowed to go home and lead a life of seclusion, writing against the papacy.

Luther had been declared an outlaw but was comparatively safe because the Emperor was busy at war with France. The Diet did not remedy the ecclesiastical grievances, and Luther's spiritual rebellion gave rise to political rebellion in the form of the PEASANTS' WAR of 1524 and 1525. Thomas Müntzer, a former Lutheran cleric, led the revolt, in which peasants demanded reforms of feudal excesses. Luther's call for peace went unheeded and he sided with the princes. The ruling prince of each principality decided the type of Christianity that would be followed; the southern princes generally sided with Rome, whereas the northerners were loyal to Lutheran teachings. At the Diet of Speyer in 1526, each German state was allowed to choose between the two religions. But after three years, in the second Diet, there was reenactment of the Edict of Worms and the Lutherans protested, thus gaining the name of *Protestants*.

TWO SIDES OF THE REFORMATION

Europe was soon divided into two blocs with the spread of the Reformation. The victory of the new faith in German Switzerland was feasible because of the efforts of ULRICH ZWINGLI (1484–1531). Another notable figure in Protestant Reformation, Frenchman JOHN CALVIN (1509–64), emphasized faith and called for a return to the Bible. He was of the belief that the church and state were essential for society and authority, for both were

given by God. Calvinism did not make state supreme over the church, a point propounded by Luther. He encouraged the civil and ecclesiastical officers to work together against wickedness.

Calvin's theological system was indirectly responsible for the cause of democracy and was embraced in England, Scotland, and the Netherlands, where democratic tradition was gaining ground. The PURITAN tradition also became effective as far away as the New England colonies. Protestant scholars went to Geneva, a center of Calvinist teaching, and took back Protestantism to their home countries in Europe. Calvin gave much importance to education and set up a training school for Protestant theologians, which eventually became the University of Geneva.

The HUGUENOTS, or French Protestants, did not succeed in making reformation a national movement. Francis I (r. 1515–47) had already made arrangements with the papacy by the Concordat of Bologna in 1516. The persecution of the Huguenots reached its height in the St. Bartholomew's Day Massacre in 1572. The religious wars were brought to an end by the EDICT OF NANTES in 1598, and the question of the Reformation was settled in France for the time being. The Reformation also did not make much headway in the Netherlands, which was under control of the Holy Roman Emperor Charles V.

Calvinism spread after 1555, when Charles V bequeathed the Netherlands to his son PHILIP II. Dissatisfaction arose in the country because of the king's administration, excessive use of Spanish troops, and heavy taxation. In 1568, the Inquisition condemned the people of the Netherlands as heretics. There arose an uprising in northern provinces under William of Orange-Nassau, prince of Orange. The northern region proclaimed independence and the "United Provinces" became the Protestant kingdom of Holland. JOHN KNOX took Scotland toward Protestantism and left a legacy known as Presbyterianism. From 1559, Knox became the leader of Protestant rebellion against the Catholic regent of Scotland, Mary of Guise.

England's break with Rome came when King HENRY VIII (r. 1509–47) attacked the papal authority in England over the divorce question. The Acts of Appeals of 1533 forbade any appeal to Rome. Henry VIII proclaimed himself the head of the CHURCH OF ENGLAND by the Act of Supremacy of 1534. The Reformation parliament (1529–36) attacked the property of the church and dissolved the smaller monasteries. In 1539, greater monasteries were dissolved. In the subsequent reign of EDWARD VI, the Protestant Reformation made great strides. The

efforts of King Christian II of Denmark made the Reformation easier in Denmark and Norway. Gustavus Vasa (r. 1523–60) introduced the Reformation in Sweden for political reasons; the king became supreme authority pertaining to religious affairs. Although the Reformation did not succeed in Italy and Spain, it effected change in Hungary and Transylvania.

COUNTER-REFORMATION

The Reformation produced the Catholic Reformation or COUNTER-REFORMATION, which endeavored to remove abuses. Reform-minded Pope Paul III entrusted the task of addressing abuses to cardinals. The COUNCIL OF TRENT (1545–63) removed some of the abuses and there was improvement through the efforts of popes such as Julius III (pope 1550–55), Paul IV (pope 1555–59), and Pius IV (1559–65), all of whom enforced discipline. The order of Jesuits acted as missionaries to purify the church. The Roman Catholic Church regained some of the ground that it had lost.

The Protestant Reformation was a watershed in the history of Christianity and its consequences were far-reaching. National language and education developed, and religion became accessible with the use of a common vernacular. The rising bourgeoisie saw in Protestantism reiteration of qualities like hard labor and thrift, which strengthened the economy. The glorification of national states became the precursor to nationalism. The call of Calvinism and Puritan revolution had its echo in the American colonies, leading to the Declaration of Independence.

PATIT PABAN MISHRA

repartimiento in Spanish America

Rooted in the verb *repartir* (to distribute, to allot), *repartimiento* in Spanish America refers to two distinct institutional practices. One relates to *ENCOMIENDA* during the first century of colonization, the second to the forced sale of Spanish goods to Indian communities, which occurred primarily during the late colonial period. With respect to the first, *repartimiento* and *encomienda* were legally distinct but functionally identical. In both cases the term referred to the official allotment or distribution of Indians to specific Spaniards under conditions of forced or coerced labor. The practice was also known locally by different names, including *coatequitl* in New Spain and *mita* in Peru.

The forced-sale meaning of the term, also called *reparto de comercio*, or simply *reparto*, referred to an increasingly common practice during the mature colonial period, particularly as the royal treasury grew strapped for cash and local officials came to depend on revenues from forced sales to maintain their standards of living. Local officials such as *alcaldes*, *corregidores*, and others, in effect foisted excess goods on Indian communities—goods either imported from Spain or locally produced—by requiring their purchase, making *repartimiento*, in effect, one more form of taxation that drained surplus labor and production from Indians.

Vigorous denunciations of the abuses of *repartimiento* from visiting inspectors and officials repeatedly crossed the royal desk, to little practical effect. One, penned in the 1730s and referring to *repartimiento* in the province of Quito, described the system as “so cruelly wicked that it appears as if it were imposed on those people as a punishment . . . a more tyrannical abuse could not be imagined.” Fiscal constraints meant that leading officials largely ignored this and many similar condemnations. In the 1750s, the Crown legalized the practice, and in many areas it continued for the rest of the colonial period. Some scholars hypothesize that excessive impositions of *repartimiento* constituted an important contributory factor in sparking the major uprisings and revolts that rocked the Andes from the 1730s to the 1780s. Others have traced more localized revolts, in NEW SPAIN and elsewhere, to the practice. In essence, *repartimiento* was one more

mechanism by which local officials and the colonial state extracted surplus labor from Indians.

MICHAEL J. SCHROEDER

Ricci, Matteo

(1552–1610) *Jesuit missionary, humanist, scholar*

Matteo Ricci was the first Jesuit missionary in China, arriving in MACAO in 1582. He died in Beijing (Peking) in 1610, having won the respect of Chinese scholars and officials as a great scholar, teacher, translator, and writer. He was the pioneer and model among Jesuit missionaries, who became the point of convergence between East and West.

Born in Macerata in Italy, Matteo Ricci studied in Jesuit colleges in Florence and Rome before setting out for Goa in India in 1578, where he was ordained as a priest. Together with another priest, Michele Ruggieri, he arrived in 1582 in Macao on China's southern coast, where the Chinese government had allowed the Portuguese to establish a trading center. Five years earlier, Father Alessandro Valignano, superior of all Jesuit mission in the East Indies (which included China), had set down rules that Jesuit missionaries in China should adapt to Chinese culture, learning to speak, read, and write Chinese, and seek to transform China from within for the long-term goal of conversion.

There could not have been a better choice than Ricci to perform this task. Ricci wore Chinese clothes, moved among educated Chinese, and impressed them with his knowledge in astronomy, mathematics, geography, and other academic disciplines. After 15 years in Zhaoqing (Shaoching) and Nanjing (Nanking), he was finally allowed to go to Beijing (Peking) in 1601, where he was initially housed in the Residence for Tributary Envoys. Ricci was granted an imperial audience, but the reclusive WANLI (WAN-LI), emperor of China, did not appear in person. He kowtowed to an empty throne but his many gifts, which included holy pictures, a reliquary, other religious

objects, plus two clocks, a spinet, and other items made in Europe, were accepted. He was granted permission to build a church and establish a mission in the capital city. He greatly impressed the court when he calculated the time of an eclipse more accurately than had the Chinese and Arab court astronomers. Since exact calendar making and astronomical predictions were highly important to the Chinese government, Ricci wrote home begging for experts in those fields to be sent to China. As a result, Jesuit astronomers built an observatory in Beijing and a Jesuit headed the Board of Astronomy, a department of the Ministry of Rites, until the mid-18th century.

Ricci was a prodigious writer and translator. He authored *Treatises on Mnemonic Arts*, *Treatise on Friendship*, *True Meaning of the and Lord of Heaven*, and *Ten Discourses by a Paradoxical Man*, translated Euclid's *Elements of Geometry* into Chinese and began to translate the Chinese classical *Four Books* into Latin. He also made a map of the world and composed songs. His fame as scholar and scientist won many prominent admirers and friends. He also made converts, the most famous being Grand Secretary Hu Guangqi (Hsu Kuang-ch'i) and President of the Board of Public Works Li Zhizao (Li Chih-tsao).

Ricci died in 1610. His work was carried on by generations of talented Jesuit scholars and missionaries who were dedicated to their faith and were also important cultural ambassadors.

Richelieu, Armand-Jean du Plessis, duc and cardinal de

(1585–1642) *French statesman*

Armand-Jean du Plessis, duc de Richelieu, was a French noble, clergyman, and statesman instrumental in laying the foundations of an absolutist state in France. Richelieu left a legacy of the use of authoritarian measures, such as censorship and the banning of political

assemblies, to maintain power. Historians have viewed Richelieu as either a patriot or a tyrant, and he was later vilified in Alexandre Dumas's classic novel *The Three Musketeers* (1844). Richelieu also pioneered such ideas of modern international politics as national sovereignty and international law.

Richelieu was born in Paris in September 1585. His father, former grand provost of France, died fighting in the French Wars of Religion (1562–98). The family avoided debt through royal assistance and received the bishopric of Luçon as a reward. Initially destined for a military career, Richelieu joined the Catholic clergy following his brother's resignation of the bishopric of Luçon and became a bishop in 1607. He became the first French bishop to implement the institutional reforms issued by the COUNCIL OF TRENT between 1545 and 1563.

He began his political career representing the clergy of Poitou in the States General of 1614. Richelieu demanded church exemption from taxation, the clergy's retention of its privileges, summoning of bishops and prelates to the royal councils, and the condemnation of Protestantism. After the dissolution of the States General, Richelieu became the queen's almoner. His ambition drove his rapid political promotion. Richelieu became secretary of state in 1616 but left the position amid political intrigue. The advisers of Louis XIII (1601–43) continued to present Richelieu as a threat to royal authority. Consequently, Richelieu went into exile in 1618.

In 1619 Marie de Medici (1573–1642), the king's mother, rebelled to regain the authority she held previously as regent. Richelieu was recalled to negotiate peace terms. He became a cardinal in 1622 and in 1624 reentered the king's Council of Ministers, quickly becoming chief minister by conspiring against those who stood in his way.

As chief minister of France, Richelieu sought to consolidate royal authority while weakening that of the nobility. In 1626, he eliminated the prestigious military position of constable of France and ordered the feudal nobility to tear down most fortified castles, leaving only those necessary for defense against invaders. These actions minimized the military threat of the nobility to the throne, thereby increasing and securing the king's authority. While attempting to consolidate royal power, Richelieu also had to contend with the rising political ambitions of French Protestants, known as HUGUENOTS, who countered national unity by threatening a religious schism. The Huguenots controlled a large military and, aided by CHARLES I of England (1600–49), rebelled against the king. In 1627, Richelieu led a siege

of the Huguenot fortress of La Rochelle and fended off an English expedition under command of the duke of Buckingham (1592–1628). The fall of La Rochelle in 1628, and the peace of Alais in 1629, eliminated the political influence of Protestantism in France. Religious toleration, granted previously under the EDICT OF NANTES (1598), continued. Such a centralization of power within the person of the French king created an absolute monarchy.

FOREIGN POLICY

Richelieu's foreign policy focused on neutralizing the growing influence of the royal HABSBUERG family, which ruled both Austria and Spain. Despite being a member of the Catholic clergy, he brokered controversial alliances with foreign Protestant nations to counter the influence of Catholic Austria and Spain. Many within the Catholic clergy were opposed to Richelieu's policies. Richelieu also supported the development of NEW FRANCE in North America.

While France was warring with its Huguenots, Spain attempted to spread its influence in northern Italy.

A reproduction of a painting of Cardinal Richelieu relaxing with his cats, by the artist T. Robert Henry

Following La Rochelle's capitulation, Richelieu led an army into northern Italy to counter Spanish ambitions. Marie de Medici sought revenge against Richelieu and conspired with the king's brother, Gaston, duc d'Orléans (1608–60), for his dismissal. On November 11, 1630, known as Day of the Dupes, the king agreed to the request of his mother and brother, only to be persuaded by Richelieu to alter this decision. While Louis XIII was never fond of Richelieu, this was his only attempt to remove him. The king later created his chief minister duc de Richelieu and a peer of France. Richelieu continued to consolidate his position through a large network of spies in France and abroad.

During the 1630s, Richelieu aligned France with Protestant German princes during the THIRTY YEARS' WAR (1618–48) to counter the threat to France posed by Habsburg control of the HOLY ROMAN EMPIRE to the east and of Spain to the west. France suffered initial defeats and Richelieu was declared a traitor to the Catholic Church. Financial costs of the war caused a strain on the king's finances and Richelieu imposed taxes on salt and land. The clergy and nobility were exempt from such taxes, thereby placing the burden on the peasants and bourgeoisie. For more efficient tax collecting, tax officials were replaced with *intendants* who worked directly for the king. There were several peasant uprisings between 1636 and 1639, all of which were crushed.

RICHELIEU AND THE ARTS

Richelieu was a patron of the arts and in 1636 founded the Académie française to promote French literature. Richelieu authored numerous religious and political works while funding the careers of notable literary figures, including Pierre Corneille (1606–84). In 1622, Richelieu became principal of the Sorbonne, sponsoring the college's renovation and the construction of a chapel. He also amassed one of the largest art collections in Europe. Richelieu continued to have uneasy relations with Pope Urban VIII (1568–1644) and the Catholic Church. The pope, to amend the situation, made Jules Mazarin (1602–61), one of Richelieu's closest political allies, a cardinal in 1641. With his health increasingly failing, Richelieu named Mazarin his successor. Richelieu died in 1642 and was interred at the Sorbonne.

LOUIS XIV (1638–1715) inherited the throne in 1643 and continued Richelieu's work of creating an absolute monarchy by further reducing the nobility's power and the remnants of political power held by Huguenots. Following success in the Thirty Years' War,

Louis XIV positioned France as the dominant European continental power.

ERIC MARTONE

rites controversy in China

From the beginning of their work in China in 1583, many Catholic Jesuit missionaries presented themselves as scholars and scientists. Their goal was to impress the elite scholar-officials with their culture and erudition and then gradually to present the essential teachings of Christianity. Thus they adapted to many Chinese ways and avoided conflict with the Chinese over unessential matters. This tactic won prominent converts among the court and high government officials during the last years of the MING DYNASTY. The fall of the Ming and the establishment of the Qing (Ch'ing) dynasty in 1644 did not damage the prestige of the Jesuits.

Discord came with the arrival of Franciscan and Dominican missionaries in China in 1634. With no knowledge of Chinese culture, they were horrified with Jesuit accommodations with Chinese mores. They also attacked the Jesuits for choosing Chinese words to express Christian terminology, for tolerating Chinese rites such as those honoring ancestors and Confucius, and for refusing to teach that Confucius, China's most revered philosopher, had gone to hell for not being a Christian. Franciscans and Dominicans, who preferred converting ordinary people, were moreover jealous of the Jesuits for their connections with leaders of society.

The most bitter fight between the Jesuits and the other orders was over Chinese rites. Jesuits maintained that ancestor worship expressed respect and filial piety, and rituals that honored Confucius were civil rites of good citizenship that did not negate worship of God. Moreover they believed that their prohibition would make it impossible for many Chinese to become Christians. A papal decree of 1656 had allowed the Jesuits

to permit Chinese converts to continue the practice of their family and civic rituals under stipulated conditions. Franciscans and Dominicans however thought these acts idolatrous and blasphemous and campaigned to have them banned. The debate generated 262 published works on the subject.

Emperor KANGXI (K'ang-hsi, ruled 1662–1722) was personally not interested in Christianity but was sympathetic to the Jesuits for their learning and because of their services to his government. He issued an Edict of Toleration in 1692 that allowed Christians to build churches and worship freely in China. However Kangxi was offended when the pope sided with Franciscans in 1704, banned the Chinese rites for Chinese converts to Christianity, and insisted that the words Jesuits had used for God in Chinese be changed.

In 1705, the pope sent an emissary to China to inform Kangxi that he wished to exert authority over all Chinese Catholics. This demand confirmed the suspicion of many Chinese leaders that there was a secret dark purpose for sending missionaries to China. Kangxi rejected the pope's demand categorically. A second papal legate, sent in 1720, was no more successful. Meanwhile in 1707, 1715, and 1742, successive popes decreed that ancestor worship and veneration of Confucius were idolatrous and incompatible with Christian practice and banned them for Chinese converts to Catholicism. After reading the papal bull of 1715, Emperor Kangxi commented in writing, "I ask myself how these uncultivated Westerners dare to speak of the great [philosophical and moral] precepts of China . . . As from now I forbid the Westerners to spread their doctrine in China; that will spare us a lot of trouble." He further decreed that all missionaries should be repatriated except for those who served as scientists and specialists in the Chinese government. However the decision was not strictly applied.

Kangxi died in 1722 and was followed by his son YONGZHENG (Yung-Cheng, ruled 1723–35), who was much less sympathetic to Christian missionaries. He said, "China has its religions and the Western world has its religions. Western religions need not propagate in China, just as Chinese religions cannot prevail in the Western world." This view was shared by his son Emperor Qianlong (Ch'ien-lung, ruled 1736–95), although both rulers continued to employ Jesuits in the government. When the papacy dissolved the Society of Jesus in 1773, the moving spirit of Christianity in China was gone and Chinese-Western religious and cultural contacts became minimal. The Jesuits' under-

standing of the differences between Chinese and Christian cultures was key to their success. That success bred jealousy among other missionary groups, resulting in the rites controversy, which severed the bridge between China and the West.

JIU-HWA LO UPSHUR

Ronin, 47

A *ronin* was a masterless samurai who had lost his privileged status in society. The tale of the 47 Ronin has become one of the central myths in Japanese history. It concerns a supposedly real-life story from the beginning of the 18th century when 47 samurai were left without a master and therefore became ronin when their leader, feeling unjustly treated, drew his sword against his lord and was, as a result, forced to commit seppuku, or ritual suicide. His domain was confiscated. The ronin plotted to take revenge on the lord who had wronged their master. Knowing that they would be watched by the authorities, they bided their time for two years, pretending to live a life of dissipation. Then on a snowy winter night they assembled in EDO, broke into the castle of the offending lord, and took his head. The Tokugawa *BAKUHAN* allowed the 47 Ronin to commit seppuku, thus ending their lives with honor. The story has been retold in print, theater, puppetry, and film many times in subsequent years. The notions of honorable sacrifice and justified vengeance-taking have become deeply embedded in the Japanese psyche.

This event is important in reinforcing the class-based structure of Japanese society at the time: Samurai were bound by the Bushido, the Way of the Warrior, to which lesser people could only aspire. Even though the 47 spent the time between the original offense and the time of vengeance hiding, disguising themselves, and spying on their enemy in a variety of ways that may be considered underhanded, this is not considered to be in any way

dishonorable, and the final result negates the means by which it is completed.

JOHN WALSH

Roses, Wars of the

The series of civil battles fought between the House of Lancaster and the House of York from 1455 to 1471 have been named the Wars of the Roses because the House of York was emblemized by a white rose and

An actor portrays Richard III in William Shakespeare's play *Henry VI—the story of the Wars of the Roses*.

the House of Lancaster by a red rose. When the TUDOR DYNASTY came to power it merged the two roses, symbolizing the union of the two factions. Since HENRY VII from the House of Tudor came out of those battles the ultimate winner, the end of the Wars of the Roses has often been dated to 1485.

During the long reign of the Lancastrian king Henry VI (1422–61), the power and dignity of the English monarchy sank rapidly as a result of the king's questionable mental capacity and lack of political and military skills. The decline of royal authority encouraged factious contentions among great noblemen of the court and broke down social order all over the countryside, where uniformed retainers of noblemen inflicted intimidation, injustice, and even regional warfare upon the people. Contemporaries referred to such disorderly conduct and senseless violence as “livery and maintenance.”

The first war broke out in May 22, 1455, when Richard, duke of York, supported by Richard Neville, earl of Salisbury and of Warwick, intercepted the Lancastrian court of Henry VI in St. Albans and fought a half-hour battle there, defeating the Lancastrian army and killing their commander, Edmund Beaufort, duke of Somerset. The Yorkist victory intensified the battle between the House of York and Queen Margaret, who was forced to lead the Lancastrians during the periodic insanity of her husband. Whenever Richard made attempts to assume the protectorate during the king's temporary sickness, the queen fought back. She subsequently succeeded in winning the court battles, forcing leading Yorkists into exile in 1459.

The crisis renewed in 1460, when the Yorkists returned and defeated the Lancastrians at the Battle of Northampton in July, capturing the king and forcing him to accept a humiliating compromise, which allowed the king to remain in power for life and made the duke of York and his heirs the successors to the throne. In December, Queen Margaret organized a successful counterattack at the Battle of Wakefield to rescue the hereditary right to the throne for her son, Prince Edward. Richard, duke of York, died in the battle, and his son Edward assumed the Yorkist leadership. The power struggle at the court became an open war for the Crown between the two houses. Both could trace their ancestry to Edward III (1327–77), but neither had a flawless claim. In 1461, two battles were fought, first at Mortimer's Cross, and then at Towton, which resulted in the end of the 62 years of Lancastrian rule. Henry VI was exiled to Scotland with his wife and son. Edward IV became the first Yorkist king.

The war continued, however, because of the weak hereditary claim of the House of York, and the nobility became even more divided when private interests and mutual hatred drove them constantly to change allegiances. In 1464 Edward IV alienated the earl of Warwick, who had helped the king win his throne and supported the king in his early years, and thus became known as the kingmaker. In 1469, the earl formed an alliance with the exiled Lancastrian queen Margaret. Together, they helped Henry VI take back London and regain the Crown in 1470. The recovery of the Lancastrian power, however, lasted only about six months. In 1471, Edward IV defeated the Lancastrians and killed the earl at the Battle of Barnet in April and won the Battle of Tewkesbury in early May, capturing Henry VI and his queen and killing Prince Edward on the battlefield.

However, after the crushing of the House of Lancaster, the Yorkists did not hold onto the Crown long. Between 1483 and 1485, the sudden death of Edward IV was followed by the usurpation of the Crown by Richard III over his uncrowned nephew Edward V. These events opened a new phase of dynastic contention. Henry Tudor, with a very weak hereditary claim to the English throne, took the opportunity and fought on behalf of the Lancastrians against the unpopular usurper, Richard III. In 1485, the right to the English Crown was finally decided at the Battle of Bosworth,

in which Henry killed Richard, dispersed the Yorkist army, and made himself HENRY VII, the first Tudor king.

The Wars of the Roses left a ravaged nation to Henry VII, who was facing troubles similar to what his Lancastrian and Yorkist predecessors had suffered for the past three decades. The legitimacy of the Crown was challengeable. The great noble houses remained divided among themselves and defiant of the central authority.

The old administrative mechanism no longer functioned and parliamentary institutions, the king, and the two houses did not know how to work together. The transformation of an agrarian economy to a mixed one with trade and commerce was well under way, social and religious crises were on the horizon, and the royal treasury was empty.

Sa'did dynasty

The Sa'did dynasty, also commonly known as the Sa'dians, ruled Morocco from the mid-16th century until 1659. The dynasty was plagued with internal and external strife but was credited with uniting Morocco, defeating the colonial Portuguese, and invading the great West African SONGHAI EMPIRE. The name of the dynasty was derived from their ancestry in the tribe of Banu Sa'd, and they were the first Moroccan dynasty claiming the title sharif, or descendants of the prophet Muhammad. The dynasty rose to power by challenging the ruling Wattasids, a declining dynasty despised for allying with the Portuguese and allowing the European power to gain a strong foothold in Morocco. Infighting of rival groups vying for power persisted for much of the early Sa'did rule and extended to neighboring Ottoman-controlled areas. During the 1540s and 1550s, the increasing success and military victories of the Sa'did leader, Muhammad al-Shaykh, forced the Portuguese to withdraw from many cities until their presence in Morocco was restricted to a small number of forts.

In 1578, the Battle of the Three Kings was waged, in which the Portuguese king and two Moroccan kings died. The Moroccans were victorious and gained a measure of international respect for defeating a European power. Now led by Ahmad al-Mansur, the Sa'dids began to have closer ties to the Ottomans, yet remained fully independent. As well, they established relations with Spain and England, the latter gaining

exclusive trade in Morocco under the Barbary Company. Al-Mansur also led a drive to form a professional military and introduced extensive use of rifles in Moroccan warfare. With his army and powerful alliances, al-Mansur steadily united the country under a despotic regime; as a consequence, a sense of Moroccan unity and national identity took root for the first time.

With his expansion hemmed in by Ottoman lands in the east, in 1590 al-Mansur made a power play to control the lucrative West African trade controlled by the Songhai Empire to his south. Al-Mansur first tried to extort taxes from the Songhai ruler Askia Ishaq II but was promptly rebuffed. Al-Mansur then made the decision to invade Songhai in 1591 under the false pretense of uniting Muslims under his authority, but his expansionist and economic ambitions were transparent. The resulting Moroccan victory ended the Songhai Empire and reduced Timbuktu, the internationally respected center of West African scholarship, to a dusty outpost, devoid of scholars of any consequence.

In 1593, al-Mansur died, instigating the fractious disintegration of the Sa'did dynasty. Once again, internal division and European political and military influence became a hallmark of the Moroccan state. By 1613, the country had split into two kingdoms and the economy was in shambles. Various rival European states allied with factions in order to gain control of Morocco for their own financial benefit, acting to further the chaotic destruction of the Sa'dids. Internal religious war, assassinations, and a string of decadent rulers, lacking

legitimacy or leadership, finally became too much for the Sa'dids to overcome. In 1669, the Alawi sharifs successfully defeated all contenders to become the power brokers in Morocco.

BRENT D. SINGLETON

Safavid Empire

The Safavid Empire was established as the Mongol il-Khan government declined and the Safavids were victorious over the numerous Turkish tribes who had established independent fiefdoms in Persia (present-day northern Iran) during the 13th and 14th centuries. During this tumultuous period, a number of Sufi, Islamic mystical orders emerged; one order, named after its founder, Shaikh Safi al-Din (1252–1334), created a network of followers who gradually viewed the head

of the order as the shah or king. By the 15th century, the Safavid rulers adopted the title *padishah* or king/emperor. The Safavid shahs asserted that they were descendants of Ali and the last Twelver Shi'i imam, who was believed to have gone into occultation to reappear at some later time. Religious zealots, the early Safavids attacked Christians as well as those of Turkish ethnicity. They also waged a long and ultimately futile series of wars on the rival Sunni Muslim OTTOMAN EMPIRE. While the Sunnis asserted that any true Muslim could rule the society, as Shi'i, the Safavids believed that the rulers of Muslim societies should be the descendants of Ali, the prophet Muhammad's son-in-law, and his sons, in particular the martyr Husayn. These conflicting views over the legitimacy of rule set the two empires on a rival course that would last for over a century.

The first Safavid king, Shah Isma'il reigned from 1501 to 1524 and established Twelver Shi'i Islam as the state religion. However he moved away from the Sufi foundations of the empire. Unlike the Ottomans, who generally assimilated new cultural styles and allowed great latitude of languages and practices within their territories, the Safavids enforced the separate identity of Persian culture and language.

In a series of battles with the Ozbegs and the Ottomans, Shah Isma'il consolidated Iran as a unified state. His successor Shah Tahmasp (reigned 1524–76) waged war with the rival Ottoman Empire for control over northern Iran and Iraq as well as attempting to extend Safavid control around the Caspian Sea and into Georgia.

The Safavid Empire reached its zenith under Shah ABBAS THE GREAT OF PERSIA (reigned 1588–1629), who ruled with an iron fist. Abbas managed to destroy the rival Turkish Gazilbash tribes, reform the army, and create a prosperous economy based on the trade of luxury goods, especially silk brocades. Unfortunately he left no able successor and after his death the empire entered a long period of decline.

Safavid society was composed mostly of rural villagers as well as nomadic pastoralists and an urban elite. The Shi'i clergy or mullahs also held considerable power, particularly over the largely illiterate peasantry, who looked to the clergy for religious and political guidance. Many mullahs were large landowners and used the revenues from their property to provide independent financing for religious schools and foundations. Thus when the central authority in Persia was weak, the mullahs often became a political force in their own right.

The Safavid throne of Persia that Sultan Selim I captured in Iran, on display in the Treasury of the Imperial Topkapı Sarayı (palace)

Safavid rulers were dependent on taxations and revenues from vast Crown or state land and often used land to reward loyal officers and bureaucratic officials. Under Abbas I, the Crown also had a state monopoly over the sale of silk and encouraged a lively trade with western European powers as well as with Russia.

Safavid rulers, like the Ottomans, were keen patrons of the arts and literature. An illustrated *Shahnameh*, book of kings, with hundreds of intricate miniature paintings was one of the most famous productions of the court artists. The Safavids maintained a lavish court from their capital in ISFAHAN and enjoyed playing polo and chess. Foreign envoys often commented on the sumptuous attire of the Safavid elite and the lavish lifestyle of the court. However every seven years, the used clothes of the royalty were burned and the gold and silver threads saved for reuse in new textiles.

Although the shahs after Abbas I were not as able or dynamic, the empire survived throughout the 17th century largely because it faced no major external threats. In the early 18th century, the Safavids were threatened by several outside forces. In 1722, tribes from neighboring Afghanistan took Isfahan, but a counterattack by Shah Tahmasp II (reigned 1722–32) restored the city to Safavid control for a short period.

Meanwhile, Ottoman forces took advantage of Safavid weakness to extend their authority into northern Persia. Further Afghan attacks effectively destroyed real Safavid power by 1726. Remnants of the dynasty continued to assert their authority as shahs, but the death, by assassination, of NADIR SHAH in 1747 marked the formal demise of the once great Safavid Empire. Toward the end of the 18th century, the new Qajar dynasty emerged as the new shahs over Persia.

JANICE J. TERRY

Savonarola, Girolamo

(1452–1498) *pre-Reformation Italian reformer*

Girolamo Savonarola was an Italian cleric and reformer whose sermons and writings predated the REFORMATION. Born in Ferrara in 1452, he was a scholar from boyhood and studied music, medicine, design, and theology. Inspired by a sermon in 1474, he entered the monastery of St. Domenico in Bologna, where he spent six years in the novitiate. Even so young, his poems expressed disagreement and indignation against the venality of the Renaissance church.

Gradually Savonarola gained fame as a preacher of the Dominican order. By 1490, he was at the Priory of St. Mark and had become so influential with his listeners that in 1491, he was elected to head post. He had become so powerful by then that he felt able to denounce the customs and ethics of the rulers of the day including Lorenzo de' Medici, the pope, and the king of Naples. His powerful position in Florence was reinforced when Lorenzo de' Medici called him to his deathbed and Savonarola refused to give absolution to the dying man because he refused to give up power in Florence.

Between 1492 and 1494, Savonarola's power expanded through his sermons and writings wherein he proclaimed that he had apocalyptic visions that the wrath of the Lord would be visited upon the guilty and the world was threatened by famine, bloodshed, and pestilence. His fame as an orator spread throughout Italy. In 1493, his order of Dominicans of St. Mark received a brief so that it was basically independent of most immediate church authority. His final ascent to power came when the Medicis were overthrown in 1494 at the approach of the French king Charles, who threatened Florence. Because of Savonarola's remonstrance, the king withdrew from Florence without bloodshed.

Because of the turn of events, Savonarola was the unofficial dictator of Florence for the next four years. He established a four-part formula for his rule: fear of God and purification of manners, promotion of the public welfare as opposed to private interests, general amnesty to all political offenders, and a council on the Venetian manner but without a doge.

Many of his prescriptions were followed during the next few years. All property was taxed. He organized boys of Florence into a secret militia. He established carnivals wherein the citizens gave away their most expensive possessions as alms to the poor as well as burning luxury items such as masks and other objects used for festivals. He did not oppose the arts, in general; in fact,

he helped save the Medici Library through funds from his convent.

During this period, Florence became rather austere. Many people left their homes to join religious orders, and many sought Savonarola's order, the Dominicans. People dressed ascetically. Hymns and psalms routinely were sung in the streets.

Savonarola's downfall resulted both from enemies without and within. He made a bitter enemy of the Borgia pope Alexander VI, by denouncing him for his crimes. The Medici worked secretly from inside Florence to return to power. When the pope tried to bribe Savonarola to silence with a cardinal's hat, he rejected it and continued his denunciations. When he declined invitations to visit Rome, Florence was threatened with an interdict. In 1498, the repeated threats from the pope to the council of Florence coupled with Savonarola's repeated denunciations of the "antipope" caused the council of Florence to become more hostile to him. At the same time, executions of Medici partisans, a desire for moderation, and resentment after the infamous Carnival of 1497 in which valuable books and artwork were burned all added to Savonarola's decline.

The final cause of Savonarola's downfall was an ordeal of fire called by his enemies, the Franciscans. When his accusers did not appear, the people felt cheated, and Savonarola became a scapegoat. He was arrested, tortured, and crucified with two followers on May 22, 1498. His death came to be seen as martyrdom in later years, and today, his life's work is viewed as a forerunner of the Reformation.

NORMAN C. ROTHMAN

scientific revolution

Between 1500 and 1789, especially the period of 1600–1750, there occurred a shift in humans' thinking from the medieval emphasis on God's eternal unchanging world, which governed people, the universe, and nature, to an approach that defined knowledge and understanding as derived from the immutable laws of nature independent of received truth. Knowledge and truth were to be gained by putting forth an idea, testing it, and expressing the results mathematically. The British coined the term *empiricism* to summarize the concept gained through human interaction with nature and continental Europeans followed the philosopher Descartes who put forth rationalism with its emphasis on knowledge that could be logically and mathematically proved.

EMPHASIS ON DIFFERENT SCIENCES

Different sciences came to the fore during these centuries. Physics and astronomy were especially prominent in the latter part of the 16th century and then 17th century; chemistry and biology, in the latter part of the 17th century and 18th century; and mathematics, throughout the period as part of scientific calculations. New methods of thought pushed to the surface. These new patterns harkened back to the writings of Aristotle and other Greek and Roman philosopher/scientists that emphasized the use of reason in addition to faith in pursuit of knowledge, nature, and contemplating humanity and the universe. The methodology associated with these thoughts came to be called the scientific method and involved two approaches—the deductive and the inductive.

The former, which was associated with the medieval mindset, put the stress on going from a general proposition to particular situations. The inductive method started with an approach to a particular problem, then through testing and observation, the drawing of valid conclusions. When combined, the two methods formed what came to be known as the scientific method. One would state a general proposition; then investigate through a review of the literature, logic, and experimental research; and then apply the result to a specific proposition or hypothesis. The hypothesis would then be subject to observation, experimentation, and collection of data as part of a proof. The test result would either be positive or negative. Conclusions would then be reached confirming or denying or declaring the proposition moot or not proved.

The proponents of these combined related approaches to bring about a new scientific revolution

were RENÉ DESCARTES and SIR FRANCIS BACON, respectively. Their seminal writings, published in the 1620s, became the underpinnings for the new way of thinking associated with the scientific revolution. Descartes (1596–1659), the French philosopher and mathematician, concluded that thought stemmed from the mind. The use of logic would deduce all truths starting with the existence of God and the basic reality of both the material and spiritual worlds. His grand concept was that of a unified and mathematically ordered universe that ran as a perfect mechanism. Everything could be explained rationally through logic and mathematics. “I think, therefore I am” summarized the approach known as rationalism.

Sir Francis Bacon (1561–1626), a politician and scientist, went a step further. He conceived of an approach that later was identified with the inductive method. He presented a system that used human reason to interpret human experiences. Bacon recommended that facts derived from experiments could be validated through proving the hypothesis. These hypotheses would then be subjected to further experimentation and ultimately be proved so as to reflect fundamental laws of nature. His approach was validated with the advent of new scientific instruments that could measure the physical world. In the 17th century, the thermometer, barometer, air pump, pendulum clock (grandfather clock), telescope, and microscope became readily available.

HELIOCENTRIC THEORY

The scientific revolution dates from the work of astronomer NICOLAUS COPERNICUS, who challenged the idea that the universe was geocentric or Earth-centered. Based on mathematics and readings of the work of Hellenistic Greeks, he advanced the heliocentric or Sun-centered theory of the universe. His work was reinforced by the observation of Tycho Brahe, who made hundreds of observations via the telescope. Brahe’s data were supported by JOHANNES KEPLER through mathematical calculations that showed that the planets moved elliptically around the Sun and that the Sun exerted a magnetic and gravitational pull on the planets. GALILEO GALILEI, the mathematician, physicist, and astronomer, perfected the telescope to investigate the Moon, sunspots, the satellites of Jupiter, and the rings of Saturn. He also did work on physics through his former work from the leaning Tower of Pisa that originated basic laws of physics—the laws of motion and gravitation. His experiments demonstrated that the velocity of falling bodies was related to the height from which they fell rather than their weight. These observations highlighted the relationship of gravitational pull

Portrait of Andreas Vesalius from his *De humani corporis fabrica* (1543). Vesalius pioneered the study of human anatomy.

to moving bodies. Acceleration would be constant no matter what the size or weight. His experiments, which also involved hydrostatics, optics, and the pendulum, helped to develop his most famous law—the law of inertia—a body at rest or in motion will remain at rest or remain in motion unless affected by an external force such as gravitation. Galileo and Copernicus suffered for their scientific advances. Both put forth ideas that went against the teachings of the Catholic Church; as a result, both were deemed heretical and had their discoveries challenged not scientifically, but theologically.

In the succeeding years of the 17th and 18th centuries, physicists built on the previous work. The French physicists Blaise Pascal and Jean Gay-Lussac developed laws and mathematical equations on volume, liquids, and gases. Two professors at the university of Bologna, Mona Agnesi and Laura Bassi, verified Galileo’s work

in mathematics and physics, respectively. Christian Huygens developed a wave theory to explain light. Otto von Guericke proved the material composition of air in terms of its ability to have weight and exert pressure.

Other breakthrough work was done in other sciences. In astronomy, astronomer and mathematician Pierre Laplace discovered that comets were governed by mathematical laws, and that the Sun, which once had been a gaseous mass, threw off the planets as it solidified and contracted. In biology, Antoni van Leeuwenhoek discovered bacteria, protozoa, and human spermatozoa. Robert Hooke discovered the cellular structure of plants. Andreas Vesalius gave detailed drawings of the human anatomy. William Harvey traced the circulation of blood.

CHEMISTRY ADVANCES

Chemistry also saw breakthroughs. Robert Boyle developed an atomic theory and investigated fire, respiration, fermentation, evaporation, and metal rusting. Joseph Priestley also developed ammonia, generated carbon monoxide, and discovered oxygen and offered an explanation of combustion. Henry Cavendish discovered hydrogen. Antoine Lavoisier proved that combustion resulted from a combination of oxygen with other elements. He also showed that respiration was another form of oxidation. Ultimately, this led to a famous law of conservation—"Matter cannot be created or destroyed." The supreme thinker of the early scientific age, perhaps, was Johannes Kepler, who developed differential calculus, mathematics of infinity, variables—the bases for modern algebra, geometry, and calculus.

So dominant was ISAAC NEWTON (1640–1727) in the later scientific age that physical science is often characterized as Newtonian, pre-Newtonian, and post-Newtonian. His writing and ideas were so prevalent that ultimately they affected philosophy, religion, and social science. His ideas influenced reformers who believed (based on Newtonian science) that a science of humanity could solve human problems just as natural sciences were beginning to solve the questions of science.

Why was Newton so influential? It was because he was able to synthesize previous discoveries. His law of gravitation stated that all natural objects attract other bodies—inversely, according to the square of their distances and directly in proportion to the products of their masses. Newton had arrived at this conclusion by methods that combined the methods advocated by Descartes and Bacon in his major work, *Principia*. In that

work, he used mathematical proofs that were tested by observation. He arrived at the conclusion that underlies all modern science—all final conclusions have to be based on solid facts. Accordingly, the hypothesis even if supported by mathematics must be rejected if it is not supported by observation or experimentation. More importantly, his basic premise, based on his own experiments in gravitation, was that laws govern all nature, including the universe. His universal laws were then applied to every area. The result in terms of religion and philosophy was deism. Succeeding philosophers following Descartes and Newton divided reality between mind and matter. Science assisted human reason in dealing with matter; faith dealt with the truth beyond the natural senses and helped the mind to intuit truth directly from God. Taking the clue from Newton, clergymen subordinated science to faith. The world was run by universal laws, of which the first law was God's will.

DEISM

The greatest influence of science and future events was in the development of deism—a belief held by many of the leading members of the American Revolution such as Benjamin Franklin and Thomas Jefferson. Even though deists considered themselves Christians, they rejected many tenets of traditional Christianity. They did accept Jesus Christ but as a great moral teacher rather than as a human savior. The view of most deists was that God was a rather impersonal force—the great physicist or master clock winder in the universe. God set things in motion, but if people behaved according to the golden rule and the Ten Commandments, everything else was left to them. God proposed; humans disposed. All moral decisions were based on the individual's reason and conscience. No formal denomination held their allegiance—nature was their church and natural laws were their spiritual guides, even their bibles.

In the 18th century, sciences passed into general acceptance. Kings endowed observatories, cities funded museums, wealthy benefactors established parks and gardens, and learned societies sponsored popular lectures. Learned societies were established, such as the Royal Society of London, the French Academy of Science, and the American Philosophical Society for Promoting Useful Knowledge. The role of the sciences changed markedly in the 18th century. Benjamin Franklin was lionized on both sides of the Atlantic for his many achievements including the Franklin stove and especially his research and experimentation that proved that lightning was another form of electricity. Whereas

scientists such as Giordano Bruno were burned for heresy in 1600, and Galileo was forced by the Inquisition to recall his writings in 1633, the situation was different in the 18th century. Isaac Newton received a well-compensated paying position, was knighted, and when he died in 1727, received the ultimate accolade—he was buried at Westminster Abbey. Joseph Priestley was a well-respected theologian and high-ranking church official as well as a scientist.

EFFECTS ON TECHNOLOGY

Just as the scientific revolution affected society, it also affected technology. Among the consequences was the application of scientific methods to farming. Scientific agriculture including planting with fertilizer and utilizing crops that restored fertilizer to the soil through legumes such as turnips, along with new methods of drainage such as irrigation, became common. Landowners also began to experiment with cross-breeding so as to improve their livestock. England especially led the way. Jethro Tull plowed land that was planted in rows through the use of a drill he invented. Charles Townshend experimented in restoring soil fertility by applying clay lime mixture as well as planting turnips in crop rotation. Robert Bakewell developed new techniques of stock raising through selective breeding that not only increased the size of meat cattle, but also increased the milk yield of dairy cows. Arthur Young lectured on the new agriculture and popularized the new method of scientific farming.

Science was applied to medicine, which utilized the findings of Vesalius, Harvey, and Leeuwenhoek. Dr. Edward Jenner developed the field of immunology through the injection of cowpox to combat smallpox, which had been the scourge of populations for two centuries.

Scientific knowledge was applied to draining mines, pumping water, drying textile fibers, producing gunpowder, manufacturing pottery, building ships, and improving navigation. The Industrial Revolution began in the first half of the 18th century of the application of science to economic development. John Kay invented the flying shuttle and James Hargreaves invented the spinning jenny. Thomas Newcomen produced the first steam engine; James Watt improved the design and revolutionized both factories and transportation. Richard Arkwright invented the water frame. Samuel Crompton invented the water mule. Edmond Cartwright invented the power loom. This first stage of the Industrial Revolution in the middle and latter parts of the 18th century stemmed directly from the scientific revolution.

The scientific revolution marked the transition of society from the Middle Ages to modern times. It advanced the perception of people and their place in the universe, the source of knowledge, and the relationship of human society to nature. It led to great advancements in science and mathematics. Beyond this direct outcome, its emphasis on reason directly led to the Enlightenment, which emphasized the natural rights of all human beings. Its questioning of previously accepted doctrines developed into a skepticism regarding received truth that ultimately led to revolution against the established order. New technologies transformed economic options and eventually living situations as people moved from the countryside to cities to seek work in the factories based on the scientifically derived inventions that preceded this technology. Above all, the scientific revolution enshrined the spirit of human initiative, innovation, and invention, which has led to change and progress in succeeding ages.

NORMAN C. ROTHMAN

Scottish Reformation

The Scottish Reformation was the movement in Scotland that ended the Scottish state's traditional, formal, religious, and governmental relationship with the Church of Rome. The Catholic Church was succeeded by a Presbyterian Church after 1560, when the Scottish parliament formally ended papal jurisdiction in Scotland, prohibited the celebration of the Mass, and ratified a Reformed (Calvinist) doctrinal document, the Scots Confession of Faith (1560), which was succeeded by the binding Westminster Confession of Faith (1647), as statements subordinate only to Holy Scripture. The

reformer most commonly associated with this movement was JOHN KNOX; other early figures of prominence include John Douglas, John Row, John Spottiswoode, John Willock, and John Winram, who were preachers and coauthors of the Scots Confession, and Andrew Melville, a primary influence on the second *Book of Discipline*. The Church of Scotland's (often referred to as "the Kirk") major Reformation statements on church polity are the first *Book of Discipline* (1560) and the second *Book of Discipline* (1578). During the Reformation, its liturgy followed the *Book of Common Order*, first published by Knox in Geneva in 1556.

As in many other parts of Europe, Catholic piety before the Reformation was strong, and religious orders enjoyed popularity and influence. The progress of the Reformation in Scotland was heavily influenced by a political scene resulting from the fate of the Scottish monarchy, which in turn was heavily influenced by three centuries of conflict with England. The fact of repeated minority succession to the Scottish throne (James V's minority lasted from 1513 to 1528, MARY, QUEEN OF SCOTS, from 1543 to 1561, James VI's from 1567 to 1581) meant that political power in Scotland was held by various coalitions of nobles rather than by the Scottish Crown. These nobles repeatedly disagreed about the need to pursue alliances with France or with England, and their desire for a decentralized government is paralleled in the ultimate organization of the kirk.

James V was the grandson of HENRY VII of England, but his father had been defeated and killed by English troops under his uncle, HENRY VIII of England, at Flodden Field (1513). James V seems to have preferred a French alliance; he made a French marriage. Support for the pro-English faction in Scotland intensified as the REFORMATION started on the Continent, however, and its ideas made their way to Scotland. While popular enthusiasm for Catholic eucharistic piety was strong, hostility toward ecclesiastical government and wealth became more focused in light of events on the Continent. Anticlericalism was a frequent theme of anti-Catholic polemic on the Continent, and the same was true in Scotland.

After Henry III introduced a reformation in England, he pressured James V to do the same. James threatened the papacy with a reformation and received a number of financial and ecclesiastical concessions in return. To mobilize popular sentiment behind his pro-French position, he attacked the English and was defeated at Solway Moss in 1542 when some of his own nobles surrendered to the English; he died a month later. The decision for the French, in combination with England's

turn toward the Reformation, made England a convenient refuge for the Scottish instigators of religious reform periodically exiled after the 1520s. John Knox, sentenced to serve as a galley slave in 1547 for his role as an associate of the murderers of the Catholic archbishop of St. Andrews, was only one of many such exiles.

SUCCESSION

The succession of James V's infant daughter led to further jockeying between the Scottish and French parties. Gordon Donaldson has pinpointed three crisis points during Mary's minority. In 1543, the pro-English party gained the upper hand, pledging Mary to Henry VIII's son, the future EDWARD VI of England (a Protestant). In the same year, however, her regent, James Hamilton, earl of Arran, repudiated the English treaty, after which English troops began vandalizing and occupying southern Scotland. In 1547, in return for help against the English, Scotland betrothed Mary to the French dauphin in 1548; he ascended the French throne as Francis II in 1549.

Over the succeeding years, however, Scottish sentiment turned against France as it became apparent that the French projected Scotland's absorption into France. Moreover, the English Crown sponsored a wave of pro-English, pro-Reformation propaganda, and its preachers were sent over the border and sheltered by members of the pro-English party in Scotland. A temporary abatement under MARY I of England ended after the succession of ELIZABETH I in 1558, who agreed to support the Scottish Protestant cause against the French.

Knox had been bought out of his French enslavement under Edward VI but expelled from England under Mary; he returned to Scotland from Geneva, where he had superintended a congregation of exiles, in 1556. In 1559, he preached a sermon that sparked a pro-English rebellion. The rebellion drew English troops into France in 1560, which in turn triggered the withdrawal of both French and English troops later in 1560. At this point the Scottish parliament, flooded for this sitting by a group of minor nobles whose participation was illegal, formally ended Scotland's relationship with the Roman Church.

During the remainder of Mary's reign, an ecclesiastical compromise remained in effect in which revenues were divided between remaining benefice holders and the Reformed Church, but Mary as a Catholic could not govern the church, so an alternative body, the General Assembly, which Gordon Donaldson has

termed a Protestant parliament, served as the kirk's governing body. Mary, unwise in her marriages, was forced to abdicate in 1567, when Scotland reverted to a government of Protestant regents until James VI attained majority.

The most unique feature of the new Scottish Church was its decentralized church polity, formulated in the first *Book of Discipline*, which also legislated on practical matters. It emphasized preaching and the distribution of the two remaining sacraments (baptism and communion). It forbade the observance of holy days, the celebration of masses and performance of prayers for the dead, and the invocation of saints. The structure of benefices was abolished, with resulting revenues to be used for supporting the clergy, educating the faithful, and maintaining the deserving poor. Congregations were to elect deacons and elders to work with ministers to regulate congregations and maintain church discipline. The General Assembly accepted many of the book's

prescriptions but did not institute the radical withdrawal of benefices from their holders. Notably absent in the book were prescriptions for a church hierarchy.

In 1572, the Crown tried to introduce bishops into the church's government, but this was abandoned by 1576 and repudiated in the second *Book of Discipline*. This document rejected royal or episcopal supremacy over the church and placed most governmental responsibilities (interpretation of Scripture, ordination of ministers, visitation, and jurisprudence) in the hands of either individual congregations (the word *presbytery* is used rarely) or supercongregational assemblies (synods or the General Assembly).

The Scottish parliament never affirmed the second *Book of Discipline*; indeed, James VI sought repeatedly to institute Crown and Episcopal control of ecclesiastical affairs. The conflict between the Presbyterian and Episcopal models of polity became a major dynamic within both the Scottish Church and Scotland's relationship with England for the subsequent century.

SUSAN R. BOETTCHER

Sekigahara, Battle of (1600)

The Battle of Sekigahara was fought between the forces of TOKUGAWA IEYASU and those of his opponents. His decisive victory ensured his appointment as shogun of Japan and the establishment of the Tokugawa Shogunate that ruled Japan until 1868.

By mid-16th century, the Ashikaga Shogunate of Japan was in terminal decline and civil wars raged in the land as rival nobles or *daimyo* sought to replace it. The second of the powerful lords, TOYOTOMI HIDEYOSHI (1535–98), almost accomplished the task. As he neared death, and with his son Hideyori too young to exercise power, he appointed a council of five regents to rule on the boy's behalf, hoping that they would checkmate one another. Tokugawa Ieyasu was one of the regents. Ieyasu had helped Hideyoshi in his campaigns and had been rewarded with extensive landholdings

A romanticized portrait of Mary, Queen of Scots, who was forced to abdicate when Scotland reverted to a government of Protestant regents

in the agriculturally rich Kanto Plain area where he had built a formidable castle at the port of Edo (modern Tokyo). Ieyasu did not participate in Hideyoshi's attempted conquest of Korea, remaining in Japan to consolidate his holdings.

The balance of power among the five regents soon dissolved with four of the five regents aligning against Ieyasu. An adroit politician, Ieyasu was able to crack the formidable coalition by securing the secret support of many of the lords ostensibly loyal to the other regents, who moreover were rivals of one another. The showdown occurred on October 21, 1600, at the Battle of Sekigahara. Ieyasu won decisively, partly through to the defection of some of his opponents' forces. The victory made him military master of Japan. Eighty-seven *daimyo* houses were extinguished, the remainder, including Toyotomi's fief, dramatically reduced, allowing Ieyasu to expand the land he directly controlled and to reward his supporters.

In 1603, the emperor acknowledged the *fait accompli* by appointing Ieyasu shogun. He would consolidate his power during his remaining years with laws that secured obedience to the surviving *daimyo* and by retiring in 1605 in favor of his son, while remain-

ing behind the scenes to ensure the stability of the shogunate. In 1614, he launched a final massive campaign, mobilizing 180,000 troops against Hideyori at his stronghold, Osaka castle, defended by 90,000 men. The castle was taken and Hideyori was killed. These two campaigns ensured the supremacy of the house of Tokugawa.

Selim II

(1524–1575) *Ottoman sultan*

SULEIMAN I THE MAGNIFICENT's last surviving son, Selim II (r. 1566–75), became sultan of the OTTOMAN EMPIRE when the empire was at the zenith of its power and glory. Although Selim was a gifted poet, his notorious abuse of alcohol, forbidden in Islam, offended many Muslims, and he was known as “the sot.” Selim was the first Ottoman sultan who had not been a military leader who personally led his troops into battle. An ineffective ruler, Selim fortunately left most of the key administrative decisions to his able grand vizier, Mehmed Sokollu, who had also served under Suleiman.

In 1571, against the vizier's advice, Selim ordered the conquest of Cyprus; some said it was because he wished to control the source of his favorite wine. After a particularly brutal fight, the Ottomans secured the island against the ruling Venetians but aroused the enmity of other European powers. In retaliation, the pope called for a joint Christian fleet to counter Ottoman sea power in the Mediterranean. The new fleet met the Ottoman navy at the Battle of Lepanto (1571) and in the fierce confrontation the Ottomans lost more than 100 ships. However in less than a year, the Ottoman navy was rebuilt, although at great cost, and it subsequently defeated the Venetians who tried to retake Cyprus; the Ottomans also successfully incorporated Tunis into the empire by 1574. They also put down a rebellion in the Hijaz (in present-day Saudi Arabia) and reinforced control over Yemen.

The Russians managed to defeat Ottoman attempts to take territory to build a canal connecting the Volga and Don Rivers and Czar IVAN IV (THE TERRIBLE) sub-

A painting of Tokugawa Ieyasu, a regent who waged the Battle of Sekigahara on October 21, 1600

Exterior view of the mausoleums of Sultan Selim II and Sultan Murad III in Constantinople

sequently signed a fairly short-lived treaty of friendship with the Ottomans. Selim and his vizier also had dreams of building a canal to connect the Red Sea to the Mediterranean but that too failed to materialize. Although not apparent at the time, the era of Ottoman expansion was almost over and other powers were soon to emerge on the global scene

Like his forebears, Selim was a patron of the arts and he commissioned the noted Ottoman architect ABDUL-MENAN SINAN to build what became his masterpiece, the great Selimye mosque at Edirne. In 1575, Selim suffered a concussion from a fall while in a drunken stupor and died soon thereafter.

JANICE J. TERRY

Sengoku Jidai

The 100 years from the end of the 15th to the end of the 16th century is known in Japan as the Sengoku Jidai, the Warring States Era (or Era of the Country at War), named after a period in China during the third century C.E. The Ashikaga Shogunate, established in 1338, and headquartered in Kyoto, enjoyed approximately a century of power. The shogunal government, or *bakufu*, was, however, unstable because it depended on deputies to look after its interests in the provinces and became ineffective when the original bonds between the shoguns and their deputies loosened with time.

The deputies, who were hereditary military governors, consolidated their holdings by appointing a single heir (a son, not necessarily the eldest) rather than letting all sons inherit a portion of their holdings, organized local warriors as military officers, and recruited peasants as soldiers. The nature of war changed during this period. Individual combat between heavily mounted aristocrats was replaced by large armies of footsoldiers armed with pikes, and, after the appearance of Portuguese in 1543, with muskets. The widespread use of muskets and cannons revolutionized warfare and resulted in the building of formidable castles. Prolonged warfare decimated aristocratic families and allowed talented lower-class men to challenge their superiors, the most remarkable example being TOYOTOMI HIDEYOSHI. Born a peasant, he rose to unify Japan through ambition and treachery. General lawlessness also led to the emergence of armed and powerful religious sects, the most powerful being the True Pureland Buddhists, who controlled a province on the Sea of Japan and strongholds in the Kyoto-Osaka region.

Shogun Yoshinori, who attempted to strengthen the *bakufu* by checking the power of the military governors, was assassinated by one of them in 1441. From then on, the shogunal government began to fall apart, culminating in the Onin War (1467–77) fought between two claimants seeking to be Yoshinori’s successor, championed by two factions of the ruling family. The war destroyed the remaining authority of the shogunate, ended the system on which it was built, and led to a century of endemic warfare called the Sengoku Jidai. The wars continued because no single family or leader emerged to unify the country. The needs of war led the successful contenders to consolidate their holdings and form alliances by pledging allegiance to more powerful lords in a pattern similar to feudalism in Europe during the Middle Ages. The territorial lords were called *daimyo*. Early Europeans who traveled to

A painting depicting a battle during the Sengoku Jidai, a 100-year period also known as the Warring States Era in Japan

Japan mistakenly called the *daimyo* kings or princes. In the second half of the 16th century, the process of unification would advance under three leaders, ODA NOBUNAGA (1534–82), TOYOTOMI HIDEYOSHI (1542–98), and TOKUGAWA IYASU (1542–1616).

The Sengoku era was also culturally brilliant and economically vibrant. The imperial court, also in Kyoto, was both powerless and poverty stricken. The shoguns continued to use their great wealth to patronize the arts, building magnificent palaces and temples in Kyoto and sponsoring dramatic presentations. Poetry and painting flourished, influenced by Zen Buddhism, as did landscaping and the tea ceremony, all influenced by the aesthetics of Song (Sung) dynasty China. Similarly many *daimyo* also patronized the arts. The economy grew, despite as well as stimulated by the wars. Agricultural advances produced surpluses that generated trade, mainly with China and Korea. Widespread piracy led the Ming government of China to negotiate a system of officially

sanctioned and regulated trade with the shoguns, which was unsuccessful because the *bakufu* lacked the power of enforcement. Japan imported porcelains, paintings, books, medicine, and copper coins from China and exported raw materials, such as copper and sulfur, as well as finished products such as swords, decorative screens, and folding fans, indicative of sophisticated manufacturing and craft industries in Japan. Towns and ports flourished—for example Hataka in Kyushu (the destination of Qubilai Khan's invading fleet)—the center for trade with Korea. Money was replacing barter trade, initially in the form of coins imported from China, later also in the form of bills of exchange.

The Sengoku era was important in Japanese history as a transition period from a decentralized estate and feudal system to a centralized feudal state. It was also an era of cultural brilliance and economic growth.

JIU-HWA LO UPSHUR

Sepúlveda, Juan Ginés de

(1490–1573) *Spanish humanist theologian*

Juan Ginés de Sepúlveda was a 16th-century Spanish humanist theologian. He pursued theological, philosophical, and juridical studies in Córdoba, Alcalá de Henares, and Bologna, where he developed a keen interest in the philosophy of Aristotle. Appointed royal chaplain, court historiographer, and tutor of PHILIP II by Emperor CHARLES V in the mid-1530s, he held reactionary views that drew him into numerous disputations, in which he sought to safeguard orthodoxy and stifle ecclesiastic reforms.

Besides those of ERASMUS OF ROTTERDAM and MARTIN LUTHER, Sepúlveda most famously attacked the progressive and humanitarian views of the Dominican friar BARTOLOMÉ DE LAS CASAS (1474–1566), the most outspoken advocate of indigenous rights in the Americas. Opposed to the so-called New Laws (1542) that banned slavery and regulated the *ENCOMIENDA*, a

neofeudal institution that granted free Indian labor to Spanish landowners, Sepúlveda persuaded the Emperor to revoke them. Las Casas, one of the inspirers of the New Laws, immediately sailed back to Spain to repel the assault of those among the Spanish intelligentsia who sided with the conquistadores and justified the killing and oppression of the Indians.

CHAMPION OF SLAVERS AND LANDOWNERS

Sepúlveda was one of them. A self-appointed champion of the interests of slavers and landowners, he had authored a treatise entitled “Concerning the Just Cause of the War against the Indians” (1547) to provide solid philosophical underpinnings for Spanish imperialism and just war theory. In doing so he treaded dangerously close to heresy. His heterodox outlook, tinged with naturalistic paganism and militaristic chauvinism, alienated him from the most significant academic circles of Spain. Even so, thanks to his impressive scholarship and to the support of economic potentates, he retained much of his influence.

These two intellectual giants were thus set on a collision course. In 1550, Charles V called a halt to military operations in the New World, until the status of Native Americans, together with the morality and legality of the Spanish conquest, had been thoroughly debated. A group of theologians and jurists (*junta*) was convoked in Valladolid to listen to the arguments of Las Casas and Sepúlveda and settle the issue once and for all. This dispute is of paramount importance because it constituted the first major articulate attempt on the part of Europeans to understand and define human variability and cultural diversity and marked the crucial universalist/racialist bifurcation of anthropological philosophy at the dawn of modernity.

PAPAL CONDEMNATION OF SLAVERY

The bull *Sublimis Deus*, issued in 1537 by Pope Paul III, had already clarified the Holy See’s official position on the subject. The pope condemned slavery and the portrayal of Indians as “dumb brutes created for our service,” incapable of exercising self-government, free will, or rational thinking, and therefore incapable of receiving the message of Christ.

Las Casas, elaborating on this bull and on the writings of Francisco de Vitoria, a Dominican professor at the prestigious university of Salamanca, as well as one of the precursors of international law and human rights theory, decried the barbarity of Spaniards by contrasting it with the meekness, humbleness, and goodheartedness of the Indians. Sustained by an unswerving faith in the

essential unity of humankind and by his conviction that a commitment to global justice was a moral imperative, he argued that Indians were fully capable of governing themselves and were entitled to certain basic rights, regardless of the nature of their practices and beliefs, which should anyhow be understood from an indigenous point of view.

ANTISLAVERY ARGUMENTS

While Las Casas, who had spent most of his life in the colonies, sided with the poor and disenfranchised, Sepúlveda, who knew very little of the Spanish colonial subjects, drew on the doctrine of natural law and on pragmatic realism to marshal most of the arguments, which would be later deployed by antiabolitionists, segregationists, and imperialists. He explained that, for all intents and purposes, given their innate physical and intellectual inferiority, Indians should be assimilated to Aristotle’s “natural slaves.”

For Sepúlveda, Christian blood was the only vessel of reason; therefore, Indians were naturally impervious to conversion. In consequence of their being ruled by passions rather than reason, Indians were actually born to be slaves and should be grateful that in spite of their sinfulness, barbarism, licentiousness, and relative indifference to the institute of private property, their new masters acted as God’s instrument of redemption and regeneration.

Finally as men ruled over women, and adults ruled over children, so inferior races should be subordinated to the will of superior races. This line of reasoning clearly allowed for the virtual enslavement of indigenous people and authorized the violent reprisals whenever the Indians refused to accept Spanish rule.

Officially neither Las Casas nor Sepúlveda won the dispute, but the monarchy made common cause with the church against the *encomenderos*, for there was a growing concern that the power of colonial landowners was rising disproportionately, and that their unwillingness to reinvest their considerable revenues was harming the Spanish economy. It is also fair to say that the Crown was motivated by sincere moral qualms.

With the benefit of hindsight, it is evident that Sepúlveda’s theses were both modern—as when he implied that the spheres of politics and religion should be kept separate and that law should reflect the reality of actual human relationships—and anachronistic, given that he relied on the notion of a natural causation of society and politics that was already obsolete at the time. Consequently, his propositions could not be reconciled with Spanish legal thinking, which had

already taken a clear antislavery position, and consistently refused to sanction the exploitation of American natives under the guise of outmoded and undignified medieval contracts.

Nevertheless exploitation and abuse continued, in POTOSÍ as in Mexico, because the cold logic of pragmatism and greed prevailed. Only those natives who learned to avail themselves of colonial laws and acted as their own attorneys could successfully fight their exploiters.

STEFANO FAIT

Seville and Cádiz

Seville and Cádiz in Andalusia (in the south of Spain) played a vitally important role in the Spanish empire in the Americas, with the empire being administered from Seville, making it one of the most important cities in Europe in the 16th and early 17th centuries.

Parts of Andalusia had been the first areas of Spain captured by the Moors in the eighth century, and by the early 13th-century, Seville, inland port on the Río Guadalquivir, was the leading city in Muslim Spain. It was captured from the Moors in 1248 by Ferdinand III in the Reconquest (Reconquista), and soon afterward, 24,000 Castilian settlers arrived in Seville, transforming the place into a Castilian city. It also became the location of a favorite residence of kings of Spain. Ferdinand III and his son Alfonso X were both buried in Seville.

Cádiz on the coast is, by tradition, the oldest continuously inhabited city in Europe, said to have been settled by the Phoenicians in 1100 B.C.E. It then became a Roman naval base and later went into decline and was occupied by the Moors. In 1262, it was captured from the Moors by King Alfonso X.

When CHRISTOPHER COLUMBUS sailed to the Americas in 1492, he left from the port of Huelva, west of Seville and Cádiz. However his second expedition was fitted out and left from Cádiz, as did his fourth expedition. It was Seville, and not Cádiz, that was to profit massively from the Americas. The kings of Spain gave Seville the monopoly of trade with the Americas, quickly making it one of the wealthiest cities during the 16th century. Vast Renaissance and baroque buildings were constructed, the most famous of which was the new cathedral. It had been a mosque but was converted into what later became one of the biggest cathedrals in the world. The famous architect Hernán Ruiz designed the belfry for La Giralda, formerly the minaret of the mosque, and the Cabildo—chapter house—which was constructed between 1558 and 1592. It is decorated by Bartolomé Esteban Murillo (1618–82), one of Spain's greatest painters and the first to gain widespread fame outside Spain.

Murillo may have been the most famous painter associated with the city at this time, but he certainly was not the only one. Francisco de Zurbarán (1598–1664) had been apprenticed in Seville and many of his paintings were for the Spanish Americas. In his last years, he was heavily influenced by Murillo, and the

Sketches of bullfight patrons, from original drawings made in the plazas of Seville by Cádiz and Company

style of many of his later paintings shows this. Juan de Valdés Leal (1622–90) was born in Seville but worked in Córdoba before returning to his native city, where he was president of the Seville Academy. When Murillo died, Valdés Leal became the most prominent painter in the city. Diego Velázquez (1599–1660) was also born in Seville but moved to Madrid, where he executed his most famous paintings. There were also a number of sculptors drawn to Seville. Juan Martínez Montañés (1568–1649) moved there in 1287 and remained in Seville for the rest of his life; Pedro Roldán (1624–1700) was responsible for the main altarpiece in Seville, along with Valdés Leal. The tomb of Columbus is also in Seville—but his body was not taken from Cuba until 1899, and it is possible that the real body was lost before this.

With Seville protected, being so far up the Río Guadalquivir, one of the main reasons for choosing it as the city from which to administer Spanish America, some traders also used the more accessible port city of Cádiz, close to the mouth of the Río Guadalquivir. It also grew wealthy during the 16th century but never achieved the fame of Seville. However the wealth of Cádiz also attracted raids from the English and the Dutch. In 1587, SIR FRANCIS DRAKE attacked Cádiz to “singe the king of Spain’s beard” and this delayed the fitting out of the famous SPANISH ARMADA, which set sail in the following year. In 1596, an Anglo-Dutch expedition attacked Cádiz again, burning down much of the city.

During the 17th century, the administering of the Americas from Seville became far more difficult. The larger vessels of the period had trouble navigating the Río Guadalquivir, which had started to silt up badly. As well as this, Seville was struck by a massive plague in 1649, which wiped out probably half the population of the city. This did lead to a greater interest in public health, and the Hospital de la Caridad (Charity Hospital) was built in 1676 and still has paintings by Murillo in its chapel. After years of indecision and prevarication, finally it was decided to move the Casa de la Contratación from Seville to Cádiz in 1717. Based on this, a series of large public buildings were commissioned in Cádiz. In 1716, plans had been started for a large cathedral for the city. Although work started quickly, it was not in fact finished until 1838. During the 18th century, nearly three-quarters of Spanish trade with the Americas went through Cádiz, making the city hugely wealthy.

Near Cádiz, the famous 18th-century stone fountain La Fuente de las Galeras, with its four spouts to pro-

vide water for ships going to the Americas, can still be seen at El Puerto de Santa María. Many of the paintings from the time when Seville was one of the richest cities in Europe are displayed at the city’s Museo de Bellas Artes. Seville also has the oldest surviving bull ring, dating from 1758. The 15th-century building that had served as Seville’s Lonja (Exchange) for the American trade is now the Archivo de Indias, where, since 1785, most of the archival records connected with Spanish America are held. Hundreds of scholars from all around the world still use it every week for research into Spanish and Latin American history and genealogy.

JUSTIN CORFIELD

Shah Jahan

(?–1666) *Mughal ruler and builder*

Mughal emperor JAHANGIR’s death and the following succession struggle ended in the triumph of his son, Prince Khurram, who took the title Shah Jahan, which means “emperor of the world.” He killed his male relatives and forced Jahangir’s powerful widow, Nur Jahan, to retire. He is best remembered for building the TAJ MAHAL, a mausoleum for his wife, Mumtaz Mahal. He was the fifth ruler of the MUGHAL (Mogul, Moghul) EMPIRE and his reign marked the zenith of Mughal power and splendor.

Anticipating his father’s death, the future Shah Jahan openly rebelled in 1623 and seized power upon Jahangir’s death in 1628, putting to death all his brothers and other possible rivals. Shah Jahan was a devout orthodox Muslim. Intolerant of other faiths, he ordered the destruction of new Hindu temples and Christian churches in 1632. In the same year, he attacked the Portuguese settlements at Hoogley and Chittagong in Bengal. Both trading outposts were far from GOA, the Portuguese viceroy’s seat, and he could send no help. Portuguese prisoners were taken to Agra and kept until 1643, when they were repatriated to Goa. Shan Jahan

also campaigned against the Shi'i ruled Muslim states in the Deccan and subdued them to vassalage. However he had to give up Kandahar in Afghanistan to the Persians in 1653 because they possessed superior artillery and guns, and he also lost control of previous Mughal holdings in Central Asia.

Shah Jahan ruled the Mughal Empire at its height and was noted for the extravagance and opulence of his court. He was famous for the buildings he commissioned, most notably the Red Fort in Delhi with its mosque and sumptuous palaces, especially for the gem encrusted Peacock Throne. Although he had a harem of 5,000 women, he was known for his devotion to his wife, Mumtaz Mahal, whose name means "light of the palace." She died giving birth to the last of their 14 children. He expressed his grief for her by assembling 20,000 workers, who labored for 20 years to complete her mausoleum in Agra. Designed by Persian architects it was a synthesis of Persian Muslim and Indian styles called Indo-Islamic and remains a wonder of the world. Most of his other monuments also remain. The demands of his campaigns and projects resulted in huge tax increases that weakened the economy.

As Shah Jahan aged, his adult sons began to conspire for the throne. He kept his eldest and favorite son, Dara Shikuh, in Agra so he could begin acquiring military and administrative experience. Fearing that he was near death, his remaining three ambitious sons revolted in 1657. They fought with one another, against their father, and against their oldest brother. AURANGZEB, the third and most ruthless, was the victor. He killed his brothers and imprisoned his aged father in an apartment in Agra fort with a view of the Taj Mahal until his death in 1666. Meanwhile Aurangzeb proclaimed himself Emperor Alamgir in 1658.

JIU-HWA LO UPSHUR

Shimabara Rebellion, Japan

The Shimabara Rebellion of 1635 was the last major uprising against the Tokugawa Shogunate, which

TOKUGAWA IEYASU had established after his victory at the BATTLE OF SEKIGAHARA (1600). He was appointed shogun, or supreme military ruler, by the emperor Go-Yozei in 1603.

The first Jesuit missionaries had arrived in Japan in 1549 and enjoyed enormous success until about 500,000 Japanese had been converted. Success, however, proved its undoing, resulting in the banning of Christian missionary activities in 1587 by TOYOTOMI HIDEYOSHI. His death in 1598 brought an end to the persecution for a time. However it was resumed by newly appointed Shogun Tokugawa Ieyasu in 1606 and enforced by his son Hidetada in 1614. He ordered the banishment of all missionaries. Persecution of Christians continued also under the third shogun Iemitsu.

Persecution climaxed in 1637, when a popular rising of disaffected peasants and *ronin* took place in a heavily Christian area near NAGASAKI. The force soon numbered some 37,000 rebels, who seized an old castle in its Shimabara Peninsula. A Tokugawa force of 100,000 men was sent against the rebels but made surprisingly little headway against them. Finally, Shogun Tokugawa had to call on the help of some Dutch warships at Nagasaki to fire on the rebels. Since at this time, the Protestant Dutch were enemies of Catholic Spain, they were happy to aid the Tokugawa army. Finally, the castle fell after a three-month siege and the holdouts were massacred, ending the revolt and Christian resistance.

The results of the Shimabara Rebellion were far-reaching. The Tokugawa Shogunate moved to seal Japan off from foreign contact. All Portuguese were expelled in 1639. In 1640, all members of a Portuguese embassy sent to negotiate with the shogun were executed. All Europeans were expelled except the Dutch, who were allowed to send to ships to Nagasaki annually. Every Japanese person who attempted to leave Japan, and then returned, was executed. For nearly 250 years, Japan was sealed off from contact with the outside world.

JOHN MURPHY

ships and shipping

By the 15th century, contact between seafarers from northern Europe and their counterparts in the Mediterranean had brought about the development of a number of ship types in use throughout Europe. Shipbuilders from the Atlantic seaboard borrowed frame-first construction techniques from the Mediterranean roundships and galleys, while southern European builders borrowed the more maneuverable square sail and the stern post rudder from ships built to weather the heavier seas of the Atlantic and North Sea. The result of such cross-fertilization was a series of ship types that would not undergo any more radical transformations until the age of steam; a 15th century tall sailing ship had more in common with the vessels of the early 19th century than with those of only 100 years before.

The basic ship types in use in Europe at the dawn of the 15th century were the carrack, a tall sailing vessel, and the galley. Much sleeker and lower in the water, the galley was propelled primarily by oars, though it also carried sails to be used in favorable conditions. Sometimes very large, up to more than 1,000 tons, carracks were driven by three or four masts, each with one or two square sails, with the exception of the mizzenmast, the one nearest the rear or the stern of the ship, which carried a lateen sail. Carracks were guided by a centrally mounted stern post rudder. These ships were often quite slow and cumbersome, their breadth being roughly two-thirds their length, but they were much more seaworthy than their medieval ancestors, the roundship and the cog.

The galley was smaller by comparison, ranging from 100 to 150 tons; was roughly eight times as long as it was wide; and carried either one or two masts fitted with lateen sails. They were steered by a pair of large oars fitted one on each side of the vessel. All elements combined to make the galley a much faster ship: the lateen sail was much more efficient at harnessing the wind while the oars meant that the ship never got stuck in calms. The galley was also incomparably more expensive to operate. More sailors were necessary to work the great triangular sails, but most of all the hundreds of oarsmen had to be fed and even paid, unless

they were slaves or convicts, as was often the case. It was primarily the difference in operating costs that made the galley the vessel of choice for transporting light, expensive goods such as spices, silk, or precious metals through the Mediterranean, while bulky goods were sent over long distances in carracks.

INTRODUCTION OF THE CANNON

The widespread introduction of cannon in the 16th century changed the face of shipmaking. Throughout the Middle Ages a ship's fighting capacity and ability to defend itself resided in the number of able-bodied men it had aboard. This gave the galley an advantage; each oarsman could be given a sword. Artillery changed that. Now a ship's fighting ability was measured in the number of cannon the ship carried, and tall sailing ships could mount more guns than low, sleek galleys. Galleys did not disappear overnight, but by the 17th century, they were relegated more and more to patrolling coasts or providing rapid transport to dignitaries. The carrack, on the other hand, continued to evolve. Hulls were lengthened in proportion to width, giving the vessels greater speed and stability. The results of this evolutionary process, the smaller caravel and the great galleons, became the instruments of European exploration and expansion.

The European tradition, however, was far from universal. The Turkish fleets as well as those of North African ports were quick to adopt the changes introduced in European shipping, though the seafarers active in the Persian Gulf and Indian Ocean produced ships of a very different type. Overseas and coastal trade tended to be carried in dhows, Arab vessels of varying sizes, which can still be found along the east coast of Africa and in the Red Sea. Dhows ranged from small craft to deep, oceangoing ships mounting one or two large lateen sails. The hulls, however, were made of planks fitted together and sewn to each other rather than nailed to an internal structure as in European ships. Such ships were unable to stand up to the cannon-carrying European vessels that began arriving in the Indian Ocean in the early 16th century. As a result, Europeans were able to dictate the terms of shipping, but European shipbuilding techniques spread to the Indian Ocean area.

CHINESE SHIPS

Chinese ships form a category of their own. The most important Chinese ship type, the junk, mounted a stern-post rudder as early as the 12th century, though it carried fanlike bamboo sails, lugsails, and had a squared, flat-bottomed hull. By the 15th century, Chinese junks

could be as large as 1,500 tons, and, unlike European vessels, were built in several watertight compartments. The centralized government of China failed, however, to encourage development of oceangoing sea power and, as a result, the Chinese presence on the sea diminished considerably beginning with the late 15th century.

EUROPEAN TRADING EMPIRES

The early modern period witnessed the expansion of European-based colonial and trading empires throughout much of the globe. That expansion would not have been possible without the developments in European shipbuilding techniques that came about during the 14th century. Substantially, the rest of the period merely witnessed the continued refinement of the ship types developed at the end of the Middle Ages. These versatile vessels were then imitated both in the eastern Mediterranean and to a large degree among the long-distance traders of the Indian Ocean region as well. The Chinese, on the other hand, having developed a robust and seaworthy ship type of their own, remained largely impervious to the developments that had taken place in Europe and that had been adopted in so much of the world.

THOMAS A. KIRK

Shivaji

(1627–1680) *Indian leader*

Shivaji was born on February 19, 1627, in the hill fort of Shivaneri. He is best remembered for his valor and relentless struggle against the Mughal emperor

AURANGZEB (1618–1707). The father of Shivaji was Shahji, a *jagirdar* (fief holder) of the sultan of Bijapur. Jijabai, his mother, inspired Shivaji by telling stories of heroes from Hindu mythologies. She inculcated a spirit of bravery and self-determination in him. Shahji sent his son to manage his land tenures around Pune region, and Dadaji Kondadeb was in charge of teaching young Shivaji the art of administration and warfare. Shivaji's personality grew among the rugged mountains in the Pune region as he matured with the care of his mother, his apprenticeship under Dadaji, and an indomitable spirit of independence.

FIRST MILITARY SUCCESSES

Shivaji's first military endeavor occurred at the age of 16, when he seized the fort of Torana. The following year two more forts, Kondana and Raigarh, were taken by his army. The conquest of Javli kingdom in 1656 made Shivaji dominant in Mavala region, and the path was open for further conquests in the Konkan area. Shivaji also came into conflict with the Mughals when he made forays into Ahmadnagar, but he made peace with them in 1657. By 1659, he seized more forts along the Konkan coast and became master of Kalyan and Bhiwandi. The Bijapur sultan Adil Shah grew alarmed at Shivaji's growing prowess. The respite from the Mughals allowed the sultan to focus on Shivaji, so he sent General Afzal Khan with 10,000 troops to capture him. The two leaders agreed to meet each other unarmed, but before Afzal could take out his dagger, Shivaji finished him with a hidden iron finger grip containing tiger claws.

Afterward, the Bijapur army was routed, and Shivaji's exploits made him a legendary figure. In 1660, Shivaji had to face the Mughal army of Deccan viceroy Shaista Khan, who was dispatched by Aurangzeb, anxious at the rapid rise of Shivaji. Pune and north Konkan came under Shaista Khan. Bijapur launched an attack under Sidi Salabat and took away Panhala. An agreement was signed between Shivaji and the sultan of Bijapur in 1662, by which Shivaji agreed not to attack Bijapur in exchange for control over northwestern part of the kingdom. The following year, Shivaji made a daring attack on Shaista Khan's camp at Pune and the latter fled in disgrace. The important Mughal port of Surat was attacked in 1664, and Shivaji returned with treasure worth a fortune. Aurangzeb wanted to subdue Shivaji and sent his capable Hindu general Mirza Raja Jai Singh with an army of 12,000. Jai Singh made careful preparations to influence anti-Shivaji forces and then struck at the fort of Purandar, where Shivaji's family was staying. It was

besieged and Shivaji had to sign the Treaty of Purandar in 1665 after lengthy negotiations. Shivaji retained 12 forts out of his 35 and agreed to remain loyal to Aurangzeb. Jai Singh's plan for subduing Bijapur failed, and he persuaded Shivaji to meet the emperor in person at Agra. He was put under house arrest but managed to escape. Another treaty was signed, but it did not stop the offensive of Shivaji against the Mughals, and in 1670 he launched another attack against their territories. Purandar and some other forts were recaptured by him. Surat was once again attacked.

SELF-DECLARED KING

On June 6, 1674, Shivaji declared himself as a sovereign king in a ceremony at Raigarh, in which he gave himself the title of Chhatrapati (sovereign king). He started the Raj Shaka (royal era) and issued *shivarai hun* (gold coin) on this occasion. An independent Maratha state became an accomplished fact in the face of the mighty Mughals and ever opposing hegemony of Bijapur kingdom. The Marathas looked him as father of the nation and the rise of Maratha nationalism owes a great deal to Shivaji, who rose from a minor chieftain to king of an independent kingdom. At the time of the struggle for freedom against British colonial rule, he was taken as a symbol of nationalism in the nationalist historiography.

Shivaji did not make an agenda of fighting for the Hindu cause against forces of Islam. He was a brave soldier who prized his independence. His waging of war against external domination was a yearning for freedom against subjugation. After 1674, Shivaji launched a spate of offensives against Mughals in Berar and Khandesh. He besieged the forts at Vellore and Jinji. As a sovereign ruler, he signed a treaty with Golconda Sultanate. He also signed a friendship treaty with the Kutubshah of Golconda Sultanate.

ADMINISTRATION

Amid his conquests and relentless guerrilla warfare against enemies, Shivaji laid the foundation of a sound administrative system. The *ashtapradhans* (eight ministers) were ministers holding different portfolios. The *ieshwa* was the most important one, having charge of finance and general administration. The *sar-i-naubat* was the commander in chief, and the *majumdar* was the accountant. The *dabir* looked after foreign powers and *waqe navis* managed the intelligence department. The departments of justice and charity were entrusted with *nyayadhis* and *panditrao*. He was one of the few rulers who had a developed navy, and he enacted improvements to the organization and functioning of

the army. The soldiers were given strict instructions for not harassing women and noncombatants. Salary was given in cash and the chiefs received land revenue grants. His numerous forts were well managed. A tax called *chauth* (one-fourth of land revenue) was levied in neighboring territories as a kind of protection money against Maratha raids. Shivaji adopted a policy of religious toleration and employed Muslims in the army. His admirals in the navy were Muslims. Shivaji was one of the greatest statesmen and generals, symbolizing the Maratha will against the imperial rule of the Mughals. He died on April 3, 1680, from high fever and was succeeded by his son, Raje Sambhaji (1657–89).

PATIT PABAN MISHRA

Sikhism and Guru Nanak (1469–1539) *founder of Sikhism*

Sri Guru Nanak Dev, founder of Sikhism, was born in 1469 in Sheikhpura district of present-day Pakistan to a Hindu family of Kshatriya caste. He was educated in Sanskrit, Persian, and Arabic. Although attracted to spiritualism, he did not adhere to religious conventions and refused putting on sacred thread according to the traditional Hindu custom. In spite of his marriage and his father's insistence that he pursue a career, the young man pursued his spiritual quest, spending hours in meditation and in religious discourse with Muslim and Hindu saints.

Nanak donated all his belongings to the poor, renounced the world, and made an extensive tour of the Indian subcontinent and according to the tradition went even to Mecca, Medina, Tibet, and Sri Lanka. During his travels to places of worship of both Hindus and Muslims, Nanak developed his religious thought and monotheism, belief in one god, who was timeless and everlasting. Like the Bhakti saints of India, he visualized an egalitarian society without any discrimination between different classes and religion. He was against

all forms of rituals and proclaimed that there was neither Hindu nor Muslim, emphasizing brotherhood and peaceful coexistence between the followers of the two religions.

Nanak's message against caste distinctions, ritualism, superstition, and idol worship attracted adherents and he mixed freely with low-class people during his travels. He distributed money among the poor and maintained a common kitchen where all could dine together.

Nanak identified himself with the downtrodden and declared that he was the lowliest of the low. He held woman in high esteem and once exclaimed, "Why denounce her from [of] whom even kings and great men are born?" Nanak advocated an honest livelihood, life of purity, and shared earnings. He believed in rebirths and taught that good deeds and chanting God's name could end the cycle of rebirths. Finally he settled as a farmer in a place called Dera Baba Nank in Punjab, attracting large number of disciples with his simple and universal message. The followers of Nanak were called Sikhs (disciples) and he was their guru, the first of nine gurus. The second guru was his son Guru Angad (1504–52). The three essential elements in Nanak's teaching were Nam Simran (thought about God), Kirt Kaara (living a normal life), and Wand Chhako (sharing with needy). In time, guru, *shabad* (ideology), and *sangat* (organization) also became important. Sikhism emphasized the necessity of family life and all gurus, except for the eighth, were married, leading normal family lives. Work was emphasized and the gurus earned their livelihoods in different vocations. There was no place for ascetics in Sikhism.

The Adi Granth that forms the basis of Sikh theology is the record of Nanak's teaching and the holy book of Sikhism. It was transcribed by Bhai Gurudas in the 16th century in Punjab, a vernacular language of northern India.

The Sikh way of life became popular among many people, and Sikhism was a dynamic and growing religion. The third Mughal emperor, AKBAR, gave a grant of land to the Sikhs as a sign of approval. The fifth guru, Arjan Dev (1563–1606), who had compiled the Granth Sahib, built Amritsar as a holy city for all Sikhs and laid the foundation of Harmandir Sahib (the Golden Temple).

The martyrdom of the Sikh leader during the revolt of Emperor Jahanair transformed Sikhism into a militant religion and long conflict with imperial power began. The militarization of the Sikh community became marked under fifth guru, Hargovind (1595–1644), at the time of SHAH JAHAN (1592–1666). Sikhs rose up against the Mughal emperor, AURANGZEB (1618–1707),

who executed Guru Tegh Bahadur (the ninth guru). His son Govind Singh (1666–1708) then fought against Aurangzeb by founding a military brotherhood called Khalsa (pure). Govind Singh was the last guru. As the MUGHAL EMPIRE disintegrated, the Sikhs established a state and strove for regional independence.

PATIT PABAN MISHRA

silver in the Americas

The discovery of massive deposits of silver in NEW SPAIN and Peru from the mid-16th century set in motion a chain of events that reverberated across the globe. Large-scale silver production in Spanish America not only transformed local, regional, and colonial economies across large parts of the Americas. It also fueled a price revolution in Europe, accelerated the growth of the nascent African slave trade, and heightened imperial competition between Europe's early modern nation-states, particularly Spain and England. American silver proved crucial in providing the Spanish imperial state with the fiscal base necessary to build and defend its overseas empire, while also sparking keen interest in American exploration and colonization by Spain's European rivals. At every level—local, regional, colonywide, and global—the economic, social, and political transformations wrought by large-scale silver production in Spain's New World holdings were enduring and profound.

Two main centers of silver production emerged in 16th-century Spanish America: the region north and west of Mexico City, centered on the provinces of Zacatecas and Guanajuato, and the "mountain of silver" at POTOSÍ in the Peruvian Andes. (Silver production at Potosí is treated elsewhere in these pages.) The development of New Spain's silver industry, with its epicenter at Zacatecas, followed a very different trajectory. Unlike Peru's, the silver deposits of New Spain had not been systematically mined by pre-Columbian

polities. The Zacatecas mining region, with its low rainfall and infertile soils, had been outside the Aztec sphere of influence and had few sedentary inhabitants prior to the CONQUEST OF MEXICO. Silver ores were first discovered there in September 1546 by Juan de Tolsa, commander of a detachment of Spanish soldiers exploring the arid region.

In the next few years, the discovery prompted a vast silver rush, rapidly and permanently transforming the regional economies of Zacatecas, Guanajuato, and, farther south, the Bajío, the breadbasket of the colony, in response to rising demands for food, clothing, and other products required by the emergent mining economy.

NEW SPAIN PRODUCTION

As in Peru, large-scale silver production in New Spain required huge infusions of both labor and capital, along with long-term investments and substantial technical expertise. Labor shortages soon proved the principal bottleneck to New Spain's silver economy. As in Peru, the Spanish Crown, eager to collect its *quinto real* ("royal fifth," a tax comprising 20 percent of all production), played a central role in creating and fostering the colony's silver mining industry, in some cases slashing its quinto in half to stimulate production. The Crown claimed all subsoil rights, but in order to attract sufficient labor and capital, and to induce prospectors to find new deposits, the imperial state came to rely on a combination of state-directed and private initiatives. Deep-shaft mines and their accompanying refining facilities were invariably owned by private individuals, primarily *encomenderos* in the mid- and late 1500s, followed by men of sufficient wealth and experience to own and operate such large and complex enterprises.

Indian and mestizo laborers were lured into the region from the BASIN OF MEXICO and elsewhere mainly by relatively high wages and related incentives. By the 1550s, African slaves also began to play an increasingly important role in the mining industry, a development that provided an important stimulus to the Atlantic slave trade during its earliest phase. Unlike the situation in Peru, where a modification of the preconquest *MITA LABOR IN THE ANDEAN HIGHLANDS* generated a hellish environment for mineworkers, symbolized by the "infernal pits" of Potosí, in New Spain silver mine workers comprised a kind of aristocracy of labor, with relatively greater privileges and freedoms than Indians held in *ENCOMIENDA*. Still, working conditions in the mines were dangerous and accidents common.

Hispanization proceeded more quickly among Indian, African, and mestizo mineworkers in Zacatecas than it did elsewhere in New Spain, creating a large, mostly proletarian Spanish-speaking male labor force. New Spain's silver mines, along with its *OBRAJES*, were thus the first to develop private labor relationships, including wage labor, independent of state mediation or control, leading some scholars to interpret the mining economy as a key locus of the origins of capitalism in Mexico. Ancillary industries, necessary to feed, clothe, and shelter mineworkers, mushroomed within the mining zones and beyond, including artisan work and craftwork, stock raising, agriculture, cloth production, and related enterprises. As in Peru, the ripple effects generated by the silver mining industry transformed local and regional economies far from the actual sites of production.

After the refinement of the mercury amalgamation process in the 1570s, silver production in Spanish America soared. While Potosí's production declined from its height in the early 1600s, New Spain's output remained relatively stable from the 1550s to around 1700, increasing dramatically thereafter. In 1700, New Spain's silver production hovered around 5 million pesos annually. By the 1780s, the figure had quadrupled. As early as 1600, silver ore, bullion, and coins constituted some 80 percent of New Spain's exports, making it far and away the largest and most important industry in Spain's wealthiest and most important colony.

INFLATION IN SPAIN

These massive infusions of silver into Spain's economy contributed to an inflationary spiral that had profound ripple effects across large parts of Europe. The causes of the so-called price revolution that socked western Europe beginning in the 1560s were numerous and complex. Along with steady population increases and the glacial pace of agricultural innovation, chief among the most common explanations for this dizzying rise in prices for food and manufactured goods in western Europe from the 1560s is the dramatic increase in the amount of silver coinage in circulation, a circumstance directly attributable to the enormous influx of silver into Spain from Peru and New Spain.

Scholarly consensus holds that overall, this price revolution disproportionately benefited wealthier classes and harmed the poor, as the relentless rise in the price of bread, cloth, and rents was not matched by rising wages or productivity.

Spain's example also spurred its rivals, especially England and France, to try to replicate Spain's stunning

successes in their own schemes of conquest and colonization in the Americas. Yet the very different histories of these emergent nation-states generated very different models of colonization, with the English, French, Portuguese, and Dutch states playing a far lesser role than the Spanish Crown, and with a much greater role for private and entrepreneurial enterprises, most notably joint-stock companies, such as the Virginia Company, as the principal engines driving the initiatives that constituted the next wave of American conquests and colonization.

MICHAEL J. SCHROEDER

Sinan, Abdul-Menan

(1489–1574) *Ottoman architect*

Sinan was born in Kayseri in central Anatolia to a Greek Orthodox family. When he was in his early 20s, older than was customary, he was recruited in the *devshirme* levy to be educated in Istanbul. He was selected for the elite JANISSARIES and served in several military campaigns, where he became a noted engineer building bridges and other structures.

He served as the major architect for sultans SULEIMAN I THE MAGNIFICENT and SELIM II (the sot) and became the empire's chief architect (*mimbar bashi*). During his long and productive life, Sinan designed more known buildings than any other architect in history. He built mosques, hammams, mausoleums, aqueducts, and palaces. Building on ideas from earlier Byzantine designs, particularly the Aya Sophia in Istanbul, Sinan struggled to surpass the grandeur and size of the dome in that great Byzantine church.

Sinan's Suleimaniya complex in Istanbul has a mosque with a huge central dome supported by two half-domes giving the appearance of soaring in the air;

the mosque, with tall needle shaped minarets, opens onto a courtyard with a portico, a style much favored in Ottoman architecture. The vast complex, with over 400 domes in total, also includes schools, a hospice, a soup kitchen, and commercial shops to support the social work of the complex. Sinan also built the elaborately decorated Rustem Pasha mosque for the grand vizier as well as the tombs for Suleiman's son Mehmed and Suleiman's beloved wife, Hurrem Sultan (Roxelana); these are adorned with brightly colored Iznik tiles in deep blues and reds. In his autobiography, Sinan rated the Selimya mosque in Edirne, outside Istanbul, as his masterpiece owing to its huge central dome, which seems to float over a vast open interior space.

Sinan died in 1574 at the age of 99 and is buried in a simple tomb close to one of his greatest accomplishments, the Suleimaniya complex.

JANICE J. TERRY

slave trade, Africa and the

The discovery of the Americas created new economic opportunities with agriculture the foundation of these opportunities. In 1493, only a year after his first voyage, CHRISTOPHER COLUMBUS introduced sugarcane into the Caribbean, the crop on which Europeans built the first plantations in the New World. Sugarcane demanded a large labor force, particularly at harvest. Europeans sought to meet the demand for labor by using criminals, orphans, indentured servants, and Native Americans.

But there was still a need for laborers. Native Americans succumbed to Old World diseases, and the supply of European laborers met only a fraction of the demand. In the mid-15th century, the Portuguese addressed the problem of labor by enslaving Africans to grow sugarcane on the Madeira Islands in the Atlantic Ocean. The Spanish used slavery in their New World colony Hispaniola (now the island of Haiti and the Dominican Republic), importing the first slaves in 1502. The institutionalization of

slavery in the New World spurred trade in slaves. The fact that demand for slaves outpaced the growth in supply by natural increase nearly everywhere in the Americas perpetuated the slave trade over four centuries.

PORTUGAL LEADS SLAVE TRADE

Portugal monopolized the trade at the outset. The TREATY OF TORDESILLAS in 1494 granted Portugal access to Africa and with it, slaves. After 1528, Portuguese shipping companies supplied Spain with slaves through a series of *asientos*, or contracts. An *asiento* specified the delivery of slaves in *piezas* de India, which quantified labor rather than slaves. Men tallied more *piezas* than women because of the expectation that men would yield more labor than women. For the same reason, the young were worth more than the old.

A cargo of 100 *piezas* constituted the smallest number of slaves if all were young males and the largest if all were elderly females. Of course slave traders rarely got the “ideal” of all young men fit for the rigors of the plantation. Market conditions yielded a mix, with a majority being young men with some women also included, particularly those of childbearing age in hopes of perpetuating the slave population by reproduction. A cargo might also contain the prepubescent and elderly because of their low prices. Their purchase, however, entailed risk because they were susceptible to disease and early death.

The value of labor and therefore of slaves fluctuated over time. In 1693, the records of the Portuguese Cacheau Company reveal that one *pieza* was worth 1.6 slaves. In 1715, however, records of the South Sea Company of Great Britain reveal that the value of one *pieza* had declined to 1.04 slaves. These figures imply an increase in the demand for slaves over time. Supply rose to meet demand. Between 1521 and 1550, Spain imported into its colonies 15,000 slaves, 500 per year on average, and between 1551 and 1595, they brought in 36,300 slaves, amounting to 810 per year on average. The largest importer of slaves, Brazil, imported more than 200,000 during these years. In total Portugal had shipped 264,000 slaves to the New World by 1600. Portugal so dominated trade that by 1600, its maritime rival Britain had shipped only 2,000 slaves to the Americas. No other nation participated in the trade until after 1600.

Portugal's trade in slaves benefited from political instability in Africa. War engulfed the empire of Jolof, spanning modern Senegal and Gambia, in the middle of the 16th century. Warlords enslaved prisoners, trading them with Portugal for guns. At the same

A slave trader identified as Captain Kimber orders the torture of a young enslaved African woman aboard his ship.

time, the deterioration of the central government of Kongo, modern Angola, Cabinda, and the Republic of the Congo permitted the Portuguese access to the interior of the kingdom and to a larger number of slaves than had been possible when Kongo confined Portugal to the coast. In 1614, Portugal allied with the Jaga, a group hostile to the Ndongo rulers of Angola. The resulting war won Portugal captives it sold as slaves. New alliances after 1640 gave Portugal access to slaves in Luanda, the modern capital of Angola.

Political instability gave Europeans more slaves than they might otherwise have expected, for Africa was impenetrable to Europeans into the 19th century. Tropical diseases made it hazardous for Europeans to roam the interior of the continent in search of slaves. Where African tribes remained united, they kept Europeans at arm's length.

Instead, Europeans established fortresses along the western coast of Africa, the first at Elmina, a town in Ghana, in 1482, and awaited the delivery of slaves from African merchants and chieftains. Once at the coast, slaves waited in dungeons, pens, or stockades until the arrival of a ship. Both Africans and Europeans, intermingling for the first time, were at risk of disease. Confinement in tight quarters on the coast and aboard ship exacerbated the danger to Africans of an epidemic.

SLAVE SHIP CONDITIONS

Once onboard the ships, slaves endured lengthy waits until the captain had enough slaves and the right force

and direction of wind to sail. Seldom less than a month, the wait on the coast sometimes stretched to half a year. All the while slaves, packed 100–1,000 per ship, depending on its size, occupied little more than six square feet of space with two or three feet of headroom. Slavers separated men from women, shackling the men in pairs to reduce the danger of rebellion.

Long chains tethered groups of slaves, kept below deck most of the time, for movement to the deck for fresh air and meals. The duration of the wait on the coast and the voyage to the Americas tempted the all-male crews to rape female slaves.

Once a ship set sail, slaves were vulnerable to the vicissitudes of weather and wind. Rain prevented them from getting fresh air on deck and increased the incidence and spread of diseases. Storms imperiled even the most promising crossing.

In 1738, a storm assailed the Dutch ship *Leusdan* only days from its destination. When it began to leak, the crew, fearing a fight over the lifeboats, locked some 660 slaves below deck, leaving them to drown. Only the crew and 14 slaves on deck survived. The absence of wind brought ships to a standstill and strained the food supply. Ship captains rarely had more than three months of food at the start of a voyage and reduced slave rations on long trips.

The crossing from the Guinea Coast was especially perilous because ships had to traverse the doldrums twice and thereby risk a lengthy calm. One study estimated the mortality rate for ocean crossings of fewer than 20 days at 8 percent, though the death rate increased to nearly one-quarter for voyages longer than two months. Malaria, yellow fever, and intestinal ailments accounted for two-thirds of deaths, and smallpox, scurvy, and suicide the remaining third.

Once a ship reached its destination, an inspector boarded to check slaves for disease, quarantining all slaves if he found one with a communicable disease and prolonging their stay aboard ship until contagion had passed. On land, slaves at last had fresh food and water. Traders amassed slaves for sale once ashore, selling the young and old first and holding men and women of childbearing age for sale until last in the expectation that prices would rise with the eagerness of buyers to close the deal.

The fact that ovulating women fetched a higher price than pre- and postmenopausal women contradicts the assertion of slave traders that they did not sell slaves for the purpose of breeding. Traders sold most slaves by auction, though an alternative was to fix the price for a group of slaves of similar age and physical condition and allow buyers to choose from among this group.

An illustration showing the dimensions allowed to slaves as cargo in a slave ship. By the 1760s, slave imports averaged between 10,000 and 15,000 per year. By 1787, the number exceeded 40,000 per year.

OTHER NATIONS ENTER THE SLAVE TRADE

Portugal's hold on the slave trade began to weaken in the 17th century, as the Netherlands entered the fray. After 1630, the Dutch imported into northern Brazil slaves they wrested from Portugal. Taking Curaçao in 1634, the Dutch used it to funnel slaves to their colonies and to those of Portugal, Spain, Britain, and France. In 1637, the Netherlands captured the Portuguese fortress at Elmina, making it the point of origin of the Dutch slave trade. After 1667, the Netherlands imported slaves into Surinam. In total the Netherlands brought 39,900 slaves to the New World between 1601 and 1650 with the number rising to 76,400 between 1726 and 1770. Thereafter the Netherlands's share of the slave trade decreased rapidly.

Britain also contested Portuguese dominance. The spread of tobacco in Virginia after 1617 opened British North America to the slave trade. In 1619, the Dutch landed 20 slaves, the first shipment of its kind, in JAMESTOWN. During much of the 17th century, the slave trade in the thirteen colonies was more trickle than deluge. In 1640, Virginia had only 150 slaves and in 1670, fewer than 1,000. In contrast to Latin America and the Caribbean, slaves in the thirteen colonies increased their numbers through reproduction, diminishing the need to import slaves.

The slave trade in British North America was strongest after the decline of indentured servitude around 1670 and the rise of rice plantations along the Carolina coast about 1700. The thirteen colonies, according to one estimate, imported between 1619 and 1750, roughly 201,500 slaves, an average of 1,550 per year. By comparison the French imported 1,690 slaves per year on average into the island of Martinique between 1664 and 1735 and the Spanish 3,880 per year on average into its colonies between 1640 and 1750.

Following the pattern of British North America, the colonization of the Caribbean opened it to the slave trade. Settling Barbados in 1624, Britain imported the first slaves in 1627. Thereafter the slave trade grew with the spread of sugar cultivation as the trade had in the thirteen colonies with the tobacco boom. Barbadian imports increased from 6,500 slaves between 1640 and 1644 (an average of 1,300 per year) to 36,400 between 1698 and 1707 (an average of 3,640 per year). In Jamaica sugar and the slave trade took hold in the middle of the 17th century.

Between 1651 and 1675, planters imported 8,000 slaves, an average of roughly 330 per year, roughly one-sixth the number imported into Barbados. By the turn of the century, however, Jamaica had eclipsed

Barbados, importing between 1676 and 1700 77,100 slaves, an average of roughly 3,210 per year.

Extrapolating the number of imports from the Royal African Company, a slave trading firm granted a monopoly by King CHARLES II, to all traders throughout Jamaica, planters imported into the island roughly 7,800 slaves between 1708 and 1711, an average of 2,600 per year. Between 1655 and 1674, Barbados supplied Jamaica with one-third of its slaves though the proportion fell by the turn of the 18th century to 5 percent. By then most imports came from Africa though the voyage to Jamaica was 1,000 miles farther west than Barbados. The Leeward Islands were the last of Britain's Caribbean holdings to enter the slave trade. By 1670, island planters had imported only 7,000 slaves. The numbers grew to 44,800 between 1672 and 1706, an average of 1,280 per year, with another 43,100 between 1707 and 1733, an average of 1,600 per year. In total the British imported 250,000 slaves into the Caribbean by 1700, and throughout the Americas, traders of all nations bought and sold 266,100 slaves between 1519 and 1600. This represents an average of 3,300 per year, with the number rising to roughly 1.3 million between 1726 and 1750, an astonishing average of 52,000 per year. In all the New World absorbed more than 1.5 million slaves between 1519 and 1750.

CHRISTOPHER CUMO

Songhai Empire

The Songhai Empire was the largest empire in the history of western Sudan. It grew from the small state of Gao, which was founded between 500 and 700 A.D. However the empire did not become a major force in the history of empire building and territorial expansion until 1464 when SUNNI ALI, also known as Ali Beer, became the king. In 1469 and 1470, his military campaigns led to the incorporation of Timbuktu and Azawad, located northward and northeast, respectively. In 1473, he attacked Jenne, a great Islamic center located southward, and in 1483, he was able to drive the Mossi out of Walata-Baghana.

Within 28 years of his ascendancy, Sunni Ali had converted the little state of Gao into a magnificent empire stretching from the Niger in the east to Jenne in the west, and from the Timbuktu in the north to Hombori in the south. He was said to be a ruthless ruler who maltreated all those who opposed his administration and did all that was possible to keep vassal states under firm administrative control by appointing governors who administered his orders.

Payment of tributes, which were in form of goods and contribution of workforce for further territorial expansion, placed the empire on a powerful economic and political footing.

The death of Sunni Ali in 1492 was followed by a 40-month reign by his son Sunni Baru, who was deposed in 1493 by Askia Muhammad Touré. Askia Muhammad Touré, popularly known in history as Muhammad the Great, completed the process of nation building and conquest initiated by Sunni Ali by extending territories of Songhai Empire to Baghana and Taghaza, a significant caravan route and salt producing area. While Sunni Ali's reign was characterized by ruthlessness and dislocation of commerce, that of Askia Muhammad the Great was known for the pacification of the subjugated people and the promotion of commerce, Islamic scholarship, and general tranquility.

His 1496 pilgrimage to the holy city of Mecca had far-reaching consequences for the promotion of Islam

as it attracted Muslim clerics and commerce to the empire. Islamic religion flourished in the great Islamic centers such as Timbuktu and Sankore. The University of Sankore produced the likes of Mahmoud Kati and Abdulrahman As Sadi, whose books are valued sources for the reconstruction of the history of Songhai and western Sudan in general. Askia Muhammad the Great relied on the advice of Muslim clerics in governing the empire and made Islamic law the instrument of political and administrative machinery in western parts. In the eastern territories of Gao and Kikiya he allowed traditional religion to exist by granting non-Muslims of the region the freedom they needed to practice their religion.

As had his predecessor, Askia Muhammad divided the entire kingdom into provinces administered by governors, or *kio*. The central administration consisted of a council of ministers predominantly from his immediate and extended families. While Jenne controlled internal commerce, Gao and Timbuktu served as link to other economic centers in the east and northeast and west and northwest, respectively.

SHORT-LIVED PROSPERITY

The prosperity of the empire was however short-lived. Starting in the middle of the 16th century, internal problems hindered the government and provided an enabling condition for its invasion and destruction by the Moroccans in 1651. At the top of the list of the internal factors that led to the fall of Songhai Empire was the succession dispute among the sons of Askia Muhammad the Great. Aside from allowing hitherto subjugated states to assert their independence, this development inhibited economic prosperity and further territorial expansion. The Civil War of 1588 had its origin in poor internal control exemplified in the succession dispute between Ishaq and Sadiq, two sons of Askia Daud, and the crises between the western parts, which was under strong Islamic influence, and the east, under the firm control of the non-Muslims.

The last straw was the Moroccan invasion of 1591. The defeat by the Moroccans can only be appreciated against the backdrop of the fact that the empire on the eve of the invasion was in the throes of an internal convulsion. Al-Mansur, the sultan of Morocco, who had failed in two early expeditions, wasted no time to invade the empire during its most turbulent period. In 1591, he attacked Songhai with 4,000 professional soldiers and another 2,000 armed with arquebus, a gun with three legs. Askia Ishaq II raised an army of 18,000 cavalry and 9,700 infantry to resist the

invasion of the Moroccan army. The overwhelming numbers of the Songhai army could not defeat their Moroccan counterparts in the battle, known to history as the Battle of Tondibi; the Moroccan army was more professional, disciplined, and equipped with sophisticated weaponry.

The Moroccan invasion led to the demise of the Songhai, the largest empire to have emerged in western Sudan. The guerrilla warfare initiated after 1591 was not formidable enough for the reassertion of political freedom. The invasion led to loss of lives and property and the extension of Moroccan political hegemony over Songhai. Islamic scholars and clerics fled to other parts of the western Sudan and the great Islamic centers of Timbuktu and Sankore lost their hitherto prime position.

SAHEED ADERINTO

Spanish Armada

The growing frictions between England and Spain in the mid-16th century gradually led to the armed conflict between the Spanish “invincible” fleet, Armada, and the English Royal Navy in the English Channel and around the British coast in 1588, resulting in the devastating defeat of Spain and a glorious triumph of Queen ELIZABETH I of England.

When Queen Elizabeth (r. 1558–1603) ascended the English throne in 1558, King PHILIP II of Spain (r. 1556–98), who had been the husband of the English Queen MARY I (r. 1553–58), showed interest in proposing marriage to Elizabeth in order to form an alliance with England to balance the French power on the Continent. When Elizabeth chose to procrastinate, Philip gradually lost patience. In the mid-1580s, the situation changed dramatically, when Philip II, a fervent defender of the Roman papacy, joined his old French Catholic rivals in their wars against the French HUGUENOTS and the Dutch Calvinists.

Meanwhile, Elizabeth became the archheretic of the Catholic world, after Pope Pius V excommunicated the

queen in 1570 for declaring herself the “Supreme Governor” of the CHURCH OF ENGLAND and introducing Calvinist rituals into public worship for her people.

King Philip’s hostility toward Queen Elizabeth was linked closely to his own personal trouble with his Calvinist Dutch subjects. In 1578, the king appointed the duke of Parma to suppress the Calvinists in the northern provinces of the Netherlands, who had been rebelling against HABSBURG DYNASTY control for decades. While the duke gained some ground in the south, the ten northern provinces declared the independence of the United Provinces, or Dutch Republic, in 1581.

Facing escalating pressure from the duke of Parma, the Dutch sought military assistance from Queen Elizabeth. She sent an army of 6,000 soldiers led by the earl of Leicester to the Netherlands, and the joint Dutch and English forces began to hold a front to check Parma’s northern advance for two years (1585–87). To Philip II, the military involvement of the English queen in his personal dynastic affairs rendered her, just as the German Lutherans, the Dutch Calvinists, and the French Huguenots, an enemy of God.

Philip II, moreover, felt humiliated by English piracy on the high seas, which challenged the century-long imperial dominance and commercial monopoly of Spain over the Atlantic Ocean. In the 1560s, Sir John Hawkins made three risky trips, transporting West African slaves to the Americas for sale, and thus helped England gain a share in the highly profitable slave trade. In the 1570s, SIR FRANCIS DRAKE carried out a series of raids on Spanish treasure ships on the high seas. Queen Elizabeth enjoyed her share of profits from both adventures.

In 1587, while the duke of Parma made progress in upsetting the Anglo-Dutch alliance in the Netherlands, the Anglo-Spanish relationship deteriorated because of two incidents. In February, Elizabeth issued the order for the execution of MARY, QUEEN OF SCOTS, who had been a proxy in Philip’s conspiracy against the heretic English queen for about two decades. In April, Sir Francis Drake led a fleet of 23 English ships, attacking the Spanish homeland, burning about 30 ships in the harbor of Cádiz, and looting treasures from the Spanish merchants worth more than 100,000 pounds in the Azores, of which Elizabeth gained 40,000 pounds. Philip became convinced that the time had come to crush the middle-aged queen, whom the Catholic world despised and the Habsburgs had to destroy in order to save the Netherlands.

In the late summer, the strategy of the Armada invasion was designed by the king himself. The Armada would sail to the English Channel at the same time as

Parma was crossing the channel with his own vessels, carrying 30,000 soldiers from Flanders. The joint forces would then invade England by disembarking near the mouth of the Thames. The strategic plan was no longer a secret at the end of the year, and Queen Elizabeth decided to take the challenge.

ENGLISH NAVAL FORCES

By common estimation, the Spanish Armada comprised 138 ships from Spain and different Habsburg dominions, weighing a total of 58,000 tons, carrying 30,000 men and 2,400 cannons. The number of soldiers would be doubled once the forces of the duke of Parma joined in. The English naval forces comprised 34 royal warships and 170 privately owned ships carefully chosen from East Anglia and Kent. Spain had dominated the high seas for about a century, but its navy was not superior to its English counterparts. The Armada had 21 galleons, which were massive in size, but slow in speed. The commander of the Armada, the duke of Medina-Sidonia, was an expert of fleet logistics, but not a professional military leader. The soldiers of the Armada were pious Catholics, but inexperienced in sea battles, especially in navigating the Channel, where winds and waves were often unpredictable.

In comparison, the major English warships were also huge, but faster, more maneuverable, and equipped with better guns. The commanders of the English Royal Navy, Lord Howard of Effington, Sir Francis Drake, and Sir John Hawkins, were career seamen, each having unique experiences in sailing and battling on the sea. The English soldiers, including many veterans from the Dutch War, knew the Channel better and were well prepared for sea battles there. Of course, both sides were determined to win, but neither side calculated correctly how the war would eventually proceed.

On July 29, 1588, after three months of voyage from Lisbon, the Armada reached the Lizard Point, the southern tip of England. It spread into a crescent formation and sailed along the English coast northeastward up to Calais. The duke of Medina-Sidonia led the main battleships in the center with the vanguard on the left and the rearguard on the right of about 20 capital ships each. On July 31, the English naval ships sailed out from Plymouth with an equally impressive force and kept chasing the Spanish fleet.

For next few days, the two fleets faced off tensely in the Channel, but neither side attempted a major military engagement. The Armada was approaching Calais on August 6, hoping to join the forces with the duke of Parma as planned by Philip II himself. However, the

duke had been outmaneuvered by the Dutch forces on land and sea in Flanders, did not dare risk being lacerated while convoying his army in his own small barges from Flanders across the Channel to England.

While the Spanish were considering how to get Parma's soldiers embarked, eight English blazing fireships, on the night of August 7, penetrated the colossus of the Armada, breaking the crescent formation, setting fires on Spanish ships, and causing the whole fleet to flee in panic. On the following day, the Spanish fleet suffered from an all-day gale blowing from the south-southwest to the north-northwest, and lost many lives in the battles off Gravelines.

Afterward, the continuously deteriorating weather dispersed the Armada into the North Sea, and thus buried any hope for the duke of Parma to join the Armada for invading England. On its way back to Spain, the Armada was forced to sail around the Scottish and Irish coasts and continued to lose ships and lives under the fierce chase of the English naval force. In mid-October, the surviving Spanish ships miraculously navigated back home. The final tally of the Armada's loss was appalling. Only 60 of 130 ships could be accounted for, and 11,000 lives might have been lost.

In 1588, Spain undoubtedly lost the battle, Philip II was certainly humiliated, and the English victory saved England from a very probable disaster anticipated by its enemy. However, the defeat of the Spanish Armada did not alter the policies and behavior of the Spanish, English, or other major European monarchs. The religious wars continued to spiral all over Europe. Neither did it immediately change the geopolitical balance in Europe. Spain recovered quickly and continued its interventionist role in transnational affairs of Europe, and England did not transform itself into a superpower overnight. However, Queen Elizabeth emerged from her victory a heroine to her subjects in England and Protestants all over Europe.

WENXI LIU

Spanish Succession, War of the

The War of the Spanish Succession (1701–14) was a great European conflict fought over which claimant would assume the vacant throne of Spain.

Throughout the 16th century, Spain had been ruled by the HABSBERG DYNASTY, which also controlled Austria and other parts of Europe. CHARLES II (1661–1700), the last Habsburg king of Spain, had no legitimate heir. He named Philip, duc d'Anjou (1683–1746), as his successor.

The BOURBON DYNASTY, which ruled France, had been long-standing rivals of the Habsburgs; the closest claimant to the Spanish throne was LOUIS XIV's eldest son with MARIA-THERESA. However, the princess had been barred from her rights to the Spanish throne as part of her marriage contract. This condition was contingent upon receipt of the bride's dowry, which was never paid. Since the promotion of Louis XIV's son to the Spanish throne would unite the thrones of both France and Spain and certainly prompt a reaction from the European powers, Louis XIV advocated that his younger grandson, duc d'Anjou, rule Spain.

Leopold I (1640–1705), Holy Roman Emperor, king of Austria, and member of the Habsburg family, attempted to preserve his family's control of Spain by forwarding himself as the rightful successor to Charles II. Such a situation would unite the thrones of Austria and Spain, a situation unacceptable to the European powers, and Leopold I advocated his son, Archduke Charles (1685–1740), as king of Spain.

EXPANDING FRENCH INFLUENCE

Louis XIV's attempts to expand French influence on the European continent prompted England and the Netherlands to side with the HOLY ROMAN EMPIRE against France in order to preserve the balance of power. The son of Leopold I's daughter, Prince Joseph Ferdinand of Bavaria (1692–99), was the preferred candidate as king of Spain by the European powers, who feared either family's gaining too much dominance. Prince Joseph Ferdinand was agreed upon as heir in 1698, but he died of smallpox in 1699. England then ratified the Treaty of London (1700) recognizing Archduke Charles as heir to the Spanish throne.

Charles II died in 1700. He declared the duc d'Anjou his successor and Louis XIV quickly declared his grandson Philip V king of the Spanish empire. England could not afford war with France and recognized Philip V as king of Spain in 1701. Louis XIV attempted to solidify his newfound influence by severing both England and the Netherlands from Spanish trade. The blow to both countries' commercial interests forced them into an alliance with Austria against France and Spain. The Treaty of the Hague (1701) of the Netherlands, England, and Austria recognized Philip V as king of Spain but transferred sections of Italy and the Netherlands under Spanish rule to Austria. It also confirmed England's and the Netherlands's commercial rights in Spain.

The war began in 1702, when Austrian forces invaded Spanish territories in Italy, forcing French intervention. England, the Netherlands, and several German states sided with Austria while Bavaria, Portugal, and Savoy supported France and Spain. Other opportunist states joined sides in the conflict, expanding fighting throughout Europe and North America, where the conflict became known as Queen Anne's War.

The duke of Marlborough captured territories in the Netherlands in 1702–03 while Prince Eugene held French forces in Italy. The French, under the duc de Villars, scored a victory at Friedlingen in 1702. Success in Alsace, located between France and the Holy Roman Empire, presented the opportunity for an invasion of Austria in 1703, but dissension among French commanders ruined this opportunity. Marlborough moved his troops from the Netherlands to Bavaria, linking with Prince Eugene's forces to defeat the French at the Battle of Blenheim (1704). Meanwhile, Portugal and Savoy switched sides, joining the coalition headed by England, Austria, and the Netherlands. In 1704, England captured the strategic island of Gibraltar.

FRENCH INVADE ITALY

In 1706, French forces evacuated Italy following Prince Eugene's victory at Turin and the Netherlands following Marlborough's victory at Ramillies. In 1708, following Prince Eugene's disastrous expedition into Provence the previous year, Marlborough and Eugene won at Oudenarde and captured Lille. French forces retreated, losing an additional battle at Malplaquet (1709). Allied campaigns in Spain (1708–10) garnered little success in weakening Philip V's position. Louis XIV opened peace negotiations, but his refusal to join against his grandson brought negotiations to a halt.

In 1711, the death of Holy Roman Emperor Joseph I (1678–1711) resulted in the ascension of Archduke

Charles (Charles VI) to the thrones of Austria and the Holy Roman Empire. The English opened negotiations to end the war.

The Treaty of Utrecht (1713) ended hostilities among France, Spain, England, and the Netherlands. Charles VI continued the war, finally ending hostilities by signing the Treaties of Rastatt and Baden (1714), which complemented the general settlement of the Treaty of Utrecht. Philip V retained the Spanish throne under the condition that he and his descendants were barred from the throne of France. Austria gained territory in Italy and the Netherlands previously belonging to Spain while England gained Gibraltar, Minorca, and exclusive rights to slave trading in Spanish America for 30 years. France recognized Anne as queen of England and surrendered some of its American territories. France's dominance over the European continent was checked and the notion of the preservation of the balance of power emerged as the cornerstone of European politics for centuries to come.

ERIC MARTONE

Stuart, House of (England)

The Stuart dynasty ruled England at a time when the power of the absolute monarchy was declining in England and the powers of representative government were increasing. The Stuart dynasty came into power in England with the death of the last Tudor monarch, Queen ELIZABETH I, in 1603. Elizabeth died without an heir, forcing the English government to ask the Stuart family of Scotland to assume the throne of England.

The Stuarts were related to the House of Tudor, as Mary Stuart and Elizabeth were cousins. Despite the fact that Mary was executed for treason in 1587, her son James Stuart (JAMES I), the king of Scotland, was chosen

to succeed Elizabeth. This choice brought the Crowns of Scotland and England under one monarch, despite the fact that they remained two separate kingdoms.

James was a firm believer in the powers of an absolute monarch, as is evidenced by his writings and speeches to the English parliament. When James came to the throne of England, he had to contend with financial difficulties and clashes with Parliament over the prerogatives of the monarchy. These issues arose as James attempted to raise new revenues by imposing taxes on his subjects without the approval of Parliament. James was also upset by the fact Parliament was against his choice of a potential bride for his son because she was Catholic and Spanish. This hostility occurred as a result of the tensions between Protestant England and Catholic Spain. James was so infuriated by the Parliament's creation of the Great Protestation in 1621, a list of privileges the English parliament claimed it was entitled to, that he dissolved Parliament and arrested four individuals responsible for this action.

CHARLES I succeeded his father to the thrones of Scotland and England when James died in 1625. Parliament continued to attempt to place restrictions on the power of the king by issuing a Petition of Rights in 1628. The petition placed limitations on the king's power to raise revenue without the permission of Parliament, required the permission of subjects to house soldiers in their homes, placed restrictions on the king to impose martial law, and restricted the king from arresting a subject without laying proper criminal charges.

Charles signed this petition because he wished to obtain funds from Parliament, but he soon illustrated his desire to subvert the petition by acquiring as much money from his subjects as possible without assembling Parliament through the extension of existing taxes. The attempt by Charles I to rule England without the assent of Parliament caused many problems and violated the traditional institutional basis of English law. Charles also made many enemies by imposing Anglican conformity on the populace and taking away the pulpits of the Puritans.

DISSOLUTION AND RECALL OF PARLIMENT

It was the desire of the archbishop of Canterbury, William Laud, to impose Anglican conformity on the Presbyterian Scots that led to the English Civil War. Charles prepared to move an army into Scotland in 1638 to create a settlement to this religious dispute with the Scots. Charles could not afford this army, and Parliament refused to give Charles any more money unless he rectified the grievances that had occurred during his

and his father's reigns. Charles refused to accept this ultimatum and dissolved Parliament in May 1640, but he was forced to recall Parliament as he needed funds to subdue the Scottish army.

When Parliament was assembled in October 1641, it attempted to place further restrictions on the ability of the king to raise revenue and stipulated the abolishment of certain administrative courts. Parliament also demanded the king to convene Parliament every three years and commanded Charles to remove certain individuals from power. This last demand eventually led to the execution of Laud and one of Charles's councilors, Thomas Wentworth, the earl of Strafford. Charles attempted to intimidate Parliament by ordering the imprisonment of five individuals who held influence in the House of Commons, but they fled. Charles chose to take drastic measures against Parliament and assembled an army at Nottingham in 1642, leading to the start of the English Civil War.

ENGLISH CIVIL WAR

The English Civil War lasted from 1642 to 1649, as the Stuart cause gained a lot of support from the northern and western sections of England and the rural areas. The parliamentary forces possessed a great deal of support from southern and eastern England certain urbanized areas of the country. A Puritan named OLIVER CROMWELL was instrumental to the parliamentary cause as his armies won important victories at Marston Moor in 1644 and Naseby in 1645 and forced Charles to flee to the Scots for assistance.

This move by Charles was disastrous as the Scots handed him over to the parliamentary forces in exchange for 400,000 pounds. A debate ensued in regard to the future of Charles and the English political system. While this debate raged, a Scottish army was assembled in support of Charles but was quickly defeated. This gave the radicals another excuse to preside over a trial of Charles, which found him guilty and executed him on January 30, 1649.

The king's son, CHARLES II, attempted to restore his family's claim to the English and Scottish thrones by allying with the Scots. Charles II won Scottish support by guaranteeing the Scottish Kirk (church) instead of imposing Anglican conformity, but his army was defeated, forcing him to flee to the continent.

Following the English Civil War, Cromwell used his influence in the army and English politics to take control of the English government by assuming the position of Lord Protector. The death of Cromwell in 1658 and the subsequent political problems the

English faced were enough for Parliament to seek a restoration of the Stuart monarch in 1660. Charles II returned to England but had to accept the limitations imposed on royal authority by the English parliament. Anglicanism was made the official religion of England and Ireland, but Scotland was allowed to retain their Presbyterian Kirk.

The major problem concerning the return of the Stuart dynasty to the English throne was the Stuart family's Catholic leanings. Charles II was influenced by the French court and his French mother, and in 1670, he allied with LOUIS XIV, king of France, against the Dutch. This agreement also stipulated Charles II would proclaim himself a Catholic when the tensions between Catholicism and Protestantism diminished in England. This agreement was a successful move in regard to foreign policy for this victory against the Dutch allowed the English to acquire the Dutch colony of New Amsterdam and confirmed the superiority of English naval power over the Dutch.

Charles II died in 1685 without leaving any legitimate heirs to succeed him, causing his Catholic brother JAMES II to ascend the thrones of England and Scotland. The accession of James II concerned some members of Parliament for they feared a Catholic monarch would stay on the throne of England for some time. James II compounded this fear by making it legal for Catholics to hold governmental positions in 1687. It is impossible to determine whether he sought to restore the absolute powers of the monarchy, but he intended to bring Catholicism back to England. This concern over a Catholic monarch became particularly acute when James II had a son in 1688, who would certainly be raised in the Catholic faith.

The Whigs and a number of Tories engineered a plan to remove James II by inviting James II's daughter Mary, who was Protestant, and her husband, William of Orange, to invade England and seize the English throne. William, who was looking for English support against the French, agreed to this and went ashore at Torbay on November 5, 1688, with an army numbering approximately 14,000 soldiers. Support for James II dwindled as the English gentry and populace wanted a Protestant heir to assume the throne after James II died. This lack of support forced James II to flee to France, thereby forfeiting the Stuart claim to the English and Scottish Crowns.

sugarcane plantations in the Americas

The histories of African slavery and sugar production in the Americas are inextricably bound together. The plantation economies of the Caribbean and Brazil, which together received approximately 80 percent of the estimated 10 million African slaves transported to the Western Hemisphere from the 1490s through the 1860s, were dominated by sugar production. As an expansive scholarly literature since the 1960s has made plain, sugar and slavery are the keywords of much of Brazilian and Caribbean history and together have shaped the cultural, economic, political, social, and demographic history of the Atlantic World in many profound ways.

The origins of sugarcane (*Saccharum officinarum* L.), a type of grass, have been traced to New Guinea in around 8000 B.C.E. By the first century C.E., it was grown across much of southern Asia and the Pacific. By 1000 C.E., its production and consumption among the elite had spread through much of the Mediterranean world, largely in consequence of the spread of Islam. In the 1400s, the Portuguese and Spanish developed important templates for later New World plantation sugar production on their Atlantic islands: the Portuguese in São Tomé and Madeira, the Spanish in the Canaries. Before the encounter with the Americas in 1492, both were employing African slave labor to produce sugar and developing processing techniques that, after 1492, were transplanted wholesale to the sugar-producing zones of the Western Hemisphere.

CHRISTOPHER COLUMBUS is credited with taking the first sugarcane to the New World in 1493 from Spain's Canary Islands. Soon Hispaniola had largely reproduced the industrial processing techniques developed in the Atlantic and made its first shipments of sugar to Europe around 1516. By the mid-1520s, large quantities of sugar were being shipped from Brazil to

Lisbon. The sweet granular substance proved a sensation among its elite customers, and demand skyrocketed. Cultivation and processing of sugar quickly spread throughout the Antilles and the Brazilian littoral as well as to Mexico, Paraguay, and South America's Pacific coast.

Early Spanish efforts in the Caribbean ended largely in failure, though by the 1580s the French and English began plantation sugar production using African slave labor in the Lesser Antilles. Large-scale slave-based commercial sugar production in the Caribbean did not take off until after 1650, on the islands claimed by the French, English, and Dutch.

The English example is instructive. Sugar from Barbados began arriving in England in the mid-1650s. In the 40 years from 1660 to 1700, annual English consumption rose from 1,000 to 50,000 hogsheads, while export rose from 2,000 to 18,000 hogsheads. By the 1750s, the vast bulk of the 110,000 hogsheads imported annually were being consumed at home. The peak of British West Indian sugar exports to England was in 1774, with nearly 2 million hundredweight. Growth rates for the French were comparable. For the Portuguese, the 1600s was the century of sugar, as their coastal plantations in Brazil spread rapidly inland, especially in the Northeast. Demand seemed insatiable, and production grew apace.

Sugar making, especially in its New World incarnation, has been aptly described as an industry that depends on farming and factory production. Through a series of complex steps requiring substantial skill and technical infrastructure, the cane juice was extracted from the stalk by mechanical means (crushing, chopping, etc.). After the juice was boiled and cooled numerous times, with precise temperatures and timing, the end product consisted of a granular precipitate of the plant's naturally occurring sucrose, ranging in color from dark brown to white. Its labor demands were intensive and immediate; for optimal production values, the cane juice must be extracted from the plant within 24 hours of its harvest.

TWO CATEGORIES OF LABOR NEEDED

Sugar production thus required two broad categories of labor: one in the field to cut and haul the cane to the mill, and another in the mill to process the juice into granulated sugar. These labor requirements in turn created two broad strata of slave laborers: more numerous field slaves, among whom mortality rates were exceedingly high (in 17th-century Brazil, an average of 90 percent of imported African slaves died dur-

ing their first seven years in the colony), and a smaller number of skilled slaves, who tended to receive more preferential treatment. Among mill slaves, industrial accidents were common, as many were crushed to death in the grinders and burned in the mill's many boilers and kettles.

As sugar production skyrocketed so did the importation of African slaves into the sugar-producing zones. The relationship between the two was direct, as most scholars agree. In 1645, before widespread sugar production had taken root, Barbados counted 5,680 African slaves; by 1698, with sugar production having grown by more than 5,000 percent, its slave population exceeded 42,000. Jamaica counted 1,400 African slaves in 1658; by 1698, their numbers had risen to over 40,000. Slave population growth rates in Antigua, Saint-Domingue (later Haiti), and other English, French, and Dutch sugar islands were comparable. The vast majority slaved in the sugar economy.

In 17th-century Brazil, sugar plantation slavery came to form the central pillar of the colonial economy. Similarly, one of the colony's core social institutions became the *engenho* (same root as the English *engine*), which came to mean both the machinery of the mill itself and the larger plantation complex. The sugar harvest (*safrá* in Portuguese, *zafra* in Spanish) began toward the end of July and continued without stop for the next eight or nine months. Slaves were divided into crews: one to cut and haul cane to the mill, another to process the cane into sugar.

Water power turned the grinding mill in larger *engenhos*, oxen in smaller *engenhos*. The highest strata of workers consisted of the boiler technicians and artisans, who could be either slave or free. The average *engenho* had from 60 to 80 slaves, though some counted more than 200. Overall slave mortality rates averaged from 5 to 10 percent annually but were higher among field slaves. Sugar planters became the dominant social class in Brazil and almost everywhere else where sugar production formed the basis of the colonial economy.

Caribbean and Brazilian sugar production generated ripple effects throughout the Atlantic World. Large quantities of West Indian sugar were exported to Britain's North American colonies, where most of it was distilled into rum. The West Indian trade also fueled the North American colonial economy through its large and growing demand for lumber, foodstuffs, and other goods produced for export to the sugar islands. Rum exports to Britain similarly skyrocketed, from 100,000 gallons in 1700 to 3,341,000 gallons in 1776. The

An engraving of sugarcane processing in the West Indies, with a white overseer directing Native laborers

effects generated by West Indian sugar production on the British and British North American economies were enormous and remain the topic of ongoing scholarly research and debate.

In his book *Capitalism and Slavery* (1944), West Indian historian Eric Williams was the first to propose a direct causal relationship between the growth of African slavery in the New World, dominated by sugar production, and the development of capitalism in Europe, particularly in Britain. Spawning a huge debate and literature, this book has been challenged in many specific points. Yet the overall thrust of his thesis—that sugar, slavery, and British capitalism all emerged together as part of the same process of social transformation—has stood the test of time, its main arguments retaining credibility in the scholarly community six decades after the book's publication.

AFRICAN SLAVERY EXPANDS

After the French acquisition of the western portion of the Spanish island of Hispaniola in the Treaty of Ryswick of 1695 (henceforth Saint-Domingue), sugar production and African slavery exploded. By the 1760s, slave imports averaged between 10,000 and 15,000 per year.

By 1787, the number exceeded 40,000 per year. By the time of the French Revolution in 1789, Saint-Domingue was populated by an estimated 500,000 slaves, more than two-thirds born in Africa, vastly outnumbering

both whites and mulattoes. Known in France as the “Pearl of the Antilles,” Saint-Domingue had quickly become the world’s largest sugar producer, with more than 800 sugar plantations, many with hundreds of slaves. Decadal mortality rates among slaves on Saint-Domingue in the mid- and late 1700s are estimated at more than 90 percent.

The more than 10 million African slaves transported over nearly three centuries to work in New World plantation agriculture, most in sugar production, has been called accurately the largest forced migration in the history of the world. The African diaspora, fueled in large part by an insatiable European demand for sugar, coffee, tobacco, and other tropical plantation export commodities of the Americas, profoundly shaped every aspect of African, European, and American history, especially in the Caribbean and Brazil. The long-term historical effects of Europe’s sweet tooth remain readily apparent across the Americas, Africa, and the broader Atlantic World.

MICHAEL J. SCHROEDER

Suleiman I the Magnificent

(1494–1566) *Ottoman sultan*

Suleiman (r. 1520–66) ruled the OTTOMAN EMPIRE when it was the most powerful empire on earth. He came to the throne after his father, Selim I (the Grim), had expanded Ottoman territories to the east and west. Although he was only in his 20s when he became the sultan, Suleiman already had experience in the field as a military commander and as an able administrator in Balkan and Crimean territories.

Suleiman was known as “the Magnificent” in Europe, and among his subjects as Kanuni (the lawgiver) for his

codification of Ottoman laws. Known for his fairness and honesty, Suleiman granted extensive local autonomy to his far-flung provinces, maintaining close regulation only over taxes and the regulation of trade.

VICTORY OVER EUROPEAN RIVALS

In 1527, Suleiman had over 80,000 trained men in military service and with better guns and horsemen than his European rivals, the Ottomans quickly seized Belgrade after the BATTLE OF MOHÁCS and moved on to lay siege to Vienna in 1529. But Suleiman failed to defeat his main rival CHARLES V, the Holy Roman Emperor, or to take Vienna. As the Ottoman troops retreated from the city they were reputed to have left sacks of coffee, already popular among the Ottoman urban elite and a commodity that would soon enjoy widespread favor in the west as well. Although Suleiman also failed in the attempt to take Malta, he ruled all of the Balkans and Hungary, as well as most of the territory around the Black Sea, the eastern Mediterranean, Egypt, and much of North Africa. He rebuilt the walls of Jerusalem, parts of which still stand.

The Austrian diplomat Ogier Ghiselin de Busbecq described in lavish detail the grandeur of the Ottoman court under Suleiman. Europeans praised Suleiman’s serious demeanor and culture, as well as his ability to discuss literature and philosophy in several languages. A contemporary of the other great monarchs of the age, Charles V of Spain, Francis I of France, and HENRY VIII of England, Suleiman made practical alliances with Francis I to counter the power of Charles V and was a major participant in European diplomacy.

MARRIAGE

Suleiman married a favorite slave from Russia, Hurrem Haseki (The Joyous One), known in Europe as Roxelana. Suleiman was deeply in love with Hurrem, and he wrote her moving love poems under the penname of *muhibbi* (beloved). However, Hurrem, as well as her mother-in-law and a rival wife, became powerful political forces in their own right and plotted ruthlessly for their particular favorites to become Suleiman’s successor. Hurrem outmaneuvered her rivals so that her favorite son, SELIM II, would become sultan. Believing Hurrem’s allegations about intrigues by his more capable sons, particularly Mustapha, Suleiman ordered their murders.

Suleiman was devastated when Hurrem died and had the famed Ottoman architect ABDUL-MENAN SINAN build a magnificent mausoleum in her memory. Sinan also designed the massive Suleimaniya complex in Istanbul as a lasting monument to the great sultan.

Although already in his 70s, Suleiman again led his troops into battle in what became another failed attempt to take Vienna in 1566. After the ailing Suleiman died on the battlefield, his commander kept the death a secret from the troops, who kept on fighting, until Suleiman's son, Selim II, had been safely installed as the new sultan. Selim inherited an empire at its zenith of power but failed to equal his father's distinction as either an administrator or military leader.

JANICE J. TERRY

Sunni Ali

(d. 1492) *founder of West African Songhai dynasty*

Sunni Ali was an African ruler who founded the SONGHAI EMPIRE in the 15th century. He was the hereditary ruler of the kingdom of Songhai, which existed from the 11th century and was centered in the city of Gao on the Niger River in the southeastern part of the present-day Republic of Mali. In 1335, Gao, as the kingdom was also called, fell under the influence of Mali, the predominant Sudanic state of the time. (The Sudan is the grassland region of West Africa between the forest area of West Africa and the Sahara, on a south-north axis. It extends from the Atlantic Ocean on the west to the Red Sea on the east.) Mali had been the dominant regional power since the mid-13th century.

After Sunni Ali ascended the hereditary throne of Gao in 1464, he transformed the kingdom of Gao into the empire of Songhai, even though the Songhai people were a numerical minority in the new empire he created. At its height in the mid-16th century, Songhai was the greatest empire in Sudanic history, with an area of more than 1 million square miles. It stretched from the Niger bend in the east (on the borders of the contemporary states of Niger and Nigeria) to the Senegal headwaters in the west and from Timbuktu and the Sahara in the north to Jenne and the forest belt in the south. In creating this empire, Sunni Ali completed by 1470 the destruction of Mali, which had been declining for about 100 years.

As in the case of the predecessor empires of Ghana and Mali, the economic basis for the empire of Songhai under Sunni Ali was the trans-Saharan trade route. This so-called Silent Trade of goods was based on a trade route that ran north-south from North Africa to West Africa. Goods from Europe and the Muslim world, such as cloth and salt, would be exchanged for gold derived from West African mines at Wangara and Bouke (in the present-day Ivory Coast). The traders from the north would leave their goods on a riverbank. If the gold miners from West Africa approved of the amount, they would leave gold and take the goods. The gold would be deposited the next day on the riverbank for the traders from the north. Usually no words would be exchanged in these transactions. Songhai benefited from the tariffs imposed on these goods, which passed through its territory.

In establishing his empire, Sunni Ali made use of his well-armed cavalry, which was very efficient. His army also had an infantry. In addition, Sunni Ali developed a powerful navy, a fleet of ships manned by Sorko fishermen (the people who had cofounded Ghana). In 1468, he ousted the nomadic Tuareg from Timbuktu, the major Sudanic city between the Sahara and the Sudanic belt. In the process, he pillaged the city, an oasis of Muslim learning as the headquarters of the famous Islamic university of Sankore, and killed many priests and scholars during these attacks, thereby earning the enmity of the Islamic establishment. In contrast, his conquest of Jenne, although prolonged, was less violent. Utilizing the navy and siege engines, he took seven months and seven days to complete the blockade of the city. Jenne was the southern counterpart of Timbuktu as it was the connecting link between the Sudanic belt and the forest belt.

After 1480, Sunni Ali had established his empire and stepped up military campaigns against nomadic peoples who threatened the economic basis of the empire. The Tuaregs who menaced Timbuktu were harassed. The Mossi who sacked the gold town of Wangara were similarly harassed and driven back into their Upper Volta homeland between 1483 and 1486. (Until gold and silver began to arrive in large amounts in the mid-1500s from Mexico and Peru, West African gold was the major source of coinage for Europe and the Middle East.) The Fulani were also pushed back to their home territory in northern Niger, Guinea, and Senegal. In fact, Sunni Ali drowned in 1492 after an expedition against the Fulani.

The empire that Sunni Ali founded lasted in part because of the administration he developed. The conquered territories were made into provinces whereby

their hereditary rulers became governors of the newly created vassal states of the empire of Songhai. Therefore, the empire that Sunni Ali created was a centralized state with some degree of local autonomy for outlying areas. In addition, places like Timbuktu and the Muslim provinces received special government.

It was Sunni Ali's lukewarm practice of Islam that incurred the wrath of the *ulema*, the Muslim scholars. He was only nominally Muslim and did not neglect traditional Songhai religious practices, which his own people continued to observe. He also did not make Islam the state religion. These actions, in combination with the sack of Timbuktu, earned him enduring hostility from Arab/Muslim historians. This enmity was a cause for the overthrow of Sunni Ali's dynasty the year after his death.

NORMAN C. ROTHMAN

Swiss Confederacy

Modern Switzerland dates from 1848. Previously, its government was based on an agreement or confederacy among three Swiss cantons in 1291. Between the 11th and 13th centuries, new technology had opened up Alpine passes and with this, trade appeared. This whetted the appetite of ambitious dynasties, especially the HABSBURGS, based originally in northern and central Switzerland, to attempt to control the trade, which meant control of the cantons. In response, the rural forested cantons of Uri and Schwyz (from which the name *Switzerland* derives), which had received judicial autonomy from neighboring counts and dukes and were directly under the Holy Roman Empire (Germany, northern Italy, Bohemia, the Low Countries, and parts of eastern France) joined, with the district of Unterwalden to form the confederacy.

They felt threatened by the encroaching Habsburg power and joined to defend one another. Victories at Morgarten (1315), Sempach (1386), and Nafels (1388) caused the Habsburgs basically to abandon their designs on Switzerland and concentrate on their new seat of power in Austria.

The military successes encouraged the expansion of the confederacy or confederation beyond its rural forested core during the 14th century, including the cities of Luzerne/Lucerne, Zurich, and Berne, so that by 1400 there were eight members and by 1460 much of what is now northern and central Switzerland was included. By that date, the confederacy had reached the Rhine.

The golden age of the confederacy came between 1475 and 1515. It was instrumental in the defeat of Charles of Burgundy, who aspired to reestablish a middle kingdom between France and Germany. In 1499, it received de facto if not de jure independence from the Empire (Germany). Its initial success in the Italian wars added towns in southern Switzerland such as Lugano and Locarno under the confederacy. After their defeat by the French at Marignan in 1515, the confederacy ceased to be a major military power, although individual Swiss acted as mercenaries for centuries. By this time, there were 13 members, including Basle.

THREE CENTURIES OF NO EXPANSION

For the next three centuries, there was no official expansion of the old Swiss Confederacy, although French-speaking districts in southwestern Switzerland, such as Fribourg, Geneva, Vaud, and Valais, were in alliance with it, as was the partly French-speaking Neuchâtel. In addition, the partly Italian-speaking canton of Grisons in the southeast, as well as the Italian-speaking Ticino, became associated with the Swiss confederation. In 1648 the Swiss Confederacy received the formal recognition of its independence from the Empire. Ultimately, the French-speaking areas that had been associated with the confederacy entered as full cantons after the Napoleonic Wars, in 1815.

At the same time, Grisons and the Italian-speaking areas that had been subordinate to the older Swiss cantons received full rights and were admitted as equal cantons with splits in existing cantons raising the total to the present 22. It was at this time that the country became officially known as Switzerland. At this date, the country achieved its present frontiers and went from an exclusively German-speaking land to a country in which approximately 30 percent of the population was French- and Italian-speaking and on equal terms with the German majority.

Nonetheless, the country remained a confederacy or confederation in structure. Each canton had its own form of government whether democratic, oligarchic, or absolute; each could impose its own internal customs duties; and each could make its own alliances within and without the confederacy.

As a result, tensions ran high during the period of 1815 to 1847 between the liberal, urban and mostly Protestant cantons and the traditional rural and mostly Catholic cantons. Eventually, disagreement came to a head when the Catholic cantons objected to the suppression of the monasteries and formed an alliance called the Sonderbund (after its seven members). The federal diet declared this alliance a violation of the 1815 constitution and war broke out. The Sonderbund was defeated, and in 1848 a new constitution was adopted that had the effect of ending the old structure of the confederacy.

TWO CHAMBER ASSEMBLY

In place of the old Swiss Confederacy diet composed of representatives of the cantons, there was a two-chamber assembly, with one chamber composed of representatives of the people and the other chamber composed of representatives of the cantons. (It was modeled on the U.S. system.) Unlike the old confederacy, there was a relatively strong executive chosen at the federal level called the Federal Council. It was composed of seven members

chosen by the assembly for three years and not by the cantons. Also unlike the old Confederacy, economic power was placed at the center so that individual cantons could no longer make separate economic arrangements. Changes in the constitution and other matters of national interest were decided by plebiscite and referendum voted on by all of the citizens not through the decisions of various cantons as in confederacy days.

The Swiss Confederacy lasted from 1291 to 1848. It came into existence as the result of new economic and political developments in the High Middle Ages; it ended because of new economic and political developments associated with the evolution of the nation-state in modern times. The old confederacy with 13 cities and small village communities dominating a country was no longer feasible.

NORMAN C. ROTHMAN

Tabin Swehti

(1512–1550) *unifier of Burma*

Tabin Swehti was the Burmese king who helped to unify the country as part of what is known as the Second Burmese Empire or the Toungoo dynasty, created by his father, Minkyinyo, in 1486 and lasting until 1752. However, it was Tabin Swehti who was responsible for unifying the kingdom and identifying and adopting cultural institutions under which the country and its people could live together.

Burma was divided into territories held by different ethnic minorities, principal among whom were the Burmans, the Shans, and the Mons. Tabin Swehti was a member of the numerically largest Burman group but he recognized the need to forge a sense of national unity to persuade the Mons in particular that they should be part of his state. He ascended the throne in 1531 and at once set out to defeat the Shans in Upper Burma. The Shans were members of the Tai family, which had migrated to the region. Having achieved this goal, Tabin Shwehti established his capital at Toungoo on the river Sittang and then dispatched a military campaign to conquer the Irrawaddy delta region and, in particular, the Mon capital of Pegu. By 1544, he had not only achieved this but defeated a Shan counterattack at Prome to the north and arranged for his coronation as king of all Burma at the ancient city of Pagan. This represented the peak of Tabin Swehti's career for he was later defeated in his next two campaigns, first against coastal Arakan

to the west and then against the rebellious Siamese Tais of Ayutthaya, bolstered by Mon refugees from Pegu. Disappointed, the king is said to have turned to drink for consolation and was assassinated in 1550. He was succeeded by his brother-in-law and chief general, Bayinnaung, who was responsible for extending Burmese power to an even greater extent. Nevertheless, Tabin Swehti is credited with uniting regions of Burma that had been torn apart since the Mongol invasion in the second half of the 13th century.

Tabin Swehti's conquest of the Mons was long and bitter. Pegu was only taken after recourse to a stratagem after four years of bitter conflict. He recognized that the Mons had a high culture (and had enjoyed a period of independence of their own since the Mongol conquest) and did what he could to conciliate them. This inspired him to take up a number of Mon practices and cultures, including adopting the Mon hairstyle. His legacy was to provide a unified state that formed the basis of further expansion and the reduction of internecine conflict.

JOHN WALSH

Taj Mahal

There are very few buildings in the world more famous than the Taj Mahal, a queen's mausoleum in Agra, India. The sense of romance that the Taj Mahal invokes was developed as a result of British fascination with this structure during the late 18th century and has continued into the 21st century.

This monument was built by the Mughal emperor SHAH JAHAN after his favorite wife, Mumtaz Mahal, died while giving birth in 1631. Shah Jahan was deeply affected by her passing, and her body was carried from Burhanpur to Agra to be entombed until the completion of the Taj Mahal.

In 1631, Shah Jahan began the construction of the Taj Mahal. Despite the fact that a massive labor force was involved in its construction, it took approximately 17 years to complete the main structure. A small village of artisans was created near the site in order to accommodate their immediate needs. In fact, many of the materials used for the construction of the Taj Mahal originated from China, Egypt, and Tibet, and a large number of people were involved, including Europeans.

The layout of the Taj Mahal has symbolic meaning; its main gate symbolizes a barrier between the outside world and the purity and serenity of the inside world. It is constructed of white marble, the color of purity. The use of water in the garden also symbolizes purity, emphasizing the belief that the Taj Mahal is a holy site. As one enters the heart of the mausoleum, Islamic prayers can be read above the doorway, which are recited before a person of the Islamic faith dies. It has been rumored that Shah Jahan wanted to con-

The Taj Mahal, the most famous monument in India, is a mausoleum built by Mughal emperor Shah Jahan as a loving tribute to his wife.

struct a black marble mausoleum for himself beside his wife's. But his son and successor, AURANGZEB, did not fulfill his wishes, and he was buried in a separate crypt beside his wife. The architecture and decorating of the Taj Mahal epitomized the highest achievement of the Indo-Islamic artistic style.

BRIAN DE RUITER

Teresa of Ávila and John of the Cross (1515–1582 and 1542–1591) *religious reformers*

Juan de Yepes y Álvarez, later known as John of the Cross, was born in 1542 in Fontiveros, a small town north of Ávila, Spain. John's father died when he was three and his mother was left to provide for her three sons, one of whom died in childhood. From the age of nine to 22, John lived in Medina del Campo, where he was fortunate to have the help of Don Alonso de Toledo, who provided him with a job as an orderly in a hospital and who paid for his studies at the Jesuit school. In 1563, John entered the Carmelite monastery of Santa Ana in Medina del Campo; from there he was sent to study for the priesthood at the University of Salamanca. He was an excellent student, yet he always found time to dedicate to prayer and to helping the poor. John was ordained a priest in 1566. A year later, he met Teresa of Ávila and, at her urging, he joined in her efforts to reform the Carmelite order in Spain.

The story of the life of John of the Cross is intertwined with the story of the life of Teresa of Ávila. Teresa was born into a well-to-do family in Ávila, Spain, in 1515. Hers was a generation when the Reconquista Christians threw out Muslim overlords of Spain. It was a time of knights, chivalry, and fierce religious devotion reflected in her own writing and ideals.

She entered the Carmelite Convent of the Incarnation in 1535. After 20 years in the convent, at the age of 39, Teresa experienced a deeper conversion and a desire

to return to the primitive Carmelite rule of Mount Carmel. The Carmelite order in Spain had lapsed in the observance of the rule of poverty, prayer, and seclusion lived out by the first hermits. Teresa felt called by God to bring about a reform in the practices of her religious order. She established her first house for nuns in 1562.

She was looking for someone to help her with the reform of the friars when she heard about John. She arranged to meet John in 1567 and convinced him to join her cause. He inaugurated the first house of Discalced (barefoot) friars in Durelo, Spain, in 1568. The friars adopted the more ascetic and contemplative observance of the primitive rule that involved a very simple lifestyle and many hours of prayer. They made some changes to the rule that allowed them to leave the monastery to preach and to hear the confessions of the nuns. John traveled extensively in his work to reform the order.

The efforts made by Teresa and John to bring about reform were met with mixed response. While many supported their efforts, some were threatened by the changes they were making. John was arrested several times by his own religious brothers. He spent nine months as a prisoner in a six-by-10 room at the monastery of the Carmelite friars in Toledo. During his imprisonment, John composed some of the poetry for which he would later be famous. After his escape from prison, John was elected superior of the Monastery of Calvario. For the next eight years, he served as superior of various houses of the Discalced friars in Andalusia, traveling extensively in his efforts to support the reform. In 1589, he left Granada and went to Segovia, where he lived until he became ill in 1591. As a result of the painful medical practices of his day and the scandalous neglect of the prior who held an old grudge against him, John's condition worsened. He died at the age of 49 in the year 1591. His body was moved in 1603 to Segovia, where it still resides.

SAINTHOOD DECLARED

John was declared a saint by the Catholic Church in 1726, and he was made a doctor of the church in 1926. He is best known for his poetry and prose reflecting his spiritual wisdom and his profound, very personal relationship with God. His major works are four books that consist of prose commentary on four of his most famous poems: *The Ascent of Mount Carmel*, *The Dark Night*, *The Spiritual Canticle*, and *The Living Flame of Love*. The remaining of John's correspondence with others gives a taste of the personal, affectionate relationship that he had with those he counseled. John was

an artist, a mystic, and, above all else, he was a lover of Christ, who lived a life of charity and service to others.

Teresa is most known for her instruction on spirituality and prayer. Her most important works include *Interior Castles*, *The Way of Perfection*, *Foundations*, and her own account of her life. All of the correspondence between John of the Cross and Teresa of Ávila has been lost or destroyed.

SUSAN CUMMINS

Thirty Years' War

The Thirty Years' War was a series of wars, escalating from armed clashes of German princes to military confrontations involving all major European monarchs from 1618 to 1648. It was a crucial stage in the ongoing European wars of religion between Catholicism and Protestantism. It was also the first civil war in continental Europe that mixed religious conflict with traditional princely territorial ambitions and emerging sentiments of national unity and transnational geopolitical balance of power.

In 1617, Ferdinand of Styria (1578–1637), the Habsburg heir apparent to the imperial throne of the HOLY ROMAN EMPIRE, was elected to be king of Bohemia. The Calvinists, the majority in Bohemia, revolted against their new Catholic king. In May 1618, a group of Calvinist noblemen threw the two most hated Habsburg councilors from the Hradschin Castle's window into a ditch, severely injuring both. This incident, termed the "defenestration of Prague," put the Calvinists in temporary control over Bohemia and spread the religious conflict into surrounding principalities.

In 1619, Ferdinand succeeded to the throne of the Holy Roman Empire as Emperor Ferdinand II. In Bohemia, the Calvinists openly rejected Ferdinand as their king and offered the Crown to Frederick V of the Palatinate. In response, Ferdinand II secured support from the papacy and the Catholic kings of Spain

and Poland and formed an alliance with Maximilian I, duke of Bavaria (1573–1651) and leader of the German Catholic League. In November 1620, Catholic forces invaded Bohemia and defeated Frederick's Union at the Battle of White Mountain. The Bohemian phase of the Thirty Years' War ended with Catholic victory in 1623. Emperor Ferdinand recovered his Bohemian throne, and Maximilian acquired Palatinate after Frederick was deposed and his Union dissolved.

In 1625, as the triumphs of the Catholic forces enabled Ferdinand to restore centralized monarchical power over Austria and Bohemia, Christian IV (r. 1588–1648), Lutheran king of Denmark and duke of Holstein, intervened to rescue the German Protestants. However, his army was no match for the Catholic League. Ferdinand secured assistance not only from Tilly, but also from Albrecht von Wallenstein, a Bohemian nobleman, who was a Lutheran by birth, then a converted Catholic, and now an ambitious mercenary with an eye on the Bohemian Crown lands.

After a series of military victories, Tilly and Wallenstein scattered the renegade German princes and compelled Christian IV to make peace in 1628. The Danish phase of the war ended again with Catholic victory. In 1629, Emperor Ferdinand issued the Edict of Restitution. The edict outlawed Calvinism, restored the former ecclesiastic territories to the Catholic Church, and restricted the right of legal appeal to the imperial diet by the Protestant princes.

The edict alienated the German Protestant princes. Meanwhile, the alliance between Spain and the Empire alarmed Lutheran king Gustavus Adolphus of Sweden (r. 1611–32) and King Louis XIII of France (r. 1610–43) and his chief minister, ARMAND-JEAN DU PLESSIS, DUC AND CARDINAL DE RICHELIEU. In the summer of 1630, the Swedish king, encouraged by the French Cardinal Richelieu and supported by the German Protestant princes, invaded Germany. After winning a few noteworthy battles in the early stage, he crushed Tilly's Catholic League army in the battlefield at Breitenfeld in September of 1631.

Facing this defeat, Ferdinand was forced to turn to Wallenstein, who had been disgraced by the German Catholic powerhouses for his greedy and fast expansion of personal power. In November 1632, Wallenstein led his newly formed army, engaged the Swedish force at the Battle of Lutzen, and killed King Gustavus Adolphus on the battlefield. He then entered into a secret negotiation with the Swedes. Because of his treachery, Ferdinand deprived him of his command and ordered his assassination in February 1634. The Swedish phase

of the war ended with the Treaty of Prague of 1635, under which the Edict of Restitution was suspended and the Empire's constitutional order was restored to pre-1618 conditions.

Louis XIII and his cardinal became increasingly disturbed by any possible settlement that would give the Habsburgs in Europe opportunities to mount attacks against France—from Spain in the south, the Netherlands in the north, and from a number of Habsburg territories in the east. A few days before the Treaty of Prague was finalized, France declared war on Spain. In retaliation, Spain invaded France and defeated Sweden, the French ally, at the Battle of Wittstock in 1636. Meanwhile, the German Imperial armies, now combining the Catholics and the Protestants allied with a new sense of national unity, marched into France, forcing the French back in Alsace and Lorraine, ravaging Burgundy and Champagne, and threatening Paris. The French, supported by Dutch Protestants, carried out a few successful counterattacks but could not gain a clear advantage over the enemy.

However, the deaths of Emperor Ferdinand (1637), Cardinal Richelieu (1642), and Louis XIII (1643) gradually slowed down the momentum of the war, and both the new emperor Ferdinand III and the new cardinal Mazarin under the child king LOUIS XIV began to work toward a peace settlement in 1643. The German people, after suffering from three decades of havoc of war, political treacheries, religious bloodshed, and economic devastation, had to live miserably for another five years to see peace.

The Peace of Westphalia was finally reached in October 1648, composed of a set of treaties among the enemies in the Thirty Years' War. It reorganized Germany into a very loose confederation with a unified diet and unified army. The emperor remained in place symbolically as feudal overlord for the purpose of recognizing and protecting "German Liberties." The peace legalized Calvinism, gave it equal status as Catholicism and Lutheranism, and recognized the rights of religious minorities in the electorates and principalities. In short, the peace treaties announced little new but redrew a constitutional framework, which would guarantee a decentralized Germany for another two centuries. However, the territorial changes defined in the treaties did help the rise of Prussia to challenge the traditional authority of Habsburg Austria in the Holy Roman Empire.

In Europe, the peace marked the rapid decline of support for prolonging the ongoing wars of religion, and fresh sentiments of national unity, national interest, and national defense would gradually reshape European

peoples and states. It also helped promote transnational cooperation and alliance. The immediate consequences of the Thirty Years' War in European geopolitics were the isolation and decline of Spain and the rise of France as the dominant power till the French Revolution at the end of the 18th century.

tobacco in colonial British America

Tobacco is an herb native to the Americas. It is believed to have originated in South America. In 1535, Jacques Cartier found natives on the Canadian island of Montreal using tobacco. The root of the word *tobacco* comes from the native word for pipe or instrument used to consume tobacco among some native people.

Sir John Hawkins took tobacco to England about 1564 although some Englishmen may have been smoking tobacco before this. In less than two centuries, tobacco was the most important export of the English colonies in North America. It remained a main export of the United States until the addictive and destructive effects of tobacco use became widely understood in the 20th century.

Among natives of the Americas, tobacco use generally had a ceremonial aspect. There is disagreement whether tobacco was always ceremonial or was used in everyday life among indigenous Americans. Because Native Americans believed tobacco was a gift from the spiritual world, they used it as a healing herb. Tobacco was used for toothaches and earaches and as a painkiller and antiseptic. Tobacco was an important gift item to seal commitments and social arrangements among Native Americans. In North America, a pipe was generally used in tobacco ceremonies.

GROWTH OF COLONIES

The future of the colonies in British North America, especially Virginia, grew because of the production of tobacco. Tobacco production affected the economic, social, and geographical development of much of the southern United States. John Rolfe of JAMESTOWN colony in Virginia in 1612 was the first to find a means of curing tobacco so it could withstand the trip across the Atlantic to Europe. Sailors spread the habit of pipe smoking to northern Europe. When tobacco was introduced into European society, it became popular as a medicinal herb. SIR WALTER RALEIGH persuaded Queen ELIZABETH I to smoke tobacco in 1600. Although tobacco growing soon began in many parts of the world, including Europe, the British North American colonies soon became the primary source of tobacco for much of the world.

The English obtained tobacco by growing it in their colonies. King JAMES I of England was one of the first to label smoking a filthy, unhealthful habit of lazy people. However, his dislike of tobacco did not prevent him from collecting taxes on the importation of tobacco into England. The Spanish Inquisition banned two other Native American drugs, COCA and peyote but, as had King James I, respected the revenue tobacco brought to Spain and did not ban it.

When the Dutch discovered tobacco, they saw it as a bond with the other major Protestant country of Europe, England. Unlike the English, the Dutch sought to gain tobacco by trading for it. The Dutch focus in the New World became setting up trading posts to buy

tobacco rather than establishing colonies to grow it. The production of tobacco was highly labor intensive. At first, indentured servants from Europe labored to produce tobacco but by 1675, African slaves replaced them. Besides labor, the production of tobacco required large amounts of land.

The coastal areas of Virginia and MARYLAND had lost nine-tenths of their Native American population in a smallpox epidemic in 1617–19. This left land open for the cultivation of tobacco. As indentured servants won their freedom, they too became tobacco growers. Soon the North American colonists needed more land to grow tobacco. Tobacco quickly removes the nutrients from the soil in which it is grown. Colonists traded with Native Americans for their land and forced the native population farther from the Atlantic coast.

While the tidewater colonies of Virginia and Maryland were engaged in growing tobacco, some northern colonies were forbidding the use of tobacco. In 1632, the Massachusetts Court of Assistants and General Court levied fines on persons caught “taking” tobacco. Later the colonies of NEW NETHERLAND (now New York) banned smoking. Connecticut banned the public smoking of tobacco in 1647. Some bans on smoking were more concerned with the danger of fire caused by smoking materials. The Articles of Piracy had rules controlling the smoking of an open pipe on board a pirate ship.

The Navigation Act in 1651 allowed only English ships to import tobacco into England. This angered the Dutch, the Scottish merchants, and the colonies. The Second Navigation Act of 1660 required colonists to sell tobacco only to the English. Fully 90 percent of all tobacco imported to Europe came through England. These acts were the beginning of what the colonists in BRITISH NORTH AMERICA would see as tyrannical treatment by the British government.

USED AS CURRENCY

The value of tobacco was so high and reliable that it was used as currency in the colonies. When inferior-quality tobacco appeared in North American exports, Virginia enacted the Inspection Act of 1730. This regulation of export of tobacco required the product to pass through government-controlled warehouses, where it was inspected and approved for export from Virginia. The size of hogsheads, the barrels in which tobacco was packed, was also regulated. Soon Maryland enacted its own inspection acts.

Since the planting of tobacco quickly exhausted the land, land was not the measure of wealth; rather wealth

resided in the number of slave laborers a family owned. Most people who owned land owned slaves. Unlike slave holders in the Caribbean, North American colonists encouraged their slaves to have children. Slaves were not viewed as an expendable commodity. Tobacco was one reason why the culture of the southern colonies was different from that of the northern colonies. Villages were less important in tobacco-growing areas because people had to live farther apart. Landowning families often controlled the local government, unlike in the more democratic communities in New England.

NANCY PIPPEN ECKERMAN

Tokugawa *bakuhan* system, Japan

The Tokugawa shoguns were the de facto rulers of Japan from 1603 to 1867, when emperors, symbolic rulers of the country, bestowed the title of shogun on the Tokugawa clan. After the BATTLE OF SEKIGAHARA in 1600, the first shogun, Ieyasu, instituted a form of government that established the dominance of the Tokugawa family completed under his grandson Iemitsu. They enacted laws to control Japan’s polity, society, and economy under the Tokugawas’ centralized authority. The center of the Tokugawa power was the Kanto Plain around EDO (Tokyo). The *bakufu* that they instituted unified Japan after the Warring States Era, brought peace to the land for 250 years, and created a vibrant domestic economy that flourished in a strict hierarchical society.

SOCIAL ORDER

Ieyasu’s policy to establish Tokugawa hegemony began with freezing the social order. Adapting China’s Confucian system, Japanese society was organized into four classes, in descending order, scholar-officials (samurai),

peasants, artisans, and merchants. The samurai and their families composed about 6 percent of the population. Since peace prevailed, the samurai became educated to perform bureaucratic tasks of administration and tax collection.

They were the only men allowed to carry a sword, which became a symbol of their social superiority. They were paid a stipend according to their rank by the lord, or *daimyo*, in whose domain they lived. Samurai were supposed to cultivate and follow a strict ethical code of behavior called BUSHIDO, of duty to the shogun, disciplined lifestyle, and frugal living. Peasants were to live and work on the land and could not marry with samurai. Peasants were not allowed to sell their land. Artisans worked their crafts organized in guilds, and merchants belonged at the lowest levels of society, despised for an unproductive life. There was some mobility between artisans and merchants. Tokugawa Ieyasu created their strictly hierarchical society to preempt social chaos and rebellion. Their stability may have been welcomed by the Japanese themselves as it created stability after a protracted period of warfare.

GOVERNMENT STRUCTURE

The basis of Tokugawa power was control of the land. Under the shogun were *daimyo* or feudal lords, who governed land given to them by the shogun, called *han*. Since powerful *daimyo* could pose challenges to the Tokugawa, Ieyasu immediately set about shuffling the domains of various *daimyo*; these numbered 295 but after the reallocation of lands there were reduced to 267.

About a quarter of the *han* lands were put under direct Tokugawa family control. Ieyasu redistributed the remainder among the *daimyo* on the basis of their allegiance to him. Ieyasu, Hidetada, and Iemitsu then created a structure by which Tokugawa hegemony was ensured. *Daimyo* were classified into three categories: (1) *shimpan* were members of the Tokugawa family, (2) *fudai* (hereditary nobles) were those *daimyo* who had been allied with the Tokugawa before the Battle of Sekigahara, and (3) the *tozama* (outside nobles) were those who had surrendered to Tokugawa dominance after the battle. Since *tozama* were least reliable, their *han* were strategically placed the farthest from Edo or between two *fudai* domains; the intent was to watch for any signs of rebellion.

The Buke Sho-Hatto, or Ordinances for the Military Houses, was first passed by Ieyasu in 1615 and then firmly reiterated by Iemitsu in 1635. These ordinances were a code of conduct for the *daimyo*. They

included the *sankin kotai* system, which required that every *daimyo* live in Edo every other year for a full year; if he could not do so then he had to send his family to Edo. Also, a *daimyo*'s chief wife and heir had to be left in Edo at all times as permanent hostages. The requirement was expensive for the *daimyo* because they had to travel back and forth with large retinues and also had to maintain two residences, one in their own domains, another in Edo. Marriages between *daimyo* families could not take place without the shogun's permission. The impressive castle-towns in which the *daimyo* resided, called the *jokamachi*, were put under shogunal surveillance and repairs or improvements to the castles needed permission from the shogun. Notably, the *tozama daimyos* were excluded from playing any active role in the *bakufu*.

The *daimyo* were required to model their government on that of the *bakufu*. A collective form of government developed. The shogun was assisted by councilors in administration. Usually four or five roju were selected from among the *fudai daimyo* who controlled the finances, made policy decisions, and dealt with officialdom. Theoretically, the *daimyo* were free to manage their local affairs and retain their own vassals, who received stipends in kind from them. Initially, the *bakufu* closely supervised the *daimyo*. In the first 50 years of Tokugawa rule, there were 281 cases of *daimyo* moved from one *han* to another, and 213 of domain confiscation because of misrule or lack of an heir. Later, the *daimyo* replicated the shogunal system of government in their *han*. The *bakufu*'s interference in the *hans* was reduced.

The main task of the civil officials in both *bakuhans* was to collect taxes. Rice was the primary form of taxation; the unit of rice, called *koku*, was equal to 4.97 bushels. The *bakufu*'s landholdings yielded 7 million *koku* out of the total 30 million *koku* produced nationwide; hence it enjoyed the most revenue. The common people lived on five *koku* of rice per capita per annum. The *bakufu* reserved the right to control all matters related to foreign affairs, minting and distribution of gold and silver coins, and interhan transportation. The machinery for collecting taxes was small and efficient. The *bakuhan* levied taxes on an entire village; it was decided within the village what each household paid as taxes. Junior-ranking samurai oversaw the collection of taxes. Nearly all the taxes were deposited to the *bakufu* and *han* treasuries.

The *bakufu* is military force. It consisted of samurai recruited from Tokugawa lands. These were divided into two categories: 5,000 standard-bearers who

enjoyed high rank, and 18,000 middling rank and footsoldiers. In addition, the *daimyo* were required to provide armies and ammunition whenever the shogun needed them, which was infrequent. Samurai were used more for policing than as active warriors throughout the era. Fudai and Shimpan *daimyo*, and their samurai, kept watch over the *tozama* domains for a possible challenge to Tokugawa authority.

The *bakuhan* system remained largely unchanged from the 1600s into the 1860s, an era of stability, economic growth, and peace internally and externally. There were only local rebellions, easily suppressed. However, the shogunate was never able to tame the *tozama daimyo* and it was the *han* of Choshu, Satsuma, and Tosa who eventually challenged the Tokugawa in the 1860s, bringing the Edo era to an end.

JYOTI GREWAL

Tokugawa Hidetada

(1579–1632) *Japanese ruler*

The second shogun of the Tokugawa family, Hidetada lived in his powerful father's shadow until the latter's death in 1616. He was TOKUGAWA IEYASU's third son; his two older brothers had died, making him Ieyasu's successor. Hidetada nominally assumed the title of shogun in 1605 when his father voluntarily retired, but as long as Ieyasu lived, Hidetada's role was to learn from and implement the policies of his father. He was a careful student, who watched his father build his realm for the family and the *bakuhan* system. Among Hidetada's achievements were the continued organizing of the Bakufu and development of domestic commerce. Both of these ensured the Tokugawa family's political and economic dominance in Japan.

In 1614–15, Hidetada helped his father in leading a victorious campaign against Osaka castle that ended the residual power of the Toyotomi family. From 1616

onward, he boldly tamed the domains of vassals who might challenge his authority. Domestic commerce grew with the expanded control of Hidetada's government. However, he was highly suspicious of foreign traders, missionaries, and those Japanese who had converted to Christianity.

Tokugawa Hidetada reinforced Ieyasu's ban on Christianity. In 1617, he had four missionaries executed. He later ordered the execution of 120 missionaries and Japanese Christians and banned any import of books related to the Christian religion. Hidetada's severe reservations about all things foreign extended to their trading ships as well. In order further to regulate foreign presence, he ordered all foreign ships, other than Chinese, to dock only in the ports of NAGASAKI and Hirado.

The British had already pulled out of Japan because of nonprofitable trade relations. Hidetada severed all relationships with the Spanish, of whom he was highly suspicious because of their Christian influence. Hidetada effectively isolated Japan, a stance his son terminated when he became shogun.

Hidetada had established a relationship with the imperial family through the marriage of his daughter to a member of the royal family. This relationship further solidified the base of the Tokugawa family. In 1623, Hidetada abdicated in favor of his son Iemitsu but continued to influence policy of the *bakufu* as retired shogun until his death.

JYOTI GREWAL

Tokugawa Ieyasu

(1542–1616) *Japanese ruler*

Tokugawa Ieyasu was granted by the Japanese emperor, the title of shogun in 1603; his family was to rule Japan until 1867. In 1605, his son, TOKUGAWA HIDETADA, officially took the office of the shogun, but Ieyasu remained the ruler from behind the scenes until his death. Reared in an atmosphere of unrelenting civil war among different clans of Japan during the Warring States Era,

Ieyasu was a remarkable unifier of competing interests among warring vassals, and a leader who brought relative peace to a land torn by centuries of civil war.

Ieyasu is remembered for his brilliant stratagems, his compassion for those enemies who accepted his authority, his skill in managing the rivalries of his generals, his commitment to keep Japan united, and his patience. He laid the foundations of a political, economic, and social system that was to lead to a century of dynamic growth in Japan.

Ieyasu started his political career as a vassal of TOYOTOMI HIDEYOSHI, from whom he learned about governance, military planning, and management of state affairs. After Hideyoshi's death, Ieyasu led a coalition of vassals against a rival group in the bloody BATTLE OF SEKIGAHARA, where he was victorious in 1600. He later got rid of Hideyoshi's young heir. He already was the master of vast tracts of military holdings in eastern Japan. Entirely ignoring the authority of the imperial court, he established his central headquarters in EDO (Tokyo); thus, the Tokugawa period is also known as the Edo era in Japanese history. He built a massive fortified castle with huge concentric moats in Edo; it is the Imperial Palace today. From here, Ieyasu used his military strength to reorganize Japan and to establish a government system called the *bakufu*.

CENTRALIZED RULE

The system of rule that Ieyasu established was begun by his two predecessors in the 16th century. Because it was based on centralized control over *daimyo* (vassal) domains, it is called a feudal structure, though uniquely Japanese.

Ieyasu sought stability for Japan and dominance for himself among the landed aristocracy. He demonstrated administrative skill that matched his military abilities. First, he redistributed the lands of the vassals. His enemies' lands were confiscated and distributed to his allies as rewards in an organized way. He kept about a quarter of the confiscated domains under his family, the remainder distributed depending on the seniority and allegiance to other clans. The reallocation of about 265 domains ensured allegiance to the Tokugawa clan and stability.

Moreover, he placed his most trusted vassals to keep a close eye on others whose allegiance was undependable. Ieyasu issued a code of behavior called Buke Sho-Hatto, or Ordinances for the Military Houses, which limited the power of the feudatories in personal, civil, and economic spheres. It required them to seek

permission from the shogun or his representative for all important activities.

Shogun Ieyasu amassed a huge fortune for the Tokugawa clan. This included property rights over commercial cities and trading ports such as Nara, NAGASAKI, OSAKA, Kyoto, Edo, and Yamada. He also owned profitable gold and silver mines and controlled the circulation of all the gold and silver coinage in the country. In a surprising turn of events between 1611 and 1614, Ieyasu issued ordinances prohibiting all teaching and practice of Christianity in Japan, deeply affecting political and economic relations of the Japanese, Portuguese, and Dutch, and moved toward seclusion. However, this seclusion did not hurt Japan's economy, as domestic commerce was robust and vigorous.

Tokugawa Ieyasu was a wealthy but frugal man. His sense of discipline directed his efforts in ensuring calm and peace for Japan after the civil war. By the time he died at 74, he had established his family's *de facto* rule, which was to last for over two centuries. In so doing, he completed the process of reestablishing national unity by a combination of military and civilian talent that amounted to genius.

JYOTI GREWAL

Toledo, Francisco de

(c. 1520–1584) *Spanish viceroy of Peru*

The most important reformer of Spanish administration in the newly conquered Andean highlands during the early colonial period, Francisco de Toledo, in his capacity as viceroy of Peru (1569–81), was instrumental in the transition from the violence and tumult of conquest to the emergence of a mature settler society. Described by supporters and detractors alike as indefatigable, forceful, and ambitious, Toledo arrived in Peru just as the last of the civil wars among Spaniards were ebbing. His most enduring accomplishment in his 12 years as

viceroy was to strengthen and unify the colonial state under a grand design intended to consolidate Spanish rule and lay the foundations for continuing Spanish domination of the Andes and its native inhabitants.

DISTINGUISHED HERITAGE

Born in Andalusia, Spain, around 1520, Toledo hailed from one of the country's most distinguished noble families. After effectively serving CHARLES V and PHILIP II, he was selected as viceroy (supreme administrator and direct representative of the king) of the newly conquered territories of New Castile (Peru). One of his first acts as viceroy was to launch a bold five-year *visita*, or tour of inspection, of all the Andean dominions subjugated by Spain.

Accompanied by the pomp and majesty appropriate to his office, Toledo undertook a census of the entire colony; ordered the *reducción* (forced resettlement) of surviving Indian communities into Spanish-style towns under the rule of Spanish and native authorities; directed the collection of testimonies on the injustice and tyranny of Inca rule with the intention of ratifying the morality of the Spanish invasion and conquest; abolished the Inca system of *MITA LABOR IN THE ANDEAN HIGHLANDS* and in its stead imposed a new and even more onerous system of obligatory native labor and tribute; reorganized and streamlined the territory's bureaucracy and administration; revitalized the emergent mining economy, particularly the vast silver mines of POTOSÍ and the mercury mines of Huancavelica; and issued a vast corpus of laws and decrees that effectively limited the autonomy of colonial officials, *encomenderos*, and other elites while linking their fortunes ever more tightly to the well-being of the colonial state.

Intolerant of dissent or sustained challenge to Spanish rule, he also directed the invasion and destruction of the neo-Inca state of Vilcabamba, hidden for decades in one of the remotest and most inaccessible corners of the eastern highlands. His decision to execute by beheading the kingdom's captured ruler, Tupac Amaru, a sentence carried out on September 24, 1572, in CUZCO, remains among his most controversial actions, even prompting a mild rebuke from King Philip, who declared in a letter to Toledo that "some things about the execution would have been better omitted."

All of these and related measures, commonly referred to as the Toledo reforms, had the effect of centralizing and strengthening the colonial state and laying the groundwork for a mature colonial economy and society that for the next two and a half centuries would ensure Spanish domination and funnel untold

riches into Spain, thus marking Toledo as one of the most important actors in all of Peruvian history. In 1581, at the conclusion of his tenure as viceroy, Toledo returned to Spain. He died in Seville three years later.

MICHAEL J. SCHROEDER

Tordesillas, Treaty of

A modification of the papal BULL OF DEMARCATION issued in 1493 by Pope Alexander VI, the Treaty of Tordesillas (June 7, 1494) divided the recently discovered New World between its two signatories, Spain and Portugal. The treaty created an imaginary pole-to-pole meridian in the Atlantic Ocean 370 leagues west of the Cape Verde Islands, granting all lands west of the demarcation line to Spain, and all lands east of it to Portugal.

In this era of uncertain geographic knowledge, both sides recognized that the division was imprecise and unlikely to prevent future conflict. Spain reckoned that the newly discovered Indies (Caribbean) fell well within its sphere of dominion, while Portugal was mainly interested in securing its sea route to Asia around Africa's Cape of Good Hope.

Notably, the treaty was concluded six years before the Portuguese, under PEDRO ÁLVARES CABRAL, discovered Brazil (1500), though once Brazil was on the map, there was little doubt that the land fell under Portugal's jurisdiction.

Thornier problems arose once it became clear that the Indies (Americas) lay between Europe and Asia, a fact that became clear after Portuguese navigator VASCO DE GAMA's journey to India and back in 1497–99, Spanish explorer Vasco Núñez de Balboa's discovery of the Pacific Ocean in 1513, and Portuguese navigator FERDINAND MAGELLAN's journey to the Pacific around the southern tip of South America in 1520 in the service of Spain. In the wake of these advances in Europe's knowledge, Portugal refused to abide by a treaty that essentially granted all of Asia to its Iberian rival.

Thus, following a series of armed conflicts in the Moluccas and elsewhere in the Pacific, the Treaty of Tordesillas was modified in 1529 in the Treaty of Zaragoza, which continued the meridian established in 1494 onto the other side of the globe, to a position of 145 degrees east. Still, the reality remained that military might effectively determined who got what—illustrated for example by the case of the Philippines, which clearly fell within Portugal’s sphere, yet the Spanish first colonized and refused to relinquish until the United States took the island-colony in 1898. Seen in a broader context, the Treaty of Tordesillas represents the earliest instance of European powers’ carving up the globe among themselves in pursuit of their own domestic, strategic, and imperial designs, a tradition that continued well into the 19th century and after.

MICHAEL J. SCHROEDER

Toyotomi Hideyoshi

(1536/37–1598) *Japanese general*

Toyotomi Hideyoshi was a Japanese lord who completed the unification of Japan begun by ODA NOBUNAGA and launched two invasions of the Korean Peninsula.

Hideyoshi was born the son of a peasant and became a soldier in the army of Oda Nobunaga and fought in many of his major battles. In 1573, after destroying two *daimyo*, Nobunaga made him a lord of Nagahama, in Omi province. In 1587, he assumed a surname, *Toyotomi*, which means “wealth of the nation.” He continued to serve with distinction in Oda’s campaigns.

Oda was assassinated by a lieutenant in 1582, followed by a power struggle during which Hideyoshi defeated his rivals in successive campaigns, winning final victory in 1590. As a result, Japan became a unified nation after centuries of divisive wars and an ineffectual shogunal government. Despite his power, Hideyoshi did not assume the title of shogun because by tradition that office had been held by a member of the Minamoto clan. However, with a faked geneology,

he assumed high court posts, including that of chancellor, ruling from Kyoto, but also building a formidable castle at OSAKA.

Hideyoshi next decided to attack Korea as a base to invade China. In 1592, he launched his first invasion of Korea, landing his forces at Pusan. The Koreans were taken by surprise and offered only token resistance. Seoul, the capital, and Pyongyang in the north fell in rapid succession. Korea was saved by the MING government, which eventually sent about 200,000 soldiers to repel the Japanese invaders. Korean admiral Yi Sun-sin, who built the world’s first metal-plated ships, wreaked havoc on Japanese supply lines, compelling Hideyoshi to abandon his invasion. Since peace negotiations failed, Hideyoshi renewed his attack in 1597, but with his sudden death, the invading forces withdrew in 1598.

Hideyoshi left a young son, Toyotomi Hideyori. Hideyoshi attempted to ensure the boy’s survival by appointing a council of five regents. But by 1600, one regent, TOKUGAWA IYASU, had defeated his rivals to become shogun and in 1615 exterminated all of Hideyoshi’s heirs.

Hideyoshi implemented several important domestic policies. One was to take a general survey of the land as basis to assign jobs to his allies and supporters. To prevent future civil wars he ordered the confiscation of all swords from peasants and ordered that all Japanese remain in their current occupation (warriors, peasants, advisers, merchants). He also issued a ban on Christianity and attempted to regulate foreign trade; these policies would be made effective by his successor.

JUSTIN CORFIELD

Trent, Council of

The Council of Trent was the longest, and one of the most significant, of the General Councils of the Catholic Church. It met at Trent in northern Italy between 1545 and 1563 (with significant interruptions).

While there had been calls on many sides for a reforming council of the church to meet since the 15th century, this call took on new urgency with the advent of the Protestant REFORMATION. The Emperor CHARLES V, in his negotiations with the Protestant princes of Germany, had promised to work for a council, which they demanded should be held in German territory. The pope and many of the cardinals resisted holding such a meeting, arguing that the Protestants would not accede to its decisions. Moreover they tended to be suspicious of the whole idea of a council, seeing it as a threat to papal authority.

When Paul III (r. 1534–49) became pope, he began in earnest to prepare for a council. In 1536, he commissioned a group including Cardinals Gasparo Contarini (1483–1542), Reginald Pole (1500–58), Gian Pietro Carafa (1476–1559), and Jacopo Sadoleto (1477–1547) to study the problems confronting the church. Their report, the *Consilium de emendanda ecclesiae*, presented in 1537, advised reform of the papal curia, better discipline for bishops, and reform of the religious orders. The pope proposed holding the council at Mantua, and issued a bull summoning it to meet there in 1537. This proved impossible, owing to objections by the duke of Mantua, and the council was summoned instead to Vicenza in 1538. King Francis I of France, as well as the Protestant princes of Germany, objected to this proposal, and only six bishops traveled to Vicenza. The pope therefore postponed the council once again and entered into negotiations with the French king and the emperor.

Trent was selected as the location for the council because while it was in Italy and easily accessible to Rome, it was in Imperial territory, meeting the objections of both the French and German rulers to a council too much subject to papal influence. War between France and the Empire delayed the opening of the council until after peace was concluded in 1544, when Francis I also promised to allow French bishops to attend the council. The bull *Laetare Jerusalem*, issued November 19, 1544, called the council to meet at Trent on March 15 (Laetare Sunday) 1545. The opening was delayed, however, and the council was not actually opened until December 13, 1545 (Gaudete Sunday). Cardinal Pole was one of the three legates who served as presidents for the first sessions, together with Cardinal Gian Maria del Monte (1487–1555) and Cardinal Marcello Cervini (1501–55).

The first session of the council included about 40 bishops and heads of religious orders, who would be the voting members, and about 50 theologians. Most

of the bishops were from Italy and Spain; in spite of the king's earlier promise, French bishops were prevented from attending. The delegates decided to deal with decrees concerning the reform of the church's government and practices at the same time as those concerning doctrine. Although 25 formal sessions were held during the life of the council, only 12 of them produced substantive decrees, the rest being concerned only with procedure.

During the first period of the council, most of the influential theologians were members of the Dominican order, in particular Domingo de Soto (1494–1560), as well as the general of the Augustinians, Girolamo Seripando (1493–1563). The decrees issued during these sessions concerned the definition of the canon of Scripture, original sin, justification, and the sacraments, in particular baptism and confirmation.

The council defined the canon of Scripture as containing the Deuterocanonical books rejected by Protestants and declared that the church recognized both the written Scriptures and unwritten traditions. With respect to justification, the council condemned both the semi-Pelagianism of some late medieval Scholastics and the Lutheran doctrine of JUSTIFICATION BY FAITH alone, upholding the necessity for the cooperation of free will and charity. Disciplinary decrees passed during this time mandated preaching by all bishops and other clergy with pastoral offices, demanded that bishops reside in their dioceses, and forbade the holding of more than one office involving pastoral care by the same person.

In early 1547, a plague broke out in Trent, and on March 8, the council voted to move to Bologna in the Papal States. The emperor and a number of bishops supporting him refused to agree to this move, and the sessions held in Bologna produced no decrees. The council was suspended on September 14, 1547, and was still awaiting disposition when Paul III died on November 10, 1549.

Cardinal Del Monte, who had presided over the council, was elected pope as Julius III, and on November 14, 1550, he issued a bull recalling the council. The council resumed at Trent on May 1, 1551. During the next two sessions, the council issued decrees concerning the sacraments of the Eucharist, penance, and extreme unction, and reform decrees dealing with the authority of bishops over the clergy in their dioceses.

Two Jesuit theologians, Diego Lainez (1512–65) and Francisco Salmerón (1515–85), who had begun to participate in the earlier sessions, were influential during this period. The council offered safe conduct to Protes-

tants who desired to attend, but the Protestant ambassadors made demands the council would not agree to, including that it withdraw its earlier teaching. On April 28, 1552, as the war between Elector Maurice of Saxony and the emperor threatened to engulf the city of Trent, the council voted to suspend for two years.

Before Julius III could recall the council, he died on March 23, 1555. His successor was another former president of the council, Cardinal Cervini, who took the name Marcellus II. He died, however, after a reign of only 22 days. Cardinal Carafa was elected to succeed him and reigned as Pope Paul IV from 1555 to 1559 but did not recall the council. His successor, Pius IV, issued a bull recalling the council on November 29, 1560.

To bring about an actual meeting required careful diplomatic negotiations with Emperor Ferdinand I and other monarchs, which were carried out by the pope's nephew and secretary of state, Cardinal Charles Borromeo (1538–84), later renowned for implementing the council's reforms as archbishop of Milan.

COUNCIL REOPENED

The council finally reopened April 28, 1562, and the final sessions included many more bishops than had attended earlier, including a number of French bishops who had been previously forbidden to attend by their monarch. Seripando, now a cardinal, was one of the legates, and the theologians Salmerón and Lainez continued to be influential, along with a younger Jesuit, Peter Canisius (1521–97), who was particularly concerned with the church in Germany. During the last period of the council, decrees were issued concerning the celebration of Mass, the sacraments of holy orders and matrimony, purgatory, the use of images and relics, indulgences, and fasting.

As with earlier sessions, these decrees mostly upheld traditional teaching that had been attacked by Protestants. The decrees concerning marriage embodied the most significant change in the church's teaching, holding that marriage contracted without at least two witnesses was invalid, and that families could not force couples to marry or invalidate their marriages.

REFORMING DECREES

Among the reforming decrees of this period was the requirement that bishops establish seminaries for the training of priests. The application of this provision had far-reaching implications for the shape of the Catholic Church as it entered the modern period. Other decrees regulated the lives of monks, friars, and nuns; provided for the establishment of an Index of

Forbidden Books; called on the pope to issue a catechism and revisions of liturgical books; forbade dueling; and abolished the preaching of indulgences for the collection of alms, the practice that had occasioned Luther's protest in 1517.

The council held its final session over two days, December 3–4, 1563. The final acts were signed by 255 bishops and heads of orders. Pope Pius IV confirmed the acts of the council in the bull *Benedictus Deus*, January 26, 1564. The council's disciplinary reforms were implemented only slowly, since they involved overcoming the resistance of many entrenched institutions and required the cooperation of secular rulers, many of whom saw the provisions of the council as threats to their own power and influence over the church. Over the next century, however, the application of the decrees of the Council of Trent led to a radical transformation of the Catholic Church.

D. HENRY DIETERICH

Tudor dynasty

The Tudor dynasty includes the reigns of the following monarchs: HENRY VII (1485–1509), HENRY VIII (1509–47), EDWARD VI (1547–53), Queen MARY I (1553–58), and ELIZABETH I (1558–1603).

The Tudor dynasty began with the clandestine marriage between Owen Tudor and Catherine of Valois and continued the Plantagenet line, although in a much modified form. This marriage produced a son, Edmund Tudor, who was made 13th earl of Richmond in 1453. His son, Henry, was eventually crowned Henry VII after his victory at the Battle of Bosworth, ending the WARS OF THE ROSES and bringing the Tudors to power.

The Tudor dynasty, spanning from Henry VII's reign in 1485 to the death of Elizabeth I in 1603, served as the catalyst for England's maturation from a weak country in the Middle Ages into a powerful Renaissance state and encompassed some of the most dynamic and progressive changes in English history. Although marked by intermittent religious strife, this dynasty also brought the restructure of English society, the spread of capitalism, intellectual and cultural advancements, the Protestant Reformation, economic stability, the growth of nationalism, the beginnings of the Renaissance, and the birth of the Church of England. The 15th and the 16th centuries were a watershed time in English history because of a multitude of events, and the Tudor dynasty played a crucial part within the larger scope of both English and world history.

The dynasty's symbol, the Tudor rose, combined the red and white roses of the Lancastrian and Yorkist Houses and symbolized the union of the two factions, which was cemented by Henry VII in January 1486 when he married Elizabeth of York, eldest daughter of Edward IV. The Tudors began their rule among bloodshed and treason but left England a more peaceful and confident nation. As Henry VII claimed the throne of England, he was acutely aware that his succession was not absolute. Although pretenders attempted to stake claim to the throne during his rule, Henry VII managed to remain in power. His son, Henry VIII, succeeded him with no dispute regarding his right to rule.

Henry VIII's reign was highlighted by his necessity to secure the Tudors' claim to the throne through a male heir and is remembered for his wives. He married six times, producing one son and two daughters. After Henry VIII's death, his young and feeble son Edward VI ascended to the throne and ruled for a short time, dying of tuberculosis at 15 years old. Before Edward VI died, he named Lady Jane Grey, who married the duke of Northumberland's son, as heir to the English throne. She ruled for nine days until she was deposed by Mary I, imprisoned, and eventually executed.

Queen Mary's rule was punctuated by her insistence on reinstating Catholicism and her quest to have a child. A devout Catholic and wife of PHILIP of Spain, Mary returned England to Catholicism after the Protestant reigns of Henry VIII and Edward VI, reinstated the heresy laws, and commenced with burning Protestant bishops and others at the stake.

This violent act only served to rally more Englishmen to adopt the Protestant faith. At two different times Mary believed she was pregnant; however, she bore no

children. Her signs of pregnancy, a swollen stomach and nausea, were believed to be either a stomach or an ovarian tumor, and she eventually died in 1558, after naming Elizabeth heir to the throne.

Elizabeth I, the last of the Tudors, found England in disarray when she ascended the throne in 1558. Her 44-year rule provided her with the longevity and the ability to solidify England's dominance in world affairs through its development of a formidable navy that eventually defeated the SPANISH ARMADA in 1588.

By the end of her rule, religious strife had largely dissipated. The Crown possessed absolute supremacy over Parliament, but the two operated in relative cooperation. She refused to marry throughout her life, although she was inundated with marriage proposals from numerous suitors. Hours before she died, Elizabeth named James VI of Scotland to succeed her, ending the Tudor rule and ushering in JAMES I of England and the STUART dynasty.

Tudor monarchs were known as politically gifted and quite charismatic; these traits were reflected in the years that they ruled. Henry VIII and Elizabeth I most accurately embodied these characteristics within their respective rules. As Henry VIII struggled to produce a male heir, he created the CHURCH OF ENGLAND and was made both political and religious leader of England with the Act of Supremacy (1534). The Church of England was established by 1536, but its power and future were severely threatened by Mary's reign. The Elizabethan Religious Settlement, drafted in two parliamentary acts, deftly settled this continuing religious feud. The Act of Supremacy (1559) reestablished the Church of England's independence from Rome. The Act of Uniformity (1559) set the order of worship to be used in the English BOOK OF COMMON PRAYER and required every man to attend church once a week or face a monetary fine. The Tudor dynasty changed England from a disjointed nation into a cohesive international power.

Valdivia, Pedro de

(c. 1500–1553) *Spanish conquistador*

Pedro de Valdivia, a Spanish conquistador, is best known as the conqueror of Chile. He was born about 1500 at La Serena, Estremadura, Spain. He joined the Spanish army at a time of near constant warfare in Europe. As a soldier in the army of CHARLES V of Spain, Valdivia fought for the HABSBURG empire in the Italian Wars. He saw action at Flanders and at Pavia in 1525. The Battle of Pavia is particularly notable as the first major modern battle, illustrating the shift from knights in armor and crossbowmen to cannons.

Valdivia went to the New World in 1535. He took part in the prolonged conquest of Venezuela and then joined FRANCISCO PIZARRO, the conqueror of Peru, in 1532. Conspicuous among the conquistadores for his learning and conceit, Valdivia became the most distinguished officer and the highest in rank in Pizarro's government. He commanded Pizarro's forces at the 1538 Battle of Las Salinas, a struggle between Pizarro and other conquistadores for control of the city of CUZCO.

Pizarro was a notoriously difficult man to the point where he was eventually assassinated by his fellow Spaniards, but Valdivia displayed an ability to get along with the conqueror and became his favorite. He received the title *maestro del campo*, or chief officer of staff, and appeared set for a prosperous life in Peru. However Valdivia had an ambitious nature. He wanted both an independent position and a territory of his own.

He picked Chile for reasons that baffled the other Spaniards. Chile had such a bad reputation after the failed expedition of DIEGO DE ALMAGRO that public opinion in Peru held that the land could not feed 50 Spaniards; there was no wealth to be had in Chile. Nevertheless, Valdivia sought Pizarro's support to explore and conquer the land. In exchange, he surrendered his valuable *ENCOMIENDA* and a silver mine at Porco.

In 1539, Pizarro named Valdivia as lieutenant governor of Chile and Valdivia set out to claim his territory. Valdivia had great trouble recruiting men to accompany him in part because he possessed little property. The commander of an expedition in this era had to pay all the expenses involved with the movement of troops. Since Valdivia had little money, he could afford only a small force. He left Cuzco in January 1540 with between five and 20 Spanish soldiers, his mistress Inés de Suárez, and a Native American auxiliary force of about 1,000 men. Along the route to Arequipa, other Spaniards joined him. At Tarapacá, Valdivia waited for additional reinforcements, but when the army finally set out across the Atacama desert, it numbered fewer than 100 Spaniards including two priests. Valdivia marched south with the items deemed most useful for colonization—European grains, principally wheat; domestic animals, especially pigs and fowl; and a collection of agricultural implements.

After 11 months of hardship, skirmishes with Indians, and internal conflicts, Valdivia's forces arrived in the valley of the Mapocho. Almost immediately they were attacked by an Indian army led by the local chief,

Michimalonco. The Spaniards eventually drove off the Indian warriors. At Copiapó, seven months after Valdivia's journey had begun, he took possession of Chile in the name of the Spanish Crown. Soon after, he convinced the local Indians to aid in the construction of Chile's first European-style city, Santiago, in February 1541. Less than a month later, Valdivia created a *cabildo* (governing council), which in turn, called upon Valdivia to make himself governor of Chile in the name of the king of Spain rather than as Pizarro's lieutenant. After perfunctory objections, Valdivia agreed. Unfortunately for the Spaniards, on September 11, 1541, the ARAUCANIAN Indians (SOUTHWESTERN SOUTH AMERICA) attacked Santiago and burned it to the ground.

The war for Chile would consume the remainder of Valdivia's life. He spent the next years pushing south from Santiago, warring against the Araucanians, and establishing a number of fort towns including Concepcion, La Imperial (present-day Carahue), Valdivia, and Villarrica. With the creation of each city, Valdivia handed out *encomiendas* to selected conquistadores, thereby granting them authority to collect tribute from the Indians in their jurisdiction and take charge of the process of Christianizing the Native Americans. Religious orders were also granted *encomiendas* by the conquistador. Since the indigenous Chileans had little accumulated wealth, tribute typically took the form of forced labor in the mines or gold washings.

Not surprisingly, the Indians put up a fierce resistance to enslavement. In 1548, Valdivia received aid and reinforcements from Peru, raising the number of Spaniards in Chile to 500 men. It would not be enough, since the Spanish troops were stretched so thinly throughout the country. On December 25, 1553, the Araucanians were under the command of Lautaro, a former groom of Valdivia's who had acquired knowledge of Spanish tactics and weaknesses during his time as a slave. Lautaro lured Valdivia into a trap. The Araucanians defeated the Spaniards in the Battle of Tucapel, killing Valdivia and all 50 of the men who had accompanied him. Although legend holds that the Indians captured Valdivia and poured molten gold down his throat in reference to the wealth that he so brutally sought, it is more likely that his decapitated head ended up on the point of an Araucanian lance. This was the Indians' customary treatment of conquered enemies.

Following Valdivia's death, most of the Spaniards fled southern Chile for Santiago. The Spanish remained in a presence only at the fort of Valdivia. Chile remained in a constant state of war until the 17th century.

CARYN E. NEUMANN

Valois dynasty

The branch of the Capet family who ruled France from 1328 to 1589, the Valois, descended from 1285 when Philip III gave the county of Valois to his brother Charles. Charles's son succeeded to the throne of France when the direct male line of the Capets failed in 1328. The succession was challenged by the English king Edward III, who claimed a closer link to the Crown via his mother, the sister of the last king. This was one direct cause of the Hundred Years' War.

There were three branches of Valois kings. The first was the direct line, reigning 1328–1498. The second was the Orleans branch, which reigned in the person of just one monarch, Louis XII. This branch dates to 1392 when the younger son of Charles V, noted poet Louis, was given the Duchy of Orleans. His descendant, Louis XII (1498–1515), succeeded in 1498.

The third branch, the House of Angoulême, which reigned from 1515 to 1589, also descended from Duke Charles of Orleans. When the male line of this family ended, it went to another branch of the royal family, the BOURBON DYNASTY, under Salic Law, which limited the royal succession to a paternal male relative.

The first king of the Valois family, Philip VI (1328–50), was unfortunate as he faced the great defeat of Crecy followed by the Black Death that took approximately one-third of France's population. The second king, John the Good (1350–64), was captured at the Battle of Poitiers (1356) and spent the rest of his time as a prisoner of the English. This was a low point for France, as much of the country was occupied and facing civil unrest.

The later kings of the first branch proved more capable. Charles V (1364–80), often called the wisest of the Valois, was able to win back most of the English conquest but died young. His successor, Charles VI (1380–1422), succeeded as a child, gave promise of ability, but succumbed to insanity in 1392. Thereafter, the French realm slid back into anarchy and eventual

English invasion by Henry V, whose victory at Agincourt and intrigue by the House of Burgundy eventually led to a treaty in 1420 that made the English king, as the husband of Catherine of France, the heir. Perhaps half of France fell under English control.

The next king, Charles VII (1422–61), was not a great king but was called “the well-served” because of his advisers and aides. A series of events led to the eventual expulsion of the English from France during Charles VII’s reign. First, Joan of Arc inspired the French in her quest to rid her country of England. Then Charles’s relatives persuaded him to establish the first standing army so as to reduce dependence on unreliable nobles. Additionally, the financier Jacques Coeur established a tax system to support the army. Together, these factors empowered the French to shake off English rule altogether.

LOUIS XI (1461–83), who along with Charles V, is considered the ablest of the Valois kings, faced a threat from Burgundy, which was an offshoot of the royal line of France. The duchy and county of Burgundy (Franche-Comté) together with much of the Netherlands were under the control of this family. Other nobles joined Charles to flout Louis XI’s authority. Louis established a new civilian administration and gradually reduced the huge territories of the nobles. He was assisted by the defeat and death of his greatest rival, Charles of Burgundy, in 1477 so that with the exception of Brittany, the major fiefs of France had been annexed by his death. The marriage of his son Charles VIII (1483–98), who married the heiress of Brittany in 1498, completed the policy of consolidation.

On Charles’s death in 1498, the direct line ended, and Louis XII succeeded. He retained Brittany by marrying the widow of Charles VIII. He also continued the Italian Wars started by his predecessor. On his death in 1515, he was succeeded by his cousin and son-in-law Francis I. A true Renaissance prince, Francis I spent the bulk of his reign struggling against the hegemony of the HABSBURG DYNASTY as exemplified by CHARLES V and I of Germany and Spain. His successor, Henry II, continued his policies. The French abandoned Italy at the end of his reign but gained the Lorraine territories of Metz, Toul, and Verdun. The last kings of the Valois (Francis II, 1559–60; Charles IX, 1560–74; and Henry III, 1574–89) had their reigns overshadowed by the Wars of Religion between devout Catholics on the one hand and the Protestant HUGUENOTS on the other. When the last of the kings was murdered by a religious fanatic motivated by revenge, the line ended after a tumultuous 261 years of rule.

NORMAN C. ROTHMAN

Vasa dynasty

The Swedish Vasa ruled Sweden directly from 1523 to 1654, and their descendants ruled through the female line until 1818. They also were kings of Poland 1587–1668.

The people of Sweden had long resented the Union of Kalmar that had united Denmark, Norway, and Sweden (which then included Finland). Throughout the 15th century, there had been sporadic attempts to break away under Swedish claimants. The kings of Denmark held the other countries as glorified satrapies (provinces). Parts of former Swedish territory in the south were held by Denmark and Norway, while trade was in the hands of the German Hanseatic League.

Against this background, the massacre of leading Swedish nobles who belonged to the National Party (the Stockholm bloodbath of 1520) by Christian II of Denmark provoked a national reaction, and in 1523 a young nobleman called Gustav Ericsson, who took the surname *Vasa*, was elected king. After a number of years of fighting, the deposition of Christian II by the Danes ultimately led to peace although for centuries Sweden was included on the Danish royal arms. In 1537, a peace between Lubeck, the leading Hanseatic power, and Sweden was arranged. As the archbishop of the Swedish church was an opponent of the new king, Gustav (1523–60) took advantage of this to establish the new Lutheran Church.

After his death, the next 50 years saw the rule successively of three of his sons. Erik XXV (1560–68) had ability but lapsed into insanity. His delusions of grandeur led to war with Denmark, Lubeck, and Poland. By 1567, his insanity had increased to such an extent that leading men feared for their lives. He had some of the foremost nobles imprisoned; others were assassinated and one was alleged to have been murdered. He was deposed in 1568, imprisoned, and died in 1577.

His successor, John III (1568–92), was pleasant but ineffectual. He made peace with the powers at war with Sweden, and ultimately Estonia was put under Swedish

control, marking the beginning of Sweden's access to great power status. From this time forward (ca. 1570), Sweden was considered the equal of Denmark, its great rival for the next two centuries. John vacillated between Lutheranism and Catholicism, as his wife was a Catholic, and his son was a potential heir to Poland. The son, Sigismund, adopted the Catholic faith and in 1587 became king of Poland. Sigismund's faith led to his deposition in the by now strongly Lutheran country, and his pronouncedly Protestant uncle, Charles II (1599–1611), took over. Thus until 1668, when the Polish Vasa line died out, there was conflict between the senior Catholic branch ruling Poland and the junior Protestant branch ruling Sweden.

Sweden's rise to great power (1630–1723) began in the next reign, when Gustav Adolphus, Sweden's great ruler, assumed the Crown. His first success was a treaty with Russia whereby eastern Karelia and Ingria (the area of present-day St. Petersburg) were given to Sweden so as to connect it with Estonia. In 1630, Gustav came to the aid of German Protestants and secured a series of brilliant victories between June 1630 and his death in battle in 1632. Nevertheless, under the able chancellor of state Axel Oxenstierna, the Swedes continued their success under Queen CHRISTINA VASA, who succeeded as a minor.

By the Treaty of Westphalia (1648) Sweden acquired large possessions in north Germany, some of which she was to hold until 1810, and part of Livonia (present-day Latvia). Christina came of age in 1644 and was brilliant, but also impulsive. Becoming interested in Catholicism, she decided to abdicate in 1654. She then converted to Catholicism and settled in Rome, where for many years she engaged in various intrigues. Her death in 1689 marked the end of the Vasa dynasty. In 1654, her cousin, a Vasa but also a Wittelsbach and a Protestant, succeeded her as king.

Vespucci, Amerigo

(1454–1512) *Florentine explorer*

An innovative explorer, pioneering cosmographer, and highly effective self-promoter during the age of discovery, Amerigo Vespucci was the first to recognize that the lands encountered by CHRISTOPHER COLUMBUS and PEDRO ÁLVARES CABRAL represented an entirely "New World," a term he coined in his collection of letters and documents titled *Paesi novamente ritrovati*, published in Italy in 1507.

During that same year, a Latinized version of Vespucci's given name—*America*—was applied to these lands for the first time in a map published by an obscure French clergyman named Martin Waldseemüller in his collection of documents titled *Cosmographiae introductio*. Thus an explorer not involved in the initial discovery of the lands of the Western Hemisphere had the singular distinction of having two continents bear his name.

His career as an explorer and cosmographer was actually Vespucci's second, as he had built his fortune as a merchant and agent for the Medici interests in Italy. Launching his second career in 1499 at the age of 45, Vespucci joined the expedition of Spanish navigators Alonso de Ojeda and Peralonso Niño in 1499 in their exploration of the coasts of northern South America. By prior agreement, Vespucci separated from Ojeda and Niño and sailed south, exploring the mouth of the Amazon as well as various Caribbean islands.

In 1500, he returned to Spain and in 1501 switched patrons. He served under King Manuel of Portugal when he explored nearly 10,000 kilometers of the southern coastline of South America and made many discoveries, including the Rio de Janeiro in Brazil. Sailing as far south as 50 degrees south latitude, south of the mouth of the Río de la Plata, Vespucci kept detailed notes, revisions of which were published in 1507. As did other explorers of his day Vespucci emphasized the most extraordinary and titillating features of the natives he encountered, describing them as perpetually naked ("just as they spring from their mother's wombs so they go until death"), sexually promiscuous ("they marry as many wives as they please; and son cohabits with mother, brother with sister, male cousin with female, and any man with the first woman he meets"), without property of any kind ("neither do they have goods of their own, but all things are held in common"), without religion ("they have no church, no religion"), and horribly deformed by "unwonted and monstrous" ornamentation on their bodies and faces.

Amerigo Vespucci greets Natives as he lands in the New World. Vespucci was the first to recognize that the lands encountered by previous explorers represented an entirely "New World," a term he coined in his collection of letters and documents.

In addition to his discoveries and publications, Vespucci was a pioneer in the art and science of cosmology, developing a method for computing nearly exact longitude (which up until then had been determined by dead reckoning). He also calculated the circumference of the Earth to within 80 kilometers of its actual dimensions.

For centuries, most scholars discounted Vespucci's accomplishments as secondary and derivative, a perception that was only corrected with the work of Italian scholar Alberto Magnaghi in the 1920s and 1930s. Vespucci died in 1512 at age 58, from malaria contracted during his explorations.

MICHAEL J. SCHROEDER

Virgin of Guadalupe

A fascinating synthesis of Roman Catholicism and pre-Columbian indigenous religious beliefs, the Virgin of Guadalupe (or queen of Mexico) represents a religious icon, a national myth, and Mexico's most important, popular, and recognizable patron saint. The origins of this dark-skinned virgin are conventionally attributed to a vision experienced by the Indian Juan Diego on the hill Tepeyac, just outside Mexico City, in the year 1531, only a decade after the Spanish destruction of the Aztec capital of Tenochtitlán and CONQUEST OF MEXICO. The question of why this particular apparition eventually reached canonical status in contrast to many other religious apparitions and visions reported by other Indians in the decades after the conquest remains a matter of scholarly debate.

Indeed the Virgin of Guadalupe was not the only syncretic folk religious icon to which the newly conquered indigenous peoples of New Spain directed their prayers and faith in the decades following the tumult and violence of the conquest. Similarly constituted sacred icons,

images, and shrines, combining both Roman Catholic and indigenous beliefs, included the Virgin of Zapotán (c. 1531), the Virgin of San Juan de los Lagos (c. 1542), the Virgin of Talpa (c. 1590), the Lord of the Conquest (or Lord of Miracles, c. 1585), the Lord of Villaseca (or the Black Christ, late 1500s), and Our Lady of Atocha and the Christ Child of Atocha (1700s), among many others. Understanding the proliferation of popular sacred icons and shrines in postconquest New Spain requires understanding the pantheon of pre-Columbian gods worshiped by Mexico's indigenous peoples; the Roman Catholic tradition of venerating saints, relics, and icons representing various manifestations of God, Jesus, Mary, and the Holy Trinity, in particular the Virgin of Guadalupe of Extremadura (Spain), the patron saint of the conquistadores; and the social and cultural devastation generated by the conquest and its aftermath of forced labor, compulsory religious conversion, and epidemic diseases, which together created a social environment ripe for the emergence of apocalyptic and messianic beliefs and doctrines.

Tenacious in their retention of their ancient religious beliefs and practices, which included magic, sorcery, and divine intervention in every aspect of human affairs (commonly denigrated as superstition by Spanish religious authorities), the indigenous peoples of the BASIN OF MEXICO and beyond responded to the destruction of the conquest by reinterpreting their ancient beliefs in the light of the newly imposed religious doctrines of the conquerors. The Virgin of Guadalupe represented one such syncretic spiritual creation. According to the French historian Jacques Lafaye, in an interpretation that has come to be broadly accepted within the scholarly community, the cult of the dark-skinned Virgin of Tepeyac (Guadalupe) emerged over decades as the synthesis of Indian folk beliefs and learned Spanish-creole writings, the most important of the latter including a book published in 1648 by the creole Miguel Sánchez, and the poems and plays of Sor Juana Inés de la Cruz. According to Lafaye, to the Indians she represented a transmutation of the Aztec goddess Tonantzin, whose traditional dwelling place was also the hill of Tepeyac.

Whatever the precise combination of spiritual impulses that together forged the cult of the Virgin of Guadalupe, by the early 1700s the cult was in full flower, her image associated not only with miracles but with a burgeoning sense of national identity among Mexico's creoles. Among the most arresting examples of this fusion can be seen in the campaigns of the hero of Mexican independence Miguel Hidalgo in 1810, whose ragtag army adopted as its emblem a banner bearing the Virgin's

image. Transmuted over centuries from an indigenous god into a syncretic Christian cult, the Virgin of Guadalupe remains to this day one of the most distinctive and important symbols of the Mexican nation.

MICHAEL J. SCHROEDER

voyages of discovery

Since ancient times, mariners have traveled large distances, usually in search of opportunities for trade or military expansion. The Phoenicians are believed to have sailed from modern-day Lebanon to England for tin, and accounts by the Romans and later the Vikings show the great skills in seamanship. The adventurer Thor Heyerdahl showed that it was possible to sail in relatively simple vessels across the Pacific in his epic voyage in the raft *Kon-Tiki*. A later expedition on the *Tigris* grew from a stone carving of Queen Hatshepsut, who commissioned the first visual record of a voyage of discovery in 1493 B.C.E.

However the voyages of discovery from the 15th century were a concerted effort by European powers to map as much of the world as possible, as well as expand trade, make Christian converts, and carve out an empire. Although the most well documented, the European voyages were not the first with some of these objects in mind. In 1421, the great Chinese admiral Zheng He headed one of the largest fleets ever when he set out from China to travel around Southeast Asia and the Indian Ocean. There is also the possibility that some of his ships reached New Zealand and even the American continent. When he returned owing to palace machinations Zheng He was never able to repeat his voyage, and China entered a period of self-isolation, never again sending a large fleet to sea.

Curiously this change in Chinese policy coincided with a move by European countries to begin journeys of exploration. The Portuguese were the first to take up this challenge. Under Henry the Navigator (1394–1460), following the Portuguese capture of the Moroccan city

of Ceuta, Henry encouraged seafarers to travel around the coasts of Africa. The Italian Marco Polo in 1271–95 and a few other intrepid adventurers had reached China by land, but with the Ottoman Turks in control of much of the Middle East and Central Asia, the cost of importing spices into Europe was very high and Henry was in the position to encourage many people to embark on great voyages, even if he himself never traveled farther than Morocco.

DIAS AND COLUMBUS

In 1434, Portuguese ships reached Cape Bojador in West Africa, and it was another 26 years before they reached modern-day Senegal. Some 22 years after that, Portuguese mariners were off the coast of modern-day Angola, and in 1488 the navigator BARTOLOMEU DIAS (c. 1450–1500) passed the Cape of Good Hope and found a route to the Indian Ocean. Being on the westernmost part of the European mainland had put the Portuguese in an ideal position to begin the European age of voyages of discovery, but other mariners from other countries had already achieved some enormous feats. English ships sailed regularly to Scandinavia and the Baltic.

There are also references in English court records to a ship returning from “Brazil” in the 1470s. This does not necessarily mean the country of that name, but scholars have conjectured, more plausibly, that this might be Newfoundland, where some English sailors probably went in search of fish. Arab sailors were also involved in voyages down the east coast of Africa and around the Indian Ocean. Many settled in places like Zanzibar, the Maldives, and Sumatra. One of the great Arab travelers of the period was Ibn Batuta, who, between 1325 and 1353, traveled around north Africa, into Mali, down the east coast of Africa, throughout the Middle East and Central Asia, into parts of Russia, and around the coasts of India, and modern-day Myanmar (Burma), Malaysia, and Vietnam to China, keeping a detailed record of the voyages.

When CHRISTOPHER COLUMBUS (1451–1506), an Italian in the service of Spain, set sail across the Atlantic Ocean in 1492 and returned in the following year, news of his voyage and discovery of the Americas swept across the capitals of Europe like wildfire. By this period, most people accepted that the world was a sphere, and some had even worked out, correctly, its size. For this reason it was thought that a voyage from Europe to China, India, or Japan would be far too long and it would be impossible to equip a ship for that voyage. Columbus believed that the world was smaller, and hence it was possible to reach China or Japan, and this idea gave him enough confidence to lead his men on their first voyage.

One of the results of the first voyage of Columbus was that the TREATY OF TORDESILLAS in 1494 was signed between Portugal and Spain by which they divided the world at a line 370 leagues west of the Cape Verde Islands. The land to the west went to Spain, and that to the east to Portugal. As a result, Portuguese seafarers limited themselves to Africa, to the Indian Ocean, and to establishing of the Portuguese Empire in Africa and Asia. It was only later that Brazil was discovered and found to be in the Portuguese sphere. Spain, on the other hand, sent ships to the Americas. An Italian in the service of Spain, AMERIGO VESPUCCI (1454–1512), sailed to modern-day Brazil in the late 1490s and had the honor of America’s being named after him. In 1513, Vasco Núñez de Balboa (c. 1475–1519) was the first European to sight the Pacific Ocean and realize that Columbus was wrong in his estimation of the size of the world.

CORTÉS AND PIZARRO

As well as voyages purely of discovery, the Portuguese were able to trade extensively and their ships brought back large quantities of spices, and also slaves. The initial Spanish voyages found very little in the way of gold or silver until 1521, when HERNÁN CORTÉS (1484–1547) sacked the Aztec capital of Tenochtitlán, and 13 years later FRANCISCO PIZARRO (c. 1475–1541) plundered and destroyed the Inca Empire. This wealth suddenly made Spain the richest country in Europe. Many of the early explorers also found much agricultural land, and in August 1535, one of the largest expeditions to leave Spain for the New World during that century sailed from Cádiz. Led by Pedro de Mendoza, it had 11 ships, more than 1,000 men, 100 horses, pigs, and cattle. The voyages of discovery had led to a desire to colonize the Americas. This expedition sailed up the river Plate and then the Río Paraguay in search of the Inca kingdoms. In a bend in the river they established the city of Asunción (now the capital of Paraguay). Within 50 years of Columbus’s first voyage, the kings of Spain had carved out an empire nearly 23 times the size of Spain itself.

The Portuguese had also embarked on more ambitious voyages, and their great navigator VASCO DA GAMA (c. 1469–1525) was able to take a fleet on a two year voyage the 13,000 miles to Calicut in India, from which he was able to take back spices. The next of the great explorers was FERDINAND MAGELLAN (c. 1480–1521) from Portugal, who sailed in the service of the king of Portugal from 1505 until 1512 and then in the service of the king of Spain from 1519. He sailed down the eastern coast of South America until he found what were later named the Straits of Magellan. Sailing through them, he

was able to reach the Pacific. His voyage was the first to circumnavigate the world, although he was killed in the Philippines, halfway through the journey. By this time the Portuguese under AFONSO DE ALBUQUERQUE (1453–1515) had started to carve out a colonial empire in Asia taking the cities of Ormuz, Goa, and MALACCA.

The English had tried to embark on a few voyages but never had much success. With Italian-born JOHN CABOT (c. 1450–98) and later his son, SEBASTIAN CABOT (c. 1476–1557), the English had tried to find the Northwest Passage—a route to the Pacific north of the Americas. They found no gold, although they did discover areas rich in fish, and eventually Sebastian Cabot joined the service of Spain. The next major English effort was through the Muscovy Company sailing to Russia. This had more success and led to the mapping of north coast of Scandinavia and some of the Russian coastline. However there was great interest in these voyages in England with Richard Hakluyt (1552–1616), a lawyer to the Muscovy Company, publishing a large number of accounts of the early voyages in his *Principal Navigations, Voyages and Discoveries of the English Nation* (1589).

DRAKE AND LA SALLE

When England and Spain went to war, many English privateers set to sea. These were privately owned ships with the queen of England's authority to attack Spanish possessions and ships around the world. The Spanish viewed them as pirates, the English as heroes. One of these, SIR FRANCIS DRAKE (ca. 1540–96), in 1577 set out in his ship *Pelican* (later renamed *Golden Hind*), which, in the next three years, circumnavigated the world. He was able to map out parts of the coast of Chile, reaching modern-day California, before heading across the Pacific. His return not only was a feat of seamanship, but carrying many spices, a massive financial windfall for investors. The fortunes to be made encouraged further English voyages including Henry Hudson's making another attempt for the Northwest Passage.

The French had not been involved in the earlier voyages of discovery but with Samuel de Champlain (1567–1635) managed to map the St. Lawrence River in modern-day Canada and founded Quebec in 1608. He became lieutenant-governor of New France from 1613 until 1625. Another French voyager, trained in a Jesuit seminary, René Robert Cavelier, sieur de La Salle (1643–87), sailed to the Americas several times, navigating the St. Lawrence and Ohio Rivers, and later the Mississippi River. With settlers he founded what became French Louisiana.

During the 17th century, the Dutch became particularly active and took control of a part of Java, in modern-day Indonesia. Their military skills in the 1630s and 1640s ensured that they were able to capture a number of the Portuguese settlements and establish their own colonial empire. By this time, Portuguese power had waned and the Dutch took Ceylon (Sri Lanka) and Malacca from them. Some early Dutch seamen also mapped parts of modern-day Australia and New Zealand.

By the early 18th century, the Russians were beginning to fund explorers. The Bering expedition in 1728, led by a Danish mariner, Vitus Jonassen Bering (1681–1741), was the first to include a number of scientists. After traveling across Siberia, a feat in itself, he sailed from Russia to modern-day Alaska, with the Bering Sea named after him. Bering died during the voyages, and only many years later was good use made of the reports by scientists from his voyages.

The last part of the world to be explored by ship was the Pacific. Englishman William Dampier (1652–1715) and Abel Tasman (c. 1603–59) had mapped some of the coast of modern-day Australia. Louis de Bougainville sailed the Pacific and his book, when published back in France, became an immediate bestseller. When Captain James Cook (1728–79) sailed the Pacific, using better instruments than Dampier and Tasman, he was able to map the coastline of Australia more accurately. He kept a very detailed journal and did not allow his crew to keep a journal so that his book, when published, would be the only accurate account of the voyage. Cook was killed in Hawaii in 1779, but his example was followed by several other mariners including one of his former officers, William Bligh (1754–1817), who tried to sail to the Pacific via Cape Horn but was forced to turn back, unable to fulfill his ambition of circumnavigating the world. He was also subject to a mutiny in 1789, which he managed to survive.

Wanli (Wan-Li)

(1563–1620) *Ming dynasty emperor*

Zhu Yizhun (Chu I-chun) was born in 1563 and ascended the throne as Emperor Wanli on his father's death when he was nine years old; his temple name, conferred after his death, was Shenzong (Shen-tsung). His reign (1573–1620) was the longest of the MING DYNASTY (1368–1644), but his personal qualities made it an irreversibly disastrous one, which his weak and incompetent successors were unable to reverse.

Because he was a child and did not rule personally, the first 10 years of Wanli's reign went well as his birth mother and his father's empress cooperated with Grand Secretary Zhang Zhuzheng (Chang Chu-cheng) to supervise his education and direct the government. All changed for the worse when Zhang died in 1582. Wanli would never appoint strong and capable men to high positions again. In fact as his reign progressed, he let many positions unfilled when their incumbents died or retired, crippling the government.

Wanli became more unpredictable and self-absorbed with time. Between 1589 and 1615 he never appeared at imperial audiences, leaving his ministers and foreign envoys to kowtow before an empty throne. He attended no public ceremonies after 1591, not even his own mother's funeral. Instead he relied on eunuchs to inform him about affairs and to act as intermediaries between him and his ministers. He refused to read government reports and official memorials, leaving the

state in chaos and upright officials in despair. He was moreover extravagant, spending lavishly on his palaces, clothes, entertainment, and a magnificent mausoleum for his body after death, bankrupting the treasury. Adding to the burden of the treasury was the by now huge imperial family scattered throughout the land, all supported by lavish grants from the treasury. Wanli was also addicted to food, alcohol, and sex and became so fat that he could not stand unsupported. The dynasty never recovered because his son and successor survived him by only a month. The next ruler (his grandson) was slow-witted and only interested in carpentry, so he entrusted the government to eunuchs and finally left the throne to his younger brother Chongzhen (Ch'ung-chen, r. 1628–44). Chongzhen never had a chance and committed suicide as rebel forces swept into Beijing (Peking), ending the dynasty.

Military problems abounded. Mongols attacked in the north, ethnic minority groups revolted in the southwest, and between 1593 and 1598 the Japanese invaded Korea, a campaign that was only thwarted after China sent a large army. A more serious threat appeared in the northeast with the rise of the nomadic Jurchens under NURHACI. Adopting a new name, *Manchu*, and a new dynastic title, the QING (CH'ING), these prior frontier vassals would later replace the Ming dynasty.

On the wider scene, the Wanli reign signaled the emergence of a new economy and society. Crops from the New World increased food production, commercial and manufacturing enterprises expanded, and with the

coming of the Europeans via sea, new trading connections would be formed. Finally Christianity was reintroduced into China under the Jesuit MATTEO RICCI.

JIU-HWA LO UPSHUR

William III

(1650–1702) *king of England, Scotland, and Ireland*

William III, king of England and prince of Orange-Nassau, is famous in history as the ruler who rallied the forces of Europe against French hegemony under LOUIS XIV, king of France. Overcoming adversity was a lifelong task for William. He was born the only son of William II, prince of Orange and stadtholder of the Dutch Republic (an elective not hereditary office in the United Provinces, the official name of the Dutch Republic between 1578 and 1815), and Mary Stuart, daughter of CHARLES I.

William's birth occurred eight days after his father's death. The death came a week after a failed coup wherein his father had sought to strengthen his position. His mother's family was in exile during this the period of the Commonwealth (1649–60). The result of the death and failed coup d'état was that the anti-Orange faction, the oligarchy of rich merchants primarily based in Holland and led by the De Witt brothers, seized control and abolished the office of stadtholder.

William saw his mother's family restored to power in England in 1660 but lost his mother later that year. Now an orphan, he awaited his chance. It came when Louis XIV made a sudden attack on Dutch territory in revenge for Dutch diplomatic attempts to block his aggrandizement in the Netherlands. The De Witt regime was overthrown, and William was made stadtholder, captain-general, and admiral for life. In the struggle for survival, although France had the military advantage, he had the diplomatic triumph of securing aid from Brandenburg, Austria, and Spain. The breakthrough came when England switched sides and he married his

cousin Mary, daughter of the duke of York, in 1677. Although France made gains elsewhere, the Dutch Republic and most of the Netherlands were saved from the French.

William organized the League of Augsburg in opposition to French annexations in Germany and the Low Countries. His major triumph came when the English opposition to his father-in-law (now JAMES II) approached him in 1687. In return for supporting the rights of Parliament and opposing the pro-Catholic religious policies of James II, they promised him the throne. William landed in England in 1688, overthrew James II, and defeated his adherents at the BATTLE OF THE BOYNE in 1690. The political result was the GLO-RIOUS REVOLUTION of 1688, which led to the formal supremacy of Parliament. Thereafter, he and his wife, Mary, third and first in the line of succession, were declared sovereigns as William III and Mary II. His position had become so secure that he was able to rule after the death of Mary in 1694, even though her sister Anne was closer in line of the succession.

William's domestic policies were not especially successful, as he remained focused on external affairs. The major blot on his record during the 1690s was the massacre of the MacDonald clan in Glencoe, Scotland, wherein the perpetrators were rewarded. His achievements during the 1690s were in the Wars of the League of Augsburg, which lasted from 1689 to 1697 and forced Louis to give up all acquisitions gained during the war.

The prospect that Spain and all its possessions would fall to France on the death of CHARLES II in 1700 threatened to undo his efforts to create a balance of power in Europe. Once again, he rallied much of Europe against France to prevent Louis XIV from becoming a new Charles V. The subsequent WAR OF THE SPANISH SUCCESSION (1702–13) did eventually accomplish this result. William, however, was not there to see it, as he died in March 1702 after a fall from his horse.

Rarely successful in war, but almost always in diplomacy, he had as his main achievement the idea of a balance of power as necessary for European security. William was the author of a precursor to the idea of collective security but did not live to see its first application in the Peace of Utrecht in 1713.

NORMAN C. ROTHMAN

Williams, Roger

(c. 1603–1683) *Puritan dissenter*

Roger Williams was born in London, about 1603, and showed promise at an early age. He graduated from Pembroke College, Cambridge, and was ordained an Anglican clergyman in 1629. He married that same year, served briefly as a chaplain to a Puritan family in Essex, and in 1630 sailed for New England.

Originally welcomed for his piety, Williams soon became controversial. Most importantly he believed in separatism, the concept that the Anglican Church was beyond reforming, and that true Christians should separate themselves from it. He considered serving the church at Salem, but Massachusetts authorities intervened to prevent it. He was briefly in Plymouth, an avowedly separatist colony, but returned to Salem in 1634 and served as teacher, or assistant clergyman, in defiance of the wishes of the colony's leaders. At Salem, he preached a set of ideas that eventually led to his banishment. In addition to separatism, he maintained that each person had the right to choose his or her own religion, and therefore neither civil nor ecclesiastical authorities had any power to enforce religious doctrine. It was an idea totally unacceptable to a people who knew they were right and were dedicated to seeing that everyone conformed to their view of God's truth.

Williams also believed that Christian charity extended to the native population, a position that forced him to argue that the Indians were the rightful owners of the land and that the king had no right to grant it to other Englishmen. It was an unacceptable challenge to the very legitimacy and even existence of the colony. Its leaders decided he must be stilled. In the fall of 1635, the General Court voted to banish Williams, and upon learning that he might establish a settlement on Narragansett Bay, sent troops to arrest him. Warned by a friend, possibly JOHN WINTHROP, he escaped to the south, and the following year established Providence, Rhode Island's first settlement. Beyond the jurisdiction of Massachusetts, Rhode Island became a haven for those driven out of Plymouth and Massachusetts

and welcomed the disgruntled and unhappy in search of a freer and more tolerant environment, particularly Baptists, Jews, and Quakers. To gain control over the inevitable unruliness of the Narragansett Bay region and thwart a possible encroachment by Massachusetts, Williams sailed to England and secured a patent for the Providence Plantations in 1644. While there, he published his most famous defense of religious liberty, *The Bloody Tenet of Persecution*. His efforts to unite the colony were challenged by William Coddington in Newport, and Williams returned to England to have Coddington's power rescinded. Williams also continued his defense of his views with the publication of *The Bloody Tenet yet More Bloody*, a rebuttal to John Cotton's response to his original work.

Upon his return, Williams reunited Rhode Island, served as its president, and continued to permit religious dissenters, including ANNE HUTCHINSON, to settle there. He also continued to ally with the native population and in the 1660s successfully defeated an attempt by William Harris to defraud the Narragansetts of their land. When KING PHILIP'S (METACOM'S) WAR (1675–1676) broke out in 1676, however, the Narragansetts sided with their fellow natives, and Williams became captain of the Providence militia. He died at Providence in 1683. A tolerant and forgiving man, although one stern in his personal religious views, Williams is best remembered for his support of religious toleration and the separation of church and state, as well as his advocacy of human equality.

H. ROGER KING

Winthrop, John

(1588–1649) *Puritan colonial leader*

John Winthrop was born in January 1588 in Suffolk County, England, the only son of a prosperous landowner. He studied at Trinity College, Cambridge, but did not earn a degree. By family arrangement, he married at 17 and devoted himself to managing family estates. He also studied law and was admitted to Gray's in 1613. He became a justice of the peace in 1617 and appointed an attorney in the Court of Wards in 1627, by which time he had become an ardent Puritan.

Beset with a large family to provide for, troubled by the widespread corruption of the Court of Wards, and deeply disturbed by the government's religious and political practices, he threw in his lot with the fledgling Massachusetts Bay Company. When the company agreed to turn control of itself over to the residents of the colony it was about to establish, Winthrop agreed to be one of those residents, and the company elected him governor. He sailed in April 1630, leaving many of his family in England. Winthrop set the character of early Massachusetts in a sermon preached on board the *Arabella*. In that sermon, he argued that the colony would be created as a covenant with God with civil and ecclesiastical power consolidated in the hands of the colony's leaders. He devoted his political life, both in and out of office, to that principle. He also maintained that Massachusetts should be "a city upon a hill," chosen by God to serve as an example to England of what God intended for his people.

Despite his best efforts, Massachusetts was not the docile, benign autocracy Winthrop had envisioned. The individualistic ROGER WILLIAMS, with his separatism and his attacks on both the colony's ownership of its land and its claim to enforce religious conformity, was a sore trial for Winthrop. Although Winthrop liked Williams personally, he understood that Williams's continued residence in Massachusetts was detrimental to the future of the colony and supported his banishment in 1635. No sooner than the Williams affair had been settled, Winthrop had to deal with a similarly destructive issue in the antinomian crisis surrounding ANNE HUTCHINSON. Hutchinson's view that salvation was gained only through God's grace, and not through the performance of works, challenged clerical leadership and church discipline and had unacceptable implications for social order and the authority of the established government. Perhaps because she was a woman, he showed far less consideration for her than he had for Williams when she was banished from the colony and later excommunicated from her church.

In both cases, Winthrop certainly showed no sympathy toward those who had challenged the colony's mission, but his goal was the survival of the colony, and in this he did what he believed to be necessary. He remained active in the life of the colony after these confrontations, serving as governor, deputy governor, magistrate, and diplomat in negotiating the formation of the United Colonies in 1644. He was its first president. His *History of New England, 1630–1649* is a major source for the early history

of both Massachusetts and New England. It reveals little about Winthrop's personal life, but it does show a man who put the greater good of his colony's survival above all else.

H. ROGER KING

witchcraft

Since early medieval times there had been persecution of women deemed to be witches throughout Europe, but the period from 1450 until 1750 perhaps saw the greatest number of people identified as witches being killed. With the fear of witchcraft beginning about 1450, many countries started enacting laws against witches. These involved targeting older women who uttered curses, lived with black cats, or embarked on "strange" practices.

The persecution took place all over Europe, both in heavily Roman Catholic areas such as Spain and southern Germany, and in Protestant England and Denmark. As witches were deemed to be heretics, their penalty was to be burned at the stake, usually after confessions had been extracted under torture. If the women confessed their sins, in some places they were garroted before their body was burned. In most cases the women suffocated from the smoke long before being burned. In 1577, it was recorded that 400 witches were burned in the French city of Toulouse alone.

In 1487, two Dominican monks, Jacob Sprenger and Heinrich Kramer, wrote the *Malleus maleficarum* or *The Witches' Hammer*, which was initially submitted to the Faculty of Theology at the University of Cologne. This book was an attempt to have a "scientific" method of identifying witches, as the authors both were inquisitors. The book went through 29 editions until the printing of the Lyon edition of 1669, with the Spanish Inquisition, in 1538, cautioning people that not everything in the book was true. King James VI of Scotland (later King James I of England) also became interested in witches after a visit to Denmark. In 1597, he wrote about them in his book *Daemonologie*. He

saw all witches as equally guilty of a crime against God. As late as 1687, another ruler, King Louis XIV of France, also published an edict against witches. However by that time interest in “witch hunting” had declined, and the last witch to be executed in western Europe was killed in 1775 at Kempten in Germany.

COLONIAL AMERICA

Witchcraft in colonial New England has captured the American imagination for centuries and remains open to interpretation. Although New England was not the only place in early America where people were accused of familiarity with the devil, it was here that religion, gender, and politics resulted in hysterical outbreaks and the execution of 35 people.

In 1542, England’s parliament first declared witchcraft a capital offense, and in 1626 a Virginia woman named Wright was accused of being a witch. Although witchcraft could mean heresy, most colonists who leveled such charges alleged “maleficium”: doing someone else harm by supernatural means. When the Puritans settled New England in the 1630s, they took these ideas with them. Intent on establishing the New Israel in America, they were perennially on the watch for any signs that the devil might be threatening their mission. To these early New Englanders, the devil could possess a Native American, a black cat, or a fellow colonist at will.

The first accusation of witchcraft in New England was leveled in 1638 at Jane Hawkins, a midwife and associate of ANNE HUTCHINSON. Hawkins’s radical religious beliefs and connection with Hutchinson probably contributed to her accusation, as did suspicions about her midwifery. “It was credibly reported that, when she gave medicines,” wrote Governor JOHN WINTHROP, “she would ask the party, if she did believe, she could help her.” The first New Englander to be executed for witchcraft was Alice Young of Windsor, Connecticut, in 1647. Over the next century, nearly 350 people were accused of maleficium, about 35 of these being hanged for their crimes. Although prosecutions ended with the 17th century, as late as 1724, Sarah Spenser of Colchester, Connecticut, was accused of being a witch.

Four of every five New Englanders accused of witchcraft were women, a statistic that reveals how intimately maleficium and gender were linked in the minds of the Puritans. They believed women to be weaker creatures than men and thus more susceptible to satanic temptation. Among women, those who were over 40 and lived alone were most likely to be accused,

Woodcut showing punishments for witches from Tengler’s *Laienspiegel*, Mainz, 1508

especially if they owned property. In terms of timing, more than half of all accusations and two-thirds of executions took place during three outbreaks. In 1662, eight-year-old Elizabeth Kelly of Hartford, Connecticut, suffered possession during which she cried out the name of a neighbor, Goodwife Ayers. Although Ayers was tried, the incident soon snowballed and over the next year, 12 more were accused and four executed. A similar outbreak occurred in Fairfield, Connecticut, in the 1690s, but these outbreaks pale in comparison to what transpired in Salem.

By 1692, the Puritans’ goal of creating a New Israel seemed to be lost. Everywhere the devil seemed to be winning: the Crown had revoked Massachusetts’s charter, Indians were raiding towns on the Maine frontier,

and young people appeared uninterested in religion. Economic change was also unsettling the region, with coastal settlements like Salem town becoming wealthy and attracting non-Puritans, much to the dismay of poorer agricultural settlements on the interior, like Salem village. In this climate, witchcraft found popular acceptance. In February 1692, Betty Parris, the nine-year-old daughter of Salem village minister Samuel Parris, began experiencing fits along with her 11-year-old cousin Abigail Williams. An investigation revealed that the girls had been engaging in occult practices to determine who their future husbands would be. The girls blamed Parris's Caribbean Indian slave Tituba for instructing them and accused Sarah Good and Sarah Osborne of tormenting them.

In late February, local magistrates investigated the situation and jailed Tituba, Good, and Osborne, but this did not solve the problem. Over the next few months, other young women began to experience fits and by May more than two dozen people had been accused. At this point, Governor Sir William Phips appointed a special Court of Oyer and Terminer to try the cases. Headed by Lieutenant Governor William Stoughton, the court quickly became a spectacle with accusers screaming when they confronted the defendants and the accused being submitted to bodily searches to see whether they possessed a teat for suckling Satan's offspring.

Flouting many of the conventions of English and Massachusetts law, the court allowed the admission of "spectral evidence": testimony about maleficium from a demonic creature in the form of an accused witch. By June 1692, the outbreak had spread to nearby towns of Andover, Haverhill, Topsfield, and Gloucester, and by October the list of the accused included the wives of Governor Phips and several leading ministers. In late 1692, Phips finally put a halt to the proceedings, and in May 1693, he ordered the last of those imprisoned to be freed. By this point, however, 185 people had been accused and 19 executed.

JOHN G. MCCURDY

Wu Sangui (Wu San-kuei)

(1612–1678) *Chinese general*

Wu Sangui was the commander of a powerful Ming army stationed at Sanhaiguan (Sanhaikuan), the pass of the GREAT WALL OF CHINA at its eastern terminus. In 1644, faced with a rebel army that had captured Beijing (Peking), and the last Ming emperor dead from suicide, he opened the pass and welcomed the Manchu army under Prince DORGON into northern China; together they freed Beijing of the rebels. The result was the creation of the QING (CH'ING) (Manchu) DYNASTY in China.

Wu Sangui was raised in Liaoxi (Liaohsi) in Manchuria, the son of a general. In 1644, his retired father and family were living in Beijing while he was stationed in southern Manchuria at the head of 80,000 troops. In April, he received orders to move his troops 100 miles south to Shanhaiguan (Shan-hai Kuan), the easternmost pass of the Great Wall that separated northeastern China from Manchuria, so that he could be in better position to relieve Beijing from threatening rebels. This move left all Manchuria, to the rapidly expanding Manchus. At the end of April, he received further orders to march to defend Beijing against the rebel forces of Li Zicheng (Li Tzu-ch'eng), but the city had fallen before he could reach it and he retreated to Sanhaiguan to await further orders.

Meanwhile the last Ming emperor had committed suicide, and Wu's family had been taken prisoner. The rebel leader then forced the elder Wu to persuade his son to surrender, and when he refused, all the Wu family were tortured and killed. Trapped between two dangers, the rebel army advancing from the south and the Manchus moving in the north, Wu negotiated with the Manchus, who had been Ming vassals for over 200 years. Prince Dorgon, regent for the boy Manchu ruler Fulin (Fu-lin), accepted Wu's offer jointly to rid the rebels.

Li Zicheng's army was no match for the coalition, and he fled Beijing for Sha'anxi (Shensi) province after an orgy of killing, burning, and looting. While the people of Beijing expected Wu to restore the Ming dynasty, what they got was Prince Dorgon, who promptly announced the Manchus as saviors of the people against the bandits and proclaimed the establishment of the Qing dynasty on behalf of his young nephew.

Wu's forces destroyed the remnant rebels in 1645 and he was rewarded with the title Prince Pacifier of the West and after serving in Shaanxi and Sichuan (Szechuan) for several years, he was sent to Yunnan province as hereditary governor with full civil and mil-

itary powers. One of his sons was married to a daughter of Manchu emperor Shunzi (Shun-chih). A Ming pretender had earlier established himself in Yunnan in 1656. Wu set out to destroy his power in Yunnan, finally chasing him into Burma, capturing him and his court, and killing him and his son.

Fearing the power and ambition of three Chinese generals who had helped establish Manchu power in 1644 (called the Three Feudatories because they had been granted hereditary fiefs in southern China) and suspicious of Wu, Emperor KANGXI (K'ANG-HSI) ordered all three to resign in 1673. Wu responded by declaring himself emperor of a new Zhou (Chou) dynasty in 1674 and began an offensive that pushed northward to the Yangzi (Yangtze) valley, winning many adherents. The tide turned in 1677, when the other two feudatories surrendered. Wu died of dysentery in 1678, leaving his throne to a young grandson who committed suicide in 1681 as his movement crumbled.

Wu Sangui left a mixed legacy. Ming loyalists regard him as a traitor because the Manchus could not have captured power in 1644 without him. His motivation was personal, and probably he did not understand the consequences of his action. By the time he rebelled, he was old and Qing power was established under a vigorous young Kangxi emperor.

JIU-HWA LO UPSHUR

Yi dynasty (early)

The Choson or Yi dynasty was founded by General Yi Songgye (1335–1408; r. 1392–1408). Yi was a successful general of the declining Koryo dynasty that had ruled Korea for about 500 years. He staged a coup against his government in 1388 and four years later, with the support of the reform-minded Confucian scholars, proclaimed himself King Taejo of a new dynasty.

With the approval of the newly established MING DYNASTY in China, to whom he rendered vassalage, he chose the dynastic name *Choson*, which means “morning serenity,” and moved his capital from Kaesong to Hanyang (present-day Seoul).

Besides the founder, the dynasty was well served by its third king, T’aejong (r. 1400–1418), and his son, Sejong (r. 1418–50), under whom it reached its zenith. The founders of the dynasty were firmly committed to Neo-Confucianism of the Zhu Xi (Chu Hsi) school that had been adopted as official in China since the Song (Sung) dynasty, 961–1289. Korean Neo-Confucian scholars, who were the mainstay of the dynasty, aimed to create in Korea the idealized state exemplified by China’s sage rulers of the golden age, Kings Yao, Shun, Yu, and the founders of the Shang and Zhou (Chou) dynasties.

Much was achieved in the first half century of the dynasty in many fields. Learning and scholarship were esteemed and talented men were encouraged to enter

government service. A National Academy was established in Seoul and state endowed schools were established in every county.

Three levels of state-supervised examinations based on Confucian texts and according to Neo-Confucian interpretations were held nationwide and most officials were chosen from the ranks of successful candidates. As in China, the study of history was highly esteemed and the state sponsored the writing of official histories.

Because of the high cost of importing block-printed books from China, Koreans invented movable type, the first in the world. Koreans had until now no written script and had used the Chinese written form exclusively, but because the structure of the Korean language was different from that of Chinese, King Sejong instigated the invention of a Korean alphabet, which was strictly phonetic, proclaimed in 1446. It was then called Hunmin Chongun and in the 21st century Hangul.

The Yi dynasty’s commitment to Neo-Confucian principles would gradually transform Korean society and end the dominance that Buddhism had exercised over Korean life during the Koryo era. The inadequacies of Buddhism and the mismanagement of government and society under Buddhist influence were blamed for the economic and moral decline of Koryo. As a result Buddhism suffered severe decline during the Yi dynasty. Instead leaders actively inculcated Confucian moral principles.

They emphasized the proper rites and rituals of ancestor worship, filial piety, loyalty, proper social relationships, the patrilineal line of descent, and proper relationship between men and women. The union between a husband and wife was regarded as the main-spring of a stable society. Whereas upper-class men previously could have several wives, who were not subject to a specified ranking order, under Confucian teachings, only one woman could be wife and mother of her husband's heir, relegating other women of the household to concubines and their children to lesser importance. Though subject to her husband, the wife had charge of the domestic sphere, and responsibility of providing the government with loyal subjects and the family with devoted sons. The public sphere was the husband's domain.

In science and technology this era saw the invention or refinement of the sundial, the automatic water-driven clock, armillary spheres (miniature representations of the Earth, Moon, and planets in the form of skeletal globes), and the rain gauge. Medical books that included new knowledge were published and made widely available. Since Confucians honored farmers as the backbone of society, farming was encouraged. Land reform and redistribution and the introduction of new agrarian methods from China greatly increased food production. Innovations included the introduction of new manure, crop rotation instead of letting fields lie fallow, irrigation, and autumn plowing. Commerce played a decidedly secondary role in the early Yi era. Attempts by the government to introduce paper money and copper coins proved unpopular and people preferred the old method of using a type of cloth and grain as mediums of exchange. This remained true until the early 17th century, when increased commerce led to the acceptance of metal coins.

The policies and practices instituted by the founders of the Yi dynasty established the firm foundations that led to a period characterized by brilliant cultural and technical achievements. They also explain its longevity despite later setbacks.

Yongzheng (Yung-Cheng)

(1678–1735) *emperor of China*

Yongzheng (r. 1723–35) was born as Yinchen (Yinchen), the fourth son of the emperor KANGXI (K'ANG-HSI) and not his father's original heir. After removing his original choice for gross misconduct, Kangxi did not name a new heir, and no one knew that Yinchen would succeed Kangxi until his will was read aloud on his deathbed. Yongzheng was stern, hardworking, and extremely capable. He consolidated imperial power and made many reforms.

Yongzheng began his reign by eliminating possible challengers. He removed princes from military commands and took personal control of all eight Manchu banner army units (whereas his father had only commanded three). He was indefatigable, personally reading and responding to reports and memorials sent by officials. Assisted by spies, he checked on the performance of officials, punishing those who were corrupt and derelict and rewarding upright ones. To ensure that officials were not tempted by graft, he granted them additional stipends to their salaries from an anti-corruption fund." He also rationalized and simplified the taxation system. In a humane move, he abolished hereditary servitude and the designation of persons of certain professions such as beggars as "mean people." He promoted learning and supervised education by issuing textbooks that promoted orthodoxy and correct historical interpretations as he saw them.

Despite Kangxi's efforts, problems persisted with Russia because of an undefined border area that allowed the Olod Mongols to raid Chinese lands and then take refuge in Russia. Thus Yongzheng sent a diplomatic mission to St. Petersburg to seek Russian neutrality in his quest to deal with the Olod and to fix the Mongolian-Siberian border between the two empires. Extended negotiations between them produced the TREATY OF KAIKHTA in 1737. Besides delineating the border the treaty opened a new trading station at Kaikhta and defined the terms of trade, provided for the extradition of deserters and criminals, and allowed Russia to maintain an Orthodox church and religious mission in Beijing (Peking). The treaty with Russia allowed Yongzheng to continue prosecuting the war with the Olod, but they were not finally defeated until the reign of his son Qianlong (Ch'ien-lung).

Yongzheng made two institutional changes in government. Because the Manchu rulers did not practice primogeniture in the selecting of a successor (as had the Ming), and rivalry between brothers could be destabiliz-

ing, he ordered that the name of the heir be deposited at several designated secure locations to be opened on the death of the reigning sovereign. He created the Grand Council of five or six top officials; some were always in attendance wherever the emperor was to help him make important policy decisions. Yongzheng was stern, efficient, and autocratic, but he was also conscientious and diligent. In a short reign, he was able to tame the ambitions of the Manchu imperial clan and nobility. He also strengthened the bureaucracy and molded it to work in the interest of the state. As a result, its members enjoyed high morale, were not troubled by factionalism, and served with efficiency and accountability so that imperial authority reached every corner of the empire. He consolidated Qing (Ch'ing) power and governed as an effective and paternalistic despot.

JIU-HWA LO UPSHUR

Yucatán, conquest of the

The Spanish invasion and subjugation of the Maya peoples of the Yucatán Peninsula, the highlands of Chiapas, and the lowlands stretching into the Guatemalan Petén contrasted sharply with their swift defeat of the Aztec Empire in 1519–21. Lacking a centralized political structure, Maya polities and communities in these regions resisted Spanish incursions for decades, some for centuries. In the absence of gold, silver, or other riches, the region became a colonial backwater and was never fully conquered. The result was a far more ambiguous, incomplete, and partial conquest than in the BASIN OF MEXICO, Peru, and even Central America.

The first Spanish encounters with Yucatán's Maya inhabitants came in 1502, when CHRISTOPHER COLUMBUS, on his fourth voyage, traded with coastal merchants. In the next decade, at least one shipwreck left several Spaniards stranded on Yucatán; at least two survived, one of whom, Jerónimo de Aguilar, became HERNÁN CORTÉS's interpreter. Further contacts occurred in 1517–18 with the expeditions of Francisco Hernández de Córdoba and Juan de Grijalva, respectively, that

culminated in the CONQUEST OF MEXICO. As elsewhere, these initial encounters brought virulent European diseases to Yucatán and beyond, killing tens of thousands of natives years before military incursions began.

SUBJUGATION EFFORTS

The first major effort to subjugate Yucatán's inhabitants began in 1527 under Francisco de Montejo, chartered by the Crown to pacify the peninsula. After some initial failures, between 1529 and 1534, Montejo and his men had explored much of Yucatán's north and center. What they found was very unlike what Cortés had found in Mexico—a diversity of ethnolinguistic groups spread out in towns and villages across a flat, riverless, and to Spanish eyes, featureless landscape, with no large city, no political center on which to focus their assault. The boundaries between towns and provinces appeared fuzzy and hard to discern, while the inhabitants' receptions of the invaders often seemed fickle and capricious. Frustrated, Montejo and his crew abandoned Yucatán in 1534, reporting to the Crown that “no gold had been discovered, nor is there anything [else] from which advantage can be gained.”

For the next five years, no Spaniard set foot on the peninsula. They returned in 1540, mainly to enslave the inhabitants, as native labor was considered the region's most valuable marketable commodity. Founding the town of Mérida in 1542 atop the ruins of the Maya city of Tihó, after a prolonged conflict with thousands of local Maya, the Spanish soon founded a second, Valladolid. In response Maya communities adopted the hit-and-run tactics of guerrilla war, to which the Spanish responded with massacres and enslavement. By the mid-1540s, Spanish *encomenderos*, granted Indians in *ENCOMIENDA* by the Crown, began settling in the two towns and their rural districts. During this same period, in 1544, the first group of eight veteran Franciscan missionaries arrived in Yucatán to direct the religious conversion of the natives.

THE GREAT MAYA REVOLT

Two years later, on November 8, 1546, came what was later called the Great Maya Revolt, when natives of seven provinces launched a coordinated attack on Valladolid and its environs, populated by some 200 to 300 Spaniards. After slaughtering numerous Spaniards and their native allies and nearly sacking the town, the rebels retreated in the face of a withering counterattack, which by spring 1547 had effectively quelled the insurgency. An eyewitness account by Franciscan friar Lorenzo de Bienvenida details the murders, mutilations, and other

The temple of Kukulcán at Chichén Itzá, built by the Maya, is located in the northern center of the Yucatán Peninsula. The conquest of Yucatán was never fully achieved, and as late as 1680 the Spanish occupied only the northwestern third of the peninsula.

atrocities inflicted by the Spanish in their suppression of the rebellion. At the time fewer than 1,500 Spaniards lived in the northwestern corner of the peninsula.

In 1549, nine more friars, including one DIEGO DE LANDA, arrived. Courageous and indefatigable, the 37-year-old Landa set off into the interior to convert the natives. In the coming years, Landa would play a central role in the political and religious life of the peninsula, while centuries later his writings on all aspects of Maya culture would serve as an invaluable resource for Maya scholars. By this time, friction had developed between *encomenderos*, who insisted on exploiting Indian labor to the greatest extent, and friars, whose principal concern was the natives' religious conversion and basic physical well-being. Similar tensions between religious orders and settlers erupted throughout the Spanish-conquered territories. The Franciscans proposed congregating (or "reducing") scattered Indian hamlets into larger nucleated settlements, or *REDUCCIONES*, a proposal

fiercely resisted by *encomenderos* but implemented in many areas. By 1557, the Franciscans established their first missions and schools.

In 1561, the General Chapter of the Franciscans in Spain combined the missions of Guatemala and Yucatán into a single province. Soon after, the friars of the new jurisdiction elected Diego de Landa as their first provincial, or leader. By 1562, 12 monasteries had been founded, while some 200 churches and schools were scattered throughout the interior. Also in 1562, a chance encounter led to the discovery of ongoing idolatry among the friars' native charges. The discovery prompted Provincial Landa to launch a major investigation. Arresting thousands of natives suspected of idolatry, Landa supervised the torture of more than 4,500 people over the course of three months; many were tortured to death.

On July 12, 1562, at the Maní mission, Landa oversaw a huge auto-da-fé, a public spectacle meant to demonstrate the superior moral and political power of

the Christian Church. Huge piles of idols were set to the torch and many convicted idolaters were put to the lash. Soon after, Landa uncovered evidence suggesting that the natives were still practicing ritual human sacrifice. The inquisitions and tortures continued, as did the destruction of idols. Many of the so-called idols were Maya sacred books. Only three survived the fires. Scholars consider the destruction of these sacred Maya texts among the most tragic losses of accumulated human knowledge in world history.

The sacred writings continued in secret, as Maya priests and elders produced new books to preserve their collective knowledge. Over time, some 14 of these sacred books came into the possession of outsiders, and some of these into the hands of scholars. Collectively they are known as the BOOKS OF CHILAM BALAM (books of the spokesmen of the jaguar lords). The best known is the Book of Chilam Balam of Chumayel.

The conquest of Yucatán and adjacent highlands and lowlands was never fully achieved. As late as 1680, the Spanish occupied only the northwestern third of the peninsula, while numerous polities, most notably the

Itzá kingdom, endured in the jungles of the Maya lowlands to the south. A major offensive into the southern lowlands in 1697 conquered the Itzá while failing to eliminate or reign in autonomous indigenous communities outside the orbit of Spanish control. In short, many parts of the Maya zone were never conquered.

MICHAEL J. SCHROEDER

Zenger, John Peter

(1697–1746) *publisher, free press advocate*

John Peter Zenger was an American publisher, editor, and journalist. Zenger is most famous for printing the first mathematics book in the New York colony. He is also known widely for helping to establish the idea of press freedom in the colonies with the aid of attorney Andrew Hamilton.

Zenger was born on October 26, 1697, in present-day Germany and immigrated to the United States at age 13 with his father and brother. During the trip, his father died, and Zenger, needing money, became an apprentice to William Bradford, who owned the *Gazette*. Zenger worked for Bradford for eight years before beginning his own weekly journal.

In 1719, Zenger married his first wife, Mary White, and moved to Chestertown, Maryland, but she died shortly after. Zenger was left with a baby son. After returning to New York, Zenger married Anna Maulist in 1722. They had five children together.

In 1725, Zenger and Bradford became business partners, but their partnership did not last. Many of the books Zenger published were religious English and Dutch texts and polemical tracts. In 1730, he also printed *Venema's Arithmetica*, the first mathematics book in the New York Colony. Three years later, he was offered the opportunity to be printer and editor of the *New York Weekly Journal*, founded by James Alexander, a prominent lawyer. The journal expressed opposition

toward the policies of the governor of the New York colony, William Cosby, who frequently imprisoned or disbarred those opposed him.

Wealthy New York lawyers and politicians such as William Smith and James Alexander had Zenger publish oppositional articles in his journal. Alexander wrote many of the editorials against Cosby. Zenger himself did not write many of the articles, but he knew the potential consequences for publishing them. In 1734, as a result of his publication, Zenger was charged with seditious libel by the governor and imprisoned for nearly 10 months. During this time, Zenger's wife ran the paper, which rallied support for Zenger's case. Both Smith and Alexander defended Zenger for the articles that were printed in the *New York Weekly Journal*. When the two attorneys accused Cosby of handpicking the two judges and the jury, their right to practice law was revoked.

The trial ended on August 5, 1735, when defense attorney Hamilton came to Zenger's aid. Hamilton proved that Zenger could not be guilty of the charges because many of the accusations written in his journal about Cosby, although indeed seditious, were true. In this manner, Hamilton gained the sympathy of the court.

Zenger died on September 28, 1746, poor and leaving his wife to continue the paper. His eldest son, John, took over the paper from 1748 to 1751. It is believed that Zenger is buried in an unmarked grave in New York City at the Trinity Church cemetery.

NICOLE DECARLO

Zheng Chenggong (Cheng Ch'eng-Kung)

(1624–1662) *Chinese general, political leader*

Zheng Chenggong (or Koxinga) led the longest and most sustained opposition to the Qing (Ch'ing) conquest of China, first from the southern Chinese coast, later from Taiwan after he expelled the Dutch from their forts on the island. His sons held on to Taiwan against Qing forces until 1683.

The Ming dynasty (1368–1644), long in decline, collapsed in 1644, when the last emperor and his family killed themselves rather than suffer capture by the rebel forces of Li Zicheng (Li Tzu-ch'eng). General WU SANGUI (WU SAN-KUEI), the Ming general guarding the eastern terminus of the GREAT WALL OF CHINA, then asked the Manchus in the northeast to help him to oust the rebels. As Wu pursued the rebels, the Manchu leader, Prince DORGON, installed his nephew on the vacant throne as Emperor Shunzi (Shun-chih) of the Qing dynasty. While northern China was quickly pacified, Ming loyalists resisted tenaciously in the Yangzi (Yangtze) River valley and throughout southern China. Several Ming princes were elevated to be emperors or “caretaker rulers” to rally loyalists against the alien rule. The era up to 1662 is called the Southern Ming when the last Ming pretender was killed.

An important supporter of the first Southern Ming emperor was Zheng Zhilong (Cheng Chih-lung), who controlled a powerful mercantile empire and large fleet that operated along the southern coast of China and Japan. One of his sons by a Japanese mother so impressed the Ming prince of Tang (T'ang) who became the Longwu (Lung-wu) emperor that in 1646 he conferred on him the imperial surname *Zhu* (*Chu*) and also gave him the name *Chenggong* which means “successful.” He came to be known as Lord of the imperial surname, from which the Dutch derivation *Koxinga* comes. In China he was called Zheng Chenggong. Zheng Zhilong defected to the Manchus

in 1646, but his son remained faithful to his pledge to defend the Ming.

With his base in Amoy and the nearby island of Jinmen (Quemoy), Zheng gained control of Fujian (Fukien) province. He also expanded his trading empire to raise revenue for his cause. In 1658, his fleet of 1,000 ships and 130,000 soldiers raided the coast of Zhejiang (Chekiang) province. It sailed up the Yangzi River in 1659 to attack Nanjing (Nanking), the southern capital of the Ming dynasty, hoping that the action would rally Ming loyalists to rise up in rebellion. It did not happen and facing Qing counterattack he withdrew across the sea to Taiwan. There he forced the DUTCH EAST INDIA COMPANY (INDONESIA BATAVIA) to surrender its Fort Zeelandia in southern Taiwan, ending its presence on the island. Zheng died in 1662 (his father and some relatives who had surrendered to the Qing were executed in 1661 for failing to persuade him to surrender), but his son Zheng Ching continued to resist. To deprive the Zheng forces from obtaining supplies from the mainland coast the Qing had to adopt draconian measures, forcing inhabitants in Fujian to relocate at least 20 miles inland and forbidding ships to take off from southern coastal ports. In 1683, Taiwan was conquered by the Qing and made a part of Fujian Province. With the fall of Taiwan the Qing dynasty completed the conquest of China.

Zheng Chenggong, or Koxinga, is honored in Chinese and Japanese folklore as a brave commander. He is also respected as a Ming loyalist.

JIU-HWA LO UPSHUR

Zwingli, Ulrich

(1484–1531) *religious reformer*

Ulrich Zwingli was a Protestant reformer who lived in Zurich, Switzerland. Often called the “third reformer,” Zwingli was a contemporary of MARTIN LUTHER and JOHN CALVIN and is remembered as the reforming theologian who died on the battlefield.

Zwingli was born to prosperous farming parents in Wildhaus, Switzerland, on January 1, 1484. At age 10, he was sent away for his education to Berne, Switzerland; then Vienna, Austria; and finally Basle, Switzerland, where he studied philosophy and theology. When the main priest for the town of Glarus, Switzerland, died in 1506, his relatives arranged for him to be ordained a priest and assigned to that church.

As was Martin Luther, who was farther north in Germany, Zwingli was interested in the intellectual developments occurring during this time, particularly the writings of Desiderius ERASMUS OF ROTTERDAM, which he (and Luther) began reading around 1510. Erasmus advocated a return to the original languages that the Bible was written in, but also a return to the notion that divine truth most fundamentally resided in the Bible. From 1514 to 1519, Zwingli read many of the works of Erasmus and other humanists, often studying late into the night. At the same time, he devoted himself to reading the Bible in the original Hebrew and Greek. Reflecting back on the time, Zwingli wrote, "In the year 1516 I began to preach in such wise that I never mounted the pulpit without taking personally to heart the Gospel for the day and explaining it with reference to Scripture alone."

In 1515, Zwingli moved to the church in nearby Einsiedeln. Shortly after moving, he had an affair with a young woman. Zwingli had been struggling with the requirement of priestly celibacy but also knew that many fellow priests were either secretly or openly living with mistresses. In 1518, the city of Zurich, Switzerland, requested Zwingli to serve in the main church of the city, the Great Minster Church. Rumors of his affair in 1515 caused some difficulty in the decision but were not a serious impediment because of the general acceptance of such behavior. Zurich was one of the principal cities in Switzerland, and Zwingli became increasingly well known and popular as a preacher and leader.

Soon after Zwingli's move to Zurich, news of the Reformation controversy had spread. Reading Luther's writings, he found that he agreed with much of Luther's position, particularly Luther's approach to the Bible. From 1518 to 1522, Zwingli did not associate himself with Luther or the Lutherans but did substantial preaching on biblical texts. While such a preaching style was similar to Luther's, it was not so unusual that it caused substantial problems. Thus Zwingli remained in good standing with the Roman Catholic Church during this time.

In February 1522, some men of Zurich ignored the normal Lenten rule against eating meat on Fridays and

had some sausages served to them in a public setting with Zwingli. This raised the eyebrows of some of the town leaders (there was no separation of church and state at this time). While such occurrences were not rare, Zwingli took it upon himself to preach on the principle of Christian liberty and fasting a few weeks later. Such a sermon looked suspiciously like that of a Protestant-leaning priest and was the beginning of what would brew into a major controversy. Also in March 1522, Zwingli secretly married a widow named Anna Reinhart and petitioned his bishop to allow such marriages (the petition was summarily rejected).

Accused of heresy, Zwingli defended himself with clear statements about the centrality of the Bible and what he viewed as problematic practices in the church. This did not satisfy his opponents, but his response was received well by leading men of the city. After a few months of charges and countercharges, a date in January 1523 was fixed for a public debate. In preparation, Zwingli published 67 theses, which were similar in character to the Ninety-five Theses of Martin Luther. A few of the theses follow:

1. All who say that the Gospel is invalid without the confirmation of the church err and slander God.
19. Christ is the only mediator between God and ourselves.
49. I know of no greater scandal than that priests are not allowed to take lawful wives but may keep mistresses if they pay a fine.
57. The true Holy Scriptures know nothing of purgatory after this life.

On January 29, 1523, Zwingli made his arguments and the town council decided to support Zwingli, calling on all priests of the territory to preach in a manner similar to that of Zwingli. A time of revolution in the churches in portions of Switzerland had begun. During the next few years, many changes occurred in church practice. Most visible were the removal of all statues and pictures from the churches. A simplified service was substituted for the Catholic Mass. Monasteries were closed, and clergy were allowed to marry. Much of what can be seen in modern-day Protestant churches (especially those coming from the Reformed tradition) had their origins in these years.

While Zwingli admired Luther, he did not agree with him on many theological points. Luther had criticized Zwingli's theology in writing and Zwingli had responded in kind. Nevertheless, some princes and political leaders in both Germany and Switzerland hoped for

unity between these two leaders, which would support military alliances allowing them to stand against the Catholic emperor CHARLES V. One of these, Philip of Hesse (or Philipp of Hessen), persuaded both Luther and Zwingli to travel to Marburg in Germany for theological discussions, hoping for a signed agreement between the two leaders. Traveling secretly, Zwingli and several other Swiss reformers arrived in late September 1529. From October 1 to October 4, there were discussions and debates on the interpretation of key Bible passages from early morning till late at night. The tone was often sharp and heated, especially on the nature of the Lord's Supper or Communion. Zwingli held that the bread and wine used in the Lord's Supper were intended by Christ as a memorial, whereas Luther held that Christ was actually present in the bread and wine.

The result of the Marburg Colloquy was a simple statement signed by Luther, PHILIP MELANCTHON, Zwingli, Johannes Oecolampadius, Martin Bucer, and others. The statement affirmed their agreement on the fundamentals of the Christian faith, including JUSTIFICATION BY FAITH, but at the end noted their continued differences regarding the nature of the Lord's Supper.

By 1531, the political situation in Switzerland had deteriorated. The Protestant cantons began a partial economic blockade of the Roman Catholic cantons, causing all to contemplate war. Many expected the

emperor to send troops to aid the Catholic cantons as they contemplated war. Zwingli took an increasingly political approach to solving the difficulties, negotiating secretly with other cantons and the duke of Milan for support, as well as assuming an ever larger role in Zurich itself. By October, the Catholics began amassing troops outside Zurich in area of the Abbey of Cappel. Zurich sent out a small number of troops, but these were insufficient. At a council of war on October 11, 1531, in Zurich, Zwingli volunteered to go out to support the troops who had been struggling that day. It is unclear whether he was armed, but he certainly was dressed as a soldier. In the late afternoon, Zwingli was caught in a retreat of the Zurich soldiers as they lost a battle and was mortally wounded.

ABOUT THE EDITORS

Marsha E. Ackermann received a Ph.D. in American culture from the University of Michigan. She is the author of the award-winning book *Cool Comfort: America's Romance with Air-Conditioning* and has taught U.S. history and related topics at the University of Michigan, Michigan State University, and Eastern Michigan University.

Michael J. Schroeder received a Ph.D. in history from the University of Michigan and currently teaches at Eastern Michigan University. Author of the textbook *The New Immigrants: Mexican Americans*, he has published numerous articles on Latin American history.

Janice J. Terry received a Ph.D. from the School of Oriental and African Studies, University of London, and is professor emeritus of Middle East history at Eastern Michigan University. Her latest book is *U.S. Foreign Policy in the Middle East: The Role of Lobbies and Special Interest Groups*. She is also a coauthor of the world history textbooks *The 20th Century: A Brief Global History* and *World History*.

Jiu-Hwa Lo Upshur received a Ph.D. from the University of Michigan and is professor emeritus of Chinese history at Eastern Michigan University. She is a coauthor of the world history textbooks *The 20th Century: A Brief Global History* and *World History*.

Mark F. Whitters received a Ph.D. in religion and history from The Catholic University of America and currently teaches at Eastern Michigan University. His publications include *The Epistle of Second Baruch: A Study in Form and Message*.

FOREWORD

The seven-volume *Encyclopedia of World History* is a comprehensive reference to the most important events, themes, and personalities in world history. The encyclopedia covers the entire range of human history in chronological order—from the prehistoric eras and early civilizations to our contemporary age—using six time periods that will be familiar to students and teachers of world history. This reference work provides a resource for students—and the general public—with content that is closely aligned to the *National Standards for World History* and the College Board’s Advanced Placement World History course, both of which have been widely adopted by states and school districts.

This encyclopedia is one of the first to offer a balanced presentation of human history for a truly global perspective of the past. Each of the six chronological volumes begins with an in-depth essay that covers five themes common to all periods of world history. They discuss such important issues as technological progress, agriculture and food production, warfare, trade and cultural interactions, and social and class relationships. These major themes allow the reader to follow the development of the world’s major regions and civilizations and make comparisons across time and place.

The encyclopedia was edited by a team of five accomplished historians chosen because they are specialists in different areas and eras of world history, as well as having taught world history in the classroom. They and many other experts are responsible for writing the approximately 2,000 signed entries based on the latest scholarship. Additionally each article is cross-referenced with relevant other ones in that volume. A chronology is included to provide students with a chronological reference to major events in the given era. In each volume an array of full-color maps provides geographic context, while numerous illustrations provide visual contexts to the material. Each article also concludes with a bibliography of several readily available pertinent reference works in English. Historical documents included in the seventh volume provide the reader with primary sources, a feature that is especially important for students. Each volume also includes its own index, while the seventh volume contains a master index for the set.

CHRONOLOGY

1754 French and Indian War Begins

For almost nine years, a war rages between British and French soldiers in North America.

1756 The Seven Years' War

The Seven Years' War includes all the major Western powers. It begins when Prussia under Frederick the Great invades Saxony.

1757 British Establish Sovereignty

The British establish their sovereignty in India when they defeat the Bengalese nabob at the Battle of Nabob.

1762 Treaty of St. Petersburg

On May 5 the Treaty of St. Petersburg is signed between Prussia and Russia. The treaty brings about a switch in the alliances in the war.

1763 Treaty of Paris

The Treaty of Paris is signed, bringing to an end the French and Indian War in North America and the Seven Years' War in Europe, Asia, and Africa.

1765 Stamp Tax Passes

In an effort to raise additional revenue, Britain imposes a tax on all documents issued in the colonies.

1770 Cook Claims Australia

James Cook, the English explorer on board the *Endeavor*, sights the east coast of Australia. He lands at Botany Bay and claims the land for Britain.

1770 Parliament Repeals Townshend Acts

The British parliament repeals the Townshend duties on all but tea.

1770 Boston Massacre

A group of British soldiers fires on a mob of colonial protesters killing five and wounding another six.

1772 First Partition of Poland

Russia, Prussia, and Austria agree on the partition of Poland.

1772 Colonists Burn the *Gaspee*

On the afternoon of June 9, the British revenue schooner *Gaspee* runs aground. That night eight boatloads of men led by merchant John Brown storm the ship. After overwhelming the crew, they burn the ship.

1773 Boston Tea Party

Boston colonists begin boycotting tea. The governor refuses to allow arriving merchants to leave the harbor

with their tea. On the night of December 16 Patriots dressed up as Native Americans board the merchant ships and throw the tea into Boston Harbor.

1774 Coercive Acts

The British parliament gives its speedy assent to a series of acts known as the Coercive Acts or, in the colonies, the Intolerable Acts. These acts include the closing of the port of Boston.

1774 Treaty of Kuchuk Kainarji

On July 21 the Treaty of Kuchuk Kainarji is signed between Russia and the Ottoman Empire, ending the conflict between them.

1774 First Continental Congress

The First Continental Congress meets in Philadelphia, from September 5 to October 26.

1775 Lexington and Concord

Forewarned by Paul Revere, American militiamen fight 700 British troops on April 19. This marks the beginning of the Revolutionary War.

1775 Battle of Bunker Hill

The Americans occupy Bunker Hill overlooking Boston, and the British respond by attacking. While the British are victorious, they suffer heavy losses.

1775 King George Declares the Colonies in Revolt

On April 23, King George III of Great Britain declares, "The colonies are in open and avowed rebellion. The die is now cast. The colonies must either submit or triumph."

1776 Watt Builds Steam Engine

James Watt develops a steam engine, enabling the advent of the Industrial Revolution.

1776 Declaration of Independence

Twelve American colonies vote in favor of the Declaration of Independence. New York abstains.

1777 Battle of Saratoga

A British force commanded by General Burgoyne is defeated by American forces at Saratoga, New York.

1778 War of Bavarian Succession Begins

The War of Bavarian Succession breaks out when Frederick the Great, king of Prussia, declares war on Austria and invades Bohemia.

1778 France Signs Treaty of Alliance

On February 6 France signs a treaty of alliance with the United States of America. France recognizes the independence of the country and offers further aid.

1779 Cook Dies

James Cook is killed by natives in Hawaii. Cook is considered the preeminent explorer of his time, and by introducing a regime of fresh fruit he eliminates scurvy from his ships.

1780 Tupac Amaru Revolt

The natives of Peru revolt under the leadership of Tupac Amaru. Tupac Amaru declares himself the liberator of his people. The Spanish crush the revolt, and Tupac Amaru is killed.

1781 Battle of Yorktown

British forces are obliged to surrender to converging American and French forces. The surrender at Yorktown marks the last major campaign of the Revolutionary War.

1781 Articles of Confederation

The Articles of Confederation are first approved by the Continental Congress in 1777. They are sent to each state for ratification.

1782 Rama I Rules Siam

The Chakri dynasty is established in Siam. Its first ruler is Chao P'ya Chakri, who rules as Rama I. The dynasty rules to this day (2008).

1782 Russia Invades Crimea

The Russian army invades Crimea in December.

1783 Treaty of Paris

The Treaty of Paris is signed between the United States, Great Britain, France, and Spain. It brings an end to the American Revolutionary War.

1784 India Act

Under the terms of the India Act, the reorganized East Indian Company cannot interfere in native Indian affairs or make a declaration of war unless in self-defense.

1786 Shays's Rebellion

Daniel Shays, a farmer and Revolutionary War veteran, leads other farmers to revolt. Shays and 1,200 followers demand relief from various taxes and debts.

1787 States Approve Constitution

On September 17, after weeks of debate, the Constitution of the United States is approved. It calls for a strong central government. Thirty-nine delegates, representing 12 of 13 states, sign the document.

1787 Amar Singh's Reign Begins

During the reign of Amar Singh in southern India, three Brahman musicians reform the art of Carnatic music and establish a new heritage for future generations of southern Indian musicians.

1789 Washington Becomes President

George Washington becomes the first president of the United States, after being unanimously elected by the members of the electoral college.

1789 French Revolution

A revolt breaks out in France, overturning the monarchy. When it ends, both Louis XVI and Mary Antoinette will have been executed.

1789 Judiciary Act Passes

This act establishes the U.S. federal court system and sets the size of the Supreme Court. It also gives the Supreme Court the right to review state court decisions.

1791 Blacks Gain Full Rights in Saint-Domingue

The French National Assembly grants free blacks in Saint-Domingue full French rights. The white colonists refuse to implement the decision, and the blacks revolt.

1791 National Assembly

The French National Assembly passes a new constitution. Under its terms France becomes a limited monarchy.

1791 Bank of United States

Alexander Hamilton urges the founding of the Bank of the United States. Thomas Jefferson opposes the idea.

1792 France Declares War on Austria

On April 20 France declares war on Austria, beginning the War of the First Coalition. The French suffer initial defeats on the battlefield.

1792 French National Convention

On September 21 the French National Convention meets for the first time. There are 749 members at the convention.

1792 Russia Invades Poland

On May 19 Russia invades Poland. The Russians fear the strengthening of Poland under its new constitution.

1793 Whitney Invents Cotton Gin

Eli Whitney, a young New Englander, invents a cotton gin that automatically cleans cotton.

1793 Second Partition of Poland

The second partition of Poland divides Poland between Prussia and Russia.

1793 Reign of Terror Begins

Maximilien Robespierre, the leader of the Jacobins, the most radical faction of the National Convention, begins the Reign of Terror in France.

1794 Whiskey Rebellion

The Excise Tax of 1791 incites many U.S. western settlers, who begin a rebellion against the central government.

1794 Haiti Independent

After defeating a 5,000-man army sent by Napoleon, Haiti is declared a black republican government. All slaves are freed and almost all whites still on the island are killed.

1794 Uprising in Poland

After Poland is partitioned for the second time, the Poles, led by Thaddeus Kościuszko, rise up against the Russians. They are ultimately defeated.

1795 Siam Annexes Western Cambodia

King Rama I of Siam extends his kingdom by annexing parts of Cambodia, including the ruined Khmer capital.

1795 Treaty of Basel

The French and Austrians reach a peace agreement at Basel, Switzerland, on April 5.

1795 Jay's Treaty

Under Jay's Treaty, the British agree to leave areas in the U.S. Northwest Territory, which they had been required to leave earlier under the Treaty of Paris.

1796 Battle of Arcole

The French, led by General Napoleon Bonaparte, invade Italy. Napoleon successfully defeats the Austrians at the Battle of Arcole (Arcola).

- 1797 Treaty of Campo Formio**
Austria and France sign the Treaty of Campo Formio, ending the War of the First Coalition.
- 1798 Battle of the Nile**
The Battle of the Nile between the French and British fleets occurs in Aboukir Bay near the mouth of the Nile River. All of the French ships are either captured, destroyed, or run aground.
- 1798 Battle of the Pyramids**
The Egyptian Mamluks are easily defeated by Napoleon at the Battle of the Pyramids on July 21. Napoleon occupies Cairo on the next day.
- 1798 Alien and Sedition Acts**
The Alien and Sedition Acts mark an attempt by U.S. Federalists to strengthen the federal government and suppress opposition from the Republicans.
- 1798 War of the Second Coalition Begins**
In December Great Britain and Russia sign a treaty of alliance against France, beginning the War of the Second Coalition.
- 1800 Act of Union**
Great Britain annexes Ireland in the Act of Union on May 5. The Irish parliament is dissolved and Ireland gains representation in the British parliament.
- 1800 Peace Treaty with France**
The United States signs the Convention of Paris with France. Under this treaty, France accepts U.S. neutrality rights at sea.
- 1802 Treaty of Amiens**
The War of the Second Coalition comes to an end with the Treaty of Amiens. The British give up all claims to the French Crown and territory.
- 1803 War of the Third Coalition Begins**
The War of the Third Coalition begins when, on May 18, Great Britain declares war against France believing that Napoleon is violating the Treaty of Amiens.
- 1803 Louisiana Purchase**
The United States purchases the vast Louisiana Territory for \$15 million from France.
- 1804 Lewis and Clark Expedition**
On May 14, the Lewis and Clark Expedition sets off from St. Louis to the Pacific.
- 1804 Serb Uprising**
In February Serbs, under the leadership of Kara George, rise up against the Ottomans.
- 1805 Battle of Trafalgar**
The Battle of Trafalgar establishes British naval superiority for over 100 years.
- 1807 Invasion of Portugal**
Portugal refuses to participate in Napoleon's continental system that was designed to deny food and other products produced on the continent to Great Britain. Napoleon sends an army to conquer Portugal.
- 1808 Beethoven Completes Fifth**
Ludwig van Beethoven composes his Fifth Symphony.
- 1809 Napoleon Occupies Vienna**
On May 13 Napoleon's forces occupy Vienna. His initial victory is short-lived, and he is soon forced to withdraw across the Danube after his defeats at the Battles of Aspern and Essling.
- 1810 Argentina Independent**
A provisional junta is established in the provinces of the Río de la Plata (Argentina). The leaders declare their independence from Spain.
- 1811 Colombia Independent**
On August 7 Simón Bolívar wins a decisive victory over Spanish forces at the Battle of Boyacá in present-day Colombia. The Congress of Angostura is then convened to declare the Republic of Colombia.
- 1811 Paraguay Independent**
On August 14 Paraguay proclaims independence from Spain.
- 1811 Venezuela War of Independence Begins**
A congress of the *criollos* (Creoles) declares independence, starting a process that ends in 1823.
- 1812 War of 1812**
The war between Great Britain and the United States lasts for more than two years. It ends in a stalemate, but confirms American independence.

1812 Battle of Borodino

Napoleon defeats the Russian army at the Battle of Borodino. The Russians withdraw, opening the road to Moscow for Napoleon. On September 14, the French occupy the nearly deserted city.

1812 Napoleon Retreats from Moscow

Napoleon maintains his army in the burned Russian capital for five weeks in the hope of bringing the Russians to terms; finally on October 19, with winter setting in and his armies far from home, Napoleon retreats from Moscow.

1812 Treaty of Bucharest

On May 28 the Ottomans sign the Treaty of Bucharest with Russia, ending their six-year war.

1812 Spanish Regain Control of Venezuela

An earthquake in Venezuela is used by the clergy to claim that heaven opposes the revolution. With support weakened, the rebel forces capitulate to the Spanish under the terms of the Treaty of San Mateo. The treaty calls for the granting of clemency to the rebels; however, the Spanish renege.

1812 Mexico Independent

After a victory at Cuautla, 45 miles south of Mexico City, José María Morelos y Pavón captures Orizaba and Oaxaca from the royalists. The next year Acapulco is captured and independence is declared.

1812 Treaty of Ghent

British and American negotiators meet in August at Ghent, Belgium, to negotiate a settlement in the War of 1812. They reach an agreement that restores all territory as it was before the war, without resolving the territorial issues.

1814 Hartford Convention

Delegates from Massachusetts, Connecticut, and Rhode Island convene in Hartford from December 15, 1814, to January 5, 1815. The majority vote for a platform demanding a change in the Constitution, requiring a two-thirds vote by Congress to impose an embargo, admit a western state into the Union, or begin a war, except in the case of an invasion.

1814 Congress of Vienna

One of the greatest international assemblies in history takes place in Vienna between September 1814 and June 1815. It successfully works out the various claims

of the nations of Europe and establishes a framework that avoids a major European war for 50 years.

1814 Napoleon Abdicates

Napoleon is defeated in a series of battles, each bringing the allies closer to Paris. On March 31 a victorious allied army enters Paris. On April 11 Napoleon abdicates and is sent to the island of Elba.

1814 Steam Engine

In 1814 George Stephenson develops his first locomotive, which was called the Blücher.

1815 Battle of Waterloo

Napoleon once again seizes power. The other nations of Europe unite to fight him. On June 18 at the Battle of Waterloo Napoleon's forces are defeated, and he flees back toward Paris. On June 22 he surrenders to allied forces.

1815 German Confederation

One of the results of the Congress of Vienna is the establishment of the German Confederation. The Confederation consists of 39 member states.

1815 British Establish Colony in Sierra Leone

The British establish a Crown Colony in Sierra Leone.

1819 Adams-Onís Treaty

Under the terms of the Adams-Onís Treaty, the United States acquires Florida from Spain. In return, the U.S. government assumes \$5 million worth of Spanish debts.

1820 Revolts in Spain and Portugal

A revolt breaks out in Spain when Colonel Rafael del Riego demands that the French constitution of 1812 be restored. On August 24 a revolt against British regency in Portugal occurs. A liberal constitutional monarchy is created and João VI, living in exile in Brazil, is invited to head it.

1820 Missouri Compromise

Under the terms of the Missouri Compromise, Missouri is admitted as a slave state, while Maine is admitted as a free state. Slavery was prohibited in the former Louisiana Territory north of the 36°30' parallel.

1821 Greek War of Independence

The Greek revolution breaks out when Greeks in Moldavia begin a revolt against the Ottomans.

1822 Ashanti War Begins

The Ashanti War begins in West Africa between the Ashanti and the Fante.

1822 Brazil Independent

On September 7 Dom Pedro, the Portuguese regent, declares Brazil independent from Portugal.

1822 Ecuador Free from Spain

On May 24 Antonio José de Sucre, Simón Bolívar's lieutenant, defeats the Spanish at the Battle of Mount Pichincha near Quito.

1823 French Forces Restore Ferdinand VII

The French intervene in the Spanish revolution. They invade Spain and force the rebels to hand over King Ferdinand VII, whom they then restore to power.

1823 Monroe Doctrine

The Monroe Doctrine issued by U.S. president James Monroe states: "The American continents are henceforth not to be considered the subjects for future colonization by any European powers."

1824 First Anglo-Burmese War

On February 24 the first Anglo-Burmese War begins when the British declare war on Burma.

1825 Decembrist Uprising

Young Russian aristocrats stage a brief uprising against Romanov rule. The revolt is short-lived but is a sign of things to come.

1828 Uruguay Independent

Uruguay becomes independent under a peace treaty between Brazil and Argentina over Banda Oriental.

1829 Baltimore and Ohio Railroad

On December 22, the first passenger railroad in the United States opens for business.

1829 Treaty of Adrianople

The Russian-Turkish War that had begun in 1828 ends with the Treaty of Adrianople.

1830 The July Revolution

The July Revolution breaks out in Paris when Charles X, king of France, attempts to suspend the constitution to overturn the recent French election. The revolutionaries gain control of Paris and force Charles X to abdicate.

1830 Belgium Adopts a Constitution

The July Revolution in France inspires Belgian revolutionaries to rise up against Dutch rule. They demand independence. In late September the Dutch are forced out of Brussels, and Belgium is declared independent.

1832 First Reform Act Passes in Britain

The Reform Act of 1832 passes the House of Lords. It doubles the number of eligible voters to 1 million. This begins a series of reforms that will eventually lead to universal suffrage.

1833 The First Carlist War Begins

A civil war fomented in Spain when Ferdinand VII dies.

1835 Second Seminole War

Under the leadership of Chief Osceola, the Seminoles refuse to move to the Oklahoma Territory. They retreat to the Florida Everglades.

1835 The Great Trek

The Dutch settlers of South Africa, known as the Boers, begin a Great Trek northward. Now known as the Voortrekkers, they leave the Cape Colony to free themselves of British control.

1836 Texas Independent

The settlers of Texas, a Mexican territory, declare their independence in 1836.

1837 Deere Invents Plow

John Deere invents the steel plow, which greatly improves the ability of farmers to plow fields.

1838 First Anglo-Afghan War Begins

The First Anglo-Afghan War begins when the British governor of India launches an attack on Afghanistan. He fears growing Russian influence in Afghanistan.

1838 Underground Railroad Begins in United States

The Underground Railroad starts as a means for escaped slaves to be moved through the North until they reach sanctuary in Canada.

1839 Opium War

The Opium War between China and Great Britain begins when the Chinese order the destruction of illegal opium stored by foreign merchants. The East India Company had promoted the use of opium by its Chinese workers.

1842 British Are Massacred

A revolt against the British in Kabul forces them to agree to withdraw from the city and return to India. The Afghans instead attack the British and massacre 4,500 soldiers and 12,000 civilians.

1844 Treaty of Wanghia

Under the terms of this treaty negotiated by Caleb Cushing, the United States gains the right to trade in Chinese ports as well as additional legal rights inside China.

1844 Franco-Moroccan War

The French begin a war with Morocco, which had refused to recognize the French conquest of Algeria and provided refuge to the Algerian rebel leader.

1844 Telegraph Becomes National

The first intercity telegraph is demonstrated by Samuel Morse. A telegraph line was built for \$30,000 between Washington and Baltimore.

1845 U.S. Annexes Texas

After the landslide victory of James Polk, who ran on a ticket supporting annexation of Texas, the U.S. Congress approves the annexation of Texas by joint resolution.

1846 First Sikh War

The First Anglo-Sikh War ends with a British victory at the Battle of Sobraon in the Punjab.

1846 Mexican War

The U.S. Congress votes overwhelmingly to declare war on Mexico despite initial Whig opposition. Over the course of the two-year war, the United States defeats the Mexicans and captures the capital, Mexico City.

1846 Oregon Treaty

The United States and Great Britain end disputes over the Oregon Territory with a compromise.

1847 Liberia Independent

Liberia declares its independence on July 26. Former American slaves had founded Liberia. It is Africa's first independent republic.

1848 Revolution in France

King Louis-Philippe of France refuses to institute political reforms and extend suffrage. In response, riots led by workers and students break out. They force the king to abdicate in February.

1848 The Viennese Revolution

Viennese students and workers inspired by events in France begin in March to protest the policies of the Austrian government. Conservative elements, however, gain control and brutally put down the revolt.

1848 Guadalupe-Hidalgo Treaty

The Treaty of Guadalupe-Hidalgo ends the Mexican-American War. Under the terms of the treaty, the border is set at the Rio Grande. The United States gains most of California, New Mexico, Nevada, Wyoming, Colorado, and Texas.

1849 Hungarians Announce Independence

In response to a repressive constitution promulgated after the failed Viennese revolution, the Hungarian Diet (parliament) on April 14 formally declares its independence from Austria.

1849 Second Sikh War

The British defeat the Sikhs at Chillianwalla and Gujart. This forces the Sikhs to surrender at Rawalpindi.

1849 Gold Rush Begins

In January President Polk announces that gold has been found in California. This sets off the gold rush, in which 80,000 people head for California to seek their fortunes.

1850 Taiping Rebellion

The Taiping Rebellion in China begins, led by Hong Xiuquan. The revolt against the Manchus lasts for 10 years and ends in failure. The revolt takes the lives of 20 million Chinese peasants.

1850 Compromise of 1850

The Compromise of 1850 holds the Union together for another 10 difficult years. The dispute concerns the admittance of additional states into the Union, while maintaining the balance between free and slave states.

1852 Second Burma War

The Second Burmese War begins when the Burmese oust their king, Pagan Min, after a six-year reign. The British capture Rangoon as the war begins.

1852 South African Republic

The British government recognizes the independence of the Boer Republic of the Transvaal under the terms of the Sand River Convention of 1852.

1854 Perry in Japan

U.S. commodore Perry arrives in Japan to attempt to open trade relations, as well as provide a safe haven for shipwrecked sailors. Perry's successful mission to Japan quickly ends the Japanese self-imposed isolation and heralds a rapid industrialization of the economy of the island nation.

1855 Livingstone Discovers Victoria Falls

David Livingstone, a Scottish explorer, departs from South Africa to explore the interior of Africa. In 1855 he discovers Victoria Falls.

1856 Arrow War

The second Anglo-Chinese war, known as the Arrow War, begins when the Chinese force a British-registered ship (the *Arrow*) to lower the British flag.

1857 Sepoy Mutiny

The Sepoys, native Indian troops employed by the British, revolt and kill their British officers. The Sepoys manage to capture Delhi.

1859 John Brown Leads Revolt

John Brown leads a group of 18 to attack the arsenal in Harpers Ferry. His goal is to foment a slave rebellion. The revolt is subdued by the U.S. Army under the command of Robert E. Lee. Brown is hanged.

1859 Darwin Publishes *On the Origin of Species*

Charles Darwin publishes *On the Origin of Species*, in which he posits the theory of evolution. That theory states that humans descended from apes and that only the fittest species survive and evolve.

1859 Italian War

The Italian War starts when Austria tries to extend its already extensive control over the Italian Peninsula. On May 12 the French declare war on Austria.

1860 Second Maori War Begins

The second Maori war is fought from 1860 to 1872 between British colonists and native New Zealanders on North Island.

1861 Fort Sumter

Fort Sumter refuses to surrender to the Confederates. At 4:30 A.M. on April 12, General Pierre Gustave Toussaint Beauregard gives the order to open fire. The next afternoon Major Anderson surrenders. The American Civil War begins in earnest.

1861 Battle of Bull Run

In July Union troops are defeated in the first major battle of the Civil War.

1862 Battle of Antietam

Confederate general Robert E. Lee leads his army into Maryland in a gamble to win the war. Both sides lose an equal number of men. The smaller Confederate force withdraws. In the aftermath of the battle, President Abraham Lincoln announces the Emancipation Proclamation.

1863 Battle of Gettysburg

The Battle of Gettysburg takes place in Pennsylvania, where Lee has led his army to invade the North following his success at Chancellorsville.

1865 Civil War Over

In April General Lee's surrounded army is forced to surrender to the forces of Ulysses Grant, ending the Civil War.

1865 Booth Assassinate Lincoln

Just six days after the South surrenders, President Lincoln is shot by John Wilkes Booth while attending a play at Ford's Theatre.

1865 Thirteenth Amendment Passes

On December 18 the Thirteenth Amendment to the Constitution is officially ratified. This amendment states that neither slavery nor involuntary servitude can exist in the United States.

1867 Alaska Purchase

Secretary of State William Seward negotiates the U.S. purchase of Alaska from Russia for \$7 million.

1868 Meiji Restoration

The Meiji Restoration begins when the newly established emperor, Mutsuhito, ousts the shogunate (military regime) of the Tokugawa clan that had ruled Japan in fact since 1603.

1868 Revolution in Spain

On September 18 the officers of the Spanish fleet foment a revolution. They march on Madrid and defeat government forces.

1869 Suez Canal Opens

On November 17 the Suez Canal opens to traffic. The canal links the Mediterranean and the Red Sea.

1869 Transcontinental Railroad

On May 10, at Promontory Point, Utah, a golden rail spike is struck, completing the first U.S. transcontinental railroad line.

1870 Italy Is Unified

Italy is unified when Italian troops enter Rome after the withdrawal of French troops. The Italians strip all temporal power from Pope Pius IX, whom they imprison in the Vatican.

1870 Franco-Prussian War

The Franco-Prussian War begins at the instigation of Prussian minister Otto von Bismarck, who believes the war will help unify Germany. On January 28, 1871, Paris falls and the French surrender.

1871 Paris Commune

When word spreads in Paris that the legislative assembly is considering restoring the monarchy, students and workers take to the streets. The Commune of Paris controls the city from March 18 until May 28.

1871 Second Reich

With the German victory in France complete, the German Reichstag (parliament) proclaims the creation of the Second Reich.

1872 Second Carlist War

The Second Carlist War begins in the spring of 1872 when Don Carlos III tries to reestablish the Bourbon reign in Spain. The war continues for two years until 1874 when a coalition declares Alfonso XII king.

1874 Japanese Invade Taiwan

The Japanese invade Taiwan—their pretext is the killing of an Okinawan seaman after a shipwreck.

1876 War in Ottoman Empire

In May the Bulgarians begin an insurrection against the Ottomans. The insurrection is brutally quelled, and thousands of Bulgarians are slain.

1876 Korean Independence

Japan recognizes Korean independence from China. Under a treaty with Korea, trade between Japan and Korea opens. China does not object to the treaty.

1879 Edison Invents Electric Light

Thomas Edison overcomes the obstacle to finding a lightbulb that will burn long enough to become com-

mercially viable by developing a bulb based on carbonized cotton.

1879 Zulu War

The Zulu nation that was founded in 1876 ends when the British defeat it in battle. On January 22 the British are defeated at the Battle of Isandhlwand. The British, however, decisively defeat the Zulu at the Battle of Ulundi.

1881 Alexander II Dies

A bomb in St. Petersburg kills Alexander II, czar of Russia, on March 13.

1881 Assassin Shoots President Garfield

U.S. president James Garfield is shot on July 2 as he walks through the waiting room of the Baltimore & Potomac Railroad in Washington, D.C. His assassin, Charles Guiteau, had been rejected for a position in Garfield's administration. The president dies on September 19.

1881 French Invasion of Tunisia

Tunisian tribesmen raid Algeria, which provides the French with a pretext for attacking Tunisia. The French withdraw after signing the Treaty of Bardo.

1882 Britain Invades Egypt

The British invade Egypt in response to antiforeign riots. The British defeat the army of Arabi Pasha at Al Tell.

1882 Triple Alliance

The Triple Alliance is created when Italy, Germany, and Austria-Hungary promise mutual support.

1883 Anglo-French Punitive Expedition

The French and the British launch a punitive expedition against Sudan that is decisively defeated by Muhammad Ahmad at the Battle of El Ubbayid.

1883 Brooklyn Bridge Opens

On May 25 the New York boroughs of Manhattan and Brooklyn are linked with the opening of the Brooklyn Bridge.

1883 Sino-French War

The French and the Chinese fight in the Sino-French war. The French occupy most of Annam (Vietnam and Cambodia), but their trade is disrupted by Chinese in northern Vietnam.

- 1884 Congo Free State**
Belgium declares the Congo a free state, open to settlement and trade by all nations.
- 1885 Germany Claims Tanzania**
The German East Africa Company gains a charter to administer Tanzania. The same year Germany claims South-West Africa and Togoland.
- 1886 Anglo-Egyptian Agreement**
The British and the Germans agree to recognize Sayid Barghash as sultan of Zanzibar.
- 1887 Ethiopian-Italian War Begins**
The Italians are defeated in the first battle of the Italian-Ethiopian War at the Battle of Dogali.
- 1889 Japan's First Written Constitution**
Under the terms of the constitution, the emperor's legislative power can be exercised only with the consent of the Imperial Diet.
- 1890 Bismarck Resigns**
Emperor William II of Germany forces Bismarck to resign. This ends the career of the man singlehandedly responsible for the unification of Germany.
- 1890 Britain Occupies Uganda**
The Germans and the British resolve their differences in Africa when the Germans give up claims to Uganda.
- 1893 Panic of 1893 in the United States**
A growing credit shortage creates panic, resulting in a depression. Over the course of this depression, 15,000 businesses, 600 banks, and 74 railroads fail.
- 1895 First Sino-Japanese War**
The Japanese defeat both the Chinese army and navy in the Sino-Japanese War.
- 1895 French West Africa**
The French organize their territorial holdings in West Africa into French West Africa.
- 1895 Sun Yat-sen Revolt**
Sun Yat-sen organizes a secret revolutionary society in Canton in 1894. In 1895 he attempts to overthrow the Manchu dynasty. His first attempt fails.
- 1896 Battle of Adwa (Adowa)**
Ethiopia defeats the Italians at the Battle of Adwa.
- 1896 Great Britain Captures Ghana**
The Ashanti capital of Kumasi is captured by a British expeditionary force. The area, which is in present-day Ghana, becomes a British protectorate.
- 1898 Spanish-American War**
The Americans decisively defeat the Spanish, capturing the Philippines, Cuba, and Puerto Rico.
- 1898 Fashoda Incident**
British and French expeditions simultaneously reach Fashoda in present-day Sudan. The crisis ends when France recognizes British claims to the Nile basin, while Britain recognizes French claims to the Sahara as well as western Sudan.

MAJOR THEMES

1750 to 1900

FOOD PRODUCTION

Between the mid-18th century and the dawn of the 20th, the ancient and essential work of feeding the world was dramatically transformed to varying extents in different parts of the world. Despite astonishing changes in mechanization, transport, agricultural science, and food preservation techniques, farmers everywhere were still at the mercy of weather and pestilence. As agriculture became internationalized, farmers were also affected more than ever before by crop and price fluctuations. The world's overall supply of food increased spectacularly, yet many still starved or were undernourished.

Most countries were still predominantly rural in 1750. In the countryside, families and communities tried, even on the tiniest plots, to grow enough food to sustain themselves. In emerging cities, most residents used available open spaces for cows, pigs, goats, or chickens and perhaps a fruit tree or vegetable patch. The wealthiest and most important people in most societies did not usually farm themselves but controlled quantities of fertile land and could compel laborers—slaves, serfs, or peasants—to farm it.

Agricultural change was already afoot. In the Americas, where settlers from Spain, France, and Britain had appropriated land formerly controlled by Native peoples, commodity agriculture built wealth for the colonizers and their homelands. By 1750, Chesapeake planters who had built a thriving economy on tobacco were diversifying into grains and other crops. After the American Revolution, cotton became king in the southern states.

Slaves were used to raise the crop that fed the textile mills of the Western world's Industrial Revolution. Even as farming became commercialized, the New World's enormous land resources seemed to promise agricultural independence to generations of farmers. U.S. president Thomas Jefferson, himself the owner of dozens of slaves, advocated an agrarian nation that would feed the world while maintaining the sturdy self-reliance of virtuous small farmers.

Mexico and Central and South America remained overwhelmingly rural until the later 19th century and continued to rely almost entirely on traditional Indian crops, such as corn and squash, and agricultural methods including burning the residual stalks and roots after harvesting. Wars of

independence between 1808 and 1824, followed by frequent outbreaks of regional civil war, led to crop and livestock destruction and great instability for farmers. In the 1830s coffee beans became a wildly successful commodity. Coffee enabled many wealthy landowners, especially in Brazil, Venezuela, and Guatemala, to enlarge their holdings at the expense of small farmers, although some small farmers in Costa Rica and Colombia were able to hold their own. In Argentina, commercial beef production grew explosively late in the century. Similarly, Australia and New Zealand, settled by British immigrants, became major exporters of grain and meat.

North America became a magnet for agricultural immigrants as land became scarcer in Europe due to population pressures and other political and economic factors. Millions of Scandinavian and German farmers headed to the Great Plains, helping to make the United States and Canada the world's most bountiful source of grains such as wheat and corn. Not all rural immigrants found agricultural opportunities: Irish peasants displaced from their lands by harsh British policies and the devastating potato famine of the late 1840s mostly resettled in Canadian and American cities. In the 1890s a worldwide decline in sugar prices caused famine in Spanish-controlled Cuba and helped bring about the Spanish-American War.

In China, even though acreage devoted to agriculture increased after the 17th century, the population rose much faster, tripling to 430 million by 1851, thanks to a period of internal peace, increased crop yields, and medical advances such as widespread smallpox vaccination. Since little additional land was available for cultivation and there were few opportunities for emigration, livelihood became difficult, leading to widespread rebellions in the mid-19th century. Japan's population also grew rapidly in the late 19th century, straining limited land resources. The adoption of chemical fertilizers somewhat improved agricultural yields.

Imperialism played an important role in reshaping agricultural economies. Subsistence farming in much of Asia, Africa, and South America was disrupted by Western demands for profitable cash crops and a growing need for cheap, nonagricultural labor. Egypt under Muhammad Ali moved away from self-sufficient farming of foodstuffs to cash crops, especially tobacco and cotton. During the U.S. Civil War, when demand was high and production low, the Egyptian economy prospered, but once U.S. production resumed, Egypt was caught in a web of indebtedness for costly development projects begun during the short boom. In India, the British undertook many irrigation projects, especially after the opening of the Suez Canal. These improvements facilitated the cultivation and exportation of various cash crops. Famines continued to occur, but agricultural and transportation improvements lessened their severity. Over the course of the 19th century, prices of commodity crops such as wheat, corn, tobacco, sugar, and cotton fell significantly. This was a boon for consumers, but difficult for small independent farmers.

Agricultural Mechanization and New Techniques. For millennia, agricultural labor had been provided by the muscle power of men, women, and children, assisted when possible by draft animals such as horses, donkeys, oxen, water buffalo, or yaks. The number of hands and hoofs available dictated the size of most farms, which were small. Most farmers produced food required by their own families, selling any extra production locally for cash to buy what they could not grow or make.

Two American innovators, John Deere and Cyrus McCormick, introduced important advances in the 1830s that made plows stronger and reapers more reliable. At first this new equipment used horse or oxen power; eventually steam power would run these labor-saving machines. Although Deere and McCormick became international names in agriculture, farmers were slow to adopt the new machinery, due to expense and tradition. As more farmers after the U.S. Civil War acquired larger farmsteads on the Great Plains, they found that it was almost impossible to cultivate the prairies without the new technology, including the tougher chilled iron plow, introduced in 1869, and seed drills that promised uniform rows for crops such as wheat and corn. The "plow that broke the Plains" would have serious ecological consequences wherever it was used, leading to soil erosion and other long-term effects.

By the 1880s most North American agriculture was specialized. In the arid West, barbed wire was the key invention that helped ranchers control their livestock, keeping cattle and sheep safe from both

animal and human predators. A swath of states from New York to Wisconsin and Minnesota provided most of the nation's dairy foods. The cotton gin, a device patented in 1794 by New Englander Eli Whitney, removed seeds from cotton fibers, making cotton a viable commodity. Cotton raised in Mississippi, Alabama, and elsewhere in the South was the United States's most important export before the Civil War, but was challenged afterward by cotton from Egypt and India. Between 1860 and 1900 the number of active farms in the United States almost tripled, and 32 million people lived on them.

Scientific agriculture began to reshape, if not always improve, traditional farming practices. Advances in crop rotation, new seed varieties, fertilizers, and pesticides began to help farmers overcome some traditional dangers to their livelihood, despite potential loss of variety and environmental harm. Mechanical irrigation could overcome drought, but at a high economic and ecological cost. In the United States in 1862 Congress authorized college-level agricultural education and created a federal Department of Agriculture. National efforts to educate and encourage farmers emerged even as new techniques and machinery began to make labor-intensive small farming obsolete. Lack of capital and conservative political and social policies prevented the vast agricultural lands of Russia from adopting efficient farming methods.

Agricultural Markets and Trade. As localized subsistence farming gave way in most of the world to international commercial agriculture, transportation and processing facilities took on the highest importance. For most countries, navigable waterways were the best option for moving crops to port cities. In the United States the Mississippi River played an especially important role, as barges carried farm goods to the port of New Orleans. Smaller streams could provide power to turn grain into flour; by the 1780s automated water mills were in use in North America. In the early 1800s localities searched to create water access. The Erie Canal, a state-financed project that opened in 1825, connected New York City to the Great Lakes, dramatically enhancing agricultural trade options. Canals were also widely used in Europe. Ocean shipping by clipper ships, and later steam-powered vessels, helped greatly in the worldwide distribution of agricultural products.

Roads good enough to accommodate heavily loaded farm wagons under a variety of weather conditions were slow to develop, but the advent of railroads in the 1830s was a major boon to farmers and their customers, because they were more reliable and cheaper than canals or rivers. Cattle and other livestock destined for urban slaughterhouses would be delivered to railroad depots by cowboys on horseback. By the 1870s refrigerated freight cars were hauling meat and other perishable foodstuffs to distant cities.

This gradual switch from food grown locally to products from the world over changed human dietary habits. Ancient preservation techniques, including smoking, salting, and pickling, were augmented by sanitary canning, developed in France and Britain in the early 1800s. French scientist Louis Pasteur's heat treatment of milk overcame serious dangers of microbes in many foods, although mandatory pasteurization only caught on widely in the 20th century. Refrigeration and new methods for providing large quantities of ice for home use were, by the end of the 19th century, making it safe to eat foods out of season.

Although these new methods promised food that was more plentiful, nutritious, and varied, standardization and new packaging had a downside. Practices that counterfeited freshness and healthfulness became endemic in the 19th century. Food-processing firms often cut corners in regard to hygiene and mislabeled their products. Cheap additives, artificial taste and coloring agents, and even known poisons made their way into packaged products. Crusades against food adulteration, led by mothers and public health professionals, gained momentum, culminating in 20th-century inspection and labeling laws in many nations.

Land and Money: Agricultural Politics. Peasant unrest frequently afflicted societies across the globe; even in more developed nations, farmers were often unhappy. In the 19th century farmers facing higher machinery and transportation costs while crop prices plummeted made their grievances known. In the next century millions of them would give up farming entirely.

In 1807 U.S. farmers, not for the first time, experienced the instability of farming as an export business. Facing attacks on shipping by both France and England in the run-up to the War of 1812,

President Jefferson, the champion of agrarianism, persuaded Congress to include farm products in his embargo of trade with the warring European powers. Since agricultural sales were a major component of U.S. trade, this proved to be a disaster. Tobacco became almost worthless, while wheat prices fell from two dollars to 10 cents a bushel, setting off a general recession.

The distribution of western lands mostly seized by the U.S. government from Indian tribes was a major issue leading up to the Civil War. In 1862 a Homestead Act was signed by President Abraham Lincoln at a time when 75 percent of Americans were farmers or lived in rural communities. It was a way to reward Union supporters during the war, although former Confederates would later share its benefits. The act promised 160 acres of free land in specified areas to families who would spend at least five years improving their new homesteads. Some 2 million families claimed free federal lands, while millions more bought surplus land from railroad companies building transcontinental lines with government assistance. Persuaded that “rain follows the plow,” many of these homesteaders would eventually give up farming after enduring droughts, blizzards, and insect infestations later in the century.

After the Civil War much of southern agriculture was based on sharecropping, a system that put landless farmers to work on the large landholdings of others. Poor whites and former slaves were most likely to farm under these circumstances. Despite promises that they might someday own the land they cultivated, sharecroppers were often exploited by high-priced “company stores” and were prey to the usual disappointments of farming. Like Russia’s serfs, emancipated by Czar Alexander II in 1861, sharecroppers often found greater opportunity in urban factories than by continuing to farm lands they might never actually own.

Farmer disappointment and unrest soon took political form. In the United States, the National Grange was founded in 1867. This fraternal organization encouraged rural families to support one another and create cooperative facilities such as grain silos. By the 1870s farmers were joining more overtly political farmers’ alliances. Millions of farmers in the Midwest, Great Plains, and South were politicized by uncontrolled rail freight charges, high seed costs, and agricultural price instability. In 1892 the new People’s Party ran former Iowa general James B. Weaver for president. This movement, whose members were called Populists, had some regional success and won electoral votes. But after their central issues, including currency reform, were embraced by 1896 Democratic Party nominee for president William Jennings Bryan from Nebraska, Populists gradually retreated into political oblivion, and their tentative efforts to build a biracial movement were swept away. In 1750 most of the farming population in Europe were either serfs or worked under conditions that had survived from serfdom. Political and social changes brought on by the French Revolution in 1789 would result in the emancipation of farmers in France and later across Europe. The last and largest group to achieve freedom was the rural population of the Russian Empire, in the 1860s. Peasant unrest and revolts characterized Russia throughout this period.

SCIENTIFIC AND TECHNOLOGICAL DEVELOPMENTS

In the 18th century Europeans, later joined by North Americans, brought about a scientific, technological, and social movement that reshaped work, wealth, and environments around the globe. Over this 150-year period, the Industrial Revolution changed power generation, transportation, and communication. It also generated important breakthroughs in pure science, as physicists, chemists, and biologists developed theoretical explanations for technologies often already in use.

On the most basic level, what the Industrial Revolution did was replace ancient energy sources—human and animal labor, wind, fire, and water—with new systems of power, initially the use of coal to run steam engines that were massively more powerful than hundreds of human workers. In 1765 Scotsman James Watt, building on the earlier work of Thomas Newcomen and others, developed the first efficient steam engine. Among its earliest applications were steam-powered machinery for turning wool, cotton, and flax into finished textiles, a process previously done

almost entirely by hand. This transformation of work from a home-based system to centralized factories relying on complex machinery was the central element of the Industrial Revolution.

Britain's newly automated spinning and weaving machinery quickly propelled the island nation into the forefront of economic production and soon set off efforts by competing nations, including the new United States, to equal Britain's industrial achievements. Bribes paid to British mechanics and industrial espionage were among the tactics used. In 1793, with the invaluable assistance of British immigrant and skilled textile machinist Samuel Slater, a limited but successful textile factory opened in Rhode Island.

In the early 1800s growing conflict between Britain and the United States, resulting in the War of 1812, had the effect of making America's home-grown industrialization even more crucial. After 1807 the number of U.S. textile mills sextupled. The most important of the new mills was Francis Cabot Lowell's Boston Manufacturing Company of Waltham, Massachusetts, where both spinning and weaving processes were automated under a single factory roof and a workforce, consisting primarily of young women from struggling New England farm families, provided low-cost labor.

In the earliest days of the Industrial Revolution, water wheels competed with the new steam engine. But as the reliability of steam power increased and its siting flexibility became obvious, energy-dense coal became Europe's and, later, North America's major industrial fuel source. At the U.S. centennial celebration in Philadelphia in 1876, George H. Corliss's steam engine, the largest in the world, was both a major attraction and sole power source for the entire exhibition. Within 40 years, steam engines would be largely replaced by electrical devices, although the electrical power these new machines used would, in most cases, still be generated by burning coal.

Some of the earliest experiments with static electricity were done by American Benjamin Franklin, whose 1751 article, "Experiments and Observations on Electricity," made him a Fellow of Britain's Royal Society. By 1753 Franklin had developed the protective lightning rod. Between the 1780s and 1800 Italian scientists Luigi Galvani and Alessandro Volta would discover electrical current and how to produce electricity chemically through the medium of the battery. In 1831 Englishman Michael Faraday's discovery of electromagnetism, scientifically refined by James Clerk Maxwell, paved the way for practical uses of electrical power. George Westinghouse, who first gained fame in 1873 as the inventor of air brakes for trains, soon thereafter became fellow U.S. inventor Thomas A. Edison's chief rival for the implementation of commercial electric power. Westinghouse's alternating current, developed for him by Nikola Tesla, became the standard. Edison, inventor of the incandescent lightbulb and many other devices powered by electricity, lost his bid for direct current but nevertheless profited mightily.

Spread of Industry. As the Industrial Revolution spread, the need to provide fuel and raw materials to new factories and ship their finished products helped set off a transportation revolution in many industrializing nations. Efforts were made in Britain and elsewhere to improve road surfaces to facilitate safer passage for wheeled vehicles, at first drawn by horses or other draft animals. In 1819 Scotsman John Macadam developed a crushed stone surface, significantly smoothing roadways. The United States began building a National Road, starting in Baltimore after the War of 1812, but regional squabbles and high costs meant that, after 44 years, the road project ended 65 miles short of its projected St. Louis terminus. Similarly, imperial powers in Africa, Muhammad Ali in Egypt, and the Ottoman Empire in western Asia all financed projects to enlarge ports and build roads and railroads to facilitate the transport of cash crops and raw materials.

In 1757 and 1764 two canals built in England made it easier to move coal to emerging factories. Other European nations and the United States soon joined in the canal-building boom. In 1825 New York State's Erie Canal, a water route connecting New York City to the Great Lakes and beyond, became one of the most successful projects in what would prove to be the brief golden age of canal transport.

The major transport successes of the early 19th century were steam-powered ships and railroads. In 1807 on the Hudson River Robert Fulton demonstrated a new kind of water-going vessel,

powered by an English steam engine. Its success led to steamboats on most large U.S. rivers and the Great Lakes. In 1800 Englishman Richard Trevithick devised a much smaller, high-pressure steam engine ideal for railroad transportation. Locomotives were used for industrial freight hauling in Britain for some years before the first public passenger line between Liverpool and Manchester opened in 1830. A worldwide frenzy of railroad construction ensued. With their dedicated trackage and modular assembly, railroads, powered by coal-fired steam engines, were well suited to hauling huge loads of both goods and people.

Major increases in the fabrication and use of iron and steel provided the sinews of the Industrial Revolution, especially the building of rail tracks. Developed in Britain, the Bessemer steel process was widely adopted in the United States and helped steel magnate Andrew Carnegie, a Scottish-born immigrant, become one of the world's wealthiest men.

The late 19th century saw the first examples of transport based on internal combustion engines—the automobile, bus, and truck. Although the Swiss inventor Nicholas Cugnot is credited with making such a device as early as 1769, European experiments that led to workable internal combustion engines began in the 1860s. The Germans Gottlieb Daimler, Wilhelm Maybach, and Carl Benz produced workable prototypes in the 1880s, while France's Peugeot firm began to perfect auto design in 1890. In 1897 the German Rudolf Diesel produced a new type of engine that now bears his name. By the end of the century Americans, too, were making cars, notably the 1893 Duryea. Ransom Olds's first Michigan auto factory opened in 1899, but the United States lagged behind European engineering by a decade.

Instantaneous communications were essential to the business and technical needs of the Industrial Revolution. Weather events, wars, and other crises could easily disrupt, even derail, factory production. Charles Wheatstone's early telegraph of 1837, systematized and improved in 1844 by Samuel F. B. Morse, made it possible to circulate information much faster than mail systems. By 1866 telegraph signals could be reliably sent and received across the Atlantic; by the end of the century, much of the world had access to telegraph communication. The Canadian Alexander Graham Bell displayed his telephone at the 1876 U.S. Centennial Exposition; within a few years it became an important business tool. In 1899 the Italian Guglielmo Marconi sent his first radio signal across the English Channel. Both telephone and radio later made the telegraph obsolete.

Mechanical Geniuses. Western science developed dramatically during the heyday of the Industrial Revolution, sparked by "untutored" mechanical geniuses like Thomas Edison, as well as growing cadres of university-trained scientists and engineers. Major breakthroughs in chemistry in the later 1700s included Frenchman Antoine Lavoisier's and Englishman Joseph Priestley's identification of oxygen and other atmospheric components, and Russian Dmitry Mendeleev's development in 1869 of a systematic table of chemical elements. In physics, discoveries in thermodynamics were spearheaded by such theorists as William Thomson, Lord Kelvin, who postulated a temperature of absolute zero at which all motion would cease. Thermodynamics provided theoretical underpinnings for methods of creating and preserving cold conditions. By the 1870s refrigerated train cars were in wide use, preserving and enhancing food products traveling from farms to distant urban areas.

Some important innovations in biological science, especially as applied to health and medicine, included Swede Carolus Linnaeus's (Carl von Linné's) 1753 classification of biological organisms, a system still in use today. The discovery of anesthetic agents such as ether and chloroform in the 1830s and 1840s soon radically improved outcomes of painful and invasive surgeries. In 1896 X-rays were first used to diagnose human ailments.

But the two most spectacular breakthroughs in this period would be evolutionary theory and the germ theory of disease. Made public in 1858, evolution was an explanation of the diversity and complexity of living organisms, reached almost simultaneously by two English naturalists, Charles Darwin and Alfred Russell Wallace. Both men had relied heavily on the early 19th-century geologic and fossil findings of Charles Lyell. In 1859 Darwin published *On the Origin of Species* in which he postulated natural selection as the mechanism that allowed some species to survive while others disappeared. His direct challenge to most religious explanations for the development of human life,

evolution, was labeled blasphemous and, outside scientific circles, remains embroiled in controversy to this day.

In the 1870s biologists Louis Pasteur of France and Robert Koch of Germany proved that microorganisms—germs—were responsible for most human, animal, and plant diseases. This rethinking of disease transmission revolutionized medical practice and gave new credibility to the emerging practice of sanitation.

Although the Industrial Revolution took place mostly in the West and helped it dominate other sections of the globe in the years between 1750 and 1900, it would be a mistake to see this burst of technological and scientific growth as an unchallenged success. From its inception, the new factory system was strongly criticized for making humans interchangeable and also forcing them to adapt to ever-faster and more complex machines. Opposition by a group of early challengers, the Luddites, reached its peak in England in 1812 when highly skilled workers, concentrated in the woolen industry, smashed installations of new machinery destined to implement the new factory system of production. By 1867 in their work *Das Kapital*, Karl Marx and Friedrich Engels, both German-born, had developed a broad critique of the Industrial Revolution and the laissez-faire capitalism that underpinned it. Engels was particularly qualified to evaluate the factory system; his father was an owner of a textile factory in Manchester, England.

A result of the Industrial Revolution less often mentioned during its 19th-century zenith was massive pollution created by industrial processes based on the unfettered burning of coal, soon to be supplemented with the combustion of petroleum products. It is no wonder that U.S. writer Edward Bellamy, in his 1887 utopian best seller and critique of industrialism, *Looking Backward: 2000–1887*, recalled 1887 Boston as squalid and “malodorous,” and reeking of “fetid air” compared to the shiny, bright, and clean Boston of a postindustrial future.

SOCIAL AND CLASS RELATIONS

This period of world history, 1750–1900, was an age of revolutions, both military and social. Although social and class upheavals were most evident in the West, other major societies also experienced important changes that affected relationships between rulers and subjects, capitalists and workers, men, women, and children. A process of globalization, spearheaded by imperialism and huge migrations within and between nations, created new political and social interactions.

The American Revolution helped bring an end to the phase of European colonialism that had begun with Spain’s 16th-century expansion into the New World. It inspired independence movements in Central and South America and eventually led to autonomy for Canada. In Europe, the republican ideas expounded in the United States’s revolution and 1789 Constitution helped spark political ferment that would produce liberalism, socialism, and communism in the 19th century. The French Revolution marked the beginning of the end of monarchical power in France, Britain, and many other Western countries, although the final demise of this ancient system of hereditary rule did not occur until World War I. As deference to royalty faded, some class barriers began to come down, especially in Europe between the 1830s and 1848, when failed revolutions in France and Germany ended in repression of dissident voices. The impact of European imperialism across Asia from the Middle East to Japan would also inspire not only nationalistic awakening but also political and social revolutions that continued into the 20th century.

These political changes would have been unlikely without the almost simultaneous eruption, first in the West and later worldwide, of the Industrial Revolution. This dramatic economic transformation hardened existing class identities but also held out promises of greater freedom, wealth, and power for people on lower and middle rungs of the social order. This new way of financing and organizing the production of goods was theoretically justified by *The Wealth of Nations*, an anti-mercantilist, pro-capitalist economic philosophy articulated in 1776, the year of American independence, by Scottish thinker Adam Smith.

Aristocratic French observer Alexis de Tocqueville, who toured the United States in 1831, was astonished by the relative equality of masters and (white) servants, but worried that even in this new

democracy, manufacturing might be dominated by a tiny group of capitalists who could “fix the rate of wages as they please,” thereby oppressing their “exceedingly numerous” workers. His observation presaged the insights of German-born journalist and philosopher Karl Marx, who articulated a fundamental critique of social and class relationships.

Marx and Friedrich Engels published their *Manifesto of the Communist Party* in 1848. The workers who poured into new factories (called “Satanic Mills” by English poet William Blake) were, said Marx, the real producers of the world’s wealth. This proletariat, he insisted, should control their work and apportion its benefits. Instead, he said, an emerging cadre of capitalists, assisted by a new bourgeois managerial class, were enriching themselves at the proletariat’s expense.

Indeed, as people moved from farms and workshops into new industrial cities, labor unions expanded and increased in militancy. Skilled, or craft, workers, almost always men, had for years found ways to extract pay and hours concessions. Men, women, and often children working in factories, however, did less skilled work and could be easily replaced. Although Britain banned unions shortly after the French Revolution, by the 1860s coal miners and textile workers had formed powerful unions. In 1871 unions in Britain were officially recognized; in 1893 unionists and socialists combined to create Britain’s Labour Party. German printers and cigar makers unionized after the 1848 unrest. By 1900 strong industrial unions played important political roles in most European nations.

In the United States, the path to worker organization was difficult. Craft workers had long been protective of their skills and membership but began to lose ground as factories proliferated. Cyclical economic downturns led to factory layoffs; assertive workers might not be rehired. Courts were hostile, seeing most union demands as restraint of trade. As immigration surged in the 1850s and after the U.S. Civil War, manufacturers had their pick of presumably docile workers. In 1869 the Knights of Labor began to organize both skilled and unskilled workers and, for their time, were unusually inclusive of workers who were female, immigrant, or nonwhite. The Knights were eclipsed in 1886 when Samuel Gompers established the craft-focused American Federation of Labor, with a 40-hour workweek as its main goal.

Americans and Britons who opposed unions and other socialistic reforms often invoked the precepts of Social Darwinism to justify their defense of class inequality, including the growing gap between rich and poor. This misapplication by sociologists Herbert Spencer and William Graham Sumner of Charles Darwin’s theory of evolution held that in the unceasing struggle for existence only the strongest humans and human groups would survive. Simplistically, most understood this to mean that society’s richest and most powerful men had been chosen to succeed by nature’s own laws. Social Darwinism bolstered the economic tenet of *laissez-faire*—the idea that government must not interfere in the marketplace—and also was used to justify Western imperialism.

Latin America. In Latin American societies, deep class and race inequalities from the colonial period persisted after most nations had thrown off Spanish and Portuguese rule. Absent social revolution, stark divisions between rich and poor continued well into the 19th century. New social classes did emerge eventually. In Mexico, for example, the rule of Porfirio Díaz saw the rise of middle-class professionals, as well as consolidation of a working class, especially miners, without access to land. Massive immigration by Spaniards and Italians into Argentina created a large urban working class in Buenos Aires and other growing cities that would link Argentina to the global economy and inspire working and middle-class demands for greater political participation.

Doctrines of racial and ethnic inequality blossomed during this period. Even though U.S. slavery and Russian serfdom came to an end in the 1860s, Western nations justified their domination of Asia and Africa on racial grounds and gloried in assuming “the white man’s burden” to better the lot of the dominated. In the United States, the end of the Civil War produced three constitutional amendments that outlawed slavery, extended equal rights to all former slaves, and granted the right to vote to African-American men.

Although some African Americans restored their families, found work, and even won public office, hopes for true equality did not materialize. Instead, the federal government looked away as

former slave states (and some states outside the Confederacy) instituted new codes of inequality, known as Jim Crow laws, enforcing them with terror tactics, including lynching. Czar Alexander II's emancipation of the serfs, who represented one-third of Russia's population, created problems of land distribution that would feed unrest leading to revolution in 1917.

Worldwide pressure on agricultural land and commodity prices pushed many millions to emigrate for economic survival. Those who continued to farm often found themselves in a spiral of debt and threatened with foreclosure. In the United States, farmer campaigns, including the Populist political movement of the 1890s, brought white and black, midwestern and southern, together to propose bold solutions to these problems—most of which required state or federal government activism. The movement ended after the elections of 1896 with recriminations over currency reform and an upsurge of racism that tore apart the fragile coalition.

Anti-Jewish prejudices, long traditional in Christian Europe, intensified, especially as Jews left their ghettos to pursue education and professions long closed to them. As anti-Semitism, in the form of terror attacks called pogroms, increased in Russia and eastern Europe, thousands of Jews fled, mostly to the United States, where some became active in socialist movements. In France, the 1894 court-martial and deportation of Captain Alfred Dreyfus, a French-Jewish army officer who proved later to be innocent of treason, revealed persecution of Jews amid rising nationalism.

Despite these “worst of times,” as British Victorian novelist Charles Dickens described the French revolutionary era, there were also advances—for a growing middle class, for children, and for women—in Western nations. Although aggressive nationalism was an increasing problem, religious tolerance generally expanded despite such setbacks as the Dreyfus affair. Victorian elites clung to a stratified class structure with rigid rules of etiquette and clear divisions between upstairs and the servants below, but class relationships were changing. The Industrial Revolution fueled a major expansion of the bourgeoisie. Emerging along with a substantial professional class were greater comfort, better education, lower birthrates and infant mortality, and new respect for childhood. Calls for women's suffrage, by both women and men, increased. Immigration, often the choice of desperate people, did offer mobility and opportunity to many millions, even if their new streets were not paved with gold.

Although women and children were still viewed as property in much of the world, there were strong indications that attitudes were beginning to change. In the Ottoman Empire there was considerable upward mobility and religious tolerance; minorities fared quite well, especially in contrast to much of the rest of the world. Women in the Islamic world had property rights and legal standing, but traditional mores often took precedence over religious laws regarding women's status.

In British-ruled India, Hindu reformers began reexamining the traditional caste system. Modernizing educational practices produced Western-oriented Indian men and women, many of whom began to demand participation in their government. India's Muslims were slower to adopt modern education. In China, failure of the Qing (Ch'ing) dynasty in the late 19th century led to the emergence of modern Chinese nationalism in opposition to the Manchu, the ethnic minority that had established its dynastic rule in 1644. Oriented toward modern Western political forms, nationalists began to demand the emancipation of women even as they struggled with incursions of Western and Japanese imperialism. In Japan, the Meiji Restoration ended the feudal system, abolished the traditional hierarchy of classes, and created universal conscription. Some male taxpayers were allowed to vote after 1889. Girls' schooling was made mandatory, and some professions were opened to women, although they did not win the vote.

TRADE AND CULTURAL EXCHANGES

By 1750 improved transportation and aggressive exploration by Western countries had dislodged the Ottoman Empire's long-standing monopoly on East-West land trade routes. New sea routes, established by the Portuguese and others, focused on Africa and the New World and helped to shift the economic balance of power toward Europe and away from Asia. So did the extraction of large quantities of silver and gold from the Western Hemisphere that, for a time, made Spain Europe's wealthiest and most powerful nation.

Trade competition led not only to new kinds of exchanges and rivalries between equals but also created opportunities for exploitation of newly encountered populations. Europeans famously tried to fool America's Indian tribes by trading trinkets for valuable land and other resources. Not all Natives were losers in these exchanges. Such manufactured items as knives and firearms helped tribal groups defend themselves against settler attacks and enhanced their advantages in inter-tribal warfare. A booming trade in alcoholic beverages, however, proved especially dangerous to American Indians, causing disease and social disruption and often giving whites an advantage in trade negotiations and treaties.

Slave trading between Africa and the Americas continued to decimate West African populations while enriching some African kings and traders with guns, textiles, and other manufactured goods. At least 15 percent of approximately 8 million kidnapped African men, women, and children died during the so-called Middle Passage, reduced to cargo in crowded, filthy ships that carried them across the Atlantic Ocean into slavery. Most were destined for Brazilian and Caribbean sugar plantations where life was brutal and short. Portugal, the Netherlands, and Britain competed for slave-trading dominance; after 1713, Britain became the world's top merchant of slavery. The African slave trade remained legal in the United States until 1809. In 1853 Brazil became the last New World nation to end slave importation.

As European nations carved out New World spheres, colonists dispatched there from home countries soon found themselves faced with both trade opportunities and restrictions. The so-called triangular trade—actually an overlapping series of trade routes connecting Europe, Africa, and the Americas—enriched both colonials and the native lands they had left. For example, the New England colonies became a center of shipbuilding and also sold fish, lumber, and grain to sugar plantations. Another trading triangle linked Britain, India, and China. Western demand for Chinese goods, notably porcelain, silks, and tea, and the lack of European goods desired by Chinese consumers, eventually led British entrepreneurs to grow poppy and refine it to opium in British-controlled India. The opium was traded to China, where it fed a growing population of addicts. The problem this trade created would lead to war between Britain and China and to growing British and European domination of the failing Qing Empire. Growing British port cities like Bristol and Liverpool, as well as colonial New York and Boston, were awash in formerly exotic and expensive goods, such as tea, silk, and china tableware, once available only to the very wealthiest people. But a series of British Navigation Acts, including the 1750 Iron Act, prohibited Americans from buying goods from other nations or making locally goods that British merchants could more profitably sell them.

At the end of the Seven Years'/French and Indian War in 1763, British colonists in North America became restless when Britain significantly tightened policies that limited internal trade with Indian tribes and with other colonies and nations. Rules that required Americans to buy most products from British companies, while forbidding local manufacturing initiatives, were central issues leading up to the American Revolution. Even after independence was won, the right to trade freely continued to cause conflict between the new nation and Britain and France, eventually becoming a major cause of the War of 1812.

More Resources. In the 19th century the rapidly industrializing nations of Europe and America aggressively sought new raw materials, markets, and trading opportunities around the world. Venetians, Portuguese, Dutch, and British had traditionally traded with the countries of the Pacific rim. Trade-driven imperial ventures intensified and also attracted the United States, which by 1848 had expanded to the Pacific Ocean's eastern shore. U.S. whaling ships regularly plied the Pacific and required refueling stations in places like Hawaii. In 1853 and 1854 U.S. naval vessels under the command of Commodore Matthew Perry sailed into Edo (Tokyo) Bay using both diplomacy and a display of military might to persuade the Japanese to open their isolationist society to the trading nations. Japan's embrace of industrial development and its participation in world trade were major results of this initiative.

Despite the U.S. Monroe Doctrine's dreams of dominating the Western Hemisphere, Latin American nations developed strong trade ties to many European powers. Throughout the 19th

century Britain was a major trading partner, providing textiles and clothing. Britain, France, and Germany were especially significant partners for the southern republics of Chile, Brazil, and Argentina. The United States was more dominant in Central America and northern South America, even before seizing Puerto Rico and Cuba from Spain in 1898's Spanish-American War. Although Mexico lost territories in the Mexican War with the United States in 1848, it became linked to the U.S. economy by mining, agriculture, and railroads. Mexico maintained strong trade ties with European powers. Such Euro-American ideological imports as socialism, communism, anarchism, and syndicalism found fertile ground among Latin America's growing working and urban classes.

Imperialism had very different consequences in India and Egypt, where Britain held sway. Attempts at local industrialization were discouraged. Instead, these regions were obliged by their colonial masters to provide cheap agricultural products and other raw materials. These policies enriched quasi-private trade groups like the British East India Company and protected European and American manufacturing. During the U.S. Civil War, Egyptian cotton mostly replaced Confederate cotton in French and British textile factories, with long-term consequences for one of the United States's most successful agricultural commodities. The opening of the Suez Canal in 1869 further marginalized Ottoman trade power and enhanced European influence and trade in the Middle East and Asia.

China, the world's most populous country, was viewed by imperial powers as a vast potential market for all manner of manufactured products. By 1900 European powers and Japan had essentially carved China into spheres of influence within which each country hoped to control trade and exploit natural resources. Meanwhile, enterprising traders from China and the Indian subcontinent became important agents of commerce in such regions as South Africa, the Caribbean, Indochina, and the East Indies (later Indonesia). Mohandas K. Gandhi, a London-educated lawyer, spent 20 years in South Africa, fighting for rights of this Indian diaspora of traders and workers before shifting his freedom quest to his own colonized nation.

Cultural Imperialism. Cultural exchange accompanied growing world trade. To a great extent, Western imperial agents attempted to impose their culture and educational values on people they believed to be backward or inferior. Christian missionaries, some Roman Catholic, but most from Protestant denominations, played an important role in spreading Western culture, even when, as in China and India, they were not successful in making many converts. Among Native tribes in the Americas, and in Hawaii, the Philippines, and some African regions, groups like the YMCA (Young Men's Christian Association) spread the word of God, and, if that failed, the benefits of modernization and education. Although the missionaries themselves often returned home with a deeper knowledge of other cultures, it rarely translated into greater respect. "Our little brown brothers" was how Americans defined the Filipinos who rose up against Spanish colonialism only to find themselves wards of the United States after the Spanish-American War.

Missionaries and government and corporate agents of imperialism did sometimes provide useful training and information. Many Indians (like Gandhi) and a number of Africans received modern English educations in new schools and universities in India or in England. Missionaries made modern schooling available to girls in China and India for the first time. After 1895 thousands of Chinese men and women chose to study in Japan because of that country's success. Japan's universal educational system was based on the German model, as was its constitution. Westerners also introduced modern medicine, which contributed to lowering mortality rates.

In the 19th century greater wealth and mobility encouraged tourism as well as artistic and intellectual exchanges. Frenchman Alexis de Tocqueville was the most famous of the dozens of curious European observers who visited America to report back on the new nation's progress. The transatlantic Grand Tour became a rite of passage for young Americans looking for Old World culture. More important, artists who gained fame through such media as newspapers, photography, the telegraph, and the telephone brought their talents to international audiences. Writers and musical and theatrical stars such as British novelist Charles Dickens, Hungarian pianist Franz Liszt, Swedish

soprano Jenny Lind, French actress Sarah Bernhardt, and Australian soprano Nellie Melba performed before enraptured crowds across Europe and America.

World's fairs and expositions became popular in the mid-19th century, beginning with London's Great Exhibition at the Crystal Palace on view in Hyde Park from April to October of 1851. Blending technology and art, powerful machines and homey kitchen tools, 13,000 international displays attracted more than 6 million visitors and trumpeted the achievements of the British Empire and its colonial domains.

The Crystal Palace exhibition set a new standard for the promotion of trade and agriculture and inspired similar extravaganzas in Paris, Vienna, Brussels, Barcelona, Melbourne, and cities in the United States. Held in Philadelphia in 1876, America's Centennial Exposition highlighted the nation's manufacturing power and, indirectly, its recovery from the recent Civil War. A 40-foot Corliss steam engine, the world's largest, powered the entire exhibition; Alexander Graham Bell introduced his new telephone to fairgoers from around the world, including the French sculptor who was in the process of crafting the Statue of Liberty. At France's 1889 exposition in Paris, commemorating the French Revolution, the Eiffel Tower was unveiled. "Exotic" natives of colonized countries, like Samoa, or natives set apart within their own countries, like American Indians, were displayed at various fairs as examples of the progress Western civilization had made in manufacturing, trade, and culture and was now bringing to the world's "backward" peoples.

WARFARE

Improvements in weapons technology, fueled by the Industrial Revolution, helped make warfare in the late 18th and 19th centuries more deadly and sophisticated. Civilians were drawn into wars more deeply than before, both as targets of enemy forces and as conscripts bound to military service. As traditional military powers, including the Ottoman Empire and China, lagged, Western nations expanded their global imperialistic aims. Although most of this period's wars pitted nation against nation, warfare against internal foes, including America's indigenous people and nomadic peoples and rebels in China, was also widespread.

Weaponry Trends. Although the ballistics revolution did not fundamentally change the tools of Western warfare, it significantly improved their effectiveness. Guns, artillery, and warships continued to be the basic components of combat, but all benefited from innovations linked to the developing sciences of engineering, physics, and chemistry. Smoothbore muskets began to give way to rifled guns that permitted much greater accuracy and impact. Cannons with rifled interiors and shapes that took account of air resistance could propel their payloads farther more precisely. As steam power replaced sails, and steel hulls replaced wooden ones, warships became stronger, faster, and more dependable. The development of interchangeable components by American Eli Whitney and others made it easier for even inexperienced soldiers to set up, load, fire, and repair both cannons and guns. Gunpowder, invented much earlier in China, was also reengineered for greater force and reliability.

Manpower Trends. Wars became bigger in the 18th and 19th centuries, partly because of new military and political systems for conscripting huge numbers of soldiers and supplying their battlefield needs. In the process, the use of cavalry—soldiers on horseback—began to wane, while the use of infantry—men on foot—expanded, as did women's roles in supporting troops with laundry, food preparation, medical aid, and weapons repair and service. During the Crimean War, Englishwoman Florence Nightingale helped pioneer a new standard for nursing injured soldiers. Slowly, battlefield improvements in medical care (including anesthesia) and food safety would help reduce military casualties from causes not directly related to combat.

By 1750 the feudal concept that vassals were obliged to fight for the interests of their overlords was already in decline, even though the British Royal Navy for many years continued to use impressment to force citizens and colonials into naval service, when volunteers fell short. In the American colonies, especially Massachusetts Bay, men aged 16 to 60 were required to join local militias during times of threat, usually from Native tribes. In the American Revolution, these mili-

tias played a vital role in repulsing attacks in their home territories, even as George Washington, leader of the new Continental army, struggled to find and keep volunteers. Meanwhile, Britain paid millions for the fighting services of 23,000 Hessians, mercenary soldiers essentially purchased from the landgrave (lord) of the German principality of Hesse-Kassel.

The idea of mandatory service of limited duration grew in the 19th century. Conscription was represented as an opportunity for patriotic male citizens to respond to national threats, service that might be sweetened by sign-up and retention bonuses. If neither of these worked, threats of punishment for draft dodging and desertion were invoked. Revolutionary France was among the first nations to impose a draft; later, Emperor Napoleon I used conscription as well as volunteers to field some of the largest armies in history. Prussian military success in the 19th century also depended heavily on the conscription of citizen-soldiers. During the U.S. Civil War, both the Confederacy and the Union adopted draft laws, which the United States had rejected in its past wars. These were extremely unpopular, in part because wealthy men could buy exemptions from service. An 1863 antidraft riot in New York City raged for days, destroying property and causing more than 100 deaths.

The increased size and changing composition of armies required officers and professional soldiers to create new methods of training, disciplining, supplying, and deploying their inexperienced forces. Once traditional military practices, such as marching in tight formations and retiring to quarters during the winter, gradually declined in this period, while more flexible tactics, some of them modeled on the methods of guerrillas and tribal peoples, began to inflect wars conducted by major national powers.

150 Years of Warfare. Four overlapping themes run through the warfare of this era. From 1754 to 1815 a series of wars to determine the future of North America altered the international balance of power. Revolutionary upheaval in France after 1789, followed by Emperor Napoleon's military ambitions and his ultimate defeat in 1815, reshaped Europe. Civil wars throughout this period tested political and social order. Near the end of the 19th century, a European (and American) scramble for non-Western colonies touched off wars of imperialism. By 1900 the overall outcome seemed to assure the triumph of Western domination in Asia, Africa, and Oceania, as well as the pacification of minority and ethnic groups that had defied or ignored nationalist agendas.

Some historians have dubbed as a "Sixty Years' War" the period of conflict that began with 1754's hostile encounter between Virginians seeking Ohio lands and French troops protecting France's claims in North America. It ended with U.S. general Andrew Jackson's victory over British troops at New Orleans weeks after the Treaty of Ghent ended the War of 1812. At stake was the future of North America, which for centuries had been a colonial possession of various European powers. When this 60-year period ended, U.S. independence was secured, and Canada's continuing connection to the British Empire reaffirmed. The French, who lost Québec in the French and Indian War, Haiti in an uprising begun in 1791, and sold Louisiana to the Americans in 1803, were no longer significant in North America. Spain had lost all but a tiny remnant of its once-huge empire in both North and South America. North America's Native peoples now found themselves and their lands major targets of expansionism.

Napoleon's voluntary exit from the Louisiana Territory was part of his plan to consolidate French power in Europe. In well-planned and executed battles against forces that included Britons, Austrians, Italians, Russians, and Prussians, Napoleon for a time seemed to be able to control much of Europe. But overextension and the severe Russian winter forced Napoleon's troops to withdraw from Moscow in 1812; within two years, European forces, with crucial help from Britain's dominant Royal Navy, had sent Napoleon into exile on an isolated Atlantic island.

Between 1815 and the 1870s numerous civil conflicts created serious problems for some nations, and opportunities for others. After Napoleon's defeat, uprisings broke out in Greece, the Italian states, Spain, and France, while militarily stronger European nations, including Austria and Russia, tried to take advantage. In China, the religiously inspired Taiping Rebellion against Manchu rule raged for 14 years, weakening China and helping Western imperialist powers to further weaken it in

later decades. Elsewhere in the 1850s and 1860s Italian nationalism culminated in the unification of Italy. Semiautonomous German states unified to form a single German nation, spearheaded by Prussia. These unifications did not occur without conflict from both internal and external opponents.

The U.S. Civil War of 1861–65 pitted 11 seceding southern slave states against the rest of the nation. It was a total war in which more than 1 million Americans died; it also offered some tantalizing opportunities to U.S. rivals. Both Britain and France considered diplomatic recognition of the Confederacy, hoping thereby to dilute the United States's growing industrial and political power, but were dissuaded by clear evidence that the Union was likely to prevail. Nevertheless, France, under Louis-Napoleon Bonaparte, used America's distraction to try to gain control of Mexico. That plan failed.

Prior to about 1830 many non-Western powers successfully held their own against European incursions. Even the Indian subcontinent, where Britain had established trading rights as early as 1619, did not come fully under British control until the 1850s. Some Western states collaborated with some Asian and African states by selling them superior weaponry. For example, the French helped Egypt build a modern naval fleet. Persian leaders and the Ottoman sultans hired Westerners to train their armies. The Japanese, watching with alarm as Western navies encroached on the Pacific, began in the 1860s, with some help from Germany, France, and Britain, to modernize their military forces and upgrade their weaponry. These steps would help Japan escape the fate soon to befall China and make Japan an Asian imperial power.

By the 1880s European competition for colonial control was at its height. In the United States, a century-long effort to “pacify” Native Americans had almost reached its goal of restricting the remaining tribes' landholdings and occupations. Britain, with its unrivaled naval power, gained dominance in Egypt and China. The British also asserted control over great swaths of Africa, defeating the Zulus and the white Dutch-descended settlers in South Africa called the Boers, in the Boer War that began in 1899. French imperial activity focused on North Africa and the Southeast Asian region that came to be known as Indochina. Germany, Italy, and Belgium also competed for colonial opportunities in Africa. Russia was especially successful in Asia, conquering the Muslim khanates in Central Asia and acquiring lands formerly under the Qing Empire on the Pacific coast.

With its four-month Spanish-American War in 1898, the United States acquired Spain's remaining American colonies of Cuba and Puerto Rico and the Philippines in Asia, joining Europeans in the imperial land rush by claiming new territory beyond its own borders. Sixteen years later, the rivalries the new colonialism had provoked among the great imperial powers and the seething millions they claimed the right to control would trigger the greatest war in world history to that point.

abolition of slavery in the Americas

The history of chattel slavery in the Americas, from its beginnings in 1492 until its final demise in Brazil in 1888, has spawned a vast literature. So, too, has the process by which the institution of chattel slavery was formally and legally abolished. A highly contentious, nonlinear, and uneven process that unfolded in different ways and followed distinct time lines in various parts of the Americas, abolition must be distinguished from manumission, in which slave owners granted freedom to individual slaves, which is not examined here. Especially since the 1960s, historians have examined many different aspects of abolition in the Americas, including the intellectual and moral impulses impelling it; the history of diverse social movements devoted to compelling colonial, state, and national governments to implement it; and the role of various individuals and groups—including merchants, planters, bureaucrats, and colonial, national, and imperial governments, and slaves themselves—in retarding or accelerating the process.

The first formal abolition of slavery in the Western Hemisphere came not from a national government but from state legislatures in New England and the Mid-Atlantic states of the not-yet-independent United States of America. In 1777 the Vermont state assembly became the first governmental entity in the Americas to abolish slavery within its jurisdiction. In 1780 the Pennsylvania state assembly passed a law requiring all blacks henceforth born in the state to become

free upon reaching age 28. State laws mandating the end of chattel slavery, each stipulating different time lines and provisions, were passed in Massachusetts and New Hampshire (1783), Rhode Island and Connecticut (1784), New York (1799), and New Jersey (1804). Significantly, actual abolition sometimes lagged for decades following passage of such laws—as in New Jersey, where legal slavery persisted until ratification of the Thirteenth Amendment to the Constitution in 1865. Because slavery did not comprise an important component of any of these states' economies, organized opposition to abolition was limited, and abolition itself carried few economic costs to slaveholders. As individual states were passing laws for gradual emancipation, the Northwest Ordinance of 1787 banned slavery in the Northwest Territories, setting the stage for the sectional conflict between North and South that ultimately led to the AMERICAN CIVIL WAR.

Far more consequential for the eventual abolition of slavery in the Western Hemisphere was the Act for the Abolition of the Slave Trade passed by the British parliament in 1807, and put into effect in 1808, outlawing the transatlantic slave trade. The law also authorized the British navy to suppress the slave trade among all slave traffickers, making Britain, in effect, the policeman of the high seas. The U.S. government passed less sweeping legislation in 1808 banning further import of slaves. Three years later, the British parliament made participation in the slave trade a felony.

Scholarly debates have swirled regarding the origins of and inspiration behind these laws. Some historians have

Exeter Hall was filled with a large crowd for the Anti-Slavery Society meeting, London, England, in 1841. Abolitionist movements gained strength in the 19th century and successfully abolished slavery in most of the Western Hemisphere by the end of the century.

emphasized the rise of a religion- and ENLIGHTENMENT-inspired antislavery and humanitarian impulse among Quakers, evangelical Methodists, Unitarians, and others in providing the impetus behind the British abolition of the slave trade. An expansive literature pays special attention to leading abolitionists like William Wilberforce and to the many antislavery societies, writers, and publications that blossomed in the late 1700s and early 1800s. Other scholars have stressed the growing commitment to the ideology of free wage labor on the part of Britain's leading capitalists. This interpretive school has located Britain's intensifying opposition to slavery within the broader context of a rapidly developing global capitalist economy and a powerful domestic labor movement that used the symbol of slavery to portray the workers' plight and denounce capitalism. Ironically, while the 1807 law made Britain the first nation to outlaw the transatlantic slave trade, from the mid-1600s leading British economic interests had also been one of the main motors behind, and beneficiaries of, the slave trade.

While the 1807 law presaged the eventual demise of African slavery in the Americas, it did not abolish slavery, or call for the abolition of slavery, or free a single slave. Nor did the law prohibit individual nations or colonies from slave trafficking within their borders. In nations and colonies with large slave populations—including Brazil, the United States, and throughout the Caribbean Basin—chattel slavery could, in theory, continue indefinitely by “natural population increases” among slaves (population increases resulting from births over deaths and excluding external influxes). The outlawing of the Atlantic trade prompted slaveholders across the Americas to implement policies intended to increase slave populations, such as forced impregnation and rape of slave women. Local slave markets reflected these changes, as prices of female slaves of childbearing years rose substantially in many areas. The 1807 law provoked fierce resistance in British colonies such as Jamaica, Antigua, and Trinidad, whose colonial assemblies at first rejected, then grudgingly accepted, the imperial mandate.

Similar patterns unfolded elsewhere, as imperial laws intended to place limits on slavery and the slave trade met stiff resistance by slave owners in the colonies. Overall, such laws originated in national governments' responses to mounting domestic and international opposition to chattel slavery and the actions of slaves themselves and their many forms of resistance to the fact and terms of their enslavement. A survey of the British, French, and Spanish colonial empires highlights these broad patterns.

GREAT BRITAIN

In Britain the 1807 and 1811 laws were followed by the amelioration laws of 1823, meant to improve the living conditions of slaves. Far more consequential was the Abolition of Slavery Act of 1833, which went into effect on August 1, 1834. The 1833 law abolished slavery throughout the empire, while stipulating a period of apprenticeship in which slaves over the age of six would continue working for four years for their former masters. A major slave rebellion in Jamaica in December 1831 (the "Christmas revolt") played a major role in prompting Parliament to pass the 1833 law—an illustration of the role played by slaves in advancing their own emancipation. In 1838, over the vociferous objections of slaveholders, Parliament proclaimed complete emancipation. Upper and Lower Canada followed the same trajectory as British colonies elsewhere in the Americas, with final emancipation coming in 1838. For the next 27 years Canada would serve as a refuge for escaped slaves from the United States, especially after the U.S. Fugitive Slave Law of 1850 made no state in the Union immune from slave-catchers and bounty hunters.

In France, with the convening of the Estates General in 1789, the Société des Amis des Noirs (Society of the Friends of the Blacks) called for the abolition of the slave trade and emancipation of slaves within the colonies. The call was rejected after a powerful coalition of white colonists successfully prevented debate on the topic. With the eruption of the HAITIAN REVOLUTION from 1791, the French assembly relinquished its jurisdiction over the question. Three years later, in 1794, the Convention outlawed slavery throughout the empire and granted rights of citizenship to all adult males. In 1801, Haitian rebel leader TOUSSAINT LOUVERTURE, whose forces had just gained control of all of Hispaniola, promulgated a constitution that prohibited slavery in perpetuity throughout the island.

The following year, in 1802, Toussaint was captured and transported to France, and NAPOLEON I

reinstated slavery throughout the French colonies. After France's defeat in the Napoleonic Wars, in 1817 the French constitutional monarchy passed a law abolishing the slave trade by 1826. A few months after the overthrow of the monarchy and establishment of the Second Republic, and under the leadership of prominent abolitionist Victor Schoelcher, on April 27, 1848, France abolished slavery throughout the empire.

SPAIN

In Spain the first effort to abolish slavery came soon after the overthrow of King FERDINAND VII and during the tumult of the Napoleonic occupation, when in 1811 the Cortes (parliament) abolished slavery throughout the empire. The law was largely ignored. In 1820, following a major revolt against a restored constitutional monarchy, the Cortes abolished the slave trade while leaving slavery itself intact—though after the INDEPENDENCE OF LATIN AMERICA in the early 1820s, Spain's American empire had been reduced to one major colony: Cuba. Abolitionist sentiment within Cuba mounted through the first half of the century, despite the colonial government's success in crushing organized antislavery agitation. In 1865, in the wake of the U.S. Civil War, the Spanish Abolitionist Society was founded, its considerable influence rooted in mounting opposition to the constitutional monarchy.

In 1868 a liberal revolution triumphed in Spain, its leaders advancing as one of their principal aims the abolition of slavery in Cuba. In July 1870 the Cortes passed the Moret Law, which emancipated children born to slaves after 1868 and slaves age 60 and older. Envisioned as a form of gradual abolition, the law's provisions were undermined by both planters and slaves. Planters sought to delay the law's implementation and subvert its provisions, while slaves pushed its boundaries in the effort to secure their freedom. The Ten Years' War on the eastern half of the island complicated the situation even further. Finally, on October 7, 1886, the Spanish government eliminated various legal categories of quasi slavery and abolished slavery throughout the island.

A brief summary of other European nations' abolition laws once again highlights the partial and uneven nature of the process of emancipation. Sweden abolished the slave trade in 1813 and slavery in its colonies in 1843. In 1814 the Netherlands outlawed the slave trade and, nearly half a century later in 1863, abolished slavery in its Caribbean colonies. In 1819 Portugal outlawed the slave trade north of the equator and in 1858

abolished slavery in its colonies while providing for a 20-year period of apprenticeship similar to the British model. Denmark abolished slavery in its colonies in 1848, the same year as France.

Turning to the independent nation-states of the Americas, most of the newly independent nation-states of Latin America abolished slavery in the first three decades after independence. In 1821 Gran Colombia (comprising most of present-day Colombia, Venezuela, and Ecuador, and parts of Bolivia and Peru) became the first Latin American nation to adopt a law calling for gradual emancipation, though final abolition did not come for more than three decades (Ecuador in 1851, Colombia in 1852, Venezuela in 1854), final abolitions followed by prolonged periods of apprenticeship that closely resembled slavery. Chile abolished slavery in 1823; Mexico in 1829; Uruguay in 1842; Argentina in 1843; and Peru in 1854. In 1850 Brazil outlawed the transatlantic slave trade, prompting a brisk internal trade in slaves that lasted until the final abolition of slavery in 1888.

UNITED STATES

In the United States, in the aftermath of state laws abolishing or limiting slavery from the 1770s to the early 1800s, abolitionist and antislavery agitation mounted. The U.S. Constitution took an ambiguous stance toward slavery, neither prohibiting it nor precluding the possibility of its abolition and making unconstitutional any law passed before 1808 banning the importation of slaves. After the LOUISIANA PURCHASE in 1803, controversies over the expansion of slavery into the territories sharpened the sectional conflict between North and South that dominated U.S. politics through much of the 19th century, culminating in the Civil War.

Such controversies brought the nation to the brink of civil war in 1820 (forestalled by the MISSOURI COMPROMISE) and again in 1850 (forestalled by the Compromise of 1850). In the 1830s the rise to prominence of vocal abolitionists like William Lloyd Garrison and Wendell Phillips sharpened the sectional conflict even further. In 1861, following the election of ABRAHAM LINCOLN as president, southern slaveholding states formed the Confederate States of America and announced their secession from the Union, inaugurating the Civil War. Less than two years later Lincoln issued the Emancipation Proclamation, which, despite its title and symbolic significance, freed no slaves. The final abolition of slavery came in December 1865 with the ratification of the Thirteenth Amendment to the Constitution.

BRAZIL

Brazil, the last nation in the Western Hemisphere to abolish slavery, offers an instructive contrast to the U.S. experience. Earlier generations of historians emphasized two key differences: Brazil did not have a comparable sectional conflict and Brazil abolished slavery without recourse to civil war. More recent scholarship has blurred these distinctions, with greater attention to Brazil's major regional differences and to the role played by the specter of violence and civil strife in accelerating the process of emancipation. The British prohibition of the transatlantic slave trade from 1808 did not diminish the number of slaves imported into Brazil, as the government and slave traders ignored the law. An 1831 treaty between Brazil and Great Britain banning the importation of slaves also had little practical effect, as the Brazilian government did little to enforce its provisions.

Over the next 20 years, an estimated half a million slaves poured into the country. In 1850, in response to tremendous British pressure, Brazil passed a law putting teeth into the prohibition, after which the transatlantic slave trade diminished markedly. The 1850 law prompted two major shifts. Planters began creating conditions under which natural population increases would permit perpetuation of slavery, including improved nutrition and living conditions, enhanced surveillance and control, and forced reproduction. Slave trafficking within the country also increased dramatically, with major flows from the Northeast to the booming coffee-based states of the South.

By the 1860s, however, the Atlantic world's mounting moral opprobrium toward slavery, combined with the carnage of the U.S. Civil War, made clear to many Brazilians that abolition was inevitable and that a gradualist approach to the problem was preferable to civil war. What eventually emerged from these debates was the Rio Branco Law of September 28, 1871. Dubbed the Law of Free Womb, the law called for all children born of slaves to be free, following a period of semibondage until they reached age 21. Many, however, including prominent abolitionists in the Chamber of Deputies such as Joaquim Nabuco, Jeronymo Sodré, and Rui Barbosa, saw the law as fatally flawed, permitting slavery's survival well into the 20th century.

In the late 1870s abolitionist pressures intensified, as did urban violence, plantation uprisings, and civil strife. Slaves especially pushed the boundaries of the law, insisting on their own emancipation. Finally, on May 13, 1888, the Brazilian parliament passed a law consisting of the following two provisions: "Article 1.

From the date of this law slavery is declared abolished in Brazil. Article 2. All contrary provisions are revoked." After 396 years, legal slavery in the Americas had ended.

The process by which chattel slavery was abolished in the Americas followed a number of distinct trajectories, as various groups of actors in conflict and alliance propelled and forestalled the outcomes. Nowhere was abolition inevitable; everywhere its achievement resulted from the determined actions of many different individuals and groups. In all cases, the actions of slaves were integral to the process, a fact to which a large and growing body of scholarship amply attests.

Acadian deportation

In 1755, during the early days of the SEVEN YEARS' WAR/FRENCH AND INDIAN WAR between France and Britain, thousands of French farming families living in Nova Scotia were forcibly deported by British troops. The dislocation of the Acadians, as these French colonists were called, became almost a mythical example of the injustice and brutality of 18th-century warfare. Although several thousand Acadians would eventually return to their homeland, thousands more, often separated from their families, ended up as far away as the West Indies and Louisiana, where the refugees became known as Cajuns.

Although the French were first to exploit the fur, fishing, and farming potential of the New World, France had trouble persuading its citizens to live in the wilderness at the mouth of Canada's St. Lawrence River.

Meanwhile, British colonies, especially those of New England, soon overtook French colonial holdings in both population and hunger for land and wealth. Along what became the Canadian border, French and British colonists frequently trespassed on each other's claims, regularly enlisting the help of friendly Native tribes.

In 1713 the Treaty of Utrecht ending the War of the Spanish Succession redrew the political map of Europe and dealt to Britain control of Hudson Bay and Newfoundland. In addition, fertile lands occupied by the Acadians for several generations were no longer New France but now became British territory.

At first, British authorities assured the Acadians that their farms would be safe and their beliefs respected. But Britain also demanded that its new colonists swear loyalty oaths and give up any notion of fighting for France in future conflicts. Most Acadians declined to take the oath, considering themselves French neutrals. As tensions in Europe between Britain and France escalated and played out in their respective colonies, neutrality—hard to achieve under the best of circumstances—became untenable for both sides.

By the spring of 1755 the British believed that 300 Acadians had taken up arms in support of France. In July Acadian leaders were summoned to Halifax and ordered to take loyalty oaths immediately. A month later the British rounded up their recalcitrant French subjects and put them on ships for deportation.

Historians disagree on the magnitude and brutality of this mass deportation. The number of Acadians affected has been estimated between 6,000 and 18,000 people. Many families were separated and many had trouble finding a place to relocate. Some believe family separations and dislocations were unintentional results of mistakes and confusion; others have likened British actions to modern-day ethnic cleansing.

In 1847 American poet Henry Wadsworth Longfellow made the Acadian expulsion the subject of one of his extremely popular epics. *Evangeline, A Tale of Acadie* told of young French-Canadian lovers torn apart by war and politics. A sensational success, the poem kept alive remembrance of British misdeeds, both among French Canadians, now subjects of British Canada, and the Cajuns of Louisiana who traced their heritage back to Acadia.

Adams, John, and family

(1750–1827) *American diplomats and intellectuals*

Descendants of Puritans who settled near Boston in 1638, members of the Adams family distinguished themselves over two centuries as political leaders and thinkers. Second cousins Samuel Adams and John Adams played crucial roles in the founding of the United States. John's wife, Abigail Smith Adams, was an early advocate for women's expanded public roles. Their son, John Quincy, was the first president's son also elected president and dedicated his later years to ending slavery. Into the early 20th century, the Adamses excelled in diplomacy and history.

Harvard-educated brewer and Boston tax collector, Samuel Adams was a leading Son of Liberty who

John Adams, second president of the United States, was one of several Adamses who influenced the early United States.

fought new taxes and restrictions imposed by Britain on its American colonies after the SEVEN YEARS'/FRENCH AND INDIAN WAR ended in 1763. He organized the 1773 Boston Tea Party in which tea worth £100,000 was dumped into the harbor to protest British policies. His younger cousin, John, a Harvard-educated lawyer, successfully defended British soldiers who killed five Americans in a 1770 encounter dubbed the Boston Massacre by people like Samuel, who deemed it a "bloody butchery." Wary of mob enthusiasms, but convinced of the rightness of American liberty, John Adams soon surpassed his cousin's importance in the looming AMERICAN REVOLUTION. Both were delegates to the First Continental Congress; John drafted plans for a new national government and soon was helping THOMAS JEFFERSON revise and refine his draft of the DECLARATION OF INDEPENDENCE.

After Continental victory at Saratoga in 1777, John endured long intervals of painful separation from his family as he pursued financial and military support for the new nation in European capitals, working uneasily with senior diplomat BENJAMIN FRANKLIN and helping negotiate the treaty ending the Revolution. In 1784 Abigail joined her husband in Europe; his diplomatic service culminated with his appointment as first American ambassador to Britain.

In 1789 Adams was selected as GEORGE WASHINGTON's vice president. As such, he had little to do, sidelined in part by the dramatic political and personal clashes of Washington cabinet secretaries Jefferson and ALEXANDER HAMILTON.

Adams won the presidency by just three votes over Jefferson in 1796; his tenure in office would prove mostly disastrous. A combination of personality traits and crises would erode Adams's reputation, ending his administration after a single term. Partisanship unleashed by earlier battles over the CONSTITUTION brought forth viciously competitive political parties. Soon Adams, a Federalist, would find himself at odds with his own vice president, Jefferson, once a dear friend, but now a rival. The two men had already split over the FRENCH REVOLUTION, whose growing violence was to Adams a horrifying breakdown of order and a direct threat to American independence.

Although Adams avoided a costly war with France, his popularity plummeted amid partisan rancor. In 1798, a Federalist-dominated Congress passed and Adams signed the ALIEN AND SEDITION ACTS. Targeting Republican publishers and other political critics, these acts clearly violated the First Amendment. Charles Francis Adams would later call these

acts the fatal error that doomed his grandfather's Federalist Party.

Adams and Jefferson resumed their correspondence, but these old friends and enemies would truly reunite only in death. Both died on July 4, 1826, the 50th anniversary of the Declaration to which both contributed mightily.

By the time his father died, John Quincy Adams, his parents' eldest son, was in the second year of his own presidency. It was a tormented four years after years of public distinction. Trained in diplomacy at his father's side as a teenager in Europe, John Quincy returned to attend Harvard and take up law, although attracted by literature and teaching. In 1803 John Quincy went to the U.S. Senate as a Federalist but often supported President Jefferson, losing his seat as a result. As JAMES MADISON's ambassador to Russia and lead negotiator of the WAR OF 1812's Peace of Ghent, John Quincy found his own political fame. He authored the MONROE DOCTRINE while serving James Monroe as secretary of state.

Becoming president seemed the obvious next step. But U.S. politics were changing as voting rights expanded. Being notable—a man of wealth or distinguished family—no longer assured electoral success. In 1824's five-way race, John Quincy became president only after a “corrupt bargain” steered votes from war hero ANDREW JACKSON to the former president's son. John Quincy's single term was almost devoid of accomplishment and dogged by family difficulties.

His postpresidential career would be as difficult but more fulfilling. In 1830 the former president was elected to the House of Representatives, a freshman member at age 64, serving his Plymouth, Massachusetts, district until suffering a stroke on the House floor in 1848. For nine years, he fought a gag rule that prevented slavery opponents from conveying their views to Congress. In 1841 his nine-hour speech to the Supreme Court won freedom for 33 Africans who had commandeered the Spanish slave ship *Amistad*.

The Adamses were hard on their sons. Just as John Quincy was John's only son of three to make his father proud, Charles Francis Adams was the only one of three of John Quincy's sons to gain distinction. Charles Francis became his family's financier and historian, publishing important family writings, including Abigail's letters.

Entering Massachusetts politics in 1840 he was the new Free-Soil Party's vice presidential choice in 1848 as the U.S. victory in the MEXICAN-AMERICAN WAR roiled sectional politics. Soon he joined the emerging

Republican Party. Appointed minister to Britain by ABRAHAM LINCOLN, Charles Francis was instrumental in keeping Britain from backing the Confederacy during the CIVIL WAR.

It was left to a fourth generation, especially brothers Henry and Brooks, to try to understand America through the lens of the Adams' legacy. Henry, Harvard lecturer and historian, was early drawn to medievalism. In *The Education of Henry Adams*, his third-person autobiography, he tried to make sense of how medieval Europe could have given birth to early 20th-century America. Brooks, a more “erratic genius,” predicted inevitable decay as capitalist civilizations faltered and more energetic nations emerged. Some believe he was describing his own family.

The family Adams did not disappear with Brooks's death. But with the transfer of the old family homestead in Braintree/Quincy, Massachusetts, to the National Park Service in 1946, the Adamses became the “property” of the nation so many of them had served.

Afghani, Jamal al-Din al- (1838–1897) *Pan-Islamic leader*

Jamal al-Din al-Afghani, often referred to as the founder of pan-Islam, was born in Iran. He attended madrasas (religious schools) in Iran and as a young man traveled to India, where he observed firsthand discrimination against Muslims by the ruling British government. After making the hajj (pilgrimage) to Mecca, al-Afghani moved on to Karbala and Najaf, the main centers of Shi'i pilgrimage in Iraq.

During the 1860s al-Afghani lived in Afghanistan before moving to Istanbul, where the ruling Sunni Muslim Ottoman elite did not accord him the respect and honor he felt he deserved. In 1871 al-Afghani moved to Egypt, where he lectured on the need for unity and reform in Muslim society.

His popular lectures attracted a following among young Egyptians, and he became the mentor to a

future generation of Muslim reformers that included Muhammad Abduh and others.

Al-Afghani's popularity, calls for political reform, and opposition to British influences in Egypt attracted the attention of the ruling authorities, and the khedive (viceroy) expelled him from Egypt. He then returned to India, where he resumed teaching and writing on what he referred to as the Virtuous City—a society based on Islamic tenets and governed by honest, devout Muslim rulers. Al-Afghani argued that only a unified Muslim world could confront the Western imperial powers, particularly the British, on an equal basis.

He traveled to London and Paris, where he debated the role of science in Islam with Ernest Renan, the noted French philosopher. He spent two years in Russia before returning to Iran, where he vigorously opposed Nasir al-Din Shah (the Qajar ruler).

In Iran as in Egypt, al-Afghani also spoke out against British influence, calling for a constitutional, parliamentary government. Al-Afghani's opposition to the monarchy forced him to leave Iran for Turkey, where he continued to write and lecture about the need for basic constitutional reforms throughout the Muslim world. Al-Afghani carried on this work until his death in 1897.

Afghan Wars, First and Second

The two Afghan wars were caused by the growing rivalry for control of Central Asia between the Russian Empire and the British Empire. Because Afghanistan was the largest organized state in the Central Asian region, it became the main focus for both countries in what the British poet Rudyard Kipling would call the "Great Game." The Great Game actually began during the Napoleonic Wars.

In 1810, while the British duke of Wellington was fighting the French in Spain, Captain Charles Christie

and Lieutenant Henry Pottinger of the 5th Bombay Native Infantry Regiment left the village of Nushki in Baluchistan for their role in the game. On April 18 Christie reached Herat, while Pottinger pursued his own mission in Persia. Finally, on June 30, 1810, the two agents were reunited in Isfahan, Persia, with both missions accomplished.

Over the next 25 years other British agents would follow Christie and Pottinger on great treks into Central Asia. Afghanistan was seen as the vital buffer state against the advance of the Russians and, while the British did not always desire to add Afghanistan to their empire, they always hoped that the ruler of the Afghans, the amir, would lend his support to them instead of the Russians.

The British concerns were realized in December 1837 when a Cossack leader arrived carrying a letter from Czar Nicholas I of the ROMANOV DYNASTY for the Afghan amir, DOST MOHAMMED. At the same time, Kabul was visited by a British officer named Alexander Burnes, who had served with the Bombay army. By this time, Persia was allied to Russia. George Eden, Lord Auckland, and his chief secretary, Henry Macnaghten, suspected that Dost Mohammed had sided with the Russians. Having ascended the throne in June of 1837, QUEEN VICTORIA was now presented with the first serious crisis of her reign.

Ultimately, nothing would suit Auckland and Macnaghten other than a regime change in Kabul. In February 1839 the British Army of the Indus, under the command of Sir John Keane of the Bombay Army, began its march for Kabul. In the beginning, Auckland's expectations that Dost Mohammed's rule could not survive appeared to be justified. In July 1839 the fortress of Ghazni fell before a furious British assault and Dost Mohammed's forces melted away. Meanwhile, the Afghans faced a combined Sikh-British expedition coming up from Peshawar. In August 1839 Shah Shuja was crowned again the amir in Kabul, and Dost Mohammed sued for peace.

Macnaghten lacked the temperament to deal with the tribesmen and, in 1841, slashed the subsidies that had earned their loyalty to Shah Shuja. As young officers pursued inappropriate and culturally serious affronts to Afghan women, relations worsened further. The British commander, Major-General William Elphinstone, lacked both the ability and the courage to face the mounting crisis.

By the end of November all Macnaghten and Elphinstone could think of was retreat. On December 11 Macnaghten met with Dost Mohammed's son Akbar

Khan to make final a British withdrawal. At a second meeting on December 23, Macnaghten was taken by surprise and killed. Elphinstone continued planning for the retreat from Kabul, which began on January 6, 1842. The British and Indian troops were harassed and sometimes attacked by the Afghans along every foot of their retreat. On January 13, the last European finally reached safety at the British post of Jalalabad. Shah Shuja himself had been assassinated.

In February 1842 Edward Law, Lord Ellenborough, replaced the unlucky Auckland as the area's governor-general, and plans were made to avenge their fallen countrymen. A punitive force commanded by Major-General George Pollock of the Bengal army entered Afghanistan again. Despite fierce resistance from Akbar Khan's forces, Pollock reentered Kabul in September 1842. Having made their point, the British evacuated Kabul again in December 1842 and this time reached British territory safely. The British permitted Dost Mohammed to take back the throne, but the overall aim of the war had been achieved—Afghanistan remained in the British camp and the Russian plans were thwarted.

During the next 40 years the British and Russian Empires continued their seemingly inexorable advance toward one another through Central Asia. During the SIKH WARS, the British defeated the once independent realm of the Sikhs in the Punjab, firmly adding it to their growing Indian Empire. Although British rule was shaken during the INDIAN MUTINY of 1857–58, the attention of the British was still focused on the ambitions of the Russians to the north and west. With the assumption of direct British rule in the aftermath of the mutiny, real decision-making shifted decisively from the British governors-general in India to London. The Great Game was definitely on again, if it ever had stopped. In 1877 the Russians went to war with Turkey and although the Congress of Berlin in 1878 promised peace, the stage was set for another confrontation over Afghanistan.

Those who supported the aggressive Forward Policy against Russia, including Robert Bulwer-Lytton, the viceroy, demanded action be taken against Afghanistan. On November 3, 1878, British diplomat Neville Chamberlain appeared at the Khyber Pass to demand passage for his delegation to enter Kabul. Afghan border troops turned him back. On November 21 the British crossed the border into Afghanistan, 39 years after the first British invasion.

As before, the Afghans were in no position to withstand the determined advance. In Kabul, Sher Ali

relinquished his throne to his son Yakub Khan. After a winter of guerrilla war, Yakub Khan realized that making peace with the British was the best policy. In May 1879 Yakub Khan accepted a permanent British resident (who would actually serve as the real power in the country) in Kabul, Sir Louis Cavagnari. In July 1879 Cavagnari made his entrance into the Afghan capital. In September mutinous Afghan troops killed Cavagnari. Although he had requested aid from Yakub Khan, the request was ignored, leaving the impression that the troops attacked the British with at least the unspoken agreement of the amir.

When news of the massacre reached India, Major-General Frederick Roberts was given command of the Kabul Field Force in order to lead a quick British response to attempt to stabilize the situation in Afghanistan before the Russians might be tempted to take advantage of the British defeat. Yakub Khan's troops made a stand at the Shutargardan Pass, but a determined British push cleared them away. Yakub Khan, chagrined at Roberts's determination, decided to make peace. However, the danger was far from past, and on October 5, 1879, Roberts was forced to fight another engagement with the Afghans.

The British now faced hostility from a different quarter. A Muslim holy man, Mushkh-i-Alam, preached a jihad, an Islamic holy war, against the British. This put the British force at Kandahar in peril. Once news reached them, Roberts began to gather a relief column to rescue them and his hard-pressed garrison at Kandahar. Within two weeks Roberts set out with a force of 10,000 men. On August 31, 1880, after a march of 21 days, Roberts broke Ayub Khan's siege of Kandahar. The next day Roberts decisively defeated him in open battle. With the relief of Kandahar the Second Afghan War came to a close. Ayub Khan and Yakub Khan were both tainted by their treachery in British eyes, and Abdul Rahman, their cousin, became the amir in Kabul. Twice in 40 years the British had asserted their primacy in Kabul and won another round in the Great Game against the Russians.

Africa, exploration of

Systematic exploration of Africa by Europeans began with James Bruce, who was born at Kinnaird in Scotland in 1730. After a century of bloody internal war, Scottish energy turned to intellectual and scientific studies, including exploration. Bruce arrived in Algiers in 1762 as the British consul, and in 1768 he was in Cairo, where he conceived the great dream of his life: to find the source of the Nile River. Unlike others, Bruce believed the source of the Nile was in Ethiopia. Bruce had the misconception that the Blue Nile was the main point of origin of the great river, not the White, as later explorers would determine. Indeed, the White and Blue Niles are two distinct rivers, as explorers would later learn.

Bruce, with self-confidence and determination, was the prototype of the African explorer. In November 1770 he reached Ethiopia's Lake Tana, the source of the Blue Nile. After months of adventure and war, he returned to Cairo in January 1773 before going on to London and then to his native Scotland. In 1790 he published the record of his journeys, *Travels to Discover the Sources of the Nile*. Four years later, Bruce, who had survived disasters and dangers, died at home from a fall on a flight of steps.

The next great explorer of Africa was another Scotsman, Mungo Park, born in Selkirkshire in 1771. In 1789 he went to Edinburgh to study to become a surgeon. Park's extraordinary abilities caught the attention of Joseph Banks, perhaps the greatest botanist of his day. After Park completed his studies, Banks helped him secure the position of surgeon on the BRITISH EAST INDIA COMPANY's merchant ship *Worcester*. When he returned, he brought descriptions of eight new species of fish. Meanwhile, French and British colonial rivalry was beginning to engulf Africa. Impressed by Park's presentation of the new species, Banks recommended Park as a scientist for the Association for the Promotion and Discovery through the Interior of Africa—an expedition-sponsoring association. He got the position, and the expedition set sail on May 22, 1795. The party located the Niger River on July 22, 1796, and Park's record of the journey was published in 1799 as *Travels in the Interior Districts of Africa*.

In January 1805 Park set sail in the troopship HMS *Crescent* and landed at the port of Gorée on the Gambia two months later. Disregarding sickness and bandits, which took a steady toll of his party, Park reached the Niger on August 19. Park wrote his last letter to his wife, Allison, on November 20, 1805. It appears the Scotsman was killed in a skirmish with tribesmen at Bussa Falls in 1805 on the Niger.

The NAPOLEONIC CONQUEST OF EGYPT guaranteed continued British interest in Africa because it brought the continent into the heart of the conflict. One of Napoleon's generals, Louis-Charles-Antoine Desaix, unwittingly became one of the first European explorers of the Nile as he pursued the defeated Mamluks into Upper Egypt. The British used the Napoleonic Wars to stake their claim on South Africa as well. In 1806 at the southern extremity of the continent, the British seized the Dutch colony at what would become Cape Town, since the Netherlands were then allied with the French. The great anchorage of Table Bay made the site vital to communications with the crown jewel of the growing British Empire, India. It became the southern British gateway to the interior of Africa, then undergoing the imperial conquests of the Zulu king SHAKA ZULU. From Cape Town came the British penetration of the southern half of Africa that continued to the end of the 19th century.

CAPE TOWN

In November 1810 the new British colony of Cape Town led to the first British journey into the unknown Bantu lands to the north. William Burchell was born in 1782, the son of a professional nurseryman. Like Joseph Banks and Mungo Park before him, an interest in botany led to his interest in exploration. It took Burchell several months to gather together an expedition. His goal was the Kalahari Desert and Angola, which the Portuguese had first visited in the 15th century in their long trek down the west coast of Africa.

Discovering the desert, the terrible heat and lack of water finally forced Burchell to abandon his quest for Angola, and in August he turned back. It would take him and his party two and a half years to return to Cape Town, having traversed some of the most forbidding terrain in Africa. In April 1815 he returned to Cape Town with an immense scientific treasure from his years of exploration. He returned to England, and from 1822 to 1824 Burchell devoted himself to writing his two-volume *Travels in the Interior of Southern Africa*.

Thus, by the end of the Napoleonic Wars in 1815, much of the coastal area of Africa had been explored, and intrepid adventurers had begun to enter the uncharted heart of the continent. For the rest of the century, the lure of the African interior would be irresistible. While governments may have had their own agendas, for the great majority of explorers, they traveled neither for imperial glory or monetary gain, but for the sheer adventure of finding out what lay beyond

the next river or mountain range. Still, as in the era of Mungo Park, one of the greatest challenges to exploration was the ancient city of Timbuktu; this and the source of the Nile formed two of the Holy Grails for generations of explorers.

In May 1825 Alexander Gordon Laing landed in Tripoli, determined to find his way to Timbuktu. Finally, after a year of incredible hardship in the desert, on August 13, 1826, he arrived at Timbuktu. Although the city disappointed him, Laing was impressed by the Mosque of Sankore, built by the great Muslim West African ruler Mansa Musa. Although Laing had achieved his goal, his exploration ended in tragedy. On September 21, 1826, Laing was told he was not safe and left the city to walk into a trap set by Sheikh Ahmadu El Abeyd, who had promised him protection. On September 22 El Abeyd demanded Laing accept Islam, but the Scotsman refused. He was killed and his head cut off.

ZANZIBAR

The chapter in the history of African exploration concerning Richard Burton and John Hanning Speke is the most tragic of all. In 1856 Richard Burton, perhaps the greatest British adventurer of his generation, was commissioned by the Royal Geographic Society to find the source of the Nile. He decided to take with him a companion from an earlier expedition, John Hanning Speke. Burton was already an accomplished traveler, proficient in Arabic, and able to carry off pretending to be a Muslim.

On December 19, 1856, Burton and Speke arrived at Zanzibar from Bombay, where Burton held a commission in the army of the East India Company. Both men took ample time in Zanzibar preparing for their expedition. They set off on their quest after years of travels and squabbles. Burton was convinced that Lake Tanganyika was the source of the White Nile, whereas Speke believed it was Lake Ukwere, which he renamed Lake Victoria.

The rivalry that began in their prior expedition came to a head, and when Burton stopped to rest in Aden, Speke went on to England, promising to wait for his return to reveal the results of their journeys. He broke that promise, and by the time Burton arrived in England on May 21, 1858, Speke had convinced the Royal Geographic Society that Lake Victoria was the source. This accomplishment earned him another commission by the society, and he did not invite Burton to join him on his return to Africa to verify the claim. Instead, Speke chose an army companion, James Augustus Grant. They arrived in Zanzi-

bar from England in August 1860. They retraced the route that Speke had taken with Burton. After several months in Uganda, Speke and Grant continued their trip. Because Grant had a severely infected leg, Speke tended to forge ahead on his own. On July 21, 1862, Speke found himself on the Nile and on July 28 came to Rippon Falls, where the White Nile flows out of Lake Victoria.

It was during Speke's second trip that he and Grant met two of the period's most colorful explorers, Samuel Baker and his redoubtable wife, Florence. They met Speke at Gondokoro on the White Nile, whose source the Bakers were pursuing. A question remained about another lake, known as the Luta N'zige. Speke believed that the White Nile flowed into it from Lake Victoria and then out of Luta N'zige. Speke suggested to Baker that he take up the investigation, and Baker was pleased to do so. On February 26, Speke and Grant resumed their journey down the Nile to Khartoum, and from there to Cairo and England.

LAKE ALBERT

The Bakers continued with their exploration and on January 31, 1864, they struck out on the final march toward Luta N'zige. On March 15, 1864, they found the lake, which they renamed Lake Albert. Samuel explored the surrounding area and saw that the Nile flowed through it. He and Florence returned to England in October, and Samuel was given a gold medal by the Royal Geographic Society. The following August he was knighted.

Meanwhile Speke returned to England without any convincing evidence that his theory was correct. The British Association for the Advancement of Science set up a meeting between Burton and Speke to make their cases. At a preliminary meeting Burton triumphed over Speke. On September 15, one day before the final confrontation, Speke was shot dead while hunting. Many claimed he had shot himself by accident, but others felt he had taken his own life.

Throughout this entire period the name David Livingstone seemed to dominate. Livingstone was a Scotsman born on May 1, 1813. He first visited Africa as a missionary, having gained a degree in medicine at the age of 25 at the University of Glasgow. Livingstone soon realized that the exploration of this virtually unknown continent was more to his heart than laboring at a missionary station and devoted himself to exploration, often with his wife. On June 1, 1849, with two companions, Orwell and Murray, he traveled to find Lake Ngami, and on August 1 Livingstone and his party sailed down the

entire lake. Then began Livingstone's exploration of the Zambezi River.

A national hero back home, Livingstone recounted his travels in his best-selling *Missionary Travels and Researches in South Africa*. From 1858 to 1864 he was in Africa on a second expedition to explore eastern and central Africa. He returned to Africa in 1864 to look for the sources of the Nile. Striking out from Mikindani on the east coast, the expedition was forced south, and some of his followers deserted him, concocting the story that he had been killed and making headline news. Livingstone, however, pressed on, reaching Lakes Mweru, Bangweulu, and Tanganyika. Moving on to the Congo River, he went farther than any European before him.

It was on this exploration that rumors reached England and North America that the great explorer was near death. In 1869 the *New York Herald* hired Henry Morton Stanley to find Dr. Livingstone. On November 10, 1871, Stanley found Livingstone at his camp at Ujji on Lake Tanganyika. Upon Livingstone's death in 1873, his body was returned to England for burial in Westminster Abbey. Stanley decided to pick up where Livingstone, Burton, and Speke had left off, and he set off on his own expedition. The most important result of the journey was the realization that Speke's theory had been right—Lake Victoria was the source for the White Nile. He followed the Congo River and caught the attention of King LEOPOLD II of Belgium, who wished to develop the Congo River basin. In 1879 Stanley set off for Africa in the service of Leopold.

The exploration of Africa led to a rivalry among the countries that had sponsored the explorers. At the same time that Stanley had been exploring the Congo for Belgium, so had Pierre Savorgnan de Brazza for France. To prevent an African rivalry from endangering the peace of Europe, Chancellor OTTO VON BISMARCK of Germany chaired a Conference of Berlin from November 1884 to February 1885 to gain the Great Powers' agreement to a peaceful partition of Africa.

The map of Africa was filling in as the end of the century approached. The areas not yet mapped quickened the heartbeats of explorers from all over the world. Kenya was the next area of interest. On January 2, 1887, the Hungarian explorer Count Teleki von Szek arrived in Zanzibar with Ludwig von Hohnel. Their goal was to explore for their patron, Crown Prince Rudolph of Austria-Hungary, another of the lakes that still tantalized African explorers, known in the local language as Basso Narok, or Black Water. Teleki was the first to climb Mount Kenya before discovering two more lakes, today known as Turkana and Stefanie.

On October 26, 1888, after close to two years, they returned to Mombasa and the voyage home.

Sixteen years later, in 1914, World War I changed the map of Africa forever. Still, in honor of the explorer who had the purest heart, in spite of the era of decolonization after World War II and the years of unrest that followed, the statue of Dr. David Livingstone still stands overlooking Victoria Falls today.

JOHN F. MURPHY, JR.

Africa, imperialism and the partition of

Imperialism, or the extension of one nation-state's domination or control over territory outside its own boundaries, peaked in the 19th century as European powers extended their holdings around the world. The huge African continent (three times the size of the continental United States) was particularly vulnerable to European conquest. The partition of Africa was a fast-moving event. In 1875 less than one-tenth of Africa was under European control; by 1895 only one-tenth was independent. Between 1871 and 1900 Britain added 4.25 million square miles and 66 million people to its empire. British holdings were so far-flung that many boasted that the "sun never set on the British Empire." During the same time frame, France added over 3.5 million square miles of territory and 26 million people to its empire. Controlling the sparsely populated Sahara, the French did not rule over as many people as the British. By 1912 only Liberia and Ethiopia in Africa remained independent states, and Liberia was really a protectorate of U.S.-owned rubber companies, particularly the Firestone Company.

By the end of the 19th century, the map of Africa resembled a patchwork quilt of different colonial empires. France controlled much of North Africa, West Africa, and FRENCH EQUATORIAL AFRICA (unified in 1910). The British held large sections of West

Africa, the Nile Valley, and much of East and southern Africa. The Spanish ruled small parts of Morocco and coastal areas along the Atlantic Ocean. The Portuguese held Angola and Mozambique, and Belgium ruled the vast territories of the Congo. The Italians had secured Libya and parts of Somalia in East Africa. Germany had taken South-West Africa (present-day Namibia), Tanganyika (present-day Tanzania), and Cameroon. Britain had the largest empire and the French the second largest, followed by Spain, Portugal, and Belgium. Germany and Italy, among the last European nations to unify, came late to the scramble for Africa and had to content themselves with less desirable and lucrative territories.

There were many different motivations for 19th-century imperialism. Economics was a major motivating factor. Western industrial powers wanted new markets for their manufactured goods as well as cheap labor; they also needed raw materials. J. A. Hobson and Vladimir Lenin both attributed imperial expansion to new economic forces in industrial nations. Lenin went so far as to write that imperialism was an inevitable result of capitalism. As the vast mineral resources of Africa were exploited by European imperial powers, many Africans became laborers in mines or workers on agricultural plantations owned by Europeans. The harsh treatment or punishment of workers in the rubber plantations of the Belgian Congo resulted in millions of deaths. However, economics was not the only motivation for imperial takeovers. In some instances, for example the French takeover of landlocked Chad in northern Africa, imperial powers actually expended more to administer the territory than was gained from raw materials, labor, or markets.

Nationalism fueled imperialism as nations competed for bragging rights over having the largest empire. Nations also wanted control over strategic waterways such as the Suez Canal, ports, and naval bases. Christian missionaries traveled to Africa in hopes of gaining converts. When they were opposed or even attacked by Africans who resented the cultural incursions and denial of traditional religions, Western missionaries often called on their governments to provide military and political protection. Hence it was said that “the flag followed the Bible.” The finding of the Scottish missionary David Livingstone by Henry Stanley, an American of English birth, was widely popularized in the Western press. Livingstone was not actually lost, but had merely lost contact with the Western world.

Explorers, adventurers, and entrepreneurs such as CECIL RHODES in Rhodesia and King LEOPOLD II of

Belgium, who owned all of the Congo as his personal estate, also supported imperial takeovers of territories. Richard Burton, Samuel and Florence Baker, and John Speke all became famous for their exploration of the Nile Valley in attempts to find the source of that great river. Their books and public lectures about their exploits fueled Western imaginations and interest in Africa.

CULTURAL IMPERIALISM

Cultural imperialism was another important aspect of 19th-century imperialism. Most Westerners believed they lived in the best possible world and that they had a monopoly on technological advances. In their imperial holdings, European powers often built ports, transportation, communication systems, and schools, as well as improving health care, thereby bringing the benefits of modern science to less developed areas. Social Darwinists argued that Western civilization was the strongest and best and that it was the duty of the West to bring the benefits of its civilization to “lesser” peoples and cultures.

Western ethnocentrism contributed to the idea of the “white man’s burden,” a term popularized by the poet Rudyard Kipling. Racism also played a role in Western justifications for imperial conquests.

European nations devised a number of different approaches to avoid armed conflict with one another in the scramble for African territory. Sometimes nations declared a protectorate over a given African territory and exercised full political and military control over it. At other times they negotiated through diplomatic channels or held international conferences. At the Berlin Conference of 1884–85, 14 nations decided on the borders of the Congo that was under Belgian rule, and Portugal got Angola. The term *spheres of influence*, whereby a nation declared a monopoly over a territory to deter rival imperial powers from taking it, was first used at the Berlin Conference.

However, disputes sometimes led European nations to the brink of war. Britain and France both had plans to build a north-south railway and east-west railway across Africa; although neither railway was ever completed, the two nations almost went to war during the FASHODA CRISIS over control of the Sudan, where the railways would have intersected. Britain was also eager to control the headwaters of the Nile to protect its interests in Egypt, which was dependent on the Nile waters for its existence. Following diplomatic negotiations the dispute was resolved in favor of the British, and the Sudan became part of the British Empire.

War did break out between the British and Boers over control of South Africa in 1899. By 1902 the British had emerged victorious, and South Africa was added to their empire. In West Africa, European powers carved out long narrow states running north to south in order that each would have access to maritime trade routes and a port city. Since most Europeans knew little or nothing about the local geography or demographics of the region, these new states often separated similar ethnic groups or put traditional enemies together under one administration. The difficulties posed by these differences continue to plague present-day West African nations such as Nigeria.

FRENCH AND BRITISH RULE

The French and British adopted very different approaches to governance in their empires. The French believed in their “civilizing mission” and sought to assimilate the peoples of their empire by implanting French culture and language. The British adopted a policy of “indirect rule.” They made no attempt to assimilate the peoples of their empire and educated only a small number of Africans to become civil servants. A relatively small number of British soldiers and bureaucrats ruled Ghana and Nigeria in West Africa. In East Africa, the British brought in Indians to take jobs as government clerks and in commerce. Otherwise, the British tried to avoid interfering with local rulers or ways of life. Although the British and French policies were radically different, both were based on the belief in the superiority of Western civilization.

European colonists also settled in areas where the climate was favorable and the land was suitable for agriculture. Substantial numbers of French colons settled in the coastal areas of North Africa, especially in Algeria and Tunisia, while Italians settled in Tunisia and Libya. British settlers moved into what they named Rhodesia and Kenya. In Kenya, British farmers and ranchers moved into the highlands, supplanting Kenyan farmers and taking much of the best land. The Boers, Dutch farmers, fought the Zulus for control of rich agricultural land in South Africa. The Boers took part in a mass migration, or Great Trek, into the interior of South Africa from 1835–41 and established two independent republics, the Orange Free State and the Transvaal. Dutch farmers clashed with the British for control of South Africa in the Boer War. In Mozambique and Angola, Portuguese settlers (*prazos*) established large feudal estates (*prazos*). Throughout Africa, European colonists held privileged positions politically, culturally, and economically. They opposed extending rights to native African populations.

A few groups, such as the Igbos in Nigeria and the Baganda in Uganda, allied with the British and received favored positions in the colonial administrations. However, most Africans resisted European takeovers. Muslim leaders, such as ABDUL KADER in Algeria and the Mahdi in Sudan, mounted long and effective armed opposition to French and British domination. But both were ultimately defeated by superior Western military strength.

The Ashante in Ghana and the Hereros in South-West Africa fought against European domination but were crushed in bloody confrontations. The Zulus led by SHAKA ZULU used guerrilla warfare tactics to halt the expansion of the Boers into their territories, but after initial defeats the Boers triumphed. The Boers then used the hit-and-run tactics they had learned from the Zulus in their war against the British. The British defeated the Matabele and Mashona tribes in northern and southern Rhodesia. In the 20th century, a new generation of nationalist African leaders adopted a wide variety of political and economic means to oppose the occupation of their lands by European nations and settlers.

JANICE J. TERRY

Africa, Portuguese colonies in

Before the 1880s most African societies were independent of European rule. With particular reference to Africa south of the Sahara, colonial rule was confined to coastal patches and the Cape region, the latter being home to Anglo-Boer political rivalry. As regards the Portuguese, their colonial interest was restricted to their colonies of Angola, Mozambique, and the tiny area of Portuguese Guinea. Interestingly, Portuguese rule in these areas was not strong. The reason was that trade,

not political administration, dominated the purpose of their encounter with Africans during this period. It was because of this that no major political responsibility was taken by Portugal, unlike the other European powers, with regard to colonies in Africa, creating the unique nature of Portuguese enterprise or activities in Africa between 1750 and 1900. The establishment of colonies and colonial rule, as well as the strategies employed by the Portuguese to keep their holdings in Africa, have an interesting history, despite their dwindling fortunes during this period, occasioned by economic, political, and strategic factors.

PORTUGUESE ENTERPRISE

Between 1750 and 1900 the Portuguese did not achieve much as far as their attempt to establish colonial rule in Africa was concerned. But if colonialism is taken to mean the occupation and control of one nation by another, then some of the attempts made by Portugal to establish political control over some parts of Africa can be highlighted as examples.

It is important to stress that the driving force behind Portuguese enterprise in Africa, and elsewhere in the world, was trade and economic exploitation of their colonies, and it is this more than anything that drove Portuguese desire for political control of these areas. Indeed, Portugal, like many of the other colonial powers, had always treated its colonies like private estates of the motherland, where resources had to be repatriated for the development of the latter. No real political administration and structure were put in place in the colonies. In the case of East Africa, the area was more or less a stopping place for the Portuguese on their way to Asia. The chief result of their rule in this region was that it contributed greatly to crippling the old Arab settlements that were once the pride of the East African coast.

Portugal viewed its East African possessions with mixed feelings. While the area did not give them the wealth they had expected, they nevertheless wanted to contain Arab influence in the area and deal directly with the indigenous Africans. It was for this that the Portuguese attacked communities in the area and established a presence in Mombasa, Sofala, Kilwa, Mozambique, and Pemba.

There were many obstacles as far as its East African project was concerned. First, many of the Portuguese settlers in East Africa died from tropical diseases. Many others were killed in the continual fighting on the coast. Second, due in large part to disease and fighting, Portugal never had a population large enough to carry out its colonial plans in East Africa. Most of its personnel were

kept busy in Brazil and their empire in the Indian Ocean. Third, competition from the British and the Dutch East India Company helped to weaken the Portuguese hold on the eastern shores of the Indian Ocean.

Then there were numerous revolts from the Arab leaders of the region. For instance, in 1698 Sultan bin Seif, the sultan of Oman, and his son, Imam Seif bin Sultan, captured Fort Jesus, which had been the military and strategic base of Portuguese holdings in East Africa. Indeed, in 1699 the Portuguese were driven out of Kilwa and Pemba, thus marking the end of Portuguese colonial interest in East Africa north of Mozambique. Earlier in 1622 a revolt against the Portuguese led by a former Portuguese mission pupil, Sultan Yusuf, helped to prepare the disintegration of Portuguese military strength in Mombasa.

Consequent upon these issues, Portuguese holdings in East Africa were far from a successful colonial rule. By 1750 Portuguese interests in East Africa were replaced by a new socio-political order led by the leaders of Oman.

AFRICAN INTERIOR

In the interior of Africa, the Portuguese did not achieve anything substantial as far as colonial rule was concerned. The Mwenemutapa (known to the Portuguese as Monomotapa) did not provide fertile soil for the establishment of Portuguese colonization. The Portuguese, for their part, were more interested in what they would get instead of what they would give. Besides, the area was already experiencing decline owing to the emergence of several dynasties in the region. This situation was not helped by contact with the Portuguese.

Elsewhere, in Guinea there was Portuguese influence, but it was not enough to be described as colonial rule. By 1750 Portuguese colonies in Africa were limited to Angola, Mozambique, and Guinea, but colonial rule was more pronounced in the first two colonies. The Portuguese also held important islands in the Atlantic off the coast of Africa.

During this period Portuguese colonies, especially Angola, remained the supply base for the Brazilian slave trade. The Portuguese sought to create a highly polished elite conditioned by their culture. This aspiration did not materialize. Indeed, the Angolan colony, which was an example of Portuguese colonial interest in Africa, was a mere shambles, in which the criminal classes of Portugal were busy milking the people for their own benefit. To this end, Angola, like Mozambique, could be described as a trading preserve from which the interior could be reached.

WEB OF MISERY

Politically, Portuguese colonies lacked effective administration. The historian Richard Hammond has painted the picture in a sympathetic way when he argued that Portugal could not effectively control its colonies. He was merely echoing the voice of a Portuguese official, Oliveira Martins, who wrote that Portuguese colonies were a web of misery and disgrace and that the colonies, with the exception of Angola, be leased to those “who can do what we most decidedly cannot.” The reason why Portuguese colonies were so painted is not hard to understand. A. F. Nogueira, a Portuguese official, said, “Our colonies oblige us to incur expenses we cannot afford: For us to conserve, out of mere ostentation, mere display, mere prejudice . . . colonies that serve no useful purpose and will always bring us into discredit, is the height of absurdity and barbarity besides.”

In 1895 the minister of marine and colonies, the naval officer Ferreira de Almeida, argued in favor of selling some of the colonies and using the proceeds to develop those colonies that would be retained. It is obvious from the issues Portugal contended with in Africa that the intent was to have a large space on the map of the world, but that Portugal was never ready to administer them practically.

This notwithstanding, it is safe to say that the Portuguese implemented the policy of assimilation in governing their colonies. The aim was to make Africans in the colonies citizens of Portugal. Those who passed through the process of assimilation were called *assimilados*. It is important to note that the number of *assimilados* ceased to grow after the unsuccessful effort of the liberal Bandeira government to make all Africans citizens of Portugal. It is not clear whether the Portuguese were sincere in their efforts to assimilate Africans in their colonies. It appears that the policy was a mere proclamation that did not have the necessary political backing. Indeed, the idea of equality was a farce. The government did not provide the necessary infrastructure such as schools, finances, or other social institutions upon which such equality, demanded by true assimilation, could be built.

The process of education in Portuguese territories in Africa was far from satisfactory. The aim of Portuguese education was essentially to create an African elite that would reason in the way of the Portuguese. However, the Portuguese officials were not committed to the cause of educating Africans at the expense of Portugal. Consequently, most schools were controlled by the Catholic Church, as a reflection of the relationship between church and state. This meant that the

state was dodging its responsibility to provide education for the people of its African colonies.

Historian Walter Rodney has criticized the type of education in Portuguese colonies in Africa. He believed that the schools were nothing but agencies for the spread of the Portuguese language. He argued further that “at the end of 500 years of shouldering the white man’s burden of civilizing ‘African Natives,’ the Portuguese had not managed to train a single African doctor in Mozambique, and the life expectancy in eastern Angola was less than 30 years . . . As for Guinea-Bissau, some insight into the situation there is provided by the admission of the Portuguese themselves that Guinea-Bissau was more neglected than Angola and Mozambique.”

Later in the 20th century, the Portuguese encouraged state financing of education in the colonies and ensured that a few handpicked Africans were allowed to study in Portugal. Sometimes, provisions were made for the employment of such *assimilados* in the colonial administration. This development notwithstanding, Portuguese colonies in Africa did a poor job in education.

SLAVE TRADE

Another important aspect of Portuguese colonial rule in Africa is its attitude toward labor and the recruitment of it. For a long time the slave trade provided an avenue for the recruitment of labor in Portuguese territories. However, in 1836, slave trafficking was abolished in Portugal’s colonies, although it continued in practice under the name of contract labor. Under this new practice, every year the Portuguese shipped thousands of people from Angola to coffee and cocoa plantations on the island of São Tomé as forced laborers. Mozambique also offered an avenue for migration of labor to work in mines in British-controlled Rhodesia. Sometimes, the migrants were happier working in the mines than being forced to work at home. All the same, the Portuguese controlled the recruitment of this labor to Rhodesia, taking revenue from each worker that they allowed to leave. This was another way to generate revenue.

The historian Basil Davidson has commented that a distinguishing feature of Portuguese colonies was the presence of large systems of forced labor put in place to exploit and oppress the indigenous people. There were reasons for this development. First, in the case of Angola, the increasing prosperity of the cocoa industry and the attendant increase in the demand for labor made forced labor a desirable alternative.

Second, toward the end of the 18th century, the supply of labor was affected by the spread of sleeping sickness in the interior. Consequently, the Portuguese had to rely on forced labor for its supply.

The colonies were subjected to a great deal of economic exploitation. From the start, Portuguese enterprises in Africa were dictated by the desire to procure slaves. Indeed, slaves constituted almost the sole export of the colonies. This continued up to the end of the 19th century. In Angola, the Portuguese established their rule of ruthless exploitation for the purpose of procuring large numbers of slaves for the Brazilian market.

The exploitation of Angola for slaves came to be known as the era of the *pombeiros*. The *pombeiros*, half-caste Portuguese, were notorious for their activities, which consisted of stirring up local conflicts in order to capture slaves for sale at the coast. The *pombeiros* were the masters of the interior whom the slave dealers relied on for procurement.

INTELLECTUAL REACTION

In 1901 a decree was issued by the government in Lisbon to put a stop to recruitment of labor by violent means. In Luanda, some pamphlets were published to denounce the practice of forced labor. This was an intellectual reaction to the phenomenon of forced labor. In practical terms, it did not have any substantial effect on the practice.

There was a violent reaction to the phenomenon of forced labor, starting with the Bailundo Revolt of 1902. In 1903 fresh regulations were issued to tackle the issue of forced labor, but they achieved little or no success. Portugal's objection to forced labor was not born out of their concern for Africans, but such a stance was taken whenever the authority felt that certain individuals were gaining too much local power. Indeed, the official view, embodied in a law of 1899, was that forced labor was an essential part of the civilizing process, provided it was done decently and in order.

The Portuguese attitude to race was one of superiority on their part and inferiority on the part of Africans. No colonial power was entirely free from racial prejudice. Segregation, whether pronounced or not, was often used as a means of preserving the racial purity of European settlers in Africa. In the case of the Portuguese, the authority was interested in ensuring the racial purity of Portuguese agrarian settlers in Angola. However, the conditions in the colonies did not favor or encourage Europeans to settle in large numbers. Conse-

quently, white populations could be maintained only by settling convicts and by miscegenation. Because of this, racial mixing in Portuguese colonies was accepted—it was necessary to maintain the population. Portugal's colonial history provides a particularly illuminating case of Europe's impact on the racial and ethnic character of Africa as far as racial-demographic engineering was concerned.

No substantial infrastructure development can be ascribed to Portuguese colonial enterprise in Africa. Even though the Portuguese treated their colonies as the "private estate of the motherland," no major policies and programs were put in place to address infrastructural development. For instance, even though Angola produced excellent cotton, none of it was actually processed in Angola. Additionally, communication was poor. The Portuguese settlements were isolated from one another. For instance, when Lourenço Marques was engulfed in crises in 1842 and the governor was killed in a raid organized by the indigenous people, it took the authorities in Mozambique a year to hear of the happening by way of Rio de Janeiro. But Portugal was lucky to benefit from development initiated by other countries. In 1879 the Eastern Telegraph Company's cable, en route to Cape Town, established "anchor points" in Mozambique and Lourenço Marques. In 1886 the telegraph line reached Luanda en route to the Cape. This provided the first major link between Portugal and its overseas colonies.

Furthermore, in 1880 Portugal and the Transvaal concluded a revised version of their existing territorial treaty of 1869, in which they agreed to build a railroad from Lourenço Marques to Pretoria. British control of the Transvaal stalled the progress of the work. Portugal on its own did not make efforts to connect its colonies in Africa in a manner that would make sense with regard to Africa's needs and development.

Lastly, bureaucracy was not effective as far as Portuguese colonial rule in Africa was concerned. There was no regular cadre of trained civilian recruits on which to draw. The effect of this was that there was an almost complete absence of the routine competence that a good administration needs. This affected the coordination of Portuguese colonial activities in Africa.

CONCLUSION

Between 1750 and 1900 the Portuguese presence in Africa was one of economic exploitation much more than actual colonial rule. In fact, the Portuguese had no major administrative systems in place in their African colonies. Instead, the primary motive for the creation

of the colonies was economic, initially the slave trade and later other lucrative commodities. The Portuguese colonies lacked basic infrastructure and lagged behind European colonies in Africa.

OMON MERRY OSIKI

Aigun and Beijing, Treaties of

The Russian Empire made important gains at the expense of China between 1858–60. The QING (Ch'ing) DYNASTY's easy defeat by Great Britain in the first ANGLO-CHINESE OPIUM WAR had made its glaring weakness apparent to the world. Russian leaders, including Czar Nicholas I, feared British dominance in East Asia and resolved to expand into Chinese territory first.

In 1847 Nicholas appointed Nikolai Muraviev, an energetic proponent of Russian imperialism, governor of Eastern Siberia. Muraviev built up a large Russian force that included Cossack units, a naval squadron in the Far East, and set up forts and settlements along the Amur River valley in areas that the Treaty of Nerchinsk (1689) between Russia and China had recognized as Chinese territory. The small and ill-equipped Chinese frontier garrison in the region was no match for the Russians when Muraviev demanded in May 1858 that China recognize Russian sovereignty on the land north of the Amur riverbank. With more than 20,000 troops and naval support, he was able to force the Chinese representative to agree to the Treaty of Aigun, named after the frontier town where the meeting took place. Under its terms, China ceded to Russia 185,000 square miles of land from the left bank of the Amur River down to the Ussuri River and agreed that the territory between the Ussuri and the Pacific Ocean would be held in common pending a future settlement. The Chinese government was furious with the terms and refused to ratify the treaty but was helpless because of the ongoing TAIPING REBELLION and others and a war

with Great Britain and France, known as the Second Anglo-Chinese Opium War.

Events played into Russian hands in 1860, because resumed warfare between China and Britain and France had led to the capture of capital city Beijing (Peking) by British and French forces. The incompetent Qing emperor Xianfeng (Hsien-feng) and his court fled to Rehe (Jehol) Province to the north and left his younger brother PRINCE GONG (Kung) in charge. Russia was represented in Beijing at this juncture by the wily ambassador Nikolai Ignatiev, who had recently arrived to secure Chinese ratification of the Treaty of Aigun. Ignatiev offered to mediate between the two opposing sides; by deception, maneuvering, and ingratiating himself to both parties he scored a great victory for Russia in the supplementary Treaty of Beijing in November 1860.

It affirmed Russian gains under the Treaty of Aigun and secured exclusive Russian ownership of land east of the Ussuri River to the Pacific Ocean to Korea's border, an additional 133,000 square miles, including the port Vladivostok (meaning "ruler of the East" in Russian). In addition Russia received the same extraterritorial rights and the right to trade in the ports that Britain and France had won by war. China also opened two additional cities for trade with Russia located in Mongolia and Xinjiang (Sinkiang) along land routes. Through astute diplomacy and by taking advantage of the weak and declining Qing dynasty Russia was able to score huge territorial gains from China without firing a shot between 1858 and 1860.

JIU-HWA LO UPSHUR

Alaska purchase

Alaska was purchased by the United States from czarist Russia in 1867. It had been occupied by Russia since the 18th century and exploited by Russian fur and fishing interests. However, by the 1860s the region was viewed by the Russian government as a strategic liability and

an economic burden. Suspicious of British intentions in the Pacific, and concerned with consolidating its position in eastern Siberia, the Russian government offered to sell Alaska to the United States. Baron Edouard de Stoeckl, Russia's minister to the United States, entered into negotiations with President Andrew Johnson's secretary of state, William H. Seward, in March 1867.

Seward was a zealous expansionist. Throughout his tenure as secretary of state, which had begun during the administration of ABRAHAM LINCOLN, Seward was avid in his desire to advance American security and extend American power to the Caribbean and to the Pacific. The AMERICAN CIVIL WAR and the lack of political and public support for expansion in the war's aftermath stymied his desires. He did succeed, however, in

acquiring Midway Island in the Pacific and in gaining transit rights for American citizens across Nicaragua.

Seward and Stoeckl drafted a treaty that agreed upon a price of \$7,200,000 for Alaska. For approximately two cents an acre, Seward had obtained an area of nearly 600,000 square miles. However, he encountered difficulty in obtaining congressional approval for the transaction. Senator Charles Sumner overcame his initial opposition and sided with Seward. He gave a persuasive chauvinistic three-hour speech on the Senate floor that utilized expansionist themes familiar to many 19th-century Americans. He spoke of Alaska's value for future commercial expansion in the Pacific, cited its annexation as one more step in the occupation of all of North America by the United States, and

The Alaska Range in the south-central region of Alaska. The purchase of Alaska in 1867 yielded rich fishing grounds, the discovery of oil and natural gas fields, and the recognition of natural beauty as a source for tourism in the following century.

associated its acquisition with the spread of American republicanism. The Senate ratified the treaty in April 1867. Despite the formal transfer of Alaska in October of that year, the House, in the midst of impeachment proceedings against Johnson, refused to appropriate the money required by the treaty. It was not until July 1868 that the appropriation was finally approved.

The purchase was repeatedly ridiculed. Alaska was referred to as a frozen wilderness, “Seward’s Ice Box,” and “Seward’s Folly.” The subsequent discovery of gold in 1898 brought about a new appreciation for the area’s intrinsic value. Alaska’s rich fishing grounds, its vital location during World War II, the discovery of oil and natural gas fields, and the recognition of its natural beauty as a source for tourism have allayed further criticism of its purchase. Its increasing population qualified it to become the 49th state in 1959.

LOUIS B. GIMELLI

Alexander I

(1777–1825) *Russian czar*

Alexander I was the czar of Russia from 1801 to 1825, a rule during which he not only instituted widespread reforms but later reversed many of them. As a child, he was raised by his grandmother CATHERINE THE GREAT in a liberal and intellectual environment. She died when he was a teenager in 1796, and his father died five years later, most likely with Alexander’s complicity as part of a conspiracy to put him on the throne.

Alexander was deeply committed to reform and sought to bring Russia up to speed with the rest of ENLIGHTENMENT-era Europe. Attempts at drawing up a constitution that could find support failed, and his early legal code was never adopted. In many cases, Alex-

ander called for reform and micromanaged its adoption, making it impossible for the reform to take place. Other reforms were simply poorly conceived, lacked a practical transition from the status quo, or were unimplementable in light of the existing bureaucracy. His European contemporaries saw him as enigmatic and inconsistent. When Russia acquired Poland, Alexander approved their constitution, which provided many of the same things he wanted for his own country.

Reform efforts dwindled in 1810 because of the Napoleonic wars that consumed Europe. Alexander was intimidated by NAPOLEON I, and perhaps by the scale of the wars themselves. He believed that at stake in the wars in Europe were the rights of humanity and the fate of nations and that only a confederation of European states devoted to the preservation of peace could prevent the dangers of dictators and world conquerors. Napoleon claimed Russia had nothing to fear from France and that the distance between the two nations made them allies.

Any ambitions this may have stirred in Alexander were crushed by the summer of 1812, when Napoleon invaded Russia. The results startled everyone; in preparation for the invasion of Moscow, Alexander ordered the city evacuated and burned. Anything that could help the invading French army was destroyed. More than three-quarters of the city was lost. Napoleon began his long retreat, and by the end of the campaign, the French forces of nearly 700,000 had been reduced to less than 25,000.

It was a turning point for both men: Napoleon would ultimately lose, and Alexander would ultimately abandon his quests for reform. He initiated few new programs, failed to see older programs through, and by the end of his reign had reversed many of his early reforms rather than repair them. Alexander died of sudden illness in 1825, on a voyage in the south. The circumstances of his death inspired rumors claiming that he had been poisoned or he hadn’t died at all and had buried a soldier in his place.

BILL KTE’PI

Algeria under French rule

France first occupied Algeria in 1830. During the Napoleonic era, France had bought Algerian wheat on credit. After the fall of NAPOLEON I Bonaparte, the newly reestablished French monarchy refused to pay these debts. The dey of Algiers, Husain, sought payment, and during a quarrel with the French consul Duval he allegedly hit the consul in the face with his flyswatter. Duval reported the insult to Paris, and the French government sought revenge. King Charles X, who wanted to gain new markets and raw materials and deflect attention from an unstable domestic political situation, used the supposed insult as an excuse to attack Algeria. As a result, a French fleet with over 30,000 men landed in Algiers in the summer of 1830 and Dey Husain was forced to sign an act of capitulation by General de Bourmont. The French pledged to maintain Islam and the customs of the people but also confiscated booty worth over 50 million francs.

The French government then debated what to do with the territory. France could keep the dey in power, destroy the forts, and leave or install an Arab prince to rule. The government also debated supporting the return of Ottoman rule, putting the Knights of Malta in power, inviting other European powers to establish some form of joint rule, or keeping the territory as part of the French empire. By 1834 the French had decided on a policy of conquest and annexation of the Algerian territory. A French governor-general was appointed, and all Ottoman Turks were out of Algeria by 1837. The French government held that there was no such thing as an Algerian nation and that Algeria was to become an integral part of France. Although assimilation of the predominantly Muslim and Arabic-speaking Algerian population into French society was ostensibly the policy of successive French regimes, the overwhelming majority of Algerians were never accepted as equals. Algeria became a French department, and the French educational system, with French as the primary language, was instituted.

In 1865 the French government under NAPOLEON III declared that Algerian Muslims and Jews could join the French military and civil service but could only become French citizens if they gave up their religious laws. The overwhelming majority of the Muslim population refused to do so, and Algerian Muslims gradually became third-class citizens in their own country, behind the mainland French and the colons, or French settlers. In 1870 Algerian Jews were granted French citizenship.

Through most of the 19th century, the Algerians fought against the French occupation. Led by Emir ABDUL KADER, the Algerians were initially successful in their hit-and-run attacks against the French. To gain the offensive, General Thomas-Robert Bugeaud created mobile columns to attack the Algerian fighters deep inside Algerian territory. With their superior armaments, the French put Abdul Kader's forces on the defensive, and Abdul Kader was forced to surrender in 1847, after which he was sent into exile. In 1870 another revolt led by Mokrani broke out in the Kabyle, the mountainous district of northeastern Algeria. A woman named Lalla Fatima also championed the fighters in the Kabyle, but by 1872 the French had crushed the revolt.

In retaliation, the French expropriated more than 6.25 million acres of land. Much of the expropriated land was given to French settlers coming from the provinces of Alsace-Lorraine that the French had lost to the Germans as a result of the FRANCO-PRUSSIAN WAR from 1870 to 1871. These punitive land expropriations made most Algerians tenant farmers and led to further impoverishment of the indigenous population. By the end of the 19th century there were approximately 200,000 French colons living in Algeria.

Indigenous Algerians were forced to pay special taxes, and limitations were placed on the numbers of Algerian children who could attend French schools. In addition, the French judicial system was implemented. In reaction to the growing social and political chasm between the colons and the indigenous population, a few Muslim leaders in the cities of Tlemcen and Bone sent a note to the government in 1900 asking for the right to vote. Called the Young Algerians (*Jeunes Algériens*), these modernizers sought to narrow the gap between the two societies and had much in common with reformers in other parts of the Arab world. Although some liberals in mainland France supported reforms, the colons remained firmly opposed to any legislation that would lessen their favored positions.

Alien and Sedition Acts, U.S.

In 1798 four federal laws restricting U.S. citizenship and severely curtailing the freedoms of speech, press, and assembly were adopted by a Federalist Party–dominated Congress and signed by President JOHN ADAMS. Sparked by mounting tensions between the United States and its former ally, France, these laws purported to be essential to the young nation’s security. In fact, they were mainly used to silence domestic critics as intense partisanship emerged.

War certainly seemed a strong possibility as the French seized U.S. ships and sailors, schemed to regain control of Spanish Louisiana, and blatantly demanded bribes in return for diplomatic recognition. As Americans expressed patriotic outrage, those who still viewed France as a key ally and hailed the FRENCH REVOLUTION were painted as traitors. Chief among these was Democratic-Republican leader THOMAS JEFFERSON, who was both Adams’s vice president and chief political rival. As these laws were implemented by his Federalist foes, Jefferson would call the years 1798 to 1801 “the reign of witches.”

A new naturalization statute and two alien laws created major barriers to what had been an extremely liberal U.S. policy of welcoming and extending citizenship benefits to foreigners. Emerging nativist suspicions focused on French “Jacobins” and the supposedly “wild” Irish. The Alien Acts gave the president broad powers to have noncitizens arrested or deported in both peace- and wartime. Anticipating deportation, French visitors chartered 15 ships to return to Europe. Soon after, Adams would personally prevent French scientist Pierre Samuel du Pont de Nemours, whose son would later found a major American chemical company, from setting foot in the United States.

The effects of the Sedition Act would prove even more significant, posing a clear challenge to the First Amendment of the CONSTITUTION, adopted just eight years earlier. Zealously enforced by Secretary of State Timothy Pickering, this act forbade utterances that might bring the president or Congress “into contempt or disrepute.” It produced 17 known indictments, focusing on Republican newspaper publishers. One of these was Benjamin Franklin Bache, editor of the Philadelphia *Aurora* and grandson of BENJAMIN FRANKLIN. Despite violent attacks on his home and person, Bache continued to publish until he died of yellow fever a month before his scheduled trial.

Politicians, too, were targeted. Matthew Lyon, an Irish immigrant and Vermont congressman who was

one of very few non-Federalist politicians in New England, was convicted for calling the Sedition Law unconstitutional. Conducting his reelection campaign from jail, Lyon won easily and was freed when supporters paid his \$1,000 fine. Federalist Jedidiah Peck, a New York assemblyman, was dumped by his party and arrested for petitioning to repeal the Alien and Sedition Acts. He was also handily reelected, as a Republican.

Opponents got no help from the Supreme Court, where ardently Federalist Associate Justice Samuel Chase personally prosecuted several sedition trials. The predominantly Republican states of Kentucky and Virginia passed resolutions condemning the laws. It took Jefferson’s narrow victory in the bitter presidential campaign of 1800 to assure that the acts, already set to expire in March 1801, did not continue. Jefferson also pardoned those still jailed for sedition. Years later, Charles Francis Adams, diplomat grandson of John Adams, would call the Sedition Act the fatal error that ultimately doomed the Federalist Party to oblivion after the WAR OF 1812.

Aligarh College and movement

Aligarh College, now Aligarh Muslim University, was the first institution of higher learning for Muslims in British India. Many prominent Muslim leaders and scholars have studied at Aligarh, and it served to provide an important focus for the development of Muslim unity and political awareness, particularly during the late 19th and early 20th centuries. The college has its roots in the belief of Sayyid Ahmad Khan that there was no conflict between education in modern empirical science and belief in the Qur’an. Khan desired to educate young Muslims in English, modern science, and the principles of Western government so they could take a leading role in the contemporary world. He was particularly interested in enabling them to

compete with Hindus and other religious and ethnic groups for positions of power in British-ruled India. In order to prepare Indian Muslims to accept Western education, Khan first created the Scientific Society of Aligarh in 1864, which translated Western scientific, historical, and philosophical works into Indian languages.

Khan visited England in 1870, and his inspiration for Aligarh College was the universities at Oxford and Cambridge. He founded what was then known as the Muhammadan Anglo-Oriental College at Aligarh in 1875; it offered a Western curriculum similar to that of an English public (private) school, and the first principal, Theodore Beck, was British. Aligarh College became the leading center for the education of modern Muslim leadership in India and helped to create an educated Muslim elite that held many political positions and were catalysts for change within the British system. The college was particularly important in providing practical experience in politics through campus debating societies and student elections and in encouraging the formation of a collective and unified identity by the Indian Muslim community.

Aligarh College became a full-fledged university in 1920 and was renamed Aligarh Muslim University. The university is located in the city of Aligarh, Uttar Pradesh, in northern India. It currently has about 30,000 students representing many religious and ethnic backgrounds and offers instruction in 80 fields of study, including law, medicine, and engineering.

SARAH BOSLAUGH

American Revolution (1775–1783)

The war that created and established the independence of the United States of America officially broke out between Britain and 13 of its North American

colonies at Lexington and Concord, Massachusetts, and ended when the Treaty of Paris was signed. However, historians now maintain that the revolution really began during, or at least in the wake of, the SEVEN YEARS’ WAR, also called the FRENCH AND INDIAN WAR, long before the “shot heard round the world” of April 19, 1775.

Serious political and social issues between Britain and its colonies emerged during this earlier conflict. Many colonial American men were not prepared to endure the harsh discipline of the British army or navy during the war and had an extraordinarily narrow and even legalistic perspective on their military obligations. For their part, aristocratic British military officers were unfamiliar with colonial America’s more boisterous political culture and expected colonial militiamen to obey orders without a second thought.

These problems of deference and duty grew worse in the 1760s as the British attempted to deal with issues of imperial governance over the huge territory they had won from France. The British struggled to reconcile the goals of its colonial subjects, who hungered for Indian lands between the Mississippi River and the Appalachian Mountains, with the need to foster peace, stability, and the continuation of the fur trade among the Indian tribes in the same region. As the French and Indian Wars were ending in 1763, an Indian coalition assembled by Ottawa chief Pontiac besieged British garrisons in and around the Great Lakes, killing or capturing 2,000 colonials and resulting in Britain’s Proclamation Line. This poorly conceived and expensive attempt to separate Indian and colonial claims proved hugely unpopular with American expansionists.

The greatest problem that Britain faced, however, was the doubling of its national debt resulting from the Seven Years’ War, as this conflict was known in Europe. Parliament sought to levy taxes on the colonies in order to manage the debt without raising levies on already heavily taxed British subjects. The colonists, mistrustful of parliamentary motives and quite used to being subsidized by the Crown, reacted with alarm to new taxes on items such as sugar, paper, and, later, tea. Each new tax was followed by petitions, protests, and even riots, especially in Boston, where leaders like Samuel Adams rallied opposition against parliamentary power over the colonies, and in Virginia, where Burgess Patrick Henry shocked fellow legislators by seeming to foment rebellion against King George III.

Each time resistance to a tax ensued, Parliament repealed it but introduced a new one, spawning more resistance that was often met by British shows of

force. When Parliament sent in redcoats after the 1774 Boston Tea Party, the deliberate destruction by colonials of 342 chests of tea subject to the hated tax, and imposed what colonists called the Intolerable Acts, it provoked even more violence between British troops and Americans.

Colonial propagandists made the most of these incidents, creating such activist organizations as the committees of correspondence and the Sons and Daughters of Liberty. By 1774, colonists had established the First Continental Congress. Using this body, as well as traditional colonial assemblies and militias, the “Continentalists” or “Patriots” soon set up a virtual shadow government that ran the countryside in each colony. The Battles of Lexington and Concord ensued when the royal governor of Massachusetts, Lieutenant General Thomas Gage, sent grenadiers and Royal Marines into the countryside to try to confiscate arms and ammunition being stored by the militias.

The first year of the war entailed a land blockade of Boston by multitudes of militias that eventually coalesced into the beginnings of the Continental army under Lieutenant General GEORGE WASHINGTON. Bloodying the British at Breed’s Hill and other battles, the Continentals were strong enough to convince British troops to evacuate the city. This triumph gave the Continentals time to organize the army and for the Second Continental Congress to begin debating independence in the wake of British measures. Once the decision for independence was reached and the DECLARATION OF INDEPENDENCE published in July 1776, Washington began to organize for the defense of New York, the most likely British target.

The fighting around New York in the late summer and fall of 1776 was the low point of the Revolution for the Americans. Washington committed several amateurish mistakes that cost the army most of its men by December. With his head count down tenfold to 2,000 men, Washington lost control of New York and New Jersey, although victories at Trenton and Princeton rallied the army and the Continental cause.

The year 1777 began with additional defeats, especially the loss of the capital city, Philadelphia, to the British. Yet the Americans did not give up. Congress evacuated to York, Pennsylvania, while Washington continued to train his army and learned to use the complementary strengths of the Continental army and various state militias. A key battle came that summer when the Americans prevented British general John Burgoyne’s attempt to conquer the Hudson River valley and sever New England

from the rest of the country. Thanks to the “swarming” tactics of the Continental militias and the skilled leadership at Saratoga of Brigadier General Benedict Arnold (later famously a traitor who defected to the British), Burgoyne’s army was forced to surrender. This victory gave U.S. ambassador to France BENJAMIN FRANKLIN the opportunity that he had been waiting for. Franklin had already succeeded in getting the French to covertly supply the Continentals with small amounts of arms, munitions, and money. Once France was convinced by the victory at Saratoga that the Americans could win, a decision was made to declare war on Great Britain and actively aid the Americans.

While waiting for this promised aid to materialize, supporters of independence endured a difficult interlude. At Valley Forge in the winter of 1777–78, Continental soldiers were camped just miles from British forces who were comfortably housed in Philadelphia. The Continental army faced hunger, freezing temperatures, and outbreaks of deadly smallpox. Some 3,000 died and another thousand deserted.

Nevertheless, Washington continued to train the Continental army for line-of-battle confrontations with the British, with the help of such European military officers as Friedrich von Steuben, a Prussian army veteran. Evidence that this training was making progress was the good showing of the Continental army in combat with British lieutenant general Henry Clinton’s regular forces at the Battle of Monmouth, New Jersey, in 1779 as the British evacuated Philadelphia and withdrew to New York. Yet when the army was led poorly, as it was in battles in the South at Savannah and Charleston by officers like Horatio Gates, the results could be disastrous.

MOBILIZING LOYALISTS

Faced with defeats or stalemates in the North and increased opposition to the war at home and in Parliament, the British cabinet decided to strike at the South in 1779 and 1780 in the hope of mobilizing Loyalists. Loyalists—opponents of American independence, many of whom eventually fled to Britain or Canada—were present in all 13 colonies, though it was not always clear in what numbers. Loyalists tended to be wealthier, Anglican, and, in the South, slaveholders, but, fearing Patriot militias, they were reluctant to show themselves unless British military supremacy was demonstrated in their local areas. What followed was a brutal military struggle in the South from 1780 to 1782 that epitomized the multiple dimensions of this war.

The American Revolution was not just a colonial rebellion against an imperial power. It was the first modern war of national liberation in which a people mobilized themselves with revolutionary nationalism to establish a republican form of government. Yet estimates are that only about 40 percent of the American population was Continental or “Patriot,” with Loyalists comprising another 20 percent, and neutrals, many of them of non-British origin, the remaining 40 percent of the population. The war, therefore, at times deteriorated in all areas of the country into guerrilla fighting between Continentals and Loyalists. Encouraged by British leaders, including former Virginia royal governor Lord Dunmore, tens of thousands of slaves escaped from bondage to British lines, although many others chose to or were forced to serve in the Continental forces. At times, a wartime decline of law and order

led to wide-scale banditry by armed groups who owed loyalty to no one except themselves.

AGGRAVATED BRUTALITIES

The war in the South especially aggravated these tensions and brutalities. When the Americans lost control of the southern coastline and cities, Major General Nathaniel Greene took command in the South and proceeded to employ unconventional strategies and tactics to ruin Major General Charles Cornwallis’s army. Greene employed large guerrilla forces under leaders like Francis Marion, the Swamp Fox, as well as local militia and Continental army units to lure Cornwallis into the southern countryside, fighting when it was advantageous and retreating when it was not.

With subordinate generals like Daniel Morgan at battles like Cowpens and Guilford Courthouse, Greene

American, British, and Hessian soldiers fight furiously at the Siege of Yorktown, the climactic battle of the Revolutionary War. The American War of Independence started in 1775, but its causes stemmed from long-term disagreements with British rule.

was able to damage Cornwallis's army severely. Heading to Yorktown, Virginia, Cornwallis hoped to be evacuated by the British navy to New York. Instead, since the French navy had by now gained temporary control of Chesapeake Bay, he found himself trapped by a French and American force led by Washington and French lieutenant general Comte de Rochambeau. The victory at Yorktown in October 1781 convinced the British government to begin peace negotiations with the United States.

While negotiations went on for 18 months, fighting by both guerrilla and regular units continued, especially in the South. When the war ended in April 1783, the Americans rejoiced at their victory but also had much reconstruction to perform. The fighting had taken place entirely on U.S. soil. Both national and state governments were heavily in debt from the war, inflation was rampant, and America's agricultural economy was so heavily damaged by the British naval blockade that it would not regain 1774 production levels until 1799.

Yet the Revolution changed American society and the world permanently. The European system of social deference made way for a new sense of individualism. African-American slaves drank deeply of revolutionary rhetoric and language, and the war began the slow process of abolishing slavery. So, too, did women and men commoners begin to advocate for revolutionary political rights that most Patriot leaders thought would be reserved for elites. By creating the first large-scale republic in the world, the American experience would become the model for revolutions and wars of national liberation for the next 200 years, starting with the FRENCH and HAITIAN REVOLUTIONS in the late 1700s, Latin American and central European revolutions in the 1800s, and the Marxist-Leninist revolutions in the 20th century.

HAL FRIEDMAN

American temperance movement

When the first European settlers began arriving in North America in the 17th century, they brought their alcoholic beverages with them and soon found local ways to quench their thirst by using new raw materials like sugarcane. Fermented drinks like cider and beer and distilled ones like rum and whiskey were viewed by virtually all settlers as a gift from God. These beverages protected drinkers from the dangers of tainted water and were perceived as both healthful and energizing. Men, women, and children drank, in varying quantities and strengths, from early morning to bedtime, at work and at play.

Drunkenness, however, was frowned on and was punishable in many colonies. Puritan cleric Increase Mather called liquor "a good creature of God . . . but the Drunkard is from the Devil." As rum became a significant moneymaker for the New World, Americans began distilling and drinking beverages with much higher alcohol content than colonials' traditional tipples. The introduction of homegrown corn and rye whiskeys also made it harder to keep drunkenness under control. In 1774 on the eve of the AMERICAN REVOLUTION, a Philadelphia Quaker called distilled liquor a "Mighty Destroyer" that was both unhealthy and immoral.

In 1784 famed physician and patriot Benjamin Rush attacked the health and moral deficiencies of "ardent," or distilled spirits. Drinking these, he wrote, would surely lead to disease and what in modern times is called addiction. Intemperance, Rush further argued, disrupted family and work life and was the enemy of those republican virtues on which the new nation had been founded and depended for its success.

Rush's idea of restricting or even banning what was becoming known as "demon rum" seemed impossible at first but eventually became part of a larger pursuit of moral perfection in 19th-century America. Although hard drinking increased between 1790 and the 1830s, new forces were at work. Temperance appealed especially to clergymen, mothers, health advocates, owners of factories, and builders of railroads whose new machines were getting faster and more complicated. It would also strike a chord with native-born Americans fearful of the rising tide of Irish Roman Catholic immigrants and their presumed heavy drinking habits, and, to a lesser extent, Germans bringing their beer-making skills to America.

Presbyterian and Methodist religious leaders began agitating against strong drink in 1811. By 1826 a new organization, the American Temperance Society, called for abstinence from whiskey, but found no fault with

moderate use of nondistilled beverages. That same year, Congregationalist minister Lyman BEECHER called for total abstinence from alcohol of any kind. Many agreed; rejecting alcohol entirely became known as teetotaling.

For the most part, early temperance efforts were spearheaded by religious and political elites, but there were exceptions. In 1840 six men, possibly while actually drinking in a Baltimore bar, created the Washington Temperance Society, a group that would help drinkers give up their unhealthful and immoral habit. In religious revival-like mass meetings, thousands of men pledged to stop drinking and a fair number fulfilled their promise.

In 1851 Maine became the first state to enact a law prohibiting the manufacture and sale of liquor. By 1855 a dozen states and two Canadian provinces had also adopted Maine laws. Between 1830 and the AMERICAN CIVIL WAR, annual per capita consumption of alcohol by persons aged 15 and over fell from 7.1 gallons to 2.53 gallons.

The temperance movement suffered a setback when the impending breakup of the Union and the ensuing Civil War dominated public concern. With the war's end, the drinking issue revived. Founded in 1869 by Civil War veterans, the Prohibition Party fielded its own presidential candidates in eight post-Civil War elections, never winning more than 2.2 percent of the vote, but helping to advance the cause.

More successfully, the Anti-Saloon League, founded by a minister in 1893, worked with both major parties to achieve its dry agenda through local-option elections and other techniques, paving the way to 20th-century prohibition.

Most important was the 1874 emergence of the Woman's Christian Temperance Union. For the first time, large numbers of women, not yet able to vote, would play a leadership role in a major public controversy. Focusing on the evils of the neighborhood saloon, WCTU members began holding prayer meetings at places that purveyed alcohol. The exploits of WCTU member Carrie Nation, a Kansan who wielded a hatchet to destroy saloons and smash whiskey bottles, became famous but were not typical of the organization's strategies or goals.

Led by Frances E. Willard, a former women's college president, the WCTU highlighted home protection against the disastrous effect that predominantly male drinking had on the women and children who depended on them.

The 150,000-member organization also campaigned successfully for antialcohol education in the nation's

public schools and sought drinking bans at federal facilities and on Indian reservations. President Rutherford B. Hayes complied; lemonade was served at White House events. Anti-drinking propaganda, including songs, plays, and heartrending novels such as the famous *Ten Nights in a Bar Room*, helped spread a message of sobriety that could be assured only by public action.

By the time Frances Willard died in 1898, her WCTU, as well as the Prohibition Party and Anti-Saloon League, were closer to their goal than any could have known. Persuaded by political considerations and progressivist arguments, all brought into sharp focus by America's entry into World War I, the nation implemented a far-reaching prohibition on alcohol sale and use in 1920.

MARSHA E. ACKERMANN

Andean revolts

In what has been called the age of Andean insurrection, there erupted in the Andean highlands of Peru and Bolivia from 1742 to 1782 a spate of revolts, uprisings, and rebellions that rocked the Spanish Empire, threatening their rule across much of the Andes and prompting a host of reforms intended to quell the disturbances and reassert the Crown's hegemony. Unlike the situation in the viceroyalty of New Spain, where revolts and uprisings were common but generally small-scale and localized, several of the Andean rebellions assumed the character of major regional conflicts, most notably the Great Rebellion led by the second Tupac Amaru from 1780 to 1782 (the first Tupac Amaru had been captured and executed two centuries earlier, in 1572). Taken together, these Andean rebellions reveal the deep fissures of race and class that marked 18th-century colonial Peruvian society; the enduring persistence of preconquest indigenous forms of religiosity, culture, social organization, and political and communal practices; and the intensification of the structural violence and systemic injustices of Spanish colonialism under Bourbon rule.

The first major rebellion in 18th-century Peru was led by the Jesuit-educated mestizo Juan Santos Atahualpa, who claimed direct descent from the Inca emperor Atahualpa, captured and executed by the Spaniards in 1533. For more than 10 years, from 1742 to 1752, Juan Santos Atahualpa led a small army of Indians and mestizos in a protracted guerrilla war against the Spanish authorities. Based in the eastern *montaña*, between the Central Highlands to the west and the vast Amazonian jungles to the east, the army of Juan Santos Atahualpa was never defeated in open battle and the leader himself never captured; in 1752 he and his troops launched an audacious foray into the heart of Spanish-dominated territory before retreating back into the eastern jungles. The movement itself, like others of this period, was inspired by a messianic ideology that foretold the end of Spanish domination and the return of Inca rule.

A major point of contention among scholars has been the extent to which this movement represented a genuinely highland Indian revolt or whether it is better understood as a frontier movement with only tenuous links to the core highland zones of Spanish domination and control. The preponderance of evidence indicates the movement's frontier character while also underscoring substantial, if diffuse, highland Indian sympathy in the heartland of the Spanish domain. It is true that highland Indians did not rise up en masse in support of the movement. Yet substantial evidence also shows the movement's ranks populated by significant numbers of highland Indians and that Spanish authorities perceived the movement as a grave threat to their rule.

A series of other, more localized revolts and uprisings marked the decades between the 1750s and the early 1780s. By one count, the 1750s saw 13 such revolts; the 1760s, 16; and the 1770s, 31. The year 1780 saw 22, and 1781, 14, including the launching of the Great Rebellion by Tupac Amaru II in November 1781. The causes of this upsurge in insurrectionary activity have been attributed to a host of interrelated causes, all having to do with the structural oppression and exploitation of Spanish colonial rule—more specifically, the practice of forced *mita* labor in the Andes; onerous and rising tax rates; the forced sale of goods under the institution of *repartimiento*; and the quickening pace of reform under the Bourbons, whose economic policies from the mid-1700s intensified the demands for Indian labor.

The Great Rebellion, which rocked the entire southern highlands in 1781–82, represented the most serious threat to Spanish domination in the Americas during the colonial period. The subject of an expansive scholarly

literature, the insurrection launched by Tupac Amaru II sought to expel the reviled Spaniards and in their stead install a divinely inspired neo-Inca state. The depths of the millenarian impulse propelling the movement and the breadth of the popular support the movement garnered constitute powerful evidence for the profundity of the cultural crisis among indigenous and mestizo Andean highland peoples in the late colonial period.

The Great Rebellion began on November 4, 1780, with a raid on the Indian town of Tinta in southern Cuzco Province, where rebels captured and executed a local official infamous for his abuses of the *repartimiento* system. Moving south, the rebels quickly gained control of much of the southern highlands, from Lake Titicaca to Potosí and beyond, suggesting a high degree of advanced preparation and planning. In January 1781 the rebels laid siege to the ancient Inca capital of Cuzco. The siege faltered with the speedy arrival of Spanish reinforcements, and soon after Tupac Amaru II and numerous lieutenants were captured and, in May 1781, executed.

The executions failed to staunch highland rebel activity, however, as remnants of Tupac Amaru's army joined forces with a similar movement led by one Tupac Katari, laying siege to La Paz (Bolivia) from March to October 1781. Tupac Katari also was captured, and in January 1782 the Spaniards negotiated a peace agreement with surviving rebel leaders. Sporadic outbreaks continued through the early 1780s across the southern and central highlands.

It is estimated that altogether some 100,000 people died in the Great Rebellion of 1780–82. In response to these crises, the colonial authorities exacted swift retribution while also attempting to address some of the root causes of the violence, reforming the judicial system and selectively easing tax burdens. Yet social memories in the Andes are long, and the deep social divisions exposed by these massive upsurges of violence endured. In subsequent decades, the Creole, mestizo, and Indian elites of Peru, Bolivia, and adjacent highland Andean regions emerged as among the most conservative in all of Latin America, the specter of violence from below representing an ever-present danger to their privileges and interests. The deep social and cultural divisions exposed in the age of Andean insurrections remain, for some observers, readily apparent to the present day.

MICHAEL J. SCHROEDER

Anglo-Chinese Opium Wars

The Anglo-Chinese Opium Wars were two conflicts in which the British and French (in the second war) fought against the Chinese in support of the sale of opium in China. The first of the wars, between Britain and China alone, lasted from 1839 to 1842, and the second from 1856 to 1860, also known as the Arrow War, or sometimes the Anglo-French War in China. Because the cause of both were disputes over opium, the two wars are known colloquially as the Opium Wars.

The sale of opium, produced in British India, to the Chinese had generated massive wealth for the BRITISH EAST INDIA COMPANY and many other British companies and individuals. It reversed the flood of British gold and silver to China to purchase Chinese products and replaced it with a trade balance in Britain's favor.

The massive increase in opium addiction in China beginning in the late 18th century had resulted in major social and economic problems. As a result, the Chinese government appointed an imperial commissioner, Lin Zeku, in Guangzhou (Canton), who seized all the opium held in warehouses operated by British merchants, producing a crisis. As tensions escalated, some drunken British sailors were involved in a fight with some Chinese, killing a Chinese villager. The British refused to hand the men over, exacerbating the crisis.

When fighting broke out, the British enjoyed overwhelming superiority, taking Shanghai and then moving upriver capturing Jingjiang (Chingkiang) and threatening Nanjing (Nanking). The Treaty of Nanking, dictated by Britain, was signed on August 29, 1842. It forced the Chinese to cede Hong Kong and to pay an indemnity in compensation for Britain's military effort and the destroyed opium. The ports of Guangzhou, Shanghai, Fuzhou, and Xiawen were opened as well. Additionally, British citizens were no longer subject to trial by Chinese courts. These concessions led to other foreign powers demanding similar treatment; these treaties were known as the Unequal Treaties.

In 1856, using the pretense of Chinese officials lowering the British flag on the ship *Arrow*, Britain went to war against China. The French joined the battle on the side of Britain, using the murder of a French missionary as a rationale. The two powers moved swiftly

against the Chinese, forcing the Treaty of Tientsin on June 26–29, 1858, which opened more ports to Western trade and residence; acknowledged the right of foreigners, including missionaries, to travel to any part of China they wanted; and provided for the British and French to establish permanent legations in Beijing. However, since the treaty also legalized the opium trade, China refused to sign, and the war started anew.

On October 18, 1860, the Chinese were forced to sign the Peking Convention, another of the Unequal Treaties. It imposed terms on the Chinese forcing them to accept the Treaty of Tientsin. It was after this that CHARLES GORDON had the Summer Palace burned down in a reprisal for the torturing of the British delegation under Sir Harry Smith Parkes. The British and the French sent missions to Beijing, where they purchased palaces in the Manchu City to turn into their legations. Gordon was to move to Shanghai, where he was to raise a force to fight against the Taiping rebels in the war that followed.

JUSTIN CORFIELD

Anglo-French agreement on Siam (1897)

The Anglo-French agreement concerning Siam (later Thailand) was the result of British and French imperialism in Southeast Asia in the 19th century. The British and French were expanding their influence into Burma and Indochina respectively and used Siam as a buffer state between the two expanding empires. Siam was able to use this agreement to ensure some degree of autonomy, as European imperialism was increasing in Asia and Africa in the late 19th and early 20th centuries. The conclusion of the Anglo-French agreement marked an important event in European relations with Siam that had extended as far back as the 16th century.

In the 16th century Portugal began attempting to extend trading relations into Southeast Asia. British, Dutch, and French merchants were also interested in

the riches of Southeast Asia and sent in merchant fleets in the 17th century.

The BRITISH EAST INDIA COMPANY was concerned with acquiring posts in Southeast Asia in order to expand trade with this region. In 1786 the East India Company negotiated an agreement with the Sultan of Kedah that allowed it to occupy Penang. In order to acquire control over Penang, the East India Company had to assure the sultan that it would defend him against hostility from Selangor. In 1826 Captain Henry Burney concluded with the Siam government another agreement that opened up Southeast Asia to greater British influence, as this agreement prevented the Siamese government from disrupting British trade in the Trengganu and Kelantan regions.

The Siamese court negotiated an agreement with the British in 1855, which allowed British subjects to enjoy extraterritorial rights in Siam, allowed a British consul to take up residence in the country, and fixed tariff rates.

At the same time, France was also seeking to expand its influence in Southeast Asia. In 1862 the French government cited the maltreatment of French missionaries in Vietnam as an excuse to take control of the southern region of the country. This region was important to the French because it exported rice and could produce rubber. In 1867 France sent a naval squadron that forced Siam to relinquish its control over Cambodia, allowing the French to assert their influence over the region. In 1884 France went to war with China over Vietnam, although Vietnamese guerrillas continued to create instability in the region. Britain became concerned that a conflict between the Siamese and French governments would give the French an excuse to occupy the region.

During the 1890s the British government also became concerned about Germany and France acquiring influence over the Malay Peninsula. Joseph Chamberlain, British colonial secretary, stated in a letter in 1895 that it would be in the best interests of the British Empire to acquire a sphere of influence in the region between the Malay States and Tenasserim in return for recognition of a French sphere of influence in northern Siam. The result was the Anglo-French agreement, an attempt by the British and French governments to transform Siam into a buffer zone between their two empires to lessen tensions in Southeast Asia. Lord Robert Cecil, the British prime minister, dispatched a message to the British ambassador to France assuring him that the agreement would not result in the end of an independent Siam. The government of Siam responded by appointing Westerners to government positions and

reforming the Ministry of Finance. The Siamese government attempted to learn technology in an attempt to improve its international position.

Following the signing of the Anglo-French agreement, the British and Siamese governments negotiated an accord in 1897. It required the Siamese government to gain permission of the British government before it could grant concessions to a third country. This new agreement strengthened the British position on the Malay Peninsula. The Anglo-French agreement, however, failed to end tensions in Southeast Asia caused by imperial rivalry between Britain and France.

BRIAN DE RUITER

Anglo-Russian rivalry

The Great Game was the name given by British poet Rudyard Kipling to the struggle between czarist Russia and the British Empire for influence in Central Asia. The contest could actually be said to have begun as early as the 18th century. That was when CATHERINE THE GREAT of Russia conquered the last remnants of the Mogul Golden Horde that had first entered Russia in the time of Genghis Khan in the 13th century. In 1784 the last khan of the Crimea surrendered the Khanate of the Crimea to Catherine in exchange for a pension.

During the same period, the BRITISH EAST INDIA COMPANY was conquering the entire Indian subcontinent. In 1799, at Seringapatam, Tipu Sultan was defeated and killed by troops of the East India Company. Between 1814 and 1816 Nepal was subdued, and the famed Nepalese Gurkha warriors first entered British service. In 1818 Governor-General Warren Hastings finally crushed the Maratha Confederacy, firmly establishing British supremacy.

The first documented mission of the British to learn Russian intentions dated from 1810, when ALEXANDER I, czar of Russia, was temporarily allied to NAPOLEON I of France by the Treaty of Tilsit. Britain had been at war with France since 1793, and the idea of huge Rus-

sian armies marching south to conquer India caused the British great alarm. Although Napoleon and Alexander I went to war in June 1812, making Britain and France allies again as they had been before the Treaty of Tilsit, it did not mean the end of the Great Game. In fact, it was only the beginning.

CONSTANT COMBAT

The collapse of the Golden Horde had left in its wake many independent khanates, such as those of Bokhara and Khiva. While strong enough to wage bloody wars among themselves, they were no match for the armies of Britain or Russia, which had been in almost constant combat for over two decades. With the defeat of Napoleon in 1815, the wartime alliance against him between Russia and Britain was soon forgotten. Instead, both great powers began to focus their imperial goals on Central Asia. The Russians desired to conquer the khanates, and the British desired to keep them as buffer states between the Russian Empire and the British Empire in India.

Beginning in 1839 Russia began a systematic conquest of Central Asia that followed the methodical planning of Czar Nicholas I. Concern over the Russian threat to India precipitated the FIRST AFGHAN WAR in 1839. By this time, Persia had become an ally of Russia and was using Russian troops in an attack on the city of Herat in Afghanistan, a country Persia had had its own imperial designs on since at least the 18th century.

George Eden, Lord Auckland, the governor-general of India since 1835, suspected that DOST MOHAMMED of Afghanistan's Durrani dynasty sided with the Russians. Auckland invaded Afghanistan in 1839. In August, the British army entered Afghanistan's capital, Kabul, with the former ruler, Shah Shuja, who Auckland felt to be more pro-British. Although the invasion went successfully, the occupation of Kabul ended in disaster. Auckland's emissary, Sir William Macnaghten, was killed, and only one man arrived in safety back in British territory in January 1842. A second British invasion as an expression of Britain's power succeeded in reaching Kabul and evacuated successfully in December 1842. Although the Afghans were suitably awed by the British ability to recoup their losses so quickly, this war was an unnecessary loss of lives and treasure, since the Russians abandoned their attempts to bring Afghanistan into their orbit before Auckland began the war.

Meanwhile, the British were consolidating their control of India. In 1843 the British under Sir Charles Napier conquered Sind. During the SIKH WARS the British defeated the once independent realm of the Sikhs in the Punjab, firmly adding it to their growing Indian empire.

Although the Sikh Wars were the most difficult the British ever fought in their conquest of India, the Sikhs ultimately became among the most redoubtable soldiers in England's Indian army. It could be argued persuasively that this sudden imperial push on the part of the British was to deny control of the Punjab to the Russians.

The British entry into the CRIMEAN WAR was in part due to British alarm over the seemingly unstoppable Russian march into Central Asia. Instead of being able to focus their energy on the khanates of Central Asia, the Russians had to face a British invasion of the Russian Crimea in 1854. The heavy Russian losses suffered in such battles as Inkerman, Balaklava, and the Alma River helped delay further Russian penetration of Central Asia by a decade.

IMPERIOUS NECESSITY

Then, in December 1864, Czar Alexander II's foreign minister, Prince A. M. Gorchakov, wrote what would become the definitive expression of Russian imperialism in Central Asia. It contained an ominous note for the British. Like all other expanding powers, Russia faced one great obstacle—"all have been irresistibly forced, less by ambition than by imperious necessity, into this onward [movement] where the greatest difficulty is to know where to stop."

Soon the British understood what Gorchakov's memorandum meant. Czar Alexander II began a massive campaign of conquest in Central Asia. As with the Crimean War, tensions between England and Russia contributed to a war scare in the RUSSO-TURKISH WAR of 1877–78. Throughout the 19th century, Russian foreign policy vacillated between seeking empire in Central Asia and desiring to expand into the Balkans. Thus in 1877 the Russians invaded the Ottoman territory in the Balkans, which would ultimately lead to the establishment of an independent, pro-Russian Slavic Bulgaria.

However, when it seemed that the armies of Alexander II would continue on until they conquered the Turkish capital of Constantinople, British prime minister WILLIAM GLADSTONE threatened to intervene on the side of Turkey. When events seemed to be leading to a general European war, the German Chancellor OTTO VON BISMARCK called all the parties to the CONGRESS OF BERLIN in 1878, which ultimately provided a peaceful solution to the crisis.

The Russo-Turkish War had immediate repercussions in Central Asia. A Russian mission arrived in Kabul under General Stolietov, supported by the czar and the czar's governor-general for the Central Asian

provinces, General K. von Kaufman. The same scenario repeated itself as in 1839. With the Congress of Berlin ending a major crisis, the czar had no purpose in creating another crisis in Central Asia, so Stolietov was withdrawn from the Afghan capital.

Nevertheless, the British ruler of India, Robert Bulwer-Lytton, Lord Lytton, the viceroy, prepared for a military invasion of Afghanistan. Lytton was a member of what was known as the Forward Policy school, which, believing war with Russia was certain, was determined to fight it as far from India as possible. When the ruler of Afghanistan, Amir Sher Ali, refused to permit a British delegation to enter Afghanistan, Lytton's army crossed the Afghan frontier on November 21, 1878.

After Major-General Frederick Roberts defeated Sher Ali's effort to stop the British, the Afghans pursued a policy of guerrilla warfare. Sher Ali left the office of amir to his son Yakub Khan, who in May 1879 accepted a British resident, Sir Louis Cavagnari. In a gesture of peace, Sir Louis Cavagnari entered Kabul in July 1879 with only an escort from the corps of guides, the elite of the British Frontier troops. In September, Afghan troops attacked the residency and killed Cavagnari, most likely acting on orders from Yakub Khan.

Retribution soon followed. In October 1878 General Roberts consolidated the British position in Kabul and defeated Yakub Khan's men. A second skirmish led to his final victory over Yakub Khan on September 1, 1880. The British could now install Amir Abdur Rahman on the throne, a leader they felt would pursue at least a neutral foreign policy and prevent the Russians from using Afghanistan as a base from which to attack India.

Indeed, the British demonstration of force in Afghanistan may have come none too soon, for unlike in the aftermath of the First Afghan War, this time Russia's expansion into Central Asia rolled on like a juggernaut. Even the great Russian novelist Fyodor Dostoyevsky wrote in 1881, "in Europe we were hangers-on, whereas to Asia we shall go as masters. . . . Our civilizing mission in Asia will bribe our spirit and drive us thither." In 1885 under the new czar Alexander III, the clash Britain had long awaited took place. A Russian army that had just conquered Merv in Turkestan continued on to occupy the Penjdeh Oasis in Herat—the Afghan buffer for British India had been breached. In Britain, the response was swift. Some £11,000,000 were voted by Parliament for war with Russia, a huge sum in those days.

Given such firm British opposition, the Russian force withdrew from Penjdeh. Taking advantage of the

Russian withdrawal, Sir Mortimer Durand drew the Durand Line in 1893, which established the eastern frontier of Afghanistan. Two years later, the British had the Wakhan region added to Afghanistan, no doubt pleasing Abdur Rahman, so that Russian territory would not border India.

The Great Game in Central Asia would continue with both nations attempting to influence Tibet and China, whose province of Xinxiang (Sinkiang) was China's closest to Central Asia. However, as the 19th century waned, the British and Russians were both faced by a greater threat in the growing power of the German Empire of Kaiser Wilhelm II. Already, the kaiser had made clear his interest in seeking German influence in the lands of the Ottoman Empire, even entering Jerusalem on horseback in 1898.

In 1907, in the spirit of cooperation brought about in the face of a mutual danger, Britain and Russia peacefully settled a dispute over oil rights in Persia by effectively dividing it into Russian and British spheres of influence. The Great Game had officially come to an end.

JOHN F. MURPHY, JR.

Arabian Peninsula and British imperialism

During the 19th century, the British extended their economic and political presence throughout the coastal areas of the Arabian Peninsula. With the largest and most powerful navy in the world, the British needed ports to serve as refueling stations and to replenish supplies of fresh foods and water for their sailors. After the Suez Canal provided an easier and faster transportation route between Europe and Asia, the coastal areas of the Arabian Peninsula increased in importance.

In 1839 Britain occupied Aden on the southern coast of Yemen, then on the further fringes of the Ottoman Empire, making it a British Crown Colony. After the Suez Canal became a major trade route, Aden became a bustling port city and trading center. Britain and the Ottomans clashed repeatedly over control of northern and southern Yemen. In the late 19th century, the British signed formal treaties with a number of tribes in the regions around the port of Aden; these became known as the Aden Protectorates. The largest of these sultanates, sheikhdoms, emirates, and confederation of tribes was the two sultanates of Hadhramaut. In the early 20th century the British and Ottomans agreed to specific borders demarking their respective territorial claims.

Britain also sought to protect its vast holdings in India and to prevent rival European imperial powers from expanding into Asia by extending its control over neighboring areas both east and west of the Indian subcontinent. Consequently, British foreign service officials in Delhi sought to extend British control along the Persian Gulf. The British secured a number of treaties with the ruling families along the Persian Gulf, which in Arab provinces was frequently referred to as the Arabian Gulf.

The patron-client relationship between Arab rulers in the Gulf and the British lessened Ottoman control and freed local rulers from Ottoman taxation while increasing their own political power. The local economies were dependant on income from pearls and sponges obtained by divers who were paid by a few trading families who often had ethnic and commercial ties with Persia. Because the area was largely poverty stricken, local sheikhs were also interested in possible economic gains from ties with the British.

The first British treaty agreement in the region was with the sheikh of Muscat (part of present-day Oman) in 1798. Successive agreements were signed between the British and the ruling Al Khalifah clan in Bahrain in 1820 and with the Sabah family in Kuwait in 1899. Under the latter, Britain had the right to conduct all the foreign relations for Kuwait, and no foreign treaties could be signed nor could foreign agents operate in Kuwait without the approval of Britain.

This enabled Britain to ensure that the proposed Berlin to Baghdad railway would not be extended to the Persian Gulf, and it also made Kuwait an unofficial British protectorate. Similar agreements were reached with the Thani clan in Qatar and with a number of local rulers in the Trucial Coast (present-day United Arab Emirates). As a result, acting through its surrogates, Britain

was able to control the coastal areas along almost all of the Arabian Peninsula.

JANICE J. TERRY

Arab reformers and nationalists

During the 19th century a number of Arab intellectuals led the way for reforms and cultural changes in the Arab world. Rifa'a al-Tahtawi from Egypt was one of the first and foremost reformers. A graduate of esteemed Muslim university al-Azhar, Tahtawi was sent to France to study as part of MUHAMMAD ALI's modernizing program. He returned to Egypt, where he served as director of the Royal School of Administration and School of Languages, was editor of the Official Gazette, and Director of Department of Translations.

Tahtawi published dozens of his own works as well as translations of French works into Arabic. In *A Paris Profile*, Tahtawi described his interactions as a Muslim Egyptian with French culture and society. His account was an open-minded and balanced one, offering praise as well as criticism for many aspects of Western civilization. For example, Tahtawi respected French originality in the arts but was offended by public displays of drunkenness.

Tahtawi urged the study of the modern world and stressed the need of education for both boys and girls; he believed citizens needed to take an active role in building a civilized society.

KHAYR AL-DIN, an Ottoman official from Tunisia, echoed Tahtawi's emphasis on education while also addressing the problems of authoritarian rule. He advocated limiting the power of the sultan through law and consultation and wrote the first constitution in the Ottoman Empire.

The Egyptian writer Muhammad Abduh dealt with the ongoing question of how to become part of the modern world while remaining a Muslim. He was heavily influenced by the pan-Islamic thought of JAMAL AL-DIN AL-AFGHANI. Abduh taught in Lebanon, traveled to

Paris, and held several government positions in Egypt. He became mufti of Egypt in 1899 and was responsible for religious law and issued fatwas (legal opinions on disputed points of religious law).

Abduh became one of the most highly respected and revered figures in Egypt, although some conservatives opposed his reforms and open-mindedness while some more radical nationalists berated him for not being liberal enough. In his publications, including *Face to Face with Science and Civilizations* and *Memoirs*, he urged the spiritual revival of the Muslim and Arab world, arguing that Islam was not incompatible with modern science and technology. He also stressed the importance not only of law but of reason in Islamic society.

Originally from Syria, Muhammad Rashid Rida was a follower of Abduh. He moved to Egypt and founded the highly respected journal *al-Manar*. His writings had a wide influence on Islamic thought, and he became one of the foremost spokespersons for what has become known as political Islam. Rida also discussed socialism and Bolshevism and the role religion should play in contemporary political life.

Egyptian Abdullah al-Nadim edited several satirical journals and was a staunch supporter of the URABI REVOLT of 1881–82. He also knew Jamal al-Afghani. Al-Nadim was exiled to Istanbul after his fiery nationalist stance earned him the enmity of the British.

Al-Nadim spoke openly about the growth of the nation (*watan*) and was one of the first modern Egyptian nationalists. In 1899 Anis al-Jalis started an Egyptian magazine that carried articles dealing with the role of women in society.

A new educated elite emerged as graduates of the many government and other schools that had been established as part of the reforming era of the TANZIMAT entered public life. In the Sudan, the British founded Gordon College to educate male youth for government service. Other schools founded by missionaries included the Syrian Protestant College (American University of Beirut, AUB), the Jesuit University St. Joseph in Beirut, and various Russian Orthodox schools scattered throughout Greater Syria. The Alliance Israelite sponsored schools for Jewish students throughout the Ottoman Empire. Separate mission schools were also established for girls. A spirit of outward-looking, pro-Western thought prevailed, and many of the elites had extensive experience with the Western world. Many were bilingual in French or English.

Nineteenth-century Arab intellectuals, many of whom were Christians, fostered a literary renaissance with a revival of interest in the Arabic language. Some

sought to modernize Arabic prose and poetic styles. Butrus Bustani was one of the era's foremost experts in the Arabic language. He also wrote a multivolume encyclopedia with thoughtful entries on science and literature as well as history. Numerous newspapers were published, especially in Cairo and Beirut. *Al-Muqtataf* produced in Cairo by Yacoub Sarruf and Faris Nimr was one of the most famous. In 1875 the Taqla family founded *al-Ahram*, which became the premier newspaper in the Arab world. Many of these new journals were published in Egypt, where there was greater freedom of the press afforded by the British than in Ottoman-controlled provinces.

Nationalism spread around the world in the 19th century, and the Arab provinces were no exception. A generation of Arab nationalists began to talk and write about the relationship of the Arabs within the Ottoman Empire and the role religion should and did play in modern nationalism. These early nationalists did not deny the importance of religion but used nationalism as their point of reference.

The first group that dealt with the controversial issue of separation from the Ottoman Empire on the basis of national identity was formed at the Syrian Protestant College in Beirut in 1847. Its members, who met secretly to avoid prosecution from the Ottoman intelligence services, included Faris Nimr. They met under the guise of being a literary society; while the members did discuss literature they also delved into the important political questions facing the declining Ottoman Empire as well as the emergence of nascent Arab nationalism. Various groups continued to meet at the college from 1847 to 1868 when a Beirut society began. Its members discussed the key political issues of Arab identity. The so-called Darwin affair of 1882 caused a number of the leading figures of the movement to leave the college. In a public address, Dr. Edwin Lewis, a professor at the college, discussed Darwin's theory of evolution; his positive conclusions about Darwin's controversial theory roused the enmity of conservative American Christians on campus. They attacked Lewis in print and forced his resignation. Several of the liberal Arab junior faculty, including Nimr and Sarruf, resigned in outrage and moved to Cairo, where they became leading figures among Christian Arab secularists.

Abd al-Rahman al-Kawakibi was born in Syria, but after his writings about Arab identity roused the enmity of Khedive Abbas Hilmi, he left Syria and became a frequent contributor to *al-Manar*, the journal edited by Rashid Rida. In his writings, Kawakibi discussed the key role of the Arabs in Islam; he also described the

decadence and weaknesses of the Ottoman Empire. He stressed the importance of Arab unity. Another Arab nationalist, Jurji Zaidan, wrote for the journal *al-Hilal*. Whereas pan-Islamists, such as al-Afghani, believed in the supremacy and integrity of the Islamic legacy, pan-Arabists like Zaidan emphasized its uniquely Arab character and the importance of history, language, and culture over religion. The ideas of these early Arab nationalists would come to fruition with World War I and the collapse of the Ottoman Empire in the early 20th century.

JANICE J. TERRY

art and architecture (1750–1900)

The style of architecture in Britain changed considerably between 1750 and 1900. The Georgian mews and squares that were popular in the 1750s gave way to large suburbs, the ease of railway travel allowing for significant city sprawl. The Georgian style in Britain was very much influenced by the style of Andrea Palladio in 16th-century Italy. The architect Inigo Jones also built in the Palladian style, with some design features coming from classical Rome. Perhaps the best example in England of this neoclassical style is the city of Bath, with its crescents, terraces, and squares. Dublin is another example.

Sir Robert Taylor (1714–88) and James Paine (1717–89) also worked in the Palladian tradition. In 1760 there emerged two great architects: Sir William Chambers (1723–96), who designed Somerset House, and Robert Adam (1728–92), who was the architect responsible for Syon House near London, Kenwood in Hampstead, Newby Hall and Harewood House in Yorkshire, and Kedleston Hall in Derbyshire. Chambers, although remaining Palladian at heart, was influenced by the discovery of Baalbek in Lebanon. Adam, by contrast, discarded classical proportions. His work was elaborated on by John Nash (1752–1835), who designed Regent Street, London, and by Sir John Soane, who worked on the Dulwich College Art Gallery.

By the end of the 18th century, the influence of India and China led to the construction of buildings that either heavily incorporated Asian themes or were entirely Asian in style. Nash's Royal Pavilion at Brighton, England, constructed in 1815–22, represents British interest in Mughal Indian architecture. Chinese-style pavilions and towers became common in places such as Kew Gardens and the English Gardens in Munich. Later, the emergence of Victorian architecture saw the classical style being retained for the British Museum (1823) and Birmingham Town Hall (1846). However, the design by Sir Charles Barry (1795–1860) for the new Houses of Parliament signaled the Gothic revival, with architects such as Augustus Welby Pugin (1812–52) and others being involved in the work. The Crystal Palace in 1851 was designed by Sir Joseph Paxton (1801–65). Norman Shaw (1831–1912) developed functional architecture for houses, the Bedford Park estate at Turnham Green, London, built in the 1880s, being a good example. Other architects included Charles Voysey (1857–1941), W. R. Lethaby (1857–1931), and Sir Edwin Lutyens (1869–1944). The Industrial Revolution also led to the construction of some iconic structures such as Iron Bridge in Shropshire.

Sculptors like John Flaxman (1755–1826), using a linear style, were responsible for many statues around London, with commissions for public monuments of national heroes such as Lord Nelson and, later, Queen VICTORIA. In terms of British art, painters like William Hogarth (1697–1764), Sir Joshua Reynolds (1723–92), John Constable (1776–1837), and Thomas Gainsborough (1727–99) were important from the Georgian era; famous Victorian painters are Pre-Raphaelites such as D. G. Rossetti, Holman Hunt, and J. E. Millais.

In France during the same period, neoclassical architecture appeared from 1740, remaining popular in Paris until the 19th century. This was, in part, a reaction against the rococo style of prerevolutionary France, with more of a search for order and the expression of republican values in Greco-Roman forms and more traditional ornamentation. Jacques-Germain Soufflot (1713–80), the architect of the Panthéon in Paris, drew parallels between the emerging power of Napoleonic France and that of the classical world. This can be seen in the Arc de Triomphe, La Madeleine, and the National Assembly building. In Paris, the Opera was built by Charles Garnier (1825–98) in 1862. Georges-Eugène, Baron Haussmann (1809–91) laid the plans for a new Paris, a features of which were open spaces, parks, and wide boulevards. The Eiffel Tower was built in 1889.

Even before the FRENCH REVOLUTION, paintings by Jacques-Louis David (1748–1825) had a clear republican

theme. David was made Napoleon's official painter, his *Coronation of Napoleon* being perhaps his most famous work. Jean-Auguste-Dominique Ingres (1780–1867) continued the neoclassical tradition, and the *Raft of the Medusa* by Théodore Géricault (1791–1824) signaled the arrival of romanticism. Eugène Delacroix drew much on his travels around the Mediterranean, with his great work being *Liberty Leading the People*, commemorating the July Revolution of 1830. It was not long before the emergence of the Barbizon School, with Camille Corot (1796–1875) and Jean-François Millet (1814–75) taking peasant life as their inspiration and providing a basis for such later painters as Vincent Van Gogh (1853–90).

Impressionism saw the emergence of painters such as Edouard Manet (1832–83), Claude Monet (1840–1926), Alfred Sisley (1839–99), Camille Pissarro (1830–1903), Berthe Morisot (1841–95), and Pierre-Auguste Renoir (1841–1919). Other important painters of this style included Edgar Degas (1834–1917) and Paul Cézanne (1839–1906), providing an influence for Paul Gauguin (1848–1903), the foremost of the postimpressionists. Vincent Van Gogh from the Netherlands created haunting self-portraits and landscapes of bright color, making his work instantly recognizable. Mention should also be made of Henri Rousseau (1844–1910), who used a naïve style, and Gustave Moreau of the symbolist school.

In Italy and Spain, baroque architecture gave way to neoclassicism, with tastes becoming more sober and restrained. In Italy this was exemplified by Giambattista Tiepolo (1696–1770) and his son Giovanni Domenico Tiepolo (1727–1804) and their work on churches and palaces in Venice. In Spain the reaction against classicism was marked, especially in Catalonia, where Antoni Gaudí (1852–1926) worked on a free-form style, a geometrically based style using a variety of material and mosaics, with work on his Sagrada Família Church in Barcelona starting in 1882. Francisco José de Goya (1746–1828) was the greatest of the Spanish painters in the last part of the 18th and first part of the 19th centuries. He was profoundly affected by the Peninsula War and his painting *El Tres de Mayo*, showing the execution by French soldiers of rebels in Madrid, is among his most well known. Other Spanish painters of the 19th century include Ignacio Pinazo (1849–1916), Francisco Domingo (1842–1920), Emilio Sala (1850–1910), Ignacio Zuloaga (1870–1945), and Joaquín Sorolla (1863–1923).

In Central Europe, increased wealth led to the construction of many major government buildings. In Austria, rococo design gave way to historicism, with the development of the Ringstrasse in Vienna. This changed

with the advent of the Secession movement in 1897. King Ludwig of Bavaria financed the construction of large numbers of “dream” castles throughout his kingdom. In Russia, the emergence of St. Petersburg led to the construction of massive public and private buildings. The Winter Palace, commissioned from Francesco Bertolomeo Rastrelli (1700–71) in 1754 by CATHERINE THE GREAT, is certainly the most well known, with others including the Yelagin Palace built for ALEXANDER I by the architect Carlo Rossi (1775–1849) also important. The Church of the Resurrection of Christ was built in the late 1880s on the site where Czar Alexander II was killed in 1881. The building of the Trans-Siberian Railroad led to the construction of large numbers of railway stations along the length of the railroad. It was a period when Russians were collecting art from around the world.

In China, with the capital Beijing divided between the Chinese City and the Tartar City, the major change came from the 1860s with the building of foreign legations in former princely palaces in the Tartar City. This followed the SECOND OPIUM WAR, which saw the sacking of the “Old” Summer Palace, with work beginning on the massive enlargement of the “New” Summer Palace in 1888. Building work continued on parts of the Forbidden City, and the Manchu Qing (Ch'ing) emperors also spent much energy in the late 18th century on enlarging the palaces at their summer residence at Chengde (Jehol). The late 19th century saw a massive influx of foreign influence into Shanghai, Tianjin (Tientsin), Weihai (Weihaiwei), Qingdao (Tsingtao), Macau, Hong Kong, Hankou (Hankow), and Guangzhou (Canton). As well as warehouses, bank chambers, office buildings, railway stations, and accommodations, there were also Christian churches for both Chinese and foreign parishioners.

There were also churches built around India—especially in Calcutta—with many buildings being erected throughout the Indian subcontinent for the military and traders. Herman Willem Daendels (1762–1818), governor of the Netherlands East Indies, helped redesign the city of Batavia (Jakarta). In Japan, many modern buildings were erected, including the famous Imperial Hotel in Tokyo. Holiday retreats such as Simla in India, Maymyo in Burma, and the Cameron Highlands in Malaya were also built toward the end of the 19th century. Many of these places, as well as earlier temples and landmarks, were the subject of drawings by Thomas and William Daniell.

In North America, vast change was reflected in the architecture. From the 1750s, there were small build-

ings such as Mount Vernon, the residence of GEORGE WASHINGTON. THOMAS JEFFERSON's home, Monticello, dates from 1768. After independence, there were a large number of government buildings erected throughout the country, with Pierre-Charles L'Enfant (1754–1825) drawing up the original plans for Washington. The White House was built beginning in 1792 in the Palladian style. The Irish-American architect James Hoban (c. 1762–1831) worked on it after winning the competition with skilled stonemasons coming from Edinburgh, Scotland, in 1793. At the same time, there was work on the Capitol, with the chamber of the House of Representatives completed in 1807. Both the White House and the Capitol were sacked by British soldiers in 1812, and it was not until 1857 that the South Wing was added to the Capitol.

There were also large numbers of other civic buildings constructed throughout the country. Southern plantation architecture was popular. In addition, around the United States, many towns and cities were being established. Unlike their counterparts in Europe, large numbers of the houses were built from wood, with log cabins constructed by pioneers. There was also the construction of the first skyscrapers with the Cast Iron Building, designed by James Bogardus (1800–74) in 1848, and the Haughwout Department Store in New York City in 1857. The first steel girder construction was the Home Insurance Company Building in Chicago, with work by William Le Baron Jenney (1832–1907) and also later his protégé, Louis Sullivan.

Prominent artists living in the United States painted pioneer scenes and portraits of political and society figures. There were a few new concepts, including the panoramic painting that illustrated some historical event. Painted in a way to show the battle or event unfolding, people paid a small fee to see the picture. There was also great interest in landscape painters.

In South America, Buenos Aires, Montevideo, Lima, Santiago, Rio de Janeiro, and other cities had large numbers of migrants arriving, with major public buildings, banking and insurance chambers, office buildings, hotels, and other buildings erected. In Australia, during the 1880s there was the period of "Marvelous Melbourne." As well as the Melbourne Public Library, Melbourne Town Hall, the university, and other major civic projects, there were also many Italianate mansions built throughout the city. In Australia there were many station properties, and in the country towns large numbers of wooden houses.

In North Africa, Cairo saw the construction of large numbers of mock-Parisian buildings, with the wealth

flowing into Egypt through tourism and the opening of the Suez Canal. The British and French built numbers of colonial buildings throughout their empire in Africa, with the Portuguese, Germans, and Belgians also constructing buildings, but on a much smaller scale. In South Africa, Cape architecture became popular not just in Cape Town and nearby areas but also elsewhere in Africa.

Asian migration to Latin America

There has been a long history of Asian migration to Latin America, with Chinese, Japanese, and Korean populations now in most countries in Central and South America. In addition there are also significant Indian communities in some countries, especially Guyana, and small numbers of Vietnamese.

The first links between the two areas may have been during the Ming dynasty in China, when some of the fleet of Chinese Admiral Cheng Ho may have reached the Americas. On many of his voyages members of the crew did not return with the fleet, and if any of his ships did reach the Americas, it seems likely that they would represent the first recent Asians to settle in the Americas.

It is also worth mentioning that in 1492, when Christopher Columbus sailed the Atlantic, he expected to reach Asia, and in 1519 Ferdinand Magellan started his voyage that was, after Magellan's death, to circumnavigate the world, sailing through what became the Straits of Magellan across the Pacific Ocean, proving that it was possible to make the voyage.

However, there was little migration from Asia to the Americas until the early 19th century. Few Chinese ventured overseas during this period, except for those already in Southeast Asia—the Nanyang, as they called

it. In 1637 the Japanese government banned travel overseas and requested their citizens to return home; Korea was so isolated that travel was extremely difficult until recently. It is probable, however, that some Filipinos did settle in Latin America, especially in Peru, the center of Spanish power, as there were close shipping ties between Lima and Manila.

In the early 19th century the increased frequency of traveling overseas by ship and overpopulation in China saw many Chinese begin to migrate, initially to the favored destinations in Southeast Asia and around the Indian Ocean, and then to the Americas. The California gold rush certainly saw many Chinese move to California and others moved in search of employment to Mexico and then to the Caribbean and South America. As a result, Chinese merchants started establishing businesses in cities and large towns along the Pacific coast. Some were farmers growing vegetables, others running shops, laundries, or restaurants.

A few Chinese families settled on the eastern coast of Latin America. A sizeable community was established in British Guiana (now Guyana), many working on plantations. The Chinese in British Guiana form the subject of novelist Robert Standish's *Mr. On Loong*. In addition, mention should be made of the family of Philip Hoalim from Guyana—Hoalim later became involved in politics in Singapore, forming the Malayan Democratic Union, the first political party ever established in Singapore.

As well as the Chinese in British Guiana, there was also a much larger Indian community. Known as the East Indians, to differentiate them from the West Indians, many spoke Hindi or Urdu, and there are numbers of Hindu temples and Muslim mosques in the capital of Georgetown. In neighboring Suriname, a former Dutch colony, there are also many East Indians and Chinese. There is even a statue of Mohandas Gandhi in Paramaribo, Suriname's capital. With its Dutch connections, there are also Indonesians (mainly from Java), many descending from indentured servants who came before the 1940s. Smaller Indian communities in Brazil, Paraguay, and northern Argentina have been instrumental in the introduction and breeding of zebu and Brahman cattle.

CHINESE COMMUNITIES

During the latter half of the 19th century, economic opportunities encouraged many Chinese to migrate to Cuba and Peru, where they worked on sugar plantations, in mining, and on haciendas, as well as running shops in townships. However, Cuba started to restrict the number of Chinese migrants. At the same time, the

Mexican government started encouraging migration from China. PORFIRIO DÍAZ, president 1876–80 and again 1884–1911, wanted Chinese coolies as a cheap labor force for building infrastructure in northern Mexico, where many settled. As with the Chinese in Peru, there were gradual changes in the economic status of the migrant communities. Whereas in the 1870s most were manual laborers, by the 1900s many were running businesses.

By 1912 there were 35,000 Chinese in Mexico. Some used it as a route to the United States, but many others established businesses, often in poor suburbs. As a result, during periods of instability, especially during the Mexican Revolution, when rioting started, Asians were often the victims of mobs. The Mexican revolutionary hero Pancho Villa was definitely anti-Chinese, calling U.S. citizens *Chino blanco* (“white Chinese”).

When he took the town of Torreón on May 25, 1911, his forces and several thousand locals massacred 303 Chinese and five Japanese. When he was eventually defeated by Emilio Obregón, he is reported to have said “I would rather have been beaten by a Chinese than by Obregón.” In February 1914 anti-Chinese riots took place in Cananea, and local Chinese took refuge in a U.S.-owned building, and in March 1915 many Chinese were attacked and robbed in rioting in Nogales. In spite of these attacks, many Chinese continued to migrate to Mexico, with 6,000 arriving in 1919–20. The Chinese community remains important in Mexico.

In Central America, there were small Chinese communities in each country, and most were involved in running small businesses. By the 1930s they had begun to dominate trade in many towns in El Salvador, so much so that the 1939 constitution included protections for indigenous small traders. A new law, passed in March 1969, limited the running of small businesses in the country to people born in Central America, specifically excluding naturalized citizens. However, many Chinese continued to operate with their businesses owned by middlemen. In Honduras, many small businesses were also owned by Chinese until the 1969 war with El Salvador, which led to fervent nationalism breaking out in the country and moves to reduce the number of Chinese-owned shops. In Central America today there are small numbers of Vietnamese, and there is also a sizable Vietnamese population in Cuba, largely as a result of political ties between the two communist countries.

As well as in Peru, there are also significant Chinese communities in Brazil, Argentina, and Chile. Indeed bilateral ties and trade (with China) with all three

countries have increased in recent years, offering many Chinese in Latin America new opportunities for establishing businesses. Chinese-language gravestones can be seen in cemeteries throughout Latin America, although most seem to be located in foreign cemeteries, such as the British Cemetery at Chacarita in Buenos Aires or its counterparts in Chile. Most Latin American countries now recognize the People's Republic of China, but a few still extend diplomatic recognition to the Republic of China (Taiwan) as the legitimate government of the whole of China. For these, most ties are with Taiwan. In Paraguay, the Taiwanese government and community plays an important role in commercial life in Asunción and has been involved in major projects, such as the refurbishment of the Paraguayan foreign ministry.

JAPANESE AND KOREAN SETTLERS

In Brazil, the largest country in Latin America, there are many people of Chinese and East Indian ancestry and also some migrants from Malaysia involved in rubber cultivation. In the southern part of the country there are also increasing numbers of Japanese—there are said to be over 600,000 Brazilians with Japanese ancestry. A number of the Japanese can trace their origins in Brazil back to 1908 when an agreement with the municipal authorities in São Paulo allowed Japanese to settle in the hinterland. They established many vegetable farms, and there are Japanese grocery stores, bookshops, and even geisha in São Paulo today.

There were also numbers of Japanese farmers who left Japan during this period, with many settling in Peru, Brazil, and Paraguay, where the government was encouraging foreigners to move to the country and establish colonies. Many were poor Japanese in search of work, but quite a number were well educated. Some of the latter settled in Panama—a few involving themselves in businesses so closely linked to the Panama Canal that spying by them has long been alleged. One of them, Yoshitaro Amano, a Japanese store owner who had lived in Panama City, spied on U.S. ships using the Panama Canal. He later fled Panama and was arrested for spying in Nicaragua, Costa Rica, and then Colombia.

Perhaps the most prominent example of the role of the Japanese in Latin America concerns two of the Japanese who left Kumamoto, Japan, moving to Peru in 1934: Naoichi Fujimori and his wife, Mutsue. Four years later their son, Alberto, was born, and the parents applied to the local Japanese consulate to ensure the child retained Japanese citizenship. He worked as an agricultural engineer and became dean and then rector of his old university, also hosting a television show. In

1990 Fujimori, heading the Cambio 90 party (“Change 1990”), defeated the author Mario Vargas Llosa in the election for president in a surprise result. Although he was Japanese, Fujimori gained the political nickname “el chino” (“the Chinese man”), with many observers crediting his victory with his ethnicity, which set him apart from the political elite of Spanish descent.

Fujimori had campaigned on a platform of “Work, technology, honesty” but in what became known as Fujishock, he instituted massive economic reforms and invested the office of the president with many new powers. His wife, Susana Higuchi, also of Japanese descent, in a very public divorce, accused him of stealing from donations by Japanese foundations. Reelected in 1995, Fujimori won the 2000 election, but soon afterwards a massive corruption scandal emerged. Fujimori, overseas at the time, then went to Japan, where he resigned. In November 2005 he flew from Japan to Chile and was arrested on his arrival. On September 22, 2007, he was extradited to Peru where he was jailed awaiting trial. On December 12, 2007, Fujimori was convicted of abuse of authority and sentenced to six years in prison. He faces three other trials on charges including murder, kidnapping, and corruption. Fujimori remains the best-known politician of Asian ancestry to hold high office in Latin America, but he has also become a byword for corruption and political sleaze.

Of the Koreans who have settled in Latin America, many run shops and small businesses. There are parts of Buenos Aires and also Rio de Janeiro with large Korean populations. In Uruguay there has been an influx of Koreans, many associated with Rev. Sun Myung Moon.

Despite the high-profile involvement of Fujimori in Peruvian politics, most of the Asians in Latin America shun media hype. Although many operate small businesses either importing Chinese merchandise or household consumer products into Latin America or run restaurants, a new generation of highly educated Asians fluent in Spanish is emerging, many of whom were born in Latin America. They are starting to enter the professions of law, accountancy, and banking, many having totally assimilated into the communities in which they live. When Hu Jintao, the general secretary of the Chinese Communist Party, visited Brazil, his first overseas visit after assuming the leadership of the People's Republic of China, he was greeted by thousands of Brazilians of Chinese ancestry.

JUSTIN CORFIELD

Australia: exploration and settlement

The island continent of Australia was the last to be discovered and explored by Europeans. It was called Terra Australis Incognita, the unknown southern land. The first European to sail into the Australian waters was a Dutchman, Abel Tasman, working for the Dutch East India Company, who discovered the western and southern coast of an island he named Van Dieman's Land (now Tasmania) in 1618. Subsequent Dutch explorers of areas of coastal Australia called it New Holland.

In the mid-18th-century France and Great Britain also became interested in exploring the unknown land. Between 1768 and 1776 Captain JAMES COOK, an officer of the British Royal Navy, made three great voyages of discovery. His first voyage sailed around New Zealand and then the eastern coast of Australia. Sir Joseph Banks, a scientist and naturalist who accompanied Cook, recorded the flora and fauna of southeastern coastal Australia, which he named New South Wales, indicating its possibilities for settlement.

Fifteen years after Cook's discovery, British Home Secretary Lord Sydney decided to set up a penal colony in Botany Bay (named by Banks), where Sydney is today. This was to accommodate the overflowing British jails resulting from the AMERICAN REVOLUTION, when former British colonies would no longer accept British convicts.

In January 1788 Captain Arthur Philip arrived at Sydney Harbor in charge of 11 ships, 717 convicts and an army detachment named the New South Wales Corps formed for the purpose of guarding them. Philip oversaw the settlement through 1792, its most critical years, due to lack of food and the unsuitability of convicts as pioneers. Although free settlers began arriving in Sydney from 1793 the main purpose of the settlement remained a repository of convicts.

Three lieutenant governors followed Philip; the third, William Bligh, earlier of the MUTINY ON THE

BOUNTY, was a man of such fiery temperament that his tenure ended with the Rum Rebellion. The cause was the illegal liquor traffic by officers of the New South Wales Corps, the prevalence of drunkenness, and consequent problems. Bligh's attempt to rein in the officers resulted in his ouster. Although the leaders of the revolt were punished, the British government recalled Bligh and undertook reforms.

The new governor was Colonel Lachlan MacQuarie who came with his own Scottish regiment. The New South Wales Corps was disbanded and replaced by regular British army units that were rotated for tours of duty. MacQuarie made extensive reforms, built up the infrastructure, and encouraged exploration into the interior as well as free immigration with land grants. The governors who followed him continued his policies, resulting in accelerated development. Between 1802 and 1803, Matthew Flinders circumnavigated Australia, proving that it was an island continent and that there was no separate island called New Holland. Flinders recommended the name *Australia* for the continent, which was accepted. In 1829 Great Britain laid claim to the whole continent.

In 1813 the first overland expedition penetrated the low mountain range that separated the coastal plains of eastern Australia from the interior. Many explorations into the interior discovered river valleys and great grassy plains suitable for agriculture and pasturage. Waves of settlers followed, encouraged by liberal land grants to free settlers and emancipists (convicts who had served their terms). The natives, known as aborigines, were hunter-gatherers and no match for the white settlers; they were killed, driven off, or survived on the fringes of white society.

Great Britain established several other penal colonies in Australia in addition to the one in Sydney. One established in 1803 in Tasmania was used to house the most violent convicts and to preempt a possible French attempt to seize the island; another was on Norfolk Island, off the eastern coast. In 1824 Brisbane, north of Sydney on the eastern coast, became another penal settlement—it became the capital of a colony called Queensland. In 1850, convicts were sent to Western Australia at the request of free settlers there because of a severe shortage of labor. Two colonies, Victoria and South Australia, never had penal settlements.

END OF THE PENAL SYSTEM

As the number of free settlers grew, local opposition to continued transportation gained ground in the

Australian colonies. At the same time, the transportation of convicts to remote colonies was questioned in Britain. In 1837 a parliamentary committee investigating the question reported against its continuation, beginning the movement to abolish it.

The last convicts were landed in New South Wales in 1840. By then it had received almost 75,000 convicts, with 25,000 still under sentence. No more convicts were transported to Tasmania in 1853, it having received 67,000 since 1803.

The first move toward representative government came to New South Wales in 1823 with an appointed legislative council. It was enlarged in 1842 to include some elected members, the electorate limited to men, including emancipists, paying certain taxes. In 1850 the British parliament passed the Australian Colonies Government Act that gave each colony the right to set up its own legislature, determine franchise, tariffs, and make laws, subject to royal confirmation. The six Australian colonies became states: New South Wales (capital Sydney), Victoria (Melbourne), Queensland (Brisbane), South Australia (Adelaide), which also administered the Northern Territory, Tasmania (Hobart), and Western Australia (Perth).

Each state adopted a constitution that with slight variations provided for a bicameral legislature of elected members (initially on a restricted male franchise) and a cabinet government on the British model.

By the mid-19th century, the interior of Australia had been crisscrossed; gold and other mineral deposits had been discovered and were being worked; steamships and telegraph connected it with other parts of the world; and railway lines were being built. The foundations of an Australian nation had been laid.

Australia: self-government to federation

Beginning with the establishment of the legislative council for New South Wales in 1823, the Australian colonies had gradually received increasing measures of self-government from the British Colonial Office. In 1850 the British parliament passed the Australian Colonies Government Act that allowed the colonies to set up their own legislatures, pass laws to determine the franchise, tariff rates, and alter their constitutions, all subject to royal confirmation. In the following years, most of the colonies adopted their constitutions with slight variations. All provided for a bicameral legislature of elected members and a cabinet on the British model (except for the most recently settled and most sparsely populated Western Australia, which established responsible government in 1890). Evidence of their autonomy was indicated when Great Britain accepted a law passed by the legislature of New South Wales in 1851 that forbade the landing of convicts in that state. The last state to stop receiving British convicts was Western Australia, in 1867.

There was rapid progress on many fronts during the second half of the 19th century, shown by the founding of public universities in each state and the introduction of compulsory public education. Railway building began in 1850, followed by the arrival of regular steamships that shortened the time of voyages, and the opening of telegraphic communications with other parts of the world. Other signs of maturity are indicated by the withdrawal of British forces from the continent in 1870 as the colonies established their own militias and the colonies agreeing to subsidize financially the British naval squadron stationed in Australian waters in 1890.

However, the lack of a central government for the continent created problems and confusion. For example, each of the states built its railways using different gauges: the standard gauge of 4 feet 8 ½ inches for New South Wales, the wide gauge of 5 feet 3 inches for Victoria, and a narrow gauge of 3 feet 6 inches for South Australia, Western Australia, and Queensland. Another question that needed a common approach was immigration. Few non-British immigrants had settled in Australia up to 1850. However, in the aftermath of the discovery of gold in Victoria in 1851, peoples of many nationalities flooded to the gold fields. Disputes over taxation resulted in an uprising by German and Irish gold miners in November–December 1854 who proclaimed the Republic of Victoria—it was quickly put down.

It was the presence of 33,000 Chinese in the gold rush that led the legislature of Victoria to pass laws in 1855 that levied a heavy poll tax and put other restrictions on the Chinese that shut down Chinese immigration. New South Wales and South Australia followed with their own laws to restrict Chinese immigration, and they prevailed despite British government pressure against them. Two other issues also affected all the Australian colonies. One involved the importation of laborers from the Solomon and other islands to work in Australia, mostly in the sugarcane fields in Queensland.

The condition of these laborers (called Kanaka) approached slavery and needed regulation. Another involved national security over control of the eastern portion of New Guinea (the Netherlands had annexed the western half). Queensland was located nearest to New Guinea and was most anxious to control all western New Guinea. However, due to British reluctance to act promptly, Germany had already claimed the northern half, leaving only the southern part, which became a British colony in 1884.

These many issues contributed to the sentiment for forming a federation of all the Australian colonies. In 1885 the British parliament established a federal council to meet every two years to consult on problems that concerned all the colonies, but it was inadequate because it had no enforcement powers. The first Australian Federal Convention to create a union with more power met in Sydney in 1891. It was composed of members of all colonial legislatures, including those from New Zealand, another British possession, presided over by Sir Henry Parkes, and failed to win acceptance of all the states. A second convention met in Hobart (Tasmania) without New Zealand in 1897 and drafted a constitution that won acceptance.

The union was called the Commonwealth of Australia, a federation that resembled the United States. The federal government was to control foreign affairs, defense, trade, tariffs, currency, citizenship, post and telegraph, etc. It would be headed by a governor-general who represented the British monarch but would be governed by a prime minister and cabinet that had a majority in the lower house of Parliament called the House of Representatives, whose members represented districts based on population. The upper house, or Senate, had six senators from each state. A supreme court guarded and interpreted the constitution.

A new city whose location would be determined later would become the federal capital. (A site in New South Wales was later chosen and named Canberra, Australian Capital Territory.) After acceptance in a referendum held

in all states, the British parliament passed a bill of ratification. The Commonwealth of Australia came into being on January 1, 1901. After Canada (in 1867), Australia became the second self-governing dominion of the British Commonwealth.

JIU-HWA LO UPSHUR

Austro-Hungarian Empire

The Austro-Hungarian Empire came together in 1867 and lasted until 1918 when it was dissolved at the end of World War I. The political entity that was formed in 1867 was a method of trying to tie together the lands that were controlled by the Habsburg dynasty as a successor to the Austrian Empire that had been created in 1804.

From the end of the Napoleonic Wars, the Austrian Empire had been one of the major military and political powers in Europe, with Count (later Prince) METTERNICH, the leading Austrian politician, helping influence European politics through the congress system. However, in 1848, the uprisings and revolutions that took place throughout central Europe—many of which were unsuccessful but still shook the ruling classes—forced the Habsburg rulers of Austria to try to come up with another political entity that would help hold together the Habsburg dynasty. One of the places that caused the Habsburgs the most trouble in 1848 was in Hungary, where the liberal revolution was crushed with great difficulty. Although the Austrian Empire stayed together, Metternich was forced out of office, and Austria had to accept a military decline in spite of its size as the largest country in Europe after the Russian Empire. This military decline was clearly demonstrated by the defeat of

Austria in the Austro-Sardinian War of 1859 and then the Austro-Prussian War of 1866.

Count Belcredi, the Austrian prime minister, felt that the Austrian government should make considerable political concessions to Hungary to ensure the support of the Hungarian nobility and the rising middle class yet retain Vienna as the center of the new empire. The agreement that the Austrian government eventually decided upon was the *Ausgleich* (*kiegyezés* in Hungarian), otherwise known as the Compromise of 1867. This established the Austro-Hungarian Empire, by which there would be a union within a dual monarchy, whereby the king-emperor would be the head of the Habsburg family who would be emperor of Austria and king of Hungary, running a unified administration but under which there would be an Austrian, or Cisleithanian, government and a separate Hungarian government. Both would have their own parliaments, each with its own prime minister. Many parts of local administration would be run separately, but there would be a common government working under the monarchy that would have the responsibility of controlling the army, the navy, foreign policy, and customs matters.

The administration of education, postal systems, roads, and internal taxation would be split between the Austrian or the Hungarian governments, depending on geography. The Compromise also led to Emperor Franz Josef II being crowned as the king of Hungary, whereby he reaffirmed the historic privileges of Hungary and also confirmed the power of the newly created Hungarian parliament.

There were also some regional concessions. This largely involved some parts of Austria, officially known as Cisleithania, such as Galicia (formerly part of Poland) and Croatia maintaining a special status. In Croatia, the Croatian language was raised to a level equal with the Italian language, and in Galicia, the Polish language replaced the German language as the normal language of government in 1869. This did gain support from the Poles but not from the Ukrainian minority. From 1882 Slovenia was to have autonomy, with Slovenian replacing German as the dominant official language and with the Diet of Carniola governing the region from Laibach

(modern-day Ljubljana). In Bohemia and Moravia, Czech nationalists wanted the Czech language to be adopted, and there were subsequent concessions made in 1882. There was also another problem dealing with the ethnic Serbs in Vojvodina, where the Hungarians were eager not to allow any part of their kingdom to gain any special status.

The Austro-Hungarian Empire was one controlled by the Austrian and Hungarian hereditary nobility, and this class system was to lead to many problems. The major one was the Archduke Franz Ferdinand, the nephew of Emperor Franz Josef and heir to the Austro-Hungarian throne, marrying Sophie Chotek, from a wealthy Czech family. This led to consternation at court, and the marriage was declared to be morganatic; their children could not inherit the throne. The Austrian prime minister, Count Taaffe, until 1893, managed to maintain the support of conservatives from the Czech, German, and Polish communities—known as the Iron Ring. However, some radical Czechs agitated for more power, with demonstrations in Czech-dominated Prague leading to the city being placed under martial law in 1893.

Franz Josef had offered parliament the choice of choosing a prime minister, but the issue of nationalities so divided the legislative body that after two years of indecision, Franz Josef appointed Count Badeni, the Polish governor of Galicia, to the prime ministership. He remained in power for two years—being ejected in 1897 with the Czechs opposing his plans for language reforms and getting the reforms repealed in 1899. Many of these problems were to become far more evident during World War I, which led to the collapse of the Austro-Hungarian Empire and its fragmentation.

JUSTIN CORFIELD

Balkan and East European insurrections

In the region between Germany, Russia, and the Balkan Peninsula, one nation after another lost its political independence, while others never even succeeded in gaining political independence to lose. In addition to the history of the empires that controlled East Central Europe and the Balkans, there is a history of nations striving for nationhood. The conquest of the Balkans by the Ottoman Empire was the dominant event of this region's history in the later Middle Ages. But when that advance turned into a retreat, the question of Eastern authority appeared. During the 1800s large numbers of Balkan peoples passed from Ottoman to Austrian rule. In addition to these political changes, the stimuli of the ENLIGHTENMENT spreading to eastern Europe promoted a revival of cultural and national traditions.

Romanians of the provinces of Moldavia and Wallachia were among the first to expect liberation from Turkish rule, which Russia's victories in 1770 against the Ottomans seemed to make possible. The Küçük Kaynarca Treaty of 1774 shaped the future of the region. Russia was later to claim that it had won a right to interfere on behalf of the sultan's Orthodox subjects, giving those subjects the reassurance that they had an ally in Russia.

In Poland, divided between Austria, Russia, and Prussia between 1772 and 1795, a resistance movement began. This insurrection had a promising start in 1794, but the Prussian failure to support the Poles

was a devastating letdown. Consequently, the failed insurrection served as an excuse for the total dismemberment of the country.

SERBIAN NATIONALISM

The Balkan nations' wars for independence started in Serbia, where the struggle against Ottoman rule continued throughout the Napoleonic period, in part because of the response that the ideology of the FRENCH REVOLUTION evoked within the region. Ottoman authority in Serbia was the weakest and foreign influence strongest than anywhere else in the Ottoman provinces. The revolutionary leader George Petrovich founded the Karageorgevich dynasty. The revolt began in 1804 with hope of success until another RUSSO-TURKISH WAR broke out two years later. Serbian insurgents were encouraged by a series of victories against regular Ottoman troops in 1805 and 1806, but also by the capture of Belgrade in January 1807. The Russians, however, abandoned the Serbs to their fate when the Peace of Bucharest was concluded in 1812.

The fight resumed in 1815, the year of the CONGRESS OF VIENNA, under a new leader, Milosh Obrenovich. His descendants were to be for almost 100 years the rivals of the Karageorgevich. Obrenovich realized that independence would not be won immediately, so he tried to gain gradual concessions from the Ottomans. In 1817 Obrenovich became prince of a small Serbia with partial autonomy. Advantage was taken of the Russo-Turkish War of 1828–29. This time, the peace treaty included full autonomy for Serbia, and in 1830, Obrenovich was

recognized as hereditary ruler, and Serbia's territory was enlarged. In 1839 the parliament (created in 1835) elected the son of George Petrovich, Alexander, under whom great progress was made toward unity with the Croats. The center of the Yugoslav movement was in Montenegro, where the throne was occupied by Petar Njegosh from 1830 to 1851.

GREEK NATIONALISM

In Greece the new-Hellenic movement wanted to create an independent Greek state. That movement had a strong appeal in western Europe, and the Greeks had a good chance to find outside support. Prince Alexander Ypsilanti raised a rebellion against the Turks in 1821, and a genuine Greek insurrection broke out simultaneously. Russia seized the opportunity to intervene along with Britain and France, thus accelerating the achievement of independence. Instead of merely an autonomous status, the independence of Greece had to be recognized by the Ottoman Empire in the Treaty of Adrianople in 1829. The treaty confirmed the autonomous position of the Danubian principalities and recognized the autonomy of Serbia.

POLISH, UKRAINIAN, AND CZECH NATIONALISM

In former Poland an insurrection against Russian rule broke out in November 1830. Under Czar ALEXANDER I, the Poles were deeply disappointed. Alexander's promises proved impossible to fulfill. The tension increased when Alexander died in 1825. His successor, Nicholas I, considered the parliamentary regime of Poland incompatible with the Russian autocratic form of government. Hence the Poles rose in defense of their constitution, and the struggle ended in a Russian victory. The uprising saw participation in the Lithuanian and Ruthenian regions contributing to the rise of Lithuanian and Ukrainian nationalism.

The Ukrainian movement was influenced by the rising ideology of Pan-Slavism. In contrast to the Poles, the Ukrainians claimed cultural autonomy rather than independence. Such ideas belonged to the group that founded the Brotherhood of Saints Cyril and Methodius in 1846. The name indicates its ideas of Slavic solidarity on religious grounds and its cultural character. But it was also dedicated to the idea of national freedom. In Russia's Baltic provinces, the local self-government favored the small German upper class. There was a separation between these German Balts and the Latvian and Estonian peasant population, but among both non-German groups, a cultural revival emerged during the

first half of the 19th century. The movement began with the study of folklore and the appearance of newspapers in the native tongues.

The same change from cultural to political nationalism can be found in the Austrian Empire. Since 1830, the *Matica ceska* (Czech mother) encouraged the use of the Czech language, thereby reviving national traditions in opposition to Austria. Czech writers of Slovak origin contributed to the revival of those Slavs who had never experienced independent states, like the Slovenes and the Slovaks. Playing the various nationalities against one another, the government used Czech officials in Polish Galicia and welcomed the antagonism between the Magyars and the other groups in Hungary. Hungarian nationalism, too, made rapid progress. The Hungarian Diet prescribed instruction in the Magyar language in the schools of Croatia. Croat nationalism was more alarmed by the pressure coming from Budapest than by the centralization being promoted in Vienna. The idea of Yugoslav unity became popular when the writer Ljudevit Gaj propagated the Illyrian movement.

HABSBURG MONARCHY

Another crisis began with a Polish insurrection directed against all three partitioning powers. Fighting started on May 9, 1848, and the insurrectionary forces had to capitulate. A violent anti-Polish reaction followed. In Austria, too, the Polish question was reopened, and concessions were made. When Polish activity was transferred to the eastern part of Galicia, the Austrian government favored the claim of the Ruthenians. The whole province was again subject to strict control by the central authorities.

During the 1848 Revolution Bohemia was invited to send representatives to the Frankfurt parliament, but the invitation was declined by historian and new Czech leader František Palacky. When a revolution broke out in Vienna in March 1848, there seemed to be hope of cooperation among peoples who anticipated that their national rights would receive consideration under a liberal constitution. The Slavic Congress opened in Prague on June 2, 1848, and delegates met to represent their constituents' desire that a reorganization of the Habsburg dynasty would give them a chance for freedom. In the end, the congress was disbanded. A constituent assembly drafted a constitution that would satisfy the claims of the various nationalities. Self-government was provided for each of the historic lands of the monarchy. Although constructive, these ideas never materialized.

The Slavs, though a majority in the Habsburg monarchy, were not the only group that had to be taken into consideration. Any change in authority was met with opposition between the historic concept of Hungary and the aspirations of the non-Magyar nationalities. They were afraid of the Magyar leaders and were not prepared to recognize the equality of all nationalities. The Slavs and the Croats were the strongest opponents of the Hungarian Revolution. Fearing for Croatia's traditional autonomy, the Croat army crushed the Magyars. Even the occupation of Budapest in early 1849 did not put an end to the Magyar resistance. They decided to dethrone the Habsburgs, and in April 1849 declared Hungary's independence. The Magyars had to fight both the Austrians and the Russians because the emperor had enlisted Russian aid. Attacked by superior forces, the Hungarians had to surrender in August 1849. For their uprising and resistance, the Hungarians were ruthlessly punished. The non-Magyar nationalities were equally disappointed; even Croatia lost its autonomy. Only the Poles made some progress toward independence.

ROMANIAN INDEPENDENCE AND UNIFICATION

In 1853 the **CRIMEAN WAR** started as one more conflict between Turkey and Russia. The next year, France and Britain came to Turkey's aid. The matter of Russia protecting the Christians in Turkey was connected with the problem of the liberation of the Balkan peoples. In the wake of its defeat in the Crimean War, it turned out that Russia was less weakened than the Ottoman Empire was. At the 1856 peace conference in Paris, only the Romanians made their problems known. The sultan had to enlarge the autonomy of both Romanian principalities.

The delayed unification of the two Danubian principalities seemed a prerequisite for a fully independent Romanian state. In 1858 Moldavia and Wallachia received the right to choose their own princes. The choice of the same prince by both of them ended their separation in 1859. But even then, Romania was far from including all Romanian populations, which remained partly under Austrian and Russian rule, while the principality (and Serbia) remained under Ottoman suzerainty. Serbia was going through a crisis because of the feud of the two dynasties, and as a result of this, Obrenovich returned to power in 1858. He resumed the idea of cooperation with the other Balkan peoples. Despite his assassination in 1868, his policy was continued.

POLISH UPRISING

Another Polish insurrection broke out in January 1863. As early as 1860 patriotic demonstrations had created tension. The independence movement created a National Committee that decided to arm the peasants in preparation for the planned uprising. Russian countermeasures hastened the outbreak of the insurrection. It found support in Lithuania, while it proved impossible to win the Ukrainian peasants, and the uprising was quickly crushed. Poland was turned into another Russian province. Even more complete was the elimination of everything Polish in historic Lithuania. The Russians decided to stop the national movement among the Lithuanians by forcing them to use the Russian alphabet. Thus Lithuanian nationalism developed in Prussia, which did not consider its Lithuanian minority dangerous. The Poles had no similar opportunities, but instead they found possibilities for cultural progress in Austria. The Habsburg dynasty officially promoted Catholicism, which was an advantage for the Poles. In spite of the Polish presence in Galicia, the Ruthenian population of that province also found conditions favorable to national development.

DUAL MONARCHY

The reorganization of Austria took place with an 1867 compromise with Hungary and the establishment of basic laws determining the constitution of the Austrian part of what was now a dual monarchy. **FRANZ JOSEF**, Emperor of Austria, admitted the difficulties of ruling a multinational state in which non-Germans constituted about three-quarters of the population. After the disastrous war of 1866 against Prussia and Italy, the emperor tried to federalize the Habsburg dynasty. But he was inclined to an intermediary solution, fully satisfactory only to the Magyars. In its historic boundaries, Hungary was recognized as an independent state with its own constitution, parliament, and government, reducing the ties with Austria to the creation of joint ministries for foreign affairs, war, and common financial affairs.

Much less satisfactory was the situation of the other nationalities of Hungary. Only the Croats in 1868 received autonomy in an additional compromise. There remained in Croatia an opposition to that settlement. Furthermore, the 1867 compromise did not end pressures from other nationalities for equality and independence. In Hungary, the Yugoslav movement was strengthened by the existence of independent Serbia. The South Slavs were in a situation similar to that of the Romanians in Transylvania and of the Slovaks and

Ruthenians. Neither group had any autonomous rights or guarantees of free cultural development.

A part of the Croats and all the Slovenes, together with the Czechs, the Poles, and the Ukrainians of Galicia, and some Romanians, remained under the Austrian part of the monarchy. They were disappointed by the fact that, unlike Hungary, the other areas of the kingdom only received provincial autonomy, with equal rights for all languages in local administration, the courts, and the schools. Even the Poles had to give up claims for a real national self-government. Particularly opposed to the 1867 settlement were the Czechs. Under these conditions, the leadership of the Czech national movement passed from the moderate Old Czechs to the radical Young Czechs.

BULGARIAN NATIONALISM

During the 1870s another Balkan crisis was approaching in connection with the Bulgarian independence movement. When the Turks repressed a revolt in 1876 in Bulgaria, Russia again intervened and made an agreement with Austria and Hungary. The Balkan Peninsula was divided into autonomous states, and both Austria and Hungary were promised some rewards in Bosnia-Herzegovina. The conflict ended in a complete victory for Russia, allied with all Balkan nations. In the Peace Treaty of San Stefano, signed on March 3, 1878, Romania, Serbia, and Montenegro were declared fully independent, and a large Bulgarian state was created. The borders, however, conflicted with the aspirations of other Balkan peoples. Alarmed at this extension of Russia's influence, European leaders met to discuss boundaries at an international congress held in Berlin, where the Peace of San Stefano was completely revised.

The disappointment felt by the Bulgarians convinced them that Russia was their only protector. Serbia and Romania became independent principalities. In Bulgaria, Alexander of Battenberg, the nephew of the Russian czar, was chosen as prince. There was a strong movement for real independence, both in the principality and in the Turkish province of Eastern Rumelia. These incompatible policies led to inevitable clashes in which Alexander proved unpredictable. The union of Eastern Rumelia with Bulgaria was finally achieved in 1885. Battenberg's replacement by Ferdinand of Saxe-Coburg in 1887 strengthened German and Austro-Hungarian influence in Bulgaria.

In the 1878 Berlin Congress, Austria was granted the provisional right to occupy Bosnia-Herzegovina. That acquisition introduced almost 2 million Orthodox and Muslims into the Habsburg realm. This was a blow

to Serbia, which had hoped to gain these provinces with their predominantly Serbian population. Nevertheless, after 1878 Serbia pursued a pro-Austrian policy under Obrenovich, who proclaimed himself king of Serbia in 1882. When he declared war on Bulgaria in 1885 after Bulgaria's occupation of Eastern Rumelia, Serbia was defeated. After securing Thessaly from Turkey in 1881, Greece fought another war against the Ottoman Empire in 1897 that only brought minor remedies regarding the Thessalian frontier.

ONGOING NATIONALISTIC CONFLICT

It was not until the 1905 revolution that Europe realized the importance of nationalism within the Russian Empire. Before that crisis, the dissatisfaction of the non-Russian minorities did not appear to be serious. In the czarist empire, the Russian majority seemed immense because the Ukrainians and the White Russians were not official nationalities. However, the larger non-Russian ethnic groups made steady progress in their national consciousness. The Byelorussians, the Ukrainians, and other nationalities formed a belt of foreign elements along Russia's western frontier. Russia kept even the most developed nationalities under strict control. Even the Poles had to postpone their hopes for liberation, focusing instead on economic and social progress.

In the Baltic, the Estonians and the Latvians emerged in opposition to Russification. Landmark events in the rise of Estonian nationalism included the compilation of the national epic (*Kalevipoeg*, published 1857–61) and a later collection of popular traditions. Similarly, the Latvians created their own epic (*Lacplesis*) and started a collection of popular songs. The Lithuanian national renaissance was different because a medieval tradition of independence could be evoked. A new tendency arose that disregarded the tradition of the former Polish-Lithuanian Union and based Lithuanian nationalism on ethnic and linguistic grounds. Writing in the Lithuanian language was making progress despite restrictions imposed by the Russian government. Lithuania's nationalism, however, carried no clearly expressed political aim.

Discouraged by Russia's imperialism, many Slavs looked with hope to the Habsburg monarchy, where the problem of nationalities was continually discussed in an entirely different spirit from that in the czarist empire. The nationalities of Austria and Hungary were divided into two groups—nations that were living entirely within the monarchy and those with smaller fragments in other nations. As for the latter, an additional distinction should be made between minorities attracted by an

independent nation on the other side of the border (as within the Serbs and the Romanians) and those who had no nation of their own at all (as in the case of the Poles and the Ukrainians).

The Hungarians, fearful of Slavic influence, were invested in the future of the Dual Monarchy, in which they enjoyed a privileged position. After 1876 the trend toward Magyarization of all non-Magyar nationalities became even stronger. Even Croatia's autonomy was hardly respected. The controversies between Magyars and Croats were a special danger because they opened the question of Yugoslav authority. Despite old rivalries that separated Catholic Croats and Orthodox Serbs, the movement toward Yugoslav unity made progress. There was unrest among these southern Slavs that was exacerbated by influences from the independent states of Serbia and Montenegro. Any concession to the Yugoslavs meant a revival of the Czech claims for a restoration of their historic statehood.

In the Balkans, but not in east-central Europe, the 19th century saw the formation of several independent states. A first period between 1800 and 1830 brought some national liberation during the first Balkan revolutions against Ottoman rule. Next came a long period (lasting from 1830–78) of political and social development, while a third phase saw the inclusion of the Balkan peoples into the European power play during the age of imperialism between 1878 and 1903.

The development of a national consciousness of all these peoples varied according to the different political and social conditions prevailing in the respective regions. National consciousness, formerly limited to the upper strata of society, penetrated into the lower classes. Considerable political development occurred under Habsburg rule. As the Ottoman Empire weakened in the 19th century, the Balkan nations began to reemerge, though their independence was compromised as they became pawns for competing European powers. Revolutionary risings were frequent under the Ottomans and, as far as the Poles are concerned, in the czarist empire.

All these processes had both nationalistic and agrarian elements. The former aimed primarily at the organization of national states, while the latter was marked by endeavors to get rid of foreign landlords. The Balkan people, up to the eve of World War I, profited from the Ottoman Empire's notorious weakness. The non-German Habsburg peoples in the Austrian part of that empire were awarded some degree of cultural autonomy, while in Hungary only the Magyars reached their goal of a practically autonomous state. The Russians

faced a massive wave of Russification after the disastrous failure of several Polish uprisings. The final elimination of all political freedom through and after the partitions of Poland between 1772 and 1795 struck a nation with such a long tradition of independence that the divided Polish territories remained throughout the 19th century a permanent center of unrest. Nevertheless, non-Russian people made considerable progress in cultural, social, and economic matters, thereby preparing the way for their independence after 1918.

MARTIN MOLL

Banerji, Surendranath

(1848–1925) *Indian statesman*

Surendranath Banerji (also Banerjea, Banerjee) was one of the creators of modern India and a staunch proponent of an autonomous Indian nation within the British Commonwealth. He was born in Calcutta to a Brahman family and, after earning his B.A. in English literature in Calcutta, traveled to London in 1869 to take the examination to join the Indian Civil Service. (This examination was not offered in India until 1921.) He achieved a high score but was disqualified over a misunderstanding about his age. When this was clarified, he received an appointment for three years, until he was dismissed for a minor rule infraction. Banerji later recalled that these early experiences demonstrated to him the essential injustice of British rule and the powerlessness of the Indian people under it.

Banerji returned to India to work as a journalist and educator, and in 1876 founded the Indian Association, the first nationalist political association in Bengal (an area now divided between northeastern India and

Bangladesh). The aim of this association was to encourage Indians of different religious backgrounds to work together, although it was never entirely successful. The Indian Association did, however, serve as the vehicle for India's nationalist movement and attracted ambitious members of the Indian middle and upper classes (like Banerji himself) who sought greater political and economic opportunities. In 1879 Banerji purchased a newspaper, *The Bengalee*, which he edited for 40 years. This paper served as a mouthpiece for the Indian Nationalist movement and had the highest circulation of any Indian weekly paper of its time.

Banerji was an effective political speaker and was twice elected president of the Indian National Congress. He advocated moderation and the achievement of reforms through the political process, and he believed the goal of British policy should be for eventual self-government for India. He also argued that India should have a constitution similar to that of Canada and that basic civil rights such as habeas corpus should be ensured. Banerji was knighted in 1921 and accepted the post of minister of local self-government in Bengal. His moderate political views were not always popular with the local populace, and after defeat in 1924 by a more radical *Swaraj* (independence party) candidate, Banerji retired from public life to write his memoirs, published in 1925 as *A Nation in the Making*.

SARAH BOSLAUGH

Banks of the United States, First and Second

Between 1791 and 1836, two federally chartered banks, both headquartered in Philadelphia, helped the United States manage its national wealth and regulate economic activity. Always controversial, each bank in turn

faced major political and managerial obstacles. When ANDREW JACKSON denied the Second Bank a new charter, America's experiment with central banking ended, not to be restored until the 20th century.

In 1790 Treasury Secretary ALEXANDER HAMILTON submitted to Congress what he believed would be a permanent solution to the young nation's shaky finances. His proposed national bank unleashed deep-rooted anxieties about the use and abuse of money and newer concerns for legitimacy. The recently ratified CONSTITUTION gave little guidance on monetary issues. THOMAS JEFFERSON, then secretary of state, was one of many Americans who believed that only specie—gold and silver coins—was honest. Paper notes and financial instruments could be (and were) used to cheat honest people while enriching corrupt businessmen and speculators. Creation of a powerful national bank raised tensions between North and South, farmers and merchants, debtors and creditors. Some feared that European investors would use the bank to undermine national independence.

After a secret meeting at which Hamilton agreed to a plan creating a capital district near Virginia, the First Bank of the United States won a 20-year charter from a regionally split Congress. Opening in 1791, it was both a private, profit-making corporation and a government agency. Five of the bank's 25 directors were presidential nominees requiring Senate confirmation. The bank's public duties included issuing paper money, collecting federal taxes, and paying federal debts, all on behalf of the Treasury.

Although President Jefferson never welcomed this powerful institution, he generally worked with it harmoniously. Meanwhile, privately held and state-chartered banks proliferated. Under pressure from local interests, especially after Jefferson's 1803 LOUISIANA PURCHASE, the bank authorized eight regional branches. In this era of slow travel and communications, this posed a problem of central oversight and led to a scandal for the Second Bank.

As the largest U.S. corporation, the bank was a lightning rod for political attacks. When the bank's charter expired in 1811, it failed by one vote in each house to win renewal. President JAMES MADISON's distrust of banking, added to denunciations by competing state banks and the enmity of important businessmen, helped kill the First Bank as the WAR OF 1812 loomed.

While British troops attacked Washington and other important sites, the Treasury struggled to finance the war and protect the economy. Many of the nation's 200 state and regional banks issued paper currency of

dubious value; some banks failed. At war's end, Madison called for a new bank, as did House Speaker Henry Clay, who had helped kill the first one. In 1816 the Second Bank of the United States won a 20-year charter and soon opened in a new Philadelphia location.

Organized on the same public-private lines as the previous bank, the Second Bank had a rocky start. During the panic of 1819, it abruptly curtailed lending, harming its reputation. In the Baltimore branch, a group of officials, including cashier James McCulloch, embezzled more than 1 million dollars. Ironically, McCulloch also figured in a major 1819 victory for the bank. Maryland, at the behest of its state banks, had imposed a tax on the federal bank's local operations. In its unanimous *McCulloch v. Maryland* decision, the Supreme Court declared the bank to be a "necessary and proper" use of federal power and forbade state taxation.

In 1823 Philadelphian Nicholas Biddle was promoted to the bank's presidency and began reshaping its oversight mission and role in the economy. Generally considered a banking success, although he lacked business training, Biddle would fail politically, as his arrogance and restrictive policies collided with the fiscal exuberance of an era of explosive growth.

Andrew Jackson was steeped in Jeffersonian ideals of agrarian republicanism. He opposed public debt, paper money, and federally financed improvements. The president's intentions toward the bank vacillated. He reappointed Biddle yet called the bank a "hydra of corruption" in his first message to Congress. Jackson's inner circle, including New York political mastermind Martin Van Buren, had additional reasons for undercutting Biddle's bank. A rivalry for banking predominance pitted New York City and Philadelphia. Elsewhere, Jacksonian entrepreneurs and speculators seethed over Biddle's efforts to curb credit and restrain inflation.

In 1832, a presidential election year, Biddle made a serious political error. He allowed anti-Jackson political leaders, including Henry Clay, to persuade him to force Jackson's hand by pressing for charter renewal four years early. Congress passed the extension but could not override the president's July veto, the first significant veto in U.S. history. In his fiery message, Jackson called the bank an enemy of "the humble members of society—the farmers, mechanics, and laborers."

Easily beating Clay to win a second term, Jackson was not content to allow the bank to complete its remaining years. By the fall of 1833 Treasury Secretary Roger B. Taney (later Supreme Court Chief Justice) had found ways to transfer government deposits

from the bank to so-called "pet" banks that supported Jacksonian initiatives. By 1836, when the bank ceased to exist, deposits had been moved to 91 of the nation's 600 banks.

The death of the Second Bank of the United States was not the only cause of the orgy of lending, speculation, and bank failure that fed the panic of 1837, but it was an important factor. Financial and political battles over gold or silver, greenbacks or hard currency, roiled the 19th century, fueling populism after the CIVIL WAR. Centralized banking did not reemerge until a Federal Reserve banking system was established in 1913 under President Woodrow Wilson.

MARSHA E. ACKERMANN

baroque culture in Latin America

The term *baroque*—originally a pejorative label meaning "absurd" or "grotesque"—is used to designate the artistic style that flourished in Europe and abroad in the 17th and early 18th centuries. The baroque influence reached Latin America in the mid-17th century and continued to make its presence felt long after 1750, the year conventionally given as the end of the baroque movement in Europe. The artistic movement, which originated in Rome in tandem with the Catholic Counter-Reformation, emphasized vigorous movement and emotional intensity. Baroque works were typically characterized by a highly ornamental style and extensive use of decorative detail. Given the movement's roots in the Counter-Reformation, it comes as little surprise that most (though certainly not all) baroque art served a religious purpose. Life-sized images aimed to capture the emotional states of their subjects (typically biblical figures), so that viewers could connect with the subject on an emotional level. On major holy days, religious statues, often dressed in ornamental garments, were paraded through the streets of Latin American cities.

While Latin American culture was clearly influenced by European styles and aesthetic ideals, Latin American baroque was by no means a mere duplicate of

European artistic forms. Baroque music was generally more lively and less technically complex in a Latin American context than it was in Europe. European innovations in the visual arts were selectively appropriated and transformed to suit a very different context. The result was a hybridization of European, Indian, and African cultural influences. Many baroque churches in Latin America, for example, include detailed carvings and other ornamentation that incorporate elements of indigenous spiritual beliefs and practices. Similarly, paintings and sculptures from the baroque era often portray their subjects clad in the native garments or situated in surroundings suggestive of the local climate and geography. The biblical scenes found in the interior of the San Francisco Church in Santa Fé de Bogotá, Colombia, for example, depict biblical figures in a rich tropical environment.

Some of the finest examples of Latin American baroque art and architecture can be seen in the work of Antônio Francisco Lisboa, known more popularly as O Aleijadinho (the “Little Cripple”). This Brazilian sculptor and architect’s masterpieces include baroque churches in São João del Rei and Ouro Preto, as well as the statuary (most famously the Twelve Prophets carved out of soapstone) at the Sanctuary of Bom Jesus do Matozinho in Congonhas do Campo. Aleijadinho’s work, some of which he produced in the early years of the 19th century, serves as a reminder of the inapplicability of rigid periodization of artistic styles in the Latin American context.

The decades following independence witnessed a backlash against baroque culture among educated elites in Latin America. The movement for political independence had been inspired in large part by European ENLIGHTENMENT ideals, and it was to European—and particularly to French neoclassicist—ideals that the Creole elites turned for a cultural model on which to base their newly independent societies. On a more popular level, however, devotional art and pageantry and other expressions of popular culture continued to demonstrate a taste for theatricality and ornamentation characteristic of baroque culture well into the 19th century and beyond. In fact, the enduring presence of baroque aesthetic norms can still be observed in Latin American cultural expression.

KATHLEEN RUPPERT

Beecher family

U.S. ministers and reformers

Bestriding the 19th century, members of the large and well-educated New England–based family headed by patriarch Lyman Beecher would play crucial roles in the development of American Protestant theology, women’s education, and the ABOLITION OF SLAVERY. Daughter Harriet Beecher Stowe’s antislavery best seller, *Uncle Tom’s Cabin*, was credited with helping to spark the AMERICAN CIVIL WAR; her elder sister, Catharine, reinvented women’s household work as home economics. Their brother Henry Ward Beecher was one of America’s most successful preachers before the scandalous 1875 adultery trial that almost destroyed him.

Born in 1775 to a long line of Connecticut blacksmiths, Lyman Beecher studied at Yale College and was ordained a Congregationalist minister in 1798. At a time when the staunch Puritanism of early New England was giving way to Unitarianism and TRANSCENDENTALISM, Lyman Beecher clung to the harsher beliefs of the First GREAT AWAKENING. He would enjoy national fame and weather severe disapproval during ministerial postings in Hartford, Boston, and Cincinnati, where he was preacher, professor, and president of the fledgling Lane Theological Seminary. A stern but loving father, Lyman Beecher was deeply involved in the religious and professional lives of his 11 children by two marriages. He saw all seven of his sons become clergymen before he died in 1863.

His eldest child, Catharine, lost her fiancé, a promising mathematician, in a shipwreck and devoted her life thereafter to female education. Beginning in 1823 when she established the Hartford Female Seminary (soon hiring sister Harriet as a teacher), Catharine advocated an expanded academic curriculum for girls and helped make teaching an honored career for women at a time when men still dominated education. Her 1841 *Treatise on Domestic Economy* was a huge success, endowing women’s work with scientific rigor. In 1850 she founded Milwaukee Female College, where young women were trained systematically to become

Harriet Beecher Stowe, her father, Lyman, and her brother Henry Ward. The Beechers were prominent abolitionists and reformers.

respected homemakers. Yet she continued, despite her own independent achievements, to proclaim male superiority at a time when other women were beginning to agitate for equality.

Harriet recalled stories of cruelty she heard as a child and developed a keen understanding of slavery and racism as a wife and mother in Cincinnati, on the border between free Ohio and slave Kentucky. Moving back east in 1850 with her theology professor husband, Calvin Stowe, she became keenly aware of the uproar over the just-enacted Fugitive Slave Law. Inspired by events and encouraged by family members, Harriet began writing. The first installment of *Uncle Tom's Cabin* was published in a tiny periodical on June 5, 1851. When the entire novel appeared the next year, millions of copies were sold. The book was an international moral and literary triumph despite hate letters from Southerners, one possibly containing the severed ear of a slave. Harriet wrote more best sellers in a long writing career; none would approach the impact of *Uncle Tom*.

Her younger brother, Henry Ward, first resisted a religious vocation, but having yielded to his father's dearest wish, became a huge success. After eight years ministering in malarial Indianapolis, where his cautious antislavery sermons sometimes put him in harm's way, Henry was invited to lead a new Congregational church in Brooklyn, New York. This "bully" pulpit was well paid, prestigious, and a place where the elo-

quent Henry could gain national attention. Unlike Lyman, Henry was no Calvinist. God's love, not God's implacable wrath, infused his sermons.

Soon, Henry was a celebrity, drawing huge Sunday crowds. He counseled temperance, denounced America's Mexican War, and took up collections to free slaves, although he long resisted abolitionism and remained patronizing toward African Americans' potential for full citizenship. After the Civil War, he supported WOMEN'S SUFFRAGE, despite opposition from his wife and his sister Catharine.

Preacher, writer, novelist, and journalist, Henry almost lost it all when Theodore Tilton, one of his closest associates, accused the minister of an adulterous affair with his wife, Elizabeth. It was almost certainly true and may not have been Henry's only affair. He denied it steadfastly; Mrs. Tilton kept changing her story. The trial lasted almost six months, ending with the jury voting nine to three to acquit. Tarnished, Henry resumed his career on the national lecture circuit, raking in high appearance fees. In later years, he condemned labor unions but stood up for Native Americans and Jewish immigrants.

The offspring of Lyman Beecher, through both achievements and mistakes, played a major role in transforming their America. Leading the way to more socially conscious religious practices, they also helped destroy slavery and elevated women's roles, foreshadowing greater changes to come.

MARSHA E. ACKERMANN

Berlin, Congress of (1878)

The Congress of Berlin in July 1878 was held in response to nationalistic revolts against Ottoman Turks in the Balkans between 1875 and 1877. In 1875 the peasants of Bosnia had rebelled against their Turkish landlords, bringing fellow Slavic states such as Serbia and Montenegro to their aid. Although the Turks defeated the Serbians and Montenegrins, the Balkan conflagration spread to Bulgaria, where the population rose in revolt against Turkish rule. The atrocities perpetuated against Bulgarian insurgents—real, imagined, and exaggerated—had an impact on public opinion in Europe.

In the wake of these revolts, Pan-Slavic sentiment supported Russian intervention to come to the rescue of their Orthodox coreligionists and Slavic brothers. They went to war in the summer of 1877 and, early in 1878 after vigorous Turkish resistance, forces were approaching Constantinople, the Ottoman capital. The Turks then signed the Treaty of San Stefano. Under those terms Serbia and Romania became officially independent (they had long enjoyed *de facto* sovereignty), and Montenegro had its independence confirmed.

It was the fear of other powerful nations, especially Austria and Great Britain, that led to the assembly of the congress. The Treaty of San Stefano had, in fact, been made because these powers had threatened to intervene. Austria had moved troops to the border of Romania, where it could strike at the flank of Russian troops if necessary, and the British fleet entered the straits adjacent to Constantinople so as to bombard Constantinople if Russia attempted to take it. This concern was related to the EASTERN QUESTION, which dealt with control of the Strait, including access to the Dardenelles (which controlled the route between the Black Sea, the Mediterranean, and the Bosphorus (the link between Asia and Europe)). The decline of Turkey, the ruler of the Straits, had aroused fear and uncertainty regarding the future of these important passageways. When the British noted that Russia's entrance into Constantinople would be cause for war, the Treaty of San Stefano was signed.

Without regard for the anxiety of other European powers, Russia dictated the treaty to create a huge Bulgaria that not only included Bulgaria proper but most of Macedonia from the Aegean to the Serbian border. Other Turkish areas were taken (with the exception of Albania), and Russia annexed territories that it had conquered in the Caucasus. Austria and Italy were opposed to the treaty, and Britain feared that Russian dominance of the Straits would endanger British dominance in the Mediterranean and the route to India. Other Balkan states such as Greece and Serbia opposed the creation of a large Bulgaria, and Romania resented the loss of all of Bessarabia to Russia and part of its southern province of Dobruja to Bulgaria.

German Chancellor OTTO VON BISMARCK realized his carefully constructed system of alliances would be torn asunder, so he invited Russia, Great Britain, and Austria to a German-hosted conference held in Berlin. The results of this Congress of Berlin (also attended by France and Italy) were much less favorable to Russia, which had to give back some of the territory it had won in the Caucasus. In effect, Bismarck supported Austria

over fellow Russian member in the Three Emperors' League of Austria, Germany, and Russia. The Bulgaria of San Stefano was split into three parts. Eastern Rume-
lia, the southeastern section, received a Christian governor but remained under the military and police control of the Turks (in 1885 it was annexed to Bulgaria). The north was made a virtually independent monarchy under a king (and in 1908 its independence was declared), and the rest, including Macedonia, was given back to the Turks.

Other changes took place. Greece received Thes-
saly to the north; Great Britain received Cyprus as a protectorate; and Austria received the provinces of Bosnia and Herzegovina as protectorates. The result of the Congress of Berlin was ultimately negative. Although BENJAMIN DISRAELI, British prime minister, informed the Turks that they had been given breathing space, he also cynically observed that he doubted that they would take it. He was correct in that assumption. Russia became estranged from Germany's ally, Austria, and closer to France, Germany's greater enemy. Austria's acquisition of Bosnia and Herzegovina infuriated the Serbs who began a campaign for the territory that ultimately led to World War I when the heir to the Austrian throne was assassinated in Sarajevo, the capital of Bosnia.

NORMAN C. ROTHMAN

Bismarck, Otto von

(1815–1898) *German statesman*

Otto von Bismarck was born on April 1, 1815, at his family's estate of Schoenhausen in Prussia. The same year, Prussia became again the most important country in Germany when its army under Field Marshal von Blücher would help the British duke of Wellington defeat NAPOLEON I at Waterloo, on June 18, 1815. Bismarck came

from the hereditary warrior caste of the Junkers, Prussian nobles who had centuries before formed the cutting edge of the campaigns of the Teutonic knights in their wars in eastern Europe. At first, Bismarck did not follow the traditional Prussian Junker calling into the military, but took up legal studies in Hanover, Göttingen, and Berlin. Bismarck showed a disinclination toward the practice of law; his interest centered on a career in diplomacy.

When the wave of revolutions swept throughout Europe in 1848, Bismarck was a conservative and relieved to see the revolutions largely fail. In France, the revolution did succeed, and NAPOLEON III, the nephew of Prussia's old nemesis Napoleon, was elected to power. Nevertheless, Bismarck was not a doctrinaire conservative but more of a political pragmatist ready to adopt ideas from political liberalism that would benefit Prussia. Throughout his career, Bismarck was characterized by this political adaptability, which helped to make him the master statesman of his day.

Bismarck became a rising star in the Prussian diplomatic service, which had been the fast track to success in the kingdom since the time of FREDERICK THE GREAT, who by his death in 1786 had made the comparatively small monarchy one of the great powers in Europe. He was sent to represent Prussia in France in 1862 and in czarist Russia in 1859, two of the three countries that could either help—or inhibit—Prussian foreign interests.

The Austrian Empire, as heir to the old Holy Roman Empire that Napoleon had destroyed in 1806, would prove to be the most important diplomatic threat to Prussian ambitions. While the Holy Roman Empire might be no more, the German Confederation existed in its place, and Prussia chafed at being subordinate to Austria. In 1851 King Frederick William (Friedrich Wilhelm) IV, in recognition of Bismarck's loyalty during the 1848 uprising, appointed him to the Diet, or assembly, of the Confederation as Prussia's representative. In one way or the other, von Bismarck would remain at the center of German affairs for the next four decades. At this time, Britain, ruled by Queen VICTORIA, treated developments in Europe, so long as one power did not become too powerful, as a second-class interest against those of Britain's developing empire overseas.

Bismarck made clear from the start that he had little liking for letting Austria take the lead in German affairs and believed that Prussia should lead instead. After serving as Prussia's minister to France and Russia and as Prussia's representative to the German Federal Diet in Frankfurt, he was rewarded with the positions

Germany's most notable diplomat, Otto von Bismarck, oversaw the unification of Germany under Kaiser Wilhelm I.

of Prussian foreign minister and prime minister in 1862. Well-schooled in diplomacy among the Great Powers, he would find politics within Prussia to be an entirely different game than the diplomatic game of nations. The kings and Bismarck came grudgingly to live with the political liberals and to realize that some accommodation with liberalism was needed if the country was to be governed at all.

Bismarck saw the army as the key to Prussia's future. On February 1, 1864, a combined Prussian-Austrian army swept over the German frontier to invade Schleswig-Holstein and the Danish garrison occupying it. In August 1865 the Convention of Gastein apportioned Holstein to Austria and Schleswig to Prussia. Although the situation seemed resolved, Bismarck secretly hoped for a casus belli, a cause of war, with the Austrians. Mutual attacks in the parliament of the German Confederation between the Prussian and Austrian representatives were finally followed by a Prussian invasion of Austrian-held Holstein. Open hostilities soon broke out between Prussia and Austria. On July 3, 1866, Prussian commander Helmuth von Moltke launched his attack on the

Austrians and their Hungarian allies. In the Six Weeks' War, the Prussians and their German allies defeated the Austrians and Hungarians. Peace between Prussia and Austria came in the Treaty of Prague in August 1866.

To Bismarck, the defeat of Austria was only a means to remove Austria from the German equation—to leave Germany's destiny in Prussian hands. Accordingly, out of the war came the North German Confederation, which Bismarck saw as a stepping stone to complete Prussian domination of the Germanic states. Bavaria, a southern contender for prominence, had also been humbled—but not crushed—during the Austrian war. With FRANZ JOSEF of Austria-Hungary removed from the equation, there was only one player on the European scene with plans for Germany: Emperor Napoleon III of France.

Although popularly elected in the wake of the FRENCH REVOLUTION of 1848, in 1852, Louis-Napoleon Bonaparte had seized power in a military coup, much as his uncle had done in November 1799. Napoleon began to see himself also as the arbiter of German affairs, which was something Bismarck could not abide. At first, Napoleon desired only territorial compensation from Bismarck in return for his neutrality in the Six Weeks' War. However, when Napoleon decided he wanted Luxembourg, Bismarck was able to marshal German opposition to French desires on German land.

The flash point, however, came in Spain. There was a succession crisis when Queen Isabella II of Spain was deposed in 1868. Spain looked for a candidate for the throne and decided on a member of the House of HOHENZOLLERN—the reigning house of King Wilhelm I of Prussia. Napoleon feared encirclement, and tension rose in both France and Prussia. The Hohenzollern candidacy was withdrawn, but Napoleon III foolishly kept up the diplomatic pressure to make it appear as a clear-cut French triumph. Rather than suffer a strategic blow, Bismarck doctored the infamous Ems Telegram to King Wilhelm I to make it appear that the French had deliberately tried to humiliate the Prussian monarch.

The end result was predictable. French pride rose up, and Napoleon answered with hostility. On July 19 France declared war on Prussia. By August 1870 France and Prussia, backed by the North German Confederation, began hostilities. From the beginning, the odds were in the favor of the Prussians and their allies: In the face of their 400,000 troops, Napoleon III only was able to muster about half of that number. On September 2, 1870, Napoleon surrendered to the Germans. With peace

of a sort in place with France, Bismarck had achieved his goal. Germany was united under the new emperor, or kaiser, Wilhelm I. Bismarck had no more territorial aspirations. Instead, he devoted his career so that the new imperial Germany could progress in peace. With France militarily neutralized (at least for a time), Bismarck devoted his attention to the Austrian Empire, the Dual Monarchy, and czarist Russia. Bismarck's goal was essentially to re-create the balance of power that had been put in place by the Congress of Vienna, which had brought 40 years of peace until Britain and France had confronted Russia in the CRIMEAN WAR of 1854–56. The peace he sought for imperial Germany would also benefit the rest of Europe and became his lasting contribution to history.

Bismarck, the minister-president (prime minister) of Prussia and the Iron Chancellor of the German Empire, died on July 30, 1898. He did not live to see the adventurist policies of Wilhelm II contribute to the coming of World War I in August 1914 and the ultimate destruction of the German Empire that he had worked so passionately to create and to preserve.

JOHN F. MURPHY, JR.

Bolívar, Simón

(1783–1830) *liberator of South America*

Revered throughout Spanish-speaking Latin America as the “Liberator,” whose single-minded determination forced Spain to grant independence to South America's nascent nation-states in the 1820s, Simón Bolívar occupies a singular position as perhaps Latin America's greatest patriot and hero. Statues and busts of Bolívar grace public plazas across the continent, while his contemporary relevance remains readily apparent, as in Venezuela's Bolivarian revolution, brainchild of President Hugo Chávez, elected in 1998. This

popular reverence contrasts sharply with the contemporaneous opinion of Bolívar in the years before his death, when many Latin American elites reviled him as an autocrat and dictator. His political trajectory is the subject of an expansive literature, as his political philosophy evolved from a broad republicanism and democratic idealism in the early 1800s to an anti-democratic autocracy and repudiation of republican ideals by the late 1820s. Weeks before his death from tuberculosis, Bolívar himself expressed his disillusionment and lamented his failure to achieve his vision of a politically unified nation-state embracing all of South America, when he famously proclaimed: “America is ungovernable . . . he who serves a revolution ploughs the sea.” His lament proved prescient, foreshadowing the endemic civil wars that wracked much of the first century of Latin American independence.

Born on July 24, 1783, in Caracas, capital of the Provinces of Venezuela of the Viceroyalty of Gran Colombia, Simón Bolívar was the son of Juan Vicente Bolívar and María de la Concepción Palacios y Blanco, one of the most distinguished Creole (American-born Spanish) families in the city of 20,000 inhabitants. His education was eclectic and unconventional, influenced by emergent ENLIGHTENMENT ideals of republicanism, popular sovereignty, and democracy, and by romantic notions regarding nature and the arts. As a youth, he traveled widely in Europe and North America, continuing his studies in Madrid, southern France, and elsewhere. He married in May 1802 in Madrid and eight months later his wife died, a catastrophic personal event that he later claimed changed the trajectory of his life. “If I had not been left a widower . . . I should not be General Bolívar, nor the Liberator,” he later observed.

Returning to Europe, in December 1804 he attended the coronation of NAPOLEON I in Paris, an event that left an enduring impression. He was particularly struck by the popular adoration for the French emperor, which he envisioned for himself for liberating South America from Spanish rule. In August 1805 on the Monte Sacro on the outskirts of Rome, he solemnly vowed that he would “not rest in body or soul till I have broken the chains that bind us to the will of Spain.” He would spend the next two decades struggling to fulfill that vow.

Bolívar’s military campaigns against the Spanish armies, culminating in LATIN AMERICAN INDEPENDENCE, comprise the subject of a vast literature. The evolution of his political philosophy can be seen in three key documents. The first, the Jamaica Letter of September 6,

A statue of Simón Bolívar, considered the George Washington of South America, stands in Caracas, Venezuela.

1815, offered a critical appraisal of the status of the Latin American revolutionary movements and a series of predictions regarding Latin America’s future. The political views inspiring Bolívar’s Jamaica Letter can be characterized as broadly nationalist and republican. The second document, a major speech before the Congress of Angostura in 1819, evinced far greater emphasis on the need for political unity and a strong central executive. The third document, the Bolivian Constitution of 1825, represents the acme of Bolívar’s political shift toward a belief in a unitary executive and strong central state and his fears of civil war and political anarchy.

Many of his prognostications on Latin America’s future proved accurate, most notably the monumental difficulties of governing territories with no tradition of democracy and shot through with deep divisions of race and class. Indeed, throughout his career as the Liberator, Bolívar sought to achieve a political revolution, independence from Spain, without sparking a social revolution from below. Remarkably, he largely succeeded. The process by which popular memories of Bolívar transformed so dramatically after his death, from a despised autocrat to a popular hero and Liberator, represents yet

another puzzle in the history of this revered Latin American patriot.

MICHAEL J. SCHROEDER

Bourbon restoration

During the FRENCH REVOLUTION, the French monarchy was officially abolished on September 21, 1792, by the revolutionary National Convention. With the radical Jacobin party of Maximilien Robespierre, Camille Desmoulins, and Georges Danton in control of the Convention, King LOUIS XVI was condemned to death and sent to the guillotine on January 21, 1793. His son, whom French monarchists considered Louis XVII, died in June 1795 in prison, either the victim of neglect or beatings by his jailors. Although the monarchy in France was officially abolished, the Bourbon dynasty continued in exile with others who had fled the increasingly radicalized revolutionaries. Due to the death of Louis XVII, the older brother of Louis XVI, the comte de Provence, assumed the title of King Louis XVIII.

During the early years of the Revolution, the comte de Provence participated in the National Assembly, as did the other royal princes, the princes of the blood. Sensing the growing radicalization of the revolutionaries, however, he fled France in June 1791, at the time that Louis XVI and his wife, Marie Antoinette, attempted to escape, only to be captured by the revolutionaries. Luckily, the comte de Provence had taken a different route and went to Coblenz. He was undoubtedly one of the émigrés with whom Louis XVI intrigued during the Revolution to help him regain his throne. It was the discovery of Louis XVI's secret correspondence, deemed proof of treason by the radical Jacobins, that was a major reason for his execution.

Throughout the years of the Revolution, the comte de Provence pursued his own interests, with little interest in Louis XVI's safety. The Revolution and the period of the Napoleonic Wars were unkind to Louis XVIII, when he was compelled to rely on the hospitality of other rulers. At the same time, his brother, the comte d'Artois, pursued a conflicting plan from his refuge in London, thus making the Bourbon dynasty a two-headed

beast. The comte de Provence remained in Great Britain until NAPOLEON I's defeat and abdication on April 11, 1814. Due to the astute negotiations of a diplomat who had switched allegiances to the Bourbons, the victorious allies accepted Louis XVIII as king of France. On May 2, 1814, he entered Paris in triumph.

Although he greeted the French people with great promises, Louis XVIII alienated the French army. When Napoleon escaped from exile on February 26, 1815, and landed in France, Louis XVIII knew that the army would never support him against Napoleon. So he fled to the Austrian Netherlands, and Napoleon triumphantly entered Paris on March 20, 1815. However, the European crowns were determined to keep Napoleon from ruling France again. On June 18, 1815, near the town of Waterloo in the Austrian Netherlands, Napoleon was decisively defeated by the British and Prussian armies. Forced to abdicate a second time, Napoleon was this time sent away to Saint Helena, far out in the Atlantic, where he died in May 1821. The nature of Louis XVIII's rule indicates that he supported absolutism. In 1815 he signed the Holy Alliance with Prussia, Austria, and Russia, with the intention of quelling any resurgence of the political liberalism that was the strongest legacy of the French Revolution. The Holy Alliance was expanded to the Quintuple Alliance in 1822, with the addition of England. These European monarchies represented a conservative ideology backed by military might.

On September 16, 1824, Louis XVIII died, and the crown passed to his brother, the comte d'Artois, who assumed the throne as King Charles X. Charles X was a very different king than his brother had been. He wanted to see a reactionary reconstruction of France. In March 1830 the liberal Chamber of Deputies, the lower house of the French Assembly, passed a vote of no confidence on the actions of Charles X's chief minister, Polignac. In response, Charles X dissolved the Chamber and called for new elections. But when the new Chamber deputies were sworn in, they held the same opposition as the one Charles had dissolved. Abandoning any pretext of supporting the parliamentary system, on July 26, 1830, Charles X issued four drastic decrees. Known as the July Ordinances, they dissolved the new Chamber, imposed strict censorship of the press, limited voting rights to certain favorable groups and businessmen, and called for a new election.

The effect of the July Ordinances was cataclysmic. The very next day, revolutionary disturbances broke out in Paris. From July 27 to July 29, the revolutionaries raised barricades in Paris and battled the police

and the soldiers. Most soldiers refused to fire on the crowd. Charles X, having no desire to go to the guillotine, quickly abdicated and sought refuge, for the second time in his life, in England.

The marquis de Lafayette, who had played important roles in both the AMERICAN REVOLUTION and the French Revolution, found a solution to the political crisis. Using his still immense popularity, he offered the French people to replace Charles X with Louis-Philippe, the duc d'Orléans, who had fought with the armies of the French Revolution. With the promise that the duc d'Orléans would respect the charter of 1814, the Chamber of Deputies offered him the crown on August 7, 1830. Louis-Philippe would now rule France as the "citizen king."

JOHN F. MURPHY, JR.

Brahmo and Arya Samaj

The Brahmo Samaj and Arya Samaj were two important institutions that developed in 19th-century India against existing social practices. The impact of the West resulted in a social and cultural renaissance in India. To regenerate society, it was felt that modern sciences and ideas of reason were essential.

RAM MOHAN ROY, occupying a pivotal position in the awakening, was the founder of Brahmo Sabha in 1828, which was known as Brahmo Samaj afterward. Roy was an enlightened thinker and well versed in Sanskrit, English, and Arabic. An accomplished Vedic scholar, he was also a great admirer of Jesus Christ. Roy wanted to bring reform to Hindu society, which had become stagnant. Evils like the sati (suttee) system of self-emulation of widows, child marriage, polygamy, and other social ills had crept in. The goal of the

Brahmo Samaj was to rid Hindu society of evils and to practice monotheism. Incorporating the best teachings of other religions, it aimed at a society based on reason and the Vedas. A golden age in Vedic society had begun. Rajnarain Bose, Debendranath Tagore, and Keshab Chandra Sen enriched the Samaj through inculcation of novel ideas that aimed at reforming Hindu religion and society. Bose used the Hindu scriptures like the Vedas, Upanishads, and the Bhagavad Gita as the holy books of the Hindus.

Debendranath Tagore, the father of Rabindranath Tagore, revived the Brahmo Samaj, which had become dormant after Roy's death in 1843. He established the branches of the Samaj and spoke out against idol worship, pilgrimages, and rituals of Hindu society. Membership of the Samaj continued to rise; from six in 1829 to 2,000 after 1835. Starting in Bengal, it spread to different parts of India. But a schism developed, as Debendranath and the older generation did not like the radical ideas of Sen, who formed the Brahmo Samaj of India in 1866. The older organization was called the Adi (original) Brahmo Samaj.

EMANCIPATION OF HINDU WOMEN

The crusade of the Brahmo Samaj resulted in the emancipation of Hindu women within the fold of the Samaj. The British government passed the Civil Marriage Act in 1872, prohibiting child marriage and polygamy, as well as the abolition of caste distinctions. When Sen violated this act at the time of his daughter's marriage, there was another split in the Brahmo Samaj of India in 1878 with the formation of Sadharana (Common) Brahmo Samaj by Ananda Mohan Bose and others. The Brahmo Samaj had done laudable work in the field of education. The urban elite of West and South India came under its spell. It remained a sort of guiding spirit for reformed Hindu society. At the time of World War I, it had 232 branches in major cities of South and Southeast Asia. Apart from the Nobel Laureate Rabindranath Tagore, the Congress presidents and nationalist leaders like SURENDRANATH BANERJI and Bipin Chandra Pal were members in the 19th century.

Swami Dayananda Saraswati founded the Arya Samaj in the colonial city of Bombay in 1875, but its growth came in the Punjab after the establishment of Lahore Arya Samaj three years later. It grew rapidly in different parts of India, with provincial branches in Uttar Pradesh (1886), Rajasthan (1888), Bengal (1889), and Madhya Pradesh (1889). It also spread to the British Empire outside of India, especially in South

Africa, Fiji, and Mauritius, where people of Indian descent lived.

REMOVAL OF UNTOUCHABILITY

Dayananda Saraswati was against idolatry, polytheism, ritual, the caste system, the dominance of the Brahmans, and the dogmatic practices of Hinduism. He launched a crusade for social equality, removal of untouchability, and in favor of female education and adult, widow, and intercaste marriages. He toured India, spreading his message. He promoted Vedic learning and its sacredness with his slogan, "Go back to the Vedas." His platform, however, was not to be misconstrued as encouraging going back to the Vedic times; he showed rationality in his approach toward reforms in Hinduism. The Vedas were to be interpreted by human reason. He also rejected all forms of superstition. He was influenced by the intellectual traditions of reason and science of the West.

He translated the Vedas and wrote three important books, *Satyartha Prakas*, *Veda-Bhashya Bhumi-ka*, and *Veda-Bhashya*. Of the Ten Principles of the Arya Samaj, the following were paramount: infallibility of the Vedas, the importance of truth, the welfare of others, the promotion of spiritual well-being, and contributing one-hundredth of one's income to the Samaj.

Unlike orthodox Hinduism, the Arya Samaj welcomed the Hindu who had embraced other religions either of his or her own will or because of force. The *suddhi* (reconversion by ritual purification) generated a lot of controversy in the 20th century. Some historians believed that the religious program of the Samaj was one of the factors responsible for the growth of communalism. Beginning in the 1890s it was also involved in the cow protection movement, leading to widespread communal violence. After Saraswati's death, the Arya Samaj became aggressive. It preached supremacy of Arya dharma (religion) and contributed to a pan-Hindu revivalist movement.

One of the objectives of the Arya Samaj was the spread of education, and it did pioneering work by establishing schools and colleges throughout the country. The Dayanand Anglo-Vedic School opened in Lahore in 1886 and was converted to a college three years later. The educational campaign of the Samaj created a schism in its rank. The orthodox faction held the teachings of Dayananda as the creed of the Samaj, whereas the liberal group saw him primarily as a reformer. After a split in 1893, the orthodox group controlled the major branches of the Samaj, including the Arya

Pratinidhi Sabha. This group emphasized reconverting the Hindus through the *suddhi*. Reviving the Vedic ideals, they established Gurukul Kangri at Haradwar in 1902. The liberal wing concentrated on relief work and Dayanand Anglo-Vedic Schools promoted modern curricula in addition to Indian values.

The Arya Samaj remained in the forefront of political agitation against British colonial rule, and Lala Rajpat Rai of the Arya Samaj was an important leader of the extremist faction of the Indian National Congress.

PATIT PABAN MISHRA

Brazil, independence to republic in

Unlike many Spanish-American countries that fought for independence and founded republics thereafter, the Portuguese colony of Brazil gained its independence virtually without bloodshed and remained under the same royal family that had once ruled the territory from afar. Hence Brazilian independence entailed a large degree of continuity. The abolition of the monarchy later in the 19th century represented Brazil's break with its European past, though the economic and cultural evolutions of the first few decades of independence prepared the way for political change by profoundly altering Brazilian attitudes and society.

NAPOLEON I's armies disrupted both Iberian monarchies; the Portuguese prince, unlike his Spanish counterpart, decided to take advantage of his country's overseas holdings and moved the royal family to Brazil in 1807. At Rio de Janeiro, the new capital of the Portuguese empire from 1808, João became king in his own right in 1814, following the death of the mentally unstable queen for whom he had served as regent. When he became king, João proclaimed Brazil a king-

dom, equal in status to Portugal. This new standing permitted freer trade and led to the creation of various institutions in Rio de Janeiro, including a naval academy, a medical school, and Brazil's first newspaper. Further, the new king established a full royal court in Rio, complete with 15,000 courtiers, bureaucrats, and aristocratic families who had also accepted exile from Portugal. The Portuguese elites came to Brazil with strong senses of entitlement and an appreciation for French culture, neither of which had been damaged by the Napoleonic conquest of their country. Brazil enjoyed a comparatively smooth transformation from exploited colony to sovereign country with its own monarch in residence.

Not all Brazilians appreciated the Portuguese monarchy's presence in Rio. Even though João himself became quite popular, his courtiers did not. In the years prior to João's 1821 return to Portugal, Brazilians began to manifest a growing nationalism that triggered revolts, including that of 1817 in Recife. French practices and aesthetics permeated Brazilian elite culture, but otherwise growing numbers of Brazilians became convinced that they could do without the ongoing presence of Europeans in their country.

After returning to Europe to defend his throne from Portuguese republicans, João left his son Pedro in Brazil to act as prince regent. Pedro followed his father's advice and soon came to identify more with Brazil than with Portugal. He refused the demand of the Portuguese Cortes that he return and acquiesce to Brazil's demotion back to the status of colony. Pedro's wife, Leopoldina, along with a group of Brazilian Creoles including José Bonifácio de Andrada e Silva, encouraged their prince to lead an independence movement.

Pedro pronounced his famous *Grito de Ipiranga* on September 7, 1822, as he rode along the Ipiranga River. He removed the Portuguese colors from his uniform and avowed, "The hour is now! Independence or death!" Despite some opposition from army garrisons and a weak attack from a Portuguese fleet, Brazil achieved its independence by 1824 with almost no blood being shed.

The first constitutional assembly of 1823 attempted to create a constitutional monarchy, with Pedro as merely a figurehead. However, Pedro dissolved that assembly and summoned a smaller group that wrote a far more conservative constitution that satisfied his tastes. Republicans in Pernambuco expressed their opposition to the arrangement; resentment of Pedro's Portuguese advisers and his arrogance displeased many Brazilians who otherwise accepted having an emperor.

The monarchy survived the early years of uncertainty. Brazil experienced a period of relative stability, if not unity, following independence. The country established close commercial and financial relations with Britain, though the advantage was entirely on the side of the European power. Brazil accrued an enormous trade deficit with Britain that translated into monetary problems at home. The polarization between conservatives and liberals typical of South America also became characteristic of Brazilian politics, though alignments differed somewhat: Conservatives represented the urban-based civil service and merchants, whereas liberals associated themselves with wealthy landowners of the north and south. The liberal landowners gained control of the general assembly but encountered resistance to their modernizing agenda from the rather autocratic Pedro.

INFLATION AND COLLAPSE

The emperor's power declined after the failed war against Argentina for control over Banda Oriental, which had been annexed to Brazil in 1820 as Cisplatine Province but would soon become known as Uruguay. The Brazilian government responded to the financial crisis brought about by the external trade deficit and the war by printing paper currency unsupported by gold reserves. The ensuing inflation and collapse in the value of Brazilian money angered urban salary earners and merchants, who joined forces with the liberals to oppose the policies of PEDRO I's government. The emperor mobilized military forces to suppress protestors, but he concluded that it was best to depart the scene. He abdicated in favor of his five-year-old son, the future PEDRO II.

During the regency, liberals passed an assortment of constitutional reforms that reigned in the executive and weakened the central government relative to the states. Federalism released energies previously kept in check by the central government, however, and revolts spread through the north/Amazonia region and the southern cattle ranching areas after 1835. In response, the assembly reversed decentralization; liberals cooperated with conservatives, at least temporarily, to defend Brazilian unity against such centripetal forces.

Pedro II came to the throne early, at age 15, and provided a focus of loyalty for the Brazilian people. The monarchy continued to provide Brazil with political, social, and cultural stability in its independence. He would be the last emperor of Brazil and did not oppress his people or adhere to retrograde ideas. Instead, he encouraged Brazilians to pursue education and science. He also allowed for the formation of the organized and

articulate opposition movement that sought to eliminate the monarchy entirely.

By the later 1860s and especially by the 1870s, however, the combined pressures of economic modernization, the effects of the decision to abolish slavery, social change, and the PARAGUAYAN WAR encouraged Brazilians to support liberal reformers and intensified demands for sweeping change. Liberals began to demand the abolition of the monarchy and the creation of a republic, in addition to other constitutional changes. When a coup led to the abolition of the monarchy and the institution of a republic, most Brazilians celebrated. Nevertheless, decades would pass before ordinary citizens gained the means to participate actively in the political system and before Brazilians began to acknowledge the various, non-European influences that made their culture unique.

The long struggle of the Paraguayan War undermined the military's support for the monarchy while alienating liberals. Army officers, especially the relatively young, developed a sense of common identity and purpose during the war. Since these officers typically came from families not part of the ruling elite or from urban centers of political influence, they had no reason to support the government run by a small portion of Brazilian society.

Further, they embraced the positivistic ideals of efficiency and professionalism in government and civil service; they did not believe that the Brazilian government of Pedro II possessed these attributes. Within a decade, general military backing for a republic became marked, especially after officers united to defend a colleague who had published a critique of the minister of war and ran the risk of imprisonment.

LIBERAL CAMPAIGN

Meanwhile, liberals intensified their campaign against the emperor's policies. During the Paraguayan War, the emperor had given control of the government to the conservatives. The army commander, the duke of Caxias, had found the previous liberal cabinet unwilling to accept his demands; he convinced the king to replace it with men who would prove more cooperative. Now out of government, the liberals added a republic to their list of demands, along with increased federalism and a parliament.

The last major base of support for the monarchy began to crumble in the 1870s as the Catholic battle against FREEMASONRY continued. Bishops pronounced Catholicism to be antithetical to Freemasonry after priests attended Masonic ceremonies in 1871. Since

several imperial ministers were Freemasons, the government castigated the bishops for overreaching and imprisoned those who would not apologize. The clergy banded together in support of the Brazilian prelates and represented themselves as resisting the forces of secularism. Pedro II and his government lost face when they felt compelled to acknowledge the power of the church and released the imprisoned bishops without further punishment in 1875.

Banking collapses after the 1873 financial crisis in Europe, to which Brazil had become closely tied as it accrued external debt during the Paraguayan War, further eroded confidence in the emperor's government.

The final phase in the disintegration of the Brazilian monarchy occurred in the late 1880s. Economic change, which favored coffee over the traditional cash crops of cotton and sugar, meant that wealth increasingly moved into the region around Rio de Janeiro (central-southern Brazil) and dwindled in the northeast. Rubber plantations began to spread through the Amazon and turned towns such as Manaus into rich cities seemingly overnight. The rubber boom lasted from the 1870s until World War I, changing the distribution of Brazil's population and wealth in the process. Newly wealthy groups began to demand political influence commensurate with their economic status.

ABOLITION OF SLAVERY

Meanwhile, the growing urban elite won ever greater support for the abolition of slavery. The Brazilian emperor and his daughter, Isabel, had both supported the various incarnations of lawyer Joaquim Mabuco's abolition campaign ever since he established the Humanitarian Society for Abolition in 1869. The government enacted a series of laws that limited the extent of slavery, before abolishing it completely. In 1871 the Law of the Free Womb emancipated children born to slaves; however, the Rio Branco Law required those freeborn children to work unpaid for their mothers's masters until they turned 21. In 1879 Mabuco resumed his campaign to end slavery as a member of the Brazilian Chamber of Deputies. A Chamber dominated by representatives from cotton- and sugar-growing areas rejected both his 1879 and his 1880 bill, either of which would have abolished slavery within 10 years. In 1880 Mabuco formed the Brazilian Antislavery Society.

Throughout the early 1880s Mabuco, along with black journalist José do Patrocínio and other allies, continued to publicize the antislavery agenda. Meanwhile, Jose Duarte Ramalho Ortigão, leader of the Bahian Chamber of Commerce and Agriculture, led opposition

to abolition on behalf of large plantation owners. In 1885 legislation emancipated slaves with at least 65 years of age. Despite important steps toward abolition and the formation of strong organizations working for the cause, Princess Isabel might not have signed the Golden Law (Lei Aurea) if not for broader economic and social change. Immigrants from Iberia and southern Europe began to arrive in Brazil in large numbers; approximately 3.5 million such people added themselves to the existing population between 1888 and 1928. The number of immigrants who arrived in Brazil over these decades surpassed the number of slaves brought to Brazil over the course of several centuries. The new availability of large amounts of inexpensive labor, paired with technological advances, made it economically feasible to operate plantations without slavery. Abolition encouraged further immigration and permanently altered both the economic and the social structure of Brazil.

While her father was abroad in Europe, Isabel assented to the Golden Law on May 13, 1888. The law provided for the complete and unconditional abolition of slavery in Brazil. Slavery came to an end with virtually no bloodshed, though its abolition alienated large landowners who had previously supported the monarchy. They resented the absence of any provision for indemnities to slave owners.

Thus by 1888 the imperial government had lost the support of the military, liberals, the church, and conservative landowners. Manuel Deodoro da Fonseca led the military coup that brought an end to the Brazilian Empire in November 1889. He met almost no resistance, though relatively few ordinary Brazilians participated in the coup or in the subsequent creation of a republic. Meanwhile, Pedro and the royal family went into exile; Pedro died in Paris in 1891.

Deodoro, who became the first president, resigned. A period of intense political contestation preceded the election of Prudente de Moraes, the first of many presidents from the state of São Paulo. The first Brazilian republic enjoyed booms in coffee and rubber exports, effected boundary settlements with its neighbors, and started to recognize the particular racial and cultural mixture that characterized Brazilian society.

MELANIE A. BAILEY

Brethren movements

Many religious denominations call themselves brethren. Pious German immigrants established most of these groups in America. The oldest and largest of them is the Church of the Brethren, founded in Germany by Alexander Mack in 1708. This denomination, with well over 200,000 American members, is one of the historical peace churches. Nevertheless, it is known for its foot-washing ritual as much as for its pacifist orientation. The more socially conservative Brethren in Christ Church was founded in 1778 by Jacob Engle and is part of the Holiness Movement, with an American membership of more than 18,000. The much smaller separatist Old Order River Brethren broke from this group in the 1850s and observes plain dress, head coverings for women, and beards for men. The Church of the United Brethren in Christ was founded by Martin Boehm in 1800. The majority of this community eventually joined with the United Methodists in 1968. The others who continued under the brethren name highlight their evangelicalism and have a current American membership of over 27,000.

However, with a North American membership of 90,000, the Christian Brethren (Plymouth Brethren) have had the most significant impact on religious thought. This evangelical and nondenominational movement, which generally practices weekly communion and functions without a traditional ecclesiastical structure, was born in Britain in the 1830s. Today, there are two primary groups of Christian Brethren in America, those who exclude from communion all but their own and those who hold an open ritual. Nonetheless, all groups within the movement of the Christian Brethren are devoted to the unique theology developed by John Nelson Darby. A priest in the Church of Ireland, he became the movement's primary theologian by the late 1840s. Darby was unhappy with the formalism of the state church, and after joining the Brethren movement in Plymouth, England, his pessimism led

him to promote ecclesiastical separatism and to create a most provocative theory of biblical prophecy, which he called dispensationalism.

Dispensationalism widely influenced the preaching of America's late 19th-century evangelists, such as Dwight L. Moody, and the teaching of early 20th-century Bible scholars, such as C. I. Scofield. The famous Scofield Reference Bible was published in 1909 by Oxford University Press to support Darby's theory. Darby claimed that history was divided into seven divinely appointed periods. Each of these seven dispensations represents a different stage in God's progressive revelation and sovereign plan for humanity's development. Darby focused his attention on the seventh period and the rise of a millennial kingdom, which was to be preceded by a series of events that included a rapture, or departure of the earthly church at Christ's first coming.

According to Darby, with the loss of Christian moral judgment, the people of Earth would be easily seduced by an Antichrist, which would lead to a time of Tribulation concluded by the so-called Battle of Armageddon. This battle between the forces of evil and Christ, who returns to Earth again, but this time with a heavenly army, would end with the establishment of a thousand-year kingdom of peace. Darby's theology has been connected to Fundamentalism and absorbed by many evangelical Protestant denominations. Moreover, it has become the dominant prophetic theory in a large number of American Bible colleges and seminaries, foremost among them being Moody Bible Institute in Chicago and Dallas Theological Seminary.

RICK M. ROGERS

British East India Company

The British East India Company was founded in 1600, during the last years of the reign of Queen Elizabeth I of England, for trade in the East Indies, which had been opened to European trade by the Portuguese navigator Vasco da Gama.

Because of rivalries for the spice trade in the East Indies, the English East India Company armed its mer-

chantmen to fight the galleons of Spain, Portugal, and, later, the Netherlands, all of which threatened British trade with the East. Because of its setback in the Spice Islands at the hands of the Dutch, the English East India Company decided to focus its energies on India, where the Dutch presence was far less powerful. The relative ease with which the British would be able to expand in India during the late 17th and 18th centuries was due to the decline of Mughal central power.

In 1757 the British East India Company—or John Company, as it was often called—took a critical step. Taking advantage of the worsening situation in India, it went from being a trading company to taking control of Indian territory as circumstances dictated. By this time the French *Compagnie des Indes* had taken the place of the Portuguese and Dutch as the main rival of the British in India. In 1756 the SEVEN YEARS' WAR broke out in Europe and quickly spread to India, where Robert Clive decisively defeated the French client in Bengal. In 1758 Robert Clive became the first governor of Bengal, signalling the transition of the British East India Company from a trading company to the ruler of a large province of India. A year before Clive's death, Parliament passed the 1773 Regulating Act, which made the governor of Bengal the governor-general, a title the chief company officer in India would hold until the British Crown took over the government of India after the INDIAN MUTINY of 1857.

Warren Hastings set in motion future British expansion in India. He instituted direct British rule, but where possible, he left native Indian rulers on their throne, but under British tutelage. Between 1784, when Hastings left India, and the beginning of the 19th century, the company's British troops continued to enlarge its domains due to the anarchy caused by the collapsing Mughal Empire. As company territory expanded, so did its direct rule. Its magistrates dispensed justice, impervious to bribery, something that local Indians had never before witnessed.

The peace the company brought to India helped undermine Indian society. The company permitted English Protestant missionaries to come to India in 1813, establishing missions and schools among the Indian population. Gradually, British authority began reforms in India. For example, William Bentinck, who was governor general from 1833 to 1835, outlawed the practice of sati (suttee), by which a Hindu widow was burned on her dead husband's funeral pyre.

The flash point of conflict between the company administration and the Indian governor-general came under the marquess of Dalhousie, who served from 1848 to 1856. He aggressively sought to enlarge lands

BOOMBAY on the Malabar Coast, belonging to the East India Company of ENGLAND...

under the company's control by the doctrine of lapse, which allowed the company to annex Indian principalities. Many points of friction culminated in a violent outbreak.

The Indian Mutiny broke out in Meerut in 1857 when some of the company's Indian soldiers rose in revolt. A terrible massacre took place at Cawnpore when an Indian ruler, Nana Sahib, had British prisoners brutally killed. Inflamed by the tales of mass murder, the British troops who retook territory that had fallen to the mutineers and their Indian princely allies showed no mercy. By the time the mutiny ended with Sir Hugh Rose's victory at Gwalior in June 1858, thousands had been killed.

The mutiny also ended the rule of the British East India Company. Although it would continue as a trading organization until 1873, in August 1858, the British parliament passed the GOVERNMENT OF INDIA ACT, which formally passed the administration of British India from the company to the British government. A secretary of state for India became responsible for the administration

of British India under the prime minister. For its complicity in the mutiny, the last impotent Mughal emperor was dethroned. In 1877, under Prime Minister BENJAMIN DISRAELI, Queen VICTORIA became empress of India.

JOHN F. MURPHY, JR.

British Empire in southern Africa

The first British involvements in South Africa were a result of maritime traffic going around the Cape of Good Hope to India. In the 17th century, the BRITISH EAST INDIA COMPANY had established trading stations at Madras, Bombay, and Calcutta. By the 18th century, a thriving trade led the British East India Company to have its own navy to carry goods and personnel back and forth from England to India. In 1652 the Dutch East India Company founded a trading station near what is now Cape Town and was busy attempting to extend its settlement into the interior, in the face of opposition from the indigenous African tribes.

The wars of the FRENCH REVOLUTION began in 1792, and the Netherlands was conquered and occupied by the French. To the British, with their unparalleled Royal Navy and need for a way station to India, the Dutch colony at Cape Town was a tempting target. In 1806 the British captured Cape Town and kept it even after NAPOLEON I's final defeat in 1815.

BRITISH EXPANSION

As the years progressed, the British became intent on making the colony more British; English replaced Dutch as the official language of the colony and its government. Anglican missionaries came to convert the Boers, the descendants of the Dutch settlers, to Anglicanism. (The Boers were staunch Calvinists of the Dutch Reformed Church.) The missionaries also advocated the abolition of slavery. Indeed, due to the influence of the London Missionary Society, slavery was virtually abolished in South Africa even before it was in the empire as a whole in 1833.

With wars against indigenous tribes an ongoing struggle for European settlements in the area, the British did not wish to take on any new imperial responsibilities in South Africa. The Kaffir Wars waged between the Europeans and the native Xhosa people were particularly lengthy and brutal. Consequently, between 1852 and 1854 the British government recognized two Boer republics, the Orange Free State, named for the Orange River, and the Transvaal Republic, on the opposite side of the Vaal River. In 1853 the Convention of Bloemfontein formalized, at least for the time being, the British relationship with the Boers.

Indeed, the entire government of South Africa was reorganized when in 1853 an Order in Council for Queen VICTORIA established fully representative government in the Cape Colony, with a parliament set up in Cape Town.

In 1877 the imperialist prime minister BENJAMIN DISRAELI expanded the Cape Colony with the annexation of the Boer Transvaal Republic. He sent out a new governor of Cape Colony to oversee the process in the colony: Sir Henry Edward Bartle Frere, who arrived in Cape Town in April 1877. The ninth, and final, Kaffir War broke out in October 1877, and although it ended with the defeat of the Africans, Frere was still alarmed. In Frere's view, the most immediate problem lay in the relations with the Zulu Kingdom, now under King Cetewayo.

Frere felt that the presence of the Zulu Kingdom, with its 50,000-man army, had to be dealt with by force. On January 11, 1879, British commander Chelmsford's South African Field Force crossed the border into Zululand. Early on the morning of January 22, Chelmsford set off after the Zulu regiments. He left a force to hold Isandhlwana, the main force of which was the 1st Battalion of the 24th Regiment. The Zulus, some 20,000 strong, pounced on the force left behind at Isandhlwana; not one British soldier was left alive. From there, the Zulu advanced to a garrison that was mostly from the 2nd Battalion. After 12 hours of fighting, the Zulu retreated.

On March 28, 1879, the British, fighting the Zulu at Hlobane, narrowly escaped another disaster like Isandhlwana. Almost immediately, plans were made to reenter Zululand; the image of a victorious Cetewayo was more than the London government could tolerate. On May 31 Chelmsford again advanced into Zululand, determined on a final conquest to redeem himself for his fatal miscalculation at Isandhlwana. On July 4, Chelmsford attacked Cetewayo's royal kraal at Ulundi and crushed the Zulu regiments. Cetewayo was captured on August 28, 1879, but Queen Victoria intervened to free him in 1883. On February 8, 1884, Cetewayo died amid rumors he had been poisoned.

AGITATION FOR FREEDOM

Ironically, the removal of the Zulu threat did not mean peace for British South Africa. After the war, the Transvaal Boers began to agitate again for their freedom, taken from them by Shepstone's annexation in 1877. On December 12, 1880, they united to fight for their independence.

The British forces were unprepared for the superior marksmanship, modern weapons, and guerrilla tactics employed by the men of the Boer commandos. Prime Minister WILLIAM GLADSTONE, opposed to the imperialist philosophy of his rival Benjamin Disraeli,

made peace with the Boers. By August 8, 1881, the Boers ruled again in the Transvaal capital of Pretoria.

In 1871 diamonds were discovered in the Cape Colony. One of those caught up in the diamond rush was CECIL RHODES. In 1881 he founded the De Beers Diamond Company. Pressing north into native African country (and away from stronger Boer resistance), Rhodes was instrumental in the annexation of Bechuanaland, today's Botswana, in 1885. His primacy among those in the Cape Colony was recognized in 1890 when he became prime minister of the Cape Colony.

Coveting the possible diamond hoard in the Transvaal, Rhodes sent Leander Starr Jameson, his assistant during prior wars, on a raid into the Transvaal Republic on December 29, 1895. Jameson and his men were quickly arrested and handed over to the British for trial and sentencing. For Rhodes, the punishment was more embarrassing; in 1896 he was forced to resign as prime minister for the Cape Colony.

The Jameson Raid seemed to the Boers another British attempt to conquer them and end their independence once and for all. In 1897 Joseph Chamberlain, the colonial secretary, or secretary of state for the colonies, appointed the ardent imperialist Alfred Milner as high commissioner for South Africa. His views on empire were very similar to Frere's. Instead of the Zulus, Milner saw the Boers as the main threat to British rule in South Africa. The British prime minister, Robert Cecil, Lord Salisbury, was an ardent empire-builder. While sporadic negotiations continued, both sides prepared for war, and Chamberlain sent reinforcements from England. Paul Kruger, a leader of the Boer resistance, determined to strike before the reinforcements could arrive. He issued an ultimatum, which would expire on October 11, 1899. This saved the British the trouble—and the blame—of declaring war themselves.

Kruger followed his ultimatum with a lightning advance by his commandos into both the Cape Colony and Natal Province. Kruger had 88,000 men and knew the British only had 20,000. However, Kruger underestimated the immense forces the British Empire had available. According to some estimates, by the end of the war, the British Empire committed a staggering 450,000 men to fight the Boers. The British forces in South Africa were commanded by General Sir Redvers Buller, who proved to be a disappointing commanding officer. Time and again, he and his troops were defeated.

On January 10, 1900, General Frederick Sleigh Roberts arrived in South Africa to replace the befuddled Buller. Roberts immediately went on the offensive against the Boers. Roberts led the British to victory on February 27

and 28, and March 13, and on May 27, 1900, he entered the Transvaal, determined to bring the war to a conclusion. On June 2 Kruger retreated from the capital of Pretoria, which Roberts entered in triumph three days later. The defeat of the Boer armies was sealed when Buller arrived in the Transvaal from Natal on June 12.

Between August 21 and 27 the last major battle of the war took place when Roberts and Buller defeated Boer general Louis Botha at Bergendal. In December 1900, with formal hostilities over, Roberts returned to Britain to become commander in chief of the army. Roberts's second-in-command, Kitchener, was left to oversee what soon became a guerrilla conflict. He adopted a draconian policy to stop the commandos, ordering his men to burn down Boer homesteads, destroy their crops, and run off or kill their livestock.

Kitchener introduced concentration camps in which to hold the dispossessed Boer families of the commandos. The conditions of the camps were appalling, and disease was endemic. According to some estimates, 28,000 Boers died in 46 camps, and between 14,000 and 20,000 Africans died in the camps. At the same time, the movement of the Boer commandos was hampered by a series of armored blockhouses. On January 28, 1901, Kitchener began a series of fierce offensives designed to wear down the commandos in a battle of attrition. On May 31, 1902, a peace settlement was made bringing the war to an end at Vereeniging. The Boers had been defeated on the battlefield, but had retained their independent spirit. Just two months earlier, on March 26, 1902, Rhodes had died, to be buried in his beloved Rhodesia. As a new century opened, a new and unknown future began for the British in South Africa.

British governors-general of India

The office of the governor-general of India was established in 1773 when Warren Hastings was made the first governor-general of the presidency of Fort William, Calcutta, taking up the position in the following year. Initially the office only had control over Fort William, but it quickly came to control the Bengal region of northeastern India.

The position was created because of the widespread belief that there was massive corruption in the East India Company that necessitated some form of British government oversight, which led to the Regulating Act. However, Warren Hastings, who held the position from October 20, 1774, to February 1, 1785, was himself subject to widespread allegations of corruption and was impeached in 1787, with the trial lasting from 1788 until his eventual acquittal in 1795.

When Hastings left for England, Sir John MacPherson was made provisional governor-general until Earl Cornwallis (later Marquess Cornwallis) arrived in India to serve as governor-general from September 1786 until October 1793. He is perhaps best remembered for his surrender of the port of Yorktown in the American War of Independence. In India in 1792 he defeated Tipu Sultan at Mysore and was succeeded by Sir John Shore who retired in March 1798. His successor was the earl of Mornington (later Marquess Wellesley), who was the brother of Arthur Wellesley, the first duke of Wellington. Arthur Wellesley became the military adviser to the governor-general and established Fort William into a training college for the British administrators in India.

Marquess Wellesley left office on July 30, 1805, and was replaced by Marquess Cornwallis, who died two months after starting his second term. After a long period of Sir George Barlow serving as provisional governor-general, Lord Minto was appointed. The earl of Moira (later marquess of Hastings), who had served in the American War of Independence, was the seventh governor-general from 1813–23. During this time he oversaw the purchase of Singapore and also worked on improving the Mughal canal system.

However, he was forced out of office owing to a financial scandal, and his successor was Lord (Baron) Amherst (later Earl Amherst) who had led a British embassy to China and hoped to expand British possessions with his involvement in the First Anglo-Burmese War of 1823. Although the war was a British victory, large numbers of British soldiers were killed.

In 1828 he was replaced by Lord William Bentinck, who had previously served in India as governor of Madras. His task in India was to massively reduce British government expenditure. He also tried to introduce some social reforms such as ending suttee, a tradition where widows sacrificed themselves on their husband's funeral pyres. His successor, Lord (Baron) Auckland (later first earl of Auckland), quickly found himself involved in a disastrous war in Afghanistan and was replaced by Lord Ellenborough. When Ellenborough arrived in India, he received news of the massacre of the British in Kabul under policies introduced by his predecessor. Although his time as governor-general included a war in Sind, he himself was largely concerned with trying to prevent increasing Russian involvement in Central Asia. Sir Henry Hardinge was briefly governor-general from July 1844 until January 1848, presiding over British India during the First Sikh War.

In 1848 Lord Dalhousie (later first marquess of Dalhousie) was appointed as governor-general. He was determined to enlarge British India and oversaw the annexation of much of Burma during the Second Anglo-Burmese War. He was more controversial for introducing his “policy of lapse.” Under this policy in any Indian feudatory state under the direct influence of the BRITISH EAST INDIA COMPANY, if the ruler was either “manifestly incompetent or died without a direct heir,” the territory could be annexed by the British. This led to the annexation of Jhansi in 1854 and Oudh (modern-day Awadh) in 1856, two of the major causes of the INDIAN MUTINY OF 1857.

Viscount Canning was appointed as governor-general in February 1856, and it was during his term that the Indian Mutiny of 1857—now often called the Indian War of Independence—broke out. In 1858 there was a complete overhaul of the British administration in India, and one result was that Canning, who became Earl Canning, was appointed to the newly created position of governor-general and viceroy of India. He was succeeded by the earl of Elgin, who died in 1863, resulting in the subsequent appointment of Sir John Lawrence (later Lord Lawrence). Lawrence had helped prevent trouble in the Punjab in 1857 and was able to maintain the status quo in India in the 1860s. When Lawrence left India in 1869 it was relatively peaceful, and the remaining governors-general, all British nobles, presided over an increasingly prosperous colonial India until its independence in 1947.

JUSTIN CORFIELD

British occupation of Egypt

Through diplomatic negotiations in 1881–82, the British and French reached an agreement whereby the French occupied Tunisia in North Africa and Britain took Egypt. The British militarily defeated Egyptian nationalist forces led by Ahmed Urabi at the Battle of Tel-el-Kebir in 1882. The Dufferin Commission was then sent to Egypt to make recommendations as to what should be done.

Initially, the British claimed that the occupation was a temporary one, but geopolitical considerations and ongoing conflict in the Sudan under the Mahdi led to the long-term occupation of Egypt by the British. The British superimposed their own administration and became the de facto rulers of Egypt while maintaining the facade of Egypt as an autonomous province of the Ottoman Empire as arranged during the rule of MUHAMMAD ALI.

The khedive was retained, with British advisers in the key government offices. A nonelective legislative council of Egyptians served in an advisory capacity. This two-tiered, often-cumbersome administration led to British control over all aspects of government from the judicial to financial to education.

Evelyn Baring, later Lord Cromer, was appointed consul general in 1883. Cromer was the virtual ruler of Egypt until 1907, when he was forced by the British government to retire following an increase of Egyptian nationalist discontent. A fiscal conservative, Cromer attempted to lessen the financial burdens on the fellahen (peasants) but devoted few resources to education or other social programs. The British did improve the irrigation systems in Egypt and also abolished forced labor. The railway system that benefited British commercial interests was also extended to the detriment of road and water transportation systems. Mixed courts dealt with all cases involving foreigners, and civil courts with Egyptian judges and lawyers served the Egyptian population. A lively press that covered a wide range of political and social issues also developed, although the

British carefully monitored it for subversive or anti-British opinions.

Over the years the number of British advisers proliferated. The presence of foreign troops and often arrogant British bureaucrats increased nationalist opposition to the occupation, particularly among the urban educated youth. Mustafa Kamil who led the Watan (Nation) Party from 1895 until his death in 1908 was one of the most vociferous and fiery of the new generation of Egyptian nationalists.

Much to the dismay of the British, Tewfik's successor, Khedive Abbas Hilmi supported the nationalist cause. Mounting Egyptian nationalism led to the emergence of political parties that the British vainly attempted to control. British control was not formalized until Egypt was declared a British protectorate with the outbreak of World War I in 1914.

JANICE J. TERRY

Buganda, kingdom of

The early history of Buganda begins with the dynasties starting in roughly 1300. Among them, the Chwezi were the most prominent. The balance of power was changed by the arrival of Luo-speaking people from the Upper Nile who were looking for good land, which they found in Uganda. Arriving in the 1500s, they represented a continuation of the migration of peoples from the Sahara region as desert encroached on the grazing area of their cattle. These pastoralists came as conquerors in many cases, imposing their ways on the more advanced people who became their unwilling subjects.

In 1497 the Portuguese explorer Vasco da Gama stopped in East Africa to take on Arab sailors familiar with the Arabian Sea. In 1498 he would visit India. Yet the riches of East Africa were not lost on the Portuguese, and they would return to attempt to carve out their own commercial empire in East Africa, with again the slave trade as one of their most lucrative markets. In 1505 the Portuguese, with their firearms, would take both Kilwa and Mombasa as part of a virtual conquest

of the entire Indian Ocean, presenting the Bugandan kings with a new and rich source of trade.

The tumultuous changes going on outside Buganda's borders inevitably had an impact on the country and its people. Portuguese and Arabs clamored to have influence with the king, the kabaka, and contributed to instability within the royal house itself. The kabakas were still strong and took astute advantage of the turmoil between the Portuguese and the Arabs to expand their kingdom.

The 19th century saw even more powerful foreign powers enter the African scene. In 1806 Britain would conquer the Cape of Good Hope from the Dutch, beginning the modern history of South Africa. In 1830–31 the French would begin the conquest of Algeria, opening their history of empire in North Africa. It was inevitable, as the European colonial powers expanded their control in Africa (Britain conquered Egypt in 1882), that the kingdom of Buganda could not stay immune from their influence. Buganda was visited by explorers, such as Henry Morton Stanley and John Hanning Speke, who were impressed by what they saw of the native kingdom. By this time, the internal pressures were causing Buganda to begin to fail as a viable state.

Finally, in 1885 the kabaka Mwanga II took an irrevocable step that would inevitably cost Buganda its independence. Between 1885 and 1887 Mwanga II had some 45 Christian converts, some 22 Catholic and 23 Anglican, murdered. Although he did this to thwart the growth of Christianity in his kingdom, the brave example of the martyrs only caused others to join their faith. At the same time, Muslims conspired to have a Muslim placed on the throne instead.

In 1867 a Bugandan king converted to Islam, if only in name. Mwanga II lost his throne, but managed to regain it. British intervention was guaranteed when, in the beginning of his persecution, Mwanga II had Anglican bishop James Hannington killed; Hannington had just been appointed to oversee the growing Anglican flock in East Africa.

At this time, Germany also entered the competition for Buganda. Carl Peters had established the colony of German East Africa, eventually known as Tanganyika. In November 1886 Great Britain and Germany signed an agreement dividing East Africa into the German zone and British East Africa, which bordered Buganda. Peters was determined to add all of Uganda to what the British called "German East."

By May 1890 Peters got Mwanga II to agree to a German protectorate over Uganda. This sent shock waves through London, where the headquarters of

the British East Africa Company could see their plans for an East African empire wither. On May 13, the British prime minister Lord Salisbury succeeded in convincing Kaiser Wilhelm I to give up any claims to Uganda and nearby territories in return for the island of Heligoland, which he saw as vital to the defense of the Kiel Canal. However, the British were taking no chances the kaiser might change his mind. The British government of Prime Minister Lord Roseberry dispatched Frederick Lugard in 1894 to end the chaos that was now causing Buganda to implode. Establishing a firm British protectorate over Buganda, as he later would do in Nigeria, in 1897, Lugard finally deposed Mwanga II.

JOHN F. MURPHY, JR.

Burlingame, Anson, and Burlingame Treaty (1868)

Anson Burlingame was a lawyer who served as a member of the U.S. House of Representatives from 1855 to 1861 and as minister to China from 1861 to 1867. In 1868 the Chinese government appointed him ambassador to negotiate treaties on China's behalf with the United States and European nations. He died in St. Petersburg, Russia, in 1870.

As a result of defeat by Great Britain and France in 1858 and again in 1860, China was forced to sign the Treaties of Tianjin (Tientsin) and Beijing (Peking), whereby Britain and France gained the right to establish legations in China's capital. Because of the most-favored-nation clause in the treaties, the United States also obtained that right.

Burlingame was the first U.S. minister to China, arriving in Beijing in 1862. He and British minister Sir Frederick Bruce championed a cooperative policy toward China based on four principles: cooperation among Western powers, cooperation with Chinese officials, recognition of legitimate Chinese interests, and enforcement of treaty rights. A decade of peace and goodwill prevailed in Sino-Western relations as a result.

China did not at first reciprocate in establishing diplomatic missions abroad despite urgings by Western nations. In 1862 a minor, Emperor TONGZHI (T'ung-

chih), ascended the Chinese throne; his uncle PRINCE GONG (K'ung) acted as regent and took charge of foreign affairs. Prince Gong needed to understand international law and Western diplomatic practices and obtained the help of an Englishman, ROBERT HART, who commissioned W. A. P. Martin and his Chinese assistants to translate 24 essays on international diplomacy into Chinese from a book by Henry Wheaton titled *Elements of International Law*. Burlingame played a role in their publication and presented a copy to Prince Gong in 1864.

The Treaty of Beijing was up for revision in 1868. That prospect aroused fear among Chinese officials due to the persistent demands of Western merchants for a more aggressive policy toward China to force further concessions. At this juncture Burlingame's tour of duty in China ended. He volunteered to represent China in a roving diplomatic mission to the West. Prince Gong accepted and appointed him and two Chinese as coenvoys.

They arrived in the United States in 1868, were received by President Andrew Johnson, and signed a treaty (called the Burlingame Treaty) with Secretary of State Seward. By its terms the United States agreed not to interfere in China's development, allowed China to establish consulates in the United States, permitted Chinese laborers to enter the United States, and granted reciprocal rights of residence, travel, and access to schools in either country. The embassy next traveled to Britain, Prussia, and Russia, where Burlingame died as a result of pneumonia. The other envoys then visited several other European countries before returning to China in 1870. All European nations agreed not to force China into new agreements.

This was China's first diplomatic mission abroad since being opened by the West. It was a great success in achieving China's immediate goals by securing Western powers' commitment to a policy of restraint and noncoercion toward China.

Burmese Wars, First, Second, and Third

The three Burmese Wars were the result of frictions between the BRITISH EAST INDIA COMPANY, which ruled a growing British dominion in India, and the kingdom of Burma, or Ava. The First Burmese War was fought from 1824 to 1826 over long-standing frontier disputes that the East India Company inherited from the MUGHAL DYNASTY of India.

At the same time that the British East India Company was expanding in India, Burma had regained unity as the kingdom of Ava in 1752. The first king of a reunified Burma is considered to be Alaungpaya, who reigned from 1752 to 1760. Even before Alaungpaya had reunited Burma, there had been friction between the British and the kingdom of Pegu. In the 1730s the British established a diplomatic resident in Syriam in Pegu to help its trade and gain access to valuable timber. But in 1743 internal unrest caused Syriam to be sacked, and the British representative returned to India. The reign of King Bagyidaw began in 1819. He annexed Assam in 1819 and went on to claim Manipur in 1822.

Faced by the Burmese invasion, the local rulers preferred protection under the British East India Company and sought its help. The Burmese struck first on September 23, 1823. In March 1824 the East India Company declared war on Burma and the governor-general Amherst executed a three-pronged assault on the kingdom of Ava. During the British invasion, some Karens, a Burmese ethnic group, actively supported the British, serving as guides. By 1825 British forces had captured the ancient city of Pagan and the king decided to make peace with the British. The war ended with the Treaty of Yandabo in February 1826 that ended the First Burmese War, with Britain gaining valuable coast territory in southern Burma.

Peace between the East India Company and the kingdom of Ava lasted until 1852 when Governor-General Dalhousie, wishing to gain complete control of the sea lanes between India and Singapore, sent an ultimatum to King Pagan Min of Ava, threatening that hostilities would begin unless the company's demands were met by the Burmese within one month. The demands made by the British stemmed from the Treaty of Yandabo. While the Burmese were quick to appease the British, England found enough reason to attack. Facing no real opposition, Dalhousie's forces annexed the main towns of southern Burma. With the end of the Second Burmese War, the British were

masters of southern Burma. Pagan Min died in February 1853, succeeded by Mindon Min. The British, unsure of the determination of the new king to fight and reluctant to be drawn deeper into fighting in the jungles of Burma, were content with the gains they had already made.

Mindon Min proved to be an astute diplomat in the competition for empire between France and Britain in Southeast Asia. In 1878, Mindon Min was succeeded on the throne by Thibaw Min, who continued to play off the French against the British. Thibaw Min, however, lacked the diplomatic skill of his predecessor and eventually ended up in war against the British.

In 1885 the Third Burmese War began when a British force numbering 9,000, with 2,800 local levies under the command of General H. N. D. Prendergast, attacked the Burmese capital at Mandalay. The official reason for the war dated back to 1878 when King Thibaw came to the throne and sought to erode British influence. In early 1885 he insisted that British representatives remove their shoes when entering his palace. With rising tensions, Thibaw began to support tribesmen in Lower Burma who were opposed to British rule. The true reason for the war was more likely that the British were worried about increasing French influence in the region—the French foreign minister Jules Ferry having begun meetings with a Burmese delegation. This coincided with a French consul taking up residence in Mandalay, although he was withdrawn for “health reasons” by the French in a diplomatic retreat soon afterward.

On October 22, 1885, the British issued an ultimatum to Thibaw demanding that the Burmese accept a British resident in Mandalay and that the British control all foreign relations of the kingdom, thereby making it a protectorate. There were also minor issues such as the matter of a fine imposed on the Bombay Burmah Trading Company because the company had underreported its logging of teak and had been underpaying its local staff. Another influence was undoubtedly British interest in the oil deposits there. On November 9 the Burmese refused to consider the British demands, and war became inevitable, with the British mustering their forces at Thayetmo.

The British advanced up the Irrawaddy River from Thayetmo on November 14. They used flat-bottomed boats manned by the Royal Navy, taking with them 24 machine guns and many ships containing supplies and ammunition. The British land forces took control of

the redoubt at Minhla, where the Burmese put up some resistance on November 17. On November 26, with the flotilla close to Mandalay, envoys from Thibaw met with General Sir Harry Prendergast and offered to surrender. The British reached Ava on the following day and accepted the Burmese surrender.

On November 28, the British started sacking Mandalay, and then a number of them were sent to Bhamo, which they reached on December 28. The war ended with the British annexation of Burma on January 1, 1886. The war was conducted with little loss of life to the British and was a further example, after the Anglo-Zulu War, of what became known as the British Forward policy.

The governor-general had been replaced by a viceroy, who ruled India directly in the name of Queen VICTORIA, who by now was the queen-empress. At the time of the Third Burmese War, Viceroy Frederick Hamilton-Temple-Blackwood (later, first marquis of Dufferin and Ava) was able to martial Crown forces that Thibaw could not match. As expected Thibaw refused the British ultimatum. After an astonishing attack, Thibaw finally told his men to lay down their weapons and acknowledged British victory.

Mandalay fell, and King Thibaw was imprisoned, although his rank as king would have been respected. After Mandalay was captured, the British went on to capture Bhamo on December 28, 1885. The British wanted to overawe the Burmese and thwart any Chinese move into Burma. On January 1, 1886, the rump state of Thibaw’s Kingdom of Ava, or Upper Burma, was also annexed to British India. The final act took place when Upper and Lower Burma were united as Burma and placed firmly within the British Raj, or Indian empire. Sir Frederick Roberts, the hero of the Second Afghan War, completed the pacification of Burma, using Indian cavalry regiments and locally raised troops to subdue remaining pockets of Burmese resistance, although guerrilla warfare would last until at least 1890.

JOHN F. MURPHY, JR.

Canadian Confederation

Prior to 1867 North American Canada was better described as a collection of Canadas. The Atlantic Maritime provinces focused on fishing, lumbering, and shipping. Lower Canada was home to New France habitants pushed unwillingly into the British Empire when the SEVEN YEARS' WAR/FRENCH AND INDIAN WAR ended in 1763. Upper Canada (Ontario) was the hub of British colonial power and wealth. North and west of the Great Lakes, a mixed population of Indians, fur traders, Hudson's Bay Company agents, and prospectors, many Canadian, others Americans, generally evaded supervision by either of their governments.

As early as 1790 in the wake of an AMERICAN REVOLUTION that fractured British power in North America, proposals emerged for a stronger union among Britain's remaining colonies. Not until the 1850s, however, did political and opinion leaders become serious about creating a real Canadian nationhood for the country's 4 million inhabitants. Among the issues at stake were continued fear of U.S. encroachment and economic power and controversial plans to assert control over western lands for the purpose of building a transcontinental railroad.

This simmering crisis over Canada's future came to a head when the United States erupted in CIVIL WAR in 1861. As Great Britain's government considered recognizing the seceding Southern Confederacy, Canada became a handy target for outraged Union supporters who often also harbored designs on Canadian lands.

Irish-American nationalists, called Fenians, used Union resentment against Britain to send their own anti-British message by attacking Canadian towns. More devastating to Canada was America's cancellation, as the Civil War was ending, of a 12-year-old United States/Canada trade reciprocity agreement vital to most Canadian provinces.

Against this backdrop, Canadian politicians began in 1864 to rough out a new plan for union. Although Britain's parliament would have the final say, the process of creating a new dominion of Canada was very much propelled by local leaders. Influential Toronto newspaper editor George Brown proposed a federal Canada, combining the constitutional model of U.S. federalism with Britain's parliamentary system, but with improvements to both. Powerful politician JOHN A. MACDONALD, later first prime minister of a federated Canada, insisted that all of Canada's provinces would be included. Québec leader George-Étienne Cartier won support among French-Canadians by assuring them that new provincial powers were strong enough to protect French culture and language. As Fenian attacks across the U.S.-Canada border crested in 1866, dominion backers used this threat to attract crucial political support to their plan. On July 1, 1867, after Parliament ratified the British North America Act, the Dominion of Canada was born. The new Canada, although still closely tied to Britain, had moved from colonial dependency to a status much closer to sovereign nationhood.

Dominion, of course, did not solve all of Canada's problems and, indeed, created some new ones. The

Maritimes, especially Nova Scotia, had little interest in sending their tax money to develop the west. Talk of secession was eased by financial and political concessions. New Brunswick and Nova Scotia joined Québec and Ontario in the Dominion in 1869. Prince Edward Island held out until 1873; Newfoundland did not formally join Canada until 1949.

Unlike their southern neighbors, Canadians had never adopted MANIFEST DESTINY, the idea that Canadians must dominate their continent from sea to sea. But the possibility of expanding Canada westward was crucial to the success of the dominion plan, and with dominion came the powers necessary to open new territories to immigration, trade, and development.

One problem was the role of the Hudson's Bay Company, a quasi-private fur and sundries trading company founded in 1670 under a royal charter granted by England's king Charles II. For practical purposes, company officers were the overseers, if not the actual governors, of the prairie lands west of Canada proper. The people of this huge territory, many of them members of Indian tribes or of mixed Indian and English or French heritage, were justifiably alarmed by the new central government's looming buy-out of "Bay" holdings.

In 1869 Canadian surveyors appeared in the Red River region, north of the United States's North Dakota/Minnesota border. They imposed new rectangular boundaries that ignored long-established farms and properties. Residents, many of them French, or French-Indian (also known as Métis) threatened violence. Resistance to faraway Canada became better organized under the leadership of LOUIS RIEL, a well-educated Red River native of Métis descent. Seizing the settlement of Fort Garry (now Winnipeg), Riel and his followers demanded negotiations.

The Red River Rising of 1869–70 began without bloodshed. But efforts to solve competing claims of territory and authority reawakened ancient hostilities between French, English, and Native Canadians. In March 1870 Riel and his men captured and executed a particularly insolent English opponent. Nonetheless, peace was uneasily maintained. In May 1870 the Red River region formally became part of the new Canadian province of Manitoba. The vast remaining unorganized territories between Manitoba and British Columbia, a Pacific coast province since 1858, became Canada's Northwest Territories. Even when these lands gained provincial status, Ottawa maintained far more control over their affairs than it did in "Old Canada."

By 1885 a private consortium, aided by huge government subsidies and land grants, completed the Cana-

dian Pacific Railway, connecting Canada's new west to the rest of the much-enlarged nation. The same year, the Northwest Rebellion in the new province of Saskatchewan revealed that Canadian federation had not resolved all the racial and sectional grievances of Métis, Native tribes, and other western settlers. Led once again by Riel, by then declining into mental illness, this uprising ended in Riel's execution, setting off outrage among French-Canadians. Canada in 1885 was a far larger and considerably more independent and developed nation than it had been on July 1, 1867. But it still faced the challenge of truly melding its disparate Canadas into a harmonious whole.

MARSHA E. ACKERMANN

Canton system

In mid-18th century the QING (Ch'ing) DYNASTY of China confined all foreign traders to the port of Canton (Guangzhou) in southern China and restricted trade. In Canton, all merchants were banned from direct contact with Chinese officials and were confined to an area of 13 factories, located outside the city walls. All foreign traders lived in quarters that came to be known by locals as factories. Since no women were allowed to enter these factories, the nearest families were housed in Macao, a nearby town that the previous Ming dynasty had ceded to Portugal. The area became the center of foreign trade in China.

While in Canton, all trade was controlled by the Chinese merchants, known as *hongs*, who imported goods from inland China to trade with the merchants who arrived in Canton each year. The responsibility for overseeing Canton trading activities and for collecting all taxes was delegated by the emperor to a *hoppo*. The *hoppo* and the guild of hong merchants were held accountable for all transactions, including the behavior of all foreign merchants.

As the foreign ships arrived in Canton, they were inspected by Chinese officials and assessed tariffs, and the Chinese frequently demanded bribes. Since they were

banned from learning Chinese, all traders were forced to hire local interpreters.

The Canton system of trade created resentment that was particularly strong among British traders who expected more respect of the foreign trade in China. However, as long as the foreign traders were greedy for Chinese goods such as tea, silk, porcelain, and lacquerware, they were forced to accept China's terms. In return for Chinese goods, the hong merchants imported tin, copper, lead, iron, wool, cotton, and linen. Up to the end of the 18th century, China enjoyed a trade balance with Great Britain.

In June 1793 King George III of Great Britain dispatched Lord George Macartney as ambassador to China to meet with Emperor QIANLONG (Ch'ien-lung) and request that China open up other ports for trading and other concessions. The emperor responded that compliance with Macartney's requests was inconsistent with "dynastic usage." He also summarily refused the king's request to open up additional ports.

By 1800 foreign traders had discovered a product that an increasing number of Chinese demanded: opium. Approximately 40,000 chests, each containing 133 pounds of opium, were being imported into Canton each year by the 1830s. Although opium was banned, foreign traders continued to smuggle it into the country. In an effort to call a halt to such smuggling, Emperor Daoguang (Tao-kuang) charged LIN ZEXU (Lin Tse-Hsu) with the task of ending the opium trade in China in 1839. Lin immediately set about reinforcing China's laws. Raids upon local opium dens netted thousands of opium pipes, but large quantities of opium remained in foreign hands.

Commissioner Lin next issued a two-pronged ultimatum to all foreign opium traders. They could either leave China immediately, or they could surrender all opium to officials. Failure to comply would result in their being prohibited in carrying out legitimate trade. A number of traders chose to leave China, some signed a bond, but others took a wait-and-see attitude. British traders developed a plan whereby they would surrender only a few chests as tokens. Lin was not deceived and continued the standoff.

Lin then removed all Chinese servants from the offending factories. The standoff lasted 47 days before the British traders surrendered some 20,000 chests of opium containing over 3 million pounds of raw opium. The opium of British merchants was first handed over to the British superintendent of trade in Canton, which made it British government property. Elliot then handed the chests over to the commissioner, Lin, who had them destroyed.

Major problems, however, remained unresolved between China and Britain, culminating in war. The first ANGLo-CHINESE OPIUM WAR (1839–42) resulted in British victory. The Treaty of Nanjing (Nanking) ended the hong system and Canton's special position as the only port of entry in China's trade with the West.

ELIZABETH PURDY

Catherine the Great

(1729–1796) *Russian czarina*

When Czarina Elizabeth died in December 1761, her nephew Peter ascended the throne. He had already alienated his wife, Catherine (Sophia Augusta, the princess of Anhalt-Zerbst in the Holy Roman Empire), by his evident lack of affection for her. Some historians believe that their son Paul was actually fathered by her lover Sergei Saltykov, a rumor believed at the time by Czarina Elizabeth prior to her death. Catherine lived in fear that without the czarina's protection, Peter might do away with her. He already had had at least one mistress, Elizabeth Vorontzov. Catherine decided to strike first, for she knew that if Peter killed her, he might have Paul killed too.

Besides his wife, Peter III had also alienated the most important political force in the capital of St. Petersburg, the regiments of the Russian Imperial Guard. Although Catherine was German by birth, she had successfully won over the Guards during the years since her first appearance at court.

To them, she was a Russian czarina, and Peter III a German usurper. Assured of the Guards' support by her current lover, Gregori Orlov, himself an officer in the Ismailovski Regiment, his brother Alexei Orlov, and other officers, Catherine seized power from Peter III in a coup on June 28, 1762.

In her manifesto Catherine declared that Peter III had intended to "destroy us completely and to deprive us of life." Peter was forced to abdicate and on July 6 was killed, apparently in a quarrel with one of those

guarding him. Whether Catherine was a party to his death, historians will never really know. But with Peter removed from the scene, she most likely slept more soundly than she had in years. On September 22, 1762, Catherine was crowned empress and autocrat of all the Russias.

Although the Imperial Guards regiments had supported her, some of them still felt a sovereign from the ROMANOV DYNASTY should rule them, not a German-born princess. To tighten her control of the Guards, and the rest of society, Catherine reinstated the secret police that Peter had abolished in one of his enlightened reforms. Catherine's secret branch became the model for the Okhrana, the special police who would serve the czars until the very end.

Foreign affairs first claimed her attention as Russia struggled with the aftermath of the SEVEN YEARS' WAR. In 1763 Augustus III of Poland died, and the Poles began the process of electing a new king in their Sejm, or parliament. As the elector of Saxony in the Holy Roman Empire, Augustus's son Frederick Christian automatically became the elector, but there was dissension over who would succeed him as king of Poland. Catherine favored Stanislas Poniatowski to succeed Augustus as king, partly because Stanislas had once been her lover, and she wanted a friendly Poland. With the weight of the huge Russian army tilting the scales now in his favor, Stanislas was duly elected the next king by the Polish Sejm as Stanislas II Augustus in 1764.

Ironically, Poland would become the means of finally making peace among the belligerent nations of the Seven Years' War. Prussia, supported by England, had fought against the Austrian Empire, France, and Russia during the conflict. In an attempt to make peace among them, the three eastern powers, Prussia, Austria, and Russia, decided to partition Poland. The first partition took place in 1772, to be followed by subsequent partitions in 1793 and 1795. By the Third Partition of Poland in 1795, Poland no longer existed as a state, and Stanislas II, without a kingdom to rule, abdicated his no-longer-existing throne. It would not be until the aftermath of World War I that Poland would rise again as an independent nation.

With Russia's western front secured, Catherine now moved against Russia's traditional enemies to the south and east, the Ottoman Empire and its vassals, the khans of the Crimea, the Gerei dynasty. In 1768 Catherine began war against the Ottoman Empire, now in its decline under the sultan Mustafa III. On July 10, 1774, the Russians under Field Marshal Peter Rumiantsev and the Turks signed a peace at the village

of Kuchuk-Kainardji in the Balkans. Russia gained full access to the Sea of Azov and the Caspian Sea and the independence of the Crimean khanate from Ottoman rule. In return, Russia returned much of the lands in the Balkans and along the Danube that it had conquered from the Turks. But it was evident that the Russians reserved the right to intervene at any time in the region.

This became the bedrock of the Pan-Slav movement of the 19th century, when the Russians felt themselves to be the particular protectors of the Slavs who still lived under Turkish rule in the Balkans. In 1778 the Turks launched a fleet on the Black Sea to send an expeditionary force to help the foundering Crimean khanate, but the Turkish fleet sailed aimlessly in the Black Sea until foul weather forced it to seek refuge at the Ottoman naval base at Sinope. In 1783 Catherine II's new favorite, Prince Grigori Potemkin, threatened the khanate with a Russian invasion. Bahadur II Gerei, the last of his dynasty, abdicated to be pensioned off by Catherine II, now becoming known as Catherine the Great.

The great campaigns, however, had thrust an intolerable burden onto the peasants, the vast majority of the Russian population. The policy of serfdom, reducing peasants to virtual slaves on the great landownings of the nobility, had by now reached most of Russia. The need for weapons for the wars had put inhuman demands on the workers in the Ural mines, and often soldiers had to be sent in to quell labor disputes.

In 1773 a Yaik Cossack by the name of Emilian Pugachev proclaimed that he was Peter III, who had come back to save the Russians from the tyranny of "the German woman." With her forces largely committed to the war with the Turks, Catherine's military resources were limited. Pugachev seized the great city of Kazan, and Nizhni-Novgorod, the third city of her empire, was destroyed when the serfs there rose in support of Czar Peter. When she saw that Pugachev might reach Moscow, and perhaps St. Petersburg, Catherine brought her troops home. With the return of thousands of her veteran troops, the tide turned rapidly against Pugachev. On January 10, 1775, he was beheaded in Moscow.

The experience with the Pugachev rebellion did not deter Catherine from her desire to modernize Russia. A self-educated woman, she corresponded regularly with the leaders of the ENLIGHTENMENT, like VOLTAIRE and Denis Diderot in France. Among Catherine's initiatives to modernize Russia were the abolition of torture (even with Pugachev) and the encouragement of industrial and agricultural growth. She also extended equal rights to the empire's Muslim population, which had grown

A monument to Empress Catherine the Great in Vilna. Her reign encompassed several wars, but she saw herself as a peacemaker.

greatly with the annexation of the Crimea after 1783. They were given the right to build mosques, although, as with all religions, Islam was kept under scrutiny by the state, and the Russian Orthodox Church remained paramount in the empire.

By the late 1770s Catherine had become to see herself as a peacemaker in Europe. On December 30, 1777, Maximilian Joseph, the elector of Bavaria, died. Frederick II of Prussia was pitted against the Empress MARIA THERESA of Austria, who ruled jointly with her son, Emperor JOSEPH II. Although Frederick began the War of the Bavarian Succession in April 1778, neither side was anxious for another bloody war like the Seven Years' War of 1756 to 1763. Although Catherine favored Frederick, both sides accepted her mediation, and the war came to an end at the Peace of Teschen in April 1779. Both Austria and Prussia received Bavarian territory in compensation, but the new elector ruled a free Bavaria as Charles Theodore.

By this time, Catherine had to face a threat from an unexpected quarter. For nearly 60 years, the thoughts

of the French Enlightenment, enlivened by her friends Voltaire and Diderot, had undermined popular support for the Bourbon dynasty in France. In July 1789 revolution broke out in France, sending shock waves throughout the monarchies of Europe. Even worse was to come when, during the Turkish War, King LOUIS XVI of France was beheaded in Paris in January 1793 by the revolutionary Committee of Public Safety. The shock to Catherine was severe—the ideas of the very men she had supported and felt were her allies had led to the death of a king. In 1793, with the countries that had invaded France thrown back, the armies of revolutionary France began to spread the ideas of liberty, equality, and fraternity throughout Europe against the forces of the First Coalition, of which Russia was a member. Nobody will ever be fully able to gauge the result of the revolutionary upheaval upon Catherine the Great, but her beliefs in progress and enlightened rule were totally shaken by the upheavals upsetting the Old Order in Europe.

On November 6, 1796, following a massive stroke, Catherine died, having ruled Russia for 34 years. Whatever the results of the FRENCH REVOLUTION, neither Europe nor Russia would ever be the same again after the reign of Czarina Ekaterina, Empress Catherine the Great.

caudillos and caudillismo

Understanding the phenomenon of the caudillo is essential for understanding the political history of 19th-century Latin America. (The terms *caudillismo* and *caudillaje* refer to the more general phenomenon of rule by caudillos.)

While there is no universal definition that fits every caudillo under all circumstances, scholars generally agree on a cluster of attributes that most caudillos

shared and that together provide a viable working definition of the caudillo phenomenon.

In general, a caudillo was a political-military strongman who wielded political authority and exercised political and military power by virtue of personal charisma, control of resources such as land and property, the personal loyalty of his followers and clients, reliance on extensive clientage networks, the capacity to dispense patronage and resources to clients, and personal control of the means of organized violence. Some caudillos were also distinguished by their exceptional personal courage, physical prowess, or ability to lead men in battle. Many also displayed a kind of hyper-masculinity and macho swagger that emphasized their maleness in explicitly sexualized terms.

In many ways, the keyword is *personal*: a caudillo was a type of leader, marked by his style of leadership, and most defined by the personal nature of his rule. Constitutions, state bureaucracies, representative assemblies, periodic elections—these and other institutional constraints on individual and personal power, commonly associated with modern state forms, all were antithetical to the caudillo style of rule, while also often coexisting in tension with it. Ideology mattered little, as caudillos ran the gamut from populist revolutionaries to moderate liberals to staunch conservatives.

There is broad agreement that the shorter-term origins of caudillismo can be traced to the tumult of the independence period, as local and regional military chieftains emerged in the fight against the Spanish. A paradigmatic example is José Antonio Páez of the Venezuelan plains (*llanos*), “totally uneducated, illiterate, and unurbanized, reared in the sun, rain, and ranges of the llanos...built like an ox, bloodthirsty, suspicious, and cunning...an unrivalled guerrilla leader” who went on to become one of SIMÓN BOLÍVAR’s key allies, and, in 1830, first president of the Republic of Venezuela, where he dominated political life for the next third of a century. The process by which regional chieftains like Páez became national leaders is the subject of an extensive literature.

At the opposite end of the spectrum from Páez, in terms of both his personal background and rise to power, was the Argentine caudillo JUAN MANUEL DE ROSAS. Scion of an elite *porteño* (Buenos Aires) Creole family, Rosas left the port city as a young man to become a cattle rancher and property owner in the pampas of the interior, living and working among the GAUCHOS, from whom he demanded absolute obedience and loyalty, and among whom he developed his base of social support. In this he represented the rising

class of *estancieros* (estate owners) whose wealth and power were based not on inherited privilege or control of state offices but on control of land, men, and resources. Rosas did not participate in the independence battles against Spain but became a key player in the subsequent struggles that defined the shape of post-independence Argentina.

Rosas was opposed to the liberal, unitarian, modernizing regime of BERNARDINO RIVADAVIA, whose policies were designed to make Buenos Aires equal with the other provinces of the Río de la Plata. His opposition to Rivadavia was not rooted in ideology but in the belief that Buenos Aires should retain its superior power. With his base of support secure, Rosas allied with the federalists who overthrew Rivadavia. Soon after, he became the governor of Buenos Aires and then absolute dictator. His style of leadership was profoundly personal: All power and authority flowed directly from him. Dispensing favors and patronage to his loyal allies, he also terrorized his foes, in part through his feared *mazorca* (literally, “ears of corn”—effectively, “enforcers”), a kind of goon squad responsible for upward of 2,000 murders during his years in power. Rosas was overthrown and exiled in 1852.

Other 19th-century caudillos demonstrated variations on these general themes. The Mexican Creole and self-proclaimed founder of the republic and caudillo of independence JOSÉ ANTONIO LÓPEZ DE SANTA ANA was first and foremost a political opportunist—beginning his career as a royalist army officer in the service of Spain, donning the mantle of pro-independence liberalism and federalism in the 1820s, and switching sides again to become a staunch conservative and centralist from the mid-1830s. What remained consistent was his style of leadership: the cultivation of personal loyalty via the calculated dispensation of patronage and favors to clients and allies, the ruthless crushing of foes, and ostentatious displays and titles intended to glorify his person and inculcate unquestioned loyalty among his followers.

One could continue in this vein, identifying individual caudillos who came to dominate the political lives of their nations—the populist folk caudillo Rafael Carrera in Guatemala, the dictator PORFIRIO DÍAZ in Mexico, and many others. Scholars have proposed various caudillo typologies, distinguishing between the cultured caudillo and the barbarous caudillo, for instance, or identifying the consular caudillo, the super caudillo, and the folk caudillo, among others. The multiplicity of types suggests the tremendous variability of the phenomenon.

Not all caudillos were national leaders, however. More often they remained lesser figures who dominated their own locales or regions—men like Juan Facundo Quiroga and Martín Güemes in the Argentine interior, Juan Nepomuceno Moreno of Colombia, and many others. Not uncommonly, at local and regional levels, and in areas with substantial Indian populations, the phenomenon of the caudillo melded with that of the cacique, a local or regional political-military strongman, who deployed the same basic repertoire of techniques and styles of personalized rule and patronage-clientage to dominate regions, provinces, towns, and villages.

Indeed, the rule of national caudillos was predicated on the support of local and regional strongmen who served as their loyal and subordinate clients, who in turn dominated their own locales. Thus there emerged in many areas a kind of hierarchical network of caudillo power, with the primary caudillo dominant over numerous lesser secondary caudillos, in turn dominant over numerous lesser tertiary caudillos, and so on down the chain of loyalty, alliance, and patronage-clientage.

Modernizing elites desirous of creating more modern state forms were among the most vociferous opponents of caudillo rule. A classic critique is the work of Argentine statesman and scholar Domingo Faustino Sarmiento, whose influential and scathing biography, *Facundo* (or, *Civilizacion y barbarie, vida de Juan Facundo*), first published in 1845, decried the rule of “primitive” caudillos like Facundo and Rosas, while framing the caudillo phenomenon in the broader context of the epic struggle between civilization and barbarism.

There is no scholarly consensus on when the caudillo phenomenon ended, or even if it has ended. Some point to the first half of the 19th century as the heyday of caudillos and caudillismo; others argue that the phenomenon continued into the 20th century and after, transmuted into various forms of populism and dictatorship, and manifest in the likes of Juan Perón of Argentina, Fidel Castro of Cuba, and Hugo Chávez of Venezuela.

Despite vigorous debates over definitions, origins, periodization, and other aspects, however, few disagree that understanding the phenomenon of the caudillo and caudillismo is essential to understanding the political evolution of post-independence Latin America.

MICHAEL J. SCHROEDER

Cavour, Camillo Benso di

(1810–1861) *Italian statesman*

Count Camillo Benso di Cavour was an Italian statesman who forged the unified Kingdom of Italy. Cavour was born in northwestern Italy in Turin, the capital of Piedmont-Sardinia, ruled by the House of Savoy. Cavour was earmarked for an army career, and he enrolled in the military academy of Turin. Because of his liberal views, however, he had to leave the army in 1831. He then administered the family’s estate. Cavour traveled widely in Europe, visiting France, Switzerland, and Great Britain, and his journeys reinforced his dislike for absolutism and clericalism.

Witnessing the constitutional monarchy of France under King Louis-Philippe, he became a strong supporter of constitutionalism. Originally, Cavour was interested in making Piedmont powerful rather than pursuing Italian unification. Convinced that economic reconstruction had to precede political change, he argued for free trade and railroad construction in the Italian Peninsula. His mind gradually changed, and he began to dream of a united Italy free of foreign influence.

With the election of the liberal Pope Pius IX in 1846, Cavour felt that the chance to advocate reform had come. Generally, Cavour did not believe that the pope would play a leading role in the unification movement. Instead, Cavour looked to King Charles Albert of Piedmont to implement the national program. In 1847 Cavour founded *Il Risorgimento* (“The Resurgence,” later a term for the unification of Italy), a newspaper advocating liberalism and unification. As editor, Cavour became a powerful figure in Piedmontese politics.

During 1848 a wave of revolutions swept Europe. Demonstrations in Genoa called for liberalization of the state, and Cavour supported the demands for a constitution in *Il Risorgimento*. Pressured by the influential paper and by the dissent in his kingdom, Charles Albert complied on February 8, 1848.

Cavour then urged the king to declare war against Austria, which ruled much of Italy at the time. Word arrived that the people of Milan on March 18, 1848, had initiated a war against the Austrians. Bowing to

pressure from Cavour's party, Charles Albert declared war on Austria.

Piedmont was defeated, but liberalism and nationalism were still strong. Charles Albert abdicated in favor of his son, VICTOR EMMANUEL II. Under the new monarch, Cavour's career flourished. He became minister of agriculture and commerce in 1850 and minister of finance in 1851, finally becoming prime minister at the end of 1852. Cavour capitalized on the antipapal sentiment in Italy following Pius IX's refusal to wage war upon Austria. The defeat of 1848 also convinced Cavour of the need for a powerful ally to separate Austria from Italy. Cavour worked hard to strengthen the state, reorganizing its army, financial system, and bureaucracy. He also encouraged the development of industry, railroads, and factories, making Piedmont one of the most modernized European states of the time.

In 1854 Piedmont entered the CRIMEAN WAR as an ally of Great Britain and France in exchange for promises that the future of Italy would be considered an urgent issue with international scope. In 1856 Cavour presented the Italian case before the peace Congress of Paris. He succeeded in isolating Austria, compromising France in the Italian question, and getting the condition of Italy discussed by the great powers, who agreed that some remedy was in order. Cavour now saw that war with Austria was merely a question of time, and he began to establish connections with revolutionists of all parts of Italy. He sought to ingratiate himself with NAPOLEON III, emperor of the French, whose support he considered crucial to avenge the defeat of 1848–49.

Napoleon sympathized with the plan for a northern Italian kingdom, and in July 1858, the two plotted against Austria. Piedmont would be united with Tuscany, a truncated Papal State, and the Kingdom of the Two Sicilies. Napoleon promised that if Austria were to attack Piedmont-Sardinia, France would come to its aid. Cavour immediately set to provoking Austria into war, and in April 1859 Austria attacked. However, after victories at Magenta and Solferino, Napoleon signed an armistice, without informing his allies. The treaty allowed Austria to keep Venetia, but Piedmont received only Lombardy. Cavour, unwilling to accept the terms, resigned. The situation soon reversed itself when the citizens of Tuscany, Modena, Parma, Bologna, and Romagna voted in March 1860 to become part of Piedmont-Sardinia.

Cavour returned to power in January 1860. Soon afterward, the Italian patriot GIUSEPPE GARIBALDI led his famous army of 1,000 adventurers into the Kingdom of the Two Sicilies. The Neapolitan government

fell, and Garibaldi entered Naples in triumph. Following the collapse of the Neapolitan kingdom, Cavour engineered its annexation. He also managed to occupy the greater part of the Papal States, avoiding the city of Rome because Napoleon was pledged to protect the pope. Cavour's dream, save for Rome and Venetia, was now realized, and Italy was nearly united. On March 17, 1861, Cavour had the Piedmontese parliament proclaim Victor Emmanuel king of Italy. The parliament also proclaimed Rome the future capital, hoping to resolve the question through an agreement with the church. Three months later, Cavour died.

Cavour's political ideas were greatly influenced by the Revolution of 1830 in France, which proved to him that a monarchy was not incompatible with liberal principles. A strong belief in liberalism, an extensive knowledge of technology, and the dream of a unified Italy allowed Cavour to unite Italy and to modernize his country both politically and technologically. When he died, his work had been carried far enough that others could complete it. Cavour is undoubtedly the greatest figure of the Risorgimento. It was Cavour who organized it and skillfully conducted the negotiations that overcame all obstacles.

MARTIN MOLL

Central America: National War

The term *National War* in Central America refers to the combined military efforts of Nicaragua, Costa Rica, Honduras, Guatemala, and El Salvador to defeat the forces of Tennessee-born U.S. filibuster William Walker in 1856–57. The Walker episode represented the pinnacle of 19th-century U.S. filibustering, or private mercenary efforts to invade, dominate, and govern territories in Mexico, Central America, and the Caribbean Basin.

The war against Walker briefly united Central America's fractious nation-states, while its aftermath ushered

in a period of elite convergence and relative political stability in Nicaragua that endured into the early 20th century. Nicaraguans tend to remember the Walker episode as the first instance of U.S. imperialist meddling in their country's internal affairs, providing a touchstone for anti-imperialist and nationalist sentiments well into the 20th century. That popular memory also tends to suppress key features of a war that all observers agree left a deep imprint on isthmian history.

In early 1855 Nicaraguan Liberals, based in the city of León, contracted with the soldier of fortune Walker, the self-proclaimed "Grey-Eyed Man of Destiny," in their ongoing civil conflict against that country's Conservatives, based in the city of Granada. The roots of the conflict between León's Liberals and Granada's Conservatives were complex, based on regional, political, and ideological divisions, and the efforts of elites in both regions to dominate the country's post-independence state. The origins of Nicaraguan Liberals's invitation to Walker can also be traced to their experience with U.S. travelers and businessmen in the transisthmian route across Nicaragua that developed in the wake of the California gold rush after 1849, most notably U.S. magnate Cornelius Vanderbilt's Accessory Transit Company, which began operations in 1851.

The 31-year-old Walker had gained fame principally in his unsuccessful filibustering ventures in Baja California and Sonora, Mexico, in 1853–54. Offering Walker and his fellow mercenaries 250 acres of land each following the Conservatives's defeat, León's Liberals were shocked when, following his army's victory in October 1855 and his usurpation of the presidency in July 1856, Walker launched a concerted effort to remake Nicaragua according to his own designs. Reinstating African slavery (abolished in 1824), he also sought to seize all state power, disfranchise the elites, confiscate elite properties, and transform the country into a Protestant slaveholding patrician society modeled on the U.S. South. His brazen power grab unified elites across Central America, who feared the loss of their own privileges and power.

Costa Rican forces, entering the country from the south, fought Walker's forces in April 1856, followed in July by the invasion from the north of a combined army of over 1,000 Guatemalans, Salvadorans, and Hondurans. A series of hard-fought battles followed, as Walker's army, stung by the desertion of most native troops, retreated to its strongholds in Granada and Rivas. Hemmed in on all sides, Walker ordered the burning of Granada. For Nicaraguans, the com-

plete destruction of the old colonial city by Walker's drunken filibusters ranks among the most horrific and memorable episodes of the conflict. With the crucial intervention of Cornelius Vanderbilt, with whom Walker had made a powerful enemy, Walker's forces surrendered on May 1, 1857. He made three further attempts to reestablish his regime; during the last, in 1860, the British navy captured him and Honduran authorities executed him.

In Central America, the National War is chiefly remembered as the first instance of U.S. imperialist and military meddling on the isthmus—even though the U.S. government played only a marginal role in the conflict. The war discredited Nicaragua's Liberals, who joined Conservatives in a series of governments that led to the most peaceful and stable period in post-independence Nicaraguan history to that time. What Nicaraguans and Central Americans tend not to emphasize is the role of León's Liberals in inviting Walker in the first place and the warm embrace he received during his first year. The National War and its aftermath shaped isthmian politics in enduring ways, especially in fostering anti-United States nationalist sentiments and continue to occupy an important position in the collective memory of Central Americans, especially in Nicaragua.

MICHAEL J. SCHROEDER

Ceylon: Dutch to British colony

The Portuguese arrived in Sri Lanka in 1505 and took over the kingdoms of Kotte and Jaffna, with the kingdom of Kandy, largely because of its geographical position in the center of the island, managing to remain free of their rule. Thus, when the Dutch admiral George Spilberg landed on the east coast in the early 17th century, he was welcomed by the king of Kandy, who invited the Dutch to settle on the east coast of the

island. He saw that this would provide an important counterbalance to the Portuguese.

The first Dutch settlement was established in 1640 with William Jacobszoon Coster as the governor. In June 1640 Coster was murdered and replaced by Jan Thysen Payart, who had started establishing farms to grow cinnamon for export to Europe. It was the fifth governor, Adriaan van der Meijden, who decided to move decisively against the Portuguese. In 1658 he managed to drive them off the island, and the Dutch then gradually took over the south of the island, then the southwest and western coast. When they took over the entire east coast of the island in 1665, even though Kandy remained independent, they controlled all the ports. By 1765 the Dutch were in control of the entire coastline, and Kandy only held the isolated highlands in the center of the island that were too difficult to attack.

Officially the island was a possession of the Dutch East India Company, and it appointed a governor based in Colombo who ruled Ceylon as a colony. Most governors were only in Ceylon for short periods, but some had a lasting effect on the place. Jan Maetsuyker, governor from 1646 until 1650—before the Dutch took control of the whole island—relaxed laws on mixed marriages to try to encourage Dutch merchants to marry, assimilate, and remain on the island. He felt that this might allow them to compete with local merchants on a much stronger basis.

In contrast, Jacob van Kittensteijn, his successor from 1650 until 1653, regarded the local wives of merchants as being “vicious and immoral.” The situation changed again after the capture of Colombo and Jaffna in 1656–58 with some 200 Dutch soldiers and merchants marrying into the Indo-Portuguese community—many of these being the wives of Portuguese who were unceremoniously deported. Rijklof van Goens, one of the longest serving governors (who had captured Jaffna), governed 1662–63 and again 1665–75. He encouraged mixed marriages—or indeed any marriages—to try to build up an indigenous Dutch settler population. However, he legislated that daughters of mixed marriages should marry Dutchmen. This had the result of ensuring that there were large numbers of people on the island with Dutch surnames.

Rijklof van Goens was succeeded as governor by his son and then by Laurens Pijl from 1679 until 1692. These three governors provided much stability for the colonial infrastructure of the island, which was divided into three parts: Colombo, Galle, and Jaffna. The latter two parts had commanders who reported to the governor, whereas the governor ruled the area around Colombo

himself, with the assistance of a small nominated council. Lower levels of the bureaucracy were staffed by Sinhalese or Tamils who originated from southern India. The Sinhalese nobility kept their privileges, and, with no worry of invasion or civil war, they actually considerably increased their wealth.

The Dutch recognized Portuguese land titles (in contrast to their actions in Malacca and elsewhere), and they widened the private ownership of land, which for the Portuguese had only operated in urban areas. This resulted in the massive settlement of fertile land, with Dutch and largely Sinhalese businessmen and farmers being able to establish considerable land holdings. There were attempts to codify the local laws, but this proved much more complicated than expected. The result was that Dutch laws gradually came to apply to the cities and much of the coastal regions, especially in areas dominated by the Sinhalese. Muslim laws applied to Muslims on the east coast, and the Thesawalamai laws used by the Tamils of Jaffna were codified in 1707 and used there, although Christians there were subject to Dutch laws.

RELIGION

In the area of religion, when the Dutch took Ceylon there were, nominally, about 250,000 Sinhalese and Tamil Roman Catholics, a quarter of these from the region around Jaffna. The Dutch banned Roman Catholicism, ejected all Catholic priests, and made it illegal for any to operate on the island. They also set about converting many of the local people to Calvinism. Roman Catholic churches were changed into Reformed churches, and many Catholics converted to Calvinism in name only, while others reverted to Hinduism or Buddhism. However, a shortage of Dutch ministers held up these plans, and Roman Catholics operated underground, especially from the Portuguese-held port of Goa, in India.

Although the Portuguese had made much revenue from Ceylon, the Dutch set about methodically expanding the revenue base of the country. The Portuguese had relied heavily on tariffs and obligatory labor for a certain number of days each year by the poor (in lieu of taxes); the Dutch maintained these but started establishing large plantations for cinnamon, which rapidly became the mainstay of the Dutch colonial economic structure in Ceylon.

The Dutch East India Company maintained a monopoly not only over the export of cinnamon but also over areca nuts, pearls, and elephants. They were particularly anxious to control the Ceylon economy tightly, and imports from India were so heavily restricted that

occasionally there were shortages of rice and textiles in Colombo. Gradually, some private traders were allowed to bring in these and some other goods, but the Dutch East India Company jealously guarded its monopolies.

With the Napoleonic Wars and the French invasion of the Netherlands and the deposing of the Dutch king, the British set about occupying Dutch colonies around the world to prevent them falling into French hands. As a result, in 1796 the British—strictly speaking the BRITISH EAST INDIA COMPANY—took control of Ceylon, defeating the small Dutch force, which made a symbolic but futile resistance. The British placed the island under military rule and governed it from their settlement at Madras, as they expected to return Ceylon to the Dutch at the end of the war. However, the British quickly discovered the importance of the island—strategically as well as financially. In 1802 Ceylon was declared to be a British Crown Colony, and the British hold over the island was confirmed by the Treaty of Amiens later the same year.

The initial problem facing the British was the kingdom of Kandy in central Ceylon. Although the Dutch had managed to seize the entire coastline, they had never been able to subdue the independent kingdom. The British had recognized the sovereignty of the king of Kandy, but Robert Brownrigg, governor from 1812 until 1820, had other ideas. He found that the frontier between British territory and Kandy was a little uncertain in places and to guard it was extremely expensive. Furthermore it would obviously be far easier if the British controlled the entire island, which would remove political insecurity and help with communications around the island.

SOME PRIVILEGES

An early British attempt to attack Kandy in 1803 failed. However, Brownrigg took advantage of a crisis in Kandy. Making an alliance with some Kandyan nobles, in 1815 he sent soldiers into the kingdom and captured it. Kandyans were guaranteed some privileges and were able to preserve customary laws and institutions, as well as having religious freedoms. However, many Sinhalese saw the erosion of the independence of Kandy as a part of a wider attack on Buddhism. This led to a large Sinhalese revolt that took place in 1818. It was suppressed, and Kandy was then integrated with the rest of Ceylon. The British also introduced a new flag for Ceylon. It had a blue field with the Union flag in the corner, as with other British colonies, and a design showing an elephant in front of a stupa to represent Ceylon.

British moves in Ceylon, as with the Dutch, were to increase revenue, and more land was taken as the number of plantations increased, many owned by British companies. As well as growing cinnamon, the British set about cultivating, on a large scale, pepper, sugarcane, and coffee. They even experimented with cotton. Coincident with this, the British also instituted many reforms. Slavery was abolished, and salaries were now paid in cash rather than in land and food. The British also relaxed the need for people to provide compulsory labor for the government each year. Many Sinhalese and Tamils, however, especially in rural areas, did resent the increase in missionary activity by British and South Indian church groups.

In 1833 Robert Wilmot-Horton, who had become governor two years earlier, enacted a widespread series of reforms that essentially adopted a unitary administrative and judicial framework for the whole island. Special rights afforded to particular groups were abrogated; this would massively affect all of Ceylon, whose people gradually came to see themselves as Ceylonese. English became the language of government and also the medium of instruction in schools, which had increased massively in number in the 1820s and early 1830s. As well as this, Wilmot-Horton reduced the powers of the governor, who could no longer rule by decree. He established executive and legislative councils that would govern. The latter were initially comprised of British officials, but gradually unofficial members were appointed representing business interests.

On an economic front, the British abolished state monopolies and also finally ended the right of the colonial government to demand labor services in lieu of taxes. Crown land was sold to cultivators, and this caused the establishment of many more small plantations and the growth of the coffee industry. From the 1830s until the 1870s there was a massive expansion in the areas where coffee was under cultivation. The planters survived the collapse in the coffee price in 1847 and gradually, as more coffee plantations were established, there was a need for a cheap labor force, and many Tamil laborers from South India started to migrate to Ceylon, leading to a substantial Tamil population by the end of the 19th century.

Unfortunately, in 1869 a rust disease started attacking coffee crops. By 1871 it had devastated the coffee industry, and there was much discussion about what could productively be done with the land to maintain employment for both plantation managers and their staff. There had been a small tea industry in Ceylon since the 1860s—largely for local consumption. This

Bringing tea to market in Ceylon. Ceylon, now called Sri Lanka, was an important possession for the British. The island had strategic significance in its location near India and produced tea, cinnamon, pepper, and other valuable cash crops.

was expanded from the late 1870s with tea bushes being grown on slopes of the hill country where the land was able to be drained easily. Rubber and coconut plantations were also developed but never rivaled the tea industry, with Ceylon tea becoming well-known throughout the British Empire. Later, the tea industry was so identified with the island that it was able to use the traditional lion, from the flag of Ceylon (Sri Lanka after independence), to symbolize Ceylon tea.

Most of the infrastructure of colonial Ceylon was built by the British in the latter half of the 19th century: ports, public buildings, hospitals, roads and railways, schools, and a reliable postal and telegraph system. However, many of the problems that were to overshadow Ceylon in the late 20th century were already apparent. The cities and towns were fairly modern, with a well-educated population, many of whom spoke English fluently and were politically aware. Employment was easy for the middle class and the well connected. However, on the plantations large numbers of Tamil laborers lived in very basic conditions, often in hostels for men—without their families—and with family ties back on the Indian mainland. Outside the urban areas

and the plantations, the villages remained isolated from much of the economic life of the island, and people still survived by subsistence agriculture. Gradually roads, and in some cases railways, reduced this isolation.

JUSTIN CORFIELD

Chakri dynasty and King Rama I

The Chakri dynasty was established on April 6, 1782, when Chao Phaya Chakri was crowned the king of Thailand (formerly Siam) as Rama I. The rulers belonging to the house of Chakri have been kings of Thailand

ever since. The illustrious rulers of this dynasty took the country out of troubled times during the colonial period. Their vision and leadership also modernized Thailand.

Rama I was born on March 20, 1737, to a noble of the Ayudhya kingdom, Phra Aksorn Sundara Smiantra. After finishing his education in Buddhist temples, he served in the royal household of the Ayudhya kings before joining the army. Phya Thaksin, Rama I's predecessor, had liberated Thailand after the Burmese devastation of Ayudhya in 1767. Rama I was in his service, participating in almost every battle fought by the king and was made governor of Ratchaburi Province. He was awarded the title Somdetch Chao Phraya Maha Kashatriya Suk (roughly equivalent to a duke) by Thaksin.

The Burmese attack had been repelled, and Cambodia and Luang Prabang were under Thai authority. The task of subjugating Vientiane was entrusted to Rama I, then an army general. He successfully completed his mission in 1778. The famous Emerald Buddha, in Vientiane's possession since 1564, was brought to the capital, Thonburi. The hostility of Buddhist monks against Thaksin's demand of obeisance led to his downfall and imprisonment. Once again, it seemed that the newly established peace and order of the kingdom would collapse in a civil war. Rama I rose to the occasion. He returned from Cambodia, where he was stationed for a military campaign, and assumed the royal title after restoring order.

Rama I shifted the capital from Thonburi to a site opposite on the bank of the river Chao Phraya. He planned the layout for a new city of Bangkok. It has remained the capital of Thailand ever since. On the eastern side of the river, he implemented a strong defense with double-lined fortification. Thonburi had been on both banks of the river to protect against Burmese attack.

Rama I did not have any plan to make an escape and concentrated on checking any future attack on the capital. A large Chinese community lived on the eastern side, so they were transferred a short distance downstream to Sampheng. It is now a famous Chinese shopping area. Within three years, the Grand Palace was constructed, and it still stands today. In keeping with earlier Thai monarchs, Rama I retained connections with Indic-style Sanskritized epithets that resulted in descriptions of the new city such as Impregnable City of God Indra, Grand Capital of the World, and City given by Indra and Built by Vishnukarma. The Emerald Buddha was installed in Wat Phra Kaew.

The reign of Rama I witnessed consolidation and expansion of the kingdom by extensive warfare. The Burmese attacks of King Bodawpaya were successfully

defeated in 1785 and 1787. The kingdom of Vientiane of Laos acknowledged the vassalage of Thailand. Chieng Mai and Chieng Saen were once again under Thailand's authority. Chao In of Luang Prabang remained as a vassal of Rama I. Thus Thai control extended into Laos.

In 1795 Rama I installed Anh Eng as ruler of Cambodia after annexing the provinces of Battambang, Siemreap, and portions of Korat. When the powerful Gia Long unified Vietnam, Cambodia had to acknowledge suzerainty of both Thailand and Vietnam. The sultans of Kedah, Kelantan, and Trengganu acknowledged the suzerainty of the Thai monarch until the British took over the sultanates in 1909.

Rama I revamped administration in the provinces as well as the capital, making his rule very centralized. The incessant Burmese invasions of the 18th century had made both the Thai bureaucracy and monkhood corrupt and lax. Between 1784 and 1801 Rama I restored the moral standard of the Buddhist monks by a series of royal decrees.

The Buddhist scripture, the Tripitaka (three baskets), and Thai civil law had been destroyed at the time of the Burmese sack of the earlier capital Ayudhya. Rama I called a Buddhist council in 1788, in which 250 monks and Buddhist scholars participated, to reconstruct the Tripitaka. The Thai king was the defender of Theravada Buddhism and the pillar of Thai governance and society, and Rama I performed his obligation to the fullest extent.

Rama I also appointed a supreme patriarch of Thai Buddhism. Further, he appointed a commission in 1795 consisting of 11 jurists and scholars to look into the laws promulgated by Rama Tibodi I (founder of Ayudhya dynasty), who reigned in the 14th century. The code of laws comprising indigenous practices and Indian legal concepts was somewhat altered. The new code of 1804, known as Laws of the Three Seals, categorized the 48 provinces of the kingdom, each with a governor, most of whom were members of the royalty and served three-year terms.

The code also enumerated provisions for civil and military administration. According to Thai sources, Rama I was a benevolent ruler who looked after the needs of his subjects, these codes being a primary example of his benevolence.

There was a flourishing of Thai literature and translations under Rama I. He had initiated the royal writings known as *Phra Rajanibondh*, and he wrote the Thai version of the Indian epic, the *Ramayana*, which depicted the feats of a hero named Rama.

A Currier & Ives print of the Great Chicago Fire on Sunday, October 8, 1871. The fire panicked citizens and caused widespread damage but produced a reinvented, modern city in its wake.

Rama I died on September 7, 1809, in Bangkok and was succeeded by his son, Prince Isarasundorn, as King Rama II. He left a legacy in Thai history as a patron of literature, a lawmaker, and a builder of empire.

PATIT PABAN MISHRA

Chicago Fire (1871)

The fast-moving blaze that consumed more than three square miles of Chicago, Illinois, causing the Chicago River to boil, killing at least 300, and leaving 90,000 homeless, would, within two decades, produce a reinvented city more prosperous and beautiful than had seemed possible when the fire burned itself out after 36 hours. In the process of renewal, the Great Fire tested the ability of politicians, magnates, and ordinary city dwellers to deal effectively with the human causes and outcomes of natural disaster.

Chicago, 37 years old in the tinder-dry summer of 1871, was a fast-growing, 35-square-mile city of 300,000. Located at the confluence of Lake Michigan, major canals, and a growing railroad network, the city was a place of fevered speculation and rapid growth that produced showy mansions abutting the

mostly wooden shacks of an expanding poor and immigrant population.

It was in one such southwest neighborhood that the fire of Sunday, October 8, was ignited, possibly, although not conclusively, by a lamp overturned in a De Koven Street barn by a cow owned by Mrs. O'Leary, an Irish immigrant. Just a day earlier, a fire in an industrial district had been contained, but only after \$1 million in damage. Already exhausted, fire fighters were unable to quell the new blaze, despite some success by men under the direction of CIVIL WAR veteran general Philip Sheridan who used gunpowder to curb the fire's southerly spread. Major enterprises, including a flour mill, the city's water supply system, rail yards, the McCormick Reaper Works, and even the "fire-proof" headquarters of the *Chicago Tribune*, were destroyed. Overall losses would be estimated at \$196 million.

Amid acres of twisted rubble, rebuilding began almost before the coals had cooled. Fire debris was used as landfill to expand the city along the lake and river. Shorn of buildings, some parts of Chicago, including its famous loop, became targets of investment and speculation. The importance of the city as an agricultural depot and manufacturing and transportation center assured that financiers from Wall Street and elsewhere would lend ample money for rebuilding.

The initial recovery proceeded with great speed, making Chicagoans feel better about their ruined city, but it produced mostly shoddy structures that ignored lessons about the need for planning and fire resistance administered by the Great Fire.

A nationwide financial panic of 1873 brought much of Chicago's building frenzy to a halt. In 1874 the so-called "Little Chicago Fire" inflicted millions in new damage to the city. By the time business conditions improved, a new generation of architects, including Daniel Burnham, John Wellborn Root, and Louis Sullivan, had emerged, along with such newly available technologies as structural steel and elevators. The result would be an innovative new architecture that made Chicago a national and international leader in the field.

By 1893 the Columbian Exposition, a hugely successful world's fair, would showcase a reborn Chicago and highlight the city's triumph over both natural and human disaster.

MARSHA E. ACKERMANN

China, spheres of influence in

China's military and economic weakness and heightened Western imperialism worldwide during the 1890s resulted in the division of China into Western spheres of influence that threatened its eventual partition. The downward spiral began with the SINO-JAPANESE WAR, caused by Japan's quest to control Korea, a Chinese vassal state. China's resounding defeat was reflected in the Treaty of Shimonoseki (1895), whereby it gave up protectorship over Korea, ceded Taiwan and the Liaodong (Liaotung) Peninsula to Japan, and paid a huge indemnity. Fearing that Japanese control of the Liaodong Peninsula would give it undue influence over the Chinese capital at nearby Beijing (Peking), Germany, France, and Russia sent identical notes to Japan in April 1898 that forced Japan to return Liaodong to China in exchange for a larger indemnity. This action was called the Far Eastern Triplice, and, for helping China, the three powers obtained several economic concessions.

Germany began the move to divide China into spheres of influence in 1898 with a number of demands: that the Chinese government lease Jiaozhou (Kiaochow) on the Shandong (Shantung) coast to Germany as a naval base for 99 years; grant Germany the right to build railways, including one to link Jiaozhou with Jinan (Chinan), capital of Shandong province; grant German banks and companies exclusive rights to loan money for development projects in Shandong; and other concessions. China bowed to Germany's demands and other imperialist nations followed Germany's lead. Russia added to its existing privileges in northeastern China. They included building the Chinese Eastern and South Manchurian Railways, branch lines of the Trans-Siberian Railway across Manchuria to Port Arthur and Dairen (which it leased from China for 25 years) on the Gulf of Peichili, and extensive economic rights in Manchuria.

Great Britain followed by leasing Weihaiwei (near Jiaochou) as a naval base for 25 years and the Kowloon New Territory for 99 years. It also secured China's promise to protect the Yangzi (Yangtze) River Valley, which became a British sphere of influence. France leased Guangzhouwan (Kwangchow-wan) for

99 years and acquired a sphere of influence in Guangdong (Kwangtung), Guangxi (Kwangsi), and Yunnan, three provinces that adjoined French Indochina. Japan exacted a promise that China would not adjoin Fujian (Fukien) province to any other power. Only Italy was rebuffed when it asked China for a sphere of influence in Zhejiang (Chekiang) Province.

In the phrase current in 1898, China was being cut up like a melon. It seemed on the verge of partition among the imperialist powers. Domestically, the perilous state precipitated a reform movement. Among the great powers, only the United States did not acquire a sphere of influence and attempted to reverse the course of events by the declaration of an Open Door policy.

JIU-HWA LO UPSHUR

Chinese Exclusion Act

In 1882, in response to the vociferous insistence of California's anti-"coolie" clubs and Irish immigrant Denis Kearney's Workingmen's Party of California, Congress passed the first law in U.S. history to ban explicitly the further immigration of a particular racial or ethnic group. Known as the Chinese Exclusion Act, the law reflected the growing ethnic and racial diversity of the century-old republic; the importance of racial identities in shaping local, state, and national politics; and the enduring legacy of racism in the wake of nearly 250 years of African slavery.

Chinese immigration to California turned from a trickle to a flood following the discovery of gold at Sutter's Mill in 1848. The ensuing gold rush, which drew prospectors from across the country, caused California's population to skyrocket, from 14,000 in 1848 to more than 220,000 four years later. The vast majority of California's new immigrants were men and included not only a diversity of Euro-Americans, many recent U.S. arrivals, but also Mexicans, African Americans, and Chinese. At first California's Caucasian population tended to look favorably on Chinese immigrants

The cover of Harper's Weekly on February 3, 1877, depicts Chinese immigrants at the San Francisco Customs House.

as diligent, thrifty, and hardworking. Overwhelmingly male, most Chinese immigrants were brought by labor contractors to work in the burgeoning railroad, construction, prospecting, and related industries. By the 1870s, however, Euro-American anti-Chinese sentiment hardened, as Chinese women and children began arriving in large numbers and as competition for scarce resources combined with political opportunism and other factors to spark the formation of anti-coolie clubs in the state's largest cities and towns. Violence against Chinese immigrants intensified, including lynchings, burnings, and rapes, while boycotts of Chinese-made goods became widespread.

In 1875, at the prompting of California congressman Horace Page, Congress passed a law barring the further immigration of Chinese women, ostensibly to protect the health of white men threatened by Chinese prostitutes. The clamor among whites for the exclusion of all Chinese immigrants mounted, spearheaded by Kearney's Workingmen's Party. By the early 1880s some 100,000 persons of Chinese ancestry lived in the United States, the vast majority on the West Coast. Many prominent white citizens supported Kearney's call for Chinese exclusion, including leading labor rights activist Henry George, who deemed the Chinese to be "unassimilable."

Congress finally responded with the Chinese Exclusion Act of 1882, which banned all Chinese immigration for 10 years while prohibiting persons of Chinese origin already in the country from becoming naturalized citizens. Ten years later, in 1892, Congress renewed the ban, and in 1902 made the exclusion permanent. To America's Chinese-descended population, the Exclusion Acts encapsulated the bitter realities of racial discrimination in their adopted homeland. Officially stigmatized as second-class citizens, Chinese Americans would remain toward the bottom of the country's economic, social, and racial hierarchy well into the 20th century, especially in the Pacific Coast region where most resided. Congress repealed the Chinese Exclusion Acts in 1943 at the height of World War II, in part as a gesture of solidarity with Chinese Nationalist forces under assault by Japan. The 1943 law also permitted Chinese-descended permanent residents to apply for citizenship, though the civil rights of many Chinese Americans did not receive full federal affirmation until the civil rights laws of the mid-1960s.

MICHAEL J. SCHROEDER

Civil War, American (1861–1865)

This most deadly and destructive of any U.S. war was the "irrepressible" outcome of sectional conflicts over

land, labor, and political power that emerged in the earliest days of colonial rule and festered for decades in the young republic. When it was over, some 620,000 Americans—Union and Confederate—were dead, as was President ABRAHAM LINCOLN, assassinated in a Washington theater five days after the war's end.

The Civil War began in April 1861 when agents of the newly formed Confederate States of America (CSA) fired on Fort Sumter, a federal facility in South Carolina. By its end at Appomattox Court House in Virginia, almost exactly four years later, this war tested the limits of state and federal power and had become primarily a war about slavery. When the Union prevailed, 4 million people of African descent were declared free.

From the early 17th century, the British were enthusiastic traders in and users of kidnapped West and Central African men, women, and children. Most Americans, including non-slave owners, saw this system as a highly desirable way to overcome chronic labor shortages in their colonies. Unlike indentured servants, Africans were easily identified and just as easily denied rights extended to white Englishmen. By the time of the AMERICAN REVOLUTION, every British colony used slave workers; most were concentrated in the southern agricultural colonies.

Even slave owners like GEORGE WASHINGTON and THOMAS JEFFERSON perceived an obvious conflict between America's intensifying rhetoric of freedom and the new nation's heavy dependence on involuntary labor. During and after the war, many northern states acted to end or phase out slavery. But the 1789 U.S. CONSTITUTION, although it never used the word *slavery*, included major concessions to slave ownership. Most significant was language allowing each state to add to its census count a number representing three-fifths of all slaves held in that state. As slavery waned in the North, and waxed in the South, this had the effect of significantly increasing southern political power based on congressional representation.

As the new nation doubled in size with the 1803 addition of the LOUISIANA PURCHASE, cotton, a labor-intensive, hot-climate cash crop in high demand for clothing, was already transforming U.S. agriculture and reinvigorating the slave labor system. Cotton farmers pushed into Alabama and Mississippi, Louisiana, and the Mexican province of Texas, bringing with them thousands of slaves uprooted from eastern states, and buying additional Africans ahead of the Constitution's 1808 deadline.

More Americans began to question the utility and morality of slavery, and a few, like Boston abolitionist

publisher William Lloyd Garrison, even demanded equal rights for African Americans. But the central issue eventually leading to war was how to deal politically with the expansion of slavery in an expanding nation. After two years of wrangling, Congress in 1820 crafted the Missouri Compromise. Meant to preserve the political balance between slave and free states, the compromise revealed a tense struggle. “Like a fire bell in the night,” wrote the elderly Jefferson, the compromise portended the death “knell of the union.”

For a time, the compromise seemed to work, but by the 1840s new land pressures sparked by a growing population and the MANIFEST DESTINY ideology renewed controversy over slavery’s expansion. President James K. Polk, a slave-owning Tennessee Democrat, recognized Texas statehood, negotiated with Britain for the Oregon Territory, and instigated a MEXICAN WAR, bringing into the nation vast new areas, many coveted by slave owners.

CURBING SLAVERY’S SPREAD

In 1846 Pennsylvania congressman David Wilmot, a Democrat disturbed by Polk’s southern bias, proposed that none of America’s potential Mexican acquisitions could be opened to slavery. Passed by the House, Wilmot’s Proviso died in the Senate. Democrats and Whigs abandoned party positions in favor of regional loyalties,

A Currier & Ives lithograph of Confederate general Robert E. Lee, published between 1860 and 1870

portending the shredding of party politics in the decade to come. In 1848 a new Free-Soil Party ran a national campaign dedicated to curbing slavery’s spread while expanding land availability for white families.

The Compromise of 1850, hammered out by veteran congressional leaders, only set the stage for greater conflict. This complex measure repealed the Missouri Compromise and allowed gold-rich California to enter the United States as a free state. Slave trading (but not slavery) was outlawed in the District of Columbia. Federal marshals were empowered to seize fugitive slaves anywhere in the United States. In Boston and other abolitionist strongholds, armed conflicts erupted when marshals tried to arrest blacks accused of running away. Harriet Beecher Stowe’s best-selling *Uncle Tom’s Cabin* helped explain and dramatize these conflicts.

In 1854 the idea of popular sovereignty, supposedly a fairer way to decide between slave and free soil, exploded as settlers and thugs from both sides staked claims and grabbed political power in the Kansas-Nebraska territories. While Missouri “border ruffians” rampaged on behalf of slavery, abolitionist John Brown randomly massacred five pro-slavery settlers. The rising tide of sectional violence spilled onto the floor of the U.S. Senate in 1856 when a South Carolina House member caned Massachusetts Senator Charles Sumner so severely that he was incapacitated for several years.

The Whig Party was an early casualty of sectional conflict, fielding its last national candidates in 1852. Although the Democratic Party maintained much of its traditional southern base, there was really no place for those trying to maintain national political cohesion. As nationalism failed, many disaffected northern and midwestern voters—“conscience” Whigs, free-soilers, temperance crusaders, anti-immigrant “Know-Nothings”—became constituents of a new sectional party: the Republicans.

Republicans did well in the 1856 election and gained traction in 1857 when a southern-dominated U.S. Supreme Court decided the case of *Dred Scott v. Sandford*. The Court ruled that Scott, a slave until the last year of his life, was entitled neither to citizenship nor freedom. Additionally, chief justice Roger B. Taney cast doubt on Congress’s power to regulate slavery anywhere at all.

With reasoned political dialogue vanishing, John Brown’s 1859 effort to spark a slave uprising by seizing weapons from a federal armory at Harpers Ferry, Virginia, brought tension to an even higher pitch. Brown and his followers were swiftly executed but

The bloodiest and deadliest war in U.S. history, the Civil War started for various reasons, many based around issues of states' rights. By the end of the war, the conflict centered around the debate of slavery. Above, officers of the third U.S. Infantry in Washington, D.C.

some TRANSCENDENTALISTS, including Henry David Thoreau, hailed Brown as a martyred hero, prompting southern Fire Eaters to argue that further intersectional discussion was useless.

ELEVEN STATES

Abraham Lincoln of Illinois, a former Whig who had supported the Wilmot Proviso, gained national attention for a series of debates with his state's sitting senator, Stephen Douglas, in 1858. Two years later, he was the Republican Party's presidential choice. In a four-way race, Lincoln was elected with 40 percent of the popular vote. Anticipating this first Republican president, seven Southern states, led by South Carolina, voted to leave the United States and form an independent nation on the North American continent. They chose Jefferson Davis of Mississippi, former senator and U.S. war secretary, as president. After Fort Sumter, the CSA was joined by four more states, most significantly Virginia, the South's most industrialized state and home of esteemed general Robert E. Lee.

The Civil War has been called the first modern war due largely to its bloody ferocity that did not spare civilians. It was a war made possible by new technologies, including ironclad ships and more powerful and reliable guns and mortars. It was among the first wars extensively documented by photographers, most famously Mathew Brady.

Although neither side was really prepared for conflict, the Union held an enormous edge in manpower, rail trackage, and industrial capacity. Yet, in early battles, the Confederacy shocked Union troops in the East, thwarting attempts to take Richmond, the CSA's capital, in the battles of Bull Run/Manassas, the Seven Days' Campaign, and Second Battle of Bull Run.

Not until September 1862's Battle of Antietam in Maryland was Union general George B. McClellan, a brilliant but vain and indecisive leader, able to claim victory over troops led by General Lee. Antietam was the bloodiest battle in American history. In one day (September 17) 4,300 men died outright while 2,000 died later of their wounds. In the West, the Union also had successes

as ULYSSES S. GRANT, soon to become head of the Union armies, captured forts in Tennessee, while Admiral David G. Farragut seized the vital port of NEW ORLEANS.

Success at Antietam helped solve major issues facing President Lincoln. Confederate envoys in Europe had been working hard to gain diplomatic recognition. They emphasized to British and French leaders the importance of cotton to the European textile industry. A temporary textiles glut, European distaste for slavery, and the Union's own diplomacy and recent military success helped derail the possibility of CSA nationhood aided by foreign powers.

In Antietam's wake, Lincoln also finally felt empowered to add an end to slavery to his original war aim of preserving the Union. Since the war's outset, slaves had flocked to Union lines, while black leaders like FREDERICK DOUGLASS urged Lincoln to allow blacks to join in a battle for their freedom. Yet Lincoln still maintained that he would not interfere with slavery where it already existed, if only the Confederacy gave up its reckless secession. Strengthened by Antietam, Lincoln gave the CSA until January 1, 1863, to surrender or face slavery's abolition in rebellious states. The Emancipation Proclamation did little to free any slaves and provoked the political backlash Lincoln had feared. But it did signal the beginning of the end of slavery and inspired more than 200,000 black men to fight for the Union.

Still, the war raged. It began with great enthusiasm as young men on both sides flocked to state militias. As bloodshed escalated, both sides had trouble mustering fresh recruits. In April 1862 the CSA instituted the first military draft in U.S. history; a Union conscription law was implemented the following March. Both had loopholes mainly allowing wealthy men to avoid service; both were highly unpopular.

The most extreme example of draft resistance occurred in New York City in the summer of 1863. Led by Irish immigrants, hundreds of protesters expressed their fury by vandalizing the homes and businesses of rich Republicans and assaulting free black citizens of New York. More than 100 died. Troops from the just-concluded Battle of Gettysburg were called in to quell the violence. Gettysburg was one of several key battles in 1863 that favored the Union. The Confederacy suffered a grievous loss at Chancellorsville, Virginia, when General Thomas "Stonewall" Jackson was killed by friendly fire. In July General Grant's troops seized Vicksburg, gaining control of the Mississippi Valley. Almost simultaneously, General George Meade's Union troops repelled Lee's deepest incursion into Union territory at Gettysburg, Pennsylvania.

Despite these indications of eventual Union success, there was no quick end. In 1862 Clement L. Vallandigham, a former Ohio Congressman, spearheaded a "peace without victory" movement that called for a negotiated reconciliation with the Confederacy and denounced abolition. These Peace Democrats, called Copperheads by Republican opponents, posed serious political problems for Lincoln, as he faced a strong reelection challenge in 1864 from his fired general, George McClellan. Union victories in the battles of The Wilderness and Spotsylvania caused huge death tolls on both sides, but were crushing blows to the smaller, poorly equipped Confederate army. Meanwhile, General William T. Sherman in September captured Atlanta and commenced his March to the Sea that destroyed farms, homes, railroads, and lives across a 60-mile-wide swath of Georgia and South Carolina. These timely successes helped assure Lincoln's reelection.

On January 31, 1865, Congress approved the Thirteenth Amendment to the Constitution, a first step in the permanent abolition of slavery. By April 3 Grant's soldiers occupied Richmond; the next day President Lincoln, accompanied only by a few Union sailors, visited the conquered Confederate capital.

In the wake of Lee's surrender and Lincoln's assassination at the hands of nationally famous actor John Wilkes Booth, a new United States emerged. The North had used the war years to consolidate its economy and create national programs, including western homesteads, agricultural colleges, and a transcontinental railroad. The decimated South began to rebuild, although it would lag socially and economically for decades. No serious secession movement ever again challenged federal authority. The end of slavery was a joyous event, but it would take generations for either the former Confederacy or former Union to seriously pursue justice for their African-American citizens.

Cixi (Tz'u-hsi)

(1835–1908) *Chinese ruler*

Yehe Nara (or Yehenala) was the daughter of a minor Manchu official. She entered the harem of Emperor Xianfeng (Hsien-feng) in 1851 and became a high-ranking consort upon the birth of a son, his only male heir, in 1856.

An incompetent ruler, Xianfeng's disastrous foreign policy led to war against Great Britain and France that culminated in the Anglo-French occupation of China's capital, Beijing (Peking). Xianfeng, Yehe Nara, their son, and some followers fled to their summer palace in Rehe (Jehol), north of the Great Wall. Xianfeng died there in 1861 and was succeeded by his five-year old son who reigned as Emperor Tongzhi (T'ung-chih).

Xianfeng's will created a board of regents for his son. However, they were quickly overthrown by a coalition of his empress, Yehe Nara, and his brother PRINCE GONG (K'ung), who had been left in charge in Beijing and had negotiated treaties ending the war with Britain and France. Xianfeng's empress became the dowager empress Ci'an (Tz'u-an) and Yehe Nara became the dowager empress Cixi (also called the Eastern and Western Empresses, respectively, after the location of their residences in the Imperial City).

Contrary to dynastic law that forbade regencies under dowager empresses, they became coregents, assisted by Prince Gong, who was given the additional title of prince counselor. Although senior in status, Ci'an was retiring by nature and was dominated by Cixi, who was both ambitious and ruthless; she also exploited her position as the natural mother of the boy emperor. Initially, she cooperated with Prince Gong, using him to run China's foreign affairs and going along with his programs in cooperation with other modernizing officials. They introduced policies and programs that strengthened China and raised armies that defeated the major rebellions (TAIPING, NIAN, AND MUSLIM REBELLIONS) that had threatened the very survival of the QING (Ch'ing) DYNASTY. Thus the era of the boy emperor's reign was called the TONGZHI RESTORATION.

As Cixi gained experience she shed anyone who could threaten her power. From 1865 she repeatedly "chastised" Prince Gong, until he was completely sidelined, replacing him with incompetent and totally compliant Manchu princes. For example, she put a minion, Prince Yihuan (I-huan), in charge of building a modern navy, then diverted funds intended for the navy to build

a lavish new summer palace, with calamitous results for China when Japan attacked in 1894. She refused to give up actual power when her son reached majority in 1872 and encouraged him to indulge in excesses as distraction. She also disapproved of his choice of an empress and did her best to separate the two. He died in 1874 under mysterious circumstances, followed by the suicide of his pregnant empress so that her unborn child, if a male, would not succeed to the throne. In violation of dynastic law, Cixi then adopted a nephew (son of her husband's brother and her sister), three-year-old Zaitian (Tsai-t'ien), as the new emperor. His youth ensured another long regency for Cixi. When the Eastern Dowager died mysteriously in 1881 after only a day's illness, Cixi's power was supreme.

Cixi and her court were corrupt to the core. Officials were required to pay her for audiences, promotions, and her birthdays and were cashiered if they objected. She allowed her favorite eunuchs and maids to sell offices. One favorite eunuch, Li Lianying (Li Lienying), her hairdresser, died a multimillionaire. She tried to terrorize GUANGXU (Kuang-hsu) into becoming a cipher, but though terrified of her and forced to marry her niece to enmesh him further under her control, he grew up to be an intelligent and studious man, convinced that deep reforms were necessary to save China. The confrontation occurred in 1898 when Guangxu launched the HUNDRED DAYS OF REFORM. In a showdown, Cixi's reactionary supporters, who feared loss of power, and an opportunistic general, Yuan Shikai (Yuan Shih-k'ai), who betrayed the emperor, allowed Cixi to launch a successful coup that imprisoned Guangxu. Six leading reformers were executed, others fled abroad; all reforms were rescinded. She installed a reactionary prince as heir, preliminary to dethroning Guangxu, but was foiled by opposition from provincial governors and Western powers.

CLIMAX OF REACTION

In 1899 a xenophobic secret society popularly called Boxers began a rampage in northern China, killing Westerners and Chinese Christians. Cixi and her ignorant supporters believed in Boxer claims of magic. She ordered all Westerners in China killed, Chinese diplomats to return home, declared war on the entire Western world, and cut telegraph lines so that her deeds would not be reported abroad. Fortunately for China, its diplomats abroad and governors in the central and southern provinces refused to obey her orders and declared the Boxers rebels. The Boxer reign of terror in Beijing ended when soldiers from

eight Western powers captured the city. Cixi fled the capital with Guangxu in tow, refusing to let him stay behind to negotiate with the Western powers due to fear that he might assume power. She returned to Beijing in 1902, blaming Guangxu for the Boxer fiasco. Cixi attempted to salvage her fortunes and those of the dynasty after 1902 by belatedly professing interest in change, sent a delegation to Western countries to study reform, and promised gradual political changes. She appointed a three-year-old grandnephew heir to the childless Guangxu before she died on November 15, 1908, after it was announced that he had suddenly died on the previous day. The Qing dynasty would last three more years.

JIU-HWA LO UPSHUR

coffee revolution

In the second half of the 19th century, what is often referred to as a “coffee revolution” swept large parts of Latin America, especially southern Brazil, northern South America (Colombia and Venezuela), and Central America (Costa Rica, El Salvador, Guatemala, and Nicaragua). The consequences of this revolution were profound, transforming land-use patterns and relations of production and exchange within individual nation-states, especially through the privatization of collectively held lands (owned either by Indian communities, the church, or the state); providing a sound fiscal base for emergent states, and thus permitting the robust growth and modernization of state administrations and bureaucracies integral to Latin America’s liberal revolution during this same period; and integrating Latin American economies more tightly within the developing global capitalist system, particularly the nexuses connecting Latin America with Europe and North America.

Coffee is among what historian Sidney Mintz called the “drug foods” of the Americas and other tropical zones; these foods also include tea, chocolate, tobacco,

rum, and sugar. Three of these tropical export products—coffee, tea, and chocolate—are bitter and were generally consumed as drinks, facilitating their consumption along with sweetening substances like sugar and molasses. In a widely accepted argument, Mintz maintains that the consumption of these drug foods by urban wage earners was part and parcel of the growth of urban working classes in Europe and North America during the INDUSTRIAL REVOLUTION in the second half of the 19th century. In France, for instance, coffee consumption increased fivefold from 1850 to 1900 (from 50 to 250 million pounds annually); Germany saw a fourfold increase during this same period (from 100 to 400 million pounds annually); the figures for other European nations were comparable. This was also an era in which African slavery was on the decline, wage labor and European migration to Latin America on the rise, and liberal reformers in Latin America’s newly independent nation-states were actively seeking greater foreign investment, free trade, and secure sources of tax revenue. All of these factors and more came together to generate Latin America’s coffee revolution.

Of African origin, coffee was cultivated in the Americas from the early 1600s, usually on lands unsuitable for sugar and tobacco, the principal export crops. European consumption of coffee rose dramatically from the 1650s, especially in urban coffeehouses, which in turn prompted increased coffee production in the Americas, usually by slave labor. But it was not until the 1820s and 1830s, with the explosive growth of urban working classes in Europe and North America, and the ending of Latin America’s colonial status, that the industrializing world’s explosive demand for coffee prompted renewed Latin American attention to this traditionally secondary (or tertiary) export commodity.

Large-scale coffee production required not only fertile, well-watered, well-drained soils, but substantial long-term capital investment and an ample supply of labor. Land first needed to be cleared and coffee seedlings planted. Coffee trees generally take three to six years from planting to first years of fruit production, requiring during this period careful tending and weeding. Coffee trees also tend to deplete soils of nutrients; thus, without application of fertilizers, production declines and new lands are needed. Also, unlike sugar, which generally requires large plantations to exploit economies of scale, coffee carries no such requirements and can be grown and marketed profitably on large plantations as well as on small farms utilizing primarily family labor.

The history of coffee in Brazil, Latin America's largest coffee producer, illustrates these patterns. Before the 1830s, Brazil had undergone a series of export booms: brazilwood, sugar, tobacco, gold, and diamonds. In the 1830s coffee production surged, and by the 1840s coffee became the country's leading export product—a position it held for the next 130 years. In the 1840s coffee made up more than 40 percent of total exports; by the 1890s nearly 65 percent; and by the 1920s nearly 70 percent.

The region around Rio de Janeiro and São Paulo in the south became the center of the coffee revolution, with the city of Rio de Janeiro emerging as the country's leading financial and commercial center and principal port city. The city's financial and transport infrastructure of banks, brokerage houses, and port facilities modernized rapidly. The decline of sugar production in the northeast and growth of coffee production in the south combined with the decline of the transatlantic slave trade to generate a brisk internal trade in slaves and a shift in the country's demographic, economic, and political center of gravity southward to the coffee zones.

By the late 1840s competition for lands suitable for coffee production intensified, prompting the national government to issue a new land law in 1850 that in effect favored large producers and made land acquisition much more difficult for smallholders. During this same period, large coffee growers sought to promote European immigration, both to "whiten" the country's population and to provide an adequate labor supply for their expanding plantations. The scheme faltered, however, as European immigrants balked at the slavery-like labor conditions and the lack of economic opportunities—a failure that in turn buttressed large planters' commitment to slave labor.

The final abolition of slavery in Brazil in 1888 prompted not only the fall of the empire by military coup and the formation of a republican government in 1889, but a surge in European immigration, much of it related to coffee production. By 1900 more than two-thirds of the world's coffee was produced in Brazil. Coffee remained the mainstay of the export economy until after 1945, but even as late as 1970 coffee revenues made up more than one-third of Brazil's export sector.

The precise nature of Latin America's coffee revolution unfolded differently in different countries and regions, varying widely according to local traditions, preexisting landholding patterns, and power relations between large landholders and smallholders, and many other factors. Overall, coffee production and commerce

tended to favor large producers over small, but this gross generalization masks important national, regional, and local variations. Costa Rica, for instance, the first Central American nation to undergo a coffee revolution, is often cited as an example of a Latin American nation whose coffee revolution favored smallholders, which in turn fostered the development of democratic institutions. Scholars generally agree that this was indeed the case. Yet even in Costa Rica, different regions experienced the coffee revolution in distinctive ways. The province of Cartago, for instance, saw large coffee farms predominate (59 percent with more than 20,000 trees), while in the country as a whole, most farms were smaller scale (60 percent with fewer than 20,000 trees). Tremendous local and regional differentiation, in short, was the norm, and not just in Costa Rica but across Latin America.

The coffee revolution's timing also varied greatly. Venezuela, like Costa Rica and Brazil, saw surges in coffee production in the 1830s and 1840s; by 1900 Venezuela was Latin America's second-largest coffee producer after Brazil. The approximate sequence in Central America was Costa Rica (1830s–40s), Guatemala (1860s–70s), El Salvador (1870s–80s), and Nicaragua (1880s–90s). Honduran coffee production remained limited through the 19th and early 20th centuries, reaching Costa Rica's 1860s production levels only in 1949.

Colombia's coffee production boomed in the late 1870s and 1880s (reaching around 14.3 million pounds in 1880), and again in the 1910s and 1920s (approximately 309 million pounds in 1921). Colombia also developed a coffee economy more akin to Costa Rica's than Brazil's, in which small, family-owned and -operated farms tended to predominate—again, with significant regional variations, with smaller farms predominating on the coffee frontier region of the central cordillera and larger production units in zones with greater abundance of labor and capital, such as southwestern Cundinamarca Department.

Everywhere, the coffee revolution introduced a host of changes generally associated with Latin America's liberal revolution: the privatization of lands formerly unclaimed or owned collectively; the formation of more modern structures of state administration and bureaucracy; the increasing importance of wage labor; the modernization of transport and communications infrastructure to facilitate production for export; state and elite-led promotion of free trade, foreign investment, and European immigration; greater vulnerability to the boom-and-bust cycles of the world market; and

tighter integration into the structures of global capitalism. The specifics of these transformations in various national and subnational contexts comprise the subject of a voluminous literature.

MICHAEL J. SCHROEDER

Colombia, War of the Thousand Days in (1899–1902)

The War of the Thousand Days in Colombia lasted from October 1899, when the Liberals staged a revolt to unseat the Conservative government, to November 1902. It is estimated that 100,000 people died during the war, which left Colombia and Panama (then a part of Colombia) devastated. It also led to the secession of Panama.

There had been much instability in 19th-century Colombia with the 1863 constitution suppressed in 1886 and a new constitution established. This failed to end the period of confrontation between the Liberals and the Conservatives, the latter managing to manipulate the electoral system to remain in power. With President Manuel Antonio Sanclemente being too ill to administer the country, there was a power vacuum which Liberal generals hoped to exploit.

The Liberal generals planned a coup d'état for October 20, 1899, but the date was brought forward to October 17 at the last moment. Instead of being a relatively straightforward conflict, many Liberals were hesitant about becoming involved in the war, some for fear of the consequences of failure, others because they were unsure whether they wanted a civil war. The outbreak of the rebellion was in Socorro, Santander, with rebels who had trained in Venezuela ready to come over the border.

The Conservative government immediately sent their loyal commanders to Bucaramanga, the capital of

Santander, but the soldiers were unhappy about being paid in what they felt was worthless paper money. This stopped the Conservatives from ending the war with a quick victory. However, they did manage to defeat some of the Liberals at the Battle of the Magdalena River on October 24. They were unable to follow up their victory. The Conservatives split into two factions, the “historical” and the “national.” Sanclemente was deposed and replaced with José Manuel Marroquín. At the same time, the Liberals, who also split into two factions, the “pacifists” and the “warmongers,” nominated one of their leaders, Gabriel Vargas Santos, as their president, and the scene was set for a civil war.

At the Battle of Peralonso, the Liberals led by Rafael Uribe defeated their opponents, but at the Battle of Palonegro, the Conservatives were able to crush the Liberals. The Venezuelans intervened to support the Liberals, but the Conservative Commander Marroquín managed to block them from coming to the aid of their allies. With neither side able to deliver a decisive blow, the first peace agreement was signed at the Neerlandira plantation on October 24, 1902. Fighting continued into the following month in Panama, and finally, on November 21, the final peace agreement was signed on the U.S. battleship *Wisconsin*. This ended the war that had wrecked the economy of the country but had also confirmed the split in Colombian society that was to lead to Panama being created as an independent republic on November 3, 1903.

JUSTIN CORFIELD

comuneros' revolt

The *comuneros'* revolt was a rebellion against Spanish colonial authority that took place between March and October 1781 in what is now considered Colombia. This rebellion in the Viceroyalty of New Granada was a response by colonists to changing economic conditions. While some of the conditions were long-standing, many of those that sparked the revolt were a result of the so-called Bourbon reforms. The Spanish government had imposed a series of reforms in their New World colonies in order to more effectively control and profit from them.

Although the rebellion is sometimes portrayed as a precursor to the independence movement that took place several decades later, its aims were actually rather limited and reformist rather than revolutionary. The rebels called not for an end to Spanish colonial rule but simply a return to the pre-Bourbon reforms situation in which the Spanish government played a lesser role in colonial affairs. The aims of the rebels can be seen in their slogan—“Long live the King, down with the evil government.” The revolt was notable in that it organized a large number of common people.

The revolt began on March 16, 1781, in the town of Socorro, an important agricultural and manufacturing center in northern New Granada. A crowd led by Manuela Beltrán tore down the posted edict that announced a sales tax known as the *alcabala*. This tax was part of a package of fiscal measures imposed by the royal official Juan Francisco Gutiérrez de Piñeres. The measures also included an extension of government monopolies, especially the tobacco monopoly, that restricted the colonists' production. These policies led to a rise in the cost of foodstuffs and consumer goods and increased the cost of industry for the colonists.

Similar incidents took place in other towns. In Socorro, colonists elected a *común*, or central committee, to lead the movement. Furthermore a *común* represented the idea of a common front of all colonial social groups that challenged the traditional hierarchical society. Members of the elite in Socorro endorsed the movement. Their leader was Juan Francisco Berbeo. The rebels had a number of demands, which included a reduction in tributes and sales taxes, a return of Native American lands, a recall of a new tobacco tax, and the appointment of more Creoles—Spaniards born in the colonies—to colonial government offices.

Berbeo organized a force of between 10,000 and 20,000 people to march on the capital city of Bogotá. The *comuneros* defeated a contingent of soldiers sent from the capital. In late May the rebels arrived in the town of Zipaquirá, just north of Bogotá. At the time, the viceroy was away in the coastal town of Cartagena. Gutiérrez fled. The capital was under the leadership of Archbishop Antonio Caballero y Góngora.

On June 5 the two sides agreed to the Capitulations of Zipaquirá, which contained 34 articles dealing with the colonists's complaints about the fiscal and administrative aspects of the Bourbon reforms. However, Spanish authorities secretly signed a document in which they declared the agreement void due to the fact that it had been obtained by force. Once the rebels retreated and dispersed, Spanish royal offi-

cial voided the Capitulations. While Spanish officials granted a general amnesty to the rebels, they enforced obedience to royal authority by sending troops to the rebellious region and reinstated many of the unpopular fiscal measures. Most of the rebels accepted these official actions and returned to their daily lives. However, a small core of the *comuneros* headed by the mestizo peasant leader José Antonio Galán continued the fight. In October 1781 Galán was captured. Spanish authorities executed Galán and three of his lieutenants in February 1782.

RONALD YOUNG

Congo Free State

In 1870 the Congo basin was unknown to Europeans. It contained 250 ethnic groups, 15 cultural regions mostly speaking Bantu languages, and a diverse climate and terrain, chiefly savanna and dense rain forest. States were highly organized, with some large kingdoms; agriculture was varied; technology was somewhat developed, particularly metalworking; cloth and artworks were elegant, especially wood carvings, later partly inspiring cubism. Economies flourished despite unhealthy lowlands and depredations of East African slaves.

In 1877 Henry Morton Stanley completed tracing the 3,000-mile Congo River, emerging at its Atlantic mouth. British disinterest led Stanley to approach LEOPOLD II of Belgium, whose machinations along with Stanley's creations of stations on the Congo resulted, after the 1884–85 Congress of Berlin, in the establishment of the Congo Free State with Leopold as the sole owner. It had 22 miles of coastline, about 900,000 square miles of vaguely defined interior, and a blue flag with a gold star. Initially it exported palm products and ivory, until most of the elephants were killed. It was governed from Brussels; administrators were European volunteers. Indigenes were used for portage, railroad and road building, harvesting wild

rubber, and lumbering. From 1891 on, coercion forced workers to turn all ivory and rubber over to the state. Forced labor requirements were high. They were stabilized at 40 hours per month in 1903, which in practice often meant more than 20 days. Much land was awarded to commercial concessions; the remainder mostly became the property of the Congo state and then to Leopold. As a result, indigenous economies were destroyed.

In the late 1890s the Congo became profitable, as world demand for rubber grew. Greed, both Leopold's (chiefly to embellish Belgium) and that of commercial concessions, along with demands for wild rubber, quota systems, and forced labor caused abuses and depopulation as well as dwindling amounts of rubber owing to lack of conservation and brutal slashing of vines. Pressure for profit led to serfdom, lashings, physical mutilations (cutting off of ears or hands), and murder, especially by commercial concessions. Resistance was widespread and often effective; villages fled at the sight of a white man.

By 1900 criticism of the Congo's maladministration mounted in both Britain and the United States. Leopold was indifferent to it. Many aspects of the situation in the Congo were not unique, but it and Leopold were easier targets than the Great Powers. The campaign of E. D. Morel in Britain, the investigation and the 1904 report of British consul Roger Casement (which chiefly condemned the system, not individuals), Morel's 1904 Congo Reform Association, missionaries, and Leopold's own 1905 investigative commission confirmed the atrocities, despite some dubious evidence. Though Leopold resisted, Belgium wrested the Congo Free State from him and reluctantly annexed it in 1908 to end the abuses, which it largely did.

SALLY MARKS

Constitution, U.S.

External challenges had motivated previous unsuccessful attempts at creating a union between the 13 English North American colonies. But neither these, nor the First Continental Congress that convened in

Philadelphia on September 5, 1774, aimed at founding an independent republic. Rather, they were concerned with restoring the rights of the colony in face of British pressure.

When the Second Continental Congress met in May 1775, matters had changed radically. A trade war had broken out with the mother country, and colonial militia had clashed with British regulars. The DECLARATION OF INDEPENDENCE followed on July 4, 1776. John Dickinson of Philadelphia submitted the first draft of a constitution. The Continental Congress felt it gave too much power to the central government.

Congress adopted the final document, known as the Articles of Confederation, on November 15, 1777. While each state held one vote, Congress was given the power to declare war, negotiate peace, make treaties with foreign nations, decide over interstate disputes, print and borrow money. Further it regulated relations with Native Americans and postal services. For all practical reasons, sovereignty still rested with the states, so did power in all matters not explicitly delegated to the central government. Revision of the Articles required a unanimous vote in Congress; important laws needed approval from at least nine of the 13 states to become effective.

In 1780, the confederacy faced bankruptcy, and GEORGE WASHINGTON's troops were on the verge of disintegration. The BANK OF THE UNITED STATES was chartered in 1781, but the plans of Congress to raise revenue through taxes and tariffs were thwarted by the states. Land sales west of the Appalachians and public loans provided temporary solutions, but the crisis exposed the major intertwined weaknesses of the Articles of Confederation: lack of power to impose taxation and the extensive sovereignty of the states at the expense of Congress.

The national debt and war created a nationalist faction in American politics, with Washington, JOHN ADAMS, BENJAMIN FRANKLIN, and John Jay demanding a stronger central government. Shays's Rebellion in Massachusetts added to the emergency. Merchants in New York, Massachusetts, and Pennsylvania resisted to protect their own state tariffs and protective subsidies. While the planters of Virginia were eager to keep import taxes low, their concern over the war chest added to the ideological inclination toward a strengthening of the federal authority. On the initiative of the Virginia legislature, the Annapolis Convention in 1786 was summoned to discuss federal finances, but the issues discussed soon widened in scope. The basic

problem was in the provisions of the Articles, and the Congress approved the Philadelphia Constitutional Convention, convened on May 15, 1787.

Part of the impetus for reform came from Shays's Rebellion. As the war debt from the Revolution trickled down to individuals, small farmers were often forced to sell their land to pay taxes and were thus unable to continue making a living. The rebellion was put down by a militia raised and organized as a private army. The lack of federal response to the situation created more aggressive calls for reform to the federal government to prevent such situations in the future.

The basis for the revision of the Constitution was to be JAMES MADISON's Virginia Plan; Madison, together with ALEXANDER HAMILTON, had led the Annapolis Convention, recommending a wider revision of the Constitution. Madison's political thinking had a big influence on the convention.

CONSTITUTIONAL CONVENTION

Fifty-five delegates from 12 states attended the Constitutional Convention; Rhode Island opposed any revision and provided no delegates. Among those present, apart from Madison and Hamilton, were Washington (who served as the president of the convention) and numerous other central figures of the Revolution: Benjamin Franklin, John Dickinson, James Wilson, and Robert Morris of Pennsylvania; Roger Sherman and Oliver Ellsworth of Connecticut; and Charles Cotesworth Pinckney of South Carolina.

It fell to the aging Franklin, Madison, John Dickinson, and Roger Sherman to keep the convention together during heated debates. The delegates were mostly merchants and planters, a feature that many historians have seen as favoring a federal government that secured property rights and debtors' interests.

In addition to the provisions given in the Articles of Confederation, the constitutional draft ensured sovereignty of the federal over the state levels, the former were empowered to raise revenue and provided direct citizenship to the United States. The proposals for a central government provided a system of checks and balances between the legislative, executive, and judicial branches, inspired by French philosopher Charles de Montesquieu. An electorate picked the executive by popular vote, but there were significant disputes over the nature of the legislative branch. Madison's Virginia plan offered a bicameral solution, where the House of Representatives was elected by popular vote, in which each state had a proportional number of seats. The House would then elect a Senate. Madison's plan

would safeguard the more populous states against irresponsible spending of the smaller ones. The smaller states rallied around the New Jersey Plan providing for a unicameral legislative with equal representation among the states, fearing abuse of power from the larger states.

The Great Compromise, proposed by a subcommittee, offered the final solution, in which the House of Representatives was to be elected by popular vote where each state has a representation in proportion to its population, while there would be equal representation in the Senate. To ease the concern of larger states, revenue bills could only be passed in the House. The judiciary was to ensure that neither federal nor state legislation nor the executive were in conflict with the Constitution.

SUFFRAGE

Contrary to the wishes of many delegates and the provisions of many early constitutions of other nations, suffrage was not contingent on income or property, neither was eligibility to run for public office. The issue of slavery was largely avoided. A 20-year clause was added concerning the question of fugitive slaves. However, in the question of population in relation to representation, slaves and indentured servants were to count as three-fifths of a full citizen. The Constitution further prescribed that two-thirds majority was required in Congress for the repeal of a presidential veto, an amendment to the Constitution, and consent of the Senate to treaties was needed.

Federal law would overrule state legislation. A system of courts would safeguard against breaches of the Constitution, and the states were obliged to enforce federal proscriptions. Pierce Butler, delegate of South Carolina, summed up the feelings of his colleagues at the end of the convention when he cited the ancient founder of Solon, who claimed not to have given the Athenians the best government he could devise but the best they would receive. In this lay the idea that the new Constitution was the best the convention could agree upon and the best the states would accept.

On September 17, 1787, the Convention adjourned, and the struggle for ratification commenced, which needed consent by nine of the 13 states. First, James Madison promised amendments—later known as the Bill of Rights—to the draft that would safeguard the rights of citizens and states against the abuse of federal power. It ensured freedom of speech and religion, the right to bear arms, safety of life and property, legal

protection, and that powers not explicitly delegated to the federal government rested with the states.

In order to convince the reluctant citizens of New York, Jay, Madison, and Hamilton wrote a series of essays called *The Federalist Papers* in 1787 and 1788. Not only did they produce an influential vehicle of opinion, they also provided subsequent generations with valuable insights into the political thought of the founding fathers of the United States. The ratifying conventions in the states met between December 1787 and June 1788 and were much more broadly composed than the convention itself, including farmers and artisans.

The struggle proved particularly hard in Massachusetts and New Hampshire. Virginia and New York also were slow to ratify the Constitution. The last states, North Carolina and Rhode Island, finally and most reluctantly ratified in 1789 and 1790, respectively. Besides differences in opinion over what would provide the most efficient and just type of government, economic self-interest and reluctance to give up control marked the debate.

FRODE LINDGJERDET

Cook, James

(1728–1799) *English explorer and cartographer*

James Cook was born in Marton-in-Cleveland, England, on October 27, 1728. His family was Scottish in origin, having left Scotland for England after the upheaval of the 1715 Jacobite Rebellion. Cook's father was a farmworker. When James was seven, his father's employer arranged for him to attend school, and at the age of 12, he became an apprentice to a shopkeeper in a nearby coastal town. This first exposure to the sea took hold of the boy, and he left his apprenticeship in 1746 for a new position with shipowners. In his new surroundings, he learned about math, navigation, compasses, and maps. In 1755 Cook became a mate on one of his employer's ships. Later that year, Cook

A noted cartographer and explorer, Captain James Cook was killed due to a misunderstanding with Hawaiian natives.

left to join the Royal Navy. Because war with France was impending, Cook expected that his experience and skills would be put to good use and result in rapid promotions.

Cook's first assignment was aboard the *Eagle*, where he met Hugh Palliser. Palliser would figure largely in Cook's life as a mentor and advocate. Within a month, Cook had proven his seafaring skills and was put in charge of the ship's navigation. In 1757 Cook was again promoted and assigned to the *Pembroke* on Palliser's recommendation. Now that Britain was at war with France, Cook's assignments were related to wartime service. He spent almost a decade in North America, charting rivers and creating maps of Canada, Nova Scotia, and Newfoundland. During these years, he returned to England once and married Elizabeth Batts in 1762. It was not long before he was back at sea, working on charts and maps of North America.

In 1767 Cook resigned command of his ship and returned to England, but his reputation soon earned him an opportunity to travel to the Pacific Ocean to observe the transit of Venus. The Royal Society commissioned his service, and upon acceptance Cook was given command of the *Endeavour*. In addition

to the scientific objectives of the mission, Cook was asked to verify or disprove the existence of a large continent in the Pacific Ocean. Cook and his crew sailed to the Madeira Islands, Canary Islands, Cape Verde Islands, Rio de Janeiro, and then went around Cape Horn into the Pacific Ocean. They reached Tahiti in April 1769, observed and documented the transit of Venus on June 3, and continued their voyage in July.

The *Endeavour* sailed on to New Zealand, where Cook spent six months working on maps and charts of the islands and the waters. Cook and his crew had their first encounters with the Maori. Although the Maori culture (particularly their ritual cannibalism) was frightening to the English sailors, Cook managed to make cultural and linguistic observations about the Maori people.

In 1770 he took his ship around Australia, which he named New South Wales when he claimed it as the king's. From there, he went to New Guinea, Java, the Cape of Good Hope, and home to England on June 12, 1771. As was common, he had lost many of his crewmen—about one-third—to scurvy during the voyage. He had circumnavigated the globe, discovering new geography along the way, and was promoted to the rank of commander.

Cook again set sail on July 13, 1772, aboard the *Resolution*, accompanied by the *Adventure*. After going to Africa, the Cape of Good Hope, and the Antarctic Circle, the ships headed for the South Pacific. They returned home in July 1775, having charted new and existing lands. As before, Cook brought back valuable new charts and maps of the globe. He had made another discovery during this voyage; good nutrition enabled his crew to stay healthy despite the long days at sea and difficult conditions living on a ship. Unlike on his voyage on the *Endeavour*, Cook lost only one man on the entire trip. For this medical advance, Cook received the Copley Gold Medal from the Royal Society.

Cook's final voyage came after his promotion to captain, and he and the crew of the *Resolution* headed for the northern Pacific to seek a passage across North America and to the Atlantic Ocean. Accompanying him was the *Discovery*, and together the ships set sail on July 12, 1776. After covering familiar ground (Africa, Cape of Good Hope, New Zealand, Tahiti, and elsewhere), Cook and his crew discovered HAWAII and arrived on the North American coast (where Oregon is today) in February 1778. His expedition explored the coast all the way up through the Bering Strait without finding

the northern passage they hoped to discover. Although the expedition was to continue back into the Pacific after a return to Hawaii, Cook was killed in a conflict with natives in Karakakoa Bay on February 14, 1779. When he and his men had arrived in Hawaii in January, relations with natives were friendly and safe, but cultural misunderstandings brought changes in the way the crew treated the natives. Eventually things escalated to the point of a violent skirmish, and Cook was stabbed. The man who stepped up to replace Cook as commander of the voyage negotiated for the return of Cook's body; the crew gave him a burial at sea on February 21, 1779.

JENNIFER BUSSEY

Crimean War

The Crimean War was a struggle between Russia and Britain, along with its allies, over Russian expansion into the Ottoman-controlled territories of the Black Sea. The war was part of the so-called EASTERN QUESTION, or what should be done about the weakened Ottoman Empire. Eager for territorial gains in the Balkans and control of warm water ports in the Black Sea, Russia wanted the Ottoman Empire to die as quickly as possible. Britain, wishing to thwart Russian ambitions, often stepped in to bolster the Ottomans in their conflict with Russia.

France and Austria-Hungary wavered on these diplomatic issues, but generally supported the British. Although they supported the Ottoman sultan against Russia during the 19th century, Britain and France both took territories away from the Ottomans in North Africa, Egypt, and along the Arabian Peninsula. They also demanded that the Ottomans institute political and economic reforms regarding Christian minorities within the empire and permit increased European involvement in Ottoman territories.

The TANZIMAT, a series of Ottoman reforms, was in many ways an attempt to address these demands. Along with the so-called Great Game over Russian and British expansion into Afghanistan, the Eastern

The fifth Dragoon Guards of the British army make camp during the Crimean War. Britain and its allies landed forces in the Crimea and laid siege to Sevastopol, the headquarters of the Russian fleet in the Black Sea.

Question was one of the major diplomatic issues of the mid- to late 19th century.

The events that led to the Crimean War started in Palestine, where the Russians had placed themselves as the protectors of Eastern Orthodox Christians and the French served as the protectors of the Catholic Christians. In 1847 the golden star that rested in the church in Bethlehem built over the spot where Jesus had allegedly been born disappeared. The Orthodox and Catholics both blamed one another for the theft; seeking to bolster French prestige, NAPOLEON III had another star made that was transported amid great pomp and ceremony to the church.

When the Eastern Orthodox refused entry to the church, the dispute was referred all the way to Sultan Abdul Majid I. Both the French and Russians professed to be insulted by the rather tepid responses of the Ottoman government, and the Russians demanded

that the Ottomans formally accept their protection over all Orthodox subjects in the empire. During negotiations, the Russian czar, Nicholas I, remarked that the Ottoman Empire was a “sick man” and the empire subsequently became known as “The Sick Man of Europe.”

When no resolution was forthcoming, the Russians declared war against the Ottoman Empire and destroyed the Ottoman fleet at the Bay of Sinope in 1853. In defense of the Ottomans, Britain declared war against Russia in 1854 and was joined by France and Piedmont-Sardinia. Britain and its allies landed forces in the Crimea and lay siege to Sevastopol, the headquarters of the Russian fleet in the Black Sea. Russia lost the city in 1855.

In a secondary front, the British and French also established a blockade of the Baltic Sea to prevent goods entering or leaving Russia.

In 1854 the British suffered a major defeat at the Battle of Balaclava made famous by the disastrous charge of the Light Brigade. Casualties in the war were high, and many died from poor health care in the field. The nursing practices and improvements in sanitary conditions made by FLORENCE NIGHTINGALE during the war laid the foundation for improved medical care in field hospitals.

After extensive negotiations, the war ended with the Peace of Paris in 1856. Under the treaty, the sultan and the Great Powers guaranteed the independence and territorial integrity of the Ottoman Empire; the sultan was to protect the minorities within the empire; the Black Sea was to be neutralized; and the waters of the Danube River were to be open to all. In addition, Russia got the Crimean Peninsula and parts of Bessarabia. Under a separate treaty, Britain, Austria, and France agreed to guarantee the Ottoman Empire, thereby prolonging its life.

JANICE J. TERRY

Cuba, Ten Years' War in

Fearing a slave insurrection like the one from the 1790s that wracked Haiti, the Cuban landowning and merchant elite opted to remain part of the Spanish Empire while the rest of Spanish America gained formal independence in the 1820s. Yet by the 1860s that same elite chafed under protectionist Spanish trade policies, high taxes, and political repression. Especially hard-hit and disgruntled were the cattle ranchers and sugar planters on the eastern part of the island.

On October 10, 1868, with the Grito de Yara (Cry of Yara), a coalition of elite landowners and small farmers, traders, and free persons of color launched a rebellion and proclaimed Cuban independence. The rebellion quickly spread westward, as far as eastern Las Villas Province. By the early 1870s, the rebels were supported by upward of 40,000 Cubans, from cattle barons and merchants to peons and slaves. The goals of the rebels varied widely. Most elites advocated political and economic reforms, defended slavery, and sought

to maintain the island's rigid social structure—though many also freed their slaves as a wartime necessity and in response to the incessant clamor of the slaves for their freedom. Workers and freed slaves tended to advocate radical social and political change, including the ABOLITION OF SLAVERY, the redistribution of land, and universal suffrage.

Despite the efforts of these more radical rebels, the rebellion remained confined mainly to the eastern part of the island. The rebel elite generally opposed taking the war to western Cuba, fearing a slave insurrection or widespread popular unrest, while western elites, with their larger landholdings and slave populations, tended to oppose the rebellion, fearing that its success would threaten their properties and undermine their privileged social position.

As the war dragged on, differences between rebel factions grew, especially along lines of race and class. The rebel armies, their ranks swelled with workers, peasants, freed slaves, and poor whites, became increasingly difficult for the landholding elite to control. The rebel elite leadership also waged war with one eye on the United States, which many hoped would seize the opportunity to annex the island.

These internal divisions combined with Spanish intransigence to stall the rebellion and keep it limited to eastern Cuba. The war lasted nearly 10 years, until a peace treaty, the Pact of Zanjón, was signed in early 1878. The rebels agreed to lay down their arms, while Spain promised political and economic reforms, general amnesty for all rebels, and freedom for all slaves and indentured servants registered in the rebel armies at the time of the peace pact.

The rebellion's failure has been attributed to numerous causes, particularly the conflicting goals of rebel leaders, their goal of annexation to the United States, which kept the war limited to eastern Cuba and dramatically circumscribed its social radicalism, and the opposition of much of Cuba's planter class. At the same time, memories of the Ten Years' War would endure throughout Cuba, especially in the east. Many of the most important rebel leaders of the later CUBAN WAR OF INDEPENDENCE gained valuable experience in the Ten Years' War, most notably Máximo Gómez and Antonio Maceo. Overall, the war created a legacy of struggle that Cuban patriots would seize on again in their final push to independence.

MICHAEL J. SCHROEDER

Cuban War of Independence

In one of the Western Hemisphere's most broad-based and violent struggles for independence, from 1895 to 1898, Cuba was embroiled in a massive, islandwide insurrection against Spanish colonial rule that ended with U.S. intervention and quasi-colonial status under U.S. domination. In the words of one of Cuba's preeminent historians, the Caribbean island's War of Independence resulted in "self-government without self-determination and independence without sovereignty." The war's outcome represented not only a thwarting of the desire of Cuban patriots for national sovereignty but also ushered in a period of U.S. suzerainty that lasted, some scholars argue, until the Cuban revolution of 1959.

The origins of the War of Independence can be traced as far back as the early 1800s, when Cuba's Creole elites balked at the prospect of risking their lives and properties in the face of a potential slave insurrection, as had embroiled neighboring Saint-Domingue (Haiti) after 1791—a reluctance reinforced by the arrival of upwards of 30,000 French exiles from Saint-Domingue who made Cuba their new home. Through the 19th century, Cuban elites were divided into moderate reformists who advocated greater autonomy under Spanish dominion and annexationists who envisioned U.S. annexation. Few were autonomists promoting outright independence. This changed from the 1860s, particularly in consequence of the TEN YEARS' WAR in eastern Cuba, a struggle that inspired a new generation of leaders whose vision of *Cuba Libre* (Free Cuba) was at the heart of the insurrection launched in 1895. The Ten Years' War and its aftermath had also created a large exile community of Cubans in the United States, centered in Tampa, Florida, and New York City. From abroad, groups of Cuban patriots plotted and planned the final insurrection, at their helm the poet, scholar, and activist JOSÉ MARTÍ.

In April 1892, after more than two decades of organizing, Martí and his compatriots in exile formed the Cuban Revolutionary Party (PRC), dedicated to the creation of a free and independent Cuba. By this time, the Cuban economy was dominated by the United States. In 1894, for instance, the United States received 84 percent of Cuba's total exports and provided 40 percent of its total imports. In that same year, the U.S.

Congress imposed stiff new tariffs on Cuban sugar imports, and Spain retaliated by imposing high tariffs on U.S. imports to Cuba. Meanwhile, the price of sugar dropped to less than two cents a pound, a historic low, while prices of imported foodstuffs rose dramatically. The combined effect sent the Cuban economy into a tailspin, negatively affecting all social sectors, including wealthy merchants and planters.

Emboldened by the turn of events, on February 24, 1895, the PRC issued the Grito de Baire (Cry of Baire) calling for independence. During the same month, autonomists launched several uprisings in different parts of the island. Most were crushed, though the uprising in Oriente Province in eastern Cuba took root and spread. In April the PRC's main leadership landed secretly in the island's far southeast: José Martí, Máximo Gómez, and the brothers Antonio and José Maceo. On May 19, 1895, Martí was killed in a skirmish 10 miles east of Bayamo in Oriente Province. Thus martyred, memories of Martí became a rallying cry for the rebel forces. By early 1896 the insurgency had spread to every part of the island, including the western provinces of Matanzas, Havana, and Pinar del Río, which had remained mostly quiescent in previous uprisings.

Scholars consider that the principal difference between the 1895 war and earlier rebellions consisted primarily in the coherence and inclusiveness of the nationalist ideology of Cuba Libre crafted by Martí and his compatriots in the years of organizing preceding the outbreak of hostilities and which came to be embraced by most Cubans during the war itself. Propelled by a vision of racial equality, social justice, and equal rights for all Cubans, the 1895 War of Independence differed in fundamental ways from previous independence struggles. In the words of rebel army chieftain Máximo Gómez, the Ten Years' War originated "from the top down, that is why it failed; this one surges from the bottom up, that is why it will triumph."

GUERRILLA WAR

In common with almost all guerrilla wars in the modern era, by 1896 the rebel columns came to be supported by a vast network of noncombatant supporters and sympathizers who provided vital resources, especially food, shelter, and information on the strength and location of Spanish military units. The war soon combined an anticolonial insurgency with a civil war pitting pro-Spanish elite landowners and sugar growers against landless and land-poor peasants and workers. Insurgents systematically torched cane fields while prohibiting production and export of sugar, tobacco, and

other commodities in a strategy designed to strangle the economy and thereby defeat the Spanish and their elite Cuban allies.

As the line between soldiers and civilians blurred, the Spanish responded by waging war against the civil populace as a whole. The acme of this approach came under General Valeriano Weyler, who from early 1896 launched his infamous reconcentration campaign. As many as 300,000 rural dwellers from all walks of life were rounded up and compelled to move into specially fortified reconcentration centers. Emptying the countryside into these squalid resettlement camps, the Spanish destroyed crops, killed livestock, and destroyed thousands of homes and villages. From 1896 to 1898 tens of thousands of *reconcentrados* died of disease, malnutrition, and abuse. In urban areas, Weyler and the Spanish jailed, deported, and otherwise terrorized thousands of Cubans of all social classes, from street peddlers and domestic servants to lawyers, businessmen, and other professionals. From an estimated prewar population of 1.8 million, by war's end the island's population had dropped to around 1.5 million, a demographic decline of more than 17 percent in only three years.

Weyler's ruthless counterinsurgency approach failed to stem the insurgent tide. In fact, it had the opposite effect, driving thousands of Cubans into the insurgent ranks. By 1897 it was clear that the Spanish were losing the military battle. Many conservative Cubans, afraid of losing their privileged social position if the insurgents triumphed and increasingly dubious about Spain's chances for victory, clamored for annexation to the United States. In early 1898 as Spanish troops grew increasingly demoralized, the insurgent leadership planned their final assault on Spanish strongholds in the major cities. Rebel victory seemed only a matter of time.

Meanwhile, in the United States, the chain of newspapers owned by William Randolph Hearst spearheaded what came to be known as yellow journalism, demonizing the Spanish as inhuman monsters slaughtering the childlike Cuban populace and clamoring for U.S. intervention. The U.S. foreign policy establishment, which had long coveted Cuba, saw the rising tide of insurgent power as a direct threat to U.S.

strategic and economic interests in Cuba and the wider Caribbean.

U.S. INTERVENTION

An ideal pretext for U.S. military intervention came on February 15, 1898, when the battleship the USS *Maine* blew up in Havana Harbor, killing over 200 U.S. sailors. Events moved swiftly thereafter. In April 1898 newly inaugurated President William McKinley asked Congress for authorization to send U.S. troops to Cuba, and on April 25, Congress declared war on Spain. McKinley's war message neither mentioned Cuban independence nor recognized the Cuban insurgents as a legitimate belligerent force. In this way, the Cuban War of Independence became the SPANISH-AMERICAN WAR, with the United States elbowing out of the way the insurgent forces that had all but defeated the Spanish in more than three years of bloody conflict.

The United States quickly defeated the beleaguered Spanish forces in Cuba, as well as in Puerto Rico, the Philippines, and Guam. The formal cessation of hostilities came on December 10, 1898, with the Treaty of Paris.

The negotiations leading to the treaty wholly excluded the Cuban insurgent forces, who were given no role in the U.S. military occupation that followed. Instead, the United States imposed the infamous Platt Amendment to the new Cuban constitution in 1901, which by a series of provisions effectively surrendered Cuban sovereignty to the United States, which dominated much of the island's economy and politics until the triumph of the Cuban Revolution on January 1, 1959, under Fidel Castro and the 26 of July Movement.

MICHAEL J. SCHROEDER

D

Darwin, Charles

(1809–1882) *British naturalist*

The famous British naturalist Charles Darwin traveled around the world, wrote several books, and developed the theory of natural selection and evolution.

Charles Robert Darwin was born on February 12, 1809, in Shrewsbury, Shropshire, in the west of England. His father, Robert Darwin, was a wealthy doctor and financier, and his mother Susannah (née Wedgwood) died when he was eight years old. He was a grandson of Erasmus Darwin, a prominent physician, on his father's side and Josiah Wedgwood, from the pottery family, on his mother's side. Charles Darwin went to Shrewsbury School and then to the University of Edinburgh to study medicine; he also learned how to stuff birds by a freed South American slave who worked at the Edinburgh Museum.

His father was disappointed at his son's lack of progress at Edinburgh and decided to move him to Cambridge. Darwin proceeded to Christ's College, where he had the idea of becoming a clergyman and studied theology. It was during this time that he started collecting beetles and developing a keen interest in entomology.

With the H.M.S. *Beagle* sailing to South America to chart the coastline, Darwin decided that he might join the crew as an unpaid assistant to the ship's captain, Robert FitzRoy. Darwin realized that it would give him an unparalleled opportunity to study the geological features of many islands around the world,

as well as to study wildlife. He had been inspired by accounts of the German explorer ALEXANDER VON HUMBOLDT. His father was unhappy about the idea of a two-year voyage (it later turned out to last for five years), but Josiah Wedgwood, his grandfather, supported the trip. Darwin set off on December 27, 1831, collecting and sending back large numbers of natural history specimens.

The ship stopped at the Cape Verde Islands, and Darwin proceeded to study oyster shells and note the changes in the land. On arriving in South America, at Bahia (modern-day Salvador), Darwin went to study the rain forest. He was angered by the treatment of the slaves in Brazil. He spent some months in the rain forest and then in July 1832 went to Montevideo, Uruguay, which was going through one of its many conflicts after becoming independent. Darwin met the Argentine dictator General JUAN MANUEL DE ROSAS and found the way the Argentine government treated the people of Tierra del Fuego bordering on systematic extermination.

The *Beagle* sailed to the Falkland Islands and then back to Argentina. In October 1833 Darwin caught a fever in Argentina and in July 1834 fell ill in Valparaíso. He spent a long time in Chile, climbing the Andes and studying the fossils in the Andean foothills. Darwin went to Peru and to the Galápagos Islands.

Darwin proceeded on to Tahiti, New Zealand, and Australia, although he never went to the settlement in the north of the country that now bears his name. In

New Zealand, he was saddened at the treatment of the Maoris and even more disappointed in the way he saw the aboriginal people of Australia being treated. The *Beagle* then headed off to the Indian Ocean, where the ship called in at the Cocos (Keeling) Islands. Already formulating his idea of animal species developing over very long periods of time, Darwin started to try to draw some conclusions on the final leg of his journey back to England, where he landed in October 1836, returning to Shrewsbury to rejoin his family.

FIRST BOOK

He received a £400 annual allowance from his father, and Darwin started a series of correspondences with other naturalists and geologists. On his return, Darwin wrote up his diary of the voyage as *Journal of Researches into the Geology and Natural History of the Various Countries Visited by H.M.S. Beagle*, which was published by Henry Colburn in 1839.

Darwin began cataloging all the different species, and in a talk at the Zoological Society, the famous ornithologist John Gould told the audience that the birds on the Galápagos Islands were not a mixture of species but all ground finches that had adapted differently. This helped fuel Darwin's ideas of evolution and natural selection. He became influenced by the ideas of Thomas Malthus and also by Harriet Martineau, a Whig political activist. Darwin developed the Malthusian ideas to form "natural selection," by which, when an area was overpopulated, the strongest would survive; he never used the term "survival of the fittest," although many later writers attributed it to him.

During the 1840s Darwin was refining his concept of evolution but initially had no intention of immediately publishing his treatise on natural selection. By 1854 Darwin had finished working out the order in which many species had evolved and had written about 250,000 words when, on June 18, 1858, he received a letter from Alfred Russel Wallace, an English socialist and natural history enthusiast who was in the Malay Archipelago. Wallace raised a similar idea of evolution to that of Darwin, with extracts of both scholars' work read at the Linnean Society on July 1, 1858. This encouraged Darwin to finish his book, which he called *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*. Darwin retreated to the North York moors when the book was released on November 22, 1859. There were 1,250 copies printed, and the entire stock had been oversubscribed by orders received by booksellers.

As Darwin had suspected, the book caused a storm of protest, and he kept a book of press cuttings, review articles, satires, parodies, and caricature cartoons. Dissenters saw merit in his book, but the members of the Anglican community at Cambridge were upset at Darwin's ideas, which they saw as directly challenging those in the Bible. Darwin, had deliberately not stated that he believed that humans had evolved from apes, but this was what many of his readers interpreted, with many reviewers talking about "men from monkeys." This denied the special status of humans, but Darwin found support from Thomas Huxley, writing his own book *Evidence as to Man's Place in Nature*, which was published in 1863.

CONDEMNATION

However, Richard Owen, the head of the British scientific establishment, condemned the book, as did Sedgwick and Henslow, who had been tutors to Darwin at Cambridge. Darwin's work was acknowledged in Prussia, where the zoologist Ernst Haeckel alerted the king of Prussia, who awarded Darwin a medal. Some German theorists were soon to go further, using the concept of evolution to develop ideas of SOCIAL DARWINISM by which one type of man was more advanced than another.

Darwin became increasingly unwell and took to his bed for many months during the 1860s. However, he continued to write more books, with six new editions of *On the Origin of Species*, and also some new works such as *Variation of Animals and Plants under Domestication*, published in 1868. He wrote *The Descent of Man, and Selection in Relation to Sex*, which was published in 1871, and his *The Expression of the Emotions in Man and Animals* was published in the following year.

His next books were titled *The Effects of Cross and Self Fertilization in the Vegetable Kingdom* and *The Different Forms of Flowers on Plants of the Same Species*.

From 1876 until 1881 Darwin wrote his autobiography for his grandchildren. He had married his cousin Emma Wedgwood, the marriage service being an Anglican ceremony that was arranged in order to suit the Unitarians. He and his wife had 10 children, three of whom died young. In 1881 Darwin finished his book *The Formation of Vegetable Mould, Through the Action of Worms*, which was to be his last published volume. He had an angina seizure in March 1882 and died on April 19. A funeral was held at Downe, where he had lived, and on April 26 he was

interred at Westminster Abbey, close to the last resting places of John Herschel and Isaac Newton.

Darwin has been remembered in many ways. An expanse of water near the Beagle Channel is named the Darwin Sound. In addition, there are many species named after him, including the finches he collected from the Galápagos Islands. In 1964 Darwin College, Cambridge, was named after the Darwin family, and in 2000 the Bank of England replaced Charles Dickens on the £10 note with Charles Darwin.

Although some historians still debate whether it was Darwin or Wallace who first came up with the concept of evolution, Darwin is the person credited with the idea and the person who did the most to advance it to a stage where it is widely accepted around the world.

JUSTIN CORFIELD

Declaration of Independence, U.S.

The foundational document of the Western Hemisphere's first republic, the first genuinely republican government of the modern era, the U.S. Declaration of Independence emerged amid an escalating war as one culmination of a long process of struggle between the American colonists and Great Britain and from a protracted process of compromise and negotiation between factions of the propertied white males who drafted and ratified it.

The document itself contained little that was original. Most of the sentiments it expressed and theories of republican government it propounded had deep roots in the French and English ENLIGHTENMENT, British-American history, and English common law.

It nonetheless captured the spirit of an era, articulating in a single statement of uncommon eloquence the reasons behind the American colonists' political break from Great Britain and the promise of political

From left, Benjamin Franklin and John Adams review Thomas Jefferson's draft of the declaration.

equality that, following the promulgation of the U.S. CONSTITUTION in 1787, formed a cornerstone of the new American republic.

Most delegates to the Second Continental Congress, which began its deliberations in Philadelphia in May 1775 in the wake of the Battles of Lexington and Concord, were hesitant to declare outright independence, despite the rapidly intensifying military conflict. A broad consensus about the necessity of proclaiming political independence emerged only after King George III's rejection of the Olive Branch Petition in late 1775 and the publication of THOMAS PAINE's hard-hitting pamphlet *Common Sense* the following January. Three well-heeled Bostonians were among the most fervent advocates of independence: the merchant John Hancock, the lawyer JOHN ADAMS, and his cousin, political agitator and onetime beer brewer, Samuel Adams.

The first formal call for a resolution of independence came on June 7 from Richard Henry Lee of Virginia. In response, the congress appointed a committee to draft the resolution, composed of John Adams, BENJAMIN FRANKLIN, THOMAS JEFFERSON, Robert R. Livingston, and Roger Sherman. This committee, in turn, designated Jefferson to draft the actual document, which was subsequently revised by Franklin, John Adams, and others. On July 2 Congress approved a resolution of independence, and two days later adopted a revised draft of the declaration originally penned by Jefferson. Henceforth, July 4 would be known in the United States as Independence Day.

Rooted in theories of natural rights articulated in previous decades by Enlightenment thinkers as diverse as John Locke and Jean-Jacques Rousseau, the document itself is divided into four parts: an introduction providing the moral and intellectual rationales for independence; a long list of complaints and grievances against King George III; its final assertion of political independence from Great Britain; and 56 signatures, most affixed on August 2 (mainly for logistical reasons, not all delegates who helped draft or voted for the declaration signed it). Many consider its second sentence to be its most socially radical, encapsulating the essential promise of political equality later codified for adult white males in the Constitution and, in the 19th and 20th centuries, extended to ex-slaves and women: “We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.”

The Declaration of Independence was not a law. Nor did it form the basis for the Constitution, adopted 11 years later. Mainly, it was a statement of principle that provided the essential rationale for the political break from Great Britain; an assertion of political unity among 13 distinct political entities in the context of a rapidly escalating military conflict; and a moral touchstone for the radical experiment in political republicanism to follow.

MICHAEL J. SCHROEDER

Díaz, Porfirio

(1830–1915) *Mexican dictator*

Remembered mainly as an iron-fisted dictator whose political cronyism and suppression of the rights of Mexico’s poor and Indian peoples led to the Mexican Revolution, Porfirio Díaz was a shrewd and canny ruler who used persuasion and cooperation as much as brute force to retain power. His regime made major strides in modernizing the Mexican economy and integrating it into the rapidly expanding structures of global capitalism. The period of his rule, known as the Porfiriato, was an era of major social and economic transformations. Under the banner of positivism, the Díaz regime systematically promoted capitalist development via free trade, foreign investment, the expansion of transport and communications infrastructure, and an expanding export economy (especially mining), while at the same time suppressing the rights of citizenship among the poor and disfranchised and the rapidly growing middle and professional classes.

It was the mounting frustration of the latter classes at being shut out of the nation’s political life, combined with growing landlessness, poverty, unemployment, and desperation among the majority, that ultimately led to the collapse of his regime. Master of the strategy of *pan o palo* (“bread or stick,” with “bread” signifying cooptation and “stick” signifying violent suppression of dissent), Díaz dominated Mexico’s political life for more than a third of a century, while the social dynamics set in motion by his rule laid the groundwork for the decade-long civil war and social revolution that followed his overthrow in 1911.

Born in Oaxaca in 1830, the son of a mestizo blacksmith father and half-Mixtec mother, José de la Cruz Porfirio Díaz received a rudimentary education, dabbling in studies for the priesthood and law before finding his calling in the military. Allied with BENITO JUÁREZ and the Liberals, Díaz distinguished himself as a military commander in the War of the Reform and the resistance against French intervention, in which conflicts he gained wide fame and a large personal following. Defeated in the presidential elections of 1871, Díaz charged fraud and launched an abortive rebellion against the Liberal Juárez government. In March 1876, five years after his first uprising, Díaz issued his Plan de Tuxtepec, once again calling for “no reelection.” In November 1876, in the so-called Revolution of Tuxtepec, his forces occupied Mexico City and overthrew the elected government of Sebastián Lerdo de Tejada.

Under the positivist credo of order and progress and following the counsel of his coterie of advisers dubbed *los científicos* (loosely, “the scientific ones”), the Díaz regime endeavored to modernize every aspect of government and the economy while retaining a tight grip on the reins of political power. Foreign investment and economic growth surged, while a host of new inventions became integrated into Mexican life, including steam-powered electric generating plants, the telephone and telegraph, railroads, electric trams, manufacturing plants, and related modern technologies. The machinery of state was overhauled and streamlined, while the country’s public finances were put on a firm footing under Secretary of the Treasury José Limantour.

To suppress rural banditry and organized dissent, Díaz expanded the Rurales, or rural police force, created by Juárez in 1872 and under Díaz comprised, in the main, of criminals and bandits put on the government payroll. The regime waged a series of wars against recalcitrant Indians, especially the Apache and Yaquí in the north. Díaz’s political cronies dominated the nation’s political life at all levels, while organized dissent of any kind was either gingerly coopted or ruthlessly crushed.

By the early 1900s disenchantment with the regime mounted among both the rapidly expanding middle class and the masses of increasingly impoverished and desperate rural and urban dwellers. The regime’s demise came in 1911, following an uprising by wealthy Liberal landowner Francisco Madero, which in turn sparked the decade-long Mexican Revolution. Overthrown, the ailing 81-year-old Díaz was forced into exile. He died in Paris a few years later.

MICHAEL J. SCHROEDER

diplomatic revolution, European

The Peace of Westphalia in 1648, ending the Thirty Years’ War, is considered the beginning of modern

diplomacy in Europe. The treaty established the idea of nation-states by acknowledging the sovereign rights of individual countries. As such, conflicts came to revolve around issues related to “the state.” In 1713 the Treaty of Utrecht, ending the War of the Spanish Succession, formalized the fundamental principle of the new diplomacy—balance of power. The idea behind the doctrine dictated the preservation of the status quo, so that no one nation-state held authority over any other. If the balance of power shifted in favor of any member state, all other states had a vested interest to intervene, even if by force, in correcting the shift.

In 1789 the FRENCH REVOLUTION unleashed myriad ideas that threatened the balance of power in Europe. Fears spread among Europe’s elite that the lower classes would overthrow the old order, or *ancien régime*, through violence. Accordingly, European leaders aimed their diplomatic efforts at minimizing the Revolution’s influence. However, NAPOLEON I’s conquest of continental Europe in the wake of the Revolution shifted the balance in France’s favor nonetheless. Accordingly, a British-led coalition formed to counter the shift in power on the continent.

In the aftermath of Napoleon’s defeat in 1815, the idea of equilibrium among the nation-states reemerged to preserve peace. As a result, Europe entered a period that would characterize the 19th century—the congress system, popularly known as the Concert of Europe, due to the spirit of cooperation it ushered in among the major European nations. The system’s intention was to enforce the peace settlement established by the Congress of Vienna following the defeat of Napoleon. Led by Austria’s PRINCE CLEMENS VON METTERNICH, participants of the Congress—Austria, Great Britain, Prussia, and Russia—set the course of European affairs, agreeing to prevent future conflicts that would endanger each nation. Although differing ideologically, it was a formal pledge to keep events like the French Revolution and the AMERICAN REVOLUTION from unbalancing the status quo.

Unfortunately, the revolutionary turmoil of 1848 signaled the end of the Concert of Europe. Triggered by events in Sicily and France, a wave of revolutions swept across the continent that marked the downfall of the *ancien régime*. Influenced by liberal reformers and dismal economic conditions, the poor working class and starving peasants reacted violently to the changes that had oppressed them. Doomed by broad reform goals and mediocre leadership, the uprisings were quickly suppressed with negligible affects on the European way of life. Despite a few exceptions—the

end of feudalism in the Habsburg Empire, the freeing of serfs in Russia—little changed other than the deepening of the socioeconomic conditions that had started the revolutions. In light of the chaos, the European nation-states isolated themselves from one another, concentrating efforts on their own national interests.

By 1875 upheavals and nationalist sentiment undermined the congress system. Amid conflicts like the CRIMEAN WAR and the FRANCO-PRUSSIAN WAR, the Concert of Europe came to an end. At midcentury, diplomacy had become synonymous with the display of military force and the demonstration of military might. Ushering in an era of new imperialism based on creating empire for empire's sake, it became the means for establishing trade partnerships, colonial outposts, and expanding and securing national interests, with considerable effect. The outbreak of the SPANISH-AMERICAN WAR in 1898 epitomized the nature of the new diplomacy: establish dominance or be dominated. With the Spanish defeat, the balance shifted from the European continent toward the United States at the close of the 19th century. However, it would take World War I to establish fully the new diplomatic paradigm.

STEVE SAGARRA

Disraeli, Benjamin

(1804–1881) *British prime minister*

Benjamin Disraeli, whose name would be inextricably linked with the growth of the British Empire, was born in London on December 21, 1804, to Isaac and Maria D'Israeli. Although England did not have the ugly record of anti-Semitism of other European countries, Isaac decided that assimilation into English society was the best path for his son. Although Isaac had his children, Benjamin, Sarah, Raphael, and Jacobus

baptized into Christianity, he himself remained committed to Judaism.

Isaac was a distinguished writer and passed the love of writing on to his son. After several failed attempts in politics, Benjamin was elected as the Tory (Conservative) Party representative in 1837 from Maidstone, in Kent, England. Coincidentally, this was also the year in which VICTORIA became queen, a woman whose life would be so closely connected to his. Although the Tory Party historically represented the nobility and the landowners, Disraeli was of the progressive wing of the party. Philosophically, he leaned more toward the Whigs, later known as the Liberal Party, and espoused the cause of the rising working class. The working class was increasingly exploited in the factories, mills, and mines of a rapidly industrializing Britain. Two years later, Disraeli married a wealthy widow, Mrs. Wyndham Lewis.

In 1841 the general elections brought the Conservatives to power in Britain, and Sir Robert Peel became the prime minister. When Peel turned Disraeli down for a seat in his cabinet, Disraeli helped form the Young England group. This group attempted to redirect politics in the aftermath of the passage of the Reform Bill of 1832, the first of several reform bills that would open the voting franchise to larger numbers of Britain's working classes.

The Young Englanders sought an alliance between the aristocracy of Britain, the backbone of the Tory Party since its formation in the reign of King Charles II, and the rising working-class poor. Although nothing came directly from these ideas, it characterized British political life in the 1840s. The group disbanded after the Maynooth Grant in 1845, the same event that led to WILLIAM GLADSTONE's resignation from the cabinet.

CORN LAWS

One of the cornerstones of Peel's policy was the repeal of the Corn Laws, which kept the price of corn artificially high. This benefited landowners, who formed part of Disraeli's constituency. Disraeli's opposition to Peel's program did not succeed, and the Corn Laws were repealed in 1846. But the divisiveness at least partly caused by Disraeli brought down Peel's administration, leading to a Whig government led by Lord John Russell.

When Russell resigned in 1852, Edward Stanley formed a Tory government in which Disraeli finally achieved his dream of a cabinet appointment, as chan-

cellor of the exchequer. Stanley became prime minister two more times in his career, summoning Disraeli back to his post each time. Concurrently, Disraeli was leader of the House of Commons, which brought him into contact with Gladstone, the leader of Whigs.

Pressure was building to extend the voting franchise. In a rare act of political unanimity, Gladstone and Disraeli joined forces to press for a second Reform Bill. While Gladstone did it out of his lifelong commitment for liberal causes, Disraeli functioned from a more complicated political calculus. If the Conservative Party did not embrace more progressive causes, it would become moribund. Due to their combined parliamentary weight, the second Reform Bill was almost assured to pass, and it did so in 1867.

In the general elections of 1868, Gladstone became prime minister, and Disraeli lost his cabinet position. The elections of 1874, however, brought Disraeli to power as prime minister, the first one totally dedicated to the expansion—and perpetuation—of the British Empire. Disraeli realized that support for the empire in a parliamentary democracy depended on the allegiance of the growing industrial classes. To support this segment of the population, Disraeli passed legislation that protected workers and trade unions.

In his quest to make England a great empire, Disraeli found an ardent ally in Queen Victoria. At this time, the SUEZ CANAL had made possible a rapid transit to the jewel of Britain's imperial crown: India. By the early 1870s the khedive ISMAIL of Egypt had virtually bankrupted Egypt through his ambitious program of modernization. When the chancellor of the exchequer requested Parliament to approve funds to buy the khedive's shares, Disraeli delivered an impassioned speech urging approval. Parliament was convinced that the purchase was a strong move. In August 1876 Victoria raised Disraeli to the peerage as Lord Beaconsfield; he was compelled to leave the House of Commons. Still, he continued to serve as prime minister.

In 1878 Disraeli faced the first major foreign crisis of his administration. In 1875 the Christian population of the Balkans rebelled against their overlords in the Turkish Ottoman Empire. Revulsion over the thousands killed again united Gladstone and Disraeli. In April 1877 Czar Alexander II declared war on the Turks. The Russians and their Romanian allies were delayed for months by the Turkish defense of Plevna (Pleven) in Bulgaria, from July to December of 1877. But after Plevna fell, the Russians and Romanians

seemed determined to press on to finish off the Turkish empire and take its capital of Constantinople. Such a grab for power was unthinkable to Disraeli, when Russia already was in a position, through its rapid conquest of the khanates of Central Asia, to threaten British India.

WAR FOOTING

Consequently, Disraeli put Britain on a war footing such as had not been seen since the war scare with France years earlier. The British Mediterranean fleet cast anchor from its base at Malta, which Great Britain had gained during the Napoleonic Wars, and moved up to support the Turks by June 30, 1877. Any further Russian advance would meet the firepower of the Royal Navy. On March 3, 1878, the Russians forced the Turks to sign the Treaty of San Stefano, which created a Greater Bulgaria, covering much of the Balkans.

Disraeli and his administration considered a Greater Bulgaria, which would have a Russian force present, as merely another stop toward a future Russian move to take over what remained of the Ottoman Empire in Europe. With the CONGRESS OF BERLIN ending the Balkan crisis in 1878 and the invasion of Afghanistan in the same year to prevent it from becoming a Russian satellite, Disraeli showed not only his belief in the British Empire, but also his determination to use both the British navy and land forces to defend it.

Although Disraeli and the Conservatives were beaten in the general election of 1880, he had made his mark as perhaps the greatest of Victorian imperialists. As for Disraeli himself, he returned to writing at the end of his political career. But after the publication of *Endymion* in 1880, Disraeli fell ill and died on April 19, 1881. Queen Victoria personally attended his funeral and burial at Hugenden.

Dost Mohammed

(1793–1863) *Afghani leader*

Dost Mohammed Khan is remembered as a powerful and charismatic ruler who reigned over Afghanistan from 1826 until his death in 1863 and made significant attempts to unite the troubled country. The times in which he ruled were turbulent in Afghanistan because rival clans struggled for power against one another, even as various members of those clans fought among themselves as they attempted to gain ascendancy by unseating those who were already in power. Dost Mohammed's reign also coincided with the period in which Great Britain and Russia were vying for control of Asian lands that they had identified as essential to their expansionist goals.

From the beginning, Dost, which means “friend,” was faced with repeated attempts to unseat him that arose from the jealousy of his numerous brothers and nephews. His most serious rival was Shah Shujah al-Moolk, the Afghan king and cousin whom he had deposed. Their rivalry was part of the continuing battle for power in Afghanistan that existed between two branches of the Durrani clan. Shah Shujah represented the Saddozai, while Dost was a member of the rival Barakzai clan. When Shujah left Afghanistan, he took his entire harem and royal jewels, including the famous Koh-i-noor diamond.

Once in power, Dost Mohammed declared himself the Amir-al-momineen of Afghanistan, the “Commander of the Faithful,” which allowed him to exercise almost totalitarian power. In order to protect himself from his numerous enemies, the Dost set up his power base in Kabul and surrounded himself with a limited bureaucracy composed of his sons and matrimonial allies. This move also eradicated a good deal of the crime and corruption that had flourished under previous monarchs. He also banned the sale of alcohol and intoxicating drugs and curtailed gambling and prostitution.

In 1834 his rival Shah Shujah began a revolt against Dost, who was victorious, but was unable to regain control of Peshawar, which had been taken by the Sikhs. To gain support, Dost Mohammed encouraged his subjects to view his campaign against the Sikhs as a jihad (holy war). On April 30, 1837, an Afghan force of some 30,000 men and 50 cannons faced the Sikhs in the Battle of Jamrud. When the battle was over, the Afghans had lost 1,000 men, but the cost to the Sikhs had been twice that. Despite the Afghan victory, Sikh leader RANJIT SINGH retained his hold on Peshawar. However, Dost Mohammed had succeeded in establishing a regular Afghan army for the first time. This army was made

more powerful by the use of the long-barreled muskets made by Kabul gunsmiths that were better than the guns used by the British army in India.

With Dost in firm control of Afghanistan, both the British and Russians began to court his favor. Generally, Dost favored British efforts to block Russian and Persian advances. However, he was also willing to turn to the Russians if the British failed to meet his demands. The British government then dispatched Sir Alexander Burnes to Afghanistan to meet with Dost and agreed to return Peshawar to Afghanistan to promote stability on the frontier.

In 1857 Dost concluded a comprehensive alliance with the British by which he received an annual subsidy from Britain, although he remained neutral when the INDIAN MUTINY occurred in 1857. Britain became convinced that he presented a threat to British control of India. Subsequently, Britain attacked Afghanistan and convinced various chiefs to support them against Dost Mohammed. With diminishing forces, Dost was soon reduced to fighting with only a couple of hundred men. Eventually, he tired of living the life of a fugitive and surrendered in 1840. The British treated him with full respect and installed him and his family in a mansion. However, his ambitious son Akbar refused to join them, attacked Kabul, and slaughtered 16,000 British soldiers and the English there. Finally, Britain decided to restore Dost to power, but to implement a hands-off policy in Afghan affairs.

In May 1863 Dost conquered the City of Herat, unifying the remaining areas of Afghanistan under one rule, but he never recovered Peshawar, which is now part of northwestern Pakistan. Dost was succeeded by his fifth son, Sher Ali Khan, but he was challenged by his brothers and Afghanistan continued to be wracked by civil wars.

ELIZABETH PURDY

Douglass, Frederick

(c. 1817–1895) *U.S. abolitionist and reformer*

Born into slavery in Maryland, Frederick Douglass became the most significant African-American leader of the 19th century. Son of field hand Harriet Bailey

and an unnamed white man (perhaps his first master, Aaron Anthony), Douglass became a powerful anti-slavery orator, newspaper publisher, backer of WOMEN'S SUFFRAGE, adviser to ABRAHAM LINCOLN, banker, and diplomat.

When he was about seven, Douglass's mother died, and her child, then called Frederick Bailey, was sent to Baltimore to serve Hugh and Sophia Auld, relatives of the family on whose plantation he was raised. Sophia, in violation of law and custom, began to teach the youngster to read; her husband instructed Frederick in shipyard skills that would eventually prove his passage to freedom. As Douglass wrote, "A city slave is almost a freeman compared with a slave on the plantation."

Family deaths, remarriages, and disputes over slave "property" threw Douglass's almost tolerable life into chaos. Underfed and cruelly treated, sent to a remote area near Chesapeake Bay, he was hired out to be "broken" into an obedient field hand. After several unsuccessful escape attempts, in September 1838 he made his way to New York City and thence, with help from abolitionists and his future wife, free-woman Anna Murray, to the port of New Bedford, Massachusetts.

Douglass would write three autobiographies that remain a key source of information about his life and thought. The first of these, his *Narrative*, published in 1845 when Douglass was still a fugitive, galvanized the American antislavery movement and forced Douglass into exile in Britain, where he lectured to huge crowds. He returned to the United States in 1847 after English supporters paid \$700 to secure his freedom. Douglass soon started a freedom newspaper, *North Star*, and resumed his work as an abolition orator. He delivered his most famous speech in Rochester, New York, on July 5, 1852. "What, to the American slave, is your 4th of July?" he asked. "I answer: a day that reveals to him, more than all other days in the year, the gross injustice and cruelty to which he is the constant victim. To him, your celebration is a sham...."

In 1848 Douglass attended the meeting at Seneca Falls, New York, that launched the drive for equal rights for women. Douglass would later fall out with important members of the women's suffrage movement over the Fifteenth Amendment to the CONSTITUTION that, in 1870, would grant voting rights to male former slaves while still excluding women of all races.

During the CIVIL WAR, Douglass helped convince President Lincoln to allow blacks to fight for the Union and publicly urged free blacks and escaped slaves to

Born a slave, Frederick Douglass became the most prominent African-American voice for abolition in the 19th century.

enlist. More than 200,000 did so, paving the way for full citizenship at the war's end. Douglass's later years in Washington, D.C., mixed achievement and disappointment. He held a number of federal positions, including a posting to Haiti, but his participation in a Freedmen's Savings Bank ended badly. His remarriage to a white woman was condemned by both whites and blacks. He lived to see the emergence of new racial restrictions, suffering some of their indignities himself. Dying of a heart attack on February 20, 1895, after attending a women's rights meeting, Douglass lay in state in a Washington, D.C., church. He is buried in Rochester's Mount Hope Cemetery.

MARSHA E. ACKERMANN

Dreyfus affair

In 1894 Alfred Dreyfus, a Jewish officer in the French army, was accused of giving military secrets to the

Germans. Although he steadfastly maintained his innocence, Dreyfus was tried and found guilty in a trial that was heavily influenced by widespread anti-Semitism within the upper echelons of French society and the military. The case became a cause célèbre that split French society between the pro-Dreyfusards (liberals) and the anti-Dreyfusards (conservatives).

Dreyfus was sentenced to Devil's Island prison off the South American coast, but his supporters continued to investigate the case and found that he had been used as a scapegoat to cover up for the real culprits, who were highly placed in French society. The French writer Emile Zola took up the case and published his famous article, "*J'Accuse*," detailing the abuses in the case. Dreyfus was bought back for another trial and, although new evidence was presented, he was again

found guilty. Dreyfus was finally freed on a pardon granted by the French president in 1899; however, his military rank was not restored until 1906. Theodor Herzl, the father of modern ZIONISM (Jewish nationalism), covered the Dreyfus case as a journalist. The prevalence of anti-Semitism in liberal France contributed to Herzl's conclusion that Jews needed to have a state of their own where they would control the political, economic, and military institutions.

Further reading: Bredin, Jean-Denis. *The Affair: The Case of Alfred Dreyfus*. Paris: Braziller, 1986, and London: Sidgwick & Jackson, 1987; Cahm, Eric. *The Dreyfus Affair in French Society and Politics*. New York: Longman, 1996.

JANICE J. TERRY

E

Eastern Question

The Eastern Question, or what was to become of the declining Ottoman Empire, was one of the major diplomatic issues of the 19th century. The major European powers, Britain, France, the Austro-Hungarian Empire, and Russia, had differing and sometimes conflicting attitudes about what to do with the “Sick Man of Europe.” Each European power had territorial ambitions over parts of the Ottoman holdings and sought to further their ambitions through a variety of diplomatic and military means. The Eastern Question had similarities with the diplomatic maneuverings known as the Great Game by Britain to prevent Russian expansion into Afghanistan and other Asian territories and may be divided into several different phases.

In phase one, 1702–1820, Russia and the Ottomans engaged in a number of wars over control of territories around the Black Sea. The long-term Russian strategy was to gain warm-water ports and entry into the Mediterranean through the Dardanelles. Generally, the British, and to a lesser extent the French, sought to thwart Russia expansion into the Mediterranean and supported the Ottomans diplomatically. The Austro-Hungarians who wanted to expand into Ottoman territory in the Balkans and feared growing Russian strength also sought to halt growing Russian power. But in general, during the first phase of the Eastern Question, Russia won its wars against the Ottoman Empire and steadily extended its control around the Black Sea.

The NAPOLEONIC CONQUEST OF EGYPT and the brief French occupation in 1798 highlighted the importance of the region and the growing weakness of the Ottomans. Phase two of the Eastern Question was a period when nationalist sentiments arose within the Ottoman Empire. This culminated in the GREEK WAR OF INDEPENDENCE, 1821–33, or phase three, when the Greeks, with the sympathy and support of France and Britain, rose up in armed rebellion against Ottoman domination. The Greek War culminated in the independence of Greece under the Treaty of Adrianople and the Protocols of London in 1830. The European powers guaranteed Greek independence in 1832.

Although the British and French supported the Ottomans in their struggles against Russian encroachment in the Black Sea and the Balkans during the 19th century, both powers took territories away from the Ottomans in North Africa and along the Arabian Peninsula and Persian Gulf. Phase four of the Eastern Question culminated in the CRIMEAN WAR, when the British and French, with small support from Piedmont-Sardinia, joined forces with the Ottomans against Russia. Although Russia gained some territory, the support of the European powers gave the “Sick Man of Europe” a new lease on life and forced a series of domestic reforms within the empire.

During the CONGRESS OF BERLIN in phase five, the British agreed to defend the Ottoman Empire against Russian ambitions to partition it, but at the same time assented to the French takeover of Tunisia in North Africa. France had already taken the former Ottoman

territory of Algeria in 1830. Britain gained the important island of Cyprus in the eastern Mediterranean, while Austria-Hungary expanded into the Balkans.

As Germany emerged as a major European power, it, too, entered into the diplomatic maneuverings involving the Ottoman Empire. Kaiser Wilhelm II visited Istanbul in 1889 and again in 1898 and announced his support for the aging empire. As a result, ties between the German and Ottoman military increased, and Germany began to invest in the Ottoman Empire. The Berlin to Baghdad railway was the cornerstone of German financial interests. The growing German influence within Ottoman territories raised British opposition. The British were particularly opposed to the possibility that the Berlin to Baghdad Railway might extend the German presence into the Persian Gulf and eastern Asia where it would compete with the British. The Germans managed to gain a concession for the railway in 1903 and hoped that it would link up with rail lines in the eastern Mediterranean. Parts of the railway were constructed through Anatolia, but the railway was never completed to Baghdad.

The Ottoman government was not a passive participant in the Eastern Question but took an active role in playing off the conflicting diplomatic policies of the European powers to prevent the dissolution of its empire. The territorial and economic rivalries of the European nations enabled the Ottoman Empire to prolong its existence while at the same time it continued to lose territories in the Balkans, North Africa, Egypt, the Sudan, and the Arabian Peninsula to the imperial European powers.

JANICE J. TERRY

Eddy, Mary Baker (1821–1910), and the Christian Science Church

The Church of Christ, Scientist (official name) was established in 1879. However, the notion of Christian Science was cultivated by Mary Baker Eddy after her

instantaneous recovery in 1866 from severe injuries sustained in an accident, in her words, “which neither medicine nor surgery could reach.” What did reach her serious condition were the healing words of Jesus, which became the foundation of her method for achieving authentic health. Born in a small New Hampshire village in 1821 to Congregational parents who were devoted to her education and her study of the Bible, Mary Baker had always been an unhealthy child and adolescent. Over the course of her life, she married three times: first to George Washington Glover in 1843, who died suddenly six months later; then to Daniel Patterson in 1853, whom she divorced 20 years later after tolerating his numerous infidelities; and, finally, in 1877, to Asa Gilbert Eddy, who died in 1882. Mary, having survived ill health, marital tragedy, and injuries, lived into her 90th year, dying in 1910.

Mary Baker Eddy's discovery of Christian Science is documented in her book *Science and Health*, a title that she later extended to include *With Keys to the Scriptures*. This book, first published in 1875, was quickly adopted as the textbook of a new religious movement. Besides a short autobiographical sketch of her recovery, it offers practical advice on family relationships and engages in analyzing literary issues such as the Genesis creation stories and scientific discussions on subjects such as Darwinism. But what sets her book apart as a new religious text is its exploration of a philosophy of radical idealism, in which only the divine mind exists, while matter is mere illusion. This illusion is what leads to intellectual error and ill health, and ultimately evil and death. Awareness of this illusion and the salvific need for a sense of “at-one-ment” with the divine mind of the biblical God is what leads to both spiritual and physical health.

Eddy sustained considerable critique of her philosophy from both Joseph Pulitzer, who accused her of senility, and Mark Twain, who made her the target of his stinging wit, as well as numerous Christian theologians, who believed she had abandoned essential orthodoxy. Deeply influenced by her encounter in 1862 with Phineas P. Quimby, the famous mentalist and ridiculed progenitor of the mind-over-matter philosophy, Eddy's resolve was more than enough to withstand a lifetime of criticism, which allowed her to publish several books and to found the Boston Mother Church, the Massachusetts Metaphysical College, the *Christian Science Journal*, and a world-class newspaper, the *Christian Science Monitor*. Each local branch church, without the benefit of ordained clergy and guided by Eddy's *Church Manual*, conducts simple Sunday services that

Thanks to her spontaneous recovery from illness, Mary Baker Eddy helped create the Church of Christ, Scientist.

consist of hymn singing and the reading of biblical texts and complementary passages from *Science and Health*. While the membership of the church is difficult to assess, given its prohibition on publishing statistics (though it claims 2,000 worldwide Branch Churches and Societies), and while the movement has faced legal challenges, given its practice of a strict form of faith healing that encourages the avoidance of hospitals, it is generally believed to have well over 300,000 American adherents and a growing European and Asian mission.

RICK M. ROGERS

enlightened despotism in Europe

Enlightened despotism represented one of the most enduring experiments before the old order was forever turned upside down by the forces unleashed by the FRENCH REVOLUTION in 1789. Ironically, enlightened despotism was fostered by the thoughts of French philosophers like VOLTAIRE; Charles-Louis de Secondant, baron de Montesquieu; and Denis Diderot who would provide the ideological gunpowder that exploded with the revolution in 1789. Embraced by rulers in 18th-century Europe like CATHERINE THE GREAT of Russia, MARIA THERESA of the Austrian Empire, and FREDERICK THE GREAT OF PRUSSIA, enlightened despotism provided a philosophy of government that motivated rulers to pursue political changes, forever breaking any ties with the monarchies of the past.

At its basis, enlightened despotism attempted to apply the rational spirit of the Enlightenment to guide governance, pushing them forward from the superstitions and sometimes barbarous practices of past centuries. It embraced not only what we would call now a progressive view of government but also the sciences and the arts.

GENERAL WELFARE

Above all, enlightened despots began to see themselves as the first servants of the state, whose duty was to provide for the general welfare of their subjects. When Frederick II became king of Prussia after his father's death on May 31, 1740, he wrote "Our grand care will be to further the country's well-being and to make every one of our subjects contented and happy."

A more mature Frederick later wrote in *Essay on the Forms of Government*, "The sovereign is the representative of his State. He and his people form a single body. Ruler and ruled can be happy only if they are firmly united. The sovereign stands to his people in the same relation in which the head stands to the body. He must use his eyes and his brain for the whole community, and act on its behalf to the common advantage. If we wish to elevate monarchical above republican government, the duty of sovereigns is clear. They must be active, hard-working, upright and honest, and concentrate all their strength upon filling their office worthily. That is my idea of the duties of sovereigns."

Above all, it was Montesquieu in his *The Spirit of Laws* (1748) who had the most practical influence on the enlightened despots and the AMERICAN REVOLUTION of 1775. Montesquieu wrote, "In every

government there are three sorts of power; the legislative; the executive, in respect to things dependent on the law of nations; and the executive, in regard to things that depend on the civil law. By virtue of the first, the prince or magistrate enacts temporary or perpetual laws, and amends or abrogates those that have been already enacted. By the second, he makes peace or war, sends or receives embassies; establishes the public security, and provides against invasions. By the third, he punishes criminals, or determines the disputes that arise between individuals. The latter we shall call the judiciary power, and the other simply the executive power of the state.”

A SAY IN DESTINY

While none of the enlightened despots like Frederick, Maria Theresa, or Catherine would willingly accept limitations on their sovereignty, they all accepted at least in principle the idea that those they governed should have some say in their own destiny. All used consultative assemblies, drawn from all the classes in society, at least several times during their reigns. In 1785, for example, Catherine issued two charters, one for the nobles, and one for the towns. The Charter for the Nobility inaugurated councils of nobles who could offer their opinions on laws that she proposed. The Charter for the Towns created municipal councils whose membership included all those who owned property or a business within the towns. At the same time, the legal status of Russia’s peasantry continued to slip under the control of the landowning nobility until they were hardly considered as human beings.

The rationalization of government saw considerable progress in the Austrian Empire, where the Empress Maria Theresa reigned jointly with her son, as JOSEPH II, after 1765. Reforms during their reign centralized government, making political and monetary bureaucracy answerable to the Crown.

Reform of the legal codes provided a keystone for enlightened rule. In June 1767 Catherine gathered a Legislative Commission to hear her proposals for a new legal code for Russia. Although the code was never adopted, the document shows the direction of the political thought that guided her long reign (1762–96). She wrote, “What is the true End of Monarchy? Not to deprive People of their natural Liberty; but to correct their Actions, in order to attain the supreme Good.”

For the sake of the subjects, perhaps the most important part of enlightened despotism was the gen-

eral belief that the use of torture to extract information was a savage relic of the Middle Ages and had no place in the judicial system of any enlightened monarch. In Russia, Catherine’s refusal to use torture was put to the test in the 1773–74 rebellion of the Cossack Emilian Pugachev. Although Pugachev’s revolt proved a distinct threat to her reign, after he was captured, Catherine refused to let his interrogators resort to the use of torture to find out if he acted alone or was the representative of some conspiracy hatched to overthrow and kill her. All the enlightened monarchs were influenced by the thought of the Italian Cesare Beccaria, the author of the historic *Of Crimes and Punishments* in 1764.

Enlightened despots attempted to improve their countries through advances in the sciences, industry, and agriculture as well. After Catherine II’s annexation of the khanate of the Crimea in 1783, she opened it to cultivation by German immigrants to improve agricultural production. When the Treaty of Jassy ended a war with the Turks in 1792, large new areas were opened in what is now southern Russia for improved agricultural production. Significantly, one of the countries most resistant to the ideas of enlightened despotism was France, where the revolution that overturned the old order began.

Religious tolerance also saw great advances in this age. Most of the prohibitions against Jews, existing from the Middle Ages, were lifted throughout much of Europe. In France, however, such a change would have to wait to take maximum effect in the reign of NAPOLEON I, after he crowned himself emperor in 1804, 11 years after LOUIS XVI of France had been sent to the guillotine in January 1793. Muslims also benefited from the general enlightenment. After the conquest of the Crimea in 1783 and the Treaty of Jassy with the Ottoman Turks in 1792, large numbers of Muslims became Catherine the Great’s subjects.

It was perhaps the greatest irony of this age of enlightened despotism that it was brought to an end by the French king Louis XVI summoning to Paris in 1789 the Estates General, the representative body of French aristocracy, clergy, and the emerging middle class. The Estates General, having not been convened for over 150 years, had much to discuss with the king. When Louis XVI refused to do so and threatened to dissolve it, the Third Estate refused to leave Paris. Instead, the Third Estate met in an old tennis court and swore to remain in session until its grievances were heard by the king and redressed by him. The French Revolution had begun.

JOHN F. MURPHY, JR.

Enlightenment, the

The Enlightenment in Europe came on the heels of the age of science. It dates from the end of the 17th century to the end of the 18th century. Beginning with John Locke, thinkers applied scientific reasoning to society, politics, and religion. The Enlightenment was especially strong in France, Scotland, and America. The Enlightenment may be said to culminate in the revolutions that occurred in America, France, and Latin America between 1775 and 1815. In attempting to justify England's Glorious Revolution of 1688, Locke argued that man had inherent rights. Man, he posited, was a blank page who could be filled up with good progressive ideas. He laid the basis for people's sovereignty. People voluntarily came together to form a government that would protect individual rights. Government, therefore, had a contract with the people. When the government violated people's natural rights, it violated the social contract. Therefore, people had the right to withdraw their allegiance. Ironically, the rationale used to justify the triumph of Parliament over the Crown in England was used against Parliament and Britain nearly a century later in the AMERICAN REVOLUTION.

Influenced by Newtonian science that posited universal laws that governed the natural world, the Enlightenment emphasis was on human reason. According to major Enlightenment thinkers, both faith in nature and belief in progress were important to the human condition. The individual was subject to universal laws that governed the universe and formed nature. Using the gift of reason, people would seek to find happiness. Human virtue and happiness were best achieved by freedom from unnecessary restraints imposed by church and state. Not surprisingly, Enlightenment thinkers believed in education as an essential component in human improvement. They also tended to support freedom of conscience and checks in absolute government.

EARLY ENLIGHTENMENT

The early Enlightenment was centered in England and Holland. It was interpreted by conservative English figures to justify the limits on the Crown imposed by Parliament. The limited government supported by the Whigs who took over was spread abroad by the newly created Masonic movement. In Holland, which was the home of refugees from absolutist leaders such as refugees from England of the later Stuart monarchy and from France after the revocation of the Edict of Nantes, and was nominally a republic, the earliest writings appeared. Its most famous philosopher, Spinoza, argued that God existed everywhere in nature, even society, meaning that it could rule itself. This philosophy applied to arguments against state churches and absolute monarchs.

BASIC ENLIGHTENMENT IDEAS

The most famous figures of the 18th-century Enlightenment were Frenchmen, including Charles-Louis de Secondat Montesquieu, VOLTAIRE, Denis Diderot, and Jean-Jacques Rousseau. Montesquieu in his greatest work, *The Spirit of Laws*, argued that checks and balances among executive, legislative, and judicial branches were the guarantors of liberty. Voltaire, the leading literary figure of the age, wrote histories, plays, pamphlets, essays, and novels, as well as correspondence with monarchs such as CATHERINE THE GREAT of Russia and FREDERICK THE GREAT OF PRUSSIA. In all of these works, he supported rationalism and advocated reform. Diderot edited an encyclopedia that included over 70,000 articles covering the superiority of science, the evils of superstition, the virtues of human freedom, the evils of the SLAVE TRADE IN AFRICA, and unfair taxes. Rousseau, however, was not a fan of science and reason. Rather, in the *Social Contract*, he spoke of the general will of the people as the basis of government. His ideas were to be cited by future revolutions from the French to the Russian.

Enlightenment thought spread throughout the globe and was especially forceful in Europe and the Americas. In Scotland, some ideas of the Enlightenment influenced the writings of David Hume, who became the best known of skeptics of religion, and ADAM SMITH, who argued that the invisible hand of the market should govern supply and demand and government economic controls should not exist. In America, deism (the belief that God is an impersonal force in the universe) and the moral embodiment of the Newtonian laws of the universe attracted THOMAS

JEFFERSON and THOMAS PAINE. On the political side, thinkers such as Thomas Hooker and John Mayhew spoke of government as a trustee that must earn the trust of its constituency and as a financial institution with a fiduciary duty to its depositors.

It was in the realms of politics, religion, philosophy, and humanitarian affairs that the Enlightenment had its greatest effect. The figures of the French Enlightenment opposed undue power as exemplified by absolute monarchy, aristocracy based on birth, state churches, and economic control by the state as exemplified by mercantilism. Enlightened thinkers saw the arbitrary policies of absolute monarchies as contradictory to the natural rights of man, according to the leaders of the AMERICAN REVOLUTION. The most fundamental part of their nature was human reason, the instrument by which people realized their potentials. The individual was a thinking and judging being who must have the highest of freedom in order to operate. The best government, like the best economy, was the government that governed least.

THE ENLIGHTENMENT IN POLITICS

The Enlightenment extended to the political realm and was especially critical of monarchs who were more interested in their divine right than in the good of their people. Man was innately good; however, society could corrupt him. Anything that corrupted people, be it an absolutist government or brutal prison conditions, should be combated. Absolutist policies violated innate rights that were a necessary part of human nature. Ultimately, political freedom depended on the right social environment, which could be encouraged or hindered by government. Absolutism, for this reason, was the primary opponent of political freedom.

The progenitors of the political Enlightenment, John Locke and his successors, maintained that government should exist to protect property of subjects and citizens, defend against foreign enemies, secure order, and protect the natural rights of its people. These ideas found their way into the U.S. DECLARATION OF INDEPENDENCE and CONSTITUTION. These documents asserted that every individual had “unalienable rights,” including rights to “life, liberty, and the pursuit of happiness.” Similarly, the preamble to the Constitution claimed that government existed to “promote the general welfare and provide of the common defense” in direct descent from Enlightenment thinkers.

The ideas of social contract and social compact did not originate with either Locke or Rousseau,

but with Thomas Hobbes. Hobbes viewed the social contract as a way for government to restrain base human nature. Ultimately, Locke maintained that people came together in a voluntary manner to form a government for protection of their basic rights. Therefore, government was based on their voluntary consent. If their basic natural rights were violated, they could withdraw their consent. This theory had echoes in the arguments of leaders of the American Revolution who argued that their revolt against various tariffs and taxes such as the tea tax was taxation without representation. Social contract theory argued that individuals voluntarily cede their rights to government, including the responsibility to protect their own natural rights. Consequently, government’s authority derived from the governed.

To keep the potential for governmental abuse of power in check, Enlightenment figures argued for a separation of powers. Before Montesquieu made his specific suggestion in *The Spirit of Laws*, Locke had proposed that kings, judges, and magistrates should share power and thereby check one another. Spinoza also proposed the need for local autonomy, including a local militia to guard against power concentrated in the center including a standing army. These ideas found their way first into the Articles of Confederation, which gave almost excessive power to the various states. The U.S. Constitution specifically stated all powers not expressly given to the national government are reserved to the states and the people.

The emphasis of the political writers of the Enlightenment was on limited government rather than on direct democracy. Although their great enemy was arbitrary absolute central government, they were not enamored of the influence of the mob. Even though they saw the voting franchise as a check on overpowerful government, they limited the franchise to property owners. Male suffrage in America did not come into existence until the age of Jackson. The founders of the Constitution were anxious to include the electoral college as the final selector of presidents. Direct election of senators did not occur until 1912–13, and it was not until, 1962, with *Baker v. Carr* and the principle of “one man, one vote,” that there were direct elections to all legislative bodies in the United States. Technically, the United States remains a representative, not a direct, democracy.

Even Rousseau, considered the advocate of direct democracy, felt that direct democracy was most suited to small states like his home city of Geneva rather than a large state like France. Along with Diderot, he advocated rule based on “general will.” However,

both Rousseau and Diderot defined general will as representing the nature of the nation or community as opposed to the selfish needs of the individual. The law should secure each person's freedom but only up to the point that it does not threaten others. In this way, they prefigured the utilitarian philosophy of Jeremy Bentham, which stressed the goal of human happiness as long as it did no harm to others.

REACTIONS AGAINST ENLIGHTENMENT

In the latter 18th century, there was a reaction against the overuse of reason and science in securing human potential. Religious, philosophical, and humanitarian movements put new emphasis on idealism and emotionalism when it came to religious, philosophical, and social reforms. Philosophically, the Newtonian vision of God as the great scientist in the sky and Locke's equation of knowledge to the mind's organization of sensory experiences along with the rise of atheism provoked a reaction.

IMMANUEL KANT

The foremost philosopher of the later Enlightenment was Immanuel Kant, whose *Critique of Pure Reason* argued that innate ideas exist before sensory experiences. Taking a page from Plato, Kant argued that certain inner concepts such as depth, beauty, cause, and especially God existed independently of the senses. Some ideas were derived from reason, not the senses. Kant went beyond pure reason.

Reason was based on intuition as well as interpretation of sensory experiences. The conscious mind was integral to a person's thinking nature. Therefore, abstract reason could have moral and religious overtones. This came to be called new idealism, as opposed to classical idealism.

Another reaction to this scientific perspective on religion was a movement in favor of a feeling, emotional deity everpresent in daily life. Known as Pietism in Europe and in America variously as evangelism and charismatic Christianity, the movement known as the GREAT AWAKENING swept the Americas and Europe in the 1740s and 1780s. Preachers such as George Whitefield and the WESLEY BROTHERS gave stirring sermons with overtones of fire and brimstone in response to excessive rationality in church doctrine. Their style of preaching appealed to the masses, whereas the intellectualized religion of the Enlightenment too often seemed like a creation for the educated upper classes. By the end of the century, the movement coalesced into the Methodist movement.

A new movement from Germany that stressed Bible study and hymn singing as well as preaching—the Moravians—earned a following in both Europe and America. Similar movements occurred among Lutherans and Catholics. The Great Awakening in the United States led to the formation of new individual-centered denominations such as the Unitarians and Universalists.

Both aspects of the religious side of the Enlightenment—rationalist and Pietist—were concerned with human worth. This desire for the improvement of human conditions led to humanitarian impulses. The antislavery movement gained momentum in the later 18th century. Other movements, such as the push for prison reform, universal elementary education, Sunday school, and church schools, were all evident by 1800. Whether rationalist or Christian evangelical, reformers supported these movements. Even absolute sovereigns such as Frederick the Great and Catherine the Great promoted reforms. Frederick abolished torture and established national compulsory education, while Catherine established orphanages for foundlings and founded hospitals. For reforms such as these, certainly not for their beliefs in human rights, they and other monarchs were termed *enlightened despots*.

Enlightenment thinkers sought human betterment and the movement took many forms. Political figures sought to deliver people from arbitrary use of power. Deists questioned the use of power by established churches. Economic thinkers argued for liberation from state control of the economy. All believed in an implicit social contract and national human rights whether political, economic, religious, or moral. Separate currents of rationalism, idealism, and Pietism all contributed to the humanitarian and revolutionary movements that emerged at the end of the period.

Ethiopia/Abyssinia

Ethiopia, formerly also known as Abyssinia, has a population of about 70 million in an area of approximately 435,000 square miles. It has a history going back more than two millennia. Topographically, it is a high plateau with a central mountain range dividing the northern part of the country into eastern and western highlands. The central mountain range is in turn divided by the Great Rift Valley, which actually runs from the Dead Sea to South Africa. The country, formerly thought to be predominantly Christian, is, in fact, multiethnic and multireligious. The largest group, the Oromo, predominantly Muslim and formerly called the Galla, make up 40 percent of the population. Other non-Christian groups are the Sidamo and the Somali, Afars, and Gurages. The Christian element is mostly made up by Amharic and Tigrean, speakers, who comprise about 32 percent of the population. Reasonably accurate and fair census reports estimate that 50 percent of the population is Muslim while 40 percent of the population is Christian, with the remainder being animist. The Christians have tended to live in the highlands in the north and central parts of the country, while, historically, non-Christians live in the lowlands.

The country's history extends as far back as the 10th century B.C.E., and tradition has it that the kings of Ethiopia were descended from the union of King Solomon with the queen of Sheba (which is identified with the northern part of the country) in the 10th century B.C.E. and claim to be the Solomonic dynasty.

Historically, the first Ethiopians appear to have been at least in part descended from immigrants from across the Red Sea in the southwestern part of Arabia known as Sabea (present-day Yemen) who arrived before the first century C.E. However, the preexisting population had been engaged in agriculture in the highlands before 2000 B.C.E., so the population was most likely sedentary.

The end result was that by the first century, a kingdom called Axum had been established, which had a great port at Adulis on the Red Sea. Trading with Greeks and Romans as well as Arabs and Egyptians, and as far east as India and Ceylon, and having agriculture based on then-fertile volcanic highlands, the trade empire became a great power between 100 and 600 C.E. It was so powerful that in the fourth century, it was able to destroy its great rival Kush/Merowe in what is now the Sudan and conquer Yemen in the sixth century.

An important element in the emerging Ethiopian identity was the conversion of Axum to Christianity in the fourth century by the missionary Frumentius to

An Ethiopian chief, possibly Menelik, who stunned the world by defeating the Italians in 1896.

the Monophysite nontrinitarian version of Orthodox Christianity also called Coptic Christianity.

The ancient Geez language remains the language of the church and is still used in services, and the modern languages spoken in Ethiopia (Amharic and Tigrean) derive from it. The common language, religion, dynasty, and system of fortified monasteries were to be key elements in the formation and survival of Ethiopian culture.

These features were critical after the seventh century, when the expansion of Islam cut off Ethiopia from the coast, as Muslim invaders occupied the lowlands. From this time forward, Ethiopia, as the country had become known by the ninth century, endured long struggles between the Christian highlands and mostly Muslim lowlands. When the "king of kings," or Negus, was in power, he united the Christian highlands and expand-

ed into the lowlands. At other times, the mountains/highlands were divided among rival chieftains, leaving Ethiopia vulnerable to attack from Muslim and non-Muslim lowlanders. However, the legend of a remote Christian kingdom (the kingdom of Prester John) fascinated Europeans. The arrival of European visitors, especially the Portuguese, who had established trade routes to India and identified Ethiopia with the legendary kingdom, proved most timely.

At this time, 1540–45, the Christian highlands faced their greatest challenge—a Muslim chieftain, Mohammed al-Gran, threatened to overrun the highlands. The intervention of the Portuguese military might at this critical juncture led to the defeat and the death of Mohammed al-Gran. Thereafter, the Portuguese were prominent in Ethiopia, but their zeal in promoting Roman Catholic Christianity led to their expulsion in 1633.

The country lapsed once more into feudalism until various chieftains fought for the throne, claiming Solomonic ancestry for two centuries, until Theodore reunited the kingdom in 1855. He was succeeded by John in 1868 and Menelik II in 1889. Under the latter, who was from the central Amharic province of Shoa, with its capital city Addis Adaba, the Ethiopian state as it exists today was formed. With Western military weapons, Menelik expanded into the lowlands and stunned the world by defeating the Italians in 1896 when they tried to make Ethiopia into a protectorate.

After the death of Menelik in 1908, the chieftain Ras Tafari gradually gained power, especially after 1916, and was crowned emperor in 1930. As the most powerful black leader of his time, he inspired the Rastafarian cult in Jamaica (from his name Ras, or Chief, Tafari). On his assumption of the title of emperor, he took the name Haile Selassie.

Acclaimed for his resistance against Fascist Italy in 1935, Haile Selassie enjoyed great prestige after Ethiopia was liberated in 1941. He was given the Italian possession of Eritrea in 1952 (much against its will), and Addis Ababa was made the headquarters of the Organization of African Unity (now the African Union), formed in the early 1960s.

NORMAN C. ROTHMAN

F

Fashoda crisis

The Fashoda crisis of 1898 was a confrontation between the British and French over control of the Sudan. The British wanted control of the water sources of the vital Nile River upon which Egypt (which they already controlled) depended. Some British imperialists such as CECIL RHODES also had ambitions to build a north-south railway to traverse the African continent from the Mediterranean to South Africa. The French also dreamed of building an east-west railway from their huge empire in West Africa to East Africa. They also wanted to thwart British imperial expansion.

In the 1890s a French major, Jean-Baptiste Marchand, embarked on an ambitious expedition to walk from West Africa across to the Sudan to claim the territory for the French Empire. After two years and the loss of hundreds of men, Marchand arrived at the small settlement of Fashoda on the Upper Nile and hoisted the French flag. At the same time, the British, led by Horatio Herbert Kitchener, had completed their conquest of northern Sudan, culminating at the BATTLE OF OMDURMAN. When Kitchener heard that a European was at Fashoda, he immediately knew that Marchand had succeeded in his expedition; however, he was not about to let the French seize part of the Sudan. Kitchener took five gunboats loaded with soldiers to confront Marchand, who was vastly outmanned and outgunned. Recognizing his inferior position, Marchand reluctantly agreed to defer the question of territorial rights over the Sudan to the diplomats back in London and Paris.

Although there were popular demonstrations in both capitals in favor of war, diplomacy prevailed. In an 1899 negotiated settlement it was agreed that the Sudan, the largest country in Africa, would become part of the British Empire and, in return, France would receive a small compensatory territory in West Africa.

JANICE J. TERRY

Fenian raids

Between 1866 and the 1870s a small number of Irish nationalist exiles invaded British Canada several times from the United States in hopes of forcing Britain to grant Ireland its independence. The Fenians failed; their attacks created new tensions between Canada and the United States but also sparked Canadian nationalism, helping secure support for the 1867 British North America Act that created modern Canada.

In 1857 refugees from the recent IRISH FAMINE and supporters of the Young Ireland movement met in New York City to enlist Irish immigrants to help throw off centuries of British rule. Named for an ancient Irish

Fenian Brotherhood troops charge the retreating Queen's Own Rifles of Canada, during the Fenian invasion of Canada.

hero, the Fenian Brotherhood would, by 1864, boast 10,000 members, including a women's auxiliary.

From the beginning, the Fenians were plagued with internal leadership squabbles and were denounced by most of the Irish Roman Catholic priesthood. The AMERICAN CIVIL WAR, however, presented an opportunity. For years, Americans had greedily eyed British Canada. As Britain outraged the Union by deviously assisting the Confederacy, influential Americans called for troops to "destroy the last vestiges of British rule on the American continent, and annex Canada..." The United States also punished Canada by canceling a 12-year-old free-trade agreement.

Canada, the Fenians decided, was the hated British Empire's most vulnerable point. As the Civil War neared its end, Fenians recruited Irish-American Union soldiers into their own ranks. After weeks of rumors, armed Fenians in May 1866 invaded the tiny village of Fort Erie, Ontario, from a bivouac north of Buffalo and soon raised their flags on Canadian soil. On June 2 a hastily assembled Canadian volunteer force clashed with the Fenians at Ridgeway, losing the battle and seven of their men. Almost simultaneously, Fenians invaded eastern Canada from northern New York and Vermont, briefly occupying several villages south of Montreal.

In these and later instances, U.S. officials acted ambivalently to Fenian attacks staged from American soil. After Ridgeway, a U.S. warship was waiting to arrest hundreds of Fenian fighters as they reentered the U.S. side of Lake

Erie. A week later President Andrew Johnson warned the Fenians against breaking U.S. neutrality laws. But to the extent that Irishmen had become a crucial voting bloc in the northeastern United States, politicians of both parties jostled for Fenian favor. Democrat Johnson, in a losing effort to prevent the Republican congressional sweep of 1866, canceled Fenian prosecutions and asked the Canadians to go easy on their Fenian captives, promising to return seized Fenian arms.

Meanwhile, Canadian leaders, already negotiating the creation of the Dominion of Canada, made official in March 1867, were looking into military inadequacies revealed at Ridgeway. Renewed Fenian attacks, near Montreal in 1870 and in Manitoba in 1871, were fairly easily put down by the reorganized and energized Canadian armed forces. These were the Fenian Brotherhood's last serious threats to Canadian sovereignty.

The cause of Irish freedom continued despite the Fenian collapse, finding more successful venues and leaders. As the Fenian era ended, so, too, did efforts to claim Canadian territory for the United States. The 49th parallel between the two North American nations became a peaceful border.

MARSHA E. ACKERMANN

Ferdinand VII

(1784–1833) *king of Spain*

Ferdinand VII was one of the monarchs of Europe about whom these words by THOMAS JEFFERSON were particularly fitting: "I was much an enemy of monarchies before I came to Europe. I am ten thousand times more so since I have seen what they are. There is scarcely an evil known in these countries which may not be traced to their king as its source, nor a good which is not derived from the small fibres of republicanism existing among them." The future Ferdinand VII was excluded from any real role in the government of Spain by his father, King Charles (Carlos) IV; his mother, Queen Maria Luisa; and her lover, Manuel Godoy, who in many ways was the most powerful figure in the kingdom.

Ferdinand's animosity toward Godoy and his mother and father was serious. In 1807 Charles IV actually

had Ferdinand arrested for a plot to overthrow him and to assassinate his mother and Godoy. In 1808 a palace revolt broke out against Godoy and his friendly policy toward NAPOLEON I. Godoy was neutralized and Charles IV abdicated in favor of his son. Ferdinand VII at last became king and then proceeded to throw away (at least for a time) his throne. In 1807 Napoleon sent troops through Spain to Portugal. Persuaded to meet Napoleon across the frontier in Bayonne, France, Ferdinand was immediately imprisoned. Napoleon gave Ferdinand's crown to his brother Joseph Bonaparte, and for the next six years Ferdinand lived as a prisoner of Napoleon safely guarded in France.

Napoleon apparently believed that the Spanish people would accept his brother as king with the rightful heir sitting in a French prison. When a French army invaded Spain and occupied Madrid in May 1808, a revolt broke out against the French troops, who most likely felt they were actually bringing modern liberty to a people still governed by the Inquisition. The revolt gave the British the excuse to exploit their naval supremacy. While England's first attempt ended in defeat, General Arthur Wellesley, the future duke of Wellington, landed on Spanish shores in August 1808.

Wellington managed to win impressive victories against the French marshals sent to fight him. After Napoleon's initial invasion of Spain from 1807 to 1808, he never returned. Yet while the Spanish people had fought the French mightily and sought the restoration of their king, they had also drunk deeply of the French ideas of liberty, equality, and fraternity. When Ferdinand returned to Spain victorious, his people expected a liberal monarchy under him, not a return to the authoritarian rule of his father. However, when he returned to Spain, he abrogated the constitution of 1812 empowered by the Spanish parliament and attempted to rule as a despot.

Under his rule, secret societies like the FREEMASONS and the Carbonari began to unify public opinion against him. In January 1820 the Spanish army officer Rafael del Riego y Núñez led a successful uprising against the king. The rebellion became widespread, and the Spanish troops could not—or would not—suppress it. Thus Ferdinand VII, in order to hold onto his throne, had to accept the constitution. However, Ferdinand's conversion to a liberal government was only a tactical move—he had no intention of governing with any limitations on his powers. Ferdinand appealed to the monarchical Holy Alliance, which had been formed to stamp out the egalitarian thought that had spread to wherever in Europe a French soldier had carried

his knapsack. The Holy Alliance was the mystical creation of Czar ALEXANDER I of Russia, who was determined after Napoleon's ultimate defeat at Waterloo in June 1815 that no Napoleon should ever again disrupt the peace of the crowned heads of Europe.

Finally, after the Congress of Verona in 1822, the restored French king Louis XVIII was given the job of crushing the forces of liberalism in Spain. This time, the French troops, royalist now, found a welcome in the reactionary sector of Spanish society. Although Ferdinand VII had promised liberal terms to his opponents, many of these foes were executed. For the rest of his reign until his death in 1833, Ferdinand governed by force of arms.

JOHN F. MURPHY, JR.

financial panics in North America

Several financial panics took place during the 19th century in America. The first major financial crisis happened in 1819, when widespread foreclosures, bank failures, unemployment, and a slump in agriculture and manufacturing marked the end of the economic expansion that followed the WAR OF 1812. The nationwide depression triggered by the panic of 1819 was the first widespread failure of the market economy, although the market had fluctuated locally since the 1790s. Businesses went bankrupt when they could not pay their debts and thousands of workers lost their jobs. In Philadelphia, unemployment reached 75 percent, and 1,800 workers were imprisoned for debt. Unemployed people set up a tent city on the outskirts of Baltimore.

Different schools of economic thought gave different explanations for the panic of 1819. The Austrian school theorized that the U.S. government borrowed too heavily to finance the War of 1812 and it caused great pressure on specie—gold and silver coin—reserves and this led to a suspension of specie payments in 1814.

This suspension stimulated the founding of new banks and expanded the issue of new bank notes, giving the impression that the total supply of investment capital had increased. After the War of 1812, a boom, fueled by land speculation gripped the country and stimulated projects like turnpikes and farm-improvement vehicles. Most people recognized the precarious monetary situation, but the banks could not return to a nationwide specie system. There was a wave of bankruptcies, bank failures, and bank runs. Prices dropped and urban unemployment rose to lofty heights.

In part, international events caused the panic of 1819. The Napoleonic Wars decimated agriculture and reduced the demand for American crops while war and revolution in the New World destroyed the precious metal supply line from Mexico and Peru to Europe. Without the international money supply base, European governments hoarded all the available specie and this in turn caused American bankers and businessmen to start issuing false banknotes and expanding credit. American bankers, inexperienced with corporate charters, promissory notes, bills of exchange, or stocks and bonds, encouraged the speculation boom during the first years of the market revolution.

By 1824 most of the panic had passed and the U.S. economy gradually recovered during the rest of the decade. The United States survived the panic of 1819, its first experience with the ups and downs of the business cycle.

PANIC OF 1837

The next significant business crisis in the United States, the panic of 1837, was one of the most severe financial downturns in U.S. history. Speculative fever had infected all corners of the United States, and the bubble burst on May 10, 1837, in New York City when every bank stopped payment in specie. A five-year depression followed as banks failed and unemployment reached record levels. This depression, interrupted by a brief recovery from 1838 to 1839, compared in severity and scope to the Great Depression of the 1930s and its monetary configurations also parallel the 1930s. In both depressions many banks closed or merged, over one-quarter of them in 1837 and over one-third the number in the 1930s depression. Erratic and unwise government monetary policies played an important part in both depressions.

PANIC OF 1857

The United States gradually recovered from the panic of 1837 and entered a period of prosperity and specula-

tion, following the MEXICAN-AMERICAN WAR and the discovery of gold in California in the late 1840s. Gold pouring into the American economy helped inflate the currency and produce a sudden downturn in 1857. The August 24, 1857, collapse of the New York City branch of the Ohio Life Insurance and Trust Company following a massive embezzlement set off the panic. After this, a series of other setbacks shook American confidence, including the fall of grain prices, the decision of British investors to remove funds from U.S. banks, widespread railroad failures, and the collapse of land speculation programs that depended on new rail routes. Over 5,000 businesses failed within a year and unemployment became widespread. The South was less hard hit than other regions because of the stability of the cotton market. The Tariff Act of 1857 reduced the average rate to about 20 percent and became another of the major issues that increased tensions between the North and the South. The United States did not recover from the panic of 1857 for a full year and a half and its full impact did not fade until the AMERICAN CIVIL WAR.

PANIC OF 1873

The end of the Civil War produced a boom in railroad construction, with 35,000 miles of new tracks laid across the country between 1866 and 1873. The railroad industry, the nation's largest employer at the time outside of agriculture, involved much money, risk, and speculation. Jay Cooke and Company, a Philadelphia banking firm, was just one of many that had invested and speculated in railroads. When it closed its doors and declared bankruptcy on September 18, 1873, it helped trigger the panic of 1873. Eighty-nine of America's 364 railroads went bankrupt and a total of 18,000 businesses failed between 1873 and 1875. The New York Stock Exchange closed for 10 days. By 1876 unemployment had reached 14 percent and workers suffered until the depression lifted in the spring of 1879. The end of the panic coincided with the beginning of the waves of immigration that lasted until the early 1920s.

PANIC OF 1884

Speculation caused a stock market crash in 1884 that in turn caused an acute financial crisis called the panic of 1884. New York national banks, with the silent backing of the U.S. Treasury Department, halted investments in the remainder of the United States and called in outstanding loans. The New York Clearing House Association bailed out banks at risk of failure, averting a larger crisis, but the investment firm Grant & Ward,

Marine Bank of New York, Penn Banks of Pittsburgh, and over 10,000 other businesses failed.

PANIC OF 1893

Precipitated in part by a run on the gold supply, the panic of 1893 marked a serious decline in the U.S. economy. Economic historians believe that the panic of 1893 was the worst economic crisis in American history to that point and they draw attention to several possible causes for it. Too many people tried to redeem silver notes for gold, eventually exceeding the limit for the minimum amount of gold in federal reserves and making U.S. notes for gold unredeemable. The Philadelphia and Reading Railroad went bankrupt, and the Northern Pacific Railway, the Union Pacific Railroad, and the Atchison, Topeka & Santa Fe Railroad failed. The National Cordage Company, the most actively traded stock of the time, went into receivership, a series of bank failures followed, and the price of silver fell, as well as agriculture prices. A total of over 15,000 companies and 500 banks failed.

At the panic's peak, about 18 percent of the workforce was unemployed, with the largest number of jobless people concentrated in the industrial cities and mill towns. Coxey's Army, a group of unemployed men from Ohio and Pennsylvania, marched to Washington to demand relief. In 1894 a series of strikes swept over the country, including the Pullman Strike that shut down most of the transportation system.

The panic of 1893 merged into the panic of 1896, but this proved to be less serious than other panics of the era. It was caused by a drop in silver reserves and market anxiety about the effects that it would have on the gold standard. Commodities deflation drove the stock market to new lows, a trend that did not reverse until after William McKinley became president. Stephen Williamson, associate professor of economics at Ottawa University, compared financial panics in Canada with those in the United States. He concluded in part that the Canadian banking system experienced fewer panics because it was better regulated and well diversified.

MICHAEL J. SCHROEDER

Finney, Charles Grandison

(1792–1875) *American theologian*

Charles Grandison Finney was one of the most prominent evangelists of the Second GREAT AWAKENING in 19th-century America. He was born on August 29, 1792, in Warren, Connecticut. When he was two years old his family moved to Hanover, New York. After graduating from Oneida Academy, Finney taught from 1808 to 1812 in the school district of Henderson, New York. In 1816 he became a clerk in the law office of Judge Benjamin Wright in Adams, New York. In 1818 Finney opened his own law firm.

In October 1821 Finney experienced religious conversion. He left his law practice and began an informal study of the Bible. In July 1824 he was ordained a Presbyterian minister. He identified himself as a Congregationalist for most of his life. From 1824 to 1833 Finney led religious revivals and preached throughout the northeastern United States. He was most active in northern New York, where he was a very popular evangelist, and in particular Rochester, where he was invited to live by that city's religious and business leaders.

In 1832 Finney became the minister of the Second Free Presbyterian Church of New York City. He also helped to establish seven other Presbyterian churches in New York City. In 1835 the wealthy merchants Arthur and Lewis Tappan, who were the financial sponsors of Oberlin Theological Seminary, invited him to come to the seminary and establish its theology department. Finney accepted their offer but continued to preach at his church. At Oberlin Seminary he held a number of teaching positions, including professor of systematic theology and professor of pastoral theology, as well as teaching courses in moral philosophy.

Finney served as the pastor of the First Congregational Church of Oberlin and as a member of the seminary's board of trustees from 1846 to 1851. He was elected president of Oberlin Theological Seminary in 1851, a position he held until 1865. While at the seminary, Finney founded what became known as "Oberlin Theology," which embodied his belief that an individual

could only attain perfection by leading a strict Christian life. His religious ideas made Oberlin Theological Seminary one of the leading religious colleges in America for almost a century.

He wrote a number of important and influential theological works. In 1836 Finney's first book, titled *Sermons on Important Subjects*, was published. He followed it with *Lectures to Professing Christians*, which was published in 1837. In 1840 a collection of his lectures was published as *Skeletons of a Course of Theological Lectures*. Finney's *Lectures on Systematic Theology* was published in 1846. Although he began work on his autobiography, *Memoirs of Rev. Charles G. Finney*, in 1867, it was not published until a year after his death.

Although he resigned as president of the seminary in 1865, he continued to teach there until he was 83 years old. Finney died in August 1875 in Oberlin, Ohio.

GENE C. GERARD

Francia, José Gaspar Rodríguez

(1766–1840) *Paraguayan leader*

José Gaspar Rodríguez Francia is considered the founding father of Paraguay. During his childhood in the late colonial period, Paraguay was a backwater nation dependent upon Buenos Aires for its outlet to the sea. Because higher education did not exist, Francia attended the College of Córdoba in what is now Argentina.

In 1790 Francia became a professor of theology in Asunción (the largest city in what became Paraguay). However, his increasingly radical views caused tension, so he left his position to study law. As a supporter of the ENLIGHTENMENT, the FRENCH REVOLUTION, VOLTAIRE, Jean-Jacques Rousseau, and others, he soon had the largest library in Asunción. Having acquired knowledge of subjects such as astronomy, philosophy, and French, Paraguayans looked at him as a wizard. By 1800, as a lawyer, he had become known as a defender of the poor.

In 1809 Francia became the mayor of Asunción and supported the coup d'état in 1810 that brought independence to Paraguay. In the new political climate, he used his diplomatic skills to secure Argentina's recognition of Paraguay; this was an important achievement, given that many people in Buenos Aires wanted to annex Paraguay.

In 1812, after resigning from the junta composed of military officers which ruled in Asunción, Francia was soon back as a chief of foreign policy. In this position, he once again thwarted Argentine designs on Paraguay. In return, he was placed in charge of half of the army and munitions available and became the single most important figure in the nascent country. To solidify his position, he called a congress of over 1,100 delegates—the first representative assembly chosen by universal male suffrage—which resulted in the formal declaration of a republic in October 1814.

From this time onward, Francia held supreme power until his death in 1840. He was influenced by French utopian philosophers who opposed private property and idealized communes. As a result, Francia ruled a self-designated community of people. The state seized private property to assist the peasants. Fully 877 families received homesteads from the land of their masters. Other measures taken to benefit the poor included very low taxes as a result of fines and confiscations levied on the Spanish elite. The confiscation of foreign properties was used to establish animal breeding farms that were so successful that livestock was given to peasants. Other innovations followed, such as importing machines used in shipbuilding and textiles. Agriculture was centrally planned so that it became more productive and diversified. Personally frugal and honest, Francia left the country richer than he inherited it, including leaving behind seven years of unspent public money.

Other policies were more controversial. Although Francia advocated power in the hands of the people, he suppressed free speech. People who dissented from Francia within the country were often tortured and disappeared without trial. Anyone suspected of anti-Francian sentiments would be sent to a detention camp where he or she would be shackled in dungeons and denied health care. Europeans were forbidden to marry other Europeans so that they would marry local people of mixed or Indian ancestry. Francia harbored resentment against Europeans, many of whom had snubbed him due to his "impure blood." Anyone who attempted to leave Paraguay could be executed. People who entered Paraguay had to remain there for the rest of their lives. In his vendetta against the elite, Paraguay's borders were sealed,

and tobacco production was largely removed from elite control.

In his hostility against the elite, Francia often took draconian measures. In 1824 all people born in Spain were arrested and placed in jail for 18 months. They were released only after they paid a large indemnity that eliminated their dominant role in Paraguay's economy. Francia banned religious orders, closed his old seminary, forced monks and priests to swear fealty to the state, confiscated church property, subjected clerics to state courts, and placed church finances under civil control.

Francia was a bit more relaxed with the underprivileged. Criminals whose crimes he blamed on the unjust behavior of the elite and the church were treated quite leniently, with murderers put to work on public projects. Asylum was given to political refugees from other countries. His foreign policy was wise and prudent. He managed to remain on good terms with both Argentina and Brazil and was not above pitting them against each other. He conducted a private trade so that Paraguay received just enough foreign goods, including armaments, to remain free from pressure. When he died in 1840 Francia left a mixed legacy. Significant economic development had taken place, Paraguay's independence had been secured, and the power of the elite had been broken. On the other hand, political expression had been stifled, and Paraguay's populace was made extremely passive and thus vulnerable to rule by dictatorship.

NORMAN C. ROTHMAN

Franco-Prussian War and the Treaty of Frankfurt

The Franco-Prussian War lasted from 1870 until 1871 and started after the German chancellor OTTO VON

BISMARCK created the North German Federation and its became increasingly anti-French. When the Prussians tried to put a HOHENZOLLERN on the throne of Spain, NAPOLEON III, worried about having to fight Germany on two fronts, decided to declare war on the Germans on July 15, 1870.

Although the French started the war, they quickly lost the initiative, with the Germans rapidly mobilizing and gaining diplomatic support from the states of south Germany: Bavaria, Baden, and Württemberg. On July 31 three massive and well-equipped German armies totaling 380,000 troops massed on the French border. The First Army, led by General Karl F. von Steinmetz, had 60,000 men located between Saarbrücken and Trier. The Second Army was under the command of Prince Friedrich Karl with 175,000 men between Bingen and Mannheim, and the Third Army (145,000 men), under Crown Prince Friedrich Wilhelm, was located between Landau and Germersheim. All these were officially under the command of King Wilhelm I; the field commander was General Moltke. Most units were under Prussian command, although troops from allied parts of Germany fought alongside Prussians in most engagements. In addition, the Prussians also held back 95,000 soldiers in case the Austrians decided to intervene in the war. Facing them, the French had eight separate army corps, with a total troop strength of 224,000, but with many units below strength and some lacking adequate provisions. They were, however, inspired by the French people who cheered them with the cry "On to Berlin."

The French, trying to force the pace of the war at the behest of Emperor Napoleon III, invaded Germany, with the first battle being fought at Saarbrücken on August 2. Battles quickly followed at Weissenburg (August 4), Fröschwiller (August 6), and Spichern (August 6), leaving the French forces in disarray and the Prussians able to advance toward Paris. On August 12 Napoleon relinquished command of the French army, and the Prussians pushed back the French forces.

The major battle was fought at Sedan on September 1, 1870. General Auguste Ducrot had taken command of the French forces from Patrice MacMahon but had been forced back to the Belgian border with 200,000 German soldiers facing him. The French had only 120,000 men. At the start of the battle, the French cavalry was destroyed by the German infantry, and 426 German guns bombarded the French forces throughout the day. However, French machine guns were able to hold off the German infantry attack. General Emmanuel

de Wimpffen, the new French commander, urged Napoleon III to lead his forces, most of whom had retreated into the fort at Sedan. The French emperor declined the offer of a final charge and surrendered to the Prussian king. Wimpffen then surrendered the rest of the French forces. This left the Germans able to march on Paris.

With the news of the defeat at Sedan, the people in Paris overthrew the Second Empire of Napoleon III and proclaimed the establishment of the Third Republic. The authorities in Paris mobilized militia and hastily gathered together an army and threw up fortifications around the French capital. The German commander Moltke decided not to attack the heavily fortified city and involve his soldiers in street fighting. Instead, on September 19, the siege of Paris began. The Prussian king, William, established headquarters at Versailles.

The French tried to disrupt the German lines of communication and at the same time raise another army in the Loire Valley and start a new war from the base of the provisional French government at Tours. On October 27, the Germans captured the city of Metz, with the surrender of the French commander Marshal Bazaine and his army of 173,000. This did not stop the French army from the Loire launching several attacks to relieve Paris. The French managed a few victories, such as at the Battle of Coulmiers on November 9, when they defeated a Bavarian Army Corps, forcing them to withdraw from the city of Orléans. On December 2–4 after a bitter battle around the city, the Germans retook Orléans.

On January 5, 1871, the Germans started bombarding Paris, and on January 10–12 managed to repulse the French at Le Mans. At the Battle of Belfort on January 15–17, the only major French frontier force that had not been captured fell. One of the volunteers fighting for France at that battle was the Italian patriotic leader GIUSEPPE GARIBALDI.

The French sued for a cease-fire on January 26, surrendering two days later. The terms of the Convention of Versailles on January 28 did not include the disarmament of the Paris National Guard and, as a result, some Parisians tried to resist in the PARIS COMMUNE. The Germans eventually marched into Paris on March 1, and on May 10, the Treaty of Frankfurt was signed between the French and the Germans. The French were forced to cede Alsace and northwestern Lorraine to Germany and pay an indemnity of 5 billion francs, a German army of occupation remaining until the indemnity was paid. The defeat was a humiliating one for the French, causing the collapse of the Second Empire, the creation of a French republic, and also the

emergence of the modern German state, with King Wilhelm I of Prussia having been proclaimed the emperor of Germany on January 18, 1871. This quick victory would also encourage German actions at the outbreak of World War I when they believed their greater efficiency, mobility, and generalship would deliver them a relatively easy victory.

JUSTIN CORFIELD

Franklin, Benjamin

(1706–1790) *American printer, scientist, statesman*

Benjamin Franklin was the ultimate American figure of the ENLIGHTENMENT. Renowned on both sides of the Atlantic, he used his enormous energy and talents for philosophy, politics, and diplomacy in service to the new United States and was involved in every aspect of its successful separation from the British Empire.

Born in colonial Boston, youngest son of English immigrant candlemaker Josiah Franklin, Benjamin began a lifelong career as printer and publisher as an apprentice to James, his older brother. Benjamin decamped to Philadelphia at age 17 in search of greater intellectual and religious independence. Despite later long absences in Europe, Philadelphia became Franklin's lifelong home. There he and Deborah Read raised their family, and there he returned to live his final years among old friends and young admirers.

In 1732, the year of GEORGE WASHINGTON's birth, Franklin launched the first number of his immensely successful *Poor Richard's Almanack*, which would appear annually through 1759. A compendium of weather lore, scientific observations, and advice for right living, the almanack helped Franklin achieve financial success, allowing him to "retire" to science and public service in 1748. As "Poor Richard," Franklin also spread enlightenment ideas about politics and virtue in an easily understandable form.

By age 30, Franklin was embarked on a political career, serving as Pennsylvania's postmaster, assembly

member, and agent in London. Franklin used his contacts and the persuasive powers of his newspaper, the *Pennsylvania Gazette*, to enrich Philadelphia's civic life, spearheading the creation of a lending library, volunteer fire company, and hospital for the city's poor.

Beyond Philadelphia, Franklin soon became internationally known as the experimenter and explainer of electricity and inventor of the protective lightning rod. His discoveries won him membership in Britain's Royal Society. In an age before scientific specialization, his curiosity was not limited to electricity. He made important findings in astronomy, meteorology, and zoology; encouraged others, including inventors of the steam engine and steamship; documented the dangers of lead poisoning; and, in his 80s, collaborated on Noah Webster's project of spelling reform.

Franklin's enduring importance, however, stems from his crucial role in the process by which 13 of Britain's North American colonies gained independence. As early as 1747 when Philadelphia faced possible attack from French freebooters and their Indian allies, Franklin challenged Quaker Pennsylvania's official pacifism to muster an armed militia to protect his colony. As the SEVEN YEARS'/FRENCH AND INDIAN WAR loomed in 1754, Franklin's "Albany Plan of Union" proposed a colonywide Grand Council to improve relations with Indian tribes and foster better coordination among the colonies themselves. The plan failed, but it presaged initiatives leading to the Revolution.

Historians have shown that Franklin loved England and was deeply committed to the British Empire, of which he saw the colonies as an integral and, eventually, an economically dominant part. But as Britain's government, in the years following its 1763 war victory, made clear that Americans would never win political or social equality with the mother country, Franklin became a committed separationist. In 1762 Franklin had pulled strings to effect the appointment of his eldest child, William, as royal governor of New Jersey. In 1775 the elder Franklin broke off relations with his son (who remained loyal to the Crown) and did not communicate with him for a decade.

Franklin spent most of the politically agitated period between 1764 and the 1775 outbreak of the AMERICAN REVOLUTION in London, fruitlessly trying to persuade Parliament that its taxes and other colonial policies would lead to a rupture. Even the death of his wife, Deborah, in December 1774 did not bring him home, but Franklin arrived on American shores in time to help THOMAS PAINE publish and distribute his fiery pro-independence pamphlet, *Common Sense*, and to

Benjamin Franklin was renowned on both sides of the Atlantic for his talents in philosophy, politics, diplomacy, and scientific invention.

be Pennsylvania's delegate to the Second Continental Congress, where he sat on a committee working with THOMAS JEFFERSON on the DECLARATION OF INDEPENDENCE. At the same time, Franklin helped shape a democratic constitution for the State of Pennsylvania.

As the war intensified, Franklin sailed for France on a mission that would make possible the United States's ultimate victory. Although his French was not fluent, Franklin was already hugely admired there, and his patient and subtle diplomacy eventually gained major military and monetary aid for the emerging United States.

When, with France's assistance, the war's end came into view in 1781, Franklin became the central member of a treaty-negotiating team that included JOHN ADAMS and John Jay. The resulting Treaty of Paris was signed in September 1783. Gladly relieved of his official duties abroad, Franklin returned to Philadelphia in time to participate in the Constitutional Convention in summer 1787. Although the now elderly statesman did not play a central role in the major debates of that contentious proceeding, Franklin's eminence and daily participation helped to keep the delegates on track. Benjamin Franklin is the only founding father whose signature appears on the Declaration of Independence, Treaty of Paris, and U.S. CONSTITUTION.

In 1790, as he lay dying at his Philadelphia home, Franklin took up a final cause. Joining with others, he petitioned the U.S. government to bring an end to slavery. Franklin had once himself owned at least two slaves; having helped make a revolution, this man who

never stopped questioning, investigating, or evolving had, in his final chapter, cast a final vote for freedom.

MARSHA E. ACKERMANN

Franz Josef (Francis Joseph)

(1830–1916) *Austro-Hungarian ruler*

The emperor of Austria, the apostolic king of Hungary, and the king of Bohemia from 1848 until 1916, Franz Josef I presided over the long decline of the Austro-Hungarian Empire, leading his nation into World War I. His reign of 68 years was only surpassed in Europe by those of Louis XIV of France and John II, prince of Liechtenstein.

Franz Josef was born on August 18, 1830, at the Schönbrunn Palace in Vienna, the capital of the empire. His grandfather was the late emperor Franz; his father was Archduke Franz; and his uncle was the ruling emperor Ferdinand. His mother, Princess Sophie of Bavaria, oversaw his education. The young Franz Josef started his training in the Austrian army at the age of 13 with his appointment as colonel. For much of the rest of his life, he was to wear the uniform of a junior officer.

In 1848, following the resignation of Chancellor Prince METTERNICH, Franz Josef was appointed governor of Bohemia but never took up the position, being sent to Italy, where he fought alongside Field Marshal Radetzky. In July 1848 the Austrians defeated the Italians at the Battle of Custoza, and the Habsburg court returned to Vienna but were forced to evacuate it again in September, this time moving to Olmütz in Moravia. By this time, Prince Windischgrätz who controlled the army in Bohemia, favored replacing Emperor Ferdinand I with his nephew Prince Franz Josef. Ferdinand I abdicated on December 2, and when his brother Franz Karl renounced the throne the crown passed to Franz Karl's eldest son, Franz Josef, who used both names in his title to try to hark back to Emperor Josef (Joseph) II. It was during these relocations that Prince Franz Josef met Elisabeth, his cousin, who would later become his wife.

At 18, Franz Josef was guided by Prince Felix Schwarzenberg, the new prime minister, and a constitu-

tion was granted in 1849. It was a troubled time for the Austrian royal house, with the Hungarians rebelling against the Habsburg central authority, trying to get their “ancient liberties” restored. King Charles Albert of Sardinia/Savoy used the Austrian preoccupation with Hungary as a good time to attack Austria, starting in March 1849. Radetzky defeated the Savoyards at the Battle of Novara and with Russian aid was able to crush the Hungarian revolt. With the end of that crisis, Franz Josef suspended the 1849 constitution and appointed Alexander Bach, the former minister of the interior, to preside over a restoration of absolutist centralism.

Prince Schwarzenberg's main aim was to try to stop the German Federation being controlled by Prussia. He wanted Austria to remain as the major power in central Europe, and Franz Josef certainly went along with this. However, Schwarzenberg died in 1852, and unable to find anybody of his caliber, the emperor took over the day-to-day running of the country, with Karl Ferdinand and Count von Buol-Schauenstein as prime minister, a position he held until 1859. Alexander Bach worked on domestic affairs, and Count Grünne on military affairs. Initially, the main problem that Franz Josef faced was how to deal with Russia, which had supported the Austrians over the Hungarian rebellion in 1848. The Russians expected that this was the start of a new alliance. When the CRIMEAN WAR broke out, the Austrians had to decide whether they would support their new ally, Russia, or their old one, France. Franz Josef finally decided that neutrality was the best course, but the Russians, not trusting him, left an army on the Galician front. This meant that at the Peace of Paris at the end of the Crimean War, the Russians felt the Austrians had been ungrateful, yet the British and the French also felt that they could not trust them.

Three years after the Crimean War ended, the Austro-Sardinian War of 1859 broke out, with Count CAVOUR of Sardinia/Savoy managing to get support from NAPOLEON III of France. Franz Josef personally led the Austrian soldiers at the Battle of Solferino and saw his army break and flee. This resulted in the Austrians losing control of Lombardy. The reunification of Italy presented Franz Josef with a strong neighbor to the south. The next war was with Prussia in 1866. At the Battle of Königgrätz (Sadowa), the large Prussian army defeated an equally large Austrian and Saxon army; there were heavy casualties on both sides, but superior Prussian weaponry carried the day. With Italy supporting the Prussians at the peace agreement at the end of the war, the Austrians lost control of Venice.

LESS POWERFUL AUSTRIA

At the end of the Austro-Prussian War of 1866, Franz Josef found himself ruling a far less powerful Austria, without its Italian possessions and with Prussia dominating Germany. Franz Josef had wanted to modernize and centralize his possessions but was forced to agree to the exact opposite. The restructuring of the Habsburg possessions led to the establishment of the Austrian-Hungarian dualism in 1867. The Hungarian Compromise of 1867 saw Franz Josef as emperor of Austria and king of Hungary, although Hungary would retain its own parliament and prime minister. Thus the Habsburg Empire would become the dual monarchy of Austro-Hungary, which would share the person of the emperor, the army, a joint minister for foreign affairs, and some financial offices.

For most of the rest of Franz Josef's reign, the Austro-Hungarian Empire was in decline. Franz Josef's mother had wanted him to marry Helene, the eldest daughter of her sister Ludovika. However, he fell in love with Helene's younger sister Elisabeth, who was only 16, and they were married in 1854. Their first child, Sophie, died as an infant, and their only son, Crown Prince Rudolf, died in 1889, allegedly by suicide, in the Mayerling incident. Both of these were viewed at the time as divine retribution, although Franz Josef's other daughters did outlive him. Franz Josef's younger brother, Maximilian, became emperor of Mexico and was deposed and executed by firing squad there in 1867. Franz Josef, although he had separated from her, was attached to his wife, and when she was stabbed to death in Geneva, Switzerland, in 1898 by an Italian anarchist, he never recovered.

The defeat of France in the FRANCO-PRUSSIAN WAR of 1870 ensured that Austria could never manage to gain control of the German states that merged with Prussia to form the German Empire. Trying to reposition Austria, from the late 1880s, Franz Josef slowly moved Austro-Hungary into an alliance with Germany and oversaw the occupation of Bosnia Herzegovina from 1878 and its annexation in 1908. This was to involve the Austro-Hungarian Empire heavily in the Balkans, bringing about the enmity of Russia, which had strong cultural ties with the Serbs.

During the latter part of his reign, Franz Josef did manage to modernize much of the empire. The opera house was built in Vienna starting in 1861, and the new Burgtheater, university, parliament building, town hall, and museums of art and natural history were all built. In 1873 an economic crisis hit most of Europe, but Austria survived relatively well, being able to show

the splendor of the Habsburg lands in the World Exhibition at the Prater in Vienna. The railway network was heavily expanded, the telegraph system built, and in 1879 the first telephone system was installed. Franz Josef was persuaded to install a telephone on his desk at the Hofburg in Vienna, but it remained a fashion accessory, and there is little evidence of him actually using it until 1914.

ROAD TO WAR

Franz Josef never liked his nephew and heir, Archduke Franz Ferdinand, and was particularly angered by the younger man's marriage to Countess Sophie Chotek, who was not from a royal house. Franz Ferdinand had insisted on the marriage, which had to be a morganatic one, with Sophie to become a consort rather than queen, when Franz Ferdinand succeeded his uncle. Franz Ferdinand was assassinated in Sarajevo on June 28, 1914, and Franz Josef was persuaded to declare war on Serbia on July 28, leading Austria into war.

The Austrian army was a multinational and multilingual one, reflecting the diversity of the Austro-Hungarian Empire. Led by Austrians, it included Hungarians, Bosnians, Croatians, Czechs, Poles, and Slovaks. Although Franz Josef knew that it would not be an easy victory, his generals felt that it would not take long to capture Serbia. They were able to defeat the Serbian armies and capture the country, but the soldiers quickly succumbed in guerrilla attacks and to disease. Franz Josef died on November 21, 1916, in the middle of World War I. He was succeeded by his nephew Karl I.

JUSTIN CORFIELD

Frederick the Great of Prussia

(1712–1786) *king of Prussia*

Born on January 24, 1712, Frederick II the Great of Prussia became king in 1740 on the death of his father, Frederick William I. Frederick William I had firmly established Prussia as a garrison state, which led some

historians to say that Prussia was an army with a state, not a state with an army. Obsessed with forming an elite infantry for the heaviest fighting, he sent agents to kidnap the tallest men in Europe to be conscripted into his Potsdam Guards Regiment.

As a father, Frederick William I was a brute. Wishing him to be in the military, he despised the prince's love for music and culture and sometimes beat him with a cane. (In spite of his father's disapproval, Frederick became one of the most distinguished flute players of his generation.) When Frederick as a youth tried to escape from his father's tyranny with his young friend Lieutenant Hans von Katte in 1730, both were arrested. Frederick was imprisoned and forced to undergo the horror of seeing Katte executed, most likely beheaded, from his cell window.

When Frederick became king in 1740, one of his first acts was to disband the Potsdam Guards Regiment. Still, Frederick continued his father's transformation of Prussia into a garrison state and commented that "for the world rested not so firmly on the shoulders of Atlas as the Prussian State on the shoulders of the Army." Frederick was dissatisfied with the condition of the army left by his father and was determined to take it in a new direction. Frederick William I's predilection for height in his soldiers led to a heavy cavalry of extremely large men on large horses, hardly suited for the role of shock action in battle that Frederick the Great envisioned for them.

Although the Holy Roman Empire was considered powerful, Frederick sensed weakness and planned an attack. The Holy Roman Emperor Charles VI had only his daughter MARIA THERESA to succeed him. However, the ancient Salic law prevented a female from becoming ruler. Charles VI attempted to circumvent the law to enable his daughter to succeed him on the throne, but in October 1740 Charles VI died.

Although the Austrians and Hungarians, the empire's main troops and Frederick's opponents, were taken by surprise by the Prussian advance, they soon recovered and fought back. Finally, after five charges, the Austrian and Hungarian cavalry refused to continue advancing into the storm of Prussian musketry. Frederick's first battle had ended in victory.

Although he considered negotiating a settlement with Austria, Frederick decided he could gain more by war. On May 17, 1742, he defeated an Austrian army at Chotusitz. The loss at Chotusitz led to the Austrians signing the Treaty of Berlin in July 1742, effectively ceding mineral-rich Silesia to the Prussians. However, when the French were defeated at the Battle of Dettin-

gen by a coalition of British, Austrian, and Hanoverian troops, Frederick feared that if France were defeated, Austria would turn all its resources against Prussia.

Frederick launched another attack on the Austrians while they were occupied with the French and Bavarians. In August 1744 Frederick captured Prague and threatened Austria itself. Maria Theresa was forced to sign the Treaty of Dresden on Christmas Day, 1745. The conflict between the French and British would continue until the entire conflict of the War of the Austrian Succession would end in 1748 with the Treaty of Aix-la-Chapelle.

Maria Theresa was bitter over Austria's defeat and planned revenge against Frederick and Prussia. She implemented what was known as the DIPLOMATIC REVOLUTION of the 18th century. She forged an alliance between the ancient enemies, Austria and the France of King Louis XV, and added Russia and Czarina Elizabeth. The express purpose of the diplomatic revolution was the destruction of Prussia. Upon learning of these negotiations, Frederick made an alliance with his former enemy, George II of Great Britain, thus completely changing the diplomatic landscape of Europe that had existed during the War of the Austrian Succession.

FIRST DEADLY BLOW

Frederick was determined to deal the first deadly blow, creating a hallmark of German strategy that would be upheld throughout World War I and World War II. On October 1, 1756, Frederick won his first battle against the Austrians. The struggle with Austria was part of the much wider European conflict, which has become known as the SEVEN YEARS' WAR. The Seven Years' War, much more than the War of the Austrian Succession, became a war of survival for Frederick, beset as he was on all sides by the French, Austrians, and Russians. At the Battles of Prague and Köln, Frederick was bloodily defeated by the Austrians.

Soon after, the French army under Marshal Soubise invaded Prussia and met Frederick at Rossbach on November 5, 1757. Rossbach would become perhaps Frederick's classic victory when, after being hidden by a hill, Frederick's commander brought his cavalry smashing into the French army, thoroughly defeating Soubise in one of the most decisive battles of the 18th century.

With the French effectively out of the war at least for a time, Frederick then turned swiftly on the Austrians, savagely defeating them at Leuthen precisely a

month after Rossbach. The failure of his enemies to coordinate their offensives brought victory to Frederick, who by now was called by his troops *Alte Fritz*, or “Old Fritz.”

The Russians attacked again in the summer of 1758, and Frederick’s victory over them was a brutal battle of attrition. Frederick had no real chance to recover when the indefatigable Austrian marshal von Daun sought another battle. The two old enemies met at Hochkirk on October 14, 1758, and, once again, Daun defeated Frederick in a hard-fought battle.

The Seven Years’ War now entered its final and climactic phase. Frederick fought three of his most hotly contested battles in 1759, as the strain of war now began to affect him and his army. In spite of all his efforts, desertions climbed. On August 12 at Kunersdorf, Frederick barely escaped capture when he was defeated by the Austrians and Russians. But the Russians did not follow up on his defeat, and he struck again. He chose Leignitz on August 15, 1760, to decisively defeat the Austrian marshal Loudon during a rare night attack. By 1761 both sides were beginning to feel the strain of five years of war.

The year 1762 finally brought the war to a close. George II died, and his son George III decided officially to end the costly subsidies to Frederick. Czarina Elizabeth of Russia had died, and her son Czar Peter II was an ardent admirer of Frederick. Frederick seized the change in the political climate, and in July and October 1762, he won two more battles against the Austrians in spite of the war weariness affecting his troops. With Czar Peter wanting peace with Frederick, Maria Theresa reluctantly agreed to end the war. On February 15, 1763, Austria signed the Treaty of Hubertusberg with Frederick, bringing the war to an end. Silesia’s vast mineral wealth was permanently ceded to Prussia.

Frederick took part in the first partition of Poland with Austria and Russia in 1772 and became involved in the brief War of the Bavarian Succession in 1778, but otherwise lived in peace at his palace at Sans Souci. During the periods of peace, Frederick enjoyed participating in the culture of his time. Between 1750 and 1755 he hosted the French philosopher Francois-Marie Arouet, better known to the world as VOLTAIRE. Frederick the Great took seriously the ENLIGHTENMENT’s view of the philosopher-king who looked after the welfare of his subjects. A truly enlightened despot (see ENLIGHTENED DESPOTISM), Frederick moved swiftly toward Prussia’s recovery from the years of war. In 1765 alone Frederick rebuilt almost 15,000 houses.

Frederick died on the morning of August 17, 1786. He left Prussia the strongest military state in Europe at the end of the Seven Years’ War. Yet his zealous efforts at rebuilding the state and its economy after the war, as much as his genius at warfare, earned for him the fitting title of Frederick the Great.

JOHN F. MURPHY, JR.

Freemasonry in North and Spanish America

The specific origins of Freemasonry cannot be determined with clarity. Freemasonry is a fraternal organization, and, because of the secrecy of its rituals and the influence of its members, is thought by some to be either subversive or bent on world domination. There do not appear to have been any permanent lodges or Masonic fraternities in America until the Grand Lodge of London was established in 1717. English Masons then turned their eyes to the colonies, establishing the first provincial Grand Master to govern and control the initiation and granting of degrees in American territories in 1730. The first American lodges were founded in Boston and Philadelphia and were of the York (American) rite.

The York rite consists of 13 degrees, 10 above the “blue,” or required three of Entered Apprentice, Fellowcraft, and Master Mason. The higher 10 are grouped into three divisions: Royal Arch Masons, Royal and Select Masters, and Knights Templar. The York rite would dominate Freemasonry in the Americas until the latter part of the 19th century.

Freemasons were important to the growth of the United States, as York rite lodges were easily formed, even in frontier areas, and provided important social and fraternal benefits to members. The United States was unique, however, in that it did not have one overarching Masonic governing body; there was no grand lodge for the United States. Instead, each state

had its own grand lodge, exercising complete control and authority over the territory within its jurisdiction. There was an attempt to establish a general (national) grand lodge after the AMERICAN REVOLUTION, but it failed when GEORGE WASHINGTON turned down the job of general grand master. While there were some minorities to be found in individual lodges, African Americans founded their own Masonic organization, the Prince Hall lodges, named after their founder. Along with the Christian Church, the Prince Hall lodges would grow in importance during the 19th century and provide crucial avenues of mutual support and interstate connections.

Freemasons in the United States almost disappeared during the 1820s and 1830s in response to the disappearance, and probable murder, of Henry Morgan. Morgan had attempted in 1826 to publish an exposé of Masonic activities and rituals in New York but disappeared after being removed from prison by known Freemasons. The public outcry resulted in the formation of the Anti-Masonic political party and also forced the closure of numerous lodges throughout the states. Some states saw all of their lodges close within the next decade.

The furor would not last, however, and by the time of the AMERICAN CIVIL WAR, the Freemasons had regained their influence. The American Civil War would provide new challenges, however, as most southern lodges withdrew from fellowship with northern lodges, declaring them un-Masonic. While there have been many stories told of kindnesses shown on the battlefield between Masonic enemies, there is little doubt that the Masons back home, in their meetings, felt little love for the Masons on the other side of the war.

This newfound tension helps to explain the rise of Scottish rite Freemasonry in the United States. This rite had 33 degrees (as opposed to the York rite's 13) and was more influenced by French Freemasonry of the Grand Orient lodge than by the English model. The Scottish Rite was filled with more pageantry than the York and because of the greater number of degrees required more members before higher degrees could be granted.

While it had been established in the United States in the early 1800s, it did not rise to prominence until after the Civil War, thanks to the work of Albert Pike. His books, particularly the *Morals and Dogma of the Ancient and Accepted Scottish Rite of Freemasonry*, provided a new way for Freemasons to join together, and many York rite lodges either converted to the Scottish rite or joined with them. In addition to the Scottish rite, the years after the American Civil War saw an explosion

of other fraternal organizations: the Elks, Grotto, Shriners, and the Order of the Eastern Star (for women), as well as groups for children.

The history of Freemasonry in Mexico and South America is more difficult to separate from the politics of the time. Spain showed a great deal of hostility to Freemasonry, as it was often connected with revolutionary movements in Europe and often expressed anticlerical positions. This ensured that Freemasonry in Spanish colonies would often be limited and oppressed, ironically making it a revolutionary force. Many revolutionary leaders were members of the Lautaro lodge—Spanish Freemasonry. However, there can be little doubt that some of the more famous revolutionaries—Carlos María de Alvear in Argentina, José de San Martín in Chile, and José Morelos in Mexico were masons. The pageantry of Scottish rite Freemasonry became prevalent during the 19th century and dominates the South American landscape of Freemasonry to the present day.

French and Indian wars

See SEVEN YEARS'/FRENCH AND INDIAN WAR (1754–1763).

French Equatorial Africa

French Equatorial Africa was formed as an administrative unit of the French empire in Africa in 1910. Of its three regions, Chad was the most important. Currently, Chad is not only confronted by a civil war but also by the fighting in SUDAN to the east.

The French conquest of what would become Equatorial Africa began around 1897, when France was beginning to expand south of its North African colonies of Algeria and Tunisia. Although considered part of French North Africa, Morocco would not officially

become a French area of control until the Algeiras Conference in 1906 gave France virtually complete dominance of the country. At the same time, France attempted to claim territory as far as the Nile River, which precipitated the FASHODA CRISIS with Great Britain. On September 2, 1898, British General Sir Herbert Horatio Kitchener defeated the last major Mahdist forces in the Sudan in the BATTLE OF OMDURMAN, putting the Sudan under British control. Taking advantage of the long British preoccupation with the Sudan, beginning with the revolt of Muhammad Ahmad Abdullah, the self-styled Mahdi, or Rightly Guided One, in 1883, France had hoped to expand its equatorial holdings straight across from Chad to Darfur in the Sudan and on to the Nile. No sooner had Kitchener defeated the Mahdists at Omdurman than he traveled up the Nile to where Marchand had planted the French flag at Fashoda. Meeting on September 18, 1898, Marchand and Kitchener established a cordial relationship, deciding to let the home governments in Paris and London resolve the problem. In the end, Marchand retreated, to full military honors from the British.

In Chad, the French discovered a complex mix of tribes and religions, with Muslims predominating in the north, while in the south, native, or animist, religions predominated, as well as some Christianity. Tribes like the Fulani had their own imperial traditions, and the establishment of French control was difficult. The current Chadian capital of N'Djamena was founded in 1900 as Fort Lamy.

Much of the history of French imperialism in the Middle Congo and Ubangi-Shari began with the explorer Pierre Savorgnan de Brazza. On September 10, 1880, Brazza signed a treaty with King Makoko of Teke, whose territory occupied a strategic position in the Congo River basin. France's claims to the Congo were hotly debated by King LEOPOLD II of Belgium. Finally, at the Congress of Berlin, which was held from November 1884 to February 1885, the fate of much of Africa was decided under the chairmanship of imperial Germany's chancellor OTTO VON BISMARCK, who was also intent on carving out a German empire in Africa. Belgium and King Leopold II controlled the CONGO FREE STATE. In honor of his contributions, the capital of the French Congo was named after Brazza: Brazzaville.

De Brazza became the most important colonial administrator in French Equatorial Africa. In April 1886 he was named commissaire-general for both the French Congo and Gabon, whose territory had been

formally recognized as under French jurisdiction at the Berlin Congress. In 1839, while France was still conquering Algeria (it had moved into Algeria in 1830), the first treaty had been signed between Gabon and France.

The government in Paris was anxious to bring riches out of the French colony differently than Leopold, who acted barbarously to the native Africans. Brazza had a genuine feeling of responsibility for the people now under his administration and refused to submit them to the barbarities of Leopold's paramilitary administration, where hands and feet were cut off for the least infraction of laws.

Tens of thousands died to profit Leopold and his consortium of investors. When Brazza refused to employ the methods used by the Belgians, he was removed from his command.

In 1900 the French government took over the system of concession companies completely, by which time Leopold had wrung his wealth from the Belgian Congo. Soon the French were using the same brutal methods that the Belgians had used. In 1905, in the face of stories of atrocities coming from the French Congo, Brazza was asked to return. His investigation led to the convictions of two Frenchmen for the murder of two natives. They both received only five years in prison.

Nevertheless, Brazza had served France to the best of his ability. On his return to France, he died on September 14, 1905.

While the French government preferred to bury the results of his findings in its attempt to keep seeking riches in Equatorial Africa, the Africans did not forget his devotion to the French "civilizing mission," the rationale the French gave for the growth of their empire. Even now, after the end of the French empire in Africa, each October 3, a celebration is held in Brazzaville to mark his foundation of the city.

JOHN F. MURPHY, JR.

French Indochina

The French had interests in what was to become Indochina as far back as 1787 when the Treaty of Versailles

was signed between Nguyen Anh, the pretender to the Vietnamese throne, and France. It allowed for Pigneau de Behaine, the French bishop of Adran, to support Nguyen Anh, who was trying to take over Vietnam, in return for Nguyen Anh's promising to give the French a privileged trading status should he come to power. He also granted commercial and missionary rights to the French, as well as control over the central Vietnamese city of Danang and the island of Poulo Condore off the southern coast of Vietnam. With the French Revolution taking place in 1789, the French were unable to fulfill their commitments. However, in 1802 the forces of Nguyen Anh won control of Vietnam and centralized power around the imperial city of Hue in central Vietnam.

Five years after Nguyen Anh's victory, the Vietnamese expanded their lands by establishing a protectorate over Cambodia. However, the king of Cambodia, Ang Duong, was keen on Cambodia becoming independent of its two more powerful neighbors, Thailand to the west and Vietnam to the east, and sought help from the British in Singapore. When that failed, he enlisted the help of the French. In 1863 the French established a protectorate over Cambodia. The French had also been active in southern Vietnam and, after the Battle of Ky Hoa near Saigon (modern-day Ho Chi Minh City), the Treaty of Saigon in 1862 resulted in the Vietnamese ceding three provinces in southern Vietnam to France. The remaining provinces of southern Vietnam were conquered by the French in 1867. By the end of the French Second Empire in 1870, the French were in control of southern Vietnam and all of Cambodia. The Philaster Treaty of 1874 confirmed French sovereignty over the whole of Cochin China.

The French then decided to expand their control over the rest of Vietnam. In 1882 a French army captain Henri Rivière decided to attack Hanoi. He managed to storm the citadel of Hanoi but was killed the following year. However, this did not stop French advances, and the Harmand Treaty of 1883 established a French protectorate over both northern Vietnam, known as Tonkin, and central Vietnam, known as Annam. This was confirmed in the Patenôtre Treaty of 1884. Three years later, in 1887, the Indochinese Union was established over Vietnam and Cambodia, with Laos joining in 1893. From November 16, 1887, when the Indochinese Union was established, the French ruled through a governor-general based in Saigon, capital of Cochin China. There were residents in Laos and Cambodia, a resident-superior in Annam, and a resident-superior in Tonkin, who ruled with the support of the regent,

and took instructions from the resident-superior in Annam.

The Vietnamese imperial family continued to live in the imperial palace at Hue, but they were quickly deprived of any power. In July 1885 the French demanded that Emperor Ton That Thuyet resign or be deposed and when the Emperor refused to countenance this, the French, in a show of force, surrounded the imperial palace with over 1,000 soldiers, and the French commander, General Roussel de Courcy, demanded an audience with the emperor. Ton That Thuyet overestimated his own strength and sent out soldiers to attack the French. These were easily repulsed, and the French invaded the imperial palace, which they sacked. As well as looting it, the French also destroyed the imperial library, where scrolls and documents dating back to medieval times were burned.

SAVE THE EMPEROR

In July 1885 the new emperor, Ham Nghi, issued an appeal called Can Vuong ("Save the Emperor") urging the wealthy to give their money, the strong their might, and the poor their bodies to defend Vietnam from the French. Three days later the emperor fled from Hue with Ton That Thuyet and some close advisers. From their jungle stronghold in what is now Laos, Ham Nghi's supporters formed the Can Vuong movement. The French responded in September 1885 by deposing the emperor and replacing him with his brother Dong Khanh. Ham Nghi was eventually captured in November 1888 after being betrayed by Hmong mountaineers, and Ton That Thuyet escaped to China. The French executed all members of the Can Vuong movement whom they captured, except Ham Nghi, who was sent into exile in French Algeria, where he remained until his death in Algiers on January 4, 1943.

In Cambodia, King Norodom I, who had accepted the French but then became nervous about having given them too much power, died in 1904 and was replaced by his brother King Sisowath, who was more pro-French. In Laos, there was a token French presence, with the French residents-superior working alongside King Sakkarin and, after his death in 1904, King Sisavang Vong.

French rule barely affected many of the peasants in the countryside throughout Indochina, whose main interactions with the French were taxation. However, gradually, many peasants were encouraged to work in plantations, which the French established throughout Vietnam and in eastern Cambodia. These centered on the rubber industry and other cash crops. Plantation life

was hard but promised, initially at any rate, guaranteed supplies of food, particularly important as Vietnam did experience a number of famines. Gradually, these plantation companies and mining companies came to dominate the export economy of Indochina, with the emergence of business enterprises such as the *Compagnie du Cambodge*.

The major impact of the French was in the cities, especially Saigon. Prior to the establishment of French rule, Saigon had been a small port. Under the French it rose to be an important trading hub, joining up with the nearby Chinese area, Cholon, to form what was to become Saigon-Cholon. The French built sections of what is now central Ho Chi Minh City, with the center of French society being in rue Catinat, where French rubber planters and their families would meet with colonial officials, businessmen, and wealthy Chinese and Vietnamese entrepreneurs and middlemen. In Hue, the north bank of the city was dominated by the imperial palace, so the French established their city on the opposite side of the Pearl River. In Hanoi, the French enlarged the city, with their quarter to the south of the citadel and the old city. Similarly, in Phnom Penh, Cambodia, and in Vientiane and Luang Prabang, in Laos, the French added their own quarters.

COLONIAL EDUCATION

In terms of education, the French provision of education in Cochin China was adequate, at least when compared to other colonial powers, but apart from an institute for tropical medicine in Hanoi, its contribution to the education of the people of Indochina was woeful. By 1945, there were only two high schools in the whole of Cambodia; in Laos, European-style education was nonexistent. Many boys from the Cambodian and Laotian elites attended Lycée Chasseloup-Laubat in Saigon. Some wealthy Vietnamese and scholarship winners studied in France, along with a handful of Cambodians. Western-style medical care was only available in major cities and largely restricted to the small European populations and the local wealthy elite.

There were protests against French colonial rule. Initially these were largely revolts by people loyal to the rulers, such as that of Ham Nghi in 1885, or the Poukombo and Si Votha uprisings in Cambodia, the first led by a monk who claimed to be from the Cambodian royal family and the latter led by a brother of the king of Cambodia. Together with an earlier rebellion by another monk, Assoa, who also claimed royal heritage, they show a distinct theme of rebels having or claiming to be members of the royal family, with some peasants

keen to follow them as royal pretenders, viewing them as the only way they could envisage an end to French rule. None of these rebellions was successful. There had been limited political freedoms in Cochin China, and by the first part of the 20th century there were a range of legal political parties. Most of the modern nationalist ideas in Vietnam come from the intellectual Phan Boi Chau, who founded the Vietnamese Restoration Society in 1912.

As well as political turmoil, there were occasions of farce such as when French adventurer Marie Mayréna proclaimed himself King Marie I of Sedang, issuing medals and postage stamps to support his claim of a kingdom in the highlands of Vietnam. He eventually settled on the Malayan island of Tioman, where he died soon afterward. Certainly he also drew the focus of world attention on French Indochina during the 1880s and early 1890s.

JUSTIN CORFIELD

French Revolution

The AMERICAN REVOLUTION inspired many people around the world in the ideas of democracy and this was certainly true of France, which had sent over many soldiers to fight in the Americas and had helped subsidize the war. In fact, it was the crisis in the royal finances, partly because of the money paid in the American War of Independence, that resulted in the series of events that led to the French Revolution.

LOUIS XVI had become king in 1774, and until 1776, his comptroller-general of finances was Anne-Robert-Jacques Turgot. In 1777 Jacques Necker was appointed as director-general of finances, and he tried to change the French taxation system to make it more uniform. This involved eroding the power of some of the law courts, which preserved aristocratic privileges. Necker was, however, undermined by the nobles, who were anxious to retain their status of not paying taxes,

and he was forced from office. Charles-Alexandre de Calonne became comptroller-general of finances in 1783, and his aim was not to have any austerity drives nor reign in expenditure but to spend more to encourage the economy and also increase the confidence of potential creditors in the stability of the French financial system. However, Calonne realized that this would not work in the long term and what was needed was a new taxation system.

REFORMATION AND CONSTITUTION

The new taxation system would be a universal land tax that would replace all other taxes. To get this approved, it was necessary to have it supported by the Assembly of Notables. The assembly was convened in 1787 but refused to accept this, and Calonne was soon replaced by the leader of the assembly, Étienne-Charles Loménie de Brienne. Brienne, however, quickly came to see the merit in Calonne's proposals and put his ideas to the king. The Paris *Parlément* and the 14 provincial *parlements* liked many of the administrative reforms but balked at the idea of a universal land tax. This left the government with the only option open to itself, the calling of the Estates General, which had last met in 1614, and have that body approve the tax reforms.

The Paris *Parlément* called for the Estates General to have the same "forms of 1614" when it last met, which involved equal numbers of representatives of the three "estates." The first estate was the clergy, the second estate was the nobility, and the third estate was the middle class and peasants. With the three bodies voting "by order," it was possible for the first two to outvote the third. There were protests, and it was decided that there would be twice as many representatives of the third estate as each of the other two. This led to debate over whether the members should actually all vote "by head," whereby the decision would be carried when a majority of the elected representatives supported a decision. It was decided to leave that decision to the assembly, which convened at Versailles on May 5, 1789.

Many members of the third estate decided to change the whole system by turning themselves into a "National Assembly of the People." Louis XVI reacted by closing the Salles des États, where the assembly was meeting, and the members then convened at a nearby indoor tennis court, where they swore the Tennis Court Oath on June 20, 1789, whereby they undertook not to leave until France had a constitution. In this move they were joined by a majority of the clergy and also 47 nobles.

THE BASTILLE

The military arrived to try to restore the king's authority, but, on July 9, the National Assembly changed itself into the National Constituent Assembly, intent on introducing a new written constitution. The king decided to dismiss Necker, who had tried to push through his administrative reforms, and many people in Paris thought that the king was about to take control. To forestall this, large crowds started arming themselves and decided to try to take charge of the supplies of gunpowder held at the Invalides, which they could then deny to the royal troops.

Some of the crowd wore a red, white, and blue cockade in their hats, and this quickly became popular with the revolutionaries and the demonstrators in coming years. When they got to the Invalides they found the gunpowder had been transferred to the Bastille and were convinced that the king was plotting a coup d'état. On the following day, July 14, the crowds started surging around the Bastille and three city deputies were admitted. One of them, Thuriot de la Rosière, requested that the governor, the marquis de Launay, draw back his cannons and not antagonize the crowd, and then let the crowds in. De Launay pulled back his cannon but would not allow the crowds in.

By noon the crowds had swelled, and the first drawbridge was let down, but the second remained up. As the crowd advanced into the courtyard, some soldiers fired to try to protect the second drawbridge. At 3 P.M., de Launay at last agreed to lower the drawbridge, and he and his 114 soldiers were then taken prisoner. De Launay was killed, along with seven soldiers, as the Bastille was sacked and the seven prisoners inside were released. The Bastille had represented royal power and despotism as many political prisoners had been held there in previous centuries. It was later demolished, and many people, including numbers of foreigners, collected bricks as souvenirs.

DEMONSTRATIONS AND UNREST

By this time there was widespread unrest and civil commotion throughout Paris and, indeed, around the rest of the country. On August 4 the National Constituent Assembly passed what became known as the "August Decrees," which ended all the special privileges for nobles, clergy, cities, towns, provinces, and guilds. On August 26 the assembly published the Declaration of the Rights of Man and of the Citizen, which, like the U.S. DECLARATION OF INDEPENDENCE, was a statement of intent rather than law.

The king had managed to get through most of this untouched, and many Parisians thought that the main problem was that the king was being badly advised in Versailles and ought to move to Paris. To achieve this, on October 5, a crowd of people from Paris, including large numbers of working women, formed what became the Women's March on Versailles. They gathered outside the Hôtel de Ville in Paris initially to demonstrate against the increasing price of bread. Gradually, they were persuaded to petition the king himself, and they set off for Versailles, accompanied by marquis de Lafayette, leading the National Guard. They were angered by stories of banquets held at Versailles, such as the one four days earlier for the royal guards, and on reaching the palace at Versailles, some of their number forced their way into the king's apartments, killing two of his guards. The king was finally persuaded to appear at the balcony and address the crowd to calm them down. This did reduce the tensions, but when Queen Marie Antoinette appeared there were hoots, and it seemed that some of the crowd might open fire at her. As the queen tried to withdraw, Lafayette, seizing the moment, then kissed her hand. The people cheered and the king agreed that he and his family would move to Paris.

On October 6, 1789, the king left Versailles for Paris, with the Constituent Assembly also moving to the French capital. By this time there were thousands of national guards to keep order. In Paris, reforms continued with the replacing of the provinces of France with the 83 *départements*, which were uniformly administered and all approximately of the same size and population. The Roman Catholic Church was also stripped of much of its power and wealth. On November 1789 the lands owned by the church in France were nationalized, and in February 1790 the religious orders had been suppressed. By July 1790 all that remained of the church was made, by the civil constitution, an extension of the French state. Pope Pius VI remained silent initially, but in March 1791 he condemned the civil constitution and the other changes; he was later also to condemn the execution of Louis XVI.

THE CALM BEFORE THE STORM

On July 14, 1790, on the first anniversary of the fall of the Bastille, the Festival of the Declaration was held at the Champ-de-Mars, with the people present swearing an oath of loyalty "to the nation, the law and the king." Led by Lafayette, the people swore the oath "we swear to be ever faithful to the nation, the law and the king." Even the king swore the oath, and Marie Antoi-

nette held her son out for all the crowd to see. There were then chants of "*Vive le roi, vive la reine, vive le dauphin*" ("Long live the king, long live the queen, long live the crown prince"). The French tricolor flag was unveiled, with 40,000 spectators cheering.

FLIGHT OF THE KING

The increasing power of the National Constituent Assembly meant that factions started to form, and in France some areas introduced more radical reforms, while others sought to restrict them. The emerging powers were members of the Jacobin Club and the Girondins, the former being extremely radical in their ideas, the latter more moderate. Sensing what might happen, many nobles and other wealthy Frenchmen started to leave the country. The National Constituent Assembly decided to legislate against these émigrés by seizing their property. As tensions escalated, Louis XVI fled Paris. Together with his family, he took part in a plot organized by Count Axel Fersen, a Swedish diplomat and close personal friend of the queen, and early in the morning of June 20, 1791, the royal family fled their residence at the Tuileries dressed as servants with some of their servants dressed as nobles.

They managed to get as far as Varennes, close to where Austrian soldiers were based, the queen being Austrian. However, the escape attempt failed because the king, anxious to travel with his family, needed a large coach rather than the two smaller (and faster) ones that Fersen had wanted. Furthermore, some people started to stare at the coach as it went past, and the king, without thinking, started to wave at people who cheered him, and it soon became obvious to all who he was. The coach in which they were traveling was stopped, and, on June 22, the king and the royal family were brought back to Paris surrounded by 6,000 national guardsmen. The Constituent Assembly made out that the king had been kidnapped, but most realized what had happened. The king was suspended from his position, and he and his wife were held under guard.

The situation for the king became worse when Leopold II, the Holy Roman Emperor (and brother of Marie Antoinette), King FREDERICK WILLIAM II of Prussia, and Charles-Phillipe, comte d'Artois, the younger brother of Louis XVI, issued the Declaration of Pilnitz in which they demanded the liberty of Louis XVI and the dissolution of the Constituent Assembly or they would invade France to achieve their will. This changed the situation dramatically, and when Leopold II died on March 1, 1792, the French decided to

A reproduction of a painting shows Maximilien Robespierre being interrogated before being executed on July 27, 1794.

declare war on Austria, which took place on April 20. The Prussians then siding with the Austrians sent their soldiers into France but were stopped by the French at the Battle of Valmy.

THE REPUBLIC

The king was in an increasingly difficult position because to say anything other than urging people to fight the Austrians and the Prussians was tantamount to treason. On August 10, 1792, large numbers of people charged into the Tuileries, where Louis XVI and his family were held. They overwhelmed the Swiss guards who were there, killing many of them, and the newly established PARIS COMMUNE took over control of much of the city. They sent men into the prisons, where some 1,400 people were summarily tried and executed; these became known as the September massacres. The Assembly was unable to do anything, but a National Convention was formed that proclaimed itself the de facto government of France on September 20, abolishing the monarchy on the next day, and declaring France a republic. This date later became the start of Year 1 of the French Revolutionary Calendar.

The French rallied to support the Convention and many were angered by the Brunswick Declaration by which the Austrians and Prussians threatened retaliation if Louis XVI was injured. On December 21 “Louis Capet, until now king of France,” was arraigned before the Convention. After his trial, on January 17, Louis XVI was sentenced to death by guillotine for “conspiracy against the public liberty and the general safety,” only by a small majority. He was executed four days later;

his last words “I die innocent, I forgive my enemies. May my blood be useful to France; may it appease the anger of God.” His widow, Marie Antoinette, was executed on October 16, and their eldest son, who became in royalist eyes Louis XVII, died while in prison. This left the younger brothers of Louis XVI—Louis, comte de Provence (later Louis XVIII), and Charles, comte d’Artois (later Charles X), as the royalist claimants to the throne. Both had managed to leave France before the Revolution.

THE REIGN OF TERROR

At this time the Committee of Public Safety, set up by the Convention, came to be controlled by a lawyer and Jacobin radical named Maximilien Robespierre. He unleashed what became known as the Reign of Terror, in which some 18,000 people were executed, mostly by the guillotine, for counterrevolutionary activities. Many of those killed were people who had supported the initial revolution but who felt that Robespierre had gone too far.

Included in those who were executed were many Girondins and also Philippe Égalité, formerly the duke of Orléans, who had even voted for the death of Louis XVI, his first cousin. Georges-Jacques Danton, one of the great revolutionary leaders, was also denounced and executed. A great orator, he had been a longtime opponent of Robespierre. Many people tried to escape to England, Spain, Switzerland, or Germany, accounts captured in novels such as *A Tale of Two Cities* by Charles Dickens and the *Scarlet Pimpernel* books of Baroness Orczy.

The reign of terror reached its peak on October 24, with the start of the use of the revolutionary calendar, back-dated to September 20 of the previous year. Just over a fortnight later, on November 10, Notre-Dame Cathedral was turned into the Temple of Reason, with Lady Liberty replacing the Virgin Mary on some of the altars. To change the internal dynamics of the cathedral, a stage set from the Opéra was placed in the transept of the cathedral, in the center of which was a model of a mountain with the classical image of philosophy mounted on it.

A young actress, with a white robe and red bonnet and armed with the spear of knowledge, then passed down the aisle with the crowds chanting “Thou, Holy Liberty, come dwell in this temple, be the goddess of the French.” It was not long afterward that over 2,000 other churches in France were also “transformed” into Temples of Reason. In May 1794 an inscription was added to the front of Notre-Dame: “The French people

recognize the Supreme Being and the immortality of the soul,” and “Temple of Reason” was then changed to become the “Temple of the Supreme Being.”

THE END OF THE TERROR

Eventually Robespierre went too far. He had been involved in the execution of many moderate Jacobins, and on July 27, 1794, in the Thermidorian Reaction, named after the French revolutionary month in which it happened, Robespierre and his leading aide, Louis-Antoine de Saint-Just, were both arrested and executed. A new government was then introduced. Known as the Directory, it consisted of a small group of five, similar to a political cabinet, who were chosen each year by the Conseil des Anciens (Council of Elders) made up of 250 senators, and the Conseil des Cinq-Cents (Council of the Five Hundred), made up of 500 representatives. It was the first bicameral legislature in French history and did much to calm the tensions that had arisen while Robespierre was in power.

The Directory restored a semblance of law and order and also allowed many émigrés to return. They were able to successfully combat military threats from the Austrians and the Prussians and also internal revolts in the Vendée region in coastal west-central France. When the British attacked Toulon in the south of France, an artillery commander, Napoleon Bonaparte, was able to encourage the French soldiers to eject the invaders. Bonaparte then was involved in the invasion of northern Italy and buoyed with his success there, where he defeated the Austrians and their allies, he went on his expedition to Egypt.

Although his forces on land managed to defeat the Turks and the Mamluks, the British under Horatio Nelson destroyed his fleet at Aboukir Bay. Soon afterward Napoleon left to return to France, where he became part of a plot to overthrow the Directory that took place on November 9, 1799 (18th Brumaire of the Year VIII), when he staged his coup of 18 Brumaire, seizing power and establishing the consulate, rule by three people, which eventually saw him becoming consul for life and, in 1804, emperor.

JUSTIN CORFIELD

Fukuzawa Yukichi

(1835–1901) *Meiji Restoration educator*

As an author and educator, Fukuzawa Yukichi was probably one of the most important nongovernment Japanese figures from the MEIJI RESTORATION, which followed the overthrow of the TOKUGAWA SHOGUNATE in 1868. Fukuzawa wanted Japan to embrace many Western ideas in order to make the country stronger and wrote more than 100 books explaining his ideas.

Fukuzawa was born on January 10, 1835, at Buzen, Japan, the younger son of a lower samurai. His father’s family had been recently impoverished, but he was able to go to school in Nagasaki, where he studied Western ideas called *rangaku* (“Dutch learning”). Although the ideas were no longer solely Dutch, the concept had arisen because the Dutch had, for many years, been the only Europeans who were able to visit Japan. As a result of this, Fukuzawa went on some of the first Japanese missions to the West, which took place in 1860 and in 1862. The initial idea had been that the shogun should send envoys overseas, and Fukuzawa offered his services to Admiral Kimura Yoshitake.

The 1860 mission was the first Japanese delegation to the United States, and it set sail for San Francisco. On arrival, Fukuzawa bought a copy of *Webster’s Dictionary*, which was to form the basis of his study of English. It helped him produce a Japanese-English dictionary, his first book. Japan’s 1862 mission went to Europe, and by this time Fukuzawa was the interpreter, accompanying the delegation to Britain, France, the Netherlands, and Prussia. On his return his book *Seiyo jijo* (Conditions in the West) was published and became an instant best seller because of its simple but detailed explanations of the political situation in Europe and the United States. He would visit the United States again in 1867, going to Washington, D.C., and New York. In Japan, Fukuzawa started writing prolifically, public speaking, and entering debating competitions. His championing of many Western ideas led to some hatred from conservatives, and there were a few attempts on his life.

Fukuzawa wrote more than 100 books. Seventeen of them form the *Gakumon no Susume* (An

encouragement of learning), which was published between 1872 and 1876. His most famous work was *Bunmeiron no Gairyaku* (An outline of the theory of civilization), which was published in 1875. In this book he argued that “civilization is relative to time and circumstance.”

As a result, a comparison of civilizations over a long time period was not as important as a comparative study of them at a particular snapshot in time. He was a strong supporter of parliamentary government, access to education for everyone, women’s rights, and other causes championed in the West. These ideas were regularly expressed in *Meiroke Zasshi* (Meiji six magazine), which Fukuzawa helped to publish. With the Meiji Restoration, he founded Keio Gijuku, which became Keio University in 1890.

In 1882 Fukuzawa founded a newspaper called *Jiji shimpo* (Current events). It became one of Japan’s most important political newspapers and was read by many liberal politicians, quite a number of whom also contributed articles. These included men like Ito Hirobumi, Inoue Kaoru, and Okuma Shigenobu. During the 1890s, Fukuzawa wrote his autobiography, which was published in English in 1934. In it he spoke of his great support for the Meiji government abolishing feudal privileges and also saw Japan’s victory in the SINO-JAPANESE WAR of 1894–95, which gave Japan the status of a great power, as one of his happiest moments.

However, this did lead to criticism of him as an imperialist and a supporter of Japanese expansionism. In reality, Fukuzawa’s support for the war was because he deplored the living conditions in China at the time, with

foot-binding, cruel punishments, and some areas suffering from famine. He felt that Japanese knowledge could contribute to improving the lot of the poor in China and would also serve as a counterweight to the Western imperial powers that had established treaty ports throughout China. He was also critical of the unequal treaties forced on China by the colonial powers and thought that Japan, embracing modernity, would be able to prevent this system from spreading. Furthermore, he genuinely believed that the progressive Japanese would be able to improve the living conditions of the peasants in Korea. Much of his interest in Korea came from a period when he invited some young Korean noblemen to Japan, and they misbehaved dreadfully, even trying to steal the school safe. With these men as the potential future leaders of the country, he despaired of what might happen if the Japanese were not able to exert themselves as a modernizing influence.

Fukuzawa died on February 3, 1901, in Tokyo. His house in Nakatsu remains a major tourist attraction in that city and is a nationally designated cultural asset. A statue of him stands in the grounds of Keio University, and an engraving of him by Edoardo Chiossone appears on the 10,000 yen banknote.

JUSTIN CORFIELD

Garibaldi, Giuseppe (1807–1882) *unifier of Italy*

Giuseppe Garibaldi, known as the Liberator in Italy, was born in Nice, the port of Piedmont-Sardinia. By 1824 he was a sailor and was committed to the unification of Italy. In 1834, after acquiring a license as a merchant captain, he took part in an abortive republican rising in Genoa. Sentenced to death, he fled to South America, where he married his first wife, Anita, who was to fight beside him in all of his battles.

Between 1836 and 1848 he was active as a soldier and a naval captain in the area around São Paulo in its ultimately futile attempt to break away from Brazil. Transferring his services at Orientale Province, he supported the province's attempt to establish its independence by forming the Italian Legion and being placed in charge of the defense of Montevideo and the small Orientale (Uruguayan) fleet. His victories at Cerro and Sant' Antonio helped to establish Uruguayan independence.

In 1848 he returned to Italy and volunteered to fight for Italian unification. Afterward he aided in military efforts to fight off French attacks on the Roman republic and defeat the forces of the Bourbon rulers of Naples. In the summer of 1849, when the Roman republic fell to overwhelming French forces, he disbanded his troops in San Marino. After being pursued by Austrian armies, he departed for America. His wife died during the retreat.

Garibaldi returned to Italy in 1854 and in 1859 took part in battles against Austrian forces, enjoying many

victories. The great moment of his life occurred in 1860. Landing with 1,000 volunteers in May with his "Red Shirts" in Sicily, he defeated the Neapolitan army and drove it out of Sicily. By September and October, he had defeated the Neapolitan army on the mainland at the Battles of Reggio and the Voltorno. He also arrived in Naples, and, by November, all of Naples and Sicily were in his hands. He then, although republican in sympathy, gave basically the whole of southern Italy to the Piedmontese monarchy.

After unsuccessful attempts to unite Rome with the new Italian state, he returned to battle in 1866, when he led a voluntary army against Austria. He defeated the Austrians at Monte Saello, Darso, Condino, and Bezzeca in July 1866. The war ended with Venetia being united with Italy. In the 1860s, he volunteered for the French army in the FRANCO-PRUSSIAN WAR after France declared itself a republic. He secured victories at Châtillon, Autun, and Dijon. Rome was occupied during the war as French troops withdrew.

Garibaldi served in the French assembly for four years and then returned to Italy, where he was sporadically active in politics. For most of the decade, however, he was in retirement on the island of Caprera north of Sardinia. A skilled seaman and soldier, he was moderate enough to avoid the temptation of power. Garibaldi could have gained power in Naples and Sicily, but, guided by his vision of a united Italy, he shelved his republican convictions so as to form the second vision. His role in the founding of Uruguay

Known in Italy as the Liberator, Giuseppe Garibaldi was instrumental in the creation of two independent nations.

and Italy puts him in rare company as a father of two nations.

NORMAN C. ROTHMAN

gauchos

This was the name given to the horsemen who worked on the Argentine and Uruguayan pampas from the middle of the 18th century until the late 19th century, having a similar image in Latin America as the cowboys have in North America. The term is sometimes also applied to horsemen in Chilean Patagonia, in southern Paraguay, and in Brazil, where the Portuguese term *gaúcho* is used.

There are many theories about the origin of the word *gaucho*. It was first used around the time of the independence of Argentina in 1816, and some claim it is a corruption of the term *quechua*, or *huachu*, meaning “orphan” or “vagabond”. Others say it derives from the Arabic word *chaucho*, which is a Middle Eastern term for a type of whip used in herding animals.

The Spanish introduced cattle into Argentina in 1531 when they established the first settlement at Buenos Aires. Five years later Indians destroyed the fort, and it was not until 1580 that the Spanish reestablished a presence at Buenos Aires. By that time, cattle that had escaped nearly 50 years earlier had bred and started to form large herds in the pampas. Horsemen rounded up the cattle, and by the early 18th century an important beef and leather industry was flourishing. The ability to salt beef and, by the mid-19th century, to refrigerate it ensured that the Argentine and Uruguayan economy would be dominated by the beef industry.

The men who rounded up the cattle and wild horses were well known for their skills of horsemanship and their ability to live in the pampas and in Patagonia, in southern Argentina, and Chile. They gained a reputation for being fearless and tough, but also for maintaining feuds and being cruel in fighting. Unlike the North American cowboy who tended to be of Spanish or British stock, the gauchos came from a variety of backgrounds. Some were of Spanish descent, but most were mestizos (of mixed European and Indian descent). There were also numbers of black—descendants of African slaves brought to the Americas—and mulattos (of mixed black and European ancestry).

As with the North American cowboys, gauchos rode and fought prodigiously. They used the lasso, the curved knife, and also the *boledoras* (or *bolos*). This last weapon was a leather cord that had three iron or stone balls sewn into it. It was thrown at the legs of an animal and, entwining itself quickly, would bring the creature to the ground. Gauchos also had a characteristic dress—with a broad sombrero, a shirt, wide trousers known as *bombachas*, tied at the ankles, and tight-

fitting leather boots. In cold weather they would wear a woolen poncho that was either a quiet sandy color or very brightly colored wool. During the 1850s, many gauchos in Entre Ríos wore red to show their support for their local leader, Urquiza. On his saddle a gaucho would often carry a rolled blanket.

When not riding with the cattle, gauchos lived in small mud huts, where families slept on piles of hides. Most were nominally Roman Catholic, although their religious beliefs tended to include local superstitions. As with their North American counterparts, they would spend much of their spare time drinking, gambling, playing the guitar (or later the accordion), and singing about their exploits or those of other gauchos. They generally ate beef and drank yerba maté, a local herbal drink consumed communally.

During the 1820s much of the land of Argentina was taken over by a small number of pastoralists and speculators who formed massive estancias. This resulted in the gauchos becoming employees of these cattle barons, to whom they were unswervingly loyal. A few of these men became CAUDILLOS or warlords controlling provinces and influencing national politics in both Uruguay and Argentina. During the fighting between the Unitarists (based in Buenos Aires and believing in a strongly centralized government) and the Federalists (who wanted regional autonomy), the gauchos supported the latter. Led by men like Urquiza, they earned a reputation for being fearless in battle and utterly ruthless to their opponents, especially after the massacres that followed the capture of Quinteros in 1858.

Gradually, the regional leaders began to lose their influence, and the murder of Urquiza in 1870 marked the end of the political influence of the gauchos. The importance of the railways that began to cover much of northern and central Argentina also helped erode their economic power. Some were able to continue as farmhands, while others moved to the cities. In Uruguay, the role of the gaucho in politics had ended five years earlier than in Argentina with the end of the cycle of wars for control of the country. However, they remained an important part of Uruguayan life into the 20th century. In both Chilean and Argentine Patagonia, gauchos remained until the early 20th century, but never as the political or military force they had been farther north.

Many people had a long-time fascination with gauchos, and Domingo Faustino Sarmiento, in *Facundo* (1845), subtitled *Life in the Argentine Republic in the Days of the Tyrants; or, Civilization and Barbarism*, wrote one of the few detailed accounts about gauchos

when they were at the height of their political power. As with the North American cowboys, it was just as the gauchos began to lose their importance that books on them started to be published. *La literatura gauchesca* became popular with Estanislao del Campo's epic *Fausto* (1866) and José Hernández's epic poem *El gaucho Martín Fierro* (1872). Some gaucho ballads and folk stories were also recorded and published, and in Uruguay books by Javier de Viana and Carlos Reyes became popular. One of the most famous novels was Ricardo Güiraldes' *Don Segundo Sombra* (1926).

There are still many traces of gauchos in Argentina, Uruguay, and Chilean Patagonia, and gaucho-style leatherwork can be seen in all three countries, as well as in southern Paraguay and parts of Brazil. In Calle Florida in Buenos Aires, expensive restaurants specializing in beef have people dressed as traditional gauchos, and the Museo del Gaucho y de la Moneda (Museum of Gauchos and Money) in Montevideo is popular with many tourists. There are also some estancias in Argentina and Uruguay that allow tourists to experience a small part of the gaucho life and culture.

JUSTIN CORFIELD

German unification, wars of

The period between 1864 and 1871 saw three wars that resulted in the unification of Germany. In essence, this period saw the formation of a German state under the influence of Prussia, guided by its chief minister, OTTO VON BISMARCK. Prussia had put itself in a good position to lead Germany. The GERMAN ZOLLVEREIN, or Customs Union, that broke down physical and financial barriers had been formed in 1819. By 1842, under Prussian leadership, it included most of central and northern Germany. Its rival, Austria, was kept out on the grounds that the bulk of its empire was non-German and outside the traditional borders of The Holy Roman Empire and its successor, the German Confederation. In addition, Prussia had gained millions of new German subjects by

the Congress of Vienna in return for giving up some of its Polish subjects; it received much of Saxony, much of the Rhineland and Westphalia, and dominated northern and western Germany. It had the effect of turning Prussia into a German state. In Bismarck, appointed in 1862, it had a practitioner of power politics who could gauge the attitude of his opponents and take advantage of opportunities.

It was unlucky that neither of Germany's neighbors, France nor Russia, would welcome a united Germany and might combine to stop it. Bismarck secured the acquiescence of Russia by providing assistance to Russia when it put down Polish disturbances in 1863. Moreover, he promised Russia that he would aid them in future Polish-related problems, thereby gaining a secure eastern front and the avoidance of a two-front conflict. Bismarck had as his goal the expansion of Prussia. If this resulted in the unification of Germany, it would be a positive by-product. The two obstacles were Austria and France. Although polyglot in composition, Austria's ruling dynasty had held the position of emperor of the Holy Roman Empire, the precursor of the German Confederation between 1438 and 1806. France had benefited from the disunity of Germany for over three centuries.

THE FIRST WAR

The first of the three wars was over the provinces of Schleswig and Holstein. The provinces that were either German in composition, as in the case of the Holstein, or partly German, as in the case of Schleswig, were united to Denmark by family inheritance through the house of Oldenburg. With the impending end of the direct male line of the crown of Denmark, the German Confederation claimed the two duchies. Denmark promised to respect the political independence of the two duchies. This agreement was violated in November 1863, when the new king, Christian IX, accepted a constitution that included the incorporation of the northern mixed population duchy of Schleswig into Denmark proper. When Denmark refused to cancel this act, Austria and Prussia as representatives of the Confederation, declared war.

The Austrians, geographically separated from Schleswig-Holstein, would have been content to allow the duchies to remain tied to the crown of Denmark by a personal union. Bismarck, however, was determined to add the duchies by one means or another. Denmark, certain that the powers would aid her, refused. War resulted. The Jutland Peninsula was occupied between January and April 1864. After an attempt at media-

tion by the Great Powers between April and June 1864 failed, hostilities were renewed. Bismarck made some vague hints to NAPOLEON III of compensation, perhaps in Belgium or Luxembourg, to secure French neutrality. Britain, under a liberal Whig administration, was sympathetic to German nationalist feeling, and Russia's neutrality had already been secured. Therefore, hostilities were renewed, and by fall much of the Jutland Peninsula had been occupied and the major Danish island of Funen had been threatened. Denmark's position was such that it was forced to sign the Treaty of Gastein. As a result, Austria administered Holstein, and Prussia controlled Schleswig on behalf of the German Confederation.

WAR BETWEEN GERMANY AND AUSTRIA

It was nearly inevitable that conflict would then occur between Austria and Prussia. Austria had nothing to gain by keeping Holstein separated from Austria by central and northern Germany, while Prussia could annex Schleswig-Holstein to connect Prussian Brandenburg with its Rhenish possession. When Austria proposed that the provinces be returned to the legitimate heir of the senior cadet line of the house of Denmark, Bismarck said this was a violation of the Treaty of Gastein and sent troops into Holstein. Austria, supported by the majority of members of the German Confederation, declared war on June 1, 1866.

The Austrians at the time were distracted by a domestic crisis with the Hungarians and started the war at a disadvantage. Bismarck had concluded a treaty with Italy on April 8, 1866, in which Italy agreed to participate on the side of Prussia should war occur within three months. In return, Italy was to receive Austria-administered Venetia. Once again, Bismarck secured the neutrality of France through vague promises of compensation after the wary Napoleon III indicated that he would like to annex Rhenish Hesse, the fortress of Mainz, Luxembourg, the Saar, and parts of Belgium. Bismarck rejected those demands and saved them for future reference in case of need of French assistance or neutrality. The Austro-Prussian War is often called the Seven Weeks' War because of its duration. Prussia had superiority in spite of its inferiority of population.

Since 1862 the Prussians had been updating their military. They had developed military training and tactics involving quick flanking pincer movements. As a result, in spite of opposition from German states such as Hanover, Bavaria, Baden, Hesse, Wurttemberg, Saxony, and others, the Prussian armies advanced very

quickly. They defeated the Hanover army at Langensalza on June 29 and occupied Nuremberg and northern Bavaria by July 1.

In the meantime, Prussian armies occupied Hesse-Cassel, Nassau, and Frankfurt. The decisive action came in July. Since Austria had sent some of its army to meet the Italians, whom they defeated at the Battle of Custozza on June 24, and some troops remained in Hungary, a way was opened for a Prussian thrust to the capital of Vienna. Therefore, in von Moltke's plan, three Prussian armies advanced from Saxony and Silesia into Bohemia. The Austrian commander general von Benedek took up a position at Koniggratz (known as Sadowa in Czech), where on July 3 he was attacked by the united first and second Prussian armies. They were joined by the Prussian third army under the crown prince, which turned the tide of battle. This intervention ended with an Austrian rout and an opening to Vienna. The war ended, although the peace agreement at Nikolsburg was not signed until July 26.

AFTER THE SEVEN WEEKS' WAR

The consequences of the Austrian defeat were greater for the German Confederation than for Austria. Austria had to pay a war indemnity, cede Venetia to Italy and Holstein to Prussia. Henceforth, Austria was to be excluded from German affairs. The German Confederation paid a heavier price. Hanover, Hesse-Cassel, Nassau, and Frankfurt were directly annexed to Prussia. This had the effect of connecting all of Prussia's possessions in northern and western Germany. Prussia now composed more than half of Germany.

There were other consequences of the Seven Weeks' War in terms of German unification. The old German Confederation was replaced by the North German Confederation of all German territory north of the Main. The four states south of the Main (Baden, Bavaria, grand ducal Hesse, and Wurttemberg) could form a South German Confederation. They had sided against Prussia, but escaped punishment except for a reduced war indemnity and an offensive and defensive alliance with Prussia. The southern states consented to Prussian troops being introduced into the military fortifications after Bismarck revealed Napoleonic demands.

The North German Confederation included the kingdom of Saxony, the former Hanseatic cities of Bremen, Lübeck, and Hamburg, the grand duchy of Brunswick, Mecklenberg, Oldenburg, and 13 other duchies and principalities. The North German

Confederation was arranged so that Prussia dominated. To further emphasize this, the presidency of the confederation was given to the king of Prussia, and the direction of the affairs of the confederation was placed in the hands of a chancellor, in this case, Bismarck. The authority of the confederation extended to foreign policy, the army, and economic affairs. The constitution of the confederation established a unified commonwealth in criminal justice, economic, and judicial affairs.

The laws of the North German Reich were to have precedence over the laws of the states. The states could maintain their own administrative system, educational affairs, and church affairs. Although the upper house, or Reichstag, gave each state one vote, the lower house, the Bundesrat, based on universal male franchise, was controlled by Prussia, with its greater population. Also, the Bundesrat had the right with the approval of the president (king of Prussia) to dissolve the Reichstag. He semi-coerced the South German states into closer association by saying that a new customs union that would replace the Zollverein had to be operated through a customs-parliament that met in Berlin. Not wishing to forfeit the large market, the South German states entered into the new custom-parliament that had equal representation from the South German states and the North German Confederation.

The South German confederation that might have served as a partial obstacle to further unification never materialized, as Baden and Wurttemberg were not willing to put themselves under Bavarian leadership. Much of the reason for this was a perceived loss of power against Bavaria, which had over half of the population of the South German states. The next few years, from 1867 to 1870, Bismarck used to firm up support both within and without.

PRELUDE TO WAR WITH FRANCE

French demands for parts of southern Germany and also Luxembourg had been put in writing. This, when disseminated, stirred up nationalism throughout Germany, including in the South German states. The French demands upon Belgium alienated the British, who considered themselves the protector of Belgium. Austria was alienated from France when Bismarck leaked the negotiations with France prior to the Austro-Prussian War. Italy would not support France as long as French troops remained in Rome. Russia was already bound to Prussia by the 1863 agreement. The immediate cause of the third war that led to German reunification was the

succession to the throne of Spain after a revolution had ejected its previous occupant. The Spaniards asked a member of the Catholic branch of the HOHENZOLLERN (the Prussian royal family) to accept the appointment of a constitutional king of Spain. This proposal caused great indignation in France, which threatened war if a Hohenzollern accepted the throne. The French felt that Hohenzollern princes in Spain and Germany would put them in a vise.

After some weeks of hesitation, the Hohenzollern prince Leopold withdrew his candidacy. It appeared that after several years of diplomatic setbacks, the French had gained a victory. However, a feeling developed that the renunciation was not enough. They sent their ambassador to Prussia to the town of Ems, where the Prussian king William I was taking the waters. The ambassador asked William to guarantee that he would never again permit the Hohenzollern to seek the throne. The king refused to undertake such a task. He then sent a telegram to Bismarck describing the incident. This famous Ems Telegram was edited and abbreviated by Bismarck so that it appeared that the French ambassador had been brusque to the point of insult to the Prussian king, while the Prussian king had been equally short to the point of offense to the French ambassador. The message was then published in an abbreviated form. Public opinion in both countries was incensed. The French declared war on July 15, 1870.

THE THIRD WAR

Although the Prussians and the French appeared equal, Prussia had certain advantages. First, the French military was still somewhat demoralized from its ill-starred adventure in Mexico between 1863 and 1867. Second, parts of the French army were tied down in parts of Indochina and Algeria, where they were busily establishing the French overseas empire. Finally, the Prussians ultimately had an advantage in manpower. The South German states had to recognize the stipulations of their offensive and defensive alliances with Prussia that put their forces under Prussian command in the event of war. The Prussians could also count on the manpower of the North German Confederation in addition to their own. Altogether, there was an army of a unified Germany of 1.2 million as opposed to a French army of 500,000, some of whom were overseas.

The Prussians immediately acted upon prearranged battle plans. Three armies were immediately formed for the purpose of invading French territories from three separate directions. General Steinmetz advanced from

the Moselle, Prince Frederick Charles from the Palatinate to Metz, and the crown prince from the upper Rhine to Strasbourg. The war was fought in two phases; July–September and September–February. At first, events went well for the French. They advanced into the Saar district in late July 1870 and won a small victory. So confident were they of victory that they drew up plans for a partition of Prussia and a redistribution of the coal-rich Saar district.

They would soon be disillusioned as Prussia/Germany scored a number of victories in August. On August 4 and August 6 the crown prince won victories over Marshal MacMahon at the Battles of Wissemburg and Worth and forced him to evacuate Alsace. Strasbourg, the capital of Alsace, fell by the end of the month. The Germans also advanced into Lorraine and approached its capital of Nancy. Two other German armies surrounded the troops of Marshal Bazaine at the key city of Metz and at bloody battles at Vionville and Gravelotte on August 16 and August 18 repulsed the attempts of the French to break out of the ring. When Marshal MacMahon attempted to get around the German north flank to relieve Bazaine at Metz, he discovered the road was already closed. When he attempted to break through against superior numbers of troops, he was decisively defeated at Sedan on September 1 and surrendered together with his army and the emperor on September 2. The war continued for another five months, but the French Empire fell. The French request for an armistice was not accepted, due to their unwillingness to surrender Strasbourg, Metz, Toul, and Verdun. The main German army then advanced against Paris, and the main fortresses of Metz and Verdun fell in September and Strasbourg in October. The last frontier fortress, Belfort, fell in mid-February 1871.

In the meantime, Paris was besieged between late September and late January 1871, and most of northern France was the scene of battles. The attempt by French troops from the north and the Loire Valley to relieve Paris failed, and ultimately it too fell on January 28, 1871. The last remaining efficient army of the French was pushed into Switzerland, where it was interned early in February 1871.

A preliminary peace was signed on February 26. The official treaty that ended the war was the Treaty of Frankfurt, on May 10, 1871. In its provisions, Alsace, northern Lorraine, and the city of Metz were ceded to Germany. (After the final formation of the German Empire, Alsace-Lorraine became a common province of the empire.) Moreover, France had to pay 5 mil-

lion francs in war indemnity. German troops occupied central and southern Lorraine until the indemnity was paid (in 1875). German troops occupied Paris until the Treaty of Frankfurt was approved by the national assembly in May 1871.

END RESULTS

The most important result of the FRANCO-PRUSSIAN WAR was the unification of Germany. The feeling of nationalism that swept Germany in the wake of the war led the South German states into negotiations. After some special concessions, especially by Bavaria, which retained the right to control its own army in times of peace, the South German states entered the confederation. After further maneuvers by Bismarck, the question of a new German Empire led by the king of Prussia, first by the king of Bavaria and then by a delegation from the North German Confederation, was presented. Upon acceptance on January 18, 1871, the king of Prussia became German emperor. This last title took the place of emperor of Germany in deference to German dynasties that did not wish to be officially subordinated to the Hohenzollerns.

The constitution that covered the old North German Confederation plus the South German states plus Alsace-Lorraine was adopted on April 14, 1871. The form of government adopted by this new state closely reflected the government of the North German Confederation, with special concessions to the South German states, such as control of posts and telegraphs and the right to post taxes on beer and brandy. The new state automatically became the strongest state in Europe due to its army and its manufacturing base.

German Zollverein

The establishment of the Deutscher Zollverein (German Customs Union) was an important step toward the goals of industrializing and unifying Germany. The German states, numbering more than 300 principalities, were bound together in the loosely federated Holy Roman Empire. After the 1815 CONGRESS OF VIENNA, the Federated League of States, consisting of 39 states with different systems, made German unification difficult. The eventual rise of Pan-Germanism, along with the Zollverein, facilitated progress toward unity.

Even Prussia, Germany's most powerful state, had 67 tariff systems. In all of Germany, there were three currency systems. There were many border checkpoints, numerous units of measurement, and different customs laws. The pioneering idea of economic unification came from Prussia, which did away with internal tariffs and established free trade throughout its scattered territories in 1818. The internal customs boundaries of different Prussian provinces became a thing of the past, with one uniform tariff against non-Prussian countries.

Prussian efforts at economic integration were such a success that they were replicated by other German states. Moreover, the Customs Union of Prussia could protect local industries against a flood of imported British goods. The two main Prussian export items, corn and linen, had been affected by British policy, and the 1818 union made these easier to sell. Anhalt, Schwarzburg-Sondershausen, and Hessen-Darmstadt joined the Prussian Union in 1828.

Two other units joined up independently of the Prussian Union, as they did not want to be under Prussian authority. Saxony, the Thuringian statelets, Hessen-Kassel, Nassau, Frankfurt, Hannover, Braunschweig, and Oldenburg established the Central German Customs Union in 1828, and after five years in the south, the Bavarian-Wuerttembergian Customs Union was founded. All three unions integrated themselves into a Zollverein in 1834 to reap the obvious economic benefits. The custom barriers were no longer in place, and a uniform tariff was applied to states outside the Zollverein. Goods coming from outside were taxed on a joint account of the member states and the proceeds were divided. The introduction of a uniform currency, the Vereinsthaler, standardized the different currencies.

The Zollverein consisted of 17 states and represented a population of about 26 million people. Its considerable size resulted in the growth of industries

with the application of a free-trade policy. The Customs Union also witnessed the lessening of Austrian influence and the gradual dominance of Prussia, facilitating the task of unification afterward. Economic leadership of Prussia would soon challenge Austria's presidency in the German Confederation. Austria, along with the two Mecklenburgs and Hanseatic towns, had remained outside the Zollverein, but Baden and Nassau joined in 1836. After six years, Braunschweig and Luxemburg also became members of the Customs Union. In 1835 the German railroads opened in Bavaria, and economist Georg Friedrich List planned railways across the whole of Germany. He had rejected the idea of diplomatic missions or bilateral treaties with European countries. Prussia signed commercial treaties with Britain, France, and Belgium, making the Zollverein even more powerful.

The railroads connecting Cologne in Prussia with Antwerp in Belgium were completed in 1843, and the next year the two states signed a trade agreement. By 1848–49 there were 3,000 miles of railway lines in Prussia. In 1851 Hanover and Oldenburg joined the Customs Union. The Deutscher Handlestag (the national chamber of commerce) was established in 1861 at the request of German economists, who were clamoring for greater economic unification. The Zollverein was dissolved as the southern German states supported Austria in the Austro-Prussian War of 1866.

The next year it was established again with no individual state having veto power. The constitution of the renewed Zollverein established the Zollbundesrat (the Federal Council of Customs) consisting of emissaries of individual rulers and an elected Zollparlament (Customs Parliament). Prussian dominance was significant, and other German states wanted to join. Schleswig-Holstein, Kausenburg, and Mecklenburg became members in 1868. The regulations of Zollverein became part of the laws of the newly created German nation. Alsace-Lorraine, taken from France after the victory in 1870s FRANCO-PRUSSIAN WAR, joined the Customs Union in 1872. The Hanseatic cities followed suit in 1888.

The dominance of Prussia made German unification inevitable. Liberating the German states from the oppressive burden of numerous tariffs and taxes, the Zollverein paved the way for economic transformation of the German Empire.

PATIT PABAN MISHRA

Gilded Age

Named after an 1873 novel by Mark Twain and Charles Dudley Warner, this era of growth and excess following the AMERICAN CIVIL WAR would more than live up to the authors' sarcasm. As American industry and agriculture began to outpace European competition, some entrepreneurs and corporate leaders became very wealthy, while the gap between rich and poor widened dramatically. Lavish public displays of self-indulgence by a small but growing number of newly rich Americans provided the "gilding" for this time of great social and political conflict.

THE "GILDED" ECONOMY

Although the late 19th century was a time of simmering worldwide economic distress that regularly erupted into panics and recessions, the United States, having overcome the single greatest challenge to its potential power, grew enormously during the years after the Civil War. The seeds were planted during the war when Union president ABRAHAM LINCOLN and Congress encouraged western agriculture, set in motion the long-anticipated transcontinental railroad project, and awarded lucrative contracts to suppliers of war materials.

Historians call the post-Civil War era an age of "incorporation." Previously, the industrial economy had been localized, mostly hiring nearby workers and serving local or regional customers. Now, new kinds of businesses and businessmen were creating national combinations of financial and industrial power. The corporation was a business model designed to be a faceless entity within which individual capitalists could make products and accrue wealth without fear of personal liability. The corporate structure was the engine that propelled the enormous growth of railroads, steel, meat-packing, and petroleum.

Few of these new industrialists were "faceless" for very long. Economic uncertainty made it possible for the bravest (or most ruthless) entrepreneurs to impose order on important industries by squeezing out smaller players and creating huge new combines, or trusts.

Especially in California, railroad barons, including Leland Stanford and Collis P. Huntington, used cut-throat tactics to dominate the most favorable routes, raising shipping rates once they had achieved control. In the 1870s midwesterner John D. Rockefeller created Standard Oil, gaining 90 percent control of the oil business and making a fortune even before the rise of the automobile. Scots-born Andrew Carnegie had successful careers in telegraphy and railroads before turning Pittsburgh into the world's steel capital and becoming one of the world's richest men.

Carnegie gave away all his millions before he died in 1919, and Rockefeller was also an important benefactor. But many of the new capitalist class were less modest. As the railroad Vanderbilts and others built luxurious summer homes in Newport, Rhode Island, and Carnegie's chief lieutenant, Henry Frick, built virtual palaces in Pittsburgh and (later) on New York's Fifth Avenue, the gilded gap between rich and poor became more obvious. The new industrialists' gaudy parties and spending sprees were covered in breathless detail by American newspapers.

Meanwhile, the urban middle class was growing. Industrialists created large organizations staffed by middle managers and served by engineers, lawyers, accountants, and other rising professionals. But for industrial laborers, whether skilled or unskilled, prospects were bleaker.

GILDED AGE POLITICS

Historians still disagree whether the business leaders of the Gilded Age were rapacious robber barons or admirable captains of industry. In either case, those building mighty industries took full advantage of the political and social attitudes of their era to amass enormous fortunes and wield great power.

In a time of weak federal power, with Congress closely divided between Republicans and Democrats (although Republicans dominated the presidency), there were few legal barriers to the creation of great wealth by any means necessary. Railroad interests (already owing much of their success to huge federal land grants and other valuable concessions) were particularly known for making deals, legal and illegal, with federal, state, and local officials. There was no corporate income tax, no meaningful regulation of stock transactions, and no barriers to monopolistic vertical trusts. Someone like Rockefeller could control every aspect of his business, from owning oil-rich properties to pumping oil out of the ground to selling Standard Oil's distinctive red cans to retail customers. Not until 1890 did Congress pass

the Sherman Antitrust Act, a weak but groundbreaking attempt to make the most blatantly brazen business practices punishable by fines and prison terms.

The era's general lack of regulation was part of the larger ideology of *laissez-faire*, the idea that only an economic system free from governmental interference could build wealth, social order, and national success. Dating back to the 18th-century writings of British economist ADAM SMITH, *laissez-faire* in the Gilded Age found a strong philosophical ally in the new creed of SOCIAL DARWINISM.

Social Darwinism arose in Britain, where writer Herbert Spencer, among others, developed a sociological theory based on CHARLES DARWIN's pathbreaking 1859 theory of evolution. Darwin's was a biological study of the origins, development, distribution, and extinction of living organisms over many millions of years. Social Darwinism, led in the United States by William Graham Sumner, a Yale University professor, applied Darwin's discoveries and theories to the existing social and economic order.

Sumner and others discovered that Darwin's laws exactly validated what was happening in industrial societies like those of the United States and Britain. Inequality was a law of nature. Those who succeeded were nature's fittest; those who failed or fell behind proved that only the strongest could or should survive. Helping the poor was a fool's game. "While the law may be sometimes hard for the individual, it is best for the race," said Carnegie. "Nature's cure for most social and political diseases is better than man's," declared the president of Columbia University. Survival of the fittest, wrote Rockefeller, is "a law of nature and a law of God."

Social Darwinism and *laissez faire* worked in tandem to diminish worker power and autonomy. A laborer, the era's ideology maintained, was free to sell his (or her) services to the highest bidder, but not free to join with other workers to demand from employers or government protection and improvement of their conditions. By the 1880s the U.S. Supreme Court, in the name of economic liberty of contract, was regularly striking down efforts to raise wages, limit work hours, abolish sweatshops, and form unions.

GILDED AGE OPPONENTS

People who worked for or depended on the new industrial system did not meekly resign themselves to the insecurity and cruelty of industrial labor. The era was beset by strikes, riots, and political radicalization among workers even before unprecedented tides of new

immigrants began arriving in the 1880s. Farmers and laborers in the predominantly agricultural West and South agitated against exploitative railroads and condemned currency and trade policies that kept them in debt.

The Gilded Age's first major upheaval was the Great Railroad Strike that erupted in 1877, the fourth year of a major recession. Starting that July in Baltimore, where the Baltimore and Ohio Rail Company had imposed a 10 percent pay cut on workers, the strike spread to rail yards across the nation. It was the first coast-to-coast strike in U.S. history. At first, the strikers were hailed by other workers and local people also fed up with railroad practices. But President Rutherford B. Hayes, provoked by some acts of worker violence, soon called out federal troops to protect railroad property. A hundred people, mostly strikers, died. Government intervention against workers on behalf of corporations became a hallmark of Gilded Age labor relations.

An 1886 strike against Chicago's McCormick Reaper Company also resulted in bloodshed and fears of mounting social disorder blamed on anarchist ideas percolating out of Europe. At Haymarket Square, where workers were protesting police violence that had killed four McCormick strikers, a bomb exploded, killing a policeman. Police raided radical and labor organizations and arrested eight anarchists. On little evidence, all eight, including six German and one English immigrant, were convicted of the bombing, and four were hanged. Five months later in New York, the STATUE OF LIBERTY, France's salute to the promise of American freedom, was ceremoniously unveiled.

The upsurge in union militancy was accompanied by a rising tide of local and national political organizing. The relatively egalitarian Knights of Labor played major roles in the railroad and McCormick strikes, but lost ground to the better organized American Federation of Labor (AFL), founded in 1886 and focused on achieving the eight-hour day. Traditional farmer organizations, like the Grange, became more outspoken. In the 1880s the Greenback-Labor Party twice fielded presidential candidates in an effort to change monetary policies unfavorable to farmers. It was a precursor to populism's Peoples Party a few years later.

GILDED AGE CRITICS

Even people like William Graham Sumner, America's apostle of Social Darwinism, knew that much was amiss in his society. Although opposed to government meddling, Sumner was a moralist who distinguished between honest and productive capitalists, who used

their power for greater good, and plutocrats who corruptly worked the political system to steal special privileges for themselves. Other critics of his era were ready to go much farther. These included social observers with alternate political agendas, critics who zeroed in on specific examples of corruption and injustice, and a host of utopian writers, many of whom imagined perfected societies in which people and their marvelous machines always behaved properly.

Henry George was a California newspaper editor who lost his labor-union-backed bid to become New York City's mayor in 1886. In a best-selling book, *Progress and Poverty*, first published in 1879, George laid out a plan he called the "single tax." This tax on land, George believed, would assure that all Americans could own some land by preventing the wealthy and powerful from buying up too much property. It was a sort of free-soil promise for urban dwellers that avoided socialistic solutions to the nation's inequities. Single-tax societies sprang up across the nation.

In some big city churches, ministers like Baptist Walter Rauschenbusch worked with labor unions to develop programs to aid the poor and immigrants with better health care, housing, and help for the unemployed. A counterattack on the tenets of Social Darwinism, this Social Gospel movement was a predecessor of Progressivism.

Jacob Riis, a Danish immigrant newspaperman, used photography to reveal problems in Gilded Age society. His New York City photos and commentary collected in the 1890 book *How the Other Half Lives* showed successful middle-class urbanites what was happening to the ignored or abused "other half"—unwashed, untutored, miserable, and much to the consternation of the comfortable middle class, possibly ready to rise up in anger.

The Gilded Age brought forth a torrent of utopian fiction, foreseeing battles between rich and poor ending in social cataclysm or even America's total destruction. The most influential and positive of the utopians was Edward Bellamy, a Massachusetts writer, whose best-selling *Looking Backward: 2000–1887* came out in 1888. Awakening in a perfectly clean, calm, and prosperous Boston, Bellamy's hero learns how America overcame the evils it was experiencing in the 19th century by introducing marvelous new machines and assuring all citizens enough of what they need and work tailored to their abilities. Bellamy Societies sprang up across the country as people argued the merits of his vision.

Although there is some dispute about when the Gilded Age ended, the depression of 1893–97, the emer-

gence of Progressivism, and the onset of World War I all worked to bring this historic era to an end. Some believe that the United States has experienced repetitions of the Gilded Age in the 20th century and will continue to do so in the 21st. But these new gilded ages are unlikely to reveal the same combination of upper-class excess, ferocious industrial growth, government inertia, and worker/farmer anger that produced the era satirized by Mark Twain.

MARSHA E. ACKERMANN

Gladstone, William

(1809–1898) *British prime minister and reformer*

William Ewart Gladstone, one of the dominant prime ministers in British history, was born in Liverpool, England, on December 29, 1809. Although his legacy is as a great Liberal reformer, he began his career as a Tory member of Parliament for Newark in December 1832. The year 1832 was important because it witnessed the passage of the Great Reform Bill of 1832, a first and historic step to enfranchise a larger segment of the British population. Before this, members of Parliament were often chosen by corrupt lords or magnates, which guaranteed the election of members handpicked by the influential local political power. The passage of successive Reform Bills in the 19th century is considered to have been the main reason that Britain missed the tides of revolution that swept through Europe during the same period.

For a man who would be a Liberal standard-bearer, Gladstone's first speeches, which marked him as a great orator, were in favor of slavery, at a time when William Wilberforce was attempting to have the institution banned. While author Philip Magnus says Gladstone was opposed to the actual institution of slavery, he was against the

sudden abolishment of slavery without due planning. Otherwise, in Gladstone's words, emancipation from slavery would be "more fleeting than a shadow and more empty than a name." In spite of Gladstone's perorations, Wilberforce's dream was realized.

Gladstone's evident parliamentary skills brought him to the attention of the Tory Party's prime minister Robert Peel. Two years after his maiden appearance in Parliament, Gladstone joined Peel's government as a junior lord of the treasury and then as an under-secretary at the Colonial Office in 1835, at a time when British relations were becoming tangled over the importation of opium from British India (then governed by the quasi-governmental BRITISH EAST INDIA COMPANY) to the Chinese QING (CHING) DYNASTY.

Peel's overall reputation as a reformer may have played a role in the gradual evolution of Gladstone's political view. When Peel resigned as prime minister in 1835, Gladstone loyally followed him. In 1841, when Melbourne fell from power, Queen VICTORIA asked Peel to form another Tory government. In 1843 Peel rewarded Gladstone's loyalty by appointing him to the prestigious position of president of the board of trade. Gladstone's evolving liberal agenda ultimately cost him the support of his long-time patron, the duke of Newcastle. Still, Gladstone retained his position in Peel's cabinet until Lord John Russell formed a Whig government in July 1847.

Serving under Peel, Gladstone became aware of the problems in Ireland and embarked on the political cause of home rule for Ireland that would dominate the later years of his political life. By the fall of Peel's administration, Gladstone had already become a rising force in the Tory Party. In 1847 he became the member of Parliament for Oxford University, a unique indication of the value of Oxford to the nation. When the Tory George Gordon, Lord Aberdeen, formed a coalition government in 1852, Gladstone became chancellor of the exchequer. Once the CRIMEAN WAR began in 1854, the Aberdeen government was blamed for all the mismanagement that dogged the British army in the long and bloody struggle with Russia, which Britain fought as an ally of the Ottoman Empire.

Aberdeen's government fell in 1857, perhaps the last casualty of the Crimean War. Aberdeen himself would die in 1860. By this time, Gladstone had earned such a name as a competent public servant that Henry Temple, Lord Palmerston, the Whig who had formed the coalition ministry with Aberdeen, offered Gladstone his old position as chancellor of the exchequer in June 1859. Taking office necessitated Gladstone giving up

the conservative Tory Party and joining Palmerston's Liberals, as the Whigs were now being called. Oxford University, as Tory as it had been when it supported King Charles I in the English Civil War, abandoned Gladstone, and he was forced to take a seat as the Liberal member of Parliament for South Lancashire. When Palmerston died in 1865, Lord John Russell became prime minister and requested that Gladstone stay on at the exchequer. Moreover, Gladstone became leader of the Liberals in the House of Commons.

VOICE OF PROGRESSIVISM

On March 12, 1866, Gladstone emerged as the voice of progressivism in the British parliament when he proposed the Second Reform Bill. Although the lack of Conservative support doomed the bill and Russell's ministry, it was clear that the time had come to extend the voting franchise once again. The workers in the factories were demanding more of a say in their government. Meanwhile, Gladstone's premonitions about Ireland were coming true. When Edward Stanley became prime minister in 1866, BENJAMIN DISRAELI, the Conservative leader in the House of Commons, also realized that another reform bill had become a political necessity. Together, in a rare display of partisan unity, the two future political rivals joined forces and mustered enough votes to pass the Second Reform Bill in 1867.

In the same year the Conservatives were defeated in the general elections and Gladstone became prime minister. While the Reform Bill opened the franchise far wider, it nevertheless still left open the voting system for abuse. In 1872 Gladstone passed the Ballot Act to ensure secret, safe, voting.

In 1874 Disraeli became the new prime minister, inaugurating the fascinating political situation where the two most powerful and astute politicians of their day took turns holding the office of prime minister. It was also a time of epochal change for Britain, for from this time on the events of its growing empire took perhaps even greater involvement of its government than the affairs at home which had previously commanded all the talents of Gladstone and Disraeli.

In 1875 the Christian subjects of the Ottoman Empire rebelled against Turkish rule. Sultan Abdul Aziz began a reign of terror, killing thousands of men, women, and children. The rebellion ultimately led to Russian intervention on the side of the Christian Slavs. Gladstone, motivated by reports of the slaughter, wrote his *Bulgarian Horrors and the Question of the East* in 1876. As Russian troops swept down the Bal-

kans, Disraeli, as prime minister, deployed the British Mediterranean Fleet off Constantinople. War between the Russians and Great Britain was finally averted when Chancellor OTTO VON BISMARCK chaired the CONGRESS OF BERLIN in 1878 to effect a diplomatic solution to the Balkan crisis.

In 1880 Parliament was dissolved by Disraeli in March. Disraeli, thinking he could score an impressive political triumph, lost the general election, and Gladstone was returned to office as prime minister. While reversing Disraeli's stern policy toward the Turks, Gladstone found himself increasingly embroiled in colonial affairs, especially in southern Africa. A British victory over the Zulus in July 1879 had made England the dominant power in South Africa. When British troops under General George Colley were slaughtered in the Battle of Majuba Hill, instead of taking revenge, Gladstone granted political self-government to the Boers in their Transvaal Republic. Either through advancing age or a godlike determination that he alone knew what was best, Gladstone almost always found himself at odds with the British people on imperial matters.

In 1875 Disraeli bought the controlling interests in the SUEZ CANAL from the bankrupt Khedive ISMAIL of Egypt and Gladstone was later forced to send a British expeditionary force to Egypt. Gladstone now was confronted with a virtual British colony in Egypt. His imperial involvement did not end there. Years of Egyptian misrule had led to a rebellion in the Sudan led by Muhammad Ahmad Abdullah, who called himself the Mahdi, the Rightly Guided One. One Egyptian expedition under General William Hicks to crush the Mahdi ended in total defeat, and the Mahdi created a separate Sudanese state.

In 1884 Gladstone sent British hero General CHARLES "Chinese" GORDON to the Sudan to evacuate Egyptians from the capital of Khartoum. When it became clear that Gordon was determined to remain in Khartoum, Gladstone authorized a British relief expedition to be sent up the Nile to Khartoum, all the while hoping Gordon would change his mind at the last moment. When the first elements of the relief force finally reached Khartoum in January 1885, it was clear that the city had fallen to the Mahdi and Gordon had been killed. As a result of this, Gladstone was blamed for the murder of Gordon, a national hero.

Gladstone continued to pursue the policy of political reform that had been dearest to his heart. In 1886, riding on his new popularity among the working class, Gladstone was elected yet again to serve as prime

minister. The other issue that mattered to him was home rule for Ireland, an attempt to make amends for generations of misguided and sometimes brutal British rule against the Irish people. On this issue, both the Tory Party and the conservatives of the Liberal Party joined forces against him, determined to preserve primacy for the British—and avoid any political autonomy for the Irish at all costs. In the general election of 1886, Gladstone's government was defeated, with his advocacy of home rule for Ireland the deciding factor. Robert Cecil, the marquess of Salisbury, was given permission by Queen Victoria to form a government, drawn entirely from the Tory Party.

In 1892 Gladstone was elected yet a third time to serve as prime minister. In 1893, his Irish home rule bill was finally passed in the House of Commons, by a vote of 307 to 267. Victory seemed near. Yet the bill still had to pass the House of Lords, where the alliance between the Tory Party and the industrial and land-owning magnates of Ireland opposed to home rule was firm. Opposition was led by Lord Salisbury, who referred to Irish home rule as "this treacherous revolution." The House of Lords defeated the bill by a vote of 419 to 41.

On March 1, 1894, Gladstone addressed the House of Commons for the last time and resigned as prime minister. He died on May 19, 1898.

JOHN F. MURPHY, JR.

Gokhale, G. K.

(1866–1915) *Indian nationalist leader*

Gopal Krishna Gokhale, the founder of the Servants of India Society, was one of the outstanding leaders of the Indian freedom movement in its earlier phase. He was born in Kotluk in the Ratnagiri district of the Bombay Presidency on May 9, 1866, to Chitpavan Brahmin, Krishnarao and Satyabhama. His father, who had risen

from a clerk to police personnel, sent him to an English school in Kolhapur. He had a prodigious memory and received a bachelor of arts degree from Elphinston College in Bombay (now Mumbai) at the young age of 18. He taught first at the New English School at Pune and then at Ferguson College of the Deccan Educational Society from 1866 to 1904.

At the same time, Gokhale came under the influence of a social reformer and judge, Mahadev Govind Ranade, who encouraged him to write articles in the English weekly, the *Mahratta*, and later to publish a daily newspaper titled *Jnanaprakash*, where he put forth his moderate views on politics. He was the Secretary of Poona Sarvajanik Sabha, founded by Ranade from 1890 to 1895, and edited its journal. There was a disagreement with BAL GANGADHAR (B. G.) TILAK, another notable leader, over the question of lifetime membership in the Deccan Educational Society. After Tilak's resignation, Gokhale and Ranade established the Deccan Sabha in 1896, which aimed at promoting liberalism and moderation in Indian politics. Gokhale joined the Indian National Congress (INC) and was its joint secretary in 1895. He met Mohandas Gandhi in 1896 and the two developed a lifelong friendship. Gandhi later wrote a book titled *Gokhale, My Political Guru*.

Gokhale went to London in 1898 to give evidence before the Welby Commission, which had been convened by the British parliament to look into the complicated question of Indian expenditure. He protested the draining of wealth from India and the exploitation of the country and severely criticized the use of Indian revenue to finance military operations outside India. In 1899 he was elected to the Bombay Legislative Council and worked on famine relief, land alienation, and municipal government. He was elected to the Imperial Legislative Council in 1902, where he argued for granting responsible government to India and fundamental rights to its citizens.

In June 1905 Gokhale founded the Servants of India Society to promote Indian national interests by peaceful means. Gokhale, as a moderate politician, had professed loyalty to the British Empire, but at the same time advocated for India the type of self-government enjoyed in Canada and Australia.

In 1905 there was a tremendous upsurge against British rule as a result of the partition of Bengal by Viceroy Lord Curzon. It was a time of frenetic activities for Gokhale, who was elected president of the INC. He traveled to England in October to meet British parliamentarians and liberals and championed the cause

of India with eloquence and clarity. His presidential address to the congress in December 1905 was a scathing attack on the British government and its repressive policy toward antipartition Indians.

Gokhale next worked to avert a split in the INC between congress old guards and extremists led by Tilak. Moderates like Gokhale favored constitutional reforms, which were helped when the British government announced the Morley-Minto Reforms of 1909, which introduced the system of limited elections that pleased the Indian moderates.

Gokhale was also concerned with the problems of Indians living in South Africa. On Gandhi's invitation, he went there in October 1912. He also served as a member of the Royal Commission on the Public Services in 1912, where he advocated greater Indian representation in the upper ranks of government services, but his proposals were not carried out because of opposition by British members. The years of hard work weakened Gokhale's health, and he died on February 19, 1915. Gokhale had started his life in a humble way and became one of the greatest leaders in the country's history, thanks to his spirit of dedication, capability, public spirit, and selfless service. Leading an austere life, he was popular with his countrymen. It was not without reason that Gandhi regarded him as his preceptor.

PATIT PABAN MISHRA

Gong (Kung), Prince

(1833–1898) *Chinese statesman*

Prince Gong was the title given to Ixin (I-hsin), sixth son of Emperor Daoguang (Tao-kuang) of the QING (CH'ING) DYNASTY and half brother of his successor,

Emperor Xianfeng (Hsien-feng), a depraved and inept ruler.

In 1853 Prince Gong was appointed Grand Councilor and took responsibility for the defense of the capital area as the Taiping rebels threatened. His mettle was put to the test in 1860 when British and French forces marched on Beijing (Peking) in retaliation for China's reneging on the Treaty of Tianjin (Tientsin) of 1858. Xianfeng and his court fled the capital to Rehe (Jehol), where the Qing emperors had a resort palace, leaving Prince Gong to deal with the invaders without soldiers under his command and few officials to assist him. The British and French forces looted and then burned the emperor's Summer Palace and forced Prince Gong to sign the TREATY OF BEIJING.

This treaty confirmed the Treaty of Tianjin and in addition granted Britain and France the right to station permanent envoys in Beijing, the lease of Kowloon (adjacent to Hong Kong) to Great Britain, the opening of Tianjin as a treaty port, and increased the indemnity to both victor nations. Xianfeng abandoned himself to dissipation and died in Rehe in 1861, leaving the throne to his five-year-old son under a council of five regents that did not include Prince Gong. In the ensuing power struggle, Gong allied with the two dowager empresses (widows of Xianfeng) and executed a coup that toppled the regents. Thereupon the dowager empresses Ci'an (Tz'u-an), wife of Xianfeng, and CIXI (Tz'u-hsi), mother of the boy emperor, assumed the powers of state with Gong as prince regent.

Events of 1860 changed Prince Gong's attitude toward Westerners from one of hostility to respect. He found allies in two prominent Manchu noblemen, including his father-in-law Gueiliang (Kuei-liang) and Wenxiang (Wen-hsiang), and Han Chinese officials ZENG GUOFAN (TSENG KUO-FAN), LI HONGZHANG (LI HUNG-CHANG), and ZHO ZONGTANG (TZO TSUNG-T'ANG) because all favored reforms. Prince Gong modernized the conduct of foreign affairs, establishing a new office called the Zongli Yamen (Tsongli Yamen) that took charge of foreign relations with Western powers for the next 40 years.

He also set up two offices to supervise foreign trade in treaty ports in northern and southern China and the Imperial Maritime Customs Service to collect duties and fees mandated by treaties made with Western nations and appointed two Englishmen, Robert Lay and ROBERT HART, to head this office. In order to train young men as interpreters, he established a language school called the Tongwen Guan (T'ung-wen kuan), which soon expanded to include modern subjects such as geography, mathematics, and astronomy; later this school became National

Beijing University. It remains China's most prestigious university. He also had works of international law translated into Chinese, which he used to China's advantage in dealings with Western nations.

In time, the ambitious dowager empress Cixi began to resent Prince Gong's powers. When Tongzhi died in 1874, Cixi seized the occasion to appoint her three-year-old nephew the new emperor in a power play that enabled her to become regent. With her position firmly established and with the death of his allies Wenxiang in 1876 and Ci'an in 1881, Prince Gong became sidelined and increasingly discouraged. To show her power and control, Cixi chastised Prince Gong for concocted misdeeds, ignored his advice, and led China toward collision with France and Japan with catastrophic results. Prince Gong was a pragmatic statesman who steered China toward stability and a quarter century of peace after the disaster of 1860. He also left numerous compilations on the conduct of state during his decades in power and two collections of verse.

JIU-HWA LO UPSHUR

Gordon, Charles

(1833–1985) *British military officer, adventurer*

Charles George Gordon was a British army officer. His famous early exploits in China between 1862 and 1864 earned him the name "Chinese Gordon," while his later actions and death in Khartoum, the Sudan, gained him the epithet "Gordon of Khartoum."

Gordon was trained as an army engineer and saw action in the CRIMEAN WAR and the INDIAN MUTINY. He was sent to China in 1860 and took part in the capture of Beijing (Peking) in the second ANGLO-CHINESE WAR. In 1862 he was sent to Shanghai, China's premier port of international trade. Southern

China was then in the throes of the serious TAIPING REBELLION (1850–64), centered in Nanjing (Nanking), the rebel capital. In 1860 the army of the Taiping Loyal King threatened Shanghai. To defend themselves the rich merchants of the city commissioned Frederick Ward, an American adventurer, to organize a mercenary army. With soldiers recruited from among Western deserters, Ward's rifle squadron captured Sunjiang (Sunkiang), a town near Shanghai, and turned back the rebels. In 1861 Ward recruited 100 European officers and expanded his force with 4,000–5,000 Chinese and 200 Filipino soldiers, whom he armed and drilled in the Western fashion. This force won many battles and repulsed another attack on Shanghai in 1862, for which the Chinese government named it the Ever-Victorious Army. After Ward died of wounds in 1862, another American, Henry A. Burgevine, was named commander, but he was soon relieved from command due to the many problems he caused.

Gordon was next appointed to lead this army with British government permission. He served under the overall command of LI HONGZHANG (Li Hung-chang), governor of Jiangsu (Kiangsu) Province, in which both Nanjing and Shanghai were located. Between 1862 and 1864 the Ever Victorious Army fought in 33 actions against the Taipings. Gordon's most famous victory was taking Suzhou (Soochow), an important city between Nanjing and Shanghai, from the rebels. The Taiping Rebellion ended in 1864 with the capture of Nanjing and the suicide of the rebel leader. The Qing (Ch'ing) government rewarded Gordon with the rank of general, which entitled him to wear the Yellow Jacket (equivalent of a high military decoration). With the end of the rebellion, the Ever Victorious Army was disbanded, and Gordon returned to England for reassignment by the British army. The Ever Victorious Army was important, because it was the first Chinese fighting force to use Western firearms and training; its effectiveness showed the superiority of Western military techniques and technology.

Gordon was stationed in Britain until 1871 and then undertook tours of duty overseas, mainly in Egypt and the Sudan. In 1884 the British government sent him to the Sudan to extricate the Egyptian garrison (Egypt claimed overlordship over the Sudan) from the forces of the Mahdi, a Sudanese religious leader in revolt against the Egyptians. Gordon's small force was besieged in the Sudanese capital, Khartoum, by the forces of the Mahdi and was killed two days before a British relief force arrived on January 22, 1885. In death, this colorful British officer who had earlier

Gordon and his force were besieged in Khartoum, and he was killed two days before a British relief force arrived.

earned the name “Chinese Gordon” became known as “Gordon of Khartoum.”

Government of India Act (1858)

The Government of India Act of 1858 was an act of the British parliament that ended the existence and long tenure of the **BRITISH EAST INDIA COMPANY** in India and transferred its power and assets directly to the

British Crown. Thus ended the role that the remaining 1,700 shareholders in the company had, directly or indirectly, over the lives of 250 million Indian people. This revocation of the company happened in spite of the fact that the charter of the East India Company had been renewed in 1853.

The impetus for the Government of India Act was the **INDIAN MUTINY** (or the War of Independence, as the Indians later called it) that took place in 1857 and shook the power of the British in India. The British East India Company was founded in 1600. Initially lucrative, it incurred large losses beginning in the 1700s and had to be bailed out by the British government, in William Pitt’s India Act of 1784. The East India Company’s deep financial trouble continued after the Indian Mutiny, leading to an overhaul in 1858.

The main provision of the bill that was passed by Parliament transferred the territories of the East India Company to the British Crown. This meant that all treaties and contracts made by the company would be honored by the British government, including a debt of £98 million, one-ninth of the entire British government’s national debt. The rule of India was placed in the hands of the secretary of state for India who was able to deal directly on Indian matters under the prime minister’s administration. The British government would also appoint a governor-general who was under the secretary of state for India.

The bill was introduced by Prime Minister Lord Palmerston and was passed on February 18, 1858. It finally became law on August 2, 1858, and started the period of direct rule of India that lasted until independence for India and Pakistan in August 1947.

JUSTIN CORFIELD

Grant, Ulysses S.

(1822–1885) *American general and president*

Ulysses S. Grant commanded the Union armies during the **AMERICAN CIVIL WAR** and was the 18th president of the United States. Hiram Ulysses Grant was born on April 27, 1822, in Point Pleasant, Ohio. When his

paperwork for admission to the Military Academy at West Point was submitted, the congressman submitting the paperwork made the mistake of listing his name as Ulysses Simpson Grant, which he never changed. Grant graduated 21st in his class of 39, was commissioned a second lieutenant on July 1, 1843, and was assigned to an infantry regiment. During the MEXICAN-AMERICAN WAR his regiment was initially attached to Zachary Taylor's army, then to Winfield Scott's army to capture Mexico City. Grant fought in all the major battles during the campaign and was breveted to captain. But his official rank was only raised to first lieutenant after the war.

He married Julia Dent in August 1848 and served in several posts after the war, rising to the rank of captain in August 1853. Grant resigned his commission in July 1854 to return to his family. Grant tried several different business ventures and ended in business with his father and brothers in Galena, Illinois. At the start of the Civil War he volunteered with the Illinois militia and was eventually given command of a regiment in July 1861. He was promoted to the rank of brigadier general in August. He led a force against the Confederate forts of Henry and Donelson in February 1862. When he demanded the unconditional surrender of Fort Donelson, the northern newspapers dubbed him "Unconditional Surrender" (U.S.) Grant.

President Grant with his wife, Julia, and son Jesse in 1872. Grant's term in office was plagued by scandals caused by his associates.

Grant spent much of 1863 attempting to capture Vicksburg, Mississippi. It was not until May 1863 that he was able to drive the Confederate army back into Vicksburg and lay siege to it. After almost two months, Vicksburg surrendered to him on July 4, 1863. With the fall of Vicksburg, Grant was promoted to major general.

In October he led a Union army that lifted the Confederate siege of Chattanooga, Tennessee. President ABRAHAM LINCOLN gave him command of all the Union armies and the job of bringing the war to an end. Grant joined the Army of the Potomac that was facing General Robert E. Lee's Army of Northern Virginia. Grant spent most of 1864 trying to destroy Lee's army and finally settled into a siege at Petersburg, Virginia. Grant was able to trap Lee's army during a breakout attempt, and he forced Lee to surrender at Appomattox Court House on April 9, 1865. After the surrender of Lee's army, the remaining Confederate armies also surrendered and brought the war to an end. Grant was rewarded by Congress with the revived rank of full general in July 1866.

Grant ran for president in 1868 as a Republican and served two terms, from 1868 to 1876. Unfortunately, he was not much of a politician, and corruption was a problem during his administration, although Grant was not personally involved. However, he also did not take a firm stance against corruption in his administration, favoring colleagues and friends despite mounting evidence of their corruption.

During his administration, Grant proposed the annexation of Santo Domingo both as a way to improve civil rights issues in the South and to attempt to force Cuba to abandon slavery. The measure was voted down in Congress, mainly due to the influence of Senator Charles Sumner. He also signed America's first national park (Yellowstone) into existence.

Grant's inability to handle financial matters caused him problems after his terms as president, eventually causing him to go bankrupt. In order to try to pay off his debts and provide for his family, he wrote his memoirs, which turned out to be a great success. Suffering from throat cancer, Grant finished his memoirs days before he died on July 23, 1885.

Great Awakening, First and Second

The First and Second Great Awakening are names given to two periods of religious revival that occurred over wide geographic areas in the 18th and 19th centuries. Revivals occur in many religions throughout the world, but they are often identified with American evangelicalism. The awakenings exerted immense influence on American culture, as later generations of Christians emulated these revivals, hoping to recreate their benefits, including unusually high numbers of conversions and an intensified piety and commitment. The idea of a nationwide revival inspires a deep longing among evangelicals to see the nation morally renewed.

The causes of religious revivals are impossible to specify, though contributing factors can be identified. The effects usually consist of greater preoccupation with spiritual things among the awakened: prayer, spiritual concern, communal harmony, and moral reform.

THE FIRST GREAT AWAKENING

The First Great Awakening began in the 1730s, touching most English-speaking populations around the North Atlantic. In New England, descendants of the Puritans were conscious of having fallen away from the severe moralism and intense religious devotion of their forefathers, seizing instead the new economic opportunities offered by the expanding Atlantic market. Christians of the middle colonies of New York, Pennsylvania, and New Jersey struggled to maintain identity and cohesion in a highly diverse religious environment utterly unlike the Europe their churches had been formed in. Churches in the southern colonies, largely Anglican, served a plantation elite, leaving the poor, and especially slaves, unevangelized.

The awakening's first interpreter was one of its major leaders, Jonathan Edwards. In 1734 and 1735 Edwards's church experienced some "surprising conversions" which he believed were the beginnings of a revival. His *Faithful Narrative of the Surprising Work of God*, written in 1737, advertised these events and what Edwards thought they portended across the Atlantic world. Churches prayed for revival, preachers empha-

sized the need to experience the "new birth." Edwards speculated that the revival was part of God's plan to evangelize the world and usher in the millennial reign of Christ. While many preachers accepted Edwards's speculations, their overriding concerns matched those of ordinary people: assuring their personal salvation rather than the salvation of the masses.

CONVERSION AND GEORGE WHITEFIELD

Conversion had always been a church and community affair. Most Protestant traditions taught that experiences of God had to be confirmed, through one means or another, by the local community of believers. Only then could the individual trust that the experience was real. The revivalists of the First Great Awakening, while far from antiecclesiastical, made the church secondary to the transaction that took place between an individual and God, and most taught that if a person truly believed, they could be assured they were converted. Thus, for people coping with more diverse communities, geographical mobility, and the declining authority of communal hierarchies, the revivals offered new paths to spiritual life.

Itinerant preacher George Whitefield (1714–70) emphasized the simplicity of conversion: "Believe on the Lord Jesus and be saved." In a society increasingly characterized by the dislocations of urban and frontier existence, this streamlined model of conversion was particularly effective. Where earlier forms of conversion required one to agree with nuances of church doctrine, as well as find a place in a local community, in Whitefield's preaching these fell to the background.

What was central was the transaction between an individual and God. Whitefield's popularity was in large part due to the nature of his message: He told ordinary people there was another way to salvation, and it did not require placating other human beings. Other factors surely contributed to his celebrity: youth, good looks, voice (which was both loud and pleasant, he had originally aspired to be an actor), and the controversy he generated by itinerating with no fixed pulpit. All appealed to the mass audiences he attracted, estimated by his friend and supporter BENJAMIN FRANKLIN at up to 20,000 on some occasions.

Whitefield's evangelistic tours, which began in 1739, revolutionized American expectations and left an altered religious landscape. Churches debated his call for a more evangelical theology and preaching. Many split, allowing for religious choice in towns where none existed before. Numerous preachers took his simple message, his appeals to the emotions, as

well as his penchant for controversy, and carried them farther, sometimes to extremes, as Protestants divided into the pro-revival (“New Light”) and anti-revival (“Old Light”) camps. New Lights sent missionaries to Indians, evangelists to work among slaves, and, most important, supported numerous educational initiatives, such as the College of New Jersey (later Princeton), which called Edwards as its first president. Pastors and scholars, influenced by the revival and eager to see it replicated, filled pulpits and lecterns throughout the colonies and infused the American culture with New Light ideas.

THE SECOND GREAT AWAKENING

The Second Great Awakening (1790–1840) was characterized by emotional preaching, outdoor assemblies, and sophisticated (for their time) publicity efforts. It spanned by some reckonings almost half a century, occurring in various regions and with a motley assemblage of leaders and participants. The energies it unleashed left an even deeper impression on the United States than the first and is seen by some historians as the beginning of modern revivalism. If the first was evangelical in the sense that it emphasized individual conversion over confessional loyalty or church membership, the second institutionalized almost all the themes that currently define evangelicalism: revivalism, publishing ventures (especially Bibles and tracts), moral crusades, and the use of political means to reform society according to a specific Protestant vision. In addition, new religious groups, known as upstart sects of Baptists and Methodists, and distinctively American movements, such as Adventism and MORMONISM, grew out of the awakening. Slaves and free blacks converted in significant numbers for the first time, altering southern religious styles in the process.

The 1760s–90s were a low point in religious adherence and belief in the United States, with enlightened deism influential among elites; churches and personal morals disrupted by war; and politics, commerce, and westward migration competing with religion for popular interest. In New England, Yale’s Timothy Dwight warned that the new nation was sliding toward infidelity. Clergy in that region were generally Federalists, supporting the old, pre-Revolutionary hierarchies: Men of education, wealth, and character needed to control politics and culture. The Revolution had turned those assumptions upside down, and, as power migrated into the hands of non-elites, conservatives feared for social order. Revival, said Dwight, would instill virtues such as respect for authority in what otherwise might

become an unruly rabble. Concerned that the French ENLIGHTENMENT was in vogue among Yale’s students, Dwight’s chapel sermons eventually sparked a revival. This phase of the awakening stressed the danger posed to youth by imported or innovative ideas and movements, offering revivals themselves as the antidote to the specter of national degeneration.

FRONTIER REVIVAL

Similar concerns in the South led to small revivals at several colleges. Graduates impressed by these events joined the swarm of migrants pouring onto the frontiers of Kentucky and Tennessee. There, widely dispersed populations had run ahead of all institutions, including churches, and were living in moral chaos. Evangelists found people starved both for the comforts of the Gospel as well as entertainment, and preachers determined to provide them with both.

It is here that the frontier camp-meeting had its start. Meetings derived from Scottish Presbyterians, who gathered annually in multi-church outdoor communion services that lasted several days, involved a series of sermons, reflection, repentance, and finally a mass celebration of the Lord’s Supper. This practice was carried to the frontier and evolved into something uniquely American. Old World sacramental decorum was traded for the boisterous, uninhibited expressions of the frontier. The result was the “Great Revival” of Cane Ridge, Kentucky, where thousands congregated in 1800–01. Cane Ridge was notorious for its bizarre phenomena: crying out, jerking, uncontrollable laughter, and swooning.

To many, these signified true supernatural work; many preachers encouraged them. The active participation of marginalized segments of society—plain folk, blacks, and women—may have contributed to the uninhibited nature of these revivals. The open market of religious choice that America now was meant that these groups had the power to affect, if not determine entirely, the style and the content of revival preaching. Democratic appeal became an essential requirement for frontier religion. Calvinism (predestination) was jettisoned to make room for more emphasis on individual ability. Sermons had to be practical, simple, and entertaining.

The result was a religion that hewed close to the concerns, but also the prejudices, of the local community. Once critics of slavery, evangelicals in the South found themselves accommodating the system to better attune the sermons to the local populace. Previously marginal churches such as the Methodists and Baptists bested competitors in popular appeal and came to dominate

the South. Abolitionism received an influx of zealous evangelicals in the North, while slavery enjoyed the blessings of all the evangelical churches of the South.

THE LEGACY OF THE AWAKENINGS

The Methodists' powerful presence in antebellum America enticed other groups to adopt their style. Perhaps the most important figure in this regard was also one of the century's most important religious figures, CHARLES GRANDISON FINNEY. A lawyer when he converted, he developed a theology and preaching style that would produce revivals. He adopted Arminian (free-will) views of human ability, arguing that conversion was an individual act that required no special divine grace. He preached in a way that argued his case and demanded an immediate decision. He brought a revivalism forged on the frontier to the urbanized Northeast and eventually the world. His ideas—and the legacy of the Second Great Awakening—were passed on in his *Lectures on Revivals of Religion* in 1835. He and many other leaders became important voices for abolition, womens' rights, health reform, the perfectibility of society, various moral reforms, and missions.

Neither awakening had as much of a numerical effect on the churches as their promoters hoped and claimed. What they did effect was a revolution in how churches operated in a diverse, democratic society. Protestants became open to experiment and were determined to grow in national influence, making evangelicism the powerful movement it remains today.

Great Game

See AFGHAN WARS; ANGLO-RUSSIAN RIVALRY.

Great Plains of North America

The Great Plains of North America extend about 2,400 miles from parts of the Northwest Territories to Alberta, Saskatchewan, and Manitoba. In the United States, they continue southward through sections of Mon-

tana, North and South Dakota, Minnesota, Wyoming, Nebraska, Kansas, Colorado, Oklahoma, New Mexico, and Texas, into Mexico, and about 1,000 miles from the foothills of the Rocky Mountains eastward to Indiana. The area of the Great Plains is 1.2 million square miles, with 700,000 square miles in Canada and 500,000 square miles in the United States.

The High Plains, a higher region of the Great Plains west of the 100th meridian, are arid and receive only 20 inches or less of rainfall a year, making the land suitable for range animals or marginal farms. The southern part of the Great Plains lies over the Ogallala aquifer, an immense underground layer of water-bearing rock dating from the last ice age. Drought devastates the plains about every 25 years and dust storms ravage it as well.

As Meriwether Lewis noted in his journal, vast herds of bison ranged on the Great Plains and provided the foundation for the lives and culture of the Native American tribes like the Blackfeet, Crow, Sioux, Cheyenne, Arapaho, Comanche, and others. Much of this territory was acquired by the United States from France in the LOUISIANA PURCHASE and was then opened to settlement. After European settlers nearly exterminated the buffalo and removed Native Americans to Indian reservations, they opened the Great Plains to ranching and grazing.

The Homestead Act of 1862 and later the Dominion Lands Act of 1871 in Canada opened the Great Plains for settlement and farming. A settler could claim up to 160 acres of land if he and his family lived on it and cultivated it for a period of time. Thousands of Americans and immigrants built homesteads. Many were not skilled dryland farmers and failed, as they were unprepared for the rigors of life on the Great Plains.

In the early 1920s historian Walter Prescott Webb introduced his Great Plains thesis stating, “. . . for this land, with the unity given it by its three dominant characteristics, has from the beginning worked its inexorable effect upon nature's children. The historical truth that becomes apparent in the end is that the Great Plains have bent and molded Anglo-American life, have destroyed traditions, and have influenced institutions in a most singular manner.”

He stressed the environmental distinctiveness of the Great Plains and differentiated them from the rest of the North American continent. He cited the comparatively level land surface on the plains, the absence of trees, the semiarid climate, and argued that two important physical characteristics across the plains were missing. These elements were water and abundant timber, and their lack made the Great Plains environmentally unique.

The second part of Webb's thesis stressed that the Great Plains represented an institutional chasm. He argued that Anglo-American lifestyles and institutions were adapted to wet, well-timbered environments, and Americans had evolved mainly from the wet and timbered regions of northwestern Europe. When they immigrated to North America, they settled along the Atlantic seaboard, a region of plentiful rainfall and dense forests. They settled the region successfully because their lifestyles, tools, methodologies, and institutions were suited to this physical environment.

When settlers came to the Great Plains, the culture and customs that they brought with them from the East made it difficult for them to cope with the foreign environment for long periods of time. Settlement jumped from the wet forests of the East to the western Pacific slope of California and Oregon, leaving the corridor known as the Great American Desert uninhabited and undeveloped. They had to adapt their institutions and lifestyles to the plains. On the Great Plains, the horse, the Colt revolver, the Winchester carbine, the open-range cattle industry, barbed wire, sod housing, windmills, dry land farming, and irrigation, as well as new laws, were all part of the process of adaptation.

JOHN H. BARNHILL

Greek War of Independence

The Ottoman Empire had ruled all of Greece, with the exception of the Ionian Islands, since its conquest of the Byzantine Empire over the course of the 14th and 15th centuries. But in the 18th and 19th centuries, as revolutionary nationalism grew across Europe (due, in part, to the influence of the FRENCH REVOLUTION) and the power of the Ottoman Empire declined, Greek nationalism began to assert itself and drew support from western European "philhellenes."

By that time, the desire for independence was common among Greeks of all classes, whose Hellenism, or sense of Greek nationality, had long been supported by the Greek Orthodox Church, by the survival of the Greek language, and by the administrative arrangements of the Ottoman Empire.

In Odessa (a port on the Black Sea now in Ukraine) in 1814, Athanasios Tsakalof, Emmanuel Xanthos, and Nikolaos Skoufas founded a Greek Independence Party, called Philiki Etairia (Friendly Society). The founders recruited merchants and rich expatriates abroad, as well as military leaders, priests, and intellectuals.

The fall of NAPOLEON I in 1815 released many military adventurers from whom the Greeks could learn the art of contemporary warfare. Vienna, Great Britain, and the United States were havens of refuge and planning for Greek émigrés. The obvious candidate to lead the Philiki Etairia was Ioannis Kapodistrias. In 1808 he was invited to St. Petersburg and in 1815 he was appointed by Czar ALEXANDER I as foreign minister of Russia. The message of the society spread quickly and branches opened throughout Greece. Members met in secret and came from all spheres of life. The leaders held the firm belief that armed force was the only effective means of liberation from the Ottoman Empire and made generous monetary contributions to the freedom fighters. With the support of Greek exile communities and covert assistance from Russia, they prepared for a rebellion.

Only a suitable opportunity of revolt was needed, and this was provided by the rebellion of Ali Pasha against Sultan Mahmud II. While the Turks were preoccupied with this threat, the Greeks rose to war. The start of the uprising can be set as March 6, 1821, when Alexandros Ypsilanti, the leader of the Etairists, crossed the Prut River into Turkish-held Moldavia with a small force of troops, or on March 23, when rebels took control of Kalamata in the Peloponnese peninsula. Regardless, on March 25, 1821, Bishop Germanos raised the Greek flag as the banner of revolt at the monastery of Aghia Lavra in the Peloponnese. The ensuing revolution went through three phases: local successes in 1821–25, the crisis caused by the Egyptian intervention on behalf of the Ottoman Empire in 1826–28, and a period of overwhelming European intervention on behalf of the Greeks ending in Turkish recognition of Greek independence in 1832.

From the beginning, the revolution had great momentum. Simultaneous risings took place across the Peloponnese, central Greece, including Macedonia, and the islands of Crete and Cyprus. Fighting broke

out throughout the Peloponnese, with freedom fighters laying siege to the most strategic Turkish garrisons and razing the homes of thousands of Turks. The worst atrocity occurred in Tripolitsa (today Tripolis), where 12,000 Turkish inhabitants were massacred. The Turks retaliated with massacres in Asia Minor, most notoriously on the island of Chios, where more than 25,000 civilians were killed.

The fighting escalated throughout the mainland and many islands. Using the element of surprise, and aided by Ottoman inefficiency, the Greeks succeeded in taking control of vast areas. Within a year the Greeks had captured the Peloponnese, Athens, and Thebes. In January 1822 the rebels declared the independence of Greece. The Turks attempted three times between 1822 and 1824 to invade the Peloponnese but were unable to take the area back from the victorious Greeks.

The Ottomans, however, soon recovered and retaliated violently. The retribution drew sympathy for the Greek cause in western Europe, although the British and French governments suspected that the uprising was a Russian plot to seize Greece from the Ottomans. The Greeks were unable to establish a coherent government and soon fell to fighting among themselves. They lacked unity of objectives and strategy, and the objectives of the different classes and regions were too disparate to be reconciled. In 1822 two Greek governments existed, and by 1824 open civil war prevailed in Greece. In 1823 civil war broke out between the guerrilla leader Theodoros Kolokotronis and Georgios Kountouriotis, who was head of the government that had been formed in January 1822. After a second civil war in 1824, Kountouriotis was firmly established as leader. These internal rivalries prevented the Greeks from extending their control and from firmly consolidating their position in the Peloponnese.

EGYPT'S RESPONSE

Fighting between Greeks and Ottomans continued until 1825, when the sultan asked for help from his most powerful vassal, Egypt. Egypt was then ruled by MUHAMMAD ALI Pasha, who had built up a large army and new naval fleet. The Egyptian force, under the command of Ali's son Ibrahim, quickly gained control of the seas and Aegean Islands. With the support of Egyptian sea power, the Ottoman forces successfully invaded the Peloponnese. They recaptured the town of Athens in August 1826, and the Acropolis, symbol of Greece's former greatness, fell to the Turks in June 1827.

The Western powers were reluctant to intervene, fearing the consequences of creating a power vacuum in southeastern Europe, where the Turks still controlled much territory. In Europe, however, the revolt aroused widespread sympathy. Greece was viewed as the cradle of Western civilization, and it was lauded by romanticism. The sight of a Christian nation attempting to cast off the rule of a Muslim empire also appealed to the European public. Help did come from the philhellenes—aristocratic young men, recipients of a classical education, who saw themselves as the inheritors of a glorious civilization, willing to fight to liberate its oppressed descendants. Philhellenes included Percy Bysshe Shelley, Johann Wolfgang von Goethe, Friedrich Schiller, Victor Hugo, and George Gordon, Lord Byron. Byron spent time in Greece but died from fever in 1824. Byron's death did even more to augment European sympathy for the Greek cause.

EUROPEAN INTERVENTION

The Greek cause was saved by the intervention of the European powers. Favoring the formation of an autonomous Greek state, they offered to mediate between the Turks and the Greeks in 1826 and 1827. When the Turks refused, a combined Russian, French, and British fleet destroyed the Turkish-Egyptian fleet in the Bay of Navarino in October 1827. This was the decisive moment in the war, although the British admiral Codrington ruined his career because he had not been ordered to achieve such a victory.

Although the Battle of Navarino severely crippled the Ottoman forces and made the independence of Greece practically certain, another two years passed before the fighting ended and nearly five before the new state took shape. In October 1828 the French landed troops in the Peloponnese to stop the Ottomans. Under French protection, the Greeks were able to form a new government. In April 1827 Kapodistrias was elected as provisional president of Greece by the third National Assembly. The Greeks then advanced to seize as much territory as possible, including the ancient cities of Athens and Thebes.

Again the Western powers intervened, and Ottoman sultan Mahmud II even proclaimed a holy war. Russia sent troops into the Balkans and engaged the Ottoman army in another Russian-Turkish war in 1828–29. Fighting continued until 1829, when, with Russian troops at the gates of Constantinople, the sultan accepted Greek independence by the Treaty of Adrianople, or Edirne, in 1829. In 1830 the Greeks still had in mind a future ruler who would remain the sultan's vassal. The treaty

of Adrianople made this impossible, and in February 1830, the throne of Greece was offered to Prince Leopold of Saxe-Coburg. In 1832, however, the 17-year-old Bavarian prince Otto from the House of Wittelsbach accepted the Greek throne and became King Otho of the newly independent state. Neither the boundaries nor the constitution of the new Greek state were yet settled, and the state at the time was much smaller than in the present day.

MARTIN MOLL

Guangxu (Kuang-hsu)

(1871–1908) *Chinese ruler*

Guangxu's personal name was Zaitian (Tsai-t'ien). He was born in 1871 and chosen emperor by the dowager empress CIXI (Tz'u-hsi) when her son and his cousin the emperor TONGZHI (T'ung-chih) died without heirs. His youth ensured another long regency by the ambitious and unscrupulous Cixi. Guangxu was bright and studious, studied English and traditional subjects under able tutors, and grew up to be a man of character and moral convictions. In 1889 Cixi married him to her niece in order to increase her web of control over him, and though she then formally retired to her luxurious Summer Palace, she continued to dictate policy and make key appointments, leaving Guangxu practically powerless.

China's catastrophic defeat by Japan in the SINO-JAPANESE WAR (1894–1895) convinced Guangxu that dramatic and immediate reforms were needed to save the nation. He therefore supported a group of reformers led by Kang Youwei (K'ang Yu-wei) in 1898 and promulgated laws that would modernize China modeled on Japan's MEIJI RESTORATION. He was betrayed to Cixi by General Yuan Shikai (Yuan Shih-k'ai), who struck quickly to imprison Guangxu, crushing the reformers, who were

killed, imprisoned, or exiled. In retrospect, Guangxu's attempt to change China was called the HUNDRED DAYS OF REFORM.

It is believed that Cixi wanted to dethrone or kill Guangxu but was prevented from doing so due to protests by powerful provincial governors and through diplomatic influence of the Western powers. Cixi's reactionary rule culminated in the Boxer Rebellion, the besieging of foreign diplomatic compounds in Beijing (Peking) by her supporters, the Boxers, and the capture of the capital by Western relief forces in 1900. She decided to flee the capital and took the captive emperor with her, murdering his courageous consort Zhen Fei (Chen-fei) for suggesting that he stay behind to negotiate with the Western powers.

When the fugitive Cixi and the court returned to Beijing in 1902 after the settlement of the Boxer fiasco, she made Guangxu take the blame for what had happened.

Guangxu endured his imprisonment with patience, reading and preparing for the day when he would be free to rule after his adoptive mother died. She died from illness on November 15, 1908, at 73, at which time the palace announced that he had suddenly died on the previous day at age 37. It is widely believed that he died an unnatural death at the hands of her supporters, with or without her consent. Thus ended the tragic life of Emperor Guangxu, who could never escape the control of his vicious aunt/adoptive mother. Before her death Cixi had named her infant great-nephew successor of the childless Guangxu. The boy ruled as Emperor Xuantong (Hsuan-tung) between 1909–11; he was the last emperor of the QING DYNASTY.

JIU-HWA LO UPSHUR

Haitian Revolution

The Haitian Revolution represents one of the signal events of the age of revolution, reverberating across the Atlantic world and profoundly shaping social and political relations across the Western Hemisphere in the decades after its eruption in 1791. The only successful large-scale slave revolt in the history of the Americas, the revolution in Haiti served as a cautionary tale for slave owners across the Americas, prompting a tightening of slave regimes and of slave surveillance and control measures from Canada and the United States to Brazil and Peru. Despite the profundity of its impact, however, the Haitian Revolution also has tended not to receive the attention it merits—partly because the French-controlled western portion of the island of Hispaniola, as a colony of neither the Spanish, Portuguese, nor British, fell outside the purview of accounts of these empires' histories (and has been conventionally excluded, for instance, from treatments of both the U.S. and Latin American independence periods), partly, in the view of some, because of the racism inherent in conventional historical accounts of this era.

The events of the revolution itself are dizzyingly complex and difficult to summarize. On the eve of the revolution, the French colony of Saint-Domingue, vaunted as the Pearl of the Antilles, was the largest sugar-producing region in the world, outpacing even Brazil, the world's second-largest, its 800 sugar plantations producing more sugar than all of the British West Indies combined. In the decade before 1789 Saint-

Domingue's slave imports averaged 30,000 per year. Its population was divided into three caste-like strata. At the bottom roughly half a million black slaves, comprising 85–90 percent of the population. At the top were 40,000 whites, divided between a tiny number of large plantation owners and wealthy merchants, or *grands blancs*, and the vast majority of poor and middling whites, the *petits blancs*, who deeply resented the former. In between were some 28,000 free people of color (*gens de couleur*, or *affranchis*, principally mulatto and some black). Despite Louis XIV's Code Noir of 1685, making mulattos and free blacks subjects of the French empire, the rights of the *gens de couleur* were restricted by a series of laws meant to protect the superior social position of whites.

With the onset of the FRENCH REVOLUTION in 1789, the revolutionary ideals of liberty, equality, and fraternity essentially percolated down the social hierarchy, from whites to free coloreds to black slaves. As the *grand blancs* sought autonomy from the French government, Saint-Domingue's free coloreds, via the influential Paris-based, mulatto-dominated Société des Amis des Noirs (Society of Friends of the Blacks) sought equal representation in the Estates General in Paris. Rebuffed, in October 1790 several free colored leaders led an abortive uprising. By this time, the colony had entered a period of revolutionary turmoil, with debates about liberty and rights resounding throughout its towns and streets. Neither whites nor free coloreds contemplated liberty for slaves, though neither could prevent their slaves from hearing or acting on these debates.

In August 1791 after a period of secretive organizing, the slaves launched their uprising, burning cane fields across the western part of the island—an uprising that lasted more than a decade, and that ultimately led to the independence of Haiti on January 1, 1804.

After August 1791, confronted with the specter of a slave revolt, whites and free coloreds temporarily closed ranks, though the animosities between the two groups proved too great to bridge. The slave rising spread into the eastern part of the island, nominally controlled by the Spanish. On March 4, 1792, the French revolutionary government granted equality between whites and free coloreds, a decree that did not stop the island's slide into civil war. The British, courted by the *grand blancs* and hoping to exploit the opportunity to weaken their French rival, invaded parts of the west, while the Spanish, hoping to regain control of the west, marched from the east. The conflict thus combined a civil war among and between the island's fractious whites and free coloreds, an international war pitting France, Britain, and Spain, and a slave uprising against them all. In the end, a small group of the most prominent ex-slave leaders emerged victorious.

A pivotal event in this process occurred on April 29, 1793, when Leger-Félicité Sonthonax, a Jacobin high commissioner sent by the French government to restore order, exceeded his authority by abolishing slavery throughout the island. The decision permitted a temporary alliance between the French and slave rebels against the British and Spanish, while also catapulting into prominence former house slave TOUSSAINT LOUVERTURE, who became commander of the French forces and the undisputed leader of the ex-slave rebels. After five years and the loss of more than 25,000 troops, the British were defeated, departing the island in April 1798. Soon after, in February 1799, mulattos under André Rigaud rebelled against Toussaint, sparking another civil war. Toussaint's forces crushed the rebellion by August 1800. Meanwhile Toussaint, Saint-Domingue's governor-general and commander in chief, established relations with the United States and promulgated a series of laws intended to maintain sugar production and a semblance of social order.

Back in France, NAPOLEON determined to regain the island. Invading in January and February 1802, French forces captured Toussaint in June. He was transported in chains back to France, where he died the next year. Leadership of the black-mulatto forces fell to Toussaint's lieutenant Jean-Jacques Dessalines. For the next 21 months some 58,000 French forces fought against Dessalines's army. They were defeated

at the cost of some 50,000 French lives, most dying of yellow fever, and in January 1804, the independent nation-state of Haiti (an indigenous name for the island) came into being.

MICHAEL J. SCHROEDER

Hamid, Abdul II (Abdulhamid II)

(1842–1918) *Ottoman sultan*

Abdul Hamid II, who reigned 1876–1909, became sultan after his brother, Sultan Murad V, was deposed because of mental illness. He came to power by promising reforms and support for a constitution, but he soon reasserted the sultan's traditional authoritarian powers. At the time, the Ottoman Empire was beset with problems. The empire was deeply in debt, nationalist rebellions had broken out in Bosnia and Bulgaria, war raged in Serbia and Montenegro, and Russia threatened to further its expansion into Ottoman territories.

However, the promulgation of a constitution and establishment of a parliament in 1877 seemed to promise new reforms that would perhaps revive the empire's former strength. The constitution, drawn up by the able administrator and reformer MIDHAT PASHA, was short-lived, as Abdul Hamid II used the 1877 war with Russia as the excuse to disband parliament and suspend the constitution. He then removed Midhat from power and sent him into exile.

Abdul Hamid II hired German advisers to rebuild the army and administer the finances. To the dismay of the British, German influence within the empire increased steadily until World War I. Abdul Hamid II turned a blind eye to the BRITISH OCCUPATION OF EGYPT, although ostensibly Egypt remained part of the Ottoman Empire, it became a de facto part of the British Empire ruled by British "advisers."

Abdul Hamid II limited the power of government bureaucrats and concentrated power within the sultanate.

He also established strict censorship over publications and monitored political activities through a network of secret agents. Although most of his predecessors had paid scant attention to their title as caliph, Abdul Hamid II reemphasized his role as caliph and protector of the Muslim world.

Abdul Hamid II vainly attempted to use the appeal of the pan-Islamic movement, popularized by JAMAL AL-DIN AL-AFGHANI, to counter the growing nationalism within the diverse Ottoman Empire. The construction of the Hijaz railway to facilitate the pilgrimage to Mecca and Medina was part of his campaign to foster Islamic support. Abdul Hamid II also rejected the Zionist offer made by Theodor Herzl to pay a portion of the huge Ottoman debt in exchange for an Ottoman charter allowing Zionist colonization of Palestine. Herzl was told that the sultan was not in the business of “cutting off his arm,” meaning that Palestine was considered an integral part of the empire, but that Jews were welcome to live there.

Fearing assassination, he made himself a virtual prisoner in the palace of Yildiz. Abdul Hamid’s authoritarian rule increased discontent within the military. As a result, the Young Turks, dominated by army officers, took over the government in 1908. Abdul Hamid II was forced to accept the reinstatement of the 1876 constitution. In 1909 he abdicated in favor of his brother, who became Sultan Muhammad V. Abdul Hamid II spent his last years under house arrest at the Beylerbeyi Palace in Istanbul, where he died in 1918.

JANICE J. TERRY

Hamilton, Alexander

(1755?–1804) *first U.S. treasury secretary*

Born in the British West Indies to parents who were not legally married, Alexander Hamilton surmounted his origins, becoming a wartime aide to General GEORGE WASHINGTON, a key theorist and promoter of the U.S. CONSTITUTION, and the creator of a bold financial system for the new republic. Proudful and

As the first U.S. secretary of the treasury, many of Alexander Hamilton's ideas contradicted conventional wisdom of the era.

outspoken, Hamilton died at the hands of Vice President Aaron Burr in a politically motivated illegal duel in July 1804.

Motherless by age 12 and estranged from his father, Hamilton trained as a clerk on the sugar island of St. Croix. There, the self-taught young man dabbled in poetry, penned an eyewitness account of a devastating 1772 hurricane, and so impressed Presbyterian minister Hugh Knox that the older man took up a collection to send his protégé to college in New York. Mentorship by important older men would become a pattern in Hamilton’s career.

Caught up in the growing revolutionary fervor, Hamilton soon became a pamphleteer and, by 1776, captained an artillery company. Noticed by Washington, Hamilton became the general’s trusted aide-de-camp. Marriage in 1780 to Elizabeth Schuyler, daughter of a wealthy and politically influential Albany landowner, and a temporary falling out with Washington resulted

in Hamilton's returning to Albany, where he studied law alongside Aaron Burr, another young and ambitious New Yorker. Hamilton resumed pamphleteering on urgent issues of governance, taxation, and finance. He found time to cofound the Bank of New York and an antislavery society, although his father-in-law owned slaves. In 1782 as a delegate to the congress crafting the Articles of Confederation, Hamilton began an intellectual partnership with a promising young Virginian, JAMES MADISON.

An early proponent of a stronger and more centralized government to replace the faltering Articles, Hamilton was New York's sole delegate to the Constitutional Convention of 1787. As "Publius," he, along with Madison and John Jay, wrote a series of arguments for ratification, later collected as the *Federalist Papers*.

CONTROVERSIAL ECONOMICS

In September 1789 Hamilton became George Washington's and the nation's first secretary of the treasury. Audaciously, Hamilton proposed a controversial economic plan based in part on the ideas of pioneering British economist ADAM SMITH. Many of Hamilton's ideas contradicted much of his era's traditional financial wisdom and religious teachings. His proposals included consolidation of state liabilities into a permanent federal debt, a national bank controlled by a public/private partnership that could manipulate the nation's money supply, and luxury taxes on such goods as tea and whiskey. Hamilton also urged Congress to use federal funds and impose tariffs to promote manufacturing and America's role in the emerging INDUSTRIAL REVOLUTION.

Hamilton soon found himself at odds with former ally Madison and secretary of state THOMAS JEFFERSON, both slave-owning Virginians who had a very different vision of the new nation, based primarily on the expansion of agriculture. Nevertheless, major portions of Hamilton's economic plan were adopted after Jefferson brokered an agreement creating a federal capital district on the Potomac between Maryland and Virginia, rather than New York, Hamilton's preference. Hamilton's FIRST BANK OF THE UNITED STATES was chartered in 1791, and the U.S. Mint approved in 1792. Although Hamilton was personally involved in the creation of one of America's first water-powered industrial cities, Paterson, New Jersey, most of his "Report on Manufactures" failed to win congressional approval.

At the height of his power and influence, Hamilton became entangled in a web of personal and financial

misadventures that would cast a shadow over his career. Although generally regarded as personally honest, he did not always use good judgment in picking close friends and assistants. Some used insider information to speculate on currency fluctuations and otherwise enrich themselves. One key aide, William Duer, not only took financial advantage of his connection with the treasury secretary but also introduced Hamilton to Maria Reynolds, a married woman. Their ensuing affair, apparently abetted by Mrs. Reynolds's husband for purposes of blackmail, continued for more than a year and ended with Hamilton's embarrassing confession, publicly revealed in 1797.

As the FRENCH REVOLUTION took a turn into violence, political differences between cabinet colleagues Hamilton and Jefferson intensified as Jefferson hailed the end of French monarchy while Hamilton abhorred turmoil in the United States's old ally. In 1794, when Pennsylvania farmers rebelled against Hamilton's whiskey tax, the treasury secretary persuaded President Washington to use troops to quell the uprising by raising the specter of anarchy akin to recent events in France. Hamilton rode into battle alongside his general. The next year, Hamilton resigned his cabinet post to resume a lucrative law practice. He would in 1796 help Washington write his farewell address.

JOHN ADAMS of Massachusetts and Hamilton were part of the new Federalist Party by the time of America's first contested presidential election in 1796, but they were not friends. Unable to derail Adams's presidential candidacy, Hamilton played a supportive role by questioning the character of Jefferson, a leader of the new Democratic-Republican Party. Hamilton also founded a newspaper, the *New-York Evening Post*, as a mouthpiece for Federalist politics and his own New York ambitions.

THE DUEL

The election of 1800 deadlocked, with Jefferson and Burr, both Republicans, each receiving 73 electoral votes. Into this procedural mess (later corrected by the Constitution's 12th Amendment) waded Hamilton. Despite their political differences, Jefferson and Hamilton were major figures, founders of the republic. By contrast, Hamilton argued as he urged the electors to pick Jefferson, Burr was an opportunist of questionable character. Burr became Jefferson's vice president; the uneasily competitive Burr-Hamilton relationship became loathing on both sides.

Against a backdrop of vicious New York political maneuvering, Burr and Hamilton squared off at dawn

on a Weehawken, New Jersey, bluff overlooking Manhattan. Both fired; Burr's bullet tore through Hamilton's liver. A day later, Hamilton was dead.

Burr, never even tried for illegal dueling, resumed his seat as president of the Senate in the next congressional session. Elizabeth Hamilton would outlive her husband by 50 years. She was buried alongside him in Trinity Churchyard near Wall Street, America's financial heart.

MARSHA E. ACKERMANN

Harris, Townsend, and Japan

Townsend Harris was born in Sandy Hill, New York, in 1804. At 14, he went to New York City, where he worked his way up from shop clerk to partner in a large company. He took a special interest in cultural and educational opportunities. He became president of the Board of Education in New York City and, in the face of entrenched political power, pursued his dream of education for all classes of society. Harris was responsible for the foundation of the Free Academy, now the City College of New York City. In 1848 he planned and carried out a tour of the South Pacific to study the islands and their indigenous native populations.

Harris's expertise in Asia and the Pacific did not go unnoticed in Washington, D.C. In 1854, the administration of President Franklin Pierce appointed him American consul in Ningbo (Ningpo), China. He followed this tour of duty with successful negotiations with Siam in 1856. Meanwhile, on February 15, 1855, Commodore MATTHEW PERRY returned to Edo (Tokyo) Bay in Japan. During his first voyage to Japan in July 1854, he had opened diplomatic negotiations with the Japanese government, promising to return the next year. A treaty was signed as a result that opened Japan.

With his diplomatic experience in the Far East, Harris was chosen as the first U.S. consul in Japan, arriving in August 1856, in Shimoda. Despite his best

With his lifelong interest in Asia and the Pacific, Townsend Harris was a natural choice as diplomat to Japan.

efforts, it was more than a year before he set foot in Edo, the capital of the shogunate (military regime). (The Japanese had two capital cities, the shogun's and the imperial capital at Kyoto.) Although Shogun Tokugawa Iesada had practiced delaying tactics in receiving Harris, he realized that Japan was too weak to risk a war with the United States. Preliminary discussions had already taken place at Shimoda, and negotiations continued in Edo. A treaty was finally signed in July 1858 and took effect in 1860.

The commercial treaty opened six Japanese ports to U.S. trade and allowed Americans to reside in Edo and Osaka. Later, added provisions fixed import tariffs at 5 percent and exempted Americans from Japanese laws. The forcing of the weak shogunate to sign unequal treaties with the United States and other Western nations undermined the TOKUGAWA SHOGUNATE and paved the way for the MEIJI RESTORATION.

Harris died in New York City in 1878.

JOHN F. MURPHY, JR.

Hart, Robert

(1835–1911) *British diplomat, Chinese official*

Sir Robert Hart was a remarkable Englishman who served both Great Britain and China. He began working in China in the British consulates at Ningbo (Ningpo) and Canton and rose to become the Inspector-General of the Chinese Imperial Maritime Customs between 1863 and 1906.

As a result of China's defeat by Great Britain and the Treaty of Nanjing (Nanking), China opened five ports for Western trade in 1842 and established customs offices in the treaty ports to collect duty on imported goods. Shanghai emerged as the premier port, but it was captured in 1853 by rebels of the Small Sword Society, who put the Chinese officials to flight. In the ensuing anarchy, British and American consuls and customs officials devised an ad hoc system of collecting customs dues for the Chinese government. Together with the French and with the approval of the Chinese governor-general of the provinces where Shanghai and Ningbo were located, they established a board of inspectors to perform the task.

Since Great Britain was the principal trader with China, the inspector-general was always a Briton, beginning with Thomas Wade, a Sinologist who soon resigned to pursue his academic work. The second was Horatio Lay, who proved unsuitable and was replaced by Hart in 1863. Under his leadership an international customs service was developed that by 1873 had 252 Britons and 156 other Western nationals. The service expanded as more Chinese ports were opened to Western trade. In 1896 China established a modern postal system and put it under the charge of Hart. The Maritime Customs only become an independent arm of the Chinese government in 1911 under the Ministry of Posts and Communications.

Hart developed a code of conduct for the Westerners who served under him—to learn Chinese, be collegial with their Chinese coworkers, and respectful of Chinese customs, reminding them that they served China. The customs receipts remitted to the Chinese government were important in funding modernizing projects such as the first modern school established under the Zongli (Tsunqli) Yamen, China's equivalent of a Foreign Office that trained interpreters and students in modern subjects. Its officers also accumulated accurate statistics on trade and local conditions in China.

Hart also gave advice to PRINCE GONG (Kung), China's leader in handling foreign affairs, and worked with powerful provincial governors such as LI HONGZHANG (Li Hung-chang) who were interested in modernizing China. He submitted position papers to the Zongli Yamen on modern education, budgetary planning, and even accompanied a group of Chinese officials to Europe in 1866 to observe Western government systems. He also strongly advised the Chinese government to break precedent and establish diplomatic missions in Western capitals. Hart also exerted his good offices in helping China reach peace terms with France during the SINO-FRENCH WAR of 1884–85, which resulted in France gaining Annam, but evacuating its troops from Taiwan and the Pescadore Islands.

A grateful Chinese government awarded him with numerous honors. He also received recognition from Great Britain and most Western nations that traded with China for his role in developing a capable, modern customs service that served all parties with integrity.

JIU-HWA LO UPSHUR

Hawaii

The Hawaiian Archipelago consists of a group of 19 islands and atolls that extend across 1,500 miles of the Pacific Ocean, 2,300 miles from the United States mainland. Eight high islands, located at the southeastern end of the archipelago are considered to be the main

islands. In order from the northwest to southeast they are Nihau, Kauai, Oahu, Molokai, Lanai, Kahoolawe, Maui, and Hawaii.

Scattered across the Pacific Ocean, the Hawaiian Islands are the most isolated from any other body of land in the world. Their isolation and a wide range of environments produced a unique array of plants and animals.

Volcanoes rising from the seafloor formed all of the Hawaiian Islands, with the last volcanic eruption outside of the island of Hawaii occurring at Haleakala on Maui in the late 18th century. Loihi, deep in the waters off the southern coast of the island of Hawaii is the newest volcano. Volcanic activity and erosion carved out unique geological features in the Hawaiian Islands, and if the height of the island of Hawaii is measured from its deep ocean base to the snowclad peak of Mauna Kea, it is the world's fifth highest island.

Anthropologists and historians believe that Polynesians from the Marquesas and Society Islands first settled the Hawaiian Islands around A.D. 300–500 or as late as A.D. 800–1000. Overseas trading and voyaging across Polynesia ebbed and fell, and local chiefs ruled and defended their settlements. Early politics tended toward growing chiefdoms that encompassed entire islands. The historical record indicates that foreigners visited Hawaii before the 1778 arrival of CAPTAIN JAMES COOK, but historians give him the credit for discovering Hawaii because he first plotted and published the geographical configuration of the Hawaiian Islands. Captain Cook named the Islands the Sandwich Islands to honor his sponsor, John Montagu, fourth earl of Sandwich.

After the Europeans, the Chinese were the second group of foreigners to arrive in Hawaii. Beginning in 1789, Chinese employees serving on Western trading ships disembarked and settled in Hawaii. In 1820 the first American missionaries arrived to preach Christianity and teach the Hawaiians “civilized” ways.

Over half of the population of Hawaii is of Asian ancestry, especially Chinese, Japanese, and Filipino, many of them descendants of early immigrants who came to the islands in the 19th century to work on the sugar plantations. These immigrants began arriving in the 1850s, and on June 19, 1868, the first 153 Japanese immigrants arrived in Hawaii.

Throughout waves of immigration and economic development, Hawaiians fought to retain their government and culture. In 1810 King Kamehameha the Great united the Hawaiian Islands for the first time under a single ruler and established a dynasty that governed the

kingdom until 1872. In 1887, claiming misgovernment, a group of American and European businessmen involved in Hawaiian government forced King Kalakaua to sign the Bayonet Constitution, which stripped the king of administrative authority, eliminated voting rights for Asians, and set minimum income and property requirements for American, European, and native Hawaiian voters. These actions restricted the electorate to wealthy elite Americans, Europeans, and native Hawaiians. King Kalakaua reigned until he died in 1891.

Anthony D. Allen of Schenectady, New York, was one of the many African Americans who found their way to Hawaii after Western contact and were warmly welcomed by the Hawaiians. Born in 1774 to a slave mother and a father who was a freeman and a mariner, Anthony was freed at age 24. Like his father before him, he shipped out to China and other ports and finally to Hawaii, where he settled around 1811.

The native Hawaiians called him *Alani*, and he served as steward to Kamehameha the Great and acquired about six acres of land in Waikiki from the high priest Hewa Hewa. He married a Hawaiian woman, and they had children and grandchildren who were Hawaiian citizens. Allen farmed successfully, keeping his own cattle and horses. He ran a boarding house, a bowling alley, and a hospital, having picked up medical skills in Schenectady, where ill or injured seamen and sea captains could recuperate ashore. Missionaries, neighbors, visitors, and native Hawaiians admired him. After a long and prosperous life, Allen suffered a stroke in December 1835, and was buried near his Waikiki house.

After King Kalakaua died, his sister, Liliuokalani, succeeded him and ruled until 1893, when a group of American and European businessmen overthrew her. She had threatened to nullify the Hawaiian constitution and even though she backed down, the businessmen staged a bloodless coup and established a provisional government. They drafted a constitution and declared a republic of Hawaii on July 4, 1894. When William McKinley won the presidential election of November 1896, he reopened the question of annexing Hawaii to the United States. In June 1897 President McKinley signed the Newlands Resolution annexing Hawaii to the United States and submitted it to the Senate for approval.

American historians have usually portrayed the Hawaiians as passively accepting the annexation of their territory and the assimilation of their culture. Current research has revealed that native Hawaiians organized

King Kamehameha the Great united the Hawaiian Islands for the first time and established a dynasty that ruled until 1872.

a massive petition drive to protest the Newlands Resolution. Ninety-five percent of the native population signed the petition, causing the annexation treaty to fail in the Senate.

Although the legality of the Newlands Resolution was questioned because it was a resolution and not a treaty, both houses of the U.S. Congress passed it, and Hawaii became a territory of the United States. Although several attempts were made to make Hawaii a state, it remained a territory for 60 years. Plantation owners found territorial status more convenient because they could continue importing cheap foreign labor, but activist descendants of original laborers finally broke their power by actively campaigning for statehood.

Admitted on August 21, 1959, Hawaii is the 50th state and the only state surrounded by water. It is the southernmost part of the United States and the only state that is located completely in the Tropics. Hawaii is also the only state continuing to grow in territory because volcanoes like Kilauea continue to produce lava flows. The official languages of Hawaii are English and Hawaiian, and Honolulu is its capital and largest city. With a total area of 10,941 square miles and a length of 1,522 square miles, it is ranked 43rd in area of the states.

Hawaii quickly became a modern state with booming construction and an expanding economy. The plantation owners endorsed the Republican Party, which was voted out of office, and the Democratic Party of Hawaii dominated state politics for 40 years. In recent years, Hawaii has implemented programs to

promote Hawaiian culture. The Hawaii State Constitutional Convention of 1978 incorporated specific programs like the creation of the Office of Hawaiian Affairs to promote the indigenous Hawaiian language and culture.

MICHAEL J. SCHROEDER

Herzl, Theodor

See ZIONISM AND THEODOR HERZL.

Hidalgo y Costilla, Miguel

(1753–1811) *Mexican rebel priest*

Lionized as the Father of Mexican Independence and champion of the downtrodden and oppressed, in 1810 the renegade parish priest Miguel Hidalgo y Costilla launched a failed rebellion against the Spanish authorities that ended in his capture and execution. Despite its failure, the rebellion inaugurated an 11-year-long struggle for independence and exposed the deep fault lines of race and class that divided New Spain in the waning days of the colonial period. Akin to the HAITIAN REVOLUTION in terms of the horror it struck into the hearts of the privileged and propertied, the Hidalgo rebellion made glaringly obvious to Mexico's elite the potential dangers of sparking social revolution from below in the fight for political independence. Thus, when independence did come in 1821, it came as a fundamentally conservative transfer of power that preserved the former colony's rigid race and class hierarchies.

The son of a hacienda manager, Hidalgo studied at the Jesuit college in San Nicolás in Valladolid and the Royal and Pontifical University in Mexico City, earning his bachelor's degree in 1774. Steeped in the classics, he also delved into ENLIGHTENMENT thinkers and learned several Indian languages. After entering the priesthood, from 1778 to 1802 he taught and served

as rector at his alma mater of San Nicolás, earning a reputation as something of a maverick and freethinker. Assigned to the backwater village of Dolores in 1803 as punishment for various offenses, he proved as much concerned with his parishioners' material well-being as their spiritual salvation, instructing them in a host of practical enterprises (such as apiculture, viticulture, silk growing, and tile manufacture).

The parish of Dolores lay in the Bajío, the "breadbasket" of the colony just north and west of Mexico City. Over the previous decades, the Bajío had seen the progressive impoverishment of its mostly mestizo and Hispanized Indian population, along with an accumulation of social grievances that would prove crucial in the events to follow. After the crisis of authority sparked by the Napoleonic invasion of Iberia in 1807–08, plots and conspiracies against the Spanish colonial government multiplied. One such plot, set to be launched on December 8, 1810, counted Hidalgo among its participants. Upon learning that the authorities had been informed of the scheme, Hidalgo leapt into action. At around 2:00 in the morning of September 16, 1810, the slumbering residents of Dolores were awakened by the ringing of the church bell. Addressing the assembled crowd in words that will never be known with certainty, Hidalgo, in his famous Grito de Dolores (Cry of Dolores) urged his parishioners to defend their religion and rise up against the bad government of the hated *gachupines* (Spanish).

Grabbing their hoes and digging sticks, the inflamed crowd made its way to nearby San Miguel, gathering recruits as it went. Around noon the next day, in the village of Atotonilco, Hidalgo appropriated from the local church a banner of the dark-skinned Virgin of Guadalupe, the patron saint of Mexico, which henceforth would serve as his movement's emblem and standard. The rebellion snowballed with astonishing rapidity. Looting and pillaging Spanish residences and public buildings, armed with machetes, slings, and farming implements, the crowd had become an impassioned mob of thousands. Around noon on September 28, the ragtag army reached the provincial capital of Guanajuato, where they had their first sustained encounter with the Spanish military. Overrunning the town by sheer force of numbers, the crowd slaughtered some 500 Spaniards, burning, pillaging, looting the granary, and wreaking widespread havoc.

Over the next month, the army continued on its rampage, taking the provincial capitals of Zacatecas, San Luis Potosí, and Valladolid before heading toward

Mexico City, the heart of Spanish power in the Americas. On October 30, 1810, at Monte de las Cruces on the outskirts of Mexico City, Hidalgo's 80,000 to 100,000-strong army defeated a much smaller but formidable Spanish force sent to stop them. At this point, Hidalgo made what many consider his most momentous and enigmatic decision. Instead of following the advice of his lieutenants and sentiments of the crowd and descending into the colony's capital city, he opted to retreat. Scholars continue to debate his reasons, though most consider that he found intolerable the prospect of the mass slaughter that would surely follow.

From this point the movement rapidly lost momentum, as his makeshift army divided and desertions mounted. In March 1811 Hidalgo was captured far to the north in the deserts of Coahuila. Tried and found guilty of heresy and treason, he was executed at dawn on July 31, 1811, his head displayed on a pole atop the ashen walls of the Guanajuato granary. Mexicans celebrate national independence on September 15–16, in commemoration of Hidalgo's Grito de Dolores, even though actual independence did not come until 11 years after the revered priest's fateful cry. More recent scholarship has focused on the social bases of Hidalgo's rebellion and the confluence of social and cultural dynamics that created the most massive popular uprising in New Spain's history.

MICHAEL J. SCHROEDER

Hohenzollern dynasty (late)

The Hohenzollern dynasty was the ruling house of Brandenburg-Prussia and of imperial Germany. The family took its name from the German word *Zöller*, meaning "watchtower" or "castle," and in particular from the Castle of Hohenzollern, the ancestral seat, today in Baden-Württemberg. In 1415 Holy Roman Emperor Sigismund made Frederick VI of Hohenzollern elector of Brandenburg. He and his successors had the right to participate in the elections of the German kings, who

were heirs to the Imperial throne. In 1525 Albert of Brandenburg, grand master of the Teutonic Knights, secularized the order's domains as the Duchy of Prussia.

In 1614 the acquisition of Cleve, Mark, Ravensburg, and the Duchy of Prussia marked the Hohenzollern rise as a leading German power. Frederick William, the Great Elector, defeated the Swedes and obtained Pomerania, the secularized bishoprics of Cammin, Minden, and Halberstadt. His reign brought centralization and absolutism to the still-scattered Hohenzollern possessions. In 1701 Frederick III of Brandenburg secured from the Holy Roman Emperor the title "King in Prussia." The change to King of Prussia was not formally recognized until 1772. The Prussian kings retained their title of elector until the dissolution of the Holy Roman Empire in 1806. The Prussian royal title was a new symbol of the unity of the family holdings.

Frederick William I, through his administrative, fiscal, and military reforms, was the real architect of Hohenzollern greatness. His son Frederick II, called FREDERICK THE GREAT OF PRUSSIA, seized Silesia from Austria, defended his acquisitions during the SEVEN YEARS' WAR, and acquired West Prussia in 1772 as a result of the first partition of Poland. Frederick William II, Frederick William III, and Frederick William IV were, however, mediocre rulers.

The CONGRESS OF VIENNA settlement in 1814–15 resulted in a substantial extension of Hohenzollern territory, and the period 1815–66 was marked by the conflict for domination of Germany.

Frederick William IV, who reigned from 1840, was a draftsman interested in both architecture and landscape gardening. He married Elizabeth of Bavaria in 1823, but the couple had no children. In March 1848 Prussia faced a revolution, which overwhelmed Frederick William. The monarch ultimately succumbed to the movement. He offered concessions, promising to promulgate a constitution. The victory of the liberals, however, was short-lived; it perished by the end of the year 1848. The conservatives regrouped and retook control of Berlin. The king did remain dedicated to German unification, leading the Frankfurt parliament to offer him the crown of Germany on April 3, 1849, which he refused, saying that he would not accept a crown from the gutter.

In 1857 Frederick William suffered a stroke that left him mentally disabled. His brother William took over as regent, becoming King William I upon his brother's death on January 2, 1861. A crisis arose in

1862, when the Diet refused to authorize funding for a reorganization of the army. William resolved that OTTO VON BISMARCK was the only politician capable of handling the crisis and appointed him minister-president.

Bismarck saw his relationship with William as that of a vassal to his feudal superior. Nonetheless, it was Bismarck who effectively directed politics, internal as well as foreign. Under Bismarck's direction, Prussia's army triumphed over its rivals Austria and France in 1866 and 1870, respectively. In the Palace of Versailles, near Paris, on January 18, 1871, William was proclaimed the emperor of a unified Germany. In 1829 William married Augusta of Saxony-Weimar and had two children, Frederick and Princess Louise of Prussia. Upon his death on March 9, 1888, William I was succeeded by Frederick III. In 1858 Frederick married Princess Victoria of Great Britain and Ireland, the eldest daughter of Queen VICTORIA and Prince Albert. The couple had eight children. By the time he became emperor in 1888, he had incurable cancer of the larynx. Frederick ruled for only 99 days before his death on June 15, 1888, being succeeded by his eldest son, Wilhelm (William) II.

A traumatic breech birth left Wilhelm with a withered left arm, which he tried with some success to conceal. Additionally, he may have experienced some brain trauma. Historians are divided on whether such a mental incapacity may have contributed to his frequently aggressive, tactless, and bullying approach to problems and people, which was evident in both his personal and political life. Such an approach certainly marred German policy under his leadership.

In 1881 Wilhelm married Augusta Victoria, duchess of Schleswig-Holstein. They had seven children. Wilhelm's reign was noted for his militaristic push to assert German power. He sought to expand German colonial holdings. Under the Tirpitz Plan, the German navy was built up to contend with that of the United Kingdom. Despite Wilhelm's attitude it is difficult to say that he was eager to unleash World War I. During the war, he was commander in chief, but he soon lost all control of German policy, and his popularity plunged. After the explosion of the German Revolution, Wilhelm could not make up his mind about abdicating. The unreality of this refusal showed up when William's abdication both as emperor and king of Prussia was announced by Chancellor Prince Max von Baden on November 9, 1918. The very next day, Wilhelm fled into exile in the Netherlands, where he died on June 4, 1941.

The Hohenzollern Swabian line remained Catholic at the Reformation. Charles of Hohenzollern-Sigmaringen became prince of Romania in 1866 and king, as Carol I, in 1881. In 1914 Ferdinand succeeded his uncle in Romania, where his descendants ruled until 1947.

MARTIN MOLL

Hong Xiuquan (Hung Hsui-ch'uan)

(1814–1864) *Chinese religious rebellion leader*

Hong Xiuquan was the leader of the most devastating rebellion that swept southern China between 1850 and 1864. An estimated 20 million people died as a result.

The Hong family lived 30 miles from Guangzhou (Canton), where Western influence on China was strongest. Ambitious to bring honor to his family through academic success, he sat for the lowest level civil service exams in Canton in 1828, 1836, 1837, and 1843 and failed each time. He suffered a serious illness and delirium after his third failure, when he claimed being taken to heaven. There, according to his account, he met his Heavenly Mother (Mary), Elder Brother (Jesus), and Heavenly Father (God). God instructed him to return to Earth to defeat the demons and establish the heavenly kingdom.

He equated his vision with writings in the tract that he was given by a Protestant Christian missionary in 1836, titled “Good Words Exhorting the Age.” He obtained more translations of Christian teachings, then went to Hong Kong in 1847 and studied under an American Baptist missionary, Issachar Roberts, but was not baptized.

With this background of personal failure and limited understanding of Christianity, Hong formed a new trinity of God, Elder Brother Jesus, and himself (God's second son); converted friends and relatives; and founded the Society of God Worshipers. His con-

verts were mostly poor people in the southern province of Guanxi (Kwangsi); they destroyed local Buddhist temples and provoked the government to send in an army. A clash in 1850 ignited the revolt, and success led to the establishment of the Taiping Tianguo (T'ai-p'ing T'ien-kuo), or Heavenly Kingdom of Great Peace. Hong became the Heavenly King, and his top lieutenant, Yang Xiuqing (Yang Hsiu-ch'ing), the Eastern King (Yang claimed to be God's third son, the Holy Ghost).

Other followers also received titles as kings and marquises. Early Taiping followers were fanatical believers in Hong's version of Christianity; they hated the failing QING (Ch'ing) DYNASTY and were highly disciplined.

By 1853 the Taiping army had swept over southern China and captured Nanjing (Nanking), which became the Heavenly Capital. There, Hong and his associates issued regulations and laws according to their interpretation of Christianity. But they had no skill in administration and implemented few reforms. Western governments were initially interested in Hong's Christianity and government and sent representatives to Nanjing to investigate. But they were disillusioned by Hong's pretensions as universal king and other bizarre pseudo-Christian teachings and practices.

Rivalry between Yang and Hong erupted into civil war in 1856 and the defeat of Yang. Thereafter, Hong trusted no one except his family members, abandoned himself to pleasures, and became increasingly delusional. The Taiping movement collapsed as Qing supporters led by ZENG GUOFAN (Tseng Kuo-fan) offered reforms and won military victories with Western arms, aided by Western officers. Hong committed suicide as his capital fell.

JIU-HWA LO UPSHUR

Humboldt, Alexander von

(1769–1859) *scientist, author, and artist*

His contemporaries once described Baron Alexander von Humboldt as the “last universal scholar in the field of the natural sciences.” Naturalist, botanist, zoologist, author, cartographer, artist, and sociologist are just a few of the titles that Humboldt earned. His influence resonates throughout the world, but, paradoxically, it is stronger throughout the Americas than in Germany, the country of his birth.

When Baron Alexander von Humboldt visited the United States for three weeks in 1804, just after the LEWIS AND CLARK EXPEDITION had departed to explore the American West, he was the guest of THOMAS JEFFERSON. Jefferson had a scholarly reputation in Europe, and von Humboldt had achieved a reputation as an explorer, scientist, and cartographer. The two men became close friends. Margaret Bayard Smith, wife of the founder of the *Washington Intelligencer* newspaper, described one of these visits in her diary.

Alexander von Humboldt's legacy resonates today as one of the most important achievements in naturalism and science.

Mrs. Smith recorded one of Humboldt's twilight encounters with President Jefferson in 1804 when the President's aide ushered him into the drawing room without announcing him. Von Humboldt found Jefferson sitting on the floor in the middle of half a dozen of his grandchildren. All were so busy playing that for some minutes they did not realize that another person had entered the room. Finally Jefferson stood up, shook hands with his visitor, and said, “You have found me playing the fool, Baron, but I am sure to you I need make no apology.”

Jefferson felt unapologetic enough to romp with his grandchildren in the presence of Humboldt, who like himself, had achieved self-taught proficiency in many scientific fields. CHARLES DARWIN respected him enough to use his journals as a reference during his year-long voyage on the *Beagle* and described him as “the greatest scientific traveler who ever lived.”

Humboldt's journey began in Berlin, Prussia, where he was born on September 14, 1769. His father, an army officer, died nine years after his birth, and his mother raised Alexander and his older brother, Wilhelm. She hired tutors to provide early education grounded in languages and mathematics for the two boys.

When he grew older, Alexander studied at the Freiberg Academy of Mines under the noted geologist A. G. Werner, and he also met George Forester, CAPTAIN JAMES COOK's scientific illustrator on his second voyage, and they hiked around Europe. In 1792, when he turned 22, Humboldt took a job as a government mines inspector in Franconia, Prussia. Five years later Alexander's mother died, and he inherited a substantial estate. In 1798 Alexander left government service and began to plan a travel itinerary with his friend Aimé-Jacques-Alexandre Goujoud Bonpland, a French medical doctor and botanist. They went to Madrid, where King Charles II granted them special permission and passports to explore South America.

Between 1799 and 1805 Humboldt and Bonpland explored the coasts of Venezuela, the Amazon and Orinoco Rivers, much of Peru, Ecuador, Colombia, and Mexico. Much like their American counterparts Lewis and Clark, they collected plant, animal, and mineral samples, studied electricity and discovered the electric eel, extensively mapped northern South America, climbed mountains, observed astronomical events, and performed many scientific observations. While he investigated the reasons for the dry interior of Peru, Humboldt discovered a cold ocean current that runs along much of the western coast of South America. It is now known as the Humboldt Current

or the Peru Current. Carlos Montufar, a scientist who later became a revolutionary in Ecuador, accompanied the pair on part of their trip.

Humboldt enjoyed many distinctions. He was the first European to witness native South Americans preparing curare arrow poison from a vine and the first person to recognize the need to preserve the cinchona plant, the bark of which contains quinine used to cure malaria. He was the first person to accurately draw Inca ruins in South America at Canar, Peru, and he also was the first person to discover the importance of guano, dried droppings from fish-eating birds, as an excellent fertilizer.

In 1804 Humboldt went to Paris and chronicled his field studies in 30 volumes. He stayed in France for 23 years and regularly met with other intellectuals. Eventually he depleted his fortunes because of his travels and self-publishing his reports. In 1827 he returned to Berlin and secured a steady income by becoming adviser to the king of Prussia. From 1827 to 1828 he gave public lectures in Berlin, and his lectures were so popular that he had to find huge halls to hold all of the people.

In the 1830s the czar of Russia invited Humboldt to Russia, and after he explored the country and described some of his discoveries, including permafrost, he recommended that Russia build weather observatories across the country. Russia built these weather stations in 1835, and Humboldt used the data from them to develop the principle of continentality, the concept that the interiors of continents have more extreme climates because of the lack of the moderating influence from the ocean.

At the age of 60, Humboldt traveled to the Ural Mountains in Siberia and to Central Asia to study the weather. He wrote extensively about his travels and discoveries. One of his books, *A Personal Narrative*, inspired Darwin. As Humboldt made more scientific discoveries, he decided to write everything known about the Earth. He titled his work *Kosmos* and published the first volume in 1845, when he was 76 years old. His work was well written and well received, and the first volume, a general overview of the universe, sold out in two months. His other volumes explored topics including astronomy, Earth, and human interaction.

Humboldt died at age 90 in 1859, and the fifth and final volume of *Kosmos* was published in 1862, based on his notes. He is buried in Tegel, Germany, and his name is commemorated in a few places in his native country, including in front of the Humboldt University in Berlin and on his grave in Tegel. Many landmarks in the Americas, including a current, a river, a mountain

range, a reservoir, a salt marsh, parks, and many counties and towns are named for Humboldt. On the Moon, Humboldt's Sea is named in his honor.

CARYN E. NEUMANN

Hundred Days of Reform

The inadequacies of the SELF-STRENGTHENING MOVEMENT adopted by the Qing (Ch'ing) government of China convinced many educated Chinese that only thorough institutional reforms could save the nation from the expansionist ambitions of the Western powers and Japan. In 1895 defeat by Japan and the humiliating TREATY OF SHIMONOSEKI provided the catalyst that stirred into action a group of candidates who had gathered in the capital, Beijing, for the triennial metropolitan examinations. One of the candidates, named Kang Youwei (K'ang Yu-wei), penned a long memorial to the throne protesting against the treaty and urging immediate reforms; it was cosigned by 603 of the candidates and gained widespread attention. Eliciting no response, Kang and his student Liang Qichao (Liang Ch'i-ch'iao) began to organize study societies in Beijing and other major cities, sponsoring lectures and founding newspapers and magazines with the goal of promoting modernization and political change. By 1898 their study societies had galvanized a sizable number of reform-minded intellectuals into a political force.

Meanwhile, the young emperor GUANGXU (Kuanghsu), who had nominally assumed the reins of government, began to show sympathy for the new reform ideas and read many of Kang's memorials and other works. He was particularly impressed by Kang's accounts of reforms under Peter the Great of Russia and in MEIJI Japan. As a result, he appointed him and his supporters to important government positions. Between June 11 and September 16, 1898, over 40 reform decrees were

issued by the emperor that encompassed such areas as education, government administration, military reorganization, economic development, and the budget.

Although there had not been time to implement most of the reforms, they nevertheless alarmed the Confucian conservatives and officials loyal to the ostensibly retired but still powerful dowager empress CIXI (Tz'u-hsi). On September 21 Cixi and her supporters mounted a successful coup d'état that stripped Guangxu of all his powers and put him under arrest. Six reform leaders were executed while Kang, Liang, and a number of others escaped and went into exile. The 103 days of euphoric reforms came to an end. All the reforms were rescinded. In the final analysis the idealistic reformers had no political experience or support from the real power holders in the government. They overestimated the ability of Guangxu to override the authority of Cixi while underestimating the opposition of the die-hard conservatives. Their ambitious program, lacking a well-thought-out strategy, was too radical for the time. Although some feeble attempts at reforms were made during the next

decade China continued its downhill slide toward diplomatic disaster and domestic instability.

As a result of the failure of the Hundred-Day Reform, disillusionment with evolutionary transition to a constitutional monarchy led to widespread support of Sun Yat-sen's call for the overthrow of the Qing, or Manchu, dynasty. The final outcome was the successful revolution of 1911 and the establishment of the first republic in Chinese history.

JIU-FONG L. CHANG

immigration, North America and

North American immigration led to the gradual unfolding of settlements throughout the continent. Spain settled St. Augustine, Florida, in 1565 and New Mexico in 1598. France settled Acadia in 1604 and Québec in 1608. New Orleans dates from 1718. New Spain and New France grew slowly, if at all, as did also New Sweden, New Netherlands, and other European efforts. From 1607 on, only England had success in attracting large enough numbers of immigrants to take control of the continent.

In 1688 the total population of the English colonies was 200,000, mostly British. In the next century the population doubled approximately every 25 years. Between 1700 and 1770, 260,000 Africans, 50,000 white convicts, and 210,000 white voluntary immigrants came from Europe to British North America, as did about 80,000 Scots-Irish and about 70,000 Germans.

The British allowed into their colonies anyone who wanted to immigrate. Mostly, the migrants to British North America were English, but from the beginning there were representatives of virtually all western European countries. Europeans came for adventure and to escape harsh conditions at home—war, pestilence, and famine. Africans came as slaves. Some of the Scots-Irish left northern Ireland because of the negative economic effects of the Navigation Acts of the 1650s and 1660s. Getting to North America was arduous because of the nature of transportation, but the indenture sys-

tem made emigrants of those who could not otherwise afford it.

After Thomas Malthus's *Essay on the Principles of Population* argued that the British population was growing faster than food production and that inevitably a large number of the British would starve, the government performed a census, counting over 10 million people and estimating that this was double the population of 1750. The shift of British agriculture to scientific farming made many farmworkers unnecessary. To survive, many British farmers moved to the cities, where they became surplus city dwellers. Then they emigrated to Australia, New Zealand, South Africa, and North America.

At the time of the AMERICAN REVOLUTION, there were 2.5 million people in the colonies, 22 percent slaves. Another quarter million were Scotch-Irish, and 200,000 were German. There were about 25,000 Roman Catholics and 1,000 Jews in an overwhelmingly Protestant population. Several thousand French opponents of their revolution came to the United States in the 1790s. In the years just before and after the Revolution, 15,000 Scots settled in North America.

Restrictions on immigration began as early as the 1790s, with the enactment of the 1790 act requiring a two-year residency for citizenship and the 1795 increase of the residency requirement to five years. The ALIEN AND SEDITION ACTS of 1798 included a Naturalization Act that changed the waiting period to 14 years and an Alien Act that authorized the president to deport any

“Leaving Old England for America”—an illustration depicting immigration in Harper’s Weekly in 1870

foreigner he deemed a threat to American interests. The Alien Act expired in 1800, and the Naturalization Act was repealed in 1802.

Between 1812 and 1920, about 30 million Europeans came to the United States. Another 700,000 came from Asia, and about 900,000 from Latin America. In 1820 the U.S. population of 9.6 million was predominantly English and Protestant, with about 2 million enslaved African-Americans. By the 1830s another 150,000 northern Irish and English immigrants had come to the United States.

The migration from England increased markedly after 1830, as a farm depression hit. Displaced farmers headed for Liverpool, which became the number-one European debarkation point in the 1830s. In 1830 about 15,000 people left from Liverpool; by 1842 the number was 200,000, a figure equal to half the European emigrant population.

Immigrant totals from the 1840s to the 1920s included 6 million Germans, 4.5 million Irish, 4.75 million Italians, 4.2 million British (English, Scottish, Welsh), 4.2 million Austro-Hungarians, 2.3 million Scandinavians, and 3.3 million Russians and Balts. The MEXICAN-AMERICAN WAR’s aftermath incorporated 75,000–100,000 Mexicans into the United States in California, Texas, New Mexico, and Arizona.

Immigrants came for free or cheap land. After the frontier closed in 1890, they came for jobs in America’s industrial sector that promised higher wages than at home. They came due to the availability of cheap passage—such as the 17th-century indentured servitude system and the credit-ticket system of the 18th century. Late in the 19th century, the switch from sail to steam allowed faster voyages by larger vessels, reducing the cost and hardship of passage.

Immigrants came for promises and hopes—after the AMERICAN CIVIL WAR, states and railroads began sending agents to Europe to attract settlers to their vacant territories. And labor recruiters as well as immigrants told the folks back home of the American land of milk and honey. Between the 1840s and 1870s Germans and Irish predominated, and between 1854 and 1892 Germans were number one every year except three, when Irish predominated. Between 1810 and 1855 about 2.5 million Irish came, and more than 3 million Germans migrated between 1820 and 1880.

THE IRISH

The Irish migration was ongoing through the 18th and 19th centuries, but it accelerated after the potato blight of 1845 destroyed about 75 percent of the Irish potato crop. The loss of the potato meant hard times for the 4 million Irish who depended on it for their primary source of food. The blight returned in 1846, and 350,000 people died of starvation and typhus that year. Although the crops for the next four years were good, death continued its toll on the Irish. The IRISH FAMINE killed 1 million people. Blaming it on the British government and absentee property owners, the Irish began to migrate. In 1846, 92,000 came to the United States. That number rose to 196,000 in 1847, 174,000 in 1848, 204,000 in 1849, and 206,000 in 1850. By 1854 about a fourth of the Irish population—2 million people—had come to the United States in 10 years. The 1850 census reported 961,719 Irish-born Americans living in New York, Pennsylvania, Massachusetts, Illinois, Ohio, and New Jersey. Despite the efforts of the Irish Emigrant Society, most Irish immigrants lacked the money for transportation, land, or

tools in the interior, so most Irish remained close to their ports of arrival.

Irish Americans used the political machine to dominate many eastern and midwestern cities. From a means to protect the ethnic community, the machines became a mechanism for Americanizing. In Chicago, Boston, San Francisco, and New York, Irish accounted for up to 30 percent of city workers, and they were overrepresented in construction, particularly in skilled union trades. Only 10 percent of the Irish returned to Ireland.

GERMANS AND EASTERN EUROPEANS

While the Irish were coming in droves in the 1840s, political turbulence in Germany led to a major influx from that country. Germans had been in North America from colonial times, but the unsuccessful REVOLUTIONS OF 1848 led to a major migration of more than 1 million people in a decade. The revolution's leaders were among the migrants, but most emigrants were ordinary people leaving a country in economic and political disarray. By 1860 over 100,000 German immigrants lived in New York City. They had 20 churches, 50 schools, 10 bookstores, and two German-language newspapers. Chicago had about 130,000 Germans and enjoyed German bands, orchestras, and a German-language theater. Milwaukee, St. Louis, and Cincinnati also had large numbers of Germans.

German Jews began arriving in the 1850s. They were successful as both large and small entrepreneurs. In 1890 about half the German Jews in the United States workforce were businessmen. French migration resumed in the 19th century. Like the Germans, many fled the failed 1848 revolution. In 1851, the French influx exceeded 20,000, and a French-language paper opened in New York. Other French-language papers were published in Charleston and Philadelphia. The FRANCO-PRUSSIAN WAR cost France Alsace-Lorraine and increased French migration, particularly to the cities of New York, Chicago, and New Orleans but also to the Middle West. Between the gold rush of 1848 and the CHINESE EXCLUSION ACT of 1882, about 300,000 Chinese came to the United States. Chinese push factors included increased taxes, social dislocation, a restrictive economy, and poverty.

Southern and Eastern Europeans began to dominate in 1896. Russian immigration began after the 1881 pogroms against southern Jews after the assassination of Czar Alexander II. Intermittent pogroms continued through the end of the century. Immigrants who believed that the path to success involved hard work and loyalty tended to acculturate. By modeling themselves after American entrepreneurs, they would find acceptance.

Those who intended to remain for a long time built collective institutions—communities within the greater American community. They emphasized strong families and built churches, lodges, unions, businesses, political organizations, and other institutions. The immigrants were Catholics, Protestants, Buddhists, and those of no particular faith. Immigrant churches maintained their ethnic identities, and each group had its own, where they worshipped in their own language and customs.

The Roman Catholic Church accommodated to the desire of eastern and central Europeans for parishes reflecting their national languages and practices—including saints, schools, hospitals, and festivals—not those of the Irish-dominated American Church. Lutherans from central Europe and Scandinavia built their own churches, schools, and hospitals. They resisted Americanization, ecumenism, and American-inspired revivalism. The Orthodox from Greece, Russia, and the Balkans began arriving in the late 19th and early 20th century. Although the Russian Orthodox mission in Alaska dated to 1794, the late 19th-century migrations made the church significant in most large American cities, as it attracted particularly Ukrainians who lacked churches of their own.

ITALIANS

While some immigrants acculturated, others maintained their ethnicity. Italian immigration began after 1870. Low wages, high taxes, and overcrowding pushed rural Italians with little education to migrate. Between 1890 and 1900, 655,888 arrived, two-thirds men, most intending to work until they could afford to return to Italy. Because they intended to return home, their incentive was to retain their home cultures, not become Americanized. Other sojourners included the Chinese and Japanese—over half of the Chinese in California and Japanese in HAWAII before 1930 returned home. The Italian return rate was 60 percent. Not all groups gained access to the political system, but all found economic roles. Denied political access, the Chinese found their niche in service sectors; the Japanese were fruit and vegetable farmers, and the Jews dominated the garment industry.

As in colonial days, Canada remained population poor, whether in the French or the English provinces. Canada finally began to attract immigrants in significant numbers in the 1890s—simultaneous with the European population explosion and the closing of the frontier with its free or cheap land in the United States. Strong leadership by Wilfred Laurier and Clifford Sifton in the 1890s led to an aggressive campaign promoting western Canada in Europe, Britain, and the United States, modeled on

the advertising of the railroads and states of the United States that helped to populate the Midwest and GREAT PLAINS areas. Sifton also forced the railroads to surrender their land grants that they had refused to open for settlement. The program began to be effective after the turn of the century, with over 750,000 immigrants from the United States between 1900 and 1914, including newcomers as well as settled citizens. Canadians began to worry about U.S. domination of western Canada's culture, economy, and politics.

An estimated 30,000 escaped slaves migrated to Canada via the Underground Railroad. While Canada had no slavery, many escapees found discrimination similar to that of northern American cities. Many settled in southern Ontario, creating many African-Canadian communities. Canadian authorities generally found reason to reject the late 19th-century and early 20th-century black applicants, who were few in number because black Americans were too poor to emigrate, unlike the white settlers from the Great Plains, who came to Canada experienced and well-financed.

JOHN H. BARNHILL

Indian Mutiny

The Indian Mutiny was the most traumatic single event to mark the British experience in India, from the first appearance of the BRITISH EAST INDIA COMPANY in the early 17th century to the end of Britain's Indian empire in 1947. Most shocking of all, it took place among the troops, whose loyalty had been the mainstay of British power since its sepoy (infantry) and *sowars* (cavalry) had won England dominance in India in the Battle of Plassey in 1757. The Muslim and Hindu sepoy were offended by the rumored use of pig and cow fat as lubricants for cartridges, which they viewed as sacrilegious. There was a deeper force driving the insurrections, however: reaction to rapid social change brought by the British to India.

The mutiny began in the cantonment (garrison) of an Indian cavalry regiment on May 10, 1857, at Meerut. The mutinous soldiers then headed for nearby Delhi, where the

last impotent monarch of the MUGHAL DYNASTY, Bahadur Shah II, resided with the vain hope that he could revive the empire of his great predecessors. However, from the very beginning, the Indian Mutiny was not the apocalyptic uprising of native troops; most of the rebellion was confined to the high-caste Hindu soldiers of the Bengal army, who had shown signs of dissatisfaction for years at their caste slowly losing prominence. The rebellion spread throughout north-central India, and cantonments in Cawnpore and Lucknow were besieged by the mutineers. It did not spread to the new regions of the empire, like the Punjab, with its Sikhs, or the Northwest Frontier, with its Pashtun population, because the Hindus and Muslims of those regions had been anti-Mughal.

The bloodiest single incident of the mutiny took place at Cawnpore, where the British cantonment was besieged by rebels under the command of Nana Sahib, who had nursed a grievance against the East India Company. Major-General Sir Hugh Wheeler was in command at Cawnpore and was unprepared for what was to come. Although the news of the mutiny had spread, Wheeler took no precautions to protect his men, women, and children. On the night of June 4, 1857, the sepoy at Cawnpore mutinied. However, just as at Meerut, in spite of the hostility of their fellow soldiers, some Indian sepoy cast their lot with the British.

By June 25 Wheeler surrendered to Nana Sahib, accepting his promises of safe conduct. But when on June 27 the British marched out to the boats that would supposedly take them to safety, they were attacked by Nana's men, and none escaped. Those who survived were imprisoned in what would become known as the Bibigarh, the "House of the Women," since most of the men were already dead; the women were murdered later. When the British recaptured Cawnpore, the atrocities so horrified the troops that they exacted grim retribution.

While the tragedy at Cawnpore was being played out, Sir Henry Lawrence managed to hold out in the British Residency at Lucknow with a garrison of some 1,800 British men, women, and children, and some 1,200 Indian sepoy. Once again, Indian soldiers had chosen to remain loyal to their officers. Although Lawrence was killed on July 4, the defenders held out against some 20,000 mutineers in one of the great epics of British history. Finally, on November 9, 1857, General Colin Campbell, who had earned fame at the Battle of Balaklava during the CRIMEAN WAR, led a relieving column that smashed the rebels still besieging Lucknow.

Meanwhile, the final phase was being played out in Delhi, where the mutineers from Meerut had headed. Delhi fell on September 20. Mopping-up action contin-

ued to 1858. Its end also spelled the end of the Mughal dynasty and the British East India Company.

JOHN F. MURPHY, JR.

Industrial Revolution

The term *Industrial Revolution* has been used to describe the most extensive change the world has ever experienced. It was coined by English philosopher John Stuart Mill (1806–73) but brought into popular use by English historian Arnold Toynbee (1889–1975). The most significant aspect of the Industrial Revolution was that it changed much of the world from a collection of separate agrarian communities into interconnected industrialized cities. In the process, much of the work that had been done by human hands for centuries was performed by machines, which were faster and more efficient than humans could ever be. While many scholars accept 1760–1850 as the official period in which the Industrial Revolution took place, it actually continued into the 20th century in parts of the world and continues to evolve in developing nations into the 21st century.

The Industrial Revolution is said to have actually started in England during the early 18th century when Abraham Darby at Madeley, in Shropshire, in the west of the country, and others, became involved in improving the production of iron, as well as improving its quality. This led to the building of ironworks, and later steelworks, in some parts of England, with charcoal use being phased out, and with coke iron being used to increase the production of iron and then steel. Much of this development took place close to the coalfields in the Midlands and also in the north of England. By 1770 there were over 170 steam engines being used in various industries around Britain, and in 1775 James Watt started to develop his first steam engine, which generated much more power using far less fuel than before. Watt's design helped manufacturers such as

Matthew Boulton produce buttons, buckles, and plate metal cheaply. There were also major developments in the textile industry, with Richard Arkwright developing water-driven mills (although others have claimed to have invented them), with the result that large wool and cotton mills were built in Lancashire. Artisan riots led to the smashing of machines in the Luddite attacks.

Other pioneers during the Industrial Revolution in Britain included Thomas Telford, who worked with canals and locks, and Humphrey Davy, who invented the miner's safety lamp in 1815. Although there was extensive use of child labor and exploitation of the poor, there were also many industrialists who exhibited a strong social conscience. The heavy emphasis on the Protestant work ethic led to Quakers such as John Cadbury (1801–89) and others like Josiah Wedgwood (1730–95) and William Lever (1851–1925) introducing medical care, pensions, and profit-sharing for employees, who were often provided with company housing.

British manufacturing was so important to the British economy by the time of the Napoleonic Wars that the French blockade, known as the "Continental System," which prevented the sale of British goods in the European continent, severely affected the British economy. The end of the Napoleonic Wars in 1815 led to a resurgence in British manufacturing, exporting goods to many parts of Europe and South America. This helped create an Industrial Revolution in Scotland during the late 1810s and the 1820s, leading to the building of factories in Edinburgh and Glasgow. The invention of the steam locomotive by George Stephenson in 1833 led to private railway companies building lines throughout the British Isles, starting in the 1840s. Shipbuilding in London, Glasgow, Newcastle, Clyde, Belfast, Hull, and Sunderland developed and became increasingly important to the British economy. Rapid improvements in printing and book production meant that the ideas of the Industrial Revolution spread quickly around the world.

The first part of the European mainland to take part in the Industrial Revolution was Belgium (then a part of France), with William and John Cockerill moving from Britain to establish small factories in Liège, in about 1807. After 1830 Belgium became wealthy due to its iron, coal, and textile industries, and also its railways, which were also constructed by the government. France developed later industrially, with the emergence of manufacturing in northern France and in Alsace-Lorraine. It was not until 1848 that France emerged as a major industrial power.

Some parts of Germany experienced industrial development, with a large pottery industry in Meissen, near Dresden. However, in the 1840s parts of Germany industrialized quickly, especially Dusseldorf in the Ruhr Valley and Saarland, with the shipyards of Hanover and the coal and steel industries at Chemnitz and in Silesia, as well as factories built in Dortmund, Munich, Posen, Stuttgart, and Würzburg. All ensured that Germany became one of the world's major industrial powers by the end of the 19th century, with the Krupp steel works and other businesses selling raw materials and products around the world. Part of the impetus of the Industrial Revolution in Germany was the building of the railway system and the construction of large shipyards. Although there was also industrial development around Prague, the coalfields near Kraców, the textile mills near Łódź, and even in some parts of Russia, such as the Donets coalfields in the Ukraine, industrialization in much of eastern and southern Europe did not take place until the 20th century.

In the United States, inventors such as Benjamin Franklin had developed devices that proved popular, and the invention of the cotton gin by Eli Whitney changed the cotton industry in the southern United States. Gradually, industrialization was centered in the northern states, with the iron, steel, and coal industries and, later, with textiles and food processing, as well as the construction of a vast railway network. This led to the building of factories in New York, Philadelphia, Pittsburgh, Milwaukee, Cleveland, and by the end of the 19th century, Chicago and Detroit. With the large distances between cities in the United States, the telegraph system proved to be exceptionally important with the emergence of Western Union. In the late 1870s the telephone network followed with the invention of Alexander Graham Bell's telephone. Both the telegraph and the telephone systems were rapidly introduced to other countries around the world.

Outside of Europe, there were factories built in Argentina, Brazil, South Africa, India, and China, especially in Shanghai, taking advantage of cheap labor and access to raw materials. The industrialization introduced into Japan after the Meiji Restoration in 1868 was largely organized by the state. This led to the building of foundries, toolmaking, and railways and shipbuilding, but all of this did not begin until well after the start of the 20th century.

JUSTIN CORFIELD

Iqbal, Muhammad

(1877–1938) *Indian Muslim leader*

Mohammed Iqbal was born in Sialkot in the Punjab region of British India on November 9, 1877. His father, Shaikh Nur Muhammad, was a follower of the Islamic school of Sufi mysticism.

Iqbal benefited from the British educational policy and attended the Scotch Mission College at Sialkot, followed by the Oriental College at Lahore. By the time he received his master of philosophy degree, he had mastered English, Arabic, and Persian (Farsi), which before the English conquest of India had been the official language of the Mughal Empire. He also knew the common language spoken in the Northwest Frontier region of India. Iqbal began writing poetry and essays in a style that reflected his many cultural heritages. From the beginning, Iqbal devoted his work to understanding and expressing the place of Muslims in the larger society of India and the world as a whole.

In 1905 Iqbal went to Cambridge, where he became interested in philosophy. Since Germany was the European center for philosophy studies, he went to the University of Munich, where he received a Ph.D. in philosophy on Russian metaphysics. This demonstrated the influence of the Sufism he had learned at home from his father. The dissertation's importance was realized in England, and it was translated into English. In 1908 Iqbal received a law degree in England and returned to India.

Once home, Iqbal tended to avoid the political arena. It was a time of political ferment among both Muslims and Hindus that would ultimately lead to the establishment of separate states for each group. Gradually, Iqbal became ideologically aligned with the All-India Muslim League and its leader, Mohammad Ali Jinnah. In 1926 Iqbal was elected to the Punjabi Legislative Council.

Yet with a belief that would be strongly condemned by Islamic extremists, Iqbal's view of the life of a future Muslim community remained decidedly liberal. To find a basis for Islam to exist and flourish in the modern world, Iqbal believed it was essential for Muslims to return spiritually to the time of the prophet Muhammad when

Islam flourished in its purest form, before the worldlier period of the caliphates. Iqbal's comprehensive vision of philosophy was embodied in his work *The Reconstruction of Religious Thought in Islam*, published in 1930. A second edition was published by Oxford University Press in Britain in 1934. An accomplished poet and scholar, Iqbal drew on the rich heritage of Persian and Urdu poetry to express his belief in the ability of Western and Muslim thought not just to coexist but to enrich each other.

In 1930 as his commitment to a Muslim state grew deeper, Iqbal accepted the presidency of the All Indian Muslim League. However, there is still a dispute whether he envisioned a totally independent Muslim state, as Pakistan became under Jinnah, or one within a larger Indian political entity. In the same year, he went to England to attend an Imperial Round Table discussion on the political future of India and its Hindu and Muslim population. He was recognized as a leader of modern Islamic intellectual life, and while he was in Europe he was feted by the Universities of Cambridge, Rome, and Madrid.

In the 1930s illness forced him to retire from public life and to pursue intellectual interests.

JOHN F. MURPHY, JR.

Irish Famine (1846–1851)

The British called it the Great Famine, the Irish middle class called it the Great Hunger, and the peasantry called it the Great Starvation. Before the famine, Irish farmers grew barley and grain. They raised cattle and dined on beef, dairy products, and potatoes.

Population growth and subdivision of farmland through inheritance—as well as loss of land due to higher rents—slowly shrank the average farm. Fifteen acres was the minimum to produce a crop surplus. Two-thirds of the Irish had fewer than 15 acres. Population pressures after 1815 produced ever smaller holdings and increased competition for land. By 1841 the population was at 8 million, with two-thirds working in agriculture. Eight million Irish were too many.

Half-acre plots became common. Only potatoes could feed a family with half an acre of land. The aver-

Ireland depicted as a woman holding up a sign for help to American ships; her foot rests on rock enscribed "We are starving."

age consumption was between seven and 15 pounds of potatoes a day. Cattle gave way to pigs and plots of cultivated oats, which gave way to rented plots on which potatoes were grown. The potato, introduced in the late 16th century, did well in Ireland's damp climate. It provided the most food per acre, which became increasingly important as the population exploded in the late 18th century. Because *conacre*, the division of land among all sons, reduced farm size drastically, those who lived on farms needed the most prolific potato, Aran Banner. However, Aran Banner was most susceptible to blight. Potato blight had struck Ireland before. A famine in 1741 killed 250,000 people. In addition, between 1816 and 1842 Ireland suffered 14 famines, some partial and some total. Between 1845 and 1848 harvests were poor and summers were wet. The wetness aided the spread of blight. Already stretched thin, the Irish peasants were unable to withstand four successive failures.

The blight of 1845 led the people to plant more potatoes than ever to compensate. They did not expect a second failure, but the one in 1846 was worse; the one in 1847 worse yet. Ireland was preindustrial, and those who failed at agriculture had nowhere to go. The starving flooded towns and cities, bringing typhoid,

cholera, and dysentery. Disease killed more than starvation. Food prices inflated, and landless and penniless laborers rioted, formed secret societies, engaged in crime and lawlessness. The British government valued the right of the owners to collect rents and crops over the needs of the people for food and shelter.

The Coercion Act established martial law and a curfew, and troops and constables safeguarded shipments of food exports. The British imposed their poor laws and expected the Irish to pay for relief. The British established a scientific study of the causes of the failure. What they did not do was establish relief and public works—at least at first. Eventually, private charities and government began providing soup kitchens; by 1847 half the population was eating at public expense. Those owning a quarter acre of land or more were ineligible. Critics accused the government of genocide.

At least 1 million Irish died of starvation or disease. Over 1 million people left Ireland for America and Liverpool. The famine decreased the Protestant share of the population and hastened the replacement of Gaelic, the language of the native poor, with English. By 1851 the Irish population was 6.5 million.

JOHN H. BARNHILL

Ismail, Khedive (Ismail Pasha)

(1830–1895) *Egyptian ruler*

Khedive Ismail was heir to the throne of MUHAMMAD ALI and became khedive (viceroy) in 1863. A keen modernizer, Ismail had grandiose plans to modernize Cairo along French architectural lines as well as to Westernize Egypt. Ismail was against the slave trade and extended Egyptian control in Sudan. During his reign the SUEZ CANAL was opened with great fanfare as well as enormous expense to the regime. Ismail also initiated numerous irrigation projects and built lavish and costly palaces. He used the increased profits from the sale of cotton, Egypt’s main cash crop, to finance his plans. Cotton prices soared when cotton from the United States became unavailable on the world markets owing to the CIVIL WAR. The khedive covered the cost

Khedive Ismail was a progressive leader in Egypt, opposing slavery and seeking to modernize his nation.

overruns by borrowing extensively from foreign banks, especially from the French. Once the United States reentered the market, cotton prices plummeted, and Ismail found his nation deep in debt. He was forced to sell his Suez Canal shares (44 percent of the total stock holdings) at bargain prices to Great Britain, thereby giving Britain controlling interest in the Canal.

As the debts continued to grow, France and Britain established the Caisse de la Dette in 1876 to ensure repayment. Ismail was forced to abdicate in favor of his son Tawfik, a weak and malleable ruler, in 1879. Control over Egyptian debt repayment enabled the two imperial powers gradually to take over Egyptian finances and led to the British takeover of the country by 1882.

JANICE J. TERRY

Italian nationalism/unification

The FRENCH REVOLUTION and the Napoleonic Era unleashed forces that engulfed the whole of Europe. Nationalism became a potent force. Although the votaries of counterrevolution made a valiant effort to check the progressive ideas at the CONGRESS OF VIENNA, Europe was changing fast. The rise of nationalism in Italy and Germany were two major events that dominated European history after 1815. The ideals of liberty, equality, and fraternity from the French Revolution appealed to the people of Italy. The reduction of the number of states into the Kingdom of Italy, Papal States, and the Kingdom of Naples and Sicily, along with introduction of reforms by the Napoleonic regimes between 1796 and 1814 unleashed the forces of nationalism. Joachim Murat, installed by his brother-in-law, NAPOLEON I, as king of Naples and Sicily, even conceived the idea of the Union of Italy in 1815 before Napoleon's defeat. The provisions of the Congress of Vienna once again vivisected Italy. The Bourbons were restored in the south in the form of the Kingdom of Two Sicilies. The Papal States once again ruled over central Italy. Austria dominated Italy by possessing Lombardy-Venetia and having close Habsburg ties with monarchs of various Italian states. Only the northwestern part of Italy, the kingdom of Piedmont-Sardinia, was free from foreign control. The smaller states included the Grand Duchies of Tuscany, Parma, and Modena, where the ruling houses had close ties with the Habsburgs.

Italian nationalism was nurtured at first with a streak of romanticism. Italian authors, particularly Alessandro Manzoni, contributed a great deal toward fostering Italian nationalism. After 1796 the FREEMASONS advocated for a united Italy. Apart from a common hatred of the Austrians, the political and economic advantages at the time of unified administration under Napoleon contributed to the rise of nationalism among Italians.

From 1810 onward, the secret societies that had sprung up in Italy against Napoleonic rule diverted their attention toward the new regimes after the Congress of Vienna. The *carbonari* (literally, "charcoal burners") members, numbering about 50,000, pledged to revolt, signing their names in blood. They had a common goal of national independence and freedom from foreign domination. The Kingdom of Two Sicilies, ruled by King Ferdinand I, felt the onslaught of a *carbonari* army led by General Guglielmo Pepe in July 1820. Pepe, a distinguished military officer, had joined the *carbonari* revolution. A liberal constitution was created, but the following year the revolution was crushed by the Austrians.

The constitution was scrapped, and revolutionaries were arrested. Pepe went into exile for 20 years. The insurrection in Piedmont-Sardinia led by a group of army officers under the leadership of Santorre di Santarosa in March 1821 also was short-lived. King Victor Emanuel I abdicated in favor of his brother, and the new king, Charles Felix, sought Austrian help to crush the revolt. Santarosa, who had become the minister of war at the time of the uprising, went into exile in France after the failure of the revolution.

The July Revolution of 1830 that swept over France had its impact in Italy, where a series of insurrections took place. Francis IV, duke of Modena, with a plan to extend his dominion, had declared that he would not oppose the rebellions. The French monarch, Louis-Philippe, also promised that he would oppose an Austrian intervention. Encouraged by this, the *carbonari* revolutionaries began to rise in rebellion in northern and southern Italy. The duchies of Parma and Modena, along with a sizable part of the Papal States, came under their control. A program of Province Italian Unite was proclaimed. But like the earlier insurrection of 1820s, *carbonari* attempts failed due to Austrian intervention. Louis-Philippe did not come to their aid after an Austrian warning against French intervention. By the spring of 1831 the resistance movement was crushed.

The Risorgimento in Italy would be dominated by three important nationalists, who had separate ideology and strategy, but had the common goal of achieving Italian unification. GIUSEPPE MAZZINI was a political theorist; GIUSEPPE GARIBALDI was a soldier; and COUNT CAMILLO BENSO DI CAVOUR was a politician. Mazzini joined the *carbonari* movement in 1827, but was imprisoned in Savona in 1830. After his release, he appealed to the new king, Charles Albert of Piedmont-Sardinia, to liberate the Italian states from Austrian domination. Although he had joined the *carbonari* as it was developing awareness among Italians, Mazzini was moving away from it.

As an exile in the French city of Marseille, Mazzini set up Giovine Italia (Young Italy) in 1831 for Italian unification. He believed in the power of youth and membership was restricted to persons under the age of 40. By 1833, membership grew to 60,000 people. Mazzini was avowedly anti-royalist and was in favor of a republican form of government. Within his agenda, social reforms played an important part. His vision of a democratic and republican Italy also extended beyond the borders of Italy. The Young Italy movement spread, giving rise to Young Poland, Young

Germany, and other organizations that were merged into a revolutionary organization called Young Europe in 1834.

RAISING AN INSURRECTION

With his political credo of liberty and equality, Mazzini believed in a mass movement to end the dominance of Austria and drive out the ruling houses from the different kingdoms of Italy. In 1832 his attempt to raise an insurrection in a Sardinian army failed, and he was awarded a death sentence in absentia. Expelled from France, he lived in Switzerland and made another abortive attempt in 1834 against Sardinia. After three years, he migrated to London and made the city his base to carry out revolutionary activities. He had become a cult figure and a prophet of European nationalism.

Apart from Mazzini's, another group, called the Neo-Guelfs, was working toward an emancipated Italy. Like the Guelfs of the Middle Ages, the Neo-Guelfs engaged the pope to free Italy from the domination of the German emperor. Their leader, Abbe Vincenzo Gioberti, published a 700-page volume entitled *Il Primato Morale e Civile Degli Italiani* in 1843, in which he outlined federated Italian states under the papacy. Executive authority would be entrusted to a group of princes. A union of Rome with Turin (the capital of Piedmont) would lead the pope to head the federation of Italian states and the army of Piedmont would defend it.

The new pope, PIUS IX, had carried out reforms, raising the hope of liberals. He was highly praised for granting freedom of speech and the press. When the February Revolution engulfed France in 1848, there was a great upsurge of revolutionary activity in Italy. In the Kingdom of Two Sicilies, King Ferdinand II was forced to grant a liberal constitution with a free press and individual liberty. Piedmont, Tuscany, and Rome also had similar constitutions. In Milan and Venice, the respective capitals of Austrian Lombardy and Venetia, there were revolutionary upsurges.

The collapse of Austrian rule in Lombardy and Venetia brought about an upsurge against the Austrians. The economic exploitation of Venetia by Austria fueled the demand for independence. The desire for political change was voiced by all, including manufacturers, bankers, and intellectuals. The Republic of St. Mark was proclaimed in March 1848 under the leadership of Daniel Manin. The Milanese welcomed Mazzini, returned from exile. Mazzini was soon joined by Garibaldi in Milan.

Garibaldi, the revolutionary hero of Italian unification, had joined the Young Italy group in 1833. He shared the political philosophy of Mazzini to a large extent. He was also sentenced to death in absentia for his participation in the abortive rebellion in Piedmont in 1834. He lived as an exile on the American continent and formed the Italian Legion in 1843.

The liberation of Uruguay in 1846 made him a hero. He, along with 60 volunteers, came back to Italy to participate in the struggle for unification and offered assistance to the Milanese. Both Mazzini and Garibaldi proceeded toward Rome, where the adherents of Young Italy had rebelled in November 1848. Pope Pius IX fled to the Neapolitan zone, where a democratic republic was in place. Mazzini was at the helm of affairs and carried out the administration and social reforms with efficiency.

TRIUMPHANT MARCH

It seemed that Italian revolutionaries were on a triumphant march everywhere, and unification was becoming a reality. But it was not to be; the Austrians led a counteroffensive. Charles Albert, the king of Piedmont-Sardinia, had agreed to a constitutional regime and annexed Lombardy along with the duchies of Parma and Modena.

He took command of the Italian forces against the Austrians, but was defeated at the Battle of Custoza in July 1845 and again at the Battle of Novara in March 1849. Albert abdicated in favor of his son VICTOR EMMANUEL II. The defeat of Albert sealed the fate of Piedmont-Sardinia, Lombardy, Venetia, and likely the whole of Italy. Besieged Venice did not withstand. General Pepe, who had returned from exile, and Manin surrendered to the Austrian army in August 1849. The Republic of St. Mark came to an end.

Meanwhile, an alarmed pope appealed to France for assistance. The new Roman republic was besieged, and Mazzini surrendered on July 3, 1849. A crestfallen Mazzini returned to London, where he attempted republican uprisings (Mantua, 1852, and Milan, 1853). They failed but kept national consciousness burning. The heroic defense of the city made Garibaldi a cult figure in the saga of Italian unification.

Italy almost returned to its pre-1948 status, divided into sovereign principalities, with Austrian domination intact. The revolutionary phase of unification was over. It was left to the cautious diplomacy of Cavour, the prime minister of Piedmont-Sardinia, to achieve the task. The kingdom took leadership, had a constitution, and elected a parliament.

Cavour began publishing the newspaper *Il Risorgimento* in 1847, and it became the mouthpiece of movement toward Italian unification. He entered parliament in 1848–49 and subsequently became the premier of Piedmont in 1852. A practitioner of *Realpolitik*, he cultivated a friendship with Britain and France. He even joined the CRIMEAN WAR against Russia on the French side.

Cavour persuaded Napoleon III to sign the Pact of Plombières in July 1858. Napoleon III wanted to change some provisions of the Congress of Vienna and desired annexation of Savoy. Piedmont-Sardinia would be enlarged into a North Italian Kingdom. Austria was defeated in the two battles of Magenta and Solferino in June 1859. Napoleon III was alarmed when Prussia threatened to help Austria. He met with FRANZ JOSEF, and the compromise formula of Villafranca in July 1859 allowed only the annexation of Lombardy but not Venetia with Piedmont.

Popular uprisings in northern and central Italy resulted in the merger of Parma, Modena, Tuscany, and Romagna with Piedmont after a plebiscite in March 1860. Garibaldi landed with his 1,000 Red Shirts and brought Sicily and Naples under his control. Afterward the two states voted to join Piedmont. The troops from Piedmont vanquished the Papal States, except for Rome. In March 1861 the Italian parliament proclaimed the Kingdom of Italy. Only Venice and Rome were outside the orbit of unified Italy. In the Austro-Prussian War of 1866, Italy sided with Prussia and received Venice. Rome voted to merge with Italy in October 1870 after the FRANCO-PRUSSIAN WAR. The city had been abandoned by Napoleon III, and Italian troops easily marched in. It became the capital of Italy in July 1871. Thus the unification of Italy was almost complete. Italian nationalists had not regained possession of Trieste and Trent, and Italy joined World War I, mainly to obtain them.

Iturbide, Agustín de

(1783–1824) *Mexican emperor*

Occupying a place in Mexican national memory as an arrogant self-serving opportunist and failure, Agustín de Iturbide (EE-toor-BE-day) was instrumental in securing Mexico's independence from Spain, after which he installed himself as the new nation's first (and only Mexican-born) emperor, only to be overthrown after a brief and ineffectual reign.

His rule extended for some 16 months: from September 28, 1821, when his so-called Army of the Three Guarantees marched into Mexico City, until his overthrow in mid-February 1823 by a coalition of rebels led by JOSÉ ANTONIO LÓPEZ DE SANTA ANA. His reign as emperor was even shorter—the eight months from his coronation on July 21, 1822, to his forced abdication on March 19, 1823. Unaware that the new congress had declared him a traitor and forbidden his reentry to Mexico, Iturbide returned from exile in Europe and was captured, tried, and, on July 19, 1824, in Padilla, Tamalpais, executed by firing squad.

Born in Valladolid (present-day Morelia, Michoacán), Mexico, Iturbide declined a post in the insurgency of MIGUEL HIDALGO in 1810, instead joining the Spanish royalist forces and helping to defeat the rebellion led by the renegade priest. His royalist military career was undistinguished until 1820, when in response to the liberal Riego revolt in Spain, he switched sides, allied with liberal insurgent leader Vicente Guerrero, issued the Plan de Iguala, formed the Army of the Three Guarantees, and marched into Mexico City unopposed. His politics can be characterized as archconservative, his principal concern with maintaining the status quo and glorifying his person and rule.

His reign had an almost surreal quality. Ignoring the myriad problems confronting the new nation, its economy devastated by more than a decade of revolution and war, Iturbide focused instead on the details of the protocol for his coronation, hiring French tailors to devise suitably regal accoutrements, commissioning artisans to craft appropriately splendid royal standards and emblems for his reign, establishing national holidays to honor the birthdays of himself and his children, making his rule hereditary, and stifling all dissent and criticism to his increasingly autocratic rule. Scholars generally recognize Iturbide's acumen in understanding the general importance for centralized rule and nationalist trappings and symbols in a geographically expansive, newly independent nation-state wracked by division and strife. Yet they also agree that

Iturbide's intolerance toward criticism and self-glorifying symbolism meant little in the absence of coalition-building or genuine engagement with the pressing issues of the day.

Iturbide did achieve one significant diplomatic coup in December 1822 when the U.S. Congress recognized his regime. That same month, JOSE ANTONIO LÓPEZ DE SANTA ANA launched his revolt against the regime in his home state of Veracruz. Iturbide's last significant action as emperor came in January 1823, when he signed a decree permitting the settlement of parts of the territory of Texas by Stephen F. Austin's colony of Anglo-Americans. In 1838, 14 years after his execution, Iturbide's remains were interred in the National Cathedral in Mexico City.

To this day one would be hard pressed to find any public memorial to his rule or person anywhere in Mexico, testimony to the disgraced position Mexico's first and only homegrown emperor occupies in Mexican national memory.

MICHAEL J. SCHROEDER

Jackson, Andrew

(1767–1845) *American president*

Although Andrew Jackson would not be elected president until 1828, the Jacksonian age can be said to have begun on January 8, 1815, when troops under Jackson's command successfully repelled a much larger British force at the Battle of New Orleans, sealing the WAR OF 1812 treaty that had been signed a month before in Ghent, Belgium. Americans greeted peace with a new optimism about the future of the nation, and that optimism helped prompt developments in the public and private sectors that would dramatically change American life. Those changes, however, created a backlash spurred by concerns that the achievements of the generation of the AMERICAN REVOLUTION were being lost. Those who feared economic changes generally cheered the ongoing political democratization that has often been associated with Jackson's name.

MILITARY LEADERSHIP

Andrew Jackson was an unusual figure to be associated with a democratic movement. Born in 1767, probably in South Carolina, to a widowed mother, he participated as a young teenager in the American Revolution and spent some time as a prisoner of war. That experience, coupled with the deaths of his mother and brother from disease (deaths that Jackson blamed on the British), led Jackson to distrust the British and the idea of aristocracy. Nevertheless, Jackson made his place in the world as a lawyer, politician, and slave-

holding planter, ultimately rising to prominence in his adopted state of Tennessee.

Jackson would also assume leadership of the Tennessee militia, leading it during the War of 1812 against those among the Creek Indians who had allied with the British as part of their attempt to resist further American incursions on their lands. After the war, Jackson would be called to service to subdue other Creek and Seminole, and he entered Spanish Florida in pursuit of that goal, causing an international incident, but paving the way for Spain to cede Florida to the United States. His national fame, however, rested on his stunning victory at New Orleans, where he lost just 71 men, compared to British casualties of more than 2,000.

Even as Jackson's men were assembling in New Orleans, a third event that would profoundly shape the age of Jackson was taking place—a meeting of the Federalist Party in Hartford, Connecticut. Although calmer voices would prevail, some of the sentiments voiced during this Hartford Convention approached treason to many Americans, seeming to suggest the utter futility of resisting the British and the need for New England to secede and sue for a separate peace. The demise of the Federalist Party ensued amid public outrage.

EARLY POLITICAL ALIGNMENT

As the Federalist Party faded from the political scene, a group of Democratic-Republicans with nationalist ideas similar to the former Federalists took control of the now one-party nation. These National Republicans embraced a stronger standing army, a series of internal

Andrew Jackson, the seventh president of the United States, rose to national prominence as a hero of the War of 1812.

improvements to aid in the movement of troops and goods, a revenue tariff with protective elements, and, most important, a **SECOND BANK OF THE UNITED STATES** to replace the Federalist's **FIRST BANK**, which the Democratic-Republicans had gleefully allowed to die just five years previously. For a short period after the war, a sense of optimism prevailed, as the leaders of the country began to come together in a common vision of the public good.

That optimism was punctured by the panic of 1819. As the ripples from the panic made their way across America, questions arose as to its source. For many Americans, a properly working political economy would have no panics; therefore, a panic signaled a failure of that political economy, generally the result of the political system giving to some person, or group of persons, special privileges. Their eyes rested on the Second Bank of the United States, to whom many privileges of doing business, including limited liability and the issuance of money, had been given by the U.S. Congress.

The sense of many on the periphery of society that some kind of cabal was controlling the government and privileging the few at the expense of the many was reinforced by the perception that those in Congress exercised unwarranted power in the selection of the president via the congressional caucus. The caucus system would take a hit in 1824, nominating William Crawford of Georgia. Among the other candidates were **JOHN QUINCY ADAMS** and Henry Clay, obvious congressional insiders, but outsiders coalesced around Jackson's candidacy. Jackson won a plurality of both the popular and electoral votes, but since no candidate won an electoral majority, presidential selection returned to Congress's hands. Congress chose Adams as president, and Adams's selection of Clay as his secretary of state caused Jackson's supporters to suspect a "corrupt bargain." For four years, Jackson's supporters seethed, and, in 1828, elected Jackson the clear winner.

In the minds of his supporters, Jackson represented the triumph of the common man; the political races in which he ran certainly drew much greater participation in the political life of the nation. Since the American Revolution, more and more states had eliminated property qualifications for voting. Still, as late as 1824, a number of states did not even poll for the presidency but left selection of electors to their state legislatures. In states that did poll, these November elections were generally held separately from state and local campaigns, and voter turnout was often substantially lower—until the Jacksonian era, when both presidential and local elections began to attract more than 90 percent of eligible voters in some states.

THREE MAJOR ISSUES OF JACKSON'S PRESIDENCY

Jackson's personal belief that he was the instrument of the people emerged from this popular support and played a significant role in shaping his positions on the three major issues that defined his presidency: Indian removal, the nullification crisis, and the Bank war. Indian removal involved the relocation of a number of Native American nations from their lands east of the Mississippi to land in Indian Territory, primarily the modern state of Oklahoma. The plan for removal far predated Jackson, as **THOMAS JEFFERSON** believed such removal would be necessary to buy time for these nations to become "civilized," when they would then be assimilated into European-American society. Rather than move farther west, many of these nations attempted to remain on their lands and resist outright assimilation efforts, even while taking on many European-American ways. Their failure to move west angered a racist electorate,

who sought their lands not as much for greed as for the belief that land secured the independence that was the birthright of white men.

When nations, particularly the Cherokee, resisted, Jackson was willing to do whatever it took to secure their removal. His approaches included political intrigue within Native American nations and defiance of the U.S. Supreme Court, all the while touting his efforts as necessary to save these nations from their demise. Despite his professions of paternalistic concern for the Native people, Jackson got their land for the many small farmers and large planters who desired it for their own livelihood.

Jackson's response to the nullification crisis also illustrates his majoritarian outlook. When South Carolina attempted to defy a federal tariff, claiming the authority to nullify any federal law, Jackson took it as a personal and national affront, even though his ideological sympathies were with South Carolina. Some of his intransigence was rooted in his personal differences with one of the leaders of South Carolina's efforts, his own vice president, John C. Calhoun. His stubbornness on this issue was also driven by his belief that South Carolina was defying the will of the American people. Jackson threatened to use federal troops to prevent South Carolina from enforcing nullification, but he would later sign off on a compromise tariff that met many of South Carolina's demands. As long as South Carolina achieved its ends through the democratic process, Jackson was willing to agree.

The fight over the Second Bank of the United States represented the melding of Jackson's commitment to the will of the people and his supporters' belief that a cabal of men had taken charge in Washington, doling out special privileges to some. Nothing loomed larger in that belief than the creation of the Second Bank of the United States, chartered in 1816 and blamed by Jackson's supporters for the panic of 1819. Jackson's own position on the bank was never clear. As the election of 1832 approached, supporters of the bank realized that if he were reelected, he would be in position to veto the rechartering of the bank that was due in 1836. Bank supporters planned to place the bank up for recharter in 1832. They believed that Jackson would agree to the bank to ensure his reelection; if he opposed the bank, he would sour the electorate, and Henry Clay would be elected and agree to a second recharter bill. Their plan was brilliant but for one false premise—the majority of the American people opposed the bank. Jackson vetoed the bank as a bastion of privileges not afforded to ordinary Americans and won reelection.

SEEDS OF DEMOCRATIC MOVEMENT

Jackson's supporters were deeply ambivalent about the direction that the American economy and society were heading; the increasing importance of the MARKET REVOLUTION economy drove them to support Jackson as a means to limit the market's penetration into their lives and maintain their independence. But if they were pessimistic about the emerging capitalist society and the creation of a plutocracy, they held an optimistic vision of the continued potential of a democratic nation of small producers. The democratic movement that emerged behind Jackson sought to create its vision of the good society, politically giving voice to the majority will of white men and economically resting on the continued dispossession of the lands of native peoples to provide the independent farms of those white men.

Jackson left office in 1837 and died in 1845, but the Democratic Party founded in his wake would continue on. The optimistic spirit of the Jacksonian era would soon be tested by the economic and social transformations of urbanization and industrialization that the Jacksonians proved incapable of preventing and by the great conflagration of the CIVIL WAR.

RICHARD F. NATION

Jefferson, Thomas

(1743–1826) *American president and statesman*

Thomas Jefferson was born on April 13, 1743, at Shadwell in Albemarle County, Virginia. Jefferson's father created the first accurate map of the Virginia colony, and when he died in 1757, he left his son 5,000 acres of land. Jefferson studied under several tutors, and in 1760, enrolled himself in the College of William and Mary in Williamsburg, Virginia. He completed his studies there in 1762. Over the next five years, Jefferson studied law and, in 1767, was admitted to the bar. He practiced law for the next seven years.

In 1769 he was elected to the House of Burgesses and began construction on his home at Monticello. He was married on January 1, 1772, to Martha Wayles Skelton. They had six children, only two of whom survived to adulthood. He published *Summary View of the Rights of America* in 1774, which was his draft of instruction that he felt should be given to Virginia's delegates to the First Continental Congress, but were considered too radical. He was elected as part of Virginia's delegation to the First Continental Congress as a backup.

Jefferson was elected to the committee charged with writing a DECLARATION OF INDEPENDENCE in addition to BENJAMIN FRANKLIN, JOHN ADAMS, Roger Sherman, and Robert R. Livingston. Jefferson drafted the initial document and although the other committee members and Congress made changes to it, most of the document was his handiwork.

The third president of the United States, Thomas Jefferson is seen as the major contributor to the Declaration of Independence.

With his return to Virginia, Jefferson joined the House of Delegates on October 7, 1776. He immediately revised the laws of Virginia. Included in the changes was the Bill for Establishing Religious Freedom, as well as doing away with primogeniture.

Jefferson was elected governor of Virginia on June 1, 1779, by the General Assembly, serving two one-year terms. The office of governor had little power because it was overseen by a committee from the General Assembly. With the loss of the revenue from the export of tobacco and then a drought in 1779 that almost totally destroyed the wheat crop, the colony was suffering. To raise money, the assembly turned to printing money, which only made the situation worse. Jefferson was not interested in serving a third term, but before his replacement could be elected, the AMERICAN REVOLUTION began, brought to Virginia by Benedict Arnold, who had switched his allegiance to the British. Arnold attacked Richmond as well as military stores; Jefferson did not call out the militia in time to protect the city.

With the end of his governorship, Jefferson took some time to be with his family and tend to his farms. He also took time to work on *Notes on the State of Virginia*, which documented geography, productions, politics, and social life in Virginia. His wife died on September 6, 1782. In November he was appointed to the peace commission in Paris, but his services became unnecessary, and the appointment was withdrawn. He was elected to serve in Congress again in June 1783.

While serving in Congress, Jefferson put forward the idea to forbid slavery in the western territories after 1800. He also presented a report on December 20, 1783, on the procedure for negotiating commercial treaties with foreign governments. Because of this report he was appointed to assist Franklin and Adams as they negotiated commercial treaties in Europe; he joined them on August 6.

MINISTER TO FRANCE

Jefferson replaced Franklin as minister to France in 1785 and held the position until he returned home in October 1789, when he was offered the job of secretary of state by President GEORGE WASHINGTON, which he accepted. Jefferson became the first secretary of state in March 1790. During his time in office, he came into conflict with ALEXANDER HAMILTON over the creation of the BANK OF THE UNITED STATES, which Jefferson opposed. Jefferson and Hamilton continued to be at odds throughout

Jefferson's time in office. A point that both men agreed on was that the United States needed to stay neutral during the FRENCH REVOLUTION. Agreeing to stay in office until the end of 1793, Jefferson decided to retire again from public life and return to Monticello.

His retirement lasted only a few years. Jefferson was nominated for the presidency in 1796 but lost to political rival John Adams. During these four years, the Congress passed the ALIEN AND SEDITION ACTS, which Jefferson interpreted as being designed more to attack his own party than to protect the new country. Writing anonymously, Jefferson and JAMES MADISON attacked the acts with the Kentucky and Virginia Resolutions, declaring that the federal government could have no power that was not specifically allowed by the states. In effect, this was the first voicing of the theory of states' rights.

THE PRESIDENCY

In 1800 Jefferson ran for president, and the election ended in a tied electoral vote between him and Aaron Burr. The tie was broken by the House of Representatives, which voted for Jefferson. He was the first president to have his inauguration in Washington, D.C., which he had helped design while secretary of state. Jefferson served two terms from 1801 to 1809. It was during Jefferson's first term that he sent James Monroe to France to purchase the town of NEW ORLEANS; Madison worked out a deal to purchase the entire LOUISIANA TERRITORY for \$15 million. The purchase doubled the size of the country. Jefferson then commissioned Meriwether Lewis and William Clark to lead an expedition into the new territory. During his first term he also sent a naval force against the Barbary pirates and against the sultan of Morocco. In the end a new treaty was negotiated with the sultan that granted the United States more favorable terms than the previous agreement.

Jefferson's second term was marked by war between France and England. The United States wanted to remain neutral and not get involved in the war. Because of the limits and restrictions placed on American merchants by both European powers, the United States found itself in a no-win situation. In an attempt to keep the United States out of war, Congress enacted an embargo on shipments to Europe to get France and Britain to negotiate better trade terms with the United States, which did not happen. On March 1, 1809, Jefferson was forced to end the embargo. Shortly afterward, his second term was over, and he was able to

turn the office and the problems of Europe over to Madison.

After leaving office Jefferson returned to Virginia, where he spent the remainder of his life. The embargo had hurt most of the planters in Virginia, and Jefferson was no exception. Taking on even more debt, he was forced in 1815 to sell his personal library to the government; the collection started the Library of Congress. He also turned over management of his lands to his grandson, Thomas Jefferson Randolph. Jefferson wanted to see a university established in western Virginia. In 1814 he got involved, as a trustee, with the Albemarle Academy, which then became Central College and eventually the University of Virginia. The General Assembly approved funding for the university in 1818, and a commission was formed, with Jefferson as a member, to find a site for the school. The final report was made, and a charter was issued in 1819 for the university, which opened its doors in 1825.

Jefferson suffered another financial setback and set about selling his land to cover his debt. He died believing that his debts would be covered, not realizing that Monticello would end up passing out of the hands of his heirs. Jefferson died on July 4, 1826.

In 1998 evidence came to light suggesting that Jefferson had fathered a number of children with his slave Sally Hemings. While such allegations were not new—as early as 1802 a Richmond newspaper reported that Jefferson lived with a slave named Sally as a concubine—DNA evidence linked Jefferson's family with that of Hemings. While inconclusive in determining the actual parentage, most experts agree that it is unlikely that any member of Jefferson's family other than Thomas Jefferson was the father of Sally Hemings's children.

This highlights Jefferson's complicated views on race and slavery. While a slaveholder himself, Jefferson spoke out against slavery; original wording in the Declaration of Independence condemned the British government for continuing the slave trade; and, as president, Jefferson abolished the slave trade in 1807. His own ownership of slaves appears to have caused him a great deal of internal conflict, and shortly before his death he freed his five most trusted slaves.

DALLACE W. UNGER, JR.

Jiaqing (Chia-ch'ing)

(r. 1796–1820) *Qing emperor of China*

Jiaqing was the name Yongyan (Yung-yen) took as the fifth emperor of the Qing (CH'ING) or Manchu dynasty. He was the fifth son of Emperor QIANLONG (Ch'ien-lung) and was secretly designated as his heir in 1773 because of his character and diligence. The choice was not made public until 1795, when Qianlong announced his intention to abdicate. Although Qianlong abdicated on Chinese New Year's Day in 1796, he continued to hold the reins of power until his death in 1799, relegating the new emperor to ceremonial duties.

Qianlong ruled too long for the country's good, sowing seeds of decay in his declining years and allowing massive corruption to go unchecked. Jiaqing began his actual rule with the arrest and execution of Heshen (Ho-shen), his father's favorite who had abused power and looted the treasury for a quarter century. The inventory of his confiscated holdings equaled about \$1.5 billion. Heshen, however, was the symptom of decay in an empire where corruption had become pervasive. Popular revolts had broken out in several provinces, some organized by religiously inspired secret societies (for example, the WHITE LOTUS REBELLION) that the Banner army units, the once-crack army that had conquered the empire, were unable to put down. The population had doubled during the 18th century to about 300 million, putting unbearable pressure on the available land, leading to food shortages and sometimes famines. The Yellow River flooded 17 times during Jiaqing's reign; relief efforts exhausted the treasury and reduced the national income.

Jiaqing was not a dynamic leader, but he was frugal and hardworking and labored to reduce corruption and waste. For example, he reduced the expenditure of the imperial household and reduced state support for the huge numbers of his relatives and retainers, resulting in an assassination attempt by a disgruntled former recipient of imperial largess in 1813. His policies were at least partially successful, restoring peace and balancing the budget during his last years.

By Jiaqing's reign, Great Britain had become China's major trading partner, accounting for between 70

and 80 percent of all foreign trade through Guangzhou (Canton). In 1793 Great Britain had sent an embassy led by LORD MACARTNEY to obtain better trading conditions, without success. In 1816 a second British mission under Lord Amherst arrived in China to announce Britain's victory over NAPOLEON I and to reopen negotiations. It again failed, due to a mix-up over Amherst's credentials and his refusal to kowtow (prostrate) before the emperor as Chinese court protocol required. Twenty-six years later the issue would be settled by war.

Jiaqing tried to stem the decline of the Qing dynasty, with limited success. He was well educated, a conscientious ruler, and a patron of learning who sponsored the compilation and publication of many works.

JIU-HWA LO UPSHUR

Johnstown flood

The May 31, 1889, flood in western Pennsylvania that devastated the industrial town of Johnstown and nearby communities that were home to 30,000 people left more than 2,200 dead. It was one of 19th-century America's most famous disasters and arguably its worst. Human errors of poor land management, deforestation, inadequate dam maintenance, and incompetent engineering combined with record-setting rains to launch this natural disaster, as telegraphed warnings went unheeded until it was too late.

It began a day after Memorial Day when the South Fork Dam, originally built in the 1850s as part of a canal system and used in the 1880s to create a fishing and hunting resort for wealthy Pittsburgh industrialists, failed after days of heavy rainfall, sending a tsunamilike wall of water racing toward unprepared communities in the Conemaugh River valley below. Within the space of 10 minutes, the torrent, sweeping trees, train cars, houses, and human and animal remains before it, had all but obliterated Johnstown, its iron industry, and most of its homes.

After the flood: A variety of factors, including deforestation and poor land management, caused the Johnstown flood.

This staggering event and its long aftermath of identification, burial, typhoid control, clean-up, and economic recovery attracted national press attention, helping to launch the career of Philadelphia journalist Richard Harding Davis, later a successful globe-trotting author. And it was at Johnstown that Clara Barton, nurse-heroine of the CIVIL WAR, proved the capability of her eight-year-old American Red Cross to respond effectively to disasters, working tirelessly with her staff in the devastated town for five full months.

Governments, communities, and individuals across the United States donated almost \$4 million to the recovery effort, while poet Walt Whitman honored the dead in verse.

Some critics, including surviving victims of the flood, blamed the disaster on the careless selfishness of members of the South Fork Fishing and Hunting Club whose dam had given way. Members of this exclusive men's club included titans of American industry, among them Andrew Carnegie and his lieutenant, Henry Clay Frick, and members of the Mellon family. None of several lawsuits seeking damages for criminal negligence in the deaths, injuries, and monetary losses was successful. However, the Johnstown incident seemed to bolster evidence of indifference by the wealthy and powerful in America's late GILDED AGE. Combined with ongoing LABOR UNION agitation, this view compounded many Americans' sense of growing national inequality and resentment.

The city of Johnstown was soon rebuilt. In 1977, after nine hours of hard rain, a 15-foot wall of water roared through the city, washing away a significant section of Johnstown and killing 76. It was a deadly and ironic coda to one of the nation's most storied disasters.

See also TRANSCENDENTALISM.

MARSHA E. ACKERMANN

Joseph II

(1741–1790) *Holy Roman Emperor and ruler of the Habsburg lands*

Emperor Joseph II of the Holy Roman Empire was the son of Empress MARIA THERESA of Austria and the Holy Roman Emperor Francis I. Joseph II was born in the middle of the War of the Austrian Succession on March 13, 1741. The War of the Austrian Succession began with the death of Maria Theresa's father, Emperor Charles VI, in October 1740. King FREDERICK THE GREAT OF PRUSSIA saw the succession of Maria Theresa as a moment of weakness and determined to attack Austria. The Salic law governing the empire had prevented a female succeeding to the throne, and Charles VI had devoted much of his reign to gaining the acceptance of the European powers to accept Maria Theresa as his successor in spite of her sex. Beseated by the Prussian invasion, the youthful Joseph II may have been his mother's secret weapon in the war. Needing Hungary's help against Frederick, Maria Theresa appeared before the Hungarian magnates at Pressburg, holding the infant boy in her arms, at her coronation there on June 19, 1741. The overwhelming wave of affection for the young mother and son did more to cement Hungary's ties to Austria than any treaty.

Joseph's education was largely supervised by his mother, who saw herself as a child of the ENLIGHTENMENT and chose to rule over Austria and Hungary as an "enlightened despot," a philosopher-queen who desired to better the lives of her subjects. Joseph was therefore raised with the Enlightenment quest for toleration and just government. On the death of Emperor Francis I in 1765, Maria Theresa chose her son to rule jointly with her, which would continue until her death on November

29, 1780. In 1778, Joseph II received his first taste of war with the War of the Bavarian Succession. Two years later in 1780, upon the death of his mother, he began to make policy for the Austrian empire on his own terms. Joseph II became an activist emperor who dedicated his reign to the improvement of his subjects' lives.

With his campaign to improve the life of the peasantry, Joseph pursued a program of land reform that was far ahead of his time. His reformist views had often received resistance from his more conservative mother, and his assumption of the throne became to him a mandate for change. While Czar Alexander II of Russia has gained praise for his abolishment of serfdom in 1861 in the Russian Empire, it is less-often noted that Joseph II of Austria abolished serfdom a full 80 years earlier in 1781. The most revolutionary part of his program was Joseph's insistence that the peasantry be able to purchase land at fair prices and marry without restrictions. Joseph's internal reforms also embodied an embryonic social welfare state more than a century before German Chancellor OTTO VON BISMARCK established one in the German Empire in the 19th century.

In terms of religion, Joseph II showed himself to be a child of the Enlightenment as well. While not apparently a Freemason himself, Joseph showed himself friendly to the doctrines of FREEMASONRY in the empire. Certainly Joseph II was a patron of the great Austrian composer Wolfgang Amadeus Mozart, who entered a Masonic lodge in 1784 and remained a Mason until his premature death in 1791. Joseph also carried out reforms within the Roman Catholic Church. Moreover, he issued his Patent of Toleration in 1781.

While Joseph II showed himself at his best in reforming the empire internally, his foreign policy of expansionism was carried out with a recklessness that had rarely been the mark of the rulers of the House of Habsburg. He had already been instrumental in bringing about the First Partition of the Kingdom of Poland between Austria, Prussia, and Russia in 1772. He pursued various means to ally with Russia for the partition of Turkey and Venice. Throughout his reign, his policy of carrying out ruthless centralization of the empire had steadily increased opposition among the people of the empire. The population was not nearly as progressive as its ruler, and he rubbed roughly against parochial interests and traditions that had remained virtually untouched since the Middle Ages. Much of Hungary was in unrest because of his determination to use German as the official language of the army and empire. As with many reformers filled with zeal, Joseph had displayed a lack of tact.

Joseph was relatively immune to retribution so long as he appeared to rule a strong empire. However, his failures at foreign policy fueled his opponents' perception of him as a weak monarch. Resistance to his reforms, long muted, burst into the open. Throughout the empire, there was upheaval. On January 30, 1790, Joseph II was forced to capitulate on his reforms. A broken man, he died almost exactly a month later, on February 20, 1790. Since he died childless, he was succeeded as Holy Roman Emperor by his brother, who would reign as Emperor LEOPOLD II. Yet as sickness had begun to take its toll in 1789, the FRENCH REVOLUTION erupted in Paris in July. Soon, the ancient institutions of the empire, which he, perhaps sensing the future, had tried to reform, would be struck down by the revolutionary doctrine of "liberty, equality, and fraternity." The upheaval caused by the FRENCH REVOLUTION would strike the Austrian empire with the force of a tidal wave that would make the reforms of Joseph II seem light by comparison.

JOHN F. MURPHY, JR.

Juárez, Benito

(1806–1872) *Mexican president*

Popularly revered as Mexico's greatest and most beloved president, sometimes called Mexico's ABRAHAM LINCOLN, Benito Juárez rose from humble origins to become a towering figure of the mid-19th century. Like his contemporary Lincoln, Juárez overcame his disadvantaged youth, entered the law, became attracted to politics, and by dint of hard work and perseverance became his nation's preeminent political leader. Like Lincoln, Juárez was distinguished by his public morality, honesty, and rectitude; his solemn demeanor and simple dress (in Juárez's case, a plain dark frock coat); deep religious convictions; faith in justice and the law;

and exceptional strength of character. Like Lincoln, Juárez shepherded his nation through the horrors of civil war only to die in office at the height of his political influence. The country's only Indian president and the personification of the country's mid-19th century liberal reforms, Juárez was profoundly committed to the rule of law in a nation historically wracked by corruption, political opportunism, and personalist rule.

Born to Zapotec parents in the province of Oaxaca on March 21, 1806, Benito Pablo Juárez was orphaned at age three and taken in by his uncle, for whom he worked as a shepherd until around age 12. Speaking only rudimentary Spanish, he migrated to Oaxaca City, where he apprenticed to a bookbinder before entering Santa Cruz Seminary, Oaxaca's only secondary school. There, he studied Latin, philosophy, and moral theology in preparation for entry into the priesthood. Disenchanted with the prospect of clerical life, at age 22 he matriculated at the newly established Institute of Science and Arts, studying political economy, mathematics, and natural sciences before receiving his law degree in 1834.

It was during his law studies that Juárez developed his lifelong adherence to ENLIGHTENMENT principles of reason, secularism, individual rights, and republican government. Delving into the rough and tumble world of local politics, he was elected to Oaxaca's city council in 1831, earning a reputation as hardworking, honest, fair, and a rigorous legal thinker. In 1842 he was appointed minister of government and, in 1847, governor of Oaxaca, leaving office in unheard-of circumstances: with a surplus in the treasury. In 1843 he married Spanish-descended Margarita Maza, a union that inverted the country's historical racial-ethnic marriage conventions. After Mexico's humiliating defeat in the War of '47 (MEXICAN-AMERICAN WAR), Governor Juárez declared President JOSÉ ANTONIO LÓPEZ DE SANTA ANA persona non grata in Oaxaca, a slight for which Santa Ana never forgave him. Forced into exile by Santa Ana in 1853, Juárez journeyed to New Orleans, where he joined a group of discontented liberals plotting the dictator's overthrow, a plan that came to fruition in 1855 in the Revolution of Ayutla.

From 1855 until his death from a heart attack in 1872, Juárez was the leading player in his nation's political life, serving as minister of justice, minister of the interior, provisional president headquartered mostly at Veracruz during the War of the Reform, president of the republic, and leader of the national resistance movement against the French occupation. In 1867 he was elected to a third term as president, and, in 1871, to a fourth, dying in office on July 18, 1872, at the age of 66.

In many ways, the life and political career of Mexico's Benito Juárez mirrors that of U.S. president Abraham Lincoln.

A lifelong practicing Roman Catholic, Juárez respected the church and its historic role in Mexican society but believed more strongly in Enlightenment principles of individual rights and the secularization of law and government. Mid-19th-century Mexican liberalism ranged on a spectrum from "pure" to "moderate" (*puros* and *moderados*). More moderate than pure, Juárez envisioned a harmonious coexistence of church and state and saw no contradiction between respect for the nation's religious institutions and a secularized state and judicial system. A strong proponent of education, he oversaw the foundation of numerous schools and colleges and devoted much of his public life to educational reform. He also pursued numerous public health initiatives, consistently exhibiting an abiding concern for the material welfare of the poor and downtrodden. His personal life mirrored his public, his personal letters revealing a man deeply committed to his wife and children.

His critics maintained that during his last years in office Juárez grew increasingly authoritarian and intolerant of dissent, his reelection to a fourth term revealing a man intoxicated by political power. Others argue that his actions must be interpreted in the context of the

period, particularly the regional revolts and uprisings that rocked the restored republic, combined with the country's weak sense of national identity, which required forceful assertion of the supremacy of the central state. His liberal policies violently rejected by many Indian communities, the Zapotec president was Indian in biogenetic terms only. His thinking, indeed his whole being, was Mexican, his political career demonstrating his commitment to transforming the collective rights of Indians in communities into the individual rights of Mexican citizens, a transformation that many Indian communities fiercely resisted. Juárez

left an enduring mark on the nation's political life and, along with Lázaro Cárdenas, is widely considered the most popular president in Mexican history, especially among the poor.

MICHAEL J. SCHROEDER

K

Kader ibn Moheiddin al-Hosseini, Abdul

(1808–1882) *Algerian leader*

Abdul Kader (Abd al-Qadir) was born into a religious family. His father was the sheikh of one of the major Sufi orders in Algeria, and he had a religious education. Abdul Kader led the armed resistance to the French occupation of the country from 1832 to 1847. The leading sheikhs pledged allegiance to Abdul Kader, who was known as Amir al-Monenin (Prince of the Faithful). Abdul Kader was able to unify the Algerian tribes based on the rule of Islam. He levied taxes, minted coins, and supported education with the advice of a council of notables.

Abdul Kader successfully employed guerrilla warfare tactics to defeat the better armed French forces. He defeated General Camille Trézel, who was subsequently replaced by General Bertrand Clauzel. Although Clauzel managed to extend French control over Algerian cities, he was defeated by Kader's forces and removed from command in 1837. The French and Abdul Kader then signed the Treaty of Tafna, whereby the Algerians controlled the territory in the hinterland and the Kabylia in the east, and the French retained control over Algiers, Oran, and Constantine.

In 1839 the French renewed the war. From 1841 to 1847 the new commander, General Thomas Bugeaud, used surprise hit-and-run tactics with superior armaments to put the Algerians on the defensive. Abdul Kader attempted to carry on the struggle from neighboring Morocco,

but the French retaliated by attacking Moroccan ports and land forces. The Moroccan ruler then pledged to limit Abdul Kader's movements. In 1847 Abdul Kader surrendered to the French. The French had developed a grudging respect for Abdul Kader, who was released after several years in prison and given a French pension. He traveled to Istanbul, where he was well received by the Ottomans, before moving to Damascus, Syria. There, he notably saved many Christian lives by granting them safe haven in his own home during the 1860 confessional riots. Abdul Kader died in Damascus in 1882.

JANICE J. TERRY

Kang Youwei (K'ang Yu-wei)

(1858–1927) *Chinese scholar and political reformer*

Kang Youwei (K'ang Yu-wei) came from a scholarly family in Guangdong (Kwangtung) Province in southern China. A child prodigy, he distinguished himself in classical Confucian studies. Deeply impressed with the orderliness and efficiency of the British colonial administration in Hong Kong and Shanghai, he was inspired to take up Western

studies through reading all available translations; they helped him form views on how to strengthen China against the threat of foreign encroachment.

Kang wrote two books, the *Datong Shu* (or Ta-tung Shu, The Great Commonwealth) and *Confucius as a Reformer*. A utopian and syncretic thinker, he redefined the Confucian way to include Western methods to legitimize the inclusion of Western institutions inside the Confucian framework. He also established a school to teach his unorthodox and controversial ideals.

In 1895 Kang went to Beijing (Peking) to take part in the triennial metropolitan examinations. The date coincided with China's disastrous defeat at the hands of Japan and the humiliating TREATY OF SHIMONOSEKI that ended the SINO-JAPANESE WAR. In response, Kang and his student Liang Qichiao (Liang Ch'i-ch'iao) coauthored a long memorial to the throne to protest the peace treaty and to urge the Qing (Ch'ing) court to initiate institutional reforms. It was cosigned by 603 of the candidates also gathered in Beijing to take the exams. Kang passed the exams with flying colors and was appointed to a government position in Beijing.

Between 1895 and 1898 he and his friends established a number of study societies throughout China that sponsored public lectures, translated foreign books into Chinese, published newspapers and magazines, and established libraries and museums. He also continued to submit memorials (a practice he had begun in 1888) to the court with specific recommendations for reforms. Despite objections from conservative high officials, the young Emperor GUANGXU (Kuang-hsu) was impressed with his arguments and granted him an audience on January 24, 1898. Many more followed that culminated in the appointment of Kang and his allies to important positions. For 103 days, between June 11 and September 20, more than 40 decrees were promulgated that mandated thorough reforms in government administration, the military, and education. Inevitably, they aroused strong opposition from inside and outside the court and served as the pretext for the emperor's aunt, the dowager empress CIXI (Tz'u-hsi), to retake control in a coup d'état, put the emperor under permanent detention, and rescind all the reforms.

Kang escaped arrest with the help of British diplomats and continued to write, raise funds and recruit followers against Cixi during his long exile. He never wavered in his belief that a constitutional monarchy was a necessary transition stage from autocracy to democracy in China. As leader of the Constitutional Party, he opposed the 1911 republican revolution led by Sun Yat-sen and was critical of the political system it established.

He was involved in the abortive attempts to restore the monarchy in 1917 and 1923, which tarnished his reputation as a utopian and reformer. But he never abandoned his vision that China could be peacefully transformed into a model democracy by combining the best of both Western institutions and Confucian ideals.

JIU-FONG L CHANG

Khayr al-Din

(1810–1889) *Tunisian and Ottoman reformer*

Khayr al-Din was one of the foremost reformers within the Ottoman Empire during the 19th century. He was of Circassian Mamluk origin and had been brought to Istanbul, where he entered the service of Ahmad Bey, the de facto hereditary ruler of Tunisia.

Khayr al-Din was given a religious and secular education; he studied French as well as Arabic. He was impressed by Western technology, particularly in the fields of transportation and education, which he observed serving as an envoy in France. Like other Arabic reformers of the age, Khayr al-Din believed that Muslim society could assimilate modern technological developments while remaining true to religious tradition and practice. He also supported the earlier TANZIMAT reforms of the Ottoman Empire.

While in the service of both the bey of Tunis and the Ottoman sultan, Khayr al-Din sought to balance French, British, and Italian imperial ambitions in North Africa with the survival of the Ottoman Empire. His diplomacy demonstrated that the Ottoman Empire was not only a passive subject of the diplomatic maneuverings of the 19th century but an active participant seeking to thwart European designs to take territory and establish economic control over the empire. To prevent French incursions into Tunisia, Khayr al-Din negotiated with a reluctant sultan to affirm Tunisian autonomy under the Husaynid family, who, as in the past, would continue to pay the annual tribute to the sultan. After being rebuffed several times, Khayr al-Din's proposals regarding Tunisian autonomy were reluctantly accepted.

In 1860 Khayr al-Din was largely responsible for the promulgation of a constitution in Tunisia whereby the bey became responsible to an appointed council. This was the first constitution to be implemented anywhere in the Ottoman Empire or Southeast Asia. He served as the first president of the council. Conservatives and political enemies opposed the reforms, however, and the constitution was soon abrogated. Nonetheless, in face of mounting economic problems, Khayr al-Din was appointed prime minister in 1873.

A political pragmatist, he did not call for the return of the constitution but did succeed in implementing much-needed fiscal reforms in an attempt to avoid indebtedness to European powers. He also established the Sadiqiyya College with a Western curriculum of sciences and European languages. Many of its graduates later became the leaders of the Tunisian nationalist movement. When he thwarted their imperial designs, the French and Russians both pushed for Khayr al-Din's dismissal, and he was ousted from Tunisia. He then entered the service of the sultan in Istanbul and served as the vizier for a short period. Again, enemies within the army and among religious conservatives forced Khayr al-Din out of government service in 1879. He lived in retirement in Istanbul until his death in 1889.

A devout Muslim, Khayr al-Din wrote a memoir and long political statement, "The Road most Straight to Know the Conditions of the State," in which he discussed the importance of political accountability and the need to integrate Muslim belief and Western ideas. Like other Arab reformers, Khayr al-Din argued that the two were not incompatible.

JANICE J. TERRY

Korea, late Yi dynasty

During the reign of Chongjo from 1776 until 1800, there were major changes in Korea, the first involving the rapid spread of Christianity. When Chongjo died, his 10-year-old son Sunjo became king. The boy's great-grandmother harbored a passionate hatred for Christianity, which was gaining many converts. She arrested many Christians, with the first ordained

Roman Catholic priest in Korea, Chou Wen-mu, giving himself up to the government to try to prevent further persecutions. He was executed, but the repression continued. In 1801 all male government slaves were freed, although slavery in Korea was not abolished until 1897.

King Hongjong (r. 1834–49) was only seven when he became king, and the regency council continued the anti-Christian persecution, executing, in 1839, the first Western resident missionary, who had lived in Seoul for several years unharmed. When Honjong died, there was a succession crisis, and he was initially succeeded by Choljong, who was his father's second cousin. Choljong reigned until his death in 1864. As he had no male heir, there was another succession crisis. A compromise was reached, and Choljong's second cousin once removed became King Kojong, reigning from 1864 until 1907.

By this time trouble began again from traders who wanted to open up commerce with Korea. Occasionally the traders brought missionaries with them. In 1866 massive local hostility against foreign priests saw the French Catholic missionaries go into hiding or try to flee the country. Subsequently, the French sent a naval expedition to seek redress for the murder of some French priests. However, the French admiral who arrived off the coast of Korea was worried about landing his soldiers. Coinciding with the French taking control of southern Vietnam—also after attacks on missionaries—the French were not eager to spread themselves too thinly in Asia.

However, 1866 was important for Korean history for two additional reasons. The American vessel *Surprise* was wrecked off the Korean coast in that year. The American sailors on board were well treated and allowed to leave the country through Manchuria. However, in August 1866 the *General Sherman*, an American trading ship with a missionary on board, traveled down the Taedong River toward Pyongyang. Just before it reached the city, at Mongyongdae, it ran aground and some of the crew were quickly involved in a dispute with local farmers. The rest of the crew managed to rescue them, but the farmers then attacked the ship and killed everyone on board. One of the men involved in this attack was a local resident, Kim Eung Woo, who was the great-grandfather of the Korean communist leader Kim Il Sung. There is a monument on the site commemorating the role of the Koreans in this event.

In 1871 an American expedition was sent to Pyongyang to try to determine the fate of the *General Sherman* and also to rescue any prisoners who might have survived. The Korean government refused to enter into

Yi Un, heir to the Korean throne in the early 20th century, was the last Yi emperor on the Asian peninsula.

negotiations with the Americans, who, after destroying forts at Kianghwa, withdrew.

Soon after this the prospect of war between Korea and Japan was raised. The Japanese had sent an expeditionary force to Formosa (Taiwan) in 1872. Three years later, Japan demanded a trade treaty with Korea and also sent another delegation to China with a similar

request. On February 26, 1876, to avoid a conflict, the Koreans signed a treaty of amity and trade with Japan, granting Japan some extraterritorial rights in Korea. However, a phrase in the treaty affirmed that “Korea being an independent state enjoys the same sovereign rights as Japan.” Japan sent a copy of the document to the new Chinese foreign ministry, which did not raise any objection to the phraseology. Although the Koreans were initially happy with the wording of the phrase, it would come back to haunt them. As Korea was essentially declared totally independent of China, it would allow Japan to interfere in Korean affairs without China being able to raise any objections.

By this time many Japanese politicians and the military were eager to take over Korea. When the British managed to get a concession at Port Hamilton, small islands off the southern coast of Korea, the Japanese prepared their plans for war with China. This broke out in 1894–95 when a rebellion led by the Tonghaks broke out in Korea. To safeguard their property and civilians in Korea, both the Chinese and the Japanese sent in troops. The Korean government quickly put down the rebellion, but neither the Chinese nor the Japanese would withdraw their soldiers. On July 20, 1894, the Japanese, in control of Seoul, seized control of the government.

They used their navy to prevent Chinese troopships from bringing in reinforcements. Both sides declared war on August 1, 1894, with the Chinese quickly building up their defenses in northern towns and cities. The Japanese acted quickly, sending their soldiers north, and on November 15, at the Battle of Pyongyang, 20,000 Japanese soldiers drove 14,000 Chinese soldiers out of the city. The Chinese then withdrew back across the Yalu River, the northern boundary of Korea. At the same time the Japanese drove the Chinese fleet out of Korean waters, and in October, Japanese soldiers crossed the Yalu River with the result that much of the rest of the fighting took place in China, especially in Manchuria and around Weihaiwei. Hostilities continued until the Treaty of Shimonoseki on April 17, 1895, when China was forced to concede territory and also to fully recognize Korean independence, leaving Korea open to Japanese invasion.

In October 1895, Queen Min, who was believed to have led the anti-Japanese faction at the Korean court, was assassinated, and the Japanese were immediately blamed. King Kojong, fearing that he also might be in danger, fled to the Russian legation in Seoul. He made an alliance with the Russians, offering them mining and timber concessions. By this time there was agitation

among many Koreans who wanted an end to Japanese interference. A political group called the Tongnip Hyophoe (Independence Club) was formed by a nationalist called So Chae-p'il. King Kojong returned to the palace and declared himself the emperor of the Tae Han empire. During the Russo-Japanese War of 1904–05, the Koreans tried to prevent the warring parties from using Korean territory but eventually had to allow the Japanese to use bases in Korea to attack the Russians. With the end of that war at the Treaty of Portsmouth, on September 6, 1905, the Western powers accepted Japan's rights over Korea and, in November 1905, Korea was declared a Japanese protectorate.

Emperor Kojong tried to get the European powers involved by sending a secret mission to an international peace conference being held in the Netherlands. The Japanese found out and forced Kojong to abdicate in favor of his son, Sunjong, who assumed the throne in 1907. However, this was not enough for the Japanese, who faced guerrilla attacks from Korean nationalists. Japan eventually forced Sunjong to abdicate in 1910. The Korean army was then disbanded, and Korea was annexed by Japan. The Japanese then ruthlessly crushed

any resistance against them, controlling Korea until 1945, when the country was partitioned.

The former emperor Kojong died on January 21, 1919, and the former king Sunjong died on April 25, 1926, both in Korea. As Sunjong had no children, his half brother, Yi Un, was made heir to the throne. From 1908, when it was clear that the Japanese would take over the whole of the Korean Peninsula, many Koreans went into exile in Manchuria, Siberia, and Hawaii. One of these was a distant member of the Korean royal family, Syngman Rhee, the direct lineal descendant of the third king of the Yi dynasty. In exile, he was president of the provisional Korean Republic from 1919 to 1945. He would become president of South Korea from 1948 until 1960.

JUSTIN CORFIELD

labor unions and labor movements in the United States

From the encyclopedic treatment of the labor movement from the 1910s–1930s at the John R. Commons School, University of Wisconsin, to the emergence of a new labor history in the 1960s and after, scholarly inquiry into the history of labor unions and working people’s movements in the United States has made up a major field of study. The new republic’s founding principle of private property created a situation in which people who lacked land or other material resources to earn their subsistence were compelled to sell their labor in the marketplace and were at a comparative disadvantage with the owners of capital. In order to enhance their bargaining power vis-à-vis business owners, working people organized into various types of associations and unions, a process that went through a number of distinct phases corresponding to larger changes in industry, transport, and markets, in a national economy marked by frequent cycles of boom and bust, which comprises a major chapter in U.S. history.

EARLY YEARS

In the early republic and antebellum periods, most manufacturing was done by artisans in small, often family-owned and -operated shops in cities, towns, and rural areas. Until the 1840s wage labor was rare. The vast majority of the nation’s inhabitants made their living by the soil, while slavery, indentured servitude,

apprenticeship, household production, and other forms of bound labor predominated. Important exceptions were the shoe and textile industries in Massachusetts, New York, and Pennsylvania during the first INDUSTRIAL REVOLUTION in the 1810s and 1820s, in which numerous large factories employing a permanent wage labor force first emerged in North America.

An example is the textile mills of Lowell, Massachusetts, based on the paternalistic Waltham System, in which hundreds of mostly young farm women labored for upward of 70 hours per week under highly supervised conditions, mainly to supplement family income. Because of the small scale of most manufacturing enterprises during this period, the most successful organizing efforts by working people resulted in the formation of relatively small and localized trade and craft unions and associations, which often melded with fraternal societies and benevolent organizations.

By the late 1820s the growth of the factory system, cities, markets, and the expanding scale of many workshops prompted the formation of the nation’s first labor movement. A commonly cited touchstone marking the emergence of a self-conscious working class was the establishment of the Mechanics’ Union of Trade Associations of Philadelphia in 1827, the nation’s first citywide confederation of local trade unions. In the same year in Philadelphia the Working Men’s Party was founded, the nation’s first political party organized specifically to defend and advance the interests of working people. Similar associations and parties were soon established in New York, Boston, and elsewhere.

The period from the late 1820s to the mid-1830s saw a flourishing of workers' associations, trade unions, and workers' political parties in major cities of the Northeast, symbolized by the formation of the General Trades' Union of New York in 1833. Inspired by 18th-century republicanism, evangelical Christianity, broader reformist impulses, and local traditions of autonomy, one of the major goals of these early organizing efforts was to establish a 10-hour workday. Most such efforts failed, as by law and custom employers enjoyed the right to dictate the terms of labor, including the length of the workday.

The issue came to a head in 1835, which saw the first general strike in U.S. history, as carpenters, millhands, stonecutters, hatters, shoemakers, horseshoers, and members of many other trades, male and female, walked off the job, set up picket lines, staged street demonstrations, and assembled in town halls and large open-air gatherings in cities and towns across the Northeast. The spate of organizing, striking, and picketing continued into 1836, a year that saw more than a dozen new unions established in major U.S. cities.

EARLY ORGANIZATION

The surge of labor activism came to an abrupt halt with the panic of 1837, which sent the national economy into a nosedive and threw thousands out of work. The economic depression lasted seven years, severely weakening the bargaining power of workers' organizations. Meanwhile major changes were transforming the face of the nation. Waves of immigrants from Germany, Ireland, Scotland, Wales, and elsewhere in Europe poured into the major cities of the eastern seaboard in the 1840s and 1850s, many heading west with the promise of ample cheap land. The transportation revolution went hand-in-hand with the market revolution, as canals, roads, and railroads made geographic mobility a characteristic feature of the young republic's burgeoning population. Ethnic, racial, and religious divisions compounded the difficulties of forging viable workers' political parties or labor unions, as did a surge in antiimmigrant (or nativist) sentiment among the American-born.

In the late 1840s, exemplifying the reformist impulse sweeping through much of the country in the preceding two decades, a resurgent labor movement coalesced under the banner of national reform, brainchild of former trade unionist George Henry Evans, who built on Jeffersonian agrarianism to envision a nation of small farmers supplied with land by the federal gov-

ernment. During the same period, industrial congresses formed in many of the nation's major cities, exemplified by the National Typographical Union, formed in 1852 and arguably the country's first national trade union. A spurt of organizing in the early 1850s created national unions of upholsterers, railroad engineers, blacksmiths, and other tradesmen. The momentum proved hard to sustain, however. Economic downturns in 1854 and 1857, combined with westward expansion and torrents of new immigrants—2 million in the 1850s alone—intensified nativist sentiments, fragmenting working people by ethnicity, religion, and politics, as well as by region. Still, these years saw major organizing efforts and several important strikes, most notably the Great Strike of 1860, sparked by shoemakers in Lynn, Massachusetts, which spread throughout much of the Northeast, in which some 20,000 workers participated and women played a major role.

The AMERICAN CIVIL WAR transformed the nation's economy in important ways and, with it, the relations among labor, capital, and the state. The state got bigger; big business got bigger; and organized labor struggled to keep up. At one level, the war created the nation's first military-industrial complex. Wartime production surged, as ever-larger factories, North and South, churned out staggering quantities of munitions, uniforms, and sundry other items consumed in the conflict. Federal government spending more than quadrupled from 1860 to 1870 (from \$72 to \$329 million), the vast bulk due to deficit spending, via bonds, to finance the war, expanding the stock market and providing a tremendous boost to the nation's banks and finance capital. Dramatically expanding the size and scope of the federal government, the war also expanded and integrated the nation's markets and its transport and communication infrastructure. In the North, full employment strengthened workers' bargaining power and heightened worker militancy, leading to a surge in labor organizing, with some 300 unions representing 61 trades founded during the war. By war's end, some 200,000 workers belonged to hundreds of trade unions, some of them national and many others aspiring to be.

ORGANIZED LABOR

Organized labor came of age during the Second Industrial Revolution after the Civil War, which reached its height from the 1870s to the 1890s, fueled by large concentrations of finance capital, rapidly expanding markets, a host of technological innovations, and torrents of immigrants pouring in from Europe and Canada and, in the West, from Asia. The growth of major industries

in railroads, steel, and manufacturing and the expansion of consumer goods and labor markets were accompanied by the formation of thousands of local unions and numerous nationwide organizations that competed for the allegiance of the country's rapidly growing industrial labor force. The National Labor Union, founded in 1866, an umbrella organization of trade unionists, agitated for the eight-hour workday and other reforms but never fully got off the ground.

More enduring in its impact was the Noble and Holy Order of the Knights of Labor, founded in 1869, which reached the height of its influence in the mid-1880s under Terence Powderly, with a membership of around 750,000 and lodges in most every county in the nation. More inclusive than other labor associations, the Knights exalted the "nobility of toil" and dignity of labor, opening its doors to all who worked, regardless of race, gender, or social class. Championing the eight-hour day, the abolition of child labor, and the creation of a "cooperative commonwealth" that would replace "wage slavery," the organization under Powderly's idiosyncratic and autocratic rule disappeared by the early 1890s, but not before exercising an important influence on a generation of labor activists and organizers.

UNIONS AND STRIKES

With the economic depression of 1873–79 following the panic of 1873, unemployment skyrocketed, leading to a spate of labor organizing and activism, including the Long Strike of coal miners in Pennsylvania in 1874–75. These events were to prelude one of the signal events in U.S. labor history, the Great Railroad Strike of 1877, in which thousands of railroad workers in Pennsylvania, West Virginia, Maryland, and Ohio put down their tools and disrupted rail traffic to protest a series of pay cuts. The protest, fueled by antimonopoly outrage among broad swaths of the populace, sparked a general strike in major industries that spread rapidly as far west as Chicago and St. Louis and at its height included more than 100,000 workers. Unplanned, unorganized, and without national leadership, the Great Strike lasted more than six weeks and was put down by federal troops at the cost of over 100 workers' lives.

The Great Railroad Strike of 1877, which made headlines across much of Europe as well as the United States, exposed the deepening divisions between working people and big business, as well as the federal government's partisan role on the side of business. In the two decades to follow, in what is commonly known as Labor's Great Upheaval, strikes, labor protests, and labor organizing mushroomed across the country and

in all major industries, especially railroads, steel, and coal mining, but also among slate quarrymen, garment workers, and hundreds of other trades and crafts. The 1880s alone saw more than 10,000 strikes and lock-outs; in 1886–87, union membership reached nearly 1 million.

THE AFL AND THE UMWA

Emblematic of this upsurge in labor activism was the formation of the American Federation of Labor (AFL) in 1886, led by Samuel Gompers, an outgrowth of the Federation of Organized Trade and Labor Unions of the United States and Canada, founded in 1881. An umbrella organization representing hundreds of individual trade and craft unions, the AFL was dedicated to "pure and simple unionism" among skilled tradesmen and focused mainly on "bread and butter" issues of wages, working conditions, and the length of the workday. Spearheaded by the AFL and supported by the Knights of Labor and other organizations, in 1886 upwards of 700,000 workers went on strike, most to press for reduction of the workday to eight hours from an industry average of 12.

The year 1886 also saw the infamous Haymarket affair in Chicago, in which the explosion of a bomb at a huge workers' rally in Haymarket Square killed a police officer, prompting the police to fire into the crowd, killing one protester and injuring many more and later resulting in the hanging of four labor organizers. Major industrialists and financiers, backed by the nation's major newspapers, seized on the Haymarket events to denounce organized labor as dominated by anarchists and terrorists determined to destroy the nation's social fabric. The charge had little factual foundation, although it found plausibility in the past decade's immigration from Germany, Italy, and elsewhere of many seasoned labor organizers influenced by the ideologies of socialism, communism, syndicalism, and anarchism then sweeping across much of Europe. Haymarket and its aftermath had a strong dampening effect on more radical labor organizing efforts.

Political parties devoted to advancing the cause of working people also multiplied in the post-Civil War years, most notably the Socialist Labor Party, led by Daniel De Leon, founded in the 1870s. Some workingmen's parties built their strength on appeals to white workers' racism, such as Dennis Kearney's Workingmen's Party of California, instrumental in pressuring Congress to pass the CHINESE EXCLUSION ACT of 1882. Unlike in Europe, however, the enfranchisement of white male workers made exclusively labor-oriented

political parties less salient, and workingmen's parties never offered a serious challenge to the country's dominant political parties.

In 1890 the United Mine Workers of America (UMWA) was founded in Columbus, Ohio, and in the coming years spread its organizing drives throughout the coal mining districts of Pennsylvania, Kentucky, West Virginia, Illinois, Utah, Colorado, and beyond. Affiliated with the AFL and associated with such legendary labor leaders as "Mother Mary" Jones and John L. Lewis, the UMWA remained one of the nation's most influential unions well into the 20th century. The 1890s also saw two of the most storied events in modern U.S. labor history: the 1892 Homestead Strike and the 1894 Pullman Strike. Both involved entire communities in large company towns, pitched battles between strikers and company-hired armed guards, intervention of state militias and federal troops, and deaths on both sides. Both also ended in defeat for the strikers, and both created a legacy of militancy and sacrifice that became emblazoned onto the collective consciousness of organized labor.

In this mounting conflict between labor and capital, the executive branch of government, at both state and federal levels, actively and consistently sided with business. So, too, did the courts. Emblematic here was the Supreme Court's interpretation of the Sherman Antitrust Act of 1890, a law intended to break up monopolies and trusts by barring combinations in restraint of trade. Instead of targeting business combinations, the courts used the law to weaken organized labor, essentially declaring strikes illegal if they interfered with interstate commerce, which virtually all could be interpreted to do.

FURTHER ORGANIZATION

By the 1890s, especially under the impact of the economic depression of 1893–98, the struggle between labor and capital as mediated by a partisan state was entering a new phase. The very concept of trade or craft unionism, criticized for many years as too narrow a basis for organizing working people, was being increasingly challenged by an emergent industrial unionism, which focused not on individual crafts but on entire industries: steel, mining, construction, transportation, manufacturing, and others. Epitomizing this industrial approach to organizing was the Industrial Workers of the World (IWW, or Wobblies), founded in 1905 and committed to the vision of one big union that embraced all workers everywhere.

As organized labor's tactics and strategies evolved, so too did business's. By the 1890s work was becom-

ing increasingly homogenized and standardized, the labor process itself increasingly under the control and supervision of management—a trend that has generated an extensive scholarly debate on the question of the deskilling of labor with the rise of factories and mass production. If the power of organized labor had grown substantially during the Second Industrial Revolution, the power of big capital had grown far more. Overall, organized labor remained much weaker than business, its victories small and tenuous compared to the victories of the forces arrayed against it.

As the foregoing survey makes plain, the growth of organized labor during the period examined here was neither linear nor continuous. Instead, it was marked by complex ebbs and flows, with periods of growth and advance punctuated by periods of retrenchment and decline. There is a lack of scholarly consensus on how to conceptualize the history of organized labor during these years. Still, many would agree that the period 1870–1930 comprises a coherent temporal unit that witnessed the formation of the modern U.S. labor movement.

Earlier studies of labor history focused principally on organizations and institutions, exemplified by the Commons School of the 1910s–1930s and the work of Philip S. Foner from the 1940s. Around 1960, there emerged in Britain and North America a new labor history (alongside a new social history) that looked beyond formal institutions to examine workers' struggles at the point of production and in the wider community, as well as women's labor history, including unpaid and reproductive labor, and the role of family, culture, ideology, race, gender, and sexuality. From the late 1980s labor studies emphasized languages of labor and discourses of worker protest, action, and culture. Meanwhile, empirically dense scholarship in the tradition of E. P. Thompson and Herbert Gutman has remained a mainstay of the field.

MICHAEL J. SCHROEDER

La Pérouse, Jean-François de Galaup, comte de

(1741–1788) *French explorer and naval leader*

The story of La Pérouse is one of the great mysteries of the sea. Jean de Galaup, comte de La Pérouse, was born on August 23, 1741, near Albi in France. He signed on to the French navy and saw action against the British in the SEVEN YEARS' WAR.

La Pérouse signed on to the second exploration voyage of Louis Antoine de Bougainville, who had made his first exploration in 1763. Bougainville had also fought in the Seven Years' War. When his trip began in 1763, Bougainville sailed with two ships for exploration and discovery, not a naval expedition. The main purpose of Bougainville's travel was to establish the existence of the Malvinas Islands, the Falklands, off the coast of Argentina. He was successful in his mission.

Bougainville arrived back in France in 1764. The success of his trip encouraged King Louis XV to charter another mission to circumnavigate the globe. When the expedition left the port of Brest on December 6, 1766, La Pérouse sailed with Bougainville. Again Bougainville was careful to take with him both scientists and writers, so that the expedition would be carefully chronicled and any new species of flora or fauna be scientifically recorded. On March 16, 1769, Bougainville returned to France to receive the acclaim of the scientific community and the king, who received him personally at the palace at Versailles.

After his voyage with Bougainville, La Pérouse continued his career in the French navy. During the AMERICAN REVOLUTION—which many in France saw as a chance for revenge at France's loss to Britain in the Seven Years' War—La Pérouse undertook a daring attack on British forts on Hudson Bay in the north of Canada in August 1782. La Pérouse took two forts: Fort York and Fort Prince of Wales.

In 1785, after peace had been made in the Treaty of Paris in 1783, La Pérouse was chosen by King LOUIS XVI to follow in Bougainville's footsteps and lead a voyage of exploration. Sailing across the North and

South Atlantic, La Pérouse succeeded in making the tumultuous passage of Cape Horn safely, to emerge into the calmer waters of the Pacific. He stopped off in Chile, which was an ally of France due to the Bourbon family compact. Both Spain and France were ruled by different branches of the Bourbon family. Although the mission was largely exploratory, the Spanish contact showed its military side. La Pérouse then sailed northward, visiting HAWAII and Easter Island. He most likely knew that CAPTAIN JAMES COOK, sailing on HMS *Resolution*, had been killed on the Sandwich Islands in February 1779 in a skirmish with the natives, so it must be assumed that La Pérouse treated them with great caution and, as a career navy officer, was ready for any sudden attack by them.

When La Pérouse reached Alaska in late June, tragedy struck the expedition, as three boats were taken by strong currents, resulting in the loss of 21 men. After his voyage to Monterey, he made an amazing crossing to the Portuguese colony of Macao, off the coast of China. France already had an interest in this region, from the trade of the Compagnie des Indes, which had fought a battle for supremacy in India but lost against the British in the Seven Years' War. In 1787 La Pérouse continued his exploration of the Pacific coast, stopping at the island of Cheju in Korea.

La Pérouse proceeded to Sakhalin Island, where he was impressed by the inhabitants. He wanted to sail his ships between Sakhalin and the Asian mainland but instead felt it more feasible to sail through the body of water between Sakhalin and the most northern Japanese island of Hokkaido. He reached Petropavlosk in September 1787 and began the most critical part of his voyage. He had received secret missions to explore the Botany Bay colony in what is now Australia. While Botany Bay has become better known as a penal colony, it was also an excellent harbor from which the British could begin to explore and claim the islands of the South Pacific—something that the French wished to do.

His next landfall was Samoa, then known as the Navigator Islands. Tragically, his friend de Langle was killed by the Samoans. In Botany Bay, La Pérouse was greeted by the British, who unfortunately had no supplies to spare. He continued on his journey after forwarding his journals and some correspondence home via a British ship. He was headed for New Caledonia, the Solomons, and other areas along the western and southern coasts of Australia, but he was never seen again. An expedition was sent to find him but returned to France without answers. Historians note that for

the French government to utilize resources during the FRENCH REVOLUTION to find La Pérouse, he was clearly an important man.

In 1826 English captain Peter Dillon purchased some swords in Santa Cruz that he thought might have belonged to La Pérouse. Locals told him about the wreckage of two ships nearby, and when Dillon investigated, he found what was left of the ships. He returned some identifiable remains of the ships, and the last surviving member of the original expedition was able to identify them as having come from one of La Pérouse's ships. The story was reconstructed, and historians now believe that the two ships were wrecked on the coral reefs, and some of the men aboard were killed by natives. The others built a small boat in an attempt to find safety, but their boat wrecked probably near the Solomons.

Another theory holds that the two ships were struck by a tropical cyclone, but that the survivors had indeed managed to sail to the Solomon Islands. While archaeological findings are suggestive, they were not definite proof that the ships had belonged to La Pérouse. Thus, like Amelia Earhart after him, the ultimate fate of La Pérouse will most likely remain one of the enduring mysteries of the South Pacific.

JOHN F. MURPHY, JR.

Latin America, Bourbon reforms in

By the late 17th century, the Spanish state had grown ossified, its grip on its overseas empire enfeebled. Trade and production in its American colonies had stagnated, Spain's debts had mounted, and its imperial rivals had grown greatly in power—especially the English, Dutch, and French. Following the death of the heirless Charles II, the last Habsburg ruler of Spain in 1700, the War of the Spanish Succession, and the resulting Peace of Utrecht, the French Bourbon dynasty assumed control of the Spanish Crown. There followed under Bourbon rule a series of reforms intended to reinvigorate the state and empire. The Bourbon assumption of the Spanish throne from 1713 heralded the onset of a host

of changes in law and policy, domestically and overseas—changes that fall under the general heading of the Bourbon reforms.

The overarching goals of the Bourbon reforms in the Americas were to strengthen Spain's dominion and control of its colonial holdings and thus reenergize the empire. These goals were to be achieved by centralizing state power through a series of administrative reforms; increasing production and trade within the colonies; augmenting the revenues flowing into the Spanish treasury; and undermining the power of the Crown's opponents and rivals. Ironically, these shifts in law and policy, intended to bring the colonies more closely under Spain's control—and occurring just as the ENLIGHTENMENT was profoundly transforming the face of the Atlantic world (indeed, the ideological impulse inspiring the Bourbon reforms has been called the Catholic Enlightenment)—ended up having the opposite effect: alienating the colonies' Creole (American-born Spanish) population, intensifying their sense of American nationalism, and laying the groundwork for the wars of independence in the first quarter of the 19th century.

For purposes of analysis, the reforms instituted can be divided by the Bourbon monarchs Philip V, Ferdinand VI, Charles III, and Charles IV into the following categories: economic, political and administrative, military, and religious. The most intensive period of reform began in the 1760s under Charles III. To understand the origins and impact of these reforms, it is necessary to situate them in the context of the major events of the 18th century, especially the SEVEN YEARS' WAR/FRENCH AND INDIAN WAR in North America, the Caribbean, and elsewhere, and the FRENCH REVOLUTION in 1789—the republicanism and tumult of the latter horrifying monarchs across Europe, especially in Spain, and effectively ending the period of the Bourbon reforms in Spain's American colonies.

ECONOMIC REFORMS

Some of the principal goals of the Bourbon reforms were to increase production of primary export products in the colonies and trade within the colonies and between the colonies and Spain. Of greatest concern to the Crown was mining, which provided the bulk of the revenues flowing into the Spanish treasury. In an effort to stimulate silver production, in 1736 the Crown slashed its tax (the royal fifth) in half. It also helped to ensure a lower price for mercury, funded technical schools and credit banks, dispensed titles of nobility to prosperous mine owners, and facilitated the formation

of mining guilds. Similar measures were adopted to increase gold production, especially in New Granada, the Crown's major source of gold.

From 1717 the Crown also created state monopolies on tobacco production and trade. In keeping with the precepts of mercantilism, one of the major concerns of the Bourbon monarchs was to prevent the colonies from producing manufactured goods that would compete with goods exported from Spain. The resulting royal restrictions on industry and manufacturing in the colonies severely dampened colonial entrepreneurial activity, with the exceptions of the export-oriented mining, ranching, and agricultural sectors. A related mercantilist concern was to restrict trade with foreigners, especially the British, and thus ensure that all colonial trade was directed solely to Spain. A long series of laws and decrees were intended to achieve this result, most notably the compendious legal code of 1778, "Regulations and Royal Tariffs for Free Trade between Spain and the Indies."

Many elite Creoles bridled at these and related restrictions, heightening their sense of alienation from the Crown. Similarly, measures to increase production in mining and agriculture generally meant more onerous production and labor regimes for workers and slaves. Overall, the Bourbon economic reforms succeeded in their aim of increasing production, trade, and royal revenues, while at the same time undermining both elite and subordinate groups' sense of loyalty and allegiance to the Crown.

POLITICAL AND ADMINISTRATIVE REFORMS

Accompanying the economic reforms were a host of political and administrative measures intended, again, to increase royal control of the colonies. One set of administrative reforms was to carve two new viceroyalties out of the Viceroyalty of Peru: the Viceroyalty of New Granada (1717 and 1739; a subjurisdiction of New Granada, created in 1777, was the Captaincy-General of Venezuela) and the Viceroyalty of Río de la Plata (in 1776). Following a series of inspections (*visitas generales*) from 1765–71, the Crown endeavored to weaken the power of the Creoles, whose influence, in the view of some, had grown too large.

In pursuit of this aim, *audiencias* were enlarged and their membership restricted to exclude most Creoles. The most substantial administrative reform came in the 1760s and 1770s, with the creation of a new layer of bureaucracy, a kind of regional governorship called the intendancy, which was to report directly to the minister of the Indies. The intendancy system, which threatened

the authority of viceroys and other high administrators, largely failed in its goal of centralizing state control, mainly in consequence of the institutional inertia that had developed over the preceding two centuries and administrators' resistance to relinquishing their authority. To the extent that the cumbersome bureaucratic apparatus was streamlined and rationalized, it was overwhelmingly in favor of peninsular Spaniards (those born in Spain) and to the detriment of Creole Spaniards—again, heightening many Creoles' general feelings of disenchantment with royal authority.

MILITARY REFORMS

Especially in the wake of the British capture of Manila and Havana in 1762 (both returned to Spanish control in the Treaty of Paris of 1763), the Spanish Crown sought to enhance its military power throughout the empire. Efforts to strengthen the military were also rooted in the growing specter of violence from below, most visibly manifest in the ANDEAN REVOLTS from the 1740s to the 1780s. The Crown's response to these crises was to increase the number of troops under arms and the number of commissioned officers. Most such commissions went to Creoles. From 1740 to 1769 Creoles made up about one-third of the officer corps. By 1810 the proportion approached two-thirds.

Elite Creoles could and often did purchase such commissions—a shortsighted policy that augmented both royal revenues and the power of American-born notables. On the other hand, given the extreme race-class divisions throughout the colonies, the Crown was reluctant to arm members of the lower classes. Overall, the military reforms failed in the goal of strengthening the ties between Spain and the colonies by creating a large body of Creole officers who would later prove instrumental in the wars of independence.

RELIGIOUS REFORMS

The alliance and intermingling of Crown and church is one of the major themes of Spanish-American colonial history. In 1753, as part of the broader effort to reassert royal supremacy, the Crown negotiated a concordat with Rome stipulating greater royal authority in the nomination and appointment of ecclesiastical authorities. But the most consequential Bourbon reform in the religious realm was the expulsion of the Jesuits from all of Spanish America (and from Spain) in 1767. By the 1760s the Society of Jesus had become one of the most powerful institutions in the colonies—economically, politically, religiously, and in the realm of education by virtue of its extensive

system of schools and colleges. The 1767 expulsion of some 2,200 Jesuits from Spanish America reverberated throughout the empire, as many Creoles, either educated in Jesuit colleges or sympathetic to the order's progressive outlook, found the expulsion deeply troubling. In subsequent decades, the Crown auctioned off the estates and properties accumulated by the Jesuits and pocketed the proceeds. The Jesuits' expulsion was a crucial source of disenchantment among many elite Creoles, driving yet another wedge between the Crown and those whose support it would most need to perpetuate its American empire.

All of these Bourbon reforms—economic, administrative and political, military, and religious—had multiple and contradictory effects, at some levels drawing the colonies closer to Spain and at other levels deepening divisions. Part of a broader trend in the 18th-century Atlantic world toward more modern and interventionist state forms, the reforms on the whole failed to achieve their intended results, mainly by generating diverse elite Creole grievances against royal authority—an accumulation of grievances that, in this age of rising nationalist sentiments in Europe and the Americas, facilitated the formation of a distinctly American identity and thus laid the groundwork for the wars of independence after the Napoleonic invasion of Iberia in 1807–08.

MICHAEL J. SCHROEDER

Latin America, economic and political liberalism in

In the wake of the AMERICAN REVOLUTION and the FRENCH REVOLUTION in the late 18th century, ENLIGHTENMENT ideologies of republicanism, political equality, secular government, private property, and the rights of citizenship spread across the Western Hemisphere, from Mexico and the Caribbean to Central and South America. Over the next several generations, these Enlightenment-inspired ideas were appropriated by diverse groups of actors, combined with existing ideologies, and adapted to suit local circumstances.

This constellation of ideas and beliefs can be divided into two broad categories: political liberalism and economic liberalism. In general terms, economic liberalism can be defined as adherence to the principles of private property and free trade, essentially to the principles underlying capitalism. Political liberalism can be defined as placing the individual rights of citizens before the state and the equality of citizens before the law and variously includes the rights of free speech, assembly, religion, and voting. (The U.S. Bill of Rights can be taken as a good guide to the general principles of political liberalism.) Both dimensions of liberalism constituted the *individual* as their primary subject, in contradistinction to the state, thus creating a contractual basis of government centered on a compact between state and citizen.

This liberal, or republican, ideology stood in sharp contrast to pre-Enlightenment notions of sovereign and subject—a notion in that the sovereign ruled by divine right, and society was divided into various orders or corporate entities that exercised collective rights (church, hereditary nobility, merchant guilds, craft guilds, military orders, and others). In this pre-Enlightenment worldview, subjects enjoyed only those rights granted by the sovereign, or those established through long-standing custom, a set of ideas that formed the basis for Spanish and Portuguese rule throughout the long colonial period.

In Latin America, beginning in the late 18th century and accelerating through the 19th, the colonial-era principles of *collective* political rights and *collective* rights in property came under increasing assault by republican notions of *individual* political rights and *individual* rights in property. Predictably, those collective entities, long accustomed to exercising corporate rights, often fiercely resisted being shorn of those rights. The most important collective entities in colonial Latin America were the Roman Catholic Church, military orders, and Indian communities. For the church and the military, collective rights were most tangibly expressed in the *fueros*, or special privileges, which included taxation, property and inheritance laws, and others but were especially manifest in the judicial system. Clergy and military officers enjoyed a long history of immunity from prosecution in civil courts, instead being subject to special ecclesiastical or military tribunals constituted and operated by their respective corporations. For Indian communities, collective rights were most tangibly represented in various types of corporate land ownership. By law and custom, Indian communities owned land in common. These collective

rights in land were of diverse types and varied widely across the Americas. The essential point here concerns the *collective* nature of Indian communities' rights to land and property.

Liberalism, with its emphasis on the individual, represented a direct assault on the collective rights exercised by the church, the military, and Indian communities. In order to create equality before the law, liberal ideology required the replacement of these corporate rights by individual rights. Resistance to this transformation often was fierce. Epitomizing such conflicts was the War of the Reforms in Mexico after the promulgation of the liberal constitution of 1857. Rallying to the cry of "Religion and *fueros!*," conservatives mounted a massive rebellion to overturn the constitution. Many Indian communities also rebelled against liberal efforts to eradicate their collective rights. From 1819 to 1900 Mexico saw the eruption of more than 100 revolts, uprisings, and rebellions by Indian communities. Of the 54 cases for which data is available, disputes over land were identified as the principal precipitating factor in 40 instances, the remainder rooted principally in disputes over taxation and other factors. Similar processes unfolded in Peru and Bolivia, where the liberal land reforms of the 1880s and 1890s sparked massive Indian resistance that persisted into the 20th century.

As liberal ideology took hold in the second half of the 19th century, and in response to widespread resistance to liberal reforms undermining collective rights, many liberal states relaxed their efforts to transform corporate subjects into individual citizens, suppressing individual rights while aggressively promoting capitalist development. Here the distinction between political and economic liberalism becomes salient. In 19th-century Latin America it was common for ruling regimes to squelch political liberalism while engaging in highly interventionist policies designed to promote economic liberalism. Perennially strapped for cash, many ruling regimes found promotion of capitalist development, especially via production for export, essential for the fiscal health of the state. Among the best examples of this trend is the regime of PORFIRIO DÍAZ in Mexico, which under the positivist banner of "Order and Progress" aggressively stifled individual liberties while actively encouraging foreign investment, free trade, private property, and capitalist development. In the name of "order" (political stability), the Díaz regime severely circumscribed individual rights of speech, assembly, and voting, while in the name of "progress" (capitalist development), individual rights to trade,

invest, and buy and sell land, labor, and other commodities flourished.

In the late 19th century, a growing disjuncture emerged in many parts of the Americas between a suppressed political liberalism and a burgeoning economic liberalism. In Brazil, slavery and other forms of bound and indentured servitude coexisted for many years with the explosive growth of the coffee economy. Foreign investment poured into the country, public lands were privatized, and labor transformed into a saleable commodity, while the rights of assembly, speech, and voting remained severely limited. In the Andean republics of Peru, Ecuador, Bolivia, and Colombia, liberal legislation privatizing land and encouraging foreign investment and free trade were frequently accompanied by violent suppression of the political rights of both rural and urban dwellers.

Modern history demonstrates innumerable instances in which states have effectively separated the political and economic dimensions of liberalism. A useful contemporary analogy can be made with China following the reforms of Deng Xiaopeng from the 1980s. In this case, the ruling communist regime made no pretense of granting political rights to individual citizens while actively encouraging the growth of markets, industry, and other core features of capitalist development. Beginning with the consolidation of liberal states in the second half of the 19th century, Latin America abounds with instances in which capitalist development and the flourishing of markets, private property, foreign investment, free trade, and a secular state proved entirely compatible with a repressive state apparatus, the absence of democratic institutions, sham elections, and the systematic suppression of citizens' rights.

Latin America, export economies in

In the 1950s there emerged in Latin America an influential scholarly paradigm, later dubbed the “dependency school,” or *dependistas*, that emphasized Latin America’s historic insertion into the expanding global capitalist economy as a subordinate producer of primary export products for the dominant industrial economies of Europe and North America. In contrast to the dominant neoclassical, or modernization, school of the period, which assumed a direct correlation between economic growth and national development, the dependency school emphasized the development of underdevelopment as an active process, pointing especially to Latin America’s historic export orientation as the prime motor of its progressive and continuing impoverishment.

Since that time, scholars have examined diverse aspects of the historic formation of Latin American export economies from the colonial period through the 20th century. Special attention has been paid to the emergence of new export products in response to rising demand in the industrial world; the strategies pursued by emergent states to encourage production for export, especially taxation and tariff policies; the extent to which growing export production fueled the growth of states’ administrative and fiscal capacities and spawned economic growth in nonexport sectors; the deleterious consequences of export dependency in a boom-and-bust global market; and the formation of new social classes and related social dynamics set in motion by rising production for export. Scholars broadly agree about the historic export orientation of Latin American economies and cluster into varied and often conflicting interpretive schools regarding what that export orientation has meant historically.

In the late colonial period, the BOURBON REFORMS imposed by the Spanish state were intended, in large part, to reinvigorate traditional export economies, particularly silver mining, but also including gold, sugar, indigo, cacao, and tobacco. With independence of most of Latin America by the 1820s, chronic fiscal insolvency was one of the principal problems confronting the newly independent states. In response to perennially empty treasuries and populaces with few taxable resources, states devised a range of strategies intended to enhance their revenue streams, particularly the promotion of production for export. These strategies promoting exports dovetailed with the desire of foreign investors and national elites for profits, and with sharply rising demands for industrial commodi-

ties and tropical agricultural products in consequence of the INDUSTRIAL REVOLUTION and urbanization in the United States and Europe. The result across large parts of Latin America was an intensification of the export-led model of national development.

THE COFFEE REVOLUTION

The COFFEE REVOLUTION in Brazil, Colombia, Venezuela, Guatemala, El Salvador, Costa Rica, and elsewhere from the 1830s to the 1880s is often taken as emblematic of this emergent export-led model. Especially after the 1850s, skyrocketing coffee exports provided these and other states with a valuable taxable resource, enhancing their fiscal and administrative capacities and permitting the further expansion of export-oriented physical infrastructure, especially roads, railroads, and port facilities. In Peru, guano played a similar role, as did copper and nitrates in Chile; wheat and beef products in Argentina; tin, lead, and zinc in Bolivia and Mexico; bananas in the Caribbean Basin; and many other export commodities in the region’s nation-states.

PERU AND CHILE

The guano boom in Peru offers a paradigmatic example of these processes. Over the millennia, the many islands off the Peruvian Pacific coast had accumulated massive deposits of bird droppings. Rich in ammonia, phosphates, and nitrogen, in the 1840s guano began to be mined and exported by a consortium of British, French, and Peruvian mining and shipping interests and marketed as a fertilizer in Europe and North America. The age of guano lasted until the 1880s, after which guano deposits were largely depleted. The estimated 20 million tons of Peruvian guano mined during this period netted an estimated \$2 billion on the world market. The guano boom provided a ready source of taxable revenue for the Peruvian state while accelerating the formation of a new commercial class in Lima and beyond. Much of the profit went into conspicuous consumption among the guano elite and interest on government debt to European banking houses; the guano crash in the 1870s generated a fiscal crisis for the Peruvian state.

Similar in both its overseas markets and domestic effects was the nitrate boom in Peru and Chile from the 1830s to the 1930s. Used in fertilizers, explosives, and in various industrial processes, nitrates accumulated by natural processes in huge deposits in present-day Chile’s northern coastal Atacama Desert provinces of Tarapacá and Antofagasta. In 1843 an estimated 16 thousand tons was mined and exported. By the height

of World War I, in response to the huge demand for military applications, production reached around 3 million tons annually.

The nitrate boom not only provided an important source of revenue for the Peruvian and Chilean states but, along with guano, sparked a major war, the WAR OF THE PACIFIC, between Bolivia, Peru, and Chile. In the war, Chile wrested from Bolivia its sole coastal province of Antofagasta—making Bolivia landlocked, as it remains to this day—and from Peru its province of Tarapacá. From the 1880s to the 1930s Chile was the world's largest nitrate producer; by 1913 the mineral accounted for more than 70 percent of Chile's total exports. Copper began to be mined on a large scale in the 1840s and 1850s. By 1870 Chile supplied about one-quarter of the world's copper, a commodity that saw sharply rising U.S. and European demand following the invention of the telegraph in the 1840s and electric light and power in the 1870s. After a sharp decline in the 1880s and 1890s, copper production surged again in the early 20th century, comprising only 7 percent of the country's exports by 1913 but over 80 percent by the early 1970s.

The effects on the Chilean state and society were complex. From the 1840s to the 1930s, with revenues earned from nitrates in particular, the state invested substantially in public infrastructure, education, and other government services, while periodic global economic downturns wreaked havoc with state finances and sparked a string of political crises and episodes of civil unrest. Sprawling open-air nitrate and deep-shaft copper mining operations and their associated processing and refining facilities, owned mainly by U.S. and British capital, attracted a large wage labor force whose organized struggles compose a major chapter in modern Chilean history.

ARGENTINA

In Argentina, the explosive growth of the meat and cereal industries in the second half of the 19th century enhanced the power of Buenos Aires vis-à-vis the interior provinces, facilitating the consolidation of the national state dominated by the port city while deepening dependence on European investment capital and markets. Argentina went through several stages in the development of its export economy, from an earlier emphasis on sheep, mutton, and wool from the 1840s to the 1880s to the rapid expansion of the cattle and wheat industries after 1880, oriented overwhelmingly toward Europe. British banks and investors were key in providing the capital needed to build a network of

roads and railroads connecting the interior provinces to Buenos Aires.

The invention of refrigerated steamships in the 1880s permitted vast quantities of Argentine beef to reach European markets. At the same time, wheat production soared. From 1872 to 1895 wheat production on the vast open grasslands, or pampas, increased fifteenfold; by 1895 nearly 10 million acres had gone under the plow, with annual exports exceeding 1 million tons and making Argentina one of the world's leading wheat exporters. In the 1890s the surging growth of the beef and wheat industries attracted an average of 50,000 mostly Italian and Spanish migrants annually, swelling the port city's working class and generating a major transformation in the country's class structure. Most of the interior lands came to be owned by a small number of wealthy landowners, or *estancieros*, further sharpening class divisions. In the late 1880s this breakneck growth was accompanied by rising government debt, precipitating a major political crisis in 1889–90. Overall, Argentina's export orientation generated a national economy dominated by Buenos Aires and highly dependent on European investors and markets, a highly skewed landowning structure, and a vast and politically disfranchised urban working class that would play a key role in the country's 20th-century history.

ELSEWHERE IN LATIN AMERICA

In the late 19th century, the skyrocketing European and North American demand for industrial minerals such as copper, lead, zinc, and tin generated similar processes in Bolivia, northern Mexico, Chile, and elsewhere. In Bolivia, the expansion of tin mining after 1890 came to be dominated by a handful of oligarchic families, while the mostly indigenous tin miners earned the equivalent of pennies per day while working in exceedingly dangerous conditions, many dying prematurely from silicosis and other debilitating pulmonary diseases. By 1913 tin composed more than 70 percent of Bolivian exports. The vast bulk of the proceeds from tin exports went into lavish consumption by the political elite and very little into education, public health, or other government services, while the country's indigenous majority remained mired in abject poverty. In northern Mexico, the years preceding the Mexican Revolution saw the rapid development of silver, lead, copper, gold, zinc, and tin mines owned by German, French, and U.S. investors, including the Guggenheim family, which had extensive investments in mining across large parts of northern Mexico (as well as Chile and elsewhere), and U.S. Colonel William Green,

owner of the Cananea Consolidated Copper Company and the so-called “copper king of Sonora.” The mining boom sparked the formation of an economically exploited and politically oppressed working class in northern Mexico that would fill the ranks of rebel chief-tain Pancho Villa’s revolutionary armies and play a key role in the Mexican Revolution.

The banana boom along the Atlantic littorals of Guatemala, Honduras, Costa Rica, Panama, and elsewhere in the Caribbean from the late 1890s generated similar processes. Like Peru’s guano, Chile’s nitrates and copper, and Mexico’s silver and lead, the Caribbean banana industry formed economic enclaves within various national economies, oriented almost exclusively toward overseas markets and generating weak economic linkages to the national economies of host countries. As elsewhere, domestic industry faltered as national economies became geared overwhelmingly toward production for export.

In the 20th century, this historic dependence on exports continued to play a major role in economic, political, social, and cultural life across the southern parts of the hemisphere. Over the past decades, scholarly investigations into Latin America’s export orientation, and the varied effects of export economies in specific instances, have spawned a vast literature. Debates continue to rage regarding whether this export orientation has generated genuine economic development, or, conversely, has actively helped to create the region’s poverty and underdevelopment.

MICHAEL J. SCHROEDER

Latin America, independence in

The period from the 1770s to the 1820s has been aptly called the Age of Revolution. In North America and

Europe, the successful independence struggle of the United States in the AMERICAN REVOLUTION was quickly followed by the FRENCH REVOLUTION and, soon after, the Napoleonic Wars, transforming the political map of Europe. The American and French Revolutions also reverberated across the southern part of the Western Hemisphere, first in Saint-Domingue (Haiti), where slave and free mulatto rebels seized on the French revolutionary ideals of liberty, equality, and fraternity to launch the only successful large-scale slave rebellion in the history of the Americas. The events of the HAITIAN REVOLUTION, in turn, reverberated back across the Americas and Europe. Subsequent events unfolded in rapid succession, such that by the mid-1820s all but a handful of American colonies had gained their independence from Spain and Portugal.

The long- and medium-term origins of Latin American independence movements can be traced to ENLIGHTENMENT notions of republicanism and the contractual basis of government; the unintended consequences of the BOURBON REFORMS, which sparked a growing sense of Creole nationalism; the examples of the United States and France (in contrast to the Haitian Revolution, which horrified elites across the Americas, especially slave owners, and served as a cautionary tale in unleashing the tiger of popular discontent); and related factors. Their short-term trigger was the Napoleonic invasion of Iberia in 1807–08. The forced abdication of King FERDINAND VII created a crisis of authority in Spain, which in turn generated a crisis of authority in Spain’s American colonies. In the absence of royal authority, who would exercise and wield it? From whence would the authority to govern derive?

CREOLE MOVES TOWARD INDEPENDENCE

These were the questions that prompted the formation of *cabildos abiertos*, or open town councils, from 1810 in Spanish America’s largest cities: Caracas, Buenos Aires, Cartagena, Cali, Bogotá, Santiago, Mexico City, and elsewhere. While each followed a distinct trajectory, in essence these *cabildos abiertos* represented Creoles’ seizure of political authority from, or in the name of, the deposed king.

In most such *cabildos*, opposing camps quickly emerged: conservatives, who favored continued obedience to royal authority, and autonomists, who favored moving toward independence. If middling positions, factions, and ambiguities abounded, the major tendencies, like the overall direction of change, were clear. Most Creole elites understood that independence ultimately would be achieved. The more

pressing questions were when would independence be achieved, and how would the Creole population go about attaining it.

Creole elites desirous of independence soon found themselves walking a tightrope: The struggle for independence must not undermine existing relations of privilege and power *within* the Americas. The lessons of Haiti, and of local traditions of popular discontent and rebellion, resounded loudly throughout the halls of the *cabildos abiertos* and beyond. Soon, opponents of moving quickly toward independence could invoke another powerful object lesson: the massive uprising led by the Creole priest MIGUEL HIDALGO in Mexico, beginning in September 1810. The specter of Hidalgo's ragtag army of upwards of 100,000 dirt farmers and unemployed mestizos and Indians looting granaries, slaughtering Spaniards, and standing on the outskirts of Mexico City before dispersing and its remnants being crushed by the Spanish army, sent shock waves throughout the colonies, much as the Haitian Revolution had done.

Creole revolutionaries would thus seek to achieve a *political* revolution from above—formal independence—without sparking a *social* revolution from below. Knowing that war is a powerful solvent of existing social hierarchies, Creole rebel leaders strove to prevent long-standing relations of power and privilege from dissolving in the cauldron of armed conflict. On the whole they succeeded.

Another major influence on the course of events was the profound regionalism in Spanish and Portuguese South America—a consequence of the continent's historical development as producer of primary export products, the coastal orientation of major population centers, a rudimentary transport and communications infrastructure, and major geographic barriers (especially the Andes and the Amazon Basin). Independence movements thus assumed very different characters in different parts of the empire.

SEVERING LINKS TO EUROPE

The first region to sever the link with Spain was Río de la Plata, the youngest viceroyalty and furthest removed geographically from the metropole. Creole elites in Buenos Aires and Montevideo actually began their fight for national self-determination in 1806, two years before Ferdinand VII's abdication, in their battle against a British invasion of Buenos Aires. The Creoles' resounding defeat of the British expeditionary force in 1807 demonstrated to them the weakness of Spain's defenses and their own power to influence events. Peninsular

Spaniards tried to put the genie of independence back into the bottle, but events had overtaken them. "The great victory of Buenos Aires," wrote the Argentine statesman BARTOLOMÉ MITRE years later, gave Creoles "a new sense of nationality."

In what was later called the May Revolution, on May 25, 1810, a Creole-dominated *cabildo* effectively assumed political control of the province of Buenos Aires. There followed a complex series of struggles and intrigues among Creole factions, and between the interior provinces and Buenos Aires, which lasted through the 1810s and after. In the process, Río de la Plata lost control of Upper Peru (Bolivia), a major source of income by virtue of the silver trade. While the political entity called the Republic of Argentina did not come into existence until 1862, the upshot was clear: The Río de la Plata region was the first to gain independence from Spain. It was quickly followed by Paraguay in May 1811, under the leadership of JOSÉ GASPAR RODRÍGUEZ DE FRANCIA, who ruled the country as an autocrat until his death in 1840.

INDEPENDENCE MOVEMENTS

To briefly summarize the complex sequence of events that followed, from this point the independence movements in South America basically developed from two main centers and under two principal leaders: from northern South America under SIMÓN BOLÍVAR, and from Chile under José de San Martín—the latter a Creole from Corrientes in the north of present-day Argentina, educated in Spain, who returned to Buenos Aires in 1812 to join the fray. The overall course of their military campaigns can be conceived as a kind of giant pincer movement, with Bolívar first liberating the region of Venezuela-Colombia in the years 1810–1821 before moving southwest to Peru, and with San Martín first crossing the Andes and liberating Chile in 1814–1818 before moving north, with the help of the British Lord Cochrane and linking up with Bolívar in Peru. The final battles took place in Peru in 1824, with Bolívar's able commander General ANTONIO JOSÉ DE SUCRE delivering the final blow against the remaining Spanish forces in the Battle of Ayacucho on December 9, 1824. Henceforth, all of Spanish South America was independent.

In subsequent years, patriotic narratives about the liberation leaders' courage and heroism became the stuff of myth and legend, as in Bolívar's epic crossing of the Andes in May–August 1819, or San Martín's fabled January–February 1817 march across the Andes into Chile, where he joined forces with the Chilean patriot BERNARDO O'HIGGINS. Similarly lauded were

the exploits of the illiterate *llanero* (plainsman) José Antonio Páez on the *llanos* of Venezuela, who outfoxed the Spaniards time and again and went on to become Bolívar's ally, the first president of the republic of Venezuela in 1830, and one of the country's wealthiest landowners. These and other events have spawned a vast literature. An especially memorable moment came in the storied meeting between the two giants of liberation, Bolívar and San Martín, in Guayaquil, Ecuador, in July 1822. No one knows what was said at these meetings, only that two months later San Martín resigned his position as protector of Peru, withdrew from the struggle, and, a year later, departed from South America, never to return, leaving Bolívar the uncontested title of liberator of the continent.

POLITICAL AND ECONOMIC LEGACIES

The legacies of the independence movements were no less complex. If political independence had been achieved without sparking a major conflagration from below, one consequence was the persistence of profoundly unequal relations of power and privilege: between the propertied and unpropertied, lettered and unlettered, light-skinned and dark-skinned, male and female. Social mobility increased by degrees, as mestizos gained in power and came to rule most of the emergent nation-states. The institution of African slavery came through the independence period intact, if weakened by virtue of slaves' participation in the liberation armies. In Venezuela, for instance, the slave population diminished by about one-third.

The structural subordination of Indians and Indian communities persisted throughout the period of independence. The Catholic Church largely retained its economic, political, and much of its moral power, becoming a bastion of conservatism after the dust of war had settled. The patriarchal family, patriarchy, and ideologies of honor and shame came through the struggles wholly intact. The endurance of preindependence social hierarchies bequeathed a legacy of inequality and racism that would continue to bedevil the continent into the 20th century and beyond.

The economic destruction wrought in the independence struggles was immense. Many regions took decades to regain their preindependence levels of production and commerce. The legacy of militarism was also profound, as the *CAUDILLO* (political-military strongman), of which Venezuela's Páez is emblematic, became the key locus of political power in the newly independent nation-states. Liberal democracy remained for many a foreign concept, in a place that for near-

ly 300 years had seen the formation of no substantial democratic institutions or traditions of power sharing. In these and other ways, the political independence of Latin America was both a revolutionary break with the past and a profoundly conservative process; with the reins of power switching hands, new nation-states created, and the nexus between Europe and the Americas growing denser, the vast majority remained as poor and as disempowered as under Spanish rule. Yet if continuities with the past were many, much had changed as well, as the reality of independence and the integration of the Atlantic world created the possibility of broader social, political, and economic transformation.

BRAZIL'S PEACEFUL REVOLUTION

In Brazil, in contrast, independence came not with war but with the solemn cry "Independence or Death!" of Prince Dom Pedro, the son of Portuguese King João VI, as he drew his sword while striding along the banks of the Ipiranga River on September 7, 1822. This famed Cry of Ipiranga, a popular mythology of Brazilian independence, obscures a far more complex sequence of events.

In brief, as Napoleon's armies approached Lisbon in November 1807, Prince Regent João, his wife Princess Carlota, his mother Queen Maria I, his sons Dom Pedro and Dom Miguel, and the entire royal family and court—some 10,000 to 15,000 people all told—climbed aboard the ships of a combined Portuguese-British convoy and set sail for Rio de Janeiro, where they arrived in March 1808, after a brief stop in Bahia, and reestablished the Portuguese government. Portugal's largest and most important colony, in essence, suddenly became its own metropole; the exile of the House of Braganza in Brazil from 1807 to 1821 is the only instance in which European monarchs ruled an empire from a colony.

The arrival of the royal family and court transformed Rio de Janeiro and Brazil. Mercantilist commercial restrictions were lifted, leading to a boom in commerce and trade, mostly with Great Britain. Manufacturing restrictions were abolished; a royal bank was established; Brazil's first printing press and first newspaper began operation in 1808; and soon after libraries, schools, military academies, medical colleges, and cultural institutes were founded. With the final defeat of Napoleon in 1815, the clamor mounted in Portugal for the royal family's return. Rather than hasten back to Portugal, on December 16, 1815, João VI proclaimed Brazil a kingdom on equal footing with the metropole, the "United Kingdoms of Portugal, Brazil, and the Algarves." João finally did return to Portugal,

in April 1821, in response to a major revolt, leaving his son Prince Pedro behind. Impetuous and romantic, Dom Pedro soon found himself at loggerheads with the Côrtes in Portugal, which sought to return Brazil to subordinate colonial status. It was his receipt of an order from the Côrtes to return that prompted Dom Pedro's famous "Fico" ("I will stay") on January 9, 1822, and in September of that year, his Cry of Ipiranga.

Brazil's peaceful path to independence has been interpreted as a prudent strategy on the part of the colony's dominant groups, especially its slave-owning planter class. It was a way to gain political independence without risking the tumult and disorder of war.

Brazil had the largest slave population in the Americas, with nearly 2 million in 1820, a white population of around 1 million, and total population of less than 4 million. The lessons of Haiti were still fresh on the minds of slave owners, not only in Brazil but in other slaveholding colonies, especially Cuba. Brazil's elites chose a path to independence that left existing relations of power and privilege intact. Cuba's elites, in contrast, opted to remain under Spanish dominion rather than risk unleashing the wrath of the enslaved.

In these and other ways, the specter of violence from below profoundly shaped the timing and nature of independence struggles in Latin America. The extent to which these Latin American revolutions were truly revolutionary remains a matter of debate, though the broad consensus is that continuity, not change, was the predominant tendency, at least in the short term. Perhaps the major interpretive challenge confronting scholars of this period lies precisely in disentangling these changes and continuities, while at the same time situating the Latin American historical experience within the broader framework of the entwined social, political, economic, and cultural transformations that marked the birth of modernity and the Age of Revolution in the Atlantic world and beyond.

Latin America, machismo and *marianismo* in

Gender construction in Latin America has often been cited as being significantly influenced by Spanish colonization. Dominant conceptions of masculinity and femininity, referred to as machismo and *marianismo* respectively, are rooted in the Spanish conquest and influence the sociocultural conditions of Latin America. There is debate as to the relationship, relevance, changes, and influences of the extremes of machismo and marianismo.

MACHISMO DEFINED

Machismo is a form of masculinity that asserts the dominance and superiority of males in society. The term is traced to the Spanish word *macho*, which means "male" or "manly." It could also refer to being courageous, valorous, and having gender pride. Although these may be positive connotations, the term *machismo* is used negatively referring to extreme masculinity encouraged by structures in society. Male dominance and superiority are further legitimized by cultural values and norms.

Machismo is characterized by hypervirility or aggressive masculine behavior expected of males in Latin societies. The machos embody physical strength, courage, self-confidence, heightened sexual power, and bold advances toward women.

Machos believe in the superiority of men over women and also adhere to conservative gender roles. The men, for example, can seek extramarital affairs while the women are expected to be faithful. Women do not have the right to participate in traditionally male positions in society. Men occupy the public sphere—the arena of politics, economy, or military—and women occupy the private sphere. Women are expected to stay at home and attend to the needs of their husband and children, to take care of the housework, and to oversee other domestic needs. The main roles of women are to be mothers and wives.

HISTORICAL CONTEXT

The origins of machismo in Latin societies come from Spanish traditions. Patriarchy emphasizes nobility, chivalry, swordsmanship, horsemanship, and formal education. Ties with nobles and crusaders are also given great importance.

In Mexico, the origins of machismo are also associated with the Spanish conquest and the conquistadores' exploitation of natives. This is the period in Mexican

history when Hernán Cortés and the conquistadores set out to convert indigenous populations. The image of the conquistador, who courageously conquered despite being outnumbered, is retained as the prototype of the modern macho male.

Likewise, the colonial economic system inculcated a dichotomized sexual division of labor. Men and women existed in separate social spheres.

ARCHETYPES OF MACHISMO

Author and researcher R. A. Andrade summarizes the four archetypes of machismo that can be found in scholarly and popular literature: the conqueror macho, the playboy macho, the masked macho, and the authentic macho. The conqueror macho exemplifies invincibility and extreme bravery in facing dangerous situations. Exaggerated sexual potency is one of the characteristics of this archetype. Examples of conqueror machos are gunslingers, or *pistoleros*. Conqueror machos are generally ruthless and bloodthirsty, and they demand power and break laws. They are the negative sides of this archetype.

The playboy macho illustrates males who are permitted to act in a sexually aggressive manner toward females. Sexual, physical, and mental abuses of females are accepted. This chauvinistic archetype is based on the idea of man's biological, social, and intellectual superiority over females. Men are thus allowed to engage in pleasures such as chasing women and adultery.

The masked macho is the third and less common archetype of machismo. A masked macho exemplifies a man who uses a mask of deceit to hide his real intentions. A masked macho often fights for the oppressed. The legendary Pancho Villa is an example.

The last archetype is the authentic macho, a man who is a responsible husband and father. The authentic macho is seen as a more balanced individual who adheres to honor, respect, strength, dignity, and protection of the family. Focused on earning the respect of family and community, this type is not popularized in literature, legends, or movies.

MARIANISMO: HISTORICAL CONTEXT

Machismo and *marianismo* are terms that are linked to the culture in Latin America. *Marianismo* is the female equivalent of machismo and considered to be the embodiment of the feminine. It is characterized by hyperfeminine behavior.

Similar to machismo, *marianismo* is traced back to the time of the Spanish conquest and may have been a

reaction to machismo. The roots of *marianismo* also reside in Roman Catholic theology. It is related to all the elements of Marian devotion seen in various cultural patterns in Latin America.

Marian devotion has a long history in colonial New Spain and the independent nation of Mexico. In 1519 Hernán Cortés arrived in Veracruz under the protection of the Roman Catholic Church and the Virgin Mary. In 1531 Juan Diego had a vision of the Virgin of Guadalupe at Tepeyac, to the northeast of Mexico City. The Virgin of Guadalupe became the key symbol of Mexican identity in the mid-17th century. Our Lady of Guadalupe was further proclaimed by the church as patroness of Mexico in 1754 and in 1900 proclaimed the patroness of the Americas.

Although historical controversies exist in these accounts, the Virgin Mary played an important role in the Catholic religion and Mexican culture. After almost five centuries of Marian devotion, pilgrimages continue to be important to Mexican culture. Marian devotion is evident in the frequency with which girls are named in honor of the Virgin. In fact, María (with or without an additional name) is the most common baptismal name for women in Mexico, and even men may be called José María.

MARIANISMO AND THE VIRGIN MARY

The *marianismo* ideal is modeled after the image of the Virgin Mary and connotes saintliness and submissiveness. Given the title Mother of God, the Virgin Mary is venerated and admired for being spiritually immaculate and eternally giving. This eventually created a conception of femininity in Mexico and in other Latin American countries—a combination of both a good and a bad woman. This is reflected in the dichotomy of the virgin and the whore.

The basis of the *marianismo* ideal is Mary's acceptance of God's will and her purity (virginity). In Mexico, where *marianismo* is strong, the Virgin Mary symbolizes the good mother in contrast to the bad woman Malinche, who was Cortés's lover.

Marianismo expects women to model themselves after Mary and to accept their roles as mothers and wives. Women should be pure, humble, emotional, kind, compliant, vulnerable, unassertive, and enduring of suffering. Women live in the shadow of their husbands and children and should support them continuously. This kind of attitude involves the expectation that women should tolerate certain behavior of men such as their aggressiveness, sexual infidelity, arrogance, stubbornness, and callousness. The expectations that a

woman should be an ideal wife and mother require her to be spiritually superior.

MARIANISMO AS A STRATEGY

Evelyn Stevens is credited for coining the term *marianismo*. Stevens turned *marianismo* into a strategy whereby women benefit from the ideal of women as semidivine, morally superior, and spiritually stronger than men. The women's movement led to the evolution of *marianismo* into a cult of feminine superiority. The power in *marianismo* comes from women's ability to produce life. By tolerating the husband's behavior and wickedness, women receive validation from society and from God. Men's wickedness, therefore, is the necessary precondition of woman's superior status. This means that to uphold their semidivine status, women should not attempt to avoid suffering and self-sacrifice. Instead, women make this suffering known and thus gain esteem and admiration from society.

On the other hand, *marianismo* as a strategy is criticized by Tracy Ehlers, who criticized Stevens's position on four grounds. First she criticized the idea that *marianismo* is a companion and complement to machismo. Second, she disagrees with the assumption that women are content with domesticity and the feminine power at home. Third, she points out that the *marianismo* ideal blames women for a man's bad behavior because the women need that behavior to attain their status as wife and mother. Fourth, she argues that the *marianismo* ideal creates a universal model that encompasses all Latin American women.

CHANGES IN THE MARIANISMO IDEAL

The socialist revolution in Cuba led to changes in the *marianismo* ideals. The Virgin Mary was replaced by the ideal of the equal and working woman.

The Caribbean island of Cuba was a Spanish colony until 1898, but after winning its independence, it became, in practice, a U.S. colony. The Cuban revolution began on January 1, 1959, when the revolutionary leader Fidel Castro forced the former dictator to leave the country. A few years later, Cuba proclaimed itself a socialist country, accompanying an economic blockade from the United States.

These political changes involve the creation of the Federation of Cuban Women (FMC) in the early years of the revolution. The organization aimed to fulfill women's rights in line with the revolutionary ideals. Today Cuba is the only country in Latin America with legalized abortion and free contracep-

tives. The Family Code in 1975 also established by law that men and women have equal responsibility in household work.

The political changes in Cuba regarding gender are still juxtaposed with the traditional gender roles and the prevailing norms of heterosexuality and the nuclear family. The traditional values of women's roles as mothers and wives as concerned with love, marriage, and the family are still present in Cuban socialist society. Women are still responsible for not getting pregnant. This implies that the mixture of machismo culture and radical changes toward socialism and equal rights continue to exist in the Cuban society.

AMPARO PAMELA FABE

Latin America, positivism in

Based on the writings of French philosopher and social reformer Auguste Comte, positivist doctrine swept large parts of urban Latin America in the late 19th century, from Mexico City to Buenos Aires, profoundly influencing intellectual currents, economic and political trends, state ideologies, forms of state organization, urban planning, immigration policies, literary styles, and related developments. Comte's philosophy of positivism, an elaborate, opaque, and in some respects bizarre body of thought, built on the rationalism of the scientific revolution and ENLIGHTENMENT to posit three stages in intellectual history: theological, metaphysical, and positive. The third stage, which in Comte's view humanity was on the cusp of achieving, was characterized by direct empirical observation, scientific experimentation, and purely rational thought.

In Latin America, positivism was appropriated by ruling liberal regimes to promote modernization

through government by intellectually enlightened elites. In practice this meant the promotion of economic liberalism, which meant free trade, privatization of church and Indian lands, foreign investment, export-led growth, European immigration, and the adoption of modern technologies. It also meant the suppression of political liberalism in the forms of free speech, freedom of assembly, and other rights of citizenship. Positivist doctrine also dovetailed with the SOCIAL DARWINISM of Herbert Spencer and others, which divided humanity into racial hierarchies, with some races more suited to survival than others. In practice, this meant the promotion of racist ideologies positing white superiority and Indian, black, and “mixed-race” inferiority. Since positivism posited women’s irrationality and intellectual inferiority, it also reinforced gender inequalities.

Emblematic here was the regime of PORFIRIO DÍAZ in Mexico, which adopted positivist doctrine under the banner of “Order and Progress,” a doctrine pursued via the policy prescriptions of his circle of advisers known as *los científicos* (loosely, “the scientific ones”). As leading Mexican científico Justo Sierra famously remarked, the path to national development might require “a little tyranny” along the way. In Brazil, positivism translated into active opposition to the reigning monarchy and to slavery, both of which were interpreted as primitive, antiquated, decidedly nonmodern institutions, especially by members of the military whose power was enhanced as a result of the PARAGUAYAN WAR. The army’s overthrow of the monarchy in 1889 was followed by a string of military-supported technocratic governments deeply influenced by positivist thought. Positivism in Brazil also translated into active support of coffee cultivation and other forms of export production, emulation of things French, and state policies intended to promote European immigration in order to “whiten” the population.

In Argentina, positivist doctrine found tangible expression in the revamping of the capital city of Buenos Aires in the 1890s to evoke the broad boulevards, parks, plazas, and stately buildings of Paris, prompting city boosters to dub their capital “the Paris of South America.” Similar facelifts transformed other South American capitals in the Parisian model, including Caracas (Venezuela), Santiago (Chile), and Rio de Janeiro (Brazil).

Across much of Central and South America, elites actively promoted European immigration to improve their nations’ “racial stock,” strengthen links with

Europe (especially France), and promote national modernization. These elite-led modernization efforts, in the name of “progress,” were accompanied by press censorship, rigged elections, political cronyism, and the suppression of political dissent, in the name of “order.” Positivism remained highly influential throughout much of Latin America until the ascendancy of populist politics in the 1910s and 1920s, though many transmuted vestiges and variants endured well into the 20th century.

MICHAEL J. SCHROEDER

Latin America, urbanism in

At independence in the 1820s, the vast majority of the inhabitants of Latin America and the Caribbean, probably more than 95 percent, lived in rural areas. From the early colonial period, cities, clustered mainly along the Pacific and Atlantic coasts, had been considered by Spanish and Portuguese colonizers and the Creole (American-born) elite as the prime locus of civilization and culture. As the crisis of political authority sparked by the 1807–08 Napoleonic invasion of Iberia intensified, the requirement of the liberal Spanish constitution of 1812 that concentrations of 1,000 persons or more establish town councils led to a dramatic rise in the number of officially incorporated towns and cities.

By fragmenting political authority, the process of independence augmented the political and economic power of urban centers. Subnational regions developed principally in relation to primary and secondary cities. Examples can be seen in southeastern South America, with Buenos Aires and Montevideo dominating the coast, and Córdoba, Tucumán, and other cities dominating the interior. In 1820 Mexico City was Latin America’s largest city, with some 120,000 people, followed by Lima (Peru) at 53,000, Buenos Aires (Río de la Plata, later Argentina) at 40,000, and Bogotá (Colombia) at 30,000.

By mid-century, with populations rising and rural-urban migration intensifying, many large cities became increasingly unattractive, congested, and unhealthy. Sanitary conditions were often abysmal, with open sewers, lack of potable water, unpaved streets that often turned to muddy quagmires, chronic poverty, and disease emerging as major problems for both national and municipal governments. Most urban cores, which were by colonial era design a central plaza surrounded by a church, government buildings, and elite residences, had become less livable and less desirable, prompting many wealthy residents to relocate to urban fringes. The deteriorating material conditions of most cities conflicted with an increasingly influential elite discourse that portrayed cities as the seat of civilization, modernity, and national progress, as opposed to the barbarism and backwardness of the countryside. Such a situation is exemplified in the writings of the Argentine intellectual and statesman DOMINGO FAUSTINO SARMIENTO.

Especially from around 1870 this urban squalor and elite discourse on modernization and national progress combined with rising European immigration and expanding export production to prompt national and municipal governments to begin the process of urban renewal, setting in motion new programs to that effect. As a result of these economic, political, demographic, and cultural pressures, in the late 19th century virtually every large city in Latin America underwent a major rebuilding effort. Emblematic were the urban revitalization programs in Buenos Aires, Montevideo, Rio de Janeiro, Valparaíso, Mexico City, and Bogotá. Paris in particular became the model for what a city ought to be. In Buenos Aires, for instance, the city center was razed, and in its stead were built broad tree-lined boulevards, parks, plazas, stately buildings, and cultural centers like theaters and opera houses. Electric streetlights replaced gas lamps; underground sewage and water systems were installed; paved avenues replaced dirt streets and alleys; automobiles and electric trolleys displaced horses and bullocks. By the turn of the century, city boosters were touting Buenos Aires as the “Paris of South America.” Similar efforts were undertaken in cities across the continent.

These and other cities grew rapidly in the late 19th and early 20th centuries. In 1880 Buenos Aires was home to around 300,000 people; on the eve of World War I, that figure reached 1.5 million. In 1890 the population of São Paulo stood at 64,000; a decade later it surpassed 240,000. In 1880 Santiago was inhabited by around 160,000 people; by 1910 the number had

increased to 400,000. Mexico City’s population rose from 200,000 in 1874 to nearly 500,000 in 1910.

By 1900 Montevideo housed around one-third of Uruguay’s population of 900,000, making it the world’s largest national capital city relative to population. Similarly rapid growth marked Rio de Janeiro, Valparaíso, Lima, Quito, Guayaquil, Caracas, Bogotá, Havana, and other national capitals and port cities. Notably, by 1900, all but a handful of Latin America’s largest urban centers lay on the coast, reflecting the region’s historic and growing reliance on export production.

The last decades of the 19th century also saw many smaller cities grow rapidly, from Monterrey (Mexico), Guatemala City (Guatemala), Managua (Nicaragua), Tegucigalpa (Honduras), Medellín, Barranquilla, and Cartagena (Colombia), to Córdoba, Mendoza, and Salta (Argentina). By the dawn of the 20th century, between 10 and 20 percent of Latin America’s population of some 60 million resided in cities, a percentage that would grow dramatically in the coming decades; by the end of the century, around three-quarters of Latin America’s population of 520 million was urban.

MICHAEL J. SCHROEDER

League of Three Emperors

After the German chancellor OTTO VON BISMARCK united Germany in the wake of the Franco-Prussian War of 1870–71, he desired peace in which the new unified Germany could mature and prosper. With France effectively neutralized by the war and the PARIS COMMUNE uprising in 1871 that followed, Bismarck set to make peace with Germany’s two traditional rivals in central Europe, Austria-Hungary and Russia. It had only been in 1866 that Bismarck’s Prussia had defeated Austria-Hungary for leadership of

the German peoples, and Bismarck was anxious that hostilities not be renewed. Bismarck's solution to this problem was the League of the Three Emperors, or the Dreikaiserbund. The emperors were Wilhelm I of Germany, Franz Josef of Austria, and Czar Alexander II of Russia.

All three empires desired stability for diplomatic and domestic reasons. Anarchist and communist groups, inspired by the Paris Commune, were becoming internal security problems for all three empires, which needed to focus their energies at home. Despite these efforts, Czar Alexander II was still killed by anarchists in Russia in 1881. Bismarck's plans were helped by foreign ministers Julius Andrassy of Austria and Prince Alexander Gorchakov of Russia.

Bismarck realized that France was seething in the wake of the Franco-Prussian War. Thus for Bismarck, the paramount reason for soliciting the League of Three Emperors was that, should Germany become involved in another war with France, it would not have to fear either Russia or Austria joining in an alliance with France against the Germans.

In addition, all three empires were concerned about the continuing disintegration of the Ottoman Empire. Since both Austria and Russia had ambitions in the Balkans, both were concerned that their desire to profit from Turkish misfortune did not lead to a clash between them. The League of Three Emperors, ratified by the three parties in 1873, was essentially a secret agreement, and none of the three signatories were in any way anxious for the other Great Powers in Europe to learn about it.

In 1875 the new league had its first major test when the Christians of the Balkans rebelled against their Turkish overlords. When the rebellion began in Bosnia and Herzegovina, Sultan ABDUL HAMID II reacted with a savagery that resulted in the deaths of thousands of Christians. The atrocities caused the rebellion to spread throughout the Balkans. In addition to having designs on the Balkans, Russia also embraced the philosophy of Pan-Slavism, which held that all Slavs were mystically united as a brotherhood. Furthermore, they all professed the same Christian Orthodox faith. Hence it was that Russia saw it as its duty to intervene to save the Slavs in the Balkans, and in April 1877 Czar Alexander II declared war on the Ottoman Empire.

Although British prime minister WILLIAM GLADSTONE condemned the Turkish atrocities, he was keenly aware of the change in the European balance of power should the Russians win the war. Gladstone

offered naval support to the Turks, as well as a British squadron anchored near Constantinople in February 1878. For a while, war between England and Russia seemed imminent.

Wanting the war to end before British intervention, the Russians forced a victor's peace on the Turks at San Stefano on March 3, 1878. Austro-Hungarian foreign minister Count Andrassy felt the settlement was adverse to future Austrian designs on the Balkans, and a potential Russo-Austrian crisis loomed. Bismarck could see his League of Three Emperors quickly dissolving into a possible Russo-Austrian War and hurriedly called for all parties to meet at Berlin.

The CONGRESS OF BERLIN, which met from June to July 1878, managed to avoid a European war, but profoundly soured Russia because it was forced to disgorge much of the territory it had won from the Turks at San Stefano. Consequently, Russia withdrew from the League of Three Emperors.

Concerned now of possible hostilities with Russia, Bismarck signed an alliance with Austria in 1879, which became known as the Dual Alliance. Both countries realized the need to lure Russia back into an alliance. This took place in 1881, with what could be called the Second League of Three Emperors. The terms of the treaty were specific and took into account the changing European situation since the first league of 1873.

Although the three empires intended at the time that the treaty would be permanent, the continuing changes in the European situation were continually changing their alliance. In 1890 Bismarck was replaced as German chancellor by the new German emperor Wilhelm II. From there the terrible slide toward World War I began. However, when seen in retrospect, the efforts of Bismarck, Andrassy, and Gorchakov in creating the first league of Three Emperors in 1873, and the league's rebirth in 1881, did secure almost 20 years of peace in which, without foreign wars or domestic insurrections, the countries emerged into what ever after would be referred to as the "Age of Progress." To accomplish this was no mean feat for any diplomats to achieve.

JOHN F. MURPHY, JR.

Leo XIII

(1810–1903) *Roman Catholic pope*

Pope Leo XIII was born Gioacchino Vincenzo Raffaele Luigi on March 2, 1810, in Carpineto and died on July 20, 1903, in Rome. Young Raffaele was sent at age eight to study at the Jesuit school at Viterbo, where he attained a doctorate of theology in 1832 and was ordained a priest on December 31, 1837.

In January 1843 he was appointed papal nuncio (diplomat) to Brussels, Belgium, and elevated to archbishop of Damiatina, Belgium, on February 19, 1843. He worked with the Belgium royalty to establish Catholic schools in Belgium, a controversial move for both parties.

Later, Raffaele was made bishop of Perugia. He was made a cardinal by Pope Pius IX, appointed *camerlengo* (head of the papal household) in August 1877, and then elected pope in 1878. As pope, he was active in diplomatic circles by courting relationships with France, Germany, Russia, the United States, and the nations of South America.

Pope Leo XIII strained relations between the Holy See and Great Britain by restoring the Scottish hierarchy of the church, declaring all Anglican ordinations invalid, and elevating JOHN HENRY NEWMAN, a convert from Anglicanism, to the cardinalate. Within the church, he resolved the schism with the Armenian Church and strengthened the Ruthenian Church. He established national colleges within Vatican City, expanded the holdings and services of the Vatican library and secret archives, and built the Vatican Observatory. He wrote encyclicals against Americanism, Freemasonry, and socialism, and for devotions to the rosary and the Sacred Heart of Jesus. His landmark encyclical *Rerum novarum* set out Catholic principles on the economic relationship between labor and capital.

JAMES RUSSELL

Leopold II

(1835–1909) *king of Belgium*

Upon his accession in 1865, Leopold decided Belgium should be beautiful, rich, secure, and more powerful.

Accordingly, he transformed Brussels and Ostend, built monuments and public works, backed Belgian enterprises abroad, gained fortifications, and, on his deathbed, signed an army reform. Additionally, since the idea of European expansion was impossible, Leopold determined that Belgium should seek colonial expansion elsewhere.

Leopold created allegedly humanitarian associations and sent H. M. Stanley to establish stations on the Congo River. These efforts helped Belgium gain influence in the Congo. Additionally, since no great power wished another to gain the vast Congo basin, Leopold used the apparent weakness of Belgium to become the sole proprietor of his CONGO FREE STATE after the 1884–85 Congress of Berlin. Leopold as king-sovereign enlarged it, gaining Orientale Province (Haut-Zaïre), effective control of mineral-rich Katanga (Shaba), and eastern regions, eliminating East African slavers. However, Britain blocked Leopold's drive to the Nile, preventing further expansion.

Leopold never visited the Congo and did not envision Africans as real. For a decade, he was chronically short of funds to administer the state and its army. Tenacious, clever, and unscrupulous, he extorted a great deal from Belgium. He built a railway around cataracts to render the Congo River navigable to the sea but otherwise avoided development. In 1891 he declared all "vacant land" (including fallow fields and hunting grounds) state property. In 1892 he created state lands that included about half the Congo. There, aside from two concessions, profits went solely to the state's expenses. As world demand for rubber rose, the Congo became profitable, and greed overtook Leopold's concern for Belgium. In 1896 he created large Crown lands in the Congo, whose profits accrued directly to him rather than to the state. Demands for more rubber led to abuses, including mutilation and murder of the indigenous population. Criticism mounted in English-speaking countries. Ultimately, the outcry became so intense and the abuses so well-documented that in 1908, Belgium, to end abuses, reluctantly took the Congo away from Leopold.

SALLY MARKS

A clever and unscrupulous ruler, Leopold II of Belgium used the resources of the Congo to increase his own wealth.

Lewis and Clark Expedition

When THOMAS JEFFERSON became president of the United States, he was determined to fulfill one of his most cherished dreams: obtaining accurate knowledge of the Far West. In his message to Congress of January 18, 1803, nine months before the United States acquired the LOUISIANA PURCHASE from France, Jefferson requested funds to outfit an expedition for the purposes of gathering scientific and geographic information about the trans-Mississippi West and for establishing diplomatic and commercial relations with the Indians of the region. Jefferson, like other Americans of his era, was also interested in determining whether or not there was a viable water route across the continent that connected with the Pacific Ocean.

With the approval of Congress in hand, Jefferson secured the services of Meriwether Lewis and William Clark. Both men were experienced army veterans and seasoned frontiersmen. They assembled a well-trained Corps of Discovery, one of whom was Clark's African-American slave, York. With wilderness gear, boats, and scientific equipment, they began their jour-

ney by ascending the Missouri River from the vicinity of St. Louis on May 14, 1804.

The party wintered with the Mandan Indians in proximity to the Knife and Missouri Rivers in what is now the state of North Dakota. There, Lewis and Clark obtained the services of Toussaint Charbonneau, a French-Canadian trapper, and Sacagawea, his young Shoshone wife. Since both spoke Shoshone and had some knowledge of the Hidatsa language, they were invaluable as interpreters and intermediaries between the Corps and the Indians.

By the following spring, the expedition had reached the three forks of the Missouri, which they named the Jefferson, the Gallatin, and the Madison. After a perilous trek across the Rocky Mountains, they descended the Snake and Columbia Rivers and reached the shores of the Pacific Ocean in November 1805. The expedition erected Fort Clatsop and remained there until spring.

Returning over much of their original route, they arrived at St. Louis on September 23, 1806. The party had traversed some 8,000 miles and had journeyed for well over two years. The hardships they had endured were largely due to the nature of the terrain they traversed, weather conditions, physical and mental fatigue, encounters with wild animals, and accidents. With the exception of the Blackfeet and the Sioux, their relations with Indians were relatively peaceful and beneficial. They returned with a wealth of information about the Indians and the topography of the Far West. The knowledge they gathered about the flora and fauna of the region proved to be invaluable for the traders, trappers, and settlers who followed. Their explorations also helped to affirm the right of the United States to Oregon Country.

The journals of Lewis and Clark have been published in many editions. They offer vivid descriptions of the explorers's encounters with the unexpected and relate their struggles with their day-to-day routines. The journals constitute an American saga.

LOUIS B. GIMELLI

Liberian colonization

After the AMERICAN REVOLUTION, many Americans, black and white, anguished over the continuing existence of slavery in the new republic of liberty. One proposed solution—colonization—attracted supporters at the highest levels. The American Colonization Society (ACS) played a key role in slavery politics before, during, and even after the CIVIL WAR. Its successes, although limited, forever changed the United States and West Africa.

The ACS was founded in 1816 by leading politicians, including Kentucky slaveholder Henry Clay and Massachusetts Senator Daniel Webster. Over the years, other prominent Americans, including Francis Scott Key, author of the “Star-Spangled Banner,” and several presidents supported the cause. The ACS’s main idea was this: “Slavery is a brutal and inefficient labor system. To end it, while protecting the interests of slaveholders and free white workers, we need to remove freed black people who would likely become a burden on American society.” In fact, states that abolished slavery often made it very difficult for freedmen and -women to stay in their communities as free people,

Although some proponents of colonization envisioned setting aside colonies for former slaves in North America, the ACS quickly focused on “returning” to Africa people who had been kidnapped into slavery there, years or even centuries earlier, and by now were mostly Christian English-speaking African Americans. In 1821 the ACS sent naval officer Robert Stockton to a region of West Africa already occupied by 16 tribal groups. There he “negotiated with a pen in one hand, and a drawn pistol in the other.” The new colony was named Liberia, for liberty, and its capital became Monrovia, named in honor of President James Monroe, who provided federal funds for the ACS venture.

As slavery politics grew more divisive, especially after Virginian Nat Turner’s abortive slave revolt in 1831, the ACS project was attacked from many sides. Abolitionists viewed Liberian relocation as deportation—a racist way to deal with slavery and race problems. Said abolitionist leader William Lloyd Garrison, a former colonizationist, “I was then blind; I now see.” Deep South slaveholders suspected colonization was a trick designed to end slavery entirely.

Few African Americans were attracted to Liberia, despite hopes for genuine independence. Liberia’s deadly malaria killed thousands. Unfamiliar plants and animals made farming difficult. American interlopers faced hostility from indigenous residents. Yet, threatening events

like Turner's rebellion and the Fugitive Slave Act and Dred Scott decision of the chaotic 1850s led to surges in emigration. Even black abolitionist leader FREDERICK DOUGLASS softened his opposition. By 1860, almost 11,000 African Americans had emigrated. More would do so when post-Civil War promises remained unfulfilled.

Liberia's earliest settlers were mainly freed blacks from the Upper South who had already gained literacy and work skills. These founding families would become an enduring ruling class who dominated Liberian politics and its economy, especially after Liberia declared itself independent in 1847 under an American-style constitution. Later, an influx of new African-American settlers, many who had gained freedom only when their masters died, became a social second tier, while African natives were relegated to the lowest social rung. Into the 21st century, lingering class and color antagonisms have destabilized Liberia, sparking civil conflict in the nation and its region.

MARSHA E. ACKERMANN

Li Hongzhang (Li Hung-chang)

(1823–1901) *Chinese statesman and diplomat*

Li Hongzhang came from Anhui Province, received the highest academic degree in 1847, and joined the government. When the army of the Taiping rebels reached Anhui in 1853, Li and his father returned home and organized a militia, serving well under various local officials. In 1858 he joined his patron and teacher ZENG GUOFAN (Tseng Kuo-fan), the most successful civilian of the Qing (Ch'ing) government, in fighting the TAIPING REBELLION. In 1860 Zeng sent Li to his home province to organize a large militia called the Huai Army (Huai being another name for Anhui). In 1862 this army was ordered to Shanghai where Li found an ad hoc force trained and led by Westerners defending the city against the rebels. This unit, known as the Ever-Victorious Army, was later led by

an Englishman named CHARLES GORDON, called Chinese Gordon due to his involvement in China.

Between 1862 and 1864 Li's Huai Army, stiffened by the Ever-Victorious Army, cleared Jiangsu (Kiangsu) Province of the rebels. In coordination with the Hunan or Xiang (Hsiang) Army of his mentor Zeng, the Zhejiang (Chekiang) Army of ZHO ZONGTANG (Tso Tsung-t'ang) and other units finished off the Taiping Rebellion that had devastated southern and central China for over a decade. Zeng was next appointed to deal with the NIAN (Nien) REBELLION that still raged along the Huai River valley, but age and other factors made him ineffective, and it was Li, as imperial commissioner, who finished them off in 1868.

Li served as governor or governor-general of many provinces between the 1860s and the 1890s, when he and like-minded colleagues forged policies that rebuilt and revitalized a ruined economy, fostered Western learning, and adopted new techniques to strengthen China. These decades became known as the era of the TONGZHI RESTORATION (after the name of the emperor) and the measures were called the SELF-STRENGTHENING MOVEMENT. Although they gave the Qing dynasty a new lease on life, they proved inadequate in the end because they were piecemeal due to the lack of central government direction under the evil and corrupt dowager empress CIXI (Tz'u-hsi).

Li also served concurrently in many other positions, notably as diplomat dealing with Western nations. He was repeatedly called on to deal with disputes involving Christian missionaries and their activities and on international trade issues. These responsibilities made him acutely aware of China's weakness and vulnerability and, therefore, its need to modernize. He also realized the need to make concessions in dealing with European powers and Japan. Such policies made him unpopular with the conservatives, who, oblivious of international affairs, advocated tough and unsustainable stands. Cixi's ignorant and vacillating policies got China involved in repeated disasters, namely the SINO-FRENCH WAR, SINO-JAPANESE WAR, and the Boxer Rebellion. Each time Li had the no-win task of damage control to salvage what he could. Li Hongzhang's half-century of public service made him the last survivor among the leaders of late Qing China.

JIU-HWA LO UPSHUR

Lincoln, Abraham

(1809–1865) *American president*

Abraham Lincoln was born on February 12, 1809, in a log cabin on Nolin Creek in Hardin (now Larue) County, Kentucky. His father was a carpenter and farmer who owned three farms in Kentucky. His family moved to Indiana in December 1816, in part because his parents did not approve of slavery, which was legal in Kentucky but not in Indiana. His family moved again in 1830, this time to Illinois. In 1831 Lincoln left home and moved to New Salem, Illinois.

In 1832 he ran unsuccessfully for election to the Illinois General Assembly. With the outbreak of the Black Hawk War, he volunteered for military service and was elected captain of his rifle company, but he saw no fighting. Lincoln ran for office again in 1834 and was elected, serving four terms in the General Assembly as a member of the Whig Party. During this time, Lincoln also studied law and in 1836 was licensed to practice. He moved to Springfield, Illinois, in 1837 and started practicing law with John Todd Stuart. He married Mary Todd from Kentucky in 1842, and they had four sons, only one of whom survived to adulthood.

Lincoln was elected to the U.S. Congress and served from 1847 to 1849. While in Congress, he opposed the MEXICAN-AMERICAN WAR because he felt that President James Polk had violated the Constitution. He also supported the Wilmot Proviso, which would have prohibited slavery in territory gained from the war. Once his term was completed, he returned to his law practice in Springfield.

Lincoln opposed the Kansas-Nebraska Act that allowed for the possibility of slavery spreading to the new territories in the Union. The act was sponsored by Democratic senator Stephen Douglas. Lincoln joined the Republican Party in 1856 and in 1858 ran against Douglas for the Senate. The two conducted a series of debates covering a number of issues, including slavery. The debates gained Lincoln national exposure, but he lost the election to Douglas.

Lincoln's exposure made him a leading candidate for the Republican presidential nomination in 1860. The primary Republican candidate was William H. Seward,

but Seward was unacceptable to several key states. Lincoln was the second most popular candidate and more acceptable than Seward, facts which ultimately won Lincoln the nomination. With a split in the Democratic Party, Lincoln won the election and took office in March 1861. Lincoln wanted to keep the Union together, and in his inaugural speech talked of conciliation, but it was too late. Seven states had already seceded from the Union, and when Lincoln ordered a ship to take supplies to the federal garrison at Fort Sumter in Charleston Harbor, the government of South Carolina ordered the fort to be attacked. This action, on April 12, 1861, officially started the American CIVIL WAR.

With the Union defeat at Bull Run on July 21, 1861, the war looked to continue for years, and Lincoln's inability to find a capable general exacerbated the Union's problems. One of Lincoln's major concerns was the involvement of Europe, particularly Britain and France, in the war. Britain saw the war as a chance to check the growth of the United States, but was unwilling to commit men or material without reassurance that the Confederacy would win.

Initially, Lincoln's position had been the preservation of the Union. However, as the war progressed, the issue of slavery became more and more important. Lincoln believed that while the Constitution protected slavery during peace, in war it was a different matter. As such, he drafted the Emancipation Proclamation. However, he was concerned that issuing the proclamation would be seen as a sign of desperation if he did so following the continuing losses suffered by the Union army.

It was not until the Union victory at Antietam in Maryland on September 17, 1862, that Lincoln got his chance. While not a decisive victory, the battle did force General Robert E. Lee to retreat to Virginia, and Lincoln took the opportunity to release the Emancipation Proclamation on September 22. With this, Britain determined that it would be best served by staying out of the conflict.

The Emancipation Proclamation only freed slaves in states in rebellion; it was not until the Thirteenth Amendment to the Constitution that slavery was fully abolished. The Amendment was ratified on December 18, 1865. The Emancipation Proclamation was worded specifically to exclude border states (such as Kentucky, Maryland and Missouri) that were still loyal to the Union but where slavery was still legal. While Lincoln could be careful not to alienate certain groups, he was also willing to do what he felt was necessary to defend the Union. To that end, he suspended the writ of habeas corpus on April 27, 1861, in limited areas and then on September

The last reception at the White House before the president's assassination: Abraham Lincoln and Mary Todd Lincoln greet Union generals, cabinet members, and other guests.

24, 1862, throughout the nation. It is believed that his administration made as many as 13,000 arrests without cause. He endured harsh criticism from other politicians and newspapers, including being called a tyrant.

It was not until 1864 that the war finally turned in favor of the Union when Lincoln brought General ULYSSES S. GRANT to Washington from the Western Theater to command all the armies of the Union. Grant proved a capable general and was able to push the Union army forward against the Confederacy. With the election of 1864, the Democratic Party decided to run former general George B. McClellan against Lincoln. The only issues that the Democrats could use against Lincoln were his supposed tyrannical policies and the fact that the war was progressing very slowly and weariness was setting in around the country. With Grant's campaign to take Richmond, followed by General William T. Sherman's capture of Atlanta,

Georgia, on September 2, 1864, and then General Philip Sheridan's destruction of part of Lee's army in the Shenandoah Valley, the war was obviously nearing its conclusion, and Lincoln won reelection in November 1864. With the war nearing its end, Lincoln began to look toward what would happen after the war. In his second inaugural address, Lincoln expressed a desire to reform the Union, "With malice toward none, with charity for all." But whatever plan he might have had for the restoration of the South and the reformation of the American Union died with him on April 14, 1865, when he was assassinated at Ford's Theatre by John Wilkes Booth, just five days after Lee surrendered at Appomattox Court House.

DALLACE W. UNGER, JR.

Lin Zexu (Lin Tse-hsu)

(1785–1850) *Chinese statesman*

Lin Zexu, the son of a teacher from Fujian (Fukien) Province, received the *jinsshi* (*chin-shih*) degree, the highest in the Chinese educational system, in 1811 and entered government service. He served with distinction and gained the popular accolade “Lin, Clear as the Heavens” for being just and incorruptible. He became governor-general of Hunan and Hubei (Hupei) Provinces in 1837, where he had notable success in implementing anti-opium laws and also took steps to cure addicts of their habits.

Opium had been imported to China since the late seventh century as a medicine. It became a recreational drug after the 17th century, and as addiction spread, the government became concerned. The law that banned opium smoking was issued in 1729; another law in 1796 totally banned its importation and cultivation, but neither had any effect, and increasing amounts were smuggled into China, mostly by British traders. By the early 19th century, the opium problem had caused an economic, public health, and moral crisis for China, but its cultivation and sale under the British in Bengal (India) had become a lucrative source of revenue for the British treasury.

In 1838 Emperor Daoguang (Tao-kuang) ordered a full-scale debate on methods to deal with the opium problem. One school favored legalization, taxing, and controlling its access. Another group advocated strict prohibition; Lin was among them, and because of his exemplary record, he was summoned to Beijing (Peking) for consultation.

He was then appointed Imperial Commissioner, with plenipotentiary powers to proceed to Canton to stamp out the evil. Arriving in Canton in early 1839, where 30,000 chests of the drug were imported annually and where opium shops were as numerous as gin

shops in contemporary London, Lin first dealt with the Chinese. He arrested corrupt officials who had not enforced the laws; confiscated smoking paraphernalia; closed opium shops; and made students, teachers, merchants, and civic leaders sign bonds to obey the law.

Next, Lin ordered foreign merchants to hand over their stocks of opium and sign bonds not to trade in it in the future. Those who did would be allowed to trade in legitimate merchandise, while those who refused had their places of trade embargoed.

He wrote a letter to Queen VICTORIA of Great Britain exhorting her to rein in evil merchants from her country whose greed inflicted such harm on the Chinese. Realizing his implacable resolve, British Superintendent of Trade Charles Elliot handed over 20,283 chests of opium (however, he refused to sign a bond for future non-importation), which Lin publicly destroyed. Trade with Britain resumed in May 1839. Lin was at the peak of his power. But diplomatic, legal, and commercial problems between China and Britain remained unresolved.

The spark that began the first ANGLO-CHINESE OPIUM WAR occurred in early 1840 over the death of a Chinese citizen in a brawl with some Englishmen and Elliot's subsequent refusal to hand over the murderer for trial. Lin then ordered stoppage of trade with Britain. British victories led to Lin's dismissal. He was sent to Ili in Xinjiang (Sinkiang) in northwestern China, where he served with distinction, opening up over 500,000 acres of land for cultivation between 1842 and 1845.

He later served as governor-general of Shaanxi (Shensi) and Gansu (Kansu) Provinces in 1846 and of Yunnan and Guizhou (Kweichow) Provinces from 1847 to 1848. Lin was among the first Chinese officials to become interested in Western sciences, weaponry, and maritime defenses and began programs to translate Western books into Chinese.

literature (1750–1900)

During the period 1750–1900, a large increase in literacy and reduced costs in printing and publishing led to large numbers of books being published. This in turn resulted in the establishment of public and private libraries around the world, which led to even more people having access to these books. The introduction of better house lighting, leading up to electric lights, also created a very favorable environment for reading.

In Britain the literary style was changing from the Augustan age, which had been seen through the works of Joseph Addison, Daniel Defoe, Sir Richard Steele, and Jonathan Swift. Henry Fielding (1707–54) wrote his last novel, *Amelia* (1751), shortly before going to Lisbon, Portugal, where he died. With the Augustan representing what was seen as the golden age of Rome, it was the period when the Grand Tour started. This idea encouraged wealthy young Britons to travel around Europe seeing the famous sites. With the emergence of Britain as a world power after the SEVEN YEARS' WAR (1756–63), British dominance of North America and the Caribbean was assured, and France seemed unlikely to pose a challenge to the British for some time to come. The emergence of the British Empire in Africa and India was also leading to increased wealth and the encouragement of the expeditions that took place in the latter decades of the 18th century. Within the reading public there was a great demand for travel literature, with the books by CAPTAIN JAMES COOK (1728–79) and Admiral William Bligh (1754–1817), among others, selling well in Britain. Books by French, German, and other explorers and travelers were also translated into numbers of languages, further fueling the curiosity of readers.

By the time Bligh's account of the MUTINY ON THE BOUNTY was on sale, the euphoria from the Seven Years' War had died down, Britain having lost many of the American colonies with its defeat in the AMERICAN REVOLUTION. Important writers during this period include the philosopher David Hume (1711–76), novelist Laurence Sterne (1713–68), and Horace Walpole (1717–97). The economist ADAM SMITH (1723–90) was author of the best-seller *The Wealth of Nations* (1776), with philosophical works by John Stuart Mill (1806–73) also being popular. Mention must also be made of Scotland's national poet, Robert Burns (1759–96), and Dr. Samuel Johnson (1709–84) and his biographer James Boswell (1740–95).

The 1780s and 1790s became known as the romantic period, with the emergence of the Lake Poets.

William Wordsworth (1770–1850), composer of *The Prelude*; Samuel Taylor Coleridge (1772–1834); and poet and writer Robert Southey (1774–1843) brought with them both the views of the European ENLIGHTENMENT, along with a reaction against the industrial revolution and urbanism. Wordsworth also explored nature, and in 1798 the first nature writer in the modern tradition, Gilbert White, published his *The Natural History and Antiquities of Selborne*. The late 1790s and early 1800s were largely a period of isolation and introspection for British literature, with Britons not able to embark on their Grand Tour anymore, owing to the Napoleonic Wars, although some did manage brief visits in the period just after the signing of the Treaty of Amiens in 1802. Two other authors who sold many copies of their books include THOMAS PAINE (1737–1809), author of *The Rights of Man* (1791–92), and his great adversary, Edmund Burke (1729–97), author of *Reflections on the French Revolution* (1790), which was read all over Europe.

Many of the other writers of the period, such as Jane Austen (1775–1817), author of *Sense and Sensibility* (1811) and *Pride and Prejudice* (1813), set all their work in England. Sir Walter Scott (1771–1832), author of *The Lady of the Lake* (1810), *Ivanhoe* (1819), and *The Talisman* (1825), wrote a very large number of works of fiction, poetry, history, drama, and essays. His Waverley novels were usually set around Scottish historical and folkloric themes, and this vast output essentially represented the introduction of the historical novel to a large reading public. This was followed by hugely popular but now largely forgotten historical novelist W. H. Ainsworth (1805–82).

Toward the end of the Napoleonic Wars, there was a second generation of romantic poets that included Lord Byron (1788–1824); Percy Bysshe Shelley (1792–1822), author of *Prometheus Unbound* (1818–19); and John Keats (1795–1821). All heavily influenced by Wordsworth and the other Lake Poets, Byron's poetry was clearly influenced by his time in Europe, which would have been impossible a decade earlier. Indeed *Childe Harold's Pilgrimage*, one of Byron's most famous poems, was about a young man's adventures on the European continent.

Having to flee England after allegations surfaced of his incestuous affair with his half sister Augusta Leigh, Byron met Shelley and his wife, Mary Shelley, at Geneva, Switzerland. They collaborated, and there are certainly some similarities between the poetry of Byron and Shelley, two free thinkers whose lives had scandalized many

in Britain. Byron was later to take up the cause of Greek independence, which resulted in his death in 1824.

The next great breakthrough in English literature is the Victorian era, when the British Empire and its power and influence dominated much of the world, developing much of the new technology and initiating social reforms. This brought forth an avalanche of literary talent, the work of Charles Dickens (1812–70) being perhaps the most memorable. Famous British writers of the period include Anne, Charlotte, and Emily Brontë; Samuel Butler (1835–1902), author of *The Way of All Flesh*, published posthumously in 1903; Thomas Carlyle (1795–1881), author of *The French Revolution* (1837) and *Sartor Resartus* (1833–34); Wilkie Collins (1824–89), author of *The Woman in White* (1860) and *The Moonstone* (1868), which T. S. Eliot called “the first, the longest and the best of modern English detective novels”; Arthur Conan Doyle (1859–1930), creator of Sherlock Holmes and Doctor Watson; Joseph Conrad (born Józef Teodor Konrad Korzeniowski, 1857–1924), author of *Lord Jim* (1900); Charles Dickens (1812–70), author of *Oliver Twist* (1837–39), *Nicholas Nickleby* (1838–39), *The Old Curiosity Shop* (1840–41), *David Copperfield* (1849–50), *Bleak House* (1852–53), *A Tale of Two Cities* (1859), and *Great Expectations* (1860–61); George Eliot (pseudonym for Mary Ann Evans, 1819–80), author of *The Mill on the Floss* (1860) and *Middlemarch* (1871–72); Thomas Hardy (1840–1928), author of *The Mayor of Casterbridge* (1886) and *Jude the Obscure* (1896); Thomas Hughes (1822–96), author of *Tom Brown’s Schooldays* (1856); Rudyard Kipling (1865–1936), author of *Barrack Room Ballads* (1892), *The Seven Seas* (1896), and the two *Jungle Books* (1894–95); Robert Louis Stevenson (1850–94), author of *Treasure Island* (1883) and *Kidnapped* (1886); William Makepeace Thackeray (1811–63), author of *Henry Esmond* (1852); and Anthony Trollope (1815–82), author of *Barchester Towers* (1857) and many other works.

Several other popular Victorian writers include poet and engraver William Blake (1757–1827), Elizabeth Browning (1806–61) and Robert Browning (1812–89), playwright John Drinkwater (1882–1937), best-selling boys’ adventure writer and journalist G. A. Henty (1832–1902), poet and craftsman William Morris (1834–96), poet Alexander Pope (1677–1744), and Alfred, Lord Tennyson (1809–92).

There were also an increasing number of books about foreign countries and lands. Thomas Stamford

Raffles (1781–1826) wrote of his time in Java, and books on Africa by explorers such as Dr. David Livingstone (1813–73) and H. M. Stanley (1841–1904) interested many people in central Africa. Quite a number of these books sold within days of their release, with *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life* (1859), by CHARLES DARWIN (1809–82), selling out on its first day.

Following the creation of the United States, there was the emergence of a new literary trend, also written in English but firmly with its own accent and eye. Again, like this period in Britain, there was a rich mix of fiction, drama, adventure, history, and science.

Important American writers included Stephen Crane (1871–1900), author of the CIVIL WAR story *The Red Badge of Courage* (1893); philosopher and statesman BENJAMIN FRANKLIN (1706–90); Joel Chandler Harris (1848–1908), creator of Brer Rabbit and author of *Uncle Remus*; Nathaniel Hawthorne (1804–64); Herman Melville (1819–91), author of *Moby-Dick* (1851); novelist Francis Parkman (1823–93), author of *The Oregon Trail: Sketches of Prairie and Rocky-Mountain Life* (1849); Harriet Beecher Stowe (1811–96), author of *Uncle Tom’s Cabin* (1852); essayist and poet Henry David Thoreau (1817–62); and poet Walt Whitman (1819–92). Historian William H. Prescott (1796–1859) produced America’s first “scientific histories,” being the author of *The History of the Conquest of Mexico* (1843) and *History of the Conquest of Peru* (1847).

Australia, despite its size, had a small population. Because of its unique history, it developed a different literary tradition, with important Australian writers including Marcus Clarke (1846–81), author of *His Natural Life* (1874, subsequently reissued as *For the term of your natural life*); Rolf Boldrewood (pseudonym for Thomas Alexander Browne, 1826–1915), author of *The Squatter’s Dream* (1875) and *Robbery Under Arms* (1888); and W. H. Fitchett (1841–1928), author of many books on the British Empire.

In other languages, again with the increase of literacy levels, new printing techniques, and the availability of cheap paper and newspapers, there was a vast output of literature. France enjoyed one of its greatest periods of cultural progress. The early work from the 1750s was heavily influenced by the Enlightenment. The major French work of this period was the *Encyclopédie* of Denis Diderot and Jean d’Alembert, published between 1751 and 1765. Many French writers

of this period were heavily influenced by French historical themes, especially the Napoleonic Wars and earlier conflicts. Alexandre Dumas (1803–70) set his *The Man in the Iron Mask* during the reign of Louis XIV, and his *The Count of Monte Cristo* covered events that followed a brief visit a ship made to the island of Elba. Victor Hugo (1802–85) became famous for his *Les Misérables* (1862), still known around the world by its French title. Hugo became interested in the history of Notre-Dame Cathedral, and his *The Hunchback of Notre-Dame* (1831) raised much awareness of the cathedral's medieval history.

Other French writers of the period include Honoré de Balzac (1799–1850), author of *Father Goriot*, among many others; Charles Baudelaire (1821–67); Gustave Flaubert (1821–80), author of *Madame Bovary* (1857); George Sand (pseudonym of Armandine-Aurore-Lucile Dudevant, 1804–76); Stendhal (pseudonym for Marie-Henri Beyle, 1783–1842) author of *The Red and the Black* (1831) and *The Charterhouse of Parma* (1839); Hippolyte Taine (1828–93), who wrote *The Origins of Contemporary France* (1875–1894), an attack on the French revolutionaries; Jules Verne (1828–1905), author of *Journey to the Center of the World* (1864) and *Around the World in Eighty Days* (1873); and Emile Zola (1840–1902), author of *Germinal* (1885). There were also important philosophical works by VOLTAIRE (François-Marie Arouet, 1694–1778) and Montesquieu (1689–1755).

Germany was, in some ways, very different, largely owing to the legacy of the Napoleonic Wars, and its fragmentation until 1871. The importance of German literature was assured by Johann Wolfgang von Goethe (1749–32), author of *Faust* (1808–32), who introduced the world to a mind and talent that remains unique. There was also a particularly important contribution to the world of philosophy, politics, drama, and poetry. Important writers of the period include poet and essayist Heinrich Heine (1797–1856), Georg Wilhelm Friedrich Hegel (1770–1831), Immanuel Kant (1724–1804), Friedrich Nietzsche (1844–1900), and Arthur Schopenhauer (1788–1860). Mention should also be made of KARL MARX (1818–83), who moved from Germany to England and was author of *The Communist Manifesto* (1848), *Das Kapital* (1867–94) and the founder of communism.

This was also one of the major eras in Russian literature, with famous writers of this period including playwright and short story writer Anton Chekhov (1860–1904), author of *The Seagull* (1896); Fyodor

Dostoyevsky (1821–81), author of *Crime and Punishment* (1866) and the *Brothers Karamazov* (1879–80); Nikolay Gogol (1809–52, author of *The Inspector General* (1836); Maxim Gorky (pseudonym for Alexey Peshkov, 1868–1936); Alexander Sergeyevich Pushkin (1799–1837); and Count Leo Tolstoy (1828–1910), author of *War and Peace* (1865–69), and *Anna Karenina* (1873–77). From Scandinavia during this period came the Norwegian playwright Henrik Ibsen (1828–1906) and the Swedish dramatist August Strindberg (1849–1912).

Outside Europe and the Americas, there were significant changes in literary traditions. The spread of European languages by way of travelers, missionaries, occupying armies, and the arrival of commercial organizations furthered the familiarity with English, French, German, Spanish, and Italian. Some gifted students, talented individuals, and the well-to-do found their way to London, Oxford, Cambridge, Paris, Berlin, Madrid, and Rome—and then returned to their homelands hugely influenced, not always sympathetically, by their experiences. Those who were to make literature their life's work often wrote in their native tongue, but, for the most part, adopting styles that their sojourns had introduced them to.

In India some prominent names are C. Subrahmanya Bharati (1882–1921), the outstanding Tamil poet; B. C. Chatterji (1838–94), a Bengali novelist described as the “first master of the true novel in India” with *Rajmohan's wife* (1864); Toru Dutt (1856–77), poet, essayist, and musician. In the Malay world the literary tradition involved *hikayats*, sagas recited by wise men, sometimes recorded. The first of these published in the West was the *Hikayat Abdullah* of Abdullah Munshi bin Abdul Kadir, secretary to Raffles, and which includes an account, albeit secondhand, of the founding of Singapore; with another important one being the *Tuhfat al-Nafis*, which was begun in 1865 but not published until 1932 when an edition was published in Singapore.

In Vietnam the greatest writer of the period was Nguyen Du (1765–1820), the creator of *Kim Van Kieu*, a verse novel, that has come to be regarded as Vietnam's national poem. Writing in Tagalog, the language of central Luzon in the Philippines, Francisco Balagtas (1788–1862) was regarded as the “prince of Tagalog poets”—Tagalog literature had already been highly developed.

Japan saw a flourishing of literature with writers such as the novelist Ichiyo Higuchi (1872–96) and Futabatei Shimei (1864–1909). China had a tradition

of literature stretching back 2,000 years and was easily able to adapt to include novels, a genre known in the country since the 14th century, with Liu E (1857–1909) writing the *Travels of Lao Ts'an* (c. 1904–07), and Chou Shu-jen (Lu Hsun) (1881–1936) who became regarded by many as the most important literary figure in modern China. Also in China, teams of historians under the Manchu QING (CH'ING) DYNASTY compiled vast histories, collecting and collating earlier works and historical traditions. In fact it was also a period, during the 1750s, when the Manchu script was gaining wider acceptance. There are also court chronicles in most Asian countries, with those in Mughal India, Cambodia, Korea, Thailand (from the 1780s), and Vietnam still surviving. The arrival of Europeans in many parts of the world led to some of these works being bought and taken to European and American libraries, where translations of extracts were published, along with the recording and publishing of many literary works that had been told orally.

JUSTIN CORFIELD

Lobanov-Yamagata Agreement (1896)

The Lobanov-Yamagata Agreement was a pact between Russia and Japan concerning their respective interests in Korea, signed in 1896. During the early 1890s, Russian and Japanese involvement in Northeast Asia in general and in Korea in particular intensified. In 1891 Russia announced the laying of the Trans-Siberian Railway from St. Petersburg to the Pacific coast, a distance of about 5,700 miles. Although this project had political and economic ends it was also defined as a

cultural mission to bring civilization and Christianity to the peoples of Asia. Three years later in 1894 the Japanese and Chinese struggle for hegemony over the weak kingdom of Korea led to the outbreak of the first SINO-JAPANESE WAR. After the Chinese defeat, Russia became Japan's main rival because of its pressure, together with Germany and France, to force Japan to relinquish its gains in south Manchuria (the "Three Power Intervention"), but also by reason of its expansionist ambitions in East Asia.

Japan was concerned about the repercussions of the Trans-Siberian Railway, but the main focus of Russo-Japanese rivalry was on Korea, whose king viewed the Russians as his saviors from Japan. Russia filled the political vacuum left by the defeated China in Korea and challenged Japanese ambitions to control the kingdom. Together with the United States, Russia induced the other powers to demand Korean concessions in the peninsula, such as a franchise for mining and for railway tracks.

Japan's position began to deteriorate in the summer of 1895 as its agents attempted to turn the country into a Japanese protectorate. In October 1895 members of the Japanese legation in Seoul entered the palace and stabbed Queen Min, the most vehement opponent of Japanese presence in Korea, to death.

In February 1896 Japanese troops landed near Seoul to assist in a revolt but King Kojong found sanctuary in the Russian legation in Seoul. Many Koreans interpreted the internal exile of their monarch as an uprising against the Japanese presence and began to act accordingly. Japanese advisors were expelled, collaborators were executed, and the new cabinet was constituted of persons deemed pro-Russian.

In this manner, a year after the First Sino-Japan War had ended, Russian involvement in Korea was greater than before, while Japan suffered setbacks. Prominent figures in Tokyo such as army minister Yamagata Aritomo argued that Japan had to come to terms with Russian hegemony in Korea for the time being and thus avoid having to confront all the Western nations on this issue.

Consequently, in May 1896, the representatives of Russia and Japan signed a memorandum in which the latter recognized the new Korean cabinet. A month later Yamagata visited Russia for the coronation of Czar Nicholas II, and on June 9, 1896, ratified the memorandum together with Russian foreign minister Aleksei Lobanov-Rostovskii. The resulting Lobanov-Yamagata Agreement contained slight amendments to

the original memorandum. Facing unfavorable conditions in Korea, Japan made considerable concessions in this agreement, which had two secret provisions. First, the two countries agreed to send additional troops to Korea in the event of major disturbances. Second, they might station the same number of troops in Korea until the emergence of a trained Korean force. When Yamagata offered Lobanov the draft of the agreement he was unaware that a few days earlier the Russians had signed with China's Li-Lobanov Agreement.

The Russians had invited to the czar's coronation ceremony the Chinese statesman LI HONGZHANG, who was bribed to sign the Li-Lobanov Agreement. The core of the agreement, whose content was revealed only in 1922, was mutual aid in the event of Japanese aggression. One clause in the agreement was implemented at once—Li's consent to grant Russia the concession to build a significant shortcut for the Trans-Siberian Railway across Manchuria, which led immediately to a substantial increase in Russian involvement in the region. Because of the changing circumstances, the Yamagata-Lobanov Agreement was replaced two years later by the Nishi-Rosen Agreement. The new accord specified that both sides would refrain from political intervention in Korea and would seek each other's approval in providing military or financial advisors as requested by the Korean government. Russia also explicitly acknowledged Japan's special position in Korea, allowing it free commercial and industrial activity in the area in return for implicit Japanese acknowledgment of Russian influence in Manchuria.

These two Russo-Japanese agreements did not prevent the struggle between the two nations over Korea. Japan increasingly regarded Russian involvement in Korea as a threat to its vital interests, especially as Russian involvement in neighboring Manchuria intensified and the Trans-Siberian Railway project was about to be completed. After 1901 Japan insisted on the formula of Manchuria-Korea exchange, namely that Manchuria would go to Russia and Korea to Japan. Failing to persuade Russia to relinquish Korea, Japan began to attack Russian bases in Korea and Manchuria on February 8, 1904, opening a 19-month campaign that would become known as the Russo-Japanese War.

ROTEM KOWNER

Louis XVI

(1754–1793) *French monarch*

Born in August 1754, the ill-fated Louis XVI became king of France in 1774, on the death of his father, Louis XV. In 1770 he had married Marie Antoinette of Austria, the daughter of Francis I and MARIA THERESA. It was a dynastic marriage, intended to cement the alliance of France and Austria-Hungary, the heart of the Holy Roman Empire. The alliance, known as the DIPLOMATIC REVOLUTION of 1756, had completely altered the balance of power in Europe, by allying Bourbon France with the Habsburgs of Austria-Hungary, who had been at odds for centuries. The alliance had been one of the major causes of the SEVEN YEARS' WAR of 1756–63. When Louis XVI ascended the throne, France was enjoying one of its rare periods of peace in the 18th century.

The time was ripe for a serious reconstruction of the economy. The extreme expenses incurred by the wars of Louis XIV and Louis XV weighed heavily on the depleted treasury, and there was the threat of bankruptcy.

However, events would prove that Louis XVI, unlike Louis XIV, lacked the determination or ruthlessness to carry out the reforms needed to rescue his kingdom. Although given a choice of some of the most astute ministers to ever serve the French monarchy, Louis XVI simply lacked the will to support them against the entrenched opposition that contested their attempts at renewal for France.

Louis's first financial adviser, Anne-Robert-Jacques Turgot, had already had substantial experience at the provincial level in France as an economist. Turgot's attempts at reforms almost immediately made enemies among the entrenched interests of France, including the nobility and the bourgeoisie of the provinces. In 1776 Turgot went ahead with six edicts to radically modernize both France's economy and society. But he seemed unable to gauge the impact of what he did and brought about negative unintended results. Finally, he made the mistake of refusing favors for those in

Queen Marie Antoinette's immediate circle. Turgot was dismissed in 1776.

The next minister to attempt to salvage the monarchy was Jacques Necker, who had been born in Geneva, Switzerland, in 1732, and had been a clerk in a Swiss bank by the age of 15. Necker, keen not to earn the unpopularity of Turgot, pursued a policy of raising money by borrowing instead of increasing taxes. It was popular with the people, but only increased the indebtedness of the monarchy at a time when Louis XVI was spending large sums of money to support the infant United States in the AMERICAN REVOLUTION against France's ancient enemy, England. Necker's downfall was his inability to implement effective reforms, after having taken the country further into debt and put almost no caps on spending. Necker was dismissed from duty, only to be brought back in 1788.

When Louis XVI summoned the Estates General to meet in Paris in May 1789, it was the first time this body had convened since 1614, following the assassination of King Henry IV in 1610. In the years since the last convocation of the Estates General, the bourgeoisie had emerged, ironically in large part due to the need to finance and provide for the wars of the monarchy, as financially the most powerful of the three estates in France. The members of this Third Estate had come to Paris determined to gain the say in French government that they felt they had now earned.

Neither the king nor the two dominant estates, the clergy and the nobility, had any intention of listening to the demands of the bourgeoisie; theirs was a society where those who worked and made money were considered the social inferiors of those who wore the court sword of the nobility. To the surprise of Louis XVI and the two elevated estates, the Third Estate proved obstinate in asserting its rights. On June 17, 1789, the Third Estate declared itself the National Assembly, asserting its belief that it alone spoke for the people of France, not the king or the entrenched members of the clergy or nobility. Gradually, progressive members of the other two estates swelled the ranks of the National Assembly. It was here that Louis XVI displayed the characteristic indecision which would ultimately cost him his life. He had two clear choices.

The first option was that Jacques Necker had created a plan that would involve compromise with the National Assembly on some key issues, while retaining the king's royal prerogative on others. The second choice, more brutal, was simply marching with loyal troops to where the National Assembly met and dismissing it and arresting or shooting those who resisted the royal decree.

When faced with his two options, Louis XVI simply issued an order closing the hall where the Third Estate met. The Third Estate replied with the declaration that they would not depart until France had a constitution. (The U.S. CONSTITUTION was ratified in 1787.) Even when Louis XVI met with the National Assembly on June 23, with troops assembled outside, he did nothing to assert his royal will, where Louis XIV would have likely used a bayonet charge to clear out the intransigent assembly.

LOSING CONTROL

Louis XVI rapidly lost control of events. On July 9, the National Assembly reconvened as the National Constituent Assembly, with the clear intent of creating a constitution under which all Frenchmen, including the king, would be subject. On July 11 Louis XVI banished Necker, who still had the confidence of the National Constituent Assembly and the people.

Three days later, the Parisians, along with the king's own French Guards regiment, stormed the symbol of royal power in Paris, the Bastille, and killed its constable, the marquis Bernard de Launay, and placed his head upon a pike. Some order was maintained when the marquis de Lafayette was placed in command of the French National Guard, which had been created as a rival to the royal army. Yet Lafayette showed none of the decisiveness that had characterized his role in the American Revolution.

The royal family was forcibly removed from the Palace of Versailles to the Tuileries Palace in Paris where the people and the National Guard could better control them. Louis XVI still commanded the allegiance of most of the people and could at this stage most likely have avoided the worst of what was to come by graciously becoming a constitutional monarch in France. Instead, Louis began to play a dangerous game. While pretending to go along with the Assembly, he entered into correspondence with the kings of Europe and with émigrés, French nobles who had already fled France and were determined to bring down the revolution. On June 21, 1791, Louis XVI abandoned all pretext of supporting the French Revolution with an attempt to escape to the Austrian Netherlands, today's Belgium, which was ruled by Marie Antoinette's brother, Emperor JOSEPH II. The disguised royal family got as far as Varennes, where they were discovered and returned under guard.

On July 25, 1792, the First Coalition of the European monarchs issued a manifesto warning the French assembly to avoid harming the French royal family. This had the effect of uniting the French people against

the coalition forming against them—and against the king. On August 10, while Louis XVI was sitting with the Legislative Assembly, the Paris mob stormed the Tuileries. After serious fighting, the National Guard and the Swiss Guard succeeded in repelling a heavy assault. The commander of the Swiss Guard felt that a final charge by his professional soldiers would break up the mob completely—and perhaps cause the entire revolutionary movement to collapse like a house of cards. Instead, Louis XVI hesitated and told the Swiss Guards to stand down. The Paris mob, encouraged by the Swiss failure to act, charged them and virtually massacred them in the cause of a king who did not deserve their loyalty.

THE FINAL ACT

Following the debacle of the Tuileries, the final act began for Louis XVI. Three days after the taking of the Tuileries, on August 13, 1792, Louis XVI was arrested for treason. His secret correspondence with the kings of Europe and the émigrés had been found. On September 20, 1792, the defeat of the regular Prussian army by the French revolutionary forces at Valmy removed any hope of foreign help. The next day the National Convention met and formally abolished the monarchy. Louis XVI was put on trial on the charge of treason on December 11, 1792.

With the radicals in charge, the outcome of his trial was a foregone conclusion. On January 21, 1793, Louis XVI went to the guillotine, meeting his death with rare dignity. Marie Antoinette would go to the guillotine on October 16, 1793. Their son, who might have reigned as Louis XVII, died in prison, most likely in 1795.

JOHN F. MURPHY, JR.

Louisiana Purchase

NAPOLÉON I's decision to cede the Louisiana territory to the United States in 1803 was a boon for the fledgling American republic. The purchase of approximately 830,000 square miles of the trans-Mississippi west doubled the size of the United States and facilitated its expansion westward.

France had been in possession of the territory since its exploration by La Salle in 1682, but ceded it to Spain at the end of the SEVEN YEARS' WAR. Under Spanish rule, citizens of the United States living in the trans-Appalachian West were allowed free use of the Mississippi River and access to the port of New Orleans for transshipment of their goods to oceangoing vessels. Expansionist-minded Americans accepted this arrangement because they were confident that America's growing population would eventually end the nominal rule of Spain in Louisiana.

The situation changed drastically when Spain ceded Louisiana to France by a secret treaty in 1800 that was reaffirmed in 1801. It was widely assumed that Napoleon planned to use Louisiana for the establishment of an empire in the Americas and that he would negate America's right of deposit at New Orleans. For President THOMAS JEFFERSON, "this affair of Louisiana" was troublesome. He was faced with the possibility of a French barrier to American expansion, the militancy of western Americans who chafed at the news of the cession, and personal attacks by members of the Federalist Party. Jefferson decided on a pragmatic approach to the situation. He reinforced American security in the West and coupled it with shrewd diplomacy. Via his French friend Pierre Samuel du Pont de Nemours, he sent an open letter to the American minister in France, Robert R. Livingston. Jefferson hinted at the possibility of an alliance between the United States and England. He also instructed Livingston to negotiate for the purchase of the port of New Orleans and dispatched James Monroe to Paris to help.

By the time Monroe arrived in Paris on April 12, 1803, Napoleon's fortunes had changed. His plans for a New World empire were foiled by the inability of his troops to quell an uprising in Saint-Domingue, and he was faced with an impending war with England. TALLEYRAND, the French foreign minister, informed the Americans that France was willing to sell all Louisiana. The Americans, without presidential authorization, accepted Talleyrand's offer and signed the Louisiana

Purchase Treaty on May 2, 1803. The negotiated price was \$15,000,000 of which \$3,750,000 was used to settle the claims of American citizens against France.

Upon receipt of the treaty, Jefferson hesitated. Preferring a constitutional amendment that would sanction territorial acquisition, but faced with a favorable fait accompli, Jefferson set aside his narrow constructionist view of the CONSTITUTION and accepted the treaty. The Senate ratified the Louisiana Purchase Treaty on October 20, 1803.

LOUIS B. GIMELLI

Macartney mission to China

China's foreign relations with other peoples and states was shaped by centuries of tradition. Called the tribute system, the tributary or vassal state sent tribute to the Chinese court, and its representative performed the kowtow, or prostration before the emperor, according to Chinese ritual, which assumed cultural and material superiority to other nations. In return he was bestowed with the seal of recognition and gifts. The system implied acceptance of Chinese superiority, regulated and maintained diplomatic relations, and sanctioned trade. It was initially land oriented, but, with the expansion of Chinese naval power under the Ming dynasty, also included many states of Southeast Asia. When the Portuguese came to China by sea in the 16th century, they, too, were enrolled in the tributary system.

The QING (Ch'ing) DYNASTY inherited the tributary system from its predecessor, the Ming, and expanded it to include other European nations that had begun to trade with China. It opened the major port of Canton to ships of all Western nations and in 1720 organized and regulated the important merchant firms of Canton into a guild called the *co-hong* and gave them the monopoly in trading with the Western nations. Periodically, Portuguese and Dutch representatives had gone to the Chinese capital Beijing (Peking) and performed the prescribed rituals for tributary states.

By the late 18th century Great Britain had become China's largest trading partner, underscored by the fact that of 86 foreign ships that came to Canton in

1789, 61 were British. Dissatisfied with China's restrictive and humiliating conditions for trade, Britain sent an experienced diplomat, George, Lord Macartney, as ambassador to China in 1792 to negotiate new terms and establish diplomatic relations. Because his arrival in Beijing coincided with Chinese emperor QIANLONG's (CH'IEN-LUNG) 80th birthday when many tributary ambassadors were congregated in the capital to offer congratulations, the Chinese government assumed that Macartney was doing the same for Great Britain. Macartney and his staff were entertained with great pomp, and he was exempted from performing the kowtow when he presented his credentials. However, China rejected all Britain's requests—for more ports and other facilities to expand trade, and new tariff and transit schedules. Macartney was sent home with a condescending letter addressed to his sovereign, King George III, that commended him for his respectful behavior. It stated that permanent diplomatic representatives in China were out of the question and reminded him that China did not need British goods and had granted trade with Britain as a favor. Although the mission was a total failure, Macartney's report saw through the facade of Chinese power and predicted its impending collapse when Qianlong's experienced guidance was gone. British involvement with the FRENCH REVOLUTION and Napoleonic Wars would postpone the formal establishment of relations between the two countries until the 1830s. Due mainly to China's disinterest in the outside world, it lost an opportunity to establish normal diplomatic relations with Great Britain.

JIU-HWA LO UPSHUR

Macdonald, John Alexander

(1815–1891) *Canadian prime minister*

John A. Macdonald, the Scots-born Ontario lawyer who became the CANADIAN CONFEDERATION's first (and third) prime minister, was in many ways modern Canada's founding father. He helped draft the British North America Act that established the Confederation in 1867 (for which he was knighted by Queen VICTORIA) and forged a close and fruitful political relationship with George-Étienne Cartier, leader of Québec's French-Canadians.

Macdonald began his long political career in 1843 as an alderman in Kingston, his home town. As a founder of Canada's Conservative Party, heir to the outdated Tories, Macdonald had the inspired idea to

call himself and his supporters Liberal-Conservatives in what would be, for a time, a successful attempt to corner the Canadian political landscape. Macdonald's party would lead Canada for all but four years between 1867 and 1896.

Quick-witted, humorous, and hardworking, despite an occasional drinking problem, Macdonald first came to public attention by taking on high-profile criminal cases before finding a somewhat more lucrative niche in banking and real estate law. In 1854 he was named Upper Canada's attorney general. During the 1860s Macdonald took on the duties of the newly created post of minister of militia affairs, and served in that capacity during FENIAN RAIDS on Ontario.

Although historians argue about how much credit Macdonald deserves for working out the details of confederation, his selection as Canada's first prime minister was widely acclaimed. Macdonald believed that Canada's new federal government should eventually dominate individual provinces, but realized the limits of his power to make that happen. He worked hard to gain many provinces's reluctant assent to the new dominion and deftly used political patronage to cement new relationships among Canada's diverse regions.

Politically tougher was the 1871 Treaty of Washington, involving Britain, the United States, and Canada. Macdonald managed his country's negotiations, visiting the United States for the first time in 20 years. Important issues of Canadian fishing rights, Fenian attack reparations, and trade reciprocity hung in the balance. (Canada and its leader were treated by the other powers as somewhat of a third wheel.)

Criticism directed at Macdonald's treaty-making was mild compared to the events that ended his first prime ministry. At issue was Canada's long-anticipated transcontinental railroad. Huge sums were at stake; competing groups of American and Canadian businessmen vied for the most favorable terms. Macdonald's close Québec ally Cartier spearheaded demands for unusually large political contributions in return for favorable government action, but Macdonald's hands were not entirely clean. His government was forced to resign in November 1873.

By 1878 he and his party had regained power. His second period of leadership saw the successful completion, at last, of the Canadian Pacific Railway by a syndicate of Canadian, American, and European investors. Less happily, in the same year of 1885, the aging prime minister faced the ordeal of LOUIS RIEL's Northwest Rebellion resulting in the French-Indian

Humorous and hardworking, John Alexander Macdonald came to public attention by taking on high-profile criminal cases.

rebel's execution. Since Cartier's death in 1873, Macdonald could no longer depend on a strong French voice to maintain harmony between French and English Canadians.

Shortly after a difficult 1891 reelection, Macdonald suffered a stroke and died a week later. Thousands attended his state funeral in Ottawa. His body was taken by train to Kingston where Canada's first national leader was buried in a family plot in Cataraqui Cemetery.

MARSHA E. ACKERMANN

Madison, James

(1751–1836) *statesman and American president*

James Madison was born in Port Conway, Virginia, to James Madison, Sr., and Eleanor Rose Conway. They owned a prosperous tobacco plantation, run by slaves, at the Montpelier estates in Orange County. The eldest of 12 siblings, Madison was sickly as a child, but excelled in school and entered the College of New Jersey (now Princeton University) in 1769 and graduated in 1771.

Madison returned to Virginia where he engaged in local politics. He was too frail for military service himself during the AMERICAN REVOLUTION, but in 1774 was appointed to the Orange County, Virginia, Committee of Safety—a local wartime provisional government—and was heavily engaged in fundraising for the county militia. In 1776 he was elected to the Virginia Convention and worked on the state constitution. In the same year Madison entered the Virginia House of Delegates, where he met THOMAS JEFFERSON.

From 1777 to 1780 he was a member of the Governor's Council before being elected to the Continental Congress in 1779. There he became a spokesman for stronger central government. Under the Articles of Confederation each state remained sovereign, while the weak central government could not even raise enough revenue to pay the expenses generated by the American Revolution. Another major deficiency of the Articles of Confederation, in Madison's eyes, was

James Madison was elected the fourth president of the United States in 1808, beating Federalist candidate Charles Pinckney.

that it tied states, not individual citizens, to the federal government. Further, any amendment was impossible, since it required the unanimous consent of the states.

In 1783 three years after the British surrender, the Treaty of Paris was signed and Madison left the Continental Congress. Back in Virginia, he studied law and entered into real estate and served in the Virginia House of Delegates again, from 1784 to 1786, where he drafted Virginia's declaration on religious freedom.

In 1786 Madison was Virginia's delegate to the Annapolis Convention on interstate trade, where he decided to work for a revision of the U.S. Constitution and a stronger federal government, expressed in his Virginia Plan. Again a member of the Continental Congress from 1787 to 1788, he joined forces with ALEXANDER HAMILTON and Jon Jay. Together they wrote the *Federalist Papers*, published in newspapers

and booklets, to prepare the citizens of New York for the Convention and proposals for a stronger federal government. Madison's contributions are an important source of political philosophy.

When the Constitutional Convention was convened in Philadelphia, Madison's Virginia Plan became the cornerstone of the ensuing work. This and his contribution during the Convention earned him the title of father of the U.S. Constitution.

Checks and balances, modeled on the theories of the French philosopher Charles Montesquieu, between the legislature, the courts, and the executive, were put in place to safeguard against abuse of power. Still the Constitution did cause alarm during the process of ratification. As a member of the House of Representatives, Madison sponsored the Bill of Rights, the first 10 amendments that protect basic individual rights against violations from the federal government.

The Federalists desired an ever-stronger central government. Madison denied any aristocratic preference once the act of founding was complete. He also had a more fundamentalist view of the role assigned to the Constitution. Together with Thomas Jefferson and James Monroe he formed the Republican Party (later known as the Democratic-Republican Party) in 1791. Madison married Dolley Payne Todd, a widow from Philadelphia, in 1794. In 1797 Madison left Congress. In the Virginia Resolutions, he condemned the centralist policies of the Federalists, especially the ALIEN AND SEDITION ACTS. Their drive toward stronger central government produced a resentment that led to the election of Thomas Jefferson as president in 1800 and the downfall of the Federalists. After serving in the Virginia legislature between 1799 and 1800, Madison became Thomas Jefferson's secretary of state, a post he held until 1809. As secretary of state he negotiated the LOUISIANA PURCHASE from France in 1803.

Madison was elected the fourth president of the United States in 1808, beating Federalist candidate Charles Pinckney 122 to 47 electoral votes. George Clinton, one of his sworn opponents, became vice president. The tension between Britain and the United States mounted and, after much pressure from both Federalists and Republicans alike, Madison declared war on Great Britain on June 18, 1812. Britain offered negotiations that were unsatisfactory and Madison refused to end hostilities. The United States also experienced trade disputes with France and territorial quarrels with Spain along the gulf coast.

Despite American surrender of the Michigan and Detroit territory to the British, Madison was reelected for his second term in 1812, with Elbridge Gerry as vice president. In 1813 U.S. forces fared a little better, capturing York (modern-day Toronto). A British invasion was not regarded as very likely and it was a great shock when British troops landed and captured Washington in 1814, burning the Capitol and the White House. Peace negotiations concluded with the Treaty of Ghent in December 1814. The Rush-Bagot Agreement on demilitarization of the U.S.-Canadian border, negotiated by Madison but ratified after he left office, substantiated this fragile peace.

Madison had let the mandate of the First Bank of the United States expire in 1811. The unsuccessful war with Britain led Madison to propose the charter of the SECOND BANK OF THE UNITED STATES in 1815, calling for the establishment of a standing army and navy, a protective tariff, and direct internal taxation. Federal funds for the Cumberland Road, linking Maryland with the Ohio Valley, and other road and canal works were also proposed. All went through Congress virtually unopposed since these issues had long been on the agenda of the Federalists.

James Monroe became president in 1817, and Madison retired to Montpelier to run the family plantation. Madison retained his slaves but also cofounded the American Colonization Society, of which he became president in 1833 sponsoring the repatriation of free blacks to Africa. He was also elected president of the Agricultural Society of Albemarle, but only his savings and selling off land kept his own plantation afloat through times of bad harvests and low prices.

Together with Jefferson and other prominent Virginians, Madison sponsored the establishment of the University of Virginia, which opened in 1825. He also held the post of rector from 1826 to 1834. In 1829 Madison performed his last public service as a member of the Virginia constitutional convention. In 1834, he wrote "Advice to My Country" and planned to publish his memories of the 1787 Constitutional Convention, but died before he finished.

Malay states, Treaty of Federation and the (1895)

The first British base in Southeast Asia was Bencoolen (now Bengkulu) in Sumatra in 1685, and this was followed by Penang Island, off the west coast of the Malay Peninsula in 1786 (this grew to include part of the nearby coastline in 1800). Both were established by the English East India Company. During the Napoleonic Wars, Britain also conquered the Netherlands East Indies, but it was returned to the Dutch in 1815 at the end of the war. In 1819, the British also purchased Singapore at the southern tip of Malaya. This gave the British the ports of Penang, Malacca, and Singapore, through which went much of the commerce from the Malay Peninsula. Exports of pepper and gambier (used in the treatment of leather), rice, coconuts, and spices ensured the prosperity of the region.

The Malay Peninsula consisted of a number of sultanates, most of which entered into treaties with the British authorities. Initially, the northern ones had been subjects of the King of Siam (Thailand), but the larger southern states of Johore, Pahang, Perak, and Selangor, as well as many minor states such as Jelebu and Sungei Ujong all signed treaties with the British.

In the late 19th century tin was found in Malaya, especially in Perak. In addition, the successful introduction of the rubber plantation made it extremely wealthy. The growth in the economy led to a massive influx of Chinese, which later created political problems for the indigenous Malay rulers. The British Colonial Office gradually moved the whole of Malaya under British rule.

Britain proposed the creation of the Federated Malay States (F.M.S.), with its capital at Kuala Lumpur (in Selangor), to consist of Pahang, Perak, Selangor, and nine small states. Johore retained separate privileges and did not join the F.M.S. The northern states of Kedah, Kelantan, Perlis, and Trengganu did not join and were called the Unfederated Malay States.

Many British civil servants who had worked in the Malay States favored a federation to standardize the rules between the states and to allow greater efficiency in administration and in business. In July 1895 the Federation Treaty was signed by the sultans of Pahang, Perak, Selangor, and Negri Sembilan, and the Federation of the Malay States of Perak, Selangor, Negri Sembilan and Pahang formally came into existence.

The Federation Treaty consisted of six articles. The first confirmed all previous treaties between the British and the Malay sultans who had “severally placed

themselves and their States under the protection of the British Government.” In other articles, the states agreed that they were entering into a federation “to be known as the Protected Malay States to be administered under the advice of the British Government,” and restricted the authority of each ruler to his own state and to acceptance of British authority. The rulers also accepted the advice of the residents-general on all matters of administration except those relating to Islam. Another article mandated economic and military cooperation between the states.

This new agreement established the position of resident-general, who was responsible to the governor of the Straits Settlements (Malacca, Singapore, and Penang), based in Singapore. The Federation Treaty also allowed for the establishment of the Malayan civil service, with members serving throughout the Malay Peninsula (including the Unfederated Malay States and the Straits Settlements). It also helped with the coordination of communications through unified railway and postal services.

NATURAL EXTENSION

For most of its existence the F.M.S. was extremely successful. The first resident-general was Frank Swettenham. A conference of rulers was held in 1897, and it was agreed that future conferences would take place on a regular basis. Swettenham remained in office until 1901. During World War I, the F.M.S. took an active part in the war effort with hundreds of Britons from Malaya enlisting, along with some Malays who served in Aden. Rubber and tin production also helped the British war effort.

In post-World War I decades, prosperity came from rubber, tin, palm oil, coconuts, and fruit exports. Many towns built civic amenities like swimming pools, dance halls, cinemas, private schools, and clubs. With the depression starting in 1929, the price of rubber fell as demand crashed. A number of plantation businesses collapsed and managers lost their jobs.

The F.M.S. continued until the Japanese invasion of December 1941. The British, unable to hold back the Japanese, were forced to withdraw to Singapore where they surrendered on February 15, 1942. In response to a Thai request, the Unfederated Malay States became part of Thailand, with the other states and the Straits Settlements run by the Japanese for the duration of World War II. During the Japanese occupation, the British government drew up the Malayan Union plan which would formally end the F.M.S. once the Japanese were defeated. It envisaged the uniting of the

F.M.S., the Unfederated Malay States, Johore, and the Straits Settlements into one political entity. When the British returned in December 1945, they put extreme pressure on the Malay Sultans to sign the Malayan Union Treaty, which formally ended the F.M.S. in 1946. In 1957 the Federation of Malaya gained full self-government from Britain, but remained a member of the Commonwealth.

JUSTIN CORFIELD

Manifest Destiny

Manifest Destiny was a popular slogan in the United States in the 1840s. It was designed to signify that the fledgling American republic was fated to become a nation of continental magnitude. It was heavily influenced by the exuberant nationalism and the religious fervor of the decade and provided a rationale for the annexation of Texas, the acquisition of California, and the American claim to the Oregon country. The slogan was in vogue in Democratic Party circles throughout the country but was especially popular in the Mid-Atlantic States and in the states of the Old Northwest. Presidents Polk, Pierce, and Buchanan were influenced by its messianic message.

The term *Manifest Destiny* was promoted by the *United States Magazine and Democratic Review* and by the *New York Morning News*, both edited by John L. O' Sullivan, a Democrat, ardent expansionist, and fervent believer in American democracy. The slogan first appeared in print in the summer of 1845 in an unsigned editorial in the *Democratic Review* that justified the American annexation of Texas. The editorial dismissed the suspected interference of England and France in the negotiations between the Republic of Texas and the United States as attempts to frustrate “the fulfillment of our manifest destiny to overspread the continent allotted by Providence for the free devel-

opment of our yearly multiplying millions.” The editorial prophesied that Mexican California would become a part of the United States and noted “the advance guard of the irresistible army of Anglo-Saxon emigration has begun to pour down upon it . . .”

An editorial in the *Morning News* of December 1845 repeated the phrase in its discussion of the dispute between England and the United States concerning the disposition of the Oregon Country. It dismissed England's title to Oregon by right of discovery and exploration, and justified the claim of the United States to all of Oregon “by right of our manifest destiny. . . .” The sentiments expressed by these periodicals were echoed in the halls of Congress, by political and literary voices, and by newspapers across the country. While the Whig Party did not reject the continentalism the term suggested, it was never as zealous for expansion as was the Democratic Party. Indeed, some Whigs ridiculed Manifest Destiny and its accompanying Anglo-Saxonism.

Manifest Destiny was never a coherent set of beliefs, but an umbrella phrase that included a number of disparate ideas, ranging from idealism to self-serving nationalism, incorporating themes that had been present since the colonial era, tailored to meet the conditions of the 1840s. Advocates of Manifest Destiny asserted that Americans were a chosen people whose political and religious institutions were sanctioned by God. Some adopted the pseudoscientific racism of the era to promote the belief that the American people were a superior branch of the Anglo-Saxon race. Enthusiasts proclaimed that Americans had been singled out by Providence to spread across the continent, carrying their democratic institutions and their Christian religion with them, not merely for themselves, but to regenerate the less fortunate occupants of the continent, mainly Mexicans and Indians. White southerners adopted Manifest Destiny as a slogan to justify the acquisition of territory for the spread of slavery. Other Americans endorsed the idea because they feared the presence of European powers on the continent would inhibit the growth of democracy and threaten American security. Some believed that extending America's boundaries to the Pacific would enhance commerce with Asia.

When Manifest Destiny was first conceived, its advocates did not envision armed intervention as a means for expanding America's boundaries and its democratic and religious institutions. However, during the course of the MEXICAN-AMERICAN WAR, a shift occurred. Force was accepted, and Manifest Destiny was used as a rationale in the unsuccessful movement to annex all of Mexico. By the 1850s, the views of some advocates turned from

justifications of continentalism to militant advocacy of intervention beyond the borders of North America to the Caribbean and Central America. Under the guise of Manifest Destiny, American filibusters supported or engaged in revolutionary movements in Nicaragua and Cuba. "Young America," a political and literary group affiliated with the Democratic Party, advocated armed intervention in the Caribbean and urged American support of revolutionary uprisings in GIUSEPPE MAZZINI'S Italy and in the Hungary of Louis Kossuth.

Beginning in 1885 a new Manifest Destiny arose, popularized by John Fiske, the historian-philosopher and Darwinian evolutionist. Fiske extolled the virtues of the Anglo-Saxon race and looked forward to the time when its institutions would be diffused around the world. Congregational clergyman Josiah Strong embraced Manifest Destiny in the same year when he linked "a pure Christianity," "civil liberty," Anglo-Saxonism, and Darwinism, and declared that the Anglo-Saxon was "divinely commissioned to be... his brother's keeper." He predicted a "competition of races" in which Anglo-Saxons would prevail. In the 1890s, the Republican Party endorsed Manifest Destiny and identified itself with intervention and insular imperialism in the Caribbean and the Pacific. President William McKinley endorsed the idealism expressed by Manifest Destiny when he justified his decision to retain the Philippine Islands at the end of the SPANISH-AMERICAN WAR. Other Republicans spoke of America's mission to regenerate and extend the blessings of civilization to less fortunate peoples around the world.

Although the phrase Manifest Destiny fell into disuse in the 20th century, the sentiments expressed by the slogan have continued. Its idealism can be found in modern American foreign policy statements that link U.S. operations overseas with an American mission to spread liberty, freedom, and democracy.

LOUIS B. GIMELLI

Maori wars

The Maori wars, also known as the New Zealand Land Wars, stretched from 1843 to 1872. These continued periods of conflict occurred because of the British colonization of New Zealand, a process that began in the late 18th century. In 1840 the British officially annexed New Zealand as a colony with the signing of the WAITANGI TREATY, which formally allowed the British to colonize certain parts of the archipelago and provided for the Maori to retain many of their territorial homelands. But the Waitangi Treaty held the British government to contradictory positions of protecting the Maori people while at the same time allowing European immigrants to colonize parts of the islands. Since there was only so much land available within the archipelago, land and cultural clashes inevitably occurred between British settlers and the native Maori.

After the Waitangi Treaty, there was a continued influx of British settlers, driven by the New Zealand Company, which promoted emigration from the British Isles to New Zealand. As the British settlers increasingly sought land, they began to try to purchase land from the Maori. This was a problem for the Maori, however, because there was not a concept of individual property ownership within their society. Property was held not by the individual, as in the British tradition, but by the group as a whole. Also, the Maori who signed the Waitangi Treaty provided for the use, not necessarily the sale, of land. Because the Maori did not individually own property there were a number of battles fought between different Maori groups when a small leader sold land to settlers.

The Wairau Affray, otherwise known to the settlers as the Wairau Massacre, was the first bloody conflict in New Zealand. A neighboring Maori group killed 22 settlers from Nelson, a city created by the New Zealand Company, when the colonizers tried to use a dubious treaty to expand into the neighboring Wairau Valley. This was soon followed by the Flagstaff War or Heke's Rebellion, a war in Northern New Zealand where Hene Heke and other Maori leaders battled against the British, who were aligned with Tamati Waka Nene's Maori group. Eventually the British and the "loyalist" Maori broke the *pa*, an earthen fort, defense of the Maori in late 1846, but only after a long siege campaign employed by the new governor of New Zealand, Sir George Grey. Grey gave clemency to Heke and the losing Maori groups, thus ending the Flagstaff War.

After a peaceful decade in the 1850s, the tension between the Maori and the settlers began to climax

Six Maori men, posing in traditional clothing, doing the haka dance (war dance). The Maori fought several wars against British colonists, most over issues of land ownership and the loss of traditional Maori lands to the British settlers.

into battle again. By the late 1850s the British settler population was nearly equal in number to the Maori population. The growing British population, as well as memories of the attempted Wairau expansion by the colonizers, helped to propel the King Movement, a Maori movement that promoted political unity of the Maori and placed a special emphasis on the communal ownership of land. In the Tarankai Province on the North Island, Te Atiawa tried to sell community Maori land directly to the British without gaining permission from group's leader, Wiermu Kingi. Thomas Browne, the governor of New Zealand, decided to send troops onto the disputed land until the Maori and the settlers could litigate the land issue. Atiawa defended his land against the New Zealand militia; this proved to be the starting point of the First Tarankai War. After a year's worth of fighting with no clear victor, the colonial New Zealand government and the Maori agreed to end the fighting in March 1861.

But this truce did not end the fighting between the Maori and the settlers. British settlers in New Zealand became angry with the King Movement, which prevented the sale of land on North Island. Governor George Grey argued that the colonial New Zealanders required the intervention of British troops from overseas on the premise that the Maori near Auckland and other Northern Island cities were a military threat. In 1863 the Waikato War began with the invasion of Waikato. George Grey formally expelled the Maori off much of the land south of Auckland and sent General Duncan Cameron to fight against the Maori.

The campaign, like the others before, involved fighting between the British troops and the Maori in their defensive *pa*. As the campaign continued against the Maori, the popular British press and the British Colonial Office, the governmental agency that handled colonial affairs, began to turn decidedly against the

offensive. While the invasion began under the pretense of protection of Auckland and other colonial settlements, it was soon portrayed as a greedy attempt to expand the boundaries of colonial New Zealand at the expense of the native Maori. The colonial government successfully achieved their mission: they annexed and controlled large parts of the Northern Island.

Though the Waikato War was the major war of the Maori wars, there were three major conflicts in the following years in addition to a major legal blow to the Maori. The Tarankai War in the mid-1860s grew out of the Hau Hau Movement, a religious movement that became increasingly antisetler, as well as the disgust of losing many of their traditional lands. During this time the Maori also lost the advantage of group ownership of land with the passing of the Native Lands Acts in 1862 and 1865, which led to the creation of the Maori Land Court that made land ownership individual instead of community. Titokowaru's War and Te Kooti's War were the final wars between the colonial government and the British. At the end of the wars, the Maori were resigned to live under British law in smaller areas than they had previously lived in, especially in North Island.

BRETT BENNETT

Maria Theresa

(1717–1780) *empress of Austria*

The ruler of the Austrian Habsburg dominions, Maria Theresa was the only female ruler (1740–80) of the Habsburg dynasty in its 650-year history. She inherited the Austrian throne when her father, Charles VI, died in 1740 without male heirs to succeed him. A capable monarch, she was admired by friend and foe alike. Even her archenemy FREDERICK THE GREAT OF PRUSSIA called her “a credit to her throne and her sex.”

Maria Theresa's reign was marred by three conflicts, the War of Austrian Succession (1740–48), which began almost immediately upon her ascent to the throne; the SEVEN YEARS' WAR (1756–64); and the War

of the Bavarian Succession (1778–79). Her experience in prosecuting these wars prompted her to undertake a sweeping modernization of her armies.

On the domestic scene, Maria restructured the tax system, started a universal school system that was separate from the church, and provided some relief to the beleaguered peasant class. A devout Catholic, she suppressed the Jesuits and was intolerant in her policies toward Jews.

Maria Theresa was the mother of 16 children, the most famous of whom were Joseph II, Holy Roman Emperor from 1765 to 1790, and Marie-Antoinette, the queen of France who fell victim with her husband, LOUIS XVI, to the FRENCH REVOLUTION. Maria Theresa died in Vienna on November 29, 1780.

market revolution in the United States

Market revolution is a term many American historians use to describe the intensive growth in trade between the end of the WAR OF 1812 and the beginning of the AMERICAN CIVIL WAR. While no definitive or complete data are available for the whole range of the economy—exports alone increased sixfold between 1820 and 1860—the number of American households involved in the market economy clearly rose dramatically in those years, and their dependence upon the marketplace for a wider range of goods also increased.

The market revolution has been characterized as a shift from an economy in which most Americans organized their economic activity around their household (household economy) to one in which they organized their economic activity around markets. In the household economy the primary purpose of work is to produce goods to be consumed by the household itself. Two goals, one immediate and one long-term, characterize the household economy. The first is to achieve a basic level of comfort for the household, a level generally considerably above mere subsistence. The second goal is to accumulate sufficient property to establish the children in their own household economies. Surpluses are traded locally for other necessities and on national and international marketplaces for those small luxuries

that provided basic comfort and for the cash necessary to accumulate property. Such an economy is focused mainly on farmers, who made up the vast majority of independent householders in the early American republic, but historians generally lump most artisan households into the category of the household economy as well, because they were primarily involved in localized economies: Few artisans sold their wares beyond their local community.

GOODS FOR SALE

In the market economy, the primary aim of work is to produce goods for sale, generally on national and international markets, and to use the proceeds of those sales to purchase necessities and luxuries. Market economies are generally characterized by specialization and large-scale production, and prices vary little from community to community; there are no localized economies.

The market economy existed alongside the household economy from the beginning of European settlement in North America. Indeed, the household economy requires an active market economy to meet its two goals of basic comfort and property for the children. From the early Virginia tobacco plantations forward, a small percentage of American colonists had looked to the international market to secure their economic well-being, but most Americans placed their trust in their own production and that of their neighbors. By the mid-18th century, Great Britain's INDUSTRIAL REVOLUTION had begun to entice Americans with a new array of affordable luxuries. The boycotts of the 1760s and 1770s, the subsequent embargoes of war, followed by the celebration of American simplicity, all worked to limit American purchases of British manufactured goods. With the end of the War of 1812, however, two key developments—the transportation revolution and the cotton boom—would play a significant role in easing many Americans toward greater involvement in the market economy.

The term *transportation revolution* is used to describe dramatic innovations in transportation methods and increased public and private investment in transportation systems in this same period. Steamboats, canals, and eventually railroads would significantly reduce the costs of transportation, thus encouraging trade. For the household economy, a raft on a river was enough: moving surpluses into the marketplace was primarily a one-way venture, with money and small luxuries the only items needing to make the return trip. But the steamboat and subsequent innovations permitted a

vast array of necessities and luxuries to be brought into the interior of the nation.

Most notable among these goods were cotton textiles. The cotton boom that occurred in the wake of the development of the cotton gin also played a key role in the market revolution. The spread of short-staple cotton production throughout the South drew some southerners directly into market production, and cotton itself became the economy's most important commodity, creating market economy jobs in shipping, finance, and manufacturing. Moreover, cheap and durable cotton textiles, both imported and domestic, had vast appeal in the marketplace, drawing large numbers of Americans, especially in the North, more clearly into dependence on distant markets for necessities.

COTTON TEXTILES

The production of cotton textiles was the first major element in the Industrial Revolution in the United States. High labor costs forced American manufacturers to depend on machinery, leading to a first-rate machine tool industry, which by late in the market revolution was able to supply Americans with an increasing array of luxuries, now priced as consumer goods. Americans' notions of what basic comfort entailed grew to include a larger and larger basket of consumer goods. Farmers in the northeast began to concentrate on producing perishable farm items for growing urban centers to provide cash to buy both necessities and luxuries, while midwestern farmers depended on the fertility of their soil to provide dependable surpluses whose sale would provide luxuries.

Many farm women in the north would seek income, often through butter and eggs, so they could purchase cotton cloth rather than manufacture textiles themselves. All were brought into the market economy, together with growing numbers of men employed in the emerging white-collar jobs of the market economy and with the men and women, often immigrants, who worked in the new manufacturing concerns. Rural southerners were less likely to make the transition, though clearly most slaveholders were by definition involved in the market economy.

While the full transition to a market economy would not be complete until the household economy was dealt twin blows by the Great Depression and the New Deal, the period of the most dramatic change occurred between 1815 and 1860.

RICHARD F. NATION

Marshall, John

(1755–1835) *U.S. Supreme Court justice*

John Marshall, one of the most influential members of the Supreme Court in its earliest years, was born in Germantown, Virginia, in 1755 to Thomas and Mary Isham Keith Marshall. At 18 Marshall began studying law, but temporarily abandoned it when his state joined the rebellion against Great Britain. After enlisting he saw action in numerous battles, but returned to the study of law when his term of enlistment ended in 1780, and he entered private practice the next year.

Marshall's political career was filled with nominations and resignations, as he repeatedly tried to reject appointments or resign to return to his legal practice. He was elected to the Virginia House of Delegates in 1782, but resigned in 1784. In 1788, he was part of the Virginia convention that was debating ratification of the U.S. CONSTITUTION, where he argued strenuously for acceptance on the basis that the states needed a stronger national government to survive. After the convention, he returned to his legal practice.

In 1795 President GEORGE WASHINGTON tried to convince Marshall to become attorney general and the next year ambassador to France, but Marshall declined both times. President JOHN ADAMS was able to convince Marshall to serve as one of the ambassadors to France in 1797 where he became embroiled in what was later called the XYZ affair. However, Adams was unable to secure Marshall's agreement to accept the position of associate justice on the Supreme Court in 1798. Patrick Henry convinced Marshall to run for a federal office, and he was elected to the House of Representatives in 1799. The next year President Adams wanted to nominate Marshall as secretary of war, but Marshall had little interest; when Adams later asked him to serve as secretary of state, however, Marshall accepted.

When Adams lost his bid for reelection to the presidency in 1800, he sought ways to ensure that a strong Federalist presence would remain, especially in the judiciary. With this in mind, he nominated Mar-

shall as chief justice of the Supreme Court on January 20, 1801. Marshall continued serving as secretary of state and oversaw other of Adams's midnight appointments that so enraged Jefferson and his Republicans. It was these appointments that brought the first major case before Marshall during his tenure on the Supreme Court.

In 1803 *Marbury v. Madison* gave Marshall his first opportunity to flex his judicial muscles. The case centered on the appointment of certain judges and other positions by President Adams, approved by Congress, signed and sealed by the president, but left undelivered. The conflict became whether or not the appointments were official. Marbury claimed that since his appointment as justice of the peace in the District of Columbia had been made, it was a valid appointment whether or not it had been delivered to him officially. Incoming president THOMAS JEFFERSON, however, believed that since such appointments only became official upon delivery, those that had remained undelivered were void. Thus, attempting to block as many of these last-minute appointments as he could, he instructed new secretary of state JAMES MADISON to leave the appointments undelivered. It was in this case that Marshall first elaborated the idea of judicial review.

In the Court's decision, Marshall argued that Marbury was legally deserving of his appointment but the remedy was based on the Judiciary Act of 1789, which the Court had declared unconstitutional. Technically Marbury won the case, but the Court had no constitutional power yet to enforce this decision by coercing Madison to comply. While the idea of judicial review would be used sparingly in the 19th century, it would become crucial to the legal battles of the 20th century.

Marshall found himself embroiled in politics once more in 1807 during Aaron Burr's trial for treason. Marshall served as the judge for the trial, and, interpreting the Constitution's definition of treason very narrowly, limited the trial in such a way that the jury found Burr innocent. The public was furious, but Marshall had once again shown the independence and potential power of the judiciary.

Other important issues decided during Marshall's tenure included the sanctity of property rights, even if they conflicted with a state's actions (*Fletcher v. Peck*, 1810); that state governments could not attempt to control federal institutions through taxation (*McCulloch v. Maryland*, 1819); and the power of Congress to control interstate commerce and trade (*Gibbons v. Ogden*, 1825). Each case stressed the

primacy of the national judiciary to decide federal issues. Marshall's Court was also heavily involved in Indian removal.

Marshall's extended years of service on the Supreme Court played an important role in the success of the fledgling United States by providing it with a more powerful and adaptive national government than was possible under the Articles of Confederation. His close working relationship with the other justices inspired goodwill and respect, even among the justices who chose to dissent from his majority decisions. Even more important, his opinions became valuable tools for the later judicial activity of the Supreme Court. Marshall served on the Court until his death on July 6, 1835.

JASON A. MEAD

Martí, José

(1853–1895) *Cuban patriot*

Brilliant and indefatigable scholar, poet, journalist, activist, organizer, and patriot, often called the “Apostle of Cuban Liberty,” José Martí is widely recognized among Cubans as the most admired figure in their nation's history and is commonly ranked among the most important Latin American heroes of the modern era. Martí's signal contribution was to forge a coherent nationalist, anti-imperialist ideology of Cuba Libre (Free Cuba), which forcefully rejected annexation to the United States, demanded independence, and transcended the island's historic divisions of social race and class to provide Cubans from all walks of life with a compelling and inclusive vision of national dignity, social justice, and political equality, regardless of race, class, or sex.

This achievement was all the more remarkable in light of the explicitly racist ideologies across the Atlantic World in the late 19th century. Swimming against a powerful tide and despite crushing hardships in his personal life that included imprisonment, illness, and many

years' exile, Martí crafted a profoundly optimistic and progressive nationalist discourse that found very receptive ears among his compatriots and that in the decades after his martyrdom continued to find deep resonance in Cuba, across the Americas, and beyond.

EXILE

Born in Havana, Cuba, on January 28, 1853, to Spanish parents (his father a soldier from Valencia, his mother from Tenerife in the Canary Islands), José Julián Martí y Pérez was the eldest brother of seven younger sisters. His teacher, Rafael María Mendive, a romantic poet and advocate of Cuban independence, exercised a strong influence on his formative years.

In January 1869 a few months after the outbreak of the TEN YEARS' WAR IN CUBA, the 16-year-old Martí founded his first newspaper, *Patria Libre* (Free Homeland), to advocate for independence. Sentenced to six years' hard labor on trumped-up charges, he was imprisoned for two years before being exiled to Spain on the condition he not return to Cuba.

In Madrid he studied law, wrote prolifically, and integrated into the lively intellectual atmosphere of the city and university. Earning his law degree from the University of Saragossa in 1874, the next year he traveled via Paris to Mexico, where he lived for several years. After a brief clandestine return to Cuba in 1877, he moved to Guatemala; soon after, in Mexico, he married Carmen Zayas Bazán, daughter of a rich Cuban sugar planter.

Returning to Cuba under a general amnesty in 1878, he joined a conspiracy against the government, only to be exiled to Spain again. Leaving his wife behind, he traveled from Madrid to Paris before heading to New York City, where, aside from a few brief stints in Central America and Venezuela, he lived for the next 14 years until 1895.

By this time, he had earned a wide reputation as a gifted writer, profound thinker, and the leading voice for Cuban independence. Through most of the 1880s, he worked mainly as a journalist based in New York, introducing to his Latin American audience the culture and history of their powerful northern neighbor, while also working with Cuban immigrants and exiles to organize the Cuban community in the United States. He became deeply ambivalent toward his host country, which he admired for its freedoms and vitality, denounced for its racial and class injustices, but mostly feared for its power and covetousness toward Cuba. “To change masters,” he repeatedly warned, “is not to be free.”

In 1890 he founded *La Liga de Instrucción* (Instructional League) in New York as a kind of educational collective for Cuban exiles in preparation for the impending struggle. In 1891 he served as consul of Argentina and Paraguay in New York and as Uruguay's representative to the first Inter-American money conference in Washington, testament to his growing hemispheric stature. Meanwhile he intensified his organizing efforts among Cuban expatriate communities in New York, Tampa, Florida, and elsewhere.

In 1892 Martí founded the Cuban Revolutionary Party (PRC), the leading organizational force in the CUBAN WAR OF INDEPENDENCE that began in early 1895. Secretly landing with a small force in eastern Cuba in April 1895, he was killed on May 19, at age 42, in a skirmish with Spanish forces a few kilometers east of Bayamo in Oriente province. His martyrdom soon became a rallying cry for revolutionary forces. Six decades later, Fidel Castro would don the hero's mantle to legitimate his struggle against the U.S.-supported Batista regime.

By this time, Martí's face and figure had become a ubiquitous symbol of Cubans' struggle for social justice and freedom from foreign domination, as he remains today.

MICHAEL J. SCHROEDER

Marxism, Karl Marx (1818–1883), and Friedrich Engels (1820–1895)

Karl Marx first met Friedrich Engels in 1842 in the office of a leftist Cologne newspaper, *Rheinische Zeitung*. They were both students, analysts, and critics of their respective environments, Marx in Cologne and Paris and Engels in various parts of England. In 1844 they met again in Paris; this meeting evolved into a lifelong collaboration, resulting in some of Europe's, perhaps the world's, most profoundly influential political philosophy. The ideology contained within their collective writings is called Marxism; it was and is a revolutionary way of thinking that nuanced the already prevalent ideas of socialism and communism. Marxist thought intensely influenced the socialist movements in several

parts of Europe in the 19th and 20th centuries; these ideas were to spread to almost all other parts of the world. The most renowned pamphlet of this movement is the 1848 *Communist Manifesto* (*Manifest der Kommunistischen Partei*). Marxist thought is explained at length in the substantial three-volume book called *Capital* (*Das Kapital*); it was Marx's lifetime of work, which was completed and published after his death by Engels.

Marx was born in 1818 in the Prussian town of Trier (now in Germany). Heinrich Marx, his father, was a lawyer, a progressive thinker, and an advocate for constitutional reform; his mother, Henrietta Pressburg, was from Holland. They were Jewish, but when his father converted to Christianity, six-year-old Karl was also baptized. However, his earliest experiences were of being Jewish, which introduced him to discrimination on the basis of religion. After completing high school in 1835, Karl entered the University of Bonn, where he studied the humanities. As a student, he was active in the rebellious student culture that prevailed. When he shifted to the University of Berlin in 1836, his thinking was honed, as he was introduced to Hegelian philosophy as Georg Wilhelm Friedrich Hegel's thought was held in high regard in Berlin.

Marx became politically active in student groups, the Young Hegelians and the Doctors Club, sacrificing serious study to activism; interestingly, he could not quite appreciate Hegel's singular attention to the world of ideas. In 1841 he received his degree from the University of Jena, where academic rigors were less demanding; there, informed by Hegelian analytical method, he completed his dissertation, titled *The Difference Between the Democritean and Epicurean Philosophies of Nature*.

Marx returned to the University of Bonn hoping to find a job; instead he decided to become a writer and then editor in an opposition journal in Cologne, the aforementioned *Rheinische Zeitung*. In his writings from 1841 onward, there is another resonating influence. It was the Feuerbachian "transformational criticism" of Hegel in *The Essence of Christianity*; in effect, Ludwig Feuerbach turned Hegelian thought on its head, grounding human reality in social and material realities. Deeply affected by Feuerbach, Marx now formulated his comprehension of history as a process of self-development of the human species; humans were basically producers and material production was the foremost form of human activity. From this idea he was to extrapolate the more sophisticated ideological theories, not the least of which was that religion was "the

opiate of the masses.” During his time with *Rheinische Zeitung* he wrote on the material realities of the invisible poor and the underclass and on communism. To understand and critique their conditions of existence, he found his development of Feuerbach’s ideas to be much more useful than Hegelian ideas.

With the Prussian government’s repressive policies against *Rheinische Zeitung*, Marx and his new bride, Jenny von Westphalen, moved to Paris in 1843. Paris was the hotbed of oppositional thinking, extreme forms of communism, and revolutionary socialist thought. Marx was to be entirely radicalized when his world intersected with that of the revolutionaries and French and German working classes. Marx began to study the history of the FRENCH REVOLUTION; he further fed his intellectual curiosity with the classics on political economy. In 1844 he met Engels for the second time; so started an intellectual and personal collaboration which contributed an impressive corpus of valuable writings to the world.

Engels was born in 1820 at Barmen; he graduated from Elberfeld high school in 1837. He came from a liberal, affluent, Protestant family; his father was a mill-owner in Barmen and in Manchester, England. Despite his leftist leanings, he could count on financial support from his family. Historians think that it was his relationship with his mother that allowed for the Janus-like existence of Engels—on the one hand he was a part of the industrial owner class and on the other a severe critic of it. He was sent to Bremen for business training in 1838 where he worked as an unsalaried clerk for an export business. But Engels was more interested in writing; his journalism was influenced by the ideology of the Young Hegelians who questioned all. Engels’s rebelliousness found its first expression in defying religion and second in his incisive, clear, and razor-sharp radicalized writings. During this time, his nom de plume was Friedrich Oswald.

From 1841–42, Engels served in the Household Artillery of the Prussian Army and attended lectures at the University of Berlin while simultaneously remaining active with the Young Hegelians. On his way to England in 1842, he met Marx in Cologne and then proceeded for his business training in the firm of Ermen and Engels in Manchester. He had occasion to closely observe and study the life of the English working class; he also joined the Chartist movement and continued with his leftist writings. In 1844 Engels contributed two of his writings to the *Deutsch-Französische Jahrbücher*, a journal that Marx had founded with Arnold Ruge. In these articles, he enunciated his earliest

Karl Marx and his colleague Friedrich Engels are seen as the fathers of modern communist political thought.

notions of private property as the source of material and social inequalities; it was his study of the English working class which had led to his first enunciations of scientific socialism. When Marx and Engels met in Paris, following their correspondence on these articles, their collaboration began.

Marx had to move to Brussels in 1845 after he was made to give up his Prussian citizenship; Engels followed him. Their first writing, *The German Ideology*, was written there. It was followed by several pieces, the most influential of which was the *Communist Manifesto* in 1848. Both participated in the Revolutions of 1848–1849 in Prussia; eventually moving to live in London in the fall of 1849. Marx resumed his studies at the British Museum in London, while Engels lived in Manchester, working for his father’s firm for the next 20 years; his salary supported his and Marx’s activities. Engels lived with Mary Burns, an Irish working class girl, until her death in 1863. He was opposed to the institution of marriage, and the two lived as partners. Marx became a regular contributor to the *New York Daily Tribune* from 1850–61; some historians believe that it was in

fact Engels who wrote the articles for publication under Marx's name. In 1867 the first volume of *Capital* was published while the other two volumes, which were ready, still needed some editorial work. Engels moved to live in London in 1870 and continued to publish books in his own right, notably, *Anti-Dühring* in 1878. After Marx's death in 1883, Engels published on his own but he also completed the editing on the second volume of *Capital* in 1885 and the third volume in 1894. Engels died in August 1895. Despite the passing of both these thinkers and philosophers in late 19th century, their ideas, writings, and ideology continued to influence many in the following century.

RADICALLY NEGATE

Marxism cannot simply be called a philosophy because at its very base it is a critique or a criticism (*Kritik*); to comprehend the mentality of Marx and Engels one has to use the lens of *Kritik*. For Marx, it was the way to radically negate the existing social reality, or in his own words, “a ruthless criticism of everything existing.” Marxist thought moves to a second step by then transforming what has been criticized. Marx and Engels's writings take concepts from the exclusive realm of ideas and connect them to the social and material reality around them. For instance, the concepts of alienation, knowledge, and nature connect with the historical, political, and economic realities so that they all exist in a vigorous relationship with one another.

Marx's basic premise was the primary human capacity to be a producer and his concern with the material conditions under which humans produced. In his words, “The mode of production in material life determines the general character of the social, political, and intellectual processes of life. It is not the consciousness of men which determines their existence; it is on the contrary their social existence which determines their consciousness.” This idea, known by the moniker of historical materialism, is the basis of all Marxist thought. Infused within all his writings, the idea of historical materialism demonstrated that every society is founded by the connections established between the “material forces of production” and the relationship between these forces—this is the economic basis. On this structure then is built the superstructure of politics and legalities which correspond to the nature of the economic substructure. It is through ideology that humans become conscious of the disjuncture between the sub- and super-structures which when critiqued reveal their lack of correspondence; it is then that conflict can arise.

Marxist texts enunciate the methods in which those who have the wealth (*Kapital*) also control the ways for creating more wealth; they are called the bourgeoisie. Conversely, those who have neither wealth nor the means to make it are in the employ of the bourgeoisie in their factories; those whose labor is a commodity are called the *Proletariat*. In Marx's time, this term referred specifically to the industrial working class. The proletariat and the underclasses are likely to move steadily toward pauperization; they are dependent either on wage labor or on the capitalist's largesse, both of which are decided by the bourgeoisie. This relationship then leaves all in a constant state of class struggle, which is not necessarily an overt struggle. The relationship between the classes is always tenuous and can rip apart societies and economies very quickly. Marxist thought offers alternative systems of production to the capitalist one because, according to him “Capitalist production develops the technique and the combination of the process of social production only by exhausting at the same time the two sources from which all wealth springs: the earth and the worker.”

OPPOSITIONAL RELATIONSHIP

In the capitalist system, the bourgeoisie and the proletariat exist in an oppositional relationship. It is in the *Communist Manifesto* that this relationship and its consequences are most clearly enunciated. Since capitalism commodifies all material reality, there will come a time when human consciousness will challenge bourgeois ownership, most likely through a violent revolution led by the proletariat. The details of the types and consequences of class revolution were unfinished in the third volume of *Capital*. However, classical Marxism does offer freedom from alienated wage labor when the proletariat leads a revolution by which it repossesses its productive powers. Once the repossessed forms of material production are changed, then humans will once again produce in freedom, leading to self-realization and self-actualization on the scale of all humanity. This new form of production was not the fundamental nature of socialism or communism, but only its precondition. Neither Marx nor Engels offered any particular name for this mode of production, other than to mention in several places that it was to be a “free activity of human beings producing in cooperative association,” as stated by scholar Robert Tucker.

Marx wrote with an acerbic pen, with a tone that was intellectually powerful, indignant, and angry. His writings were not easily accessible. In fact, it was

Engels's clear, concise, free-flowing prose made the powerful message in Marx's works popular; his complementary treatises on Marx's writings explained their intense concepts. Some scholars believe that without Engels, Marxism would not have been what it became. Marx and Engels contributed through their *Kritik* and theorizing a massive body of political thought whose significance continues unabated.

JYOTI GREWAL

Mazzini, Giuseppe

(1805–1872) *Italian revolutionary*

Giuseppe Mazzini, born in Genoa on June 22, 1805, was the intellectual source behind the Risorgimento, or resurgence. The son of a doctor, he completed his legal education in 1827 at the University of Genoa and became a practicing lawyer. He was a romantic revolutionary and an avid reader of drama and history. His writing was not just intended for the elite but for the masses. As a lawyer, he had tried cases for the disadvantaged. The annexation of his native republic of Genoa into the kingdom of Sardinia-Piedmont in 1815 dismayed him, and Mazzini had a burning desire to make Italy an integrated republic. An avowed antimonarchist, he favored a republican tradition. The task of unifying Italy divided into the kingdoms of Piedmont-Sardinia, the Two Sicilies, Lombardy-Venice, the Papal States, and smaller grand duchies was unappealing.

Mazzini joined the revolutionary *carbonari* (literally coal burners), whose members signed their oaths to rebel with blood. The bulk of *carbonari* members were drawn from the middle class and were responsible for insurrections in the 1820s in Naples, Sicily, and Piedmont. Mazzini was declared an outlaw and imprisoned at Savona in 1830. After his release, he appealed to King Charles Albert of Piedmont-Sardinia to liberate the Italian states from Austrian rule. In 1831 he went to Marseille, France, as an exile and gathered fellow Italian emigrants. There he began organizing the

movement to unify Italy from abroad, and he spent most of his years as an exile. Mazzini established a political society, La Giovine Italia (Young Italy), based on the ethical principle of a strong faith in God and commitment to progress, sacrifice, and duty. Branches of Young Italy sprang up in various Italian cities and by 1833 its membership reached 60,000. Only people under the age of 40 were eligible. In 1834 he set up a revolutionary organization called Young Europe to unite movements like Young Poland, Young Germany, and Young Italy.

Mazzini believed that a mass movement could drive foreigners from Italy, and an Italian republic could be established based on the principles of democracy, equality, and social reforms. He combined his political philosophy with action in hopes of making his dream of Italian unification a reality. In 1832 Mazzini made an attempt to foment a rebellion in the Sardinian army. He was sentenced to capital punishment in absentia. He was expelled from France and from his new home in Switzerland. He organized another insurrection against the government of Sardinia in 1834, which also failed. His Young Europe movement made him a cult figure and prophet of nationalism throughout Europe. In 1837 he moved to London, where he lived for many years. He published a newspaper, *Apostleship of the People*. Attempts were made to revive the Giovine Italia, which was languishing due to series of abortive attempts at rebellion. In his writings, Mazzini talked of a national consciousness of Italy.

The mantra of the February Revolution that swept Europe was nationalism. It prompted Mazzini to make another attempt at the political unification of Italy. For him, the REVOLUTIONS of 1848 fulfilled a mission for humanity. He came back to Italy after the Austrians were ousted from Lombardy. The impact of the revolution was felt all through Italy. The people of Milan welcomed Mazzini, who served for awhile with another Italian revolutionary, General GIUSEPPE GARIBALDI. The adherents of Giovine Italia in Rome rebelled in November 1848 and drove out Pope PIUS IX, who fled to the Neapolitan area. The democratic Roman Republic was put into place, with Mazzini at the helm, instead of the Papal States. It was the crowning glory of his career.

Elected as a triumvir of the republic, Mazzini carried out his social reforms with efficiency and an authoritarian streak. On July 1, 1849, the popularly elected Assembly passed the constitution of the Roman Republic. But Mazzini's dream was short-lived as French troops, who responded to the appeal of the pope, besieged the new

republic. Mazzini surrendered on July 3. Italy almost returned to its pre-Revolutionary status, divided into sovereign principalities, and a disillusioned Mazzini returned to London. He disliked the “narrow spirit of nationalism,” and deplored the usurping of leadership by the politicians of Italy and Germany afterward.

The revolutionary phase of Italian unification was over and the kingdom of Piedmont-Sardinia took leadership in proclaiming the Kingdom of Italy in 1861. The amateur revolutionaries failed, and the path was cleared for professional politicians to take leadership of Italy’s unification, much to Mazzini’s dismay. He continued to strive for democracy and an agenda of social reforms. Mazzini was arrested in 1870 and lived in Pisa for two years under a pseudonym. He died of pleurisy on March 10, 1872.

Mazzini remains a respected figure in Italy, whose ideals were active into the 1990s under the banner of the republican party. Mazzini’s philosophy influenced not only nationalists in Italy, but nationalists abroad as well. Mohandas Karmachand Gandhi, an important figure in the Indian freedom movement, for example, was influenced by Mazzini and worked for both political and social emancipation in his struggle against British colonial rule.

PATIT PABAN MISHRA

Meiji Restoration, Constitution, and the Meiji era

In December 1867 the 15th and last shogun (military leader) of the TOKUGAWA dynasty (1603–1867), Yoshinobu, surrendered his power to Emperor Meiji, which means “enlightened government.” The event is called the Meiji Restoration.

In 1868 Meiji took a charter oath that would create a modernized state when several important feudal lords (daimyo) surrendered their lands to the emperor. The process was completed in 1871 when all feudal holdings were confiscated from their traditional landowners, and Japan was divided into prefectures, still the main organizational departments of Japan today.

When Meiji became emperor, he inherited a state that had been severely handicapped in its development by the Tokugawa Shogunate, which closed Japan to foreign influence. Emperor Meiji and his supporters had to move swiftly to modernize his empire and, above all, its armed forces. The treaty of 1858, which was negotiated with the United States’s first envoy to Japan, Townsend Harris, included a clause: “The Japanese Government may purchase or construct in the United States ships-of-war, steamers, merchant ships, whale ships, cannon, munitions of war, and arms of all kinds, and any other things it may require. It shall have the right to engage in the United States scientific, naval and military men, artisans of all kind, and mariners to enter into its service.”

In his search for military and naval modernization, Meiji looked also toward western Europe. A delegation was sent to study the armed forces of Europe and initially felt that the French represented the best model for Japan’s army and that Britain would furnish the naval model since the British navy had reigned supreme since Admiral Horatio Nelson’s defeat of NAPOLEON I’s fleet at the Battle of Trafalgar in 1805. The Meiji government thus went to Britain to purchase Japan’s warships. Many of the early Imperial Japanese battleships came from British shipyards. Japan’s army, however, shifted to the German model when the French army was decisively defeated by Prussian forces in the FRANCO-PRUSSIAN WAR in 1870.

In 1873 Emperor Meiji introduced universal conscription to the armed forces, to bring Japan in line with German and other European practices. This ended the centuries-long samurai monopoly of armed military service. Such drastic changes, however, resulted in discontent. In 1877 some early supporters launched the SATSUMA REBELLION, which failed in the face of the discipline and modern weaponry of the new army.

Meiji pursued reforms throughout the government. In 1885 Meiji adopted a cabinet system loosely based on the cabinets under the U.S. president and the British prime minister. In 1889 a constitution was promulgated for Japan with a bicameral legislature. The upper house, or House of Peers, resembled the British House of

Lords, while the lower house, or Diet, would be elected by adult males who paid a certain sum in taxes.

In order to create the modernized state Meiji and his advisers realized that a comprehensive system of education was essential. In 1871 a ministry of education was created to carry out a far-reaching system of educational reforms. It created universal education for both boys and girls and modern universities and vocational colleges.

Industrialization was a primary goal of the Meiji government because it was the way that Japan could quickly take its place among the Great Powers. The government undertook major infrastructural building and also encouraged modernizing traditional industries. The textile industry was a prime example. It benefited from having a considerable labor pool available for industry. Many of the textile millworkers were girls from peasant families who could find no work for them on their agricultural lands. Japanese economic development followed that of other industrializing countries. As manufactured goods became a larger part of the economy of the country, the share of agriculture declined, reflecting the draw which the burgeoning factories had upon Japan's laboring population.

While the first 20 years of Emperor Meiji's reign were devoted to development at home, the last 20 years were involved with foreign adventurism. In 1894–95, Japan joined the ranks of those countries seeking to benefit from the weakness of neighboring China. One result of victory in the SINO-JAPANESE WAR was its annexation of the island of Taiwan (Formosa). It also contributed forces to the multinational army that rescued foreigners trapped in Beijing (Peking) during the Boxer Rebellion.

In 1902 Japan and Great Britain formed an alliance (Anglo-Japanese Alliance) to counter the threat posed by Russia toward British India and the Far East, especially Japanese interests in Korea. In February 1904 Japan attacked and inflicted a series of stunning defeats on the Russian army and navy in the Russo-Japanese War. A peace treaty was mediated by U.S. president Theodore Roosevelt at Portsmouth, New Hampshire, in September 1905 whereby Russia conceded to Japan's domination of Korea. In 1910 Japan annexed Korea and would rule it until 1945.

JOHN F. MURPHY, JR.

Metternich, Prince Clemens von (1773–1859) *European diplomat and peace broker*

Prince Clemens Lothar Wenzel von Metternich was the son of the Austrian envoy to the Rhenish clerical courts (later envoy to the Netherlands). A man of charm and presence, Metternich gained influence by marrying Maria Eleanora Kunitz, the granddaughter of the minister of Maria Theresa. Having received educational credentials via a degree in philosophy from the University of Strasbourg and a degree in law and diplomacy from the University of Mainz, and after traveling to England, he began his official career. He entered diplomatic service in 1797 as the representative of Westphalian courts at a congress of German states. In 1801 he became ambassador to Saxony for Austria.

Metternich's obsequious manner and shrewd powers of observation helped advance his career. In November 1803 he was named to the major court of Berlin for Austria. He then became Austria's ambassador to Russia for a year and finally ambassador to France in 1806. In that post, he ingratiated himself with the rising statesman CHARLES-MAURICE DE TALLEYRAND and NAPOLEON I's sister Caroline. When war broke out between France and Austria in 1809, he was held as a hostage for two months. In October 1809 the treaty of Schonbrunn greatly reduced Austria in size and brought it to its lowest point in history. At this point, Metternich, who had become minister of state in August, was appointed both foreign minister and minister of the imperial house. He was appointed partly because of his knowledge of Napoleon and partly because of his ability. From that point forward, Metternich was to dominate Austria (and often Europe) for nearly 40 years.

From this time onward, his emphasis was on maintaining a balance of power to preserve Austria. To gain time for Austria to recover and prevent a possible rapprochement between Napoleonic France and the Czar that might crush Austria, he acceded to Napoleon's request to arrange for the hand of Marie Louise. Marie Louise was the daughter of Austria's Francis II (who was also Holy Roman Emperor Francis I). In the subsequent Franco-Russian hostility, Metternich negotiated with both sides until it became apparent that Napo-

leon was on the defensive. He was then able to gain the maximum advantage for Austria as Russia and Prussia were becoming more anxious for Austrian troops as the decisive engagement at the battles of Leipzig and Dresden drew near.

After these coalition victories against Napoleon, Metternich hosted the powers of Europe as they arrived in Vienna to draw up settlements, many of which would last for a century. His main goal at this congress and thereafter were balance of power, legitimacy, and compensation. At the CONGRESS OF VIENNA he led the effort to prevent Russia from becoming too powerful. The Russians wanted all of Poland, which would threaten Europe as the Czar had already taken Finland, most of the Caucasus, and Bessarabia during the Napoleonic War. Prussia, in turn, who would give up her share of Poland, wanted all of Saxony, a densely populated industrialized state in Central Germany. This would make Prussia too powerful in Germany. Supported by the British and the French who were anxious to be readmitted to the club of Europe, Metternich managed to limit Russian gains in Poland and keep half of Saxony free.

The period 1815–48 was the age of Metternich, who dominated European diplomacy. The bases for this dominance were the arrangements made at the Congress. Under legitimacy, monarchs were restored in much of Europe, although much of the feudal system west of Austria was abolished. Monarchs were restored in Italy, Germany, Spain, Portugal, and the Netherlands. States that lost territory were compensated. Thus Sweden, which had lost Finland to Russia, received Norway, and Holland, which had lost colonial territories to Britain, received Belgium from Austria to form the Kingdom of the Netherlands.

After 1815 the council of Europe was formed to make sure that the leading powers of Europe (Britain, Austria, Prussia, Russia, and, in 1818, France) would act in unison to maintain order, peace, and stability, thereby avoiding conflict among themselves. This system, although threatened by the revolutions of 1830 and 1848 as well as independence movements in the Balkans against Turks, endured until the CRIMEAN WAR in the middle of the century.

To enforce the system, the powers utilized two alliances. The Holy Alliance was signed in order to placate the czar. All of Europe signed an agreement to promote “justice, Christian charity, and peace.” The exceptions were the British king (who was insane); the pope, who considered himself the keeper of Christian charity; and the Turkish sultan, who was not Chris-

tian. A more practical alliance was the Quadruple Alliance among the great powers (changed to the Quintuple alliance with the eventual addition of France). This alliance would hold congresses to act on matters of mutual concern.

The business of the alliance involved collective security, and the results involved multimilitary intervention to restore the status quo, even if it resulted in application of force to repress forces of liberalism and nationalism. Thus the Congress of Aix-la-Chapelle in 1818 adjusted the relationship of France to the other powers; the Congress of Karlsbad in 1819 occurred after the assassination of a Russian envoy in Germany and was used by Metternich to force press censorship, government supervision of universities, and the suppression of representative institutions not sanctioned by ancient usage. The German states submitted to this Congress. After the Congress of Laibach in 1821, Austrian troops intervened to suppress a popular uprising in Naples and Sicily and finally in 1822 at Verona, French troops were sanctioned to put down a Spanish uprising against the king. As a result of the last three congresses, the parliaments that had been established in Sardinia, in Naples, and in Spain were abolished.

By that time, Britain and Russia had become less enthusiastic. The British, along with the United States, opposed a plan to restore the Spanish king’s authority over Latin America. They had developed a thriving trade with a Latin America free of Spanish mercantilism. Russia supported the Greeks as fellow Orthodox coreligionists. By the middle 1820s Metternich was no longer unfettered in his policy objectives but was still considered first among equals. Inside Austria, he exercised complete power for as long as Francis II ruled. However, after 1835 he had to share power as one of a number of councilors who advised the somewhat feeble-minded Ferdinand I.

By the 1840s the Metternich system came to be seen as something oppressive and even reactionary, and the author of this system was hated. On March 13, 1848, having seen the writing on the wall, he resigned. Exiled, he went to England and Belgium, before returning to Vienna in 1851. He died in 1859, at the age of 86. Married and widowed three times, he died alone. He had 11 children, seven of whom survived him. In terms of 19th-century diplomacy, only OTTO VON BISMARCK rivaled his influence and impact.

NORMAN C. ROTHMAN

Mexican-American War (1846–1848)

In a profound national humiliation for Mexico and the biggest land-grab in U.S. history, from April 1846 to February 1848 the United States waged a war of conquest against its southern neighbor that had major repercussions for both nations. For Mexico, La Guerra de '47 discredited the leadership of JOSÉ ANTONIO LÓPEZ DE SANTA ANA and his cohort of ruling conservatives, setting the stage for the emergence of a new generation of liberal reformers after 1855. It also created in Mexican national consciousness a combination

of resentment, fear, and respect toward its northern neighbor that endured well into the 20th century. For the United States, the war added 1.3 million square kilometers to the young republic, thus fulfilling the vision of proponents of the notion of MANIFEST DESTINY by spreading U.S. dominion from the Atlantic to the Pacific Oceans. It also sharpened the sectional division between North and South and played a key role in the eruption of the AMERICAN CIVIL WAR 13 years later.

Before the war, most of this vast region was claimed by Mexico but not under its effective dominion. Comprising the northern frontier of the viceroyalty of New Spain and inherited by Mexico after independence in 1821, the region was inhabited by perhaps 75,000 people, some of Spanish descent and perhaps as many native peoples. The Spanish-speaking population was clustered in two main zones: the Upper Río Grande Valley, centered on Santa Fe (in present-day New Mexico); and further west in the ribbon of missions and settle-

ments hugging the Pacific coast of California from San Diego to San Francisco. The vast bulk of the conquered region was given over to an intricate mosaic of sedentary, semi-sedentary, and nomadic native peoples in the throes of dramatic changes.

The long-term roots of the war lay in the aggressively expansionist ideology of Manifest Destiny, shared by the most prominent U.S. politicians and opinion-makers in the aftermath of the 1803 LOUISIANA PURCHASE and the WAR OF 1812 with Britain. The war had an important precedent in the TEXAS WAR OF INDEPENDENCE in 1836, in which a highly militarized and well-organized group of Anglo-Americans wrested Texas from Mexico. After 1836 debates swirled regarding the status of Texas. Most Anglo Texans urged annexation to the Union, as did many white Americans west of the Mississippi and in the Southern slaveholding states. In 1844 at the prompting of President Tyler, Texas applied for statehood for a second time (it first applied in 1836), an initiative defeated in the Senate by a coalition of Northern non-slave states.

In the presidential elections of 1844, former governor of Tennessee James K. Polk was elected on a platform of reoccupying Oregon territory and annexing Texas. After Texas became a state in December 1845, Mexico protested by breaking diplomatic relations with Washington. Meanwhile, pressures were mounting in Washington and beyond for the acquisition of New Mexico and California territories.

Rebuffed in its bid to purchase the land, the Polk administration turned to war. Using the pretext of a border conflict between U.S. and Mexican troops in the disputed territory between the Rios Grande and Nueces in southeastern Texas, on May 13, 1846, the U.S. Congress declared war on Mexico.

The war itself, the subject of an expansive literature, was more hard fought than U.S. policy makers had anticipated. In summer 1846 General Stephen W. Kearney's Army of the West captured Santa Fe before marching west to California, where it linked up with an expedition led by Colonel John C. Frémont. By early 1847 the two principal zones of Mexican settlement in what later became the U.S. Southwest were in U.S. hands. Meanwhile forces under General Zachary Taylor marched south from the disputed territory in Texas, meeting unexpectedly fierce resistance before taking Monterrey in September 1846.

The third arm of the offensive, the Army of the Occupation led by General Winfield Scott, invaded Mexico on the southern outskirts of the city of Veracruz in March 1847. Bombarding the walled city for

48 hours with some 6,700 artillery shells, killing hundreds of civilians and reducing much of the city to rubble, Scott's army moved methodically westward, following the same route as Hernán Cortés 328 years earlier, taking Mexico City on September 13, 1847 after several weeks of fierce fighting that left thousands dead.

By the terms of the February 2, 1848, Treaty of Guadalupe-Hidalgo that formally ended the war, the United States acquired the northern two-fifths of the national territory claimed by Mexico, a region embracing the present-day states of Texas, New Mexico, Arizona, California, Nevada, and parts of Utah and Colorado. In exchange Mexico received \$15 million in cash, plus \$3.25 million in U.S. assumption of outstanding claims—about \$14 per square kilometer. The treaty also guaranteed full U.S. citizenship of Mexican nationals in the ceded lands, a provision to which the U.S. government did not adhere in the long term. In subsequent years, the landholding Spanish-descended *californios* (settlers in California) were stripped of their lands and political rights, while many of the Spanish-speaking peoples of the Southwest, especially in Texas, New Mexico, and Colorado, became second-class citizens and a low-wage labor force in the region's burgeoning commercial agriculture, ranching, and mining industries.

In the shorter term, the war sharpened the sectional conflict between North and South by reopening the divisive issue of the expansion of slavery into the territories, initiating a chain of events that led directly to the Compromise of 1850, a deeply flawed agreement whose unraveling 11 years later resulted in the Civil War—a war in which many of the most prominent military leaders on both sides were veterans of the Mexican campaigns.

Mexico, early republic of (1823–1855)

Several major themes dominated the first three decades of the independent Mexican republic—sometimes referred to as the “Age of SANTA ANA”—each relating to a specific axis of social, political, and international conflict. The central arena of struggle was the process of state formation, the constituent elements of struggles to forge a viable national government pitting liberals against conservatives, centralists against federalists, and pro-church against anti-church factions. Conservatives generally were centralist and pro-church, and liberals were federalist and anti-church, though there were many exceptions to these broad tendencies.

Related to these domestic political conflicts were struggles in the international arena, pitting the new Mexican state against foreign interlopers, especially Spain, France, and the United States. The early republican period was marked by profound political instability, economic dislocation, and deep divisions between various leaders, parties, and factions. It also saw Mexico’s national territory slashed nearly in half, with the loss of Texas in 1836 and the MEXICAN-AMERICAN WAR of 1846–48. The political turmoil and national humiliations of the early republican period set the stage for the rise of a new generation of political leaders in the mid-1850s, epitomized by the revered Liberal reformer BENITO JUÁREZ.

Following the overthrow of AGUSTÍN DE ITURBIDE in 1823, a provisional military junta oversaw the creation of the nation’s first constitution, the Constitution of 1824. A liberal, federalist document modeled on the U.S. Constitution, the 1824 Constitution created the *Estados Unidos Mexicanos* (Mexican States United) comprised of 19 states and four territories. The new charter gave individual states more power than did its counterpart to the north (as implied in the new nation’s name, the “Mexican States United,” *not* the “United States of Mexico”), while also granting the president special powers in times of emergency.

It also preserved the religious monopoly of the Catholic Church and special privileges of military officers and the clergy. The administration of the country’s first elected president, Guadalupe Victoria, was marked by fiscal crises and an armed revolt by Vice-President Nicolás Bravo—squashed by forces led by José Antonio López de Santa Ana—a harbinger of the political turmoil to come. In 1829 under Victoria’s elected successor Vicente Guerrero, Spain attempted to reconquer their former colony but was roundly defeated by forces under Santa Ana. In the same year the Guerrero government abolished slavery throughout the republic.

Meanwhile, the conservative disenchantment with the liberal government intensified.

Sensing the shifting political winds, Santa Ana, elected president as a liberal in 1833, retired to his estate and left the daily business of governance to his vice-president Valentín Gómez Farías. When a coalition of conservatives rose in revolt, Santa Ana put himself at their head, defeated the liberal government, and installed himself as the new conservative president. The Constitution of 1824 was scrapped and in its stead was imposed the Constitution of 1836, or *Siete Leyes* (Seven Laws), a far more conservative and centralist document. The new constitution dramatically circumscribed the political autonomy and power of states and territories, including the slaveholding Anglo-American settlers in Texas, whose numbers had grown dramatically in the past two decades.

Rising in revolt, in 1836 Texas declared its independence from Mexico. Santa Ana took the field again, and, after some initial successes, was defeated, captured, and sent back to Mexico City. Soon after, in 1838, a conflict with French property-holders escalated into open hostilities with France—the so-called Pastry War—in which French battleships shelled the port city of Veracruz before Santa Ana (who lost his leg in the battle) negotiated a settlement.

The final nail in Santa Ana’s political coffin came with the Mexican-American War of 1846–48, in which the United States, driven by visions of MANIFEST DESTINY, wrested from Mexico the northern two-fifths of its national territory. Discrediting Santa Ana, the war was experienced by many Mexicans as a profound national dishonor. Compounding the crisis, just as the war with the United States was ending in the far north, a major revolt by Maya Indians was erupting in the far south—the so-called Caste War of Yucatán, which came to a boil in 1848 and simmered for the next half-century. Atop all the turmoil and strife of the first three decades of independence, the defeat at the hands of the United States created an auspicious environment for the emergence of a new generation of leaders and the period of *La Reforma* (the Reforms) from the mid-1850s.
