The struggles in Geneva reassembled those that broke out later in France itself over the issue of municipal citizenship and access to office. The conflict in the United Provinces, however, was more complex. Here the Amsterdam oligarchy of merchants, who called themselves “republicans” and later “patriots,” was pitted against the Orangist party, which supported the stadtholder and was backed by plebeian and noble elements as well as the more rural provinces. The Amsterdam merchants favored an alliance with France and, through France, support of the American rebels in their war for independence from Great Britain, while the Orangists favored the traditional alliance with Britain. In 1780 the merchants prevailed and went to war with Britain. Opinion blamed the stadtholder for the disastrous campaigns that followed. The fear of the prince’s army provoked the formation of the Free Corps, which soon numbered some twenty-eight thousand volunteers. At the same time many municipal councils revolted against the prince’s power of appointment, and some began to adopt the elective principle. The Prussians intervened in 1787 to restore the old order, while many patriots fled to the Austrian Netherlands or to France.

Meanwhile, the reforms of Holy Roman Emperor Joseph II (ruled 1780–1790) threw huge areas of the Austrian empire into turmoil. Like the other “enlightened despots,” Joseph was motivated in part by the desire to improve his finances and his military after Austria’s mediocre performance in battle under his mother, Maria Theresa. Unlike his “enlightened” counterparts, he did not believe that further exploitation of his subjects was desirable. Instead, Joseph’s policies borrowed from many of the nostrums of the intellectuals of his day. Thus his

tax reforms were based on a thorough land survey that evaluated real resources, and they also annulled the exemptions for nobles and certain corporate bodies. He promulgated religious toleration for Protestants (but not for Jews or Muslims). He also suppressed the contemplative orders of the Roman Catholic Church, which he considered useless, and seized their property.

These measures provoked massive disturbances throughout Joseph's realms. Peasants in the Tyrol rebelled against the suppression of their monasteries, while the Hungarian nobility flirted with treason over the loss of their privileges. The most prolonged resistance originated in the Austrian Netherlands (roughly modern Belgium), where the numerous provincial Estates were upset that the new tax reforms had been introduced without their consent. Eventually, the Estates were simply replaced with a set of "rational" administrative bodies responsible to the emperor's officials in Brussels. Meanwhile, peasants in the Flemish-speaking regions revolted against the religious reforms. The war on the Turks delayed repression, but when repression came in mid-1789, it was met with widespread resistance. In a phenomenon that became common elsewhere, excitable priests and monks did everything they could to stir up opinion by claiming that "religion" was threatened. The patriots' civilian militias—contemptuously referred to as the "Army of the Moon" by the Austrians, who grossly underestimated them—met with considerable success, and their victories encouraged further rebellion. Finally, having routed the Austrians, the Estates General declared independence and the formation of a United States of Belgium in December 1789.

THE FRENCH REVOLUTION

It is seductive to see parallels between the revolution in France and the revolutions in these other countries. After all, as in the Austrian Netherlands, the government in France needed to reorganize the fiscal system in order to compete with its great-power rivals. In France as elsewhere, oligarchs struggled among themselves for control of state power. But in Belgium, traditional society exerted itself against princely power, and so privilege protected all of society against despotism. In France, patriots saw privilege and despotism as one and the

same. Furthermore, unlike in Geneva, the Dutch Republic, or Belgium, the repression from outside came very late in the French case, well after the revolution had defined itself. European powers initially interpreted the French Revolution as a collapse of French power and saw no reason to intervene; rather, they saw limitless advantage in letting France immolate itself. In short, because a revolution had broken out in a great power, other powers were bound to treat it differently. For that reason alone, the revolution in France followed a different course.

With the Declaration of the Rights of Man and Citizen (26 August 1789) the Revolution declared its principles: liberty under the law, due process, religious toleration, and protection of property. It took more than a year to work out the implications of these principles, but they were by any standard a radical departure from the recent past. The Constitution of 1791 established a unicameral legislature elected by an indirect but very wide male suffrage. The king was to have extensive executive powers over foreign relations and the military, as well as a veto over any legislation, one that could not be overridden easily. The constitution failed to provide for a speedy resolution to a clash between the legislature and the executive, leaving force as the only solution should such a conflict arise.

By the new constitution, the old division of France into provinces was abolished and replaced by eighty-three territorial entities called "departments." Although theoretically responsible to the national government, the department administrators were not paid officials but elected volunteers. Government was henceforth in the hands of at least a million enthusiastic citizens, who often governed in their own way, frequently ignoring direct orders from Paris.

FISCAL CRISIS

The revolutionary crisis had begun over the insolvency of the crown, and the Constituent Assembly inherited huge problems of public finance. Its attempts to resolve these problems were disastrous. In a series of laws, the Assembly seized the property of the church and sold it at auction. But the church had much less property and many fewer resources than contemporaries imagined. Church land comprised about 3 to 4 percent of the national patri-

Age of Revolutions. Undated engraving of the Tennis Court Oath. Meeting in an indoor tennis court on 20 June 1789, the self-proclaimed National Assembly of France vowed not to disband until a constitution had been written and accepted by King Louis XVI. The king agreed but was ultimately overthrown as the revolution progressed to its anti-monarchical republican stage.

mony, not 10 to 15 percent as had been thought. Moreover, the Assembly's decision to issue non-interest-bearing bonds (paper money, in other words) called *assignats* turned out to be calamitous. *Assignats* amounted to a loan that was supposed to be retired as the church lands (termed *biens nationaux*) were sold. But this did not happen. The economist and deputy Antoine-Laurent Lavoisier pointed out that *biens nationaux* were worth far less than they seemed, because the Assembly also assumed responsibility for the church's massive debt and the payment of clerical salaries. The value of the *assignat* against gold therefore began to fall almost immediately. There were more and more *assignats* in circulation that were not backed by the mass of *biens nationaux*. Thus in January 1791, the *assignat* had lost 10 percent of its value, and a year later, nearly 40 percent.

The consequences of this monetary disaster reverberated throughout the country and abroad. Farmers refused to bring grain to market if they were going to be paid in the deteriorating currency. The result was endless rioting from 1791 until 1795. Smart citizens paid their taxes in *assignats*, when they paid at all. Not only did the state lose, so did private individuals. Holders of government bonds, among whom the high nobility was well represented, had their fortunes wiped out. Landlords who received rents in cash were also big losers. The falling *assignat* even affected how the French fought their wars for the rest of the decade.

One of the biggest demands in the summer of 1789 was for fiscal equality. With the outbreak of the Revolution, the implicit assumption was that the destruction of fiscal privilege would lower the tax burden. This did not happen. Estimating whether the new regime's citizens paid more than the Old Regime's subjects is tricky, but it is certain that the Revolution did not effect much, or even any, transfer of wealth. By law, landlords were allowed to add the equivalent of the defunct tithe to leases. A rise in rents would have happened regardless—because of the intense land hunger in France—and the rise in rents exceeded the former tithe and former seigniorial dues combined. Indeed, the higher rents gave landlords some compensation for the loss of their fiscal privileges. But the state was the main beneficiary, since the increase in taxes gouged landlords. In Brittany, for instance, large landowners paid

roughly 15 percent of their incomes in taxes under the Old Regime, but 40 percent during the Revolution. Under Napoleon Bonaparte, this percentage was cut by half. No wonder the emperor was popular. Nobody had anticipated that fiscal equality would mean higher taxes.

It was in this context of monetary crisis, continuing economic inequality, and rising rents and taxes that the French were asked to express their loyalty to the Revolution, and the result in many areas of the country was disturbing to the new regime. The regime attempted to regulate the relations between church and state by means of a new law, the Civil Constitution of the Clergy (12 July 1790). Unlike the Americans, the revolutionaries in France did not believe in the separation of church and state. Instead, they envisioned the clergy as proselytizers for the revolutionary regime, and the Civil Constitution was supposed to promote this new role. When the upper clergy balked, the Constituent Assembly added an oath of loyalty to the Civil Constitution. About 60 percent of French parish priests took the oath, but in large parts of the country, especially in the west and south, huge numbers of clerics refused it. In many cases, they had the support of their parishioners, many of whom had gotten nothing from a revolution that had once been so promising. Many of the supporters of the refractories, as those who refused the oath were called, were women who had deep emotional attachments to their parish priests, many of whom had long attended to their families. Still others supported the refractories simply because these clerics were overtly defiant of the bourgeois revolutionaries who, many felt, had deceived them.

THE END OF THE MONARCHY

A Revolution that should have been over at the end of 1789 thus proved impossible to conclude because of the unforeseen consequences of the Constituent Assembly's policies. National politics aggravated this turmoil immeasurably. On 20 June 1791, Louis XVI and his family fled Paris for the eastern frontier. What the king hoped to accomplish is unclear, and perhaps he did not know himself. The next day he was apprehended at Varennes and brought back to Paris. The flight to Varennes had enormous consequences. At first the politicians in the Constituent Assembly were masters of the situa-

tion. They had no intention of deposing the king and preferred to believe he had been kidnapped. Their determination to preserve the monarchy probably cut short a drift to republicanism in the provinces, and in the capital republicanism was dealt a violent blow in the Champ de Mars massacre (17 July 1791).

Nonetheless, restoring Louis XVI to the throne was a huge error. Many disgusted patriots, including the radical journalist Jacques-Pierre Brissot, began to demand a war on the hereditary enemy, Austria, to smoke out, as they said, the “great traitors.” The question of war and the defense of the Revolution dominated the new Legislative Assembly (October 1791–September 1792). According to Brissot, war would define loyalties clearly, and Louis XVI had shown where he stood by vetoing several laws penalizing the refractory clergy and émigrés, those who had fled abroad.

The vetoes not only revived the democrats in Paris, who began to denounce the king; they also galvanized the provinces. Democrats in the provinces had expressed their dismay at the king’s betrayal following the flight to Varennes but had largely demurred on the issue of a penalty for his attempted escape. After the vetoes, many provincial administrations and many Jacobin clubs went far beyond the demands of the radicals in Paris. They illegally interned refractory priests, invoking a justification often heard later, during the Terror, that the safety of the people is the supreme law. They also demanded, well ahead of Paris, the suspension of the king. By mid-summer of 1792 dozens of National Guard battalions, including that of Marseille, converged on Paris, singing the hymn that later became the national anthem.

On 10 August 1792 the provincial National Guards, with some help from Parisian radicals, overthrew the monarchy. But this did not neutralize the immediate threat. The internal enemy—the supporters of the refractory priests—was as dangerous as ever. Furthermore, Brissot finally persuaded the Legislative Assembly to declare war on Austria (20 April 1792). Prussia soon allied with Austria, and the Prussians were indeed the first to cross the frontier. Shortly after the fortress of Verdun surrendered to the Prussians, the September Massacres (2–6 September 1792) began in Paris. About 1,400

people were murdered in this appalling episode, in which murderers methodically dragged prisoners from their cells, set up kangaroo courts, and murdered the “guilty” in the streets. The most prominent victim was the Princesse de Lamballe, an intimate of Marie Antoinette, whose head and body parts were paraded through the Marais section of Paris.

The overthrow of the monarchy was also the death of the Constitution of 1791. Consequently, a new body, the National Convention, was elected to replace the Legislative Assembly. The Convention declared France a republic on 20 September 1792. Military victories at Valmy and Jemappes forced the Prussians out of France and allowed the French to occupy Belgium. The Convention also decided to put Louis XVI on trial. It ignored the fact that he was immune for all political acts under the Constitution of 1791. Despite widespread charges that the king was guilty of treason (a charge that many historians continue to repeat), the Convention failed to produce any evidence that he had betrayed his country in wartime.

Even so, the Convention found Louis guilty, and he was executed on 21 January 1793. The men of the Convention were convinced that they were living through a great moment in human history. They were right, but not for the reasons they imagined. They thought they had founded the republic of universal happiness, that the sacrifice of their king had made them true republicans, that spilling the blood of Louis the Last had sacralized the republic. It did none of this. Indeed, the republic succumbed to a dictatorship eleven years later, in part because of what they had done. In effect, the execution of the king provoked the counterrevolution, in the person of the king’s brother, the new self-proclaimed regent. He vowed that a successful counterrevolution would demand the execution of the regicides. The execution of Louis XVI therefore rendered impossible any compromise between revolutionary and counterrevolutionary France.

THE CRISIS OF 1793

The death of the king solved none of the pressing challenges before the Convention. In February and March, the Convention declared war on Great Britain, Holland, and Spain. Every great power except Russia was now at war with France. Moreover, the

spring military campaign went badly. A renewed Austrian offensive forced the French into retreat. Worse still, one of the French generals, Charles-François du Périer Dumouriez, tried to turn his troops on Paris to “restore the sane part of the Convention.” He failed, but his treason fueled the revolutionaries’ already powerful conviction that conspiracy was everywhere and no one could be trusted.

The economy, meanwhile, teetered on the brink of collapse. By January 1793 the *assignat* was at half its original value. There were riots in several major cities, particularly in Paris, where journalists and demagogues demanded a law prescribing death to hoarders. The Convention balked at that, but it did decree a “maximum,” a law fixing the price of grain. The maximum did little for the cities, but it

did fix the price the government would pay for grain for the swelling armies of the republic.

Alongside foreign war and economic chaos, the third dimension of the crisis of 1793 was counter-revolutionary insurrection in the west of France. The first riots were spread over fourteen departments in Normandy, Brittany, Maine, Anjou, and Poitou. The revolutionary army and local National Guard put down most of the rebellion, but they failed to do so in four departments south of the Loire, known as the “Vendée *militaire*” or simply the “Vendée.” This was easily the most extensive and enduring peasant rebellion of the entire Revolution. It began as a protest over the recruiting law of 24 February 1793, whereby the Convention conscripted 300,000 young men into the army. But whole communities, upset over higher taxes, higher rents, and the disruption of their spiritual life by the

Age of Revolutions. A contemporary engraving depicts the execution of Louis XVI of France, 1793. ©BETTMANN/CORBIS

Civil Constitution of the Clergy, soon joined the young men. By July, noble leaders, often impressed into service by their former “vassals,” had formed a “Catholic and Royal Army of the West” and sent out emissaries to seek out British arms and money.

The Convention responded with the first steps toward the Terror. It established a Revolutionary Tribunal in Paris, whose initial purpose was to punish traitors like Dumouriez, and a Committee of Public Safety to take whatever measures were necessary to save the young republic. It also established revolutionary committees to arrest suspects, that is, anyone thought to be a potential enemy. And it passed the law of 10 March 1793, which established revolutionary tribunals that reduced enormously the protections for the accused as guaranteed in the Declaration of the Rights of Man and Citizen. Finally, it authorized its own members, known as “representatives on mission,” to fan out over the provinces to supervise conscription and the application of revolutionary laws in general.

These early measures of defense provoked widespread resistance, especially in the cities of the south. Because local Jacobins took these measures even further than the Convention intended and threatened a bloodbath of their enemies, many in the south rebelled under the banner of “federalism.” The federalists had little contact amongst themselves and not much of a program beyond resistance to the Jacobin vision of the future, but one by one they took over many cities in the region. These cities, Lyon, Marseille, Toulon, Bordeaux, and some smaller ones such as Arles and Aubagne, had all experienced lynchings the previous summer. Like the September Massacres in Paris, these lynchings had never been punished.

THE TERROR

Federalism and the Vendée were defeated, at least militarily, by the end of 1793. At the same time, the purge of Brissot’s friends from the Convention (31 May–2 June 1793), the accession of Maximilien Robespierre to the Committee of Public Safety (27 July 1793), and the murder of the journalist-deputy Jean-Paul Marat in his bath by Charlotte Corday (13 July 1793) all combined to ratchet up a will to destroy the enemies of the Revolution.

These events led France to the Terror, the most violent and also one of the most misunderstood

episodes of the Revolution. Most of the victims of the Terror were found guilty of counterrevolutionary acts, but in fact their trials were too short to establish guilt or innocence: in Marseilles they averaged twenty minutes each, in Lyon seventy-two seconds. Around Nantes, one tribunal passed 666 death sentences in three days. Among the victims were numerous women, priests, and children. In any case, the language of Terror was not defensive, and it was deliberately horrible and cruel. “The guillotine awaits its game birds,” said the representative on mission in Arras, Joseph Le Bon. According to the representatives in Lyon,

Our enemies need a great example, a terrible lesson to force them to respect the cause of Justice and Liberty. All right then! We are going to give it to them. . . . All their allies at Liberated City [Lyon] must fall before the thunderbolts of justice and their bloodied corpses, tossed into the Rhône, offer from its two banks until its mouth, under the walls of the infamous Toulon, to the eyes of the cowardly and ferocious English, the impression of horror and the image of the all powerful French people.

The Terror had many purposes, but one of the most common justifications at the time was that it was needed to purge the nation of corrupting influences and to regenerate the citizenry, to make it worthy of the egalitarian republic. Hence the necessity to make executions as spectacular as possible and hence, too, the frequent ceremonies, often known as dechristianization, to exorcize the Christian, royalist, and feudal past. The Terror was intended to purge the Old Regime from people’s minds.

The Terror as mass execution, of course, failed, and it formally came to an end with the execution of Robespierre and his faction on 28 July 1794. But the successor regimes, known as the Thermidorean Convention (after the month in the revolutionary calendar when the Terror ended) and the Directory (the government established by the Constitution of the Year III, or 1795) nonetheless remained revolutionary regimes. They, too, aimed to produce a new republican man animated by public virtue, through reforms in the school curricula and lengthy, didactic public ceremonies. They were enthusiastically anticlerical and maintained the death penalty for returned refractory priests and émigrés. Finally, they established exceptional military commissions from time to time, whose legal basis and procedures were

scarcely different from revolutionary courts of the Terror.

EXPORT OF THE REVOLUTION

Thus, when the French expanded into western Europe, they brought with them not the promise of 1789—a regime based upon the rights of man, fraternity, and limited government—but rather revolutionary regimes, which they imposed upon the newly liberated peoples. Moreover, they exported not only policies, but also stubborn habits of mind. French authorities viewed all opposition as the result of conspiracy, and religious dissidence as the work of refractory priests. They believed foreigners unworthy to receive the blessings of liberty, since they had been corrupted by centuries of despotism. The same attitudes had played themselves out in France itself; abroad, the result was the same: repression followed by resistance.

The pattern of repression and resistance appeared almost everywhere as people protested the French-imposed reforms of the Catholic Church. In France, strong anticlerical surges throughout the 1790s provoked an equally powerful response, including talk of apparitions of the Virgin in sacred oak trees, pilgrimages to holy fountains and wells to ward off divine wrath, stories about the end of days, pilgrimages to the Holy Land to establish the “Republic of Jesus Christ,” and so on. The rest of Europe was no different. On the left bank of the Rhine, for instance, although the monasteries were left alone for a while, the invaders imposed the revolutionary calendar, forbade pilgrimages, suppressed outdoor religious ceremonies, deported unruly priests, and took other similarly repressive measures. The response in the Rhineland was similar to that in France. Around Aachen, one widely distributed pamphlet denounced “all enemies of the saints, of their images and of their solemn veneration . . . all harbingers of the Anti-Christ . . . O Lord, be gracious unto us! At a time when many carry the mark of the beast.” In Italy, there were stories of miraculous appearances of the Virgin in lonely dilapidated chapels, stories of miraculous cures at her shrines, stories of her statues weeping, blinking, falling over, or speaking. The French, like the Tridentine reformers before them, deplored the reports as senseless superstition and tried to suppress them, but in driving such sentiments underground,

they made the faithful cling to their traditions even more. As in France, clerics who had once condemned such enthusiasms as aberrations began to see their value as stimulants to faith, and the church entered the new century with priests and laity more in harmony than they had been in centuries.

Another reason for discontent was that the French occupiers did not bring liberty to Europe’s oppressed for free. Not only did they expect the natives to sustain the occupation and tolerate pillage, they also expected indemnities. When the republican armies overran Belgium, the Dutch Republic, and the left bank of the Rhine in late 1794–early 1795, they made the price clear. In the former Dutch Republic they established the first of the “sister republics,” the Batavian Republic, and staffed it with Dutch patriots. But they also imposed an indemnity of 100 million florins, and over a fifth of the new republic’s expenditure was for the upkeep of French troops. One of the reasons for the invasion of Switzerland was to loot the treasury of the city of Bern in order to finance Bonaparte’s Egyptian campaign. General Guillaume Brune levied an indemnity of five million livres and took hostages among the patricians to ensure compliance. One commissioner threatened to toss the patricians into the nearby lakes as fish food. In the Kingdom of Naples, ordinary people welcomed the French because they believed their liberators would abolish all taxes. Instead, they levied an indemnity of 2.5 million ducats as well as a separate indemnity on Bari of 40,000 ducats. Royalist opponents of the French, in turn, got a great deal of traction by promising a moratorium on all taxes for ten years.

Resistance against the French emerged almost everywhere. Although the particular motivating factors varied from place to place, rebellion usually had to do with increased taxation, conscription, and religious innovation. In Belgium, for instance, the French definitively abolished the old institutions of estates and provinces that had recently defied the Austrian “despotism,” creating instead nine new subservient departments. Many priests refused yet another oath of loyalty, and nearly five hundred were deported to Guienne or the islands of Ré and Oléron off the Atlantic coast. In December 1798, a “War of the Peasants” broke out on both sides of the Flemish-Walloon linguistic line to protest conscription. Young men; the rural poor, now desper-

ate because of the abolition of traditional relief; and the socially marginal, including demobilized imperial soldiers and men the French called “brigands,” took up all manner of farm tools and tore down liberty trees, burned vital statistics registers, robbed tax offices, and welcomed refractory priests. One band called itself the “Catholic Army of Brabant,” while others shouted their support for George III, the prince of Orange, or the Austrian emperor. Many of these same people had rebelled against the innovations of Joseph II nine years before. French repression was far more successful than Austria’s had been; some five to ten thousand Belgians were arrested, and nearly two hundred were shot by military commissions.

In the vastly over-taxed Batavian Republic, the Dutch navy mutinied during the Anglo-Russian invasion of August 1799, but the rebellion did not spread, possibly because the Orangist pretender remained an uncompromising enemy of the former patriots, now Jacobins, just as he had been in the 1780s. There were also significant disturbances in Switzerland. Many could see little point in the “Helvetic Republic,” with its modern and expensive government, its requisitions, and its military drafts. People in the more remote cantons had never paid taxes of any sort and had certainly never been drafted (there were similar conditions in many of the tiny German statelets, where the knights of the Holy Roman Empire lived off their own resources and made no demands on their subjects). Everywhere the French tax system was disruptive, since the Swiss had never known a direct land tax. As in France and elsewhere, in Switzerland protests based on religion were dismissed as the work of fanatics, and in one rising nearly four hundred were killed.

In Italy there was counterrevolutionary resistance almost from the beginning of the French invasion in March 1796. There were irregulars operating against the Army of Italy in Lombardy, Liguria, Romagna, and Tuscany. The “Jacobins” who accepted positions of authority in the sister republics—the Ligurian (Genoa, June 1797), Cisalpine (Milan, July 1797), Roman (February 1798), and Parnethopean or Neapolitan (January 1799)—had very little popular following and were always threatened with insurrection. There was a major counterrevolutionary rising in the Ligurian Republic as early as September 1797, which the French saw as a

clerical and noble-inspired rising (like previous risings in France) to restore the Genovese oligarchy using religion as a pretext. In fact, French anticlericalism had outraged local religious sensibilities. Around Rapallo some peasants wished to plant “a tree with the banner of the Madonna” to counter the French liberty trees. Nearby, the “low people” decided to “raise the Genovese standard, reinforced with the image of the Immaculate Virgin.” In a rising in Ferrara, one rebel leader said he was a “captain of the Emperor.” In Nice and western Piedmont, a particularly vicious guerilla movement, known as the *barbets* or *barbetti*, murdered “the French” and bragged about eating their livers and bread soaked in their blood. They frequently decapitated their victims and took the heads with them.

There was a major insurrection in Rome on 25 February 1798, in which up to two hundred French may have been killed. Earlier, General André Masséna had been accused of being the Antichrist. On the eve of the declaration of the Roman Republic, “around 90,000 faithful, covered with the grime of penitents, implored divine help.” The occasion for the rising itself was the decision of the republic to abolish the Jewish ghetto and free Jews from the obligation to wear a yellow symbol. Jews could now wear the republican tricolor, which raised fear and suspicion that they supported the French. The rebellion was quickly suppressed and on 27 February alone, thirty rebels were executed after sentencing by a military commission. Over the next two years over eighty people were executed.

The year 1799 witnessed generalized insurrections throughout the peninsula. These had begun in Piedmont, in the valley of the Aosta, the previous December; in February 1799 they spread to the Neapolitan Republic, and they became general with the Austro-Russian invasion. The Russian commander Aleksandr Suvorov entered Milan on 28 April, whereupon the Cisalpine Republic collapsed. Turin fell a month later. This encouraged the counterrevolution throughout Italy. In the Alpine villages, the local captains of the irregulars were parish priests who had swords and pistols stuffed into their cassocks. The most dramatic and bloody rebellion occurred in the Neapolitan Republic. In February 1799, Cardinal Fabrizio Ruffo, a former official in the papal curia, set out from Sicily and

landed in Calabria with just four men. Gradually, he gathered more and more forces to his movement, the Santa Fede or 'Holy Faith'. Officially, he called his army the "Most Christian Armada of the Holy Faith," although it was less an army than a constantly changing series of formations of local irregulars. On 13 June, the Santafedisti entered Naples and began an orgy of revenge and bloodletting. Ruffo himself watched with despair. As an enlightened reformer, he had gnawing misgivings about the crude faith of his followers, but he contributed to the lawlessness by promising them confiscated Jacobin estates. Indeed, authority collapsed to such an extent, and the restored Bourbons and their advisor Lord Horatio Nelson were in such a vindictive mood, that the vendetta killings continued for another year. Brigandage remained a problem in the kingdom for decades afterward.

NAPOLEON AND THE END OF THE REVOLUTION

The French Revolution destroyed the ancient institutions of old Europe, institutions that had kept an uneasy and not always successful balance between despots and subjects. The consequence of this destruction was the Napoleonic despotism and, in response, a revival of the Catholic enthusiasm that the Tridentine reforms had tried to contain over two hundred years before. No one could have anticipated such an end to the Revolution back in the summer of 1789, amid the blissful hopes for a humanity reborn.

DONALD SUTHERLAND

REYNOLDS, JOSHUA (1723–1792), English portrait painter and theorist. Sir Joshua Reynolds's critical role in the development of British art from the eighteenth century lay both in his painting practice and his position as the first president of the Royal Academy. As the leading painter of aristocratic and intellectual society in the second half of the eighteenth century, Reynolds looked to classical and Old Master models to endow his "great style" portraits and his own reputation with art historical seriousness. He articulated his method for raising

the social status of the artist in theoretical form with the fifteen lectures (known as the *Discourses on Art*) he delivered between 1769 and 1790 to the students and members of the Royal Academy that he helped found in 1768.

Born in Plympton, where his father, an Oxford fellow, was master of the local grammar school, Reynolds began his London career as an apprentice to fellow Devonshire-born portrait painter Thomas Hudson in 1740. After three years (although he had been indentured for four), Reynolds began his independent practice in London and Devonshire. To complete his artistic education, he sailed with his friend Commodore Augustus Keppel to Italy, where he studied in Rome between April 1750 and April 1752.

On his return to London at the end of 1752, Reynolds set up his studio near Covent Garden, the neighborhood then popular with artists. His second portrait of Keppel (c. 1753–1754; National Maritime Museum, London) in the pose of the Greek sculpture *Apollo Belvedere* demonstrates Reynolds's study of the antique statues in Rome, as well as the heroic figures of Michelangelo. As his future student James Northcote related, Reynolds's success was consolidated with his commissions of "several ladies of high quality, whose portraits the polite world flocked to see." Reynolds's hectic schedule of sittings (in 1758 he had sittings every day of the week) provided the income necessary for his move to a larger house in Leicester Fields in 1760.

That year also marked the initial exhibition of the Society of Artists, which was the first public exhibition of paintings to be held in England. Reynolds contributed four portraits, including the classicizing full-length portrait of Elizabeth Gunning, duchess of Hamilton (1758–1759; Lady Lever Art Gallery, Port Sunlight). Reynolds continued to exhibit at the Society of Artists; however, he socialized with men of letters, such as Samuel Johnson, Oliver Goldsmith, and Edmund Burke, and was a founding member of the Literary Club in 1764.

Soon after his two-month trip to Paris, the Royal Academy was founded, in December 1768, and Reynolds was elected its first president. It was for the academy rooms that he painted his only portraits of King George III and Queen Charlotte. Although he never succeeded in winning royal pa-

tronage, Reynolds was knighted in April 1769 and named principal painter in 1784 on the death of Allan Ramsay.

The following two decades of Reynolds's career revolved around his dual role as painter and theoretician at the Royal Academy. At the annual exhibitions, Reynolds displayed his most ambitious works, such as *Mrs. Siddons as the Tragic Muse* (1783–1784; Huntington Library Art Collections, San Marino, Calif.), in which the dramatic actress is seated in the pose of Michelangelo's prophet Isaiah from the Sistine Chapel ceiling.

Presented annually for the first five years and then every other year at the academy's annual awards ceremony, Reynolds's *Discourses on Art* were not only a prescriptive course of study for aspiring artists, but also presented the president's case for the intellectual status of the artist in society. In his stated theory of beauty in Discourse IX, Reynolds's emphasis on the cerebral is clear: "The beauty of which we are in quest is general and intellectual; it is an idea that subsists only in the mind."

Although Reynolds's dictate to artists urging inventiveness may seem at odds with his own borrowing of poses from antique sculpture and Old Master paintings, his allusions to great works from the past are in keeping with the theory he outlines in Discourse XII: "The daily food and nourishment of the mind of an Artist is found in the great works of his predecessors. There is no other way to become great himself." To this end, Reynolds recommends the "great style" of the Roman and Bolognese schools, as opposed to the "ornamental" approach of the Venetians.

Reynolds's own attempts to achieve the richness of color of Titian and the Venetian school led him to experiment with mixtures of varnish, turpentine, bitumen, and other unconventional ingredients that often caused irreparable damage to his paintings. To Northcote he confessed that "I had not an opportunity of being early initiated in the principles of Colouring." Reynolds stopped painting upon the deterioration of his eyesight in 1789. On his death in 1792, he was buried in the crypt of St. Paul's Cathedral. In his eulogy, Edmund Burke took up Reynolds's own insistence on the intellectual role of the artist, noting that "he was a profound and penetrating philosopher."

RHETORIC. The term “rhetoric” refers to the art of persuasive discourse or to the presence of rhetorical elements in prose, poetry, or oratory.

THE HERITAGE OF THE MIDDLE AGES

As a discipline, rhetoric crowned education in the culture of ancient Greece and Rome and served in the Middle Ages as one of the three liberal arts of the *trivium*: grammar, logic, and rhetoric. Even though occasions for the practice of live oratory in judicial courts and political forums declined in the medieval period, rhetoric supplied theoretical principles for the arts of preaching, letter writing, and poetry.

RENAISSANCE RECOVERY OF CLASSICAL LITERATURE

Humanists in fourteenth-century Italy began to study newly recovered classical manuscripts, including previously unknown rhetorical works, histories, and other literary texts. At the same time the advent of printing carried forward the pedagogical influence of the most ubiquitous rhetorical manuals of Roman antiquity: *De inventione* (On invention) by Cicero (106–43 B.C.E.) and the anonymous *Rhetorica ad Herennium* (Rhetoric for Herennius). The recovery of *De institutio oratoria* (On the education of the orator) by Quintilian, a first-century Roman

teacher of rhetoric, reinforced and expanded the content of the early works. All of these depicted rhetoric as including five parts or canons: invention, arrangement, memory, delivery, and style; and all envisioned three kinds of oratory: political, judicial, and ceremonial (epideictic).

The discovery around 1400 of Cicero’s *De oratore* (On oratory), a dialogue, and many of his orations and letters to friends inspired scholars to imitate his Latin and to regard as inadequate the medieval form inherited from the Scholastics. Ciceronianism, as the new movement was called, had its critics, who argued against excessive imitation of the vocabulary and syntax of Cicero.

Interest in the language and literature of ancient Greece also arose in the fifteenth century when Greek scholars came to reside in Italy, bringing with them Greek manuscripts of works unknown for centuries. Among these scholars were Manuel Chrysoloras (c. 1353–1415), who taught Greek in Florence, and George of Trebizond (1395–1486), author of a popular rhetoric incorporating the Greek and Byzantine tradition and a translator of Aristotle’s *Rhetoric* into Latin. His was the first of many translations that made Aristotle’s teachings available once more.

Prominent among the manuals of rhetoric reviving the whole classical tradition were George of Trebizond’s *Rhetoricorum Libri V* (c. 1433; Five books on rhetoric); Guillaume Fichet’s *Rhetorica* (1471); Lorenzo Guglielmo Traversagni’s *Nova Rhetorica* (1478; New rhetoric); Johannes Caesarius’s *Rhetorica* (1542); and the Jesuit Cipriano Soarez’s *De Arte Rhetorica* (1562), which was reprinted continuously into the eighteenth century. Some very popular textbooks of the Renaissance were devoted entirely to invention and some solely to style.

THE CHIEF ELEMENTS OF RENAISSANCE RHETORIC

As occasions for the use of rhetoric in the city-states of Italy increased at the beginning of the Renaissance, so too did interest in the elements of the art. Invention, the technique of developing arguments on both sides of a subject, was deemed critical to persuasive speech or prose. Rhetoric shared with logic (or dialectic) the need for invention, but dialectic debated philosophical questions while rheto-

ric argued matters of public concern in order to persuade a general audience.

Invention aided orators in creating arguments when certain knowledge could not be attained, when one could argue only from what seemed probable. The ancient dialectical method of assessing probabilities, “the topics,” was used to probe a subject systematically by asking for its genus, species (or definition), accidents, and properties (and its similarities, opposites, and relationships). Rhetorical texts added to the topical lore of invention the topics of persons (ancestry, education, appearance, and character) and action (manner of life, deeds, words). Collectively these were referred to as “commonplaces” in English, *koinoi topoi* in Greek, and *loci communes* in Latin. In sixteenth-century England students kept “commonplace books” in which they recorded topical arguments, memorable sayings, and set pieces of eloquence. The topical method permeated creative efforts in poetry and literary prose as well as public discourse. Closely linked to the topics was the canon of style. Its concern with levels of discourse, tone, and the fecundity of figures of speech inspired even more interest than invention in the Renaissance. The figures or “colors” were exploited extensively in oratory, prose, and poetry to appeal to the emotions.

The lines between the provinces of dialectic and rhetoric began to break down in the sixteenth century when more and more philosophical subjects came to the attention of an increasingly educated public. The scope of rhetoric was thus widened beyond the three traditional kinds.

HUMANISM AND CURRICULAR REFORM

The recovery of Quintilian’s *De institutione oratoria* in 1416 confirmed humanists in their efforts to revamp the curriculum to emphasize both literary and practical concerns. The *studia humanitatis*, which soon replaced the *trivium* in most Italian schools, included grammar, poetics, rhetoric, history and moral philosophy. Logic was deleted from the new curriculum in reaction to what was deemed Scholastic preoccupation with syllogistic reasoning.

Among the later humanists, Desiderius Erasmus (1466?–1536) was probably the best known in his lifetime. His influence spread across the Continent to England, where his *De Ratione Studii*

(1512; On a course of studies) and *De Copia* (1512; On copiousness), a treatise on style, were adopted by John Colet (1467–1519) for use in St. Paul’s School in London. Juan Luis Vives (1492–1540), educated at the University of Paris, also carried humanist studies to England. Soarez’s *De Arte Rhetorica* (1562), mentioned earlier, circulated from Portugal to Italy and to Jesuit schools throughout the world. Philipp Melancthon’s (1497–1560) rhetorical works extended his humanistic approach to Germany and other northern areas.

RISE OF THE VERNACULAR

Although Latin remained the predominant language for scholarly communication, during the sixteenth century the vernacular increasingly became the preferred medium for familiar letters, preaching, publications, and oratory aimed at a general audience. As consciousness of national differences increased in the sixteenth and seventeenth centuries, so also did attention to the perfection of national languages and a desire to make them equal to classical Latin. Textbooks of rhetoric soon appeared in the vernacular, for example, Thomas Wilson’s *The Art of Rhetorique* (1553) in English and Bartolomeo Cavalcanti’s *La retorica* (1555) in Italian.

RAMISM

The Dutch humanist Rudolph Agricola (1444–1485) and the French scholar Petrus Ramus (1515–1572) suggested changes in the curriculum that reversed earlier humanist alterations. Teaching at the University of Paris, Ramus followed the lead of Agricola in returning attention to the study of dialectic, making it the master discipline. Attempting to eliminate overlap in the curriculum, he allocated invention, organization, and memory to dialectic and gave style and delivery to rhetoric. The effect was to attribute to dialectic his own methods of analysis and composition and to equate rhetoric with stylistic artifice, neglecting entirely its aim of persuasion. Ramism was most popular in northern Europe and England during the last half of the sixteenth and early seventeenth centuries.

SCIENCE AND RHETORIC IN THE SEVENTEENTH CENTURY

The rise of interest in scientific induction and experiment in the seventeenth century brought with it a concern for clearer, more succinct prose. Francis

Bacon (1561–1626) called for a more analytic approach to the coloration of meaning in expression. René Descartes (1596–1650) and John Locke (1632–1704) deplored stylistic artifice. Invention, which Bacon saw as primarily associated with science, diminished in importance. Emphasis in teaching style moved from stress on elegant figures and extensive elaboration to that on precision in diction and clarification of meaning in open, familiar expression.

EIGHTEENTH-CENTURY TRENDS IN RHETORIC

Four major and enduring trends in the study of rhetoric can be discerned in the eighteenth century: neoclassicism, elocution, belletrism, and philosophical-psychological theory. Neoclassicism and elocution both flourished in the first part of the century. Neoclassicism called for renewed study of the Greek and Latin classics of rhetoric. Bernard Lamy (1640–1715) and François Fénelon (1651–1715) in France and John Lawson (1709–1759) and John Ward (1679?–1758) in England were foremost in this movement. Elocution, the old canon of delivery concerned with voice and gesture, came into vogue as a separate art because critics believed that proficiency in pulpit and political oratory had seriously declined. Thomas W. Sheridan (1719–1788) successfully promoted this new trend in education.

The latter half of the eighteenth century saw the rise of belletrism and the philosophical-psychological approach to rhetoric. Neither of these retained invention, their focus being analysis of the written word. Growing out of the Scottish Enlightenment, the belletristic movement engaged such disparate figures as Henry Home, Lord Kames (1696–1782), Adam Smith (1723–1790), Edmund Burke (1729–1797), Joseph Priestley (1733–1804), George Campbell (1719–1796), and Hugh Blair (1718–1800). They stressed interpretation of literary texts and such concepts as taste, the sublime, and the beautiful. George Campbell approached the study of rhetoric from the standpoint of the new theories of the human mind, termed faculty psychology. His *Philosophy of Rhetoric* (1776) treats the aims of discourse and the creation of effects on the mind. All four of these views of rhetoric were transported to North America.

JEAN DIETZ MOSS

RICHARDSON, SAMUEL (1689–1761), English novelist. Samuel Richardson was born at Mackworth in Derbyshire. His father was a joiner, and his family were farmers. Richardson's poverty precluded a classical education, and he went to a common school. Apprenticed for seven years to a printer, John Wilde, Richardson became a Freeman of the Stationers' Company and of the City of London in 1715. He married his employer's daughter, Martha, in 1721, and they had six children, all of whom died in childhood.

Hardworking and diligent, Richardson established himself as a prosperous stationer and printer in 1721 near St. Bride's Church off Fleet Street, London. Renowned for his charity and generosity, he printed the novels *Moll Flanders* and *Roxana* by Daniel Defoe, the duke of Wharton's periodical the *True Briton*, and works by the philosopher Francis Hutcheson. Characterized as an extreme Tory printer, he was impeached by the secretary of state in 1722. Two years after his wife's death in 1733, Richardson married Elizabeth Leake; they had four daughters, Mary, Martha, Anne, and Sarah. He moved his business to Salisbury Square, which be-

came his home until his death, and did not travel far outside of London.

Richardson's first work was *The Apprentice's Vade Mecum; or, Young Man's Pocket Companion* (1733), a book of letters of advice on model behavior for apprentices. Addressed to his own nephew and apprentice, Thomas Richardson, the book expounds on the importance of the moral duties between employer and employee, especially obedience and mutual respect. In 1735 he printed the pro-government *Daily Gazetteer*. Richardson's revisions and prefaces to Defoe's *The Complete English Tradesman* and *Tour thro' the Whole Island of Great Britain* display his interest in the cultural aspects of Britishness. Richardson was asked by the Society for the Encouragement of Learning to write a book of model letters on how to act morally in different situations.

Richardson's first novel *Pamela; or, Virtue Rewarded* (1740–1741) developed from a further morally improving project called *Letters Written to and for Particular Friends on the Most Important Occasions* (known as *Familiar Letters* and published in 1741). One of the letters, "A Father to a Daughter in Service, on Hearing of Her Master's Attempting Her Virtue," inspired Richardson to explore "practical examples, worthy to be followed in the most critical and affecting cases" (*Pamela*, Preface). Pamela writes to her parents about her master, Mr. B., who locks her up and tries to rape her. She evades this fate by marrying him. A critical success and praised for its heroine's steadfast virtue, *Pamela* was reprinted four times in 1741 and inspired imitations, a play by Henry Gifford, and Pamela merchandise including wax dolls. Novelist Henry Fielding, however, denounced *Pamela* as an opportunistic example of virtue and parodied the novel with *Shamela* (1741). Responding to this criticism, Richardson published *Pamela in Her Exalted Condition* (1741), but the sequel was less successful. That year also saw Richardson elected to the Court of Assistants of Stationers' Company.

Written "in a double yet separate correspondence," (*Clarissa*, Preface) Richardson's epic novel *Clarissa* (published in installments between 1747 and 1748) allows him as self-styled editor to effectively depict the subtleties of the voices of the four principal characters, reflecting their unfolding emo-

tional states. Begun in 1744, the novel explores the interior life of the bourgeois paragon Clarissa Harlowe, who is disowned by her family after not marrying the man of their choosing. Duped by the aristocratic rake Robert Lovelace, whom she loves, she believes she can "rescue" him to virtue, but he deceives her, imprisoning her in a brothel and raping her. Her hopelessness causes her death, and Lovelace dies in a duel with her cousin. Instantly successful, the novel was translated into French by writer and priest Abbé Antoine François Prévost d'Exiles; with *Pamela*, Richardson founded the sentimental novel.

Richardson encouraged women's writing among his fellow novelists and friends, Sarah Fielding, Frances Sheridan, and Charlotte Lennox, and engaged in extensive literary and moral debate with women. Shocked by female readers' attraction to the character of Lovelace, he revised the novel in the 1750s and extracted "instructive" passages from it for publication.

The History of Sir Charles Grandison (1753–1754), his last novel, creates a virtuous male equivalent of Clarissa, who is desired by two very different women. The novel's light satire of "vicious" individuals influenced novelist Jane Austen. Richardson died in July 1761 and is buried in St. Bride's Church in London.

MAX FINCHER

RICHELIEU, ARMAND-JEAN DU PLESSIS, CARDINAL (1585–1642), French ecclesiastical and political figure. Richelieu was the youngest son of a middle-ranking noble family from Poitou, whose father enjoyed short-lived prominence as grand provost of France under Henry III (ruled 1574–1589), but whose early death and bankruptcy (1590) spelled possible disaster for his widow and young children. The support of patrons, new and old, and the goodwill of King Henry IV (ruled 1589–1610) enabled Armand-Jean, after foreshortened theology studies in Paris, to become a very young bishop of Luçon by 1606. Although a neglected and unattractive diocese with well-entrenched Protestant communities, Luçon could afford wider career prospects to an ambitious cleric. This and several years of active pastoral activity in Luçon gradually drew him into contact with the royal court during a time of political—especially ministerial—instability following Henry IV's murder in 1610. This context, rather than his role at the 1614 Estates-General, explains his appointment in 1615 as grand almoner to Louis XIII's (ruled 1610–1643) young queen, Anne of Austria, and then secretary of state in November 1616, but he was rapidly swept out of office (April 1617) with the assassination of his first patron, Concino Concini, the Italian favorite of the queen mother, Marie de Médicis. Alone among Concini's protégés to make a political comeback, Richelieu survived seven turbulent years during which he honed his political skills as he was successively sent into internal exile, recalled, and finally made a cardinal despite the deep-seated reluctance of Louis XIII and his ministers. Well before 1624, when he was made a minister again, he had become Marie de Médicis's right-hand man and the principal beneficiary of her insistence on playing a political role throughout the 1620s.

THE KING'S MINISTER

Richelieu's new position, which would gradually evolve toward that of a "principal" minister, struck most contemporaries as that of a conventional royal favorite. But despite the enormous power and influence he enjoyed until his death, he never became Louis XIII's favorite in the accepted sense. From the outset, his relations with Louis were tense and difficult, and they remained so even after the political ménage à trois with Marie de Médicis finally ended with her disgrace and exile abroad in 1630–1631. Until then, Richelieu's ministry had been highly vulnerable: he depended mainly on Marie and her supporters, the *dévots*, at a time when the overlapping of domestic and foreign questions created acute problems of political management. Protestant and aristocratic rebellion was an enduring feature of the 1620s, and could sometimes play havoc with pursuing a foreign policy that, because it aimed at containing Habsburg expansionism, required alliances with certain Protestant states. This required considerable dexterity, and laid Richelieu—a cardinal of the Roman church, after all!—open to accusations of being a disciple of Machiavelli. The ending of Protestant revolt in 1629 was the only major success of this period, while France's military efforts against the Habsburgs were limited to intervention in northern Italy, when the real threat was building up elsewhere, in the empire. King and minister agreed fully on the need to oppose it, but were wary of precipitous action while aristocratic revolt and provincial discontent were still serious domestic threats.

Richelieu, whose essential duty was to articulate and manage foreign policy, fell foul of Marie and her *dévo*t supporters, who were deeply hostile to Protestant alliances and wanted peace in order to pursue internal reforms. He barely survived the ensuing crisis, known as the Day of the Dupes (November 1630), although it took at least two more years to deal with the aftershocks from it. This partly explains the caution of foreign policy and the preference for fighting the Habsburgs using proxies like Denmark or Sweden. Thus full-scale war was postponed until it became unavoidable, in 1635. The king and minister's optimism about an early victory and peace was rudely shattered, so that the final years of Richelieu's ministry were dominated by the unending burdens of organizing and financing arm-

ies, coaxing allies, cajoling military commanders to fight—all with very mixed results—and, finally, framing plans for a peace that would only materialize in 1648.

THE PLENITUDE OF POWER

Richelieu's position as chief minister took final shape during the 1630s, when his attention was devoted primarily to war and foreign affairs. After Marie de Médicis's fall, he no longer needed to fear opposition within the ministry itself, since all of the ministers were now clients of his who could work well together and who recognized their dependence on him. Internal affairs were, consequently, largely devolved to them, and the main changes to royal government resulted more from the pressures of war than from conscious plans for reform or centralization, plans that Richelieu progressively jettisoned by the late 1620s. His relations with Louis XIII could still be strained, thus offering hope to assorted royal favorites and conspirators to plot his downfall. The last of these, the famous Cinq-Mars conspiracy (1642), may even have had some royal sympathy and ended only months before Richelieu's own death. But Louis's waverings were always effectively countered by Richelieu's astute realization that all important decisions be taken explicitly by the king, thus making it virtually impossible for him to disown them later. The main opponents of Richelieu's accumulation of power and influence came from within the royal family and certain great noble houses. But a general assault on them was scarcely possible, given the wider political context, and Richelieu himself was no sworn enemy of the higher nobility. The best he could do was to win over as many of them as possible through offices, military commands, or advantageous marriage alliances, but some, like the Guise and the Montmorency, would not play the game by his rules, and suffered disgrace, exile, or even execution. Moreover, this policy of "divide and rule" was itself limited in its potential scope: it worked far better in peacetime than during war, when the crown depended more heavily on aristocratic goodwill. Some of Richelieu's strongest enemies had to be given army commands after 1635, and at least one used his army to provoke a rebellion in 1641. The cardinal's most spectacular success lay in turning the previously rebellious Bourbon-Condé family into allies, even to the extent of securing the marriage of

Cardinal Richelieu. Engraving after the painting by Philippe de Champaigne. LIBRARY OF CONGRESS

its heir, the future "great" Condé, to his niece in 1641. Richelieu made additional enemies and critics by the way he used his immense power to restore and extend his family's fortunes, a sometimes ruthless process in which his wealth consolidated his power, and vice versa. His power was not confined to the "four square feet of the king's study" or council chamber but extended into the provinces, thanks to provincial and town governorships as well as tenure of the admiralty of France. When he died, he was not only Louis XIII's richest subject, but he had secured three duchies for members of his extended family, who were now well integrated into the upper reaches of the French nobility.

POWER AND IDEAS

Richelieu's many offices, his great wealth (which included works of art, precious stones, and châteaux) and his many buildings (the Palais-Royal, Richelieu town and château in Poitou, the new Sor-

bonne college) all show him behaving as a Renaissance-style cardinal was expected to do. But neither wealth nor office alone could sustain political power, especially when it was as bitterly contested as his was. His early years in politics convinced him that cultural patronage, beginning but not ending with political propaganda, was indispensable.

From the early 1620s, he recruited writers into his service and initially used them to undermine existing favorites and ministers of Louis XIII—a dangerous game, which he learned to play effectively. Back in office, he needed propagandists to defend often unpopular policies. He quickly saw the advantages of crown-sponsored newsletters and gazettes, not to mention quasi-official histories of his own time. Thus, crown policies would be stoutly defended in print, successes publicly celebrated by every means available. Even the foundation of the Académie Française (1635) and Imprimerie Royale (1640), both important milestones in the French monarchy's attempts at cultural absolutism, were not divorced from such political considerations. Many of Richelieu's other projects, such as founding special academies to educate the nobility, were frustrated by the imperatives of war. Finally, as befitted a university theology graduate with enduring intellectual aspirations, he wrote extensively throughout his career on religious matters—pastoral instructions, a catechism, treatises on the conversion of France's Protestants and on Christian perfection. These works may not bear comparison with those of his greatest contemporaries (François de Sales, Pierre de Bérulle), but they show a genuine desire to apply religious precepts to the daily life lived by ordinary mortals. In theological terms Richelieu was essentially a Thomist who, despite being influenced by neo-Stoic ideas, never shared the Augustinian pessimism of contemporaries like Bérulle or Saint-Cyran. Psychologically and intellectually, he was comfortable with a relatively optimistic view of humankind as inhabited by a God-given reason. It may be claimed that his *Political Testament*, the most problematic of his works but not published in his lifetime, was itself typical of this lifelong didactic passion, and it was aimed at the Christian—as exemplified by his master, Louis XIII—rather than the Machiavellian prince.

RIGHTS, HUMAN. See *Rights, Natural*.

RIGHTS, NATURAL. The idea of natural rights is inseparable from the doctrine that all human beings, regardless of extrinsic differences in circumstance (nationality, class, religion) or physical condition (race, gender, age, etc.), share an identical set of powers, freedoms, and/or competencies. Scholars have customarily treated natural rights theory as a hallmark of modern legal and political thought, although one with roots in preceding intellectual traditions. In particular, the idea of natural rights has been contrasted with earlier teachings about natural law that were grounded in more robust principles of reason and natural or divine teleology. Many important thinkers of early modern Europe subscribed to a version of natural law without endorsing a doctrine of natural rights.

Central to the concept of natural rights is the view that every human being enjoys a complete and exclusive dominion over his or her mental and bodily facilities—and the fruits thereof—in the form of personal property. Thus, a natural rights theory entails a conception of private ownership grounded on the subjective status of the individual human being. The rights arising from such human subjectivity are

both inalienable and imprescriptible in the sense that any attempt to renounce or extinguish them would constitute at the same time the cessation of one's personhood. Thus, for example, natural rights theory renders incoherent arguments for slavery based on alleged natural inequalities of intellect or physique.

Consequently, an important feature of the fully developed idea of natural rights is its direct and immediate political bearing. Given that natural rights may not be curtailed or eliminated without the denial to a person of his or her very humanity, any government that attempts to suppress them without due process has no claim on the obedience of its citizens. Natural rights always take precedence over artificial communal or public rights that might be imposed by political institutions. In this way, the doctrine of natural rights circumscribes political power and may even generate a defense of resistance to or revolution against systems of government that violate the rights of individuals.

The assertion of the modernity of natural rights theory must be qualified by the recognition that many of its characteristic elements were present in and elaborated by earlier theorists. For instance, scholars have found in Aristotle (384–322 B.C.E.) the logical rudiments of natural rights theory, albeit imperfectly articulated and applied. The language of rights was first clearly expressed in the teachings of classical Roman lawyers, for whom *ius* ('right' or 'law') constituted the basis of law and persons were fundamentally bearers of rights derived from law. Likewise, medieval canon (church) lawyers and Scholastic philosophers insisted that God endowed human beings with basic rights to themselves and to those goods that they required to preserve their divinely created lives.

Many attempts have been made to identify the "first" theorist of natural rights. In addition to Aristotle, the Scholastic philosopher/theologians Jean de Paris (c. 1240–1306; also known as John of Paris), William of Ockham (c. 1285–1349), and Jean de Gerson (1363–1429) have been nominated. Several of the participants in the fourteenth-century controversy between the papacy and the members of the spiritual wing of the Franciscan Order over the status of voluntary ecclesiastical poverty also moved the debate about the naturalness of

property ownership in the direction of a theory of rights. Yet in each instance, some of the ingredients central to the fully "subjective" or individualistic doctrine of natural rights doctrine associated with modern thought are absent.

It is perhaps best to examine the development of the theory of natural rights after 1450 as an incremental process. Various thinkers contributed important dimensions to its history without necessarily enunciating the idea in its final form or perhaps even appreciating the wider significance of their particular contributions. One such source may be found in the work of a group of theologians of a Thomist orientation working at the University of Paris in the later fifteenth and early sixteenth centuries, most prominently Conrad Summenhart (c. 1455–1502), John Mair (c. 1468–1550), and Jacques Almain (c. 1480–1515). In a number of writings, these authors equated *ius* with *dominium* ('lordship' or 'ownership'), which was understood to reside in people naturally and to license in them the power or faculty of acquiring those objects necessary for self-preservation. Their argument was as much theological as legal or philosophical: just as God enjoyed ultimate ownership of the earth and the rest of his creations by virtue of his will, so human beings, in whom God's image resided, could claim dominion over themselves and their property.

The Reformation brought further refinement and application of the idea of natural rights. On the Protestant side, rights theory became a major element of late sixteenth-century Huguenot efforts to ground the justification of resistance to governments that imposed doctrinal conformity upon religious dissenters. While the earliest generations of Reformers had looked toward duty to God in order to justify acts of political disobedience, a noticeable change in language and concepts occurred in the wake of the St. Bartholomew Day's Massacre of 1572. In their reactions to the massacre, Théodore de Bèze (1519–1605) and Philippe du Plessis Mornay (1549–1623; also known as Duplessis-Mornay), as well as the authors of a large body of anonymous texts, argued for a condition of natural liberty—a privilege of nature whose rightful withdrawal is impossible—that precedes the creation of political society. Hence, any subsequent government must result from, and must be consonant with, the basic natural state of humanity. And those who would use

political power to deny to human beings the exercise of their liberty—including the freedom of conscience to dissent from the established Roman Church—may properly and licitly be challenged with forms of resistance to their tyranny. The Huguenots stopped short, however, of advocating popular rebellion. Instead, they looked to so-called intermediary magistrates as the appropriate instigators of resistance to tyrannical conduct. Hence, in the hands of sixteenth-century Reformers, the idea of natural rights became a stimulus for a religio-political movement that directly opposed forms of religious intolerance and suppression of dissent.

The Counter-Reformation produced its own version of natural rights theory that developed out of the language and concepts pioneered by the Parisian theologians Mair and Almain. This is especially evident in the work of the so-called second Scholastic thinkers associated with the School of Salamanca, such as Francisco de Vitoria (c. 1480–1546), Domingo de Soto (1494–1560), and Francisco Suárez (1548–1617). Vitoria had been trained at Paris and returned to Spain to disseminate the ideas to which he had been exposed there. Although Vitoria himself wrote nothing, leaving only lecture summaries, his immediate students and their intellectual progeny produced some of the fullest and most enthusiastic elaborations of natural rights. In particular, Vitoria and de Soto explored the complexities of rights theories, moving away from the traditional Thomistic conception of rights as objective duties required by reason. Vitoria's work seems to have contained two differing conceptions of subjective natural rights—one connected with individual *dominium*, the other defined in relation to communal law. Each position involved notable limitations and flaws, a fact that led de Soto to attempt to resolve them into a coherent picture of rights that incorporated both public and private dimensions. Suárez added further to the picture by identifying *ius* with self-preservation and drawing from this some, albeit limited, political implications. He held that a natural right existed to resist extreme forms of tyranny, construed as those circumstances in which the survival of the community as a whole was endangered. Otherwise, the misbehavior of government was to be tolerated lest communal destruction result from acts of disobedience and resistance.

While the School of Salamanca remained steeped in the neo-Aristotelian doctrines of the medieval past, other thinkers attempted to replace this framework with a paradigm for natural rights rooted purely in legal principles. Especially celebrated in this regard were Hugo Grotius (1583–1645) and John Selden (1584–1654). Grotius proposed that rights should be grounded solely upon the universality of the propriety of human self-preservation, thus placing self-interest at the center of a natural system. He reasoned that human beings enjoy *dominium* over those goods that are immediately necessary in order to preserve themselves: rightful private ownership is directly licensed as a natural right. Moreover, he attacked the Aristotelian doctrine of the naturalism of political society. For Grotius, social order was voluntary, and the only reason that people joined into civil society was for self-protection. As a consequence, the individual does not surrender natural rights by entering into a communal arrangement and indeed might resist a direct attack on those rights by a magistrate. While Selden enunciated a sustained critique of Grotius, he ultimately embraced an account of natural rights derived from his adversary. Selden pushed the devaluation of reason understood as a moral force with the power to bind and compel the actions of individuals. Rather, he stressed that natural rights were directly correlated to natural liberty, such that the only basis for individual obligation could be free assent to contracts and compacts, which, once agreed to, had to be maintained without exception. Hence, for Selden, unlike for Grotius, natural liberty itself could be renounced by a valid act of human will.

Selden's best-known follower was Thomas Hobbes (1588–1679), who developed the insights of the former into a powerful individualist theory of natural rights. In his major works, culminating in *Leviathan* (1651), Hobbes ascribes to all human beings natural liberty as well as equality, on the basis of which they are licensed to undertake whatever actions are necessary in order to preserve themselves from their fellow creatures. Such self-preservation constitutes the indispensable core of human natural rights. Adopting a position radically opposed to the Aristotelian teaching of political naturalism, Hobbes maintained that the exercise of one's natural liberty leads directly to unceasing conflict and

unremitting fear, inasmuch as nature confers upon each individual the right to possess everything and no legitimate limitation on one's freedom to enjoy this right. Unalloyed nature yields a state of chaos and warfare and, as a result, a "solitary, poor, nasty, brutish, and short" life, the avoidance of which leads human beings to authorize a single sovereign ruler in order to maintain peace. The exchange of natural freedom for government-imposed order, constructed through a social compact, requires renunciation of all claims on rights that humans possess by nature (except, of course, for the right of self-preservation itself) and voluntary submission to any dictate imposed by the sovereign. In this way, Hobbes seconded Selden's defense of absolute government, yet upheld the basic right to self-preservation. Moreover, under the terms of Hobbes's absolute sovereignty, the subject was still deemed to retain the right to choose for himself concerning any and all matters about which the ruler had not explicitly legislated.

John Locke (1632–1704) crystallized the preceding conceptions of natural rights into the quintessential statement of the modern idea. He began his major work of political theory, the *Two Treatises on Government* (written c. 1680; published 1689), with the postulation of the divinely granted natural rights of individuals, understood in terms of the absolute right to preserve one's life and to lay claim to the goods one requires for survival. Arguing against the patriarchal doctrine of Sir Robert Filmer (c. 1588–1653), Locke insisted that no natural basis—neither paternity nor descent—justifies the submission of one person to another. Rather, all people are deemed sufficiently rational, as well as free and equal, in their natural condition that they can govern themselves according to a basic cognizance of moral (natural) law, and thus will generally respect the rights of others. In contrast to Hobbes, then, Locke maintained that the condition of perfect natural liberty does not represent a state of war. In the state of nature, human beings can enjoy unimpeded rights to acquire private property, the ownership of which is asserted on the basis of the admixture of their labor (the natural talents and industry of their bodies) with the physical world. Indeed, Locke's state of nature resembles nothing so much as a fully functioning commercial society, which has introduced a system of exchange relations

and money, all perfectly consonant with the recognition of the natural rights of individuals.

For Locke, then, there is no pressing necessity for people living in the state of nature to eschew this condition for formalized communal life. Hence, should they choose to enter into bonds of civil society by means of a contract, the sole reason that they do so is to avoid the "inconveniences" and inefficiency of the pre-civil world. This does not require parties to the contract to surrender any of their natural rights. Indeed, the only government worthy of authorization is that which strictly upholds and protects the rights that persons possess by nature. According to Locke, any magistrate that systematically denies to his subjects the exercise of their natural rights to their life, liberty, and estate is tyrannical and unworthy of obedience. Locke closes the *Second Treatise* with a discussion of the dissolution of government. In his view, a regime that violates systematically natural rights places itself in a state of war with the members of civil society, who severally and individually may renounce allegiance to it and may vote to establish a new government. Some have viewed Locke as justifying revolution on the basis of natural rights, but his actual point seems to be less extreme: the retention of one's natural rights in civil society affords one the ability to protect oneself from those (whether housebreakers or magistrates) who would try to take one's property or limit one's proper sphere of liberty. Locke's resistance theory represents a chastened, but nonetheless genuine, defense of natural rights.

Locke's theory, then, stated an integrated position that drew upon many of the earlier strands of natural rights thought. In turn, the eighteenth century would see the extension, refinement and, in some respects, radicalization of the fundamentals of the Lockean doctrine. Locke's language was adopted, for instance, by both theorists and polemicists who sought to halt Europe's complicity in the global slave trade. Likewise, defenders of the equal rights of women to political and social power, such as Mary Wollstonecraft (1759–1797), framed their ideas in the language of rights. And critics of natural nobility and other claims to in-born human inequality invoked the universality of rights as the basis of their assertion of the equal worth and dignity of all people, regardless of birth, class, or occupation. The elaboration of the Lockean stance during the eigh-

teenth century perhaps enjoyed its European apotheosis in the Revolutionary French Declaration of the Rights of Man and the Citizen. The Declaration, which forms perhaps the major source for all later declarations of human rights, proclaims that the aim of civil life is “the preservation of the natural and imprescriptible rights of man”—they nearly included woman, too—including political, economic, social, religious, and cultural rights as well as resistance to tyranny. Of course, Lockean natural rights received their share of criticism during the eighteenth century as well, whether from communalist democrats such as Jean-Jacques Rousseau (1712–1778) or from more individualistic proponents of political economy like Adam Smith (1723–1790). But in general, the 1700s may well be regarded as the European “century of natural rights.”

RITUAL, CIVIC AND ROYAL. The words “ritual” and “ceremony” are here used interchangeably because separating them would be anachronistic and would suggest distinctions that people did not make until near the end of the early modern period. By the nineteenth century, the words had come to denote the ostentation of power and superstitions and the exotica of non-Western or illiterate societies. The words first gained currency in the sixteenth century to disparage heretical religious and extravagant political practices. Before this time, rituals or ceremonials were not concepts as much as books of practices that gave some precision to the places, costuming, and gestures in processions and assemblies, as seen in the late-fourteenth-century Roman *clerici ceremoniarum* or the *Libro Ceremoniale* (1475) of Florence. Despite sixteenth-century print culture’s derogatory usage of the terms, cities and kingdoms staged lavish and magnificent processions and urban pageantry—productions in which hundreds and often thousands participated. These large-scale performances frequently placed religious, royal, and civic-legal rituals on the same plane.

With the growth of the state in the late sixteenth and early seventeenth centuries, the most powerful element and participants were those intent on expanding their spheres of influence in the government. As arguments about national character and divisions of power continued, these interested parties invested in rituals to strengthen—or on occasion to question or to redirect—governmental authority and their status or rank within it. Courtiers, nobles, judges, wealthy townsmen, and others dependent on the resources and patronage of princes sought to define in their favor the overall meaning of ritual or ceremonial performances and to represent in them their personal or official status in the state. Thus, the terms “ritual” and “ceremony” came to describe the highest performances of princely and royal celebrations. By 1619, the French royal historiographer and parlementaire Théodore Godefroy entitled his collection of royal public performances *Le cérémonial de France*. In it, he published historical accounts of the ranking and actions of officials and courtiers in rituals-with-the-king, which he presented according to the prescriptions of an encompassing political theory of hierarchy and kingship. The collection also incorporated many el-

ements of traditional legal protocols and religious acts. In 1649 Godefroy, with the aid of his son Denis, expanded the work into the two-volume *Le cérémonial françois*. In these collections, rituals and ceremonies supplied essential cultural components for the practice of what we call “politics” and what early modern people thought of as mysteries of governance.

Rituals and ceremonies bound together the societies of medieval and early modern Europe; they occurred any place where a group of people claimed a particular purpose, legitimacy, and identity. Townsmen, judges, English common lawyers, and princes self-consciously expanded the scale, rhetoric, and publicity of civic and royal events as rites of passage and of government, which served for the sanctification, legitimization, and continuity of communal and national authorities. According to their needs and the circumstances, fifteenth- and

sixteenth-century governments appropriated ritual practices and ideas from religious, classical, feudal-military, and legal-constitutional traditions. Public participation—even in the roles of spectator or reader—was extended over time, space, and social groups through processional rankings, symbols, medallions, program books, special costumes, reenactments, and ritual theater. By 1600, and certainly under the influence of earlier Italian rulers (like the Sforza of Milan, the Medici of Florence, and the doges of the Venetian Republic), royal rituals in England, France, and Germany exalted the ruler from a symbol of state and society to its actual embodiment, and the ceremonies frequently equated these kings with pagan rulers or gods. In early-seventeenth-century Stuart England (1603–1649) and Louis XIV’s France (1643–1715), rituals were staged as dramas of state. They encouraged obedience within the political hierarchy and obligated nobles, royal officials, and subjects to act out their

parts in that order, and they centralized the king and his royal court as the source of privilege and honor. Similarly, in guild elections, funerals, or pageant-laden communal processions, western European cities staged rituals to reinforce sociopolitical hierarchies and to connect individuals to the larger community.

HISTORICAL CONTEXT OF A RITUAL MENTALITY

For royal ceremonies, the European monarchies, particularly those of France and England, perpetuated in a new key the medieval ritual expressions of Christian sanctity, while Renaissance Italy added strikingly new artistic and theatrical effects and iconologies. Many early modern Europeans held the medieval belief of the “king’s two bodies,” that is, kingship was represented in a unique royal person who possessed both a natural, mortal body and a mystical, immortal, political one. According to this belief, the king, in ritual, became the intermediary who joined God’s working in the world and his justice with the preservation of a people as a unique body politic. In studying the belief in French and English kings’ ability to heal scrofula by touching people with the disease, Marc Bloch’s groundbreaking study *The Royal Touch* traced how “rather vague ideas” based on a general belief in the supernatural character of royalty “crystallize in the eleventh and twelfth centuries into a precise and stable institution” that lasted for seven centuries. The ritual of the royal touch developed into frequent public demonstrations of the miraculous results of coronation rites, in which kings were both anointed with holy oil and crowned. Bloch traced the vicissitudes of the ritual among the divergent explanations of eight centuries of writers. By 1500, the coronation mattered less than the evidence of the king’s unique nature as a royal person. French kings performed the ritual until the Revolution; the practice ended in England with the death of Queen Anne in 1714.

The belief in the power of the royal touch emphasizes the notion that the king was a “mixed person”—part sacred and part layperson. Although the essentially religious attributes of this notion are related to the concept of the “king’s two bodies,” they should not be confused with it. The latter concept has a larger scope than the particular ambience and rites around the king’s person and finds its fullest development in juridical thought and

ceremonies that emphasized the king as image or embodiment of justice: justice being, after truth (religion in medieval Christian thought), a permanent part of God’s creation. In the fifteenth and sixteenth centuries, lawyers, officials, and corporate bodies claimed rights in this divine creation according to the notion of legal fictions: that is, that towns or institutions have rights in law as do persons. Ceremonies with kings and princes articulated these rights and mirrored right order in secular titles, offices, and institutions. Among the people participating in political life, rituals complemented and represented constitutional developments over which the seventeenth-century French were best positioned to assert hegemony as model builders. Other national histories took different turns: in Spain the isolationist policies of the monarchy starting with Philip II (ruled 1554–1598) prevented foreign ideas and innovations in state rituals; in Germany independent imperial principalities limited the spread of royal ceremonies; in England royal ceremonies took shape bounded by the weakness of the monarchy and growth of parliamentary power; in Italy the Habsburgs, papacy, and princely dynasties favored the new inventions of political spectacles over rituals that contained residues of civic traditions; and throughout Europe Reformation and Counter-Reformation churches were attentive to maintain the purity of religious ceremonies from secular pollution. Through symbolic forms and performances, early modern rituals placed one’s sense of status and civic consciousness within a framework of loyalty to national monarchy or state identities.

RITUAL AS MODELS OF KINGSHIP

Ralph E. Giesey has argued that the ever-changing “event-filled [European] history” requires a constitutional explanation of rituals in contrast with the “affective comprehension of kingship that anthropologists apply so well when studying societies that have no thick transcription of their ‘constitution.’” Rituals are historical sources for a society’s temper, presenting comparative indices for understanding continuity and changes in the ways that societies constitute themselves around the central agent of legitimate power, the king. Four major French state ceremonies represent the models of European rulership. “Sacral kingship” associated with coronations was joined by the new form of “juristic kingship” as dramatized in royal funeral ceremonies.

Civic and Royal Ritual. A late-seventeenth-century German engraving depicts the funeral of a prince. THE ART ARCHIVE/

Royal entries advanced a civic and secular model of “humanistic kingship.” The *lit de justice* ceremony with the king in solemn assembly with the Parlement of Paris portrayed “constitutional kingship.” By 1700, the court-centered “rites of personality” exemplified by Louis XIV (1638–1715) had depreciated these traditional ritual models for enacting kingship.

Each ceremonial model of rulership had its own forms and venue. The coronation took place in great churches where the clergy and magnates of the kingdom had major roles in the ritual drama, which was replete with royal paraphernalia including the crown, holy oil, scepter and sword of state, gloves, slippers, and robes. The ritual entailed an undressing, anointing, redressing, and crowning of

the king. The English Queens Mary (ruled 1553–1558), Elizabeth (ruled 1558–1603), Mary (ruled 1689–1694), and Anne (ruled 1702–1714) had coronations like kings, but issues of Protestantism and revolution—more than sex—gave occasion to changes in the liturgy, language, and scenic effects of the English ceremony. The Spanish did not have a coronation ceremony, since their king ruled over an Iberian monarchy with regional inaugural rites, of which the most noted in the early modern period was the Oath of Aragón. While Holy Roman emperors had elaborate coronations, imperial elections demystified the rituals and placed attention on politics of the empire. Through a combination of rituals, legends, and myths, the French king’s coronation came to be seen as sacred in character, ancient

in the continuity of its liturgy, and most prestigious in its divinely chosen dynasty.

In France, royal funeral ceremonies developed an influential style and unique interregnum practices, such as the display of a lifelike effigy along with the corpse in its coffin and the disappearance from public duties of the heir until after the funeral. This was done to call attention to the undying part of the king's two bodies as the source of justice. By the time of Philip II's 1598 funeral, the Spanish had fully accepted the notion of *rey muerto, rey puesto*, that is, after a king dies, another immediately replaces him. The funeral celebration focused on services before a magnificent catafalque with thousands of candles built within the church; the funeral served as an occasion for the court hierarchy to reassert itself in the form and order of its mourning. Other elite groups mourned in satellite celebrations

before catafalques in churches throughout the king's domain.

From the fourteenth century, royal entry ceremonies into cities gave kings and subjects occasion to acknowledge the reciprocal obligations between them, particularly the king's charge to preserve justice and confirm corporate liberties and the people's duty to demonstrate obedience and devotion. By the fifteenth century, Italian city-states such as Florence and Venice had appropriated processions to celebrate local saints into rituals that became "the principal mechanism for representing governmental authority," as Edward Muir writes. In London and Paris, royal entries were distinctly political by 1500. Their rites aimed to balance the tensions inherent between the dual desire to preserve local liberties and to give unconditioned loyalty to the sovereign. In London, guilds lined the streets in their livery as

Civic and Royal Ritual. Engraving showing the order of the coronation procession, Britain, eighteenth century. ©HULTON-DEUTSCH COLLECTION/CORBIS

the new ruler and his entourage viewed street plays while en route to the coronation at Westminster. In Paris, the king returning from his coronation appeared on horseback under a canopy carried by guild members. He processed with his royal robe, hat, helmet, gauntlets, and sword displayed before him. From 1484, the royal seal and the chancellor of France preceded the king to accentuate the legal nature of the ceremony. Likewise, the Parlement of Paris in robes of office closed the ranks of several thousand liveried urban groups. Thousands of splendidly costumed lords and nobles followed the Parisians as part of the royal procession. The Parisians had exited from the city to submit to the king and to lead the march into the city, where the king slowly made his way among *tableaux vivants* and street plays to a banquet at the Palais de Justice, residence of the Parlement of Paris.

Other towns staged entries and progresses, but metropolitan and royal ceremonies tended to establish the norm in terms of rank and privilege within kingdoms. In Italian cities, despots and princes transformed the style and ultimately the meaning of entry pageantry from reciprocal ceremonies between rulers and cities to celebrations of power. By the 1600s, northern cities appropriated Italian monumental architecture, classical symbolism, and awesome images of the Roman triumph to their royal entries. In the process, they replaced the ceremonial image of the ruler as judge and arbitrator of a unified body politic with that of sovereign and absolute ruler. In the fifteenth century, French kings replaced royal robes of office with armor of parade. By 1660, Louis XIV began his Parisian entry seated on an especially built royal throne to receive the kneeling representatives of all major Parisian institutions, including the Parlement of Paris. Like the submission of the Parlement of Paris in the entry, the *lit de justice* ritual came to dramatize the king's absolute power and not the court's pretensions of partnership in governing.

RITUALS, CIVILITY, AND MANNERS

Public political ceremonies declined after about 1650. In England after the Glorious Revolution of 1688 and the subsequent advancement of parliamentary power, royal ceremonies became shadows of their earlier magnificence and suggested constitutional restraints. The Spanish Habsburg Monarchy

since Philip II had eschewed public state ceremonies, and royal rituals were performances of conduct and protocol within the relative privacy of the Spanish royal court. By the eighteenth century, most European rulers followed France's example of emphasizing "rites of personality" and frequent ceremonies around the king's body to punctuate every royal accomplishment, such as awakening (*lever*), dining (*diner*), retiring (*coucher*), and other events in the life of the prince. If the ruler were sacred in one place, like the coronation, he was now seen as sacred in all places and at all times. Thus, with the centering of princely activities in their courts, particularly Versailles, the minutiae of daily rituals inundated and depreciated traditional one-time or occasional state ceremonies. Seventeenth-century ceremonial researchers culled the rules governing the ranks, protocol, and conduct of subjects and those in royal service from the historical records of monarchical ceremonies. In many cases these were precarious, occasional, and random examples of behavior or acts that promoters of monarchical absolutism succeeded in ossifying into rules of deportment in a society based on ranks, orders, and honors. Rituals performed very occasionally in past centuries supplied the foundations for a perpetual etiquette at the royal court.

Rituals that today appear to have been for minute distinctions—such as a system of seating and standing based on rank—were fundamental to the thought and habits of court and political society. The king's power to rule was partly grounded in the belief that he had a sacred duty to preserve the rituals that symbolized the honor and hierarchy of his nobility. Royal ceremonies marked the degree of honor possessed by any individual and his or her family. They set standards of deference for a code of courtesy, which guided both noble and bourgeois into new forms of civility. Ritual was refashioned into conduct, forms of association, and practices of disassociation.

An imaginative and highly informed study of the vast enterprise entailed in the making and promoting of Louis XIV's royal image from 1660 to 1715. Essential for understanding how royal power does not just happen but is fabricated.

———. *The Fortunes of the Courtier: The European Reception of Castiglione's Cortegiano*. University Park, Penn., 1996. Studies the *Cortegiano* as the stimulus to a series of discourses that contributed to codifying the social imagery and ideals of life among the early modern European aristocracy.

Elias, Norbert. *Court Society*. Translated by Edmund Jephcott. New York, 1983. Highly influential, sociologically based study of the court of Versailles as a model of aristocratic behavior and shaper of modern codes of conduct.

Elliott, J. H. "Philip IV of Spain: Prisoner of Ceremony." In *The Courts of Europe: Politics, Patronage, and Royalty*, edited by A. G. Dickens, pp. 169–190. London, 1977. Basic source for the workings of Spanish royal ceremony. Dickens's edition has other useful studies of European courts as well.

Geertz, Clifford. *The Interpretation of Cultures: Selected Essays*. New York, 1973. A work of extraordinary influence in the study of rituals that gives European history an anthropological frame for more contextualized studies.

Giesey, Ralph E. "Models of Rulership in French Royal Ceremonial." In *Rites of Power: Symbolism, Ritual, and Politics since the Middle Ages*, edited by Sean Wilentz, pp. 41–64. Philadelphia, 1985. An overview of four major royal ceremonies that reveals access—which escapes positivist-minded historians—to institutions, events, and political history. The chronology of the rising and ebbing of a model offers a way to understand changes in the thought and practice of politics. The introduction and other essays in Wilentz's edition are also of interest to ritual studies.

———. *The Royal Funeral Ceremony in Renaissance France*. Geneva, 1960. A foundational study of the culture and mentality that animated this royal ceremony and made its imagery expressions of royal political thought.

Hanley, Sarah. *The Lit de Justice of the Kings of France: Constitutional Ideology in Legend, Ritual, and Discourse*. Princeton, 1983. For histories of ceremonies and

political thought, this extraordinarily original study places the rise of a new form of constitutional discourse in the mentality of Parisian parlementaires' ceremonial practices when they invented a tradition to strengthen their claims to co-guardianship of the crown against the innovations of the king.

- Harding, Vanessa. *The Dead and the Living in Paris and London, 1500–1670*. Cambridge, U.K., 2002. A comparative study of funerary rituals that demonstrates their utility in preserving the civic hierarchy and reinforcing orderly behavior.
- Jackson, Richard. *Vive le Roi! A History of the French Coronation from Charles V to Charles X*. Chapel Hill, N.C., 1984. Shows that ritual and interpretations of this central royal ceremony changes as the ideas and needs of the rulers change.
- Kantorowicz, Ernst. *The King's Two Bodies: A Study in Medieval Political Theology*. Princeton, 1957. From the medieval period through seventeenth century, a foundational study of royal and (due to the influence of Roman Law) civic political thought (or, as he calls it, political theology) as revealed in a synthesis of religious liturgies and processions, canon and civil law, processions, iconography, and ceremonies. His paradigm of transitions from Christ-centered kingship to law-centered and man-centered rulership remains essential for any history of European monarchies and their ceremonies.
- Le Roy Ladurie, Emmanuel. *Saint-Simon, and the Court of Louis XIV*. Translated by Arthur Goldhammer. Chicago and London, 2001. A study of court and aristocratic society and *mentalités* that centers on careful analysis of ideological models detected in Saint-Simon's writing. An impressive and persuasive revealing of the mind of an age in which royal ceremonies were critical in sustaining the power of the state and defining status, honor, and worth. Calls for a different outlook on the cultural influence of court society from that of Norbert Elias.

LAWRENCE M. BRYANT

RITUAL, RELIGIOUS. Ritual is one means by which a society expresses its beliefs both symbolically and explicitly. In the late medieval and Reformation era, the performance of religious rites reconfirmed traditional precepts and instructed each new generation afresh. Whatever a church's intentions were, such ceremonies did not remain static, but evolved. We can assume that as conditions changed the meanings that people attributed to such acts also altered.

Religious ritual and ecclesiastical ritual overlapped, but they were not synonymous. The former expressed people's views of the supernatural world and its bearing on daily life, as by praying and crossing oneself before going to bed or saying grace at the table. These might be far more than ritualized behaviors; they could be fairly elaborate and regular, like going on a pilgrimage to a nearby (or more distant) shrine in order to be healed of an illness. Ecclesiastical ritual was presided over by a priest or, later, a pastor and usually took place within or in proximity to a church. It adhered to more and more narrowly prescribed models. During the sixteenth and seventeenth centuries, Catholic and Protestant authorities strove for uniformity and precision in the rubrics they introduced.

Prior to the Reformation, the division between these two kinds of religious ritual was blurred. A great strength of the Catholic Church during the

centuries of its gradual conversion of most western Europeans was its tolerance of folkish elements and its willingness to express by means of its ceremonies the telluric concerns of the unlettered masses. It gladly lent the strength of the Mass, via the priest's blessing, to water, salt, wax candles, bread, and crops. People could bear the more portable items home to radiate their heightened benefits upon all who used or consumed them. In June, during Rogation Days, the priest led peasants out to their fields and blessed their crops. At other times, he sprinkled holy water on their houses, and in Germany, he often received a loaf of bread from each household in recompense. On Corpus Christi the elaborate circumambulation of parts of the city by clergy, magistrates, and guilds, besides displaying the Host, implicitly told the populace of the protective powers of the Body of Christ. No church building alone contained all ecclesiastical ritual.

In the performance of their holy ritual offices, priests were, and within Catholic Reform remained, charged personages. On those occasions when they said or sang a full Mass (rather than a so-called dry Mass or *missa sicca*), they entered the sanctuary in procession, garbed in vestments that were sometimes elaborately embroidered with symbols, with acolytes bearing the emblems of their functions and their special connection with God. Their signal capacity lay in transubstantiating the bread and wine, by means of the verbal formulae *Hoc est corpus meum* and *Hic est sanguis meus*, into the true body and blood of Christ. So potent was this veritable miracle that every person and object associated with the Mass acquired some degree of sanctity.

In a number of respects, the Protestant Reformation in its several salient forms has been shown to rely on late medieval precedents. This is only relatively true of the celebration of the Eucharist. To be sure, voices against the powers of the Mass could be heard in the fourteenth and fifteenth centuries, but they were muted. The Reformers as a group broke radically with the assumptions underlying the Mass. Because the messages it conveyed symbolically were now rejected, the symbolic acts and artifacts were themselves eliminated. Protestant groups as they emerged nevertheless took varying stances on particular aspects of the Lord's Supper. Luther's theology of consubstantiation left intact the Real Presence even as it demolished the priest's sacral power

of producing Christ's body for the communicants' ingestion. The sacral space, whether intentionally or not, remained quite highly decorated with biblically attested stories depicted in altarpieces and other paintings, colored windows, and crucifixes. Organists and choirboys, along with congregational singing, made a joyful noise, and church bells continued to toll. Luther himself permitted the elevation of the Host and the Chalice until 1542, and although he preferred a simple choir robe when presiding at services, by the end of the century Lutheran divines might again be decked out in admirable vestments even though not cloth of gold. By century's end, all pastors faced their congregations and had added Communion tables at the outer edge of the altar dais, from which males and females, at their respective corners, received the dual elements of the sacred meal.

Followers of Huldrych Zwingli and John Calvin—those of the latter including Puritans and Dutch Reformed—decisively rejected the doctrine of Christ's physical ubiquity and conveyed their conviction fittingly, in the radical simplification of ritual space. Zwingli's Eucharist was strictly commemorative, and Calvin wrote of spiritual nourishment. Determined to abolish "idolatry," the Genevan reformer followed Zwingli in recommending the removal of every possible decorative accompaniment to worship—statues, stained glass, paintings, altars together with their daises and niches, candelabra, monstrances, pyxes, thuribles, rich chalices and patens, baptismal fonts, church bells (except in France), organs, and all singing except the unison intoning of metrical Psalms. Occasionally, a tablet displaying the text of the Ten Commandments hung over the Communion table, which was now often at the foot of the pulpit. Where new churches could be built, their architecture avoided a place for an altar. The whitewashed walls in both old and new churches provided an interplay of light and shadow that attracted many painters of Dutch interiors. These seem to signify God as a spirit, for they offer no place for the eye to rest.

Protestant innovators retained baptism as the second biblically validated sacrament. Luther pared down but still retained exorcism, which some, but not all, of his followers abolished late in the century. Zwingli and Calvin removed this act from the rite, along with the sign of the cross, immediately. They

also insisted that infant consecration take place before the gathered congregation and that biological fathers be present beside the godparents. Luther advocated, but the Swiss reformers rejected, the emergency baptism of infants in the birthing chamber, and the same respective opinions determined the preservation or abolition of the churching of women after childbirth.

When the Reformation began, only nobles, magistrates, and sometimes nursing mothers and elderly women had seats in churches. Throughout the later sixteenth and on into the seventeenth century, pews appeared everywhere, including Catholic churches. They should be regarded as an aspect of ritual in that they held the people's bodies in place and directed their attention more pointedly to the drama of the ceremony, including preaching. Pews also expressed the new Protestant requirement that the laity attend church. Because people sat in the same places, any absence could be detected.

Binding all wings of the Reformation together, from Canterbury to Lund and from Geneva to Königsberg, was the centrality of the sermon. The preached Word took the place of the transubstantial moment as the ceremonial *pièce de résistance*. Pulpits replaced altars as the focal point in sanctuaries. By the seventeenth century, some formal training in homiletics, an extension of the humanist curriculum in rhetoric, was a requirement for entering the clergy. The hearing of the Word was often a prerequisite of enjoying Communion, having one's infant baptized, or getting married; visitation records and other assessments of lay behavior record people's coming to church only after the sermon, a serious but ultimately irremediable transgression. Preaching was regarded as crucial because it enabled the Holy Spirit to fructify the faith of the elect. Promoting this function was surely one factor encouraging the printing presses from the mid-sixteenth to the mid-eighteenth century to pour forth sermons in tangible, legible rather than audible form. Throughout northern and central Europe, households of adequate substance acquired small numbers of such books for the edification of their increasingly literate members, and for "house-fathers" to read in family devotions. Whereas the Mass had lent its power to the community by means of priest-blessed objects, the sermon extended its benefits via the printed book.

Post-Tridentine Catholicism adhered to medieval liturgical patterns even though, in 1588, the church founded the Sacred Congregation of Rites and Ceremonies. After 1614 and the publication of the *Rituale Romanum*, the central hierarchy urged adherence to its new standard upon all quarters. Regional and local tropes and altarpiece representations of unattested saints were to be cleansed from the churches. No study exists of the extent to which local and regional churches complied. Certainly there was much resistance, even if for political reasons, to the decrees of Trent. Carlo Borromeo (1538–1584), Archbishop of Milan (from 1560), provided detailed instructions for the administration and elaborate decoration of churches in his archdiocese. His influence, via his *Instructiones* and other writings, was broad. He urged catechetical instruction for all children, which might have provided the laity with a better basis for understanding Catholic ritual. He is credited with introducing the confessional box as we know it today and with promoting frequent confession.

The Catholic Church in the age of the baroque everywhere adopted a Protestant stress upon preaching. Even though the sacrifice of the Mass remained central, the proliferation of baroque high pulpits throughout Catholic Europe bears witness to the integration of the sermon into the service. Members of the Capuchin and Jesuit orders turned preaching into a high art, the outcome of concerted training in homiletics. In the Catholic world, too, the sermon gradually became a ritual artifact. Holy Week preaching marked the apogee of the annual cycle and was designed, along with the late-emerging Stations of the Cross, to move the faithful to tears. Ritual repentance as contained in the sacrament of penance was closely tied to this affect, for a sense of personal complicity in bringing about Christ's torment was to produce frequent—more frequent than the once-yearly enumeration of sins demanded by the Fourth Lateran Council—resort to auricular confession.

Catholicism continued to regard marriage, the anointing of the dying (extreme unction), and priestly ordination as sacraments. Confirmation, long officially of sacramental status yet neglected, underwent a revival as the church acknowledged the need to better inculcate its precepts via the catechism upon each new generation.

Nowhere were liturgical practices more contested than in the British Isles. The ambiguity of the Anglican Church's early history permitted varied preferences to be expressed. On the return of the Marian Exiles at the accession of Elizabeth, a so-called Puritan party gradually appeared with its pro-Genevan inclination toward spare and didactic liturgy. Puritan divines objected to the ornate traditionality (which is to say, at least the potential idolatry) of the forms provided in the Edwardian prayer books. They objected to the outpouring of cathedral music during the Restoration. Like their confreres on the Continent, they would not brook funeral sermons, for these elevated individual human beings, the deceased, to an undeserved height. They objected to clerical vestments, wedding rings, and churching. As heirs of Calvin, the Puritans stressed interiority and cared little for outward ritual acts. Their services intentionally bespoke the unworthiness of humans and the omnipotence and separateness of God. In Scotland, Presbyterian leaders, too, favored the utmost simplicity. Under pressure during the English Revolution, the Reformed creeds accepted compromise among themselves in adopting *A Directory for Publique Worship in the Three Kingdoms* (1644). Although disputed, in Low Church parishes this rubric would remain a basic guide for centuries. On the High Church side, the Book of Common Prayer of 1662 restored some of the language (priest instead of minister) and practice of Catholicism but avoided extremes. Owing to its bifurcated past, the Anglican Church down to today affords its adherents a spectrum of liturgical choices, from Protestant plainness to near-Catholic elegance.

Two contrasting trends characterize the late seventeenth and eighteenth centuries: the heightened mysticism visible in Pietism and the Catholic baroque, and the rational approach to religion claimed by leaders of the Enlightenment. Most ordinary Christians would not have been conscious of the qualitative changes effected at theologians' behest. Johann Sebastian Bach's (1685–1750) music finely embroidered Lutheran worship and moved hearts by its own devices; Philipp Jakob Spener (1635–1705) verbally urged the imitation of Christ and a heartfelt longing for moral improvement as a precondition of the experience of God's presence. Everywhere the states' ties to their territorial

churches found expression in the nobility's elaborate grave monuments within and near sanctuaries and in longer prayers for the well-being of rulers. Educated city dwellers of means could espouse Enlightenment calls for the daily, practical application of ethical and neighborly principles. This class might be persuaded by voices critical of the irrational, "superstitious" dimensions of all religion. However, the masses uncritically entered their local churches as always and participated in the ceremonial patterns established in the sixteenth century, or, in the case of Catholicism, long before. Eighteenth-century urban congregations did begin to feel the effects of the state's withdrawal as an enforcer of religious conformity. Increasingly, people could select from more than one theological position. Available positions were most immediately communicated by means of liturgy. Throughout the early modern period, ceremony informed even the unlettered laity and involved it in the tacit affirmation of the tenets on which it was based.

SUSAN C. KARANT-NUNN

ROBERTSON, WILLIAM (1721–1793), Scottish historian, clergyman, and educator. William Robertson was born on 8 September 1721 in Borthwick, Midlothian, where his father, William, was a parish minister in the Church of Scotland. The Robertson name was descended from the Robertsons of Gladney in Fifeshire and, more distantly, from the Robertsons of Struan in Perthshire. His mother, Heleanor, was the daughter of David Pitcairn of Dreghorn and Mary Anderson. The eldest of eight children, Robertson was educated in the Borthwick school and in nearby Dalkeith. In 1733, his father was called to Edinburgh as minister of Lady Yester's Church, and two years later Robertson entered the University of Edinburgh. According to his biographer Dugald Stewart, his dedication as a student was aptly demonstrated by his prefixing to his commonplace books the motto *vita sine literis mors est* (life without literature is death). As was typical of many students at the time, Robertson did not take a degree, but in 1740–1741 he studied divinity and subsequently took his examinations to become a minister of the Church of Scotland. In 1744 he was ordained minister of Gladsmuir, and seven years later he married his cousin Mary Nisbet, daughter of James Nisbet, minister of the Old Church, Edinburgh, and Mary, daughter of David Pitcairn. Together they had six children.

In 1758 Robertson, like his father, was called to Lady Yester's Church. Before arriving in Edinburgh, Robertson had already begun to establish himself as a leader in the church, joining a group of ministers, eventually to be known as the Moderates, who advocated church reforms, and publishing a well-regarded sermon, "The Situation of the World at the Time of Christ's Nativity" (1755), which prefigured his historical interests. He had also completed much of the work on his first book, *The History of Scotland during the Reigns of Queen Mary and King James VI*. Published in 1759, the book was a great success, going through some thirteen editions in his lifetime. As a result of this success, Robertson received several appointments, the most notable coming in 1762 when he was named principal of the University of Edinburgh, a post that he would hold until his death.

ROADS AND ROADBUILDING. *See* Communication and Transportation.

During his years as an administrator, Robertson made substantial contributions to the stature of the university, improving the library, strengthening the medical school faculty, and lobbying for new buildings (a dream that only became reality beginning in 1789). In assuming the position, Robertson relinquished some of his parish duties, though he remained a minister, moving from Lady Yester's to Old Greyfriars in 1761. Robertson also exercised leadership in the Church of Scotland's General Assembly during the 1760s and 1770s, championing the Moderate Party's often controversial policies of patronage and toleration, together with a demand for a more educated clergy.

In 1769 he published *The History of the Reign of the Emperor Charles V* in which he studied the development of the European state system and the concept of the balance of power by tracing the career of the most notable Habsburg ruler of the sixteenth century. He was unable to include discussion of the Spanish conquests in the Americas because he believed they would dilute the focus of his history, and this omission gave rise to his next project. In 1777 he published *The History of America*, describing the Spanish exploration of the fifteenth and sixteenth centuries in Mexico and South America. He had intended this history to be part of a general history of European colonization in the Americas, but after *America* he was only able to complete a small portion concerning English colonization (published posthumously in 1796). His work was interrupted by a physical breakdown, manifested in chronic congestion and increasing deafness during the late 1770s and early 1780s. He retired permanently from church leadership in 1780. By 1785, however, his health had revived sufficiently for him to undertake a complete revision of his historical works (published in 1787–1788) and to write *An Historical Disquisition concerning the Knowledge Which the Ancients Had of India* (1791), a discussion of European contacts with India up to the sixteenth century, with clear implications for contemporary British involvement in the area. In 1792, however, his health once again began to fail, and, after enduring considerable pain, he died on 11 June 1793. He is buried in Old Greyfriars churchyard.

JEFFREY SMITTEN

ROCOCO. A style of art characteristic of the eighteenth century, its focal point was France, where it was the dominant style during the first half of the century, although it enjoyed manifestations throughout Europe. Etymologically, "rococo" probably derived from a combination of the first two syllables of the French words *rocaille* (a form of rockwork found in architectural ornament and decorative arts) and *coquillage* (a shell motif that accompanied the *rocaille*). Coined in the 1790s by students of the neoclassical French painter Jacques-Louis David (1748–1825), "rococo" began as a pejorative expression. In an ironic twist of history, however, the earliest instance of the term's recorded usage applied it to David, rather than to a rococo artist properly speaking (such as Antoine Watteau, 1684–1721, or François Boucher, 1703–1770). A group of David's students (he called them his "Greeks"), finding his *Intervention of the Sabine Women* (1799) not Greek enough, judged his masterpiece "[Charles André] Van Loo, [Madame de] Pompadour, rococo." Originally then, the term was studio slang that involved critical judgments about aesthetic taste in general and about painting in particular, rather than a designation for stylistic tenden-

Rococo. The Würzburg Palace, designed by Johann Balthasar Neumann and built 1720–1744. THE ART ARCHIVE/DAGLI ORTI

cies in decorative arts, interiors, or architectural ornament (what the eighteenth century called *le rocaille* or *le genre pittoresque*, which rococo now denotes in its strictest usage). This account of the word's origin (which comes from David's student, Etienne Delécluze) also suggests that from the start "rococo" was a critical term bound up conceptually with issues of gender and class—hence the synonymy between rococo and Madame de Pompadour (1721–1764), the longtime favorite of Louis XV (ruled 1715–1774).

Until the end of the nineteenth century "rococo" was not widely used as an art historical term, except in Germany. For the French it remained a general label for the taste that was fashionable during the reign of Louis XV. As early as the 1840s the French also commonly applied it to anything that was old-fashioned, as did the English. By then Jacob Burckhardt had begun to use it as a generic art historical term for the decadent phases of all period styles (he described a "rococo" in Romanesque, Gothic, and Hellenistic art). Soon thereafter other German art historians began to use rococo as a formal classification of the general period and style of Louis XV, and it was they who inaugurated the first critical analyses of the style. Though recognizing rococo as a mode of decoration that originated in France, these scholars were concerned largely with theorizing the style in relation to baroque architecture in Germany and Italy. The Residenz in Würzburg, designed by Balthasar Neumann (1687–1753), is a magnificent example of German rococo architecture.

Since Fiske Kimball's foundational book, *The Creation of the Rococo* (1943), the term has been used most commonly to name an indigenously French style of decoration, marked by asymmetry and motifs both fanciful and naturalistic, that was distinct and separate from the baroque and was developed by a small number of designers, ornamentalists, and architects during the first half of the century (these included Gilles-Marie Oppenord, Nicolas Pineau, Juste-Aurèle Meissonier, and Jacques de Lajoüe). In the meantime, the word has continued to be used variously as a designation for a broad historical period spanning the decades from the Regency to the reign of Louis XVI (ruled 1774–1792), known as the "Rococo Age," or a pan-European style "capable of suffusing all spheres of

art." Some scholars have argued that it was the first "modern" style; others have denied that it qualifies as a style at all. Lately it has become possible to speak of rococo as a cultural mode of being, thought, and representation rather than exclusively as a formal idiom.

ROMA (GYPSIES). The Roma, or Romani, entered southeastern Europe via the Byzantine Empire in the late Middle Ages from India. Early chronicles referred to the Roma as *AEgyptians*, hence the name *Gypsies*. However, in much of Europe they are referred to as *Zigeuner*, *cigán*, *cigány*, or *tsiganes*, which are derived from the Byzantine Greek word *Atsinganoi*, 'itinerant soothsayers and wanderers'. Most members of this diverse ethnic group prefer to be called Roma, 'group', or Romas, the adjectival form being Romani.

By the beginning of the early modern period, there were Roma scattered throughout the Balkans. While most lived as nomads, those in Walachia and Moldavia (modern Romania), traditionally the Eu-

Roma. *Washerwomen and Gypsies in a Grotto*, seventeenth-century painting by David Teniers II the Younger. THE ART ARCHIVE/

ropean homeland of the Roma, had been enslaved by the boyars (nobility). Initially the Roma were respected for their skills as metalsmiths, gunsmiths, equine specialists, and musicians. As the Ottoman Turks gradually took over other parts of the Balkans, the Roma were subject to a growing body of prejudice that sought to restrict their settlement patterns or force them into a more permanent nomadic status.

Some Roma who tried to seek refuge in central and western Europe met with similar prejudice, particularly in the Holy Roman Empire. By the beginning of the early eighteenth century, Habsburg rulers threatened nomadic foreign Roma with branding, torture, and execution if they were caught. Such policies changed during the Enlightenment, particularly under Maria Theresa (ruled 1740–1780) and her son Joseph II (ruled 1780–1790). They adopted new policies designed to force the Roma to assimilate into Habsburg society; this included kidnapping Roma children, who were then placed into foster Catholic homes. They also ordered that wheels be taken off Roma wagons, and they limited the number of horses that a Roma family could own. Most of these policies failed, and many Habsburg Roma resumed their nomadic ways. One of the few good results of these policies was a series of extensive Habsburg Roma censuses detailing Roma life at the end of the Enlightenment.

The plight of the Roma in the rest of the Balkans was not much better, particularly in Walachia and Moldavia, where the Roma remained slaves until 1864. The Roma suffered from similar discrimination in other parts of Europe during this period. They had entered France as early as the fifteenth century and also moved out of the Balkans into the German states, Scandinavia, the British Isles, and Russia, although the bulk of Europe's Roma remained in the Balkans.

While most of Roma history in the early modern period tends to focus on various aspects of the discrimination they faced, the Roma contributed significantly to the history and culture of Europe during this period, particularly in the fields of music and literature. They formed the modern basis of Russian choral music and Spanish Flamenco and inspired some of Europe's most prominent writers.

ROMAN LAW. *See* Law: Roman Law.

ROMANIA. The principalities of Walachia and Moldavia, formed in the fourteenth century, were the nucleus of what would become modern Romania in the nineteenth century. Their populations were ethnically the same, spoke the same language, and professed the same Orthodox faith; and their political institutions, culture, and historical development throughout the early modern period were similar. They were situated at the crossroads of East and West: their Latin heritage linked them to Rome; their religion drew them to Constantinople.

The decisive force in the international relations of the principalities from the middle of the fifteenth to the end of the eighteenth century was the Ottoman Empire. Despite the heroic efforts of princes such as Stephen the Great of Moldavia (ruled 1457–1504) to defend their independence, both countries were eventually forced to recognize Ottoman suzerainty, Walachia between 1420 and 1480 and Moldavia between 1484 and 1498. Under the terms of *ahd-names* (treaties) granted by the sultans, they accepted vassal status and agreed to pay an annual tribute, to participate in Ottoman military campaigns, and to sever direct political relations with foreign countries. But both principalities avoided occupation by the Ottoman army and the settlement of Muslims on their territory, and they preserved their political institutions, laws, and economic and social structures, thus escaping the incorporation into the Ottoman Empire to which the peoples south of the Danube had been subjected. Their relationship with the Ottoman Empire constantly evolved and became increasingly restrictive and burdensome. By the eighteenth century the sultans were treating the principalities as mere prov-

inces and their princes as Ottoman functionaries. Yet the heaviest burdens they bore were economic and fiscal, as the Ottomans continually increased the amount of the tribute, the number and size of bribes, and the quantities of foodstuffs to be delivered at fixed prices.

Opposition to the Ottomans was constant, but the majority of princes were realists. Aware that their countries were too weak to challenge Ottoman supremacy directly, they looked for support to Poland, the Habsburg empire, and Russia. Theirs was the classic strategy of playing powerful neighbors off against one another, thereby securing independence. One of the high points of this delicate game was the reign of Michael the Brave of Walachia (ruled 1593–1601), who allied himself with the Habsburgs and won several significant victories over Ottoman armies, notably at Calugăreni in 1595. He also brought Moldavia and the principality of Tran-

sylvania under his rule for a brief time, but his enemies prevailed, and the Ottomans regained their predominance over the principalities. Other significant attempts to throw off Ottoman rule occurred a century later. Constantin Brâncoveanu of Walachia (ruled 1688–1714) cooperated with Austria, and Dimitrie Cantemir of Moldavia (ruled 1710–1711) turned to Peter the Great of Russia to regain independence, but neither alliance was successful, and both princes lost their thrones.

The Ottomans, convinced that they could no longer trust native princes, dispensed with elections altogether and appointed princes mainly from among important Greek families of the Phanar (Lighthouse) district of Constantinople. During the so-called Phanariot regime, which lasted until 1821, Ottoman political interference in the principalities' internal affairs, economic and fiscal exploitation, and corruption reached its height. Yet it was also an

era of significant reforms under forward-looking princes such as Constantin Mavrocordat (ruled six times in Walachia and four times in Moldavia between 1730 and 1769), who reorganized administrative, judicial, and fiscal institutions and abolished serfdom in Walachia in 1746 and in Moldavia in 1749, and Alexandru Ipsilanti of Walachia (ruled 1774–1782, 1796–1797) and Moldavia (ruled 1786–1788), who introduced new governmental reforms and undertook the codification of laws. In the latter decades of the eighteenth century, the striving for independence became more intense and was led by the *boiers* (nobles). Their efforts coincided with Russia's own policy of aggrandizement against the Ottomans and brought an easing of Ottoman rule. The Treaty of Kuchuk Kainarji (1774) required the sultan to respect the autonomy of the principalities guaranteed in the *ahd-names* and enabled Russia to intervene regularly on their behalf.

The economy of the principalities rested on agriculture. Production was organized around large estates controlled by the *boiers* and the monasteries, which were worked by peasants, many of whom were serfs (before 1746 and 1749) or were dependent in some other way. There were also free peasants who had their own holdings, but their numbers steadily declined. Artisan crafts were practiced in villages as well as towns, where they were organized into guilds; production was mainly consumed locally. Local commerce was carried on by small merchants, artisans, and peasants, while long-distance and transit trade was mainly in the hands of foreign merchants. Among the main exports of the principalities were foodstuffs, timber, and salt, the bulk of it going to the Ottoman Empire, which monopolized their foreign trade.

Society was dominated by the *boiers*, who formed a hereditary estate and owed their status to control of land and to posts in government. The great majority of the population (about 600,000 in Walachia and 400,000 in Moldavia in 1700) consisted of peasants, who bore the greatest share of taxation and other public burdens but had few civil or political rights. The native middle class was small, mainly because of the modest level of urbanization, the artisan industry, and commerce, and it exercised little influence in public affairs. The clergy of the Orthodox Church, to which the great majority of

Walachians and Moldavians belonged, was the primary spiritual force, especially in the villages.

Cultural and intellectual life until the eighteenth century reflected the principalities' primary orientation toward the Byzantine-Orthodox world. Education was the province of the church, and monasteries were the centers for the copying and diffusion of manuscripts, which were almost all religious in nature. The majority of books, the printing of which began in 1508 with a liturgy book, were also religious. Slavonic persisted as the official language of the church and the princes' chancelleries until the seventeenth century. But influences came from the West, too. The Reformation stirred religious debate and hastened the replacement of Slavonic by Romanian. Contacts with Western scholarship helped transform chronicles into true histories, as in the works of Miron Costin (1633–1691), which revealed a new, secular consciousness of man's destiny. The Enlightenment brought the elites still closer to Europe and provided them with the analytical tools they needed to define their condition and chart their future. By the end of the eighteenth century, the transition from a medieval to a modern society was underway.

ROMANOV DYNASTY (RUSSIA). The Romanov family was one of the old boyar families in Moscow, but its fortunes really began in 1547,

when Anastasiia Romanovna Iur'eva married Tsar Ivan IV. Her relatives remained prominent boyars throughout the reign and suffered little from Ivan's suspicions and resultant executions. Anastasiia's nephew, Fedor Nikitich Romanov, received boyar rank in 1586 and played a major role in the politics of the court of Ivan's successor Fedor. The election of Boris Godunov as tsar in 1598 was a defeat for the Romanovs, and in 1600 Boris sent Fedor Romanov and his wife into exile. They were forced to enter monastic life, taking the names Filaret and Marfa. During the Time of Troubles Filaret as metropolitan of Rostov helped overthrow the first False Dmitrii (ruled 1605–1606) and fought against Tsar Vasiliu Shuiskii (ruled 1606–1610). He supported the election of Władysław, the son of King Sigismund III of Poland, to the Russian throne. When negotiations with Poland broke down in 1610, Sigismund threw Filaret in prison.

Back in Russia Marfa looked after their son Michael (born 1596) in Kostroma. The defeat of the Poles in 1612 led to the calling of an Assembly of the Land in 1613, which elected Michael tsar. He ruled until his death in 1645, at first under the influence of his mother and then after 1619 of his father Filaret, who was elected patriarch of Moscow on his return in that year.

In the reign of Tsar Michael Russia slowly recovered from the devastation of the Time of Troubles, repopulating the center and west of the country and expanding settlement south and east. The government returned to normal and slowly expanded in size, aided by the relative peace at court among the boyar factions. An unsuccessful attempt to regain losses to Poland in the Troubles was balanced by the successful construction of extensive fortifications and garrisons on the southern frontier that guarded against Crimean raids.

Michael's son Alexis Mikhailovich (ruled 1645–1676) was far more successful. The long war with Poland brought back the lost territories and also the Ukrainian Hetmanate as an autonomous unit within Russia. Internal disputes in the church led to much reform but also to the schism of the Old Belief by 1667. For most of his reign Alexis was content to balance the boyar factions and rule by consensus, a system interrupted by the ambitions of Patriarch Nikon (reigned 1652–1658), which led

to Nikon's eventual downfall. By the end of the reign Alexis relied more and more on his favorite, Artamon Sergeevich Matveev.

The male children of Alexis by his first wife Mariia Miloslavskaia, whom he married in 1648, were not a healthy lot. The first heir Alexis died in his teens, and his brother Fedor was ill (probably with scurvy) from childhood. A younger son, Ivan, was also sickly and partly blind. The daughters flourished, but according to Russian custom could not rule. The second marriage of Tsar Alexis in 1671, to Nataliia Naryshkina, produced another daughter but also a healthy son, the future Peter the Great.

At Alexis's death in 1676 the throne went to Fedor, who was too young and sickly to rule until 1680, two years after which he died. After the revolt of the musketeers in 1682, Alexis's daughter Sofiia ruled as regent for the young Peter and his brother Ivan. Peter and his allies at court overthrew her in 1689, inaugurating thirty-six years of deep transformation of the Russian state and Russian culture. By his death in 1725 Peter had made Russia a major regional power, built a European absolutist state, and brought Russia into the circle of European culture. He did not, however, secure the succession. The conflict in 1718 with his son Alexis led him to decree that the tsar could choose his successor, but he did not do so. Thus on his death the Russian elite chose his wife to rule as Catherine I.

The death of Catherine I in 1727 threw the succession back to Peter II, the son of the unfortunate Alexis Alekseevich. Peter II died suddenly of smallpox in 1730, and the elite this time chose Anna, the daughter of Peter the Great's co-tsar Ivan and widow of the duke of Courland, to be the empress. She ruled with the help of her Courland favorite Ernst Johann Bühren (known in Russia as Biron) until 1740. As she had no children, the succession was again in question. Anna's desire was to leave the throne to her infant grand-nephew in the maternal line, Ivan VI, the son of the duke of Brunswick-Lüneburg. The inevitable regency was unpopular, and in 1741 the ruling elite and the guards overthrew Ivan and his family and placed on the throne Peter's daughter Elizabeth.

Elizabeth restored a sense of legitimacy to the throne and the dynasty. She reestablished harmony

at the court by returning Anna's enemies from exile and pursued the building of the Russian state, economy, and culture, including the founding of Moscow University in 1755. Russia's armies defeated Frederick the Great of Prussia in the Seven Years' War (1756–1763). Elizabeth's secret morganatic marriage to Aleksei Razumovskii produced no heirs, so she arranged the succession of the duke of Holstein-Gottorp, the son of Peter the Great's daughter Anna. As Peter III he took the throne on Elizabeth's death in 1762, but he was soon overthrown in favor of his wife, Catherine II.

Catherine, born Sophie of Anhalt-Zerbst, ruled from 1762 to 1796 and was one of Russia's greatest rulers. Her defeats of the Ottomans, the attendant conquest of the north Black Sea coast, and the partitions of Poland made Russia a great power in Europe. At the same time her rationalization of provincial and town administration, with the granting of limited participation to merchants and gentry, strengthened legal order and added new dimensions to Russian administration. The Charter of the Nobility (1785) for the first time spelled out the rights and obligations of the gentry. Her promotion of education and Enlightenment culture spread new political ideas among the gentry. Later liberal opposition to the monarchy sprang from these ideas.

In her memoirs Catherine said that it was her first lover, Sergei Saltykov, rather than Peter III, who was the father of her son Paul. Paul came to the throne in 1796 during the European crisis sparked by the French Revolution. Alarmed by its success, Paul briefly joined the anti-French coalition and reversed many of his mother's reforms. Elite discontent led to his murder in March 1801. Ironically, his succession decree of 1797 allowed for an orderly succession to his son, Alexander I, for the first time in over a century.

ROMANTICISM. According to most definitions, Romanticism begins sometime around or after 1789, the terminal date of this encyclopedia and the moment of the French Revolution. 1789 has been the key date in a good many historical narratives, the point at which everything is thought to have changed forever. But much of what we recognize as Romantic was in place before the Revolution. Confusion arises from the way in which scholars and critics have understood Romanticism as both a period (somewhere between 1760 and 1850) and an attitude or disposition whose priorities include (but are not limited to) emotionalism, excessive self-consciousness, respect for the dignity of childhood, a critique of neoclassicism, an interest in folk culture and primitive origins, a preference for rural life, and a high valuation of private reading over public performance. Artists or writers who foreshadow these concerns before 1789 are likely to be called “Preromantics” (Brown, 1991) or to be assigned to the “age of sensibility” (Hilles and Bloom). The poet George Crabbe (1754–1832) is squarely within the Romantic period but is anti-Romantic because he opposes the spirit of the age. Some writers, like Johann Wolfgang von Goethe (1749–1832), go through Romantic and anti-Romantic phases; others, like Lord Byron (1788–1824), appear throughout as excessively Romantic in some ways (the melodramatic hero) and doggedly antagonistic in others (the decision to use neoclassical rhyming couplets).

Romanticism can be politically radical and democratic (as it was held to be in Britain among the poetic avant-garde in the 1790s) or reactionary and traditional (as it mostly was in France). Often it can be somewhere in between, leading to a lively controversy about, for example, the politics of Wil-

William Wordsworth's (1770–1850) poetry. National chronologies also vary significantly. British and German Romanticisms are held to be well under way in the 1790s; French and other European Romanticisms come later, in the 1800s and after; and American Romanticism comes later still. Romanticism also varies according to the forms and genres we examine. Ludwig van Beethoven (1770–1827) and Franz Schubert (1797–1828) are Romantics; there are Romantic painters (Francisco Goya [1746–1828], James Mallord William Turner [1775–1852], and Eugène Delacroix [1798–1863]); but there is no familiar concept of Romantic architecture (Gothic revival comes closest). There is lots of Romantic literature, especially poetry.

Intellectual historians have often favored explanations relating both the Revolution and Romanticism to preexisting conditions, and in this they repeat a common assumption of the 1790s whereby massive historical changes were attributed to the power of ideas. Commentators of both left and right blamed or praised Voltaire (1694–1778), Denis Diderot (1713–1784), and Jean-Jacques Rousseau (1712–1778) for historical events that none of them lived to see. Many recent interpreters have assimilated Romanticism into a “long eighteenth century” starting around 1690 and extending well into the 1800s, making it central to our understanding of modernity as a whole. Others retain an allegiance to the idea of a clear break between a “classical” eighteenth century and a “modern” worldview. Michel Foucault took the second position in describing the emergence of the “sciences of man,” for which biocultural life is both the origin and the object of knowledge. The compulsive reflexivity and often anxious self-consciousness emanating from this sense of temporality can also be traced in historically earlier forms, though we might agree that it comes to be dominant and impossible to ignore in the Romantic period and the Romantic attitude. Debates between the so-called ancients and moderns throughout the eighteenth century had taken up the question of how much we could expect to understand in the literature of the past, given its different conditions of production and reception. Some felt that truth was transhistorical and natural, others that meaning could only be recovered by careful and patient research (Levine).

The 1700s also saw the emergence of a biblical hermeneutics (science of interpretation) concerned to establish the origins and relative authenticities of the various parts of the Bible (Frei): the sacred book was given human time and place. Again, the Romantic interest in folk and popular culture emerged from a preexisting tradition of antiquarianism that was already implicated in a nationalist-imperialist agenda, one that became even more urgent during the European and world wars that dominated the years between 1793 and 1815. Romanticism embodies a north European, Gothic primitivism that could be invoked to support both popular democracy and the monarchist alliance against Napoleon, as well as a liberal-classicist, cosmopolitan admiration of the pagan Mediterranean that was used to critique the restorations of 1815 (Butler, ch. 5). We can look to Romanticism as containing forms of resistance to the “civilizing process” described by Norbert Elias, evident, for example, in the revolt of Lord Byron, Robert Burns (1759–1796), and Gérard de Nerval (1808–1855) against the rituals of bourgeois self-discipline. However, it includes also those forms of acutely anxious self-examination, as in William Wordsworth's or John Keats's (1795–1821) poetry, which are so clearly coincident with the taming of social violence and the internalization of revolt that Elias traced in the evolution of modern manners.

Romanticism has mostly been a polemical and politicized construction, whether in the interpretations of latter-day scholars (Simpson, 1993, 2000) or in the earliest inventions of the category itself. Hegel gave us the most forceful early definition in positing Romanticism as marked by a turn from the external to the internal, spiritual world and the afterlife. He saw this beginning in the Christian Middle Ages and intensifying in later centuries. His Romanticism is thereby somewhat coincident with the royalist, Christian, antirevolutionary movement typified by François René Chateaubriand (1768–1848) and Victor Hugo (1802–1885). A chronologically more contained Romanticism has been based on the Byronic hero, with its obvious allusions to the figure of Napoleon in its liberating as well as its tyrannical incarnations. Still another can be based on the new interest in folk culture (Johann Gottfried von Herder [1744–1803], William Wordsworth, Robert Burns, and Sir Walter Scott

[1771–1832]). Romanticism has been identified with both religion (orthodox and nonconformist) and atheism, with the political right and left, with progressive optimism and besetting nostalgia, according to the needs of its various interpreters. It is perhaps best understood as an assembly of all of these tendencies (and others) within a loosely understood historical period, giving us the tools for setting about a study of individual artists or movements without imposing a prescriptive boundary.

DAVID SIMPSON

ROME. From 1500 to 1789, Rome’s population grew from about 50,000 to over 160,000. A small civic government maintained some autonomy well

into the seventeenth century, but the papacy increasingly controlled local and regional administration, even as its own role in European politics declined. As the center of Catholic Christendom, Rome remained the focal point for the church hierarchy, for numerous religious orders, and for pilgrims. From the 1540s on, concern for doctrinal orthodoxy circumscribed written and artistic expression, but for another two centuries the city of the popes remained a site of cultural creativity and accomplishment, particularly in architecture.

E C O N O M Y A N D G O V E R N M E N T

In 1500, papal revenues still came primarily from dioceses and church landholdings throughout Europe. After the Protestant Reformation diminished that source, the popes relied more upon heavy taxation of their territories in central Italy, known as the Papal States. A funded debt established in 1526 helped rationalize the curial economy. By 1600, Rome’s administration of its territories was arguably as sophisticated as that of any other European state, but its failure to develop new sources of wealth meant reliance upon deficit spending and foreign patronage. The economy of the city beyond the Curia, built largely around the annual influx of pilgrims, perennially lacked a strong industrial or agricultural base. Bad harvests could readily lead to famines, as happened in 1763–1764.

Whereas sixteenth-century popes such as Julius II (reigned 1503–1513) and Paul III (reigned 1534–1549) engaged in wars with powerful Roman families such as the Colonna, over time the local nobles were subsumed into the church hierarchy. A civic government, the Senate and People of Rome, retained some judicial powers and provided a forum for rallying public opinion. It had influence particularly during periods of vacant see (i.e., between popes). But by 1600 all top state officials were churchmen: a cardinal-chamberlain (*camerlengo*) headed administration of the papacy’s temporal domain, with cardinal-legates governing different regions and a cardinal serving as secretary of state. Thereafter, Roman nobles played an essentially ceremonial role, except to the extent that family members obtained high curial offices.

F O R E I G N R E L A T I O N S

By 1500, Italian politics were being transformed by the presence of French and Spanish armies. Pope

Rome. When Giambattista Nolli published his famous twelve-sheet plan of Rome in 1748 he included a reduced reproduction of Leonardo Bufalini's 1551 woodcut map of the city. Bufalini's map represented a major advance over its medieval and Renaissance predecessors, which were usually odd collections of buildings drawn in elevation or oblique view with inconsistent topography. The drawing here is meticulous and complete, with every street clearly depicted. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

Julius II played the two against each other while strengthening his economic and political hold on the Papal States. By the mid-1520s, however, the might of Spain and the Holy Roman Empire, united in the person of Charles V (ruled 1519–1556), became decisive. Clement VII (reigned 1523–1534) sought intermittently to form alliances to contain imperial power on the peninsula, but the League of Cognac (formed 22 May 1526), in which the pope joined forces with Venice and France, was too disunited in purpose to prevent an imperial army from sacking Rome on 6 May 1527. Clement VII ultimately made peace with Charles V, and he officially crowned Charles emperor in Bologna in February 1530.

Thereafter, Spanish sovereigns often proved critical in defending Rome and in furthering papal goals beyond Italy. Paul IV (reigned 1555–1559)

bucked this trend, forming with France an alliance designed to drive the Spaniards from Italy, but the strategy backfired when an imperial army under the duke of Alba encamped near Rome in 1557, forcing the pope to make peace. French defeats soon led to the Treaty of Cateau-Cambrésis (1559), following which Spain enjoyed a uniquely privileged relationship with Rome: Spanish kings exerted influence in the papal court and gained control over substantial church revenues in Spain. In turn, the kings generously endowed religious institutions in Rome and provided military support to the papacy. Meanwhile, the Vatican diplomatic service grew more complex and systematic, especially under Gregory XIII (reigned 1572–1585) and Clement VIII (reigned 1592–1605), and it came under official control of cardinals.

By the 1620s, the balance of power between Spain and France shifted temporarily in the direction of the latter, and Urban VIII (reigned 1623–1644) was elected pope with strong support of French cardinals. Spain remained influential throughout the century, particularly during the pontificate of Alexander VII (reigned 1655–1667). But following the Peace of Westphalia (1648), which ended the Thirty Years' War, religion became sharply less important in European politics, and so Rome ceased to be as critical to dynastic strategies.

THE URBAN LANDSCAPE

Although the building of Renaissance Rome was well under way by 1500, Pope Julius II gave it added impetus. Seeking to make the city suitably dignified for his ambitions, he sponsored construction projects including the Via Giulia and St. Peter's Basilica (begun 1506). Paul III enhanced the fortifications of the Vatican, employed Michelangelo to restore the city capitol (the Campidoglio), and saw to the construction of major urban thoroughfares. Subsequent pontiffs, notably Sixtus V (1585–1590), further edified and embellished the city. Classical models inspired both urban design and the building of suburban villas with gardens.

The seventeenth century saw the addition of massive baroque structures, many designed by Francesco Borromini (1599–1667) and Gian Lorenzo Bernini (1598–1680). Commissioned in 1638 to build the Church of San Carlo alle Quattro Fontane, Borromini later designed its imposing curved facade. Bernini's projects included overseeing the completion of St. Peter's and designing the colonnade that surrounds its square (completed 1667).

In the eighteenth century, elaborate new facades for churches and other buildings transformed the appearance of existing squares and streets. Wealthy families such as the Corsini and the Doria Pamphili commissioned private palaces whose facades vied for attention in the public theater of the city. There was more practical construction, as well: some structures were divided into private apartments of varying size to house the burgeoning ranks of mid-level papal officials, and new buildings were erected for oratories, monasteries, convents, and charitable institutions. By the later eighteenth century, construction was curtailed amidst economic crises, but there was by then a dense core of build-

ings in central Rome, surrounded on the outskirts by the villas of the wealthy.

RELIGIOUS AND CULTURAL LEADERSHIP

Although the Protestant Reformation cut into the papacy's prestige and revenues, Rome remained the world center of the Catholic faith. Starting in the pontificate of Paul III, it was also a center of reform. When the papacy convened the Council of Trent (1545–1563), which enacted extensive doctrinal and institutional reforms, new religious groups had already emerged, including the Capuchins (1528) and the Society of Jesus, or Jesuits (1540). The latter's zealous and at times controversial promotion of the faith, which could threaten secular rulers' prerogatives, led in 1773 to its temporary suppression by Pope Clement XIV (reigned 1769–1774). Beginning in the mid-sixteenth century, the Roman Inquisition and the Index of Prohibited Books (first promulgated in 1559) limited the scope of acceptable theological expression but did not entirely stifle other forms of intellectual creativity. The University of Rome, strong before the Sack of 1527, had to shut down for eight years. After reopening, it had mainly regional importance, educating lawyers, mid-level papal and civil officials, and some doctors. Bologna remained the premier university in papal territories. Within Rome, religious orders' schools, especially the Jesuits' Collegio Romano (established 1551), dominated theological education. Literary, scientific, and archaeological culture flourished in the later sixteenth century and beyond, when private collections of manuscripts and antiquities became increasingly fashionable. The constraints of orthodoxy limited radical religious expression, at times forcefully, as in the case of Giordano Bruno, who was burned at the stake in Rome in 1600. Philosophical, scientific, and literary pursuits that did not directly contravene church dogma flourished, especially in academies such as that of the Lincei (1603–1630) and the Arcadia, founded in 1690 by scholars who had enjoyed the patronage of Queen Christina of Sweden (d. 1689), who had converted to Catholicism.

The early sixteenth century, a peak period for artistic creativity in Rome, encompassed Michelangelo's painting of the Sistine Chapel ceiling (1508–1512) and Raphael's work in the Vatican stanze (begun 1509). Later influential contributions in-

Rome. *A View of Rome with the Bridge and Castel St. Angelo by the Tiber* by Gaspar van Wittel. ROY MILES FINE PAINTINGS/ BRIDGEMAN ART LIBRARY

cluded Michelangelo's *Last Judgment* (completed 1541), and around 1600 Rome still drew major painters like Annibale Carracci (1560–1609) and Caravaggio (1571–1610). Achievements in architecture reached new heights the following century in the works of Borromini and Bernini, the latter of whom also made enduring contributions to baroque statuary, notably his *Ecstasy of St. Theresa* (1652) in the church of Santa Maria della Vittoria, and the Fountain of the Four Rivers (1651) in the Piazza Navona. In the eighteenth century, public spaces were redesigned with an eye to theatricality. Major projects included the Spanish Steps (1723–1726), the Piazza Sant' Ignazio (1727–1735), and Nicola Salvi's design for the Trevi fountain (mid-1730s), which still today dominates its piazza.

By 1789, Rome had ceased to be a center even of architectural innovation. Still, prints designed and compiled by the architect and engraver Giovanni Battista Piranesi (1720–1778) helped disseminate abroad an appreciation for the city's cultural riches, as did its distinction as the final stop on European aristocrats' grand tour. Although Rome's cultural role had waned, the Renaissance, Reformation, and baroque ages would bequeath a rich legacy to future generations, much as the culture of antiquity had done for them.

KENNETH GOUWENS

ROME, ARCHITECTURE IN. In the early sixteenth century, the architectural development of Rome was spurred by a campaign to reclaim the city as the *caput mundi*, while the century closed with the more pragmatic goal of providing Catholic pilgrims with a coherent and forceful spiritual experience as they moved about the city. Early-seventeenth-century efforts celebrated what was hailed as a triumph for the Catholic Church over the Protestant Reformation, but by the early eighteenth century, as the power of the Church waned and the papal budget for building flagged, triumph turned to a hope that Rome would become a destination on the grand tour of Europe. On more than one occasion over this span of 300 years, observers commented that the city itself resembled one big construction site, as architecture became the visible sign of these shifting goals.

THE SIXTEENTH CENTURY

Two projects—one sacred and one secular—spanned much of the sixteenth century. Reconstruction of the church of St. Peter’s began in 1506 at the command of Pope Julius II Della Rovere (reigned 1503–1513) on the design of Donato Bramante (1444–1514), who projected a Greek-cross plan with a massive central dome, a radical departure in design from the Latin-cross plan of the original fourth-century foundation of Old St. Peter’s marking the burial site of Peter, the first pope. The scheme was fantastic and promised to rival the scale of Roman imperial public architecture. Although the massive piers for the crossing were begun according to Bramante’s design, the plan was revised repeatedly after his death—by Raphael (1483–1520), by Baldassare Peruzzi (1481–1536),

by Antonio Giamberti da Sangallo the Younger (1483–1546), and finally, beginning in 1546, by Michelangelo Buonarroti (1475–1564), who simplified the plan by embedding the Greek cross in a square, capped with a magnificent double-shelled dome offering a striking skyline image for this, the city’s most important pilgrimage destination. The great sculptor turned architect was also responsible for the restructuring of the Campidoglio, the civic center atop the Capitoline Hill, close by the Tabularium and Forum Romanum of the ancient city. Beginning in 1539, the work was carried out in phases (Palazzo Nuovo was not even begun until 1603), but Michelangelo’s mark is apparent in the brilliant design of the oval space, focused on the ancient equestrian statue of emperor Marcus Aurelius and framed by the angled placements of the flanking structures.

Highlights of private building in the city include Bramante’s Palazzo Caprini (c. 1501–1510), an elegant townhouse design that spawned a new category of urban domestic architecture. In contrast, the majestic Palazzo Farnese, built over time on designs by Sangallo, Michelangelo, and Giacomo della Porta (c. 1537–1602), established the aristocratic Roman palace type. In the category of church building, noteworthy developments include experimentation with oval designs, such as S. Anna dei Palafrenieri, Vignola (begun 1565) by Giacomo Barozzi (1507–1573) and S. Giacomo degli Incurabili, Volterra (begun 1592) by Francesco Capriani (c. 1530–1594). In contrast, the newly sanctioned Society of Jesus, founded by Ignatius of Loyola and headquartered in Rome, built the church of Il Gesù (begun 1568), designed by Barozzi, financed by Pope Paul III Farnese (reigned 1534–1549) and responsive in its architecture to the reforms called for at the close of the Council of Trent (1563). Strategically located in the city center, the church is Latin-cross in plan, with a shallow transept and a broad nave, devoid of side aisles, but with a series of discrete side chapels. The unified interior space was to accommodate large crowds with good acoustics for preaching, while the side chapels provided individual altars for serving the requisite daily masses. Likewise, the facade, designed by Della Porta, established a new type of aedicular composition with two stories of unequal width reflecting the elevation of the church. The

Architecture in Rome. This is a reproduction of the lower-right corner of Giambattista Nolli's magnificent twelve-sheet 1748 plan, which also features elaborate symbolic scenes. In this scene, the Christian character of the city is emphasized. The inscription above the seated figure refers to Pope Clement XII (reigned 1730–1740), and the map was dedicated to his successor Benedict XIV (reigned 1740–1758); both did much to beautify Rome. Architectural monuments are also depicted. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

plan, the interior articulation, and the facade of the Gesù were widely imitated; notable among these offspring are the churches of S. Maria in Vallicella (begun 1575), S. Andrea della Valle (begun 1591), and S. Susanna (begun 1595).

In the same spirit of reform, the century drew to a close with the election of Pope Sixtus V Peretti (reigned 1585–1590) who instituted, with his architect Domenico Fontana (1543–1607), an urban scheme to unify the city by establishing a network of straight streets and vertical markers, ancient Roman commemorative columns, and ancient Egyptian obelisks, each topped with Christian symbols. The Sistine plan for the city, aimed at pilgrims in anticipation of the holy year of 1600, served to link the city center with the outskirts where the early Christian basilicas—obligatory stops on the pilgrimage route—were located. In this way, Sixtus stimulated growth of the city and established a framework for its later urban development.

THE SEVENTEENTH CENTURY

The expansion of St. Peter's to form a Latin-cross plan and the completion of its facade, all at the direction of Pope Paul V Borghese (reigned 1605–1621) on designs by Carlo Maderno (1556–1629), opened the seventeenth century on a note of celebration. This tone is evident in both private and public architecture, where new forms and hybrid solutions abound. The grand tradition of Palazzo Farnese was transformed in the designs of Palazzo Borghese (Maderno; 1605–1614), Palazzo Barberini (Maderno and Bernini; 1628–1638), Palazzo Pamphili at the Piazza Navona (G. Rainaldi and Borromini; 1646–1647) and Palazzo Chigi-Odescalchi (Bernini; 1664–1667), each a palace of family members of the reigning pope. What had appeared as formidable blocks showing reserved faces to the city grew into organic structures with facades replete with arcades and orders orchestrating opened and closed wall segments in response to the immediate urban context and the larger

cityscape. Likewise, church architecture attained new levels of invention, both in plan as well as in elevation. Central plans attracted renewed attention, as for example in Pietro da Cortona's SS. Martina e Luca (begun 1635) and Francesco Borromini's S. Carlo alle Quattro Fontane (begun 1638). Facades that were planar as aedicular compositions (horizontal elements that support a vertical element), stemming from the Gesù, grew increasingly complex with heavily tectonic designs marked by a dramatic repetition of the columnar order in planes that break forward into space, as for example at SS. Vincenzo ed Anastasio (M. Longhi the Younger; 1646–1650), S. Maria in Campitelli (C. Rainaldi; begun 1662), and S. Marcello (C. Fontana; 1682–1683). These inventions, with their marked attraction to the dramatic in purely architectural terms, define what we mean by the term “baroque.”

Nowhere is this baroque mentality more apparent than in the architectural works of the triumvirate of design personalities—Francesco Borromini (1599–1667), Pietro da Cortona (1596–1669), and Gian Lorenzo Bernini (1598–1680)—and their papal sponsors, Urban VIII Barberini (reigned 1623–1644), Innocent X Pamphili (reigned 1644–1655), and Alexander VII Chigi (reigned 1655–1667). At S. Ivo della Sapienza (1640–1660), Borromini offers a purely architectural composition celebrating the theme of wisdom, appropriate to the

chapel of a university and revealed in the highly unusual star-hexagon plan, the undulating walls, the pleated dome, and the extraordinary lantern. Cortona's facade design for S. Maria della Pace (1656–1661) involved formation of an urban setting, a small polygonal opening carved into a dense neighborhood that not only facilitated access to the church by carriage, but also offered a dramatic setting for the semicircular portico of the facade that ironically seems to fill the open space as the church aggressively seeks its visitor. Bernini's S. Andrea al Quirinale (1658–1676) offers a stage like architecture that begins on the street with its grand, one-story aedicular facade announcing the aedicule of the altar opposite where the crowning pediment opens to reveal Andrew in his ascent to the heavenly dome where his fellow fishermen await him. The drama of the sculptural event in this small oval church highlights Bernini's role as impresario and his manipulation of the viewer for whom he stages spectacular events, whether in his design of the Baldacchino (1624–1633) at the crossing of St. Peter's, in the Cornaro Chapel (1645–1652) in S. Maria della Vittoria, or in the monumental Piazza S. Pietro (1656–1667). The Piazza S. Pietro, the crowning achievement of the papacy of Alexander VII, completed the campaign to rebuild St. Peter's. Here, the defining lines of the giant colonnades unite the opposing forms of the latitudinal oval, a gathering space for the faithful, and the trapezoid, a

funnel-like space leading to the church. These spaces also function to frame the ritual appearances of the pope in the Benediction Loggia at the center of the church facade and in his apartment at the upper story of the papal palace to the north. In each case the architects of baroque Rome focus on the participant and in so doing offer exciting challenges fraught with subtleties of scale, of surface, of space, and of time.

THE EIGHTEENTH CENTURY

Although the pace of building in Rome slowed at the end of the seventeenth century, the eighteenth century brought an interesting combination of architectural styles, stemming from the baroque, while also offering a contemporary aspect. The classical strain of architecture, employed for official commissions, recalls Bernini's (and even Michelangelo's) architecture and reflects the growing fascination among her tourists with Rome's ancient past. The more playful rococo style, apparent in urban planning and smaller church and domestic architecture and spawned by the fanciful creations of Borromini, offered an important foil, yet the two strains seem perfectly compatible. On the one hand, new facades for S. Giovanni in Laterano (Galilei; 1733–1736) and S. Maria Maggiore (Fuga; 1741–1746) demonstrate both the severity as well as the drama of the classical style in which the wall has been eliminated to reveal dark recesses in space while the order alone remains to define the skeletal structure of the whole. On the other hand, the curvilinear shapes of the open-air designs of the Spanish Steps (De Sanctis; 1723–1726) and Piazza S. Ignazio (Raguzzini; 1727–1735) offer an alternative sensibility of refinement and elegance suitable to a new leisure class of Romans as well as to tourists drawn to Rome to study both ancient and contemporary art and architecture. On occasion, the two styles merge in monuments such as the Fontana di Trevi (Salvi; 1732–1762), where the classical language furnishes a luxurious backdrop for the extraordinary sculptural display and waterworks, and the main facade of Palazzo Doria-Pamphili (Valvassori; 1730–1735), where the skeletal aspect of the classical conjoins with the decorative and curvilinear elements of the rococo.

The appeal of this architecture, beginning in the early sixteenth century and continuing well into the

eighteenth century, is its grandeur and drama, aspects that enjoyed success whether in the service of the church, of public institutions, or of individuals. The wonder of this architecture lies not only in the sheer number of buildings that were built, but also in the staggering variety of these buildings that together created Rome's marvelously variegated and unified urban fabric.

DOROTHY METZGER HABEL

ROME, ART IN. Like the art and architecture of the early modern city, the art of ancient Rome was largely produced by ambitious immigrants: ever since the legendary early days when Rome welcomed Etruscan kings and Sabine women, its culture had always been both international and eclectic. But art in early modern Rome was eclectic in a highly particular sense, incorporating influences from vastly different times as well as different cultures. Even after the Vandal invasions of the sixth century cut the ancient aqueducts and reduced the Roman population to a fraction of its million inhabitants, artists in Rome were compelled to face the imposing physical legacy of the ancient city: its monumental ruins, its fading frescoes, ancient

buildings that had never gone out of use (like the Pantheon, some early Christian basilicas, and many humbler structures), and a population of statues that sometimes rivaled the numbers of the living. The legacy of Roman grandeur and Roman style persisted in the work of later artists and architects, who often adapted a set of columns, a statue, or a marble inlay for their own projects. A pair of lions from the twelfth-century cloister of the basilica of Saint John Lateran feature Egyptian *nemes* head-dresses like those of the ancient sphinxes their sculptors must have seen in the ruins of the Temple of Isis. A statue of Saint Helen from the church of Santa Croce in Gerusalemme, itself built into a vaulted hall of Helen's Sessorian Palace, has been cleverly recarved from an ancient image of the goddess Juno. Medieval Rome was filled with colonnaded porches, porphyry inlays, gilt mosaics and marble statuary all directly inspired by—and often made of—the physical remains of the ancient city. Medieval Roman painters like Pietro Cavallini (c. 1250–c. 1330) gave their figures the same majestic solidity they must have seen in ancient frescoes.

THE ALLURE OF THE ANCIENT

By Cavallini's time, however, the Roman economy lagged far behind that of emerging merchant republics like Pisa, Siena, and Florence; the presence of the pope and his curia could not compensate for the lack of a thriving merchant class to attract and nurture artists and architects with a range of plentiful, competitive commissions. Visitors described medieval Rome as a landscape of ruins: the Forum was called Campo Vaccino (cow pasture) and the Capitoline, site of ancient Rome's most glorious temple, had become Monte Caprino (goat hill). The huge basilicas of Christianity, themselves relics of late Roman antiquity, crumbled in squalor as vendors hawked souvenirs and straw pallets to the pilgrims who bedded down within their huge, shabby porticoes. Yet the columns and statues strewn among Rome's ruins also seemed to contain the mysteries of perfect proportion, known to the ancients and lost in later eras—a perfection based on the harmony between the human body and the divine cosmos. Ancient Latin and Greek inscriptions expressed their own version of this divine order in the stately forms of their lettering. Thus, in their tantalizing incompleteness, the monuments of Rome

came to excite the early modern artistic imagination, spawning ideas of a scope and daring that no “complete” city could ever have inspired. The idea of restoring Rome to its ancient splendor had seemed an impossible vision to Petrarch when he visited in the mid-fourteenth century. The papacy had recently moved to Avignon, further crippling the feeble Roman economy, and Petrarch worried that the spark of ancient inspiration had gone out for good. During the first half of the fifteenth century, however, the popes gradually returned from Provence, trailing cardinals, curates, and bankers. To reinforce the permanence of their return to Rome, the fifteenth-century popes and their courts began to speak openly about renewing the city or, more radically, fostering its rebirth. Because of Rome's unique political structure, its history, and its physical presence, this culture of renewal also took on its own distinctive characteristics. In the first place, the papacy, with its theocratic monarchy, deliberately drew inspiration from the ancient Roman Empire rather than from the preceding republic. When republican ideals took hold in Rome, as they did on occasion, the result, until the Italian unification late in the nineteenth century, was almost invariably chaos. Second, the brooding presence of ancient ruins gave Renaissance Rome's sense of the ancient past an urgent physical immediacy. The architects of Renaissance Rome could hardly resist emulating the grand proportions of ancient buildings. Through painstaking study, they eventually came to understand, and then to apply, the ancient Romans' subtle system of aesthetic refinement, deployed with their inspired sense of freedom, and governed by the same rigor. But they also looted the fallen portions of the Colosseum to erect the walls of *palazzi* whose forms were themselves eloquent reworkings of the Colosseum's facade. The sheer complexity of Renaissance Rome's position between ancient past and imaginative present meant that the city's revival fostered an unusual degree of collaboration. The culture that resulted from the collaboration of these sometimes unlikely groups of friends represented an unusually broad population by comparison with Florence, where the Medici dictated intellectual and artistic fashion for generations, or Naples, with its Spanish-centered court, or even Venice, with its broad-based but carefully regimented civic life. The cultural life of fifteenth- and sixteenth-century Rome eventually thrived in a wide

variety of places such as the *palazzi* of cardinals, businessmen, and papal bureaucrats as well as the Apostolic Palace. For even if the popes commanded spiritual as well as temporal power during their reigns, the reigns were often quite short—popes, like Venetian doges, tended to be elected as old men. The cultural life of the city therefore became unusually adaptable and always maintained a certain degree of diffuse independence from its one dominant figure.

RENEWAL OF ROME

The initial stages of Rome's artistic renewal were dominated by Tuscan artists. (Tuscans also dominated the curia to the extent that the Roman dialect changed in these years from a distinctively southern to a central Italian vernacular.) Masolino da Panicale created a fresco cycle for the Dominican church of San Clemente in the 1430s. Twenty years later, Pope Nicholas V invited the Florentine painter Fra Angelico (Guido di Pietro, c. 1400–1455) to decorate his private chapel in the Vatican Palace. In both cases, the renowned Tuscan painters brought their native style to Rome, but Rome exerted its own suggestive power over that style; in the shadow of the Colosseum, the Palatine palace, and the great Roman baths, their work took on a new gravity, their compositions became more architectonic, and architecture itself came to figure prominently in the paintings. As late as 1481, when Pope Sixtus IV gathered a team of painters to decorate the walls of his new chapel in the Vatican, he summoned them from Florence. Yet the frescoes produced by that team of Florence-based Tuscan and Umbrian artists on the Sistine Chapel walls entirely reflected their Roman setting: triumphal arches and Roman-style basilicas dominate the background, and even the famously sinuous figures of Botticelli and Ghirlandaio acquired the grandeur of Roman historical relief. Melozzo da Forlì's (1438–1494) fresco honoring Sixtus's chartering of the Vatican Library in 1475 (finished 1476) ranges the pope, his librarian, and his nephews within a spacious marble hall. The most majestic of these figures, the cardinal Giuliano della Rovere (the future Pope Julius II) is ranged against a classical column as if he is literally a pillar of the library—as indeed he was. The bronze tomb designed for Sixtus by the Florentine artist Antonio Pollaiuolo reflects his acute awareness of Etruscan and Roman

bronzes. Similarly, the Florentine painter Filippino Lippi's frescoes for the chapel of Cardinal Oliviero Carafa in Santa Maria Sopra Minerva are focused compositionally on grand architectonic structures and move with the measured deliberation of an ancient Roman procession. Two Umbrian painters, Pietro Perugino and Bernardino Pinturicchio, and a Tuscan, Luca Signorelli, dominated painting in Rome at the turn of the fifteenth century. All three had been at work in Rome off and on since the 1480s, and for them the city's ruined buildings, statues, paintings, and stucco reliefs provided an inescapable stimulus to paint more grandly, with more clearly articulated spaces, more substantial figures, sturdier architecture. Pinturicchio's scenes from the life of Saint Bernardino of Siena for the Bufalini Chapel in Santa Maria in Aracoeli, his decorations for the Vatican apartments of Pope Alexander VI Borgia, and his ceiling for the choir of Santa Maria del Popolo are especially remarkable. Indeed, all three of these talented masters would have a far greater reputation today if it were not for what happened in Rome during the first decades of the sixteenth century. In December of 1503, Cardinal Giuliano Della Rovere was elected Pope Julius II (reigned 1503–1513), a man of enormous vision and implacable temper who took the project of Rome's renewal to heart with a vehemence that swiftly eclipsed the work of his active uncle Sixtus IV. He sought out Donato Bramante (1444–1514), a mature artist born in Urbino and recently arrived in Rome from Milan, who had begun to make his mark as an architect in the classical style. Together, the two of them embarked on an ambitious plan to raze the tottering early Christian basilica of St. Peter's, develop the Vatican Palace around a huge internal garden that would house the papal art collections, and transform the city itself into a model metropolis of broad, straight thoroughfares, glorious new buildings, and bustling river traffic. A perceptive collector of ancient sculpture, Julius also made contact with a young Florentine sculptor, Michelangelo Buonarroti (1475–1564), whom he set to work on designing his tomb beneath the crossing vault of Bramante's new St. Peter's. By 1507 Julius had decided to decorate his private apartments as well. Following the successful stratagem of Sixtus IV, he called in a team of illustrious painters from central Italy to execute the project, including a young relative of Bramante's named Raffaello

Sanzio (Raphael, 1483–1520). Raphael's first two frescoes proved so evocative, however, that Julius assigned him the whole commission. A host of other artists flocked to Rome in the early days of Julius's reign: the Tuscan sculptor Jacopo Sansovino, the dynasty of architects known as the Sangallo (after their neighborhood in Florence), the Tuscan painters Antonio Bazzi (called Il Sodoma) and Baldassare Peruzzi. Most of the Sangallo clan returned to Florence when it became clear how entirely Bramante would dominate architectural commissions in the city. Antonio da Sangallo the Younger, who remained in Rome, began to work his way through the ranks on the St. Peter's project in hopes of eventually setting up on his own. Pope Julius commissioned two elaborate marble tombs of Sansovino for the choir of Santa Maria del Popolo; one of these, the tomb of Cardinal Ascanio Sforza (1505), is remarkable for the lively reclining figure of that lean, sophisticated Milanese prelate. Other commissions followed from wealthy members of the curia. Sodoma and Peruzzi were taken up by the Siense banker Agostino Chigi, who was rich enough in 1503 to have provided Cardinal Giuliano Della Rovere with the bribe money that secured his election as pope, and who became richer than ever once he and Pope Julius began to pilot the economic course of the papacy. The unerring artistic instinct that prompted Julius II to see a painter in the sculptor Michelangelo inspired the irascible pontiff to push the equally irascible artist into replacing the gilt stars and blue background of the Sistine Chapel ceiling with a design that began as a depiction of the twelve apostles and eventually expanded dramatically to trace the history of the papacy back to the creation of the universe. It took Michelangelo only four years, from 1508 to 1512, to cover the chapel's ceiling with his broad, sure brushstrokes. Two muscular marble statues from the papal collections, the Belvedere Torso and the Laocoön (the latter discovered in 1506), inspired the epic physiques of Michelangelo's figures, but his extraordinary colors—purple and orange and sea green—seem to have been his own invention, and all at once they changed the palette of Italian art. Raphael, the most attentive of painters, had already absorbed Michelangelo's grand figure style and novel color schemes long before the Sistine Chapel ceiling was unveiled; Bramante, to Michelangelo's chagrin, had let him in for a preview. The results can

be seen in Raphael's *School of Athens* (1510–1511), his *Isaiah* in Sant' Agostino (1511–1512) and his *Galatea* (c. 1512–1514), painted for Agostino Chigi. When Julius died in 1513 and was succeeded by the Florentine pope Leo X, a distinctive Roman style had already been established in painting, sculpture, and architecture, characterized by powerful, elegant human figures, high contrasts of light and dark, strong architectural lines, mastery of space, and strange, brilliant colors. There was even a distinctive papal style for architecture: Doric triglyph-and-metope friezes, Tuscan columns, and rusticated masonry, devised by Bramante for St. Peter's and the unbuilt Palazzo dei Tribunali on the Via Giulia, one of the long, straight boulevards that formed an important part of the pope's city planning. Pope Leo and successors like his cousin Clement VII (reigned 1523–1534) and their contemporary Paul III (reigned 1534–1549) continued to foster this grand, colorful Roman style for projects like the Villa Madama, Palazzo Farnese, Michelangelo's Campidoglio, and the seemingly never-ending project of St. Peter's. Before his death in 1520, Raphael had established a flourishing workshop; furthermore, thanks to his association with the penetratingly insightful Bramante, he lent a strong theoretical instinct to the creation of art, so that onetime associates like Antonio da Sangallo the Younger, Perino del Vaga, and Giulio Romano could continue creating works of art and architecture along the same basic lines. In many ways, these were the same lines adopted by Michelangelo, an equally thoughtful student of ancient Rome—and an equally independent flouter of the compositional principles he observed in ancient art. Like the ancient Roman architect and writer Vitruvius, who used two-story columns to “lend authority” to the interior of the basilica he designed in the city of Fano, Bramante, Raphael, and Michelangelo all used giant orders of columns to bind together huge facades, none so brilliantly as Michelangelo for the Palazzo dei Conservatori (c. 1537) on the Capitoline Hill and for the exterior walls of St. Peter's. The dome of Hadrian's Pantheon inspired Bramante, Raphael, Michelangelo, and finally Giacomo della Porta in their successive designs for the dome of St. Peter's; it was della Porta who elongated the profile to its present graceful shape. Raphael's workshop's rediscovery of the formula for ancient stucco in about 1518 allowed architecture to merge with

sculpture, and sculpture with painting, as in Raphael's Vatican Logge for Pope Leo X, his workshop's Palazzo Madama, and his facade for Palazzo Branconio dell'Aquila. The melding of stucco work and architecture reached its apogee with the facade of Palazzo Spada in 1550.

By the middle of the sixteenth century, the Protestant Reformation had provoked Pope Paul III to convene the reforming Council of Trent, which closed in 1563 after a quarter century of wrangling. Its call for a newly persuasive religious art did not produce immediate effects on the look of art in Rome; the distinctive, sophisticated local tradition had become too strong to change immediately. In the very last years of the sixteenth century, however, a Milanese painter named Michelangelo Merisi da Caravaggio (1573–1610) suddenly gave forceful new expression to Trent's call for a simple, persuasive religious art: his paintings, with their dramatic contrasts of light and dark and their apparently down-to-earth figures (many of them drawn from ancient models) brought the stories of the Bible dramatically into the here and now. In their effect, they were sermons in paint, performing exactly the same devotional service as the priest's homily at mass. Roman painting now began to show an apparent split between dramatic, even grubby naturalism and sophisticated classical style, but these poles were never truly opposed. Caravaggio's *Deposition* in the Vatican (1602–1604), however dirty its figures' feet, adopts the poses of an ancient Roman sarcophagus, and there is no more grittily rustic peasant than the arch-classicist Annibale Carracci's *Bean Eater* (c. 1585) in the Galleria Colonna.

THE SEVENTEENTH CENTURY

Caravaggio's stark lighting affected later artists like Guercino (Giovanni Barbieri, 1591–1666) and Mattia Preti (1613–1699), their dramatically posed figures emerging from deep shadows; silvery flesh tones and a loose brushwork gave their large paintings an added vibrancy. The versatile Orazio Gentileschi (c. 1562–c. 1647) and his daughter Artemisia (c. 1597–after 1651) also worked occasionally in this style, as did the popular Guido Reni (1575–1642) for his *Crucifixion of St. Peter* in the Vatican Museum. Soon, however, the spareness and

restricted color of Caravaggio gave way in Rome to a more elaborate, colorful taste in painting.

The classical whimsy of Annibale Carracci's ceiling frescoes for the Galleria in Palazzo Farnese added new life—and lightness—to the stately, architectonic quality of monumental painting in Rome, so that an important commission like Pietro da Cortona's ceiling fresco for the grand entrance hall of Palazzo Barberini (1631) could amuse as well as celebrate the family by showing their coat of arms, a trio of gigantic bees, buzzing in formation into the heavens. The same kind of virtuoso whimsy assured the popularity of Gian Lorenzo Bernini (1598–1680), whose phenomenal ability to carve marble was matched by the fertility of his imagination. His series of early works for Cardinal Scipione Borghese, *Apollo and Daphne* (1622–1625), *David* (1623–1624), and *Pluto and Persephone* (1621–1622) seemed to turn stone into living flesh where Pluto's fingers press into plump Persephone, where Daphne's fingers sprout leaves and her toes take root, and where David (a self-portrait of the artist) bites his lip in concentration. Bernini's later commissions often combined sculpture with architecture, from the Baldacchino in St. Peter's (1633) to the Throne of St. Peter (1657) in the same basilica, to the tombs of Popes Urban VIII (1647) and Alexander VII (1672–1678), this last with a gilt skeleton struggling to free itself from a red jasper curtain that symbolizes—all too literally—the flesh. Bernini's sheer technical skill and his lively compositions set the standard for all other sculptors in Rome. His fountains still dot the city: the Fountain of the Four Rivers in Piazza Navona (1651) incorporates an ancient Egyptian obelisk into its complicated symbolism of life's instability and religion's offer of eternity, contrived with the help of the Jesuit scholar and philologist Athanasius Kircher (1601–1680). A century later, Nicola Salvi's Trevi Fountain (1732–1762) would look to Bernini's masterwork for its chief inspiration, just as Andrea Pozzo's altars to Saint Ignatius Loyola and Francis Xavier in the church of Il Gesù (1695) ultimately owe both the upward sweep of their design and the daring richness of their lapis lazuli decoration to Bernini's designs for St. Peter's and the Jesuit church of Sant'Andrea al Quirinale (1658–1670), where he designed both the architecture and the

sculptural decoration, which merge into one another seamlessly.

The creation of art in seventeenth-century Rome was a matter of intense intellectual discussion, and conspicuously learned artists who worked there included the young Fleming Peter Paul Rubens (1577–1640), destined to become both painter and diplomat after his studies in Rome in 1601–1602 and 1605, and the Frenchman Nicolas Poussin (1594–1665), whose theories about color and classicism injected a stately sobriety into the painting of his adopted city. Yet the same collectors who assembled Poussin’s myths and allegories also collected paintings of flowers, peasants, and landscapes, all separate genres in the burgeoning seventeenth-century art market (as was the venerable art of portraiture). Raphael had already excelled at por-

trait painting in the early sixteenth century, and his image of a pensive *Pope Julius II* (1511–1512) may have been in the mind of the Spanish painter Diego Velázquez when he created his glorious portrait of a gimlet-eyed *Innocent X* more than a century later (c. 1650). The contrast between Raphael’s meticulously fine brushwork and Velázquez’s commanding sweeps of raw paint could not be greater, but they share the gift of psychological insight. The eighteenth century in Rome would add a new kind of portrait to the traditional repertoire of churchmen, nobles, merchants, and courtesans: the so-called swagger portraits of English “grand tourists” who had begun to flock to Rome and felt that they could not leave until they had been immortalized, striking a pose in a recognizably Roman setting, by Pompeo Batoni (1708–1787).

Raphael also had been a pioneer as a print-maker, with the help of the engraver Marcantonio Raimondi, and as a result most painters and sculptors from the sixteenth century onward came to rely on prints as a vital means by which to illustrate works in other media as well as a cheap, attractive art form in their own right. But Rome had never seen anything like the prints that began to emerge in the eighteenth century from the burin of Giovanni Battista Piranesi (1720–1778): monumental visions of Roman ruins, intricate, surreal prisons (in his *Carceri d'invenzione*, 1749–1750), fireplace designs based on Egyptian and Etruscan as well as classical motifs, all executed with a sureness of touch equaled in the history of the medium only by Albrecht Dürer. Piranesi's exaggeratedly tiny human figures, his tempestuous skies, and the wayward smoke of his fireplaces give his designs a haunting immediacy.

In the eighteenth century, the aesthetic theories of Johann Joachim Winckelmann (1717–1768), secretary in Rome to Cardinal Alessandro Albani, began to encourage painters like Anton Raphael Mengs (1728–1779) to work in a more restrained, classical style inspired by Raphael (for Mengs, the similarity in their names also acted as a stimulus); Winckelmann also amassed an impressive collection of ancient sculpture for the cardinal. In 1791, inspired by the same movement, the successful but restless sculptor Antonio Canova (1757–1822) undertook a design for the tomb of Pope Clement XIII in St. Peter's Basilica that was radical enough to make the apprehensive artist attend its unveiling in disguise. With its simplified neoclassical forms and its now-famous weeping lions, the massive white marble tomb marked a sharp departure from the legacy of Bernini. Canova had exchanged the rich textures and headlong movement of the baroque for the calm and clarity that he, like Winckelmann before him, had observed in ancient art. Canova quickly dropped his disguise; the Romans immediately loved his new work, indicating that their tastes, like those of Europe as a whole, were shifting toward a different understanding of the ancient classical ideal—neoclassicism—that would soon transform all the arts.

ROME, SACK OF. The conquest of Rome on 6 May 1527 by troops of the Holy Roman emperor Charles V (ruled 1519–1556) has traditionally been viewed as a turning point in the history of papal Rome and in Renaissance culture. While recent research has highlighted economic, political, and social continuities between pre- and post-sack Rome, a consensus remains that the event, which occurred during the Italian Wars of 1494–1559, had cultural repercussions of lasting significance.

The conquest itself was brief. Around dawn on 6 May 1527, an imperial army composed primarily of Spanish and German troops besieged the poorly

defended city. Their commander, Charles de Bourbon-Montpensier (1490–1527), died in the initial assault, but by sunset virtually all of Rome had fallen to his men. His successor, Philibert of Orange-Châlon (1502–1530), could not control the victorious troops, who proceeded to spend months desecrating sacred objects, ransacking the city, and torturing its citizens in order to extract ransoms. Pope Clement VII (Giulio de' Medici; reigned 1523–1534), who had taken refuge in the Castel Sant'Angelo, formally capitulated on 5 June, and remained a captive there until early December. Only in February 1528 did the occupying army leave Rome.

The sack resulted most immediately from Clement VII's decision to join with Florence, France, Milan, and Venice in the League of Cognac (22 May 1526), an alliance formed to limit Charles V's power on the Italian peninsula. As Bourbon-Montpensier's army advanced southward, the particular goals of the Venetians and the French had come to outweigh the interests they shared with the papacy. In March 1527, the pope had agreed to a truce with Charles de Lannoy, the imperial viceroy of Naples, but Bourbon-Montpensier and his men had refused to honor it. Historians disagree about whether or not Charles V authorized the attack on Rome; certainly he abhorred the atrocities that followed. Meanwhile, Clement discovered that he could not count on the league's armies either to come to his rescue or to mount a coherent counteroffensive. Having been effectively abandoned, in 1529 the pope made peace with Charles V, whom he crowned as Holy Roman emperor in Bologna in February 1530. Thus, he adjusted with some success to the emperor's now decisive hegemony on the peninsula.

The cultural impact of the sack was felt acutely throughout Europe. Many artists and architects, including Rosso Fiorentino (Giovanni Battista di Jacopo, 1494–1540) and Sebastiano Serlio (1475–1554), sought safety and patronage elsewhere, and in so doing promoted the diffusion of High Renaissance Roman culture. In humanists' rhetoric, claims that the papacy would soon initiate a golden age perforce gave way to more modest expectations. Religious interpretations of the event varied, but there was a widespread consensus—shared even by Pope Clement himself—that moral failings of the

clergy were in part to blame for the catastrophe. His successor, Paul III (reigned 1534–1549), did much to restore the papacy's prestige, political influence, and cultural centrality, but any optimism was tempered by a new awareness of political contingency and by nostalgia for an idealized age of cultural efflorescence that was widely perceived to have already passed.

KENNETH GOUWENS

ROSICRUCIANISM. Rosicrucianism is the ideology of the Rosicrucians, a mysterious, possibly apocryphal, religious sect announced in early-seventeenth-century Germany. The existence of a secret Brotherhood of the Rosy Cross, the Rosicrucians, was proclaimed in *Fama Fraternitas* (Rumor of the brotherhood), a short treatise that circulated in manuscript several years before it was published by Wilhelm Wessel in Kassel in 1614. Further details about the brotherhood followed in the *Confessio Fraternitatis* (1615; Confession of the brotherhood), ostensibly the secret society's manifesto. A spate of "Rosicrucian" treatises ensued, written by a cadre of radical reformers associated with several princely courts and universities of Germany and published mainly in Kassel, Frankfurt, and Danzig.

Although these earliest treatises were anonymous, it appears that the *Fama* was written, perhaps as early as 1608, by Tobias Hess (1558–1614) and circulated by Adam Haslmayr (1588–1602) and Benedict Figulus (1567–1624). These three appear to have played key roles in codifying the fundamentals of Rosicrucianism from the philosophical and theological ideas of the German reformer Paracelsus, but drawing on material from John Dee (1527–1608), Cornelius Agrippa (1486–1535), and other “Hermetic” authors. The religious teachings of Paracelsus (1493–1541), who despaired of the institutionalized church and urged focus on a German mystical, inner realization of divinity, were especially amenable to Protestants who felt that the Reformation had stopped short and abandoned its original principles. This same impulse had produced numerous radical sects, but the especially attractive claim of the Rosicrucians was their call for a reform of all society to bring it a unified ideology based on a true, irenic (peaceful) religious movement, and a scientific and technological enlightenment.

Many of the Rosicrucian ideas and mode of expression are chemical in nature, clearly evident in Johan Valentin Andreae’s (1586–1654) *Chemical Wedding of Christian Rosencreutz* (1616; *Chymische Hochzeit Christiani Rosencreutz*) and blended readily with Hermetic philosophy and religion in treatises like the *Secretioris Philosophiae Consideratio Brevis* (1615; Brief consideration of the very secret philosophy) of Philip a Gabella (a pseudonym, possibly for Raphael Eglinus or Johannes Rhenanus), which was largely extracted from works by John Dee, Sendivogius (1556–1636), and other Paracelsian writers. The Rosicrucians’ calls for a refounding of society along radical Calvinist and natural philosophical lines struck a chord with a broad audience, piquing the curiosity of the Danish physician Ole Worm (1588–1654) and the Englishman Robert Fludd (1574–1637), a contemporary of William Harvey (1578–1657) and fellow member of London’s elite Royal College of Physicians. Men such as these sought further information about the brotherhood or, in the case of Fludd, promoted its aims through his own Hermetic publications and correspondence.

Soon, too, a number of condemnations arose, penned by those fearful that the Rosicrucians presented a real threat to the status quo, or merely

convinced that they were yet another heretical sect bent on contributing to Europe’s disquiet in the tumultuous years leading up to the Thirty Years’ War (1618–1648). Chief among these from the scientific community was Andreas Libavius (1560–1616), who attacked the Rosicrucians as heretics and proponents of false, Paracelsian chemical philosophy. But theological censure was particularly energetic, coming from all orthodoxies. A well-known episode, the “Rosicrucian furor” that erupted in Paris after the discovery of publicly posted Rosicrucian placards in the summer of 1623, is now known to have been the work of a cabal of French Jesuits, who sought to link dissident, free-thinking libertines with Hermetic and Rosicrucian heresies of the sort promoted by Rudolph Goclenius, Jr. (1547–1628), painting them as the dangerous devil-spawn of Lutheranism.

Efforts to see in the Rosicrucians a specific political movement centered on the Calvinist Palatinate aiming to wrest the kingdom of Bohemia from the Catholic Holy Roman emperor have now been discredited, as it is evident that the main actors were not in Heidelberg, but in other courts. The question of the Rosicrucians’ contribution to the development of modern science is still unresolved. While the Hermetic and Calvinist ideas they promoted encouraged the development and deployment of technology for social betterment, an idea taken up and publicized by Francis Bacon (1561–1626), the historical connections remain to be clarified. Likewise, their ideas on the importance of fathoming the divine mind by empirical study of creation and experimentation with natural processes must be discerned from contemporary attitudes among Lutherans and other denominations. Yet it is undeniable that many of the champions of scientific reform, particularly the influential Hartlib Circle (a group of scientists and philosophers that formed around Samuel Hartlib [1640–1656]) and its Continental correspondents were keenly interested in finding and studying the Rosicrucian tracts. Continuity between the seventeenth-century Rosicrucians and the eighteenth-century Freemasons and modern Rosicrucianism has been adduced, but the historical connections have not been convincingly teased out.

JOLE SHACKELFORD

ROUSSEAU, JEAN-JACQUES (1712–1778), French philosopher and writer. Rousseau is widely viewed as the greatest social, political, and pedagogical philosopher of the French Enlightenment. He gives education the task of transforming naturally self-loving egoists animated only by their own “particular wills” into polis-loving citizens with a civic “general will” (“the will one has as a citizen”). For Rousseau, the “Great Legislator” (more accurately the great civic educator) must “change the nature of man” by turning self-lovers into “Spartan mothers” (who ask not whether their own sons have survived battles but whether the “general good” of the city still lives). Rousseau also insists that education, however “denaturing,” must finally produce autonomous adults who can ultimately say to their teachers (with Émile), “I have decided to be what you made me” (Foxley translation, p. 435).

Jean-Jacques Rousseau was born in the Calvinist stronghold of Geneva on 28 June 1712, the second son of the watchmaker Isaac Rousseau and his wife Susan; both were “citizens” of Geneva, and Rousseau styled himself *citoyen de Genève* until his final renunciation of citizenship in 1764. Rous-

seau’s mother died ten days after his birth. With his father the child read (and then perpetually cherished) *Plutarch’s Lives* of the greatest Greeks and Romans. Later he was brought up by a puritanical aunt who (he admitted in the *Confessions*) did much to warp his sexuality. In 1722 Isaac Rousseau fled Geneva after a quarrel, and the ill-educated Jean-Jacques had to be apprenticed, first to a notary, then to an engraver.

In March 1728 Rousseau missed the Genevan city curfew, found himself locked outside the gates, and wandered on foot to Annecy in Savoy, where he was taken in by Mme de Warens, who became his protector and then (1733–1740) his lover. In the provincial salon of Mme de Warens (“Les Charmettes”), Rousseau acquired the education he had lacked in Geneva (Plutarch apart). One gets some sense of his autodidactic passion from his poem, “Le Verger des Charmettes,” in which he declares his debt to Gottfried Wilhelm von Leibniz, Nicholas de Malebranche, Isaac Newton, and John Locke.

Mme de Warens, who specialized in finding Catholic converts, sent the young Rousseau to Turin, where he renounced his inherited Calvinism and converted to the Roman Church; he even briefly attended a seminary for priests, until a Catholic ecclesiastic attempted to seduce him. Returning to Les Charmettes, he lived with de Warens (“Maman”), completed his education, and undertook his earliest writings, including the remarkable *Chronologie universelle* (c. 1737), with its eloquent praise of Fénelon’s charitable moral universalism.

In 1740 Rousseau began to serve as a tutor, moving north to Lyon and living in the house of M. de Mably, whose children he instructed. However, in Lyon he met M. de Mably’s two elder brothers, Étienne Bonnot (later the Abbé de Condillac, with Voltaire the greatest “Lockean” in post-Regency France) and the Abbé de Mably. This was the beginning of Rousseau’s connection to the Paris philosophes, with whom he would later have a love-hate relationship. At this same time Rousseau became a considerable composer, music theorist, and copyist; in later years he would represent himself as a simple Swiss republican who earned a living as a musical craftsman.

In 1742 Rousseau moved definitively northward to Paris, carrying with him a new system of musical notation, a comedy, an opera, and a collection of poems. In Paris Rousseau eked out a precarious living by tutoring, writing, and copying music; for a brief period (1743–1744) he served, not very happily, as secretary to the French ambassador in Venice—an interlude that he described in his later *Lettres écrites de la montagne* (1764). He also met and befriended Denis Diderot, soon-to-be editor of the great *Encyclopédie*, who would ultimately commission Rousseau's first great writing on civic "general will," the *Économie politique* of 1755.

It was while visiting Diderot in prison (for alleged impiety) in 1749 that Rousseau decided to write an essay for a prize competition sponsored by the Académie de Dijon, dealing with the question whether morals had been harmed or advanced by the rebirth (renaissance) of the arts and sciences. Rousseau won the prize with *Discours sur les sciences et les arts* (Discourse on the arts and sciences), the so-called First Discourse, in which he defended Spartan-Roman civic *généralité* against the Athenian literary "tyranny" of poets and orators. The *Discourse* made his European reputation, even attracting the criticism of the king of Poland, and from this period forward Rousseau was a leading citizen, however reluctantly, of the *République des lettres* (as Voltaire maliciously reminded him).

In 1752 his opera, *Le devin du village* (The village soothsayer), was performed at the court of Louis XV at Versailles; at roughly the same time his black comedy *Narcissus, the Lover of Himself* was given in Paris at the Theatre français. As a good *citoyen de Genève*, Rousseau refused a royal pension, continuing his republican self-support as a musician by publishing *La lettre sur la musique française* (Letter on French music) in 1753, which, with its strong defense of Italian simplicity against French elaborateness, led to a collision with Jean-Baptiste Rameau, the greatest French composer of the day.

Rousseau's *Discours sur l'origine et les fondements de l'inégalité parmi les hommes* (Discourse on the origins of inequality among men) was completed in May 1754. The most radical of his works, this so-called Second Discourse urges that existing government is a kind of confidence trick on the part of the rich, who persuade the poor that it is univer-

sally and equally advantageous to be subjected to law and to political order. In June 1754 Rousseau left Paris for a visit to his native Geneva, where he reconverted to Calvinism and had his civic rights restored and where, in 1755, he published his *Inégalité* and the *Économie politique* (the Third Discourse). In 1756 he moved to the countryside, taking up residence at l'Hermitage, the country seat of Mme d'Épinay (inspiring Diderot's sarcastic epigram, "a fine citizen a hermit is"), a move that marked the start of the weakening of Rousseau's ties to the philosophes—a process accelerated by his 1758 *Lettre à d'Alembert*, which opposed the latter's scheme to found a theater in Geneva. (Platolike, Rousseau urged that such a theater would be inimical to civic virtue and good morals and that Molière's *Misanthrope* would have a deleterious effect.)

In 1758, too, Rousseau began *L'état de guerre* (The state of war), his most brilliant and scathing critique of Thomas Hobbes and Hobbism. Taking over observations first made by René Descartes and Gottfried Wilhelm von Leibniz (*Essais de théodicée*, 1710), Rousseau insists that Hobbes has simply mistaken badly socialized, ill-educated Englishmen for "natural" men, leading to Hobbesian unquestionable "sovereignty" as the only antidote to rapacious appetite: Looking out his London window, Hobbes "thinks that he has seen the natural man," but he has really only viewed "a bourgeois of London or Paris." Hobbes, for Rousseau, has simply inverted cause and effect, mistaking a bad effect for "natural" depravity.

In the late 1750s Rousseau labored on (but never published) the *Lettres morales* (for Sophie d'Houdetot) and then produced his vast epistolary novel, *Julie, ou la Nouvelle Héloïse* (published 1761), with its celebrated account of a small ideal society, Clarens, superintended by the godlike, all-seeing M. de Wolmar. The novel was a runaway best-seller, the greatest literary success since Fénelon's *Telemachus, Son of Ulysses* in 1699.

In May 1762 Rousseau brought out two of his greatest but most ill-fated works: *Du contrat social* (The social contract) and *Émile, ou Traité de l'éducation* (both focusing on transformative, "denaturing" education). Both were condemned and publicly burned in Paris at the behest of Arch-

bishop Christophe de Beaumont (and with the acquiescence of the Parlement of Paris); Rousseau, under order of arrest, fled to Geneva (only to find the same works condemned and burned there). Against charges of impiety leveled by the Genevan public prosecutor—alleging the danger of Rousseau’s “natural” theology in *Émile*’s “Profession of Faith of the Savoyard Vicar”—Rousseau composed and published his trenchant *Lettres de montagne* (Letters written from the mountain), in which he defended ancient “civic” religion and insisted that Christianity produces good men whose other-worldliness makes them “bad citizens.” This of course only increased the furor against him, and he took refuge in the Prussian enclave of Neuchâtel (Switzerland). Renouncing his Genevan citizenship definitively, Rousseau occupied himself by writing a constitution for recently liberated Corsica; increasingly threatened, his paranoia aggravated by genuine danger, Rousseau accepted the offer of British refuge from David Hume, although he soon came to see the benevolent Scot as part of the “league of malignant enemies” bent on his destruction. After an unhappy period in England, Rousseau returned incognito to France, living under the assumed name of Renou. While living under this name, Rousseau finally married his longtime companion, Thérèse Levasseur, by whom he had fathered—if the *Confessions* are to be believed—five children, all supposedly abandoned in a foundling hospital.

The *Confessions* themselves increasingly occupied Rousseau’s time, and he often read substantial fragments of this work in progress in sympathetic aristocratic salons. In 1772 he produced the remarkable *Gouvernement de Pologne* as part of an effort to avert partition by Prussia, Austria, and Russia; the book combines intelligent constitutional reforms with Rousseau’s most glowing account of Spartan and Roman-republican civic virtue. In the same year he wrote (without publishing) the brilliantly innovative *Rousseau juge de Jean-Jacques*, in which he bifurcated himself and had one half comment on the other half—schizophrenia turned into a literary genre.

In 1777 Rousseau wrote his last great confessional work, *Réveries d’un promeneur solitaire* (The reveries of a solitary walker), which begins with the celebrated words, “Here I am, then, alone on the Earth, no longer having any brother, or neighbor,

or friend, or society except myself.” A year later, while in refuge on an aristocratic estate at Ermenonville (north of Paris) and while engaging in his beloved botanical studies, Rousseau died quite suddenly on 2 July 1778. He was originally buried in a quasi-Roman sarcophagus on the Isle of Poplars at Ermenonville, but at the height of the French Revolution his ashes were translated, in a dramatic torchlight procession, to the Pantheon in Paris and placed next to the remains of his nemesis Voltaire (1794).

ROYAL TOUCH. See *Ritual, Civic and Royal*.

RUBENS, PETER PAUL (1577–1640), Flemish painter. Peter Paul Rubens became the most influential northern artist in seventeenth-century Europe. His prolific production included religious, historical, and mythological paintings as well as landscapes and portraits. In his idealized figural paintings Rubens brought the artistic traditions of the Netherlands, early modern Italy, and classical antiquity into an unprecedented harmonious synthesis.

BIOGRAPHY AND DEVELOPMENT

Rubens received his professional training in Antwerp, the art center of northern Europe, where his most influential teacher was the learned Otto van Veen. Stylistically, Rubens's works before about 1600 resemble his generalized forms. From 1600 to 1608 Rubens lived in Italy, where the stylistic diversity of his production testifies to his intense viewing of classical remains and works by Renaissance and contemporary artists (for example, Michelangelo and Titian, Caravaggio and Annibale Carracci). He also successfully pursued a professional career, working as court painter to the duke of Mantua, but also portraying nobility in Genoa and painting altarpieces in Rome (such as the prestigious commission for Sta. Maria in Valicella).

In 1608 Rubens hurried back to Antwerp at the belated news of his mother's fatal illness. He remained there, living in a splendid house that accommodated a large library, extensive art collection, and a spacious studio. Stylistically, Rubens shifted to a less individualized technique with smooth surfaces, clear contours, and local colors. This style looked more traditional to local patrons and also proved accessible to the studio assistants who helped with the execution of various paintings. With studio help Rubens carried out extensive commissions as court painter to the regents of the Southern Netherlands, Archduke Albert and Archduchess Isabella, and for other patrons in the Southern Netherlands, Spain, France, England, Germany, and Italy. An allegory about Europe's plight, *The Horrors of War* (1638; Florence, Pitti Museum), exemplifies how Rubens increasingly loosened his paint technique, which

Peter Paul Rubens. *The Miracle of Saint Ignatius Loyola*, oil sketch. This sketch served as a compositional model for the finished work, shown on p. 271. ©ERICH LESSING/ART RESOURCE, N.Y.

enabled him to suggest optical effects of soft light and atmospheric conditions.

During his last decade Rubens resided half of each year at his country house. There he painted more landscapes, such as the panoramic, light-filled *Landscape with Château Steen*, based on his own estate (circa 1631; London, National Gallery).

WORKING METHOD

The artist rightly regarded an ability to work on a huge scale as his special talent. "I confess I am by natural instinct better fitted to execute very large works than small curiosities" (letter, 13 September 1621). Yet despite this preference for a life-size or larger scale, Rubens believed in correlating subject matter with size. "As for the subject, it would be best to choose it according to the size of the picture" (letter, 25 July 1637).

The sensual impact of huge rippling forms and coloristic richness camouflages the intellectual component in works by this exceptionally erudite artist, who was respected as an equal by other scholars. Rubens's learning and intelligence are especially evident in his choice and interpretation of literary subjects for paintings, tapestries, and the title pages he designed in his free time for the Plantin-Moretus publishing house in exchange for books.

Rubens's deep familiarity with classical literature is matched by his intimate knowledge of classical art. Quotations from classical authors fit seamlessly into the content of letters written in Italian, French, or Flemish, and probably no other artist so frequently quoted or paraphrased figures from classical and early modern art, subtly using the associations that clung to the borrowing to amplify the meanings of his own works.

Some paintings are entirely autograph, such as *Pelzchen* (The fur coat; circa 1638; Vienna, Kunsthistorisches Museum), which portrays his young second wife as Venus. By contrast, pupils and assistants executed all or part of many large-scale paintings (for example, Medici cycle, circa 1622–1625; Louvre, Paris, originally Luxembourg Palace). For practical reasons, and to raise the status of his profession, Rubens organized his workshop to separate invention from much of the manual execution. He planned works by making compositional drawings and studies from the model, but also, untraditionally, through oil sketches on oak panels. The oil sketches served as both compositional models for assistants and colorful demonstration pieces for patrons. No previous artist had given such sketches a large role in the working process. Rubens often retouched finished paintings so that weaker execution by studio assistants did not spoil his invention, for example, in *The Miracles of St. Ignatius* (1617–1618; Vienna, Kunsthistorisches Museum). Both sketch and altarpiece originally hung in St. Charles Borromeo, the new Jesuit church in Antwerp. Although Rubens never worked as a sculptor, he furnished designs for sculptures, such as the reliefs on the facade of St. Charles Borromeo. Victory-like angels transform its doorway into a triumphal arch through which one originally entered an interior whose decoration included thirty-nine ceiling paintings by Rubens and his studio as well as two altarpieces in sculptural frames of Rubens's own de-

sign. The ensemble exemplified his persuasiveness as a propagandist for the Roman Catholic Church.

For economic and perhaps aesthetic reasons Rubens also worked extensively with collaborators who painted the landscapes and still-life portions in various works, such as the eagle in *Prometheus* (finished by 1618; Philadelphia Museum of Art) by the animal specialist Frans Snyders. When painting figures in landscapes and interiors by Jan Bruegel the Elder, however, Rubens adjusted his sweeping style to his older friend's miniaturized, delicate approach (as in *The Earthly Paradise*, circa 1625; The Hague, Mauritshuis).

Printmakers, among them Lucas Vorsterman, also played an important role because prints made after the paintings circulated Rubens's "inventions" through and beyond Europe.

SOCIAL HONORS

Ennobled in 1624 for his artistic achievements, Rubens received knighthood in 1630 from Charles I of England and in 1631 from Philip IV of Spain. Although he had carried out extensive commissions for both kings (ceiling paintings in Whitehall Banqueting House, London, circa 1629–1634; series for a hunting lodge, Torre de la Parada, circa 1636–1638, now in Madrid, Prado), they knighted Rubens explicitly for his political activity as a diplomat who worked to promote peace in Europe.

RUDOLF II (HOLY ROMAN EMPIRE) (1552–1612; ruled 1576–1612), Holy Roman emperor and Habsburg monarch. Rudolf II was a controversial figure during his lifetime and has remained one for historians since. He has many claims to fame and infamy. His political and religious policies led to his ouster as ruler by members of his own family and contributed to the outbreak of the Thirty Years' War (1618–1648), one of the most destructive wars in European history. He became a believer in and practitioner of the occult, promoting alchemy, pursuing research into the Cabala, and seeking truth in various mysteries and superstitions. And he was one of the great patrons of the arts and letters, financing the work of scientists such as Tycho Brahe (1546–1601) and Johannes Kepler (1571–1630), commissioning artists and engravers of remarkable skill, and collecting fine works throughout Europe.

Rudolf possessed an unstable personality and suffered serious physical and psychological upheavals in 1578–1580 and 1599–1600. In response to the latter, Rudolf retreated to his castle in Prague and became somewhat of a recluse, focusing his attention on the occult. In some ways his breakdowns and his internal struggles can be attributed to the two heavy burdens that tormented his reign—the increasingly divisive struggle between Catholics and Protestants and the threat to his lands posed by the Ottoman Empire.

Regarding the first, Rudolf and his brothers were educated at the leading Roman Catholic center of power in Europe, the court of Philip II (ruled 1556–1598) of Spain, who was the cousin of their father, Emperor Maximilian II (ruled 1564–1576). In Spain they observed the implementation of Philip's belief that political and social strength can only come through religious conformity—in this case Catholicism—and likewise observed the destructive impact sectarian violence could have in the war in the Netherlands. Their father, unlike Philip, was perfectly willing to tolerate Protestantism, and some historians have argued that he was in fact a closet Lutheran. By the time Maximilian died, a majority of Habsburg subjects had adopted Lutheranism, and some had converted to Calvinism or one of the other Protestant movements. Likewise the

Estates of most of the Habsburg lands had become strongholds of Protestantism.

Scholars have argued that, given his upbringing, Rudolf believed it his task to restore Catholicism to his patrimony. He invited the Jesuits into his lands, and they worked hard to reconvert Protestants. That action got him into trouble with the Protestant Estates. In 1606 the Estates of Hungary, Austria, and Moravia voted to turn him out and recognized his brother, Matthias (ruled 1612–1619), as ruler. That in turn prompted Rudolf to issue in 1609 what became the famous Letter of Majesty to the Estates of Bohemia, promising them religious toleration if they would retain him as sovereign. That did not work, and just before Rudolf's death in 1612 the Bohemian Estates themselves recognized Matthias. The perceived infringement of the Letter of Majesty in 1618 inspired the Bohemian Estates to reject Habsburg rule altogether and to engage in those events that precipitated the Thirty Years' War.

Rudolf's foremost biographer, R. J. W. Evans, has argued that Rudolf's religious beliefs were by no means so solid. In fact he did not like Catholicism because of the power of its clergy, and he particularly distrusted the papacy. Yet he also had no affinity for Protestants because of their tendency to divide endlessly into sects and squabbles. In the end he was uncertain about religion and whether or not it did any good. Evans has argued that in many ways Rudolf reflected doubts about religion found elsewhere in Bohemia and has compared him to his distant successor Joseph II (ruled 1765–1790), who was a tolerant Catholic but suspicious of the church. Rudolf's doubts about religion encouraged his forays into the occult and the mysterious in hopes of finding a different truth that underlay life. Thus the Catholic-Protestant divide deepened not because of his actions but because of his inability to take action.

Rudolf's other deep concern was the threat from the Turks. In large part because of that threat, Rudolf moved the capital of the Habsburg lands from Vienna to Prague, which became under his aegis a cultural capital of Europe. Brahe and Kepler did their work there, and Rudolf employed many of Europe's brilliant architects and artists there. He brought much art to the city. His wars with the

Turks lasted until 1606, ending with the Treaty of Sitvatorok, an obscure treaty but the first in which the Turks acknowledged the Habsburgs as their equals in international diplomacy. By that time the radicalizing of the Catholic-Protestant split, Rudolf's seclusion, the growing opposition to him among the Estates, and the discontent of his family members had created an atmosphere that would no longer tolerate him as ruler. Stripped of power, Rudolf died in 1612.

RURAL LIFE. *See* Agriculture; Peasantry; Villages.

RUSSIA. Russia emerged as a state at the end of the fifteenth century on the northeastern periphery of Europe, with a thin population spread over the forest belt of the east European plain. Never having seen either feudalism or serfdom, its society was different from that of western Europe. Its Christianity came from Byzantium, which further set it apart from its western neighbors. During the sixteenth to eighteenth century Russian society changed rapidly, with the appearance of serfdom, economic growth, and expansion south into the steppe and east to Siberia. The Russian state grew in size and sophistication, especially after the reign of Peter I the Great (ruled 1682–1725). Peter inaugurated a vast cultural revolution, bringing European secular culture to Russia and thus including Russia in the circle of European civilization.

GROWTH OF THE STATE

The core of the Russian state was the Moscow principality, which gained control of the original Russian ethnographic territory with the annexation of Novgorod (1478), Pskov (1510), and other neighboring regions. Essentially a household state managed by a few secretaries and the boyar elite, the Russian state began to acquire the trappings of state administration in the reign of Ivan IV, “the Terrible” (ruled 1533–1584). The growth of the state in the center was not matched by a corresponding development in local administration. The abolition of “feeding,” direct payments in kind from local areas to provincial governors, occurred in the 1540s. From then on the treasury paid local officials, but tax collection remained largely in the purview of the local communities, which collected the dues as a service to the crown. Thus the grand claims of the tsars to autocracy met very sharp limits in the small size and limited competence of administration, especially local administration.

In the seventeenth century the central apparatus grew swiftly, reaching some two thousand officials and scribes by the 1680s. Again provincial administration lagged behind, with huge areas managed only by a governor with a staff of some five to ten clerks and scribes and little or no armed force. Even the cadastres that registered landholdings and tax obligations of the rural population were compiled almost entirely on the bases of the village communities' own reports of their population and holdings. These cadastres allowed the state to collect an annual tax on peasant households, mainly to support the army. The collections were also in the hands of the village communities, which meant that collection was slow and often in arrears. The state did have some more effective tools for raising revenue, such as the sales tax and the vodka monopoly. Older systems persisted, such as the expectations that musketeers would live partly from trade and handicrafts and that the gentry cavalry would live from their estates, both serving in the military only during the summer months. These methods were enough to ensure Russia success in some wars and expansion to the south and east. At the same time the state had little effective control over the countryside. Confronted with popular unrest, as in 1604–1605, 1648–1650, and 1671–1672 (the great Cossack revolt of Stepan Razin), the tsar could do little more

Russia. This map, which appeared in editions of Abraham Ortelius’s *Theatrum Orbis Terrarum* from 1570 to 1612, was based on a lost map by the Englishman Anthony Jenkinson, an agent of the Muscovy Company who traveled in Russia from 1557 to 1660. At that time Ivan IV (the Terrible) was gradually expanding Russian territory and had recently seized the southern Volga regions of Kazan and Astrakhan, providing Russia with access to the Caspian Sea. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

than call out the army and hope that it could restore order.

Administrative reform. Ultimately, the existing forms proved inadequate in the face of the larger aims of Peter the Great. Peter transformed the Russian state. After several experiments, he established the Senate to coordinate government and take the routine tasks away from the tsar, eleven colleges or ministries headed by a committee for central administration, a reorganized local administration, and the Table of Ranks (1722) to regulate promotions and status in the army and civil service. His army was a permanent body, living in barracks and ready to

fight at any time of the year. He shifted the burden of taxes further onto the peasantry by the introduction of the “soul tax,” levied on individuals, not households. He attempted to increase the size and effectiveness of provincial administration, but here he was less successful. Some of his measures in this area had to be rescinded as too complex and expensive.

Catherine II the Great (ruled 1762–1796) and her son Paul I (ruled 1796–1801) continued the reordering of the state along European lines. Catherine redrew internal boundaries into more easily administered provinces, increasing the size and ra-

tionalizing the structure of provincial governments. She also introduced modest participation by the gentry into the judicial system, as well as similar forms of participation in the courts for the urban elites. Her Charter to the Nobility (1785) specified the rights and obligations of the gentry, for the first time introducing such formulations into Russian legislation. The outcome was a great increase in efficiency in the provinces, but the neglect of the central administration. Her son Paul recentralized government in the 1790s. Both reigns prepared the way for a more modern central state after 1801. The result was a relatively modern government in St. Petersburg, still resting on thin foundations in the provinces. If to a lesser extent than in the sixteenth century, the autocracy of the tsars still meant grand claims and more limited reality. Society was only in part subject to state direction.

SOCIAL STRUCTURE AND ECONOMY

For the whole of the early modern period Russia remained an agrarian society. In the sixteenth century Russian peasants inhabited settlements often of two to four small households, widely scattered along the rivers and lakes of the central and northern forest zones. While the peasants of the center and northwest cultivated grain and raised livestock in modest quantities, northern peasants derived most of their livelihood from hunting and selling furs and obtaining other forest products as well as preparing salt from saline springs. The life of the Russian peasantry changed fundamentally at the end of the sixteenth century with the appearance of serfdom. Unfortunately little is known about the process and causes of enserfment. The law regulated only peasant movement, at first allowing landlords to bring back peasants who left the estates within five years, but by 1649 allowing them to do so in perpetuity. The restrictions on peasant mobility, though difficult to enforce in practice, corresponded to the state's need for a stable tax base and populated land to reward the gentry cavalrymen.

By the mid-seventeenth century a bit over half of the Russian peasants were serfs of secular landlords, about a fifth serfs of the monasteries and bishops, and another fifth, concentrated in the north, the Urals, the Volga region, Siberia, and the southern border, remained free and normally without gentry or ecclesiastical landlords. The north

prospered in these years, especially as the increasing trade with Holland and England opened new markets for furs and other forest products and the expansion of population in Russia itself meant a growing market for salt. The population of Russia grew rapidly after recovery from the Time of Troubles (1598–1613), reaching about eleven million by the 1670s. Much of the increase came from colonization of new land in the south and the Volga region.

Among the peasants of Russia who were not serfs, nearly half were also non-Russian in ethnicity. The largest groups lived in the middle Volga region, the descendants of the peoples of the Kazan' Tatar khanate. The Muslim Tatars lived in villages around Kazan', while the Bashkir pastoralists occupied the steppe to their southeast toward the southern Urals. To the north, east, and west of these Turkic-speaking peoples were other, smaller Turkic and Finnic groups, animists in religion. All of them paid a tax to the state called *yasak* and were not enserfed. Similarly, the incorporation of the Ukrainian Cossack Hetmanate into Russia as an autonomous unit brought in Ukrainian peasants who were legally free (mainly as Cossacks), and more than half of whom also owned their own land.

Among peasants and townspeople, households were small, comprising the nuclear family and occasionally a relative. Better-off townspeople and northern peasants might have a servant or two in addition, while the nobles maintained large staffs of house servants, artisans, and stewards. Some of the latter were bondsmen in the sixteenth and seventeenth century, a status that merged with serfdom in the early eighteenth century. The greatest aristocrats maintained huge establishments in Moscow, with hundreds of servants as well as a large body of administrators for their vast estates. Toward the very end of the seventeenth century the aristocrats began to build the first country houses, mostly within a few hours' ride of Moscow.

The ruling elite of Russia was organized in a system of court and military ranks, at the top being the Duma ranks—boyar; *okol'nichii*, a sort of junior boyar; Duma gentleman; and Duma secretary—in all about a hundred men from some two hundred families by 1600. They formed the pinnacle of the sovereign's court, and in turn the core of the Moscow ranked gentry. Below them were the provincial

gentry, organized for purposes of military service around provincial towns or forts, more or less coinciding with residence and landholding patterns. Men with Duma ranks, especially the two highest, held all important household positions at the court, military commands, and provincial governorships, and in the seventeenth century also headed almost all chanceries (*prikazy*). Immensely wealthy, the boyars also provided the inner circle of advisers, formally through the Duma or tsar’s council and informally as friends or favorites of the tsar. Other than the tsar’s relatives by marriage, powerful men from outside this circle were extremely rare.

In elite families women were secluded in separate parts of the houses and did not join in the all-

male banquets that were the staple of elite socialization. Women of all classes were expected to dress modestly, in the voluminous traditional Russian clothing and with their hair covered, and to obey fathers and husbands. But women also owned and managed property, including tax obligations to the state. This was particularly true of the mothers and wives of the gentry, whose men were often away with the army every summer for years in a row. In merchant families the men traveled to distant markets while the women stayed home and ran the business as well as the household.

Social control. The inability of the state to regulate social life to the extent of Western societies placed a premium on various forms of communal solidarity.

Russia. First published in Abraham Ortelius’s *Theatrum Orbis Terrarum* in 1570, this map of “Tartary or the Land of the Great Khan” shows Siberia, China, and Japan, as well as the unexplored northwest coast of America. The Great Khan is shown in the upper left corner, seated in front of his splendid tent. Often considered the earliest printed map of Siberia, this is also one of the first depictions of the Strait of Anian between Siberia and North America. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

The urban and peasant communities collected taxes themselves and judged many petty crimes and civil disputes. The absence of any police or military force over large areas meant that even serious crimes (murder, rape, banditry) were often left to local communities, rather than to state authorities as required by law. The local communities had a conception of what sort of actions by administrators were incorrect and petitioned the tsar or revolted if these were violated. Sometimes state and community norms coincided. Many disputes over slander, verbal arguments, and insults were settled in state courts as disputes over honor. Everyone in the Russian state, even slaves and serfs, had honor, and an insult to that honor was punished by fines or, if the victim was higher in rank, by beating, prison, or various rituals of humiliation. Repeated violations of the community and state norms of honor put the offender outside the protection of his neighbors, as did witchcraft (the majority of accused witches were male).

RELIGION AND CULTURE

Until the very end of the seventeenth century, culture in Russia was essentially equivalent to religion. Though the predecessors of the Russian princes had received Orthodox Christianity from Byzantium, Russia did not inherit the secular culture of Byzantium, with its ancient Greek classics. The language of the church was not Greek but Church Slavonic, a dialect of early medieval Bulgaria. Thus the religious literature of Russia had its foundation in Slavonic translations of the church fathers and some later Byzantine theological and devotional literature.

Until 1448 the Orthodox church in Russia was under the jurisdiction of the patriarch of Constantinople, who appointed the metropolitan of Kiev and later of Moscow. Most of the metropolitans were thus Greeks or southern Slavs, and the Moscow princes had little say in their appointment. At the council of Ferrara-Florence (1438–1445), however, the Greek metropolitan of Moscow, Isidoros, went over to Rome, and the Russian church and the Moscow prince deposed him, appointing the Russian Iona in his place. The Orthodox church thus became in fact autocephalous. Even after the restoration of Orthodoxy in Constantinople, the Russians continued to select their own metropolitan.

Conflicts between the princes and tsars and the metropolitans were inevitable, especially as the tsars tried to increase their power over the church in the course of the centuries. If Metropolitan Makarii was an ally to Ivan the Terrible, his successors were expected to obey, and Metropolitan Filipp was murdered for opposing Ivan in 1569. The elevation of the metropolitan to the rank of patriarch by the Greeks in 1589 regularized Russia's relations with the Greek church, but the new patriarch, Iov, was very much the tsar's man.

Structurally the church in Russia differed in some ways from the Byzantine model. In place of the many small eparchies in the former Byzantium, the sees of Russian bishops were very extensive, and bishops were few in number and controlled little landed wealth, except for the metropolitan (later patriarch) of Moscow. The monasteries, in contrast, were as great and wealthy as those of the Greeks, if not more so. Collectively they were the lord of at least a fifth of the peasantry, more in central Russia. They were also the spiritual centers of Orthodoxy, producing almost all the saints and the devotional literature, original and translated from Greek. Only the metropolitan of Moscow himself, and to some extent the archbishop of Novgorod, had comparable spiritual authority and power at the start of the sixteenth century.

Laymen came to the monasteries for occasional spiritual advice, but also for pilgrimages to the burial places of holy monks and saints. They came for cures at the many shrines, both relics of saints and miracle-working icons. The elite and the provincial gentry tried to bury their dead in the monastery cemeteries and pay for liturgies for the dead. Particular monasteries became the objects of charity of particular clans and families, who endowed them with land, money, and valuable vestments, books, and even whole churches. Most larger monasteries enjoyed valuable immunities from taxation as well as from local judges and administrators. The parish clergy of the sixteenth century largely served churches created by private foundations and were subject to the founders' jurisdiction. They lived poorly on small parcels of land or meager income from services and gifts from parishioners. The clergy was not yet a hereditary caste, though most parish clergy were of humble origin, while monks were usually lesser gentry landholders. The ruling elite

almost never entered monastic life voluntarily, though they gave generously to support it and buried their dead at the great monasteries.

Religious life for the laity in the sixteenth century revolved around the celebration of the liturgy in daily life, observation of the many fasts, and processions and pilgrimages to local shrines and monasteries. Preaching was virtually nonexistent, and the spiritual and moral direction came mainly from the clergy as spiritual fathers of laymen, each parish priest and sometimes monks taking on a group of families to follow through life.

Reform within the church. In the seventeenth century the Orthodox church saw many changes. The increasing influence of Kiev and the Ukrainian church under Polish rule played a major role. The Orthodox church in Kiev retained its dogmatic beliefs but also began to present them in the neo-Scholastic forms of Catholic theology. The basis of learning was no longer the fathers but Latin grammar and the Jesuit curriculum in language and philosophy. Preaching became a prominent part of religious life, while miracle cults and shrines were secondary and mainly served the purpose of confessional propaganda. Simultaneously in Russia reformers among the parish clergy called for greater propagation of Orthodox teaching and stronger discipline, coming to influence Tsar Alexis I (ruled 1645–1676) on these matters. In 1649 the tsar invited the first of a series of Kiev-trained clergy to Moscow to aid in translation of religious texts. They also preached in and around the court, giving a strong impulse to native reformers.

Earlier in the century Patriarch Filaret (d. 1633) had been a powerful figure, dominating his son, Tsar Michael (ruled 1613–1645), as long as he was alive, but his power came more from his position as the tsar's father than from his position in the church hierarchy. In 1652 Nikon, one of the reformers, was selected patriarch by the reformers in the church, with the informal pressure of the tsar. Besides taking a crucial role in secular politics, Nikon introduced liturgical reforms that ultimately caused a schism in the church. He left the office in 1658 over a quarrel with the tsar, a dispute only resolved by his deposition at the council of 1666–1667. The later patriarchs Ioakim (reigned 1674–1690) and Adrian (1690–1700) reinforced the power of the patriar-

chate and the clergy, striving especially hard and largely successfully to remove the parish clergy from the power of gentry church founders and place them under ecclesiastical jurisdiction.

In the later seventeenth century the impulses from Kiev grew stronger every decade, reinforced by the establishment in 1687 of the first real school in Russia, the Slavonic-Greek-Latin Academy in Moscow. Though its teachers were Greeks, they were Italian-educated and relied exclusively on Jesuit textbooks. These changes in the church, supported by the increasing flow of secular texts from the west, especially from Poland, changed the culture of the court and ruling elite, taking them away from traditional Orthodoxy with its monastic orientation toward a lay religion that included a much stronger moral element as well as some elements of secular culture. Greater changes were ahead.

Cultural change and secularization. These changes came from Peter the Great, who vastly accelerated the pace and scope of change. Culturally, his reign was a revolution. He sent young noblemen abroad to study languages, mathematics, and other subjects. He ordered the printing presses to produce a long series of texts basic to secular culture, elementary reading texts, introductions to history, architecture, mathematics, geography, and military sciences. He reoriented the ritual of the court away from the pilgrimages and virtually daily attendance at liturgy to secular celebrations of great victories and name-days and birthdays of the tsar's family and favorites. His new city of St. Petersburg was a port city with European-style architecture and only one monastery, in contrast to the dozens in and around Moscow. By the end of his reign the basic ideas of European politics, art, and learning were available in textbooks translated into Russian. In thirty-six years, the old exclusively religious culture came to an end.

The church also changed rapidly in Peter's time. At the death of Patriarch Adrian Peter appointed a Ukrainian, Stefan Iavorskii, as *locum tenens* of the patriarchate. Throughout his reign he preferred Ukrainians to Russians as bishops, a practice that continued until the 1760s. Eventually Peter abolished the patriarchate altogether and established in its place the Holy Synod, a board composed of laymen and clergy appointed by the tsar to run the

Russia. A late-eighteenth-century French map of southern European Russia during the reign of Catherine the Great (ruled 1762–1796). Under Catherine, Poland was partitioned, the Crimea was annexed, and vast territories in the south and west were taken from the Ottoman Empire, including Belarus, parts of Ukraine west of the Dnieper River, and the Black Sea shores. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

church. The monasteries came to play a very subordinate role. In the later seventeenth century their revenues had already been placed under state control, and Peter reestablished that policy, hoping to use them as hospitals and schools rather than centers of ascetic spirituality.

BUILDING A MODERN STATE

Peter's political and administrative measures were not as radical, but they nevertheless had major effects. They produced a European style of absolutism in the central government, though still without sufficient apparatus outside the capital. Combined with

victory over Sweden and the acquisition of a Baltic seacoast and new capital, Peter's state-building made Russia a major regional power, and one with a European culture. His successors in the eighteenth century continued to reorder and build the state, maintaining Russia's power as well. In the 1730s Empress Anna (ruled 1730–1740) upheld Russian influence in Poland and retained a foothold on the Black Sea. Russia was an active participant in the Seven Years' War (1756–1763), emerging with no concrete gains but considerable prestige owing to the defeat of Frederick the Great of Prussia. It was Catherine the Great who made Russia a great power

in Europe, with two successful Turkish wars (1768–1774, 1787–1792) and the partitions of Poland (1772, 1793, 1795). These victories moved Russia's borders far to the west, incorporating most of Ukraine, Belarus, and Lithuania and conquering Crimea and the whole of the northern Black Sea coast.

While the years from Peter's death until the middle of the reign of Elizabeth (ruled 1741–1762) were devoted to court intrigues and succession struggles, the 1750s saw the resumption of policies designed to modernize state and society. Under the influence of her favorite, Count Ivan Ivanovich Shuvalov, Elizabeth founded Russia's first university in Moscow (1755) and encouraged other cultural projects, such as Russian-language theater at court. Other measures included fostering trade and industry, the abolition of internal tolls, and other economic projects. Plans to free the nobility from obligatory military service and to confiscate monastery lands came to fruition only after Elizabeth's death.

Catherine's reign saw more extensive political projects in the Legislative Commission (1767) and reorganization of provincial as well as central administration. These measures included a certain element of participation by the nobility and urban elites, as well as the delineation of their rights and privileges in law. By the end of her reign the issue of serfdom arose, most sharply in the work of Aleksandr Radishchev, who condemned the institution on moral and economic grounds. Catherine herself was by then alarmed at the French Revolution and sent Radishchev to prison, but his ideas, like her own measures, were typical products of the European Enlightenment.

RUSSIAN CULTURE IN THE AGE OF ENLIGHTENMENT

The Enlightenment was the first European current of thought to be fully received in Russia. Peter's cultural revolution had laid a foundation not only by example but through new institutions as well. His plan for an Academy of Sciences was realized in 1725, after his death. The academy brought scientists and scholars of European reputation to St. Petersburg, where they not only pursued their researches but also taught Russian students. The Noble Cadet Corps, based on the European noble

academies, came into being in 1731, teaching young noblemen a curriculum that emphasized modern languages, law, history, and the sciences as well as proper behavior at court. Few formal schools followed its example, but private tutors among the gentry and private gymnasia supplemented the few state schools. The theater, dramatic and musical, flourished at the court, joined in the 1750s by a Russian-language dramatic theater and even theaters outside the capital. The Academy of Arts (1758) trained Russian painters to supplement the few Western and Western-trained artists already at work. Catherine founded a Society for the Translation of Foreign Books in 1768, which merged into the Academy of Letters in 1783. St. Petersburg evolved into a city of largely baroque and classical architecture, built by Italians and Germans. Even in Moscow and the provinces classical palaces sprang up alongside ancient churches and monasteries in the older Russian styles.

Both within the framework of these institutions and outside of them, Russians absorbed European thought and culture with great speed. Most of the well-known European writers of the time appeared in Russian translation—all of Jean-Jacques Rousseau, for instance, except *Du contrat social* (1762; Social contract), had appeared by 1780. Works that remained untranslated nevertheless circulated widely, since the elite generally knew either German or French by mid-century. Russia contributed little that was original to European culture in the eighteenth century. Its art and literature followed European patterns, as with Aleksandr Petrovich Sumarokov's (1717–1744) tragedies, based on the models of Jean Racine and Voltaire. Even the church followed European patterns, in spite of the turn toward Russian rather than Ukrainian bishops in the 1760s. Earlier in the century the seminaries and other church schools continued the seventeenth-century Jesuit curriculum inherited from Kiev, but gradually other trends emerged. Pietism was a major influence after about 1750, with Johann Arndt's *Vier Bücher vom wahren Christentum* (1605–1609; True christianity) a work widely read, even by such luminaries as St. Tikhon Zadonskii. The great preachers of Catherine's time, such as Metropolitan of Moscow Platon Levshin, followed Lutheran models, preaching a mildly rationalized Christianity and sentimentalizing morality.

Political thought stayed within the framework created elsewhere by Voltaire, Charles-Louis de Secondat de Montesquieu, and others, propounding ideas of enlightened absolutism, aristocratic rights and privileges, and the need to create legal order. Radishchev was unusual in his radicalism in the face of serfdom, but he too borrowed his theoretical arguments from European writers on slavery, such as the abbé de Raynal. The importance of the eighteenth century lay not in original contributions but in the thorough integration of European thought and art into Russian culture.

SOCIAL AND ECONOMIC CHANGES AND IMPERIAL EXPANSION

Underneath the intellectual growth and ferment Russian society moved within the inherited framework of serf agriculture, but some new phenomena emerged. The settlement of the southern steppe with its rich black earth soil continued, especially after the Turkish wars and the defeat of Crimea. The southern steppe zone gradually became an area of great estates worked mainly by labor services, which diminished or disappeared in central Russia. The new ports on the Black Sea gave an outlet to grain from the steppe, while central Russia turned more to market gardening, crafts, and seasonal labor such as transport on the great rivers. The result was a boom for the gentry, who began to build great country houses on their estates, even those far from the cities. Nobles tried to use the latest ideas in European agrarian practices to enhance their incomes. In Peter's reign noblewomen had emerged from seclusion to mix freely with men and women outside the family at home and at court. They retained more property rights and played a larger role in estate management than women farther west. For non-elite women, however, little changed.

The serf peasants of central Russia found themselves neighbors of the "economic peasants" when monastic lands were confiscated in 1764 and put under the College of the Economy. Many of the former monastery villages were great centers of crafts and trade, producing dynasties of wealthy merchants. In these villages and those of great noblemen the crafts began to turn into more modern enterprises. In the Sheremetev villages of Ivanovo and Voznesensk serf entrepreneurs built cotton textile factories and hired their fellow serfs as laborers. The Urals, with more primitive technology but low

costs, became a major iron producer. By the 1760s St. Petersburg was the center of Russian trade in the Baltic, as Peter had hoped, becoming the home of an international business community of Russians, Germans, Swedes, Britons, Dutch, and other commercial peoples. In the Volga area the growing trade with Persia and Central Asia came to a large extent into the hands of the Kazan' Tatars, giving them a new significance in the area and incidentally a leading role among Muslims in Russia. The conquest of the south and the foundation of Odessa in 1794 gave rise to a new port and new trade, dominated by Greeks, Jews, Bulgarians, Poles, and even some Russians, exporting grain to western Europe and trading with the Ottoman Empire. In remote Siberia, the Russian-American Company entered the fur trade in Alaska.

Russia's population grew rapidly, reaching some thirty-six million by 1800, of which only about six million came from territorial annexation. This demographic expansion, which continued into the twentieth century, provided an important stimulus to economic growth and to colonization of the southern steppe as well as eastern regions. If the center and south of Russia prospered, the north went into decline, resulting from the decline of the northern salt industry and the shift of the fur trade ever farther east. The Siberian economy was hampered by low population, but the discovery of silver and gold in the 1720s laid the foundation for a new and increasingly important industry, one largely under state control.

The expansion of the empire brought in new peoples. The nomadic Bashkirs, Kalmyks, and Tatars were now fully inside Russian borders in the south. The partitions of Poland brought most of the Ukrainian people into Russia, as well as Lithuanians and Belarusians. In the vast formerly Polish territories the nobility was almost entirely Polish, and initially Russia maintained Polish local gentry institutions, placing them under Russian governors. The towns in this area were largely Jewish in population, bringing another new people into the Russian orbit. As with the Polish nobility, Russian policy initially preserved preexisting community structures. In the old Ukrainian Hetmanate, the defection of Hetman Ivan Mazepa to Sweden in 1708 led Peter to appoint his own hetman and later abolish the office. Local institutions and laws remained, however, until

the 1780s, when Catherine's reform of provincial administration meant the end of the Hetmanate's remaining autonomy. It also meant the integration of the Cossack nobility into the Russian imperial nobility, reflected in high positions in the army and government. Similarly, the German nobility of the Baltic provinces retained local rights and elected institutions until the 1780s, while Baltic German families played an increasingly central role in St. Petersburg. As many conservative Polish magnates chose to serve the tsars as well after 1796, the Russian ruling elite took on an increasingly multiethnic character, with Germans, Poles, and Ukrainians prominent in all spheres of the government and military services.

At the end of the eighteenth century Catherine's son Paul, frightened by the French Revolution, satisfied his conservative instincts by a re-centralization of government, paradoxically coupled with some restoration of local gentry rights in the Baltic provinces and elsewhere. His eccentric personality, however, led to his assassination on 11 March 1801, ushering in a new century and a return to more liberal measures under his son Alexander I. Russia's society, state, and especially culture changed rapidly in the early modern era, but not enough to erode the basic structures. Those would have to wait for more powerful forces still to come.

PAUL BUSHKOVITCH

RUSSIA, ARCHITECTURE IN.

Construction in old Russia was principally of horizontal logs from trees abundantly available in the forested zones where most Russians lived. Floor plans of log structures were typically combinations of square or rectangular cells, whether the structures were houses, palaces, fortification towers, or churches. In church architecture, carpenters reproduced the two basic plans inherited from Byzantine (Eastern Roman) Christian masonry churches: an extended east-west plan of sanctuary, nave, and narthex, or a centrally oriented plan of a square or octagon of logs, sometimes with extensions built around a central nave. Several open-air museums of

Architecture in Russia. This image is part of a very large and elaborately decorated nine-sheet map of St. Petersburg produced by the Russian Academy of Sciences in 1753. Dedicated to Elizabeth I, who reigned from 1741 to 1762, the sheet shows the base of a statue of the empress and some of the architectural features of the city. The inscription reads “Capital City of St. Petersburg. Dedicated to Elizabeth I, Empress of All Russia, Daughter of Peter the Great.” MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

traditional wooden architecture have been established in Russia, among them Suzdal’, Novgorod, Kostroma, Kizhi, Arkhangel’sk, and Lake Baikal.

Wood and masonry architecture influenced one another in numerous ways. In wooden log churches, for example, the curve of a masonry apse is imitated by a half-octagon of shortened logs. The “storied” effect of some masonry churches (for example, the Church of the Intercession at Fili, 1690s, Moscow) is copied from log churches surmounted by tiers of receding log octagons (for example, the wooden Church of the Transfiguration, eighteenth century, Museum of Wooden Architecture, Suzdal’). Especially popular in village wooden church architecture was a tent-shaped superstructure, usually with eight slopes arising from an octagonal drum. The drum in turn was placed on one or more

square or octagonal bases (for example, the wooden Church of the Dormition from the village of Kuritsko, 1595, Novgorod open-air museum). A masonry imitation is the brick Church of the Ascension at Kolomenskoe, 1532, Moscow.

St. Basil’s Cathedral (sixteenth to seventeenth centuries) on Red Square in Moscow represents a sort of encyclopedic combination of elements from both wooden and masonry architecture. Its central chapel, for example, imitates a log tower/tent structure, topped by an onion dome. The Russian onion-shaped dome was functional in design—to shed rain and prevent snow buildup—and also symbolic; its shape was likened to a candle flame of faith reaching up to heaven. Among masonry influences, St. Basil’s has exterior ornamentation borrowed from the walls and churches of the nearby Italian-built Kremlin.

A major building project in Moscow in the late fifteenth to early sixteenth centuries was the reconstruction of the Kremlin, the central citadel of the city. Because of the lack of experience and skill among native builders, architects from northern Italy were imported for the task. Italians designed and built the present red brick-faced Kremlin walls, the Cathedrals of the Dormition and the Archangel Michael, the Palace of Facets, and the Great Ivan Bell Tower and adjacent Dormition Belfry. Least Italianate in the appearance of these structures is the Dormition Cathedral (1470s) by Aristotele Rudolfo Fioravanti, an engineer who copied—as instructed—the cubic mass surmounted by five domes of the twelfth-century Dormition Cathedral in Vladimir. Most importantly, Fioravanti and his colleagues introduced Russian builders to better brick and mortar construction techniques, making possible an unprecedented building boom throughout Russia in the sixteenth and seventeenth centuries.

Standing on Cathedral Square in the Kremlin, one can identify architectural elements that mirror the political and territorial rise of Muscovite Russia: architectural compositions and ornamentation from regions incorporated into Muscovy (Pskov, Novgorod, Vladimir), from village wooden architecture, and from Italy. In turn, given the prestige of major buildings in the capital city, Kremlin structures became models for buildings throughout Russia. For example, the Dormition Cathedral became an oft-repeated model for subsequent major cathedrals (Novodevichii Convent in Moscow, Vologda, Kostroma, the Trinity-St. Sergii Monastery outside Moscow, Rostov Velikii, and others).

THE BAROQUE AND WESTERN INFLUENCE

If Muscovite architecture achieved a synthesis of regional, village, and Italian influences in the fifteenth and sixteenth centuries, that synthesis was shattered in the seventeenth century when west European influences entered Russia from Ukraine, a portion of which was incorporated into Muscovy in the mid-seventeenth century. A so-called Moscow baroque decorative style characterized many churches and palaces in the second half of the seventeenth century (the Church of the Trinity in the Nikitniki Courtyard, mid-seventeenth century, Moscow, is an example), but aside from baroque

decorative elements, these structures show little of the balance and symmetry of the baroque style of Western Europe. Several regional centers developed their own schools of architecture, notably Iaroslavl', northeast of Moscow, whose seventeenth-century churches are crowned by elongated slender drums under the domes.

Building and design in Muscovy was typically a family affair: a builder would pass on his skills to his sons (although none of them might be literate) and design plans might not be drawn up in advance of a construction project. With the founding and buildup of St. Petersburg, beginning in the early eighteenth century, the old Muscovite building trade became the new “science” of *arkhitektura*, studied in special new schools where pupils were taught foreign languages, mathematics, and classical architecture. Teachers and textbooks first came from west Europe but were quickly followed by newly trained Russian masters and Russian translations. A Chancellory of Construction was established which supervised training and construction, first for St. Petersburg, then later in the eighteenth century for cities throughout the country.

Beginning with Peter I the Great (ruled 1682–1725), west European architectural trends determined the overall style of “high” architecture—almost all significant government and private construction—and the personal taste of the ruler determined the current style employed. Peter’s favorite architect, Domenico Trezzini, employed the restrained baroque of northern Europe, for example in his 400-meter-long Twelve Colleges Building, 1722–1742, St. Petersburg. The very existence of such a large government building, the likes of which did not exist in Moscow at the time, indicates a new and major investment by the government in an extensive administrative system. The planned design of St. Petersburg, with its neat grids and patterns of streets, regular building heights and setbacks, wide avenues, and huge squares and public spaces, brings to mind another eighteenth-century city planned from scratch and designed to impress citizens and foreigners alike: Washington, D.C.

Major architectural styles after Peter were a fancy baroque, or rococo during the reign of Elizabeth Petrovna (ruled 1741–1762), exemplified by the works of Bartolomeo Francesco Rastrelli (Win-

ter Palace, Smolnyi Convent, Catherine Palace at Tsarskoe Selo), and classical or neoclassical in the reign of Catherine II the Great (ruled 1762–1796), for example the Hermitage Theater by Giacomo Quarenghi, the Great Palace at Pavlovsk by Charles Cameron and others, and the Marble Palace by Antonio Rinaldi.

The “St. Petersburgization” of architecture in other cities—in particular, the dispersion of classical or neoclassical norms—gained momentum during Catherine’s reign and continued to influence Russian architecture throughout the imperial period. An early example of classical architecture in Moscow is the Pashkov House, attributed to V. I. Bazhenov (1780s), now a part of the Russian State Library, formerly the Lenin Library.

JACK KOLLMANN

RUSSIA, ART IN. Formal art in fifteenth- and sixteenth-century Muscovite Russia (the principality of Moscow) was concentrated in the Russian Orthodox Church and consisted principally of icons, frescoes, and manuscript illuminations. Most artists were monks or closely associated with the church, typically trained in monastic painting workshops. To be an artist was considered a holy calling. Instructions for artists were essentially identical with those for scribes copying religious texts: “copy exactly from holy models, changing absolutely nothing.” And yet, no two painted scenes or hand-copied manuscripts are alike: local preferences varied in subject matter, style, and coloration; the availability of natural pigments varied locally; training was not standardized; no cartoon books existed before the seventeenth century (the “holy model”

at hand might vary drastically from place to place); and finally, each artist differed in taste and talent.

FROM BYZANTINE TO MUSCOVITE

A famous example of Byzantine art that influenced Russian art is the icon of the *Vladimir Mother of God*, thought to have been painted in Constantinople in the early twelfth century (State Tretyakov Gallery, Moscow), and often copied in Russia. From Byzantine and early Russian regional schools, notably that of Novgorod, Moscow synthesized artistic styles and subjects. As Moscow absorbed the other eastern Slavic principalities and city-states, it acquired the best of their art and architecture.

Two additional trends distinguished Muscovite art. First, the introduction of Moscow-specific themes, frequently imbued with political significance. Moscow was not the first to insert Russian themes into church art. The “schools” of the merchant city states of Novgorod and Pskov introduced local themes: a locally revered saint (for example, St. Paraskeva-Piatnitsa, patroness of Friday market day) or a local event (the miracle of the saving of embattled Novgorod by the palladium icon of Novgorod). The appearance of Russian saints (and the report of their miracles) in Russia provided artists with new material beyond the confines of Byzantine tradition, amplifying their role beyond that of mere copyists. One of the more notable examples of Moscow patriotic art is the 12-foot-long mid-sixteenth-century icon of *The Church Militant*, or *Heavenly Forces* (Tretyakov Gallery), thought to be an allegory of the conquest of Kazan’ (1552). It depicts the Moscow grand prince (possibly Tsar Ivan IV, “the Terrible”) and the Archangel Michael leading columns of current and historical Russian princes and troops toward the heavenly city, where the Christ child, sitting on his mother’s lap, hands out crowns of glory.

A second major trend in Muscovite art was the literal rise of the iconostasis. From the Byzantine and early Russian tradition of placing icons singly or in a row before the sanctuary, the Muscovite church expanded the icons upward and outward, creating a wall of images that reached toward the ceiling vaults and spread across the nave and into the side aisles. Standing before it, even the illiterate churchgoer is instructed visually in the teachings of the church,

because the meaning of each icon is explained in services on relevant days in the church calendar.

The “classical” period of Muscovite icon painting (late fourteenth and fifteenth centuries) is exemplified in works attributed to the monk and artist Andrey Rublyov (c. 1360/70–c. 1430), who was named by the 1551 Stoglav (“hundred chapters” church council) as a model for artists to emulate. The icon of the *Old Testament Trinity* (Tretyakov Gallery) attributed to him is especially harmonious, with its pastel colors and circular composition of the three angels who visit Abraham and Sarah (Genesis 18).

The Muscovite synthesis of regional themes and styles achieved in the fifteenth and sixteenth centuries was shattered in the seventeenth century. The acquisition of left bank Ukraine in the mid-seventeenth century led to an influx into Moscow of Ukrainian clerics and scholars who had been exposed to western European Renaissance, Reformation, and Counter-Reformation culture via Poland. Among changing trends in seventeenth-century Muscovite art were the following: western European post-Renaissance perspective and three-dimensional illusionism (for example, the use of chiaroscuro) began to supplant the traditional use of inverse perspective and two-dimensional treatment of figures and scenes; engravings in western European publications, such as the Dutch Piscator Bible, provided fresh subject matter and stylistic ideas to artists, notably teams of painters who created a remarkable series of frescoes in churches in Yaroslavl’, Rostov Velikii, Kostroma, Vologda, and elsewhere; icons began to be produced in small sizes (rectangles whose vertical height was frequently no more than twelve to sixteen inches) for personal and home use by individuals (for example, in the Stroganov School, commissioned initially by that wealthy family); Moscow political themes became more overt; the artist began to sign work which had previously been left anonymous, and increasingly it was expected that he would imbue his work with his own individual, recognizable style.

Of some 2,800 names recently published in a dictionary of Russian icon painters of the eleventh through seventeenth centuries, approximately 95 percent worked in the seventeenth century. Exem-

plary among these was Simon Ushakov (1626–1686). In his icon of the *Vladimir Mother of God and the Tree of the Muscovite State* (Tretyakov Gallery), Ushakov “updates” the twelfth-century icon with profuse references to the glory of Moscow; in his *Old Testament Trinity* (State Russian Museum, St. Petersburg), he alters the simplicity of Rublyov’s icon with extraordinary detail and the use of chiaroscuro to suggest three-dimensional faces on the three angels. Both works by Ushakov are signed and dated.

PORTRAITS AND SCULPTURE

Portrait painting arose in the seventeenth century, partly under Polish influence via Ukraine, but overtly western European post-Renaissance subjects and principles came to characterize Russian art only in the eighteenth century. Peter I the Great (ruled 1682–1725), who imported western European culture wholesale for his new city of St. Petersburg, had his portrait painted scores of times by foreign and domestic artists—and in oil paint, which lends itself better to chiaroscuro than does the egg tempera medium of traditional icons. European artists were imported to record the buildup of the city, decorate the interiors of buildings, and train Russian students. Some Russian art students were also sent abroad for training. During the eighteenth century, the Academy of Fine Arts, founded by Empress Elizabeth Petrovna (ruled 1741–1762) and funded significantly beginning with Catherine II the Great (ruled 1762–1796), dominated art training. Leading eighteenth-century Russian artists include Dmitry Levitsky (1735–1822), whose portraits of aristocratic girls at Catherine the Great’s Smolny Institute show great skill, Vladimir Borovikovskiy (1757–1825), who broke new ground with his relatively informal study of Catherine walking her dog in a park (copies in Tretyakov Gallery and State Russian Museum), and Ivan Argunov (1729–1802), who was born a serf yet rose to become one of the founders of the Academy of Fine Arts in 1758. His career demonstrates that in post-Petrine Russia advancement could be based on merit and not on privileged birth alone.

In sculpture, the adoption of western European neoclassical traditions paralleled developments in painting. Fedot Shubin’s (1740–1805) numerous plaster and marble busts of aristocratic patrons show

Art in Russia. An icon of the holy doors showing Metropolitan Peter and Alexius, with the Annunciation above, sixteenth century. THE ART ARCHIVE/KIZHI MUSEUM/NICHOLAS SAPIEHA

the fruits of his six years of study in Paris. St. Petersburg's most famous statue, the equestrian *Bronze Horseman of Peter the Great*, was commissioned by Catherine and designed by the Frenchman Étienne-Maurice Falconet (1716–1791) and his pupil and mistress, Marie-Anne Collot (1748–1821).

Space does not permit discussion of folk art, which flourished largely apart from the formal trends identified here. Folk art influenced formal art before the eighteenth century to some extent, but less so beginning with the westernization of formal art.

JACK KOLLMANN

RUSSIAN LITERATURE AND LANGUAGE. The category of “old Russian literature,” however enduring, constitutes little more than an omnibus retrospection of almost all prose native to Rus’ and written in Slavonic or Russian prior to the eighteenth century. It marks the mythic boundary between antiquity and modernity in Russian culture and includes heroic tales and epics, compendia of saints’ lives (*chet’i minei, prologi*, etc.), chronicles (*letopisi*), general Christian histories (*khronografy*), and numerous individual codices (*sborniki*) compiled from a wide range of materials, usually by anonymous monastic bookmen.

From the end of the twentieth century scholarship increasingly replaced this confining typology of an undifferentiated old Russian culture with more nuanced and fragmented constructs that posit inner tensions, regional variations, and epistemic shifts over the centuries between the fall of Kiev and Peter the Great’s assertion of Russian modernity. Such tensions and variations were particularly marked during the late sixteenth and seventeenth centuries,

thanks in large measure to a cultural influx from Poland and Ukraine. Another major stimulus came from the schism within Russian Orthodoxy in the 1650s, out of which emerged the movement known as Old Believers or Old Ritualists. Edifying vitae soon appeared for many of the movement’s early martyrs, including Boiarynia Feodosiia Morozova, Ivan Neronov, and Iuliana Lazarevskaia. The most outstanding of these was the autobiographical account of the leader of the Old Believers, the archpriest Avvakum Petrovich. Told in earthy and vivid prose, *The Life of the Archpriest Avvakum* (1672–1673) marked the beginning in Russia of a vernacular form of autobiographical writing, penned by an identified author and directed at a broad literate audience who read outside of the church service. All of these lives were widely known, at least among religious dissenters, and their abiding tropes of civic powerlessness and suffering for one’s faith later became commonplaces of eighteenth-century memoirs and autobiographies.

At the same time Russia was developing a new “high” literature beyond the narrowly devotional, including highly literary sermons, religious poetry, drama, and an ever growing corpus of tales and fables, translated in large measure from Polish. Most scholars tie these innovations to the courts of Tsar Alexis I Mikhailovich (ruled 1645–1676) and, especially, his daughter Sofiia, who was the de facto regent between 1682 and 1689. Starting in 1672 the Muscovite court housed an intermittent theater whose repertoire mixed biblical tales (such as that of Artaxerxes) with Greek fables and dramas based on saints’ lives (for example, of St. Catherine).

Another important new genre of literary expression was the sermon, a rarity in Russian culture before the mid-seventeenth century. The central figure in this trend was the monk Simeon Polotskii, who moved from Belarus to Moscow in 1660. During the final few decades of the seventeenth and throughout the eighteenth century, several other religious hierarchs, almost all of them Ukrainians linked to the Kremlin or important monasteries near Moscow, were active in sermonizing. Although subject to severe restrictions in form, theme, and structure, sermons afforded these clerics the opportunity to create new texts, many of which were subsequently published in collections, and to be recognized as their authors.

CIVIL ORTHOGRAPHY, PRINT, AND THE NEW LITERARY LANGUAGE

Peter the Great's new civil orthography of 1707 and his aggressive deployment of print initiated new explorations toward a distinctly civil Russian (as opposed to Slavonic) literary language. Most scholars now believe that this discourse did not arise in a linguistic vacuum, but that the developments of the late-seventeenth century as well as the evolution of what is sometimes termed "chancellery (*prikaznyi*) writing" set the context for the reforms. During the 1730s, Vasili Trediakovskii, Antiokh Kantemir, and Mikhail Lomonosov debated furiously about the shape of this literary language. At issue were the use of arcane constructions and "pure" slavonicisms versus the construction of something more in line with contemporary European literature. All three of the principals, but especially Trediakovskii and Lomonosov, chose the medium of literary translation as their linguistic laboratory, often creating texts that were stilted and idiosyncratic but nonetheless literary. A noted example is Trediakovskii's rendering of Paul Tallemant's *Le voyage à l'isle d'amour de Lycidas*.

Along with the new orthography and the nascent literary language, the institutionalization of literature benefited from the proliferation of lay publishing, primarily at educational institutions. Drawing from a mixture of foreign scholars, professional translators, and a handful of brilliant former seminarians and cadets (including Trediakovskii, Lomonosov, and Sumarokov), the Academy of Sciences during the second quarter of the eighteenth century acted as midwife for the birth of a lay print culture, producing small runs of poetry, tales, and translated opera librettos. Exceedingly modest in volume when compared to the rest of Europe, this work was nonetheless momentous for creating what we would now call Russian literature, as a creative, public, accessible, lay discourse for private reading and pleasure.

Mid-century witnessed several new publishing houses, primarily at Moscow University and the Cadet Academies; together these presses provided an institutional setting for young—mostly noble—literati to engage in literary pursuits and develop a public voice. Virtually every luminary of the Elizabethan and Catherinian eras—including Mikhail Kheraskov (1733–1807), Denis Fonvizin (1745–

1792), Ippolit Bogdanovich (1744–1803), Gavriila Derzhavin (1743–1816), Aleksandr Radishchev (1749–1802), and several others—participated in this collective endeavor of literary and institutional creation. In most cases these writers earned little or nothing from their original works (a bit more from translations), and the great majority maintained commissions in state service. Derzhavin, for example, had been in an elite guards' regiment, and he ultimately became a full-time civil administrator, rising to the very high position of provincial governor. Some, however, including Nikolai Novikov (1744–1818) and Nikolai Karamzin (1766–1826), became something approaching professional intellectuals in that they devoted all their time to intellectual pursuits, sometimes, as with Novikov, resigning their commissions. During the last quarter of the eighteenth century the life of literature and literary production developed very rapidly, thanks to the growth in secondary education, both secular and religious, which produced an exponential rise in the number of writers and readers, as well as the easier access to print, especially after 1783, when the decree on private presses made publishing much simpler.

GENRES

In addition to the profusion of literary translation, poetry provided some of Russia's most important writing during this period. Especially significant were the lyric and religious poetry of Trediakovskii, the epic poetry of Kheraskov (the "Russian Homer" and author of the lengthy *Rossiada*), and, above all, the reflective and highly personal verses of Derzhavin. As was true throughout Europe, travel literature, recounting journeys both real and imaginary, proved to be a particularly effective medium for combining entertainment with cultural commentary. Karamzin's *Letters of a Russian Traveler, 1789–1790* (1797), although often fanciful, nevertheless offered entertaining glimpses of the mores Karamzin observed during his European grand tour of 1789–1790, and it situated Russia in the European context and oriented the reader's sense of national identity and civility. The genre also lent itself to severe social commentary, most famously in Radishchev's novel, *A Journey from St. Petersburg to Moscow*. Taking advantage of lax censorship, Radishchev published this savage critique of serfdom and Russia's lack of freedom in 1790, much to the

outrage of the empress Catherine II, who ordered all copies confiscated and the author jailed. Dramatic as this episode was, Radishchev's pained voice of political and social opposition remained the exception for the eighteenth century, as few of his contemporaries expressed—or apparently held—views in opposition to the political status quo.

Beginning in the mid-1750s and especially from the late 1760s onward, literary and philosophical journalism became the medium of choice among aspiring literati. Few of these ventures lasted longer than several months, and most could count their readerships in hundreds rather than thousands. But these journals came out frequently and regularly, and as one folded others took its place. Essayists and translators, as often as not still unidentified by name, could pool their resources and energies and use periodical publication to construct the rudiments of an engaged textual community, playing off of other journals to establish a clear field of discourse. The prime example comes from the so-called satirical journals of 1769–1774. During this period, journals linked to Novikov (*The Painter*, *The Drone*, *The Tattler*) parried with others associated with the empress (*Bits of This and That*), who was herself an avid author and essayist. As was true elsewhere, editors employed public subscription campaigns to generate a reader base and to inscribe a public onto their enterprises. Some of these campaigns, such as Novikov's solicitation for his pietistic journal *Morning Light* (1777–1780), were quite successful, generating hundreds of subscribers (who thereby subsidized Novikov's new charity schools) from towns throughout the empire and from social groups, such as clergy and merchants, well beyond the omnipresent cosmopolitan audience. Most journals, however, attracted several dozen to about a hundred subscribers, almost 90 percent of whom derived from the hereditary nobility.

MODES OF SOCIABILITY

The intimate and largely male world that produced Russia's lay literati led easily into a proliferation of small societies, translation groups, student seminars, private lending libraries, reading circles, and eventually salons, at which women often were in attendance. By far the most popular sites of sociability, though, were Masonic lodges, which in Russia were quintessentially masculine in outlook and

membership. During the Catherinian period as many as three thousand Russian subjects belonged to dozens of lodges, most of which combined a vaguely Neostoic sense of public improvement with the conviviality of brotherhood. Some scholars have seen the lodges as the beginnings of a Russian public sphere, while others have emphasized their secrecy, exclusivity, and sense of hierarchy. But there is no doubt that the lodges became centers of sociability that encouraged the fusion of literary activity and an increasingly ritualized politesse, which reached its apotheosis during the era of Aleksandr Pushkin in the 1830s. Although they were typically not oppositional, their combination of fraternity, secrecy, and commitment to moral improvement evoked periodic suspicion from officialdom, leading to periodic censure and closures in the latter fifteen years of the eighteenth century and again during the early 1820s.

RUSSO-OTTOMAN WARS (1710–1711; 1736–1739; 1768–1774; 1787–1792). The first Russo-Ottoman War of the eighteenth century occurred during the expansion era of Peter I, also known as Peter the Great (ruled 1682–1725), who stopped paying tribute to the Khan of the Crimea, an Ottoman vassal, when he became tsar in 1683. He staged attacks on the Perekop Isthmus in the 1680s and Azov in 1695 because the Russians viewed the Crimea as a haven for Tatars who continually raided Russian areas to seize captives, property, and livestock. In 1696, Peter mounted the first successful attack on Azov, using the new flotilla he had built. In a 1700 Russian-Ottoman peace treaty, Russia was permitted to keep Azov and had the cancellation of its tribute payment to the Crimean khans formally recognized.

RUSSO-OTTOMAN WAR OF 1710–1711

Sultan Ahmet III (ruled 1703–1730) initially looked favorably on the Russians because one of his grand viziers, Chorlulu Ali Pasha, cultivated good relations with them to prevent Ottoman entanglement in European politics. Russia's overwhelming victory against the Swedes at Poltava in 1709 has been attributed to the fact that Ali Pasha kept Crimean troops from intervening against Russia.

Ali Pasha was soon dismissed, though, when the mood of religious officials in Constantinople was swayed by the anti-Russian sentiment of the Crimeans. Also, the Swedish King Charles XII (ruled 1697–1718) had fled to the Ottomans from his failed encounter with Peter I and worked to stir up anti-Russian sentiments even more. When it appeared that after their Poltava triumph the Russians were getting ready to attack the Crimea, the Ottomans preemptively declared war on them. A Russian army led in person by Peter and his wife, Catherine I, invaded Moldavia for the first time in centuries,

attempting to secure it before Ottoman forces could arrive.

However, the Russians ran into severe food shortages there, and a large Ottoman army proved to be close by. When the Russians were suddenly surrounded at a place on the Pruth tributary of the Danube on 21 July 1711 by regular Ottoman forces on one side and Tatars on the other, they had to surrender to avoid annihilation. Peter agreed to give back Azov, demolish his fortresses in its vicinity, release Ottoman prisoners, and allow Charles XII safe passage to Sweden. This swift Russian agreement to favorable terms for a time convinced the Ottomans that the Russians were not a serious threat. The final peace treaty (1713) pushed the Russians back as far north as the Orel River and required Peter to evacuate Poland within two months. Its terms would constantly be challenged over the next few years as Peter continued to modernize and expand his nation, which aroused Ottoman suspicions of Russian intentions.

Notwithstanding these tensions, both took advantage of the turmoil produced by the 1722 Afghan conquest of Iran to occupy Iranian territory in Azerbaijan and the Caucasus. The Russians and the Ottomans signed an agreement in 1724 that recognized each other's recent acquisitions in Iran. The agreement called for the restoration of the Shi'ite Safavids instead of the Sunni Afghans as the rulers of Iran—a curious stance for the Ottomans, quintessential defenders of Sunni Islam against Shi'ism. This agreement, too, proved fleeting when a new Iranian monarch, Nadir Shah (ruled 1736–1747), drove both the Russians and the Ottomans out of their occupied territories.

RUSSO-OTTOMAN WAR OF 1736–1739

The next Russo-Ottoman conflict broke out in 1736, when Russia determined to put a stop to Crimean Tatar attacks on its territories and finally to establish a presence on the Black Sea. After Russia had resolved its then outstanding conflicts with other European nations, the tsar denounced Ottoman negligence of the Treaty of Pruth as a pretext for war. Encouraged by the French, the Ottomans declared war on both Russia and Austria in May 1736 to protest the placement of a pro-Russian candidate on the Polish throne.

The first result was that the Russians, who were better mobilized, invaded the Crimea and took Azov within three months. However, they soon had to withdraw because of poor logistics. Russia then shifted focus to Moldavia and Walachia when its ally Austria captured Niš in 1737. Soon, though, the Austrians were pushed back so decisively that they were forced to sign a treaty with the Ottomans in 1739 at Belgrade, giving up most of the territory they had been assigned at Passarowitz in 1718.

As this agreement was being signed, the Russians were in the midst of trying to incite a Balkan Christian revolt against the Ottomans, had advanced deep into Moldavia, and were preparing to conquer Walachia, but news of the treaty ended these plans. With Austrian assistance gone, the Russians also signed an agreement with the Ottomans and relinquished Azov again.

RUSSO-OTTOMAN WAR OF 1768–1774

In 1768, when Catherine II, also known as Catherine the Great (ruled 1762–1796), revived Peter's imperialist projects and began interfering in Polish affairs again, the sultan declared war on Russia. Because internal Crimean politics and severe logistical difficulties had greatly weakened the Ottoman military, the Russians advanced swiftly into Moldavia and Walachia. They decimated a huge Ottoman army at Kartal in 1770. The Russians also finally took Crimea and came to dominate naval warfare in the Black Sea and even in the Aegean. In this conflict, Austria actually restrained Russia because it worried about excessive Russian influence in Poland.

Following a significant number of Russian victories, the 1774 Treaty of Kuchuk Kainarji allowed the Ottoman sultan to remain the religious leader, or caliph, of the Crimean Muslims, who were declared politically autonomous. Russia then took much of the northern Black Sea coast and received a large war indemnity from the Ottomans. A Russian cathedral was built in Constantinople, which was later construed to mean that the tsar was the protector of all Ottoman Orthodox Christians.

RUSSO-OTTOMAN WAR OF 1787–1792

In 1787, Catherine developed a scheme to expel the Ottomans from Europe and divide their European territories between Russia and Austria. The Otto-

man reaction was to wage war to regain the Crimea. The war reached a critical stage in 1789 when the Austrians conquered Belgrade and the Russians took Walachia. Just as the two were set to advance on Constantinople, other European powers persuaded them to end the war in order to help contain the tide of revolution sweeping across Europe from France. The Russians finally signed the 1792 Treaty of Jassy, by which they extended their control of the Black Sea coast and declared that henceforth Russia was the sovereign of the Crimea. In effect, the Black Sea, too, now passed into Russian hands.

ERNEST TUCKER

RUSSO-POLISH WARS. From the 1480s to 1667 Muscovy fought a series of devastating wars along its western frontier, first with the Grand Duchy of Lithuania and then with the Polish-Lithuanian Commonwealth. Muscovy's wars with Lithuania had four principal causes: disputed claims over the right to collect tribute and taxes in border districts and competition for the fealty of influential Orthodox princes; the question of ecclesiastic jurisdiction over Lithuania's large Orthodox population; Muscovy's gradual absorption of the Republic of Novgorod; and involvement in the struggle between the Crimean Khanate and the Golden Horde over the Pontic Steppe.

The 1480s saw a series of border clashes between Lithuania and Muscovy, particularly along the Novgorod-Pskov front. The death of the Polish king and Lithuanian grand duke Casimir finally gave Muscovite Grand Prince Ivan III the opportunity to

launch a major invasion of Lithuania (1492–1494). Casimir's successor was forced to renounce his claims to Novgorod, Pskov, and Tver' and to cement the peace by taking Ivan's daughter Elena in marriage. But the peace did not last. In the Second Muscovite-Lithuanian War (1500–1503) Muscovite armies seized about a third of Lithuania—most of the former principalities of Chernigov (Chernihiv) and Novgorod-Seversk and about half of the Smolensk region. One crucial objective eluded Ivan III, however: the capture of the Lithuanian fortress of Smolensk, which commanded the roads and waterways to Moscow, Kiev, and Riga. Grand Prince Vasili III therefore resumed the struggle for mastery of Smolensk in a Third Muscovite-Lithuanian war (1512–1522). Smolensk fell to Muscovite forces in 1514, but the war wound down in stalemate.

The Muscovites invaded Lithuania again in the second phase (1563–1571) of Tsar Ivan IV's Livonian War. Ivan's objective was to seize control of the entire course of the Western Dvina in order to blockade Riga into submission, but he also hoped to force King Sigismund II Augustus of Poland to cede him the rest of Livonia in exchange for his withdrawal from Lithuania. The Muscovite invasion instead had the effect of finally pushing the Lithuanian nobility into accepting Sigismund's proposal for the union of Lithuania and Poland in a Commonwealth (1569). Sigismund's successor Stephen Báthory drove the Muscovites from Livonia and Lithuania (1579–1580) and invaded northwestern Muscovy, forcing Ivan to cede Livonia to the Commonwealth and Sweden in exchange for an armistice (1582, 1583).

Polish-Lithuanian intervention in Russia's Time of Troubles initially took the form of private adventurism by magnates and border governors who perceived in the political upheaval an opportunity to recover some of the borderlands lost in 1503 and 1522. They abetted the two False Dmitriis (1603–1606, 1607–1610). After the defeat of the second, his Muscovite supporters and some powerful boyars decided to overthrow Tsar Vasili Shuiskii and place King Sigismund III's son Władysław on the Russian throne. Shuiskii's overthrow in July 1610 permitted Polish forces to enter Moscow, but the resulting Polish military dictatorship provoked several Muscovite provincial governors and gentry leaders to

join with Cossack elements in a national liberation army, which defeated the Poles in October 1612. Three months later Michael Fedorovich Romanov was proclaimed tsar. Eventually the Treaty of Deulino (1618) established an armistice in exchange for the return of Smolensk, Chernigov (Chernihiv), and Seversk to the Commonwealth.

Michael's government, intent on recovering these territories, invaded eastern Lithuania in 1632 with an army of 33,000 men. This war (1632–1634) marked the largest experiment to date with Russian troops in reorganized Western-style "new formation regiments" trained and officered by Swedish, Dutch, and English mercenary officers. Some twenty towns fell to the Russian army, but their long siege of Smolensk failed and their commanders were forced to sue for armistice in exchange for safe evacuation.

From the mid-1630s Ukrainian churchmen and Cossack leaders had pleaded for Russian support for their rebellion against the Commonwealth. Moscow held back until 1654, when Bohdan Khmelnytsky agreed to place the Zaporozhian Host and the territories it held—Kiev and all Ukraine east of the Dnieper—under the tsar's protection. But the greater inducement to military intervention was the opportunity to recover Smolensk. The Treaty of Andrusovo, ending the Thirteen Years War (1654–1667), partitioned Ukraine along the Dnieper and restored the Smolensk region to Russia. This was the last great war fought between Russia and the Commonwealth, in large part because of the rising danger to both from the Ottoman Empire; the two signed an "eternal peace" in 1686.

BRIAN DAVIES

RUYSCH, RACHEL (1664–1750), Dutch painter. One of the most successful women artists of early modernity, Ruysch was born in The Hague. While growing up, she assisted her father, Frederik Ruysch, a professor of anatomy and botany, by recording the appearances of the exotic plants he studied. The resulting works may have encouraged her father, who was also an amateur painter and collector, to apprentice his fifteen-year-old daughter to the Amsterdam still life painter Willem van Aelst (1627–c. 1683). While it was uncommon for a girl to train for a profession outside the home, painting still lifes posed fewer obstacles than other genres because, for example, she was spared drawing from nude models—an activity deemed inappropriate for women until well into the twentieth century.

In her earliest works, Ruysch closely followed the dramatically lit woodland scenes of the Dutch painters of the previous generation, Otto Marseus van Schrieck and Abraham Mignon (1640–1679). In paintings like *Arrangement of Flowers by a Tree Trunk* from the 1680s (Glasgow Art Gallery and Museum), Ruysch depicted forestal vignettes complete with small-scale creatures. Characteristically, Ruysch repeats Schrieck's motif of the lizard with a butterfly perched in its open mouth, but minimizes the menacing import of such a creature by reducing its scale and by relegating it to the fringe of the composition. Mignon's influence is more noticeable in *Floral Still Life* from 1686 (Memorial Art Gallery, University of Rochester), which replicates the right half of a Mignon painting in Vaduz Castle. Ruysch adopted Mignon's practice of placing cultivated plants in natural settings, but she omitted Mignon's signature goldfinches and other latent Christian symbols. By choosing to stress decorative effects over iconographic details in both the Glas-

Rachel Ruysch. *Bouquet of Flowers*, 1706. ©ALI MEYER/CORBIS

gow and Rochester paintings, Ruysch limits symbolic interpretations of her paintings.

In 1693 Ruysch married Mignon's adopted son, the portrait painter Juriaen Pool. Despite the demands of raising ten children, Ruysch remained active as a painter, becoming a member of the *Confretrie Pictura* in 1701 and later joining the painter's guild in The Hague in 1709. Shortly thereafter, Ruysch and Pool relocated to Düsseldorf, where they became court painters to the elector palatine John William.

In her mature works Ruysch increased the decorative and theatrical aspects of her compositions, presumably to suit her patron's sense of refinement. While her early endeavors represented floral groupings as they occurred in nature, she later experimented with juxtapositions of cultivated and wild plants in vased bouquets. Ruysch also explored fruit assemblages as pendants to her floral pieces. One sees all of these elements combined in *Fruit and Flowers in a Forest* from 1714 in Augsburg. This piece, which originally hung in the elector's bed-

room, shows Ruysch's skill in rendering the vibrant flowers' fragility to contrast with the lusciously firm fruits strung across the forest floor, a motif that recalls her earlier woodland vignettes. Ruysch deliberately composed the scene, imposing her own order upon the natural world with the floral arrangement occupying the upper register across the stone ledge, the fruit closer to the Earth, and the requisite insects and reptiles framing the scene from the periphery. In the Augsburg painting, as in her entire oeuvre, Ruysch retained the dark, moody lighting of her early manner, yet heightened the vibrancy of individual elements. For example, while at the elector's court, she began to employ the newly discovered pigment Prussian blue, an inexpensive means of summoning luminous blues. Similarly, Ruysch utilized a smooth touch to craft crystal-clear surfaces. When Ruysch and Pool returned to Amsterdam in 1716, Ruysch brought her aristocratically fostered aesthetic with her and continued to paint elegant still lifes such as *Still Life with Flowers on a Marble Table Top*, now in the Rijksmuseum, Amsterdam. Here, Ruysch replicated the supple textures of the petals and crafted a subtle play of pinks against the dark backdrop and cobalt vase, as she had done in Düsseldorf, but restricted the scope to a moderately sized bouquet. Ruysch painted works of

this type for gentrified Dutch burghers until she was well into her eighties.

Ruysch's work found a receptive audience and contemporary writers praised her extensively. Such esteem was admirable for any painter, but especially so for a woman. As Johan van Gool wrote in *De nieuwe schouburg der Nederlandtsche kunstschilders en schilderessen* in 1750, her artfulness "was all the more astonishing and to be praised in women, who by nature are destined to other occupations" (vol. 2, p. 541). Despite such gendered trepidations, Ruysch earned international renown for her expertly wrought and pleasingly arranged creations.

SADE, DONATIEN-ALPHONSE-FRANÇOIS DE (1740–1814), French writer. Belonging to one of France's most ancient noble families, the marquis de Sade attended Paris's rigorous Louis-le-Grand lycée as a youth and then a light cavalry academy that would steer him toward a military career. At the age of sixteen he was commissioned as a lieutenant and standard bearer in the Carabiniers, a prestigious military unit of armed officers, and he took part in the war against Prussia. By early 1759, when he was eighteen years old, Sade was nominated captain in the Burgundy cavalry. Early in his military career Sade had earned a reputation with his peers as a gambler and a ladies' man, and the young officer often lamented both his lack of motivation to do the things required to succeed and the absence of close, sincere friends in his life. When the Seven Years' War ended in 1763, Sade's family began marriage negotiations with the Montreuil family, petty nobility of the robe who were nevertheless extremely wealthy. Sade resisted his family's wishes that he marry, but when the woman with whom he was in love scorned him, Sade returned to Paris from Provence four days before his

wedding in May 1763 and married Renée-Pélagie de Montreuil, whom he did not meet until the day before the wedding.

Five months later, the marquis was imprisoned in the Vincennes dungeon for licentiousness and blasphemy. This first of his many incarcerations resulted from the violence he meted out to the young Jeanne Testard, whom he had paid to spend the night with him in small rented quarters in Paris which, like a number of aristocrats, the marquis kept for occasional trysts. During his encounter with Testard, the marquis first asked the young woman whether she believed in God, and then proceeded to desecrate a number of crucifixes and other religious objects. He asked the young woman to beat him with a red-hot whip and pressed her to choose the whip with which he would flagellate her. Testard made a deposition to the commissioner of police, Sade was arrested, and taken to Vincennes, an ancient fortress on the southeast edge of Paris. Sade remained there for less than a month, but would return to Vincennes or to the Bastille on numerous other occasions for similar acts of blasphemy and sexual violence. (He spent a total of about thirty years, including the years from 1801 to the end of his life, in prison.) Sade wrote most of the works for which he is best known while incarcerated. His first significant piece is the *Dialog between a Priest and a Dying Man*, probably composed in 1782 while he was imprisoned in Vincennes. The dialogue treats some standard eighteenth-century views on religion, philosophy, materialism, and reason, and the dying man concludes that it is the latter faculty,

Donatien-Alphonse-François de Sade. Engraving depicts a demonic young de Sade. ©CORBIS

more than faith in God, that leads to human happiness. Shortly after Sade finished the short philosophical piece, authorities confiscated all the prisoner's books because they appeared to give him inappropriate ideas. In the remaining years of the decade Sade wrote *The 120 Days of Sodom*, *The Misfortunes of Virtue*, and *Aline and Valcour*, a semi-autobiographical novel. Other major works consist of a number of short stories and plays.

The marquis de Sade's novels combine a philosophical interest in materialism, an intense examination of the extent and limits of human reason, and an extremely vivid, often overwhelming, depiction of graphic sexual violence. All of the major novels revolve around the planning, narration, and carrying out of elaborate, often implausible acts of torture and mutilation, many of which involve religious motifs. Most often, a sophistic diatribe

concerning, among other things, the absurdity of virtue in a class-based society accompanies the consummation of the violent acts. The libertines who inflict the violence in Sade's novels engage in a nonstop philosophical conundrum in which they attempt to locate the limits of language, power, bodily existence, and domination. Repeatedly attempting to physically and subjectively annihilate their victims, they rely all the more on those whom they would destroy for their own identities in their attempts to do, say, and be all. The dialectic Sade constructs throughout the better part of his fiction interrogates the possibility of unmediated access to such ostensibly natural phenomena as the body, pleasure, pain, and intersubjective violence.

Virtually all of Sade's works have been reviled and censored since their very first appearances, and even as late as 1956 the publishing firm Pauvert was fined for printing the complete works. Nevertheless, Sade has had considerable influence in artistic and philosophical circles. André Breton (1896–1966) and the surrealists, in particular, found in his work liberating ideas for thinking about reason and sexuality.

THOMAS DIPIERO

ST. BARTHOLOMEW'S DAY MASSACRE. Early on the morning of 24 August 1572 (St. Bartholomew's Day by the Catholic Church calendar), French Catholic troops began to slaughter unarmed Protestants who had gathered in Paris for a royal wedding. The wave of popular violence that followed resulted in the death of some two thousand persons in Paris and another three thousand in other French cities. Known collectively as the St. Bartholomew's Day Massacre, these events constitute the most infamous episode in the French Wars of Religion and a turning point in these wars. Scholars continue to debate the questions of who authorized the killings and why, who took part in them, and what they tell us about the nature of religious intolerance.

Although some contemporaries believed the massacre to be the product of a conspiracy plotted during Queen Mother Catherine de Médicis's 1565 meeting with Spanish emissaries at Bayonne, most scholars now regard it as a more immediate response to deteriorating relations between Huguenots and

the crown in the aftermath of the Peace of Saint-Germain, which ended the third religious war in August 1570. Popular opposition to the measures of toleration accorded the Protestants made the peace difficult to enforce, and yet Protestant leader Admiral Gaspard de Coligny continued to press for full enforcement. He further irritated Catherine by attempting to convince her son, the young King Charles IX, to send troops to aid Dutch Protestants in their revolt against Spain. Some historians believe that Catherine, jealous of Coligny's growing influence over Charles IX, tried to have the admiral assassinated on 22 August 1572. Others have blamed members of the Ultra-Catholic Guise family for the attempt, which wounded but did not kill Coligny. This was the view of the Huguenot leaders, who had assembled in Paris to celebrate the wedding of Henry of Bourbon, king of Navarre, to the king's sister, Marguerite of Valois. Their demand for revenge appears to have sparked both a popular outcry and a defensive reaction on the part of the king and queen mother, who feared a Protestant coup.

St. Bartholomew's Day Massacre. Painting by eyewitness François Dubois. THE ART ARCHIVE/MUSÉE DES BEAUX ARTS LAUSANNE/DAGLI ORTI

A secret meeting in the Louvre on the night on 23 August resulted in the order to eliminate the Huguenot leadership. We do not know how many persons were to be killed or how willingly the king consented to the plot, but it is clear that in the aftermath of the order the killings took on a life of their own. The duke of Guise's men first dispatched the admiral and then hunted down other Huguenot leaders. Overhearing Guise remind his troops that they killed at the king's command, militiamen posted about the city to ensure its defense began to take part in the violence. Private citizens joined in, and the murders spread to encompass ordinary men, women, and children. Looting was common, and some of the victims' corpses were mutilated or subjected to crude parodies of judicial and religious rites. Some Protestants saved their lives by recanting their faith; others were hidden by charitable friends until they could secretly flee. It took more than a week to recover order in Paris, by which time the killing had spread to other French cities.

In some towns the killing began as soon as word arrived of the massacre in Paris. In other cases, a precarious peace was maintained until local events touched of a wave of murders several weeks later. At least twelve cities, including the provincial capitals of Lyon, Rouen, Bordeaux, and Toulouse, experienced significant levels of violence. All were predominantly Catholic cities that had once harbored sizeable Huguenot minorities, and all witnessed the same popular participation and ritualistic murders as Paris. In each, moreover, participants appear to have shared a common belief that the king had authorized the killing.

While surviving Protestant leaders fled to the west and launched a fourth religious war, Huguenot propagandists publicized the murders in order to gain international support for their cause. Articulating new theories of political resistance, François Hotman, Théodore de Bèze, and other Huguenot writers defended the right of subordinate magistrates to withdraw obedience from a tyrannical monarch who would permit such atrocities against his subjects. Shock and horror at the extent of the killing prompted some moderate Catholics to oppose the renewal of war and advocate further compromises in order to secure a lasting peace. Although this policy ultimately triumphed with the Edict of Nantes in 1598, the immediate result of the

moderates' defection was rather to encourage Ultra-Catholics to demand that the king act more decisively to eliminate the Protestant heresy. Saint Bartholomew's Day thus initiated the last, radical phase of the religious wars, at the same time that it seriously traumatized the Huguenot faithful and permanently undermined the Protestant movement in France.

ST. PETERSBURG. Founded in 1703 and by 1712 already the capital of Russia, St. Petersburg existed in the mind of Peter the Great (ruled 1682–1725) and on the planning boards of his architects almost before construction began—"the most abstract and intentional [or, 'premeditated'] city in the whole world," in the words of Dostoevsky (*Notes from Underground*, 1864). In contrast to Moscow, which grew organically over the centuries in concentric circles, St. Petersburg was planned from scratch (like Washington, D.C.) by west European architects who attempted to impose geometric street patterns on the swampy delta of the Neva River. Echoes of the city's planned origins are preserved in the not-so-romantic names of several north/south streets on Vasili Island: Second/Third Line Street, Fourth/Fifth Line Street, and so forth (each of these streets was originally intended to be a canal, with a numbered line of houses on each side of the canal).

St. Petersburg. Johann Baptist Homann's map appeared in 1718, not long after the city was founded by Peter the Great in 1703. It reflects the plan developed by French architect Jean-Baptiste Leblond who proposed making Vasileyev Island (on the left) the city center with a formal pattern of streets and canals. Instead only the right tip of the island was developed in the eighteenth century, and the whole map shows a St. Petersburg largely imagined, not as it really existed at this time. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

LOCATION

St. Petersburg is located far to the north, at about 60 degrees latitude, above the middle of Hudson's Bay in Canada and slightly above that of Juneau, Alaska. It is situated on the Gulf of Finland in the Baltic Sea in the delta of the Neva River, which flows from Lake Ladoga forty-six miles to the east. Though short, the Neva carries a large volume of water (sixth largest in Europe) and its currents are strong. Winding through St. Petersburg, the Neva divides at the tip (*strelka*, or 'arrow point') of Vasiliï Island, the Large Neva to the south, the Small Neva

to the right. Some one hundred islands dot the delta. The largest, Vasiliï Island, was originally envisioned as the future city center, but security and supply considerations prompted a shift to the left bank. The left bank itself is not "mainland": several rivulets, notably the Moïka and the Fontanka, flowed through the area and were preserved as canals in the city center. Because the flat territory of the city is close to the level of the Gulf of Finland (only six feet above it at the western end of Vasiliï Island), and because storms and tides sometimes combine to back up water in the entire delta, low-

lying areas of the city periodically flood. In 1703, as Peter the Great was starting to build the city's fortress (a not unwise choice, given that the area belonged to Sweden at the time), a flood carried off construction materials. In 1777 a major flood destroyed buildings and some fifty fountains in the Summer Gardens. The gardens were restored, but not the fountains; the adjacent Fontanka River/Canal was named for the fountains. Snow lies on the ground some five months a year, and the river and nearby gulf typically freeze over for two to four months each year. Nevertheless, prevailing winds from the west over the Baltic have a slight moderating effect on the climate. There is no good building stone in the area. In the early eighteenth century, a stone levy was placed on carts and boats entering the city, each one required to bring in stone for building foundations. As in Venice, many buildings in eighteenth-century St. Petersburg were set on wooden pilings driven into the mud.

PETER THE GREAT'S MOTIVES

Why did Peter persist in building the city in this inhospitable location? He had first tried to gain access to the Black Sea in the south, but he failed militarily to hold a position there. In any case, the Neva and the Gulf of Finland promised more direct contact with the countries of northern Europe with which he wanted to communicate and trade. From his youthful experiences among foreigners in Moscow and his two trips to western Europe, Peter was enamored with the accomplishments of west Europeans in science, industry, military and naval technology and training, and political administration. Sea power and maritime commerce captured his attention, and he determined to gain access to the sea for Russia by establishing a port city like Amsterdam. Moscow, with its narrow winding streets of logs or mud, its buildings of wood that fueled the city's frequent fires, its traditional culture, was for Peter—to use a modern term—backward and underdeveloped. “Sanktpiterburkh”—as he named the city in a Germano-Dutch spelling—was his initial experiment in transforming Russia into a sea power and giving his new Russian Empire an impressive European capital. In the twenty-one-year-long Great Northern War (1700–1721), Peter defeated Sweden's army and naval forces and formally annexed territory on the Baltic.

ST. PETERSBURG IN 1725

The rapidity with which St. Petersburg was created is remarkable. As of 1703, when the city was founded, there was one Swedish fortress in the immediate area and a few modest fishing villages. By 1725, when Peter died, St. Petersburg had some forty thousand residents and over six thousand buildings. James Cracraft, in his authoritative study *The Petrine Revolution in Russian Architecture*, lists the reasons why the city was built up so quickly: the government commanded the resources of the entire nation to be devoted to the cause; conscripted and convict labor was used; foreign architects and artisans were imported; Russian students were trained in architecture and building in St. Petersburg and abroad; training and city planning were standardized and coordinated by newly established government offices; and factories were established for bricks and other building materials. The costs were high; thousands of laborers perished in the harsh conditions. While St. Petersburg acquired the epithet of “Venice of the north,” it was also described as “built on bones.”

ARCHITECTURE

For Peter, architectural style per se did not matter much, but he admired the sober practicality of north European restrained baroque, and he recognized that the Dutch use of brick as a construction material was appropriate for St. Petersburg. In any case, architecture was an integral part of the west European cultural package that he sought to implant in St. Petersburg (minus restraints on the ruler's authority). His chief architect, Domenico Trezzini, a Swiss-Italian, created most early structures: the Fortress of St. Petersburg (later called the Peter and Paul Fortress, after the name of its cathedral, which Trezzini also designed), the Summer Palace and Gardens, the Twelve Colleges government administrative building, the Alexander Nevsky Monastery, and others. Peter's daughter, Empress Elizabeth (ruled 1741–1762) and her favorite architect, Bartolomeo Francesco Rastrelli, added extravagant rococo concoctions (the Winter Palace, Smolnyi Convent, the Catherine Palace at Tsarskoe Selo). During Empress Catherine II the Great's reign (ruled 1762–1796), the city acquired numerous neoclassical ensembles designed by west Europeans, including the Hermitage Theater and State Bank by Quarenghi, the Marble Palace and

St. Petersburg. Engraving of the Winter Palace, built 1754–1762 as a royal residence for Elizabeth Petrovna, daughter of Peter the Great; it is now part of the Hermitage Museum. ©REPRODUCED BY PERMISSION OF THE STATE HERMITAGE MUSEUM, ST. PETERSBURG, RUSSIA/CORBIS

Sliding Hill Pavilion at Oranienbaum by Rinaldi, the Cameron Gallery at Tsarskoe Selo and Great Palace at Pavlovsk by Charles Cameron. In addition, Russian architects, trained in west European neoclassical principles, made contributions, notably I. E. Starov, who built the Tauride Palace and rebuilt the Trinity Cathedral in the Alexander Nevsky Monastery.

Catherine's most famous contribution to the city is the equestrian statue of Peter the Great, designed by the Frenchman Étienne-Maurice Falconet, later called the "Bronze Horseman," after Pushkin's poem (1833) of that name. St. Petersburg symbolizes Russia's turn to Western culture, and, as such, is a historic rival of Moscow, which symbolizes traditional Muscovite culture.

JACK KOLLMANN

SAINT-SIMON, LOUIS DE ROUVROY (1675–1755), duke and peer of France, whose memoirs depict courtly life and politics during the reign of Louis XIV and the regency. Saint-Simon was the offspring of a favorite of Louis XIII.

Having lost his father at the age of eighteen, he served in the army and tried to gain prominence at the court. Soon, however, disappointed by Louis XIV's perceived neglect of the nobility, he retired from the military and incurred the king's disfavor. Instead of a promising career, he thus embarked upon the path of a clandestine and critical observer of the court.

Although removed from the king's favor, Saint-Simon had powerful allies and informants: his beloved wife, Marie-Gabrielle de Lorges, duchess of Saint-Simon, who remained in Louis XIV's closest circles in spite of her husband's precarious position, and to whom he owed regular invitations to the much coveted royal secondary residence at Marly; Philippe II, the duke of Orléans, the king's nephew and future regent; a state chancellor; several ministers who formed with François Fénelon the circle of Louis, duke of Bourgogne, heir to the crown and its would-be reformer. Thus Saint-Simon gained close knowledge of state politics in which he even participated briefly during the regency. Living at the court from 1691 through Louis XIV's death in 1715 to the regent's in 1723, he saw, listened, and took secret notes at night, in a small dressing cabinet behind his Versailles apartment. He composed numerous genealogies, timely memos to influence decisions of etiquette and rank politics, and even a bitterly critical anonymous letter to Louis XIV that he had the courage to circulate during the monarch's lifetime, in spite of a recognizable personal style of writing.

After he retired from the court, Saint-Simon came upon a detailed journal kept by the well-known courtier Philippe de Courcillon (the marquis of Dangeau). Shocked by its boundless flatteries and "lies," he reread and annotated it between 1729 and 1739 and, at the age of sixty-four, set out to write his own journal, a truthful "history of his time." His monumental *Mémoires*, 2,754 manuscript pages narrating court intrigues and crown politics over thirty-two years (1691–1723), encompass over seven thousand characters depicted with inimitable insight and wit, and lament the chaos introduced into the kingdom by absolutism and predict its demise. The narrative was destined by its author to "remain under the safest locks" for at least fifty years after his lifetime. His wish was granted: a first, incomplete, version was published

in 1788, and not until 1829–1830 did a first complete edition appear in French. By presenting a unique backstage view of Versailles, in spite of a certain partiality admitted by the author and due to his distinct noble ethos, his memoirs give an exact picture of daily life at court and of its factions and intrigues, and constitute an important source for court sociologists and historians. Testifying to Saint-Simon's unique vision and style, his memoirs have also inspired French novelists including Stendhal and Marcel Proust, and they remain a masterpiece of early modern French literature and of the memoir genre as a whole.

SALAMANCA, SCHOOL OF. A group of sixteenth-century Spanish moral theologians, also sometimes called the Neoscholastics, centered at the universities of Salamanca and Alcalá de Henares. Largely members of the two most powerful religious orders, the Dominicans and the Jesuits, they were concerned with political rule, tyranny, morals, law, economics, and the justice of war and conquest. Their writings, though steeped in Aristotle, St. Augustine, and St. Thomas of Aquinas, engaged directly with the imperial, political, and economic challenges of the sixteenth century. The outstanding Neoscholastics were the Dominicans Francisco de Vitoria (1492–1546), Domingo de Soto (1495–1560), and Melchor Cano (1509–1560), followed a few decades later by the Jesuits Luis de Molina (1535–1600), Francisco Suárez (1548–1617), and Juan de Mariana (1535?–1624). Several of the movement's leading figures represented Spain at the Council of Trent.

The tension between the Gospel and the flow of silver and gold from America was important to the Dominicans, a mendicant order. Commerce seemed to be replacing land as the source of wealth, which some called ultimately impossible, and others called simply pernicious. The Dominicans believed economics was a human activity whose objective must be to satisfy needs without sacrificing morality. They were concerned not with how well the economy was running but with how fair it was, and some of their fiercest debates concerned price ceilings and the just price. Buying and selling, in short, were matters of justice and equality.

Vitoria, who taught in Paris, Valladolid, and Salamanca, is often considered to have established the foundations of international law, which later would be elaborated upon by Hugo Grotius (1583–1645). Vitoria's starting point was the conquest of America, a testing ground for *dominium*. In 1539, in lectures entitled *De Indis* and strongly influenced by Aristotle, Vitoria argued that the Indians were rational, and therefore the crown had no right of sovereignty or property rights over

them. Vitoria further rejected the notion that Indians were what Aristotle called slaves by nature. A public debate on the matter with one of his contemporaries, Juan Ginés de Sepúlveda (Charles V's tutor and his generation's supreme authority on Aristotle), was held in Valladolid in 1550–1551. It was also attended by the Indians' great defender, Bartolomé de las Casas (1484–1566), who proclaimed the Indians' innocence and their eagerness to become Christians.

In the political realm, the Neoscholastics elaborated upon natural law theory, building upon Aquinas and Aristotle to construct a plausible and moral basis for human law. In particular, Soto, in his six-volume *De la justicia y del derecho* (1556), offered guidelines for ensuring that justice and the common good were the ultimate arbiters of rule. All the Salamanca thinkers believed a king was bound by the rule of law, and at one time or another considered such controversial issues as tyrannicide and popular representation.

The Jesuits were less bound than the Dominicans to the teachings of Aquinas, and the two orders sometimes clashed on theological issues, particularly about metaphysics, predestination, and will. Both Molina's work on grace (1588) and Suárez's *Disputationes metaphysicae* (1597) were highly influential throughout Europe.

SALONS. The salon was a venue for intellectual sociability that took form in the seventeenth century and flourished in the eighteenth but only acquired its name in the nineteenth, after it had been supplanted at the heart of the world of letters and ideas by more democratic, masculine, and politically oriented institutions. In the seventeenth century the gatherings later classified as salons were called *ruelles* (after the corridor beside the bed on which the hostess received her guests) or *réduits* (alcoves) or, as would be most common in the eighteenth century, were referred to simply by the day of the week on which they took place: Mademoiselle de Scudéry had her “Saturdays,” Madame Geoffrin her “Mondays,” and so on.

Those assemblies recognized in retrospect as “salons” differed from other forms of social and intellectual exchange in well-recognized ways: by gathering intellectuals and socially prominent men and women on a regular basis in a woman’s home for conversational exchanges on issues of mutual interest. But the fact that this venue for intellectual sociability lacked a name during the period when its importance was most evident and its influence strongest suggests some of the ambiguities attached to this unofficial social form.

Which among the assemblies that aspired to offer both pleasure and instruction should be considered salons? At what point did an assembly veer so far toward gaiety in one direction or high-mindedness in the other as to blur the boundaries with parties at one extreme or professional meetings at the other? How widespread was the phenomenon? Relatively few of these assemblies managed enough longevity and appeal to be truly important, but how many other salons or would-be salons met briefly or in obscurity, and to what effect? A salon was easy to establish—there being no formal prerequisites to meet or permissions to acquire—yet difficult to pull off. What blend of ingredients—the intangibles of the hostess’s personality and the participants’ chemistry, the tangible patronage available to be dispensed there—made for success? Though it was by definition hosted by a woman in her private quarters, how central or marginal was the *salonnière* (another term of nineteenth-century invention) to its intellectual pursuits? As in any leisure entertainment, the hostess was understood to direct her

guests’ activities, yet the serious business of the evening turned, as did the meetings of academies and male coteries, on the attending men of letters who were her guests. It might even turn on the husband in the late eighteenth century, when several salons were led by a married couple (Condorcet, Helvétius, Suard), though the fact that the masculine construction *salonnier* was never coined implies the continuing identification of the venue with its female host.

Salons flourished in France, especially in Paris, but they could also be found in the French provinces and elsewhere in Europe, notably in Berlin. For antecedents one can point in the sixteenth century to intellectual coteries surrounding Marguerite de Navarre and other learned women at the French court as well as to occasional urban literary circles such as the one held in Poitiers by Madeleine and Catherine des Roches. But the first fully developed salon is generally held to be that founded by Catherine de Vivonne, marquise de Rambouillet, in the 1630s at her home, the Hôtel de Rambouillet, in Paris. In her *chambre bleue* she orchestrated light entertainments, poetry readings, serious discussions, even dramatic productions.

Later in the seventeenth century, influential venues that likewise centered their sociability on literary pursuits were established by such talented women as Mademoiselle de Scudéry, Madame de La Fayette, Mademoiselle de Montpensier, Madame de La Suze, Madame de Sablé, and Ninon de Lenclos. Writers including La Rochefoucauld, Paul Pellisson, Gilles Ménage, Charles Perrault, and Charles de Saint-Évremond offered up their own works in these salons, and amateurs among the *gens de bonne compagnie*, men and women alike, tried their hand at composing literary pieces, often as a collective activity. Several original genres emerged in the salon to shape the development of French literature generally: the word portrait that was so influential in creating a new language of emotions and character psychology, *précieuses* verses and allegories (such as Mademoiselle de Scudéry’s *Carte de Tendre*) that enriched the French language with new concepts and purged it of old usages, neochivalric romances, and other brief fictional narratives that evolved into the modern novel.

The participation of women in these early salons reflected the vast expansion of the literary field effected by the new print capitalism. Women probably accounted for at least an equal proportion of the increase in readers and writers over the course of the century. As a cultural venue sharply divergent from the masculine world of humanist erudition, the salon seemed to promise that men and women would advance side by side as creators and interpreters of modern literature. Late in the century, however, as the literary field coalesced once again in a hierarchical and masculine structure, women were increasingly steered into minor genres (occasional poems, fairy tales) and into marginal roles as consumers rather than producers of culture, inspirations to creativity rather than the inspired.

The prominence of literary pursuits in the early salons has led some to see them, quite incorrectly, as apolitical and as distinguishable on those grounds from the overtly politically oriented salons of the eighteenth century. These early salons were deeply, though subtly, political in original ways. Intertwined with the new literary genres they pioneered, seventeenth-century salons incubated a discourse of innovative ideas—*honnêteté*, meritocracy, and feminism—that acknowledged and celebrated the distinctive kind of community they constituted and the transformations in social practice being effected by the dynamics of salon society. Both this discourse and those dynamics would have far-reaching consequences on social organization in the longer term. This tripartite discourse was political in the sense not of formal politics but of asserting claims about power relationships in the salons where they were articulated and, by extension, in the world of absolutist authority in which salons dwelt.

The ideal of *honnêteté*, ‘politesse’, prescribed a model of sociable behavior (*moeurs*) that was refined, orderly, moderated, lofty in spirit but (unlike family, state, and corporate society) nonhierarchical. Its quintessential discursive practice was reciprocal conversation among equals rather than disquisition or prescription by superiors. In the case of the *honnête homme* or the *honnête femme*, disciplined behavior emanated from inward character rather than being imposed by external constraint.

Within salons ruled by *honnêteté*, character and manners were said to count more than the criteria of

social status operative in Old Regime corporate society. The person of whatever rank or lineage whose personal and intellectual qualities (his or her “merit”) were pleasing in company was preferred to the person of even the loftiest birth but rough manners. This evocation of meritocracy expressed a reality of salon life. The women who hosted salons, as well as the men and women who attended them, might come from traditionally dominant noble families, but just as often they were recently ennobled or non-nobles who were distinguished for their wealth or wit. By mixing individuals of varied statuses, salons fostered a new pattern of egalitarian relations within the very heart of hierarchical society. Salons, then, provided a way for aristocratic society to absorb newly powerful individuals and families into the Old Regime elite without overturning established hierarchy.

A third discourse emerging from the very nature of the salon reimagined gender difference in ways that contested received notions of hierarchy between women and men, feminine and masculine. Some salon writings claimed that observable differences between men’s and women’s behavior were not innate or “essential” but merely socially prescribed, the effect of “custom.” Others accepted gender differences as “natural” but deemed them complementary in ways that advantaged women. Either way, women were seen as suited for spheres of activity broader than household and family.

Again, this discourse expressed a reality of salon life, for the salon was the one intellectual space to which women were admitted and in which they might exercise informal cultural authority. There, they read and wrote, voiced their judgments, granted or refused patronage to men and women of letters, contributed orally and through letter writing to networks of opinion. Women’s authority in salons was most commonly grounded in a gendered sense that feminine qualities—sensibility, delicacy, and intuition—grasped the rules of polite conversation and reciprocity better than masculine reason and so could insulate intellectual sociability from practices of contestation that structured male domains (intellectual and military).

The prominence of women in salons, however, generated tension within the world of letters and sociability about the part women should play in

society and culture. It made women vulnerable to insult or mockery, wrath or scorn from those who decried the three revisionary salon discourses and their revisionary social underpinnings. From Molière's *Les précieuses ridicules* (1659) through Nicolas Boileau's "Satire on Women" (1694) to Jean-Jacques Rousseau's *Émile* (1762), commentators denounced women who aspired to cultural authority as agents of corruption in the literary world, in society, and in their neglected families.

The renowned salons of the eighteenth century adapted the main structuring features of the early salons to evolving intellectual, social and political contexts. There were still salons, such as Madame de La Ferté-Imbault's, that played rhetorical and chivalric games. But as Enlightenment thought developed its critical edge, as the philosophes set out (in the words of the *Encyclopédie*) "to change the common way of thinking," discussions in salons turned critical as well. The marquise de Lambert, Madame Geoffrin, Julie de Lespinasse, Madame Du Deffand, Madame Necker, and Madame d'Épinay hosted centers where disparate philosophes could form an intellectual community with one another as well as a community of discourse and manners with persons of education and power. In salon conversations, reformist ideas were introduced, reshaped, and disseminated to those who might enhance them in theory or apply them in practice.

The ties between the Enlightenment and salons far transcended the mere presence of philosophes in them: new visions of society diffused by the Enlightenment bore the imprint of the sociable norms and social dynamics that lay at the heart of salon society from its beginnings. The salon norm of *honnêteté* and moderated exchanges of views broadened into a claim that civil society ought to conform to the practices and norms of sociability and that societies should be judged by the refinement of their *mœurs*, their "civilization." The meritocratic and universalistic rhetoric of the salons ripened into a new vision of social relations as egalitarian rather than hierarchical or corporate. In the privacy of the salon, outside the political space defined by absolutism, a reconfigured "public" learned to form and express opinions on political matters. In short, the salon emerged in the eighteenth century as one of the institutions of the "public sphere" that prepared a

new kind of political participation for an expanded elite.

Enlightenment salons continued to serve as places where women could educate themselves, participate in literary and intellectual life, and form networks of friendship and correspondence. The character of salons as women's networks became particularly salient in the *salonnière-protégée* networks that abounded there. Madame de Tencin initiated Madame Geoffrin, who trained both her own daughter, Madame de la Ferté-Imbault, and Madame Necker; the last apprenticed her own daughter, Germaine Necker, later to gain fame as the Romantic writer Madame de Staël. Yet one of the puzzles about salons as women's institutions is the fact that whereas the ideals of sociability ("fraternity") and social egalitarianism would be enshrined by the Revolution, neither gender equality nor the participation of women in the public political sphere would accompany those other major features of salons into the new social order.

The need to explain why women's roles in salons did not translate into rights of citizenship in the modern liberal state continues to prompt reexaminations of salon history: the extent to which the roles women played in salons were integral to the formation of opinion; how notions of gender difference, upon which women's authority in salons had rested, came to justify exclusion of women from modern politics; whether salons, despite their independence from absolutism's political space and despite their egalitarian rhetoric, were yet institutions bred by and limited to aristocratic forms of society that, like salons, fell to the margins as the eighteenth century came to an end. Such issues make the history of salons important for understanding both the Old Regime and the origins of modernity.

SALZBURG EXPULSION. On 11 November 1731 Leopold Anton von Firmian, the Catholic archbishop of Salzburg (reigned 1727–1744), ordered the expulsion of all Protestants from the archbishopric. Poor and landless Protestants were ordered to leave within the week; householding Protestants were given two months. The order affected more than twenty thousand peasants, mostly from the Pongau region (about thirty miles south of Salzburg)—the largest religious deportation in early modern European history after the expulsion of Huguenots from France at the revocation of the Edict of Nantes in 1685.

For decades Protestantism had flourished almost unencumbered among the peasants in the alpine valleys south of Salzburg. Not long after his election as archbishop in 1727, Firmian tried to exert stronger administrative and pastoral control over the remoter regions of his see. His efforts provoked resistance, which became widely publicized throughout Germany with the publication, in June 1731 in Nuremberg, of a document pur-

portedly stating the grievances of nineteen thousand oppressed Salzburg Protestants, a considerably larger number than Firmian had anticipated when he began his re-Catholicization campaign. The growing regional rebelliousness and the surprisingly large size of the Protestant minority prompted Firmian to turn to expulsion as a solution.

The first exiles left Salzburg at the end of November. They spent the winter wandering in southern Germany, unable to find a permanent home. When the bulk of the householders were expelled in April 1732, the king of Prussia offered his lands as a destination for the refugees. East Prussia was relatively unpopulated, and King Frederick William I (ruled 1713–1740) was happy to have immigrants to populate it. Prussia administered a convoy system to transport immigrants to their new homes. By 1734 twelve thousand refugees were settled in East Prussia.

One consequence of the expulsion was that Prussia solidified its identity as the political bulwark of German Protestantism, which it had first achieved by receiving Huguenot refugees in 1685. A massive outpouring of sermons and pamphlets by politically active Protestants drew attention to the plight of the emigrants as they made their way to Prussia. The expulsion was therefore a public relations disaster for political Catholicism in Germany. The “legend” of the Salzburg expulsion was as potent in the cultural clash between German Protestantism and Catholicism in the nineteenth century as it was in the eighteenth.

JOHN THEIBAULT

SANITATION The word “sanitation” only entered the English language in the nineteenth century, and the term is inextricably linked with integrated water and sewer systems. Lacking such technologies, early modern Europeans are often

reckoned to have lived without sanitation. Their epidemiology of the time might seem to support this contention: three out of every ten babies born in Geneva between 1580 and 1739 died by their first birthday and the infant mortality rate in late seventeenth-century London was over one in four. Many of these deaths were caused by dirt-related infections like infantile diarrhea—what contemporaries termed “griping in the guts.” Moreover, there are many vivid complaints of noxious conditions in early modern cities—one account of 1670s Edinburgh, for instance, claimed that one could not step anywhere in the streets without treading on turds.

Appearing in an Englishman’s denunciation of all things Scottish, this claim was designed to promote prejudice. The charge also reveals how early modern people did indeed discriminate between cleanliness and dirt. Their sanitary technology rarely consisted of more than cesspits, chamber pots, and carts to carry ordure from their communities, but early modern Europeans possessed notions of public health and collective salubrity. Furthermore, scholars are now revealing the extent to which they sought to regulate and cleanse their environments.

URBAN DIRT AND URBAN ORDER

Such efforts were rarely entirely successful—early modern utopian writing appreciatively delineated the cleanliness of the ideal community—but civic authorities regularly commanded that streets be swept and nuisances removed. Such sanitary regulation was linked to wider conceptions of order. Noxious wastes shaped social and symbolic geographies. Offensive trades such as butchers and tanners were generally confined to particular districts, often downstream or outside city walls. In Paris the bodies of condemned criminals were buried in the municipal dump at Montfaucon. In central Europe the emptying of cesspits and the removal of waste were associated with other “dishonorable” trades. Between the sixteenth and nineteenth centuries, for instance, the “night-king” (chief latrine-cleaner) of Augsburg had to share a residence with the city executioner. Furthermore, precepts for cleansing streets often coincided with drives to rid communities of vagrants and “disorderly persons.”

MIRE AND MEDICINE

Medical beliefs further encouraged sanitary care. Throughout the early modern period it was generally believed that plague and other epidemic diseases were caused or spread by corrupt airs or miasma produced by rotting organic matter. Environmental regulation thus sought to prevent evil smells. Perfumes and fumigants were used to purify infected spaces; street cleaning often intensified in periods of epidemic. In late-sixteenth- and early-seventeenth-century London, for instance, householders were required to sweep in front of their houses every morning and evening. During the early seventeenth century the boards of health of northern Italian states energetically sought to remove dunghills and other sources of miasma from the towns and villages under their jurisdiction.

Early modern doctors knew of “miasma” from a range of classical works, especially those of the ancient Greek physician Hippocrates. From the mid-seventeenth century medical authors became preoccupied with one strand of his work—the relation between epidemics and the airs, waters, and weather of particular places. Population statistics derived from bills of mortality and parish registers revealed geographical variations in the incidence of fevers and other fatal diseases; eighteenth-century analyses of air by natural philosophers like the English chemist Joseph Priestley sought to isolate mephitic substances that caused disease. Many eighteenth-century doctors proposed ways of reducing mortality by draining marshes, ventilating buildings, and reorganizing the environments and the ways in which people lived. Such interventions in the physical environment were often associated with proposals for the police of national populations. The term “police” had wider connotations than does its modern usage. It expressed a desire for the regulation of all aspects of life in order to achieve a smoothly functioning polity and (crucially) a healthy and productive population. The work of the German professor Johann Peter Frank exemplified the scale of this concept. His six-volume *System of Medical Police* (1779–1817) recommended the regulation of everything from midwifery and marriage to water supply and street cleaning.

The impact of medical police was less than the ambition of its advocates. Nevertheless, eighteenth-century Europe did see medically inspired reforms

of daily life. In the 1750s, for instance, the British physicians Stephen Hales and John Pringle oversaw the installation of ventilators in the notoriously disease-ridden London prison of Newgate. In the 1780s the French Royal Society of Medicine not only declared that the Cemetery of the Holy Innocents in Paris was so full that it was a threat to public health but also had it closed and all human remains removed from it. More generally there was a considerable extension of new forms of sanitation, bathing and hygiene in hospitals, barracks, and similar institutions.

WATER SUPPLIES

These reforms were restricted by the general scarcity of water in preindustrial Europe. Clearly, this was a pressing problem in arid regions like southern Spain, where elaborate systems of water regulation were developed during the Middle Ages. But water was also a limited and costly resource in northern European communities not associated with drought. In eighteenth-century Paris, for example, a cubic meter of water would have cost a laborer more than two days' wages. Households spent much time and energy fetching water from rivers, streams, and wells. Communal life literally revolved around water sources. In larger urban centers public authorities maintained wells and sponsored schemes to pipe water to public fountains or conduits. In 1585–1587, for instance, Pope Sixtus V established the Acqua Felice, redeveloping the waters of an ancient aqueduct, the Aqua Alexandrina, in order to supply the eastern districts of Rome. Princely and aristocratic fountains like those at Louis XIV's palace of Versailles were, by contrast, ostentatious displays of conspicuous consumption.

The comparative scarcity of water remained a structural characteristic of European society throughout the early modern period. However, the sixteenth and seventeenth centuries saw the establishment of the first water companies piping supplies to the houses of private paying customers. The London Bridge Water Company (established 1582) and New River Company, which began supplying London in 1613, were among the first such concerns. They soon had imitators. By around 1700 one could rent a piped water supply in nine of the ten largest English provincial towns. Such companies were unevenly spread across Europe—no water

company operated in Paris until after the French Revolution—and the supplies they offered were unreliable and intermittent. However, they did pioneer new technology. Eighteenth-century water companies were among the first users of steam power, and thus laid the foundations for the subsequent industrialization of urban water supplies. In the nineteenth century the intellectual heritage of medical police combined with such technological developments to produce the public reforms that are conventionally associated with the term sanitation.

MARK JENNER

SANTA CRUZ, ÁLVARO DE BAZÁN, FIRST MARQUIS OF (1526–1588), Spanish admiral. Born in Granada to Álvaro de Bazán the elder, who contracted and commanded both Atlantic squadrons and Mediterranean galleys, the younger Bazán began early to serve alongside his father and, in 1543, fought at Muros Bay against the French. In 1554, he sailed in the armada that took Philip II of Spain to his marriage with Mary Tudor of England. On the death of the elder Bazán in 1555, he assumed command of his Atlantic squad-

ron. With peace in 1559, Bazán took command of eight galleys to patrol the Strait of Gibraltar. In the war on corsairs, he closed the harbor of Tetuán, aided by engineers, and in 1564 participated in the capture of Peñón Vélez de la Gomera, an island off the coast of northern Morocco. In 1565 he joined García de Toledo's armada for the successful relief of Malta, under siege by the Turks. Philip II promoted Bazán to command the Neapolitan galleys, and in 1569 made him Marquis of Santa Cruz de Mudela. On his estates in La Mancha, Santa Cruz constructed at Viso del Marqués an Italianate palace decorated with murals of his naval triumphs.

At the Battle of Lepanto in 1571, Santa Cruz proved brilliant in command of the Holy League rearguard and countered an attempted Turkish rally to ensure the league's victory. In 1572 he captured a Turkish galley and liberated its slaves, an episode related in *Don Quixote* by Miguel de Cervantes, a Lepanto veteran who called Santa Cruz "that thunderbolt of war . . . and never defeated captain." Interested in shipbuilding, Santa Cruz designed six galleasses (large warships using oars and sails) for Naples.

In 1578 he took command of the royal galleys of Spain. His quick response to the defeat and death of Dom Sebastian in Morocco saved Portugal's remaining strongholds at Tangier and Ceuta. For Philip's annexation of Portugal in 1580, Santa Cruz assembled a vast armada at Cádiz for a joint campaign with the duke of Alba. Alba invaded from Badajoz and marched to the sea at Setúbal. Santa Cruz sailed with his armada, assisted the duke of Medina Sidonia in the subjection of the Algarve, and met Alba. He loaded Alba's army aboard his armada and landed them at Cascais, downriver from Lisbon. The forces of Dom António, Philip's rival, had to abandon their positions upriver to face the invaders. Alba, supported by Santa Cruz's galleys, routed them, capturing Lisbon and the Portuguese navy.

Backers of Dom António, with covert aid from France and England, gained control of the Azores, save for São Miguel. Terceira was their stronghold. In 1582 Santa Cruz assembled an armada against the Azores and in July sailed from Lisbon. Off São Miguel, he encountered French admiral Philip Strozzi and the Portuguese count of Vimioso with

thirty large and over thirty small armed vessels. He had twenty-five big ships, including two Portuguese galleons. After several days of maneuvering, on 26 July Strozzi forced the Atlantic's first big blue-water battle. After a hard fight, Santa Cruz emerged victorious. In 1583 he returned with an invasion force and conquered Terceira. Triumphant, he suggested that he invade England, which backed Dom António and Dutch rebels. Philip made Santa Cruz Captain General of the Ocean Sea and a grandee, but shelved the suggestion and allowed Santa Cruz's armada to dwindle.

In 1585 war erupted between Philip and England. Francis Drake attacked Vigo in Spain, then sacked Santo Domingo and Cartagena in the Caribbean. Philip ordered Santa Cruz to collect an armada of thirty-four ships to pursue Drake and asked him to submit a plan for the Enterprise (invasion) of England. Santa Cruz proposed an armada of more than 500 ships, large and small, to carry an invasion force from Spain. Philip decided on a smaller armada that would support an invasion army from the Spanish Netherlands.

In April–May 1587 Drake attacked Spanish preparations at Cádiz and the Algarve. Unprepared, Santa Cruz did not sail till July. He met the homeward-bound treasure fleets in the Azores, but on his return his armada was battered by storms. In Lisbon he found new orders to sail with 6,000 reinforcements to join Parma in the Narrows and cover his invasion of England. Storm damage, shortages, and foul weather held him to port, despite Philip's repeated demands that he sail. Under criticism and in failing health, he died on 9 February 1588. An aggressive and innovative commander, he might have succeeded, Spaniards believed, had he lived long enough to command the armada he had created.

PETER PIERSON

SARMATISM. Sarmatism grew out of Renaissance theories about the genealogy of the Slavs. It developed into a peculiarly Polish-Lithuanian way of viewing the world and the place of the Commonwealth in it, and in the seventeenth and eighteenth centuries it came to describe aspects of a way of life associated with the gentry. Sixteenth-century Polish historians, drawing on classical and medieval notions of geography and cartography, elaborated a myth of the Sarmatian homeland of the Slavs in general and the Poles in particular. The myth came to have several components; it identified Sarmatia with the Jagiellonian Commonwealth of the Two Nations and prized the Commonwealth's political system as superior to all others, and it limited the Sarmatian ethnogenesis to the political nation, that is, the gentry (or *szlachta*) of Poland-Lithuania, thus excluding the burghers and peasants, who were seen in extreme cases as members of another "nation."

Polish Sarmatism passed through a number of phases. In its initial period, from the reign of Stephen Báthory (ruled 1575–1586) to the death of Władysław IV (ruled 1632–1648), the original Renaissance components focusing on the historical genealogy of the Sarmatians were reworked in a new, baroque context. At first, Sarmatism—which divided the gentry from all other inhabitants of the Commonwealth—served to unite a multiethnic and multiconfessional "noble nation." We soon find, however, the beginnings of a new divide between the "foreign," cosmopolitan culture of the magnates and the nativist, peculiarly Sarmatian identity of the gentry, especially the middling and poorer gentry. This division would deepen in the second, peak period of the development of Sarmatism (from 1648 to the death of King John III Sobieski in 1696), with the growing servitude of the peasantry and the further weakening of the cities. In this period, the Sarmatian myth was consolidated, taking on mystical and messianic colorations. Sarmatism now became the way of life and the worldview of a traditional, exclusive, xenophobic, more decidedly

Catholic landed gentry. It emphasized gentry hospitality, patriarchal values, grandiloquence, and ostentation. There were certain paradoxes here; for one, a nation that saw itself as the bulwark of Christendom (*antemurale christianitatis*) eagerly adapted eastern (Turkish or Tatar) elements in custom, dress, lifestyle, and language.

The zenith of Sarmatism coincided with the beginning of the decline of the Commonwealth. In fact, some later blamed the fall of Poland-Lithuania on certain aspects of Sarmatian culture—gentry anarchy, the overly jealous defense of personal freedom at the expense of royal power and the commonweal, even gentry ostentation and love of speechifying. The rule of the Saxon kings Augustus II the Strong and Augustus III in Poland-Lithuania (1697–1763, a period later known as the "Saxon Night") was characterized by a certain "Sarmatian degeneracy." Reactions against Sarmatism that began in the 1740s (with Stanisław Konarski and other Piarists, as well as the Jesuit Franciszek Bohomolec) gained momentum under Poland's last king, Stanisław II August Poniatowski (ruled 1764–1795). There was a growing division between a western-looking reform movement, which followed models of the Enlightenment and included burghers and peasants in its purview, and a traditional, now backward, gentry, which still equated Sarmatian values with patriotism. The latter group was exemplified by the participants in the Confederation of Bar in 1768–1772.

Sarmatism lived on after the partitions, especially in petty gentry circles in the east (in Lithuania and Belarus, but also Ukraine), and it became the object of romantic nostalgia following the failed November Uprising (1830). Some still find elements of Sarmatian mentality in modern Polish worldviews.

DAVID FRICK

SARPI, PAOLO (PIETRO) (1552–1623), Italian theologian, scientist, and historian. Paolo Sarpi became notorious as the defender of Venice against the papacy during the Venetian Interdict of 1606 and as the author of a controversial history of the Council of Trent. Before 1606 he was an obscure ecclesiastic, a member of the Servite order; after 1606 he was known throughout Europe. Before this turning point, Sarpi was free to cultivate a range of intellectual interests, as his *Pensieri*, a collection of aphoristic notes on scientific and philosophical topics, demonstrate. The ones on religion are written from a notably detached and strictly philosophical point of view. The *Pensieri*, which only began to be studied thoroughly in the twentieth century (the complete corpus was only published in 1996), have had great influence on the scholarly interpretation of the “private” Sarpi. He was certainly abreast of the most advanced scientific and philosophical ideas of the time and was a leading member of the milieu of Galileo Galilei (1564–1642). He was also, to say the least, indifferent to formal religion except as an instrument of social and political organization, and many see him as a libertine and a virtual atheist.

In the 1590s and the early 1600s the level of jurisdictional and political conflict between Venice and Rome was rising. Venice claimed to control navigation in the Adriatic, Rome (backed by the Habsburgs of Spain and Austria) claimed freedom of navigation there; Venice had friendly contacts with non-Catholic states; in 1604 Venice forbade the construction of any new churches or shrines without permission from the state; in 1605 Venice forbade any further transfers of real property to ecclesiastical institutions without permission from the state; and in the summer and autumn of 1605 Venetian authorities arrested two delinquent clerics in mainland cities. In the late spring of 1606 Pope Paul V (reigned 1605–1621) excommunicated the Venetian leadership and interdicted all clergy in the Venetian dominion from performing their functions. Venice defied the interdict and ordered all clergy to continue in their duties, and the affair rapidly escalated into a European crisis. Sarpi was recruited by the Venetian government to act as adviser and publicist, and he wrote many effective memoranda and works for publication in defense of Venetian jurisdiction. After much hard negotiation,

in which Sarpi was closely involved, the interdict was lifted in April 1607. Sarpi was excommunicated in early 1607 and, targeted for assassination, was almost killed in October. But he retained his post and his influence on government policy for the rest of his life and became a prolific writer on church-state relations. He also maintained a network of epistolary and personal contacts with many influential individuals throughout Europe, Catholic and Protestant, as a way of acquiring support for Venice and reinforcing opposition to Rome and the Habsburgs.

As a young man Sarpi obtained firsthand information from a number of ecclesiastics who had participated in the Council of Trent (1545–1563) and had access to some of the private correspondence between Rome and the papal legates who had steered the sessions of the council, as well as other unpublished sources. Long before beginning his history of the council in the 1610s, Sarpi was convinced that the papacy had manipulated it to thwart Catholic sovereigns like Charles V (1500–1558), defeat the movement for internal reform, and reinforce its own preponderance in the Catholic world. Some historical narratives of the general history of the sixteenth century were in print, as were the decrees on doctrine and ecclesiology passed by the council. But the normal process by which these decrees would have been subjected to open debate and interpretation by competent specialists had been explicitly forbidden by Rome in 1564, as had the publication, which would also have taken place in the normal course of events, of the *acta*, or “acts,” of the council (the record of the deliberations and proceedings; publication of them began only in the late nineteenth century). In result the history of the Council of Trent was more or less an arcanum until the publication of Sarpi’s celebrated *Istoria del concilio tridentino* (History of the Council of Trent) in London in 1619. This work was considered poisonous and scandalous at Rome and has been challenged consistently by Catholic historiography. It is indeed moderately tendentious, as Sarpi fully intended it to be, but overall its veracity and its classic status are not in doubt. The influence it had on the perception of the papacy in Europe throughout the early modern period is incalculable.

WILLIAM McCUAIG

SAVOY, DUCHY OF. Situated in the western Alps with its capital at Chambéry, the duchy of Savoy began as a county of the Holy Roman Empire in the Middle Ages. During the reign of Amadeus VIII (1391–1436), the duchy acquired significant territory in Piedmont, east of the Alps, and its ruler was promoted to the status of duke by the Holy Roman emperor in 1416. In the fifteenth century, the duchy of Savoy included both Nice and Geneva, but by the sixteenth century the focus of the duchy turned east of the Alps. Savoy and the other western territories were difficult to defend against the powerful neighbor state of France. The plains of Piedmont offered more fertile land, greater population, and more possibility of expansion. Turin, the largest city in Piedmont, became the capital of the duchy in 1560.

The survival of the duchy as an independent state was precarious throughout the sixteenth century. Riddled by factions of *savoïardi* and *piemontesi* internally, it was also subject to the whim of its more powerful neighbors, France in the west, and the Habsburg domains in the east. Although Savoy had strategic importance as the “gatekeeper of the Alps,” it could not stand up to the major powers by itself. Rather, it could only be a useful ally to further the aims of one or another power. In general, France and Spain recognized that Savoy provided an important buffer between their states, and the game

of diplomacy often worked well for Savoy. At others times, it caused disaster. During the Italian Wars of the sixteenth century, France overran and occupied the state in 1536. Duke Emanuel Filibert, through an alliance with Spain, managed to reconstruct the Savoyard state in 1559 in the peace of Cateau-Cambrésis. Subsequent dukes were less successful, and once again, Savoy was reduced to the status of a French satellite until the late seventeenth century.

The turning point for the state of Savoy in the early modern era was the reign of Victor Amadeus II (1675–1730). Not only did this ruler manage to reacquire the territories lost to Savoy-Piedmont in the preceding century, but he also carried out reforms that would make Savoy a model of efficient government in the eighteenth century. Due to his participation in the War of the League of Augsburg (1688–1697) and the War of the Spanish Succession (1701–1714), Victor Amadeus II was awarded the island of Sicily in the Peace of Utrecht in 1713. Although Sicily was later exchanged for Sardinia, both islands brought the dukes of Savoy the title of king. In the nineteenth century, the western Savoyard territories were finally absorbed into the French state. The kings of Piedmont-Savoy would be compensated by the crown of the newly unified kingdom of Italy.

ECONOMY

As an Alpine region, Savoy lacked many natural resources and fertile land. Its main importance stemmed from the fact that it held the main mountain passes between France and the Italian peninsula. Although towns such as Susa and Chambéry were significant entrepôts between Italian and French cities, the majority of the revenue from this trade went to foreign rather than Savoyard merchants. The territories of Savoy on the western side of the Alps were economically backward throughout the early modern era. The economy there was primarily based on subsistence agriculture. In a mountainous environment, this meant frequent shortages. Feudal lords subjugated the peasantry. On the eastern side of the Alps, however, the territory of Piedmont had fertile plains and a significant silk industry in Turin. The main importance of Turin, however, was not economic but political. As the center of government, Turin held the most lucrative offices in the government administration.

Economic differences exacerbated social and cultural tensions between the two sides of the Alps. The old nobility of Savoy in the west spoke French and leaned toward France in alliances that often challenged the legitimacy of the central government. In contrast, most of the regions in the east spoke Italian, and often leaned toward the empire. Conflicts between the Savoyard nobility in the west and the central government in the east increased when Victor Amadeus extended greater state control over Savoy, abolishing ancient governmental institutions in Chambéry and ending feudal dues by the middle of the eighteenth century.

RELIGION

In terms of religion, the dukes of Savoy were loyal supporters of the Roman Catholic Church. One of the greatest figures of the Catholic Reformation, François de Sales, was a native of Savoy and became the archbishop of Geneva (situated in Annecy after the loss of the city). The author of the influential introduction to the *Devout Life*, de Sales worked ceaselessly to convert the Savoyard territories surrounding the Protestant Swiss cantons to Catholicism, advocating persuasion rather than force as a means of conversion. He was canonized in 1661. A noteworthy exception to the Catholic majority in Savoy was the enclave of Protestant Vaudois in the mountains outside of Turin. The remnants of the Waldensian heresy going back to the 1100s, the Vaudois were grudgingly tolerated with the exception of major persecutions in 1487, 1551, 1655, and 1663. Victor Amadeus II carried on a war of extermination against the Vaudois from 1684 to 1687, executing or exiling and dispersing the entire community, and resettling the area with Catholics. Despite the loss of many thousands, the community somehow managed to survive.

STATE BUILDING AND MILITARY CULTURE

The state of Savoy provides historians with an interesting example of absolutism and state building in the early modern era. Without an abundance of natural resources, the state survived through its ability to play the major European powers off each other in complex diplomatic maneuvering. However, the strength of the state was also due to its efficient centralization and peculiarly militaristic culture. Although the institutions of state were in large part established under Emanuel Filibert in the

late sixteenth century, the major phase of state building took place under the reign of Victor Amadeus II one hundred years later. An energetic ruler who led his troops into battle, Victor Amadeus mobilized his small state for war to an extraordinary extent. His reforms included tax reforms based on meticulous land surveys, and state-run systems of education and poor relief. He established an increasingly professional bureaucracy that included provincial intendants, government officials who made sure that the provinces were acting in accord with the central government. Such reforms ensured the greatest amount of revenue for the centralized state. The Savoyard government was admired as a model of efficiency throughout Europe. In addition, Victor Amadeus made Turin a showplace of state power. Miles of elegant baroque arcades linked the splendid royal palace to government institutions. The architect Juvarra was commissioned to build the great basilica of Superga, on the highest hill in Turin. Visible for miles, the enormous domed structure commemorated the victorious battle of Turin (1706) that ensured the survival of the state, and it stood as a monument to the glory of Victor Amadeus II and the house of Savoy.

The centralization of Savoy has been the subject of extensive historiographical debates. Jean Nicolas has seen it as a reaction to a resurgent aristocracy in the seventeenth century. Geoffrey Symcox attributes it to the desire of Victor Amadeus for absolute power. Others, such as Samuel Clark and Christopher Storrs, have seen Savoy as a perfect model of state building in the service of war. In their view, success in war ensured the continuation of the state, and the efficient mobilization of resources for war created state institutions that in turn were a by-product of the war effort.

Savoy was an unusually militaristic society. Per capita, it had the largest army of any major European state. From the sixteenth century on, it had conscripted a peasant militia with legal rights. The nobility, unique among Italian states, maintained its militaristic identity throughout the early modern era. Very often when the nobles were not fighting in the army of Savoy, they were fighting in the armies of foreign states. Contemporaries frequently noted the quality of Savoyard soldiers and their loyalty to the state. This militaristic culture, along with efficient administration and astute diplomacy contrib-

uted to the success of the Savoyards in maintaining an independent state throughout the early modern era.

REBECCA BOONE

SAXONY. The rise of Saxony dates from 1423, when the Holy Roman emperor Sigismund gave the electorate and duchy of Saxony to Margrave Frederick of Meissen of the Wettin dynasty. The gift was consequential, unifying the regions of Thuringia and Saxony under the House of Wettin. In return, the strengthened Wettin princes were to guard the Bohemian border during the Hussite wars and protect the Holy Roman Empire's northeastern frontier against the Ottoman Empire. Saxony also possessed parts of the province of Meissen, of the Vogtland, of the Ore Mountains, and that portion of Franconia south of Schwarzburg.

POLITICS

The elector of Saxony was one of seven princes with constitutional authority to elect new emperors and was also the imperial vicar and president of the Imperial Council of Regency, making him second only to the emperor in terms of constitutional power within the empire. Saxon rulers, possessing lucrative salt and mineral mining rights, became financially powerful in the early modern era. This wealth, combined with the Wettins' ability to inte-

grate lesser nobles and cities into their territorial system, made them the strongest of all north German princes by the late fifteenth century. Saxony's location on the northeastern fringe of the empire protected it from direct imperial and papal influence; indeed, the emperor and pope relied on Saxony to guard the Bohemian border.

Saxony was divided in 1485 by the ducal brothers Albert and Ernest. The partition left the dynasty in a perilous condition but can be explained by the fact that fifteenth-century princes regarded their lands as patrimonies and tended not to think territorially. The major towns in Albertine Saxony included Dresden, Leipzig, and Freiberg. Important towns located in the Ernestine portion included Zwickau, Torgau, and Wittenberg. During the sixteenth century none of these achieved a population over ten thousand. Because the electoral title was attached to the possession of territory around Wittenberg, the Ernestine branch retained (until 1547) the electoral dignity. Both lines passed laws that guaranteed the indivisibility of their domains and the succession of the eldest son. Neither line, however, was able to create an enclosed state. Contained within Saxon borders were a plethora of independent territories. These included the domains of the counts of Henneberg, Schwarzburg, and Mansfeld, the city of Erfurt, imperial abbeys, powerful monasteries, and wealthy bishoprics. Indeed, Lutheran visitation committees sent out in the 1520s to consolidate the Reformation often had to ask peasants whether their village lay within Saxony.

Ernestine Electors John the Constant (ruled 1525–1532), and his son, John Frederick the Magnanimous (ruled 1532–1547; died 1554), were devoted Lutherans who exercised less caution in the religious-political realm than had their predecessor Frederick the Wise (ruled 1486–1525), the elector famed for protecting Luther. At the Imperial Diet of Augsburg (1530), electoral Saxony led a group that presented a summary of Lutheran religious beliefs that is now called the Augsburg Confession. The inability of this diet to resolve religious differences and the perceived threat to national institutions within the empire encouraged John the Constant to form the Schmalkaldic League in 1531. This “defensive” league consolidated the gains of the Lutheran movement.

During the time of the league's ascendancy, the Holy Roman emperor, Charles V, had been preoccupied with external dangers presented by the Turks and by France. Peace with France (1544) and the Turks (1545), combined with a grant of money and troops from Rome, allowed Charles to confront the Protestant threat. In June 1546, Duke Maurice of Albertine Saxony, himself Lutheran, committed his domain and forces to the imperial cause against his cousin and rival. The decisive battle of the Schmalkaldic War (1546–1547), fought in April 1547 at Mühlberg, resulted in defeat for the league. The Wittenberg Capitulation (May 1547) transferred most of the Ernestine lands, and the electoral dignity, to Maurice. The Ernestine line was left scant territory around Weimar, Gotha, Eisenach, and Coburg, and a ducal title. Charles's decision to preserve the Ernestine line and his annexation of certain Wettin territories from Electoral Saxony indicated the rise of imperial might and foreshadowed the decline of Electoral Saxony as a political force.

In 1618 Elector John George I rejected approaches to become king of Bohemia. He continued instead a policy of helping the emperor maintain the empire's constitutional foundation, seeking to preserve his power as elector. As war loomed, John George, an enemy of Calvinism, pledged Saxony's support to the Catholic emperor. The first phase of the Thirty Years' War resulted in a persecution of Protestants throughout the empire. Though Saxony absorbed nearly 150,000 Bohemian refugees who had been forced into exile, its position within the Protestant world was compromised. In 1631 Saxony and Sweden allied against the empire, resulting in an invasion of Saxony. After a devastating defeat at Nördlingen, Saxony made peace with the empire in 1635. Saxony was not spared: until 1648 Swedish armies used it as their base and plundered it.

The Peace of Westphalia (1648) created a system that encouraged rivalries of power, and Saxony was quickly eclipsed by Austria, Bavaria, and Prussia. Both Frederick Augustus I (Augustus the Strong; ruled 1694–1733) and Frederick Augustus II (ruled 1733–1763) realized Saxony had to expand outside Germany to survive; each had himself elected king of Poland in an unsuccessful effort to broaden the Wettin dynasty's lands. The Saxon-Polish union did not elevate Saxony's power; rather,

its economy declined due to the cost of assuming the Polish crown twice and of establishing a permanent standing army. Saxony's involvement in eighteenth-century conflicts like the Seven Years' War exposed its military frailty and contributed to further decline. Under the regency of Maria Antonia (1763–1768) and during the reign of Frederick Augustus III (1763–1827), Saxony benefited from enlightened reforms, fiscal responsibility, and a prudent foreign policy based on maintaining deferential relations toward greater powers.

ECONOMY

Between 1300 and 1600 Saxony had a diversified and robust economy. Mining, metallurgy, and smelting were crucial industries. Cobalt, tin, zinc, bituminous coal, iron, silver—all indispensable commodities—were mined in the Ore Mountains (Erzgebirge). Copper was plentiful in parts of Thuringia, as was iron ore in eastern Saxony. The growing mining industry absorbed workers, sparing Saxony the destabilizing effects of the fifteenth century's rapid population growth. Sixteen new towns with populations over five thousand were founded in this era. A significant smelting industry existed in the Thuringian Forest. Merchants from southern Germany's wealthy cities were eager to invest in Saxony; the Fuggers of Augsburg established an important foundry at Georgenthal and a smeltery at Hohenkirchen. Lucrative salt mining operations also existed in Thuringia. Because mining in Saxony did not depend on a single mineral, the boom receded slowly.

Textile manufacturing provided another crucial segment of Saxony's economy. An internationally important flax and linen industry developed in southern Saxony, centered around Chemnitz. Over three hundred villages in Saxon-controlled Thuringia specialized in cultivating woad, a plant from which a valuable blue dye was extracted. These towns enjoyed a woad monopoly and, as a result, they prospered economically. A highly developed woolen industry also contributed to Saxony's economic strength. Moreover, Saxony was advantageously situated at the center of international trade routes. Leipzig emerged by the sixteenth century as the principal entrepôt in central Europe and hosted numerous international fairs. One of Europe's larg-

est international cattle markets took place at Buttstädt.

Several factors allowed Saxony to limit the social unrest that befell other parts of Germany in the late fifteenth and sixteenth centuries. Though impartible inheritance was practiced east of the Saxon Saale River, the mining boom minimized the economic difficulties that this custom generated elsewhere. Labor-intensive viticulture along the Elbe River around Meissen and along the Unstrut River also absorbed excess population. Saxony thus suffered less from the strains of overpopulation than did other German parts of the empire. The Wettin lords successfully subordinated local nobles into a network of territorial estates, forestalling potential rivalries, and concurrently expanding the state's administrative apparatus in the countryside. Saxony also benefited from an "intermediary" system of landlordship, one based on both wage labor from free peasants and forced labor services performed on large demesnes. This unique form of landlordship kept the organization of rural communes at a rudimentary level and served to mitigate conflicts associated with the "crisis of feudalism." With the noteworthy exception of mining areas in Thuringia and the Ore Mountains, Saxony escaped the violence generated by the Peasants' War of 1524–1525 and avoided the rural unrest that plagued Upper Germany after 1570.

CULTURE

Saxony possessed impressive educational institutions: influential universities at Leipzig (1409), Wittenberg (1502), and Jena (1588); a number of remarkable secondary schools (*Lateinschulen*) for the privileged and gifted; and, after the Reformation, schools throughout the land to teach every boy and girl reading and writing. Leipzig also was an early center for book publishing (1480s) and for book trading. Humanist circles, encouraged by Duke George of Albertine Saxony (reigned 1500–1539) and Elector Frederick the Wise, emerged in Leipzig and Wittenberg. Thinkers such as Martin Luther, Philipp Melancthon, and Agricola made Saxony a leading center for humanism in Germany. All these factors were instrumental in making Saxony the birthplace of the Reformation and the home to its crucial events. Early modern Saxony's contribution to world culture cannot be underestimated: Lucas

Cranach, Johann Sebastian Bach, George Frideric Handel, Gottfried Wilhelm Leibniz, Gotthold Ephraim Lessing, and Johann Gottfried von Herder were either born in Saxon lands or developed their talents within them.

JAMES GOODALE

SCARLATTI, DOMENICO AND ALESSANDRO (Pietro) Alessandro (1660–1725) and (Giuseppe) Domenico (1685–1757), members of a renowned family of musicians, originally from Sicily. Alessandro has traditionally been credited as the founder of the Neapolitan school of opera; his son Domenico was a noted harpsichordist and composer. Not much is known about Alessandro's parents except that they were involved in Palermo's musical life and that his father, Pietro, was a tenor. Alessandro proved to be a gifted young musician and continued his studies in Rome, where he moved with his mother and several siblings in 1672.

Alessandro Scarlatti. ©BETTMANN/CORBIS

Alessandro cultivated his musical skills as well as an influential circle of friends in Rome. In April 1678 he married Antonia Anzaloni, and in the same year he was appointed *maestro di capella* of the church of San Giacomo degli Incurabili and also composed his first opera, an untitled work, for Filippo Bernini, son of sculptor Gian Lorenzo Bernini (1598–1680). Two years later, Alessandro's short comic opera *Gli equivoci nel sembiante* (1679) not only established him as one of Rome's leading operatic composers, but also introduced him to his most famous patron, Queen Christina of Sweden (ruled 1632–1654), who was living there in exile. He served as her *maestro di capella* until 1683, and she sponsored private productions of several of his operas. In Rome during this period, operas were presented only occasionally and in private to the aristocracy and to foreign ambassadors, since public opera and theater performances were banned under Innocent XI (reigned 1676–1689), who closed Rome's first public opera house three years after it had opened.

Desiring more artistic freedom, Alessandro accepted a commission from Domenico Marzio Carafa, the viceroy of Naples, and moved there in 1684, becoming *maestro di capella* at the vice-regal court at the age of twenty-four. The following year, his sixth child, Domenico, was born. As master of the royal chapel in Naples until 1702, Alessandro composed nine oratorios and sixty-five cantatas, and composed and produced more than eighty operas. His most successful operas from this period were *Il Pirro e Demetrio* (1694), his only opera to be produced internationally during his lifetime; *La caduta de' Decemviri* (1697), the first piece to employ a three-part rather than two-part Italian *sinfonia*; and *Tito Sempronio Gracco* (1702), one of his most financially successful endeavors. Significant during Scarlatti's tenure in Naples is the change from the five-act opera popular in Rome to works of three acts. He also maintained his contacts in Rome, returning there occasionally for performances of cantatas and oratorios and to put on new operas for private patrons such as Cardinal Pietro Ottoboni (1667–1740) and Cardinal Benedetto Pamphili. At the weekly concerts established by Ottoboni, he met virtuosos and composers including Arcangelo Corelli (1653–1713). One of Scarlatti's operas, *La Statira* (1690), was even given a public performance in Rome when Alexander VIII (reigned 1689–1691), Cardinal Ottoboni's uncle, reopened the theater that Innocent XI had closed; but Alexander's successor, Innocent XII (reigned 1691–1700) renewed the ban on public opera productions and finally dismantled the theater in 1697.

In 1702, with the position of the Neapolitan nobility becoming insecure due to the onset of the War of the Spanish Succession (1701–1714), Alessandro and his family left Naples and went to Florence, where he sought work for himself and Domenico from Prince Ferdinand de' Medici. Receiving commissions for several operas but no full-time job there, he took his family back to Rome, where he accepted an appointment as assistant *maestro di cappella* at the church of Santa Maria Maggiore, composing motets and masses. He remained in Rome until 1708, supplementing his income with commissions from Cardinals Ottoboni and Pamphili, and from a new patron, Marquis Ruspoli, as well as from Prince Ferdinand. In 1706 he was elected, along with Corelli and Bernardo

Pasquini (1637–1710), to the Arcadian Academy, a circle of poets and musicians devoted to a classical aesthetic modeled on Greek antiquity, and he must have met George Frideric Handel (1685–1759) at one of the Arcadians' gatherings in 1707. With the papal ban on public opera still in effect in Rome, he concentrated on oratorios, serenatas, and cantatas, although he wrote four operas for Ferdinand in Florence during this period and in 1707 went to Venice to direct two new five-act operas, which were not successful there. He returned to Rome briefly as *maestro di cappella* at Santa Maria Maggiore, but when he was offered his old position in Naples in 1708 by the new Austrian viceroy there—that city having come under Austrian occupation—he accepted it. Naples remained his center of activity for the rest of his life, as a composer and a teacher (with such students as Hasse and Quantz), although he made periodic visits to his patrons in Rome, where he was able to produce some of his finest late operas, including his last, *La Griselda* (1721).

Oratorios at that time were a substitute for opera during the seven-week period of Lent, and Alessandro wrote approximately forty of them, including *La Giuditta* (1697), based on the biblical account of Judith of Bethulia. He also wrote at least twenty-two serenatas, large festive cantatas on secular themes, often political in nature, written to commemorate important events and performed in open-air theaters. Among the more politically oriented serenatas was *Pace, amor, e provvidenza* (1714), composed for the nameday of Emperor Charles VI to celebrate the 1714 Treaty of Rastatt, one of several treaties comprising the Peace of Utrecht, which ended the War of the Spanish Succession. The libretto's allegorical figures each claim responsibility for Charles's diplomatic triumphs. Among Alessandro's most celebrated compositions are his more than six hundred chamber cantatas, both sacred and secular, most set for solo soprano accompanied with basso continuo, with lyrical poetic texts frequently focused on the theme of love. Alessandro's church music, including masses, motets, and psalm settings, spans both the *stile antico* and the *stile moderno*. He also wrote purely instrumental music, including seven toccatas for harpsichord, and twelve concerti grossi in the style of Corelli.

Domenico Scarlatti.

Alessandro Scarlatti's reputation rests largely on his dramatic compositions for the stage. The opening sinfonias of these works are of particular importance. The majority of his approximately 114 operas can be categorized as *drammae per musica* (musical dramas); many are based on ancient history (sometimes apocryphal). Some use literary subjects as their basis, such as *La Griselda*, which draws its libretto from Boccaccio; others can be classified as *commedie in musica*, or *pastorales*. The three-part Italian sinfonia, consisting of an introductory Allegro, followed by a slower contrasting section, and concluding with a fast movement in triple meter, was the precursor to the classical symphonies of Wolfgang Amadeus Mozart (1756–1791) and Franz Joseph Haydn (1732–1809).

The most famous of Alessandro Scarlatti's children was Domenico, born in 1685, the same year as Handel and as Johann Sebastian Bach (1685–1750). His keyboard-playing talent was recognized at an early age; he may have studied harpsichord with Pasquini or Gaetano Greco (1657–1728) in

Rome. Alessandro helped him procure the position of composer and organist at the Cappella Reale in Naples in 1700 when Domenico was fifteen. After a brief period in Florence with his father, he returned to Naples to take over his father's duties for the 1703–1704 season while Alessandro was in Rome and then was sent by his father to Venice, where he was “escorted only by his own ability” (as Alessandro wrote to Ferdinand de' Medici in 1705). Domenico returned to Rome in 1707, where he is reported to have entered a keyboard competition under the auspices of Cardinal Ottoboni in 1708 or early 1709. Among the contestants was Handel, who was judged Domenico's equal on the harpsichord, but whose organ skills surpassed those of Scarlatti. In 1713 and 1714, Domenico was appointed to two of the most important positions in Rome: first as *maestro di cappella* in service to Maria Casimira, the exiled dowager queen of Poland, and then as chapelmaster of the Cappella Giulia at St. Peter's. Both titles afforded him financial security. In addition to the seven operas Domenico composed from 1710 to 1714 while in Rome, it is believed that he went briefly to England in 1719 to revise an earlier work, which Handel produced at Drury Lane in 1720.

In 1719, Domenico finally freed himself from his father's control when he was granted legal independence from Alessandro and resigned his positions in Rome. His most important position came soon after that, when he was appointed *mestre de capela* in Lisbon, where he also oversaw the education of John V's younger brother, Don Antonio, and John's daughter Maria Barbara. He returned to Rome for a visit in 1728 to marry the sixteen-year-old Maria Catarina Gentili. In 1729, when Princess Maria Barbara married the Spanish crown prince and became queen of Spain, Domenico followed her to Seville, and then in 1733 to Madrid, becoming her *maestro da cámara* and spending the rest of his life there. His wife died in 1739, and sometime before 1742 he married Anastasia Maxarti Ximenes.

Most of his approximately 550 keyboard works were written at the Portuguese and Spanish courts, and many of these reflect an influence of Iberian folk-music idioms. Known for his ability to improvise at the harpsichord, Domenico did not write down his compositions until 1738, when he published his first collection of keyboard pieces, thirty

Essercizi per gravicembalo. He was knighted by John V that same year, and in return he dedicated the *Essercizi* to the king.

Domenico organized a large number of his harpsichord works into two volumes (1742, 1749) and presented them to Maria Barbara. It was through this patron that he met the famous castrato Farinelli (1705–1782), who inherited several volumes of the composer's keyboard manuscripts after the queen's death. Between 1752 and 1757, Domenico composed an additional 200 keyboard suites (or sonatas, as he called them), which he compiled and edited for publication, possibly with the assistance of one of his students, Catalan composer Antonio Soler (1729–1783), as his copyist.

Domenico Scarlatti's compositions include fourteen operas, over seventy cantatas, several serenatas (of which only two have survived, including the *Festeggio armonico*, written in 1728 for the engagement of Maria Barbara to the Spanish crown prince), and various sacred pieces. He is best remembered for his large output of single-movement keyboard sonatas, which place him as one of the founders of modern keyboard technique. Scarlatti's sonatas are technically innovative in their use of hand crossings, quickly repeated notes, and wide leaps, requiring a high level of technical proficiency. The sonatas skillfully utilize the harpsichord to its fullest capacity and demonstrate the composer's gift of melodic and harmonic invention. The elegance and graceful ornamentation of these works epitomize the refined qualities of the early rococo style. The binary structure of Scarlatti's sonatas is noteworthy; an antecedent to sonata form, it is similar to the Italian sinfonias of his father, in that both were influential to the development of later Classical-period music. The sonatas have remained an integral part of the keyboardist's repertory.

GREGORY MALDONADO

SCHILLER, JOHANN CHRISTOPH FRIEDRICH VON (1759–1805), German dramatist, poet, historian, and philosopher. Born on 10 November 1759 in Marbach, in Württemberg, the only son of a low-ranking army officer, Schiller was educated from 1773 to 1780 at the military academy founded by Karl Eugen, duke of Württemberg (1728–1793). His first play, *Die Räuber* (1781; The robbers), premiered at the Mannheim National Theater in 1782. Forbidden by the duke to pursue his literary work, he absconded from Württemberg later that year, and after serving as resident playwright at Mannheim for one year, he moved to Dresden and Leipzig and then in 1787 to Weimar, home of several leading literary figures, chiefly Johann Wolfgang von Goethe. In 1789 he was appointed professor of history at the University of Jena, on the strength of his *Geschichte des Abfalls der vereinigten Niederlande von der spanischen Regierung* (History of the revolt of the United Netherlands from Spanish rule, 1787).

Schiller married Charlotte von Lengefeld in 1790. After a serious illness in 1791 he remained a semi-invalid for the rest of his life. In 1794 he formed a friendship and alliance with Goethe based on shared convictions about the enduring validity of classical principles in art and about the centrality of art as a human activity. Their correspondence, along with their joint essays and projects, had a lasting impact on German literary debate and practice. In 1799 Schiller moved from Jena to Weimar, and he died there on 9 May 1805.

Schiller's work as a poet and dramatist falls into two distinct periods: before 1789 and from the mid-1790s to his death. His first three plays, *Die Räuber*, *Die Verschwörung des Fiesco zu Genua* (1783; The conspiracy of Fiesco at Genoa), and *Kabale und Liebe* (1784; Intrigue and love) owe much in style and spirit to the short-lived but influential avant-garde literary movement of the 1770s, the Sturm und Drang. Written in vigorous prose and showing the impact of the Sturm und Drang generation's

reception of William Shakespeare, the plays explore flawed idealism, the charismatic leader, social divisions, and the impatience of the young with the imperfections of the world. They also bear the imprint of Schiller's medical training at the military academy and in particular of his interest in the problem of mind-body relationships. His fourth play, *Don Carlos, Infant von Spanien* (1787; Don Carlos, infante of Spain), anticipates his later dramas in its use of blank verse and concern with historical and public themes.

The compositional difficulties Schiller encountered with *Don Carlos* provoked a creative crisis, and though he wrote two seminal poems in 1788, “Die Götter Griechenlandes” (The gods of Greece) and “Die Künstler” (The artists), he turned away for almost a decade from creative writing, with the purpose of clarifying his thoughts on art in general and tragedy in particular. In 1791 he turned to the German philosopher Immanuel Kant's philosophy. Kant's dualism, according to which human beings belong to the realm of nature but also partake through reason in the realm of freedom, became fundamental to Schiller's thinking on aesthetics, for he saw art as a means of reconciling the tensions between nature and reason. His theory of the sublime in tragedy claims that tragedy mediates an experience of transcendence derived from the awareness that human beings may assert their moral freedom even while being physically destroyed (see in particular “Über das Pathetische” [On tragic pity]). In his influential treatise *Über die ästhetische Erziehung des Menschen in einer Reihe von Briefen* (1794; On the aesthetic education of man in a series of letters), he argues that beauty as “living form” symbolizes and helps bring about the ideal harmony of sense and spirit to which human beings aspire. His notion of beauty as play and of aesthetic semblance have been important in later discussions of aesthetics. His final major treatise, *Über naive und sentimentalische Dichtung* (1795; On naive and sentimental poetry), defines the problem of the modern (“sentimental”) writer's divided consciousness.

During 1795 Schiller started again to write poetry. In 1799 he completed his greatest drama, *Wallenstein* (published 1800). A rapid succession of verse plays followed up to his death: *Maria Stuart* (1801; Mary Stuart), *Die Jungfrau von Orleans* (1802; The maid of Orleans), *Die Braut von*

Messina (1803; *The bride of Messina*), *Wilhelm Tell* (1804; *William Tell*), and *Demetrius* (unfinished). Each signals a new departure in style. Together they reflect Schiller's preoccupation with some of the pressing themes of the age of the French Revolution: legitimacy of government, conscience versus political calculation, and the individual within the tide of events. His later poetry encompasses the more popular in style (for example, his ballads and "Das Lied von der Glocke" ([The song of the bell]), but he also used poetry as a meditation on the nature of art (for example, in "Das Ideal und das Leben" [The ideal and life] and "Der Tanz" [The Dance]).

The action-filled plots, strong characters, and thrilling encounters of Schiller's plays have not only guaranteed their continued place on the world stage but have inspired numerous opera composers, Giuseppe Verdi being the most prominent.

SCHMALKALDIC WAR (1546–1547)

The Schmalkaldic War (fought between July 1546 and April 1547) was a short-lived military victory by the Holy Roman emperor Charles V (ruled 1519–1556) over the forces of the Lutheran princes and cities of the Schmalkaldic League (1531–1547). The history of the league and the survival of Protestantism after such decisive military defeat reflect both the strengths and weaknesses of the Holy Roman Empire.

HISTORY OF THE SCHMALKALDIC LEAGUE

The Schmalkaldic League was a German Protestant military federation based on an agreement made at Schmalkalden in Thuringia in December 1530 and ratified in February 1531. The original members of the league included the two military commanders Elector John Frederick of Saxony and Landgrave Philip of Hesse; the northern princes of Anhalt-Bernburg and Mansfeld-Hinterort; the northern cities of Lübeck, Magdeburg, and Bremen; and the southern cities of Strasbourg, Ulm, Memmingen, Konstanz, Biberach, Lindau, and Isny. The presidency of the league alternated between the elector and the landgrave.

The league differed from previous federations, including the Swabian League (1488–1534), in both its defined purpose and scope. The purpose of the league was the defense of religion in addition to traditional aims of mutual defense. The defense of the evangelical movement brought together powers, such as the ruling families of Strasbourg and the elector of Saxony, who had no other interests in common. Unlike the Swabian League with its strictly upper German focus, the Schmalkaldic League was imperial in scope, eventually stretching from east to west from Pomerania to Strasbourg and from north to south from Oldenburg to Konstanz. Although the league tried to break out of the imperial borders through attempted alliances with Henry VIII of England and Francis I of France, these efforts ended in failure.

The league, originally formed for six years, ratified a fixed constitution at Schmalkalden on 23 December 1535, which was almost immediately revised in October 1536 because of the growth in league membership. The cities of Esslingen, Brunswick, Goslar, Einbeck, and Göttingen all joined the league between 1531 and 1535. In 1535 the dukes of Pomerania and Württemberg, the count of Pfalz-Zweibrücken, two princes of Anhalt-Dessau, and the cities of Frankfurt am Main, Kempten, Hamburg, and Hannover all joined the league. Under the new constitution the league was divided into two “circles”: a northern, “Saxon” circle and a southern, “upper German” circle.

The league faced the same political and constitutional problems that plagued the empire. The league’s tax structure and sole means for financing its military force mirrored the imperial tax structure. Despite the efforts of many leaders from the southern cities (in particular, Jakob Sturm von Sturmeck [1489–1553]), the league consistently defeated proposals to reform and streamline its collection of revenue.

The principle success of the league was its defense of the Protestant cause against the emperor, the Imperial Diet, and the Imperial Chamber Court. The league’s first victory was its successful campaign to suspend all suits by Catholic clergy for the restitution of ecclesiastical property seized by evangelical cities and territories. Charles V’s policy of toleration, however, required the league’s support for and participation in his wars with the French and the Ottoman Turks as well as a series of theological colloquies at Hagenau, Regensburg, and Speyer.

The league had no fixed seat but it did meet some twenty-six times over the course of its sixteen-year history, over a more extensive area than did the Imperial Diet (which met only once in the same period). The league also had no chancery or league court or any official means of mediating disputes among its members and was, therefore, unable to agree upon a common ecclesiastical constitutional, or liturgical, policy for ecclesiastical properties.

The politics of particularism also hindered the league’s effective unity—especially in the case of the northern cities (the southern cities largely continued their long-standing practice of mutual consulta-

tion). Originally possessing four of nine possible votes and later six of thirteen votes in the league, the cities in general also found themselves in a long familiar position of minority status in relation to the princes. The confessional nature of the league, based as it was upon the religious conflict between the Catholic and Protestant camps within western Christianity—and the distractions of Charles V in the Mediterranean and of Ferdinand I of Austria with his Jagellon territories and Turkish incursions—estranged the cities from their traditional alliances with the crown against the princes. For example, in 1534 Philip of Hesse was able to restore the (Lutheran) duke Ulrich of Württemberg in his territories with the support of Bavaria, France, and Strasbourg, over the opposition of the Saxon elector and most of the imperial and free cities.

CAUSES OF THE WAR

The underlying causes of the Schmalkaldic War were the ambitions of the leading princes of the league, particularly Landgrave Philip of Hesse and Elector John Frederick of Saxony, and the imperial effort to bring the territories and cities of the league to heel confessionally. The ambitions of the nobles and their limitations as political and military strategists can be clearly seen in the political offensive led by Elector John Frederick to secure the North German prince-bishoprics for the evangelical cause.

In 1542 the league successfully invaded the last remaining Catholic lay territory in northern Germany, the Duchy of Brunswick-Wolfenbüttel, but in 1543 the league failed to come to the aid of the elector’s brother-in-law, Duke William of Cleves-Jülich, against Charles V. The southern cities of the league viewed these campaigns as of little lasting value and approved the Brunswick-Wolfenbüttel campaign reluctantly. The perception among the cities that they were bearing more than their fair share of the costs of the league’s military operations began to foment open dissent, and left the league in enough political disarray that its reratification would have been in doubt even without its military defeat by the imperial forces.

The need to justify resistance to imperial authority was a standing issue for Protestant rulers and their advisers. As a result, beginning with Martin Luther’s own *volte-face* in 1531 in favor of active resistance against an unjust emperor, Lutheran the-

ologians, lawyers, and counselors were under constant pressure to portray their resistance against the empire in a positive light. By the time the city of Minden was outlawed in the autumn of 1538, Wittenberg theologians judged that a preemptive attack by the league in defense of Minden would be a “defensive” first strike under the terms of the league’s charter.

The Schmalkaldic League did not intend to undermine any territorial sovereign. In 1543–1544 the Protestant community of Metz in Lorraine petitioned the league for admission. Although Martin Bucer and the senate of Strasbourg supported the Metz Protestants, Elector John Frederick, on the advice of the Wittenberg theologians, blocked their bid for admission on the grounds that they were dissident subjects of a legitimate government. Nonetheless, the league ignored concerns for legitimacy in the case of the city of Brunswick when it admitted that city as a member even though it was still ruled by Duke Henry the Younger, a Catholic.

The proximate cause of the war was the rejection by the members of the league of the conditions under which Charles convened the Diet of Regensburg in June of 1546. The immediate circumstances that finally allowed Charles to act against the Lutherans were the conclusion of peace treaties with France (the Peace of Crespy on 18 September 1544) and with the Ottoman Turks (on 10 November 1545), the successful negotiation of the participation of papal troops in a campaign against the league, as well as free passage for these troops through the Bavarian territory of Duke William, and the tacit support of Duke Maurice of Saxony against his cousin John Frederick upon Maurice’s withdrawal from the league in 1542. Despite careful imperial preparations for a confrontation with the league, the initial league offensive caught Charles off guard in Regensburg with only a small number of Spanish and German troops.

PROGRESS OF THE WAR

Among the league’s initial advantages were successful attempts to reinforce its field army with experienced mercenaries, who had been released recently from French service, and the recruitment of the famous mercenary captain Sebastian Schertlin von Burtembach as a field commander. Official command, however, remained in the inexperienced and

clumsy hands of the princes, especially Elector John Frederick. The elector’s imperial counterpart, Fernando Álvarez de Toledo, duke of Alba, was one of the finest military commanders of the sixteenth century. In short, John Frederick was no match for Alba or Charles.

There were two distinct phases to the war. In the first phase, in the south, the imperial troops under Charles and Alba escaped from Regensburg by outmaneuvering the league’s forces and then joined forces with papal troops from Italy via Bavaria and with heavy cavalry from the Netherlands under Egmont, count of Buren. The indecisiveness of the league’s war council caused Schertlin to be called off just when he could have cut off the papal reinforcements in the mountains and destroyed them piecemeal. The ability of the imperial troops to avoid a decisive engagement along the Danube, coupled with the failure of John Frederick to seize the initiative, precipitated a financial and political crisis within the leadership of the league.

Duke Maurice’s attack on electoral Saxony began the second phase of the war and shifted the front to the north. Electoral troops broke off contact with imperial forces along the Danube and marched home, where they successfully counterattacked and overran much of Maurice’s ducal Saxony and defeated an imperial relief force under Albert of Culmbach. During this phase of the war, however, the revelation of Philip of Hesse’s scandalous bigamy effectively removed him from the military and diplomatic fray. Meanwhile, since most of the league’s forces were defending electoral Saxony, Alba and Charles were unopposed as they neutralized the southern cities and then moved north to reinforce Maurice on the northern front.

John Frederick’s fatal strategic miscalculation of advancing to the south away from easily defended locations proved to be the beginning of the end for the league. Upon realizing his error, John Frederick attempted to keep the Elbe River between the league’s forces and the imperial forces, but Alba’s scouts discovered a ford and the imperial infantry was able to force its way across the Elbe, across the Protestant line of retreat. During the battle on 24 April, now known as the Battle of Mühlberg, the imperial troops gradually destroyed the scattered Protestant formations and captured John Frederick.

PROTESTANTISM AND THE WAR

In the aftermath of his victory, Charles stripped both John Frederick and Philip of Hesse of their domains, installed Maurice as ruler of all of Saxony, and proclaimed the institution of Catholic religious conformity with the Augsburg Interim. However, Charles's triumph proved to be short-lived. After sixteen years of protection provided by the Schmalkaldic League, the Protestant cause was now strong enough to survive politically even after a sound military defeat.

The Gnesio-Lutheran stronghold of Magdeburg was a center of resistance after the league's defeat. Lutheran clergy (led by Nikolaus von Amstdorf, Matija Vlačić [Matthias Flacius Illyricus], and Nikolaus Gallus, among others) continued to develop a constitutionalist theory of resistance by so-called inferior magistrates against the empire. In both formal publications and pamphlet campaigns this political innovation proved to be influential in other confessionally based political resistance movements, such as the Huguenot Monarchomachs and the Reformed Dutch revolt against the Spanish, and among the English Marian exiles and political theorists opposed to the claims of absolutism, such as Johannes Althusius (Althaus).

The so-called Prince's Revolt and the Treaty of Passau in 1552 ensured the survival and even official recognition of the Lutheran cause. These events culminated in the Religious Peace of Augsburg (1555), which placed a territory's confessional allegiance squarely in the hands of its ruler.

SCHOLASTICISM. In the early modern period the term "Scholasticism" denoted the systematization of learning in schools and universities, mainly in philosophy and theology, occasionally extended to law and medicine. It may be characterized by its distinctive method and language and by its elaboration into competing systems of thought.

SCHOLASTIC METHOD

What is called "scholastic method" started with the disputations that were held in the schools of the Middle Ages. A disputation began with the posing of a question that could be answered either affirmatively or negatively. It involved two interlocutors, one on each side, and the method of arguing was basically that explained in the *Topics* of Aristotle (384–322 B.C.E.). The topics or problems were drawn from a teaching text, usually in philosophy or theology, and expressed in Latin. The rules of reasoning were those concerned with concepts, propositions, and arguments and contained in other logical works of Aristotle. The proponent of the affirmative, called the defendant, stated his thesis in the form of a proposition, and then proceeded to develop arguments that supported his thesis. In response, the proponent of the negative, called the objector, developed counterarguments that dis-

proved the defendant's thesis. To these counterarguments the defendant then replied by reformulating his initial arguments, introducing distinctions of meaning to meet the opponent's objections. The argument went back and forth in this form until either the objector was convinced that his difficulties had been met and he conceded the thesis, or the defendant was unsuccessful in his defense of the thesis and conceded defeat.

Scholastic method grew out of this procedure. Its basic instruments were definition, distinction, and argumentation, and its ideal goal was certain truth, although frequently it could reach only probable conclusions. By the time of the Renaissance a stylized format had been developed for meeting these objectives. First the thesis was stated, usually as a universal affirmative proposition. Then three steps were commonly envisaged, consisting of prenotes, proofs, and difficulties that might be brought against the thesis. In the prenotes the proponent provided definitions of the terms in the thesis, distinctions relating to them, and different positions being held on the thesis. Then various proofs were offered, first from authority, such as the Bible or a noted philosopher, then from reason, using varieties of argument. Finally, objections against the thesis were restated and resolved, usually on the basis of distinctions introduced earlier in the presentation.

MEDIEVAL SCHOOLS

The development of Scholasticism coincided with the founding of universities in the late twelfth century and of religious orders such as Dominicans and Franciscans in the early thirteenth century. In the universities newly translated texts of Aristotle provided the basis for a system of thought known as Aristotelianism. Additionally, religious orders had their favorite doctors, whose teachings were also systematized. Dominicans followed Thomas Aquinas (1225–1274), whose system was called Thomism, and Franciscans followed Duns Scotus (1266?–1308) and William of Ockham (c. 1285–1347), whose systems were called Scotism and Ockhamism, respectively. A feature of medieval universities was public disputations in which doctors of these schools debated before the student body. Different though their systems were, the discourse was made possible by the participants' reliance on Aristotle's method of logic.

The language of Scholasticism was a technical Latin, with specialized vocabularies suited to particular subject matters. Geographically, Scholasticism flourished in Italy and on the Iberian Peninsula, in France, Germany, the Low Countries, and in the British Isles. The leading schools were the University of Oxford, noted for philosophy, the University of Paris, for theology, and the University of Bologna, for law and medicine.

In the late twelfth and thirteenth centuries Augustinianism, a theological form of Neoplatonism advanced by Augustine of Hippo (354–430), was influential. In the thirteenth and fourteenth centuries, Latin Averroism, a teaching of Averroës (Ibn Rushd; 1126–1198) that denied the immortality of the human soul, assumed importance, mainly at the University of Padua. Ockham's insistence that universal natures cannot be known in things, but only their names (*nomina*), led to his system's being known as nominalism. The opposing systems, which held that natures could be known to be real (*realia*), were then seen as various forms of realism. Debates between realists and nominalists were frequent in university disputations.

THE RENAISSANCE

Scholasticism reached its highest state of development during the Renaissance, roughly from about 1450 to about 1650. The first phase, to the mid-sixteenth century, was focused in Italy and Spain and is known to historians as "Second Scholasticism." The second phase saw its development by the Jesuits and its extension to the schools of northern Europe, Protestant as well as Catholic.

In the first phase Thomism, Scotism, and nominalism developed extensively. Thomism was advanced mainly by Dominicans, of whom the most significant were the Italians Tommaso de Vio Cajetan (1469–1534) and Giovanni Crisostomi Javelli (1470–c. 1538), and the Spaniards Francisco de Vitoria (c. 1486–1546) and Domingo de Soto (1495–1560). Cajetan was the most profound synthesizer of St. Thomas's theology, whereas Javelli is best known for his teaching manuals in philosophy. Vitoria and Soto worked extensively on social and political thought, arguing that natives in America had souls and therefore had the same rights as Europeans.

Scotism was largely the preserve of the Franciscans, who adopted Scotus as their order's doctor in 1539. Before that, a revival of Scotist teachings had been promoted by the French Peter Tartaretus (d. c. 1532), and the Italian Antonio Trombetta (1436–1517). Trombetta was a critic of Cajetan and is known especially for having combated Averroism at Padua.

A nominalist revival radiated out from the University of Paris to other countries, including Spain and the Low Countries. Its chief promoters were Gerard of Brussels (d. 1502) and the Scot John Major (1469–1550), both teaching at Paris, and Johannes Eck (1486–1543), whose career was mainly in Germany. Among Major's students were Pedro Ciruelo (1470–1554) and Gaspar Lax (1487–1560), the latter well known for his manuals in logic. Major's school made significant contributions to the study of motion and prepared the way for the scientific revolution of the seventeenth century.

The second phase of the Renaissance began with the founding of the Jesuit order in 1540. Jesuits blended humanism with Scholasticism and introduced methods of teaching that had profound effects throughout Europe. In general, they subscribed to Thomism but introduced variations within that system. Their most important school was the Collegio Romano, located in Rome, which was staffed initially by Iberians, notably Franciscus Toletus (1532–1596) and Gabriel Vázquez (1549–1604), who wrote influential textbooks. Their most outstanding teacher was Francisco Suárez (1548–1617), whose version of Thomism is referred to as Suarezianism.

Although Martin Luther (1483–1546) held a disputation against Scholasticism in 1517, it came to occupy a central place in Protestant universities within a hundred years. This was true whether the universities leaned to Calvinism, as in Heidelberg and Marburg, or to Lutheranism, as in Wittenberg, Altdorf, and Helmstedt. The basic approaches were those of Philipp Melancthon (1497–1560), who composed textbooks on physics, psychology, and ethics at Wittenberg, and Jacob Schegk (1511–1587), who commented on Aristotle's logic and natural philosophy at Tübingen.

For metaphysics, Jesuit textbooks, particularly Suárez's, were used initially but were later replaced by Protestant manuals. Johannes Caselius (1535–1613), working at Helmstedt, wrote early texts in the Aristotelian tradition pioneered by Schegk. Works showing Suárez's influence include those of Jakob Martini (1570–1649) at Wittenberg and Christoph Scheibler (1589–1653) at Giessen, the latter called the Protestant Suárez. For systematic thought, notable works are those of Bartholomaeus Keckermann (1571–1608), who taught at Heidelberg and Gdańsk and wrote manuals for all of philosophy and science. Johann Heinrich Alsted (1588–1638) followed Keckermann's teachings with his own *Encyclopediae* in 1620 and 1630. At Leiden, Franco Burgersdijk (1590–1635) wrote similar compendia for Scholastic philosophy that were widely used throughout Protestant Europe.

LATER PERIOD

By the seventeenth and eighteenth centuries, Scholasticism had run its course. The way of thought it had spawned, with its many “-isms,” had become overburdened and toppled of its own weight. Disputations that had earlier held great interest had by then degenerated into making subtle distinctions and quibbling endlessly over terms. Scholastic method continued to be employed in religious houses of study and in universities, however, though in the latter it gradually gave way to new methods based on experimentation and mathematical reasoning. This transition is seen graphically in the early writings of Galileo Galilei (1564–1642) and Isaac Newton (1642–1727). Galileo's Latin notebooks on logic and natural philosophy, written at Pisa between 1588 and 1592, were couched in the language of Scholastic disputations. The same can be said of Newton's Trinity notebooks, written at Cambridge in the early 1660s.

Scholasticism was transplanted to the New World by religious orders in time for the founding of institutions of higher learning in North and South America and the Philippines. Those in Mexico and the Philippines followed the teachings of Spanish Scholastics, mainly from Salamanca and Alcalá, whereas American colleges, such as Harvard, Yale, and William and Mary, reflected teachings current in Protestant universities in England, Scotland, Germany, and the Low Countries.

WILLIAM A. WALLACE

SCHÜTZ, HEINRICH (1585–1672), German composer. Heinrich Schütz was the most important German composer of vocal music in the seventeenth century. For much of his long career, Schütz was kapellmeister (music director) to the elector of Saxony at the Dresden court, as well as serving in the court of Christian IV of Denmark. A student of the Venetian masters Giovanni Gabrieli (1557–1612) and Claudio Monteverdi (1567–1643), Schütz synthesized Italian and German procedures in an unprecedented manner that was to have a profound influence on the course of German baroque music.

Schütz was born in Kösteritz near Gera (Saxony) and baptized 9 October 1585. At the age of four his musical talent attracted the attention of Landgrave Moritz of Hessen-Kassel, who persuaded Schütz's parents to send him to his court for

further education in music and art. He was an apt pupil who excelled in languages, and also studied law at the University of Marburg. However, with the landgrave's support, he traveled to Venice to study with Giovanni Gabrieli. Here he received training in Renaissance polyphony as well as the polychoral innovations favored at San Marco, and published a set of five-voice madrigals in 1611.

Upon his return to Germany around 1613, Elector Johann Georg I of Saxony requested Schütz's service for the Dresden court. Schütz obtained his release from Moritz after several years of complex negotiations, arriving in Dresden in 1615, becoming the vice-kapellmeister in March 1617 and kapellmeister in 1619, although he only received this title officially in 1621 after the death of Michael Praetorius (1571–1621). The Dresden court maintained a large musical establishment, and Schütz's extensive duties included the training of choirboys, hiring personnel, staffing, and the producing of secular and sacred music for all civic and religious occasions. Music in Dresden flourished prior to that city's belated involvement in the Thirty Years' War, as did Schütz's productivity and fame. His *Psalmen Davids sampt etlichen Moteten und Concerten* (1618), the first important collection of German church music, reflected the influence of Gabrieli's *Symphoniae Sacrae* and exploited the lavish vocal and instrumental resources at the Dresden court and the sonic potential of the elector's chapel. The originality of this enterprise is apparent in the detailed instructions included in the preface, which describes the proper size, makeup, and position of the forces, and other aspects of performance practice.

In addition to sacred compositions in a variety of genres, including biblical dramas and Latin motets, Schütz composed what is usually regarded as the first German opera, *Apollo und Dafne*, which has not survived. A second trip to Italy in 1628—and studies with Claudio Monteverdi—introduced Schütz to the most recent Italian innovations in dramatic music, in particular the techniques for expressive solo singing associated with the *seconda prattica* (second practice). Schütz's first set of *Symphonie Sacrae* (1629) integrates this revolutionary new approach to text setting with the impressive use of instrumental colors and vocal sonorities gleaned from Gabrieli.

Heinrich Schütz. GETTY IMAGES

The last decades of Schütz's career at Dresden were marked by the economic pressures of the Thirty Years' War, which Saxony entered in 1631, and the meager vocal and instrumental forces he used in the compositions from this period, such as the first two sets of *Kleine geistliche Konzerte* (Little spiritual concertos), dating from 1636 and 1639, reflect the severe economic conditions in Germany. He twice journeyed to Copenhagen to compose music for the court of Christian IV (to whom he would dedicate his second set of *Symphoniae Sacrae* [1646]) and served several other prominent North German courts. In failing health, Schütz was finally permitted to take partial retirement in 1656, although he continued to advise the court on musical matters as kapellmeister. During the 1660s, he also composed a biblical drama based on the Christmas story (*Historia . . . der . . . Geburt . . . Jesu Christi* [1664]) of three Passions: St. John, St. Matthew, and St. Luke, all performed in Dresden in April 1666. These intense, personal works are noteworthy because of their stark, highly dramatic quality, the fidelity to the text of the Gospels, and the use of a different mode for each to accentuate the individual nature of the utterances. Schütz died on 5 November 1672, and his funeral was held at Dresden's Frauenkirche on 17 November.

Although little of Schütz's secular music has survived, he left an impressive body of sacred works in numerous genres that range from sober expressions of Lutheran piety to full-bodied, dramatic manifestations of unmatched sonic splendor. The essence of Schütz's style is an extraordinary synthesis of German and Italian techniques—the grand approach of Gabrieli and the expressive text-setting and sense of drama that distinguishes Monteverdi's compositions, combined with the contrapuntal integrity and innate serious tone that was part of Schütz's German training and heritage. It is this genius that would find expression in the high German baroque through the music of Johann Sebastian Bach (1685–1750) and George Frideric Handel (1685–1759).

SCIENTIFIC ILLUSTRATION. The development of scientific illustration in early modern Europe paralleled a rising interest in studying, collecting, and classifying the natural world. These practices gave rise to new methods of documenting and displaying nature and its products. Although early modern European artists and naturalists did not deliberately set out principles or rules for creating scientific images, a common set of practices emerged during the period that formed the foundation of scientific illustration into the modern period.

From the late medieval period pictorial techniques designed to convince viewers that an image contained an exact record of the artist's observation were increasingly employed in the illustration of botanical and medical texts, as well as in illuminated manuscripts. To convey the impression of accuracy and lifelikeness, artists often depicted objects against a plain background and offered highly detailed renderings of surfaces and textures. Such images functioned variously as practical aids to identification and study, as delightful entertainments, and as symbolic representations of religious and philosophical ideas. The plants and other minute objects represented in the margins of illuminated books of hours inspired readers to marvel at both the complexity and beauty of the natural forms and the artist's skill. During the early modern period images of the natural world continued to be characterized by a dual capacity to delight and instruct the viewer. Leonardo da Vinci's (1452–1519) pen-and-ink studies of plants, animals, and the human body combined meticulous observation of natural structures with idealized forms and harmonious compositions. Albrecht Dürer's (1471–1528) plant and animal studies treated subjects similar to those found in the borders of illuminated manuscripts but focused on previously "marginal" subject matter as the main subject of the compositions. The two major botanical publications of the sixteenth century, *Herbarum Vivae Eicones* (1530–1536) by Otto Brunfels (c. 1488–1534) and *De Historia Stirpium* (1542) by Leonhard Fuchs (1501–1566), exemplify one of the central problems of scientific

Scientific Illustration. An illustration from *De humani corporis fabrica* by Andreas Vesalius, 1543. GETTY IMAGES

illustration. The illustrations in both publications rely on empirical observation but reflect differing ideas about the meaning of accuracy and lifelikeness in images. The images of plants in Brunfels are individualized portraits containing signs of decay and features unique to a particular specimen, whereas the images in Fuchs attempt to capture the general characteristics of the species by presenting perfect, idealized specimens.

Other early modern European artists highlighted the ambiguous relationship between visual images and the reality they purport to represent.

Joris Hoefnagel (1542–1600) often depicted imaginary creatures in a meticulous and convincing visual style, while the deep hues, intense luminosity, and sculptural forms of Jacopo Ligozzi's (1547–1627) botanical drawings create a profound material presence that in some cases may have surpassed that of the actual specimen. By the end of the seventeenth century, artists such as Maria Sibylla Merian (1647–1717) incorporated the meticulous style perfected by Dürer, Hoefnagel, and Ligozzi into vibrant compositions of living creatures in their natural habitats competing with one another for survival.

Scientific illustration in early modern Europe was closely connected to the collecting practices of the period, particularly in the field of natural history. Collectors such as Ulisse Aldrovandi (1522–1605) and Conrad Gessner (1516–1565) assembled exotic objects from the New World, Asia, the Middle East, and Africa into cabinets of curiosities, the forerunners of modern museums, and published copiously illustrated natural histories based on their collections. Illustrations were used to document and supplement existing collections, and in some cases functioned as collections in and of themselves.

Close connections between artistic and scientific practice were also evident in the area of anatomical illustration. Andreas Vesalius (1514–1564) worked with artists from Titian's (1488 or 1490–1576) workshop to produce the illustrations for his *De Humani Corporis Fabrica* of 1543, in which human figures in various stages of dissection were depicted in poses derived from ancient sculpture. Early modern scientific illustration also treated technical and mechanical subjects, making use of visual forms used in botany, natural history, and anatomy, as well as diagrams, used by astronomers and mathematicians to describe movement and abstract ideas. Over the course of the seventeenth century optical instruments such as the telescope and the microscope were used to investigate previously invisible structures and phenomena, and illustrations were used to communicate these discoveries to others. Galileo Galilei's (1564–1642) *Sidereus Nuncius* of 1610 made use of both diagrams and illustrations to convey new knowledge gained through the use of the telescope about the surface of the moon and the newly discovered moons of Jupiter. Robert Hooke's (1635–1703) *Micrographia* of 1665 presented readers with meticulously crafted illustrations of

magnified objects and creatures observed with a microscope.

SCIENTIFIC INSTRUMENTS. The early modern period saw the use of devices both to advance scientific research (such as the telescope and the microscope) and those of a more practical nature that embodied scientific knowledge (such as the astrolabe and the thermometer). Because scientific instruments are typically made by specialized craftsmen who produce improvements in design and effectiveness through technical means, their production may also be considered as a discrete technology.

Although in the Middle Ages there had been specialized craftsmen who made astrolabes and, later, clocks, the emergence of a specialized craft for the production of a line of scientific instruments with distinct functions first emerged (in England, at least) in the 1540s, in response to the need for more accurate measurement in navigation, surveying, and astronomy. In England, the multiple forces of population growth, agricultural expansion, and, later, the draining of The Fens, stimulated the development of professional surveying, which required in-

struments for making angular measurements. The age of discovery, moreover, expanded the market for navigational instruments at a time when the “lunar distance” method (involving difficult observations of the distance between the Moon and a designated star, the use of tables, and calculation) was the predominant method of navigation. At the same time, in the course of the sixteenth century, practical mathematics was developed and then diffused in printed manuals. The primary measurements involved in describing the use of such instruments themselves required instrumentation, as did the mathematical manipulation of observations made by using such manuals. The emergence of a scientific-instrument craft in the 1540s was the result of the interaction of all of these factors.

THE TELESCOPE

Once eyeglasses came into common usage toward the end of the thirteenth century, it was just a matter of time until two such lenses were combined to produce either a telescope or a microscope. That insight, however, took quite a long time to realize. The telescope is first documented in Holland in the fall of 1608, when at least three different craftsmen, including a maker of spectacles, were manufacturing them. Because the principles involved were widely known, the telescope is a good example of invention appearing simultaneously in different places. Galileo Galilei heard of the Dutch instruments by the summer of 1609 and made his own version, with a diverging eye lens and a converging (convex) object lens. These early examples had magnifications of two or three, but within a year Galileo, who ground his own lenses, achieved magnifications of twenty and thirty and objectives with increasingly long focal lengths. The Englishman Thomas Harriot heard of the Dutch instruments in the same period and was drawing maps of the Moon in August 1609, before Galileo’s most significant research had begun. Galileo published his first telescopic results in March 1610 in his famous *Sidereus nuncius* (Starry messenger) and by the end of the year Johannes Kepler had published two little books on the results of telescopic research, without having done any yet himself. (Kepler’s contribution was a telescope with both eyepiece and objective converging, which made it possible to create a real, though inverted, image and project it onto a screen beyond the ocular, which became the normal way of observ-

ing the Sun.) As is frequently the case with recognizably important inventions (the automobile, the airplane), the invention and innovation of the telescope caused a quickening of communication among scientists and stimulated simultaneous excitement in countries widely removed from one another.

Galileo’s earliest telescope observations—of the lunar landscape, the satellites of Jupiter, and the Milky Way—caused a sensation. The satellites of Jupiter, moreover, revealed that Earth was not the only planetary center of rotation, which worked against Aristotelian cosmology and in favor of that of Nicolaus Copernicus, as did Galileo’s subsequent description of the phases of Venus. The discovery of sunspots also contradicted the Aristotelian axiom of the unchangeable nature of celestial bodies. In the hands of Galileo alone, the telescope changed the nature of planetary astronomy, both how it was conceptualized and how it was observed.

One of the problems of early telescopes was that the objective caused the images to appear with extraneous colors. The solution was the achromatic lens, developed in England in the 1730s. To avoid such coloring and other distortions, seventeenth-century telescopes had very small apertures and long focal lengths. The eventual solution was a two-component objective, with two lenses of different density in contact with one another, worked out by Parisian craftsmen in 1763, and then by John Dolland in England. This was the most popular telescope until William Herschel (1738–1822), toward the end of the century, invented a reflecting telescope with a large mirror that made possible the gathering of enough light to be able to examine much fainter celestial objects.

The telescope’s impact was sudden, immense, and rippled across the length and breadth of cultures, affecting scientific theory and method, of course, but also theology, philosophy, literature, and art. In particular, Galileo’s depiction of a jagged, rough, and crater-pocked lunar surface threatened a whole range of entrenched cultural conventions, including the Aristotelian perfection of heavenly bodies and the pure, diaphanous quality of the Moon, which was theologically associated with the purity of the Immaculate Virgin. Galileo himself had had training in art and interacted with artists, many of whom had observed the Moon tele-

scopically with reference to specific paintings. Ever since Plutarch wrote his essay on the face that seemingly appeared on the Moon's surface, it had been common to refer to the lunar facade as similar to the surface of a painting, and in the seventeenth century writers conventionally likened the dark and light sides of the Moon to painted pigments. The Virgin was, for theological reasons, conventionally painted in the presence of a crystalline moon. In his *Inmaculada* of 1619, Diego Velázquez depicted the Virgin standing on a textured moon, the image he had almost certainly seen for himself through a telescope in Seville.

THE MICROSCOPE

The success of the telescope and consequent diffusion of its optical principles led quickly to the appearance of the first compound microscopes between 1612 and 1618. Galileo himself had one, but until the second half of the seventeenth century they seem to have been more a curiosity than an active research tool. The main technical problems of microscopes were to illuminate the substance under observation effectively and to produce a small lens that could provide a sharp image. Large magnifications tended to yield blurry images. Microscopy really got under way with the publication of Robert Hooke's *Micrographia* (1665) and Jan Swammerdam's general history of insects in 1669. In the early 1670s they were joined by contributions from Marcello Malpighi (1628–1694) and Antoni van Leeuwenhoek (1632–1723).

The earliest microscopes looked like telescopes: the lenses were set in wooden rings mounted on the ends of cardboard tubes, the one that held the ocular fitting inside the tube with the objective. Hooke used a compound microscope with a double-convex lens objective and a complicated three-lens eyepiece. By this time, however, improvements in grinding techniques had produced simple microscopes with much higher powers of magnification, the kind used by Leeuwenhoek. Sold in large numbers at the end of the seventeenth century, this was the instrument that popularized microscopy.

NAVIGATIONAL, SURVEYING, AND PRACTICAL INSTRUMENTS

In the late Middle Ages and early modern times, the so-called mariner's astrolabe was used for telling time: by lining up the site with the Sun the user

could read the time of day directly from a dial on the instrument. But the device had no use in practical navigation. The most common nautical instruments were the cross-staff, the back-staff, and the quadrant, reasonably simple handheld devices for measuring the altitude of stars but which could not easily be used to measure the angle between two stars from a moving boat. These instruments were all abandoned in the 1770s, replaced by John Hadley's reflecting quadrant, or octant, which eventually gave rise to the sextant, still in use today. With it, the navigator could bring the Moon's reflection down to the horizon, where the image would remain immovable, no matter how violently the ship was rolling.

Folding rules could be used by surveyors, gunners, or carpenters for small-scale plotting of terrain, or to estimate heights and depths, and were engraved with useful information like timber and board measures. A sector was a jointed rule with two radial arms engraved with a graduated scale. With the invention of logarithms (1614), the sector gave rise to the slide rule. Such ruled instruments were only as accurate as their graduations. Various methods of graduation, constantly improved, such as subdividing a scale by transverse lines that could be read to the one-hundredth part of quite small units, depending on the quality of the engraving, allowed the direct reading of angles, to an accuracy of five or ten seconds. Such graduation schemes became increasingly geometrical in the course of the eighteenth century and finally machines were devised for engraving linear scales.

There were also instruments of a practical nature designed to be carried by ordinary citizens. One such was the compendium, a pocket-sized brass gadget made for personal use that typically included an equinoctial sundial, religious calendars, a table of latitudes, a magnetic compass, a nocturnal (to determine time at night), a tide computer, and a table for establishing ports.

PHYSICAL INSTRUMENTS

Thermometers based on a variety of principles and materials were built as curiosities in the seventeenth century. It was not until the German physicist Daniel Gabriel Fahrenheit began to use mercury systematically in the 1720s that the thermometer design stabilized, even though competing models used

other kinds of liquid. Most used alcohol, which was cheaper, but the reading of the scale varied with the concentration of alcohol. The Fahrenheit thermometer (with two fixed points, the freezing [32°] and boiling [212°] points of water, respectively) was adopted in England, Germany, and the Netherlands; France used René-Antoine Ferchault de Réaumur's scale, where 0° was the freezing point of water.

Robert Hooke devised a barometer to measure atmospheric pressure based on the variation of a column of mercury; Christiaan Huygens made a similar model but, following an idea of René Descartes, it used two liquids, mercury and water. The only barometer widely used around 1700 was that of Evangelista Torricelli, a tube plunged into a container of mercury. At issue was how to achieve consistent variations in the height of the mercury column, how best to contain the mercury, and what kind of scale could be devised (in the end, a metal casing placed around the glass tube bore the graduation marks). The hygrometer, to measure humidity, presented similar difficulties. The problem was to find an appropriate substance that was sturdy yet suitably sensitive to humidity. Finally, around 1783, Horace-Bénédict de Saussure perfected a model in which a hair held by a clamp at one end was attached at the other to a silver thread which, as it wound around a horizontal axis, caused a pointer to move across a 360° graduated dial. In the case of all three of these instruments, there was a century-long process whereby scientists devised workable instruments through the trial-and-error methods of empirical craftsmen.

ELECTRICAL MACHINES

Benjamin Franklin's discoveries made electrical machines and demonstrations fashionable after 1750. A variety of machines featuring the production of electrical current with a hand crank were made in the first half of the eighteenth century; but they were not generally produced until the English instrument maker Jesse Ramsden's plate machine of 1766, which was equipped with an electrometer to measure the charge produced. Subsequently, all such machines had electrometers because they were useful in measuring the shock applied to patients undergoing electric-shock therapy. Such machines could be connected to Leyden jars serving as batteries.

SPECIALIZED WORKSHOPS

Specialized workshops making and selling scientific instruments proliferated in England and in France in the eighteenth century. Some of the earlier ones specialized either in navigational or surveying instruments, on the one hand, or physical instruments, especially barometers, on the other. The first large instrumentation workshop in England was that of George Adams founded in 1735, identified by a sign of Tycho Brahe's head in Fleet Street, London. Brahe (1546–1601), of course, was a pre-telescopic astronomer famous for his design and use of huge, finely calibrated observational instruments using the unaided eye alone, and thus became an apt symbol for the craft of instrumentation. Microscopes were Adams's specialty, as well as mathematical instruments of all types. John and Peter Dolland, father and son, opened an optical shop in London in 1752. The Dollands made quadrants, telescopes, and other observational instruments in large numbers. Of all the English instrument makers of the period, Jesse Ramsden (1735–1800) was said to be the best mechanic and optician. He was famous for large-scale astronomical and geodesic instruments, built telescopes for European observatories, and was elected a fellow of the Royal Society. In Holland, Jan van Musschenbroek, himself an important popularizer of Newtonian physics, had a famous workshop (in which he made instruments for his brother Pieter), as did Fahrenheit, a German born in Danzig who lived and worked in Amsterdam. Fahrenheit specialized in glass instruments, particularly the thermometer whose scale he established, and the barometer.

In France, the great instrument makers of the late eighteenth century tended to work for institutions. The Mégnies (probably two brothers) were associated with the Academy of Sciences, where they built chemical apparatuses for Antoine-Laurent Lavoisier (1743–1794), as well as telescopes and other optical instruments. Étienne Lenoir (1822–1900) worked mainly for the Weights and Measures Commission, where he built the apparatus that French expeditionaries used to measure the meridian.

INSTRUMENTS AND IMPERIAL RIVALRIES

As the expeditions sent out by European powers to the Pacific came increasingly to focus on scientific matters, they began to take on the guise of floating

laboratories, equipped with instrument collections that increased in size with each succeeding expedition. In the last quarter of the eighteenth century, numerous expeditions tested the marine chronometer devised by John Harrison (1693–1776) for the determination of longitude at sea. The instrument was a matched set of clocks, one set to the prime meridian, the other to local time. The difference in hours multiplied by fifteen yields the degree of longitude. On his 1772–1775 voyage, Captain James Cook tested four English chronometers, one by Harrison and three by John Arnold. He quickly determined that with accurate chronometers longitude could be determined within 1.5 degrees of accuracy, and more importantly, he let it be known publicly that he was abandoning the complex and tedious “lunar distance” method for determining longitude in favor of chronometers.

The role that scientific instrumentation played in imperial rivalries of the late eighteenth century can be appreciated in the provisioning of the expedition that the Italian captain Alessandro Malaspina led for the Spanish crown between 1782 and 1794. For the procuring of scientific instruments, the Spanish navy had an agent in London and another in Paris. The instrument makers were anxious to place their wares on spectacular expeditions such as the one being planned, because the performance of the instruments was highly publicized after the voyage in the string of memoirs by officers and naturalists sure to follow. Malaspina carried seven sets of chronometers, four made by Arnold and three by Ferdinand Berthoud. Alexander Dalrymple, who supplied Malaspina with English instruments, had close connections with Arnold’s shop, as a result of which Malaspina offered to provide Arnold with systematic comparisons of the longitude results given by Arnold’s instruments and those obtained simultaneously by astronomical methods. In this way, detailed field results were fed back to the manufacturer, who could then make the necessary corrections in future models. Malaspina’s judgment was that an Arnold chronometer was the best of the six, a Berthoud almost as good; the others ran too fast. The rest of Malaspina’s apparatus was heavily English: an astronomical pendulum invented by George Graham, two Dolland achromatic telescopes with triple objectives, and thermometers from the houses of Nairne and Blunt, respectively.

INSTRUMENT COLLECTIONS

As a result of the scientific revolution, collections of scientific instruments emerged in all of the centers of the Western world. Some collections were formed at universities and other teaching institutions for didactic purposes; others fulfilled the whims of wealthy scientific amateurs. Popularizers of Isaac Newton, who diffused the results of the scientific revolution in public lectures in the early eighteenth century, required a large number of instruments with which to conduct experiments or illustrate scientific principles during their presentations. The prototypes of much of this Newtonian demonstration apparatus were built by Pieter van Musschenbroek at the request of Willem J. s’Gravesande. The entire collection, including pulleys, weights, pendulums, pumps, and machines for illustrating specific concepts of physics is still preserved in Holland. In the second half of the eighteenth century, electrical apparatus was added to the repertory of demonstration equipment. The reputation of lecturers on physics depended in great part on the quality of their apparatus. Instrumentation became so expensive that private institutions like the Royal Society were dependent on patrons to supply them with instruments. The collection of the German counts of Hesse in the early eighteenth century had 57 telescopes and 32 microscopes. To own such instruments was a mark of culture. The collection of the kings of France at Versailles contained 245 instruments, including 52 pieces of electric apparatus, at the time of its confiscation during the French Revolution. In Madrid, the Spanish crown established in 1791 a Royal Machine Museum (Real Gabinete de Máquinas), a collection of 270 models of different kinds of machines. Private collectors of the same period, whose collections we know through inventories included in their wills, inevitably owned electrical machines and air pumps. Franklin’s experiments had made the former a symbol of scientific progress, and air pumps, as a kind of prototypical machine, though of a size manageable for demonstrations, were a convenient symbol of the incipient industrial revolution and could be used to run a multiplicity of experiments.

SCIENTIFIC METHOD. Methods for investigating the natural world were transformed in the early modern era, leading to a variety of approaches that emerged from diverse philosophical orientations. To call these diverse methodologies "scientific" is a convenience but one that entails anachronistic usage. The Latin word *scientia*, meaning, broadly, 'knowledge', has none of the methodological implications of the modern term *science*. Early modern investigators called themselves philosophers, natural philosophers, physicians, and experimental or mathematical philosophers rather than scientists. Methodological issues often were the focus of lively discussions and bitter disputes. By the end of the era, approaches to investigating the natural world had undergone profound changes that historians traditionally have called the "scientific revolution."

ARISTOTELIANISM

The predominant methodology inherited by early modern learned culture was Aristotelian. The writings of Aristotle became the basis of the medieval

university curriculum and remained so well into the seventeenth century. For Aristotle, knowledge (*epistēmē* in Greek, *scientia* in Latin) was universal and necessary. The goal of natural philosophy was to grasp the principles and natures of natural substances and to understand their causes. The method was a logical one based on syllogistic reasoning. If A equals B and B equals C, then A equals C. The four Aristotelian causes comprised the material cause (what a thing is made of), the formal cause (what kind of thing it is), the efficient cause (what made it), and the final cause (its purpose or goal), this last being most important. Demonstration was a process whereby a syllogistic proof of an effect was constructed through an analysis of its causes.

In the mid-sixteenth century at the University of Padua, traditional Aristotelian logic began to provide a renewed methodological basis for investigating the natural world. The most important figure in this development was Jacopo Zabarella (1533–1598). Remaining within an Aristotelian framework, the new logic asked how investigators got from sense perception to demonstrable truth. They discussed "demonstrative regress, a logical technique permitting the scholar to reason from an observed effect (fact) to its proximate cause and then to reason back (regress) from the cause to the effect where the reasoning began" (Grendler, p. 263). These methodological explorations influenced Galileo and other investigators until the mid-seventeenth century when Aristotelianism itself declined in influence.

HUMANISM AND NEOPLATONISM

Without replacing Aristotelianism, new approaches developed in the fifteenth and sixteenth centuries that emphasized particulars. Humanism was a broad intellectual movement that engaged in the reform of Latin and the rediscovery of ancient texts. Humanists criticized the logical approach of Scholasticism and often focused upon individuals in specific times and places, utilizing the dialogue and letter as literary forms that allowed the expression of individual points of view. They also studied and edited ancient texts, many of which became significant for the investigation of the natural world.

Renaissance Neoplatonism emerged as a result of this humanist textual work. A key figure is Marsilio Ficino (1433–1499), who during the sec-

ond half of the fifteenth century translated and edited the writings of Plato, Neoplatonic philosophers such as Plotinus (205–270 C.E.), and the Hermetic corpus. The latter consisted of a group of writings actually dating from late antiquity that Ficino and his contemporaries believed were written before the time of Moses by one Hermes Trismegistus. They considered that the Hermetic corpus comprised a synopsis of ancient theology (*prisca theologia*). Ficino and his many successors in the sixteenth and seventeenth centuries believed in the reality of magic and in occult powers because they viewed the universe as a spiritual unity connected in all its various parts by sympathies and antipathies. The magus or magician could influence remote parts of the cosmos by manipulating these connections, and he or she did so to influence worldly matters, such as sickness and health. The operational aspects of Neoplatonic magical traditions may have influenced the development of experimentation, a methodology that entailed the active manipulation of the natural world.

Neoplatonic doctrines also influenced notions about experience and its role in investigating nature. One example entails the doctrine of signatures and illumination. In one version, that of the sixteenth-century physician Paracelsus (1493/94–1541), experience is framed by the biblical context of the Fall. Humans after their expulsion from paradise no longer had direct access to the Word of God or direct knowledge of the world of nature. Yet because God had put the light of nature (*lumens naturalis*) in them they could overcome their fallen state. The light of nature awakened in their minds, so they were able to see signs stamped on natural things. Directly experiencing such things, they could thereby see God's "signatures," which were external signs that pointed to the internal nature of things.

MEDICINE AND ALCHEMY

Within the discipline of medicine, interest in particulars and a validation of individual experience developed in a variety of ways. In the fourteenth century a branch of medicine known as *practica* emerged that concerned the particulars of disease and treatments. By the sixteenth century the writings of the ancient physician Galen (129–c. 199 C.E.) had become widely influential, particularly with respect to

his empirical orientation and his practice of dissecting animals. Human dissection was taken up as part of the medical curriculum in the late medieval universities. Initially dissections were carried out in formal, public settings in which a high-status, learned doctor stood on a podium to read an authoritative text on anatomy, while a low-status person performed the handwork of dissection. In his famous *De Humani Corporis Fabrica* (On the fabric of the human body) published in 1543, Andreas Vesalius (1514–1564) advocated hands-on dissection by the high-status physician as well as careful observation and the visual depiction of body parts. Vesalius criticized but was also indebted to Galen. His famous treatise is part of a rich tradition of anatomical study that continued through the eighteenth century. This tradition notably includes the experimental work of William Harvey (1578–1657) in the 1620s on the circulation of the blood.

Alchemy represents a distinct discipline that developed in early modern Europe after the medieval transmission of key texts from the Islamic world. Alchemists often undertook hands-on, laboratory operations entailing separations, distillations, and the like. In the seventeenth century alchemy and related fields developed genuine experimental procedures. Jean Baptiste van Helmont (1579–1644) carried out numerous careful determinations of specific weights of substances he produced in his laboratory. George Starkey (1627–1665) undertook thousands of experiments to discover a single method of changing all sulfurs into medicines. The laboratory experiments of Robert Boyle (1627–1691) were influenced by this work. Scholars have investigated these seventeenth-century developments in detail and have traced their influence on eighteenth-century chemists, such as Antoine Lavoisier (1743–1794). This scholarship has brought into question the traditional sharp distinction between early modern alchemy and modern chemistry.

MECHANICAL ARTS

The mechanical arts entailed skilled craft work, including carpentry and weaving, but also arts that are now considered fine arts, such as painting and sculpture. The influence of artisanal craft values on early modern scientific methodology has been a long-standing topic of discussion in the history of science. The Viennese scholar and refugee Edgar Zilsel

(1891–1944) argued that artisanal values that appreciated hands-on experience and craft work influenced the emergence of an experimental methodology in the seventeenth century. Subsequent scholarship has shown that the fifteenth- and sixteenth-century proliferation of writings on mechanical arts transformed the practical knowledge of the crafts into discursive subjects worthy of the attention of learned persons. Painters and other practitioners wrote books in which they articulated the value of practice and direct experience as crucial for obtaining knowledge of the natural world.

MATHEMATICS AND MECHANICS

Practical problems in the mechanical arts increasingly came to be analyzed in mathematical terms. The ancient mathematician Archimedes (c. 287–212 B.C.E.), who had applied geometric analysis to problems of statics (the science of weights), came to be highly influential. In the sixteenth century Niccolò Tartaglia (1499–1557) published the first Latin treatises of Archimedes and also wrote books in which he mathematically analyzed practical problems, such as the trajectory of cannonballs. Later in the same century authors, such as the nobleman and patron of Galileo, Guidobaldo del Monte (1545–1607), wrote treatises on machines and mechanics in the context of theory and mathematics.

This sixteenth-century tradition preceded the development of the new science of motion developed by Galileo Galilei (1564–1642). Galileo worked out the mathematical kinematics of motion. Disregarding air resistance, he concluded that all bodies fall in uniformly accelerated motion and that velocity increases in proportion to time elapsed. He went on to deduce the mathematical results of this conclusion, for instance, that the distance increases in proportion to the square of time. Following Galileo, Christiaan Huygens (1629–1695) worked out the mathematics of the pendulum and of circular motion. Near the end of the seventeenth century, in *Philosophiae Naturalis Principia Mathematica* (1687; *Mathematical principles of natural philosophy*), Isaac Newton (1642–1727) created a system of terrestrial and celestial dynamics in which he demonstrated mathematically a large array of propositions concerning natural phenomena. In these and many other examples in the seventeenth and eighteenth centuries, the aim of natural and experi-

mental philosophers was to describe motion by means of mathematics. This project was possible because of simultaneous developments within mathematics itself, culminating in the invention of calculus by Newton and by Gottfried Wilhelm Leibniz (1646–1716) at the end of the seventeenth century.

INSTRUMENTATION AND EXPERIMENTATION

During the sixteenth and seventeenth centuries the use of instruments to measure and investigate the natural world came to be increasingly important. The Danish nobleman Tycho Brahe (1546–1601) is considered the greatest observational astronomer before the invention of the telescope. For twenty years, from his Uraniborg observatory, Brahe made systematic observations of the moon, the planets, and other phenomena, such as the comet of 1577. He used these observations not only to correct and improve available data but to investigate and develop theories about the nature of the heavens and the structure of the cosmos.

Observational astronomy changed with the invention of the telescope. With this new instrument Galileo made detailed observations of the moon and the stars of the Milky Way. He further discovered the four moons of Jupiter (the Medicean Stars). In *The Sidereal Messenger* (1610) he described these discoveries with both text and drawings. Galileo's conclusions were by no means instantly accepted. He had to persuade his contemporaries that his instrument produced valid data, not optical illusions. Like Brahe and others of his predecessors, Galileo produced new data, but he also used that data to make novel claims about the nature of the cosmos.

Instruments and devices became especially significant in the seventeenth and eighteenth centuries. Among these devices were “philosophical” machines especially devised to investigate the natural world. A prominent example of such a philosophical machine was the air pump, used by Boyle to investigate the nature of air. The pump was difficult to build and to use. Nevertheless, it was key to a whole series of experiments concerning air carried out in the mid-seventeenth century.

In seventeenth-century England the notion of the reliable witness to experiments emerged. Such a witness was an honorable person, preferably a gen-

tleman (therefore immune from the self-interest of the artisan), who could attest to the accuracy of the stated results of a given experiment. Valid experimental results came to be tied to the social requirements of gentlemanly honor. By the eighteenth century, however, learned visitors interested in natural philosophy who came to London often visited the shops of instrument makers to purchase instruments but also to discuss philosophical and experimental issues. By this time the instrument maker's shop had become a space for philosophical discourse, while the status of certain kinds of craft practitioners had risen.

The use of instruments to investigate nature had important methodological implications because it challenged the notion of Aristotelian common experience. For Aristotelians common experience was valid because all reasonable people without question agreed that a particular claim was true. In contrast, truth derived from experimentation, and instrumentation depended on the manipulation of a device that was only available to particular individuals. Such individuals had to have access to the device itself and had to possess particular skills to use it. Aristotelian common experience and seventeenth-century experiment represented opposing methodologies. Further the use of instrumentation to investigate nature challenged the Aristotelian separation of the categories of *technē* (material production and reasoning about that production) and *epistēmē* (certain knowledge of unchanging truths).

BACONIAN EMPIRICISM AND NATURAL HISTORY

The English jurist and philosopher Francis Bacon (1561–1626) proposed a new methodology that aimed to bring about a continuous flow of new facts about the natural world. Bacon's most significant methodological work was *Instauratio Magna* (1620–1626; The great instauration), which included *Novum Organum* (1620; New instrument). Bacon rejected syllogistic logic, pointing out that the premises of the syllogism could be in error. His own method entailed gathering a large amount of data on a variety of subjects and applying that data to the development of axioms. His goal was to account for the many particular things in nature in all its diversity. Yet his method entailed more than the simple collection of sense experiences, for Bacon believed the senses could deceive. Rather, in the

creation of axioms he took into account the “maker's knowledge,” that is, the presuppositions necessary for the fabrication of a thing. To gather data, Bacon proposed a cooperative effort to write “histories of the trades,” detailed accounts of the essential operations of productive arts, such as silk textiles, mining, printing, papermaking, and agriculture, as well as “natural histories” on topics such as snakes, birds, and metals.

In the sixteenth and seventeenth centuries, particularly in Italy, natural history was the focus of growing interest. The creation of natural history collections by naturalists, such as Ulisse Aldrovandi (1522–1605) and Athanasius Kircher (1601–1680), and the intense study of the specimens in those collections became an important aspect of the investigation of nature. Museums became “laboratories of nature” (Findlen, p. 154), where investigations entailing testing, dissection, and distillation occurred. In some instances the collection of specimens was accompanied by the creation of detailed drawings based on careful observations. Collecting specimens, examining them, and having them drawn or painted became important modalities for the study of nature. Federico Cesi (1585–1630) and other members of the Academy of the Lincei, a scientific society founded in 1603, were particularly active in this form of investigation of the flora and fauna of Italy.

DESCARTES AND THE MECHANICAL PHILOSOPHY

The methodological writings of René Descartes (1596–1650) laid the foundations for the “mechanical philosophy.” Descartes's famous dictum “*Cogito ergo sum*” (“I think therefore I am”) is the basis for his notion that mind is a thinking substance and is to be excluded from the physical world entirely. That world, composed of particles of matter, is characterized by extension. These particles move only by virtue of mechanical necessity. Their motions produce all the variety of natural phenomena. Descartes eliminated spiritual or mental qualities from the material world, leaving the thinking subject (the “I” of the cogito) as the discoverer of the clear and certain truths of nature. That natural world, characterized by extension, is ordered by mathematical relationships. For Descartes certain knowledge could be obtained by applying mathematical rules to the world of nature.

CONCLUSION

Investigations of the rich methodological cornucopia that characterizes the early modern period have been guided by several general principles. First, early modern thought is studied on its own terms, not according to the values of modern scientific methodology. Second, the wide-ranging connections of methodological thought to contemporaneous language and meaning on the one hand and to social and cultural conditions on the other are being explored in depth. Finally, studies have followed the sources, whatever that content might be. As a result, natural history has taken its place beside physics. The doctrine of signatures has been studied as thoroughly as the laws of planetary motion. Such contextual approaches have greatly expanded knowledge of early modern methodologies for investigating the natural world.

SCIENTIFIC REVOLUTION. The scientific revolution took place from the sixteenth century through the seventeenth century and saw the formation of conceptual, methodological, and institutional approaches to the natural world that are recognizably like those of modern science. It should not be seen as a revolution in science but a revolution in thought and practice that brought about modern science. Although highly complex and mul-

tifaceted, it can essentially be seen as the amalgamation of what was called natural philosophy with various so-called subordinate sciences, such as the mathematical sciences, astronomy, optics, and geography, or with separate traditions, such as those of natural magic and alchemy. The traditional natural philosophy, institutionalized in the universities since their foundation in the thirteenth century, was almost entirely based upon the doctrines of Aristotle and followed rationalist procedures. When those trained in natural philosophy began to recognize the power of alternative traditions for revealing truths about the physical world, they increasingly incorporated them into their natural philosophies. In so doing, these natural philosophers inevitably introduced different methods and procedures to complement and refine the earlier rationalism. To fully understand the scientific revolution, however, requires consideration not only of what happened but also of why it happened. Before looking at this, it is necessary to consider the status of the scientific revolution as a historiographical category.

HISTORIOGRAPHY AND THE SCIENTIFIC REVOLUTION

The *scientific revolution* is the historians' term and should be seen as a shorthand way of referring to a multitude of historical phenomena and processes, not all of which were directly related to one another. Although potentially misleading in so far as there were not, for example, defining moments when the revolution can be said to have begun or to have ended nor a recognizable body of revolutionaries who were all self-consciously affiliated with one another, it continues to be recognized as a valid label. The lengthy time span of this revolution might also seem anomalous, but this is easily outweighed by the undeniable fact that approaches to natural knowledge in 1700 were completely different from those deployed in 1500 and that there is no exaggeration in calling these changes revolutionary. Those historians who have chosen to emphasize the undoubted continuities between the thought of the scientific revolution and medieval thought nevertheless concede that, by the end of the period, things were completely different from the way they had been at the beginning. It is perfectly possible, for example, to see Nicolaus Copernicus (1473–1543), who first suggested that Earth was not stationary in the center of the universe but was re-

volving around the Sun, not as the first modern astronomer but as the last of the great medieval astronomers. Far from being an indefensible position, this is the only way to fully understand what Copernicus did and how he did it. Nevertheless it remains true to say that the switch from an Earth-centered universe to a Sun-centered planetary system had revolutionary consequences that cannot possibly be denied.

An important indicator of the persuasiveness of the notion of a scientific revolution is its role in one of the most influential works in the modern philosophy of science, Thomas Kuhn's (1922–1996) *Structure of Scientific Revolutions* (1962). Inspired chiefly by the Copernican revolution (which he made the subject of an earlier book) and its far-reaching aftermath, Kuhn developed a theory about the nature of scientific progress based upon radical innovations that mark a revolutionary disruption from earlier thinking. Kuhn's influence has been greatest among philosophers and sociologists of science concerned with understanding the nature of scientific innovation and advance, but his ideas were directly inspired by and modeled upon the historiography of the scientific revolution.

Given the importance of this historiographical category, it is hardly surprising that it has attracted a number of attempts to provide a simple key for understanding it. Two of the most serious attempts to explain its origins are the so-called scholar and craftsmen thesis and the Protestantism (or even Puritanism) and science thesis. Deriving essentially from Marxist assumptions, the scholar and craftsmen thesis takes for granted the idea that modern science is closer to the work of elite craftsmen and skilled artisans than it is to the ivory tower philosophizing of the medieval university. All that was required to bring about the scientific revolution therefore was a realization by educated scholars, provoked by the economic stimulus of the incipient capitalism of the Renaissance period, that artisans were producing accurate and useful knowledge of the physical world. This thesis is untenable on a number of grounds. Among the more wide-ranging are the fact that it pays insufficient attention to the continuities between the natural philosophy of the scientific revolution and medieval natural philosophy and the obvious fact that craftsmen and artisans do not, as a rule, rely upon, much less produce,

scientific thinking while doing their work. There is too much reliance in these Marxist accounts on glib talk to the effect that experimentation is manual work, craftsmen indulge in manual work, therefore craftsmen do experiments. Nonetheless it is certainly true that scholars began to pay attention to the work of technical artisans in the Renaissance, and this no doubt owed something to economic factors. But the scholars took this craft knowledge and turned it into something closer to modern science; the artisans themselves were not already in possession of scientific knowledge.

The Protestantism and science thesis, based more on statistical claims that Protestants play a disproportionate role in the development of modern science than on causative explanation, is also problematic but much harder to dismiss. Although it is quite clear that Roman Catholic thinkers, notably Copernicus, Galileo Galilei (1564–1642), and René Descartes (1596–1650), played a major role in the early part of the scientific revolution, the later period does seem to be dominated by developments in Protestant countries, even though the Protestant population as a whole remained the minority in Europe. Nevertheless the reasons advanced to explain why this might be so remain unconvincing. One of the most powerful refinements of this thesis, by the American sociologist Robert K. Merton (1910–2003), seeks to explain the culmination of the scientific revolution in late-seventeenth-century England, with the formation of the Royal Society and the appearance of its most illustrious fellow Isaac Newton (1642–1727), as the result of the rise of Puritanism in the civil war period. Here the statistics have proved much less satisfactory, since it is virtually impossible, without merely begging the question, to say who was a Puritan and who was not. Moreover the suggested reasons seem to apply equally to all English Protestants, not just Puritans, and indeed in some cases to European Catholics as well. The starting point for these explanations is the claim of the German sociologist Max Weber (1864–1920) that the “spirit” of capitalism is linked to the Protestant work ethic. Again it is difficult to accept the suggested reasons for this link, and yet, as a result of collective prosopography, a feeling remains that there must be some truth in it.

Another influential historiographical claim about the scientific revolution, but this time one

that does not seek to explain its origins but its cultural impact, links the development of the scientific revolution with a vigorous reassertion of patriarchal values and the subjection of women. Based on a historiography that presents premechanistic worldviews as holistic, organic, vitalistic, and feminine, the mechanical philosophy of the scientific revolution (see below), by contrast, is shown to be manipulative, exploitative, and aggressively masculine. Supported by pointing to the routine use of sexual metaphors by the new natural philosophers in which the investigator is recommended to subdue, constrain, and bind into service Mother Nature in order to facilitate penetrating her inner secrets, feminist historians have seen these attitudes as a reason for the gendering of science that persists into the twenty-first century. There seems to be a prevailing assumption that science is a masculine pursuit and that women are somehow mentally unsuited to it. This is a legacy not of the ancient period or of the Middle Ages, feminists claim, but of the new approach to the natural world developed during the scientific revolution. Although there is some interesting and undeniable evidence for this general view, the claim that earlier natural philosophy was in some way feminine or feminist seems merely tendentious. The magical worldview, for example, was exploitative and manipulative for centuries prior to the scientific revolution. What’s more, traditional natural philosophy excluded women throughout the Middle Ages.

If the historians’ concept of a scientific revolution remains indispensable for understanding the origins of modern science, it raises another important set of historiographical issues. Why did the scientific revolution occur when it did (at the end of the Renaissance and the beginning of the early modern period)? Why did it occur only in western Europe? More to the point, why did it not occur in ancient Greece, early imperial China, medieval Islam, or Byzantium, where there is enough historical evidence to suggest it might have occurred? To what extent was the scientific revolution responsible for the subsequent cultural dominance of the West? Debates on these issues continue in the twenty-first century. Requiring a wide-ranging familiarity with the history of diverse cultures as the basis of comparison and an enlightened caution against chauvinistic assumptions that Western culture is somehow

innately superior, there has so far been little or no consensus. It seems likely, however, that this aspect of the historiography of the scientific revolution will grow as awareness of the need for multicultural perspectives to reach a full understanding of the past increases.

THE RENAISSANCE AND THE SCIENTIFIC REVOLUTION

In its origins the scientific revolution can be seen as another outcome of that sea change in European life and thought known as the Renaissance. In particular the new emphasis by intellectuals on the *studia humanitatis*, the ‘study of humanity’, with its concomitant concern for the *vita activa*, the ‘active life’ lived for the public good, as opposed to the traditional religious emphasis upon the contemplative life, stimulated new attitudes toward natural knowledge. Traditional natural philosophy had always been seen as a “handmaiden” to theology, the queen of the sciences, and as such it was a contemplative pursuit concerned with understanding God’s creation for its own sake. The Renaissance humanists, concerned with living the active life, increasingly looked to alternative intellectual traditions with more pragmatic aims, in particular the mathematical sciences and the traditions of what was called natural magic.

These changes in attitude toward knowledge and what it was for went hand in hand with revelations emerging from the rediscovery of ancient wisdom. Humanist scholars systematically searched monastery libraries all over Europe for any surviving copies of ancient Roman and subsequently ancient Greek writings. Previously the only body of writing on natural philosophy available to Western scholars was that of Aristotle (384–322 B.C.E.), but for the first time it was possible to read the works of Plato (c. 428–348 or 347 B.C.E.), Epicurus (c. 341–270 B.C.E.), the Stoics, various Pythagorean or Neoplatonic writers, and others. Plato proved especially influential, and this boosted the importance of the later Pythagorean and Neoplatonist writers who were seen to be his followers. Since these writers tended to see mathematics and especially geometry not merely as human constructs but as reflections of the divine mind, the principles of which had been built into the world in Creation, they stimulated humanist scholars to see mathematics as a legitimate and powerful means of discovering truths about the

natural world. This was in stark contrast to the prevailing Aristotelian view of mathematics, which was dismissed as essentially irrelevant for understanding nature because it was abstracted from physical considerations and did not provide explanations in terms of causes.

Similarly, the discovery of a body of writings attributed to Hermes Trismegistus (Thrice-Great Hermes), who was assumed to be an ancient sage deified by the Greeks, gave a new legitimacy and intellectual kudos to magical traditions. Although actually written in the second and third centuries C.E., the Hermetic writings were assumed to be contemporary with Moses and his writing of the Pentateuch. Since these works were highly magical, it now seemed that magic was part of ancient wisdom, the wisdom known to Adam that gradually became forgotten after the Fall. Throughout the Middle Ages the church had condemned magic, declaring it to be entirely dependent upon demonic intervention. After the discovery of the Hermetic writings, for a brief period magic was seen as a powerful system of knowledge that exploited the natural qualities and powers of bodies to recover the dominion over all things that God had offered to Adam (Genesis 1:28).

The elevation of the intellectual status of mathematics and natural magic had far-reaching effects. Large numbers of mathematical practitioners of various kinds were quick to extol the virtues of their practice in terms of its certainty (unlike the speculative natural philosophy) and its pragmatic usefulness. The result was an increasing mathematization of the world picture, culminating at the end of the seventeenth century in the supreme achievement of Newton. The title of his great book, *Philosophiæ Naturalis Principia Mathematica* (1687; The mathematical principles of natural philosophy), still widely regarded in the twenty-first century as one of the most important scientific books, sums up the change from an Aristotelian natural philosophy where mathematics had no role to a physics dependent upon mathematics. Other salient points in this transformation were Copernicus’s insistence in 1543 that Earth must move, in spite of the lack of compelling physical reasons for its movement, simply because the mathematics of a heliocentric system was more elegant and coherent, and the belief of the astronomer Johannes Kepler (1571–1630) that the

world can be understood in geometrical terms because “Geometry, which before the origin of things was coeternal with the divine mind and is God himself . . . supplied God with patterns for the creation of the world” (1619; *Harmony of the World* [*Harmonices Mundi*], p. 304). The great Italian mathematical physicist Galileo claimed that the book of nature “is written in the language of mathematics . . . without which it is humanly impossible to understand a single word of it” (*The Assayer*, 1622, in *Discoveries and Opinions*, p. 238).

The increased concern with the practical utility of knowledge of the Renaissance humanists ensured that practitioners of occult arts, like alchemy, astrology, sympathetic magic, and what was called “mathematical magic” (the construction of technological devices and machines—regarded as occult because their operations could not be explained in Aristotelian terms), also earned enhanced intellectual status. The most important outcome of the rise of magic was an appropriation of one of its chief methods of exploration—the experimental method—and a far-reaching reassessment of the concept of so-called occult qualities.

The use of the experimental method in natural philosophy is undoubtedly a characterizing feature of the scientific revolution, but the method itself was not newly invented in this period. It was simply incorporated into the previously entirely speculative natural philosophy from the natural magic tradition. Alchemists and those seeking supposed sympathetic effects of one substance on another, in order to bring about desired ends, had long since developed and continued to use techniques of experimental manipulation. The most prominent figure in the scientific revolution responsible for promoting the experimental method was the English statesman and philosopher Francis Bacon (1561–1626), but it is perfectly clear that he took his inspiration from the magical tradition. Similarly William Gilbert (1544–1603), an English physician and author of a seminal book on magnetism generally seen as the first scientific book based almost entirely on the experimental method, was directly influenced by a medieval magical treatise. It used to be assumed by historians that Gilbert’s *De Magnete* (1600; On the magnet) took its experimental method from craftsmen and artisans working with iron or manufacturing magnetic compasses, but all the features of his

experimental method are in a *Letter on the Magnet*, written by the natural magician Petrus Peregrinus de Maricourt (fl. 1269) and first published in 1558.

The issue of occult qualities came to prominence as a result of increasing dissatisfaction with Aristotelian matter theory and emerging awareness of alternative magical accounts. The aim of Aristotelian natural philosophy was to explain everything in terms of easily understood and obviously true factors. Accordingly, it tried to account for physical changes in terms of changes in the four manifest qualities, hot, cold, wet, and dry, all of which were obvious to the senses. In many cases, of course, a certain amount of ingenuity was required to refer changes back to these four qualities. A change from roughness to smoothness, for example, would be explained as a change from dryness to wetness. When ingenuity failed, however, there was often nothing for it but to admit that occult qualities were at work—qualities that could not be referred back to the manifest qualities but whose effects were undeniable to the senses. The classic occult quality is magnetism—the lodestone’s ability to attract iron does not seem to be reducible to the action of heat or any other manifest quality, but its effect, the movement of a piece of iron, is visible for all to see.

It was common in the magical tradition to assume that some bodies could act upon others by inherent sympathies or antipathies, a notion that was dismissed by Aristotelians as an “asylum of ignorance” because it explained nothing. As the experimental method became increasingly accepted as a legitimate aspect of natural philosophy, however, it became possible to demonstrate the operation of sympathies or antipathies experimentally (consider any of the phenomena, for example, that modern chemists refer to as elective affinities between chemical compounds) and to consider them as operationally defined. This in turn led to speculations about causes. Either bodies could act on one another at a distance, or there was some form of invisible interaction. For some, particularly those in England who were influenced by Bacon’s emphasis upon experiment devoid of speculation, it was possible to accept action at a distance merely on empiricist grounds and forego further speculation. For others, however, this was too magical to concede, and it was assumed that effects must be brought about by invisibly small particles streaming between

bodies. This strategy was favored by those aware of the alchemical tradition, which had a long history of explanation in terms of invisibly small corpuscles, and was further reinforced by the revival of ancient atomism as the result of the rediscovery of the writings of Epicurus and of the summary of Epicurean principles by Lucretius (c. 100 or 99–c. 55 B.C.E.) in his *De Rerum Natura* (On the nature of things).

At its extreme the attempt to explain all physical phenomena in terms of the interactions of invisibly small particles led to a vigorous denial of occult qualities. Descartes, the French mathematician and philosopher, believed that his system was capable of explaining all phenomena without recourse to occult qualities and that all occult qualities themselves, including magnetism, were reducible to the motions of invisibly small particles. In England, by contrast, the Cartesian system was seen as unacceptably speculative and not always supported by the evidence. This was particularly apparent in what would now be thought of as chemical reactions (about which Descartes was largely silent) and in the case of gravitational attraction. If gravity was caused, as Descartes suggested, by continual streams of descending particles pushing things to Earth, why was it not possible to shield a body from these streams and keep it suspended? It is surely historically significant that the universal principle of gravitation, seen as an occult force capable of acting across vast distances of empty space, was developed by an English alchemist working within the tradition of Baconian empiricism—Newton.

The new importance of matter theory in understanding the nature of the physical world is another characterizing feature of the scientific revolution. These variations on the use of invisibly small particles, their motions, and their interactions were generally referred to as the mechanical philosophy, a term first coined by the English experimental natural philosopher Robert Boyle (1627–1691). Although only the systems developed separately by Descartes and Thomas Hobbes (1588–1679) could be said to be strictly mechanical in the sense that they assumed particles of matter to be completely passive, capable of acting only by virtue of impact in collision with other particles, there was a range of other mechanical philosophies, such as those of Pierre Gassendi (1592–1655), Robert Hooke (1635–1703), and Newton, where particles were

held to be endowed with various inherent principles of activity (“seminal powers” or “internal faculties” in Gassendi, for example, and gravitational attraction in Newton).

The mechanical philosophy went hand in hand with two other innovations still seen as characteristic of modern science. Although the concept of laws of nature is as old as natural philosophy itself and can be found among the ancient Greeks, they were only invoked in a nonspecific, even vague way as principles of regularity in nature. The sun rises, for example, in accordance with a law of nature. Because Descartes was concerned with explaining all phenomena in terms of the motions of invisibly small particles out of which all gross bodies were composed and those motions were said to be the result of earlier collisions and could only be passed on by further collisions, he needed to be able to codify precisely how motions were passed on. This need for precision was also inspired of course by his background in mathematics and the rise in the belief that the world itself was mathematical through and through. Accordingly Descartes based his system of natural philosophy on three precise and carefully defined laws of nature supplemented by seven rules of impact (to clarify exactly what happens in different kinds of collision). Although now seen to be misconceived, Descartes’s laws had an enormous influence and seemed to his contemporaries to be the major factor in radically transforming natural philosophy from a speculative to a certain, physically and mathematically grounded enterprise. This confidence in the new mechanical philosophy was fully justified not long after, when Newton’s *Principia* established three revised laws of motion, which proved to be the correct basis for a highly successful mathematical physics until the advent of relativity and quantum theories in the early twentieth century.

Descartes was also aware that, in stark contrast to Aristotelian philosophy, which was supposedly based on common sense, his philosophy explained the world in ways that were not only contrary to sense impressions but were in principle undiscoverable by the senses. What the senses revealed was mere appearances; the underlying reality was one of crowding and jostling particles too small ever to be seen. Even light itself, according to Descartes and the other mechanical philosophers, was not

what people might think. Either pressure pulses in the intervening medium between the eye and the thing observed or streams of invisible particles flowing into the eye, light and color were subjective experiences, the reality of which was different. This fundamental belief was open to different interpretations and gave rise to differing opinions. Where Descartes believed people could infer the reality underlying appearances by essentially rationalist procedures, others took a more skeptical line. Out of these debates the English philosopher John Locke (1632–1704) initiated the philosophical position known as British empiricism. Locke insisted, against Descartes, that one can never be sure about the nature of the substance underlying the subjective experience of reality and must rely on empirical investigation rather than potentially misleading rational reconstruction. Subsequent thinkers took even more radical positions. For instance, the Anglo-Irish philosopher and divine George Berkeley (1685–1753), later bishop of Cloyne, said that all people can know is what they perceive, and they cannot even know that there is an underlying reality. British empiricism is a movement in philosophy rather than in science, but the distinction between what are called primary qualities (the qualities of the invisibly small particles, like size, shape, motion) and secondary qualities (subjective qualities, like taste, color, temperature) remains an important distinction in modern science.

THE WIDER CULTURE AND THE SCIENTIFIC REVOLUTION

Although it is possible to present the major innovations of the scientific revolution, that is, the mathematization of the world picture, the experimental method, and the concern for a practically useful knowledge, as well as their development into the mechanical philosophy, as direct outcomes of the humanist movement in the Renaissance and its concern with the active life, there were other important elements in the historical context. As is well known, the Renaissance was also the period that saw the rise of city-states and regional and national principalities, to say nothing of wealthy mercantilist corporations, all of whom had not only the wealth but also their own reasons for patronizing various enterprises. The role of patronage in the fine arts is well known, and its effects on the more realist nature of Renaissance art compared to medieval art and its

frequently more secular subject matter are plain to see. The role of secular patronage in changes in natural philosophy has not yet been fully explored, but it is already clear that this played a major part in the emphasis upon practically useful knowledge.

Royal courts employed mathematicians and natural magicians before they employed natural philosophers. Furthermore this kind of patronage led to the establishment of the first alternative institutional setting for learning about the natural world since the formation of the universities. At the Platonic Academy in Florence, under the patronage of Cosimo de' Medici (1389–1464), Marsilio Ficino (1433–1499) first translated not only the works of Plato into Latin but also those works attributed to Hermes Trismegistus. Subsequently, royal patrons began to support academies devoted directly to the investigation of the natural world, such as the *Accademia dei Lincei* (Academy of the Lynxes) supported by Federico Cesi (1585–1630) that grew around the famous natural magician Giambattista della Porta (1535?–1615) but later included Galileo among its members.

The importance of these academies and of the individual patronage of leading thinkers like Galileo (by Grand Duke Cosimo II de' Medici, 1590–1621) or Kepler (by the Holy Roman emperor Rudolf II, ruled 1576–1612) can be seen from the fact that virtually every conceptual or methodological innovation in the scientific revolution was introduced by thinkers working outside the university system. The most successful of these scientific research institutions were the Royal Society of London, founded in 1660, and the *Académie des Sciences* in Paris, set up in 1666, both of which consisted of the leading natural philosophers in their respective countries.

The universities should not be overlooked entirely, however. Although there was little innovation in the arts faculties where natural philosophy was taught, it was sometimes different in the medical faculties, where there was always a greater concern with the practical usefulness of knowledge. Most famous is the medical faculty at Padua, where Andreas Vesalius (1514–1564) revolutionized the traditional teaching of human anatomy by performing the dissections himself. More usually a lower-status surgeon performed the dissection for the class

while the medical professor simply read from the relevant work of the ancient medical authority Galen (c. 130–201 C.E.). By performing the dissections himself, Vesalius claimed to have discovered over two hundred errors in Galen's anatomical works. In particular Vesalius established that there was something seriously wrong with Galen's account of the heart and the movement of the blood. This led to the discovery of the lesser circulation of the blood (its circulation from the right ventricle to the left ventricle of the heart by crossing the lungs) by another professor at Padua, Realdus Columbus (1510–1559), in 1553 and the discovery of the full circulation by William Harvey (1578–1657), a former student at Padua, in 1628.

The medical faculties sometimes provided the institutional setting for advances in knowledge about the so-called *materia medica*, medicinal minerals, plants, animals, or parts of animals, although they had to compete for honors with the so-called cabinets of curiosities gathered by wealthy collectors that can be seen as the origins of modern museums. In many cases a wealthy patron not only set up a cabinet of exotic specimens from the natural world but also employed a learned curator, who then became well placed to revise current knowledge of flora and fauna. For example, Pierandrea Mattioli (1500–1577), curator of Archduke Ferdinand of Tyrol's (1529–1595) collection, became one of the leading naturalists of the age.

Generally speaking, of course, university-trained medical practitioners were able to make a good living, and many were able to pursue further study independently. Medical practitioners form the single biggest group of contributors to the scientific revolution. But it was not always university men who made the greatest contributions. The itinerant Swiss autodidact who called himself Paracelsus (c. 1493–1541) developed a new system of medicine and therapeutics based on assumptions about the alchemical nature of the whole of Creation, the macrocosm and the microcosm of the human being. Physiological processes were seen as alchemical processes within the body, and it was assumed that alchemically produced medicines could be as efficacious as traditional herbal remedies if not more so. Accordingly Paracelsians used far more mineral-based medicines than had been usual previously. Although Paracelsian methods were always contro-

versial, some notable therapeutic successes (and the inadequacy of traditional cures) ensured that it was widely adopted by numerous followers throughout Europe.

Responses to Paracelsianism point to another important aspect of the reform of natural knowledge. For many contemporaries the radical and iconoclastic nature of Paracelsianism was seen as subversive of orthodoxy. Traditional Galenic medicine, like Aristotelian natural philosophy, was seen as guaranteeing what were regarded as traditional verities enshrined in university curricula and confirming the old authorities. More to the point, it was seen as all of a piece with orthodoxy in religion. In Catholic countries Paracelsus was regarded as the Luther of medicine, as subversive to the health of the body as the religious reformer Martin Luther (1483–1546) was to the health of the believer's soul. Paracelsianism tended to flourish therefore in societies riven by religious and concomitant political factionalism. In France it was promoted by the Protestant Huguenots, in Germany it flourished in the Protestant states, and in England after the Civil War it was promoted by parliamentary physicians, who saw Galen as a tyrant in medicine who had to be deposed as Charles I (ruled 1625–1649) had been.

The most famous aspect of the alliance between traditional authority in natural knowledge and orthodox religion is, of course, the alliance between Aristotelianism and Roman Catholicism, particularly as manifested in beliefs about the stationary position of Earth. But the situation was significantly different from the response to Paracelsianism. Perhaps because astronomy was of less concern to people in their everyday lives than was medicine, little attention was paid to the innovations of Copernicus when they were first published in 1543. Only after Galileo widely publicized discoveries he had made by turning the newly invented telescope to the heavens in 1610 did the Catholic Church begin to take notice. Galileo's telescopic innovations could do nothing to prove the truth of Copernican astronomy, but they could and did show that Aristotle's ideas were significantly wrong. Galileo used his considerable rhetorical skills to imply that Aristotelian cosmology should be replaced by Copernicanism. Unfortunately, Galileo's rhetorical strategy included a widely circulated letter to Grand Duchess Christina (1615; the dowager duchess was the

mother of Galileo's patron Cosimo de' Medici) in which he suggested that certain biblical passages should be reinterpreted to make them compatible with Copernican theory. The Catholic Church could not let this intervention by a layman into matters of scriptural interpretation pass and made a ruling in 1616 that confirmed the traditional, geostatic interpretation of Scripture and condemned Copernicanism as erroneous and heretical.

It is significant that the Protestant churches, usually more concerned with biblical literalism than the Catholic Church, took no comparable action against Copernicanism. The fact that the Catholic Church took no action until Galileo made the religious implications of Copernicanism highly public, some seventy years after the publication of Copernicus's book, suggests that analyses that have emphasized the local contingencies in the Galileo affair are correct and that it is wrong to use this affair to argue that science and religion are irreconcilable world-views.

Indeed, most of the evidence from the scientific revolution points the other way, showing a strong alliance at this period between science and religious belief. The end of the sixteenth century saw the beginnings of atheism in Europe, arising at least partly out of a skeptical crisis among intellectuals as a result of the newly discovered alternatives to Aristotle from ancient thought, including ancient skeptical writings. It seems clear that early atheists (for the most part they covered their tracks well—atheism was, after all, a capital offense) used their interpretations of natural philosophy (at first Aristotelianism and subsequently the mechanical philosophy) to promote irreligion. Nevertheless, all the major contributors to the development of the scientific revolution seem to have seen themselves as “priests of the Book of Nature,” to use Kepler's phrase. The starting point of Descartes's system of natural philosophy was an argument he saw as undermining any skeptical position, his famous argument, “I think, therefore I exist.” And his next move was to prove the existence of God before going on to build up his rational system of nature. Once again the culmination of this line is in the work of Newton, who privately admitted, “When I wrote my treatise about our system, I had an eye upon such principles as might work with considering men for the belief of a Deity; and nothing can

rejoice me more than to find it useful for that purpose” (Letter to Dr. Richard Bentley, December, 1692, in *Papers and Letters*, p. 280). Accordingly, in the second edition of the *Principia* (1713), he publicly declared that “to treat of God from phenomena is certainly a part of natural philosophy” (p. 943).

If modernity is associated with the advent of secularism, therefore, the role of early modern science is by no means unambiguous. On the one hand, the tradition of natural theology, that is, using the principles of science and close observation of the natural world to suggest that the world shows signs of intelligent design, can be seen as an attempt to resist secularization of the world picture. On the other hand, however, this same movement led believers away from Scripture and revelation to a rationalist and intellectual approach to God that ultimately came to seem indistinguishable from a science-based atheism. Similarly, although some early modern scientists used the limitations of the mechanical philosophy to point to the need to accept the existence of a spiritual realm, using accounts of witchcraft and ghosts to make their points, others insisted on the reality of the immaterial rational soul but proceeded to explain as many mental phenomena as possible in terms of a material “animal soul.” Eventually the new science contributed to the movement toward secularization, but the process was not fully accomplished until the Enlightenment, the age succeeding that of the scientific revolution.

JOHN HENRY

SCOTLAND. In 1500 Scotland was a small, poor, and peripheral country on the northern fringe of Europe. Its economy was largely agricultural, its religion unremarkably Catholic, its political leanings toward France, its military and commercial significance minor, its people largely illiterate. By 1800 Scotland was a European leader in the fields of agriculture and commerce; it had long been self-consciously, perhaps aggressively, Protestant; its philosophers had changed the face of European thought; its inhabitants, by now among the best educated in Europe, saw themselves as Scots, but also as Britons; its people, practices, and ideas had left a stamp on the whole British, European, and Atlantic world.

RELIGION AND POLITICS

The first step in this progression was the Reformation. Politically it was made by Scotland’s separate Parliament, at grass roots principally by urban middle classes, and in popular memory by John Knox (1513–1572). Where the Scandinavian and German lands espoused the Word according to Martin Luther, Scotland followed the Swiss model of John Calvin, which also appealed to the northern Netherlands and certain parts of what is now France. To make a political statement against Mary Queen of Scots (1542–1587) and her French connections, Scotland’s Parliament introduced in 1560 an assertive Calvinist Confession of Faith. Within a generation or two, Protestantism’s institutions were firmly established in the Lowlands, and within three or four generations it had become the faith of most of the country.

Pockets of Catholicism survived into the eighteenth century, but the principal religious battles in the generations after the Reformation were fought over church organization: should it be presbyterian

or episcopalian? Bishops and presbyteries coexisted unhappily from 1560 until 1689. The Scottish Revolution of 1638, which eventually led to an invasion of England and the overthrow of Charles I, and the “Glorious Revolution” of 1688–1689 were sparked by Presbyterians; powerful ties existed between Scottish Presbyterians and radical English Puritans in the period up to 1646. Late-sixteenth- and early-seventeenth-century Scotland was a hotbed of revolutionary religious and political ideas.

The political origins and standing of the Church of Scotland gave it power almost unique in Europe, for example allowing it to control the moral and religious behavior of all Scots through parish “kirk sessions.” Yet this was fatally weakened by a Toleration Act in 1712 and by further splits between Protestant denominations (for example, in 1733), which

continued to fragment the faith into the mid-nineteenth century. Vocal and sometimes violent anti-Catholicism also persisted throughout the early modern period.

Calvinist reformers placed education at the top of their agenda. A national system of parish schools was established by Parliament during the seventeenth century, giving Lowland Scots among the highest literacy levels in Europe by the mid-eighteenth century. Scots came to value education highly. Around 1790 Scotland had the highest ratio of universities per million inhabitants in Europe (3.3 per million; the figure was 0.2 for England, Wales, and Ireland, 0.9 for France). Early growth in university numbers was fueled by demand for training in Protestant theology, while its eighteenth-century expansion was principally associated with legal and medical education—Scotland’s universi-

Scotland. A miniature map of Scotland originally engraved for Thomas Porcacchi's *Isole piu famose del mundo* [The most famous islands of the world] first published in 1572. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

ties produced nine out of ten British medical graduates between 1750 and 1800. Student numbers rose from just over 1,000 to 4,400 between 1700 and 1820. Young men were attracted to Scotland's institutions of higher learning by important changes in teaching methods and curricula, and by the fact that Scotland was almost the only country in Europe where it became cheaper in real terms to attend university over the course of the eighteenth century. Thus Scotland's universities were much less elitist than Oxford or Cambridge and were becoming more socially inclusive during the eighteenth century.

Scotland's eighteenth-century universities represented the country to the world. Yet from the 1707 Union of Parliaments until 2000, Scotland had no representative assembly. At one level the Union of 1707 was part of a process of growing

integration with and dependence on England. Links with England, regarded since the Middle Ages as the "auld [old] enemy," had been enhanced by the Union of the Crowns in 1603. James VI of Scotland (ruled 1567–1625) became James I of England (ruled 1603–1625) after the extinction of the Tudor dynasty with the death of Elizabeth I. James left the old royal palace of Holyrood in Edinburgh for the decidedly more lavish setting of London. From 1603 to 1714 the house of Stuart reigned over Scotland (as it had since 1371), England, Wales, and Ireland, albeit with a shift in the line of succession in 1689 when James VII of Scotland (James II of England) fled to France. The Union of the Crowns brought about important changes in the status of the border counties of England and Scotland, pacifying and integrating them into unified government structures, but in all other regards the nations remained distinct. The most important

Scotland. This is another miniature map from Porcacchi's book, showing northern Scotland and the Hebrides and Orkney Islands. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

event integrating them was the Union of Parliaments in 1707.

Earlier attempts at integration, for example by the crown with its disastrous attempt to impose an Anglican prayer book on Scotland in 1637–1638 and by the Republican Oliver Cromwell with his forced union in the 1650s, had met with failure. In the early 1700s the mood of Scots remained decidedly Anglophobic, and the Union was constructed by elements of the ruling elite. “We are convinced that an Union will be of great advantage to both. The Protestant religion will be more firmly secured, the designs of our enemies effectually disappointed, and the riches and trade of the whole island advanced.” So argued supporters of the Union. In exchange for giving up their own Parliament, they got 45 members in the 513-strong House of Commons and 16 representative peers in the House of Lords, both in London. Scotland was thereafter part of the “United Kingdom of Great Britain” and was managed by a succession of aristocratic patrons, notably the dukes of Argyll. For all that Scots prized an egalitarian ethos, theirs was not a politically democratic society. Scotland had only 3,000 county electors in 1788, and the burgh franchise was confined to town councils; Edinburgh’s member of Parliament was elected by just thirty-three men.

While Queen Mary (wife of William of Orange and co-ruler with him 1689–1702) was a Stuart, the change of monarch in 1689 left many Scots (and some English) uneasy, feelings accentuated by the arrival of a Hanoverian monarch (George I) in 1714. This discontent provided support for the Jacobite rebellions of 1715 and 1745. Glorious failures as they may have been, the rebellions bound Scotland ever more closely into the political, military, and imperial destiny of her nearest neighbor.

SOCIETY

The defeat of the ’45 also signaled important social changes. Lowland society had long been a “modern” one. Landowners were the elite. Landownership was concentrated in a few hands, and the “lairds” dominated the hierarchies of wealth, status, and political power. The men who attended Scotland’s Parliament until 1707 were members of the landed nobility. Beneath them in the social hierarchy came the tenant farmers, along with their subtenants or “cottars” and servants, who worked

the land that provided the bulk of wealth and well-being. In the Lowlands approximately a fifth of late-seventeenth-century rural dwellers were craftsmen and tradesmen. Until the eighteenth century the “middle class” was made up of prosperous tenants and small landowners in the countryside and the merchants of the larger towns. Then professionals came into their own—lawyers, doctors, and educators—along with the increasingly confident merchants and manufacturers spawned by the industrial and commercial revolutions.

Highland society was distinctive until the eighteenth century. The structure of landholding was superficially similar, but Highland society was based on very different premises, which were increasingly alien to Lowlanders and to the English. Highland nobles were not just landlords, but also chiefs, in charge of clans built on the bonds created by feuding and feasting. The crown used clan rivalries to extend its hold on the Highlands, most notably in the notorious massacre of MacDonalds by Campbells at Glencoe in 1692. Weakened by political and economic change since the sixteenth century, the cultural framework of clans was not finally dismantled until after the failure of the 1745 Jacobite rising. In its aftermath the wearing of Highland dress and the carrying of bagpipes were banned, except for Highland regiments abroad.

The early modern Highlands were densely peopled, and indeed the distribution of Scotland’s population was very different from that of the present day. As late as the mid-eighteenth century more than half of Scotland’s people lived north of an imaginary Highland Line drawn from just south of Aberdeen to just north of Glasgow. In common with most northern Europeans except the Dutch, Scots were country dwellers. Just 3 percent lived in towns of 10,000 or more in 1500. However, the rate of urbanization was the fastest in Europe in the eighteenth century. Just one Scot in twenty lived in a large town in 1700, compared with one in six by 1800. The most rapid eighteenth-century growth occurred in Glasgow and neighboring towns in the west-central Lowlands, the former on the back of the colonial tobacco trade, the latter mostly thanks to textile manufacturing.

Until the eighteenth century population figures are largely guesswork. Scotland may have had

700,000 people around 1500 and perhaps one million by about 1700, though most of the growth probably took place between about 1540 and 1640; the first accurate census in 1801 showed there were 1.6 million people. Scotland's population growth rate was slower than elsewhere in the British Isles—strikingly so in the eighteenth century because Scottish women married later than did their English and Irish counterparts, and a larger proportion never married during their childbearing years. Slow growth occurred despite the fact that adults began to live much longer in the eighteenth century. Life expectancy at the age of twenty-five years rose from twenty-eight years in the early seventeenth century to thirty-eight years by the end of the eighteenth century. Apart from low fertility and high mortality, the other reason was substantial emigration, this usually of young men for military or mercantile service. The North Sea and Baltic countries had always been important destinations for Scots (as had England), but the main goal in the seventeenth century was Ireland and in the eighteenth the Atlantic and Caribbean colonies.

The redistribution of population to the west central Lowlands in general and the rise of Glasgow in particular marked a profound shift in the economic focus of Scotland's wealth and overseas trade. In the Middle Ages both had centered on the east coast, Scots looking to the North Sea and the Baltic; then the emphasis changed to the west, focusing on the Atlantic economies. Scotland's agriculture had always been less developed than that of England, but the second half of the eighteenth century saw dramatic improvements in arable farming, which brought rural productivity onto a par with the best in Europe. Industry, until then located mainly in the countryside, became more identifiably urban and began to diversify from textiles and other "organic" economies (using, for example, leather and wood) into mineral-based production of coal and metals. Scotland had already become more dependent on her southern neighbor for trade by the end of the seventeenth century, and experienced agricultural and industrial revolutions at the same time as England a century later.

Yet for all the convergences of experience, Scotland was in many ways a very different country from England even in 1800. There was fiscal integration with England from 1707, but Scotland's legal sys-

tems, educational framework, religious establishment, and even currency—the pound (£) Scots was worth about one twelfth of the pound (£) sterling and the Bank of Scotland was a separate foundation in 1695. The trading privileges of her royal burghs were preserved distinct from England's at the Union of Parliaments. Key social institutions also differed. For example, poor relief was discretionary and recipients had less clearly defined rights than in England; it was usually supplementary and therefore meager; there were fewer institutions like workhouses, which existed mainly in some of the larger towns.

CULTURE

Within Scotland's borders considerable social and cultural diversity also persisted. Highland literacy was much lower than Lowland because most people there spoke Gaelic, not Scots (a West Germanic tongue similar to English). Gaelic was the first language of half of Scotland in the fifteenth century, a third in 1689, but just a fifth in 1806. Linguistic variety did not end there, for all of Scotland was becoming more Anglicized. Scots itself had flourished as a literary medium in the late Middle Ages (c. 1480–1520) but was in retreat thereafter as standard court Scots fragmented into regional dialects after the departure of James VI in 1603. Anglicization of language and culture proceeded in the eighteenth century. The literati of Enlightenment Edinburgh aspired to pronunciation and orthography that conformed to the best London practice, and it was English rather than Scots that became the tongue of Scotland's landed, professional, and aspirant mercantile classes.

Edinburgh was the crucible of the Scottish Enlightenment, which also flourished in the universities, drawing rooms, and clubs of Glasgow and Aberdeen. Scotland's enlightened thinkers and writers—Adam Smith and David Hume, to name but two—were of worldwide significance, bound together by a shared faith in the improvability of individual and society through education, reason, and discussion. They celebrated and promoted commercial change, including an early consumer revolution, by arguing that economic cooperation and exchange would promote sociability, refinement, and "taste." Scotland's Enlightenment was

far more vigorous, socially diverse, and influential than England's.

While Scotland ended the early modern period closely integrated with England and tied up in its industrial, commercial, and imperial future, its independent evolution and effects on England (and Ireland) in the early modern period illustrate that different parts of the United Kingdom influenced each other's development. Through contacts with Europe and the Atlantic world, Scotland also exerted a wider influence over space and time. Aspects of the educational system developed in the seventeenth century, political theories expounded at the Reformation and after, the ideas aired in the Scottish Enlightenment, and Scotland's interpretation of Calvinist theology and some of the practices of church organization and discipline are all examples of an enduring international impact of her early modern development.

R. A. HOUSTON

SCUDÉRY, MADELEINE DE (1607–1701), French novelist, philosopher, and moralist. One of five children born in Le Havre to a noble family of relatively modest means, Mlle de Scudéry was one of the most influential and popular novelists of the seventeenth century. She spent most of her youth in Rouen, where she received a better education than that of most girls of her social background and time. In 1637 she joined her brother Georges in Paris, and together they frequented the thriving literary salons of the Marais district. The two siblings worked together on works of fiction that enjoyed immediate success. In 1641 Madeleine published her first novel, *Ibrahim ou l'illustre Bassa*, under her brother's name. This practice of using the name of her brother as her pseudonymous signature was one that she continued for most of her prolific career as a

writer, despite the fact that her own authorship was openly acknowledged in the gazettes, memoirs, and letters of the time. Although the precise nature of his contributions is uncertain, Georges did clearly collaborate to some extent with his sister in the writing of her novels, and he wrote the prefaces to several of her books.

Artamène, ou Le Grand Cyrus, Madeleine de Scudéry's second novel, published in ten volumes between 1649 and 1653, assured her celebrity both in France and abroad. It was translated into English, German, Italian, and Arabic. The French civil wars known as the Fronde were coming to a close during this same period, and Scudéry dedicated the novel to the duchess of Longueville, who had been a leader in the uprisings against the throne. Although its characters were drawn from historical sources and the setting was remote, *Artamène, ou Le Grand Cyrus* was a roman à clef in which most of the major characters could be identified with real people among Scudéry's contemporaries. She included a character sketch of herself as the Greek poet Sappho, expounding with her friends on platonic love and the life of the intellect. While she was writing the novel, Scudéry established her own literary coterie known as the *samedi*, named for the day of the week on which she received her guests, and modeled after the famous Rambouillet salon gatherings that Madeleine and her brother had frequented in the 1630s.

In her later works Scudéry focused increasingly on the philosophical discussions of salon society. The most famous episode in her third novel *Clélie, histoire romaine*, published between 1654 and 1660, concerns an allegorical map of the human heart, called the *Carte du pays de Tendre* (Map of the land of tenderness). The conversations generated by the map elaborate a theory of love that values reason over passion and discourages marriage. This led to Scudéry's novels being labeled as subversive by some, including the theorist of neoclassicism Nicolas Boileau-Despréaux, who published a harsh satire on novels in which *Clélie* and the *Carte du pays de Tendre* were targeted as fostering waywardness among women and contributing to the decline of marriage as a social institution.

In the 1660s Scudéry moved away from the heroic novel genre and turned to shorter narrative

forms, publishing three novellas, *Célinde, nouvelle première* (1661), *Mathilde d'Aguilar* (1667), and *La promenade de Versailles* (1669). These works were more realistic than her novels and were situated in modern times, and their action took place in locations that would have been familiar to her readers. But Scudéry continued to portray characters who themselves were captivated by the epic plots of heroic novels, thus focusing on the strong influence of novels on the collective imagination of her own social world. The 1660s were difficult years for many of Scudéry's circle, following the disgrace of her protector and patron Nicolas Fouquet, the superintendent of finances (1615–1680). Madeleine and her friend the historian Paul Pellisson (1624–1693) were among the small number of authors who dared to write appeals to Louis XIV on behalf of Fouquet, and Pellisson was imprisoned from 1661 to 1666. Although in 1671 Scudéry received the first prize awarded to authors by the Académie Française, she ceased to publish for the next nine years, until the appearance of the first of her collections of conversations, *Conversations sur divers sujets* (1680).

The last phase of Scudéry's career as a writer was devoted to ten more volumes of collected conversations, many of them excerpted from her novels. These were regarded by her contemporaries as representing the best of her writing, and unlike her earlier works, they were published under her own name. They reflected the collective efforts of Scudéry's milieu to cultivate the art of talk and develop a new aesthetic and practice of conversation. Translated almost immediately into English, they contributed to a body of literature describing new "French" styles of living that were imitated by elite circles in England, Germany, Italy, and Spain.

ELIZABETH C. GOLDSMITH

SCULPTURE. By 1500 in Italy, the recovery of classical antiquity permeated all aspects of art and culture. In Padua, Mantua, and Florence, sculptors like Riccio, Antico, and Verrocchio revived the small bronze in exquisite tabletop figures of satyrs, gods, goddess, emperors, and heroes of ancient Rome that evoked the ethos of antiquity. In Rome, however, the Renaissance manifested itself on a larger scale. Here, the young Michelangelo Buonarroti (1475–1564) carved a remarkable life-sized marble statue, *Bacchus* (1496). Not even in antiquity had the god of wine been shown like this: pudgy, tipsy, lascivious, mouth open and eyes glazed in Dionysiac abandon, the very embodiment of wine's intoxicating effects and the ancient world's appeal to the carnal senses. If *Bacchus* represented the epitome of worldly classical values, then Michelangelo's *Pietà* (1499) in St. Peter's was its Christian counterpart. The young Madonna looks down pensively at the nude, lifeless body of her crucified son. Carved to anatomical perfection and brought to a high polish, the body of Christ holds an irresistible appeal for the beholder. The *Pietà* was recognized both as a masterpiece and a powerful spiritual icon created in the new idealized vocabulary of classical antiquity, yet infused with Christian piety.

POWER AND THE FORMS OF SCULPTURE

Both sculptures were created in Rome, capital of the ancient Roman Empire, seat of the papacy, and center of humanistic literary and artistic study. Pope Julius II della Rovere (reigned 1503–1513) accelerated earlier campaigns of urban renewal in his strong desire to return the Eternal City to its ancient glory. During his reign, Julius II also ruthlessly reestablished the papacy as a major secular power by militarily reuniting far-flung papal territories. Yet consolidation of political power and association with the prestige of imperial Rome was the goal not only of Spanish, French, and English monarchs but that

©SCALA/ART RESOURCE

of the Holy Roman emperor as well. These rulers sought to express their power and garner prestige in major sculptural projects meant to glorify their persons and dynasties.

In Germany, Holy Roman Emperor Maximilian I (ruled 1493–1519) gave sculptural form to his political, dynastic ambition with plans for a colossal, multi-figured bronze tomb begun in 1502. Despite its medieval style, its size and conception rivaled the tombs of the ancient Roman emperors. Maximilian planned to erect this monumental structure in a specially designed church in Innsbruck. It featured a bronze, life-sized kneeling effigy situated atop a large, high free-standing rectangular structure decorated around the sides with reliefs showing important events from his life. In it, forty life-sized bronze statues of Maximilian's ancestors (both men and women, beginning with Julius Caesar and ending with Ferdinand and the Catholic of Spain), thirty-four bronze busts of Roman emperors beginning with Julius Caesar, and a hundred statuettes of Habsburg saints were to accompany the emperor. The ambitious program, only partially realized, genealogically linked the Holy Roman emperor, his ancestors, and his future heirs to the imperial legacy and glory of Emperor Julius Caesar.

However, Pope Julius II's commission for his tomb to Michelangelo (1505) unified in form and content the legacy of ancient art with the pope's dynastic, political, and spiritual needs. Designed as a huge, freestanding three-storied marble structure (roughly 23 by 36 feet), with niches for statues and terms on the first level in front of which were bound prisoners, the plan called for forty allegorical marble statues and numerous bronze reliefs celebrating the pontiff's achievements and virtues. Now only the statue of *Moses* on the much-reduced tomb in San Pietro in Vincoli provides a clue to its original splendor. Formally it evoked not so much the tombs of Julius's papal predecessors as ancient Roman imperial monuments. Although never realized on this scale, the *Julius Tomb* nonetheless set an ambitious standard for dynastic sepulchral monuments.

The return of the Medici to power in Florence in 1512 and the election of Giovanni de' Medici as Pope Leo X in 1513 (reigned 1513–1521) led to a Medici funerary chapel at San Lorenzo, Florence, designed by Michelangelo (1519–1534). The pope's

dream of dynastic supremacy in Italy, and the end of foreign intervention, was shattered by the premature deaths of the young Lorenzo and Giuliano de' Medici (1519, 1516). In their marble effigies, seated pensively above sarcophagi upon which recline representations of the times of day, Michelangelo subtly transcended dynastic panegyric, creating a poetic meditation upon the meaning of life, fame, and art itself.

In 1529, Henry VIII of England commissioned from the Italian sculptor Benedetto da Rovezzano (1474–1554) a tomb with numerous bronze statues and statuettes, one of the most ambitious sculptural projects ever conceived (abandoned in 1536). Later, Henry II of France planned at St. Denis a great chapel and tomb dedicated to the Valois dynasty. However, Philip II of Spain erected the most majestic tomb of all by building the Escorial (1563–1584), thus fulfilling his father's request (Holy Roman Emperor Charles V, reigned 1519–1556). At the sides of the Capilla Mayor's high altar, Leone Leoni's (1509–1590) over-life-sized gilt bronze and enameled effigies of Charles V, Philip II, and family members kneel facing the chapel's majestic sacrament tabernacle in perpetual adoration. Here was an eternal demonstration of Habsburg piety, sacramental devotion, and divine dynastic favor.

Throughout the sixteenth century, sculpture embellished civic spaces throughout Italy. The first and most important example is Michelangelo's colossal marble *David* erected in 1504 outside the Palazzo Vecchio, Florence. The *David* represented not only an emblem of republican liberty but also a fundamental psychological shift that merged Christian spirituality with worldly, man-centered values of antiquity. After the return of the Medici to power in Florence, Baccio Bandinelli carved his muscular, marble giant *Hercules and Cacus* to flank the *David*, an authoritarian antidote to *David's* republican sentiments. Cellini's bronze *Perseus and Medusa* soon rose on the Loggia dei Lanzi along with Giambologna's serpentine, three-figured group *The Rape of the Sabines*. Giambologna's elegant, mannered style was disseminated throughout Europe via exquisite small bronzes frequently presented as diplomatic gifts establishing him as the most influential artist of the last third of the sixteenth century. His legacy was carried forward by Antonio Susini and Adrien de Vries.

BERNINI AND ROME

Widespread political and religious conflicts generated by the Reformation and the Catholic Counter-Reformation wracked Europe, and Renaissance worldly values ebbed in favor of a purified Christian spirituality. In the arts, the Catholic Counter-Reformation spurred the reform of Italian painting toward the end of the sixteenth century. However, sculpture awaited the appearance of Gian Lorenzo Bernini (1598–1680) who became the most renowned artist of the seventeenth century. During the course of his long and incredibly productive career, Bernini changed Rome through commissions for churches, palaces, fountains, statues, chapels, monuments, and tombs. Orchestrating a small army of artists and workmen, Bernini dominated the artistic scene. His combination of painting, sculpture, and architecture into one unified and dramatic whole was a major influence in the

development of the baroque style that soon spread throughout Italy and Europe.

Like Michelangelo, the young Bernini immersed himself in the study of ancient sculpture. His first large-scale statues for Cardinal Scipione Borghese reflected years of intense analysis. These dramatic marbles stunned Bernini's contemporaries. *Pluto and Proserpina* (1621–1622, Galleria Borghese, Rome) presents an explosive combination of motion and emotion. The large, muscular Pluto, inspired by the ancient Roman *Hercules and the Hydra* (Museo Capitolino, Rome), hefts the distraught and struggling girl on his hip as he strides vigorously forward across the threshold of the underworld symbolized by the snarling, three-headed dog Cerberus. Proserpina's soft flesh yields to the god's violent grasp, her braids spin out into space, and marble tears course down her smooth cheeks. The over-life-sized group's startling impact and compelling naturalism is all the more remarkable as Bernini set it on a low pedestal against a wall, creating a commanding frontal view and strong physical presence directly to the viewer.

Apollo and Daphne (1622–1624, Galleria Borghese), inspired by a passage in Ovid's *Metamorphoses*, represents the instant that the fleeing Daphne's prayers are answered and she is turned into a laurel tree as she tries to escape the pursuing Apollo. The startled god (inspired by the *Apollo Belvedere* in the Vatican but in this instance running madly) appears as amazed as we are to witness the transmutation of Daphne's flesh (marble) into leaves, roots, bark, and cloth. This hallucinatory realism was made all the more shocking by the way that Bernini orchestrated the visitor's perception of the group. When in its original position in the villa, the approaching viewer saw only Apollo's back. As the visitor moved into the room, the drama unfolded in real time and space until reaching its crescendo. In this way, Bernini controlled the viewer's experience, as he did on a much larger scale in St. Peter's.

It is at St. Peter's that Bernini's mark is firmly implanted. The church is defined from beginning to end by Bernini. St. Peter's Square and the curved *Colonnade's* embracing arms greet the visitor; at the crossing, under the dome in four pier niches, colossal marble saints—Longinus, Andrew, Veronica,

and Helen—activate the crossing by looking upward or seeming to move toward the immense bronze *Baldachin*, whose four spiral bronze columns and canopy mark the high altar and the tomb of the First Apostle. In the apse, the majestic bronze reliquary containing the throne of St. Peter—the *Cathedra Petri*—has descended from heaven accompanied by the Holy Spirit and its golden light burst. Cloud-borne and surrounded by a host of angels, the *Cathedra Petri* hovers miraculously above the apse altar, steadied by colossal bronze statues of the two Greek and two Latin church fathers. A shimmering apparition, the *Cathedra Petri* is a dramatic artistic culmination of the church’s image and visible proof of the papacy’s divinely endowed power.

The *Triton Fountain*, the *Elephant Obelisk*, and the stupendous *Four Rivers Fountain* at the center of Piazza Navona are but three of Bernini’s best known sculptural landmarks, each offering novel interpretations of well-known types. However, it is the Cornaro Chapel (1647–1652, Santa Maria della Vittoria) that remains Bernini’s most famous and potent symbol of seventeenth-century spirituality. Cardinal Federigo Cornaro commissioned a funerary chapel to commemorate seven other members of his family and to honor St. Teresa of Avila, the sixteenth-century Spanish mystic and reformer canonized in 1622. Into the existing architecture of the left transept chapel Bernini wove a related order of pilasters and entablature. Above the altar he placed a pedimented tabernacle framed by double columns into which the marble group of St. Teresa and the angel was set below a hidden window providing illumination. The altar frontal is decorated with a gilt bronze relief of the Last Supper; in choir boxes at each side, four members of the Cornaro family are engaged in discussion, or reading. Two skeletons in roundels on the floor look upward in prayer and wonder as they seemingly rise from their graves. At the apex of the vault is a fresco of the dove of the Holy Spirit, accompanied by a multitude of cloud-borne angels. The frescoed clouds cover a portion of the vault window and the actual architecture of the chapel, creating the illusion of an arriving heavenly host. This unity of painting, architecture, and sculpture focuses on the altarpiece, the *Ecstasy of St. Teresa*. Here Bernini depicted her rapture: the moment when an angel appeared with a golden

Sculpture. Bust of Molière by Jean Antoine Houdon, 1778.

spear with a point of fire. In her own words, “. . . With this he seemed to pierce my heart several times so that it penetrated to my entrails. When he drew it out, I thought he was drawing them out with it and he left me completely afire with a great love for God.” In his sculpture, Bernini alluded to other mystical events described by Teresa (and others) in their writings: her levitation upon receiving the Eucharist, her mystic marriage to Christ, and her death when, though old, she became young and lovely.

Indeed, the entire program revolves around the action taking place at and above the altar. The dead rise ecstatically from their graves through the chapel floor; members of the Cornaro family bear fervent witness to the portentous significance of this proof of divine love; the Holy Spirit and angels descend into the chapel in celebration of Teresa’s union with God. The banderole carried by angels at the apex of the chapel bears God’s message: “If I had not created heaven, I would create it for you alone.” Teresa appears as an example of faith, as

intercessor and emblem of God's love for all mankind, and of his promise of eternal salvation through the Eucharist. Bernini's seamless visual logic gathers and unites the spiritual themes into an instant of stunning clarity focused on St. Teresa and the angel. This programmatic and aesthetic unity represents the culmination of Bernini's career, a perfect unity of form and content, and the artistic zenith of the Counter-Reformation.

Although Bernini's chief rival, Alessandro Algardi (1598–1654), labored in his shadow, he was an artist of immense talent. As a portraitist, Algardi was much admired for the sensitive handling of marble and the psychological depth he imparted to the sitters. The monumental marble relief in St. Peter's, *The Encounter of St. Leo the Great and Attila* (1646–1653), a sculptural tour-de-force, initiated a new genre for baroque art that would be emulated into the eighteenth century. The doubled life-sized marble group the *Beheading of St. Paul* (1634–1644, San Paolo Maggiore, Bologna) is set above the altar and seen in the round. The composition captures the moment before the executioner's raised sword strikes and displays Paul's peaceful, spiritual resignation in the face of imminent death.

The influence of Bernini's baroque style extended to the end of the seventeenth and well into the eighteenth century. The *Altar of St. Ignatius Loyola* at the Gesu in Rome (1695–1699) was designed by Andrea Pozzo and executed by a number of sculptors including Pierre Legros. A marble, gilt bronze, and frescoed confection on a truly monumental scale, it was designed to overwhelm by size, opulence, and the extravagant use of colored marbles. Herein lay the seeds of the decline of the baroque style, for the deep personal piety that vivified Bernini's art was not evident in that of his followers. With the advent of the Age of Reason in the eighteenth century and the concomitant decline in the status of the church, art theorists scorned baroque illusionism and its exuberant emotionalism as an affront to reason.

Slowly taste turned, favoring the restrained aesthetic of ancient Greek art for what Johann Joachim Winckelmann called its "noble simplicity and calm grandeur." Rome still attracted sculptors from all over Europe but they began to seek different ways

of expressing the time's new ideas. The young Jean-Antoine Houdon's statue *St. Bruno* (1766–1767, Santa Maria degli Angeli) pointed the way with still, smooth vertical draperies, a closed profile, and placid, meditative calm. His portrait busts are a marvel of natural observation that ennobles the sitters' intellectual traits. Yet it was an Italian sculptor, Antonio Canova (1757–1822) who created what we now think of as the first neoclassical sculpture, *Theseus and the Minotaur* (1781, Victoria and Albert Museum, London). His subsequent works, such as *Cupid and Psyche* (1787–1793, Louvre, Paris), *Perseus* (1804–1806, Metropolitan Museum of Art, New York), *Paolina Borghese as Venus Victorious* (1804–1808, Galleria Borghese) and *The Three Graces* (1815–1817, London), recouped the artistic and ethical purity of Greek art and inspired artists on two continents, initiating the century-long reign of neoclassicism.

MICHAEL P. MEZZATESTA

SEA BEGGARS. The Sea Beggars were pirates who made a living in the 1560s from capturing North Sea shipping. On 1 April 1572, six hundred Sea Beggars seized by surprise the small harbor city of Brill. It turned out to be a turning point in the history of the Netherlands, the beginning of what

later nationalist historians have coined the “heroic phase of the Dutch Revolt,” with its epic sieges of Haarlem, Alkmaar, and Leiden. The Sea Beggars were thus inextricably bound up with the genesis of the Dutch nation. Until 1572, they had been ordinary privateers, confining themselves to disrupting maritime traffic, raiding the coast of the Netherlands, plundering monasteries, and pillaging supplies of the Spanish troops, but with their seizure of Brill and its aftermath, they had become part of national history and memory.

In May 1568, during his invasion of Friesland, Louis of Nassau (1538–1574), the youngest brother of William of Orange (1533–1584), needed a small fleet to defend his supply routes to Emden. He called on the assistance of John Abels, a local corsair, and formed a fleet of fifteen ships. The military role of these newly formed Sea Beggars was, however, short-lived. After the failure of Louis’s invasion in July 1568, because they lacked a harbor of their own, they were forced to piracy. William of Orange discerned their importance for his own military plans but could not afford to pay them properly. Instead, he provided them with letters of marque, which allowed them to attack hostile ships. Operating out of the communities of exiled Calvinists from the Netherlands in Emden and the English Channel ports, the Sea Beggars performed their acts of piracy and planned their raids of the Netherlands. In the spring of 1571 their force amounted to some thirty ships.

Their disruption of maritime traffic, however, more and more annoyed the authorities in Emden and England. On 1 March 1572, Queen Elizabeth I denied them admittance to English ports. Cruising aimlessly in the English Channel, they decided to seize Brill, hoping to find a new base for their undertakings. The news of the seizure took William of Orange by surprise and complicated his own plans for an invasion of the Netherlands. In the following months, however, one after another the towns of Holland and Zeeland opened their gates to the Sea Beggars. At last, William of Orange had his base in the Netherlands.

The Sea Beggars never proved to be a reliable armed force. Consisting mainly of fortune seekers and Calvinist exiles and commanded by such first-generation rebels as Lumey van der Marck and Wil-

liam Blois of Treslong, who had consciously broken with their pasts to revolt, the Sea Beggars cultivated an ethos that differed markedly from that of professional soldiers. They believed themselves to be God’s elect and fought with the bitterness of the exile, and this made them hard to control. Their military advance in Holland and Zeeland was accompanied by the murder of priests, raping of nuns, and plundering of monasteries. Fearing that this behavior would alienate the moderate citizenry and town councils, William of Orange dismissed obstinate commanders such as Lumey and incorporated the ordinary men into a new, more professional army.

PAUL KNEVEL

SECRETS, BOOKS OF. One of the most popular genres in early modern science publishing, the collections of recipes known as “books of secrets” began to stream from the presses in the mid-sixteenth century and were printed continuously down to the eighteenth century. These popular works contained hundreds of medical recipes, household hints, and technical recipes on metallurgy, alchemy, dyeing, and the making of perfume, oil, incense, and cosmetics. The books of secrets supplied a great deal of practical information to an emerging new middle-class readership, leading some historians to link them with the emerging secularist values of the early modern period and to see them as contributing to the making of an “age of how-to.”

However, the books of secrets were not merely “how-to” books. They were also intended as serious contributions to the study of natural philoso-

phy, as science was then called. Underlying the books of secrets was the premise that nature was a repository of hidden forces that might be discovered and manipulated by using the right techniques. Unlike the recondite contemporary treatises on magic and the occult arts, the books of secrets were grounded upon concrete, experimental trials. At the same time, the books of secrets popularized the emerging experimental method and attitudes to the lay public.

The most famous sixteenth-century book of secrets was a work attributed to Alessio Piemontese, *I Secreti del reverendo donno Alessio Piemontese* (1555; The secrets of Alessio). Alessio's *Secreti* went through more than a hundred editions and was still being reprinted in the 1790s. The humanist Girolamo Ruscelli (1500–1566), the real author of the *Secreti*, reported that the work contained the experimental results of an “Academy of Secrets” that he and a group of humanists and noblemen founded in Naples in the 1540s. Ruscelli's academy is the first recorded example of an experimental scientific society. The academy was later imitated by Giambattista Della Porta, who founded an *Accademia dei Secreti* in Naples in the 1560s.

Alessio Piemontese was the prototypical “professor of secrets.” The description of Alessio's hunt for secrets in the preface to the *Secreti* gave rise to a legend of the wandering empiric in search of technological and scientific secrets. Its enormous popularity made the work play a key role in the emergence of the conception of science as a hunt for the secrets of nature. The concept of science as a hunt pervaded experimental science during the scientific revolution.

In the books of secrets, experimental science shaded into natural magic. Giambattista Della Porta's famous *Magia Naturalis* (1558; Natural magic) deployed practical recipes in an effort to demonstrate the principles of natural magic. Other books of secrets, such as Isabella Cortese's *Secreti* (1564), a compilation of alchemical recipes, disseminated experimental techniques and practical information to a wide readership. Recent research has suggested that the books of secrets played an important role in the emergence of early modern experimental science, acting as intermediaries between the private and esoteric “secrets” of medieval alche-

mists and magi and the public Baconian “experiments” that characterized the research programs of the Royal Society of London and other seventeenth-century experimental academies.

SEIGNEURIALISM. *See* Feudalism.

SEMINARY. The Council of Trent (1545–1563) required the creation of diocesan seminaries with the canon *Cum Adolescentium Aetas*, adopted during the council's twenty-third session in 1563. It became compulsory for every diocese to erect a seminary for the purpose of educating the local clergy.

Some historians claim that this legislation was fundamentally a return to the concept of cathedral school, where, from the beginning of Christianity, young men were prepared for priesthood. It was thus conceived as a restoration and renovation of the traditional way in which priests received their training. In its original design, the Tridentine seminary legislation was influenced by three factors. First, petitions coming from Italy, France, and the Holy Roman Empire had highlighted abuses in the education of the clergy, and had proposed either the reformation of cathedral schools or the erection of special schools attached to cathedral churches. Second, the Society of Jesus insisted on the necessity of providing adequate means for clerical education, and had already pursued this aim in founding and running colleges, including the famous Germanicum, founded in Rome by the Jesuit Claude Le Jay in 1552. Finally, the synodal legislation, promulgated for England by Cardinal Reginald Pole (1500–1558) in his *Reformatio Angliae* (1556), was taken as a model. Pole's solution was to cure the

carelessness of the clergy by erecting seminaries at every cathedral church. This directly inspired the fathers of the council in their writing of the Tridentine decree.

According to this decree, the diocesan colleges were to be *seminaria* ('breeding grounds') for the future priests. The students were to be adolescents at least twelve years of age, who were born of lawful wedlock and were already able to read and write. They also had to show a sincere desire to dedicate themselves to the service of the church. Under the local bishop's control, students were to receive a liberal education first, then an ecclesiastical one. The young men were thus to study letters, humanities, chant, liturgy, sacred scripture, and dogmatic, moral, and pastoral theology. Their spiritual formation included daily attendance at Mass and monthly confession. However, the decree did not specify that all priests should pass through the seminaries. On the contrary, the seminary seemed rather a means to help poor but deserving young people to become priests. The rich could be admitted on the condition that they paid for their education. In fact, what is most important in this decree is that it placed the formation of future priests, or at least a good number of them, under the direct responsibility of the bishops. The local bishop, as the chief administrator of the school, had to have an eye on the content of the courses and the quality of the professors who provided them. The rest of the diocesan clergy was also closely associated in the project. Not only was it asked to finance the seminary, in paying a special tax imposed on its revenues, but it also had to delegate four of its members to help in the administration of the new institution.

The creation of seminaries became the main concern not only of the popes attached to the Catholic Reformation, such as Pius V and Gregory XIII, but also of the political powers (principally the Catholic sovereigns and sometimes the local authorities) who saw in this measure a good way to reinforce the expansion and the control of higher education. The number of seminaries expanded quickly in Europe under these conditions. Two small Italian dioceses disputed the honor of having founded the first Tridentine seminary in 1564, Larino in Umbria and Rieti in the kingdom of Naples. The seminary of Milan, founded by Archbishop Cardinal Carlo Borromeo, followed shortly,

a year before his uncle Pope Pius IV founded the Collegio Romano. A great many seminaries were created in Italy but their spread was uneven. In fact, certain large dioceses, such as those of Genoa and Florence, had to wait until the seventeenth and even the eighteenth century before being endowed with a seminary.

Pope Pius IV and his successors worked hard to implement the Tridentine decision in countries where Catholics were in a majority. Thus, from 1564 onward, the number of seminaries spread quickly. In the German countries, seminaries were founded in Eichstätt, Breslau, Würzburg, Bamberg, Trier, Salzburg, Gurk, and Graz. Poland opened its first seminary in 1564 (Poznan, Warmia) and Hungary in 1567 (Tyrnau). However, the colleges established in Rome such as the Germanicum and the Hungaricum (united in 1580) had more impact on the formation of priests than the diocesan seminaries created in central Europe.

In the Netherlands, the development of seminaries progressed more slowly because of the 1566 uprising against the religious policies of Spanish king Philip II. These troubles led in 1579 to the revolt of the Calvinist provinces of Holland and Zeeland against Spanish domination and ended in 1609 with the independence of the United Provinces. Tridentine seminaries were thus erected almost exclusively in the southern provinces, in cities such as Ypres (1565), Namur, Bruges, Liège, and Malines.

Contrary to other countries, Spain had already secured training for its priests through a solid network of university colleges. Some of them, such as those of Grenada, Malaga, and Sigüenza, were used as diocesan seminaries. However, most of the Spanish bishops were willing to obey the Tridentine decree. At least twenty new seminaries were founded from 1565 onward, among them Burgos (1565) and Teruel (1566). In 1651, twenty-six out of fifty-four Spanish dioceses had a seminary. However, the expansion was not without difficulties. Because of hostility from the local chapters, many seminaries were short of financial and human resources. The need for training of the local clergy was also felt in the Spanish colonies. It took only ten years before the first seminary was founded in Antequera in Mexico (1574). Before the end of the sixteenth century,

under the initiative of Saint Toribio, archbishop of Lima, the seminaries of Santiago de Chile, Lima, Bogota, Cuzco, and Sucre were created.

It is clear that there was a great desire among European bishops to apply the decree of the council, even in France, which had not yet officially accepted the council's decisions. In effect, many French bishops bypassed the official position against Rome and tried to implement the Tridentine Reformation, especially the decree concerning the training of the local clergy. This explains why as early as 1567, Charles de Guise, the cardinal of Lorraine, founded the first seminary in Reims. However, because of the Wars of Religion, it was difficult to gather the necessary money for the founding of seminaries. After the wars ended, competition with colleges (which had chairs of theology) and universities impeded the growth of seminaries, which still remained optional for the aspiring priests. All this explains why, between 1580 and 1620, only sixteen seminaries were created in a country that counted 108 dioceses. The number increased from 1641 onward, however, and in 1790, most French dioceses had a seminary. This development was due to astounding founders of new orders for secular priests, such as Pierre de Bérulle, Vincent de Paul, Jean-Jacques Olier, and Jean Eudes, who founded, respectively, the seminaries of the Priests of the Oratory, the Lazarists, the Sulpicians, and the Society of the Sacred Heart. These institutions were to have considerable influence later in the erection of similar houses in the British Isles, Canada, and the United States.

Most of the Tridentine seminaries were modeled on that created in Milan by Cardinal Borromeo. He first opened a major seminary, that of St. John the Baptist, with facilities for 150 students. But recognizing that all candidates did not have the intellectual capacity to be admitted to this institution, he established La Canonica, a preparatory school for about sixty students who would receive a basic education about the care of souls, through classes on holy Scriptures, cases of conscience, and Roman catechism. He then founded three preparatory seminaries: one for younger boys, another for adolescents, and a third for older students. From these three institutions the candidates were to pass either to the major seminary or to La Canonica. Borromeo also wrote rules dictating students' life

and piety, which were adopted by almost all the European seminaries. Most of them also adopted the Milanese way of giving the management of the study program to the Jesuits. In reality, the majority (excepted that of Pavia) were closely associated with the local Jesuit college. They ended up being boarding houses that lodged a rather small number of young men (sometimes fewer than ten, through lack of money) who attended classes with the Jesuits. In fact, the existence of these first seminaries was often brief and always difficult because of financial and political problems. In the seventeenth century, their failure was imputed to the young age of the students. Catholic reformers such as Vincent de Paul promoted the education of adults rather than that of adolescents with the "seminaries for ordinands," centered on a more practical religious education and destined for grown men ready to take the orders.

In fact, if the intellectual and moral qualities of the European clergy were stronger in the seventeenth and eighteenth centuries, that strength was due less to the Tridentine seminary training than to a better selection of candidates and better control of the local priests (by the bishop's visit and by the frequent holding of synods). Above all, the improved qualities were due to the Jesuit colleges, who trained a growing part of the European clergy. A strict schedule, tamed behavior and attitudes, the practice of prayer, the conferences about piety and spiritual examinations, the weekly confession and communion, all this prepared the priest to live and behave as dictated by the Council of Trent.

SENSATIONALISM. See **Empiricism**.

SENSIBILITY. During the eighteenth century, cultures of sensibility came into general existence in several European countries and colonies; they persisted well into the nineteenth century, and while they have been fragmented as coherent middle-class cultures, the values they embodied have persisted into the twenty-first century. In their intense interest in the operation of the mind and in interpersonal relations, these cultures displayed the rise of what we think of as modern consciousness and, within it, psychology. Their context was the time and space that newly developing consumer economies first afforded significant numbers of women and men, and they were preoccupied with pleasure and pain, as more and more people found themselves able to choose more of the former and to transcend more of the latter. How widespread the culture was in any nation depended, therefore, on the extent of the consumer revolution in the eighteenth century and thereafter. Cultures of sensibility existed in such urban centers as Edinburgh and Paris, but appear to have been most widespread in England, Holland, and the British colonies that

became the United States. They both displayed transnational characteristics (among multilingual and often well-traveled elites) and reflected local ones, as people drew upon their language and other modes of expression—tears above all, but other physiological signs (legible to other people of sensibility), such as blushes and trembling—in response to their own thoughts, to interpersonal exchanges, to the “distress” of others, and to “sublime” natural phenomena.

The word “sensibility” denoted the receptivity of the senses and referred to the psycho-perceptual scheme systematized in the late seventeenth century in the nerve theory of Isaac Newton and the environmental psychology of John Locke, both of whom were influential, not only in their native England, but in European philosophical thought in general. Sensibility (and “sensible” and “sentiment”) connoted the operation of the nervous system, the material basis for consciousness. By the mid-eighteenth century, “sensibility” stood for a widely held body of beliefs signifying a particular kind of heightened consciousness of self and others, and incorporating a “moral sense”—a conscience, but also something thought to be an equivalent of the other senses, like sight and touch. The coexistence of reason and feeling was assumed, but the proportion of each was endlessly debated, above all because of what many saw as the dangers of unleashed feelings.

Notable eighteenth-century expositions of sensibility’s operation ranged from the philosophical publications (1711) of the third earl of Shaftesbury (1671–1713) and those of his disciple, the Scot Francis Hutcheson (1694–1746), in the 1720s; to Abbé Prévost’s novel *Manon Lescaut* (1731); to the internationally influential novels of Samuel Richardson (1689–1761), published 1740–1754; to the neurology (published 1751) of another Scot, Robert Whytt (1714–1766), and that (published 1753) of the Swiss, Albrecht von Haller (1708–1777); to *The Theory of Moral Sentiments* (1759) by Adam Smith (1723–1790); to *Julie, ou la Nouvelle Héloïse* (1761) by Jean-Jacques Rousseau; and to Johann Wolfgang von Goethe’s *Die Leiden des jungen Werthers* (The sorrows of young Werther, 1774). The latter two demonstrated the sexually subversive possibilities in the responsiveness of sensitive nerves and the aggrandizement of feeling. Much the same can

be said of two playful novels by Lawrence Sterne, *The Life and Opinions of Tristram Shandy* (1759–1767) and *A Sentimental Journey* (1768). The consequences of these sexual potentials were emulation and recoil, heightening tensions over the value of sensibility. From the 1740s the boundaries of sensibility and satire were crossed and recrossed frequently.

The French Revolution was a turning point in the history of sensibility because its opponents attributed it in part to the emotional abandon of Rousseau. Indeed, its ideology, like that expressed by the American Declaration of Independence (1776), did manifest some of sensibility's values. The debate over the proportions of reason and feeling in persons of sensibility was politicized, and the need for women to channel their feelings toward moral and domestic goals was reemphasized. The word "sentimental," which had been used positively, became a label for "excessive sensibility" and self-indulgence.

Sensibility and sentimentalism continued to flourish at all levels through the nineteenth century, both on the Continent and in the New World, developing into or accompanying Gothic, anti-Gothic, romantic, and realistic forms through the nineteenth century. The tradition extended through antislavery narratives and sentimental novels (Harriet Beecher Stowe), reform-oriented novels (Charles Dickens), and in popular and religious forms (Gustave Flaubert). While there were significant changes in the language of sensibility over time, its major terms and values were still important to the exquisitely conscious upper-class Europeans and Americans described by Henry James at the turn of the twentieth century. Mark Twain continued to place central value on heightened consciousness and on the morality of inner feeling even while he replaced the language of sensibility with fresh democratic forms.

The continuing persistence of this tradition through the nineteenth century, however, is remarkable only if one neglects its deep popular appeal and its links to consumerism. As the word "culture" implies, the phenomenon was by no means limited to intellectual and literary expressions. Its different origins had included the code of behavior of the Renaissance courts of Italy and France, subsequently

imitated by aristocrats and would-be aristocrats throughout Europe, then absorbed by upwardly mobile groups below them in the social pile, in accordance with "the civilizing process" described by Norbert Elias. Also key had been changes of religious thought (to which Newton and Locke were connected) in England, as well as in France and Holland. Some of the ideals and corresponding behavior were absorbed by evangelized working-class audiences, as well as by the increasingly literate bourgeoisie. That the culture's chief feature was the elevation of pleasurable feelings meant that it held appeal for all, including those who had been denied literacy, let alone formal theological and intellectual training—those who now found value in the "heart" alone, and an empowering sense of victimization and of moral superiority. Thus sensibility can be detected in overlapping Christian, bourgeois, and reformist ideologies and identities, as well as in mere fashion, but could also sponsor, even revolutionize, individual consciousness.

SENSIBILITY, RELIGIOUS BELIEF, AND CONSUMERISM

Both elite and popular thought reimagined God to reflect the more positive reconceptualization of human nature that had arisen amid gentler material circumstances. God was now seen to be benevolent and responsive to the same signals of human wishes and needs as men and women of sensibility, although representations of the older God of inflexible justice and condemnation persisted. Religious campaigns for "the reformation of manners," from the later seventeenth through the nineteenth centuries, aimed at inculcating, in objects from upper-class debauchees, working-class males, and uncouth frontiersmen to frivolous women, the non-European colonized, and the enslaved, the habits Max Weber (1864–1920) was to call the "Protestant ethic" (although subsequent scholars have pointed out such an ethic was not limited to Protestants). During the eighteenth century one sign of such reformation was a feeling heart. Colin Campbell has shown that the religious traditions explored by Weber had in fact incorporated the emotional materials from which sensibility and consumer psychology were developed; complacent religious feelings, first stimulated by a sense of religious goodness, were extended to embrace the pleasures derived from consumer goods.

“Taste” in goods expressed sensibility (and was identified with morality), but unsuccessful struggles by elites to maintain standards demonstrated that aesthetic dikes could not prevail against the flood of consumer and producer desires. Home was where new objects (from novels to tea sets, more elaborate cuisine to chamber pots) were primarily enjoyed, and where their owners expressed the feelings with which they were invested. Sensibility was generated in more sentimental families, where children were nurtured in more indulgent, future-oriented ways. Women became more central as consumers as well as mothers; their demand was crucial to the new economies. But new male capitalists had their own interests (in addition to religious imperatives and those emanating from their wives and mothers) in internalizing, or at least displaying, sensibility as they pursued commercial ends rather than the warrior and knightly ideals of the feudal past. Liberated commerce was seen as a reform integral to the “civilizing process,” albeit susceptible to the corruptions of ambition, greed, and insincerity at the hands of unfeeling men. Extending from cities to international and imperial horizons, it required the reputation and trustworthiness manifested by sensibility, although men might feel threatened in that sensibility by the charge of effeminacy, to which they were vulnerable because they now shared much with women. Their new, related republican ideologies embodied values that overlapped with those of cultures of sensibility.

SENSIBILITY, WOMEN, AND HUMANITARIANISM

The empowerment of bourgeois women extended from home to public heterosocial spheres beyond the traditional churchgoing to shopping, visits, assemblies, dances, and even masquerades, where fashions and manners transmitted sensibility. In entering the new culture women were not limited by class (although enjoyment of the range of possibilities was); in daily working relations with employers, in their exposure to sensibility’s religious outlets, and motivated by their own interests at home, particularly in the challenge of reforming men, they seized new opportunities. Increasingly women became literate, writing in a wide range of forms, from private letters to published poetry and novels, specializing in the sentimental.

These and other kinds of female self-assertion provoked powerful opposition. Sensibility was thus of ambiguous value to women; it could be deemed the cause of nervous disorders and sexual corruptibility as well as the source of moral superiority. A major symbol of sensibility was the often feminized figure of “virtue in distress,” archetypically Richardson’s heroine in *Clarissa*, drugged and raped by Lovelace. Women and their male allies elevated sensibility as a standard, demanding that unfeeling men of archaic or new, competing cultures, reform themselves and their treatment of women. If one root of feminism lay in that empowering sense of victimization and the “relief” (a common term in women’s sentimental writings) brought out by its private and public expression, another lay in criticism of the disabling effects of gendered sensibility exaggerated at the expense of intellect. The most developed argument here was Mary Wollstonecraft’s (1759–1797) *Vindication of the Rights of Woman* (1792), which aimed to reform women’s manners, which she said were utterly sensitized to pleasing men.

We can see the efforts to soften men as women’s chief expression of the application of sensibility to reform. But both sexes also worked (although usually separately) in humanitarian efforts. “Humanity” became synonymous with the sympathy automatically stimulated in the nervous system of people “of feeling,” and it was a nongendered term; indeed, it was a term intended to undermine all invidious distinctions, even though humanitarians often marked their efforts with condescension and racism. “Humanitarianism” is an umbrella term for a startling variety of reforms, some of which had been attempted from the very beginning of the eighteenth century. Most of these focused on the abuses of the bodies of human beings (some were concerned with animals, too); this preoccupation mirrored the physicality of the sensibility of the reformers themselves. Instances of humanitarian targets were the physical abuse of enslaved Africans, the flogging of children, sailors, and criminals, judicial torture, and the seduction and abandonment of women.

The sympathy that cultivators of sensibility felt for such victims (Adam Smith’s 1759 *Theory of Moral Sentiments* took for its opening model the irresistible sympathy he argued human beings felt

for their “brother” on the rack) was the expression of the transcendence of age-old deprivations and sufferings on the part of those who were now consumers. An essential condition for the rise of cultures of sensibility, however, was the unevenness and inequity of the consumer revolution—indeed, that it depended on the exploitation of others. If eighteenth-century people, developing their consciousnesses and indulging their delicate feelings in conditions of comfort, remained aware at some level of the harsh circumstances of their predecessors, more immediate was the contrast between prosperous consumers and those around them still living in misery. Contrasts were central to the self-conception of women and men of sensibility and included art versus nature; rural life versus the city; the past versus the present; private, domestic retreats versus the bustling, public “world”; and most fundamental, pleasure versus pain. All of these contrasts stimulated feelings of sensibility, from *schadenfreude* (taking pleasure in another’s pain) to nostalgia, from self-indulgence to sympathy. Men and women of feeling, finally, were preoccupied with their own sincerity and insincerity—a debate over the culture of sensibility that continues today.

G. J. BARKER-BENFIELD

SEPÚLVEDA, JUAN GINÉS DE (1490?–1574), Spanish humanist scholar and philosopher. Juan Ginés de Sepúlveda was a distinguished university professor possessed of a mastery of Latin style. In 1515 he moved from Córdoba to Italy, where he was accepted into the Spanish College in Bologna. Working under the direction of the eminent Pietro Pomponazzi (1462–1525), Sepúlveda developed into one of the leading scholars in Italy. By 1526 he had become the official translator of Aristotle’s writings for the papal court. During his twenty years in Italy he worked to recover the “true” Aristotle. He compiled and published in Paris a Latin translation of the *Politics* that for centuries was an indispensable work. Upon his return to Spain he translated Aristotle’s *Ethics* into Castilian for the Habsburg Monarchy.

In 1542 the king of Spain, Charles V of the Holy Roman Empire (ruled 1519–1556), signed the “New Laws,” which prohibited the enslavement of Indians. The king ordered in 1550 that conquests in his name cease until the Council of the Indies should decide upon the justness of Spain’s conduct. Sepúlveda’s opinions were solicited by the president of the Council of the Indies. Sepúlveda was an ardent nationalist, much impressed by his compatriots’ conquests in the Americas described in Gonzalo Fernández de Oviedo’s (1478–1557) writings, which belittle aboriginal peoples. Never having visited the territories under question or having met a native, Sepúlveda had no personal or fiscal stake in his theoretical arguments.

Sepúlveda produced *Democrates Alter sive de justiciis belli causis apud Indios* (Concerning the just cause of the war against the Indians; first published in Latin 1545 with a Spanish apology published in 1550 and the definitive version finally published in 1554). In this dialogue, Demócrates, a spokesman for the author, convinces Leopoldo, a German with Lutheran tendencies, that war against Indians is the

just and necessary preliminary to their conversion. Sepúlveda's request that the Latin manuscript be published was denied, and the university faculties of Alcalá and Salamanca also recommended against granting permission. A committee of government officials, scholars, and theologians was formed in response to Sepúlveda's insistence that there be a debate over the merits of his argument. The committee's deliberations at Valladolid began in 1550 and reconvened the following year.

To Sepúlveda the Spanish were obviously champions of an advanced civilization. He believed that hierarchy, not equality, was the natural condition of human society. This argument mirrors Aristotle, who maintained, rather inconsistently, that some humans are by nature slaves and others masters. Natural slaves are persons of inborn rudeness and inhuman and barbarous customs, and those who exceed them in prudence and talent, even if physically inferior, are their natural lords. Sepúlveda's variant is: "If you know the customs and nature of the two peoples, that with perfect right the Spaniards rule over these barbarians of the New World and adjacent islands. . . . There is as much difference between them as there is . . . between apes and men And if they refuse our rule, they may be compelled by force of arms to accept it" (*Demócrates Secundus*).

Sepúlveda claimed that every native was barbarous. Thus their natural condition was to obey a superior because they committed crimes against natural law by eating human flesh, offering human sacrifice, and worshipping "demons." War may thus be justly waged and should be waged against these infidels in order to prepare the way for preaching the True Faith.

Sepúlveda next abbreviated his principal arguments for his *Apología* (1550). This time he focused on the bulls of Pope Alexander VI (reigned 1492–1503), which he claimed gave Spain entire authority over the Indies. According to the laws of both nations and Nature, to the victor belong the spoils. Although Sepúlveda published the *Apología* in Rome, it was never made widely available in Spain, where it was confiscated by royal authority.

The committee next heard from Father Bartolomé de Las Casas, who took five days to read from an enormous manuscript. One of the committee's

members then condensed the long argument for Sepúlveda, who wrote a point-by-point refutation of the positions held by the Dominican "Defender of the Indians." The two contenders did not debate face to face, and the proceedings proved inconclusive since the committee never produced a final report.

Sepúlveda's views about the inferiority of the Indians became well known and largely prevailed in the Western Hemisphere, where his stance was popular with the colonists. The municipal council of Mexico City sent Sepúlveda a letter of congratulations and thanks. From a theoretical viewpoint, however, Sepúlveda lost the debate because his manuscript was not published in Spain, where the government rejected his central argument that it was just to wage war against the Indians.

MARVIN LUNENFELD

SERBIA. The kingdom of Serbia disappeared from the map of Europe in the fifteenth century, following defeats at the hands of the Ottoman Empire beginning with the Battle of Kosovo in 1389. The Ottoman conquest socially leveled Serbia. The Serbian aristocrat either converted to Islam, lost his lands and privileges, or was killed. The result was a society consisting of peasants. However, the memory of independence was kept alive by the Serbian

Orthodox Church. A Serbian archbishopric had been founded in 1219 thanks to the initiative of the monk Sava (Rastko Nemanjić, a son of Nemanja, the founder of the Nemanjić dynasty). The archbishop had been raised to the level of patriarch by Stefan Dušan in 1346. Although this patriarchate did not survive him, a Serbian church remained and continued to define the Serbian population culturally. The Ottomans restored the Serbian patriarchate in 1557 at Peć, a city in modern northwestern Kosovo. It lasted until 1766, when fears of collusion with Ottoman enemies convinced the government to abolish it. The church, ministering to its peasant flock via its peasant clergy, nourished the continued existence of a Serbia not as a state, but as an identity.

SERBIA UNDER THE OTTOMANS

Most of medieval Serbian territory fell to the Ottoman province of Rumeli, which extended from the Peloponnese to the Danube; Serbian populations also inhabited the provinces of Bosnia, Kanije, and Temeşvar, until the latter two were taken by the Habsburg Monarchy in wars of the seventeenth century. The notable towns of the Serbian kingdom now became Ottoman garrisons. Belgrade, not a part of Stefan Dušan's Serbia in any case, had up to 40,000 inhabitants in 1632, but was down to 15,000 in 1838. Niš, Kruševac, Peć, and other important towns in Serbia withered. As inhabitants of the Ottoman Empire, Serbs both suffered and benefited. Many Serbs chose to convert to Islam, in which cases they instantly became members of the favored faith and thus part of the ruling class. It is true that Orthodox Christian Serbs were subject to taxes and levies that Muslims did not pay, but those burdens were potentially balanced by the fact that Christians did not have to fight in Ottoman armies. Above all, though, the fact remains that the Orthodox Christians of the Ottoman Empire were administered via the millet system, by which they were governed by their own church hierarchy.

The millet system was established in 1453 as a result of a decree by Sultan Mehmed II (ruled 1444–1446, 1451–1481). It reflected the Ottoman belief that one's identity is fundamentally religious. Thus, while one had the option to convert to Islam and enjoy the fruits of that conversion, one also had the right to maintain one's faith. Thus, the Ottomans administered their subjects as religious

beings, and the Orthodox patriarch in Istanbul was given responsibility for the Orthodox Christians of the empire. On the local level, where contact between the believer and the church was most common, the parish priest was of the ethnicity of the flock. The church was made responsible for marriage, divorce, and the collection of dues to the church as well as to the state. The millet system thus ameliorated some of the effects of the Ottoman conquest. Serbian statehood was gone, but a Serbian, Orthodox Christian identity was maintained through what many Serbs see as a "dark age" thanks to a system that allowed a degree of self-administration.

Over the course of the Ottoman conquest and in subsequent centuries, many Orthodox Christians migrated northward and westward under the pressure of the Ottoman advance. Thus, a large Serbian presence was established in the Habsburg Monarchy. Population movements began in earnest after the Battle of Smederevo in 1459, and by 1483, up to two hundred thousand Orthodox Christians had moved into central Slavonia and Srijem. The final major population shift occurred in the 1690s, following an Austro-Ottoman war, when at least 30,000 Orthodox Serbs, led by Patriarch Arsenije III Crnojević, made their way from Kosovo north to southern Hungary. The center of authority in the Serbian Orthodox Church moved with the migrants. The Patriarchate at Peć, which would finally be extinguished by the Ottomans in 1766, was essentially replaced by the Metropolitanate of Sremski Karlovci, in Croatia. Through the late nineteenth century, two institutions, the military frontier and the metropolitanate, would define Serbian life in the Habsburg Monarchy. The military frontier would exist until 1881. The Orthodox Christians who had made their way from Ottoman territories to the Habsburg Monarchy were given certain privileges, usually including a plot of land, freedom from taxation by the local aristocracy, and freedom of worship, but they paid for these privileges with military service in times of crisis. Individual agreements, the most famous of which was the *Statuta Valachorum*, issued in 1630 by Emperor Ferdinand II (ruled 1619–1637), regulated the obligations of the Orthodox Serbian population. Settlement patterns, with Banija, Kordun, and Lika in the west, and parts of Slavonia in the east, heavily

populated by Serbs, were a result of these agreements.

ORIGINS OF THE INDEPENDENCE MOVEMENT

Although the Serbian population of the Habsburg Monarchy was more advanced economically and educationally, the origins of a modern Serbian state can be traced to the late eighteenth century in the *pašalik* (Turk., *pashalik*) of Belgrade, the northernmost reach of the Ottoman Empire in Europe. This region, south of the Danube and Sava rivers and east of the Drina River, would become the geographic core of modern Serbia. The first stirrings of rebellion among the Serbs of the region followed the Austro-Ottoman War of 1788–1791, during which Serbs had fought for the Austrian empire. Thereafter, the Serbs of the region were left to their own devices by the Austrians, who had lost the war. In spite of their disloyalty to the sultan, the Serbs as well as the Ottomans desired stability in the region. However, in the ever-weaker Ottoman Empire, the borderlands had come under the sway of local janissaries, and the *pašalik* of Belgrade was no exception. The sultan and his Serbian subjects had a mutual interest in destroying the destabilizing influence of the janissaries, and the roots of the Serbian independence movement were thus paradoxically to be found in an alliance of local Serbian headmen with the Ottoman central government. The revolution of 1804 thus began as a movement for economic and political stability within the Ottoman Empire rather than as a romantic-nationalist movement for independence.

NICHOLAS J. MILLER

forced dependence on seignorial overlords. Serfdom could be an inherited, personal status (serfs of this sort were known as *neifs* in English, *hommes de corps* in French, and *Erbuntertanen* in German) or the consequence of the tenure of servile land (serfs of this sort were known as *villeins* in English, *serfs de la glèbe* in French, and *Gutsuntertanen* in German). During the early modern period serfdom encompassed a wide variety of conditions and social relations. Generally speaking, however, serfdom was a more recent, more widespread, and more onerous phenomenon in eastern than in western Europe, although even here there were important regional variations.

West European serfdom was of diverse and often obscure origin. In some places it developed out of the late Roman colonate (peasant tenants who were legally tied to the land during the fourth and fifth centuries); in others it was the result of self-commendation by peasants to powerful landlords in exchange for protection. Particularly important was the extension of the private jurisdictions of landlords at the expense of public systems of justice during the tenth and eleventh centuries, a process often accompanied by the imposition of fees and labor services on the peasantry. Finally, at the frontier between Christendom and the Islamic world, serfdom was also spread through military conquest. Thus in Sicily, which was seized by Norman adventurers between 1061 and 1091, most serfs were Muslims.

LEGAL STATUS OF SERFS

By the twelfth and thirteenth centuries, serfdom in western Europe had acquired a more precise legal definition, and was associated with a fairly standard series of legal disabilities. Particularly prominent was the obligation to provide *corvées*, or labor services, for the lord, ranging from a few days a year in southern France and the Mediterranean to one to two days every week on the northern European plain and in England. Serfs were forbidden to live outside the seignorial territory, and had to pay fines to marry the serf of another lord (*merchet*, *formarriage*, *Ungenossame*). Serfs were also subject to a characteristic set of fees, including poll taxes or annual recognition fees (tallage, *chevage*), fees at the commencement of tenancy (entry fines, *Handlohn*, *Erdschatz*), and death duties (heriots, *mainmorte*,

SERFDOM. Serfdom was a status of legal bondage, almost invariably referring to peasants in en-

Todesfalle). Finally, serfdom often entailed disqualification from public office or exclusion from public jurisdiction.

Nevertheless, serfs were not slaves, but persons with rights in law. Only rarely could serfs be sold apart from their land; most “sales” of serfs in western Europe represented only the transfer of jurisdictional rights from one overlord to another with no physical movement of the peasants concerned. Moreover, de facto control of the means of production (the tenanted land) gave the serf leverage to bargain, and over the course of the Middle Ages, most of the rents, fees, and charges associated with serfdom became fixed by custom, while labor services tended to be commuted into cash payments. Serfs always retained extensive potential to resist seignorial pressure, either actively, through negotiation, protest, flight, and revolt, or passively, through foot-dragging and pilfering. Western European serfs also became adept at manipulating royal courts and other systems of public justice, despite seignorial efforts to impede their access to external legal authorities. Furthermore, it should be kept in mind that the serf’s material circumstances were by no means necessarily inferior to those of the free peasant, as the legal encumbrances of servility were often counterbalanced by the greater size of servile, as opposed to free, landholdings. The English “Hundred Rolls” of 1279–1280 indicate that the average villein landholding was twice the size of its free counterpart, and similar patterns emerge from mid-sixteenth-century Swabian tax registers.

Serfdom was never a universal condition of the West European peasantry. It was insignificant in Scandinavia and most of the Iberian Peninsula (Catalonia being the main exception). Even in England, where servility assumed much greater significance, free peasants made up fully 50 to 60 percent of the rural population during the High Middle Ages. Furthermore, from the thirteenth century serfdom began to decline in significance throughout western Europe. Sometimes this happened through formal decrees of enfranchisement, as at Bologna (1257) and Florence (1289), or through mass sales of freedom, as in the Paris region from 1246. During the later Middle Ages serfdom also became a subject of several peasant protest movements, most notably the so-called *Jacquerie* in northern France (1358), the Peasants’ Revolt of 1381 in England, and the

German Peasants’ War of 1524–1526. Almost all of these uprisings failed to secure a formal abolition of servile status, and instead were brutally suppressed by the authorities. The one great exception to this pattern occurred in Catalonia, where a series of revolts beginning in the 1370s culminated in the Peasants’ War of 1462–1486 and ended with the suppression of serfdom by the Sentence of Guadalupe (1486). Despite the limited immediate successes of these rural rebellions, serfdom was in fact fatally undermined in western Europe by the plagues of the fourteenth century and by the ensuing late medieval agrarian depression.

The wave of epidemics that commenced with the Black Death of 1347–1351 and persisted into the fifteenth century created an acute labor shortage throughout the European continent, and the peasantry was able to capitalize on this situation by extracting major concessions from overlords. Initial efforts to enforce strict pre-plague wage and labor conditions, such as the English Statute of Laborers (1351) and the German Golden Bull of Charles IV (1356) foundered on economic realities and peasant resistance, and serfdom began to wither away through the practical modification of tenurial arrangements, rather than through formal abolition (that serfdom declined primarily in this way underscores the fact that most west European peasants incurred serfdom through villeinage rather than neifty). Landlords began to abandon the direct exploitation of seignorial reserves, which had required the mobilization of considerable labor services, and instead began parceling out their demesnes to the peasants in tenancy. Labor services and servile disabilities were gradually abandoned or (more commonly) commuted into fixed monetary payments and made incidents of land tenure, while peasant property rights grew more secure and increasingly heritable. In England, where the phenomenon has been particularly well studied, bondland was transformed over the course of the later Middle Ages into secure “customary” tenure, with robust rights of inheritance, conveyance, and mortgage. The tenant’s rights were formalized in the manorial court roll, and a copy of the entry was issued to the tenant (hence the alternative appellation “copyhold” tenure). From the fifteenth century disputes over copyhold land could be appealed to royal courts, and by the 1580s English common law even

upheld the copyholder's right to sublet such property to third parties. A similar pattern obtained in Germany, where the fourteenth and fifteenth centuries saw the spread of heritable tenancy (*Erblehenrecht*) with extensive rights of conveyance, and guaranteed by the issue of parchment charters authenticated by seal.

By the beginning of the sixteenth century, therefore, the burdens of servility had been "tenurialized" in most of western Europe, thereby disarming serfdom as a status of legal bondage. In France, even tenurial serfdom was largely confined to the eastern regions of Burgundy and Franche-Comté, where one-third to one-half of the population remained serfs until the institution was abolished by the French revolutionaries on 3 November 1789. In England, serfdom was still mentioned in the grievance lists of Kett's Rebellion (1549), and crown serfs were manumitted as late as 1575, but as far as contemporary commentators like Thomas Smith (1581) and William Harrison (1577) were concerned, neifty had ceased to exist, while villeins were "so fewe . . . it is not almost worth the speaking" (quoted in Hilton, 56). The most significant exceptions to this trend in western Europe were the German-speaking lands of the Holy Roman Empire, where serfdom remained a vital institution throughout the early modern period.

The persistence, indeed intensification, of serfdom in Germany at the end of the Middle Ages was in part a reaction to the late medieval agrarian crisis. Thus, in the German southwest, ecclesiastical lordships in particular began to impose new mobility restrictions and extend the scope and weight of death duties during the later fourteenth and early fifteenth centuries in order to retain control over the thinning ranks of the tenantry. This seignorial reaction ultimately collapsed because of determined peasant resistance—most spectacularly the aforementioned Peasants' War of 1524–1526—and most lordships came to an accommodation with their subjects guaranteeing peasant inheritance rights and capping the disabilities imposed by servility. More significant changes flowed from the second impetus for the revival of serfdom in Germany (again, especially in the southwest), namely the drive for territorial centralization. During the later fifteenth and well into the sixteenth centuries, rural lordships, territorial princes, and even free imperial

cities began systematically exchanging rights with neighboring territories over "foreign" serfs in order to create exclusive jurisdictions free of legal claims from external authorities. Territorial serfdom of this sort did also entail some fiscal burdens and marriage and mobility restrictions, but the former were not especially onerous and the latter could always be waived for a moderate fee. By the early seventeenth century serfdom had ceased to occasion widespread complaint in Germany (with the notable exception of a protracted conflict in Hauenstein, in the southern Rhine Palatinate, between 1725 and 1745), and the institution persisted in its tenurial and territorial forms until abolished in the various German states over the years between the revolutions of 1789 and 1848.

EASTERN VERSUS WESTERN EUROPEAN SERFDOM

In eastern Europe serfdom had a rather different history from patterns in the west, although historians now characterize the east-west contrast as a gradual and varied transition, rather than in terms of a sharp demarcation along the river Elbe. Serfdom appeared only at the end of the fifteenth and especially during the sixteenth century in Eastern Europe, and was closely associated with intensified seignorial jurisdiction (often called *Gutsherrschaft*) and the spread of vast demesnal economies predicated on large-scale inputs of labor service (often called *Gutswirtschaft*). Explanations for the rise of *Gutsherrschaft* and *Gutswirtschaft* remain controversial, but most accounts stress a combination of factors, including the relative sparseness of population (which increased the appeal of a dependent labor force), the sixteenth-century boom in cereal prices as a result of both local and international demand, and the relative weakness of village communities, which were less able (though by no means utterly incapable) of resisting seignorial pressure than their counterparts in western Europe.

Eastern European serfs were subjected to the same kinds of disabilities as in the west, including the obligation to provide labor services, and restrictions on mobility and outmarriage. Eastern European serfdom also recognized the distinction between tenurial and personal serfdom, with the former pattern predominating in the lands of the Austrian Habsburgs and Prussian Hohenzollerns, and the latter obtaining in Poland, Hungary, and

Russia. On the other hand, serfdom tended to be introduced in eastern Europe by governmental decrees forbidding peasants from leaving the jurisdiction or territory of their landlords, rather than spreading piecemeal as a result of the policies of individual overlords (as in the west). Decrees of this sort were first passed in Bohemia (1487) and Poland (1496), and thereafter in Hungary (1514), Prussia (1526), Brandenburg (1528), upper Austria (1539), Pomerania (1616 and 1645), Russia (1649), and Mecklenburg (1654).

Eastern European serfdom has often been characterized as more oppressive than its western counterpart because of the intensity of labor services demanded (three, four, and in some cases up to six days of work per week), the denial of a serf's right of appeal against the lord to royal or other public courts, and the fact that serfs could be sold apart from their land in the east (thousands of such cases have been documented for Poland alone). Although this contrast is broadly true, it is subject to important qualifications. First of all, a great deal of time often elapsed between a royal proclamation of serfdom and the full elaboration of seignorial jurisdiction and demesne economies. In the Russian case it seems that it was only in the later eighteenth century that the system of servile dependency implied by the 1649 law code was actually enforced. Moreover, in some parts of eastern Europe (in particular Prussia and the Austrian Habsburg lands), the steady intrusion of royal courts into seignorial jurisdiction during the eighteenth century created a significant avenue for the mitigation of serfdom, as peasants were able to appeal to the crown for redress. Nevertheless, serfdom lasted much longer in eastern than in western Europe, and was only abolished over the course of the nineteenth century, beginning in Prussia (1807), and then later Austria (1848), Hungary (1853), Russia (1861), and Romania (1864).

GOVIND P. SREENIVASAN

SERFDOM IN EAST CENTRAL EUROPE. From the sixteenth to the seventeenth centuries, peasants in Poland, Ukraine, Hungary, and Bohemia were gradually subjugated to their landlords. This subjugation, usually referred to as the "second serfdom," had three aspects: economic, by virtue of the peasant's use of the lord's land; judicial, whereby peasants fell under the landlord's jurisdiction; and personal, in that peasants now needed their lords' permission in order to leave their villages. Enserfed peasants owed goods and services to their lords, including tribute in kind (usually grain, dairy products, or poultry), rent in money, and above all labor, or *corvée*, on the lord's lands (the demesne or *folwark*). Beyond the above-mentioned countries, aspects of the "second serfdom" were also seen in Russia and Prussia.

As landlords expanded their demesnes during the early modern period, *corvée*, initially limited to several days a year, increased to a few days a week. Peasants worked their lord's estates using their own plow oxen and farm implements or, lacking those, simply their hands and bodies. *Corvée* often involved the most arduous work of farming a large

estate, and eventually the burden of the demesne's production costs was shifted onto the peasants' shoulders. Serfs were also bound to do additional work, such as providing transport and helping during the harvest. They were often also constrained by the landlord's monopoly on the production and/or sale of wine, beer, and spirits. The monopoly gave landlords an outlet for excess grain when market conditions were unfavorable, as in the second half of the seventeenth and the first half of the eighteenth centuries, as well as providing additional income from the sale of alcohol. Peasants were in most cases forbidden to produce alcohol themselves, and they were required to purchase it at their lord's tavern. In Hungary, while peasants were allowed to produce wine, they could sell it only to their lords. The limitation on the peasant's right to leave the village was also often extended to his family. In some cases serfs were de facto bought and sold, as when an estate or part of an estate was sold along with its residents, or when a landlord who had taken in a runaway peasant offered monetary compensation to the original owner in lieu of returning the runaway.

The "second serfdom" has been variously interpreted. Some scholars have stressed the legal aspects of enserfment, while others have analyzed the social or economic aspects. Some of the interpretations put forward have had a distinctly ideological character. Marxist historiography (especially in Soviet-bloc countries) saw the enserfment of the peasantry in the early modern period as contributing to a "refeudalization" of society and sometimes even the return to a natural economy. The "second serfdom" was, according to this view, a return to the most primitive form of peasant service (*corvée*) and a retreat from a market-based and money-based economy. Marxist historians further argued that it led to the gradual destruction of both peasant and urban economies, because by hampering the growth of an affluent rural population and by fostering the self-sufficiency of landed estates, it deprived urban craftsmen of markets for their products. Generalizations about "refeudalization" have not gained lasting acceptance, but historians continue to react negatively to the second serfdom, particularly when comparing developments in eastern Europe with the social and economic structure of western European countries during the same period. The second

serfdom is seen to reflect the underdevelopment of eastern Europe.

One can date the beginning of the second serfdom in Poland to the end of the fifteenth century and the beginning of the sixteenth, when the first limits on a peasant's right to leave the village were imposed (1496) and a parliamentary decree mandated one obligatory day of *corvée* a week from each full peasant allotment, or *laneus* (1520). One can also connect the beginnings of enserfment with the 1423 decree giving landlords the right to buy the office of village administrator (Latin *scultetus*) and subordinate villages directly to themselves. It is generally held that these developments were related to the enlargement of the landlord's demesne, as landlords sought to produce more grain to meet market demand. The growth in grain exports through Gdańsk, along with the price revolution in Europe, created greater opportunities for landlords to sell their grain. From the sixteenth to the first half of seventeenth century the burden of *corvée* grew significantly heavier. By the second half of the sixteenth century it had reached three to four days a week per allotment, even though most peasants had only half of a full allotment (*laneus*). The peasant could, however, realize substantial profits as the result of the growth of grain prices and the lease of supplementary lands (without giving *corvée*); he could also send his servants (farm hands) to implement the *corvée* on the landlord's demesne.

The burdens entailed by enserfment and the deficit of manpower in the country were such that the frequency of peasant flight increased steadily in this period. Ukraine was a particularly popular destination, as services were less burdensome there, and landlords rarely demanded *corvée*. The situation of the peasantry took a sharp turn for the worse after the wars of the mid-seventeenth and early eighteenth centuries. Peasants' farms grew smaller, the grain market shrank, and the landlord's demesne asserted an ever tighter monopoly over the production and sale of beer, the staple drink of the region. The effort to replace *corvée* with rent during the eighteenth and nineteenth centuries failed. But reforms granting peasants personal freedom, independent jurisdiction, and even the right to vote were introduced after the second (1793) and third (1795) partitions of Poland in the territories annexed by Austria, Prussia, and Russia.

In Hungary, after the 1514 peasant uprising led by György Dózsa, the parliament consolidated the lord's right to land and introduced an obligatory *corvée* of one day per week. Although Hungarian landlords were unable to export grain, their demesnes started to develop markedly between 1530 and 1540 (in Slovakia c. 1550). *Corvée* reached two to three days a week only in the second half of sixteenth century, and it became widespread in the seventeenth century. Because of the Turkish conquest and the ravages of war, the agrarian economy was forced to evolve; the steppe regions shifted from grain to cattle breeding and the export of livestock, while the northern regions moved to viticulture. In these conditions, and because the agrarian economy was more diversified, serfdom could not be fully enforced. Landlords tried instead to take over peasants' wine production. In Hungary the heyday of the second serfdom was the seventeenth century, and it can be said to have ended in 1767, when the empress Maria Theresa limited peasants' labor services. Her son Joseph II went further in 1785 when he abolished the personal subordination of peasants to their lords.

In Bohemia early steps toward enserfment were taken in the fifteenth century. The parliament limited the peasant's right to leave the village, and later in the century it passed further regulations against peasant flight. But historians consider the years 1530–1540 to be the beginning of the development of the demesne and the concomitant intensification of enserfment. Since the market for Bohemian grain was limited to Bohemia's urban population, landlords looking for additional revenue tried to take over and monopolize the production and sale of beer and to breed fish on their demesnes. In such conditions the demand for peasant labor services grew rather slowly. In some places *corvée* reached two to three days a week by the second half of the sixteenth century, but this became common only after the defeat at White Mountain in 1620. In 1680 *corvée* was fixed at three days a week from each allotment (*lanens*). Thus in Bohemia the second serfdom did not fully establish itself until the seventeenth century. Its end came with the peasant uprising of 1775 and the abolition of personal serfdom by Emperor Joseph II in November 1781.

The notion of the “second serfdom” is misleading, for it gives the impression that east central European peasants had been relatively free during the late Middle Ages—while their counterparts in western Europe toiled under the “first” serfdom. According to this view, before the early modern imposition of the “second serfdom,” east European peasants enjoyed the right to leave the village, rendered their services in money instead of *corvée*, and were under the jurisdiction of village administrators who represented the village self-government rather than the lord. But a closer look at these circumstances undermines the notion that late medieval east European peasants were free. The right to leave the village was in fact limited, because labor was more valued than land. Even in free villages, the village administrator was the lord's official and judged on his behalf, not on behalf of the community. Finally, it can be doubted that peasants ever paid services in money (“rent”), since there were few cities where peasants could sell their goods to obtain money. The earlier serfdom did lack the extended labor services that characterized serfdom in the early modern period, but this was because landed estates were autarkic and could serve the landlord's community without recourse to the market. The relation between these estates and the larger economy changed, and early modern east European serfdom should thus be seen as not a new, “second” serfdom but rather as a continuation of medieval serfdom, as adapted to the conditions of the agrarian market economy that arose during the period.

ANDRZEJ WYCZAŃSKI

SERFDOM IN RUSSIA. The origins of serfdom as a form of migration control can be seen in mid-fifteenth-century documents that restricted peasant movement to the period on or around St. George's Day in November. By the early 1580s decrees proclaiming "forbidden years," which prohibited all peasant movement for specific periods, were already functioning in certain districts, and they were extended to the rest of the realm in the reign of Fyodor Ivanovich (ruled 1584–1598). By 1597 the state instituted central registration of deeds and documents—*kreposti*, the root of *krepostnichestvo*, or 'serfdom'—regulating various kinds of dependency. Although Muscovite slavery was also regulated by government officials, slaves belonged to a separate juridical category denoted by the Russian term *kholop*, which could refer to various forms of indentured servitude and debt bondage as well as to chattel slavery. The majority of slaves were Russian males of diverse social origins, primarily employed in nonagricultural occupations.

Serf legislation developed primarily in the core lands of the Muscovite state in order to secure labor for estates belonging to elites and military servitors. Beginning in the sixteenth century the majority of dependent peasants came under the control of individuals and families in state service. Two forms of landholding predominated in the rural economy of early modern Russia. Hereditary properties

(*voitchina*) could be sold or transferred to kinsmen, while usufruct or conditional land grants (*pomest'e*) were revocable grants of lands and their revenues awarded to individuals in return for fulfillment of military service. In order to preserve their revenue and military potential, conditional lands could not originally be donated to the church or sold, nor could they be passed on to heirs without government authorization.

The supply of service lands expanded as Moscow conquered neighboring political structures, most notably Novgorod in 1478 and Kazan' in 1552. Lands annexed along the southern steppes also fueled the growth of a significant class of provincial cavalymen supported by the labor of a small number of dependent peasant households. By the mid-sixteenth century retention of all lands was made contingent upon service, and by the early decades of the seventeenth century the stark distinctions between the two forms of landholding were eroding, and service tenure lands were being acquired, exchanged, and passed on to heirs like hereditary lands. The combining of both forms of landholding into a single category was recognized de jure in 1714.

Competition for a limited supply of peasant labor and endemic peasant flight and relocation drew the government into recording, regulating, and policing the relations between agricultural laborers and their masters. Decrees specifying a limited period of years (five at the turn of the seventeenth century and ten by mid-century) after which peasants could not be returned to their former masters particularly hurt provincial gentry. As early as 1637 they petitioned for an end to such restrictions, and in January 1649 the limitations on returning fugitives were abolished throughout Russia. By the turn of the eighteenth century serfs could be moved, bought, and sold, and by the 1720s the legal distinctions between serfs and slaves were eliminated.

At the end of the first quarter of the eighteenth century, the overwhelming majority of peasants were enserfed to private masters. Many landowners merely extracted resources from their serfs, allowing serfs to work only their own lands or ply other trades in exchange for cash (*obrok*) payments. Others sought to develop their estates by issuing

detailed instructions on the management of their properties to stewards and attempting to control various aspects of the rural serf economy, from land tenure to marriage. Around the same time formerly free groups of militiamen from the southern frontier and some non-Russian groups were equated in status with the tax-paying (*chernososhnye*) peasant communities of the Russian north and Siberia and were reclassified as state peasants. By the mid-eighteenth century over fifty thousand state peasants were forced to work in factories in the Urals region and Siberia, and a growing number of private serfs were also put to work in industrial enterprises.

Under serfdom the peasant commune (*mir*) coalesced into a distinct labor and fiscal unit. The available evidence does not clearly outline the features of the peasant commune until the seventeenth century. Institutions of community suretyship over and collective responsibility for the actions and obligations of individuals were a significant feature of the early modern Russian rural economy. Government taxation and fiscal policies also significantly shaped household and village structures. By the last decades of the seventeenth century sources record certain contours of the *mir* and its communal gathering (*skhod*) that show how it assigned lands and apportioned shares of the collective fiscal burden to its individuals. In the first half of the eighteenth century, elected representatives of the *mir* often worked jointly with government officials and landowners to ensure that villages and their inhabitants fulfilled their economic obligations to the state and/or to their landlords, in addition to providing recruits for the army. The *mir* could function as both a rapacious institution of communal control over individuals and a vehicle for negotiating communal interests and voicing them to the wider world. Active resistance by serfs was primarily realized through flight, suggesting that the government's attempts to wholly regulate movement were not always effective in practice. Serfs frequently joined rebellions instigated by Cossacks along the southern frontiers in the seventeenth and eighteenth centuries.

BRIAN BOECK

SERVANTS. Domestic service, often ignored in the first decades of research into the social history of early modern Europe, has recently benefited from greater scholarly attention. Investigation has made it clear that a knowledge of master-servant relations provides essential insights into the larger relationships of elite and popular classes and into the unexpected elasticity of the boundaries of public and private spheres in this period. Since servants were considered part of the family, at least until family values began to emphasize privacy and affection around the middle of the eighteenth century, their history also adds depth to efforts to understand the evolution of family structures over time. Yet far more is unexplored than is known about the domestic servant population, particularly since most researchers have focused on England and France, with some initial surveys of Renaissance Italy and the Dutch Republic.

The major obstacle to achieving a better understanding of the roles of servants in the past is the difficulty of finding documentary sources with useful information. Servants were not members of a corporate group that might have maintained records on their numbers, their wages, or the terms and conditions of hire. In a time when censuses were rarely taken, the presence of servants in a household was seldom systematically noted. They were occasionally considered a luxury item and hence taxable, notably in Holland in the 1740s and in England in 1777. Despite this, government records rarely provide much data on the servant population. Servants produced little in the way of autobiographies, and any letters they might have written were not addressed to families that had the resources to preserve them. While criminal court records do contain some interesting information, they cannot support conclusions about the larger population of law-abiding servants. The picture we have of servants' lives then

is based on a diverse assemblage of household account books, wills, servants' ordinances, and similar local records. These establish that servants' experiences varied not only over time but according to the sizes of the households in which they worked, the households' wealth and location in urban or rural settings, and the work servants were expected to do.

FUNCTIONS OF DOMESTIC SERVICE

Servants were a practical necessity in an era before labor-saving appliances; they freed the mistress of a household to cultivate social networks or to participate in the family business. Domestic service enabled poor and unskilled people to survive. It was usually a temporary occupation, especially for women, who might save their wages toward the dowries that would enable them to make respectable marriages.

But as an institution, domestic service filled many more roles in early modern Europe. It bridged the worlds of workers and elites. Servants initiated into the manners, the values, and the fashions of the elites transmitted that culture to the laboring classes. They were the most regular contacts members of the middling and elite groups had with working people, so such relationships helped form class attitudes. In supervising domestics, bourgeois housewives learned managerial skills. And retinues of liveried men were a public and visible sign of wealth and status for members of the nobility.

HOUSEHOLD AND HOUSEWORK

Contemporaries certainly noticed the ubiquity of servants in their communities. In his *Letters on the Importance of the Rising Generation of the Laboring Part of Our Fellow-Subjects* (1767), Jonas Hanway estimated that one in thirteen Londoners was a domestic, and Sébastien Le Prestre de Vauban gave the same figure for France in *Projet d'une dixme royale* (Plan for a royal tithe) in 1707. Historical demographers have confirmed the guesses made by an earlier generation. Most studies have concluded that servants comprised roughly 7 to 15 percent of the population.

Servants were so important in early modern Europe that they were employed in any household that could afford their upkeep. Indeed possessing at least one live-in domestic acted as a marker indicating that a family could claim respectability and status in

the community. Estimates of the percentages of households employing servants hover around 23 percent, though it could range much higher in towns that were judicial or administrative centers.

The most common form of domestic servant was a maid of all work, often the only servant in a household, whose work included whatever errands, cleaning, food preparation, or child care tasks a family required. The larger the establishment, the more specialized the servants became, as families hired cooks, coachmen, valets to attend to the masters' wardrobes and personal needs, dress maids to do the same for the mistresses, nursemaids, governesses and tutors, and ultimately platoons of male lackeys, postilions, and footmen, whose presence shielded employers from contact with commoners. The establishment of any truly grand seigneur required some fifty servants, according to Audiger's *La maison réglée et l'art de diriger la maison d'un grand seigneur & autres* (1700; *The ordered house and the art of directing the house of a great lord and others*).

In the countryside servants in husbandry added to the variety of occupations considered domestic service. A dairymaid was a servant even if the family marketed its cheese. Indeed Europeans did not make sharp distinctions between workers hired for domestic labor on the one hand and for productive labor on the other until the eighteenth century—and in some places well beyond that time. An apprentice might be required to accompany his or her mistress to market, while a girl hired to keep the family home tidy might find herself scrubbing the shop floor as well as the kitchen floor. The salient feature that defined the nature of domestic service to contemporaries was dependence. From an archbishop's secretary to an orphaned scullery maid, all were dependents and hence servants.

WHO BECAME SERVANTS?

Much of the evidence to date has concluded that the majority of servants were young, unmarried migrants who traveled from rural villages to larger towns and cities for work. Some were poor relatives of their employers. Historians of domestic service have engaged in a debate over the ratios of men to women employed as household servants. Some have identified a process of "feminization" of domestic service, in which the numbers of men employed as

domestics declined in relation to the numbers of women during the course of the eighteenth century. Two trends are said to have produced this shift. As middle classes or bourgeoisies replaced the aristocracies in roles of political and economic leadership, status markers no longer emphasized splendor and public display. The demand for male servants decreased. At the same time, changing attitudes about gender roles emphasized independence and autonomy for men, making service less desirable for them.

Other historians, however, have challenged feminization as a means of analyzing shifts in the structure of domestic service. The majority of domestic workers were always women, they argue. The apparent trend is the result of a focus on researching the largest establishments of the wealthy, which gives too much importance to the roles played by menservants. The boundaries of the public sphere or of the domestic sphere were perpetually shifting, so what appears to be feminization could be more the result of a redefinition of work roles than it was of occupational demographics.

“Live-in” servants were not married. Employers wanted people in their service who would surrender their own interests to those of the household, and married couples did not meet that condition. At the same time, early modern servants rarely saw their jobs as lifetime occupations. The point of entering service was to escape from it. Women sought marriage with a partner who offered financial security and a home of their own. Men looked for the contacts who could provide them a means of earning an independent living. But there were no guarantees that such ambitions could be fulfilled, particularly when employers restricted their servants’ opportunities of meeting people outside the household.

CONDITIONS OF SERVICE

Servants who lived under the same roofs as their employers had little in the way of private lives. Their time was not their own. They were expected to be working before their employers rose from bed, and those in attendance on their masters or mistresses had to remain awake late into the night if their employers had gone out to a social event. Time off was a matter of individual arrangements; some servants might receive an afternoon once or twice per

month, while others had to apply for each rare hour off. Many had no leisure time at all. Employers discouraged servants from socializing in their homes. Local laws in some parts of the Dutch Republic actually made servants’ social use of their employers’ food a criminal act. Employers considered their domestics’ time to be their property, and unauthorized socializing represented the theft of that property. Socializing also provided opportunities for domestics to spread gossip about the family and might lead to maidservants becoming pregnant out of wedlock. Hence many elite employers absolutely refused to give their domestic workers any leisure time.

Wages earned by servants were low. Very young, inexperienced, or unskilled servants might receive only room and board. Domestics received their earnings no more frequently than semiannually and in many cases received nothing until they left the household. Wages varied by location, and they varied depending on the skill level of the worker. Male servants were always paid more than female ones, even when the type of work was the same. (Cooking and gardening, for example, were less sex-linked than other tasks.)

But historians have emphasized that the rewards of service included far more than the wages paid. Room and board itself might be of better quality and quantity than that which a servant who otherwise would have been a pauper might have enjoyed. During inflationary periods such payments-in-kind meant that servants’ remunerations effectively kept pace with the rise in prices, something wageworkers did not enjoy. Custom called for servants to be remembered in their employers’ wills, although the tradition was not universally honored. Other rewards included cash gifts at holidays, tips, and “vails”—guests staying for a holiday at an upper-class home in England were expected to provide gratuities to their hosts’ servants when they departed. Servants who accompanied their employers in public wore liveries, uniforms decorated to indicate the identities of their masters. Personal domestics so often received their employers’ hand-me-down clothing that many considered it a “right,” according to their testimony before courts when they were prosecuted for theft after they had helped themselves to items they thought were worn out. The maids and valets who obtained the fine clothes

of their employers—either with or without their approval—could supplement their income by reselling the articles through second-hand clothes dealers.

Sexual harassment represented one of the greatest perils of service. Young, unmarried girls, isolated from family and friends, were vulnerable to their employers, their employers' sons and male guests, as well as to male servants. Whether quartered in common areas or attic rooms, they could not put a locked door between themselves and sexual predators. Gentlemen seeking a sexual outlet found their household domestics convenient, easy to pressure or to seduce using threats or promises. A maidservant who became pregnant, whether as the result of rape or a voluntary relationship, faced disaster: immediate dismissal without the good reference that any other employer would require and, as a woman who had lost her virtue, little or no prospect of making a respectable marriage. Yet it would be a mistake to believe that all sexual relationships involving female domestics were the result of rape or harassment. Deliberately confined in their workplaces, some maidservants found sex within the household offered their only opportunities for affection and physical relief and so undertook such relationships willingly.

SHIFTING ATTITUDES: THE QUESTION OF PATERNALISM

Prescriptive literature in household manuals, confessional guides, and religious tracts defined an ideal of master-servant relations that historians have termed “paternalist.” Linked to the authoritarian stage in the evolution of the family among Europeans, the paternalist ideal defined a standard of reciprocal obligations between masters and servants in which servants were bound to loyalty, obedience, and diligence in the service of their masters, while the latter were held responsible for the moral and physical welfare of their domestic workers, just as they were responsible for their own children's welfare. This ethos required employers to care for servants who became sick, to support those who had grown old in the service of their masters, and to provide for all servants' religious educations. As a set of values governing master-servant relations, the paternalist ideal had disappeared by the early nineteenth century if not before, replaced by a contract mode of relations based on the exchange of work for

money. But historians still debate the timing and the causes of this shift, which varied from one location to another. These arguments notwithstanding, other historians doubt that reciprocity was ever characteristic of the reality of most master-servant relationships.

CONCLUSION

Two decades of efforts to rescue the domestic servant from historical oblivion have demonstrated that there are few if any features that can be considered universal of the institution in early modern Europe. Researchers have grown quite critical of work that accepts stereotypes and generalizations about servant and employer demographics, the sexual division of labor, and overall trends in the evolution of master-servant relationships. Only with additional research will enough data emerge to support broad generalizations about servant life in early modern Europe.

MARYBETH CARLSON

SEVEN YEARS' WAR (1756-1763).

Encompassing conflict in Europe, North America, the Caribbean, and India, the Seven Years' War resulted from a collision between two very different international problems. First, there was the growing colonial and imperial friction between Britain and France, which became acute in the early 1750s as the French authorities and the British colonists in North America began staking out rival claims to the Ohio River Valley. Open warfare then erupted in the backcountry during 1755, and this was followed by repeated British seizures of French shipping in the North Atlantic. In response Louis XV despatched Louis Joseph, marquis of Montcalm, with reinforcements for the French colonial forces, to take military command in New France (Quebec) in April 1756.

Second, the Seven Years' War stemmed from Austria's refusal to accept the loss of Silesia to Frederick II of Prussia during the War of the Austrian Succession, and from Russian determination to humble Prussia. The Peace of Aix-la-Chapelle (1748) had merely suspended Austro-Prussian conflict over Silesia. While Austria carried out internal reforms to her administration, Count Wenzel Anton von Kaunitz, one of Maria Theresa's inner councillors who became chancellor in 1753, pursued the possibility, remote at first, of a French alliance against Prussia. Nevertheless, during 1755-1756 his patience and hard work began to pay dividends. Great Britain, anxious about the security of George II's German domains and no longer able to rely on Austrian support, secured Russian guar-

antees in September 1755 for George's electorate of Hanover in exchange for promised subsidies. This Anglo-Russian agreement in turn prompted a fearful Frederick II of Prussia to manage a reconciliation with Britain in January 1756 in the shape of the defensive Convention of London. But the unforeseen consequence was the "diplomatic revolution." A furious Russia all but repudiated her agreement with Britain and tightened her alliance with Austria, and both powers prepared for a combined war against Prussia. Now bereft of allies, Louis XV took up Kaunitz's proposal of an end to 250 years of Franco-Habsburg antagonism, and on 1 May the defensive first Treaty of Versailles was signed between France and Austria (Russia acceded to this treaty in January 1757). Two weeks later, after France invaded British-ruled Minorca, war broke out between the two states. Frederick II, now acutely aware of the forces gathering against him, felt he had no choice but to launch a preemptive strike in August to seize Saxony and take over its army, causing France to activate its Austrian alliance.

PRUSSIA'S STRUGGLE FOR SURVIVAL

Not until the summer of 1757 did the triple alliance launch an assault on Prussia, after France and Austria concluded the offensive second Treaty of Versailles (1 May) with the purpose of dismembering Frederick's state. Frederick's invasion of Bohemia was halted, and the Russians invaded East Prussia, but more damaging was the neutralization of the trapped Anglo-Hanoverian army by the French at Kloster-Zeven in early September. In the face of such a crisis, Frederick fought a campaign of strategic brilliance. First he crushed the poorly commanded and logistically weak Franco-Imperial army at Rossbach (5 November), deploying the greatly improved Prussian cavalry under Friedrich Wilhelm von Seydlitz and moving his infantry swiftly across the battlefield in echelon, rather than linear, formation. Then he followed this up with the defeat of the Austrians at Leuthen, two hundred miles to the east and exactly a month later, using the "oblique order" in an attack on the enemy right flank. After Rossbach, George II repudiated the convention of Kloster-Zeven, and Anglo-Hanoverian operations resumed under the command of Frederick's protégé Ferdinand of Brunswick-Wolfenbüttel. Moreover, thanks to William

Pitt's return to power in June 1757, Britain began subsidizing both the Hanoverian forces and, from April 1758, Frederick's Prussia. With the odds evened up, Austria henceforth sought to wear Prussia down by a process of attrition, but this presupposed a certain strength within the triple alliance that itself was fading.

In 1758 the French were pushed back over the Rhine by Ferdinand, while the emerging dominance within the French government of Étienne-François, duke of Choiseul, produced in March 1759 the third Treaty of Versailles, in which France reduced her role in the continental war to that of an Austrian auxiliary, and concentrated instead on trying to force Britain into peace. Yet when the French returned to Westphalia in 1759, Ferdinand of Brunswick smashed them at Minden on 1 August. The principal burden of attacking Prussia had in fact passed in 1758 to the Russians, a symptom of their growing strength and stamina. Königsberg, in East Prussia, was captured in January, forcing this kingdom under Russian occupation for the rest of the war. However, in his Brandenburg heartland, Frederick II defeated the Russians in the bloody battle of Zorndorf in August, while an Austrian surprise attack at Hochkirch in October failed to loosen his control of Saxony and Silesia. Despite the apparent stalemate, the Austrians and Russians made a further joint offensive against Prussia during 1759, in which Frederick suffered his worst defeat ever, at Künersdorf, forcing him to abandon Saxony and Silesia. The following year saw victories on both sides, but Frederick's success against the Austrians at Torgau was bought with greater casualties than were suffered by the vanquished (3 November), and Russian troops even reached Berlin and held it to ransom.

How was it, though, that the three greatest military powers on the Continent failed to crush Frederick's Prussia? To begin with, Austria and Russia both suffered from sluggish systems of planning and logistics that impeded offensive operations. Furthermore, their leading generals were cautious, unimaginative, and relatively uncooperative, and in the French case frequently incompetent. Maria Theresa and her advisers displayed poor strategic sense, waging a war of aggressive intent in a largely defensive and attritional fashion that allowed Frederick to deal with his enemies in turn in each campaign.

Elizabeth of Russia was similarly unable to provide clear strategic direction after her stroke in 1757 allowed a major split to open up in her council. Related to this, the aims of the three powers diverged sufficiently to impede any overriding common purpose of destroying Prussian power. All this combined to prevent Frederick's enemies from holding the initiative for any length of time, and from following up their military successes.

The weaknesses of the triple alliance were matched by the remarkable resilience of Prussia. Britain's financial support of Prussia and Anglo-Hanoverian military protection of Brandenburg from the west enabled Frederick to concentrate his forces against only two enemies after late 1757: Austria and Russia. Frederick's strategic, operational, and tactical skill, while by no means flawless, enabled a united Prussian command, and a heavily centralized and obedient state, to take full advantage of the deficiencies in the triple alliance's war effort. If Prussia was exhausted financially and materially, with underage and substandard recruits filling the army's ranks by 1760, the Austrians and the French were also incapable of further offensive action.

THE ANGLO-FRENCH IMPERIAL STRUGGLE 1755-1760

While the war in Europe produced stagnation, the Anglo-French conflict was vastly more decisive, in large part because Pitt was determined to destroy as much of France's overseas power as possible. In India, Robert Clive's skillful handling of indigenous auxiliary troops and combined operations with the navy allowed him to recapture Calcutta from the Nawab of Bengal in March 1757 after its loss the previous year; and he followed this by gaining control of all Bengal after his victory at Plassey (26 July). But in North America things were going considerably less well for the British. Montcalm made much progress in the backcountry in 1756-1757, but this only forced the British commanders to reconsider their strategy and plan instead for a full assault on New France up the Saint Lawrence River, for which they requested massive land and sea reinforcements from London.

They were fortunate that Pitt endorsed their request, and in early 1758 the issues that had bedeviled relations between the regular forces and the colonies were resolved to the satisfaction of the colonists, unlocking colonial military resources im-

mediately. As if to prove the need to attack New France by sea, in July 1758 Montcalm blocked the British advance at Fort Ticonderoga at the foot of Lake Champlain, but the same month the French were unable to prevent a British amphibious seizure of their fortress of Louisbourg on Cape Breton Island. Four months later the British also reduced Fort Duquesne at the forks of the Ohio, and the cumulative effect of these successes was to neutralize the American Indian nations, who now came to an accommodation with the British colonial authorities. In the meantime, during 1758 Pitt launched a series of diversionary amphibious attacks on the French Atlantic coast, the mere threat of which pinned down French forces so they could not be deployed either against Hanover or in the colonies.

Worse was to come for Louis XV in 1759. Montcalm's forces in New France were suffering from a lack of supplies and dwindling manpower, in spite of the mass mobilization of the colony's adult males. Britain, by contrast, sent out eight thousand fresh troops under James Wolfe, who in June sailed up the Saint Lawrence with twenty-two ships of the line to Quebec City, which soon found itself cut off and with dwindling supplies. While Amherst cap-

tured Ticonderoga, securing New York and Massachusetts, in September Wolfe provoked Montcalm into a battle just outside Quebec where both commanders were killed, but the British were victorious. Although Quebec surrendered, remnants of the French army managed to escape, and, reinforced to seven thousand men, marched on Quebec to attempt its recapture in April 1760. Yet Lévis's victory over a British force just outside the city walls could not prevent the abandonment of the siege in the face of British relief, and in September the French governor, Pierre François de Rigaud, marquis of Vaudreuil, surrendered the rest of New France. But in spite of this vigorous campaign, the outcome in North America had, in reality, been determined the previous year at sea, when the British had destroyed one French battle fleet off Lagos (Portugal) on 17 August, and defeated the other at Quiberon Bay off the coast of Brittany (20 November). Not only did

this dash Choiseul's serious hopes of an invasion of Britain; it also assured Britain command of the Atlantic and English Channel, allowing the blockade of French ports and cutting off the French overseas from the homeland. In June 1761 Britain even managed to capture Belle-Isle, dominating the southern coast of Brittany.

DOMESTIC POLITICS AND THE ENDING OF THE WAR

However, by the end of 1760 there was a general war-weariness among all the belligerents, even the British, whose economy was flourishing. Indeed, during 1761 Anglo-Prussian relations deteriorated largely because Frederick II refused to consider any concessions to his enemies, culminating in the curtailment of British subsidies in April 1762. All this notwithstanding, the hostility of Elizabeth of Russia to Frederick II, and Pitt's determination to wring a "Carthaginian peace" out of France pro-

Seven Years' War. A map from John Entick's *General History of the Late War*, a British account of the Seven Years' War, showing the theater of war in the German states. longed the conflict. What pushed the great powers toward peace was not victories or defeats but rather changes in their domestic political configurations.

George III's accession in October 1760 produced a notably more pacific tone in the British government, driving Pitt out of the ministry a year later. France sought to profit from this, ratcheting up demands in peace negotiations. Louis XV forged a third Family Compact in August 1761 with the anglophobe Charles III of Spain, who had acceded to his throne in 1759. This produced in January 1762 a Spanish declaration of war against Britain, ostensibly to protect Charles's New World economic interests, but Charles's rash decision was soon repented, as Britain captured both Havana (August) and Manila (October) in successful amphibious operations. That same year, the British also captured the islands of Martinique, Saint Lucia, Saint Vincent, Grenada, and Tobago from France, to add to earlier seizures of Guadeloupe in 1759 and La Gorée in West Africa (1758). The Franco-Spanish position at the end of 1762 was worse than it had been a year earlier. Nevertheless, John Stuart, earl of Bute, now directing the British government, concluded the unnecessarily lenient Peace of Paris (10 February 1763) in which Martinique, Guadeloupe, Saint Lucia, and La Gorée were returned to France. All of New France, except Saint Pierre and Miquelon and fishing rights off Newfoundland, was retained by the British, and in India France was permitted to retain only the five trading posts held in 1748; Minorca was returned to Britain in exchange for Belle-Isle. To recover Cuba and Manila, Spain ceded Florida to Britain, receiving compensation from Louis XV in the form of Louisiana. Britain had shattered the French empire, and France had seen her armies humiliated (with serious domestic political consequences), but the French territories George III handed back to Louis XV were the most productive.

Prussia's survival intact, with peace concluded at Hubertusburg (15 February 1763), equally owed much to changes in domestic politics: the death of Tsarina Elizabeth in January 1762, and Peter III's immediate withdrawal of Russia from the triple alliance. Catherine II, after her usurpation of the throne six months later, maintained Russian neutrality but refused to assist Frederick as her husband had wished to do. With the treaty, Europe reverted

to the status quo ante bellum. By merely carrying on the war, and regularly defeating his enemies against massive odds, Frederick II acquired the sobriquet "the Great" for himself and Prussia's recognition as a great power by the other states. Austria had failed dismally in the attempt to regain Silesia, prompting a further bout of administrative reform that, in less than a decade, increased the quality and quantity of her armies. Yet Russia, in spite of making no territorial gains from the war, emerged as the arbiter of eastern Europe, in part through her military performance but also thanks to the new tsarina, Catherine II, who was determined that Russia would henceforth act to maintain its newly acquired pivotal role.

GUY ROWLANDS

SÉVIGNÉ, MARIE DE (Marie de Rabutin-Chantal, marquise de Sévigné; 1626–1696), French letter writer. Madame de Sévigné occupies a special position in the history of French literature. She is one of the best-known writers in the language, but she never wrote anything intended for publication. Her fame derives exclusively from her correspondence, made up of thousands of letters that were first published after her death. She was born in Paris to a mother from a wealthy bourgeois family and a father who was a titled nobleman from

Burgundy. Orphaned at a young age, she grew up in the large and affectionate household of her maternal grandparents. She received an education under their guardianship that emphasized broad readings in French and Italian literature and in religion. Her paternal grandmother was Jeanne de Chantal, founder, with François de Sales, of the religious order of the Visitation.

After her marriage in 1644 to Henri de Sévigné, a young nobleman, Marie had two children: Françoise-Marguerite, born in 1646, and Charles, born in 1648, and the family moved to the Sévigné estate in Brittany. She was widowed after seven years of marriage when her husband was killed in a duel fought over a mistress. She then moved back to the Marais district in Paris, where she had spent her youth, and where she was quickly assimilated into the elite social circles of court and city. As a widow of some means who enjoyed the support of her extended family, Madame de Sévigné had considerable freedom in the conduct of her life. She never remarried, but enjoyed a lifetime of close friendships with many of the principal figures on the French literary, cultural, and political scene: Marie de La Fayette, Madeleine de Scudéry, François, duc de La Rochefoucauld, Jean François Paul de Gondi, cardinal de Retz, and Jean de La Fontaine. Sévigné's close ties with the circle patronized by Nicolas Fouquet (1615–1680), minister of finance in the first years of Louis XIV's reign, drew her into the debates that polarized Parisian high society during Fouquet's trial for treason in 1664. Her letters written during the trial offer a subtle interpretation of political events and a lively, dramatic narrative.

As time went on, Sévigné was to see other close friends suffer disgrace or exile. Her letters invited her far-flung correspondents to continue their participation in social conversations and remain, at least through writing, on the “inside.” In her letters to her cousin Roger de Rabutin, comte de Bussy, who spent most of his adult life trying in vain to regain favor at court, she regularly reported how his letters were read aloud, absorbed into social dialogue, and given real power in a world where gossip and political action were never very far apart. To other correspondents who spent periods away from the capital she became a prized source of information, and her own letters were circulated, read and admired by many readers, who valued them for their witty and

Marie de Sévigné. Portrait by Claude Lefevre. ©ARCHIVO ICONOGRAFICO, S.A./CORBIS

conversational style as much as for the news they contained. Sévigné's principal correspondent was to be her daughter, Françoise-Marguerite, who in 1671 moved to Provence with her new husband, the comte de Grignan. Three-fourths of the letters of Madame de Sévigné that we know today were written from mother to daughter. They reveal an intense, often contradictory relationship. Madame de Grignan's move to the provinces precipitated a profound sense of isolation in her mother, an experience that was new to this woman known by all to be a paragon of sociability. In the process of building her correspondence with her daughter, Sévigné discovered her vocation as a writer. Her letters written from Paris are rich personal chronicles of behind-the-scenes events in an extremely volatile social milieu. Her letters written from her family property in Brittany evoke more intimate memories that she can share with her daughter. She fills her descriptions of the woods and the familiar property with allusions to their shared taste for pastoral romance, and invites her correspondent to imagine herself with her in the same stable company of their

favorite landscapes and books. During the winter and spring of 1696, while Sévigné was visiting her daughter in Grignan, Françoise-Marguerite suffered a lengthy illness. Her mother exhausted herself in attending to her. In April the older woman fell ill, and died two weeks later.

Mother and daughter visited each other for lengthy periods, but their repeated experience of separation and reunion inspired Sévigné's ongoing struggle as a writer to find words to express her passion. The theme of the inadequacy of language for communicating love recurs throughout Madame de Sévigné's correspondence. To put her maternal feeling into words, she drew on a multitude of discourses from her culture—the language of prayer, erotic love, and myth—and in so doing she designed an image of a mother's passion that has become an important model for literary, historical, and psychological discussions of the mother-daughter bond. As the intimate and articulate record of a long life fully lived, Sévigné's letters have been the favorite reading of great writers from Voltaire to Virginia Woolf.

ELIZABETH C. GOLDSMITH

SEVILLE. The Andalusian city of Seville, located fifty-four miles inland from the Atlantic Ocean, was the hub of the Spanish empire for much of the early modern era. In 1503, Isabella of Castile and Ferdinand of Aragón established the Casa de Contratación (House of Trade) in Seville and

thereby launched the ascent of this provincial capital. The number of households doubled between the censuses of 1534 and 1565, and the local population was amplified by droves of foreign traders, sailors, and slaves. The population peaked at over 100,000 at the end of the sixteenth century, making Seville one of the three largest metropolises of Europe and the single most populous city in Spain. A catastrophic plague in 1649 reduced that population by almost half, and it would not recover until the early 1800s. Seville's preeminent position within the empire formally ended in 1680 when the monarchy named the coastal city of Cádiz as the official port for the Indies trade. In its imperial heyday, Seville was notorious for its ostentatious public displays and for the active underworld described so vividly in Golden Age classics by Mateo Alemán (*Guzmán de Alfarache*, 1599), Miguel de Cervantes (*Rinconete and Cortadillo*, 1613), and Tirso de Molina (*El burlador de Sevilla*, 1630).

Seville lies along the east bank of the southwesterly flowing Guadalquivir River, which empties into the Gulf of Cádiz. A countryside rich in natural resources produced high-quality olive oils, wines, and citrus fruits for export to Europe and the Americas, while pine trees provided raw materials for local shipbuilding. The main industries of early modern Seville—soap and ceramics—were located in Triana, a neighborhood across the river, connected to the city center by a single wooden bridge laid atop a string of boats. Triana also housed the castle of the Inquisition, which was founded in Seville in 1480. In the eighteenth century, tobacco production flourished at Seville's Royal Tobacco Factory (1757), the setting for Bizet's *Carmen* (1873–1874) and the current site of the University of Seville.

Royal interests were represented in Seville by an official called the *Asistente* and by a royal tribunal (*Real Audiencia*). Honored by four royal visits in the sixteenth and seventeenth centuries, Seville was transformed into the court for five years under the first Bourbon, King Philip V (ruled 1700–1746). Local government was led by an aristocratic *ayuntamiento* ('city council') comprising thirty-six *veinticuatro*s and fifty-six lesser-ranked *jurados*. The council's jurisdiction extended over many neighboring towns and villages, although Seville's territory shrank considerably as the Habsburg kings sold independent status to many of those towns and

Seville. A late-sixteenth-century engraving by Braun. THE ART ARCHIVE/MUSEO DE LA TORRE DEL ORO SEVILLE/DAGLI ORTI

villages for much-needed cash. The most serious challenge to local authority took place in 1652, when a popular uprising began with bread riots and ended in a bloody crackdown. Seville was the seat of a wealthy archbishopric and a powerful cathedral chapter, and perpetual tension existed among the city's religious, municipal, and royal authorities.

Seville's enormous Gothic cathedral (completed 1506) dominated urban life, and its Giralda—a minaret redesigned as a bell tower—symbolized the city. Until the 1500s, Seville had retained its medieval Islamic character, but the urban fabric changed dramatically as the imperial metropolis burst the seams of the old medieval city. New neighborhoods developed outside the old walls, city gates were expanded, and wide, straight avenues replaced narrow, twisting lanes. In 1572 the Casa Lonja (House of Trade, the present-day Archive of the Indies) was built to store New World goods. The Lonja joined the cathedral, Alcázar ('royal palace'), and archbishop's palace as the physical center of power. The Plaza de San Francisco was another important urban nucleus, as the site of the main Franciscan monastery (now destroyed), the Royal Audiencia, the city jail, and the town hall

begun in 1527 in the elaborately decorative Plateresque style. Seville's sixteenth-century humanists found inspiration in the Roman ruins of nearby Itálica, and grand urban projects (notably the Casa de Pilatos and the Alameda de Hércules) completed Seville's conversion from an Islamic to a Renaissance city.

Urban development was predominantly religious in the 1600s, a century marked by the founding of dozens of new religious institutions, by the growing popularity of Holy Week and Corpus Christi, and by wide popular support promoting the cause of the Immaculate Conception. The baroque church of San Salvador was begun in 1674, and the 1670s also saw the construction of two spectacular hospitals for the poor, the Hospital de los Venerables and the Hospital de la Santa Caridad, both founded by noble patrons with fortunes from New World trade. The new architecture of Counter-Reformation Seville was filled with masterworks by the local painters Francisco de Zurbarán (1598–1664), Bartolomé Murillo (1617–1682), and Juan de Valdés Leal (1622–1690) and the sculptors Juan Martínez Montañés (1568–1649) and Pedro Roldán (1624–1700).

AMANDA WUNDER

SEXUAL DIFFERENCE, THEORIES OF. Historians agree about two things: that sexual differences were carefully marked in the early modern period, and that theories of difference underwent significant changes in the late seventeenth and eighteenth centuries. How these differences were marked and how they changed, however, are the subject of much scholarly debate.

For much of the early modern period, theories of sexual difference derived from those of classical antiquity. Humoral theory, the basis of learned and lay medical thinking, explained that everyone was made up of four humors (yellow bile, black bile, phlegm, blood), but that men and women differed constitutionally. Men tended to be hotter and drier than women. Two strands of classical thought described the creation of sexual difference. Aristotle argued that male seed acted on female matter in the womb to create a new being. Because matter strove toward perfection, the ideal was always male, but sometimes inadequate heat or weak seed resulted in a female. In this model, males are the default setting and females are the result of some failure or deficit. The Hippocratic model was more generous: males

and females contributed seed to make a new being, and the shape of the resulting offspring was due to the interaction of both seeds.

Galen's (129–c. 199 C.E.) ideas about sexual anatomy also portrayed the male as the more perfect specimen. Male and female reproductive parts were the same, but located in different arrangements in the body. The penis and the scrotum were like the womb and vagina turned inside out; the male body's greater heat and perfection pushed these internal organs outside. Renaissance anatomists highlighted these similarities in their illustrations. The historian Thomas Laqueur has described this as the "one-sex" model, meaning that sexual difference was a matter of degree rather than kind. He has emphasized that male and female sexual desire and fulfillment were thought to be necessary for reproduction; only in the heat of orgasm could a new person be created.

If male and female bodies were thought to be so similar, Laqueur argues, then the burden of difference was borne by gender, that is, by social and cultural arrangements. Biblical authority was constantly invoked to remind women that they were the daughters of Eve, and legal proscription attempted to constrain the desires of what was thought to be the lustier sex. Women's history provides a wealth of examples to illustrate the maintenance of difference by means of patriarchy. In England, for example, men who murdered their wives were guilty of homicide and hanged, but women who murdered their husbands were guilty of the far more serious crime of petty treason and burned at the stake.

Historians have argued about the extent to which Laqueur's model truly dominated discussions of sexual difference. Lyndal Roper, for instance, has highlighted the significance of maternity, arguing that the corporeality of women's repeated experiences of pregnancy and lactation emphasized the radical differences between male and female bodies to both sexes. Recent work has also suggested that Renaissance anatomists were fascinated by manifestations of sexual difference, although they often highlighted sexual dimorphism in features that we no longer see as sexually specific.

By the end of the eighteenth century, ideas about sexual difference had changed. Broadly speaking, historians agree that by the late eigh-

teenth century differences rather than similarities between male and female bodies came to be emphasized; that women were no longer thought to be the lustier sex; and that sexual difference permeated the entire body, not just the arrangement of the genitals.

Laqueur dates this larger shift as occurring around 1780–1820, and he connects the development of the “two-sex” model to social and political change. He suggests that contract theories of government and redefinitions of the political subject created an imperative to define women as categorically different from men. He emphasizes the work of thinkers such as Jean-Jacques Rousseau, who declared in 1762 that a man is only a man occasionally, but a woman is a woman for her whole life, by which he meant that men usually functioned as gender-neutral subjects while women were constantly marked as different and, therefore, as incompetent to function as political subjects.

Anthony Fletcher dates this shift toward greater difference earlier in England, describing a move from scriptural to secular patriarchy. By the later seventeenth century, Fletcher suggests, gender difference was rooted in beliefs about women’s innate modesty and godliness, rather than the older view that saw them as sinful and disorderly. Female chastity was the natural result of women’s lack of sexual desire and their investment in motherhood rather than passion. For Fletcher, such differences were understood in bodily terms—women were “naturally” different from men—but those corporeal differences were not highly articulated.

Randolph Trumbach complicates this picture by reminding us that same-sex desire shaped ideas about gender relations. He suggests that with the late-seventeenth-century development of “molly houses” in Amsterdam and London—clubs frequented by men who had sex with other men—masculine and feminine roles became more tightly defined as a third sex—the molly, or effeminate man—was imagined, represented, and lived. Such a suggestion resonates also with the work of Henry Abelove, who suggests that the range of usual sexual behaviors between English men and women narrowed to focus on the reproductive act sometime in the early eighteenth century.

Other interpretations focus on changing views of the nervous system. Popular medical works by the physician George Cheyne (1671–1743) and novels by Samuel Richardson (1689–1761), grounded in John Locke’s psychological theories, portrayed the human body as a creature of sensation. Nerves mediated a person’s relationship to his or her surroundings, but nerves were not gender-neutral. Women’s nerves tended to be finer and more delicate than those of men, whose grosser nerves demanded more stimulation (often in the form of sex and alcohol). Women’s more refined nerves made them the moral center of the domestic sphere, but also made them prey to a range of ailments.

All of these interpretations suggest that difference became more fully embodied in the eighteenth century. None of these, however, grounds that change in scientific developments. Instead, historians see scientific work as culturally shaped, part and parcel of larger social changes.

SEXUALITY AND SEXUAL BEHAVIOR.

Since the 1970s, new approaches to the history of sexuality have combined to transform understanding of early modern sexual practices and beliefs. Social historians began by recovering sexualized aspects of the life cycle such as marriage and childbirth. Historians of women and gender examined longstanding patterns of sexual socialization relative to such issues as coerced sex and arranged marriage and the patterns of community response to such sexually marked populations as prostitutes and nuns. Michel Foucault’s *Histoire de la sexualité* (1978; *History of sexuality*) provided a new intellectual framework for sexuality studies by arguing that modern sexuality ought to be understood as discursively organized and marked by technologies of power. That is, patterns of language such as confession and silencing around sexual acts operate in complex ways within structures of power (such as the family, church, state, and science) to form sexual identity. Foucault’s work stimulated and reformulated questions and approaches to the history of sexual behavior even as he was criticized both for the lack of historical specificity in his account of ancient sexuality and for contending that the beginning of the modern notion of sexuality was fundamental to identity in eighteenth-century Europe.

Since Foucault, much empirical historical work on sexuality has filled gaps in his chronology and challenged a number of his particular assertions. Nonetheless, the work of historians of sexuality on such issues as birth control, prostitution, pornography, and homosexuality remains indebted to Foucault for his insights regarding the patterns of meaning and significance with respect to sexuality and sexual behavior. What follows takes into account both the empirical and the discursive understandings of the history of sexuality and sexual practices in early modern Europe. For purposes of clarity, “sex” throughout refers to sex acts, while “biological sex” refers to male or female bodies.

“Sexuality” refers to the complex of ideas associated with sex and often inflected by “gender,” by which is meant the cultural meanings attached to biological sex.

SEXUAL PRACTICES

From the emergence of Catholic Christianity in late antiquity, suspicion of corporeal matters as detracting or distracting from the Christian’s duty to focus on eternal salvation was especially strong with regard to sex. Procreation was permitted, but pleasure was generally frowned upon by the church. Persistent beliefs and strictures indicate that fears of sexuality remained very much in play throughout the Middle Ages. Theologians were adamant that sex was primarily procreative and ought to be confined to legitimate marriage. In general, any sort of sex in which procreation was impossible (anal, oral, homosexual) or even made difficult (by means of withdrawal, for instance) was regarded as “against nature.” Although other factors were not entirely excluded, strictures regarding marital sex reflected the predominance of procreation to the exclusion of other factors. Couples were not supposed to have sex when the woman was already pregnant, since the sexual act could not possibly produce children. Men were supposed to be on top during the act in part because of the belief that if the woman was on top, the man’s seed would spill out, preventing conception. As long as procreation was the aim and a reasonable expectation, sex was permissible.

Procreation as the goal did not eliminate the understanding that sex was an important form of marital intimacy. From St. Paul and medieval theologians, early modern Europeans inherited the concept of the marriage debt, which was seen as a crucial element in the maintenance of marriage. Tensions over the marriage debt are manifest in the extensive discussions about mutual obligation and exceptions to it. While both partners were expected to provide sex on demand, most assumed that men would be more demanding, despite the widespread cultural belief that women were the lusty sex because of their inferior capacity for reason. The marriage debt was enforceable, but it also could be evaded. Women resisted unwanted marital sex by observing church-defined days and periods of abstinence. Three days of abstinence were required on either side of participation in the sacrament of Com-

munion. The penitential season of Lent was a period of sexual abstinence. Sexual relations were also forbidden before a woman was blessed by a priest after childbirth in a “churching” ceremony. These evasive strategies functioned in effect as birth control and supported the cultural climate that regarded sex as inferior to chastity and devotion to God.

Sex and medicine. Medical knowledge about sex was largely organized around procreation. The understanding and treatment of diseases of both men and women centered around making certain that their bodies were properly balanced for insemination, conception, and pregnancy. Ancient medical authorities remained a significant source of (often dubious) knowledge about sexuality in the early modern period. Greco-Roman humoral theory continued to dominate thinking about conception and pregnancy, with women described as cold and wet, while men were dry and hot. Following Galen in particular, early modern medical practitioners believed that failure to conceive was often the result of an imbalance in the fluids—blood, black bile, bile, and phlegm—that corresponded to the humors (hot-wet, cold-dry, hot-dry, and cold-wet, respectively). Medical intervention for complaints such as irregular menstrual cycles, improper configuration of the womb for conception, and lack of sperm of the proper consistency and potency was organized around making certain that the humors were properly balanced within each partner and between the partners. While historians have been careful for lack of direct evidence, Roy Porter and Lesley Hall have argued that sex advice was used both positively and negatively. An explanation of the best conditions for conception, for instance, implied that the converse might prevent conception. Advice to prevent miscarriages by avoiding spicy foods, heavy lifting, and jumping suggested what exactly to do in order to induce a miscarriage.

Humoral theory was combined with assumptions about gender hierarchy inherited from the ancients as well. From elaborate potions and poultices to reminders that women should lie on the right side and avoid sneezing after intercourse, advice manuals, herbal recipe books, and medical texts were replete with ways to facilitate conception. Since Aristotle had defined male qualities as superior, and because men were generally considered more valuable and of higher status than women,

many questions about sex revolved around making certain that proper humoral balance would result in male children. Failure to conceive, in the Aristotelian tradition was entirely the woman’s fault, but popularizers of medical knowledge in the Renaissance were not so certain. Experts contended that factors such as uterine environment, physical conditions during intercourse, and frequency of intercourse could influence the biological sex of the child. While medical writers such as Laurent Joubert (*Erreurs populaires* [1578; Popular errors]) and Giovanni Marinello (*Delle medicine partinenti all’infermità delle donne* [1563; Medicine for the infirmities of women]) debated who was responsible for the biological sex of the offspring, they accepted the Aristotelian claim that only men produced seed thought to produce the infant’s soul. Women were thought to provide only the matter necessary to produce the baby. Others agreed with Galen that women provided a necessary seed of their own that joined with the male seed to form a fetus.

Information about dysfunction was abundant; consensus was not. Consider impotence, a topic of central importance, as family lineages depended on successful reproduction. Causes and cures of impotence, male and female, filled thousands of pages of commentary. Numerous, exceedingly complicated recipes claimed to help men enhance desire, sustain erections, and produce high quality sperm. Following humoral theory quite literally, some thought excessive coldness or dryness in a man caused impotence, and advised adding heat or moisture. If the specified imbalance was corrected and the impotence remained, perhaps the problem was a penis either too short or too long. For the latter condition, the advice was to choose a tall bride. No advice was forthcoming for the man with a small penis. Others looked to the *Malleus Maleficarum* (c. 1486; The hammer of witches), blaming witchcraft for male impotence. For women too, the range of possibilities was vast. Diets, baths, and douches in a bewildering array were prescribed for sterile women. If these remedies were unavailing, one might try remedies to alter the shape or orientation of the uterus. Issues of sexual mood and timing mattered as well: if the woman was not sufficiently aroused, her seed would not be released. The husband was advised to engage in foreplay to make certain that this did not happen. The air of des-

peration in the range of remedies was in part because failure to reproduce disrupted social norms. But the remedies themselves—both in their complexity and their vast number—only increased anxiety about sex.

Indeed, the failure of medical authorities to reach consensus contributed to the development of scientific efforts around sexual issues. While physicians like Leonardo Fioravanti in his 1564 *Dello specchio di scientia universale* (Mirror of universal science) started publicly rejecting the established medical wisdom about sex, others sought to utilize debate to further sexual knowledge. Anatomists, for instance, engaged in controversies, particularly over female sexual anatomy: whether the womb was stationary or mobile; if it could be influenced by smells; whether the hymen existed; and also whether the penis was made of ligaments, muscles, or cartilage. As strictures on dissecting human bodies loosened, such questions could increasingly be answered by reference to empirical evidence. Gradually, such empirical efforts started to replace the medieval and Renaissance habit of fitting observed data into predetermined frameworks formulated by ancient authors and shaped by the need to reconcile pagan knowledge with Christianity.

One key idea that shifted with the development of science was about the relationship of the biological sexes. Thomas Laqueur has argued that medieval Christians generally accepted the Aristotelian hypothesis of one sex—male—with women as inferior and inverted versions of men. Anatomists and physicians beginning in the early modern period increasingly allowed that men and women were sexually distinct. Some contended that men and women constituted two sexes designed to complement each other. This more egalitarian image of sexual biology competed with the older, hierarchical model until the Enlightenment, and even then, remnants of the one-sex model remained. Laqueur's account has been criticized as overly schematic. But as with other aspects of sexual knowledge, the lack of fixity about sexual difference prompted investigations that increased the information available about male and female sexual anatomy.

Disease and adultery. The gradual increase of knowledge about sex and sexuality was slow to allay everyday sexual anxieties and ambiguities. While sex

was believed to have positive effects—doctors allowed that sex combated melancholy and stimulated the senses—commentators were in rare agreement that too much sex was harmful. Frequent intercourse supposedly drained a man of his vital fluids, resulted in weak or degenerate offspring, and even caused death. For women, too much sex could contribute to excessive moist, cold humors. There was, however, little consensus on what was meant by “frequent.” Similarly, old people were told to avoid sex for the most part, but texts rarely agreed on what constituted “old” and varied on whether sex ought to stop entirely or just happen less often. With the emergence of syphilis in the late fifteenth century, anxiety about venereal disease ran high as well. As the origins of syphilis were unclear, national groups blamed each other for the disease (the French called it the “Neapolitan pox,” and the Italians, the “French pox”), and some claimed women who mixed the seed of several men in their wombs were responsible for the disease.

By far the most prominent anxiety was the fear of adultery. Fictional texts, legal tracts, and abundant case law warned that uncontrolled female lust could destroy the household: the wife would exhaust her husband, and then seek her pleasures elsewhere. Early modern commentators maintained the story from Hippocrates that women imprinted what they saw on the child developing in the womb. A woman could get pregnant by any man and pass the child off as her husband's as long as she thought about her husband during intercourse. As the jurist Jacques Buchereau noted in his 1580 commentary on the Institutes of Justinian (*Les Institutes impériales de Justinian*), adultery provisions in legal codes typically penalized adultery with confiscation of goods, corporal punishment, and banishment. These penalties weighed more heavily on women, however, because of their more limited resources. Jurists considered the disproportional punishment of women to be reasonable because women could introduce illegitimate offspring into the family lineage.

GENDER ASYMMETRY

That the penalties for male cheating were rarely so severe points to the enormous asymmetry in power relations between men and women where sex was concerned. Seemingly benign manifestations in-

cluded the tendency to sequester women in the home, with greater seclusion for women of higher socioeconomic status. In Venice, respectable middle-class and noble women left their homes to go to church, but otherwise hardly at all. Lower-class women could move more freely but were often subject to sexual violence. In some Italian cities, gangs of young men raped unprotected women, and isolated peasant women in the countryside were similarly vulnerable to sexual violence. Sexual honor for women centered on chastity and sexual fidelity, while (in addition to factors such as prowess in war) male honor included acquiring and maintaining sexual mastery over women. Sexual insults, even if completely untrue, could destroy a woman's reputation and make her effectively unmarriageable. Slander cases often included disputes over one party calling a woman a whore or a slut. Sexual honor, lost through words or deeds, might be regained if a woman could prove she had been tricked into sexual relations, but generally only if the man married her. Men lost some sexual honor if they were thought to be out of control sexually or if they allowed themselves to be treated as the passive partner. A man who was thought a cuckold was regarded as having failed to control, or worse, having failed to satisfy his wife sexually. These were serious complaints, but where sexual honor was primary to a woman's reputation, it was only one of several components of male identity.

The combination of cultural anxiety, increased availability and spread of information, and lack of consensus about sex figured prominently in the early modern organization of families. Freedom in terms of choosing marriage partners was virtually nonexistent for men, but was especially unavailable for women. As Christiane Klapisch-Zuber noted regarding Renaissance Florence, men defined membership in "houses," or families. This was true throughout Europe, as male family members controlled most aspects of economic, legal, and political life. Women brought goods into the family lineage in marriage, managed the household, and were necessary for reproduction, but the family lineage passed through husbands and fathers to sons, rather than to daughters, who married into other families. One implication of this configuration was the sharp difference in age of marriage: men were often in their late twenties or thirties, while women were

usually in their teens when first married. Men had to be relatively secure financially to start a new household, while the desire to be certain of chastity and purity made early marriage more likely for women. Women who survived childbirth were often widowed, and often while still young and with small children because of the age differential at marriage. Whether a woman could remarry was determined by negotiation between her marital family and her family of birth. Especially if she had children, the marital family would try to keep the woman and her dowry within their family, but the birth family might return her to the family home and seek a new marital alliance with another lineage.

The sexual pressures on women were in many ways far more extensive than those on men. A woman could lose her sexual honor even if she was raped, especially if she got pregnant: common belief held that conception was only possible if the woman felt pleasure. Finally, female sexuality was heavily subject to familial strategies organized by male family members, often throughout a woman's life cycle.

DISCIPLINE AND DEVIANCE

Catholics and Protestants alike measured sexual transgressions against a combination of theological and communal standards upheld by church courts, the family, and state institutions. Together these loci of power defined sexual behavior in such a way that non-normative sexual behavior was subject to scrutiny and even criminal penalties.

Catholic theology as confirmed at the Council of Trent (1545–1563) retained marriage and holy orders as sacraments, and the notion that marriage was the best state for those who did not take vows of celibacy remained implicit in Catholic belief. Protestants rejected both holy orders and marriage as sacraments on the grounds that they lacked scriptural warrant, but the main Protestant groups (Lutherans, Calvinists, and Anglicans) continued to emphasize marriage as a means of controlling sexuality. More radical sects (such as Anabaptists) were sometimes persecuted because of their rejection of the dominant sexual mores. Catholic ecclesiastical courts and Calvinist consistory records are among the richest sources regarding regulation of sexuality. Fornication was especially prominent in these records, but issues surrounding marriage, illegitimacy, and sexual violence also appear regularly.

The immediacy of the parish in the life of virtually all Europeans meant that religious courts and strictures had much more influence than state efforts to regulate sexuality, but states engaged in efforts to control sexuality as well. The patriarchal and hierarchical structure of society meant that state legislation and jurisprudence tended to uphold paternal power in matters of sexuality. The most common areas of state intervention were around clandestine marriage, adultery, rape, fornication, and prostitution. Across Europe, parental consent was generally required for marriage. The French monarchy produced a series of ordinances against clandestine marriage, beginning with Henry II's 1556 edict condemning it as a crime against God and king. In 1579, the penalty was changed from disinheritance to death for those convicted of "rapt" (abduction or seduction of a minor for purposes of clandestine marriage). Ordinances in 1639, 1697, and 1730 upheld the state's interest in marriage, utilizing the language of the king's sacred authority, even as the monarchy encroached on areas traditionally reserved to the church and its courts.

State intervention in cases of rape and fornication tended to vary by social status, marital status, and reputation. Seduction of a woman of high status typically received greater penalties than if the woman was of lower status. Virginity raised the stakes, with jurisdictions often willing to force the man either to marry the deflowered woman or provide her with sufficient dowry to enable her to marry respectably. Monetary penalties in many Italian cities were graded explicitly by social status, with the most vulnerable population—female servants—virtually unprotected. State authorities generally did not intervene when men attacked women who were at a comparative social disadvantage.

The efforts of the state with respect to prostitution were often complicated by the mixed inheritance from the Middle Ages and the practical needs of particular jurisdictions. While the church regarded sex as distracting from salvation, it grudgingly allowed unmarried men recourse to prostitutes on the grounds that fornication under controlled circumstances was less sinful than allowing sexual urges to spill over into violence. Because women were regarded as lustier by nature than men, prostitutes were often seen as women indulging their carnal desires. Few recognized the economic

pressures on poor women. Many municipalities, moreover, regarded brothels as revenue sources. Brothels and prostitutes were regulated by such measures as special clothing to distinguish prostitutes from "respectable" women, limits on access to prostitutes, and bans on freelance prostitution. As Reformation and Catholic Reformation rhetoric about morality took hold, municipal brothels gradually disappeared, while religious foundations to redeem repentant prostitutes, such as the Convertite House in Venice (founded in 1552) and the Magdalen Hospital in London (founded in 1758), sprang up.

State attempts to control prostitution were generally ineffective. The focus on the prostitute as a fallen moral agent rather than on the economic problems that produced prostitution, combined with the inattention to male customers, ensured that prostitution flourished. The major change resulting from state antipathy was the decline in management of prostitution by women and the rise of the pimp. This made prostitutes increasingly vulnerable to violence and economic exploitation. States often accepted more or less open prostitution in less respectable parts of towns. To satisfy moral crusaders such as the Society for the Reformation of Manners (founded in the early 1690s in London), states engaged in or allowed occasional raids of such areas, but generally allowed business as usual, as long as order was not routinely disrupted. Higher class prostitutes (courtesans) were often prominent culturally as mistresses of kings and courtiers. Vulnerable to the vagaries of favor, such women were hardly subject to state pressure. By the outbreak of the French Revolution (1789), prostitution was much more "illegal" than it had been at the beginning of the Renaissance, but it remained a prominent feature of the sexual landscape.

Cross-dressing, infanticide, and sodomy were also subject to state regulation. While early modern jurists did not use the vocabulary of gender, these crimes were all violations of gender norms. Cross-dressing threatened the social hierarchy that presumed that men and women were in a stable relation to each other by virtue of biology. Men who cross-dressed were deemed effeminate, while women who did so were regarded as unnatural and were pressured to conform. By the eighteenth century, cross-dressing men who frequented private

clubs, notably in London, were subject to police harassment and prosecution. Prison terms, fines, and periods of standing in the pillory were often the penalties for those caught and convicted. Infanticide was punishable by death, but lesser penalties (fines, banishment) were often substituted. Women accused of infanticide were regarded as unnatural mothers who violated the primary purpose of their sex. Statutes required unmarried women to declare their pregnancies or risk being charged with infanticide if the baby died. Many women convicted of infanticide had tried to hide their pregnancies with the help of clandestine networks in larger European cities.

Sodomy was more complicated in that it meant a number of things. Sodomy was “sinning against nature,” and it encompassed nonreproductive sexual techniques such as masturbation, sex between two men, between human and animal, or between a man and woman in such a way that conception was impossible. Sodomy was associated with weakness, and passive male sodomy was often seen as resulting from a deficiency of proper male gender characteristics. But male homosexual sodomy, as Michael Rocke has argued, was a significant mode of political socialization in Renaissance Florence, and the efforts to prosecute it suggest that it was widely practiced. Officially, sodomy often carried the death penalty, but this seems to have been carried out primarily against socially disadvantaged individuals. By the eighteenth century, the state occasionally attempted to disrupt the meeting places of “sodomites,” particularly when pressured by moral crusaders. The social pattern of prosecutions persisted as members of the elite caught in raids were usually fined, while harsher penalties were reserved for poorer men.

While Foucault asserted that sexual identity categories only developed in the nineteenth century, historians such as Alan Bray have argued that the earlier emergence of identifiable homosocial institutions such as “molly houses” (private residences where men could meet other men for sex) created a sense of sexual difference. Where Foucault contended that Europeans thought in terms of sexual acts rather than identities marked by systematic sexual preferences, his critics argue that institutional settings, linguistic practices such as pet names for those “in the know,” and sartorial indicators

formed basic elements of sexual identity. In the face of official hostility, deviant practices had some organizational structures that made it easier for those who participated in them to recognize themselves as different from the dominant sexual ethos.

THE MEANINGS OF SEX

Both church and state maintained that sex was procreative in purpose, but sex had a number of other meanings. The infusion of classical texts in the Renaissance increased the prominence of secondary meanings. Over the course of the early modern period, these additional ideas threatened aspects of the religious and cultural hegemony of Christianity.

The association of sex with pleasure was not new in the early modern period, but the idea that pleasure was a positive good received several endorsements, beginning in the Renaissance. The revival of Plato, especially by Marsilio Ficino (1433–1499) and his followers, suggested that sexual pleasure was an important aspect of love. Since Neoplatonic theory held that love was the means to salvation, carnal love had a significant role to play. While most Neoplatonists tried to downplay the corporeal elements, every important thinker who advocated Neoplatonic notions of love addressed pleasure as an element of sex and love. Protestants such as Lutherans, Calvinists, and Anglicans allowed that sexual pleasure within marriage created stronger emotional ties between husband and wife. Rather than distracting from salvation, in Protestant thought sexual pleasure facilitated harmonious relations that enabled men and women to focus on matters of grace, faith, and scriptural knowledge. The Protestant rejection of non-biblical sources of doctrine downplayed the ascetic tradition that regarded pleasure as dubious.

The printing revolution was crucial to Renaissance humanism and the Protestant Reformation, but it also played a significant role in disseminating ideas regarding sexual pleasure. Sexual poetry and prose were not invented in the Renaissance, but both the recovery of ancient writers of sexually explicit material such as Catullus and Juvenal and the development of hermeneutical techniques that allowed for new readings of old texts brought the issue of pleasure to the fore. Ovid’s *Metamorphoses* had been read allegorically before Renaissance humanists developed critical techniques to situate an-

cient texts in context and recover the range of explicit sexual behavior in antiquity. Figures like Pietro Aretino (1492–1556), notorious for sexually explicit poetry and ribald dialogues, took advantage of the openness of humanist culture to ancient sexual ideas and texts. Aretino utilized the print medium to disseminate erotic and pornographic materials, and generations of imitators produced images and texts in the same vein. “Aretino’s Postures” (c. 1524) —sexually explicit engravings by Giulio Romano based on ancient images to which Aretino appended even more explicit, very raunchy sonnets—took the “high culture” of humanism and put it in the comparatively accessible format of the cheap print. Often regarded as a precursor to modern pornography, Aretino’s work loomed large throughout Europe as the paradigm of sex emphatically devoted to pleasure. Audience demand for explicit sexual material grew to such an extent that novels like John Cleland’s *Fanny Hill, or Memoirs of a Woman of Pleasure* (1748–1749) remained perennial popular sellers despite official censorship.

The valorization of pleasure had proponents whose ideas expanded into a full-scale challenge to Christian orthodoxy, with sexual pleasure as a core element. Libertines as described by Molière in his 1665 play *Don Juan* were amoral and atheistic. The title character married or promised to marry women indiscriminately, and left one as soon as another caught his eye. Don Juan’s pursuit of pleasure leads to his death in Molière’s play, and more famously in Wolfgang Amadeus Mozart’s opera, *Don Giovanni* (1787). Libertine men who rejected the notion of familial domesticity in favor of homosocial gatherings that celebrated sexual pleasure often also rejected Christian sexual mores. Groups like Sir Francis Dashwood’s Dilettanti Society (established in 1732) were organized ostensibly to share research about ancient Greece and Rome. Members of the society undertook to reconstruct the supposed rites of Priapus, a minor Roman deity famous for his oversized, perpetually erect penis. Libertine organizations remained small in size, but their ideas about sexual pleasure in place of marriage and advocacy of pagan sexual ideas over Christian ones impressed and shocked mainstream European society. The fear of libertine influence often made their ideas more prominent because of their shock value.

The early Enlightenment libertines like Dashwood still drew on Renaissance modes of producing meaning. That is, they looked to the ancients for information and for authority for their own ideas. Later Enlightenment libertinism, partly in reaction to the growing popularity and hegemony of sentimental domesticity, advocated most famously by Jean-Jacques Rousseau (*Émile*, 1762), made a rather different case for libertine sexual ideas. Following the lead of materialist philosophers like the physician Julien Offray de la Mettrie (*L’homme machine* [1747; Man a machine]), pornographers increasingly described sex through reference to materialist philosophy, which posited that everything, including human beings, was simply matter. The extreme version of this tendency is exemplified in the works of the Marquis de Sade. His *Philosophy of the Bedroom* (1795) took Enlightenment language about reason and nature to the logical extreme. Any form of pleasure, even if it involved pain or death, was justified as reasonable and natural. Because pleasure was naturally occurring, Sade explicitly rejected any other criteria for evaluating sexual acts. Sade was, and to many still is, outrageous for his exploitative view of human behavior and sexual violence, in part because he effectively yoked sexual pleasure to reason and nature within an Enlightenment intellectual scheme.

The significance of libertine discourse in early modern Europe underscores the shift between the Renaissance and the Enlightenment in terms of the meanings of sex. In keeping with the larger cultural understandings of the production of knowledge, Renaissance advocates of pleasure as a central meaning of sex looked to the ancients. Enlightenment thinkers, generally dubious about tradition as well as religious belief, framed sexual pleasure in terms of reason and nature. Sade’s version was extreme to be sure, but the notion that pleasure was a natural part of sex permeated much Enlightenment thinking.

The other side of Enlightenment thinking about sex—the association of sexuality with gender roles in ways that presume men to be sexually aggressive and women passive—has remained more prominent. The Enlightenment inheritance has in fact included both the assumptions about gender roles and the multiple logics that resulted from the application of reason to nature and sexuality. The family, church, state, and science were not replaced

by Enlightenment reference to reason, but rationality, largely envisioned on a personal level, shifted assessments of sexual behavior to the individual. Sexuality as a matter of preference or desire could then much more easily be imagined as integral to the self. But modern sexual identity was, and is, clearly built on the structures and habits of early modern European society.

KATHERINE CRAWFORD

SHABBETAI TZEVI (also Sabbatai Sevi, Zevi, or Zebi, 1626–1676), Jewish rabbi of the Ottoman Empire whose messianic claims and abrupt conversion to Islam in 1665–1666 convulsed Jewish communities in Europe and the Near East. The widespread appeal of his messiahship establishes the movement as the most significant millenarian outpouring in modern Jewish history. The crypto-Jewish sect known in Turkish as *Dönme*, ‘convert (to Islam)’, refers to a minority of devotees who clung to belief in Tzevi as messiah and followed his lead in converting. Although “Shabbetean” principally denotes believers in Tzevi’s messiahship, the term also can apply to currents and sympathies among nonadherents, especially regarding the movement’s mystical (Cabalist) conceptions.

FAMILY AND EARLY CAREER

Many of the details of Shabbetai Tzevi’s life have been clouded by partisanship and Tzevi’s own self-representations. He was born in Ottoman Izmir (Smyrna) in 1626, the son of Mordecai Tzevi, a merchant broker recently arrived from Salonika. Both his mother, Clara, and his father died before his famous movement. After a period of study in Izmir, Tzevi was ordained as a rabbi when he was eighteen (Scholem, p. 111). Tzevi’s early inclinations toward Cabala, or Jewish mysticism, are unclear. In his subsequent travels, he studied the Lurianic teachings (after Isaac Luria, 1534–1572) that permeated contemporary Cabalism. The reve-

lations and prophecies of his eventual movement are deeply imprinted with Cabalist thought. He was pious and ascetic for the most part, but his behavior could also be bizarre and unpredictable. Observers saw in his eccentricities everything from madness and blasphemy to genius and divine blessing. In 1648, his behavior, which included messianic utterances, led to chastisement by the rabbinic authorities and, in the early 1650s, expulsion from Izmir. His transgressions at the time are not known, but in the following years he was reprimanded for saying aloud the divine name and for parodying religious rituals.

FROM OUTCAST TO MESSIAH

For a number of years Tzevi lived in a succession of Jewish communities in Ottoman Europe, but he was expelled from both Salonika and Istanbul and returned to Izmir in 1658. After three years he decided to travel to Palestine. However troubling his reputation may have been at this point, when he arrived in Jerusalem in 1662 he was well received by the rabbinic leadership and was even employed as their agent to gather Egyptian contributions for the city. In Egypt in 1664, Tzevi married Sarah, a young woman who had been orphaned by the massacres in Poland of 1648–1649. Until then his messianic claims had been cryptic and inconsistent, but that changed in 1665 when he formed a relationship with a famed Cabalist, Nathan Ashkenazi of Gaza. Buoyed by Nathan's zeal, Tzevi proclaimed himself messiah in May 1665 (Scholem, pp. 220–221) Nathan's letters of announcement and the rumor of miracles soon stirred messianic fervor from Gaza deep into Europe. The promise of imminent redemption and retribution took on a life of its own. European Christian millenarians shared in the enthusiasm, predicting the fall of the Ottomans and Islam. Given the recent Jewish massacres in Europe and the memory of the expulsion from Spain, the movement's own retributive focus fell more on Christendom than on Muslims or the Ottoman Turkish Empire (Scholem, pp. 349–350).

In December of 1665, Tzevi and his adherents fought their way into the main opposition synagogue in Izmir, and the movement had its greatest triumph to date. Congregations all over the eastern Mediterranean were in an uproar. As Tzevi attempted to land at Istanbul in February 1666, the

Ottomans arrested and imprisoned him, first at Istanbul, then later and more comfortably at Gallipoli. Tzevi's opponents and the rabbinic authorities in the capital, skeptical of Tzevi and fearful of repercussions from the Ottomans, no doubt had a role in his detention, but the movement among the masses continued to grow. With pilgrims from as far away as Poland converging upon Gallipoli and partisan clashes disrupting life in the cities, the central government acted again. In September 1666 Tzevi was brought to the imperial palace at Edirne for interrogation by the grand vizier Ahmed Köprülü and Mehmed IV's chief preacher Vani Efendi, among others. Faced with the prospect of execution, probably for encouraging mayhem, Tzevi denied his messianic mission and, to gain the sultan's mercy, agreed to convert to Islam. With a new name (Aziz Mehmed), a Muslim turban, and a paid appointment in the palace service, Tzevi was pardoned. His renunciation of Judaism was a calamitous shock to the Jewish community, especially when Tzevi began to proselytize on behalf of Islam.

Although some Shabbeteans, including Tzevi's wife, also converted, Tzevi was not a convincing Muslim for long. In 1672 he was banished to Dulcigno in Albania, where he died in 1676. Many believers clung to the hope that his conversion had been part of the messianic plan or a sacrifice in their interests. In the 1680s and 1690s, hundreds of Jews converted to Islam, most of them as members of the Donme sect. The rabbinical leadership sought to restore the community by erasing memory of the episode, but its effects were too profound to forget.

MADELINE C. ZILFI

SHAKESPEARE, WILLIAM (1564–1616), English playwright, poet, and actor. Shakespeare is universally recognized as the foremost writer in the English language to date. The thirty-seven plays associated with his name, including the major tragedies *Hamlet*, *King Lear*, *Othello*, and *Macbeth*, and his romances and comedies, *Twelfth Night* and *A Midsummer Night's Dream* among them, have been translated into many languages and have crossed all kinds of cultural divide. His poetry, in particular his intricately woven and fiercely passionate love sonnets, have stirred the senses of reader and critic alike for generations past and will do so for generations to come.

Shakespeare was born in Stratford-upon-Avon in Warwickshire, England, and he was probably educated in the 1570s at the free grammar school there known as the King's New School. His father, John Shakespeare, has been described as a glover or whittawer, which means someone who works with animal skins. Shakespeare's mother, Mary Arden, was from a noted local family, the daughter of Robert Arden, John Shakespeare's landlord. At some point, perhaps in 1568 when his father was high bailiff (mayor) of the town and responsible for Stratford's entertainment, Shakespeare must have first seen actors perform as traveling players visiting on tour.

In about 1582, Shakespeare married Anne Hathaway, a rich yeoman's daughter. The marriage was undertaken during a notable downturn in the affairs of Shakespeare's father. Having been a respected and confident town official during Shakespeare's earliest years—initiating an application for gentry status in 1576, for example—during 1586 John Shakespeare's alderman status was withdrawn. Although controversy surrounds the possible reasons for Shakespeare's marriage to a woman who was eight years his senior, three children were produced from the marriage. Susanna was the first-born in 1583 with a pair of twins produced in 1585—a son, Hamnet, who died in childhood, and a daughter, Judith.

William Shakespeare. AP/WIDE WORLD

LONDON ACTOR, PLAYWRIGHT, AND POET

Whether Shakespeare had to leave Stratford for some reason, or whether he joined a visiting touring company such as the Queen's Men, we first hear of him as a London playhouse personality seven years after the birth of the twins. This is when he is mentioned in a pamphlet called *A Groatsworth of Wit Bought with a Million of Repentance* (1592) written by a writer and playwright named Robert Greene. This text was written while the writer knew that he was dying, and in it he urged his fellow well-educated peers, Christopher Marlowe, Thomas Nashe, and George Peele, to forsake the stage. "For there is an upstart crow, beautified with our feathers," Greene wrote, "that with his 'Tiger's heart wrapped in a player's hide' supposes he is as well able to bombast out a blank verse as the best of you, and [. . .] is in his own conceit the only Shakespeare in a country." We know this allusion is directed toward Shakespeare, not only because of the play on his name and profession as a "Shake-scene," but also because of the misquotation from one of his *Henry VI* plays: "O Tiger's heart wrapped in a woman's hide!" (Part III, act 1, scene 4, line 138).

By this time, scholars believe that the player Shakespeare had not only embarked on his English

history cycle with the three *Henry VI* plays, but had also presented the highly successful if violent *Titus Andronicus* as well. In this play a woman is raped, has both her hands cut off and her tongue cut out, and a queen unknowingly eats her own children, baked in a pie. However, in a matter of a few years Shakespeare was also provably capable of writing the extraordinarily poised and tragic *Romeo and Juliet*. Here two young lovers, divided by their families' antagonism to one another, meet, marry, and die while speaking the most beautiful words of love written for the English stage.

By 1595, Shakespeare, as a sharer member of the acting company called the Lord Chamberlain's Men, was entitled to a portion of the company's takings. This status was acquired through his investment in things for the company like costumes, playbooks, and props. However, there is some evidence to show that Shakespeare wanted to be perceived more as a serious poet than as either an actor or a playwright. In 1593 and 1594 he published his two narrative poems, *Venus and Adonis* and *The Rape of Lucrece*, both dedicated to his supposed patron Henry Wroithesley, 3rd earl of Southampton. This period also marks the time when it is believed he had begun his 154 sonnets, published as a collection in 1609, with Southampton a candidate for the "Fair Youth" to whom the first 126 possibly allude. The fourteen-line sonnet, quietly evolving in form since its first emergence in fourteenth-century Italy, had reached England through poet-courtiers such as Sir Thomas Wyatt and the earl of Surrey earlier in the sixteenth century. In the hands of Shakespeare, many sonnet conventions were challenged, questioning the poetic expectation of comparing one's lover to nature, for example. "My mistress' eyes are nothing like the sun" is the bold opening of Number 130, for example. Thus Shakespeare chose to use the sonnet to engage, not only with the passions and intellect of the person to whom the sonnet is addressed, but even with poetry itself. It is interesting that Greene chose to mark out Shakespeare's verse as his primary objection to him as an "upstart." Shakespeare indeed wrote much of his drama in blank verse, the flexible iambic pentameter form of unrhymed poetry, again used by Henry Howard, the earl of Surrey, and taken on by dramatists such as Christopher Marlowe. However, Shakespeare's energy when approaching his plays

did not hold back on inventiveness and variety. The blank verse form reached its apotheosis with Shakespeare, but a few of his early plays contain sonnet moments too. The Prologue to *Romeo and Juliet*, given by the Chorus, is a sonnet, and later in this lovers' play, one is interwoven through the dialogue when the protagonists first speak together (act 1, scene 5, lines 90–113).

By the turn of the seventeenth century, the Lord Chamberlain's Men had rebuilt their Shore-ditch amphitheater (called the "Theater") as the Globe on London's Bankside (the south bank of the Thames). They were now the most well established of the city's playing companies. By this time Shakespeare had begun to write his heavyweight tragedies for them, beginning with *Hamlet* published in 1603. If *Titus Andronicus* was violent, and *Romeo and Juliet* tragically romantic, *Hamlet* was Shakespeare's play concerned with the human mind. The eponymous prince of Denmark, whose father's ghost tells him how he was murdered by Hamlet's uncle, sets out on a course of revenge, while at the same time, as the philosopher prince studying at Wittenburg University, he questions life and death and any decision involving them. Shakespeare is creative with the revenge tragedy form, using the vengeful mindset of the main character to explore highly philosophical questions. "What a piece of work is man!" (act 2, scene 2, lines 293–300) and "To be, or not to be, that is the question" (act 3, scene 1, lines 58–90) are two lines from speeches of profound mental depth. *Hamlet* is the most widely quoted and most investigated of Shakespeare's plays, attracting a phenomenal amount of scholarly study, just as much because of the questions it poses as because of the answers it fails to give.

THE JACOBEAN SHAKESPEARE

In 1603, after the death of Queen Elizabeth and the accession of James I, the company were renamed the King's Men, acquiring royal patronage status. In 1608 they also acquired a new, small, more select playhouse known as the Blackfriars that was to be used alongside the Globe, the public playhouse. Shares in this venture, which company members were given, were very lucrative acquisitions for the actors—including Shakespeare. This period marked the writing of plays such as *Othello*, first performed 1603–1604 and published in the 1620s, *King Lear*

of 1606, published in 1608, and *Macbeth*, again c. 1606 but first published in the collected First Folio of Shakespeare's works of 1623. The plot lines and characters of these tragedies continued to demonstrate the extraordinary range of Shakespeare's mind as he dealt with, for example, jealousy and deception in *Othello*; madness, mercy, and true filial love in *King Lear*; and the dangers of encouraged ambition in *Macbeth*. In about 1613, however, at the peak of his writing powers, Shakespeare was to give up his career on London's stage.

SHAKESPEARE THE STRATFORD MAN

By 1616, Shakespeare had returned to Stratford and the substantial home called New Place that he had bought for his family. It was there that he was to die in 1616 of a fever, reputedly after a rowdy visit from his friend and colleague Ben Jonson. He died where he began, therefore, not in London where he made his name, but in the Stratford of his birth. Back in 1596, gentry status had finally been achieved for his family, and the payee for this was likely to have been William. He died, therefore, not only rich, but respected and esteemed in his community, to become later in the minds of many the man most associated with the finest use of poetic English.

In the historical context of his day-to-day existence as an actor and a companyman, Shakespeare's significant output as a dramatic writer can be interpreted as simple good business sense that resulted in his family's bettered status at home. By writing good plays he drew audiences to playhouses in which he had financial interests. Shakespeare's plays did not, in fact, belong to him, but were the property of his company. Despite evidence that Shakespeare was involved in the printing of his poetry, there is no proof of authorial concern with the printed publication of his plays. His dramas were only collected as serious "works" seven years after his death in 1623 for what we now know as Shakespeare's "First Folio," put together by his fellow actors. A man of extraordinary talent, however, at a time when there were no rulebooks for the English language or its lexicon, his contribution to what we now perceive as beauty through dramatic story and words is inestimable.

EVA GRIFFITH

SHERIDAN, RICHARD BRINSLEY

(1751–1816), Irish playwright, theater manager, and politician. Sheridan was born in Dublin shortly before 4 November 1751, the day when he was baptized. His father was Thomas Sheridan, an Irish Protestant actor and theater manager; his mother was Frances Sheridan, who became well known as a writer of novels, including *The Memoirs of Miss Sydney Biddulph* (1761) and the Oriental tale *The History of Nourjahad* (1767).

The family moved to England, where Sheridan attended, and disliked, Harrow School, until 1770 when he left and moved, again with his family, to Bath. Early efforts at writing included *Jupiter*, a farce that prefigures *The Critic* and that was rejected for production by Sheridan's future colleague David Garrick; verse for the *Bath Chronicle*; and fragments of political essays. In Bath he met and eloped with the singer Eliza Linley (1754–1795), but the validity of their marriage was contested by both families and by another admirer of Linley's with whom Sheridan fought two duels. Although the families eventually dropped their opposition to the marriage, Sheridan remained very short of money, having moved to London to study law in 1773.

His first play was the comedy *The Rivals*, staged at Covent Garden in January 1775. It is a polished and urbane “comedy of manners” whose satirical targets include the corruption of language by Mrs. Malaprop (who famously describes another character as “as headstrong as an allegory on the banks of the Nile”), and the corruption of morals in the contemporary cult of “sentimentality.” After a near failure on the first night, it went on to achieve spectacular success and to bring Sheridan both money and aristocratic contacts. Sheridan went on to write a string of brilliant and successful comedies: The farce *St. Patrick’s Day* was produced in May 1775 and *The Duenna*, an operatic play, followed in November 1775. In 1776 Sheridan became manager and part-owner of the Drury Lane Theatre. *A Trip to Scarborough*, a loose adaptation of John Vanbrugh’s comedy *The Relapse*, was staged there in 1777, followed in May of that year by the classic comedy *The School for Scandal* in which a hypocritical “man of feeling” is contrasted with his rakish but good-hearted younger brother in a comedy set in the world of newspaper columns and society gossip. In 1779 Sheridan became the sole owner of the Drury Lane Theatre, where he produced *The Critic, or A Tragedy Rehearsed* in the same year.

1780 marked a turning point in Sheridan’s career: he spent over £1000 securing election as a member of Parliament for Stafford and ceased to write for the theater. A political ally of Charles James Fox and the Whigs, he joined the government in 1782 as the undersecretary of foreign affairs, and in 1783 became secretary of the treasury. His most famous parliamentary interventions, however, related to the impeachment of Warren Hastings, governor of India. A particular facet of the case related to the Begums of Oude, whom Hastings was alleged to have unlawfully deprived of their property: Sheridan discussed the case in a five-hour speech on 7 February 1787 that even his opponents acknowledged as “the most splendid display of eloquence and talent which has been exhibited in the House of Commons during the present reign” (Bingham, p. 237). Politically, Sheridan also argued against the Act of Union, and against press censorship.

However, Sheridan himself was sinking into debt. The Drury Lane Theatre was declared unsafe in 1792 and had to be demolished; Sheridan himself

borrowed the money for the building of a new theater on the site. After the death of his first wife, Sheridan married in 1795 the nineteen-year-old Esther Ogle, daughter of the dean of Winchester. In 1799 Sheridan even returned to dramatic writing, and his tragedy *Pizarro*, an adaptation from August Friedrich Ferdinand von Kotzebue’s *The Spaniards in Peru*, earned enough money to gain him a brief financial reprieve; but in 1802, with debts on all sides, the Drury Lane Theatre went into receivership. At the same time, his political career was stalling.

In the 1806 “ministry of all the talents,” Sheridan was made treasurer of the navy, but this relatively minor post did not carry cabinet rank. In 1809 the new Drury Lane Theatre burned down. Although, characteristically, he was able to joke about it—he is said to have watched from a nearby coffeehouse, remarking, “a man may surely be allowed to take a glass of wine by his own fireside”—the fire made his financial ruin unavoidable and marked the end of his ownership of the theater. Sheridan had been a friend of Prince George (later King George IV) and should have benefited from George’s elevation to Prince Regent in 1811, but the prince’s favor proved short-lived. The following year Sheridan lost his seat in Parliament, and although the prince supplied him with £3000 to buy his way back in, Sheridan spent the money clearing personal debts. In 1813 Sheridan was again imprisoned for debt. He lived in poverty and alcoholism until his death on 7 July 1816.

MATTHEW STEGGLE

SHIPBUILDING AND NAVIGATION. A revolutionary change in the design and construction of seagoing sailing ships occurred around 1400. The two established European shipbuilding traditions, one Mediterranean and the other northern, merged in the production of the full-rigged ship. From the north the rounded tubby hull form of the cog, the sternpost rudder, and the large square sail for driving the ship were combined with the abutting or carvel hull planking and the lateen sail of the south. Full-rigged ships carried three masts with a large square sail on the mainmast, a triangular lateen sail on the mizzen, and a small square sail on the foremast to balance the lateen at the stern. The square sails provided power while the lateen made the ship more maneuverable. Relying on the internal frame for strength—necessary if the hull planks did not overlap but instead abutted one another—made for lower initial construction costs, though such a hull required more repair and maintenance.

The carrack was the most prominent example of the new type, but there were smaller versions that were also capable of more reliable passages and over longer distances at lower cost than before. The higher carrying capacity per sailor gave these vessels much more range than did any of their predecessors, while the rig made it possible for them to survive more dangers. The most impressive accomplishment of the new merged type was its ability to carry Europeans on voyages across the oceans and, ultimately, around the world.

The change in construction also meant a change in the organization of work in shipbuilding. There was a growing distinction between the master builder, who drew the lines, and so designed the ship, and the carpenters who formed the wood according to his directions. Once established, the design of the full-rigged ship was far from static. Shipbuilders experimented with variations and explored the potential of the new design.

Late medieval northern European cargo ships were about three times as long as they were wide,

and deep, with high freeboard. The tendency through the fifteenth and sixteenth centuries was to reduce height while increasing length. Oared ships—galleys—did not disappear and their length-to-breadth ratios of 6:1 or more probably served to influence the design of cargo ships. In the state shipyards of the Mediterranean region, most notably the Arsenal at Venice, oared ships such as the heavy galleass and the more common light lower galley continued to be produced. Only governments built those types, for use against similar ships in war, because they were no longer useful for carrying cargo.

Oared warships changed in response to the introduction of gunpowder arms on board. The galleon, built in a number of places in southern Europe from the 1530s on, may have been an effort to get the most from both the new full-rigged design and heavy cannon. The type had a low beak and carried heavy armament in the bow like a galley, but the rest of the ship was like other full-rigged ships, the exception being a relatively high length-to-breadth ratio. Modified over time, the galleon proved to be an effective carrier of expensive goods. In some cases builders added a fourth mast, a bonaventure mizzen, with a second lateen sail to increase speed and maneuverability.

The galleon and other similar sixteenth-century types proved that the future of naval warfare belonged to the sailing warship armed with cannon. There would be mistakes in developing and exploiting the new technology, mistakes that now provide invaluable information through the work of underwater archeologists. The English *Mary Rose* sank in 1545 when the overmanned vessel took in water through gunports no one had thought to close, despite what was an obvious danger. The Swedish *Gustavus Vasa* sank in Stockholm harbor in 1628 on a shakedown cruise, one that the builders did not want to attempt because they knew the ship was unstable and needed modification. Political authorities insisted on the ill-fated voyage because the warship was a symbol of royal power as well as a vehicle for battle at sea. In each case the difficulties of dealing with novelty were obvious.

The diffusion of new techniques was often slow. The durability of medieval types of construction features continued into the eighteenth century. Ship-

Shipbuilding and Navigation. *Table of the Mechanical Arts: Shipbuilders for the Arsenal of Venice*, seventeenth-century Italian painting. ©ARCHIVO ICONOGRAFICO, S.A./CORBIS

building was typically conservative, given the high cost of error, so shipbuilders were often reluctant to adopt new methods. Old designs and types persisted for centuries, especially in smaller craft and riverboats. New composite or bastard types appeared when builders tried to exploit some of the advantages from the new improvements without giving up what they knew.

Builders and captains changed the sail plan of the full-rigged ship further, exploiting the advantages of combined rig. The general tendency was toward a more divided sail plan. They added new sails, a square sail above the mainsail and a square sail under the bowsprit, and even a square sail above the square sail on the foremast. The greater number of sails meant that sailors could work on each one separately. Captains enjoyed greater choices in de-

ploying canvas and owners enjoyed lower labor costs. Because the individual sails were smaller than the single mainsail on the mainmast had been, the maximum effort required to handle sails decreased, and with it the size of the crew needed to man the vessel. To further reduce crew, masts were made simpler and rigging reduced so that more of the work of handling the sails could be done from the deck. That, in turn, reduced dangerous time aloft for the crew and further decreased the labor requirement.

The advances in the building of cargo ships came together in the highly efficient *fluyt*, developed in Dutch yards in the late sixteenth century. It had a length-to-beam ratio of 5:1 or 6:1 and a low bow with a tapered or fluted stern. It carried little or no armament and a simplified rig. The vessel was

Shipbuilding and Navigation. In June 1667, at the end of the Second Anglo-Dutch War (1665–1667), Dutch admiral de Ruyter conducted a daring raid on the English fleet at Chatham, near the mouth of the River Thames, destroying several British ships and capturing the flagship Royal Charles. This map, with a portrait of De Ruyter in the upper left, shows the Dutch fleet and the attacks on Queenborough and Sheerness on the Isle of Sheppey, as well as the action off Chatham. suiting for the carriage of bulk goods such as grain and salt between the Baltic and western Europe. Because it traveled in peaceful waters, it required a smaller crew. The *fluyt* was slow but it offered relatively low costs, and it became a critical factor in the rapid growth of Dutch shipping and trade in the seventeenth century.

Builders modified the *fluyt* for use in different waters or for special purposes, and in its various forms the *fluyt* was widely used throughout Europe. Cargo ships required protection in wartime, so the diffusion of the *fluyt* promoted the use of convoys and an enduring distinction between ships for trade and ships for fighting. Because the number built was so large, Dutch builders were, to some degree, able to standardize parts. They also centralized much

new construction in shipyards along the Zaan River just to the north of Amsterdam, where the wharves were permanent. The presence of a sizable skilled labor force and of complementary industries—such as sawing and canvas and rope making—made it possible to produce ships quickly and less expensively. The pattern in the Zaanstreek was followed, perhaps to a lesser extent, in a number of places such as the lower Thames in England and the lower Tagus in Portugal.

For many trade routes in the eighteenth century, the sailing packet proved superior, especially for transporting more costly goods over long distances. The packet carried full rig, although on the mizzen there was now a spritsail, a true fore-and-aft sail, which was easier to handle than a lateen.

Whereas the giant carracks that the Portuguese used for trade to India in the sixteenth century reached 2,000 tons and more, the *fluyt* proved that for most trades the most efficient size was significantly smaller. The packet was typically about 500–600 tons, the optimum economic and technical size for a sailing cargo ship.

There were variations in size and in design to suit specific trades or functions. There were lighter variants for safe trades similar to the *fluyt* and its descendants, and there were heavier variants such as the East Indiaman produced by the yards of the national trading companies in the Dutch Republic and England, which carried enough weaponry to make them similar to warships. Competition for the packet in the north came increasingly from two-masted ships such as brigs and snows. Builders found ways to make those types larger, nearly the optimum size of a full-rigged ship, while reducing crew size. Two-masted ships became especially popular for regional trades. In the Mediterranean, smaller types, for example, the polacre and the felucca, which retained traditional triangular sails, survived in short distance and coastal commerce. State shipbuilding yards in the south still produced galleys at the end of the eighteenth century, but their numbers were small and declining.

At the same time that oared ships were disappearing, improvements in metallurgy—among the first signs of the industrial revolution—led not only to better and more reliable tools for shipbuilding but also to the introduction of iron for major framing and supports. Such composite construction was the first step toward the iron, and then steel, ships of the nineteenth century. Like cargo ships, warships tended toward greater standardization over time. With vessels built to fight, government agencies made the decisions about design so that limitations on design were much stricter. By the eighteenth century, navies had their vessels divided into specific rates, each with its own form of hull and rig and level of armament. The distinction between warships and cargo ships was by 1750 virtually complete, in sharp contrast to the years through about 1600. With no value as traders, warships were built exclusively in government yards that also typically served as bases with all the necessary stores and spare parts needed for the operation of those ships.

In the late Middle Ages sailors came to use a method of finding their way at sea that relied on the use of compass bearings and estimates of speed. Such dead reckoning could replace the traditional combination of experience, some stargazing, and the use of lead and line to find out about depth and the nature of the bottom. Portolan books, available in several languages by the sixteenth century, were compilations of data on sailing along coasts with directions, distances, and warnings about dangers. The pilots who worked along portions of coast in the Mediterranean and western Europe used them. From the thirteenth century they also had portolan charts, which visually represented the knowledge in the books. It is likely, though, that pilots and captains did not abandon the use of stars as a guide. Dead reckoning made possible impressive navigational feats. Long-distance voyages across the open sea, far out of sight of land and around the world, presented very different navigational problems from sailing along or near coasts. Still, navigators like Columbus found their way to, and, more importantly, their way back from, sites consistently, all that before the growth in astronomical knowledge that precipitated and was part of the scientific revolution. The influence of the new knowledge on navigation in the short term was small. It did, however, generate increasing interest in research on the movement of the stars and planets and in the potential of using observations of the heavens to aid navigation. For most of the voyages undertaken in early modern Europe, however, other information, such as prevailing wind directions or dangers of specific coastal features, was more critical for sailing.

As part of the exploration of the west African coast, Portuguese sailors developed ways to measure latitude—the distance they were south of Lisbon. Already discussed and formalized in the fifteenth century, the measurement of latitude was normal by the eighteenth century. What was lacking was a way to measure longitude. It was not until the perfection of an accurate chronometer by John Harrison in the second half of the eighteenth century that it was possible to establish the position of a ship at sea with accuracy. The diffusion of the more sophisticated navigational techniques was slow and, in 1800, sailors still commonly used lead and line and dead reckoning to find their way at sea, especially on shorter voyages in smaller vessels. Even if old tech-

niques persisted in both shipbuilding and navigation into the nineteenth century, advances from the late Middle Ages on made possible the massive increase in trade and commerce that was the hallmark of the society and economy of early modern Europe. They also made possible the sharp increase in the productivity of workers on board ship, a success that translated into improvements in welfare, not just for sailors but for all people touched by waterborne transportation.

RICHARD W. UNGER

SHIPPING. Shipping went through a radical transformation between the fifteenth and eighteenth centuries, a transformation that eventually had extensive influence on most aspects of the lives of Europeans. Shipping was the economic activity of the period with the greatest potential for growth. The merchant marine experienced a rise in tonnage per capita of more than 400 percent from 1500 to 1800. The productivity of sailors manning that tonnage rose dramatically, faster than in virtually all other major occupations. The range of government efforts to promote shipping, a bundle of policies often lumped together under the omnibus term

“mercantilism,” indicates that Europeans realized the possibilities created by improvements in water, especially ocean, transport. It was not just the increasing scale but also the scope of shipping that made it so important to early modern Europe. Adam Smith (1723–1790) in the late eighteenth century attributed some of the greatest strides in improving the wealth of nations to shipping, both over short distances and across the Atlantic. Even in art and literature there was recognition that shipping was a part of life going through dramatic changes and thus worthy of consideration. Seascapes became standard fare for painters, and by around 1800 the romance of ships and sea travel had made its way into fiction.

VESSELS, ROUTES, AND CARGOES

Beginning in the late thirteenth century Europeans were at last able to connect the shipping regions of the Mediterranean on the one hand and the North and Baltic Seas on the other. The contrary currents and winds of the Strait of Gibraltar had made sailing out into the Atlantic from the Mediterranean all but impossible before around 1270. It was then that ships from Italy made regular voyages back and forth between the north and the south. Great galleys with two or three triangular lateen sails were the vehicles for the scheduled trips by Venetians and later by Florentines. Large tubby two-masted carracks, principally from Genoa, soon joined the galleys. This new type combined the hull form of the northern cog with the abutting hull planking of Mediterranean ships. It also combined the large square sail on the mainmast with a lateen sail on a second or mizzenmast. The carrack was more maneuverable, and the addition of a small square sail on a foremast to balance the lateen mizzen created an even more versatile vessel. The new full-rigged ship, also called a carrack in its largest version, made possible the efficient carriage of luxury goods in ever-increasing volume between northern and southern Europe.

The development of the full-rigged ship also made possible the opening of new all-sea routes outside of Europe at the end of the fifteenth century. Christopher Columbus (1451–1506) had intended to open direct trade with Asia by sea but instead found lands to colonize. In the New World, he quickly adopted the model of settlement and

exploitation already established on Atlantic islands like the Canaries and Azores, which Iberian sailors had opened to shipping over the previous 150 years. As in those cases, trade with the New World soon developed in colonial agricultural goods. They were followed by shipment to Europe of the products of mining. The direct sea route to India, first exploited by Portuguese sailors making trips contemporaneous with Columbus's voyages, proved to be extremely long. The distances involved and the routes chosen meant that shipping around the Cape of Good Hope was slow to develop in the sixteenth century. Alternative routes overland in Asia and then by water from the eastern Mediterranean to Europe proved to be as effective in getting such oriental goods as spices to Europe.

While the fifteenth century was characterized by revolutionary changes in ships and routes, the sixteenth century was a period of gradual exploitation of those revolutionary changes. The tonnage deployed and volume of goods transported along internal European routes expanded in the wake of growth in population and in the production of goods. Contributing the most to increased tonnage and the increase in the average size of cargo ships during this time was the rise in the carriage of bulk goods, that is, those with low value for each unit of volume. The most obvious case was the rising trade in grain. While the shipping of wheat from Crimea to Italy, a route in place in the High Middle Ages, might have decreased because of wars generated by Turkish expansion, the carriage of grain from the Baltic to northwest Europe grew dramatically as the century went on. Supplies were large enough and shipping efficient enough that by around 1600 Dutch shippers carried Baltic grain to Italian ports in years of shortage in the Mediterranean. The carriage of other bulk goods, like fish, cured and packed in barrels, salt, and wood for building, also contributed substantially to the growth in shipping through the sixteenth century. The result within Europe was an increase in the volume of shipping and an even greater increase in the exchange of knowledge. Avenues for the transfer of commercial information became more plentiful and, along with the rise in the volume of trade, led to the more efficient exploitation of ships. Those valuable capital goods could be kept at sea for a greater part of the year if captains knew when and where they could

find cargoes. That knowledge generated a greater return on the sizable investment that was the cargo ship. To meet the need to carry bulk goods in northern Europe, shipbuilders developed new types of vessels, often elaborating on existing designs. The most obvious case was the *fluyt*, a relatively long three-masted ship with a boxlike cross section, first built in the Netherlands at the close of the sixteenth century. It was well suited to shipping cargoes back and forth between the Baltic and western Europe; variants soon emerged that were designed for moving wood from Norway or traveling to the Mediterranean from the Low Countries.

European shipbuilders designed special vessels to deal with the various distances and dangers involved. The giant carracks of Portuguese trade to India were the largest wooden ships ever built. The galleons, originally warships for battles in European waters, were adapted to handle the carriage of silver from the New World to Spain. While emphasis within Europe was on shipping bulk goods, in extra-European trade the cargoes were typically luxury items. Among the luxuries shipped were tropical goods that could not be produced in Europe. Human beings as settlers or slaves were taken to the New World, and soldiers, merchants, and officials were taken to Asia. The volumes of goods shipped were small compared with those carried over much shorter distances in and around Europe. Trade outside of Europe tended to be controlled and regulated by governments, which directed investment and routes used. Shippers had to sacrifice flexibility but received in exchange security and some predictability of profits in trade that involved high levels of risk.

In the seventeenth century, shipping continued to evolve along established lines, but there were some setbacks. The grain trade from the Baltic expanded, reaching its peak in mid-century, but stabilization, or in some regions a fall, in population led to a shrinking demand for food grains and so in turn in demand for transportation. Efficiency improvements in shipping largely compensated for those pressures in the second half of the seventeenth century. There were no major changes in ship design nor the opening of any new categories of trade, factors that had been the basis for earlier growth. The use of routes through the southern Indian Ocean made possible faster and more frequent trips

to the Far East, engendering increased shipping to Asia. The agents of that growth were the Dutch and English East India Companies, which made even more clear over time that ships and shipping were the foundations of European colonization. Meanwhile, within Europe, the elaboration of earlier practices, both in shipping and shipbuilding, laid the groundwork for the great expansion in shipping that was to occur in the eighteenth century.

The pattern of trade established in the Baltic and North Seas in the sixteenth century—the carriage of bulk goods and the reliance on agents to assemble cargoes and pass along commercial intelligence—spread throughout the world from the late seventeenth century on. Shipbuilders found ways to get the most from the three-masted ship, constructing a packet boat in the range of 500 to 600 tons, a size found to be the optimum for most long-distance trades. A vessel of that size and design could carry out a range of tasks and do so at lower risk. Two-masted vessels like barks and snows came to compete with the three-masted sailing ships for the carriage of bulk goods in regional trades, such as moving grain, wood, and coal around the North Sea. The rapid growth in English coal production and the rising demand for the fuel in urban centers made a significant contribution to the growth in shipping and to the use of barks and other colliers. The two-masters, larger than in the past, needed fewer sailors per ton than three-masted ships and increased flexibility in deploying shipping services. As in the north, in the Mediterranean two-masted ships or ones smaller than the sailing packet, like the polacre and the felucca, found increasing use in regional trades. The rising exchange in bulk goods like fish between northern and southern Europe, however, generally meant employment for three-masted ships. Large three-masters in trade to the Far East, the East Indiamen, proved effective in carrying the increasing volume of goods imported into Europe. The volume of shipping in extra-European trades in general and to the New World in particular increased dramatically in the eighteenth century. Improvements in production as well as falling shipping costs led to a collapse in prices of sugar, followed by coffee, tea, tobacco, rice, and other agricultural products most economically grown in the New World or South and Southeast Asia. Lower prices, in turn, led to dramatic increases in demand

in Europe. Both the quantity and the range of commodities shipped grew. That made possible the regular and predictable marshaling of goods to be sent out. Though such changes may have decreased the urgency of gaining commercial information, the greater frequency of travel and the development of newspapers, often created for people involved in shipping, made access to the latest news easier. The larger populations of Europe, the increasing production of goods, the greater demand for commodities, and especially the rapidly falling shipping costs of the late eighteenth century led to more rapid and dramatic growth in the shipping sector than ever before.

COMMERCE AND WARFARE

Shipping was not merely about the carriage of goods. There were always many interconnected activities that depended on and facilitated shipping. That became most obvious in the eighteenth century with the overall growth in commerce. The trading markets, the bourses for exchange of various goods, were also sites for arranging the financing and insurance of shipping. Shipbuilding and ship repair and related industries like rope and sail making were necessary to shipping. More generally, the growth in the size and wealth of port towns in early modern Europe indicated the long-term success of shipping and the interconnected nature of the shipping enterprise. In itself shipping was not the largest sector of the economy. That was always agriculture. But the contribution of shipping to the economy was sizable and growing throughout the period. Its value was not just in opening new possibilities but also in its rapid development, probably more rapid than any other sector.

By the late eighteenth century, European shipping encompassed interconnected routes around the world. There were regular sailings with something close to predictable travel and movement of what was, compared with earlier years, a mass of a broad range of goods. Governments relied heavily on the income generated by taxes on shipping and commerce. Political and economic advantages fell to states that enjoyed the most successful shipping sectors. Venice and Genoa set the pattern first in the late Middle Ages. Spain and Portugal followed in the sixteenth century and then the Dutch Republic in the seventeenth. The success of France in the

eighteenth century, thanks to government promotion of shipping, and of the Scandinavian kingdoms at end of the century was eclipsed by the even greater success of Great Britain. It was no coincidence that some wars of the eighteenth century were fought by navies over the control of shipping routes. Improvements in the sailing qualities of warships in Europe paralleled those in cargo ships. The introduction of cannons on board beginning late in the thirteenth century led to the building of specialized warships by the sixteenth century. The process of division between fighting ships and cargo carriers was expedited by the falling prices of guns and their increasing reliability in the second half of the sixteenth century. The protection of shipping with warships built for that purpose became a proper function of government. By the end of the eighteenth century, the quality of one's navy could mean the difference between winning and losing a war. The ability of a state to protect its shipping was vital to its ability to wage war, if for no other reason than that government needed the income from shipping to sustain any military effort.

CONCLUSION

Shipping changed probably more than any other sector of the early modern European economy. Technical changes improved the ships. Organizational changes on shore in the assembling, handling, and distribution of cargoes created greater efficiencies. Developments in shipping made significant contributions, most obviously to the economy in increased production, but also in lowering costs of supplies to producers as well as opening new markets for their goods. Improvements in shipping expanded the scope of goods available to consumers and allowed governments to extend their authority. Much of the transformation of the economy and many aspects of politics and to a lesser extent society in Europe can be traced to changes in shipping between 1450 and 1789.

RICHARD W. UNGER

SHOPS AND SHOPKEEPING. In the late seventeenth century, it is estimated that there were about forty thousand shopkeepers in England and Wales, most of them based in towns. Though identified as grocers or drapers, they operated what were, to judge from their inventories, general stores, selling whatever they could. So understood, shopkeeping is a form of retailing: the selling of merchandise in individual units or small lots by a business established for that specific purpose. In the broader sense of a full-time mercantile activity, its history reaches into the past to peddlers hawking their wares and marketplaces drawing sellers and buyers together. In the narrower sense—retailing carried out in a specialized, permanent structure—its history is relatively limited.

Whichever sense—narrow or broad—is preferred, the origins of shopkeeping are unknown. The first shopkeepers to sell from permanent structures, thus competing with marketplaces and fairs, were probably artisans. Producers sold their products from the windows of their workshops in the intervals between market and fair days. Such sales are probably as old as artisanal production itself. Most European cities reveal traces of this activity in their topography. Shops—and, therefore, the trade in certain goods—tended to cluster in particular neighborhoods, leaving traces in the architecture

and names on the streets. Baker Street and Tanners Alley are not uncommon examples.

The first true shopkeepers appear somewhat later, perhaps as early as the eleventh century. They were not producers but rather middlemen of exchange between producers and consumers, who confined their activities to buying and selling. Throughout the Middle Ages, shopkeeping was distinct from other forms of retail. Peddlers walking the streets or vendors setting up stalls in marketplaces carried out the majority of retail selling. According to the 1296 City Law of Augsburg, for example, the sale of goods that “one must weigh with a scale,” apart from the annual markets, was open only to shopkeepers operating out of permanent shops. This law captures a tension that was present and that created conflict in all towns and cities in the Middle Ages as well as the early modern period, the distinction and competition between shops and marketplaces on the one hand and between specialized and nonspecialized shops on the other hand. Being bound to stable structures in fixed locations separated these merchants from itinerant peddlers and other vendors. Market vendors were allowed to erect their stalls only in areas designated as marketplaces. Certain trades, for example, bakers and smiths, congregated in particular neighborhoods, often located on the edge of the city, for safety reasons or because such locations made it easier to get needed supplies. Shopkeepers, in contrast, scattered freely, and opened their doors anywhere and everywhere in the city.

Their shops offered a variety of goods to a variety of customers. Some sold necessities of limited value, catering to the needs of a poorer clientele. It is thought that the well-to-do of medieval cities visited local markets to purchase from foreign merchants, who could supply higher-quality goods in larger quantities over longer periods of time. Some shopkeepers, however, imported wares of various sorts: spices, wax, metalwares, faience, and silks. Their shops tended to be general stores that offered luxury commodities to wealthier patrons. The tremendous variation in quality and quantity of wares led to a no less tremendous variation in income and status among the shopkeepers of any given city. In Augsburg, once again, analysis of tax records from the early seventeenth century indicate that shopkeepers were distributed evenly across the economic

scale, from 13 percent reckoned “have-nothings” to 11 percent reckoned wealthy. A similar range of income distribution has been identified for shopkeepers in seventeenth-century Dutch cities, including Amsterdam, as well as mercers in eighteenth-century Paris. It stands to reason that shops providing luxury goods to elite customers would be more profitable than their common counterparts, trading in daily or popular items. Nor would such distinctions be limited geographically.

Given the wide variation in degrees of prosperity among shopkeepers, it is not surprising to find hierarchies developing among them. Nor were these limited to their wealth or the quality of their wares and patrons. Unlike many craft and trade guilds, shopkeepers were a diverse group. Economic development during the late Middle Ages and early modern period created ever more distinctions based on ever-greater specialization. In general, there was a clear line of demarcation between shopkeepers and grocers, retailers who trafficked in foodstuffs. Shopkeeping tended to resolve itself further into various subspecialties based on types of commodities: those who trafficked in herbs and spices, in cloth and clothing, or in iron and metal. They began to discriminate among themselves according to sale by weight as opposed to measure. Further divisions arose between those who sold new and those who sold used goods. This internal differentiation, which becomes visible in the late fifteenth or early sixteenth century, eventually separated the various specialty shops from one another, ironmongers from apothecaries and so forth. The tendency toward specialization should not distract from the general observation that most early modern shopkeepers, whether rich or poor, sold whatever they could.

Generally speaking, however, whether a shopkeeper was impecunious or prosperous, his wares cheap or expensive, his customers poor or rich, his specialty one thing or nothing, he was not allowed to sell locally produced goods, a ban that preserved the rights of local producers to sell their own products. This prohibition was commonly placed on shopkeepers and indicates the near universal competition between local producers and retailers, a competition that led to frequent conflicts in the late Middle Ages and early modern period. The necessary engagement of some shopkeepers in the import trade, to say nothing of the relative prosperity some

achieved, has led some scholars to postulate the origins of international commerce in domestic shopkeeping. Superior shopkeepers, acting for themselves or as factors for consortia of shopkeepers, visited foreign marketplaces and fairs to buy goods wholesale while other household members minded their shops.

Shops and shopkeeping expanded significantly in the early modern period, a reflection of the general development of the economy toward increased production, distribution, and consumption of goods that has led scholars to speak of a retail revolution or a consumption revolution in early modern Europe as a whole. The increasing number of shops was often the most tangible evidence of economic growth and social change to early modern Europeans. In 1606, the Spanish playwright Lope de Vega's observation that in Madrid "everything has become shops" took note of this development. In London, Daniel Defoe observed that "merciers" (sellers of expensive fabrics) had increased "monstrously" from roughly fifty to as many as four hundred in the second half of the seventeenth century. By 1789, excise commissioners reckoned that Britain possessed over 141,000 retail outlets, of which all but 21,600 were located in London. In 1774, Justus Möser cited the increase in the number of merciers in the German city of Osnabrück by a factor of three, while the number of artisans had decreased by half, as evidence of economic modernization, the transition from an economy marked by local self-sufficiency to one of market connection. Similar increases occurred in Holland and France, more specifically Amsterdam and Paris.

This growth has attracted new attention and appreciation among scholars. The growth of the European population spurred a corresponding growth in the European economy. As the supply of goods and the number of consumers increased, retailers recognized the advantages of fixed points of distribution. These made possible longer business hours, stable customer relations, and improved business communication, among other things. As a result, distribution networks became more extensive and the distribution of goods became more intensive. Abraham Dent of Kirkby Stephen in Westmorland, for example, drew goods from 190 suppliers in 51 locations. By so doing, he and his peers throughout Europe provided access to goods

and services that would otherwise be available only in major cities. As John Brewer noted, "Shopkeepers linked market towns and local communities to a network of markets that stretched beyond the nation's boundaries and across oceans and continents." Shops and shopkeeping contributed directly, therefore, to the growth of the European economy by providing sales outlets for increasingly efficient forms of production and by promoting consumption even at the lowest levels of society. They provided the necessary infrastructure for a consumer revolution that reached all parts of early modern Europe and linked those parts to a wider world.

They provided another crucial service as well. Shopkeepers were an essential source of credit for individual consumers. Indeed, they existed in a unique credit nexus. On the one hand, shopkeepers received credit from wholesalers, whom they paid in installments for purchased inventories. At the same time, they granted credit to customers, who were forced to run a "tab" between paydays. Living on and off credit made shopkeeping a risky business. Should a customer fail to pay on time, or a distributor demand payment in advance, the entire fragile complex could come crashing down. There is some evidence to suggest that many early modern bankruptcies involved shopkeepers caught in such ruptures. Shops and shopkeeping nonetheless played a crucial role in supplying credit to consumers who might otherwise have been unable to make purchases. By so doing, they further increased the speed and extent of the circulation of goods. Yet next to nothing has been written about it. As important as they are now understood to be in the larger history of European economic development, as crucial as they were in promoting demand—that is, in shaping taste—shops and shopkeeping await a history of their own. Too little is known about the wholesale networks that supplied these fixed points of sale. If these shops trafficked only in imported goods, in order to protect local producers, who were the wholesalers and what was their place in local and regional economies? Too little is known about the expansion of shopkeeping itself. The established explanation reads like the triumph of modern consumption and convenience. Could the rise of shopkeeping have another side?

Shopkeeping was a far easier trade to enter than other sectors of the manufacturing economy. Because it required no artisanal skills, no laborious period of training and certification was necessary, and little start-up capital was needed. Any ground-floor space, including a rented room, might serve, and inventories could be obtained with no money down and payment by installments. And, it required a relatively low level of experience to operate, though a great deal of experience to operate successfully, allowing a shopkeeper's family to lend a hand in a wide range of shopkeeping activities. The efforts of women and children, often extended by the presence of servants in the more prosperous houses, kept the shops running in the all-too-frequent absence of the shopkeepers. Shopkeeping provided, therefore, an important by-employment for many households. In Holland, sailors' families often ran shops to provide income while their men were at sea. Likewise, it provided a source of employment for households headed by females. Studies of eighteenth-century Amsterdam reveal that one in seven households were headed by women, some 30 percent of whom were shopkeepers. Taking these conditions into account might explain why the trade of shopkeeping expanded so rapidly. In a growing economy that displaced so many people, retail selling attracted many economically marginal individuals. They could afford it: they needed no particular skills, no particular resources. That same marginality may explain the extraordinary number of failures. They could not afford it for long without good skills and good fortune: the least bad luck or bad management could drive them into default.

The general rise of shopkeeping—whether the result of economic growth or ease of access or both—meant that the number of shopkeepers rose in most cities and towns. Numbers gave them a political potency beyond the relative prosperity of individuals. In many cities, shopkeepers, together with members of other trades that involved more specialized forms of retailing, such as the hatters, cutlers, purse makers, lace makers, and brush makers, formed one of the largest and, therefore, most influential guilds. Paris on the eve of the French Revolution was home to no fewer than four thousand mercers. Nor was their political role necessarily limited to guild representation or population size.

General stores served a social as well as an economic function. People gathered in them not only to buy but also to meet. They took care of their daily needs and exchanged the daily news. Shops provided a place for a wide range of interaction and exchange, including political discussion. It should not be surprising, therefore, if shopkeepers played a prominent role in the rebellions and revolutions that rocked early modern Europe. The sans-culottes, for example, recruited heavily from among Parisian shopkeepers during the French Revolution. Although the political function of coffeehouses and taverns is well known, a corresponding history of shops and shopkeeping has yet to be written.

THOMAS MAX SAFLEY

SICKNESS AND DISEASE. *See* **Medicine; Public Health.**

SIDNEY, PHILIP (1554–1586), English poet, courtier, and statesman. Born at Penshurst (Kent) to Sir Henry Sidney, viceroy of Ireland, and Lady Mary Dudley, sister of Queen Elizabeth's favorite, the earl of Leicester, Sidney was educated at Shrewsbury and Christ Church, Oxford, and then sent on a three-year tour of the Continent in 1572. In Paris he made the acquaintance of Sir Francis Walsingham, the English ambassador (whose daughter Frances he was to marry in 1583), and of Hubert Languet, an older Huguenot political observer who became his friend and mentor. Narrowly escaping the St. Bartholomew's Day Massacre of 24 August 1572, Sidney spent a year at the University of Padua, and then traveled the Continent from Florence to Cracow.

Back in England (1575), he represented his father at court, and in 1577 was chosen to head a congratulatory embassy to the new Emperor Rudolph II, secretly exploring possibilities for a Protestant coalition against the pope's Holy League. That project came to nothing, but Sidney acquitted himself brilliantly.

The next few years saw him cutting a dash at court and writing a masque, *The Lady of May* (1578), with Queen Elizabeth in a deciding role (the masque was written in such a form that at the end the queen was given the role of deciding which suitor the Lady of May should accept). When in 1579 Spanish successes revived the project of the queen's French marriage, the court's alarmed Prot-

estants chose Sidney to write an open letter dissuading her from wedding the duke of Alençon. He also quarreled with the dissolute earl of Oxford, one of the marriage's supporters, was rebuked by the queen on grounds of rank (even though Sidney was in the right, in a quarrel with an earl, a mere gentleman should give way), and withdrew for a year to Wilton, the country manor of his sister Mary, the countess of Pembroke. Here he began his three major literary works, the treatise *A Defence of Poesy*, the prose romance *Arcadia*, and the sonnet sequence *Astrophil and Stella*. ("Astrophel" is the spelling long used, but the consensus among most modern scholars is that the double pun of "Astrophil" is too good not to have been intended. He is the "Astro-phile"—the Star-Lover—and his name is "PHIL-ip.")

The graceful *Defence* (c. 1580, published 1595; also called *The Apologie for Poetrie*) adapts Continental literary concepts to English conditions. Imitating a legal speech for the defense, it claims for "poesy" (imaginative writing) the highest role in moral education, and passionately defends the poet's faculty of "invention" which makes poesy, alone among human arts and sciences, the equal of creating Nature, under the overall authority of God.

Astrophil and Stella (c. 1581, published 1591), based upon but not tied to Sidney's love for Penelope Devereux, Lady Rich, uses the *Defence's* principle of *energia* (liveliness or poesy's power to "move" its readers) dramatically to revive the 250-year-old Petrarchan sonnet sequence. Its rhetoric movingly dissects the way esteem becomes love, love becomes desire, and desire eventually undermines true love. Its vitality created a wave of English sonnet sequences and influenced John Donne (1573–1631) and his followers George Herbert, Henry Vaughan, Richard Crashaw, Thomas Traherne, Thomas Carew, and Andrew Marvell.

The *Arcadia*, begun in 1580 and written initially for his sister Mary, also adapts Continental models, especially Jacopo Sannazaro's "Arcadia" (1504) and Jorge de Montemayor's "Diana" (c. 1559). Its adventures of two princes, Musidorus and Pyrocles, in combat and in love (with the princesses Pamela and Philoclea), are interspersed with eclogues in which shepherds' singing matches become virtuoso poetic experiments. This first ver-

sion, now known as the *Old Arcadia*, only circulated in manuscript, and was then lost until 1908.

Sidney's later revision, now known as the *New Arcadia*, remained unfinished at his death. It was subsequently completed with the ending of the old and issued as a composite (1593): this became the *Arcadia* read until the twentieth century. The *New Arcadia* consistently moves toward greater narrative complexity and less frivolity: it is a more "serious" work, concerned with principles of both public and private (self-) government.

The early 1580s saw Sidney engrossed in preparations for war with Spain and writing more religious works: he versified the first forty-three Psalms (later magnificently completed by his sister Mary), and began a translation of Guillaume de Salluste du Bartas' *La semaine* (1578; The week) on the Creation (since lost), as well as an English version of his French friend Philippe Duplessis-Mornay's work *The Trewnesse of the Christian Religion* (completed by Arthur Golding).

As Spain advanced in the Netherlands, Elizabeth finally sent troops; in return for English military aid, the queen and her government asked for three forts and fortified towns to be garrisoned by English troops and held as sureties for the repayment. In 1585, Sidney was made governor of Flushing, chief of these three cautionary places. With Prince Maurice of Orange, Sidney stormed the town of Axel, and in the autumn of 1586 helped besiege Zutphen, on the Spanish supply corridor that ran from Franche-Comté through Burgundy to the Netherlands. On 22 September 1586, against heavy odds the English attacked a Spanish column that was coming to relieve Zutphen. Sidney was wounded in the thigh, and three weeks later, at the age of thirty-one, he died of gangrene at Arnhem. He became an instant hero and in February 1587 was buried in St. Paul's Cathedral in London, receiving the grandest funeral of any private Englishman until Winston Churchill's in 1965.

Sidney, the statesman, courtier, and convinced Protestant, is most remembered as a poet. He was a profoundly serious man, yet of great charm; a passionate man, yet deeply religious and filled with the morality of politics; a reflective man, yet a skilled and daring soldier when the occasion came. His

friend Duplessis-Mornay's motto *Arte et Marte* ("by art and Mars") applies equally to Sidney.

SIGISMUND II AUGUSTUS (POLAND, LITHUANIA) (1520–1572; ruled 1530–1572), last of the Jagiellon kings of Poland and grand duke of Lithuania (from 1529). Under pressure from his parents, King Sigismund I the Old and Bona Sforza, Sigismund was made grand duke of Lithuania and elected king of Poland (coronation on 20 February 1530) in his father's lifetime, which was contrary to the law then in force. In 1543 he was married to Elizabeth of Habsburg (daughter of the emperor Ferdinand I), who suffered from epilepsy and died childless in 1545. In 1543–1548 he stayed in the Grand Duchy of Lithuania, dealing with the problems of that country and hunting with relish. It was then that he fell in love with Barbara Radziwiłł and married her secretly (1547), which provoked a hostile response in the country. After the death of his father (1548) he returned to Cracow and took up his royal duties. At the Sejm held in 1548–1549 a conflict arose between the king and

some magnates and nobleman over his marriage to Barbara.

Throughout the 1550s the king, supported by the most powerful magnate families, opposed the nobility's call for the enforcement of laws demanding a ban on the holding of multiple public offices by one person (the so-called *incompatibilitas*); the return of royal estates given away or pawned by previous rulers, mainly to magnates (which had impoverished the state treasury and led to the amassing of enormous fortunes); freedom of religion; and the unification of the laws of Poland and the Grand Duchy. The king was also against a stronger union between Poland and the Grand Duchy of Lithuania. It was only in the 1560s that he changed his internal policy; this was partly due to the impending war with Russia, which required joint Polish-Lithuanian military measures and the support of the nobility. From 1562 to 1569 the Sejm, supported by the king, passed several significant resolutions: most importantly, it concluded a Polish-Lithuanian Union (1569); other resolutions provided for the return of royal estates, reformed the financing of the standing army, and curbed the holding of multiple offices of state.

Sigismund also concurred with politicians and humanists who proposed to guarantee religious toleration; this was reflected in the edict banning trials for heresy (1570) and, after the king's death, in the Compact of Warsaw (1573), which guaranteed peace between followers of different religions and granted dissidents equal rights with Catholics. Sigismund was the first European ruler to accept the decisions of the Council of Trent (1564), although the Sejm did not confirm them until 1577. He also deserves credit for a great land reform carried out in the royal estates in the Grand Duchy of Lithuania in 1557–1566.

Sigismund strengthened relations with the Habsburgs by the treaty of Prague (1549) and in 1553 concluded a peace with Turkey. Livonia became an important question for the king's policy; after the secularization of the Order of the Brothers of the Sword, which ruled there, he took Livonia under his rule and protection. In 1563 a war for Livonia broke out with Russia; it was brought to an end by an armistice (1570), but the conflict was not resolved. Sigismund also took part in the rivalry for

the Baltic, and during his reign the nucleus of a royal navy was created, and a Maritime Commission, the first Polish maritime office and law court, was set up (1568). Sigismund committed a grave mistake, however, and one with far-reaching consequences, when he granted the Brandenburg line of the Hohenzollerns the right of succession to the Duchy of Prussia (1563).

Sigismund Augustus was a patron of writers, a music lover, a collector of arrases, and the founder of the first large royal library in Poland. After the early death of Barbara (1551), the king, pressed by advisers who wanted to see an heir to the throne, married Catherine of Austria, daughter of the emperor Ferdinand I; this was an unhappy, childless marriage, ending in separation in 1563. Sigismund's death meant the extinction of the male line of the Jagiellonian dynasty. He was buried in the cathedral on Wawel Hill.

SILESIA. Because of their considerable regional variety, the principalities of Silesia became important locations for power politics, and Silesia played an integral role in the political, economic, and cultural systems within the lands governed by the crown of Bohemia. It is possible to understand many of the integrating and disintegrating trends in European history through the example of Silesia. Its history contains many parallels with the development of Bohemia, but it also has important differences. For a long period the interests of the Piast, Jagiellon, Přemysl (Opava), Luxembourg, Habsburg, and Hohenzollern dynasties in the region

complicated Silesia's relationship with the Bohemian crown.

In the late Middle Ages the seemingly marginal Silesian territory demonstrated its economic and strategic importance and highlighted the extent of the religious and political changes taking place in the northern part of the Czech state. Many Silesians wielded extraordinary political influence in central Europe (for example, Prince Casimir II, duke of Teschen; Victor, duke of Münsterberg; Frederick II, duke of Legnica; George, duke of Brandenburg-Ansbach-Krnov; George John Brandenburg-Krnov; John II, duke of Opole; Charles, duke of Münsterberg). On the other hand, the princes of Silesia were feudal subjects of the Bohemian king, and at times their differences with the crown drew them into the camp of Bohemia's Czech adversaries. In the sixteenth century a clear turn took place in the policy of Silesian princes and estates in their relations with the kingdom of Bohemia and the margravate of Moravia, leading to various kinds of cooperation. By compromising on religious differences (there was a religious allowance between Catholic Silesia and Hussite Bohemia), Bohemia gradually escaped from its post-Hussite provincial isolation in all spheres of life. In the power struggle against Hungarian and Polish interests, Silesia in the end maintained its constitutional place among the lands of the crown of Bohemia.

The turbulent social and political history of the estates of Bohemia involved Silesia as well. The tensions between the Habsburg Catholic minority and the Protestant opposition of the estates found expression in nearly all of the Silesian principalities, and as a result the traditional hierarchical principles of Bohemian and Silesian society and the rules of political engagement were disrupted. When Ferdinand I mounted the throne of Bohemia in 1526, Silesia was undergoing a wave of religious reformation, which, unlike the Hussite movement, was fully accepted by the majority of the population. A major role in this process was played by certain princes (the Krnov Hohenzollerns and the Piasts of Legnica-Brzeg), who through the descendants of George of Podebrady (ruled 1458–1471) aspired to the throne of Bohemia. In 1537 they concluded an important family contract with the Hohenzollern elector of Brandenburg to secure inheritance and cooperation in protecting the Protestant religion.

After 1523 the Breslau town council also introduced Lutheran preachers into the town's churches. Considered politically, these religious changes aligned Silesia with the Bohemian "heretics."

Of the Silesian princes, by the mid-sixteenth century only the bishop of Breslau, resident in Nysa, remained loyal to the Catholic faith, and he mainly concentrated on the struggle with the Polish churchmen in Gniezno to achieve the independence of his diocese. In competition with the Protestant princes, the bishops of Breslau lost their position of power at the turn of the seventeenth century, and it was only after the Thirty Years' War that they regained their preeminence.

After the uprising of the Bohemian estates in 1618–1620 (the Bohemian War that marks the beginning of the Thirty Years' War), and especially after the Danish units were defeated in Silesia, major social changes erupted, even at the periphery of a Bohemia that was now dominated by Habsburg absolutism, centralism, and Catholicism. The new Silesian power elites were recruited from the bureaucracy, the army, and the imperial court (such as Charles, duke of Liechtenstein; John Weikhard, duke of Auersperg; and Albrecht Wallenstein/Waldstein). For more than a century the tone of political life was set by representatives of these newly successful noble families, who patiently built up their wealth and who even more importantly had no ties to the rebellious and centrifugal noble estates of prewar Silesia-Bohemia.

From the late Middle Ages on, the cultural and religious development of Silesia was strongly influenced by German scholars and artists and by those from other neighboring countries, including Martin Luther, John Calvin, Philipp Melancthon, Balthasar Hubmaier, and Jan Hus. A decisive role was also played by the economic and social network of an area which, along with the regional capital of Breslau, was one of the most important parts of the Czech state. A wide range of religious opinions existed side by side, along with a rich variety in the realms of art and literature based on the cultural maturity of the German, Jewish, Polish, and Czech populations. Silesia's literary and artistic production testified to the fact that its society was open to the outside world, enabling it to contribute considerably to the treasury of European civilization.

The margraves and electors of Brandenburg introduced a split in Silesia during the early modern period. The Hohenzollerns of Brandenburg wanted to rule Lower Silesia and the region of Crossen, while the Ansbach line of the same house struggled to form a family enclave in the territory of Upper Silesia, especially in the regions of Opole, Racibórz, Krnov, Bytom, and Bohumín. The creation of Hohenzollern possessions in Silesia and their stabilization alongside the properties of the Opava Přemysl family, the Saxony Wettins, the Silesian Piasts, and the descendants of King George of Poděbrady became a political reality. In the first half of the sixteenth century, it could not have been foreseen that the existence of the Hohenzollern power in the Oder region would become a stepping-stone for Prussian militarist expansion in the eighteenth century under Frederick II and would eventually lead to the division of Silesia after 1740 in the Wars of the Austrian Succession.

SILESIA WARS. See **Austrian Succession, War of the (1740–1748).**

SINAN (Sinan bin Abdulmennan, c. 1489–1588), chief court architect of the Ottoman dynasty from 1538 until his death; his works defined the architectural style of the Ottoman Empire in the sixteenth century. Born to Greek parents in a central

Anatolian village, he converted to Islam and was recruited into the elite Ottoman janissary corps in the 1510s and trained as a carpenter. In his autobiography he noted that the military campaigns he took part in founded his architectural knowledge. In these campaigns he worked on the construction of several military structures, and he learned from the architectural monuments he encountered.

The fifty years that composed Sinan's career as chief court architect correspond to the reigns of three sultans, Suleiman (ruled 1520–1566), Selim II (ruled 1566–1574), and Murad III (ruled 1574–1595), and to the peak of Ottoman political power. As builder of the major architectural monuments of the Ottoman dynasty and ruling elite, he helped to create and spread the imperial court culture that was consolidated throughout the second half of the sixteenth century.

As chief architect, Sinan was designer and overseer of all building activity of the centralized Ottoman court, hence the large number of buildings (between 344 and 422) he claimed to have built. Although Sinan's many imperial, religious, educational, commercial, and civic structures were dispersed throughout the vast empire and made a myth out of his long career, his major works are located in Istanbul, the Ottoman capital, and in Edirne and Damascus, cities of importance to the dynasty.

Ottoman architecture inherited architectural typologies from the medieval Islamic world. It also reflected aspects of the Greco-Roman and Byzantine architectural legacies of western Asia Minor from the previous two centuries: a cellular and additive notion of design, based on domed cubic volumes, shaped buildings of ashlar (a type of hewn stone) and masonry in various scales. Sinan transformed this legacy. His centralized schemes integrated various volumes through a complex interplay of architectural elements. A hemispherical dome supported by half domes, smaller domes, and vaults defined the superstructure; this system of vaulting determined the external massing and the interior space of the building. A masterly use of windows allowed natural light to accentuate all of these features. Externalization of the structural order and exploration of the plastic possibilities of stone marked important Sinan buildings.

The three buildings that Sinan singled out as his masterworks also marked important stages in his career; these buildings exhibit Sinan's relationship with a series of architectural traditions and concepts of design. The Şehzade Mosque (1548–1549), built for the crown prince Mehmed, son of Suleiman the Magnificent, features a perfectly centralized scheme of a square prayer hall covered by a hemispherical dome rising on four half domes in a quatrefoil design reminiscent of Leonardo da Vinci's drawings for centralized churches. The mosque of Suleiman the Magnificent (1557), centerpiece of the largest socioreligious compound in Istanbul, is an Ottoman interpretation of the Hagia Sophia. The Selimiye Mosque in Edirne (1574–1575), with its immense dome held by an octagonal support system, sums up a career of explorations with domed spaces wherein attached or freestanding piers disengage a domed canopy from surrounding walls, turning the latter into luminous membranes pierced by numerous windows.

While monumental mosques were the primary symbols of Ottoman power, and therefore constitute Sinan's primary works, a series of lesser structures embody other aspects of his architectural style. Dynastic mausoleums exhibit novel interpretations of polygonal, double-shelled commemorative structures from the early Islamic era and medieval Iran; a hospital and a college, built for Suleiman's wife Haseki Hurrem and the grand vizier Rustem Pasha, interpret a fifteenth-century scheme with an octagonal courtyard. A number of aqueducts reflect Sinan's engineering skills and mastery in sculptural articulation. The Çoban Mustafa Pasha Bridge in Svilengrad (1529) and the Drina Bridge in Visegrad (1578) are among his important engineering works in the Balkans.

Sinan's contribution to the urban environment was his method of relating buildings to their immediate urban context as well as to the larger cityscape. His building complexes were laid out in multiaxial arrangements that offered multiple views of urban space, creating varying spatial experiences and dramatic encounters with buildings. These buildings also contributed to the creation of Istanbul's imperial image, as the city's famed silhouette was consolidated through these constructions.

Sinan was called the "Euclid of the times" by his contemporaries. Modern commentators have noted the rational architectural sensibility and predilection for centralized schemes he shared with architects of the Italian Renaissance.

ÇİĞDEM KAFESCIOĞLU

SIXTUS V (POPE) (b. 1520, reigned 1585–1590), Felice Peretti, born 13 December at Grottammare, near Montalto, March of Ancona. A farmer's son, educated by the Conventual Franciscans at Montalto, he joined the order at age twelve and received training at Fermo, Ferrara, Bologna, Rimini, and Siena before his ordination in 1547; he received a doctorate in theology from Fermo in 1548. Peretti's Lenten preaching at Rome in 1552 brought him notoriety, and he entered papal service as a member of Paul IV's (pope 1555–1559) reform commissions. During his service as inquisitor for Venice (1557–1559), he so vigorously enforced the Index of Prohibited Books of Paul IV that he was forced to flee the city. Appointed consultor of the Roman Inquisition in 1560, made vicar-general of the Franciscans and bishop of Sant'Agata dei Goti in Benevento in 1566, he was elevated to cardinal by Pius V (pope 1566–1572) in 1570 and transferred to become bishop of Fermo (1571–1577). Because of disagreements with Gregory XIII (reigned 1572–1585), Peretti (now known as Cardinal Montalto) withdrew to the Esquiline Hill, where he worked in obscurity on an edition of St. Ambrose's writings.

Supported by a strong minority of reform-minded cardinals, he was elected pope on 24 April 1585.

Sixtus's five-year pontificate was significant internationally for his support of Catholic monarchs against Protestantism and for rallying (unsuccessfully) Christian princes against the Turks to recapture the Holy Land. He promised Philip II of Spain (ruled 1556–1598) monetary aid for his invasion of England, but after the Armada's ruin in 1588, he reneged and battled him, diplomatically at least, until the end of his life. Sixtus refused to recognize the right to the throne of French king Henry of Navarre (Henry IV, ruled 1589–1610), whom he excommunicated in 1585, as long as the king remained a Huguenot; Sixtus later encouraged Henry to return to Catholicism to resolve the religious wars in France. In Poland, he assisted Stephen Báthory (ruled 1575–1586) against Russia, and Sigismund III Vasa (ruled 1587–1632) of Sweden as Báthory's successor. His relations with the Holy Roman emperor Rudolf II (ruled 1576–1612) deteriorated, though he succeeded in putting in place a plan for the restoration of Catholicism in the empire.

Sixtus ruled the Papal States with severity, extirpating bandits, executing them publicly and punishing their protectors; but his severity also roused the anger of many fellow Franciscans, clergy, Romans, and others. He established public funds (*monti*) for carrying out public works; he drained swamps, promoted the wool and silk industries and agriculture, increased taxation, and reduced expenses. At his death he left over five million *scudi* in the papal treasury.

Sixtus is perhaps best remembered for his reorganization of the administration of the *Curia Romana* into fifteen congregations (nine for the spiritual affairs of the church, the others for the administration of Rome and the Papal States). He fixed the number of cardinals at seventy. The result made clear that the Sacred College's function was to offer advice and help, not to corule with the pope. Sixtus mandated that bishops visit Rome and submit regular reports on their dioceses. At Rome, his massive public works included road construction linking the seven pilgrimage churches, setting them off with obelisks crowned with crosses, the most prominent being that erected in Saint Peter's

Square by Domenico Fontana (1586). He continued work on Saint Peter's Basilica, refurbished the Lateran Basilica and the Quirinal Palace, built the new wing for the Vatican Library, rejuvenated the University of Rome (Sapienza), repaired the aqueduct of Alexander Severus to bring fresh waters (*aqua felice*) to the Esquiline, and saw the completion of Michelangelo's dome for Saint Peter's. Sixtus died on 27 August 1590. His remains lie in the Basilica of Santa Maria Maggiore, where they were translated on 26 August 1591.

FREDERICK J. MCGINNESS

SKEPTICISM: ACADEMIC AND PYRRHONIAN.

Skepticism dogged claimants to knowledge and truth throughout early modern Europe. In its most general sense it refers to uncertainty, doubt, disbelief, suspension of judgment, and rejection of claims to knowledge. It is characterized by its opposition to dogmatism, which means the holding of firm beliefs (from Greek *dogmata*) about truth and reality. As a philosophical stance it is best understood as the outcome of two traditions in ancient Greek philosophy. Academic skepticism was attributed to Socrates and to Plato's successors at the Academy in Athens (fifth to second centuries B.C.E.), and Pyrrhonism was traced back to Pyrrho of Elis (c. 365–275 B.C.E.).

ACADEMIC SKEPTICISM

Roman statesman and philosopher Marcus Tullius Cicero (106–43 B.C.E.) is our chief source for Academic skepticism. In his *Academica* (45 B.C.E.) he reported on the teachings of Arcesilaus (315–240 B.C.E.) and Carneades (214–129 B.C.E.), who were heads of the Academy, and he claimed allegiance to the Academic school. St. Augustine's earliest extant work was entitled *Contra Academicos* (386 C.E.;

Against the academics), and this polemic was an important source of knowledge about Academic skepticism.

Placing Socrates at the origins of skepticism turns on the argument that he only asked questions and did not teach positive doctrines. Plato and Aristotle strayed from the path when they claimed to know the truth. Arcesilaus gave renewed vigor to skepticism, arguing against the opinions of all men, as Cicero put it. But he also showed that skeptics could make choices by relying on the *eulogon* (the reasonable) in the absence of truth. Carneades, who was also a master of arguing on both sides of every issue, refined this into the standard of the *pithanon* (the credible). In Cicero's translation into Latin, this became *probabile*, which set the stage for the skeptics' claim to live by the probable in the absence of truth.

Cicero's *Academica* was read by some thinkers in the Middle Ages but does not seem to have had a major impact. It was first printed at Rome in 1471, and numerous commentaries and annotations followed. More than one hundred editions had been published by 1600.

One of the first to take Academic skepticism seriously was Dutch Humanist Desiderius Erasmus (1466?–1536), who expressed admiration for the Academics in his *Praise of Folly* (1511), provoking opposition from Christian scholars like Philipp Melancthon (1487–1560). Gianfrancesco Pico della Mirandola's *Examen Vanitatis* (1520) drew on both Cicero and Sextus Empiricus. Omer Talon emphasized the philosophical freedom from dogmatism of the Academics in his *Academia* of 1547, and Petrus Ramus praised their style and rhetoric in *Ciceronianus* of 1557. Both of these were attacked by Pierre Galland and Guy de Brués. Giulio Castellani defended Aristotelianism against Academic skepticism in *Adversus . . . Ciceronis* (1558), partly by showing empirically that disagreement was not as widespread as the skeptics claimed it was. Johannes Rosa published the most substantial early commentary on the *Academica* in German-speaking Europe in 1571, and Pedro de Valencia reconstructed Academic skepticism in his own *Academica* of 1596, showing that these ideas were available in Spain.

The publication of the works of Sextus Empiricus in the 1560s replaced Cicero's writings as the

chief source of knowledge about ancient skepticism. In the following centuries most authors drew their inspiration from both sources to the extent that it is hard to speak of purely Academic skeptics after that point. One exception is David Hume (1711–1776), who has sometimes been called an Academic skeptic because—among other reasons—one of the characters in his *Dialogues concerning Natural Religion* (1779) takes the role of an Academic. There has also been scholarly debate about whether other individual early modern figures were Academic skeptics or Pyrrhonians, but in this period the two traditions were often run together, and few, if any, authors made a clear distinction between them.

PYRRHONISM

Our chief source for ancient Pyrrhonism is the work of the Alexandrian Greek physician Sextus Empiricus (second century C.E.), including *Outlines of Pyrrhonism* and *Against the Mathematicians*. A few manuscripts of Latin translations of Sextus Empiricus existed in medieval collections, and more came from Byzantium in the mid-fifteenth century. Florentine religious reformer Girolamo Savonarola (1452–1498) used Sextus to combat pagan philosophy. But the printing press made for the most influential dissemination of these texts. Latin translations by Henri Estienne (Stephanus) (1562) and Gentian Hervet (1569) provided the stimulus for a widespread “skeptical crisis.”

As Sextus explained it, skepticism was not a philosophy but rather a way of life in which one opposed all philosophical claims with equal opposite claims (equipollence). He laid out standard tropes or formula arguments which could be used against any certainty or truth and which he attributed to Greek philosophers Aenesidemus (first century B.C.E.[?]) and Agrippa (first century B.C.E.[?]). The result was that one would suspend judgment and then find oneself in *ataraxia* or tranquillity, no longer disturbed by philosophical disputes. One would live in accordance with the phenomena or appearances without taking a stand on the truth or reality behind them, and one would follow one's natural impulses as well as local customs and laws.

Michel de Montaigne (1533–1592) was the most influential of the early writers to draw on the writings of Sextus, in his *Essais* (1580–1595). In a long chapter entitled “Defense of Raymond

Sebond,” Montaigne retailed most of the skeptical tropes and all of the skeptical vocabulary from Sextus Empiricus. Here and in other essays he demolished any pretensions to human knowledge and argued both sides of almost every issue. And yet he never despaired; rather, he showed people how to live a happy life in the face of skepticism, which may explain why his writings were so popular.

Later philosophers often started from Montaigne. One who went far beyond in posing questions of skepticism was René Descartes (1596–1650). Without specific sources in the ancient materials, he set out to answer the skeptical idea that there could be an all-powerful *malin genie* or evil demon that controls our perceptions and reasoning and fools us about the world. His conclusion was that we know we exist because we can think—the famous “I think therefore I am.” Pressed for an explanation as to why our perceptions of thinking could not be a deception, Descartes asserted that God would not allow such deception. Thus, religion is invoked to certify truth. Later skeptics would worry about a deceiving God.

Bishop Pierre Daniel Huet (1630–1721) and Huguenot refugee Pierre Bayle (1647–1706) have been described as the “master skeptics.” Huet invoked Sextus Empiricus in great detail against Descartes and many other dogmatic philosophers in his *Traité de la faiblesse de l'esprit humaine* (1723; Tract on the weakness of the human mind). Bayle’s massive works attacked all previous philosophy and historical scholarship.

David Hume expressed the skeptical challenge in ways that made him central to philosophical discussion up to and including our own day. His *Treatise of Human Nature* (1739–1740) argued for skepticism about both facts and reason. His critique of our ideas of causation reduces them to little more than a habit based on constant conjunction. And yet in typical skeptical fashion he showed how people could live with skepticism on the basis of probabilities and custom.

Immanuel Kant (1724–1804) was called the “all-destroyer” in his own day because of his rejection of so many other dogmatic philosophies. He adopted skeptical Greek vocabulary when he argued that we could have no knowledge of the noumena—the reality behind appearances—but

only of the phenomena. He saved free will and morality from scientific determinism only by reducing our knowledge of them to faith rather than knowledge. Other skeptics writing in German in his time included Salomon Maimon (1753–1800) and Gottlob Ernst “Aenesidemus” Schulze (1761–1833). When Carl Friedrich Stäudlin’s *Geist und Geschichte des Skepticismus* (History and spirit of skepticism) of 1794 showed Hume facing Kant on the title page, it became clear these two thinkers had posed the skeptical challenge for the age: Stäudlin decried an unphilosophical skepticism even as he showed that the philosophical skeptics could not be refuted.

SKEPTICISM IN SCIENCE AND MEDICINE

Francis Bacon (1561–1626), who was chancellor of England from 1618 to 1621, served as a spokesman for early natural philosophy, convinced that the experimental method would produce absolute certainty. Skeptics like François de La Mothe le Vayer (1585–1672) used many of the skeptical tropes to show that science could not produce certain knowledge. Other natural philosophers such as Marin Mersenne (1588–1648) and Pierre Gassendi (1592–1655) in France dispensed with the need for absolute certainty and defended experimental science on the ground that it could produce useful knowledge, in accordance with the phenomena, even without certainty. This attitude prevailed at the Royal Society in London as well. Skepticism could be used to sweep away the pretensions of Aristotelians and other dogmatists while leaving experimental scientists free to continue their work. In this spirit Robert Boyle (1627–1691) named his spokesman “Carneades” in *The Sceptical Chymist* (1661), and Joseph Glanvill (1636–1680) titled one of his books *Scepsis Scientifica* (1665).

Of all the fields that we now consider sciences, medicine was especially intertwined with skepticism. Sextus Empiricus was a practicing physician whose work influenced his philosophy, and each of the ancient schools of medicine had taken positions for or against philosophical dogmatism or skepticism. Ancient Hippocratic sources stressed the importance of skeptical observation and experience and the dangers of dogmatic theory in medicine. In early modern Europe the writings of Hippocrates (c. 460–c. 377 B.C.E.) and Galen (c. 129–c. 200

C.E.) were an important part of medical studies, and they introduced the student both to dogmatic medicine and to the skeptical critique.

Several prominent early modern physicians contributed to the literature on skepticism and medicine. Toulouse professor Francisco Sanches (c. 1550–c. 1623) called himself “Carneades philosophus” and attacked Aristotelian science in his book *Quod Nihil Scitur* (1581; That nothing is known). The English physician and philosopher John Locke (1632–1704) may have picked up some of the skeptical elements in his philosophy from skeptical physician Thomas Sydenham (1624–1689). Martín Martínez (1684–1734), royal physician and president of the Royal Academy in Seville, was the author of *Medicina Sceptica* (1722–1724), which attacked dogmatic Galenism, and *Philosophia Sceptica* (1730), which introduced Gassendi and Descartes to Spain. Ernst Platner (1744–1818) was a German physician whose skeptical writings were influential in Kant’s time.

SKEPTICISM, HISTORIOGRAPHY, AND POLITICAL THOUGHT

Especially in the seventeenth century, skepticism made its way into historiography as writers began to question the received accounts of history. La Mothe le Vayer’s *On the Small Amount of Certainty in History* (1668) and Pierre Bayle’s *Historical and Critical Dictionary* (1697–1702) brought numerous historical errors to public attention. The only lasting solution was to learn to live with the appearances and accept lower standards for practical purposes instead of absolute certainty, as in natural science.

Throughout the early modern era skepticism was used to justify a wide variety of political stances, from quietist conservatism to radical activism.

SKEPTICISM AND RELIGION

The historical scholarship of Isaac la Peyrère (1596–1676), Baruch Spinoza (1632–1677), and Richard Simon (1638–1712) contributed to skepticism about the Bible. In response, throughout the early modern period it was common to accuse skeptics of atheism, libertinism, and immorality. But skeptics were not necessarily atheists. In fact, one of the most common uses of skepticism was its use by the self-described orthodox against pagan claims to

truth, by the Lutherans and Calvinists against Catholic claims to infallibility, and by Catholics against Protestant claims to truth. Many religionists believed that their own truth was immune from skepticism, but one argument was that if all claims to truth can be demolished, one should accept traditional religion on faith. This position is known as fideism.

Various versions of fideism were widespread. Thinkers from Montaigne to Huet and Bayle to many figures in the eighteenth century wrote that skepticism cleared the way to faith by removing rationalist objections. Blaise Pascal (1623–1662) in France in the seventeenth century and Jean de Castillon (1709–1791) in Berlin in the eighteenth century Christianized skepticism by showing that, properly understood, it set the scene for Christianity. In the *Critique of Pure Reason* Kant famously wrote that he had had to deny knowledge in order to make room for faith (Preface to Second Edition [1787], B, xxx). Whether each such figure was sincere or was using fideism as a defense against possible persecution for heresy has been the subject of debate ever since.

JOHN CHRISTIAN LAURSEN

SLAVERY AND THE SLAVE TRADE.

Slavery has existed throughout history. Most societies have made provisions for it within their struc-

ture, and most peoples have been sources of slaves at one time or another. The expansion of slavery was often a by-product of empire building as a dominant power turned its prisoners of war into slaves through conquest. However, from empire to empire there was considerable variation in slaves' legal status and prospects for incorporation into the polity; likewise, within a given society or state, there could be a wide range of status, labor, and opportunities among different slaves.

Indeed, a precise definition of slavery that will fit all societies is difficult to present. Most forms of slavery share the following characteristics: (1) slaves are obliged to live their lives in perpetual service to their master, an obligation that only the master (or the state) can dissolve; (2) slaves are under the complete power of their masters, although the state or community may impose certain restrictions upon the master's treatment of the slave; (3) slaves are property, which may be sold or passed along as an inheritance at the master's discretion; and (4) the condition of slavery is transmitted from parent to child.

Historians often distinguish between "slave societies" and "societies with slaves," based upon the centrality of slavery to the economy. Ancient Rome and the plantation colonies of Brazil, the Caribbean, and the American South were "slave societies"; during the early modern period, most European countries and many Latin and North American colonies were merely "societies with slaves."

The question of who can legitimately be enslaved in any society often boils down to a definition of who constitutes an "insider" and who is fundamentally excluded from a society. Over the course of the early modern period, these lines shifted from religious to somatic categories, thus creating the relatively new category of "race." Thus, fifteenth-century Christians justified the enslavement of non-Christians on fundamentally religious grounds. In some contrast to the Russian and Ottoman empires, by the seventeenth century all western European powers defined Africans as peculiarly destined to enslavement, an opinion that was often justified by the biblical account of the curse upon Noah's sons. As Enlightenment secularism and materialism became influential in the eighteenth and nineteenth centuries, a new, biologically justified discourse of

racism was buttressed by the pronouncements of science. Some theorists, including those in nations with no direct ties to the slave trade, embraced these attitudes. For example, the German Enlightenment thinker Immanuel Kant cited with approval David Hume's characterization of blacks as highly superstitious, overly talkative, lacking intelligence, and ungifted in the arts. Various forms of racism—scientific, institutional, and cultural—outlived the institution of slavery and persist in Europe today.

ROOTS OF EARLY MODERN SLAVERY

While slavery was a significant feature of ancient Greek and Middle Eastern societies, the direct roots of Europe's early modern traffic in slaves can be traced to ancient Rome and to early Islam. At the height of its power (c. 200 B.C.E.–200 C.E.), the Roman republic depended upon perhaps 2 million slaves (or about a third of its population) to perform every kind of labor, from agricultural production and domestic service to military command and political advising. Many of these slaves were taken from the communities and cultures at the empire's periphery and pressed into service where, through trade networks, they relocated throughout the lands under Roman imperial control.

With the collapse of the Roman Empire in the late fourth century, slavery became much more marginal in most European regions. While some families continued to maintain small numbers of slaves, often as domestic servants, widespread agricultural slavery generally gave way to serfdom, especially in northern and western Europe (including England, Scandinavia, and France). The chief difference between serfs and slaves was that serfs were bound to the land—they could not be traded away from the manorial estate to which they were born. Slaves, by contrast, were chattel property that could be bought and sold; their legal existence was mediated through their masters. By 1086, when William the Conqueror ordered the survey of the lands of England commonly known as the Domesday ("Doomsday") Book, only about 10 percent of the English population was counted as slaves, and the proportion continued to decline after that. Regions with stronger ties to the Byzantine Empire (for example, Russia) and Muslim northern Africa (for example, Sicily) had greater access to slave markets, and slav-

ery continued as a minor but persistent feature of southern and eastern European medieval societies.

Islam, being religiously and linguistically distinct from Christian Europe, expanded a preexisting slave system in the seventh and eighth centuries during its major conquests from Europe's Iberian Peninsula (Spain and Portugal) to the frontier of China. The Islamic empire, like Rome, allowed for the integration of conquered people into its own population through various assimilation mechanisms, including slavery. The Arabic language—the dominant language of the original Muslims—provided bureaucratic and cultural unity to elites while many vernacular languages and customs persisted. Yet the religion of Islam gave legal, cultural, and linguistic unity—at least at the elite administrative level—to a diverse and cosmopolitan empire.

Slavery under Islamic regimes, however, differed from Roman slavery in certain ways. First, it was not a central feature in agricultural production, as slavery had been to the Italian peninsula; most slaves held by Muslims were employed in domestic service. Second, the great majority of slaves in early Islamic states were women and children—male prisoners of war who resisted were more likely killed than enslaved. However, male slaves came to be used by the thousands as soldiers and administrators in later empires, like those of the Mamluks of Egypt and of the Ottomans.

Another important feature of Islamic slavery, from the perspective of early modern Europe, is the development of trans-Saharan slave routes and an emerging discourse associating blackness with slavery. While Muslims enslaved an extremely diverse range of peoples, from the blond and blue-eyed Caucasians to the ebony-skinned Zanj of East Africa, a literary trope emerged around 675–725 under the Umayyad dynasty, connoting inferiority to those with dark skin. The Muslim world also supplied the Iberian Peninsula with slaves, so that by completion of the Reconquista in the fifteenth century, there was a stable community of several thousand blacks of sub-Saharan African descent in the major cities of Portugal and Castile.

Constantius II (ruled 337–361), the Christian emperor of Rome, had decreed in 339 that Jews were not permitted to hold Christians as slaves. During the Middle Ages a new policy barring the

enslavement of fellow Christians—possibly in imitation of similar Muslim prohibitions against the enslavement of coreligionists—served to win pagan converts to the expanding Christian feudal order. Most of the western European languages' words for slave are etymologically related; “slave” (English), *Sklave* (German), *esclave* (French), *esclavo* (Spanish), *schiaivo* (Italian), and even the Arabic *sagaliba* are all based upon the ethnic term “Slav” and refer to the southern Balkan peoples who were one of the chief sources of slaves during the ancient and medieval periods.

EUROPEANS AS SLAVES

Europeans were not only slaveholders in the early modern period; they were also slaves. From at least the sixteenth century, thousands of Europeans were captured by Muslim privateers in or along the coasts of the Mediterranean Sea, Atlantic Ocean, or North Sea and sold into slave markets from Alexandria, Egypt to Meknes, Morocco. Seamen, fishermen, traders, travelers, and soldiers were the most vulnerable to seaborne raiders. On land, with the expansion of the Ottoman Empire into Europe, peasant families were just as subject to enslavement as were combatant soldiers. Some Christian captives converted to Islam and made new lives for themselves, others were ransomed by their relatives, escaped, or died in captivity. Some were pressed into service as galley slaves on Muslim ships. Many observers noted that their treatment there was better than on the French, Italian, or Spanish galleys. In general, slavery in the Ottoman Empire was reportedly

milder than slavery elsewhere, and manumission (the individual freeing of slaves) was a common, even expected, form of charity for observant Muslims.

In the second half of the seventeenth century, Jean-Baptiste Colbert, the chief minister to France's king Louis XIV (ruled 1643–1715), expanded a system of galley slaves as punishment for many different kinds of crimes. More than 1,500 Protestant dissenters were condemned to the French galleys. During the same period, the Habsburg emperor Leopold I (ruled 1658–1705), in conjunction with Louis XIV, suspended the religious freedom guaranteed by the Hungarian constitution and sent some sixty Protestant ministers to be sold to the Spanish galleys; twenty-six surviving prisoners were released in 1676. The French galley penal system continued until 1748.

In the same period, from the end of the seventeenth century until the end of the eighteenth, the seizure of war captives for ransom or labor became a fixture of warfare between the Russian and Ottoman empires. However, in contrast to the Ottomans, whose slaves were overwhelmingly non-Muslim outsiders, Russia drew most of its slaves from its own domestic population, many of whom sold themselves to escape famine or destitution.

Slavery persisted in Russia until the early eighteenth century, when the tsarist state redefined domestic slaves as serfs so that they might be taxable. The line between serf and slave, however, was often blurred in practice. Slavery in Ottoman Europe continued in reduced form through the nineteenth century until its formal abolition at the end of the century.

EUROPE AND THE TRANSATLANTIC SLAVE TRADE

The roots of Europe's slave colonies in America can be found in Portugal's fifteenth-century exploration of the western coast of Africa. Upon conquering the Muslim fortress of Ceuta in North Africa in 1415, Portuguese rulers turned their attention to the trade goods being delivered across the Sahara desert. By skirting the coast, royally sponsored explorers hoped to trace the supplies of gold and other precious goods to their source, thus bypassing the costs of the middlemen traders. By the mid-1450s, the Portuguese had begun to purchase slaves along the

West African coast, establishing contracts with Wolof, Mandinga, and Bati rulers to exchange gold, cotton, ivory, and slaves for horses, red cloth, and iron. In the 1480s, the Portuguese established the entrepôts of São Tomé and Elmina to serve the regular trade routes from Congo and Benin. At the same time, following the medieval model of sugar production in North Africa and several Mediterranean islands, the Portuguese established plantations on the Atlantic islands of Madeira, the Cape Verde islands, and the Canaries, and they increasingly worked them with slaves imported from Africa.

Though some African slaves arrived in America along with Spanish conquistadors as early as 1502, most early colonial labor needs in the New World were initially met by Amerindians. The Spanish rulers replicated the feudal tribute system of *encomienda* in their New World colonies, compelling Amerindians to produce staples such as corn, beans, and cotton, as well as luxury products, including gold and silver. Due to this exploitation, susceptibility to Old World diseases, and perhaps, in some regions, an environmental crisis of soil depletion, native populations died at appalling rates: in the highly populated Mexican basin, 90 percent of the population died within a century of conquest. A confluence of this labor shortage with ready supplies of African slaves from the entrepôts in the western and central African regions of Senegal, Elmina (along the Gold Coast), Angola, and Congo facilitated Spanish colonies' experimentation with the importation of African slaves to the Caribbean, Mexico, and Peru. By 1580, some 74,000 Africans had been shipped from Africa for the Americas, while some 232,000 Spanish and Portuguese left for the Americas during the same period.

From 1580 until 1700, the relative proportion of emigration from Africa and Europe reversed. Approximately 1,531,000 Africans left Africa for the Americas (though an average of 20 percent perished during the grueling Middle Passage), while during the same time only about 944,000 Europeans ventured out for the New World, primarily to Spanish and British colonies. Key in this transformation was the introduction of sugar cultivation, first in Portuguese Brazil, then in the Caribbean. Unlike tobacco, another exotic product grown in America for export to Europe, sugar required a large labor force to process the ripe sugarcane on site before it rotted.

Colonial planters sought economy of scale by consolidating large plantations, with gangs of 20 to 200 slaves staying up through the night to feed the proto-industrial sugar mills and tend the refining vats.

Also in the seventeenth century, the Dutch took over much of the Portuguese empire, conquering trading posts in Africa and Brazil and confiscating the lucrative transatlantic slave trade. Meanwhile, English and French colonists began to encroach on the Iberian colonial monopoly in North America, the Antilles, and coastal Guyana. At first, the favored commodity in Virginia and the Caribbean was tobacco, grown primarily with indentured servants from Europe, but gradually this was overtaken in the tropics by sugar and indigo, and it was supplemented by coffee and cotton. These crops accelerated the colonial demand for slave labor so that from 1700 to 1760, some 2,775,000 Africans were shipped for the New World, while only 891,000 Europeans departed for the same destination.

In this way, a “triangle of trade” emerged, linking the continents of Europe, Africa, and the Americas. Slave traders from Portugal, the Netherlands, England, and France brought raw and manufactured materials (such as iron, glass, guns, cloth, and horses) to African traders. African rulers profited from this trade, waging war on neighbors or requiring tribute in the form of slaves, which they, in turn, bartered to Europeans for the exotic luxury items they supplied. European traders packed slaves into sailing ships for the notorious Middle Passage, which averaged two to three months in the sixteenth century but could be completed in as little as 20 to 40 days by the nineteenth century. Survivors of the transatlantic voyage were sold to slaveholders for sugar, gold, tobacco, and rum, which in turn were sold in Europe.

The royally sponsored Portuguese trade was eclipsed in the seventeenth century by the Dutch, English, and French trading companies, each with exclusive national privileges, or charters, to trade between specific regions. Yet many colonists chafed against these mercantilist restrictions, and smuggling was widespread, especially outside the central commercial hubs. By the mid-eighteenth century, the English and French dominated the Atlantic slave trade.

SLAVERY AND THE ECONOMY OF EUROPE

The effect of Atlantic slavery on Europe’s economies has been a matter of considerable debate since the 1944 publication of Eric Williams’s *Capitalism and Slavery*. As part of his argument about the rise and fall of Atlantic slavery, Williams asserted that the Atlantic slave system created the export demand, the trading network, and one of the main streams of capital that fueled England’s industrial revolution. Williams’s claims have been challenged, however, by a generation of historians, such as Roger Anstey and Seymour Drescher, who have argued that profits from the slave trade were never sufficient to be a significant source of capital for the industrial revolution, and that the slave colonies, rather than generating substantial profits, were actually a net loss for the metropole.

Still, the complex economic relationships established within and between Europe, Africa, and the Americas during the early modern period make it difficult to isolate Europe’s economic developments from the American slave complex. Some historians continue to argue that African slaves were responsible for about 75 percent of the American products that fed the seventeenth- and eighteenth-century commercial revolution, which in turn contributed to Britain’s urbanization, creation of markets, export manufacture, and shift to industrial production after 1750. Others suggest that the concentration of capital, technological innovation, and organization of labor for efficiency in the colonial sugar plantations were models for the industrialization of the European textile industries.

SLAVERY AND THE LAW

Slave law, as with law more generally, encompasses positive law (statutes), jurisprudence (legal philosophy), and case law. While knowledge of the statutes is necessary to know the prescriptive status of slaves in any given jurisdiction, a better understanding of their actual condition in any community can be found through an examination of the judicial cases concerning slaves, as well as those concerning former slaves or “freedmen.”

Roman slave law, codified in Justinian’s sixth-century *Corpus juris civilis*, influenced most continental European legal systems, although as slavery became economically important to American colonies the law was modified to reflect local interests.

Several characteristics of Roman law were fundamental to later jurists, including manumission practices, civil status, and criminal law. For some purposes, the law treated slaves as though they were human beings, for others, as things.

Roman law facilitated manumission, or individual freeing of slaves, and slaves' entry into the populace as citizens. Although manumitted slaves did not enjoy all the rights of freeborn Roman citizens, their freeborn children did. Slaves, like freeborn sons or daughters of Roman citizens, could not own property in their own right until the death of the master/patriarch. However, Roman law allowed for the creation of a savings fund, or *peculium*, which—though technically the property of the master—was administered by the slave within the constraints dictated by the master. Thus slaves were permitted to purchase their freedom through accumulated savings, with the permission of, and at the price set by, the master.

The emperor Justinian introduced a range of procedures that, if enforced, would moderate the slave system from the point of view of the slave. For example, Justinian's code held that a master could not kill his slave with impunity and, in cases of extreme abuse, a slave could seek the protection of the emperor or the church. And while the late Roman republic (c. 50 B.C.E.) had recognized only three avenues to freedom—manumission by enrollment on the census, manumission by testament, and proceedings whereby liberty was restored to a free person who had been wrongfully held as a slave—under Justinian, additional means of manumission were recognized, including a letter signed by five witnesses, manumission in the Christian church, and official recognition by a master that a slave was his son.

Yet under Roman law, slaves could not be parties to civil lawsuits, nor accusers in criminal cases, nor under Roman law could they marry. Their testimony could, under certain conditions, be accepted, but not against their masters. In those instances where their testimony was authorized, they were required to undergo torture. At the same time, it was perfectly legitimate to try slaves as defendants in criminal cases. Escaped slaves were not punished by the state, but, if caught, were subject to the master's discipline.

Most of the judicial courts of western Europe absorbed Roman law as part of their legal culture, yet innovated according to their own customs and conditions through the medieval and early modern eras. For Castilian Spain, *Las siete partidas*, a compilation consolidated under Alfonso X (ruled 1252–1284) around 1265 (and promulgated in 1348) integrated Roman features with Visigothic codes and medieval practices. The new Spanish law recognized slave marriages, even over a master's opposition, and masters would be penalized for fostering a clandestine marriage between their own slave and that of another. Portugal's *Ordenações Filipinas*, promulgated by Philip II (ruled 1556–1598) and confirmed by the Portuguese king John IV (ruled 1640–1656) in 1643, established general slave laws for Portuguese territories past Brazilian independence in 1822, but these were supplemented explicitly by the *Corpus juris civilis* until 1769, when Roman precedents were discarded for natural law principles of the Enlightenment. In many regards, including manumission, Portugal's laws were therefore identical with Rome's. While France's *Code noir* of 1685 strongly reflected Louis XIV's desire to make Catholicism the sole religion of the kingdom (an innovation over Roman traditions), many of the French law's provisions mirrored the ancient Justinian code.

Despite these continuities with Roman law, the new Atlantic slave experience generated new legal customs and, eventually, statutes. In French Caribbean colonies, the *Code noir* contained a provision, apparently following local custom but no doubt sanctioned by the church, to the effect that any master who sired a child with his slave concubine would bear a hefty fine and the slaves would be confiscated for the state, unless the master married the slave in question, whereupon both mother and child would be thereby recognized as free. When the *Code noir* was reissued for the new colony of Louisiana in 1724, however, this provision was omitted and a new one explicitly forbade marriages between whites and blacks.

The most striking innovations were apparent in England and its colonies, where neither Roman legal traditions, nor the practice of enslavement, carried through the Middle Ages into the early modern period of Atlantic colonization. England's colonial assemblies were authorized to make local law dis-

tinct from that of the metropole; hence each colony developed its own unique statutory and case law with regard to the status and treatment of slaves and freedmen. During the late seventeenth and eighteenth centuries, British American colonies passed increasingly harsh measures regulating slaves and free blacks. For example, a Virginia statute of 1682 held that if a slave died resisting the force of his master, the master would not be liable for felony charges since “it cannot be presumed that [premeditated] malice should induce any man to destroy his own estate [property].”

The written law of Spain mutated further in the colonial settlements of the New World. For example, slaves were sometimes permitted to testify in court and a master’s privilege of re-enslaving an ungrateful freedman fell into disuse. One of the most significant customary innovations in slave law was the practice of *coartación*, which developed in eighteenth-century Spanish America. On the basis of *coartación*, a slave who presented a fair price to his master could achieve his freedom—with or without the master’s consent. This factor, along with demographics, economic conditions, and cultural reasons, helps to explain why people of color made up a larger proportion of the free population in many Latin American colonies.

ANTISLAVERY AND ABOLITION

The movement to abolish slavery has roots in European urban culture, elite European religious and intellectual movements, and African-American slave resistance. Yet it was not until the late eighteenth century that all of these forces combined to create a sustained attack on the institution of slavery itself, and not until the nineteenth century that the Atlantic slave trade, and then American slavery, were finally abolished.

Since at least the thirteenth century, urban centers in France, such as Toulouse and Pamiers, became refuges from the most extreme forms of bondage by adopting charters that freed slaves upon entrance to the village. In England, a Russian slave was freed in 1567 on the grounds that “the air of England is too pure for a slave to breathe.” In seventeenth-century France, local traditions supporting liberty were extended to the French kingdom in the maxim, “All persons are free in this

kingdom; and as soon as a slave had arrived at the borders of this place, being baptized, is freed.”

As the Atlantic slave system began to expand, some critics argued for limitations on the excesses of slavery and the slave trade throughout the early modern period. In sixteenth- and seventeenth-century Spain and Spanish America, some Catholic clergy voiced their concerns, including Bartolomé de Las Casas (1474–1566), who opposed the enslavement of Indians, and Tomás de Mercado and Alonso de Sandoval, who challenged the most extreme cruelties of the slave trade. In 1646, the Capuchin missionary order was expelled from the French Antillean colony of Saint-Christophe, allegedly because they preached the idea that once baptized, blacks could no longer be held as slaves since “it is an unworthy thing to use one’s Christian brother as a slave.” In 1688, several Dutch-speaking Quakers of Germantown, Pennsylvania, chastised their coreligionists for owning and trading slaves, for they “have . . . as much right to fight for their freedom as you have to keep them as slaves.” Yet many Christians also stressed the virtue of slaves’ obedience to their masters, and the suspension of reward until the hereafter, thus implicitly sanctioning slavery and inequality in the here and now.

In the eighteenth century, more secular voices began to critique slavery on the grounds of natural law and the linkage of personal slavery with political despotism. Scottish Enlightenment writers Francis Hutcheson and George Wallace were among the first to attack both slavery and the slave trade as violations of “natural justice” and “humanity.” French philosopher Jean-Jacques Rousseau (1712–1778) drew directly from Wallace to challenge the right of slaves to sell themselves into bondage in his *On the Social Contract*. By 1762, there was a sufficient body of antislavery thought for the Pennsylvania Quaker Anthony Benezet to publish the first title devoted solely to the abolition of slavery and the slave trade, a collection he titled *A Short Account of That Part of Africa Inhabited by Negroes*, which was widely read on both sides of the Atlantic.

The third source of abolitionism was the actions taken by slaves themselves to resist slavery. In the Americas, slaves who ran away, known as “maroons,” established independent communities in

the regions beyond direct colonial power, such as the canyons of Jamaica, the mountains of Guadeloupe, the *sertão* of Brazil, and the swamps of Florida. Some of the maroon communities were so powerful militarily that they established treaties with the local European colonial powers, as in Surinam.

From as early as 1527 and throughout the expansion of plantation slavery in the seventeenth, eighteenth, and nineteenth centuries, slaves plotted and revolted against masters. Most such revolts were small-scale events, with the aim of seeking local justice. Whether they were enacted on the individual or communal scale by the maroons, or in the wider arena of revolt or revolution, slaves overcame tremendous odds in seeking autonomy for themselves and, when possible, in extending that freedom to others. The 1791 slave revolt in northern Saint Domingue that escalated into the Haitian Revolution articulated a strong antislavery ideology and effected the first universal emancipation (of French colonies, in 1794) and the first independent republic established by former slaves (Haiti, 1804).

The end of the eighteenth century also marks the beginning of the bourgeois Atlantic abolition movements. Granville Sharp, an eccentric and pious Englishman, took up the cause of a slave who had been kidnapped and beaten by his master in England in 1765. Sharp's research into the law convinced him the English constitution was antithetical to slavery. English abolitionists had their first major success when they rallied to the support of the slave Somerset, whose master attempted to expel him from England on a ship bound for Jamaica in 1772. Though the extent of Judge Mansfield's decision in the *Somerset* case has been debated by historians, it was widely interpreted at the time as effectively abolishing slavery within England, and Scottish courts soon followed suit with an even broader pronouncement against slavery in 1778.

In North America, patriots of the American Revolution equated British political tyranny with slavery and offered proposals to ban the slave trade. Some extended the critique to slavery itself, though antislavery and antiblack sentiments were sometimes intertwined. Vermont prohibited slavery in its 1777 constitution while Pennsylvania, Rhode Island, and Connecticut all adopted emancipation statutes. Judges in Massachusetts and New Hamp-

shire issued decisions similar to England's *Somerset* decision, thus establishing these territories as free states. In the North, only New York and New Jersey, both with sizable slave populations, maintained a legal apparatus permitting the continuation of slavery, yet these states also generated active, if elitist, abolitionist societies.

Sharp was soon joined by other antislavery activists in England, including the Methodist founder John Wesley, who preached against the evils of slavery on both sides of the Atlantic. Quakers, Methodists, Sharp, and others formed the Society for Effecting the Abolition of the Slave Trade in 1787 and set about lobbying the British Parliament for their cause. Thomas Clarkson was the society's full-time organizer and propagandist. Within months, the group had collected more than 10,000 signatures on an antislavery petition from the city of Manchester alone, comprising half of the adult male population. Former slaves, including Olaudah Equiano (Gustavus Vassa) and Ottobah Cugoano penned their life stories and went on the lecture circuit to rally audiences to the cause. William Wilberforce, an influential member of Parliament, translated the antislavery sentiment into legislative initiatives. The first of these was defeated by pro-slavery opponents in 1791. Petition drives increased, with nearly 400,000 signatories in 1792. At this same time, the Danish government announced that it would abolish its own slave trade within ten years.

In France, the outbreak of the French Revolution in 1789 and the Saint Domingue slave revolt of 1791 made it expedient for the French antislavery association, the Amis des noirs, to focus on mulatto rights. In 1794, the French Convention ratified the republican commissioners' offer of freedom to slaves who would fight against the royalists in Saint Domingue, and they extended it as a universal emancipation to slaves in all other colonies still under French control. However, Napoleon's forceful reimposition of slavery to the Caribbean colonies in 1802 precipitated Haitian independence and postponed French abolition until 1848.

The French and Haitian revolutions proved a setback to the British abolitionist movement, as conservative forces asserted that the popular classes were incapable of self-rule. It was not until 1808 that the Atlantic slave trade was formally abolished

by Britain and the United States, with Britain policing the seas in an attempt to prevent Spanish and Portuguese trade to the Caribbean and Central and South America. It would take another thirty years for Britain's abolitionists to eliminate slavery within its remaining colonies (for example, Jamaica and Barbados), and not until 1888 was slavery abolished within the last American state, Brazil.

Though slavery was officially abolished in the Americas in the nineteenth century, it expanded in some parts of Africa as a direct result of Euro-American abolition. Slavery and related forms of coerced labor still exist today in many countries of the world. Women and children are especially vulnerable.

SUE PEABODY

SLEIDANUS, JOHANNES (Johannes Philippi; 1506–1556), German historian. Johannes Sleidanus was a diplomat, scholar, translator, historian, and finally official historiographer of the Lutheran party—that is, of the Schmalkaldic League—who left the most authoritative account of the Lutheran Reformation in its political as well as religious aspects.

Johann Philipson (son of Philipus, a merchant), was born in 1506 in Schleidan and, along with his friend Johann Sturm, studied first at the school of Johann Neuburg in that Rhineland town, then in Liège with the Brothers of the Common Life and at the academy of Cologne, later rejoining Sturm at Louvain. Sleidanus served Count Dietrich IV of Manderscheid, a moderate Catholic, as tutor to his son. In 1533 Sleidanus moved to France, where he remained until 1542, studying law briefly at the University of Orléans, publishing a translation of Jean Froissart's *Chroniques* (1537), and entering into the service of Cardinal DuBellay, who was engaged in pressing the German Protestants into an alliance with King Francis I. In this cause Sleidanus, in the company of Lazare de Baif, attended the religious colloquy in Hagenau in 1540, but his mission was unsuccessful, as were those to the colloquy of Regensberg the next year, to England in 1545, and to the Diet of Augsburg in 1547. Sleidanus was in a difficult position, poised between Emperor Charles V and the French king (who had only a political interest in the Lutherans and who had begun to persecute the French Protestants), and in 1544 he returned to Strasbourg, where he continued his scholarly as well as his political work, beginning with his "Zwei Reden an Kaiser und Reich" (Two orations on the emperor and the empire.) In 1546 he was married to Iola Nidbruck, who bore him three daughters, and he was appointed a "civil servant" to the Strasbourg council, a post that included being liaison to the French population as well as composing his history.

Throughout his intellectual life Sleidanus was interested in the writing of contemporary history. He expressed this first in his Latin translations of Philippe de Commynes's *Mémoires* (1537), of Froissart's chronicles, and of Claude de Seyssel's *Monarchy of France* (1548), dedicated to King Edward VI of England, but most comprehensively in his extensively documented history of the Reformation. In 1545, with the support of Martin Bucer (1491–1551) and Jacob Sturm, he began negotiations with the Schmalkaldic League for this project, which he had begun as early as 1539. This book Sleidanus had first conceived as a "history of the restored religion" (*historia restauratae religionis, histori der erneueter religion*), but he later included the political dimension as well. "In the history of religion," Sleidanus wrote in the preface to his *De Statu Religionis et Reipublicae Carlo Quinto Caesare Commentarii*, "I would not omit what concerned the civil government because they are interwoven with the other, especially in our times, so that it is not possible to separate them." In this effort Sleidanus was diligent in the collecting of manuscript and archival as well as published materials and careful to preserve an impartial stance, as befitting a moderate Protestant, residing in Strasbourg and situated between German, French, and English parties. Published in 1555, the work offered a comprehensive survey of European history from All Saints' Eve 1517 to February 1555, that is, from Luther's appearance on the public scene at Wittenberg on All Saints' Eve 1517 to the retirement of his great nemesis Charles V in February 1555. His last major topic was the Diet of Augsburg of 1555, which put an end to the first phase of the Reformation, but the book (translated soon into English, French, and German) was extended in later editions, from Sleidanus's own notes, to September 1556, when the author died.

Sleidanus was a major contributor to the Renaissance "art of history." As a larger background to his epic survey Sleidanus also published a small textbook surveying "the first four great empires of the world," of which, through the principle of *translatio imperii*, Sleidanus's own sovereign, Emperor Charles V, was the last beneficiary. Reactions to Sleidanus's work were extreme, ranging from the adulation of friends, Calvinists as well as Lutherans, to the denunciation of enemies, Protestants as well

as Catholics. Sleidanus answered with an “apology,” which posthumously made public his historiographical confession of faith and in which he concluded by declaring that “I am the enemy of all falsehood and do not boast when I affirm that I would rather die than say, still less write, anything without proof.” Leopold von Ranke (1795–1886), though not impressed with Sleidanus’s critical abilities, would not object to his claim to be the “father of Reformation history.”

DONALD KELLEY

SMITH, ADAM (1723–1790), Scottish economist. Along with figures like his teacher Francis Hutcheson (1694–1746) and his best friend David Hume (1711–1776), Smith was one of the principals of a period of astonishing learning that has become known as the Scottish Enlightenment. He is the author of two books: *The Theory of Moral Sentiments* (1759) and *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776). His first book brought him considerable acclaim during his lifetime and was quickly considered one of the great works of moral theory—impressing, for example, such people as Immanuel Kant (1724–1804), who called Smith his *Liebling*, or ‘favorite’, and Charles Darwin (1809–1882), who in his *Descent of Man* (1871) adopted some of Smith’s argument and

called his moral thought “striking.” The book went through fully six revised editions during Smith’s lifetime. Since the nineteenth century, however, Smith’s fame has largely rested on his second book, which must be considered one of the most influential works of the past millennium.

Smith matriculated at the University of Glasgow at the age of fourteen in 1737. He considered his instruction at Glasgow, which was heavy in the classics, quite good; the influence of Hutcheson—whom Smith later referred to as “the never to be forgotten Dr. Hutcheson”—was pronounced. After Glasgow, Smith studied at Balliol College, Oxford, with whose level of instruction Smith was not so impressed: “In the university of Oxford, the greater part of the publick professors have, for these many years, given up altogether even the pretence of teaching” (*Wealth of Nations*, Liberty Fund edition, p. 761). Smith made good use of the libraries at Oxford, however, studying widely in English, French, Greek, and Latin literature. He left Oxford and returned to Kirkcaldy in 1746.

In Edinburgh (1748) Smith began giving “Lectures on Rhetoric and the *Belles Lettres*,” as Kames’s biographer Alexander Tytler reports, focusing on literary criticism and the arts of speaking and writing well. It was during this time that Smith met and befriended Hume, who was to become Smith’s closest confidant and greatest philosophical influence. Smith left Edinburgh to become professor of logic at the University of Glasgow in 1751 and then professor of moral philosophy in 1752. The lectures he gave there eventually crystallized into *The Theory of Moral Sentiments*.

In his *Theory of Moral Sentiments* Smith argues that human beings naturally desire a “mutual sympathy of sentiments” with their fellows, which means that they long to see their own judgments and sentiments echoed in others. Because we all seek out this “sympathy” or harmony, much of social life is a give-and-take whereby people alternately try to moderate their own sentiments so that others can “enter into them” and try to arouse others’ sentiments so that they match their own. This market-like negotiation results in the gradual development of shared habits, and then rules, of judgment about moral matters ranging from etiquette to moral duty. This process also gives rise,

Smith argues, to an ultimate standard of moral judgment, the “impartial spectator,” whose perspective we routinely seek out in judging both our own and others’ conduct. When we use it to judge our own, it is what constitutes our conscience. We consult the impartial spectator simply by asking ourselves what a fully informed but disinterested person would think about our conduct. If such a person would approve, then we may proceed; if he would disapprove, then we should desist.

Morality on Smith’s account is thus an earthly, grounded affair. Although he makes frequent reference to God and the “Author of Nature,” scholars disagree over to what extent such references do any real work in his theory—and thus to what extent Smith’s theory of moral sentiments is a relativistic account, eschewing reliance on transcendent, objective rules of morality.

In 1763, Smith resigned his post at Glasgow to become the personal tutor of Henry Scott, the third duke of Buccleuch, whom Smith accompanied on an eighteen-month tour of France and Switzerland. It was during his travels with the duke that Smith met François Quesnay (1694–1774), Jacques Turgot (1727–1781), and others in France called Physiocrats, who were publicists arguing for a relaxation of trade barriers and for laissez-faire economic policies. Although Smith had long been developing his own, similar ideas, frequent conversations with the Physiocrats no doubt helped him refine and sharpen his ideas. In 1767, Smith returned to Kirkcaldy to continue work on what would become his *Wealth of Nations*.

In *The Wealth of Nations* Smith argues against the mercantilists that wealth is not mere pieces of metal: it is rather the ability to satisfy one’s needs and desires. Since each person wishes to “better his own condition,” the argument of *The Wealth of Nations* is that those policies should be adopted that best allow each of us to do so. It turns out, Smith argues, that markets in which the division of labor is allowed to progress, in which trade is free, and in which taxes and regulations are light are the most conducive to this end. Smith argues that in market-oriented economies based on private property, each person working to better his own condition will increase the supply, and thus lower the price, of whatever good he is producing; this means

that others will be in a better position to afford his goods. Thus each person serving his own ends is led, in Smith’s famous phrase, “by an invisible hand” simultaneously to serve everyone else’s ends as well. Much of *The Wealth of Nations*’s 1000-plus-page bulk is concerned with providing historical evidence supporting this theoretical argument.

By the middle of the nineteenth century, *The Wealth of Nations* was regularly cited in the British Parliament—for example, in the Corn Law debates—and its recommendations of free markets and free trade went on to have great influence in the subsequent political and economic developments not only of the British Isles, but also of most of the Western and even parts of the Eastern world. Smith’s influence on the founding of the United States was also great. Among his readers were Benjamin Franklin (1706–1790), George Washington (1732–1799), Thomas Paine (1737–1809), and Thomas Jefferson (1743–1826). When compiling a “course of reading” in 1799, Jefferson included *The Wealth of Nations* along with John Locke’s *Second Treatise of Government* (1690) and Marie-Jean Caritat de Condorcet’s *Esquisse d’un tableau historique des progrès de l’esprit humaine* (1793; Sketch of the progress of the human spirit) as the essential books. The English historian Henry Thomas Buckle (1821–1862) wrote that *The Wealth of Nations* “is probably the most important book that has ever been written,” including the Bible. Today most countries in the world either rely on some version of Smithian market-based economies or are in the process of creating them.

Smith remained in Kirkcaldy until 1777, when he left to become commissioner of customs in Edinburgh. During this time he visited regularly with friends—including Edmund Burke (1729–1797), the chemist Joseph Black (1728–1799), the geologist James Hutton (1726–1797), the younger William Pitt (1759–1806), and Lord North (1732–1792)—and he took active roles in learned organizations like the Poker Club and the Oyster Club. He also extensively revised his two books for new editions, while additionally working on a “theory and history of law and government.” The latter work was never published, however. One week before he died, Smith summoned Black and Hutton to his quarters and asked that they burn his unpublished manuscripts, a request they had been resisting

for several months. This time Smith insisted. They reluctantly complied, destroying sixteen volumes of manuscripts. It is probable that Smith's theory and history of law and government were among the works that perished in that tragic loss.

Smith was a true polymath: he was master of several languages and their literatures, a historian of the ancient and modern worlds, a philosopher in his own right, and a brilliant observer of human society and behavior. Although he is known today principally as the father of the discipline now known as economics, given the scope and breadth of his work, he is probably better considered the father of sociology.

JAMES R. OTTESON

SMOLLETT, TOBIAS (1721–1771), Scottish novelist, translator, and periodicals editor. Smollett is perhaps best known as the author of the hugely successful picaresque novel *Roderick Random* (1747), as an editor of the monthly magazine *The Critical Review*, and the patriotic periodical *The Briton* (1762–1763), and the xenophobic travel book *Travels through France and Italy* (1766), which details his own experiences of traveling in Europe. He was born Tobias George Smollett in Dumbarton, the son of a Scottish laird, attended Glasgow University to read medicine, and was subsequently apprenticed to a surgeon to learn the trade. In 1741 he traveled to the West Indies as a surgeon's mate in the navy, where he met his wife, Anne Lassells, the daughter of a wealthy plantation owner in Jamaica. He returned with her to London in 1744 to establish himself as a surgeon in Downing Street.

Smollett's career as a surgeon did not flourish. In order to supplement his income, and to satisfy an urge that had inspired him to produce the play *The Regicide* in 1739, he undertook editing, translating, and, subsequently, writing. In 1746 he produced "The Tears of Scotland," a poem in support of Scottish tolerance after the Jacobite uprising of 1745. As a Scot and lifelong supporter of the British union, Smollett was not afraid to court controversy or to be outspoken in his opinions. Indeed, he declared in the preface to his first novel that his "avowed purpose" in writing was to arouse "generous indignation against cruelty and injustice" wherever possible.

Smollett anonymously published his first novel, *Roderick Random* (2 volumes), in 1747 to enormous public and critical approval. As a picaresque tale, a form that Smollett himself believed to be best for a novel, *Roderick Random* has a rambling struc-

ture detailing the life of a hapless, outcast naval surgeon seeking his fortune and a wife, who ultimately emerges at the end of the novel wealthy and married, despite an eventful and at times violent series of events. Following Smollett's success with this novel, he wrote two more tales in a similar style, including *The Adventures of Peregrine Pickle* (2 volumes, 1751 and 1758), which contained many savage caricatures of contemporary figures, including Henry Fielding; and *The Adventures of Ferdinand Count Fathom* (2 volumes, 1753), the story of a charming but treacherous con man in search of a fortune. Neither of these tales enjoyed the success of his first novel, however, leading him to engage in other literary ventures in addition to writing novels.

In 1755, Smollett translated Cervantes's seventeenth-century romance *Don Quixote*, and, in the following year, cofounded *The Critical Review*, which, though not a commercial success, ran for seven years and placed Smollett at the heart of literary London. In the late 1750s, Smollett turned his attention to nonfiction and published *A Compendium of Authentic and Entertaining Voyages* (7 volumes, 1756) and his own *A Complete History of England* (4 volumes, 1757–1758), which sold well and made him financially secure. His fourth novel, *The Adventures of Sir Launcelot Greaves*, appeared serially in *The British Magazine* in 1760.

In the 1760s, after he had suffered with consumption (tuberculosis) for a number of years, Smollett's health began to deteriorate. Despite his ill health, however, he embarked on a new project, *The Briton*, a pro-union periodical that he wrote and edited in the years 1762–1763, but that was eventually killed off by a rival publication, the satirical *North Briton*, edited by John Wilkes. In the same year that his periodical was taken off the press, his only child died suddenly, and Smollett headed for France and Italy, hoping the change of climate would restore both his mind and body. Returning to London in 1765, he published the story of his journey through Europe as a series of anonymous letters in *Travels through France and Italy* (1766), a book that was condemned for its xenophobic portrayal of the French, and prompted Laurence Sterne to rename its author Smelfungus in 1768, but also admired for its frank reporting of his own experiences and his detailed observations of life in the French town of Nice. Smollett returned to France in

1768. Before his death in Livorno in 1771 he wrote and published two further novels, the anonymous and bizarre *The History and Adventures of an Atom* (1786) and, perhaps his most respected work, *The Expedition of Humphry Clinker* (1771), a comic epistolary novel that tells the story of a family's tour through Great Britain.

ALISON STENTON

SMOTRYTSKYI, MELETII (c. 1577–1633), Orthodox archbishop of Polatsk, bishop of Vitsyebsk and Mstsislaŭ, archimandrite of the monastery of the Vilnius Orthodox Brotherhood of the Descent of the Holy Spirit; subsequently, following his conversion to the Uniate church, archbishop of Hierapolis and archimandrite of the Uniate monastery in Volhynian Derman'; philologist and polemical writer.

Smotrytskyi was born into one of the first documented families of a burgeoning Ruthenian Orthodox intelligentsia: his father Herasym, a client of the palatine of Kiev Kostiantyn Ostrozkyi, was one of the editors of the 1581 Ostrih Bible, the first printing of Holy Writ in Church Slavonic. Meletii's educational path took him from the Orthodox "Academy" at Ostrih to the Jesuit Academy in Vilnius (late 1590s), and then to Protestant universities of western Europe (including Leipzig and Wittenberg in the years around 1606, when he served as preceptor to a young Orthodox nobleman).

Smotrytskyi likely experienced the Union of Brest (1596) while a student of about nineteen years at the Vilnius Jesuit Academy, and his entire career unfolded in the context of the debates that agitated Rus' and the Polish-Lithuanian Commonwealth in the early seventeenth century. He had returned to Lithuania by 1610, when his *Threnody* appeared at the Orthodox Brotherhood press in Vilnius. The work became a battle cry for the Orthodox, and it brought about royal warrants to arrest the anonymous author and printer and close the Vilnius printing shop.

In the 1610s Smotrytskyi worked on two major projects of "national education," a Ruthenian-language Homiliary Gospel, a sort of Orthodox postil intended to supplant existing Protestant and Catholic versions in Polish (1616), and a grammar of Church Slavonic (1618–1619), the liturgical language of the Orthodox Slavs, which would be supplanted as a textbook only at the beginning of the nineteenth century.

By 1618 Smotrytskyi had become a monk at the Vilnius Orthodox Brotherhood Monastery of the Descent of the Holy Spirit, and in 1620 he was made archbishop of Polatsk, when Patriarch Theophanes of Jerusalem, returning home from a sojourn in Muscovy, consecrated seven bishops to "vacant" Orthodox sees. The sees were in fact occupied by bishops who had joined the Union in 1596, and thus the consecrations were viewed as illegal by Polish-Lithuanian authorities. From his seat in Vilnius (he had also become archimandrite of the influential Brotherhood Monastery in 1620), Smotrytskyi became the leading spokesman in defense of the new Orthodox hierarchy, publishing five lengthy polemical tracts in the years 1621–1623.

From 1623 to 1625, Smotrytskyi made a controversial pilgrimage to the Holy Land, where he encountered Kyrillos Loukaris, one of his former teachers (perhaps at Ostrih), now patriarch of Constantinople. After returning to the Commonwealth, Smotrytskyi began seeking ways to reunite the "Ruthenian nation," and he became a covert Uniate. He was "unmasked" at a Ruthenian Orthodox Church synod held in Kiev in August 1628. He retreated to his new seat as archimandrite of the Volhynian Derman' monastery, where he wrote four major polemical works in the years 1628–1629, now propagating the Union as true Ruthenian Orthodoxy and unmasking the Orthodox intellectual elite (including his own former literary incarnations and Loukaris) as heretics and even crypto-Protestants. On 5 June 1631 Pope Urban VIII made Smotrytskyi archbishop of the "Church of Hierapolis, which is *in partibus infidelium*, under the patriarchate of Antioch." Smotrytskyi died at Derman' in December 1633.

SMYRNA (İZMİR). İzmir (the Greek Smyrna), nestled at the eastern end of a gulf along the central western Anatolian coast, remained the only port town to escape the Ottoman ruler Bayezid I's hands when he conquered the rest of western Anatolia in 1390. It was not until 1424 that the Ottomans finally absorbed the town. In the subsequent five centuries, İzmir became transformed several times.

A combination of events and structural changes caused these dramatic alterations. In the years immediately before the Ottoman takeover, İzmir was a town divided between a Turkish-Muslim settlement in and around a hill castle, Kadifekale, and a Latin Christian settlement in the small harbor below. In such circumstances, the site could not thrive, and the Ottomans inherited an almost deserted place in 1424. Nor, without a potent navy, could the authorities do much to revitalize the port thereafter. A Venetian raid in 1474 exposed its vulnerability.

The creation of an eastern Mediterranean Pax Ottomanica in the early sixteenth century did little for İzmir. The conquest of Constantinople in 1453 had led to an Ottoman policy that envisioned western Anatolia as a provisioning zone. As part of its strategy, the government discouraged international commerce in İzmir. A reflection of this policy was an almost exclusively Turko-Muslim population of no more than two thousand in 1575.

The combination of new European trading companies and Ottoman political decentralization in the seventeenth century stimulated İzmir's growth. The weakness of the Ottoman center eased foreign manipulation of provincial economies and societies in general. İzmir itself became a "new port city," created by the combined interests of foreign traders and local Ottoman elites. By 1630, İzmir's diverse popu-

lation of perhaps fifty thousand Turkish-Muslims, Armenians, Jews, Greeks, and foreigners had fashioned a cosmopolitan frontier entrepôt, whose wealth was based upon trade in silk, dried fruits, grains, and other goods.

The Ottoman government set out to tame the place. In about 1659, the grand vizier Köprülü Mehmed had a castle, Sancakburnu Kalesi, built at the narrow entrance to the Gulf of İzmir in order to oversee naval activity and shipping. During the following decades, his successors constructed a customs shed, aqueducts, public bath, and other edifices. İzmir maintained much of its autonomy, however. French, English, Dutch, and other foreign communities had carved out such a strong presence in the town that not only did its most vital district become known as "Franks Street," but foreign representatives also shared more and more municipal power with town notables.

The city quickly rebuilt after a calamitous earthquake in 1688. In the eighteenth century, French and British traders used the influence of their ambassadors in Istanbul to hold the central Ottoman government at bay, and negotiated with local notables and native merchants to better their positions in İzmir and its hinterland. As the century progressed, İzmir became a nexus of Mediterranean and European commerce and culture. Its population also remained diverse, and its physical appearance more and more resembled other world cities.

İzmir is at the center of several historiographical debates. Among these are the causes for the city's sudden emergence in the early seventeenth century, its characteristics as an Ottoman, a Mediterranean, or a world city, and its role in the "world economic system."

SOFİIA ALEKSEEVNA (1657–1704; ruled 1682–1689), regent of Russia. The daughter of Tsar Alexis I and his first wife Mariia Miloslavskaia, Sofiia spent her life until 1682 in the privacy of the women’s quarters of the Kremlin palace with her sisters and aunts. She seems to have been well educated by the standards of the time for women. She emerged into view during the confusion after the death of her brother Tsar Fedor III in 1682. The boyars and the patriarch had proclaimed Peter Alekseevich (Peter the Great) tsar over his sickly elder brother Ivan. The musketeers objected and rioted, killing Peter’s uncle and several other boyars. Sofiia emerged as the central figure among Peter’s opponents, as the representative and leader of the Miloslavskii clan, the family of her mother and of Tsar Ivan V (d. 1696). The struggle ended when both boys were proclaimed co-tsars, with Sofiia as regent. In the course of the summer of 1682, she managed to neutralize and suppress a bid for power by the favorite of the musketeers, Prince Ivan Khovanskii, whom she arrested and executed in the fall. For the next seven years she ruled the country as de facto regent with her favorite, Prince Vasilii Vasilevich Golitsyn. Peter’s mother Nataliia Naryshkina and her clan remained unreconciled to the new regime, providing a source of instability at court.

Sofiia was the first woman to rule Russia, if only as regent. In decrees and official rescripts her name came after those of Ivan and Peter, but from 1686 she, too, was usually accorded the title “autocrat.”

Beginning with the audience for the Swedish ambassador in May 1684 she took a more public role in political matters. The exact nature of her personal relationship with Golitsyn has been the subject of romantic fancy, but evidence is sparse. What is certain is that she, not the favorite, made the final decisions.

Sofiia maintained peace with Sweden, and her emissaries negotiated the treaty of Nerchinsk with China, setting the border in Siberia for the next century and a half. After complex negotiations, Russia joined the Holy League of Poland, Austria, Venice, and the papacy against the Ottoman Empire, completing the transition of Russian policy away from concentration on the rivalry with Poland. Two Russian military expeditions against the Crimean Khanate in 1687 and 1689 were unsuccessful and ultimately led to Sofiia’s downfall. In the meantime, her government continued most of the policies of her predecessors.

One exception was in religious affairs. The penalties for religious dissidents (the Old Believers) were drastically strengthened, and the Protestant mystic Quirinus Kuhlmann was arrested and condemned to death. In contrast, foreign Catholics received permission for the first time ever to open churches and bring priests to Russia. Two Jesuits were allowed to come to Moscow to serve the various needs of the foreign Catholic community (Protestant foreigners had long had these rights). The price of these concessions was the alienation of Patriarch Ioakim, the powerful and vigorous head of the church. Ioakim pursued his own agenda of elevating the educational level of the clergy and ultimately secured Sofiia’s support for the Slavonic-Greek-Latin Academy, founded in 1687. Nevertheless, the patriarch remained a supporter of Sofiia’s opponents, the Naryshkin clan and its allies.

Sofiia’s brief regency was also a period of incipient cultural transition, as baroque architecture, knowledge of Polish and Latin, and an acquaintance with the religious culture of Ukraine began to spread among the elite. Sofiia and Golitsyn both encouraged these trends.

The failure of the Crimean campaigns undermined the credibility of Golitsyn and Sofiia, and after the return of the army in 1689, the Naryshkins saw their moment. By that time not only Ioakim

supported them, but also the court of Tsar Ivan. Fearing a possible plot against him in August, Peter and his court went to the Trinity Monastery, where their allies joined them. Peter's camp blamed the secretary Fedor Shaklovityi for this alleged plot and demanded his arrest. In the course of the next weeks Sofia realized that her support among the boyars and the army had evaporated, and by early September she surrendered. Shaklovityi was executed, and Sofia was sent to the Novodevichii convent. There she remained until 1698, when Peter interrogated her about the musketeer revolt of the previous summer. Peter believed that she had been involved in the rebellion, and from then on until her death, Sofia lived in virtual isolation from her sisters and associates. Her irregular status as regent and Golitsyn's military failures ensured her fall.

PAUL BUSHKOVITCH

SONGS, POPULAR. The popular song in early modern Europe was a melody, usually widely known in society, that was set to a poetic text and communicated either in private or public performance or in print. The melodies had origins variously in folk music, tavern singing, comic opera, or vaudeville, all-sung opera, or even hymn singing. In fact, they moved back and forth between such contexts, being set to new words. In this period “vaudeville” had different meanings in different countries, referring to courtly songs in France and “country” ballad or song in England.

Here “popular” should be taken to mean “general” culture, part of what almost everyone was assumed to know, rather than an idiom that was

distinctive of the lower classes or was seen on a lesser cultural level.

In such countries as France, England, and Germany, popular songs were disseminated during the sixteenth and seventeenth centuries chiefly by men who both sang and sold them in fairs, most notably on the Pont-Neuf in Paris. The *chansonnières* were part of the *charlatans*, unlicensed trades such as jugglers, magicians, or vendors of medical or cosmetic items. Essential to the *chansonnières*' business was the maintenance of a wide network of connections and news by which to write ballads on topics of general interest. They also formed part of small companies that put on skits in fairs. Editions of songs, which were numerous beginning in the early seventeenth century, became closely linked with political dispute, as in the *Recueil general des chansons de la Fronde* (General collection of songs of the Fronde) of 1649.

In the early eighteenth century the song became institutionalized within the musical theater known variously as opera buffa, *opéra comique*, vaudeville, *Singspiel*, and what was called either English or ballad opera. Their productions combined songs with a spoken text, the latter usually linked to the former in mood rather than plot line. The same songs were attached to dramas in the licensed theaters; by 1700 London playwrights had become concerned that much of the public went to Drury Lane more for the songs than the plays. In both Paris and Vienna some works in these idioms—most notably *Die Entführung aus dem Serail* and *Die Zauberflöte* by Wolfgang Amadeus Mozart (1756–1791) and *Le Déserteur* by Pierre-Alexandre Monsigny (1729–1817)—were by 1789 thought to stand on a level of sophistication equal to that of all-sung opera.

Writing texts for songs became an extremely important aspect of both amusement and politics during the eighteenth century. Robert Darnton shows that chansons evolved in a process of successive, collective authorship that was deeply rooted in aspects of sociability. It served as a central means by which news was spread, became interpreted, and thereby influenced public life anew. A leading aficionado of chansons was Jean-Frédéric Phélypeaux, comte de Maurepas (1701–1781), minister to Louis XV; his collection was published in Émile Raunié's *Chansonnier historique du XVIIIe siècle*

(1879–1884). Some men of letters, most notably Charles Collé (1709–1783), made a career out of writing chansons.

By 1750 editions of the songs in a well-known work that had been done by a famous singer became a major commercial component of music publishing. Tendencies of mass marketing can be detected by 1800 in the production of songs designed to be easy to appreciate by the expanding ranks of people playing and singing at home. Publishers in Britain and Germany pressured composers to write songs on supposedly Irish or Scottish themes that came to be seen as mere fashion and hype in some quarters.

WILLIAM WEBER

SOUTH SEA BUBBLE. *See* Economic Crises.

SOVEREIGNTY, THEORY OF. The modern concept of sovereignty owes more to the jurist Jean Bodin (1530–1596) than it does to any other early modern theorist. Bodin conceived it as a supreme, perpetual, and indivisible power, marked by the ability to make law without the consent of any other. Its possession by a single ruler, a group, or the entire body of citizens defined a commonwealth as monarchy, aristocracy, or popular state. Without it a commonwealth was not properly a state at all. In his *Six livres de la république* (1576; Six books of the commonwealth) Bodin came to favor absolute monarchy, but the legacy of medieval juristic ideas and the political conflicts of his time led him into some contradictions and changes of front.

In the sixth chapter of his *Methodus ad Facilem Historiarum Cognitionem* (1566; Method for the easy comprehension of histories) Bodin first discussed the nature of sovereignty, which he called in Latin *soverénitas*. Using a comparative historical method, he classified past and present states and empires and reviewed the opinions of Roman law jurists on the meaning of such terms as *summum imperium* (the highest authority) and *merum imperium* (unqualified authority). He insisted that the mixed state was an impossibility, but at this stage he did not stress the legislative function. It was listed as only the second of five functions of sovereignty, the others being creating magistrates, declaring war and peace, hearing judicial appeals in the last resort, and deciding on life or death where the latter was the prescribed penalty. In *The Commonwealth* making and unmaking law became the sole function, engrossing all the rest. Here Bodin was influenced by Roman law traditions that saw legislative power as command or will, as expressed in the maxim "what pleases the prince has the force of law" (*quod principi placet legis vigorem habet*). His term for sovereignty became *souveraineté* in French and *majestas* in Latin.

The main reason for Bodin's change of heart was probably the desire to outflank theories of legitimate resistance to the French crown advanced by Protestant writers in the contemporary civil wars. However, he did suggest certain limitations on the power of what he termed "royal monarchy," as distinct from lordly and despotic types of rulership where power knew few or no boundaries. In a royal monarchy, such as France, England, Scotland, and Spain, the sovereign was bound to observe divine and natural law; he could not tax his subjects without their consent; he should keep contracts with his subjects; and he was unable to alter certain fundamental laws, such as the laws of succession to the throne. Despite these limitations, the power of a royal sovereign was termed "absolute," and this is not surprising, since Bodin undermined most of these constitutional reservations. The sovereign was the sole judge of divine and natural law; he could tax without consent in emergencies; and he could decide that contracts were no longer operative when, in his view, a subject had ceased to benefit from them. An additional novelty was introduced in *The Commonwealth*. While continuing to insist on the

indivisibility of sovereignty and the impossibility of the mixed state, Bodin made a distinction between the form of the state and the method of its administration. A sovereign might choose to administer his realm using officials of aristocratic or popular origin, thus giving the false impression of mixture.

BODIN'S INTERPRETERS

In the seventeenth century Bodin's idea of absolute sovereignty became influential throughout most of Europe. In France it was absorbed into the prevailing doctrine that kings were appointed by God and responsible to him alone, but its juristic elements remained important and were even strengthened in some respects. The jurists Charles Loyseau (1564–1627) and Cardin Le Bret (1558–1655), for example, eliminated Bodin's view that the sovereign should normally obtain consent to taxation in their respective treatises *Traité des seigneuries* (1608; On lordships) and *De la souveraineté du Roi* (1632; On royal sovereignty). Le Bret invented the celebrated phrase that sovereignty was as indivisible as a point in geometry.

Bodin, whose *Commonwealth* was translated into English in 1606, was often cited in political discourse in England during the early part of the reign of Charles I (1625–1648), but it was not until war broke out between the king and the Long Parliament in 1642 that his concept of sovereignty seemed relevant to English conditions. The militant pamphleteer who later made his peace with the Stuarts, William Prynne (1600–1669), adapted Bodin to claim sovereignty for Parliament without the king in *The Sovereigne Power of Parliaments and Kingdomes* (1643). He also enlisted French sixteenth-century resistance theorists in the parliamentary cause, associating the underlying authority of the people with sovereign power in a way that would have been anathema to Bodin. Opposing polemicists referred at times to Bodin in support of Stuart absolutism, but the general policy of Charles I's advisers was to assert that it was Parliament that had broken the mixed English constitution by asserting a superior authority.

In Germany Johannes Althusius (1577–1638), professor of law at Herborn (Nassau) and syndic of Emden, had close ties to the resistance to Spanish rule in the Netherlands and sympathized with French resistance literature. Like Prynne forty years

later, he linked these ideas with the Bodinian definition of sovereignty, but in a much more logical fashion. His *Politica Methodice Digesta* (1603; Politics systematically analyzed) concluded that in every state Bodinian sovereignty reposed inalienably in the community as a whole, and that rulers and magistrates were mere delegates of the people. This, he asserted, was what Bodin had implied when he held that fundamental constitutional laws belonged to the sovereignty and not to individuals who ruled in name.

Other German jurists resented Bodin's classification of the Holy Roman Empire as an aristocracy and of the emperor as no more powerful than the doge of Venice. Some ingeniously exploited Bodin's qualifications to his theory to make it fit the complexities of the German constitution. Henning Arnisaeus (1576/1579–1636), a physician who acted as political adviser to the king of Denmark, criticized Althusius and defended monarchical sovereignty in a manner closer to Bodin's intentions. His best-known theoretical work, *De Jure Majestatis* (1610; On the right of sovereignty), not only defended Bodin's denial of the mixed state, but refused to admit its equivalent through Bodin's distinction between form of state and method of government. However, the complications in imperial institutions led Arnisaeus to suggest that the attributes of sovereignty could be distributed among several authorities.

Another German theorist, the Hebrew scholar Bartholomäus Keckermann of Gdańsk (1571–1608), used the distinction between form and method to argue in his *Systema Disciplinae Politicae* (1606; System of political science) that the empire was monarchic in form but aristocratic in governance. Perhaps the most discerning German commentator on Bodin's theory of sovereignty was Christoph Besold (1577–1638), who taught jurisprudence at Tübingen and Ingolstadt. He adopted the theory of double sovereignty, in which personal sovereignty (*majestas personalis*) resided in the ruler or in a corporate entity of unequal parts (such as the emperor and the diet), while real sovereignty (*majestas realis*) lay permanently in the community as a whole. The latter, however, could only be exercised as a constituent power when government collapsed and a new constitution was needed. These views were expressed in *Politicorum Libri Duo*

(1618; Two books on politics). Besold also remarked that, if personal sovereignty was shared among several persons in an aristocracy, it was pointless to deny the possibility of the mixed form.

GROTIUS AND PUFENDORF

The idea of constituent power was also implied by the influential Dutch statesman and jurist Hugo Grotius (1583–1645). Although he had some constitutional reservations, Grotius strongly admired Bodin's view of monarchical sovereignty. His best-known work was *De Jure Belli ac Pacis* (1625; On the law of war and peace), in which he preferred the Roman law term *summum imperium* to *majestas*. He suggested two possessors of sovereignty, the proper owner (*subjectum proprium*) and the communal owner (*subjectum commune*), but denied that the latter could be invoked to support resistance. It resembled a theory propounded by Arnisaeus, who held that the whole community or *civitas* existed as a latent corporation to protect property rights.

In 1672 Samuel Pufendorf (1632–1694), a Saxon jurist at Heidelberg who entered the service of the king of Sweden, published his *De Jure Naturae et Gentium* (Of the law of nature and nations), a book comparable with Grotius's *War and Peace*. A student of the German constitution, he was more critical of Bodin than was Grotius, and he generally found German institutions too complex to fit the straitjacket of any political theory. Nevertheless, he described sovereignty in terms of a legal fiction as “a composite moral person (*persona moralis composita*) whose will . . . is deemed the will of all; to the end that it may use and apply the strength and riches of private persons towards maintaining the common peace and security.”

HOBBS, BOSSUET, AND ROUSSEAU

Thomas Hobbes (1588–1679), perhaps the most logical of all the theorists of sovereignty, achieved a level of abstraction in his masterpiece, *Leviathan* (1651), which ignored historical facts and previous thinkers with equal disdain. Superficially, Hobbes's concept of sovereignty appears similar to Bodin's in terms of absolute power, indivisibility, and the voluntarist view of law, but its premises are entirely different. Human beings were not, in terms of Aristotelian organicist imagery, by nature social and political animals: they were egotistical beings whose

mutual hostility had created a savage state of nature from which they were obliged to escape by agreeing with each other to surrender all their rights to a sovereign for the sake of security. Thenceforth the sovereign represented all citizens separately, and in a sense they became the authors of all his acts. They could not, it is true, renounce the right of self-defense, but all the corporate resistance and contract theories of the past were refuted by this new and ruthless doctrine of absolute sovereignty.

The personal rule of Louis XIV (ruled 1643–1715; took personal charge of the government of France from 1661) seemed to contemporaries to incarnate absolute monarchical sovereignty. Indeed the king himself, preparing his memoirs in 1666, said that kings were absolute sovereigns controlling all the property of their subjects, whether clerical or lay, for the needs of the state. Elements of the juristic tradition of sovereignty lay behind this attitude, but the ideology that dominated the reign was that of the divine right of kings. Its principal spokesman was Jacques-Bénigne Bossuet (1627–1704), bishop of Meaux. His *Politique tirée des propres paroles de l'écriture sainte* (composed 1670, published 1709; Politics drawn from the very words of Holy Scripture) expounded this doctrine, but also stressed that the king owed a duty to his subjects and pointed out that his power was absolute but not arbitrary.

In the eighteenth century the concept of absolute sovereignty began to be replaced by a theory of checks and balances defined by Charles-Louis de Secondat, baron de La Brède et de Montesquieu (1689–1755). However, a new kind of sovereignty was devised by the proto-Romantic writer Jean-Jacques Rousseau (1712–1778) in *Du contrat social* (1762; The social contract). Rousseau had read Hobbes closely and, like him, based his doctrine on multiple agreements between primitive people to escape the state of nature. At the same time Rousseau detested both Hobbes's premises and his conclusions. Instead of postulating a presocial people involved in a brutal war for survival, Rousseau believed moral sentiment and a desire for the common good had moved humankind to renounce the state of nature. Instead of agreements to surrender individual rights to an absolute ruler, Rousseau proposed primeval agreements to merge all particular rights in a democratic corporate community whose

general will (*la volonté générale*) was the sovereign. Since the general will was always devoted to the common good, its decisions must always be morally right: "Now, as the sovereign is formed entirely of the individuals who compose it, it has not, nor could it have, any interest contrary to theirs. . . . The sovereign by the mere fact that it is, is always all that it ought to be."

Rousseau's formula bore the shades of earlier theorists of sovereignty. It reflected Bodin's indivisibility and legislative power, Althusius's communal sovereignty, and even Pufendorf's "composite moral person whose will is deemed the will of all" (see above). The problem was that Rousseau had no clear idea of how the general will could be determined. He did not believe in representation, and he regarded majority decisions with suspicion. His theory seemed to make sense only in the context of an ancient Greek city-state society, where the free citizen could realize his full potential. This was not the way his ideas were applied in the French Revolution, where Jacobin demagogues declaimed that they alone were the bearers of the nation's general will.

SPAIN. Although the term "Spain," from Latin *Hispania*, had long been used to refer to the greater part of the Iberian Peninsula, that nation did not become a political reality until the marriage of Isabella of Castile (1474–1506) to Ferdinand of Aragón (ruled 1479–1516) united the kingdom of Castile and León with the crown of Aragón. Castile added the Canary Islands during the fifteenth century, Granada in 1492, Melilla in 1497, and most of Navarre after 1512. The crown of Aragón possessed the kingdoms of Aragón and Valencia, the county of Barcelona (Catalonia), and the Balearic Islands. Between 1707 and 1716, Philip V (ruled 1700–1746), first king of the Bourbon dynasty, unified these regions into the single kingdom of Spain, with its sole capital at Madrid.

Prior to the War of the Spanish Succession (1701–1714), the crown of Aragón also held the Mediterranean kingdoms of Sardinia (after 1323), Sicily (from 1409), and Naples (from 1443). Castile, beginning in 1492, acquired a vast empire in the Americas and the Philippine Islands, along with a few towns and forts on the North African coast.

GEOGRAPHY

Spain occupies 85 percent of the Iberian Peninsula. It borders France to the north, the boundary defined since 1659 by the crest of the Pyrenees, following Spain's cession to France of Roussillon and most of Cerdagne. To the west Spain borders Portugal, with the boundary running through rugged, sparsely inhabited country save in its southern reaches, where the Rio Guadiana defines it. For the rest, Spain is surrounded by sea: its northwest and southwest coasts face the Atlantic, its east coast, the Mediterranean. Some eleven miles of the Strait of Gibraltar separate Spain from North Africa.

Spain is mountainous, and its climate, apart from the rainy northwest, ranges from Mediterranean to semiarid. Much of Castile is a high tableland, known as the *meseta*. Barely half Spain's terrain was historically productive, only a fraction rich. Four important rivers, the Duero, Tagus, Guadiana, and Guadalquivir, flow west to the Atlantic. None is navigable for other than small craft until it nears the sea. Each defines a valley with mountains separating it from the others. Of the rivers that flow east, only the Ebro is long, allowing barge traffic in its lower reaches. Shorter rivers that flow east water fertile soils in Catalonia and Valencia and irrigate semiarid *vegas* ('fertile plains') in Murcia and eastern Granada.

For most of the early modern period the historic kingdoms and principalities of Spain defined its political geography. The largest kingdom, Castile, incorporated many others: Galicia in the northwest; the principality of Asturias and the Basque lordships of Vizcaya and Guipúzcoa facing the bay of Biscay; a third Basque lordship, Álava, inland of them; León and Old Castile in the Duero valley; the kingdom of Badajoz, today's Extremadura; New Castile, often called the kingdom of Toledo; the kingdoms of Jaén, Córdoba, and Seville along the course of the Guadalquivir; and, in the mountainous southeast, the kingdoms of Granada and Murcia. The Bourbon King Ferdinand VI (ruled 1746–1759) replaced Castile's historic kingdoms with twenty-four provinces in 1749, each based in a populous capital. In 1799, further subdivision increased the number to thirty-two.

POPULATION AND LANGUAGES

The first attempt at a modern census occurred in 1768. Earlier population figures derive from counts of heads of household (*vecinos*), usually undertaken by bishops. Sometimes their figures are precise, more often they are rounded guesses. Demographers use multipliers that range from 4 to 6, with 4.5 most common. Philip II (ruled 1556–1598) undertook a detailed census, the *Relaciones topográficas*, but data for only a few regions were actually collected. His counselors thought Castile had about 1,250,000 households. Around 1500 there may have been 6,000,000 Castilian subjects, another 100,000 in Navarre, 300,000 in Aragón, 400,000 in Catalonia, and 600,000 in Valencia. Most were Roman Catholics. In 1492 at least 40,000 Jews, of a population that had numbered over 200,000, chose to leave rather than accept Christianity. The rest became or had earlier become "New Christians," mainly under pressure, and were known as *Conversos*. Many Muslims left after 1500, when Islam was proscribed; most, however, some 400,000, remained and accepted Christianity, as often as not superficially, and became Moriscos.

During the sixteenth century Spain's population grew until checked in the late sixteenth century by agrarian crises and recurring epidemics that decreased it by as much as 20 percent by 1660. In 1609–1611, over 200,000 Moriscos were expelled to North Africa. Economic shifts depopulated many northern Castilian cities, even as Madrid and Seville grew. Emigration to the Americas attracted a few thousand each year, while endless foreign wars took more. Growth in population did not return till after 1680, and the 7,500,000 estimated for the early eighteenth century matched the figure for the sixteenth. By the end of the eighteenth century, Spain's population had reached 11,000,000, with much of the growth in Catalonia, Valencia, the Basque Country, and Andalusia. Apart from the overpopulated capital of Madrid and its vicinity, the Castilian heartland recovered more slowly.

Spain's people spoke several languages. Castilian in its several dialects prevailed in Old and New Castile, Andalusia, Murcia, old Aragón, and most of Navarre. In Galicia people spoke Gallego, a dialect very close to Portuguese. In Catalonia, Valencia, and the Balearics, people spoke Catalan. All these were Romance languages and mostly mutually intel-

ligible. In the Basque Country and parts of Navarre, people spoke Basque, a unique language with no relation to the Romance languages. At court, for government, in correspondence, printing, and literature, Castilian came to dominate. Antonio de Nebrija published a grammar for Castilian in 1492, but, until the establishment of the Royal Academy in 1713, spelling continued to vary widely. Catalan and Galician literature, rich in the Middle Ages, would experience a revival in the nineteenth century.

ECONOMY

Most Spaniards worked the soil and lived at a subsistence level. They dwelled communally in villages, towns, and cities. Many peasant proprietors were found across northern Spain, but in the south large estates (*latifundia*) prevailed, owned by a few and

worked by landless laborers. In the seventeenth century high taxes and hard times forced many from the land, and Spain had a conspicuous number of vagabonds. Where lands were arable, cereal crops predominated, save in Valencia, where rice provided an alternate staple. Maintained close to dwellings, gardens provided vegetables and fruit, and poultry provided meat and eggs. Orchards were widespread and Spanish citrus fruit, fortified wines, and olive oil proved profitable exports. While scrub woods suited pigs, much of Spain's land was suitable only for grazing cattle and sheep. Wool provided a major export. Each year vast flocks of sheep walked from winter pastures in southern New Castile and Andalusia to summer pastures in Spain's northern mountains. In a trade that had its ups and downs, Burgos became the center for shipping wool to the

Primer Mapa conocido de España

Cl. Ptolomeo, Siglo II. Impreso en Ulm, 1482

Es de notar en la parte sur de este mapa, la ciudad de Asil (Fernandob), actualmente llamada Ceuta, hacia las costas españolas de Marruecos y sus correspondencias, plantadas en España la religión, las artes y las ciencias y las lenguas de los hebreos. [San Gregorio VII].

Spain. A reproduction of the first printed map of Spain, from the 1482 edition of Ptolemy's *Geographia* published in Ulm, Germany. It was the first edition to contain woodcut maps, which were drawn by Nicolas Germanus, a Benedictine monk. Ptolemy's work was translated from Greek to Latin in 1406 and disseminated throughout Europe. Early Renaissance geographers used it as their model, adding new maps to the Ptolemaic maps of the classical world. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

mills of northwest Europe. Wool shipments to Italian looms were also considerable.

Given Spain's topography, cities of 20,000 people and more, or towns greater than 10,000, generally stood thirty to forty miles distant from one another. Each served as the economic, political, and ecclesiastical hub for its surrounding villages, and provided a focus for the larger regional economy. The lack of navigable rivers and the many mountain barriers limited long-distance transport as well as communication. Most transported goods rode the backs of pack animals. Before the serious improvement of roads in the eighteenth century, wagon

transport seldom left its home region. Until that century, little was done for inland water traffic, despite discussion and periodic planning.

The chief regional economies were those of the major river valleys, the valleys of Catalonia and Valencia, and the maritime economies of the north coast, the gulf of Cádiz, and the coasts of Granada, Murcia, Valencia, and Catalonia. Barcelona, a great medieval commercial center, had been devastated by fourteenth-century plagues, and not till the eighteenth century did it reach its former prosperity. Until that century, local privilege in Castile and the Aragonese realms added further restrictions to in-

ternal commerce. Thereafter, Spain's maritime regions became more closely linked, with a revived Catalonia and the Basque Provinces leading.

Manufacture was chiefly limited to local markets. In ironware, military hardware, and shipbuilding, the Basque Provinces dominated, although ships were built along the entire north coast. Old Castile for a long time had a lively textile industry, but that declined in the seventeenth century because foreign goods were cheaper. In the eighteenth century textiles revived, but mainly in Catalonia and Valencia. Catalonia also built ships, though primarily for the Mediterranean. In the sixteenth century Barcelona's arsenal built Spain's Mediterranean galleys, and Málaga founded bronze cannon.

With the opening up of the Americas, their commerce became an important element in Spain's economy and fed many exaggerated notions of Spain's wealth. The crown made Seville the center of American commerce in 1503, but it soon became a clearinghouse. The influx of treasure in the sixteenth century drove Spanish prices up till Spain could only compete through tariffs and restrictions. Other parts of Europe, with longer experience and better resources, produced cheaper goods that came to dominate the American trade, so long as they cleared Seville. By the mid-seventeenth century, Spain could not even provide sufficient shipping for its American trade.

The European wars of the Habsburg dynasty, a heavy tax burden, and the diversion of treasure, goods, and people to warfare abroad, were the chief causes of Spain's economic woes. In the seventeenth century, inflation was compounded by the debasement of currency. In finance and banking, foreigners, above all the Genoese, supplanted less-experienced Spaniards and took their cut. Though popular theorists known as *arbitristas* proposed plans for economic reform, many of them harebrained, little was achieved before the eighteenth century, when Spain made a remarkable economic recovery under more efficient government, even if its Bourbon rulers continued to go to war.

The recovery was most marked on the periphery, where population and industry grew in what became a relatively free market. Influenced by Enlightenment ideas, many of Spain's elite formed societies of *amigos del país* ('friends of the country')

and stimulated improvements in education, local industry, and agriculture, while the crown promoted agricultural colonies in long-deserted areas. Economic recovery enabled Spain to tighten control over commerce with its empire, which, along with positive results, bred Spanish-American resentment and inflamed aspirations for independence after 1800.

SOCIETY

Spanish society was based on the three Estates: clergy, nobles, and commoners. The clergy was entered by vocation, the others by birth, although service or money might bring a commoner noble status. Spanish religious life was strong, and the church rich, attracting some 200,000 men and women to the clergy at any time. For ambitious people of humble origins, it offered an avenue to fortune and power. In annual income Spain's primate, the archbishop of Toledo, was second only to the pope.

Perhaps 400,000 Spaniards claimed noble status. At the top stood the *grandees*, whose number grew from twenty-five in 1520 to 119 by 1787. With great wealth and often great debts, they maintained their domains through *mayorazgo* ('primogeniture'), and dominated provincial life. Like the number of *grandees*, the number of other nobles with titles grew from perhaps a hundred in 1500 to 585 in 1787. The Bourbon monarchs after 1700 opened a new round in the creation of titles to reward those who served them. With few exceptions, Spanish titles were personal, usually based on one of the holder's domains. Alba de Tormes, from which the duke of Alba's title comes, is simply a lordship, not a duchy. Many without titles possessed domains and were known simply as *señores de vasallos*, 'lords of vassals'. The term *vassal* in Spain, where vestigial feudalism was limited to Aragón and Catalonia, meant anyone under a lord's jurisdiction.

For those claiming noble status, but without domains, the terms *hidalgo* ('nobleman') and *caballero* ('knight') were loosely applied. One was born a *hidalgo*; the king could create a *caballero*, most often as a reward for military service. All natives of some regions, most notably Guipúzcoa, Vizcaya, and Navarre, claimed *hidalgo* status.

Most Spaniards, at whatever economic level and whether they lived in town or country, were com-

Spain. This Ptolemaic woodblock map of Spain is from Sebastain Münster's 1542 edition of the *Geographia*. At the time of this map, Spain was completing a long process of unification. The last Moorish kingdom, Granada, was conquered in 1492 and the expulsion of the Jews followed soon after. The "Lusitania" on the map is the historic name for Portugal, independent since the twelfth century but claimed by Spain during the Spanish Captivity of 1580–1640. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

moners. Unlike the clergy and nobility, they were subject to direct taxes and were often referred to as *pecheros* ('taxpayers').

GOVERNMENT

A monarchy, Spain came under royal jurisdiction. The crown provided justice, made law, organized defense, upheld the church, and collected taxes. From the early sixteenth century, Spanish rulers resided chiefly in Castile and appointed viceroys to their Aragonese and other dominions. To assist the sovereign at court, a system of councils developed that continued through the seventeenth century. The Council of State advised on high policy for all the sovereign's possessions. For Spain there were

councils for Castile and Aragón that dealt with administration and law. The Council of War handled military and naval matters. Spain's overseas empire was the business of the Council of the Indies. As Castile provided most of the revenues, its Council of Finance set fiscal policy, largely a matter of struggling with crown debts. The poorer Aragonese realms contributed little, and that with strings. A Council of Military Orders, of which the king became grand master, managed the orders' properties. Most notorious was the Supreme Council of the Inquisition, established in 1480, with jurisdiction over Christians throughout Spain, an organization suspected of being used for political as well as religious ends.

Spain's Bourbon kings after 1700 eliminated the councils, regarded as clumsy and dilatory, save for an honorific Council of State. In their place they appointed responsible ministers for justice, finance, foreign affairs, interior, army, navy, and overseas possessions. Captains general replaced viceroys in the former Aragonese realms and Navarre. In Castile, hereditary offices were suppressed and captaincies general of maritime regions became appointive.

If the sovereign ruled all Spain, at the bottom, in villages, towns, and cities, noble and taxpaying householders elected councils on which both commoners and nobles served. While female heads of household with underage children might not hold office, they enjoyed limited voting rights until they remarried or a son came of age.

Into the major cities of Castile that came directly under its jurisdiction, the crown sent *corregidores* ('magistrates') to look after its interests. Most *corregidores* were well trained in law, and tended to dominate elected counselors, part-timers who had their own private interests to look after. In fortress towns, the *corregidor* was often a soldier, who was assisted by a legist (a specialist in civil law). In the Aragonese kingdoms cities retained greater autonomy until Spain's Bourbon rulers introduced *corregidores* into them. Everywhere they increased *corregidores'* powers, and later appointed intendants (governors) to each province with even greater authority.

Smaller towns and villages might come under the crown's jurisdiction, or that of an ecclesiastical or secular lord, or the nearest city. It was jurisdiction that defined a seignorial domain and produced income through offices, taxes, dues, and fines. Both jurisdictions and offices were often for sale. The lord of a domain, whether king, churchman, or noble, usually owned some lands and businesses in it, but hardly all. Most belonged to vassals, whether noble or common. Much land, especially pastures and woods, was considered common, and there were understood rights to grazing, cutting wood, hunting, and fishing. In Castile *señores* might appoint their own *corregidores* to villages. Villages often sought greater liberty with payments to crown or lord.

In the provision of justice and making of law, Spain's sovereign was in theory absolute, bound only by divine and natural law, and the fundamental laws of Spain, such as the right of female succession. Legal advisers assisted the sovereign. Two chancelleries, in Valladolid and Granada, served Castile as high appellate courts, with broad authority to supervise municipal and seignorial courts. *Audiencias*, lesser appellate courts, existed in Seville and elsewhere. The Aragonese realms had their own appellate system, and Aragón itself had a *justiciar*, who might challenge the king's rulings. After the Chief Justiciary in Saragossa joined a revolt in 1590, the office was suppressed. Under the Bourbon dynasty, Spain's court system was centralized and further refined.

The church served in many respects as a branch of government. The pulpit was the surest way to reach the entire population. The church was also a great landholder. Churchmen served in high office for the crown. Through concordats with the papacy, the crown gradually gained the right to nominate Spain's bishops for papal approval. Education, hospitals, and feeding the poor were the church's business. In theory, Spaniards tithed, though a third of the tithe went to the crown.

For revenues the crown derived many rights from Roman law, including customs and the royal fifth of minerals, which extended to the gold and silver mines of the Americas. Some rights to salt flats and customs duties had been transferred to nobles during the later Middle Ages, but from the reign of Philip II the crown gradually recovered them. Much of the historic crown domain had been transferred as well, but by Ferdinand and Isabella's acquisition of the grand masterships of the Military Orders of Santiago, Calatrava, Alcántara, and Montesa, the crown regained extensive, though seldom rich, domains. These soon became encumbered with debts.

On Castile, richer than the Aragonese realms at the time of union, fell the chief burden of direct taxes till the advent of the Bourbons. After 1538 nobles no longer sat in the Castilian Cortes ('parliament'), which voted subsidies and approved tax increases. Only thirty-six delegates, two each from eighteen royal towns, attended. While stubborn, they generally yielded to the crown's demands.

Spain. This curious map of the Iberian Peninsula is from Edward Wells's atlas *A New Sett of Maps Both of Ancient and Present Geography* published in a number of editions in the early eighteenth century. An Oxford geographer, Wells intended the atlas as an instructional tool for students, perhaps explaining the stylized printing and relative lack of interior detail. Wells was also a tutor to young William, duke of Gloucester, hence the dedication in the title cartouche. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

From Moorish times the crown held the right to the *alcabala*, in theory a ten-percent tax on sales and business transactions. Its actual rate was lower and required bargaining with the Cortes for its collection by municipal corporations, and increasingly by royal tax collectors and agents of creditors. Only reluctantly, because of mounting debt and repeated bankruptcies, did the crown agree to levies on basic foodstuffs. The Cortes also granted periodic subsidies in addition to the sums raised through the *alcabala*. As the delegates to the Cortes largely came from the elite, the tax burden fell unduly on the poor. Church wealth provided another big source of royal revenue, mainly arranged through

the papacy, on the argument that Spain crusaded against infidels and heretics.

The Bourbon dynasty, which summoned the Cortes only to acclaim succession to the crown, proved unable to overhaul the Castilian tax structure, but, by eliminating regional privileges in the Aragonese realms, it increased revenues from Catalonia and Valencia as prosperity returned to those areas. From the mid-seventeenth century, corporations of tax farmers undertook much of the revenue collection. Beginning in the early eighteenth century, government finances improved and debt began to decline. Ferdinand VI, whose reign was peaceful, saw a surplus. Mexican silver financed the

wars of Charles III (ruled 1759–1788), but with the coming of the French Revolutionary and Napoleonic Wars, debt mounted and government finances turned chaotic.

EDUCATION AND CULTURE

Education was in the hands of the church. Colleges and universities, established in the Middle Ages, concentrated on theology and canon and civil law. To career-oriented students law had the greatest appeal. Science was pursued largely outside the university. Interest in navigation led to an academy of mathematics in Madrid in 1582, while the exotic plants of empire encouraged botanical studies. Though Philip II brought anatomist Andreas Vesalius (1514–1564) to Spain, Spanish medicine remained undistinguished before the work of Andrés Piquer (1711–1772) at the University of Valencia.

Spanish literature of the “Golden Age” peaked with *Don Quixote* by Miguel de Cervantes (1547–1616). Theater flourished with Lope de Vega (1562–1635), Tirso de Molina (1583–1648), and Calderón de la Barca (1600–1681), poetry with St. John of the Cross (1542–1591) and Luis de Góngora (1561–1627). Tomás Luis de Victoria (c.1548–1611) proved a giant of Renaissance music. The Cretan El Greco (1541–1614) caught Spain’s religious fervor in paint, while Diego de Velázquez (1599–1660) took painting to unsurpassed levels. For all its renewed prosperity, however, the eighteenth century produced little remarkable, apart from the powerful art of Francisco de Goya (1746–1828), and some good music, with that of Antonio Soler (1729–1783) perhaps the best.

POLITICAL HISTORY, 1474–1516

Ferdinand and Isabella put an end to endemic civil war, restored government, and in 1492 completed the seven-hundred-year “reconquest” of Spain from the Moors with the conquest of Granada. They expelled Spain’s Jews, avowedly to prevent those Jews who had become Christian from backsliding. Also in 1492 Isabella commissioned Christopher Columbus to seek Asia by sailing west. His discoveries brought an American empire to Spain.

Rebellion by the Muslims of Granada brought expulsion after 1500 of those who did not accept

Christianity. Perhaps 400,000 remained in Spain as New Christian Moriscos, suspected nevertheless by Old Christian Spaniards of insincerity and collaboration with Barbary corsairs and the Ottoman Turks.

Ferdinand’s foreign policy led to the dynastic marriage of Princess Joanna to Archduke Philip, son of the Habsburg Holy Roman emperor Maximilian I. The deaths of her only brother Juan, older sister Isabel, and Isabel’s infant son made Joanna her parents’ heir. When Isabella died in 1504, Queen Joanna (1504–1555) and her consort, Philip I, succeeded to Castile. Philip died in 1506 and Ferdinand became regent for Joanna, who was known as *la loca* (“the Mad”), deemed unfit to rule and confined to a palace at Tordesillas.

HABSBURG SPAIN, 1516–1700

When Ferdinand died in 1516, Joanna’s Habsburg son Charles (Carlos I, ruled 1516–1556) succeeded to Castile, Aragón, and the Italian possessions. Born in the Low Countries, which he inherited from his father, Charles also inherited the Austrian lands on Maximilian’s death in 1519, and was elected Holy Roman emperor Charles V (ruled 1519–1558). Dunning Spain for money, Charles hurried to Germany in 1520, provoking many Castilian towns to rise in the revolt of the *Comuneros*. Feeling threatened, the landed nobility rallied to Charles and crushed the revolt. A revolt in Valencia that mixed urban grievances and hostility to Moriscos was also crushed by the nobility.

Charles bequeathed his Austrian inheritance to his brother Ferdinand in 1522 and returned to Spain to restore his rule, yet after 1530 he spent little time in Spain. Wars with France in defense of his Low Countries and Italian possessions, with German Lutherans and the Ottoman Turks, drained his energies and increased Spain’s debts. In 1556 he abdicated to his Spanish-born son Philip II (ruled 1556–1598). Philip wished to improve government in Spain, but became embroiled in foreign wars. He began his reign with a bankruptcy in 1557 that allowed him to renegotiate his debts. Gaining an edge on France at the battle of St. Quentin (1557), he achieved a favorable peace at Cateau-Cambrésis (1559). Both he and the king of France feared the spread of Protestant heresy. Extirpated by the Inquisition in Spain, Protestantism would prove the

chief issue in the Low Countries, where growing unrest led to open revolt in 1568. By 1580 the Low Countries had divided into a Protestant, Dutch-dominated United Netherlands in the north and the “Spanish” Netherlands in the south. Battling the Dutch Revolt proved a drain on both the Spanish treasury and manpower.

In the same years, Ottoman Turkish ambitions fired conflict in the Mediterranean, and in 1568–1571 the Moriscos of Granada rebelled. Though Philip’s half-brother Don Juan of Austria crushed the Morisco revolt and, in league with the pope and Venice, defeated the Turkish navy at Lepanto (1571), Philip could not sustain simultaneous wars in the Mediterranean and Low Countries. In 1575 he declared bankruptcy again, and in 1578 achieved a truce with the Turks.

In 1580 he annexed Portugal when its legitimate male line died out, and acquired Portugal’s Asian empire with its African way stations. Increasingly fearful of his power, both Protestant England and Catholic France fed the Dutch revolt and attacked Philip’s overseas empire and treasure routes. In 1588 Philip launched his great armada to overthrow Queen Elizabeth and restore England to Roman Catholicism, or at least compel her to cease aiding the Dutch. The armada was defeated, but an English attack on Portugal in 1589 also failed. That year Protestant Henry IV succeeded to the French throne. Philip encouraged Catholic rebels and sent his army of Flanders into France against Henry. In 1590, local issues led to a brief revolt in Aragón. By 1595, Philip was at war with the Dutch, England, and France. In 1596 an Anglo-Dutch fleet sacked

Spain. This map was published by Jan Jansson in Amsterdam about 1626. Around the top and bottom borders of the map are several views of Spanish cities (and a portrait of Philip III), while the side borders contain illustrations showing the dress of the Spanish nobility, merchant class, and peasants. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

Cádiz. Philip vainly counterattacked with armadas in 1596 and 1597, and again declared bankruptcy. In 1598 he made peace at Vervins with Henry IV, now Catholic, and tried to separate the Low Countries from Spain by bestowing them on his daughter Isabel and her husband, Archduke Albert.

Though disease and famine racked Spain in 1599–1601, Philip III (ruled 1598–1621) persisted in war with England and the Dutch. Winning no advantage, he made peace in 1604 in London with James I of England, and in 1609 accepted a Twelve Years' Truce with the Dutch, but refused to relinquish his claims on their lands. Blame for Spain's shortcomings fell on his *valido* ('favorite'), Francisco Gómez de Sandoval y Rojas (1553–1625), duke of Lerma. Unsuccessful abroad and facing economic problems at home, Spain's government expelled the Moriscos, who did not seem sufficiently assimilated and were suspected of conspiring with North Africa. In 1618, war in central Europe involving the Austrian Habsburgs sucked in Spain as well.

In 1621 Philip III died, the Low Countries reverted to the Spanish monarchy when Albert died childless, and the truce with the Dutch expired. Sixteen-year-old Philip IV (ruled 1621–1665) ascended the throne, while a new *valido*, Don Gaspar de Guzmán (1587–1645), count-duke of Olivares, acquired direction of policy. He determined to make Philip IV the greatest of sovereigns, though most Spaniards had become disillusioned by endless wars, heavy taxes, and relentless recruiting. Olivares knew that Castile bore a disproportionate share of the monarchy's burdens and called for a Union of Arms, which would require more from the Aragonese realms and Portugal. Opposition proved immediate. After early victories, the tide of war turned against the Spanish and Austrian Habsburgs. In 1628 the Dutch captured a treasure fleet, impairing Spain's credit even as Olivares pushed into the Mantuan succession crisis that brought war to Italy. In 1635, France openly joined the anti-Habsburg forces it had long aided, and in 1639 the Dutch shattered Spain's last great armada in the battle of the Downs.

Early in 1640 Olivares's policies provoked rebellion in Catalonia. At the end of that year Portugal, its empire savaged by Spain's Dutch foes, de-

clared independence under John IV of Braganza. The growing cry for Olivares's removal succeeded in 1643, when Philip dismissed him. Don Luis de Haro took over direction of policy and sought peace. In 1648 Philip conceded Dutch independence at Münster, but war with France continued over holdings both crowns claimed. Even as Philip recovered Catalonia in 1655, England joined France against Spain. Beaten, in 1659 Philip signed the Peace of the Pyrenees, which both ceded territory and gave his eldest daughter Maria Teresa as bride to Louis XIV of France. Though she renounced all claims to Spain's throne for herself and her heirs, most jurists held that she could not bind them. When Philip IV died in 1665, his sickly four-year-old son Charles II (ruled 1665–1700) became king. Charles's sister, Margarita, married Emperor Leopold I (ruled 1658–1705).

The reign of Charles proved the nadir of Spain's fortunes, though after 1680 there was some faint hope for recovery. Always sickly, he sired no offspring. Bourbon Louis XIV and Habsburg Leopold I each sought to win Spain's throne for a candidate of his dynasty, while Louis nibbled at Charles's possessions that bordered France. In Spain Juan José de Austria (1629–1679), Philip IV's bastard, and the count of Oropesa, chief minister (1685–1691), struggled to maintain government while England and the Dutch tried to arbitrate the anticipated Spanish succession by partition of the inheritance among rival candidates. But Charles rejected partition and Spaniards supported him. Irritated by the Habsburg party at court and aware that France, not Austria, had a navy, Charles's counselors, led by Cardinal Portocarrero of Toledo, persuaded Charles to will his inheritance to Philip (1683–1746), duke of Anjou, grandson of Maria Teresa and Louis XIV, who became Philip V of Spain.

BOURBON SPAIN, 1700–1808

On Charles's death (1 November 1700), Louis accepted Charles's will and dispatched Philip V (ruled 1700–1724, 1724–1746) to Spain. Leopold declared war and claimed Spain for his younger son Charles. In 1702 England and the Dutch joined Leopold in the War of the Spanish Succession. When it ended in 1713, Philip retained only Spain and its overseas empire. Aided by Frenchman Jean Orry, dedicated ministers undertook fruitful re-

forms. In 1724 Philip abdicated to his son Luis, who quickly died, and Philip resumed the throne. His second wife, Elisabeth Farnese, involved Spain in wars that successfully won the Two Sicilies for her son Charles and Parma for her son Felipe. Philip and his son Ferdinand VI (ruled 1746–1759) continued to enjoy the services of ministers committed to improvements, such as Zenón de Somodevilla (1702–1781), marquis of La Ensenada. As Ferdinand was childless, Charles III (ruled 1759–1788) came to Spain from the Two Sicilies.

His enlightened reign saw Spain prosper, after the so-called Esquilache riots of 1766, spurred by the high cost of bread, prompted further reform. Modernizing ministers included the counts of Aranda, Campomanes, and Floridablanca, and Gaspar de Jovellanos (1744–1811), the most renowned. Threatened, the church and old nobility opposed many reforms, and in 1767 Charles expelled the Jesuits, but the Inquisition, an embarrassment to many, survived. Spain allied with France against Britain in the war of American Independence. With Louisiana ceded to Spain by France in 1763, and California opened to colonization, the empire reached its greatest extent.

A year after Charles IV (ruled 1788–1808) succeeded his father, revolution erupted in France. Spain joined the antirevolutionary coalition and went to war. When the regicides who guillotined Louis XVI were overthrown, Spain made peace with France. Manuel de Godoy (1767–1851), Charles's chief minister and purported lover of Queen Maria Luisa, came to dominate the Spanish government and renewed the French alliance. War as France's ally, however, proved disastrous. The battles of Cape St. Vincent (1797) and Trafalgar (1805) destroyed Spain's navy. Napoleon coerced Louisiana from Charles and sold it to the United States. Spaniards demanded peace and at Aranjuez in 1808 popular riots forced Charles IV to abdicate to his son Ferdinand VII (ruled 1808–1833). Napoleon promptly invaded Spain, imprisoned Charles and Ferdinand in France, and put his brother Joseph Bonaparte on Spain's throne. Spain's war of Independence (1808–1813) followed, leaving Spain devastated and its American empire in revolution. The restoration in 1814 of the absolutist Ferdinand quashed the effort of the 1812 Cortes of Cádiz to make Spain a constitutional monarchy, and created

a state of political instability that racked Spain during the nineteenth century.

PETER PIERSON

SPAIN, ART IN. In 1469 the marriage of Ferdinand of Aragón and Isabella of Castile united their respective territories, giving form to what was, even in the fifteenth century, identified as “Hispania.” Their reign saw the surrender of Granada, which brought an end to a seven-century-long campaign to regain the Iberian Peninsula from

the Moors who had invaded in 711; it also saw Christopher Columbus’s voyage to America. The reign of these monarchs—known as the Catholic kings—has long been seen as a “golden age” in Spanish history.

As the monarchs solidified their powers, the court of the Catholic kings was continually on the move. The historian J. H. Elliot sees in this a certain cultural advantage: Isabella, who enjoyed a European reputation as a patron of learning, brought distinguished scholars to her court, whose ideas were disseminated as the court moved about the Iberian peninsula. However, a peripatetic court is not conducive to patronage of painting or collecting. Thus, the monarchs made no effort to encourage training or patronage of native artists and often turned toward Northern Europe to fulfill their needs, which included court portraiture. Such patronage continued a trend famously illustrated by Isabella’s father, John II of Castile, who had founded the Carthusian monastery of Miraflores near Burgos in 1442 and donated an altarpiece by Rogier van der Weyden, described in contemporary documents as “Master Rogier, the great and famous Fleming” (Staatliche Museen, Berlin).

Yet the Catholic kings’ patronage of nonnative artists, such as the Estonian Michel Sittow or the Flemish artist simply known as “Juan de Flandes” (John of Flanders), introduces a trend that is seen throughout the history of painting in early modern Spain, namely, royal patronage of non-native artists whose style then influenced the work of other painters. In the coming centuries, Philip II commissioned from Titian several mythological paintings, known as the *poesie* and illustrating stories from Ovid’s *Metamorphoses*, and Philip IV would commission of Peter Paul Rubens several works, including a series of mythological subjects to decorate his hunting lodge, the Torre de la Parada. And when, in 1701, the Bourbons replaced the Habsburgs on the Spanish throne, they looked to France and Italy for artists to fill the demands at court. The history of painting in Spain is thus a history of cross-currents and international influences, and it is misleading to reduce the story to a strictly nationalist concept of “Spanish” painting.

The influence of Flemish artists is seen in the early works of Pedro Berruguete (1450s–d. by 6

January 1504) but is tempered by lessons learned during the artist's trip to Italy sometime prior to 1483. One of Berruguete's best-known works is a series of paintings for the main altarpiece of the Dominican monastery of St. Thomas in Ávila, several panels of which hang today in the Museo del Prado, Madrid. One of these is a multifigured scene, showing Saint Dominic presiding over an auto-da-fé. While the linear rendering of the figures betrays lessons gleaned from Flemish art, the complex space of the painting, with its stairs and various platforms, suggest the artist's interest in addressing issues of perspective possibly learned in Italy.

In 1519 the grandson of Ferdinand and Isabella came to the Spanish throne as duke of Burgundy and Charles I of Spain, and would ultimately become Charles V, Holy Roman emperor. His need to oversee and protect his vast dominions, which added to the Iberian territories Burgundy, the Netherlands, Austria, Naples, Sicily, and Sardinia, meant that his court was, like that of his grandparents, peripatetic. He nevertheless met Titian in 1529, and from that developed a relationship of patron and artist that would continue until Charles's death in 1558. When Titian joined the emperor in Augsburg in 1548, the result would be a key painting in monarchic iconography that also captures the militaristic nature of his reign: the equestrian portrait *Charles V at the Battle of Mühlberg* (1548; Museo del Prado, Madrid).

PAINTING UNDER PHILIP IV

In 1561 Charles's son Philip II, who had reigned for five years, made the decision to move his court from Toledo to Madrid, perhaps because the winding, narrow streets and medieval infrastructure of Toledo could no longer accommodate Philip's growing retinue. In Madrid, the court would reside in the Moorish fortress of the Alcázar, which would be continually renovated and serve as the residence of Spanish kings until it was destroyed by fire in 1734. Perhaps because the Alcázar no longer exists, Philip II has become more closely identified with the palace-monastery at the Escorial, where the court would reside during Holy Week and on other major church feasts.

The Escorial, commissioned by Philip and built during his reign, is a unique complex encompassing apartments for the royal family and court, a semi-

nary, a monastery, a royal basilica, and a royal tomb. Begun by the court architect Juan Bautista de Toledo (d. 1567), the project was taken over after his death by Juan de Herrera (c. 1530–1597). In 1576 Juan Fernández de Navarrete (c. 1526–1579) was contracted to paint forty altarpieces to decorate the basilica. These were to represent paired saints, and their iconography reconfirmed the validity of the veneration of saints as well as the use of devotional images, both tenets reconfirmed by the Council of Trent (1545–1563). Three months before his death, Navarrete received the commission for the high altar of the basilica. Padre de Sigüenza, a prior of the Escorial who in 1605 provided an invaluable account of its history, wrote that had Navarrete not died, Spain might have been spared the incursion of Italian artists who subsequently took over the decoration of the complex. The main Italian contributor was Pellegrino Tibaldi (1527–1596), who after his arrival in 1588 directed a team of artists to paint the murals in the library and also painted the main altarpiece for the basilica. But the Escorial also lured a painter destined to become far more closely identified with painting in Spain, Doménikos Theotokópoulos, more commonly known as El Greco (1541–1614).

El Greco had arrived in Toledo in 1577, where he was commissioned to paint *The Disrobing of Christ* (1577–1579, Cathedral Sacristy, Toledo) and the main altarpiece of Santo Domingo el Antiguo, the central panel of which depicts the Assumption of the Virgin (1577; The Art Institute of Chicago). In both works, vibrant colors, fluid brushwork, and complex compositions of gesticulating, elongated figures attest to lessons learned during the Greek native's sojourn in Venice and Rome (1568–1577). In the case of *The Disrobing of Christ* several iconographic details met with the disapproval of El Greco's patrons, suggesting that the artist brought with him from Italy a strong sense of artistic license to which Spanish patrons were unaccustomed. The artist's creativity also may have worked against him when, in 1580, he received a commission to paint *The Martyrdom of Saint Maurice and the Theban Legion* for the chapel at the Escorial (1580–1582; the Escorial Museum). In the final painting, El Greco goes against Counter-Reformation dictates, relegating the scene of martyrdom to the distance, while placing in the fore-

ground the consultation among the soldiers that led to the martyrdom. This order was reversed in a second version of the theme, painted by Romulo Cincinato, which was displayed in the chapel; El Greco's painting was relegated to the chapter house of the monastery.

Having failed to win his bid for royal patronage, El Greco returned to Toledo, where he would establish his reputation among a learned group of private and ecclesiastic patrons. Here he would paint what is perhaps his greatest achievement, *The Burial of the Count of Orgaz* (1586–1588, Santo Tomé, Toledo) to decorate the count's refurbished burial chapel. The subject of the painting is the 1323 funeral of this distinguished and charitable citizen of Toledo, at which Saints Stephen and Augustine miraculously appeared to lower him into his grave. El Greco includes portraits of his contemporaries attending the funeral, as the count's soul is taken to the heavens, depicted in the upper half of the painting. Here, weightless and elongated figures are perched on the clouds, likewise witnessing the miracle.

PAINTING IN SEVILLE

During the last years of the sixteenth century, the southern port city of Seville became increasingly important, enriched by trade with the New World. Art patronage often follows wealth, so it is not surprising that the first half of the seventeenth century finds in Seville the young Diego de Velázquez (1599–1661), who would soon move to the court of Madrid and will be discussed in the context of his career there; Francisco de Zurbarán (1598–1664); and Bartolomé Esteban Murillo (1617–1682). Zurbarán and Murillo worked mainly for religious patrons, although we should not overlook the masterful still-life paintings of Zurbarán, or the genre scenes of young children by Murillo, which were the first works by the artist admired widely outside of Spain.

Zurbarán's mature style is characterized by a realism and intense chiaroscuro that give his otherworldly figures a sculptural presence in the here and now. Although these traits might recall the work of Caravaggio, Zurbarán's style is far less Italianate in its absence of mathematical perspective and rendering of volumes. Examined closely, we find his figures to be linear and somewhat flat, traits

countered by the hyperrealistic shadowing. Yet, the absence of Italianate principles does not compromise the power of his figures, exemplified by the almost life-size *Christ on the Cross* painted for the Sevillian monastery of San Pablo el Real (1627; The Art Institute of Chicago). Here, the painter's precise handling and dramatic chiaroscuro demand our attention—as it forced the monastic viewer to contemplate the humanity and sacrifice of Christ. Anatomical correctness is secondary to the overall impact: Christ's arms are too long for his form, and his body, despite its surface modeling, appears without volume in space.

By the 1640s Zurbarán's dominance of painting in Seville would be challenged by the younger Murillo, who soon moved away from a Caravaggesque realism to depicting more idealized figures in a softer, more painterly idiom. It has often been suggested that Murillo's more tempered style provided an aesthetic antidote to the troubles that ravaged Seville at midcentury, as New World trade moved south to the port city of Cádiz. Certainly, the beautiful Madonnas who float in the heavens in Murillo's images of the Immaculate Conception would support this theory. But even in narrative images, such as *The Return of the Prodigal Son* painted for the Hospital of Charity in Seville (1667–1670; National Gallery of Art, Washington, D.C.) realism is tempered, and the theme of love and forgiveness emphasized.

PHILIP IV AND VELÁZQUEZ

Meanwhile in Madrid, Philip III died prematurely at the age of forty-three in 1621, leaving the throne to his sixteen-year-old son, Philip IV. The young Philip did not come alone to power but was accompanied by an Andalusian aristocrat, Gaspar de Guzmán y Pimental, better known as the count- duke of Olivares. Assuming the role of the royal favorite—that is, close adviser and confidant of the king—the count- duke was also loyal to his native Seville. This connection explains the arrival at court in 1623 of the twenty-four-year-old native of that city, Velázquez.

Soon after his arrival, Velázquez established himself as a court portraitist, painting the king, his brother (Don Carlos), and the count- duke. But equally important, his presence at court led him to study the royal collection—rich in works by

Art in Spain. Still life by Francisco Zurbarán, c. 1633. ©FRANCIS G. MAYER/CORBIS

Titian—and also to meet Peter Paul Rubens (1577–1640), who visited the court in 1628. It was perhaps this encounter that led Velázquez to attempt his first mythological subject, *The Feast of Bacchus* (1628, Prado). The painting marks a breakthrough in Velázquez's work, as he creates a multifigured scene, centered on the partially nude figure of the god. Perhaps, too, it was Rubens who inspired Velázquez to undertake in 1629 his first journey to Italy, following an itinerary that would take him to Venice, Rome, and Naples.

During the 1630s Philip IV undertook the construction and decoration of a new pleasure palace in Madrid, to become known as the Buen Retiro. He would commission twelve artists—among them Velázquez and Zurbarán—to paint scenes commemorating recent military triumphs for the ceremonial hall known as the Hall of the Realms. Velázquez's contribution, *The Surrender at Breda* (1634–1635, Prado), shows the degree to which his style had matured since his arrival at court. On a canvas measuring ten feet in width, he portrays the surrender of the Dutch general Justin of Nassau to Ambrogio Spinola. Figures from both armies surround their leaders in a foreground set against a panoramic landscape that is made luminous by the liberal use of white underpainting, covered by glazes of color.

Unlike many court patrons, Philip IV apparently did not limit the range of Velázquez's work and may well have encouraged his experimentation. To be sure, Velázquez continued to paint portraits of the royal family. But he also took up other themes, including portraits of court jesters and dwarfs, mythological subjects, and complex compositions that blend mythology and contemporary genre (*The Fable of Arachne*, c. 1655, Prado). His greatest achievement, blending narrative, theater and portraiture, is *Las Meninas* or *The Maids of Honor* (c. 1656, Prado).

On one level, *Las Meninas* is a portrait of the Philip's daughter, the Infanta Margarita, attended by her retinue. But looking to the left, we find Velázquez painting at his easel and, like the infanta, looking in our direction. Although the object of his gaze is uncertain, it may well be the king and queen, who are reflected in the mirror at the center of the back wall in the painting. Some scholars have suggested that the royal couple has just entered the room, which explains why some of the figures in the painting are aware of their presence and others not. But if this is the case, what is Velázquez painting?

Velázquez marks the zenith of painting at the Habsburg court, and his capable contemporaries and successors at court are diminished by comparison. As a result, such painters as Juan Carreño de

Art in Spain. *The Surrender at Breda* by Diego Velázquez, 1635. THE ART ARCHIVE/MUSEO DEL PRADO MADRID/THE ART ARCHIVE

Miranda and Claudio Coello, who painted during the reign of Charles II (ruled 1675–1700), have not received the attention they deserve.

ART AT THE BOURBON COURT AND GOYA'S BEGINNINGS

On the death of Charles II, it was decided that the grandson of Louis XIV would accede to the Spanish throne. Although this succession was challenged by England, Austria, and the Netherlands, the death of their candidate in 1711 led to the Treaty of Utrecht, which gave the Spanish throne to the Bourbons, who reign to the present day.

This change in dynasty signaled a major change in patronage, as the Bourbon monarchs brought to

Spain Italian and French painters, sculptors, and architects, such as René Carlier, who in the 1720s designed the rococo gardens of the palace at La Granja outside Segovia. Adopting French models, the Bourbons also founded establishments for the manufacture of luxury goods needed by the court, including porcelains, silks, and tapestries. Painters, like the architects and designers brought to Spain by the Bourbons, introduced a radical stylistic change, epitomized by the group portrait *The Family of Philip V* (1743; Prado) by Louis Michel van Loo (1707–1771). Here, members of the court, including Philip's second wife, Elizabeth French, pose in French costume before a draped colonnade that opens onto a park. The Bourbons also encouraged

Art in Spain. *The Family of Carlos IV* by Francisco Goya, 1801. ©ART RESOURCE

new genres, including scenes of life at court, and views of the royal palaces created by Michael-Ange Houasse during the 1720s.

The major artistic undertaking of the mid-eighteenth century was the building of the royal palace, to replace the Alcázar, destroyed by fire in 1734. The Italian Giovanni Battista Sacchetti (1690–1764) worked on the project until 1760, when the new king, Charles III (himself recently arrived from Naples) replaced him with Francisco Sabatini (1721–1797). It was during Sabatini's tenure as first court architect that Anton Raphael Mengs and Giambattista Tiepolo arrived in Madrid to paint ceiling frescoes within the palace. Mengs, in turn, trained Spanish artists, including Francisco Bayeu y Subías, who, as court painter, would proba-

bly introduce his brother-in-law, Francisco Goya y Lucientes, to court in 1774.

Although Goya is more often linked to Velázquez than to any other painter, we should not underestimate the extent to which the cosmopolitan patronage of the Bourbons informed his training. His early training in Saragossa was with a Neapolitan-trained painter, and he traveled to Parma and Rome in the early 1770s, developing a late baroque figural style seen in religious paintings done on his return to Saragossa in 1772. When he was invited to Madrid in 1774, it was to create designs, or cartoons, for tapestries to be woven by the Royal Tapestry Factory of Santa Barbara—one of the luxury goods factories established by the Bourbons. Although his first series, done under the supervision of Francisco Bayeu, were rather staid

hunting scenes, he soon received permission to conceive scenes of “his own invention.” The impetus for the innovative nature of these scenes of life in and around Goya’s Madrid has never been explained but may be indebted in part to the work of French genre painters, such as Houasse (whose works were in the royal collection) or Jean-Antoine Watteau (whose works Goya might have known through engravings).

When Goya turned to portraiture in the 1780s, he worked in a very detailed and descriptive style inspired by Mengs, as illustrated by *The Marquesa de Ponteijos* (1786; National Gallery of Art, Washington, D.C.). The marquesa stands against a pastel landscape, wearing a dress of gauze decorated with flowers and ribbons, in a work whose tones and compositions recall the portraits of Mengs.

In April 1789 Goya won the long-sought position of court painter. But with the downfall of the Bourbons in France, Goya’s patrons would demand an independent identity and iconography. Goya himself would create this identity, as in his royal portraits of the late 1790s—including *The Family of Carlos IV* (1800–1801; Prado); he looked back, not to the French artists brought to Spain under the Bourbon court, but to Velázquez, whose somber palette and painterly style he now emulated. Thus the artist creates a “Spanish tradition” in his quest to define the Spanish identity of his patrons. It is at this point that we can begin to speak of Spanish painting as a willed construction rather than a historical fact.

AFRICA AND THE CANARY ISLANDS

The geographic frontier between the Iberian Peninsula and North Africa is well defined by the Strait of Gibraltar. However, the cultural and religious frontier between those geographical areas has not always been so clear. For five centuries (the eighth to the twelfth centuries) Muslim invaders from North Africa ruled more than half the territory that now defines Spain and Portugal. Thereafter the Christian kingdoms in Portugal and Spain took advantage of factional strife in Al-Andalus—as the Muslims called their Iberian lands—to make rapid territorial gains. Once the great cities of Cordoba (Cordova) and Seville fell to Christian troops in 1236 and 1248, respectively, Castilian armies pushed southward against the remnant of Muslim territories.

The final assault against the Nasrid kingdom of Granada in 1492 completed the Spanish Reconquista. Thereafter the “Catholic monarchs” Ferdi-

nand of Aragón (ruled Castile 1474–1504; ruled Aragón 1479–1516) and Isabella of Castile (ruled Castile 1474–1504; ruled Aragón 1479–1504) established several strongholds on North African shores, forming a new frontier against the kingdom of Morocco and the Ottoman regencies set up in Algiers and Tunis. In geopolitical terms the most dynamic forces were driving from north to south instead of from south to north, as they had in medieval times. Nonetheless, despite the differences in religion and economic outlook that divided the peoples on opposite sides of the frontier, they should be considered as parts of the same complex Mediterranean civilization, as Ferdinand Braudel so eloquently argued. Scholars have traced the divergent history of the eastern Mediterranean (the Maghreb) and the western (the Iberian Peninsula), so a few centuries later Latin Catholics and Sunni Muslims living at opposite ends of the Mediterranean seemed to have little in common.

Regardless of scholarly controversies about the matter, it seems obvious to most observers that the union of the crowns of Castile and Aragón in 1479 and the overseas discoveries from 1492 on impelled Spanish naval and commercial interests to establish several strongholds along the northern coast of modern Maghreb: Melilla in 1497; Oran, Bejaïa (Bougie), and Tripoli in the first decade of the sixteenth century; and finally Ceuta, which had been in Portuguese hands since 1415, in 1580. Thereafter for the rest of the early modern period these and other forts along the Mediterranean and Atlantic coasts of North Africa formed a Christian frontier against Islam.

Exerting an attraction for kings, sailors, and adventurers from both Spain and Portugal, these strongholds also might have served as springboards for further conquests into Africa but for several historical developments. First, the development of Spain's American colonies and Portugal's Asian colonies exhausted most of the energy and resources they had available for overseas development. Second, the strong resistance of local peoples and their Muslim leaders thwarted Christian attempts to capture substantial territory in the Maghreb. The disastrous defeat of Portuguese forces at the battle of Al-Qasr (Al-Kasr Al-Kabir) in 1578 proved to be a powerful deterrent to Iberian ambitions across the Strait of Gibraltar for the rest of the early modern

period. Those ambitions were only renewed in the halcyon days of empire building in the late nineteenth century.

The military conquest and administrative inclusion of the Canary Islands within the crown of Castile took place over the course of the fifteenth century—in other words, as Iberian mariners and adventurers explored into the western Mediterranean and Atlantic Ocean with royal backing. Although such adventures became possible during the last two centuries of the Christian Reconquest of the peninsula from the Muslims, it was by no means easy due to the remoteness of the Canary Islands from mainland Europe and the strong resistance of the native Canarians (Guanches). Eventually, as Iberian colonies were settled on each of the seven islands, a new society began to evolve but largely in a random and unplanned manner. Although precise statistics do not exist, many scholars think that most of the native population succumbed to European diseases and warfare and that those remaining intermarried with their conquerors. For all practical purposes they ceased to exist as a distinct group. By the end of the sixteenth century the whole Canarian archipelago probably held about fifty thousand people.

From the late fifteenth century to 1821 the Canaries underwent a process of increasing assimilation into Spanish political and cultural norms, despite periodic attacks from North Africa and from Dutch and English privateers and pirates in the seventeenth century. By the early twenty-first century the Canary Islands still formed part of the Spanish state, included in the 1978 constitution. Ceuta and Melilla were the last remnants of Spain's colonial presence in North Africa. They were also part of the Spanish state, their position defined by the 1978 constitution and by negotiations in the 1980s.

THE CARIBBEAN

Historiography often renders the Spanish Caribbean islands of the early modern period either as mere backwaters, the initial significance of which was rapidly overtaken by the much larger and more lucrative colonies of New Spain and Peru, or as the "Caribbean experiment," the sites where insular colonialism was first tried before being perfected on the continents. However, from the very first moment of contact the encounters and clashes between Spaniards and native peoples of the Caribbean forged the intellectual and cultural template for Spain's subsequent colonial rule in the rest of the hemisphere. Though the major colonies of Cuba, Puerto Rico, and Hispaniola became the imperial periphery after the conquest and colonization of the mainland empire, they remained strategically important as a periphery that Spain nonetheless defended fiercely. Thus Spain's Caribbean colonies must be understood as integral parts of the early modern colonial system.

CONQUEST AND COLONIZATION

When the inhabitants of the Caribbean islands first laid eyes on Christopher Columbus and his men in 1492, they could not have known that they were witnessing the creation of the modern world. Nor could Columbus himself have understood the fundamental difference of the world that lay before him, as evinced in his assertion, in his famous letter of the first voyage, that Cuba was part of mainland Asia, a continent already known to Europe. The *Capitulaciones de Santa Fe*—the contract between Columbus and the Catholic monarchs of Spain Ferdinand (ruled 1474–1516) and Isabella (ruled

1474–1504) for dividing the imagined spoils of his first voyage, which was typical in form and content to other commercial contracts of its time—also points to the extent to which the monarchs imagined a purely commercial enterprise, not the spiritual and military conquest that New World colonization would become. The necessity of this transformation quickly became apparent with Columbus's return with "Indian" slaves in tow as a gift to the queen. This act, by proving the existence not of the "human monsters" predicted by medieval lore but rather of souls thought ignorant of the word of God, immediately transformed the venture into one of colonization. It also presented a first challenge to the ways in which the world was understood, especially through the Bible, as a known, closed system. Notable among early attempts to recuperate the newly found peoples into received understandings of history include that of Hernán Pérez de Oliva. Despite having never seen the new possessions himself, he wrote a florid account of the meeting of Columbus with the Arawak *cacique*, 'chief', Guarionex in Hispaniola, in which both protagonists deliver stately speeches in the rhetorical style of classical Roman history writing, as exemplified by Cicero. Pérez de Oliva followed classical rhetorical style because it defined historical truth in late antiquity; eyewitness accounts from the New World would fundamentally alter this definition of historiographic authority.

The realities of cultural clash and adaptation on the new colonial ground were far more complex than anything Pérez de Oliva could imagine, and constructing eyewitness accounts of them was a much more compelling exercise for Europeans actually present in the Caribbean. The Caribbean gave rise to the first ethnographic treatise of the modern world, in Fray Ramón Pané's *An Account of the Antiquities of the Indians*. Pané, a friar who accompanied Columbus on his second voyage, was charged by the admiral with learning the religious practices of the inhabitants of Hispaniola. His account, in a form as garbled as Pérez de Oliva's was logical, highlights his constant struggle with cultural understanding, particularly his failed attempts to grasp the structure and function of Arawak narrative style.

These problems of cross-cultural communication were not benign; rather, they directly contributed to the enormity of violence inflicted on the

Spanish Colonies: The Caribbean. This map, which first appeared in a Dutch atlas of 1636, was based on a rare chart of the Caribbean by Hessel Gerritsz compiled several years earlier. In 1628 Gerritsz sailed to South America and the West Indies, charting many of the islands in the area. His influential map was widely copied by other mapmakers. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

native inhabitants of the new colonies. The link between the pretense of linguistic comprehension and violent conquest is present in the ritual, unique to Spanish colonialism, of the *requerimiento*, ‘requirement’. Conquistadores were legally bound to read this document aloud, in the original Castilian, to natives to announce the act of colonization. Once the native peoples were thus conquered, native territories would be subject to the *repartimiento*, the “allocation” of a *cacique* and his people to a particular conquistador, the abuses of which were one of the key factors in the demographic collapse of the native population. In addition, the first systems of anthropological classification of Caribbean peoples, as either Caribs or Taínos (known today to ethnologists as Arawaks), also set the stage for violence. While Taínos were thought docile, Caribs—

said to be ethnologically distinct from Taínos—were considered fierce, wild, and subject to conquest. Peter Hulme’s textual analysis of contemporary Spanish documents, however, shows that this distinction was highly fluid and selectively applied to meet the political and strategic needs of a particular moment. Indeed, one of the key traits meant to distinguish one group from the other was its reaction to conquest: those whose response was deemed peaceful could be designated Taíno, while those who showed signs of resistance risked being classified as Carib.

The combined effects of the *repartimiento*—forced labor, population dislocation, and epidemics (particularly of smallpox in 1518–1519)—led to the demographic collapse of the native populations of the Caribbean. Natives on Hispaniola alone, of

whom Massimo Livi-Bacci estimates there were up to 300,000 before the arrival of Columbus—numbered only 60,000 by 1508; by 1520 they were well on the road to extinction. Yet while the Caribbean saw the birth of genocide and violent conquest in the Americas, it also was the source of the first colonial critiques. Bartolomé de las Casas (1474–1566), who would become the most passionate defender of Indians throughout the Americas, witnessed the conquest of Cuba firsthand as a colonizer before a religious conversion left him a fierce opponent of colonial abuse. While he later catalogued (and some say exaggerated) maltreatment from many colonies, it was his initial witness in the Antilles that served as the template for the moral outrage and rhetorical power that made his most famous work, *Short Account of the Destruction of the Indies*, so influential in its day.

OUTPOSTS OF EMPIRE

After the conquest of New Spain (1521) and Peru (1532), the importance of the Caribbean islands shifted: no longer the principal site of Spanish colonization, they became a colonial periphery. Although the islands had been “granted” to Spain by papal bull, rival imperial powers fiercely contested Spain’s initial dominance in the New World. Although Columbus had in theory claimed all the islands he laid eyes on for the Spanish crown, in practice, significant settlement was limited to Cuba, Puerto Rico, and eastern Hispaniola, leaving many islands underdefended and open to being claimed by rival powers in the early modern period. Thus Jamaica, initially settled by Spaniards in 1509, was captured by the British in 1655, while in 1697 the western portion of Hispaniola, the island that had seen Spain’s first settlement in the Americas, was ceded to France for what would become its most lucrative colony, Saint Domingue. The remaining major colonies—Cuba, Puerto Rico, and Santo Domingo—became the gateway to an empire and were of enormous strategic importance to Spain as it continually fought off the English, French, and Dutch. Havana and San Juan became highly fortified cities, particularly in response to the presence in the Caribbean of British corsairs (Sir Francis Drake was defeated outside San Juan in 1595).

Though now a periphery with the shift of the center of empire to New Spain, the Caribbean colo-

nies were still a part of the colonial system. Havana, because of its role as an entrepôt in the fleet system that lay at the heart of Spanish mercantilism, became a bustling port by the end of the sixteenth century. Because the fleets departed only twice a year, and because the Caribbean colonies were not as self-sufficient as New Spain and Peru, the islands necessarily depended on illegal trade with foreigners. The Bourbon reforms of the eighteenth century, which liberalized colonial trade within Spain and reorganized the empire’s bureaucratic structure, meant a political and economic restructuring for the whole of the empire. For the Caribbean islands the Bourbon reforms marked economic growth and demographic change—the latter due to peninsular immigration and the slave trade—that would not be complete until the full flowering of the plantation societies of the nineteenth century and the return of these colonies to the center of a greatly reduced empire.

JAVIER MORILLO-ALICEA

MEXICO

The Spanish presence in Mexico began in 1519 when Hernán Cortés and his companions landed on the mainland of North America and established a permanent Spanish presence there. The Spanish called the colony the viceroyalty of New Spain. The name of the principal Aztec city—Tenochtitlán—eventually became Mexico (today Mexico City), and this was later applied to the whole territory. The viceroyalty originally covered the whole of what is now Mexico and Central America, as well as much of the Caribbean and the American Southwest. With the growth of Spanish population and the conquest and pacification of more regions, the Spanish divided New Spain, creating additional territories including Guatemala, which consisted of Central America and parts of what is now southern Mexico, and New Galicia, which included the northwestern parts of modern Mexico and the American Southwest, with its capital in Guadalajara.

A viceroy based in Mexico City oversaw the government of the region. Appointed by the Spanish crown, he exercised the administrative function and served as a physical embodiment of the monarch. Each division of the region (Mexico, New

Galicia, and Guatemala) had a high court of justice or *audiencia*. Judges appointed by the king served on these courts and heard cases on appeal from lower courts throughout the colony. In the absence of the viceroy, and in the two inferior territories (Guatemala and New Galicia), the court also exercised some administrative functions. Local magistrates administered smaller internal territories. These magistrates, known as *corregidores*, *alcaldes mayores*, or *gobernadores*, had many duties and obligations, most importantly the collection of taxes and the maintenance of order. The crown occasionally appointed local magistrates, but normally that authority fell to the viceroy or *audiencia*. Within New Spain there were over 200 local magistrates. The towns and cities, governed by municipal councils, constituted the lowest level of government. The councils consisted of aldermen, either elected to long terms by the citizens of the city or appointed to life terms by the king, who also appointed two justices or *alcaldes ordinarios*, who served one-year terms.

Native communities occupied a complex place in Spanish colonial administration. On the one hand, they were subject to Spanish royal authority. On the other hand, the Spanish recognized their preexisting right to self-government, provided that their laws and customs did not violate Christian principles. Native communities, then, had both traditional leaders and a government imposed by the Spanish. Traditional leaders, who might be chosen from any of a number of members of a ruling family, tended to conform eventually to Spanish inheritance patterns, the eldest male heir taking precedence. Native peoples participated in elections for town council members, but these positions too came to be associated with various families and clans.

New Spain’s society consisted of a complex scheme of different castes, each legally defined and occupying a specific place in society. The Spanish occupied the pinnacle of society. Internally a distinction was drawn between Spaniards native to the Iberian Peninsula, called *peninsulares*, and those born in the New World, known as *creoles*. The native peoples, at least in legal theory, consisted of an independent, self-governing republic, the *república de los indios*. Along with these groups, the Spanish brought African slaves. Free persons of color, at

least initially, formed part of the Spanish caste. With the passage of time, mixed groups emerged: *mestizos* (Spanish-Indian offspring), mulattoes (Spanish-African offspring), and *zambos* (Indian-African offspring). Each came to be identified as a caste. With the emergence of other mixtures, the caste system became nearly unworkable. Eventually a middle group of *pardos* (persons of color) emerged to encompass all of the mixed groups, as well as free persons of color and natives who had abandoned native customs, dress, and other cultural attributes.

The ecclesiastical territory contained seven dioceses. Each of the major cities of the region—Mexico, Puebla, Valladolid (modern Morelia), Guadalajara, Oaxaca, Mérida, and Guatemala—had a bishop exercising episcopal control with an archbishop reigning in Mexico. But the evangelization of Mexico largely fell to the religious orders, not to the secular clergy. As the religious orders arrived,

they tended to concentrate their missionary efforts in different parts of the region. The Franciscans, who arrived in 1524, just a few years after the conquest, tended to dominate the central and western region. The Dominicans, who arrived in 1528, focused their efforts on the central and southern region. In 1533 the Augustinians arrived, concentrating their efforts on the western region and filling various gaps in the central zone. Lastly, the Jesuits arrived in 1569, and while they established colleges in the major towns and cities, they focused their missionary efforts on the northern frontier.

THE ECONOMY OF COLONIAL MEXICO

The colonial economy quickly came to depend on the extraction of natural resources, principally silver and gold, and on agricultural production and commerce. Mexico has large silver and gold deposits. The climate of the region varies from dry, desert-like conditions in the northwest, to a temperate

Spanish Colonies: Mexico. Map of Mexico City and environs, engraving by Didac Cisneros c. 1618. ©CORBIS

climate in the mountain valleys of the central region, to hot, humid coastal areas. This allowed for the production of a wide range of agricultural commodities. The mining and agricultural industries were highly interdependent. The crown taxed gold and silver production at 20 percent (the royal *quinto*, or fifth). Much of the gold and silver ended up going to Spain, either as tax remittances or as payment for finished goods imported from Europe. A small part remained to circulate in the local economy, having been minted into coins in Mexico. While nearly every region had some mining, the silver mines were largely at various points along the western cordillera (mountain range). Principal mining districts included Zacatecas in the near north central region in the sixteenth and seventeenth centuries, and Taxco, in the south central region, in the seventeenth and eighteenth centuries. Pachuca, immediately north of Mexico City, was a steady producer throughout the colonial period. After the first high-quality ores had been extracted, miners had to deal with poor-quality ores that defied simple refining processes. In the sixteenth century the Spanish introduced the amalgamation process, in which ores are combined with mercury in a chemical reaction to better extract the silver. This increased production, but the cost of the mercury also increased production costs. The crown declared a monopoly on both salt and mercury, two elements essential to the process; in so doing it could easily regulate overall production of silver, since that production was based on proportions of salt and mercury consumed in the amalgamation process.

Agricultural production fulfilled two major functions. On the one hand, it provided many of the raw materials for mining and the small industrial sector. On the other hand, it produced goods destined for export. Among the agricultural products in highest demand were wool, sugarcane, and cattle. The wool went to local mills, or *obrajes*, which supplied the local economy. The cattle provided hides for export, tallow, bone, and other products for local industry and consumption. Sugarcane was processed by refineries (*ingenios*) and then exported. Niche products included cochineal (a dye-stuff), pulque (a mildly intoxicating beverage made from the maguey [agave]), and silk, until that indus-

try was destroyed by regulations and cheaper Asian imports.

Major agricultural areas developed in colonial Mexico. The lowlands became focal points for sugarcane and other tropical products. The temperate zones with sufficient water specialized in the production of cereal grains, fruits, and vegetables. The dry areas of the north central region specialized in livestock production. It was in this last area that the large landed estate, the hacienda, developed, characterized by livestock production and a moderately large fixed labor force. Nevertheless, similar large-scale ranches and farms also developed to produce cereal grains and sugar. In the case of sugar production, the operations were heavily vertically integrated, with the largest producers owning both production land and the sugar mills.

The commercial sector of colonial Mexico was of tremendous importance. Commerce linked the colony to Spain. Pedro Menéndez de Avilés (1519–1574), captain general of Spain's Indies fleet, organized the annual convoys from Spain to the New World and back in the mid-sixteenth century. Under this system, all ships sailing to New Spain departed from Seville at the same time, and sailed in a fleet to the Lesser Antilles. There the fleet divided, with some ships proceeding to Panama, others to Hispaniola, and the largest part on to the port of Veracruz, in Mexico. Similarly, ships returning to Spain would rendezvous in Havana, Cuba, and sail as a fleet back to Europe. This allowed the Spanish government both to protect the convoy from pirates and to closely monitor all goods and people sailing to or from New Spain. As a result, commercial goods from Europe all landed in Mexico at the same time. The Spanish merchants' guild or *consulado* controlled transatlantic trade. After about 1570, transpacific trade developed between Manila in the Philippines and Acapulco in southern Mexico. This became an important source of exotic goods in the Mexican market, and evolved to such a degree that the *consulado* feared Asian goods would cut into the market for European products. As a result, by the early seventeenth century all Asian goods had to be shipped to Spain before returning to Mexico, though smugglers often avoided the requirement.

MEXICO'S NATIVES IN DECLINE

One of the important features of colonial Mexico was the dramatic decline in the native population. Estimates of the population before the arrival of the Spanish vary, but modern consensus holds that about 25 million natives lived in the region encompassed by modern Mexico. Within 125 years of the conquest, the population had declined to approximately 1.5 million people. The dramatic decline was a result of several factors, most importantly warfare and diseases imported from the Old World to the New. Many natives perished either directly as a result of war or indirectly in the chaos that followed. Among diseases, smallpox, measles, plague, and malaria lead the list of probable pathogens. Added to these factors, the Spanish treatment of the natives also influenced levels of mortality, along with disruptions of social structure, of modes of production, and environmental change.

Immediately after the conquest, the Spaniards sought to control the two most important limited resources: land and labor. The use of natives for the purpose of labor service was important among the rewards provided to the conquerors. Based vaguely on a peninsular Spanish precedent, the institution known as the *encomienda* allocated the labor of a specific population of natives to a conqueror. Although legislation provided for a quasi-contractual arrangement between the natives and the Spaniards, in reality the native peoples fell under the effective control of the Spaniards. As a result of abuses in the system, and other examples of poor treatment of the natives, the crown, spurred on by the Dominican friar Bartolomé de las Casas (1474–1566), eventually placed severe limits on the *encomienda* and set forth a program for its ultimate abolition in a set of decrees known as the New Laws (1542). The crown then moved toward a policy of incorporating the native peoples into a system of free wage labor: that is, natives would contract independently for their services. The crown provided a transitional process called the *repartimiento*, wherein natives were required to perform labor services on a rotational basis, but were paid at an officially established rate. The funds would go to the native community in order to pay taxes back to the state and its designees. In this way the natives would slowly enter into the money economy. By the early seventeenth century, the *encomienda* was rapidly disappearing, and the

repartimiento reached its peak. Neither institution fully disappeared, but continued to decline into the eighteenth century. The final coercive labor institution was debt peonage, which grew consistently through the seventeenth and eighteenth centuries. Under debt peonage a Spaniard would make a small cash advance to a native in return for future labor services. Once engaged, the native could not successfully work off the debt and thus became permanently tied to the Spanish employer.

The eighteenth century saw dramatic changes in New Spain. With the change in ruling houses in Spain, administrative changes followed; the colony fell under more direct royal supervision as a result of reforms implemented by Bourbon rulers. The old system of over 200 *corregidores* was abolished in favor of a dozen or so well-trained *intendants*. The military, which had never played a significant role in the colony, was organized and greatly augmented; militias and new royal units were created. The fleet system disappeared in favor of individually licensed vessels. Control over trade passed from the Spanish merchants' guild to new guilds created in various ports. The crown authorized intercolonial trade. The church lost some of its independence and fell more under the control of the crown, especially as the crown attempted to take over lands and investment capital held by the church. In 1767 the Jesuit order was expelled from the Spanish colonies. These and other reforms served as the impetus for creole dissatisfaction with the Spanish crown, leading eventually to the wars of independence in the early nineteenth century.

JOHN F. SCHWALLER

OTHER AMERICAN COLONIES

The initial phase of Spanish imperial activity in the Americas involved finding, subjugating, and then exploiting nucleated Native American settlements. Later, Spaniards developed mechanisms for creat-

ing nucleated settlements from semi-nomadic Native American groups, gangs of enslaved Africans, and free Hispanic labor. Subjugation was followed by limited Spanish immigration. In the parts of North America that became the United States and Canada, these early purposes were soon expanded to include defensive ones as Spain tried to protect the Bahama Channel and Gulf of Mexico trade routes and, later, to create remote frontiers to protect the mines of northern Mexico from its European imperial rivals.

EXPLORATION AND SETTLEMENT

The Spanish explorers of the coasts of southeastern North America (the area that became the United States)—Francisco Alvarez de Pineda, Diego de Miruelo, Juan Ponce de León, Pedro de Salazar,

Pedro de Quejo, Lucas Vázquez de Ayllón, Pánfilo de Narváez and Alvar Núñez Cabeza de Vaca—found a coastal zone lacking nucleated settlements except for the areas around Sapelo Sound (Georgia) and the Caloosahatche River (southwest Florida). Ayllón and Narváez, in Georgia and Florida, and Cabeza de Vaca, in the Rio Grande valley, picked up hints of nucleated settlements in the interior. Hernando de Soto's epic peregrination in the southeast checked on the former, while Fray Marcos de Niza and Francisco Vázquez de Coronado examined the latter, in each case reporting not only the hardships of their journeys but also the existence of towns of sedentary Indian agriculturalists. Explorations on the coasts of Baja and Alta (U.S.) California failed to find nucleated settlements.

Spanish Colonies: Other American Colonies. This map of the Americas appeared in Abraham Ortelius's *Theatrum Orbis Terrarum*, the first modern atlas, published in many editions between 1570 and 1612. It was more accurate than other contemporary maps, especially in regard to the Caribbean and Central America. The odd-looking bulge in the west coast of South America was corrected in later editions after 1587, but the northwest coast remained unexplored and unknown. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

The Tristan de Luna expedition (1559–1562) to the Mobile-Pensacola area was intended to follow up de Soto's findings with conquest and exploitation of the interior chiefdoms of Coosa and Cofitachequi, but it failed to do so. Supply problems led to a mutiny, and Philip II (ruled 1556–1598) ordered most of the men removed to the Point of Santa Elena (Tybee Island, Ga.); this was in response to what he believed was a French plan to occupy a port on the Atlantic coast and thereby attack the vital Bahama Channel sailing route.

Thus diverted to the east coast and as a counter to French designs, Spanish imperialism in the American southeast took on the defensive posture that would characterize its later actions in North America. French colonies at Charlesfort (Parris Island, S.C., 1562–1563) and Fort Caroline (near modern Jacksonville, Fla., 1564–1565) resulted in the founding of St. Augustine in 1565. It remained the anchor of Spain's southeastern presence until the eighteenth century and the acquisition of Louisiana.

An effective sequel to Coronado's discoveries of the pueblos of the upper Rio Grande Valley was delayed until Juan de Oñate took up the task beginning in 1598. Several earlier efforts had failed.

MISSIONS AND PRESIDIOS: THE MATURE COLONIAL SYSTEM

By the time New Mexico was being subjugated, the Spaniards had worked out the mission-presidio system for inducing semi-sedentary peoples to accept life in nucleated agricultural communities. Offering food, clothing, tools, and protection from raiders (the ostensible reason for the garrison) to gather a population, the mission sometimes used coercion to retain it. Baptisms of the gathered Native Americans provided a justification for continued royal support when the crown, during the years 1600–1608, considered withdrawing the garrison at St. Augustine, the Florida missions, and Oñate's colony. Thereafter, defense against European rivals (in Florida) and Native American raiders of New Mexico again brought the defensive rationale to the fore, even as the missionary impulse continued.

For the balance of the seventeenth century and into the early eighteenth century, the mission-presidio system expanded in both Florida and the southwest whenever the Franciscan friars who manned it could persuade the crown to allow, and pay

for, new ventures. In Florida that meant missions in the nucleated settlements of coastal Georgia and northeast Florida, then inland along the central Florida Ridge, and then in the area of modern Tallahassee after 1633. The Franciscans claimed in excess of 35,000 converts at the height of the missions' population. As Old World diseases reduced Native American populations, the friars relocated the people of outlying settlements into the central mission towns. The Hispanic population numbered less than 3,000. The next extension of the Florida missions would have been into the Creek towns in the Chattahoochee River drainage had not Englishmen from Charleston offered the Creek better prices and products and no overt political or religious control, beginning in 1685. In New Mexico, the nominally converted Indian population was some 17,000 on the eve of the Pueblo Revolt of 1680; there were some 2,500 Hispanic residents there at that time. The Spanish reoccupation of 1693–1694 was followed by less energetic missionary work. Warfare against raiders such as the Comanches and Navajos began long before 1680 and continued after 1694. New Mexico lived a precarious existence but grew to have a population of 19,276 Hispanics and 9,732 Puebloans in 1800.

EIGHTEENTH-CENTURY CHALLENGES

The dawn of the eighteenth century brought new international challenges and a new focus on defensive reasons for Spanish imperial activity in North America. In 1704 a Creek–English force destroyed the Florida missions and effectively confined the Spanish presence to St. Augustine. Farther west, the development of French La Louisiane (1699) provoked the extension of Spanish missions into eastern Texas (San Antonio) and western Louisiana (1690–1693 and after 1716), supposedly to stop smuggling as well as to save souls, although they did little of either. Then in 1763 French Louisiana (population about 10,000) was divided into the British West Florida, along the Mississippi south of modern Vicksburg (and Indian territory between West Florida and the Appalachians), and Spanish Louisiana, which embraced the “Isle of Orleans” and all of the land west of the Mississippi. Viewed from the beginning as a remote defense of Mexico, much as Texas had been, Louisiana became, with Havana, the basis for the Spanish conquest of British West Florida in 1779–1781, as Spain sought to restore its control of

©BETTMANN/CORBIS

the entire Gulf of Mexico as a defense for its economic interests in Mexico. The peace treaties of 1783 ratified that conquest and restored East Florida to Spain (it having been lost in 1763).

In the 1770s on the west coast of North America, rumors of Russian and British interest in sea otter pelts seemed to pose a threat to the use of harbors in California as emergency ports for Spain's Manila galleon trade. Beginning in 1769, the Spaniards built a string of mission-presidios in California as far north as San Francisco, ultimately embracing twenty missions and more than 21,000 converts. In the 1780s Spaniards began to assert their claims as far north as Nootka Sound, on Vancouver Island. The result was the Nootka Sound crisis of 1789–1790, which almost brought Spain and Great Britain to war. Spain backed down because of general naval and military weakness and because Revolu-

tionary France was unwilling to honor the Franco-Spanish alliance against Great Britain. By agreement, in 1795 both Spaniards and Englishmen abandoned permanent camps at Nootka Sound.

THE EBB OF SPANISH IMPERIALISM IN NORTH AMERICA

The Spanish retreat at Nootka Sound marked the beginning of what proved to be a general retreat of imperial activities in the Mississippi Valley and the southeast in the face of growing U.S. demands that Spain recognize the Mississippi River and 31 degrees north as the western and southern boundaries of the United States. Although supportive of the major Native American nations in the southeast in their struggles against American encroachment and instrumental in increasing Louisiana's francophone population, Spain failed to develop a large, loyal Hispanic population in Louisiana and so lacked the

local means to defend the colony. In 1803, the population was about 50,000, half of them African slaves. Moreover, Louisiana and Florida rapidly became economic dependencies of the United States despite Spanish efforts to foster trade within their own empire and with France (before 1793). Pinckney's Treaty of 1795, the Treaty of San Lorenzo of 1800 (the conditional retrocession of Louisiana to France), and the transfer of Louisiana to France in November 1803 marked the steps in Spain's retreat. The Adams-Onís treaty of 1819, effective in 1821, conveyed the Floridas to the United States and set the western boundary of the Louisiana Purchase, preserving Texas (population of about 2,500) as a Spanish province. The Mexican Revolution for Independence of 1821 removed Spanish control of the southwest, ending over three centuries of imperial activity in the areas that became the United States and Canada.

PERU

The viceroyalty of Peru covered virtually all of Spanish-speaking South America, an area that today encompasses all or part of Colombia, Ecuador, Peru, Bolivia, Chile, Argentina, and Paraguay. Its topography and climates vary, from the deserts of coastal Peru and Chile to the rainforests of the upper Amazon basin, the Mediterranean climate of Chile's central valley, and the glaciated Andean peaks and nearby alpine meadows. The unifying element is the

Andes Mountains, which stretch down the western coast of Central and South America from Panama to Tierra del Fuego.

GEOGRAPHICAL SETTING

The Andean mountain range extends south 4,971 miles (8,000 km) from northern Colombia to Tierra del Fuego. In Chile the range is narrow; in Bolivia it is broadest. South of the Gulf of Guayaquil the mountains seem to rise abruptly out of the Pacific, and there is a deep-sea trench along the coast. The highest summits approach 22,966 feet (7,000 m). The vertical distance from the deepest part of the trench to the Andean peaks reaches 45,931 feet (14,000 m). Numerous volcanoes—active, dormant, and extinct—occur throughout the chain, and there are frequent earthquakes. Although ferrous metals and coal are absent, there is abundant mineral wealth, and for centuries deposits of gold, silver, copper, lead, and zinc have been exploited.

The cold-water counterclockwise Humboldt Current sweeps northward along South America's coast; in northern Peru it curves westward. This current, with its prevailing southwesterly winds, provides a temperate climate—even near the equator—and is responsible for the desert conditions of coastal Peru as well. During El Niño periods, the current shifts, and a warm coastal countercurrent from Ecuador filters southward. Rapid increases in humidity, heavy rainfall, and flooding along the normally desert coast occur, causing catastrophic damage. The Humboldt Current also nurtures rich marine life, providing a staple food in communities along the western coast of South America.

PRECONQUEST PERU

When the Spanish arrived in the sixteenth century, the population was spread over the region, on the coast, highlands, and upper Amazon basin. Andean peoples were settled agriculturalists, supplementing their diets by fishing and hunting. In desert coastal valleys some had developed highly sophisticated irrigation and terrace agriculture. There is debate over the number of Amerindians when the Spanish came; 14 million in the polity established by the Inca is generally accepted as a reasonable estimate. That population was composed of several dozen ethnic entities. Quechua and Aymara were the principal language groups, and there were many dialects and other discrete languages. Under Inca Pachacuti

in the mid-1400s, the Quechua-speaking Inca united many Andean ethnic groups in a period of rapid expansion from their base in and around the Cuzco Valley. This relatively recent empire was in turn quickly conquered by a small group of Europeans under Francisco Pizarro.

EUROPEAN CONQUEST AND SETTLEMENT

In contrast to Mexico, where Spanish conquest and stable political organization came quickly, Peru's first years were characterized by native resistance, rebellion, and internal strife among the conquerors. A division of authority among partners Francisco Pizarro, Diego de Almagro, and Panamanian cleric Hernando de Luque (acting for a silent investor) led to dissension. Pizarro conducted most of the exploration along South America's west coast, Almagro supplied men by sea, and Luque handled affairs in Panama.

Hardships were extreme and many explorers died. The halting second expedition (1526 to mid-1528) reached the mid-coast of Peru, where they first encountered conclusive evidence of wealthy populations. The partners agreed to return Pizarro to Spain to report and secure royal authorization for conquest and settlement. The contract with the crown (26 July 1529) provided Pizarro with the lion's share as governor and captain general, leaving Luque bishop of Tumbes, and Almagro the administration of its fortress.

The suspicions of the partners in Panama were realized—Pizarro was untrustworthy—and future interactions among the men were based on distrust and greed. Almagro's complaints to the crown ultimately led to his appointment as governor of the land south of Pizarro's jurisdiction, but the boundaries and wealth of the territory were unclear.

The third and final voyage of discovery began in December 1530. Much time was wasted in coastal Ecuador, with the result that it was not until September 1532 that San Miguel de Piura was founded as a Spanish town on Peru's north coast. At San Miguel, Pizarro left the ill and old and marched toward the Inca heartland. There were only 168 Spaniards, but they took Indian allies with them. The Inca Atahualpa was resting with a large army near Cajamarca, following victories over his half-brother Huascar. Both had contested the succession after their father Huayna Capac succumbed to

Spanish Colonies: Peru. This bird's-eye view of the Inca capital of Cuzco in Peru was published in Braun and Hogenberg's *Civitates Orbis Terrarum* not long after the Spanish conquest. Supposedly based on travelers' accounts, the plans of Cuzco and Mexico City were the only views of New World cities to appear in this famous collection of urban plans. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

smallpox in the mid-1520s. Atahualpa was surprised, taken captive by the Spanish, and forced to rule as a puppet until his execution (26 July 1533). The Spanish were offered a ransom—Atahualpa promised to fill two large rooms, one with gold, the other with silver—but, in spite of his compliance, he was killed on the basis of dubious charges.

The Spanish then marched southward through the Andes toward the Inca capital, and finally entered Cuzco (14 November 1533). Native resistance was modest; not all Andean ethnic groups rallied to the Inca cause. Pizarro, as the expedition's governor and captain-general, held extensive political authority. His contract with the crown empowered him to distribute treasure, provide the conquistadors with tributary grants (*encomiendas*, a system that gave the Spanish control over native populations and required those populations to pay tribute to them), establish cities, and distribute unclaimed lands. His power was checked only by Spanish custom and the presence of a royal legal agent and treasury official.

Spanish cities were quickly founded: Cuzco (23 March 1534), Lima (6 January 1535), with Trujillo, Puerto Viejo, and Guayaquil before year's end; Chachapoyas and La Plata in 1538, Huamanga in 1539, and Arequipa in 1540. Personal rivalries and the internecine fight for spoils, however, prevented the early creation of a stable administration. To summarize a complex series of events: Almagro set out from Cuzco to explore his supposedly rich domain to the south in July 1535. Shortly thereafter a generalized rebellion against Spanish rule in the Andes, extending from north of Lima to Lake Titicaca, erupted under the leadership of Manco Inca. Cuzco was besieged by thousands of natives and communications were cut between the Spanish camps. Almagro returned from his disastrous reconnaissance of Chile in 1537 and helped lift the siege. He now claimed that Cuzco lay within his jurisdiction and captured Hernando Pizarro. But at the Battle of Las Salinas (26 April 1538), Almagro was captured, tried, and subsequently executed by Pizarro. Three years later (26 July 1541), a group of Almagrists under Almagro's mestizo son, Diego de Almagro the Younger, surprised and assassinated Francisco Pizarro in Lima and took control of the realm. The crown already had sent a new administrator, Cristóbal Vaca de

Castro, who carried orders to investigate the problems besetting Peru and bring to justice those implicated in Pizarro's death. In the ensuing Battle of Chupas (16 September 1542), Governor Vaca de Castro defeated Almagro the Younger, who was later captured and executed.

At this juncture one might expect that royal authority had been fully established. Indeed, by the New Laws of 1542, the viceroyalty of Peru was created, and its *audiencia* (royal court) authorized. Both the justices (*oidores*) and the first viceroy, Blasco Núñez Vela, were authorized to sail to Peru and to found a government in the coastal capital of Lima, but the New Laws also included important provisions for the protection of Amerindians living under the *encomienda* regime. Most devastating for settlers hoping to establish American dynasties, the grant was to be only temporary. In Mexico, Viceroy Antonio de Mendoza suspended enforcement of the legislation pending review of its impact, thereby avoiding rebellion.

In Peru, Núñez Vela made clear his intent to enforce the new order no matter the consequences. Not surprisingly, the *encomenderos* (the Spaniards who collected tribute from the Indians) resisted. Their captain was a reluctant Gonzalo Pizarro, another Pizarro sibling. The new viceroy's arrogance and his involvement in the killing of a royal official convinced wavering colonists to join the movement. The viceroy was imprisoned and shipped to Spain, but escaped in Ecuador and collected a royalist force. The rebels under Pizarro defeated the viceroy at the Battle of Añaquito near Quito (18 January 1546), and the viceroy was killed.

Aware of the deteriorating situation in the Andes, the Council of the Indies named cleric Pedro de la Gasca president of the *audiencia*, gave him broad powers, and sent him to inspect the land and reestablish royal authority. Armed with blank papers signed by the king, he reached Panama in August 1546 and slowly began to collect adherents by issuing pardons and rewards. In spite of their rebellious nature, the Peruvian elite largely supported the monarchy; there was, after all, no alternative example of an independent Andean realm under European leadership.

There were two important battles. In the first, the Battle of Huarina (21 October 1547), royalists

were soundly defeated by Caravajal's effective use of artillery. Pizarro, however, was unable or unwilling to complete his victory, and he moved southward toward Lake Titicaca instead. In the Battle of Xaquixahuana (9 April 1548), near Cuzco, Pizarro's supporters deserted and crossed the field to the side of La Gasca. Pizarro was taken and executed, along with Caravajal and other ringleaders, a few days later. This victory largely brought the Spanish settlers under royal authority, although there would be brief, weak uprisings in the mid-1550s.

ADMINISTRATIVE ORGANIZATION

By the early 1560s the administrative superstructure was largely complete and the vicerealty system seemed firmly established. Lima was the capital. The viceroy, sometimes a relative of the royal family, who by birth and education could command respect, was appointed in Spain by the Council of the Indies. The viceroy's arrival in Peru with his large retinue of extended family and other officials was celebrated with festivities and civic displays. There were twenty-three Peruvian viceroys under the Habsburg dynasty; their average tenure was eight years. Frequently, they first served as viceroy of New Spain, a less prestigious post. The viceroy was the chief military and administrative officer: he sat as president of the *audiencia* when it was in session, appointed lesser officials and supervised administration, and was responsible for defense in times of emergency. His power was checked only by treasury officials with a direct link to the Council of the Indies, and individuals who were willing to communicate directly to the crown to voice their concerns. This occurred surprisingly frequently, for subjects could always directly petition the king. There could be open or secret investigations (*visitas*) of his administration, and, at the end of his term, he was subject to review (*residencia*).

The *audiencia* in the viceregal capital took precedence over lesser courts. *Audiencias* were established in Panama (1538), Lima (1542), Santa Fe de Bogotá (1549), Charcas (1559), Quito (1563), Chile (1565, 1609), Buenos Aires (1661, reverted to Charcas in 1671), and finally Cuzco (1787). The president presided with four to a dozen *oidores* ('chief justices'), depending on the period and importance of the jurisdiction. The president was usually the oldest *oidor*, and, when a viceroy died or was

absent for some reason, the president of the *audiencia* served as chief official. In its normal activity as a court, the *audiencia* met several times weekly. Appeals of the court's decisions went directly to Spain's Council of the Indies. There were several associated officials of the court including a secretary, a recorder, a solicitor (*procurador*), a chaplain, and the crown's attorney (*fiscal*). Almost all the higher officials came from Spain.

The closest experience to local rule in the vicerealty was the town councils (*cabildos*). The *cabildo* had jurisdiction over all the territory from the boundary of one Spanish city to another. Officials came from the local elite, those with land and Indian *encomiendas*; they were named by the leader when the town was founded. Pizarro, for example, founded towns such as Lima and Trujillo, and made the original land grants, both urban plots and rural agricultural lands, and named local officials. Afterward, the city, as a corporation, assumed the right to sell or rent lands, levy taxes, regulate trade and prices, oversee the markets and construct bridges, public buildings, and a water supply. The council met regularly. In the first meeting in January the body elected officials such as the two *alcaldes ordinarios* ('town magistrates'), the *regidores* ('town councilmen' or 'aldermen'), the *alguacil mayor* ('sheriff'), a jailor, and inspectors of weights and measures and other officials. The number of *regidores*, usually four to eight, depended on the importance of the place. Under the Habsburgs the crown sold many offices to relieve financial strain. The *cabildo* could act as a minor court in lesser crimes. According to Viceroy Francisco de Toledo's Ordinances, Indian towns had a similar administrative structure.

At first, control of the native population of the countryside was left to *encomenderos*, but because of their abuses of power this quickly changed. In the mid-1560s Governor Cristóbal Garcia de Castro introduced the *corregimiento* system that divided the vicerealty into several dozen units under an Indian agent called a *corregidor*. By then the *encomenderos* were forced to reside in the nearest Spanish city rather than in their *encomienda*. The *corregimientos*, often composed of several *encomiendas*, paralleled Andean ethnic units or Inca provinces. The *corregidores* collected tribute in goods and cash, administered justice as judges in

Spanish Colonies: Peru. A map of Peru and the Amazon watershed, identified as "The Land of the Amazones, Little Known," from an early-eighteenth-century edition of Herman Moll's *The Compleat Geographer*. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

minor cases, supervised local church activities, and provided security. They also disbursed funds to pay the salaries of local leaders and teachers of religion, and doled out to the *encomenderos* their share of the tribute. Their term of office averaged three to five years, and, in order to avoid corruption, they were to come from the outside and not have relatives in the same district. There were frequent abuses, however, because their salaries were insufficient and there were numerous ways in which an enterprising *corregidor* could supplement his income.

THE COLONIAL ECONOMY

The colonial Andean economy was based on three pillars: a largely Amerindian labor force; mining, principally silver and, concurrently, mercury, which boosted silver output; and agriculture. Several economic cycles operated. In the first months and years the economy was blatantly exploitative; the goal of most Spaniards was to extract the maximum amount of wealth as quickly as possible and return to Spain. The sacking of local leaders and despoliation of burial sites went on as long as the treasures, amassed

over generations, could be easily expropriated. Incredible riches were despoiled: 168 men, for example, shared the booty of Atahualpa's ransom. The astute and fortunate quickly returned to Spain. Unfortunately, the men who arrived earliest had control of the lion's share of the treasures. One quickly sought-out source of wealth and power was the *encomienda*, which provided a cash tribute payment plus access to labor in return for bringing Christianity and "good government" to the Indians. A large *encomienda* permitted a life of leisure for the Spanish recipient, so grants were worth fighting for. The first systematic distribution of *encomiendas* by Pizarro occurred in 1538, although he had made grants earlier when the first Spanish cities were founded.

Another avenue to wealth came through land. In early colonial Peru a land grant without laborers was almost worthless. Here the Spanish attitude of *hidalguía* ('nobility') prevailed: a gentleman did not labor with his hands. As long as there was an ample native population, or, later, African slaves, there was no problem, but the number of Amerindians began to decline steadily. Around 1560, however, land became a viable source of wealth and power; by then all the available Indians had been granted in *encomienda*. Outright enslavement of Indians was prohibited by the crown, and, except for a trickle of captives taken during rebellion or in frontier regions, Indian slavery did not provide labor for the colony.

The state played little economic role in the conquest; the enterprise was largely left to individuals or family investors, who pooled resources to join in the expeditions. Spain merely authorized the actions, naming someone to be the principal leader, and then made certain that royal treasury officials were present to take the king's share. At first the most important revenue for the crown was the *quinto*, or fifth, that the government received for any mineral wealth, precious stones, and other key products. With the mines, the crown received a stable and reliable source of *quinto* revenues for many decades. The crown also administered part of Indian tribute. The sales tax, or *alcabala*, was collected on petty commerce in the Spanish cities, but not in the barter economy of the rural countryside. There were many other minor sources of revenue: government monopolies on playing cards, ice, and stamped paper;

taxes on the sale of slaves; and special taxes to assist in paying costs for transportation and defense. In the seventeenth century, the crown increasingly resorted to the sale of public offices.

Much gold was taken during the first years of the colony, with much of it being plundered. Gold was also extracted in many places in the viceroyalty; for substantial production, placer mining in riverbeds that carried alluvial gold dust and nuggets was preferred. Unfortunately, the costs of placer mining, which required a large labor force, often consisting of expensive imported slaves, were too high to warrant exploitation, save for a few very rich gold sources such as Carabaya in the upper Amazon basin or Colombia's Atrato River.

Silver ore, on the other hand, was ubiquitous, and silver mining was the key to the economy of colonial Peru, and, indeed, fueled Spanish imperial activities. There were dozens of quickly exploited mines. The most famous was Potosí; the mountain, which had been known by native miners, was "discovered" by Spaniards in April 1545. Within months there were more than a dozen significant mine operators, each vying to secure the richest veins and competing for laborers. A principal problem was extracting the silver from the crushed ore, which required substantial heat. There was no coal, or even wood for charcoal, at Potosí's elevation of 13,123 feet (4,000 m). Native technology relied on small puna-grass-fired blast furnaces located on the top of slopes where wind was strong and predictable. Such a method of combustion functioned only while the supply lasted. Fortunately, it was discovered that mercury has an affinity for silver, and under the right conditions combines with it, extracting silver from crushed ore. The amalgam can be heated at relatively low temperatures, the mercury comes off as a gas, and the molten silver remains to be poured into a mold to form an ingot. One of the world's richest sources of mercury was discovered at Huancavelica in Peru's central Andes in 1565.

With the technical problem of production solved, the labor supply once again became the primary issue. Viceroy Toledo solved that dilemma with the *mita* system. By his order, one-seventh of the tributary population of sixteen Indian provinces near Potosí was required to work in the mines one

month each seven years as *mitayos*. It was paid labor, and there was a daily stipend and travel allowance, although the amount was less than the market price. Toledo partly borrowed the idea from the Incas, who used *mitayos* on great public works projects. Under Toledo, *mitayos* were also used in Spanish cities for the *mita de plaza* to help build churches, city offices, bridges, and water systems, and they were also used in other essential activities. Such labor demands could disrupt native subsistence activities, with damaging consequences. Furthermore, work in the mercury mines was unhealthy, and there were constant fatalities associated with all mining efforts: cave-ins, flooding, and dangerous gases.

Although colonial mining was the economic engine supporting Spain and her imperial demands in Europe, agriculture also played a role in the viceroyalty of Peru. Herding and the associated production of wool were a constant in the Andean highlands. The animals could be native llamas and alpacas, or imported sheep, and woolen cloth was required as part of the Indian tribute payment in wide sectors of the Andes. Production tended to be in the hands of families, with women doing most weaving, similar to “cottage production” in pre-modern Europe. Here, however, it was not for profit, but tribute payment. The amount varied, but was usually not more than one piece per adult male tributary each year. Quality also varied, with substantial cloth production consumed internally rather than being sold for export. In some regions small textile mills (*obrajes*) were established by European entrepreneurs, with production for export in mind. Indians worked in these—those in the *audiencia* of Quito district were famous for their blue wools—and female and child labor caused cries of alarm by those witnessing abuses.

Wheat was introduced and proved adaptable to highland production. At first wheat production tended to be cultivated near Spanish cities, for the European populations, but by the eighteenth century much wheat produced in the viceroyalty was grown in the central valley of Chile. The native population continued to prefer native staples: corn, potatoes, quinoa, or, in warm humid areas, corn and manioc. Of course there were a host of native plants that had been domesticated that continued to be preferred by the autochthonous population. Europeans introduced grape and olive cultivation, but

these products competed directly with Andalusian wine and olive oil shipped by Sevillian merchants, and regulations against American production, coupled with technical difficulties, meant that they never achieved true export status in the colonial period.

For alcoholic beverages the native populations used *chicha*, a light corn beer, or *aguardiente*, produced from sugarcane. Sugarcane was introduced into some of the irrigated valleys of north and central coastal Peru, and by the early seventeenth century was produced in quantities ample for local supply. In Paraguay, however, sugarcane was planted for export. Jesuits often participated in the direction of the plantations in both locales.

THE SOCIAL ORDER

Colonial society was hierarchical, with clear distinctions, making it possible to identify one’s position in society. At the same time there was a near caste order, with the blocks of Amerindians, Europeans, and sub-Saharan Africans providing the human material for an evolving colonial society. Although the social groups were initially separate, the evolution was toward a mestizo world.

When the Europeans entered the Andean world, indigenous ethnic peoples varied; there were dozens of separate linguistic groups, with a wide range of possible cultural characteristics. The Inca empire covered much, but not all, of the territory that would be called the viceroyalty of Peru. The Inca had accepted and maintained local folkways, even as they were attempting administrative uniformity, religious acceptance of a general Inca cult, and the use of the Quechua language. The Spanish continued Inca policies, including quechuaization, with Christianity replacing the imperial cult. The common division of native society was between commoner and leader, called a *kuraka* (‘chieftain’). Leadership was usually not hereditary, but based on merit, although the tendency was for leadership to be held within certain families. There was always a group of elders that commanded respect and was involved in any important community decisions. In Andean societies there was rough gender equality, with parallel inheritance. The fundamental social unit was the *ayllu*, an extended family unit that understood itself as having a common ancestor, generally not identified as a person, but as a physical

place, such as a volcano, spring, or lake. The *ayllu* shared resources and production, and collaborated on various activities necessary for group survival. It was not a money economy; products were exchanged as needed among *ayllu* members on the basis of customary value equivalencies. In the central Andes there was also a moiety-like structure, with divisions into halves called *saya*. There is considerable debate about the nature of both *ayllu* and *saya* among ethnohistorians. There was competition between the *saya*, some of it ritualized, which may have contributed to community stability.

The Spanish adopted these rather complex structures as they set up the viceroyalty of Peru. They ruled in conjunction with the local *kurakas*, giving them a special status, permitting them to wear silk, bear arms, and ride horses, normally prohibited for the Indian commoners. The *kuraka* helped collect tribute for the Spanish officials, they chose the *mitayos*, and they helped maintain community solidarity. Although all Amerindians could participate in agricultural activities, there was specialization of labor.

Hierarchy also existed within the African community, and the legal condition of slave or free marked the first boundary. Africans came on the earliest expeditions, and their number increased rapidly after the Spanish began to found cities. The number of free blacks engaged in the trades was initially small, and they clustered in skills such as blacksmithing and tanning. Successful wealthy conquerors often purchased household slaves, who provided a status symbol representing conspicuous consumption, since slaves were costly in the early colony. With the collapse of the Amerindian population along the viceroyalty's coast, increasing numbers of slaves were imported to labor on coastal sugar and cotton estates. The Jesuits came to use large numbers on various plantations. Slaves were also used in placer gold extraction in the Esmeraldas district of coastal Ecuador and in rivers of the upper Amazon basin.

Labor conditions were so harsh in some of these that numerous slaves escaped and set up runaway communities of their own. Those of coastal Colombia and Ecuador are particularly well-documented. The Catholic Church viewed the soul of the African to be just as valuable as the soul of anyone else. As a

result, the question of the immorality of holding another person in bondage worried the Spaniard, and manumission was viewed positively. There were frequent manumissions of slaves by their masters at important life events, such as a marriage, birth of a child, or the approach of death. The demographic consequence within the viceroyalty was a continuously growing population of free blacks, who tended to cluster in the Spanish cities, especially along the coast. Within that free black community there was also a hierarchy, with some slaves also owning slaves.

There were two principal elements in the European group, the *peninsulares*, those who were born in Europe, and the creoles, those born in the New World. The *peninsulares* usually held the political appointments, whereas the creoles tended to be wealthier. It is no surprise that there was friction between them. The European social ladder was based on wealth; nonetheless all Europeans, no matter how poor they might be, saw themselves as superior to the other groups. Hence, Spaniards of lesser status, including miners, artisans, and craftsmen, as well as drifters in search of fortune, attempted to throw off their low-status baggage and emulated the lifestyle of the elite. Although it was difficult to convince other Spaniards of their new status, the Indians, blacks, and mestizos had little choice but to suffer their overbearing ways. Given that only the first conquerors had any real chance of success in securing an *encomienda*, the newcomer might make it through trade, perhaps first as a merchant's factor, or in mining, given technical knowledge. Any excess capital would be invested in land, which provided the foundation for social recognition.

Preferred marriage was within the group. Although families played a large role in the selection of a spouse, during the sixteenth and seventeenth centuries there was a remarkable degree of individual choice. The Spanish woman was expected to uphold all the Christian virtues and to be an emblem of the family; beyond this there was a remarkable range of possibilities. The married Spanish woman could expect to have a household servant or even a slave, which was less likely for her female relative in the peninsula. In the absence of a male in the household, either by death or prolonged absence, the woman assumed the full range of economic activi-

ties, administering the household, supervising business, even buying and selling properties. The Spanish pattern of inheritance was for equal distribution of the estate, which provided the daughters with virtually the same capital as their brothers. Only the very rich with an entailed estate (*mayorazgo*) provided the eldest son with the major property and title.

The process of mixing the three primary ethnic populations began immediately and continued throughout the colonial period. From the European standpoint the mixture was most pronounced in the first decades when there were few Spanish women. Francisco Pizarro, Diego de Almagro, and other leaders set the example. The mixed offspring foreshadowed the future population, but their access to high social standing was frustrated. In the first place

many, if not most, were illegitimate. Many conquistadores took Indian women or black slaves as concubines and produced numerous progeny, only later to discard the mother and her brood and marry a Spanish woman. In some cases elite native women, for example the Inca princesses (*ñusta*), or daughters of *kurakas*, who brought land, livestock, and other sources of wealth into the relationship, might secure legal matrimony. There are several well-known cases of such matches, perhaps the best-known being the marriage of *ñusta* doña Beatriz Coya, one of the granddaughters of Inca Huayna Capac, to Captain Martín García de Loyola, a relative of the founder of the Jesuit Order. The possibility for social advancement of the mestizos was limited, for they were between worlds. Raised by their mothers and too often rejected by their fathers, they

were portrayed in the popular literature as shifty, untrustworthy, and volatile. The church might have provided an avenue of social mobility for them, but after several notorious cases of misbehavior by mestizo clergy, the church rejected the idea. The church also rejected an Indian clergy. Not all mestizos were unsuccessful, however, and many gained status and recognition as majordomos, muleteers, petty merchants, and miners.

SPIRITUAL CONQUEST

The process of effective Christianization of Andean South America was slow and required generations. Hernando de Luque, one of the three original participants in the conquest of Peru, was named “Protector of the Indians” and bishop of Tumbes in 1528, although he never reached his post. The first clergyman in Peru was friar Vicente de Valverde, who confronted the Inca Atahualpa with religious text in hand at the square of Cajamarca in 1532. The encounter boded ill for Christianization. Efforts to bring Christianity to the Indian populations were at first left to the leading figures. Pizarro invited clerics and friars, and with grants of *encomiendas* the Spanish recipients were initially required to find someone to catechize their Indian charges. By the 1540s representatives of the principal church orders were present: Dominicans, Franciscans, Mercedarians, and the Augustinians. The Jesuits arrived in 1569 and soon played a major role in educating the children of the region’s elite. Much of the conversion of Indian parishes (called *doctrinas*) was left to the friars; the secular clergy preferred to work in the churches of the Spanish cities where opportunities for advancement were greatest. Soon convents were established in the major centers for daughters of the conquistadores and the native elite; Cuzco alone had the convents of Santa Clara (1558), Santa Catalina (1605), and finally Santa Teresa (1673).

The church’s administrative hierarchy evolved rapidly. In 1538 Dominican friar Vicente de Valverde became first bishop of Cuzco, a diocese that extended from modern Colombia to Chile. Lima became the seat of a bishopric in 1541, under the leadership of another Dominican friar, Jerónimo de Loaysa, and by 1549 it had become an archbishopric holding spiritual jurisdiction over all Spanish South America. By the early seventeenth

century, bishoprics were seated in Charcas, Paraguay, Buenos Aires, Tucumán, Santiago de Chile, and Concepción. For effective conversion it was necessary for the clerics to learn Amerindian languages, and dictionaries and grammars prepared by missionaries quickly began to circulate in manuscript form. The first book published in South America was the *Doctrina Cristiana*, a trilingual text in Spanish, Quechua, and Aymara, published in Lima in 1584.

There were several general church councils to oversee the Andean mission. One of the most important was the Third Lima Church Council of 1583, which resulted in the standard catechism, in conformity with the precepts of the Council of Trent. Purity of the faith of the Amerindians was handled by religious inspections ordered by the bishops, a principal task being to extirpate idolatries. The natives were exempt from the Inquisition, however, introduced into Peru by Viceroy Francisco de Toledo in 1570. During its active years, between 1573 and 1773, thirty people were condemned and executed for a variety of offenses, from witchcraft to Protestantism of various sorts to “converted” Jews who practiced Judaism in secret. Hundreds of others received lesser sentences, and the institution successfully checked the spread of nonconformity in the colony, as it reinforced respect for authority. Although the conversion of Andean peoples was largely successful, native traditions were deeply embedded and quickly blended into the daily practices of the colonial church.

NOBLE DAVID COOK

THE PHILIPPINES

The powerful nations of Europe undertook a global project of imperialism and colonization in the late fifteenth century. Spain and Portugal, followed by other European states, used religion as a motivating force for economic expansion. As a result of Europe's conquests and attempted conquests, the

Americas and large segments of Asia were eventually subjugated and annexed as European possessions or outposts. Following Columbus's expeditions to America, Cortés's conquest of Mexico in 1519, and Magellan's "discovery" of the Philippines in 1521, a series of unsuccessful Spanish attempts to colonize the Philippine archipelago took place. It was not until 1565 that the first permanent Spanish settlement succeeded under Miguel López de Legazpi, a minor Spanish official in Mexico. It remained part of the Spanish empire until 1898.

On 13 February 1565, an expedition set out from New Spain (Mexico), reaching Gamay Bay off Samar Island, then proceeding to touch at Leyte, Camiguin, Bohol, and finally Cebu on 27 April. In May 1571 the group of settlers moved to Manila. Thereupon, Juan de Salcedo conducted an expedition of conquest around Laguna de Bay and down the Cagayan River. Martín de Goiti and one hundred soldiers penetrated the center of the island of Luzon. After 1571, Manila became the center of Spanish colonization. The original Spanish incentives to occupy the Philippines were control of the spice trade and control of Pacific trade routes. However, the Philippines were too far from the spice routes, and other European powers never acknowledged Spanish hegemony in the Pacific Ocean.

The Spanish home government set up a jurisdiction that placed the Philippines under the rule of the viceroy of Mexico. Like the Americas, the archipelago had a governor-general, an *audiencia* ('advisors and court'), and a *cabildo* ('town council') for the city of Manila. In the areas outside of Manila, *alcaldías* ('provinces') were organized, with an *alcalde mayor* ('provincial governor') as head.

What proved to be the major cultural force in the archipelago were the religious orders. Augustinians, Jesuits, Dominicans, and Franciscans were the frontline representatives of Western culture who indoctrinated and converted local peoples. They were followed by the secular clergy, who gradually took over the task of ensuring that the new converts to Christianity did not "relapse." Although the archipelago consists of almost seven thousand islands, not all were inhabited or came under Spanish rule. The southernmost parts of the archipelago were Muslim and remained so throughout Spanish occupation. As Christianity was extended throughout

the islands, the Western value system it represented was incorporated into the native Malay society.

Local income from the tribute taxes imposed by the Spaniards was so low that it soon became clear that the maintenance of the Philippine archipelago as a colony in the Pacific was a financial drain on the Spanish Empire, and retaining the colony as the only Christian outpost in Asia became the new motivating force. The economy of the islands was in the hands of the “Manila Galleon,” merchants who loaded a large ship with Asian luxury items each year and sold them in Acapulco, Mexico. On its return the Manila Galleon carried silver pesos.

In the latter part of the eighteenth century, a concentrated effort was made to develop agriculture and mining under the Bourbon dynasty. In the nineteenth century the external trade of the islands grew considerably, sparked by capital growth, large-scale imports of raw materials, and a rising population. English and American vessels unloaded wines, copper, nails, oil, and other manufactured goods, and in return carried away hemp, sugar, tobacco, and rice.

Spain’s long colonial rule produced deep-rooted changes in Philippine society. Christianity, foreign commerce, and new political and economic relations, as well as new concepts of land use and land distribution, affected native society profoundly.

NICHOLAS P. CUSHNER

SPANISH LITERATURE AND LANGUAGE. Spanish thought in the early modern

period was greatly influenced by Renaissance humanism, the Counter-Reformation, the growth of the Spanish empire, and the institutionalized persecution of Jews and their descendants. The high-water mark of Spanish letters is said to have ended in 1681 with the death of the dramatist Pedro Calderón de la Barca. Spanish literature faded in the eighteenth century, and the Spanish version of the Enlightenment can properly be considered as a reflection of, or a reaction against, French influence.

LANGUAGE AND EMPIRE

In 1492—the year of the conquest of Granada, the expulsion of the Jews from Spain, and Columbus’s first voyage to the New World—Elio Antonio de Nebrija published *Grammatica Castellana*. The momentous events of 1492 heralded the advent of a new world empire, and Nebrija explicitly wished his book—the first grammar of a modern European language—to be an instrument of that empire. Addressing Queen Isabella the Catholic in his prologue, Nebrija wrote:

Most noble Queen, when I ponder upon and contemplate the antiquity of all the things that were written for our memory, I come to one certain conclusion: that language was always the companion of empire, and accompanied it in such a way that together they began, they grew and flourished, and afterwards together they fell.

Nebrija believed the codification of a nation’s language was a necessary step in the development of a great power.

By Nebrija’s time, Castilian had already progressed from being simply one of many Latin-derived dialects spoken on the Iberian Peninsula to the legal and administrative language of the most powerful kingdom in Spain. The language of Castile now became the administrative and literary language of her colonies. In time, the predominant language of the kingdoms of Spain became known simply as Spanish.

THE CRITIQUE OF EMPIRE

The conduct of the Spanish conquistadores in the New World has been rightly criticized over the years. One of the remarkable aspects of the whole endeavor, however, was the open and lengthy debate that took place in Spain over the proper handling of the conquest. Almost from the very beginning of the conquest, intellectual opinion in Spain

had been divided over what should be the goals of the adventure and what should be the empire's policy toward the natives. Following Aristotelian precepts, some scholars argued that Indians were naturally subhuman and, by nature, were designed to be the slaves of their Spanish betters. Wars against them were therefore justified. The other argument held that the Indians were well adaptable to Christianity and ought to be won over to the faith by persuasion and gentleness. The fact that they were barbarians did not mean that they were incapable of rational thought or that they were incapable of being good Christians. Spain was the first imperial power in history to publicly agonize over the rights of the conquered.

One of the most powerful advocates for the natives was Bartolomé de Las Casas. Las Casas first traveled to the New World in 1502. There, on the island of Hispaniola, he lived as a gentleman planter. The future defender of the American natives even owned slaves. In 1515 he had a change of heart, gave up his property, and dedicated the rest of his life to working for the benefit of the Indians. During his long life, he produced voluminous writings in both Latin and Spanish decrying the treatment of the Indians by the colonists and advocating for their rights. A pivotal moment came in 1550 when he disputed with Juan Ginés de Sepúlveda, who advocated the position that the Indians ought to be exploited. Against Sepúlveda, Las Casas argued that the Indians were rational people. He went on to write some of his most important work, including the *Brevísima relación de la destrucción de las Indias* (1552). This tract caught on with Spain's enemies and was partially responsible for the Black Legend, which consisted of the often wildly exaggerated tales of Spanish perfidy embraced by anti-Spanish and anti-Catholic propagandists from the Renaissance up to the present day.

FIFTEENTH-CENTURY COURT CULTURE

The enthusiastic Renaissance culture sponsored by the court of Ferdinand and Isabella did not arise in a vacuum. Court culture during the earlier reign of John II had fostered poetic trends that embraced not only traditional Spanish poetic forms, but also was influenced by Italian humanism. Many in the nobility were themselves poets. Among these was Íñigo López de Mendoza, the Marqués de

Santillana (1398–1458), an accomplished wielder of traditional verse forms, who also tried his hand at Italian-style sonnets. Jorge Manrique (c. 1440–1479), meanwhile, marshaled a host of classical tropes to lament the death of his father in “Coplas por la muerte de su padre.” Santillana and Manrique were among the many poets who were anthologized in the *cancioneros* (songbooks) of the fifteenth century. As the name suggests, the *cancioneros* were devoted to lyric poetry on a wide range of subjects, from love to satire. In addition to the poetic wordplay of the *cancioneros*, reading tastes ran to sentimental romance, such as the elaborate love allegory *Carcel de amor*, and early versions of chivalric romances, the genre that Cervantes would later parody so successfully in *Don Quixote*. The fifteenth century also saw the first time that the traditional Spanish ballads, or romances, were anthologized. Often derived from medieval epics, ballads related tales of history and heroic deeds.

The University of Alcalá, founded by Cardinal Francisco Jiménez de Cisneros, confessor to Queen Isabella, archbishop of Toledo, and later grand inquisitor, made an early and lasting contribution to humanistic studies with the publication in 1522 of the Complutensian Polyglot Bible, a six-volume critical edition that placed the Hebrew, Chaldean, and Greek texts of the Bible in parallel columns with the Latin Vulgate.

JEW, CONVERSOS, INQUISITION

While the court of Ferdinand and Isabella sponsored Renaissance openness and reform, their reign is also notable for increasing animosity toward the Jews. This culminated in the establishment of the Spanish Inquisition by 1480 and the expulsion of the Jews from Spain in 1492.

Relations between Jews and their Christian neighbors had begun to deteriorate rapidly in 1391 with a series of pogroms that shook the long-established Jewish communities of Spain. This was the first large-scale violence against the Jews in Spain, and its immediate effect was a massive demographic shift, as Jews from established communities in the cities began to relocate to the relative safety of the smaller towns. Another effect was the conversion of many Jews to Christianity.

The pogroms of 1391 and the mass conversions that followed added a new element to Spanish life:

the *converso*, or convert. *Conversos*, also called New Christians, soon found themselves at odds with so-called Old Christians, and as New Christians achieved positions of greater prominence, Old Christians began to doubt the sincerity of their conversions. Because *conversos* who returned to their former faith were seen as dangerous to the health of the church and the society, Ferdinand and Isabella sought and received in 1478 papal permission to establish an Inquisition in Spain. Unlike the earlier medieval inquisition, which was subordinate to the papal authority, the Spanish Inquisition became an arm of the government, with the monarchs themselves retaining the right to appoint inquisitorial officials.

Many scholars have suggested that the tensions inherent in the *converso* experience inevitably created a sort of conflicted *converso* identity, and that out of this identity crisis sprang the intellectual fervor of the early Renaissance, as well as many—if not most—of the great literary works of Spain's Golden Age. Under this thesis, almost any Spanish voice supporting church reform or any kind of upending of the social order must arise from the conflicted tensions of the *converso* writer. While it is undeniable that many of the great writers of the Golden Age had Jewish roots, and some of them explored new forms of social realism, there is no evidence to attribute their writings as a group to a specific *converso* experience.

The undisputed masterpiece of the reign of Ferdinand and Isabella, however, was indeed written by a *converso*, and it also represented an antidote to the cultural pretensions of court literature. Written by Fernando de Rojas, and first published in 1499, the *Tragicomedy of Calisto and Melibea*, also known as the *Celestina*, tells a sordid story of sexual transgression, seduction, and suicide. The work breaks new ground in both form and content. It is written in dialogue, but is clearly not a play. Instead, it seems to occupy a middle ground between drama and novel. The story concerns the efforts of a young nobleman, Calisto, to seduce a young woman, Melibea. His servant Sempronio helps him secure the services of a go-between, the old crone Celestina. Celestina is a procuress, and her task in life is to arrange liaisons between lustful young men and the often reluctant objects of their affection. The seduction succeeds, but also sets in motion a series

of events that ends in the deaths of all the principal characters of the story. The book puts an ironic twist on the conventions of courtly love and intersperses this with something new to literature: the wily and unscrupulous servant. Instead of patiently and faithfully serving their masters, the servants in this work criticize and conspire against them, motivated by a lust for money in much the same way their masters are motivated by sexual lust. Through the *Celestina*, the reader can catch a realistic glimpse of class relations during the reign of Ferdinand and Isabella. This peek from the margins can be considered a precursor to the squalid realities depicted in that most Spanish of genres, the picaresque novel.

THE PICAESQUE

While stirrings of the form appeared earlier in the century, the first great picaresque work was *Lazarillo de Tormes*, published in 1554. The book narrates in the first person the adventures of a young boy set loose on the world and the life lessons he learns from a succession of employers. Through the eyes of Lazarillo, the reader is able to see the hypocrisies of Spanish society laid bare. Lazarillo serves, in turn, a blind beggar who abuses him, a priest who allows him to starve, and a minor nobleman whose misplaced pride in his status prevents him from seeking gainful employment that might keep him from starving. The rest of Lazarillo's employers throughout the course of this very brief book are churchmen of varying degrees of venality. Lazarillo's prime motivation through all of this is hunger: hunger to improve his own position in the world, and, in the process, keep himself from ever having to go hungry again. The subversive nature of the book led to its being placed on the Inquisition's Index of Prohibited Books in 1559, and some scholars have assumed from the fierce criticism directed at church officials that this anonymous masterpiece was written by a *converso*.

Lazarillo—the young, aimless rogue—is the quintessential *pícaro*, and his story is the first good example of picaresque fiction: episodic adventures reflecting society's various social strata, related by a less-than-reliable, first-person narrator. The next important picaresque novel, *Guzmán de Alfarache*, by Mateo Alemán, was published in two parts in 1599 and 1604. Francisco de Quevedo, one of Spain's two greatest baroque poets, also wrote a

very funny—and very bitter—picaresque novel known today as *El Buscón*, published in 1626.

THE ITALIANATE REVOLUTION

The political connections between Spain and Italy eventually led to the conquest of Spanish poetry by Italian literary forms. This permanent infiltration of Italian literary forms into Spanish letters largely occurred through the efforts of two poets: Juan Boscán (1493–1542) and Garcilaso de la Vega (1503–1536). Boscán wrote that he was prompted to attempt writing Spanish poetry in the Italian style through a direct challenge from the Venetian ambassador to Spain. The challenge lay in adapting Italian meter to the rhythms of Spanish. Boscán accepted the challenge and also prevailed upon his friend Garcilaso to try his hand at Italian-style poetry as well. The efforts of these two poets permanently altered the literary landscape of Spain. Boscán was a competent poet, but Garcilaso de la Vega was the true genius of the two. In many ways the quintessential Renaissance poet, Garcilaso died in battle in 1536.

THE COUNTER-REFORMATION

If the reigns of Ferdinand and Isabella, and later of Charles V, represent an early embrace of Renaissance values, the reign of Philip II proved to be very different. After the Council of Trent and the beginning of the Counter-Reformation, Philip began to transform Spain into a closed society. Philip believed Spain to be the last line of defense for the Catholic world and that it needed to be guarded from foreign influences. Students studying at foreign universities were recalled, and foreign books were banned, along with many literary works from Spain's earlier and more open Renaissance. Scientific inquiry also suffered in the Spain of the Counter-Reformation, although there was considerable interest in applied science and technology, including ballistics and navigation.

LUIS DE LEÓN

The climate created by the Inquisition and the Counter-Reformation had an impact on Spanish letters. One scholar to come under suspicion was Fray Luis de León, a professor at the University of Salamanca. Born in 1527, Fray Luis was of *converso* heritage and had a background in Hebrew scholarship. Luis de León came under suspicion partly be-

cause of his desire to use Hebrew in his commentaries. Not content with the Latin biblical tradition, Luis de León wished to resort to Hebrew to settle theological questions. He was imprisoned by the Inquisition in 1572 for publishing and commenting on the Song of Songs in Castilian and was detained by the Inquisition for five years. Once he was set free, he returned to his post at the university. Tradition holds that he began his first lecture in Salamanca after five years imprisonment with, “As we were saying yesterday, . . .” He died in 1591.

Fray Luis is known today as one of Spain's greatest Renaissance poets. His work is distinctly Neoplatonic in tone. His poetry extols the virtues of simple living, away from the tumult of society, and expresses the belief that art can lift the spirit to a higher sphere of consciousness and closer to communion with God.

MYSTICISM

While not a true mystic, Fray Luis shared with the mystics an intense desire to liberate the soul from the shackles of the world and move toward a higher plane of experience. True mystics seek a union of the soul with God. This union is the essence of the mystical experience, and arises out of the ecstatic experience of the pure love of God. Marriage and sex become useful poetic metaphors for ecstatic union.

The most well-known mystics of Golden Age Spain were Saint Teresa of Ávila (1515–1582) and St. John of the Cross (1542–1591). Born Teresa de Ahumada in Ávila in 1515, Teresa entered the Carmelite order in 1534 and later gained fame through her efforts to reform the order. Of her many prose works describing her mystical experiences, the most important is *El castillo interior* (1577). A close associate of St. Teresa was Juan de Yepes, who was later canonized as St. John of the Cross. Born in 1542 in the province of Ávila, he entered the Carmelite order in 1563. He was twice jailed for his reforming activities, and much of his writing seems to draw from the experience of having been imprisoned. St. John sought to express his mysticism through highly charged, complex poetry. He often compared the relationship of the soul to God with that of a wife and her husband. His most famous poem is the “Noche oscura del alma.” Here the soul's search for union with God is figured as a young girl

waiting until the house is quiet so she can sneak out and meet her lover. Their sexual rendezvous represents the moment of the soul's union with God.

CERVANTES

Golden Age Spain's most renowned writer was, without a doubt, Miguel de Cervantes Saavedra. Born in Alcalá de Henares in 1547, he was the son of an unsuccessful barber-surgeon. When young, he enlisted as a soldier and fought in the battle of Lepanto in 1571. There he received a wound that rendered his left hand useless to him. On the return trip to Spain in 1575, he was captured by pirates and taken to Algiers, where he was held captive for five years. Upon his ransom and return to Spain in 1580, he worked a series of low-paying jobs and began his writing career. He finally received a government post, but discrepancies in his accounts led to his being jailed twice in Seville. Cervantes dabbled in the major literary genres of the age. Although he tried his hand at theater and poetry, his fame rests on his prose works, principally the *Novelas ejemplares* and his masterpiece, *Don Quixote*.

Critics have been debating *Don Quixote* for close to four hundred years and will surely continue to do so. The work that many consider Western literature's greatest novel started out as a broad parody of the novels of chivalry that had been in vogue throughout the sixteenth century. *Don Quixote* is an impoverished gentleman from a forgotten corner of Castile who goes mad from too much reading and comes to believe he is a knight errant. Clad in rusty antique armor, he ranges the countryside—first alone, and then in the company of his trusty peasant “squire” Sancho Panza—attempting to right wrongs and live the code of chivalric honor. Even to Cervantes's readers, an armor-clad knight errant was a laughable anachronism, and the humor of the book arises from the incongruities of a daft, idealistic knight set loose on modern and more cynical society. *Quixote* is often said to represent idealism, and Sancho the realism of the world he butts up against.

Published in 1605, *Don Quixote* was a huge success, but Cervantes did not profit from it. The success of the first book led Cervantes to publish a very popular sequel in 1615, the year before he died.

BAROQUE

Spanish baroque literature is characterized by elaborate style and often by excessive metaphors. Two poetic movements in particular stand out: *culturismo* and *conceptismo*. Both were intellectual movements that emphasized extreme use of language. *Culturismo* sought to create a highly intellectual poetic language that looked to Latin as its model. It used neologisms, extreme metaphors, and greatly contorted syntax. The representative poet of *culturismo* was Luis de Góngora y Argote (1561–1627). Góngora wrote poetry in traditional Spanish as well as Italian forms, with his later work tending to be highly artificial and, consequently, much harder to understand than his earlier work. His long poems “Polifemo” and the unfinished “Soledades” do not lend themselves easily to casual reading, but can nevertheless be extremely rewarding. *Conceptismo*, epitomized by Francisco de Quevedo (1580–1645), stressed the creation of audacious poetic conceits. Although poets from the two schools bickered—often writing withering satires about one another—the two are not mutually exclusive, and there was much overlap. Quevedo today is remembered as a writer of cutting satire and one of the great picaresque novels, *El Buscón*. Góngora fell into disfavor, but was rediscovered by Spain's poetic Generation of 1927.

LOPE DE VEGA AND THE COMEDIA

Cervantes's lack of success as a dramatist was more than compensated by that of Felix Lope de Vega Carpio. Cervantes himself called Lope a “freak of nature” and blamed him for altering the theatrical landscape and changing public taste to the point that his own plays could not be successful. Lope did not invent theater in Spain, but he transformed it to such a degree that he is considered the creator of the Spanish national theater. Born in 1562 in Madrid, Lope was a true literary phenomenon. He claimed to have written more than 1,800 plays, in addition to lyric poetry, epic poetry, and novels. Some five hundred of Lope's plays still survive.

If Lope's plays seem a little formulaic, it is because they are. Lope sought to make his plays appeal to a wide public, and he was not ashamed to admit that he loaded them with elements designed to make them popular. He codified his dramatic theory in *Arte nuevo de hacer comedias en este tiempo* (1609), where he specified a three-act structure. According

to Lope's plan, the first act should set up the argument, the second should develop the tension, and the third should bring a swift and unpredictable conclusion after a period of heightened suspense. Lope lived a dissolute personal life, but his plays are essentially conservative reaffirmations of society's mores. For example, *Fuenteovejuna*, about a real peasant uprising in 1476, becomes an apology for the policies of Ferdinand and Isabella. The citizens of Fuenteovejuna rebel against and murder their lord and then collectively take responsibility for the action, saying that Fuenteovejuna itself committed the crime. The lord in question had fought against Ferdinand and Isabella in the recent civil war, and when the Catholic Monarchs eventually forgave the town, the action could be taken as an affirmation of royal authority.

The other great dramatists of the Golden Age were Tirso de Molina (1583–1648) and Pedro Calderón de la Barca (1600–1681). Tirso, the pen name of Gabriel Téllez, is principally remembered today as the first dramatist to treat the Don Juan theme, in *El burlador de Sevilla y convidado de piedra*. Many critics consider Calderón a greater dramatist than Lope, if not in quantity, then at least in quality. His finest achievement was *La vida es sueño*, which pulls out all the stops in its exploration of the fine line separating dreams from reality.

THE ENLIGHTENMENT

Spain's literary Golden Age ended with the death of Calderón in 1681. But while literature may have been moribund in the eighteenth century, the situation for other intellectual pursuits was not as dire. Spanish scientists had been isolated from the rest of Europe, but changes did begin to seep in. Medical thought began to drift away from strict adherence to Aristotelian precepts, with some physicians accepting William Harvey's theories of blood circulation. Renewed interest in medicine and science in Spain led in 1700 to royal recognition for the Royal Society of Medicine, one of the first of the learned academies that would spring up during the Enlightenment.

With the advent of the Bourbon dynasty in Spain in 1700, Spanish culture began to be heavily influenced by French thought. The Enlightenment emphasis on scientific categorization led to the founding of the great national academies. In addi-

tion to the Royal Society of Medicine, another important academy was the Royal Spanish Academy, founded in 1714. This academy focused on purity of the language and produced within a short time its six-volume *Diccionario de autoridades*.

In literature, the essay form dominated. The premiere essayist of the first half of the eighteenth century was Benito Jerónimo Feijoo (1676–1764). His eight-volume *Teatro crítico universal* contained learned essays on a wide variety of subjects, from science to superstition. Gaspar Melchor de Jovellanos (1744–1811) was another essayist who sought to reform Spanish society and letters. Whereas there was a new openness to science and learning, art and literature in Spain stagnated in the eighteenth century, characterized by largely imported and derivative production.

MICHAEL HAMMER

SPANISH SUCCESSION, WAR OF THE (1701–1714). The succession to the extensive Spanish empire had been a live issue since the 1660s, when rumors spread that Philip IV's (ruled 1605–1665) only surviving son, crowned Charles II in 1665, was unlikely to survive childhood.

PARTITION TREATY OR INTEGRAL INHERITANCE?

The assumption that the new reign would be short motivated the first partition treaty between the head of the Austrian branch of the Habsburgs, Leopold I (ruled 1658–1705), and Louis XIV (ruled 1643–1715) of France in January 1668. This treaty remained a dead letter since Charles II, though not siring an heir, survived the next three decades and only finally weakened during the 1690s. During this time the issue of the Spanish succession had not become less contentious. After the War of the League of Augsburg (1688–1697), Louis believed that France could not afford another major conflict. But this new realism about military resources was counterbalanced by considerations of dynastic honor and future French security; Louis could not accept that the entire Spanish inheritance might pass to the Austrian Habsburgs. This, however, was precisely what Leopold I now wanted, and, thanks to his conquests in Ottoman-controlled Hungary and his successful leadership of a substantial coalition of German princes in the recent war, he was unprepared to discuss partition. Louis nonetheless found an apparent ally in his previous archenemy, William III (ruled 1689–1702), king of England and de facto ruler of the Dutch Republic. William

was equally anxious to avoid another costly war and had no wish to establish the same branch of the Habsburg family across western and central Europe. Bilateral negotiations in the summer and autumn 1698 proposed the exclusion of both Habsburg and Bourbon dynasties from the full succession, nominating instead Joseph Ferdinand, young son of the Bavarian Elector, as heir to most of Charles II's inheritance. As compensation it was proposed that Louis's son would receive the kingdoms of Naples and Sicily, and Milan would go to Leopold's second son, Archduke Charles. The sudden death of Joseph Ferdinand in 1699 annulled the plan, and Louis XIV's diplomats now proposed that France, Britain, and the Dutch Republic should sponsor a simple partition: France would receive all of Spanish Italy but would allow the rest of the empire to pass to Leopold I's son, Archduke Charles. Despite the apparent generosity of the offer, the Austrians realized that without the linchpin of Milan, the two Habsburg dominions could never function together, and the security of much of the Spanish inheritance would be jeopardized. Nevertheless Louis and William signed this new partition treaty in March 1700, hoping that Leopold would follow. Leopold had still refused to sign on 1 November when Charles II finally died. Against expectations—though rumors had been flying around the Spanish court for the previous month—Charles II's final will did not name Archduke Charles as his universal heir of choice. Giving priority to maintaining the territorial integrity of the empire, Charles II's councillors had persuaded him to make over the entire inheritance to Philip of Anjou (1683–1746), Louis's second grandson.

Historians have long debated Louis's decision to accept the will in the name of his grandson, but it is difficult to see that he could have done otherwise. Leopold had refused to ratify the partition treaty; if Louis rejected the Spanish offer, Charles II's testament then offered the entire inheritance to Archduke Charles. Louis could call on the military support of the English and the Dutch to make good his claims under the partition treaty, but there was little chance that either would act to uphold French dynastic rights. France would be left to fight the combined Habsburg powers to try to prize Italy from their grip. In contrast, by accepting Charles's will Louis would ensure that Spain and her territories

would be his allies in any confrontation with the Austrian Habsburgs.

Louis's real error lay in the inability to see that consolidating the position of his grandson without provoking European war required qualities of restraint and empathy in dealing with other states. Leopold soon declared war, but so long as the Maritime Powers were reluctant to intervene, any conflict might be contained by France. Yet a succession of preemptive moves and provocations turned an ambiguous situation into one in which France was again faced by a hostile alliance of major powers. By moving French troops into the Spanish Netherlands and occupying the "barrier fortresses" garrisoned by Dutch troops since 1697, Louis undermined the key Dutch gain from the treaty of Ryswick (1697). Granting French merchants exclusive trading advantages in the Spanish New World antagonized both the Dutch and the English, while Louis's refusal to explicitly repudiate Philip's position in the French order of succession caused widespread consternation. By the time Louis formally recognized James II's son as James III of England and Scotland, the process of alienation had already led to renewal of the military alliance between the Austrian emperor, the English, and the Dutch (September 1701), and there was no turning back.

THE COURSE OF THE WAR

Louis was initially optimistic that France's situation was better than it had been in the previous conflict: France would fight beside Spain and the Spanish empire, whose subjects had acclaimed Louis's grandson as Philip V and accepted French support to preserve the integrity of the kingdoms; Portugal, Savoy, and Bavaria were initially also allies of Louis XIV. But defeating the coalition would depend on rapid French military success, and despite some striking achievements in the first two years of war, this proved elusive. In 1703 the opportunity to launch a Franco-Bavarian campaign against the Austrian lands was lost. Meanwhile, English naval success at Vigo Bay (1702) was instrumental in persuading Portugal to abandon the French alliance, while Victor Amadeus II of Savoy (1666–1732) saw the north Italian operations of the imperial general, Prince Eugène (1663–1736) of Savoy, as an opportunity to slip out of his own commitment to France. The critical reversal came in August 1704 when

allied armies under the Duke of Marlborough and Eugène annihilated the Franco-Bavarian forces at Blenheim and removed any prospect of knocking the Austrians out of the war. The subsequent four years of conflict saw a few successful French initiatives and some capacity to recover ground lost after the hammer-blows of subsequent allied victories at Ramillies (1706), Turin (1706), and Oudenarde (1708), but the balance had tipped toward the assertive, battle-seeking strategies of Marlborough and Eugène. The situation in Spain appeared even worse as allied forces acting in the name of Archduke Charles, now proclaimed Charles III of Spain, had by 1706 occupied Madrid, Barcelona, and other major cities.

The situation stabilized to some extent when French forces imposed huge casualties on the allies as the price of their victory at Malplaquet (1709); military affairs had been improving in Spain since 1707, above all because the population remained fiercely loyal to Philip V. But apparent revival was offset by domestic crisis in France, where a miserable harvest followed by the bitter winter of 1708–1709 led to catastrophic mortality, mass starvation, and tax failure. As in the 1690s, France lacked the resources to continue the war; faced with collapse at home not counterbalanced by overwhelming success in the field, Louis's diplomats began to negotiate for a settlement on allied terms.

PEACE NEGOTIATIONS AND FRENCH RECOVERY

Allied demands in the spring of 1710 were as harsh as France's worst expectations: Philip V would be ejected from the Spanish throne; France would relinquish most of her territorial gains since 1648. Yet Louis was desperate to extricate France from a war that threatened invasion and disintegration at home. Only the imputation that France should act alone in removing his grandson from Spanish territory finally led Louis to break off negotiations. The allies continued to take fortresses and breached the French frontiers in 1710, and once again managed briefly to expel Philip from Madrid. But beneath this success the allied coalition was cracking; the English, and to some extent the Dutch, recognized that they could now get everything they demanded in terms of security and economic advantage while the French military humiliation rendered France less prepared to sanction a Habsburg-dominated Eu-

rope. The fall of the Whig government in Britain signaled the end of Marlborough's political and military ascendancy. Soon after, the sudden death of Joseph I (ruled 1705–1711), ruler of the Habsburg lands and Holy Roman emperor since the death of his father Leopold in 1705, left Archduke Charles in 1711 as successor to his eldest brother in central Europe and allied claimant to the Spanish inheritance. During 1711 the English effectively withdrew from the war effort and drew up a bilateral peace with France. This winding-down of the war was abruptly halted by the sudden deaths of three of Louis XIV's direct heirs in the winter of 1711–1712, leaving the French succession to the two-year-old duke of Anjou and, after Anjou, to Philip V. But the dangerous issue of the separation of the Bourbon crowns was finally resolved through a further and explicit renunciation of the French throne by Philip. English forces once again withdrew from the conflict, and in July 1712 a French victory at Denain permitted the recapture of crucial frontier fortresses, blocking further allied incursions into France. The main settlement between France and the Maritime Powers was made at Utrecht in the first months of 1713. France escaped lightly, the peace being bought by Spanish concessions in Europe and the Americas. Britain in particular gained substantial colonial and commercial benefits from Spain's transatlantic empire. Archduke Charles, now Emperor Charles VI, held out to the end of 1713, but French successes in the empire persuaded him to settle at Rastatt in November, gaining Milan, Naples, and the Spanish Netherlands in return for accepting Philip V and the Bourbon succession to Spain. The settlements were finally ratified in 1714.

DAVID PARROTT

SPAS AND RESORTS. Water therapy and visiting spas had a long history in Europe, especially in areas where the Roman legacy was deeply ingrained. There was growing interest in hydropathy in late medieval Italy, in some cases using bathing facilities that survived from the Roman era, and in fourteenth-century Hungary the granting of town status to a settlement frequently prompted the erection of a bathhouse.

THE PATTERN OF DEVELOPMENT

The tradition of the spa may have been less strong on the western edges of Europe. Not until the late

sixteenth century did visiting spas became fashionable in France and Britain. Under the influence of royal and aristocratic patronage, and stimulated by professional promotion, a series of centers emerged in France, but only three of these—Bourbon, Vichy, and Forges—were consistently patronized by the elite. Prior to the French Revolution, most Gallic spas remained small in size and appear to have focused on their medicinal roles, eschewing the formation of sophisticated social facilities.

Events took a different course in Britain. The late Tudor and early Stuart phase of growth, which saw important investment in Bath and Buxton and the discovery of Tunbridge Wells, was curtailed by the political instability of the years surrounding the Civil Wars (1638–1660). After the Restoration, however, the discovery and formation of spas accelerated. Many served a local or regional market, such as the cluster of semirural centers—including Epsom, Islington, Hampstead, and Sadler’s Wells—that sprang up on the edge of London. A few spas catered to a national clientele, and in 1700 Tunbridge and Bath were the market leaders.

Change forged ahead faster in Britain than France. A key factor was that, whereas in France the state kept a tight rein on development, a resident *intendant* (‘superintendent’) controlling the pace and character of new initiatives and keeping the emphasis firmly on health, in Britain no such regulatory framework existed. Competition and commercialization were given full play. Such was the level of demand in Britain that it spilled over to the Continent. Although spas in France and Italy were visited by Britons in the eighteenth century, the principal destinations were Spa and Aachen, which offered an engaging social life, including opportunities for intensive gambling. Some Britons also traveled to the many spas in central Europe (such as Baden, which capitalized on the demand from Vienna), many of which possessed several baths that catered to a range of social classes.

The rising level of demand in Britain also led it to pioneer what was to prove a critical diversification in water cures, the development—particularly in the coastal counties closest to London—of the seaside resort, a trend clearly underway by the 1750s. Serious investment in continental coastal resorts only began to occur from the 1790s. Parallel with the

emergence of the seaside resort, and as a consequence of economic growth in the English Midlands and North, a second wave of spa development began, which stimulated both the expansion of Bath (to the point where, by 1800, it was among the top ten or so cities in England), and the rise of spas like Cheltenham, Malvern, Buxton, Matlock, Harrogate, and, later, Leamington.

RESORT CULTURE

Central to the character of spa and resort culture were the waters themselves. Popular interest in holy wells, sacred springs, and sea bathing was long established, but elite involvement stemmed from two factors. First, there was in the early modern period a growing fascination with and sympathy for the natural world as a whole. This expressed itself in areas such as gardening (which combined water and horticultural elements) and the picturesque and romantic movements, and led to the reconceptualization of the sea as a phenomenon to be admired and enjoyed rather than feared and avoided. Second, emphasis on the curative chemical properties of water was closely aligned with the rise of natural philosophy and science, and the shift from sacred and magical forms of health treatment to a regime based on rational “scientific” principles. In playing to the agendas of nature and science, water therapy articulated two of the principal themes of the Enlightenment, and demonstrated itself to be as much a cultural as a medical phenomenon.

One aspect of this was that spas and resorts became centers of pleasure as well as of health. In Britain the watering places were one of the key factors in an urban renaissance which, from the later seventeenth century, helped elevate the cultural status of the town. The water resorts acquired an ensemble of social facilities that included assemblies, theater, concerts, gambling, walks and pleasure gardens, sports like bowling and horse racing, and circulating libraries, together with a range of luxury shops and services. The scale and sophistication of this package would vary according to the importance of the resort, but its standardized character was striking. So also was the highly formalized daily routine that bound together the various parts of the package and propelled visitors into contact with each other. As one account of 1737 put it, “you cannot well be a free agent, where the whole turn is

to do as other people do; it is a sort of fairy circle; if you do not run round in it, you cannot run at all, or are in everybody's way." This holiday camp mentality placed a huge premium on corporate behavior, and it is clear that one of the functions of the watering places was to weld together the members of the ruling order who flocked to them. In Britain the boundaries of this elite were expanding to accommodate a growing middling order of professionals and businessmen, and the resorts—particularly in their function as marriage markets—played an important role in merging old and new social groups. Such a process was tenable so long as the expansion of the middling order remained within certain limits. However, by the late eighteenth century such was the growth within this sector of society that spa life began to fragment, with social events becoming increasingly cliquish and privatized, and many among the landed elite vacating the big spas for smaller, exclusive coastal resorts.

PETER BORSAY

SPENSER, EDMUND (1552 or 1553–1599), English poet and author. Born in London, perhaps at East Smithfield, Spenser was educated at the newly founded Merchant Taylors' School and at Pembroke Hall, Cambridge. His family may have been related to the Spencers of Althorp. As both politically engaged author and dutiful state servant, he first came to public notice in 1569. In that year, he translated verses by Petrarch (1304–1374) and

Joachim Du Bellay (c. 1522–1560) for *A Theatre for Worldlings*, an English version of a work by the Dutch Calvinist Jan van der Noot (c. 1540–c. 1595)—a key text for the reforming tradition of militant Protestantism to which Spenser belonged—and was paid on 16 October for bearing letters from Tours in France for Sir Henry Norris, English ambassador there, to Queen Elizabeth—the beginning of a long secretarial career.

At Cambridge he began a long-lasting friendship with fellow scholar Gabriel Harvey. He received his B.A. in 1573 and his M.A. in 1576. After a few years in which little is known of his activities or whereabouts, Spenser exploded onto the literary scene in 1579 with *The Shepheardes Calender*, a pastoral poem in the form of a collection of "eclogues," or conversations among shepherds. Much more than a publication, it was a literary event. *The Shepheardes Calender* founded the myth of Gloriana, contributing to the cult of Elizabeth at the very moment when Spenser, frustrated in his efforts to secure preference at court, was seeking his fortune abroad. Despite its panegyric to the queen in the April Eclogue, it contains a covert critique of church and state. Like his later work, it contests the very authority to which it apparently commends itself.

Published anonymously, but carefully timed to coincide with correspondence with Harvey containing clues to its authorship, *The Shepheardes Calender* came complete with the kind of editorial apparatus associated with classical texts by canonical authors, yet was illustrated with woodcuts, and contained dialogue written in the language of ordinary country folk. This mix of playfulness and purposefulness, with its inventive and often subversive borrowing from high and low culture, is characteristically Spenserian. *The Shepheardes Calender* was dedicated to Sir Philip Sidney, earning Spenser a mention in Sidney's *Apology for Poetry* (1595).

In 1580 Spenser became secretary to the new lord deputy of Ireland, Arthur, Lord Grey de Wilton. Ireland remained Spenser's home until his death. Having presented himself as the most promising poet of his generation with *The Shepheardes Calender*, Spenser failed to publish for a decade, busy both with the writing of his epic poem, *The Faerie Queene*, and with his role as secretary. From

1588, he occupied an estate of three thousand acres at Kilcolman, County Cork, one of many parcels of land seized from the late earl of Desmond as part of a government plan to settle lands in Munster with English tenants. This earned him the title of gentleman and provided a base from which to pursue his literary projects. He associated with Sir Walter Raleigh (1554–1618), who was a neighbor.

In September 1598 Spenser was appointed sheriff of Cork. Weeks later, Kilcolman was razed as part of a popular uprising. Spenser fled to Cork City, and from there to London, carrying a letter from the provincial president, Sir Thomas Norris, to the Privy Council, outlining the plight of the settlers. This last commission came thirty years after the performance of a similar duty for Norris's father. Spenser died in London on 13 January 1599.

THE FAERIE QUEEN

The first three books of *The Faerie Queene* appeared in 1590. A heady brew of Italianate romance, classical epic, and indigenous idioms inspired by Geoffrey Chaucer, John Gower, William Langland, John Lydgate, and John Skelton, its verbal density and formal difficulty marked a radical break with English poetic form, impacting later developments in poetry. Its sheer ambition coupled with an intimate attachment to landscape inspired poets from John Milton, John Dryden, and Alexander Pope, to Samuel Taylor Coleridge, William Wordsworth, John Keats, and Seamus Heaney. Its greatest innovation was the Spenserian stanza, a nine-line fusion of French "rhyme royal" and Italian "ottava rima," eight pentameters ending on an alexandrine, with a rhyme scheme of ababbcbcc. The second part of *The Faerie Queene*, books 4–6, appeared in 1596. Critics detect a darkening of purpose in the later books, as the allegory becomes more historical and political, especially in book 5, "The Legend of Justice." The "darke conceit" of *The Faerie Queene* shadows—and shares in—the dark doings of the English in Ireland, from martial law to massacres. Cowardice was not part of Spenser's makeup. Those who condemn his role in the government's violent suppression of resistance to colonization in Ireland respect a writer who had the courage of his convictions.

Spenser's work retained its critical edge right to the end, whether published in his own lifetime or in

posthumous parting shots, from the anticourtly sentiments of *The Shepheardes Calender* and *Colin Clout's Come Home Againe* (1595) to the sharp criticisms of government that litter the prose dialogue *A View of the State of Ireland* (1596; published 1633), and, in *The Faerie Queene* itself, from the provocative account of the trial and execution of Mary, Queen of Scots (1542–1587), in canto 9 of book 5—which so enraged her son, James VI (ruled 1567–1625), that he asked for the poem to be destroyed and the poet punished—to the sniping from the margins in the "Mutabilitie Cantoes" that form a fragment of book 7 (unpublished until 1609).

Spenser lacked the means—perhaps even the muse—to write in England the national epic he was able to forge freely in Ireland. Born and buried in England, his career and corpus were made in Ireland. Spenser's colonial status both empowered and impaled him. His Irish experiences continue to engage and enrage critics in equal measure. For some, Spenser's astonishingly varied and vibrant literary output remains unbound by any context, historical or political. For others, the poetry, like the prose, is tainted by the world of violence from which it sprang. But where Ireland was once associated with the burden of history in Spenser studies, it has recently opened up his work to new readerships and new readings. Given his location between two cultures, as an imperial servant who became increasingly attached to his adopted country, it is no surprise that Spenser has received attention from postcolonial critics. His fusion of forms has attracted others who see him as an early postmodernist. One thing is clear: studying Spenser is, like his writing itself, an endless work.

WILLY MALEY

SPINOZA, BARUCH (Benedictus de Spinoza; 1632–1677), Dutch philosopher. Baruch Spinoza's radical metaphysical, theological, moral and political ideas made him one of the most vilified thinkers of his day. Spinoza was born in Amsterdam to a Portuguese-Jewish family. He was raised and educated within the city's community of Sephardic Jews, many of whom had once been forced converts (*conversos*) to Christianity in Spain and Portugal. At the age of twenty-three, however, Spinoza, now a young businessman, was expelled from the congregation. The writ of *cherem*, or ban, the most vitriolic ever issued by the community's leaders, speaks only of his "abominable heresies and monstrous deeds," and the specific reasons for his expulsion remain vague. It is fairly certain, however, that among the offenses for which Spinoza was punished were his ideas on God, Jewish law, and immortality.

Spinoza's earliest philosophical writings, dating from the late 1650s and early 1660s, include the *Treatise on the Emendation of the Intellect* and the aborted *Short Treatise on God, Man, and His Well-Being*. He first came to public attention with the publication of a critical exposition of Descartes's *Principles of Philosophy* (1663). It was the anonymously published *Theological-Political Treatise* of 1670, however, that brought him great notoriety. The reaction to this stunningly bold work of Bible criticism and political thought was immediate and harsh; it was banned by numerous political and religious authorities, and its author was excoriated as a blaspheming atheist. As a result of the outcry, Spinoza decided not to publish his philosophical masterpiece, the *Ethics*; it did not appear in print until after his death, together with other unpublished writings, including *A Compendium of Hebrew*

Grammar, some correspondence, and the never-completed *Political Treatise*.

In the *Ethics* Spinoza rejects the traditional providential God of the Jewish and Christian religions. The notion of a benevolent, wise, purposive, judging God is, he insists, an anthropomorphic fiction, one that gives rise only to superstition and irrational passions. God, according to Spinoza, is nothing but the active, generative aspects of nature. In an infamous phrase, Spinoza refers to *Deus sive Natura* (God, or Nature), and identifies it with the substance, essential attributes, and causal principles of the universe. All beings are "in" God, but only in the sense that Nature is all-encompassing, and nothing stands outside Nature's laws. Everything happens in Nature with a deterministic necessity. Even human beings, often (he alleges) regarded as autonomous creatures whose freedom puts them outside Nature's dominion, are a part of Nature and thus subject to its rigorous determinism. Some measure of freedom or "activity" is obtainable for human beings but only insofar as they can achieve an intellectual understanding of Nature and themselves and thereby exercise control over their passions. Spinoza adopts a Stoic conception of human well-being. Happiness is the result of virtue and consists in success in the pursuit of knowledge and self-mastery. Moreover, the rewards of virtue are to be found in this life. While human beings do "participate" in eternity, particularly through the knowledge they acquire, there is no personal immortality. Spinoza's metaphysics, epistemology, and moral philosophy reveal a variety of influences, especially Descartes, medieval Jewish philosophy, and ancient sources. However, there can be no denying the originality of his thought.

In the *Theological-Political Treatise* Spinoza turns to a critique of organized religion and an investigation into the status, history, and interpretation of the Bible. He begins with a deflationary account of prophecy (the prophets, he insists, were simply people with highly active imaginations) and a denial of the possibility of miracles (since Nature's laws admit of no exceptions). He insists, moreover, that Jewish ceremonial law was only of temporary validity (that is, during the Temple period) and is no longer binding on contemporary Jews. His most stunning theses, however, concern Scripture. Spinoza argues that the Bible is not literally of

Baruch Spinoza. Undated portrait engraving. ©BETTMANN/CORBIS

divine origin and that its first five books (the Pentateuch) are not the writings of Moses. Rather, Scripture as we now have it is simply a work of literature, a compilation of human writings passed down through generations and edited in the Second Temple period. Others before Spinoza had suggested that Moses was not the author of the entire Pentateuch, but no one had taken that claim to the extreme limit that Spinoza did, arguing for it with such boldness and learning and at such length. Nor had anyone before Spinoza been willing to draw from it the conclusions about the interpretation of Scripture that Spinoza drew. The meaning of Scripture is to be sought not by appeal to theological dogma or to demonstrated truth—after all, the authors of Scripture were neither theologians nor philosophers—but by a close examination of the texts themselves and by a historical investigation into the backgrounds and intentions of its authors. If there is a universal truth conveyed by Scripture, it is a simple moral principle: love God and your neighbor.

Spinoza's discussion of Scripture takes place in the broader political context of his argument for a liberal, tolerant secular state, one in which the freedom to philosophize is defended against attempts to make it conform to so-called religious truth. For it is the "excessive authority and egotism of preachers," he tells one of his correspondents, that most threatens the freedom "to say what we think." The key to diminishing the undue influence of the clergy, who justify their abuses by appealing to the holiness of a certain book as the Word of God, is to demonstrate the true nature of Scripture and its message and eliminate the "superstitious adornments" of popular religion. By naturalizing Scripture, Spinoza hopes to redirect the authority invested in it from the words on the page to its moral message; and by formulating what he takes to be the proper method of interpreting Scripture, he seeks to encourage his readers to examine it anew and find therein the doctrines of the true religion. Only then will people be able to delimit exactly what needs to be done to show proper respect for God and obtain blessedness.

SPORTS. Sport was an essential and socially significant pastime in the early modern world, an arena in which individual identity and ability were expressed by king and milkmaid alike. Capable sportsmanship at tennis, jousting, and even wrestling were increasingly perceived as the markings of a strong monarchy, which determined the athletic displays and rites of passage that prevailed in an aristocratic

court. The sporting culture, in turn, was philosophically sanctioned by many humanists who extolled the “gentlemanlike pastimes” of swimming, archery, swordplay, and horseback riding as valuable components of any elite education.

Peasants and those of the lower orders also engaged in sport for their own purposes, reinforcing community cohesion by carving out their own particular spheres of play. Not all sport was universally embraced, however, and over the course of the period Puritans and others began to lament the “devilish” activity that joined other activities such as drinking, gambling, and dancing to produce “moral degeneracy.” Nevertheless, sport prevailed against these assaults and emerged from the period more varied and popular than ever.

In the *Book of the Courtier* (1528), Baldassare Castiglione (1478–1529) set the tone through his admonitions regarding proper court behavior and etiquette, in which sport occupied—at least for males—a central and elevated position. Sport, however, was conceived by such writers in very different terms than those who came before (or perhaps since). For them, personal skill at a game such as archery was offset by the concept of *Fortuna* (‘Lady luck’), a capricious goddess who determined the tides and turns of one’s own personal luck. Sport was also imbued with a humanist regard for man, his body as well as his soul. According to Castiglione, the perfect man at court was “well built and shapely of limb,” and displayed his physical capabilities by excelling at games of war—archery, horsemanship, and swordplay—as well as less martial physical activity, notably swimming, running, throwing, and jumping. Especially in games of mock war, such as jousting, the point was to achieve individual distinction on a physical level, as one performed on a stage that recalled traditions of military triumph. Even kings entered the game in this sense, as was the case with the famous encounter on the Field of the Cloth of Gold in 1520, when Henry VIII of England engaged Francis I of France in a wrestling match, alongside other gaming activities.

Despite its dangers and the increasing obsolescence of mounted and armored warfare on the battlefield, jousting sports continued to flourish in the form of fencing, which witnessed a shift to the long thin-bladed rapier and the use of point and the

lunge, and with it an increasing emphasis on speed, dexterity, and technique. Another sport in which actual weapons figured prominently was archery, which sustained its popularity even as the bow and arrow became increasingly archaic in war. According to Roger Ascham (1515–1568) in 1546, “How honest a pastime for the mind [is archery]; how wholesome an exercise for the body; not vile for great men to use, not costly for poor men to sustain.” Finally, horses also continued in their martial importance, as they were used in the hunt, and in races such as the Italian *palio* and in England during annual competitions. Dressage, which was an extremely difficult, technical, disciplined—and time-bound—form of classical riding, was undertaken by military academies, though it, too, enjoyed a reputation as a more elevated sporting spectacle, and one that reinforced and perhaps played out social hierarchies in presenting the mounted rider—according to one Tudor writer—as a force of “majesty and dread to inferior persons.” At the same time, the increasing precision of horsemanship, in the form of dressage, reflected a greater emphasis on uniformity and mathematical rules, as reflected in the writings of Descartes or by the early modern military shift to the use of drill.

Other activities enjoyed by the upper levels of society included tennis, which became the sport of kings such as Henry VIII, most notably, and was referred to in the writings of Erasmus, More, and Montaigne (with the latter’s brother dying after being hit in the head with a tennis ball—no trivial accident when balls were frequently decried as too hard). After 1600, however, tennis declined in popularity, though it continued to ebb and flow in the elite consciousness alongside the new sport of golf.

Meanwhile, though football and related communal games tended to be spurned by elites and their writers, the similar game of *càlcio* (‘soccer’) flourished in Italy, allowing gentlemen, in the words of Cardinal Silvio Antoniano, to appear “more erect and more eager, and [enabling] them to meet sadness and depression with unruffled brow.” Like other sports of the day, *càlcio* was affected by increasing bureaucratic intervention and mathematical quantification, as rules were drawn up to establish standards of play as well as objective and (increasingly) recorded scoring systems.

While sport among the elite was lauded by religious and secular leaders, sport among the lower orders was subject to greater condemnation on the part of authorities, who might have feared the disruptive and violent potential it could contain. The church and civic officials had long attempted to curtail football and other peasant games, with writers such as Sir Thomas Elyot (1490?–1546) advocating that football, in particular, be “put in perpetual silence.” Urban footballers, or those who practiced their exertions near churches, were particularly odious to churchwardens, city administrators, and other leaders, who understandably feared the destruction of property. The “bloody and murdering” practice of football continued, however, in spite of Puritan hostility and denunciation, and despite the increasingly restricted fields that were fenced in after the enclosure movement in England. While games were allowed within proscribed time periods and special festival occasions such as Shrove Tuesday or May Day, the community- and identity-reinforcing benefits of sports proved too enticing for villagers and townspeople alike.

Such attachments were due in part to the fact that certain sports were so embedded in the peasant tradition, where football—usually involving two opposing teams that kicked or threw the ball against the opponents’ goals—extended back centuries. In England the game had mythical origins, with claims that it had originated among Roman legionnaires in Britain, or later, among Saxons. Whatever the truth, the term *football* first appears in records of the fourteenth century, with indications that the sport had already existed for a while. Similar to football, but more like modern-day soccer, was the game known in France as *la soule à pied*, which also extended back to the Middle Ages and involved opposing villages or specifically designated individuals competing to propel a leather ball forward by feet alone. *Shouler à la crosse*—which would evolve, with American Indian contributions, into modern lacrosse—involved similar feats using sticks, while the stick-based game of hockey—derived either from the French *hocquet*, meaning ‘shepherd’s staff’, or the Anglo-Saxon *hoc*, meaning ‘hook’—also originated in the Middle Ages.

Less physically taxing than fencing or football, though perceived as sport by upper and lower orders alike, were gambling games and related pas-

times such as cockfighting. Though an ancient and universal game, dicing in early modern Europe continued its popularity and used the familiar cubed objects rather than the original knucklebones, though some dice were carved in the image of men or beasts. German mercenaries called *landsknechts* (literally, ‘servants of the country’) were particularly renowned dicing gamblers of the time, while knights and ladies, along with children and villagers, also continued to participate. Not surprisingly, objections were raised by Puritans, although enforcement of prohibitions was uneven. Gambling was not simply a “profane exercise” but also quite clearly a sin and banned in places such as John Calvin’s Geneva. As one epigrammatic writer put it in 1636, the banning of sport and games resulted in “dull iron times” that made one long for “the Golden Age’s Glories.” Restrictions were subsequently eased, however, in reaction to the failed suppression of sport; partly as a result, the eighteenth century witnessed a veritable explosion of games and gambling, which continued, as they already had, to provide a sphere in which to exhibit, perform, show off, display physical prowess, and fashion one’s identity through the kick of a ball, the lunge of a sword, or the roll of *Fortuna*-imbued dice.

SPRAT, THOMAS (1635–1713), author of *The History of the Royal Society of London, for the Improving of Natural Knowledge* (1667), an impor-

tant document for those interested in Baconianism, the nature and program of the early Royal Society, and the development of English prose style. Educated at Wadham College, Oxford (B.A. 1654; M.A. 1657) and patronized by John Wilkins (1614–1672), the warden of Wadham College and an important figure in the founding of the Royal Society, Sprat appears to have been groomed for a clerical and literary career. His first publication was a panegyric to Oliver Cromwell (1659).

Commissioned by the Royal Society in 1663 to publicize and defend its aspirations, methods, and accomplishments, Sprat's *History of the Royal Society* was guided by a society committee and by John Wilkins. Scholars differ as to whether the sentiments expressed should be considered those of Sprat or Wilkins and the extent to which it represents the "official ideology" of the society. Sprat's *History* offers a Baconian vision of a useful, experimental, natural philosophy, although it accepts mathematics and hypothesis to a greater extent than Bacon did. Like Bacon's *Advancement of Learning* (1605), it argues that the pursuit of natural philosophy was not politically, socially, or religiously dangerous. Publication of the *History* was delayed by the plague and the fire in London. In the interim Sprat defended English science from the critique of Samuel Sorbiere (1615–1670).

The *History* is prefaced by a laudatory poem by Abraham Cowley (1618–1667) praising Bacon, the efforts of the Royal Society, and Sprat's literary style. Soon after, Sprat supervised the publication of Cowley's works and provided an account of his life and writing. Book I of the *History* is an outline of the history of learning, giving special attention to the defects of the Scholastic method and to the society's "new way of Inquiry." The accomplishments of the ancients are admired, but their authority rejected. Sprat emphasizes the detrimental effects of religious controversies and the need for peace if knowledge is to flourish.

Book II contains a description of the Royal Society's origins, its constitution, and legal structure. Although the society is characterized as open to men of all religions, nations, and professions, the role of gentlemen is particularly emphasized. Sprat notes the society's avoidance of politics, morality, oratory, and religion and describes its method of

inquiry, highlighting the role of experiment, its preference for cooperative over individual investigation, and its rejection of the Cartesian method. It also includes a survey of the society's experiments and activities.

Book III, more apologia than history, defends experimental philosophy, emphasizing the society's hostility to religious fanaticism and other varieties of dogmatism. Sprat argues that experimental natural philosophy is not injurious to traditional education and its disciplines, altering only natural philosophy. Although the society did not meddle in spiritual things, its investigations supported natural religion, Christian belief, and the Church of England. The experimental approach also benefited the manual arts, the nobility and gentry, and wits and writers as well as encouraging the spread of civility and obedience to civil government. The *History* was attacked by Henry Stubbe (1632–1676), and modern scholars have questioned the accuracy of Sprat's account of the society's origins, the degree to which it represented accurately the society's methodology and goals, the extent of society supervision, and whether the *History* should be considered a latitudinarian document.

The best-known portions of the *History*, those advocating a plain, unadorned prose style devoid of metaphor and other figures of speech, have been central to discussions of scientific writing and prose style more generally. Sprat suggests that eloquence ought to be banished from civil society and that ornaments of speech are opposed to reason. The society therefore resolved "to reject all the amplifications, digressions, and swellings of style: to return back to the primitive purity, and shortness, which men delivered so many things, almost in an equal number of words." Sprat supported creation of an academy to polish the English language.

Sprat was a popular preacher and participant in high-church politics, holding a number of clerical posts before becoming bishop of Rochester in 1684. He defended the doctrine of the divine right of kings, wrote against the Whigs and the Rye House Plot, and served on James II's (ruled 1685–1688) ecclesiastical commission. Although willing to read James's *Declaration for Liberty of Conscience* from the pulpit, Sprat resigned from the commis-

sion, refusing to prosecute those unwilling to do so. Sprat accepted the Revolution of 1688.

STAR CHAMBER. The court of Star Chamber took its name from the Camera Stellata in Westminster where its sessions were routinely held. The term does not appear to have been used before 1550 and only became popular in 1618 in Ferdinand Pulton’s *Collection of Sundrie Statutes*. The court grew out of the medieval practice of the king’s council hearing cases by petition, an alternative to the cumbersome process of the common law courts. Under Cardinal Wolsey’s chancellorship (1515–1529), these legal functions of the council were separated from its administrative functions and the business of the court increased tenfold. Privy councillors, sometimes joined by the leading common law judges and lawyers, heard petitions and passed judgment. Most of the court’s business in the early sixteenth century was civil, but by the 1560s an increasing number of criminal cases were heard. From 1566 the court also dealt with sedition, and its reputation for hearing politically sensitive cases increased. The court’s business declined under the early Stuart kings, but its unsavory reputation for summary trial without jury and use of arbitrary power by the crown increased. Political show trials, such as those of the Puritans Alexander Leighton in 1630 and William Prynne, John Bastwicke, and Henry Burton in 1637, and the cruel and unusual punishments inflicted meant that Star Chamber became a prime target of opponents of Charles I in 1640–1641. On 5 July 1641, the Long Parliament abolished Star Chamber along with that other symbol of prerogative justice, the Court of High Commission.

DAVID GRUMMITT

STATE AND BUREAUCRACY. The years between 1450 and 1789 were crucial in the development of the modern European state and state system. Political communities became increasingly centralized, territorialized, and bureaucratized. In much of Europe, state sovereignty displaced imperial and feudal conceptions of authority. These changes meant a reduction in the number and variety of actors participating in what we would now call “international politics.” Familiar notions of statecraft, such as the importance of the “balance of power” and “reason of state,” gained widespread acceptance, and by the latter part of the seventeenth century, religion was no longer a major factor in interstate relations.

Despite these trends, the states of early modern Europe were very different from our own. Dynastic notions of legitimacy contoured both domestic and interstate politics; the scope of the state’s authority remained limited and fragmented by the standards of contemporary advanced industrialized countries. Nationalism and the goal of national self-determination did not emerge as significant forces in European politics until after the French Revolution. Yet many scholars believe that developments in the early modern period explain patterns of authoritarianism and democratization into the early twentieth century.

A number of factors share responsibility for the significant changes in European political institutions that took place in the early modern period. Among these, three kinds of large-scale processes were particularly important. First, frequent and increasingly expensive warfare placed great fiscal pressures upon states and their rulers. These pressures produced political bargains, administrative adaptations, and social struggles that altered the scope and nature of state power. Second, changes in the European economy associated with the rise of preindustrial capitalism and the development of direct trading connections—often through imperial expansion—with Asia, Africa, and the Americas brought about shifts in the relative influence and resources of different social actors and, at the same time, led to new sources of revenue and power for many rulers. Third, new ideas and ideologies, particularly those connected with the Protestant Reformation and the

Enlightenment, played important roles in shaping and justifying new and old forms of state power.

THE CONCEPT OF THE STATE

It was not until the end of the sixteenth century that the word “state” became a common term to describe governments and their territories. Used in late medieval Europe to refer to the standing of a ruler or the state of his realm, the term gradually came to encompass the territories held by a political community and then the political community itself. The fact that “state” took on its now familiar meaning at the start of the early modern period suggests that the state—as an institution—emerged at roughly the same time.

Our contemporary understanding of the state derives directly from these conceptual innovations and the ways in which they were consolidated in the seventeenth and eighteenth centuries. The “state” may be taken, at a minimum, to refer to the combination of a government, the people it governs, and its territories. Such a thin concept of the state allows analysts to speak of a variety of different kinds of states. For example, Florence, Venice, and Genoa are often called “city-states,” although each came to control subservient cities and regions. Some historians—perhaps misleadingly—have referred to the monarchies of medieval England and France as “feudal states.” Many scholars now use the term “composite state,” coined by H. G. Koenigsberger, to describe the patchwork quality of early modern states. States have been, and still are, organized in a variety of ways; the states of late medieval and early modern Europe had quite different characteristics from those associated with modern, particularly industrialized, nation-states.

Contemporary accounts of the development of the European state and state system rely heavily upon the work of the German social scientist Max Weber (1864–1920). According to Weber (pp. 55–56), the modern state is “an administrative and legal order subject to change by legislation, to which the organized activities of the administrative staff, which are also controlled by regulations, are oriented.” A key feature of the modern state is that rule is impersonal. Political authority derives from the office, not from the person occupying that office. The consistent application of the legal code takes priority over personal relationships, and rulers

may only change law through settled procedures. These features entail the rise of professional and meritocratic forms of administration at the expense of patrimonial office holding. In patrimonial systems, offices are “owned” by individuals and their families, who occupy them by right rather than by merit.

Weber also argued that the modern state “claims binding authority, not only over the members of the state, the citizens, most of whom have obtained membership by birth, but also to a very large extent over all action taking place in the area of its jurisdiction. It is thus a compulsory organization with a territorial basis.” Indeed, “today, the use of force is regarded as legitimate only so far as it is either permitted by the state or prescribed by it. . . . The claim of the modern state to monopolize the use of force is as essential to it as its character of compulsory jurisdiction and of continuous operation.” The modern state exercises territorial sovereignty. No other actor may claim the right to make or enforce rules within the boundaries of a state—at least without the express permission of that state. States also enjoy autonomy with respect to their external relations, exercised through the sole right to make treaties, declare war, and regulate their borders for themselves and their citizens.

Despite the influence and insightfulness of Weber’s discussion of the characteristics of the modern state, we need to be careful about how we use it in analyzing historical processes. Indeed, some historians question the usefulness of Weber’s definition. They argue that it promotes teleological accounts of European state formation, blinding analysts to the variety of manifestations of the state that have existed over the last few hundred years. It also, critics contend, leads scholars to overestimate the true power that expanding central bureaucracies actually wielded. The existence of an extensive bureaucratic infrastructure does not necessarily indicate a high degree of practical centralization and state power.

Such problems often plague analysis of state formation, but they should not lead us to abandon Weber or his definition of the state. Weber’s discussion of the nature of the state is what he calls an “ideal-typical” construction, not a description of actual states. No political community, in any period

of human history, has ever perfectly fit his definition of the state. Ideal types are the starting point of discussion and analysis, not descriptions of concrete reality. If we keep this fact in mind, Weber’s understanding of the state remains a valuable tool for understanding the development of states in early modern Europe.

STATE FORMATION IN EARLY MODERN EUROPE

The most important source of variation in early modern state formation into the seventeenth century was created by the uneven expansion of princely, or dynastic, power. Trends in this direction date back into the fourteenth century, but their contours began to take shape in the late fifteenth century. In western Europe, particularly in England, France, and Castile, princes expanded their control at the expense of the autonomy of other concentrations of power, such as towns, nobles, and the church. The result, by the beginning of the sixteenth century, was the formation of what some historians call the “new monarchies” of western Europe. At the same time, territorial princes in Germany were in the process of appropriating legislative power—with mixed success—into their own hands. The trend toward princely power was not limited to kingdoms and principalities. In Italy, where city-states rather than kingdoms predominated, great families were busy establishing their own dynastic control over most formerly independent communes and republics. In all three cases, princes were able to expand their power by successfully manipulating divisions between other political actors, mostly within the nobility and the towns, while also tying the fortunes of both to princely authority.

Elsewhere, attempts to expand princely power met with rather different fates. Until the second half of the seventeenth century, the Danish nobility successfully curtailed princely authority—a situation dramatically reversed in 1660 when an alliance between the Danish King Frederick and the non-noble estates (burghers and clergy) led to the establishment of an absolutist system of government. An open succession in Hungary in 1439 allowed its national assembly to reassert the elective principle of that kingdom’s monarchy. Baronial interests ultimately thwarted attempts at centralizing reforms. After the division of the kingdom between the Habsburgs and the Ottomans stabilized in 1541,

the relative power of the Habsburgs remained comparatively weak. The ascendancy of the nobility was even more pronounced in Poland, where the powerful diet checked monarchial authority; Poland became a “republic of nobles” with little centralized power.

Variation in the expansion of princely and dynastic power had an impact across three directions of state formation. The first was the eclipse of the influence of nondynastic pathways of state formation. With the exception of the Dutch Republic and the Swiss Confederation, city-states and urban federations gradually ceased to be major players in international politics. The second was the loss of international influence of alternative centers of power within dynastic states, such as cities and nobles. These two trends were related: the same factors that oriented actors’ struggles for influence toward the states in which they resided also undermined the viability of nondynastic states. The third trend involved the balance between agglomerative and consolidative impulses in dynasticism, and the ultimate rise of consolidation as the most effective pathway of state formation.

THE RISE OF DYNASTIC STATES

The expansion of princely authority in many regions of Europe made dynastic states the crucial players in European power politics. City-states, city-leagues, and the majority of nobles—in other words, those who were not directly implicated in dynastic politics—saw a corresponding reduction in their independent international influence. The crucial question for most of the sixteenth and seventeenth centuries was not whether dynastic states would expand their preeminence over international politics, but what kinds of dynastic states would predominate in Europe: the relatively—with an emphasis upon “relatively”—more centralized, territorially compact dynastic states represented by the English and French monarchies, or the confederal and more expansive forms of dynastic states represented by the Habsburg monarchies.

To understand the significance of this transformation, we need to consider that there were a number of different kinds of international actors contending for power from the late medieval into the beginning of the early modern period. In addition to powerful nobles and towns within kingdoms and

principalities, there were a variety of nondynastic states active in international politics. Like dynastic states, most of these were “composite states,” cobbled together from heterogeneous institutions, regions, and linguistic groups.

One important type was city-states. These were composite polities dominated by a single urban community. Although the name suggests a city whose borders were coterminous with a state, in reality city-states were, at minimum, made up of a city and attached—usually dominated—regions. Most German city-states were of this type, but their Italian cousins had, by the late medieval period, come to control a number of formerly independent communes. These dominated entities retained their distinctive legal and institutional personalities and were usually accorded some degree of autonomy over certain spheres of rule. In other words, city-states were really empires run by an urban core. This is particularly apparent if we consider the great Italian city-states, such as Venice, that controlled and fought over maritime empires in the Mediterranean.

By the end of the fifteenth century, Venice was the only Italian city-state that had not become integrated into, to borrow a phrase from Richard Mackenney, dynastic micro-empires headed by powerful Italian families such as the Medici. This process was reinforced after the French invasions of Italy began in 1494 and the peninsula became the focus of dynastic competition between the French Valois, on the one hand, and first the Aragonese Trastámara and then the Habsburgs on the other. The growth of princely power in much of Europe combined with the standard operating procedures of dynasts—based upon marriage alliances and dynastic claims—to empower dynasts even in those regions where princely power was less well developed, not only in Italy but in the elective monarchies of eastern Europe. Most German city-states had the status of imperial cities, and their fate was tied up in the consequences of the Protestant Reformation.

Another alternative to dynastic states was federative polities. Federations often had strong urban components, but they also included rural regions and even, as in the case of the German Swabian League (founded in 1385), small principalities, knights, and monasteries. Federations originated as alliances motivated by the commercial and security

concerns of political actors unable to fulfill those needs through their own recognizance. Although many federations originated in the Middle Ages, they enjoyed a resurgence in the face of dynastic consolidation in the early modern period. A number of federations, including the Hanseatic League and the Swiss Confederation, amounted, unlike the Italian city-leagues, to more than temporary balancing alliances.

The fate of federations was a bit more complex than that of city-states. The Swiss remained viable in this period and were joined by the Dutch in the latter part of the sixteenth century. In general, the fate of most federations was directly linked to that of princely power. The territories of many federations overlapped with those under the titular rule of princes. As princely power expanded, the relative influence of independent and quasi-independent federations, particularly urban federations, declined. In essence, they were absorbed into consolidating dynastic states. The same trends that favored princely power directly undermined the autonomy of federations. The Hanseatic League, for example, scored its last major victory when its principal city, Lübeck, helped secure Swedish independence from the kingdom of Denmark in 1522–1523. By the end of the Thirty Years' War in 1648, the league was in precipitous decline.

CONSOLIDATION AND AGGLOMERATION

The rise of dynasticism in this period still left a great deal of room for different manifestations of dynastic states. The expansion of dynastic authority occurred through two processes: consolidation and agglomeration. The former involved the integration of dynastic holding and the latter the accumulation of holdings under a single dynastic line.

The accumulative potential of dynasticism stemmed from the significance of marriage in cementing alliances and brokering relations between different families. Decades, and sometimes centuries, of strategic marriages between important European families and dynastic lines led to intricate webs of hereditary claims to kingdoms, counties, and principalities. Since there was little legal basis by which a dynast could renounce a familial claim to a particular territory, an heir could always invoke such a claim as a justification for political loyalties or outright conquest. For example, long after the English

had been routed at the end of the Hundred Years' War, Elizabeth I's royal title still referred to her as the "king of France."

The processes of integration and accumulation interacted in a variety of ways to produce different dynastic configurations. The addition of new holdings brought new institutional arrangements under the auspices of a dynastic line, and could therefore increase the heterogeneous character of a dynastic state. For instance, from 1369 to 1477 the dukes of Burgundy created a "middle kingdom" by conquering or accumulating parts of modern-day Belgium, Luxembourg, France, Germany, and the Netherlands. The majority of those territories subsequently transferred to Habsburg hands as a result of marriage and inheritance. Early modern France was itself the product of a period of reconstitution and expansion during the later stages of the Hundred Years' War. There, dynastic practices produced a complicated array of institutions and jurisdictions with different rights and exemptions vis-à-vis the monarchy.

But the most profound transformation resulting from the agglomerative possibilities of dynasticism was the sudden creation of a vast confederal empire united through the person of Charles of Habsburg (Emperor Charles V). Starting in 1517, Charles became ruler of a large swath of territories in western, central, and southern Europe. In only a few years, the Habsburg line amassed unparalleled power in sixteenth-century Europe. As Holy Roman emperor and the dynastic head of a vast and heterogeneous collection of territories, Charles's position revived the prospects for universal empire in Latin Christendom. After he abdicated his various titles between 1556 and 1557 (see below), Charles's holdings were divided between his son Philip II of Spain (ruled 1556–1598) and his brother, Ferdinand I (king of Bohemia and Hungary, 1526–1564; Holy Roman emperor, 1558–1564). The rump Habsburg lands of the Spanish monarchy still made Charles the most powerful international actor in Christendom until the dénouement of the Thirty Years' War. Ferdinand also controlled a formidable, and formidably heterogeneous, agglomeration including Austria and the remnant of the Kingdom of Hungary. In the eighteenth century, Austria would emerge as a great power in its own right.

During the sixteenth and seventeenth centuries, the crucial question of state formation was whether the Habsburg model would prove more significant and enduring than the more compact alternative represented by the French monarchy, or indeed how the balance between consolidation and agglomeration would play out in dynastic states in general. In the end, consolidation, along with a movement toward sovereign territoriality, became the preponderant pathway of state formation in most of Europe.

PROCESSES OF CHANGE

A combination of three factors influenced the rise of princely power: transformations in the conduct of warfare, developments in the art of rule, and economic changes. The first undermined the ability of towns and lesser nobles to mount effective opposition to princely authority, the second helped to transform social relations and the balance of influence among different groups within states, and the third led to new coalitional possibilities for princes. These factors varied in their configuration, orientation, and timing in different places in Europe. They also interacted with preexisting institutions to produce different results; this helps to explain why some polities saw a decline in princely authority instead of its expansion.

Developments in the nature of warfare had a profound influence on state formation in the entire period under consideration. These changes involved the increasing importance and sophistication of gunpowder artillery in conjunction with new organizational tactics—most famously associated with the Swiss pike square—and the rise of new fortification techniques designed to cope with the impact of gunpowder artillery on siege warfare. Together they are sometimes called the “military revolution,” but more recent scholarship suggests that the changes in warfare in early modern Europe were more evolutionary, and hence more complicated in nature. Two key changes associated with the military-technical revolution, the rise of mercenary forces recruited by independent and quasi-independent contractors and the decline in importance of feudal levies in warfare, actually began in the medieval period, although their importance only grew over time. The development of the revenue expropri-

ation apparatus needed to finance mercenary armies also predates the early modern period.

The introduction of combat-effective handheld gunpowder artillery in the fifteenth century combined with the continued shift toward mercenary armies gave important advantages to those with the power to extract and wield greater fiscal resources. Simultaneously, these changes began to undermine the kinds of armies fielded by lords and their retainers. In practice, the advantage went to princes and regional magnates, but large cities with high concentrations of wealth could also afford to hire mercenaries. Meanwhile, the castles and fortifications of the lesser nobility were obsolete in the face of new siege techniques that made use of gunpowder.

The new reality was that most cities and nobles simply could not, on their own, amass the concentration of wealth and manpower necessary to mount forces capable of challenging princes. If princes could exploit the divisions inherent in composite dynastic states—between regional interests and social classes—they were relatively insulated from successful challenges to their power.

To aid them with this task, dynasts had new ideologies and techniques of rule at their disposal. With the growth of patronage as the basis for durable political ties—itsself connected to economic changes discussed below—heads of state, particularly in those kingdoms already marked by comparative centralization aided by hereditary rule, found themselves situated at the top of a complex network of patron-client relations. Their prerogatives made a great many of their subjects ultimately dependent upon them for continued financial and status perquisites. This, combined with increasingly sophisticated propaganda drawing upon theories of royal authority, gave princes ideological and material resources with which to prevent the formation of effective coalitions against them.

Finally, economic changes had a crucial impact. Growth in the European economy in the Middle Ages, particularly with respect to long-distance trade, had already contributed to the rise of towns. Where rulers had successfully pivoted between burghers and nobles—as in France, Aragon, and England—they had already done much to build a position of comparative strength. Population pressures,

economic growth in the sixteenth century, the influx of silver from the newly discovered Americas, and numerous other causes of the “price revolution” that accompanied the expansion of preindustrial capitalism in early modern Europe, played a decisive role in accelerating the breakdown of what was left of feudal forms of loyalty. New sources of wealth, changing social classes, and diverging economic interests increased the distributional role of the state in the allocation of money and prestige.

Moreover, these developments generally favored entrepreneurial merchants and the higher nobility. The latter not only benefited from the increasing price of agricultural goods, but could also derive income from patronage and military activity. In western Europe this made them more dependent on the crown, not only with respect to patronage but also because monarchical brokerage became essential to the ability of large landowners to raise rents and squeeze profits from the peasantry. In contrast, lords in northeastern Germany and Poland were particularly powerful and held extensive lands, which meant they did not need to become dependent upon their titular rulers. Indeed, such nobles were able to institute a neo-serfdom far more burdensome than the older variety, and these regions became the principal exporters of grain for an urbanizing western Europe.

As this last point suggests, the conjunction of economic and military factors also exerted strong influence over the early development of bureaucratic elements in state administration. In general, significant aspects of bureaucratic administration first appeared in dynastic holdings that contained concentrations of capital resulting from urban trade, where rulers already had some relative advantage over their domestic competitors, and where rulers were engaged in intensive warfare utilizing newer, more expensive recruitment techniques and military technology. The first two factors provided the means to expand tax collection and the administration of debt, while the last provided the impetus for increasing royal control. Thus, western European kingdoms such as France and Castile developed early aspects of bureaucratic governance. These techniques were insufficient to finance the debts incurred by conflict, and periods of war making were abruptly halted by financial pressures and outright bankruptcies. But the management of debt

itself provided a crucial impetus to the kinds of ad hoc administrative arrangements that laid the seeds for later bureaucratization.

Even in the new monarchies of the early sixteenth century, princes were not as strong as their propaganda and their increasingly extravagant court cultures sought to suggest. The smooth functioning of their authority depended upon the cooperation of regional magnates and urban centers, and on preventing coalitions against princely authority from forming between various regional and local actors. In the sixteenth and seventeenth centuries, resentment against the centralizing tendencies of dynasts mixed with religious dissent to plunge large swaths of western and central Europe into political conflict and civil war.

THE EMERGENCE OF A MULTISTATE, SOVEREIGN-TERRITORIAL EUROPEAN POLITICAL ORDER

The Protestant Reformation and the Peace of Westphalia of 1648, which marked the end of the Thirty Years' War, were once seen as watersheds in European history that ended the prospects for an intra-European universal empire and established a sovereign-territorial, multistate system. Although some scholars defend qualified versions of this interpretation, there is very little evidence to suggest that the Reformation and Westphalia led directly to the modern state system. In fact, even before the Reformation, the position of the church in many dynastic states was becoming subordinate to the interests of secular rulers.

A more balanced understanding of the role of the Reformation in the emergence of a multistate, sovereign-territorial European order is that it accelerated some trends already caused by military-technical and economic change, while undermining others, particularly aspects of the more confederal, dynastic agglomerative pathway of state formation. In this way, it tilted the balance toward a sovereign, multistate system but was not decisive in its development.

Thus, in the German regions of the Holy Roman Empire, the rise of Protestantism ultimately enhanced the importance of territorial principedoms. Charles V's unwillingness to engage in a long-term compromise on the issue of religious belief convinced many of the princes that they could only

preserve Protestantism by relying on self-help. Their eventual victory over Charles led to his abdication and the 1555 agreement at Augsburg that specified, with some qualifications, that each prince would determine the religion of his territory. Augsburg led to a period of confessionalization, in which hardening doctrinal divisions between different sects of Christianity tended to coincide with territorial boundaries.

Some scholars argue that confessionalization, whether through processes of the Reformation or Counter-Reformation, played a major role in expanding the scope, nature, and territorial authority of the state not just in Germany, but throughout Europe. For instance, the state took on oversight of responsibilities such as social welfare concerns that had been largely local and ecclesiastical in the medieval period. Although some of these claims are exaggerated, it is clear that confessionalization forwarded existing trends in those directions.

For its part, the spread of Calvinism into France and the Netherlands temporarily worked to undermine the advantages gained by princes as a result of military-technical change and political institutional effects. Calvinism provided a basis for cooperation that transcended regional and class differences. These differences were crucial components of the divide-and-rule strategies used by dynasts and institutionalized in dynastic composite states. Moreover, the organizational abilities and transnational connections afforded by Calvinism—and by militant Catholicism in France—allowed nonstate actors to gain access to sufficient resources to mobilize competitive military forces.

The Dutch Revolt, in which religious tensions played a decisive role in escalating other grievances against Habsburg rule, led directly to Spanish strategic overextension and contributed a great deal to Spain's eventual failure to maintain European primacy. Moreover, major innovations in fiscal administration developed in Holland during Habsburg rule were expanded during the Dutch Republic's war for independence against Spain (1568–1648). The Dutch were forced to field continuous and substantial military forces on a predominately mercantile financial base.

In contrast, the French Wars of Religion (1562–1598) were, in the short term, much more

devastating to France's cohesion and international position. Yet they also revealed the advantages that more compact dynastic states had in the context of religious strife—even when the Huguenots established a “state within a state,” secession from the French crown was never a serious option. The experience of the wars provided added impetus for the expansion of sovereign authority in the kingdom, and, somewhat paradoxically, thus led to the growth of a more integrated, centralized state.

The religious conflicts that engulfed various parts of Europe between the promulgation of Martin Luther's Ninety-Five Theses in 1517 and the end of the English Civil War in 1648 played some role in important conceptual changes in European statecraft. Their most direct impact can be found in developing ideas about sovereignty. The experience of religious civil war led directly to Jean Bodin's (1530–1596) and Thomas Hobbes's (1588–1679) different formulations of sovereignty, as well as to new syntheses of ideas about the right of resistance to unlawful or unjust rulers. These debates, and those that followed from them, were pivotal in making questions about state sovereignty—who ultimately holds it and what its limits are—a central element of political theorizing.

Religious conflicts also made a significant contribution to the (largely implicit) adoption of Italian notions of “reason of state” in Europe. Reason of state, or, more frequently, “necessity,” was the justification for reconciling temporary accommodation of confessional differences or even putting aside religious differences in the support of enemies of one's own dynastic opponents. Of course, it was generally the opponents of religious compromise who accused moderates of adopting Machiavellian attitudes or “politique” positions, but the processes of making these decisions involved formulating the antecedents of ideas about state interests.

Religious struggles were less important in the emerging notion of the “balance of power,” which owed more to the propaganda campaign inspired by fears of Habsburg primacy. Since the Habsburgs were the main dynastic backers of the Catholic cause, these debates were often tinged with religious concerns, but the more important concern was the possibility of a more robust Habsburg hegemony or even a Habsburg universal empire in which

the other princes of Europe would be subordinate players. The threat of Habsburg hegemony led to a critique of empire that served as a justification for defensive aggression: lesser powers could engage in proactive strategies—from alliances to warfare—to prevent one actor from accumulating an imbalance of power. These arguments were refined during the wars of Louis XIV in the later seventeenth and early eighteenth centuries. Indeed, France admitted in the 1713 Treaty of Utrecht that it was fear of French power that motivated the War of the Spanish Succession—the first mention of the balance of power in a European peace treaty.

CONSOLIDATION AND BUREAUCRATIZATION

The conflicts of the seventeenth and eighteenth centuries forced those states that had not been subject to the same opportunities and pressures that initially favored bureaucratization in western Europe to launch their own administrative reforms. In general, states such as Sweden, Brandenburg-Prussia, and Austria lacked the kind of access to domestic capital sources that played an important role in early European bureaucratization. Where princes were comparatively strong, particularly in Prussia, in some of the German principalities, and for more contingent reasons, in Sweden, they built extensive bureaucracies capable of extracting enough resources to compensate for their comparatively poor access to trade revenues. In Poland, by contrast, patrimonial administration persisted and ultimately led to the demise of the commonwealth. Indeed, some argue that the ways in which states financed warfare in the sixteenth and seventeenth centuries determined whether they became, in the nineteenth, moderately democratic or authoritarian.

In general, state formation in the second half of the seventeenth and eighteenth centuries was characterized by a decisive shift toward territorial sovereignty and greater bureaucratization of the state's financial and administrative activities. Enlightenment ideas of rationality and the obligation of rulers to subjects provided an important impetus to these developments, although financial pressures and political interests played perhaps a more decisive role.

A major impetus to additional bureaucratization came from the replacement of mercenary forces with professional militaries. Professional armies and

navies were usually recruited from within the state and were always integrated into the state's institutional structure. This greatly expanded the fiscal and administrative costs of warfare, but also increased the reliability of military forces. It was this transformation that placed the means of organized violence beyond the reach of citizens and subjects.

Although these changes meant greater centralization of authority, they did not necessarily lead to particularly efficient or coherent bureaucratic structures. The sale of offices for revenues, problems with particular administrative bureaucracies, and other factors often led to duplicative governmental activity. France developed such patchwork institutions. Indeed, local revolts against royal demands for revenue and greater authority continued to plague French administration in the decades before the French Revolution. Britain, borrowing directly from Dutch innovations and with the advantage of parliamentary oversight, was more successful at creating an efficient fiscal-administrative system.

Brandenburg-Prussia is usually taken to be the most extreme case of this fusion of military and administrative centralization. Prussia's reliance on centralized, coercive fiscal-military institutions stemmed from its precarious geographical position, expansionist foreign policies, and the fact that its resource base lacked extensive trade and capital endowments. These factors meant, initially, that expansion, such as the seizure from Austria of Silesia, and foreign subsidies were crucial to Prussia's ability to sustain its great-power status. Such pressures also led to a bureaucratic framework that lacked the functional specialization found in other European states.

If Prussia represents one extreme, then Austria might be considered another divergent case. Austria remained a relatively confederal dynastic agglomeration. In fact, it had come close to collapsing in 1618–1620 under the pressure of religious contestation and local rebellion. However, after the War of the Spanish Succession (1701–1714), the Austrian dynastic empire controlled more territory in Europe than the Spanish monarchy ever had. Starting in the middle of the eighteenth century under Maria Theresa, Austria's Habsburg rulers began to make real progress in administrative reform. But these successes were often checked by assertive local actors,

particularly the nobility. Austria's rulers could often squeeze more revenue from their heterogeneous domains, but they generally could not overcome their dependence on cooperation from local elites.

Throughout Europe, direct and indirect rule continued to coexist; by and large, the expansion of bureaucratic administration was often more impressive in a formal sense than a practical one. The erosion of patrimonial officeholding in many parts of Europe did not prevent bureaucratic officeholders from seeking to enrich themselves at the expense of the state. In France, and even at some points in Prussia, rent seeking emerged as an enormous problem for the new bureaucracies.

The early modern period witnessed a decisive transition to territorial sovereignty within Europe, and it saw the emergence of robust bureaucratic forms of governance and the expansion of state administration into a variety of new areas, but it did not mark the triumph of the Weberian bureaucratic state. However, such states, to the extent that they ever existed, were a result of the transformative effects of nationalism and industrial capitalism upon the institutional infrastructures and international political practices developed between 1450 and 1789.

DANIEL NEXON

STATISTICS. The word statistics comes from the German *Statistik* and was coined by Gottfried Achenwall (1719–1772) in 1749. This term referred to a thorough, generally nonquantitative description of features of the state—its geography, peoples, customs, trade, administration, and so on. Hermann Conring (1606–1681) introduced this field of inquiry under the name *Staatenkunde* in the seventeenth century, and it became a standard part of the university curriculum in Germany and in the Netherlands. Recent histories of statistics in France, Italy, and the Netherlands have documented the strength of this descriptive approach. The descriptive sense of statistics continued throughout the eighteenth century and into the nineteenth century.

The numerical origins of statistics are found in distinct national traditions of quantification. In England, self-styled political and medical arithmeticians working outside government promoted numerical approaches to the understanding of the health and wealth of society. In Germany, the science of cameralism provided training and rationale for government administrators to count population and economic resources for local communities. In France, royal ministers, including the duke of Sully (1560–1641) and Jean-Baptiste Colbert (1619–1683), initiated statistical inquiries into state fi-

nance and population that were continued through the eighteenth century.

Alongside these quantitative studies of society, mathematicians developed probability theory, which made use of small sets of numerical data. The emergence of probability has been the subject of several recent histories and its development was largely independent of statistics. The two traditions of collecting numbers and analyzing them using the calculus of probabilities did not merge until the nineteenth century, thus creating the modern discipline of statistics.

The early modern field of inquiry that most closely resembles modern statistics was political arithmetic, created in the 1660s and 1670s by two Englishman, John Graunt (1620–1674) and William Petty (1623–1687). Graunt's *Natural and Political Observations Made upon the Bills of Mortality* (1662) launched quantitative studies of population and society, which Petty labeled political arithmetic. In their work, they showed how numerical accounts of population could be used to answer medical and political questions such as the comparative mortality of specific diseases and the number of men of fighting age. Graunt developed new methods to calculate population from the numbers of christenings and burials. He created the first life table, a numerical table that showed how many individuals out of a given population survived at each year of life. Petty created sample tables to be used in Ireland to collect vital statistics and urged that governments collect regular and accurate accounts of the numbers of christenings, burials, and total population. Such accounts, Petty argued, would put government policy on a firm foundation.

Political arithmetic was originally associated with strengthening monarchical authority, but several other streams of inquiry flowed from Graunt's and Petty's early work. One tradition was medical statistics, which developed most fully in England during the eighteenth century. Physicians such as James Jurin (1684–1750) and William Black (1749–1829) advocated the collection and evaluation of numerical information about the incidence and mortality of diseases. Jurin pioneered the use of statistics in the 1720s to evaluate medical practice in his studies of the risks associated with smallpox inoculation. William Black coined the term *medical*

arithmetic to refer to the tradition of using numbers to analyze the comparative mortality of different diseases. New hospitals and dispensaries such as the London Smallpox and Inoculation Hospital, established in the eighteenth century, provided institutional support for the collection of medical statistics; some treatments were evaluated numerically.

Theology provided another context for the development of statistics. Graunt had identified a constant birth ratio between male and females (14 to 13) and had used this as an argument against polygamy. The physician John Arbuthnot (1667–1735) argued in a 1710 article that this regularity was “an Argument for Divine Providence.” Later writers, including William Derham (1657–1735), author of *Physico-Theology* (1713), and Johann Peter Süssmilch (1707–1767), author of *Die Göttliche Ordnung* (1741), made the stability of this statistical ratio a part of the larger argument about the existence of God.

One final area of statistics that flowed from Graunt’s work and was the most closely associated with probability theory was the development of life (or mortality) tables. Immediately following the publication of Graunt’s book, several mathematicians, including Christiaan Huygens (1629–1695), Gottfried Leibniz (1646–1716), and Edmund Halley (1656–1742) refined Graunt’s table. Halley, for example, based his life table on numerical data from the town of Breslau that listed ages of death. (Graunt had to estimate ages of death.) In the eighteenth century, further modifications were introduced by the Dutchmen Willem Kerseboom (1690–1771) and Nicolaas Struyck (1686–1769), the Frenchman Antoine Deparcieux (1703–1768), the German Leonard Euler (1707–1783), and the Swede Pehr Wargentin (1717–1783). A French historian has recently argued that the creation of life tables was one of the leading achievements of the scientific revolution. Life tables were used to predict life expectancy and aimed to improve the financial soundness of annuities and tontines.

The administrative demands brought about by state centralization in early modern Europe also fostered the collection and analysis of numerical information about births, deaths, marriages, trade, and so on. In France, for example, Sébastien le Prestre de Vauban (1633–1707), adviser to Louis XIV

(ruled 1643–1715), provided a model for the collection of this data in his census of Vézelay (1696), a small town in Burgundy. Although his recommendations were not adopted, a similar approach was pursued decades later by the Controller-General Joseph Marie Terray (1715–1778), who requested in 1772 that the provincial intendants collect accounts of births and deaths from parish clergy and forward them to Paris. Sweden created the most consistent system for the collection of vital statistics through parish clerks in 1749. Efforts in other countries failed. In England, two bills were put before Parliament in the 1750s to institute a census and to insure the collection of vital statistics. Both bills were defeated because of issues concerning personal liberty. While these initiatives enjoyed mixed success, they all spoke to the desire to secure numerical information about the population. Regular censuses, which would provide data for statistical analysis, were not instituted until the nineteenth century.

ANDREA RUSNOCK

STEELE, RICHARD (1672–1729), English essayist and dramatist. Steele's name is associated with that of Joseph Addison, with whom he collaborated. Born in poor circumstances in Dublin, Steele was brought up by his aunt and uncle, Lady Katherine Mildmay and Henry Gascoigne. His extended family were influential Protestant gentry, but little is known of his parents. At fourteen, Steele went to the Charterhouse School, where he met Addison.

In 1689 Steele went to Oxford University, where he did not take a degree but joined the second troop of Life Guards in 1692. His first publication was a poem on the death of Queen Mary II in 1694; it was dedicated to Lord Cutts, colonel of the Coldstream Guards, who rewarded him with the rank of captain and made him his secretary. Steele had a daughter with Elizabeth Tonson. He did not acknowledge the fact at first, but later brought the child up in his home. While stationed in Suffolk as commander of a garrison, he composed *The Christian Hero* (1701). In this reforming tract and moral manual, Steele contrasted the passion and universal heroism of Christianity with his perception of the

false reasoning of Stoicism of the Roman emperors. Steele wrote his first play, *The Funeral, or Grief à la Mode*, the same year. A didactic satire on hypocritical undertakers and dishonest lawyers, it was praised by William III. Unfortunately, the king died before conferring any favors on Steele. Finding promotion in the army increasingly difficult to achieve without powerful connections, Steele left in 1705 to pursue success as a writer. In his second play, *The Lying Lover* (1702), he continued his didactic dramatic vision, portraying virtuous characters as models for audiences to emulate, as opposed to the predominantly “immoral” characters on the Restoration stage.

In 1705, Steele married Margaret Ford Stretch. Because of his theatrical success, he was well acquainted with London society and became involved in Whig politics. He was appointed gentleman waiter to Prince George of Denmark, Queen Anne's husband, in 1706. Engaging in the pamphlet war with satirical essayist Jonathan Swift, his public opponent, Steele wrote *The Crisis*, attacking the Tory ministry for its unenthusiastic support for a Protestant successor to the throne. In 1707, after his first wife's death, Steele married Mary Scurlock. At this time he was editor of the *London Gazette*, the official government periodical.

Steele's fame rests on his founding of *The Tatler* (1709–1711) and *The Spectator* (1711–1712), forerunners of modern journalism, which he wrote anonymously with Joseph Addison with the object of targeting the intellectual and political melting pots of London's coffeehouses and bookshops. *The Tatler*, a series of thrice-weekly papers in which Steele planned to educate “Politick Persons,” was addressed predominantly to fashionable society, whereas *The Spectator* appealed to a wider audience. Using the idea of a club of different personalities, politics, culture, and foreign and domestic topics were explored in *The Tatler*. Steele used the figure of Isaac Bickerstaff, created by Jonathan Swift, to satirize the annual almanacs. Steele's fundamental purpose was moral didacticism: he wished to inculcate a practical morality in an accessible style. Swift, however, attacked Steele's loose use of syntax and the use of juxtaposition in his writing.

Published daily, *The Spectator* developed from *The Tatler* and included essays on relationships be-

tween the sexes, manners, London life, taste, and politics. *The Spectator* assembled a club of narrators whose personalities, eccentricities, and political viewpoints were revealed in concrete detail. Led by Mr. Spectator, the narrators included the Tory country squire Sir Roger de Coverly, and Sir Andrew Freeport, a Whig mercantilist. Steele's contribution to *The Spectator* is distinguished for his use of the letter form and the dialogue between either fictional personae or a writer and a reader (real or imagined). His essays on women such as "The Education of Girls" (no. 66, 16 May 1711) reveal both his sentimentalism and his open, sympathetic stance towards women's social and sexual status.

Steele's desire to be more politically outspoken against the Tory ministry produced two anti-Tory periodicals, *The Guardian* (with Addison's help) in 1713, and *The Englishman* (1713–1714), as well as several pamphlets and short-lived periodicals. Elected as M.P. for Stockbridge in 1713, his position in the House of Commons was disputed, and a Tory majority expelled him. Steele was granted a governorship of Drury Lane Theatre in 1714 to, as he expressed it in his pamphlet *Town Talk*, "Chastise the Vices of the Stage, and promote the Interests of Virtue and Innocence." In 1715, he was knighted by George I, and made a surveyor of the royal stables. Steele argued publicly with Addison in 1718 over the peerage bill, an incident that led to the revocation of the Drury Lane patent. He then began a biweekly paper called *The Theater* and later issued pamphlets about the South Sea Bubble. His last play, *The Conscious Lovers* (1722), was based on Terence's *Andria*; in it Steele portrayed ideals of male and female manners and began the tradition of the sentimental comedy. The play's success enabled him to settle his debts. Steele retired in ill health to his estate in Wales and died in Carmarthenshire in 1729.

MAX FINCHER

STENO, NICOLAUS (Niels Stensen; 1638–1686), Danish anatomist, paleontologist, and geologist. Born 11 January 1638 to a Copenhagen goldsmith, Steno attended the University of Copenhagen from 1656 to 1660, where he studied medicine and anatomy with Thomas and Erasmus Bartholin. Moving on to Amsterdam and Leiden from 1660 to 1664, he made several important discoveries concerning glands, which were a new field of investigation. Inspired by René Descartes's *Treatise on Man* (published posthumously in Leiden in 1662), Steno began studying the physiology of the heart, and he came to argue, against both Descartes and William Harvey, that the heart was not a specially endowed organ but merely a muscle. Failing to secure a position at the University of Copenhagen, Steno traveled to Paris, came under the patronage of Melchisedec Thevenot, and continued his anatomical studies. He gave a lecture on the brain in 1665 in which he took further issue with Descartes's theories of brain function, and he argued that ideas about brain physiology should be grounded in the results of detailed dissection. This lecture was published four years later as *Discourse on the Anatomy of the Brain* and was the most influential of his anatomical works.

Continuing his slow journey south, Steno spent some time in Montpellier in 1665, and in 1666 he arrived at Pisa and the summer court of the Medici family of Florence. He was invited to join the circle

of the Accademia del Cimento, and he readied for publication a study of muscle anatomy. His career abruptly changed course when he was given the head of a giant white shark to dissect by the grand duke, Ferdinand II. Steno was indeed interested in the muscle anatomy of the shark, but he was even more fascinated by its teeth, which closely resembled the fossil objects known as *glossopetra* or tonguestones. Tonguestones, and nearly all other fossils, were commonly regarded as mineral objects that grew in the rocks where they were found and were not thought to have an organic origin. Steno considered the problem and offered compelling reasons why tonguestones must have once been sharks' teeth. When he published his *Elements of Myology* in 1667, he appended to it a short treatise, "The Dissection of the Head of a Shark." This essay marks the beginning of the science of paleontology.

Steno then addressed the more general problem of ascertaining the history of rock formations by examining the clues within them. He formulated principles by which he could determine if formations had been moved or altered after they had been laid down and which formations had been deposited first. Within eighteen months, he had completed his major geological treatise, *Prodromus to a Dissertation on Solids Naturally Contained Within Solids*. Steno argued here that rock strata are like the pages in a book of history, and that proper understanding of the principles of stratigraphy will allow that book to be read. The *Prodromus* marks the beginning of historical geology.

Steno resumed his travels in 1668, touring much of central Europe; he returned to Florence in 1670 for two years and then was invited back to Copenhagen in 1672, where he was royal anatomist until 1674. But his interest in anatomy had been waning for some time. Steno had converted to Catholicism in 1667, and he gradually turned his attention to religious and churchly matters. He returned to Florence in 1675 to be ordained a priest; in 1677 he was appointed apostolic vicar of the northern missions (Germany), and shortly thereafter became the titular bishop of Titiopolis. He spent the last nine years of his life in Hanover, Münster, and Hamburg, trying to bring the followers of Luther back into the Catholic Church. He died on 5 December 1686 in Schwerin. The grand duke of Florence, Cosimo III de' Medici, had Steno's body brought back to Flor-

ence, where he was buried in the cathedral of San Lorenzo. About three hundred years later, on 23 October 1988, Steno was beatified by Pope John Paul II.

WILLIAM B. ASHWORTH, JR.

STEPHEN BÁTHORY (1533–1586; ruled 1576–1586), king of Poland and prince of Transylvania (from 1571). Báthory was brought up at the imperial court in Vienna, was well educated, and knew several languages. In 1559 he was appointed commander of the Wardar fortress, took part in John Sigismund Szapolyai's struggles against the Habsburgs, participated in peace negotiations with the emperor in Vienna, and was interned there for several years. As prince of Transylvania he had to acknowledge his subordination to both Turkey and the emperor; he organized a mercenary army, reformed education, and upheld the principles of religious tolerance.

After Henry of Valois's flight from Poland (1574), Báthory submitted his candidacy for the Polish throne and expressed his intention to marry Princess Anna Jagiellonka. Despite the fact that the primate, Jacob Uchański, proclaimed the emperor

Stephen Báthory. Sixteenth-century portrait engraving.

Maximilian II king of Poland (12 December 1575), many magnates (including Jan Zamoyski), clergymen, and a majority of the nobility supported Báthory, who was proclaimed king on 15 December 1575. On 1 May 1576 Báthory married Anna and was crowned in Cracow. The former followers of the Habsburg candidate gradually came over to his side. Báthory launched a campaign against Gdańsk, which had supported the emperor, and after a lengthy blockade and siege, a compromise agreement was reached (12 December 1577), in which Gdańsk recognized Báthory's election, agreed to pay a high contribution to the royal coffers, and preserved its extensive autonomy.

In his internal policy Báthory, backed by Chancellor Zamoyski's advice, sought to strengthen royal power and did not shrink from overcoming the opposition of magnates and noblemen by force (for instance, in the execution of Samuel Zborowski in 1584). However, when Livonia was threatened by Russia, the king, wishing to start war preparations, made some concessions to the nobility, as its consent to additional taxes was indispensable in order to pay the army. He gave up some of the royal

judicial prerogatives and set up supreme courts of appeal in Poland (1578) and Lithuania (1581). He pursued a policy of religious toleration, observing the provisions of the Compact of Warsaw (1573), which guaranteed freedom of religion and equal rights to Catholics and dissidents. In 1578 he transformed the Jesuit college in Vilnius into a higher school, the Vilnius Academy.

Báthory's military reforms were of great significance: he organized (1578) an infantry composed of peasants from the crown estates (the so-called selected infantry), furnished the cavalry with lighter protective equipment and firearms, strengthened the artillery, introduced pontoon bridges, and brought over specialists in the construction of fortifications. Having assembled a nearly 30,000-strong army, he attacked Russia. In three victorious campaigns (1579–1581) he defeated the forces of Ivan IV the Terrible, took Polotsk and Velikiye Luki, and laid siege to Pskov. In the armistice concluded at Iam Zapol'skii (15 January 1582) Ivan gave up Polotsk and land and castles in Livonia, while the Poles returned Velikiye Luki to Russia. Báthory's ambitious plans to conquer Russia and launch an expedition against Turkey (supported by papal subsidies) were interrupted by his death. Báthory was one of Poland's most prominent rulers and an excellent military commander. Despite his attachment to Hungary, he was motivated in his work by Poland's *raison d'état*—but he never learned Polish. He was buried in the cathedral on Wawel Hill in Cracow.

MARCIN KAMLER

STERNE, LAURENCE (1713–1768), English novelist. Sterne is perhaps most famous as the author of *Tristram Shandy* (1759–1767), his serially published comic novel that propelled him from his quiet life as an Anglican clergyman in Yorkshire to the heart of London's literary society. The son of an infantry ensign, Sterne grew up living in army barracks in England and Ireland before attending

school in Yorkshire at the age of ten. From there, Sterne went to Jesus College, Cambridge, and in 1738 took holy orders, obtaining a living (an endowed ecclesiastical position) at a country parish church near York with the help of his uncle, an influential church lawyer. His career in the ministry was made more lucrative when, in the 1740s, he was employed by his uncle to campaign on behalf of the Whig party in local county elections. In return for this, Sterne received ecclesiastical preferment, becoming a prebendary (recipient of a stipend given to a member of the clergy) of York Minster.

Marrying Elizabeth Lumley in 1741, Sterne added the living of Stillington to his ministerial duties and lived a relatively quiet life in Yorkshire until 1759, when he published his first imaginative prose, *A Political Romance* (also known as *The History of a Good Warm Watch Coat*). This satire on local ecclesiastical courts included uncomplimentary and thinly veiled portraits of Minster clergy and was ordered by the archbishop of York to be burned.

In the same year, and with more success, Sterne also published the first two volumes of *Tristram Shandy*. This serialized novel tells the life story of its eponymous hero, beginning with the exact time of his conception, and including long, often absurd or bawdy, digressions about his family, especially his flamboyant father Walter and his soldier brother Toby. Volumes 3 and 4 were published in 1761, 7 and 8 in 1765, and the last volume, 9, in 1767. In the final volume, a conversation between Tristram's mother and the parson Yorick about Walter's bull seems to sum up the entire story inadvertently: "'L-d!' said my mother, 'what is all this story about?'—'A COCK and a BULL,' said Yorick—'And one of the best of its kind I ever heard.'" When Sterne visited London in 1759, shortly after the first two volumes had gone on sale, he discovered that his novel was an immediate success and had sold out at the booksellers. Declaring that he wrote "not [to] be fed, but to be Famous," Sterne nevertheless capitalized on his success with *Tristram Shandy* by persuading his London bookseller to publish a selection of his sermons in 1760.

With his literary reputation established and his financial position secure, in 1762 Sterne headed for France and Italy. For many years, Sterne's wife Eliz-

abeth had suffered from mental illness (at her worst, she believed herself to be the queen of Bohemia); Sterne had suffered with consumption (tuberculosis) since his days at Cambridge, and the trip to Europe was hoped to be beneficial for both. Finally returning to London in 1767, Sterne began an affair with Elizabeth Draper, the wife of an official in the East India Company. When she was forced to move to India with her husband, Sterne began his *Journal to Eliza* (also called the *Bramine's Journal*), which he kept for six months, and which was discovered in 1851. In 1768, Sterne published his next, and final, novel, *A Sentimental Journey in France and Italy*, which drew on his own experiences of touring in Europe and resurrected the impulsive parson, Yorick, from *Tristram Shandy*, as its protagonist. As with *Tristram Shandy*, which satirized the conventions of the contemporary "Life of . . ." narrative (or novel), *A Sentimental Journey* satirized the conventions of travel writing by claiming to be a journal of a grand tour (a tour of the Continent traditionally undertaken by young Englishmen) and "a quiet journey of the heart in pursuit of NATURE," with comic, and famously bawdy, encounters.

As the author of *Tristram Shandy*, Sterne is credited with being the originator of the "stream-of-consciousness" novel, influencing modern authors Virginia Woolf and James Joyce in particular. Even in its day, this book was celebrated because it brought a new level of consciousness to the developing novel by satirizing the manipulation of fact for the purpose of fiction, and by casting comic doubt on the idea of capturing a life in writing. In his own life, Sterne also trod a fine line between fact and fiction, living in "Shandy Hall" and writing to friends under the name of "Yorick." A month after the publication of *A Sentimental Journey*, Sterne died in his lodgings in London; the *Journal to Eliza* was published for the first time in 1904.

ALISON STENTON

STOCK EXCHANGES. Stock exchanges are formally organized secondary markets for financial assets that have already been issued in primary capital markets. Stock markets have become the hallmark of successful modern capitalist economies, despite the frequency of volatile price movements that lead to excessive speculation followed by panics and despite repeated scandals. They play an important role, however, for both the primary capital market and the mobilization of bank credit within any economy, basically by providing liquidity for the initial investors in government or corporate debt or in corporation stock. The assurance that a ready market exists for the sale of an investor's holdings in case of second thoughts, emergencies, or better alternatives for investment makes it easier to place debt or equity in the first place on the primary capital market. The daily pricing of all such financial products on a stock exchange also makes them ideal instruments as collateral for loans. In sum, stock exchanges are important complements to the efficient operation of the rest of an economy's financial sector.

The historical development of worldwide stock exchanges shows that three features are essential for their long-term success: a large stock of homoge-

neous, readily identified financial assets available to the public; a numerous and diverse customer base that is aware of the financial assets available; and a set of trustworthy intermediaries to handle trades of the various financial products among the customers.

The first feature arose with the creation of large-scale government debt, initially by Italian city-states such as Venice, Florence, and Genoa in the fourteenth and fifteenth centuries. While a secondary market of sorts existed, the city debts do not appear to have been widely held, as they took the form of forced loans from the wealthiest merchants and gentry. The second feature appeared with the creation of the joint stock of the Dutch East India Company or VOC (Vereenigde Oost-Indische Compagnie) in 1602, which was a forced amalgamation of a series of trading ventures organized within six different cities of the United Provinces. The existing shareholders were numerous and varied greatly in wealth and investment objectives; many were unhappy at the forced amalgamation and loss of voice in the management of the company. Active trading in the shares arose soon afterward, and a group of specialists in trading VOC shares appeared on the Amsterdam Beurs, which was the general wholesale market for commodities. According to de le Vega, these traders met in a corner of the exchange when it was open and continued business after hours in nearby coffeehouses. But this grouping does not appear to have had a formal organization or many other trading opportunities in other securities. Even though each city and province in the Netherlands issued large amounts of debt, each issue was closely held and seldom traded outside the city or province of origin. Not until 1795, when the Batavian Republic instituted reforms inspired by the French Revolution, did a regularly printed list of stock prices appear in Amsterdam, even though Dutch newspapers had reported prices of the leading securities since at least 1723.

In 1688, when Dutch financial techniques were grafted onto the English system of central government with parliamentary control over a constitutional monarch, the new British governments rapidly increased both their debt and the transferable stock of corporations holding government debt, such as the Bank of England, the New East India Company, and the South Sea Company. Despite the general collapse of share prices after the South

Sea Bubble of 1720, the customer base for English securities was large and increasingly diverse, comprising foreigners as well as provincial customers throughout England. Dedicated professional traders appeared who usually acted as brokers and often as dealers holding stock on their own account as well. Not until 1773, however, do we find documented evidence that they had a formal organization to assure confidence in trading with each other and on behalf of the general public.

With the substantial increases in government debt during the Napoleonic Wars, however, a formal exchange was created: the London Stock Exchange, with its self-regulated set of trading rules and information system. In response, the Paris Bourse, which had come under strict government control in 1726 after the collapse of the Mississippi Bubble in 1720, and then fell into disuse during the financial disruptions caused by the French Revolution, was revitalized by the French government and maintained under Napoleon. In the United States, the creation of federal debt in 1790 led to the appearance of the New York Stock Exchange, as well as other exchanges in Philadelphia, Boston, and elsewhere, eventually leading to over two hundred regional exchanges in the United States by World War I.

LARRY D. NEAL

STOCKHOLM. The capital of Sweden, Stockholm originated as a fortress on a small island (*holme* in Swedish), part of an archipelago on the Baltic Sea at the mouth of Lake Mälaren. Tradition attributes construction of the fortress to Birger Jarl, one of Sweden's early kings, and dates it about 1250. Its strategic location helped protect against attacks by sea; it served as a lock on the entry to the navigable waters of Mälaren as well as a transit point for export of iron and copper from inland provinces. By the mid-fifteenth century, Stockholm was already referred to as Sweden's capital, although it was not yet the permanent residence of the monarch. With about six thousand inhabitants, mostly merchants and artisans, Stockholm was an important Baltic trading center. About half the population consisted of German merchants from cities such as Lübeck.

In the late fifteenth century Stockholm was besieged on several occasions, primarily during conflicts with Denmark. After a definitive split from the loose union that had governed Sweden, Denmark, and Norway, Sweden became a nation-state with a more powerful monarchy. Under Gustav I Vasa (ruled 1523–1560), Stockholm began to change from a self-governing town to *Hans Nådes stad* (the city of His Grace, the king) and became the seat of royal authority. Stockholm's development since then has always been linked to the state. Whereas the city had previously been dominated by merchants, the percentage of the population engaged in government administration increased significantly by the reign of Gustav I's son, John III (ruled 1568–1592).

Physical changes to the city came about in connection with the Reformation and Gustav I's subsequent appropriation of Catholic church property, including the tearing down of cloisters and churches. Stockholm was still, however, a city within walls, mostly confined to the area now known as Gamla Stan (the Old Town). In the seventeenth century Stockholm entered a period of expansion related to Sweden's emergence as a European military power under Gustavus II Adolphus (ruled 1611–1632). The city's population grew from about 10,000 in 1620 to more than 40,000 by 1660. City authorities drew up new street plans during the 1630s, and the Swedish nobility used for-

Stockholm. Johann Baptist Homann's detailed early-eighteenth-century plan clearly shows the expansion of the city from its original nucleus of three islands in Lake Malar. This expansion was accelerated during Sweden's Age of Greatness, from the reign of Gustavus II Adolphus (1611–1632) through that of Charles XII (1697–1717). MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

tunes secured in foreign wars to build palatial residences. One result of these changes was the disappearance of most of the city's medieval towers and walls.

New economic policies encouraged trade through Stockholm's ports. The city also became the center of military production in support of Sweden's aggressive foreign policy. While Sweden was unable to establish a monopoly over Baltic trade, Stockholm did have a virtual monopoly on the export of tar, produced in the extensive forests of Sweden and Finland, which was still part of Sweden at this time.

During Queen Christina's reign (1644–1654) the royal court resided more or less permanently in Stockholm for the first time. Christina's diverse intellectual interests helped make Stockholm, rather than the university towns such as Uppsala, the center of literary activity. Artists began to produce paintings and engravings showing views of the city during this period. The most complete pictorial record of Stockholm at this time is Erik Dahlberg's (1625–1703) book of engravings, *Suecia Antiqua et Hodierna* (Sweden ancient and modern), first published in its entirety in 1716. In 1697 a fire ravaged the royal castle, allowing extensive reno-

vation of the antiquated building in the classical style by the architect Nicodemus Tessin the Younger (1654–1728). These renovations were not completed, however, for almost fifty years.

Population growth stalled after 1705 as the city entered a period of stagnation, due in part to the many wars of the period; from over 55,000 in the 1680s, the population declined to about 45,000 by 1720. An outbreak of plague in 1710 also claimed a third of the population. Political changes after the death of Charles XII (ruled 1697–1718) led by the 1730s to protectionist economic policies that promoted manufacturing (especially of textiles) while restricting imports drastically. These policies tended to favor Stockholm over other parts of Sweden, which resulted in an increase in the city's population, to about 70,000 by 1760. Most of this population growth came from immigration, however, as the mortality rate in Stockholm was very high; one in three children died in the first year of life.

After 1760, political changes led to a decline in manufacturing subsidies, slowing Stockholm's development. The city lost its privileged trading status in the Baltic, and the west coast city of Göteborg began to develop as a port. Though Stockholm remained by far the country's largest city, and the only one with over 10,000 inhabitants, the percentage of Swedish citizens living in Stockholm, about 4 percent in the mid-eighteenth century, declined over the following century.

PAUL NORLÉN

physics, and ethics. The study of logic taught the recognition of truth and the avoidance of error, preparing the mind to understand the physical construction of the world and to engage in ethical behavior. The Stoic cosmos was an organic unity that unfolded according to the *logos* or plan of a universal mind or soul. The physical basis for the universal mind was the *pneuma*, an all-pervasive animating spirit. At the beginning of each cosmic cycle, the *pneuma* condensed, producing the terrestrial elements of earth, water, and air at the center of a spherical universe but continuing to pervade the heavens as life-giving fire. The planets were regarded as the natural creatures of this celestial region: they burned fuel provided by transporting terrestrial elements into the heavens. When this process had exhausted the finite supply of terrestrial elements, the cosmos returned to its primordial state and the entire cycle repeated. Within this cosmos individual entities, including human beings, were defined by the portion of the universal *pneuma* that animated them, and they played roles in the history of the cosmos completely controlled by the *logos*.

For the Stoics, ethical action accorded with the steadily unfolding plan of the cosmos. But the cosmos frequently unfolded in ways that were painful or frustrating to human beings. The Stoics believed that control over nature was illusory except for the contents of the human mind. Practically, they taught the cultivation of *apatheia*, a state of mind permitting the tranquil disregard of suffering, and *autarcheia*, or self-sufficiency. Equally indifferent to wealth and poverty, fame and disrepute, Stoic sages were rendered immune to the vicissitudes of human life. Drawing all three aspects of philosophy together, they were expected to carry out their ethical duty, following the physical plan of the cosmos as revealed by logic, regardless of personal cost.

THE RENAISSANCE REVIVAL OF STOIC ETHICAL AND POLITICAL DOCTRINES

Although Roman authors like Cicero and Seneca examined all aspects of Stoic doctrine, later writers, for example Epictetus (fl. 90–115 C.E.) and Marcus Aurelius (emperor of Rome, 161–180), were primarily interested in the ethical teachings. Their works were known in various forms throughout the Middle Ages but received new attention when humanist philological skills were applied to newly

STOICISM. In the century after Aristotle's death, the Greek founders of Stoicism recognized three interrelated constituents of philosophy: logic,

available Greek texts during the Renaissance, and the recovery of Diogenes Laertius provided new information on both Stoic doctrines and the biographies of the founders. Early modern interest in Stoicism developed from an initial phase, in which Stoic ideas were combined eclectically with other doctrines, until writers like Justus Lipsius (1547–1606) attempted to renovate the Stoic doctrines as a distinct school. Parallel to this later stage, Stoic physical ideas were briefly important in debates on the nature of the heavens and planetary motion.

Throughout this period Stoic doctrines entered humanist literature, although they were limited and conditioned by the authors' Christian opinions. Petrarch (1304–1374) advocated an essentially Stoic scheme for the subjugation of the passions in *De Remediis Utriusque Fortunae* (Remedies against good and ill fortune) and became the first of many Renaissance writers to borrow Stoic providential design arguments to prove the existence of God. Politian (Angelo Ambrogini; 1454–1494) translated Epictetus's *Enchiridion* (Handbook) into Latin; Politian's translation appeared in 1497, and the work was published in Greek in 1528. François Rabelais's *Pantagruel* stories appeared between 1532 and 1564. Later books in the series presented central characters who exemplified the virtues of Stoic sages and a Stoic worldview identifying God and nature as a single, all-pervasive creative principle. However, Desiderius Erasmus and later Michel de Montaigne denied that a Stoic sage could achieve happiness without divine assistance, while Philipp Melancthon criticized the Stoic ambition to achieve by human reason what can only be achieved with God's assistance, although he freely used the same Stoic proofs of God's existence that had attracted Petrarch.

The most important reviver of Stoic doctrines was Lipsius, who taught at Louvain. In 1584 he published *De Constantia* (On constancy), the title indicating a form of *apatheia* that would help its readers cope with the religious and civil strife of their times. Lipsius attempted to collate the surviving fragments of Stoic doctrine in ancient literature in his *Manuductionis ad Stoicam Philosophiam* (1604; Guide to Stoic philosophy). In his *Physiologiae Stoicorum* (1604; Physiology of the Stoics) he attempted to reconcile Stoicism with Christian

doctrine. At about the same time, translations of Epictetus appeared in France, England, and Spain.

THE REVIVAL OF STOIC PHYSICS

Stoic physical ideas reappeared later than Stoic ethics. A renewed interest in Pliny revived the doctrine that the substance of the heavens was a fluid through which the planets moved themselves. An early endorsement came from Jacob Ziegler (1531). The Parisian mathematician Ioannes Pena (Jean de la Pène; 1528–1558) derived the same idea from Cicero. Pena explained the apparent failure to observe the bending of light rays as they entered the atmosphere from the ether above by denying that there was any sharp boundary between the earth and the heavens, which were occupied by Stoic vital air. Writing in 1586, the German astronomer Christoph Rothmann borrowed Pena's arguments to explain why comets were able to move freely in regions that should have been impenetrable ether according to Aristotle. Rothmann corresponded with the Danish astronomer Tycho Brahe (1546–1601), who saw these ideas as the solution to a central problem facing the cosmology he favored, in which the sun went round a central earth, but the planets went round the sun. In this system the spheres supporting the sun and Mars interpenetrated in ways forbidden for the Aristotelian celestial substance. Brahe adopted a fluid heavens and redefined the celestial spheres as geometrical boundaries in it (1588). Johannes Kepler (1571–1630) adopted the latter view in a sustained defense of heliocentrism (1596), although he later rejected the Stoic view that the planets moved themselves and was led thereby to introduce a force, emanating from the sun, to do the same work.

Early in the seventeenth century, the revival of atomism and the appearance of the mechanical philosophy limited the development of exclusively Stoic physical ideas, although they remained influential in alchemy and chemistry throughout Isaac Newton's lifetime. But Stoic ethical doctrines held a continuing appeal, as shown by the favorable treatment of Stoicism in Ralph Cudworth, new editions of Epictetus, and Thomas Stanley's 1655–1662 history of philosophy, which allots more space to Stoicism and its rival Epicureanism than to the philosophies of Plato and Aristotle.

STRASBOURG. Founded in 16 C.E., the Alsatian city of Strasbourg owed its subsequent prosperity and influence to its situation on the left (western) bank of the Upper Rhine, where it commanded the last bridge over that river before its mouth. The city's trading network extended north and south along the Rhine, as well as east deeper into the Holy Roman Empire, and west into France. Though an annual fair was held beginning in 1228 and the city became a regional banking center by 1500, it failed to develop an indigenous manufacturing sector beyond cheap woolen goods known as "Strasbourg gray." The city remained vulnerable to external pressures that threatened to disrupt its livelihood and food supply.

The most important of these pressures was the local prince-bishop, who initially controlled the city, but was ejected by its inhabitants in 1262 and took up residence in Dachstein castle, about 10 miles (16 kilometers) to the west. Though the city was now a self-governing free city, the bishop still exercised jurisdiction over its clergy, convents, and the huge cathedral that was never finished. The bishop was a prince of the empire with a voice in imperial institutions and his own territory extending across 276 square miles (715 square kilometers) of land to the west, south, and southeast and populated by around sixty thousand people by the late eighteenth century. Strasbourg itself had sixteen thousand inhabitants in 1444, rising to between twenty and twenty-five thousand by the early sixteenth century. The population thereafter remained stable, reflecting the city's declining influence and economic stagnation that set in from the 1550s. There were another ten thousand or more peasants outside the walls who lived under the city's jurisdiction.

Urban government was transformed by a series of violent protests between 1332 and 1449 that secured representation through the city's twenty guilds, but the patriciate gradually hardened into a new oligarchy of thirty to forty families who controlled the key decision making committees. This process was not yet complete by 1522 when many

councillors accepted the Reformation. Strasbourg intellectual life had been stimulated by local humanist scholars, including Jacob Wimpfeling (1450–1528), Johann Geiler von Kaysersberg (1445–1510), and Sebastian Brant (1458?–1521), who helped make the city an important publishing and educational center. However, their attempt to reform local spiritual life contributed to the already strong tradition of anticlericalism left by the earlier struggles against the bishop. The Reformation was introduced with popular support but passed swiftly into the hands of the magistrates, who ensured a moderate course after 1529. The chief reformer was Martin Bucer (1491–1551), who sought a theological compromise between North German Lutheranism and Swiss Zwinglianism; in this Bucer complemented the council's strategy, guided by its leader Jacob Sturm (1489–1553), of negotiating a broad Protestant urban alliance. The city was drawn into the Schmalkaldic League and suffered from its defeat by Emperor Charles V in 1547. Conservatives controlled the council until 1562, when Calvinist influence grew and radicals again called for a more energetic external policy, culminating in armed intervention in the bishop's affairs in 1593–1594. Moderates regained control and reaffirmed orthodox Lutheranism in 1598. Though Strasbourg joined the Protestant Union in 1608, it remained neutral after 1618 and avoided further political ambitions. Johannes Sturm (1507–1589) made a lasting impact on Protestant German education and also founded a grammar school in 1538 that became the University of Strasbourg in 1621. Johann Wolfgang von Goethe was a student there and received a law degree, but the university was closed by the French revolutionaries in 1793 and not reopened until 1872.

New defenses, built 1633–1680, failed to save Strasbourg from French annexation in 1681 as the magistrates surrendered rather than face a bombardment. The bishop also acknowledged French jurisdiction over his lands west of the Rhine and was allowed to return to the city. Sébastien Le Prestre de Vauban strengthened the fortifications 1682–1690, and Strasbourg became a major French garrison, held by ten thousand mainly German-speaking soldiers. Urban self-government remained while the economy revived, and the population grew to fifty thousand by 1789. French became the second lan-

guage, and half the population converted to Catholicism. Strasbourg became a symbol for early German national sentiment, but little effort was made to recover it, although in 1697 the French were obliged to surrender the small fort of Kehl, built at the eastern end of the Rhine bridge between 1683 and 1688. The empire failed to maintain Kehl, which the French periodically recaptured (1703–1714, 1733–1735), and the place was abandoned in 1754. The bishopric remained formally part of the empire, but in 1682 the emperor refused to acknowledge the election of the French candidate, Wilhelm Egon von Fürstenberg, and his successors after 1704 were appointed from Paris. Strasbourg's full incorporation within France only came after 1789, while the bishopric maintained a precarious existence in its lands east of the Rhine until these were annexed by the state of Baden in 1803.

PETER H. WILSON

STRIKES. Collective work stoppages, or “strikes” (a modern term), have been part of the industrial landscape since the Middle Ages, although their frequency increased during the early modern centuries. Such stoppages occurred for many reasons stemming from conflicted relations between employers (master artisans) and employees (increasingly the trained workers who came to be called journeymen). Workers’ strikes centered on such issues as hiring practices, wage rates, piece rates, the duration of the workday, and the freedom to come and go as workers pleased, but resistance always began in one way or another with journeymen’s demands to work according to the rhythms of life that structured their existence and framed its meaning. This understanding entailed an assumption about freedom of movement in and out of shops and worker discretion about the pace of work.

Directly or indirectly, work practices reflected a certain relationship between labor and time. Workers often understood the relationship one way and masters another. The craft economy of the early modern centuries was increasingly dynamic, diversified, and specialized, and demand for craft products grew, at certain times and in certain places, dramatically. Masters responded to the pressure on production schedules by trying to extend the workday and by keeping workers on the job more continuously than had been customary. Moreover, more and more masters combined a new morality of industriousness with this imperative about time and production, and disparaged uncooperative workers as not only insubordinate but lazy.

PRE-EIGHTEENTH-CENTURY STRIKES

Workers defending a customary labor regimen often resisted the more disciplined scheme of their employers. Until the eighteenth century, examples of resistance in the form of work stoppages were most evident in the manufacturing sectors such as

printing and, above all, textiles, where substantial demand was regularly exerted upon production practices and schedules. In the sixteenth century in the printing industry, to maintain or increase profits in an expanding and increasingly competitive market, master printers tried to reduce wages and increase working hours. An especially well documented strike in the printing industry occurred in Lyon in 1539, when the work stoppage was orchestrated by a “company” of journeymen pressmen, typesetters, correctors, and proofreaders called the Griffarins. In response to masters’ attempts to eliminate the customary arrangement of monetary wage plus meals at the master’s table, the Griffarins coordinated an industrywide strike throughout the city that lasted almost four months. The Griffarins physically assaulted any journeymen or apprentices who tried to work, and so solidarity within the ranks of the strikers was maintained. In the end the journeymen forced their employers to reinstate the customary food and wage arrangement for another thirty years.

In the textile industry, especially in the Low Countries, between the fifteenth and seventeenth centuries the most effective weapon for workers was the *uitgang*. In this practice, laborers collectively left town if employers did not meet worker demands. This happened in Leiden in 1478, when all the fullers left after their thirty-four demands went unsatisfied. This was certainly not the first *uitgang*, for they referred to similar walkouts “staged by our forefathers.” Nor was it to be the last, for the weavers of Amsterdam staged an *uitgang* in 1523, and the shearers of Leiden in 1643. In the seventeenth century, however, the *uitgang* gave way to the strike, and a wave of the latter in the mid-seventeenth century shows that the coordination of the workers’ activities spanned cities. From 1636 to 1639, for example, strikes led by shearers were staged in Haarlem, Hoorn, Gouda, and Rotterdam, and strikers held clandestine meetings to coordinate their actions and blacklist strikebreakers. Leiden, the clothmaking center of Europe and home in 1670 to 45,000 textile workers out of a total population of 70,000, was also the scene of frequent strikes during the turbulent seventeenth century, occurring in 1619, 1637, 1644, 1648, 1700, and 1701.

EIGHTEENTH-CENTURY STRIKES

Until the eighteenth century work stoppages largely occurred in industries that most felt the pressure of demand. During the eighteenth century, with the stimulus of the “consumer revolution,” however, this pressure spread to many more trades than ever before and the number of strikes increased proportionally. At times the number of striking workers was enormous; twenty thousand silk workers shut down production in Lyon in 1779. In France alone between the 1720s and 1780s, work stoppages and boycotts occurred in more than sixty towns. In Paris more than fifty incidents of strikes took place, involving, for example, the stocking-cap makers in 1724, the blacksmiths in 1731, the locksmiths in 1746, the cutlers in 1748, the hatters in 1764, the bookbinders in 1776, and the masons and stonecutters in 1785.

Workers in most trades called strikes all over Great Britain as well—373 between 1717 and 1800, with 120 in London alone. Wool workers in various cities and regions struck sixty-four times, ship’s carpenters thirty-seven, and tailors twenty-two. Weavers, too, were ready to protest, largely against wage reductions. In the late 1720s striking wool-weavers from Wiltshire, calling themselves “regulators,” descended upon some employers’ houses in the town of Frome in Somerset and presented a list of wage demands. If an employer rejected the demands, “the windows paid for it,” as a local commentator put it.

Early modern laborers, mostly journeymen who were organized into brotherhoods and thus could coordinate their actions more effectively than the unorganized simple wage earners, struck over many issues—manipulation of the relationship between the length of the workday and the daily wage, depressed or stagnant wages in the face of rising prices, denser working days, or, increasingly in the eighteenth century, over payment in kind or “truck,” whereby masters overvalued the goods and so effectively depressed wages. Whatever the cause, long before the industrial revolution of the nineteenth century and the “labor movement” emerging at that time, workers in Europe had discovered the power of collective action and work stoppage to redress common grievances.

JAMES R. FARR

STUART DYNASTY (ENGLAND AND SCOTLAND)

The Stuart dynasty was descended from Marjorie, daughter of Robert I (the Bruce) by her marriage to Walter Stewart. Their son, Robert II, became king of Scotland in 1371, but the late fourteenth and fifteenth centuries saw a succession of weak monarchs, four minors, and a polity dominated by rebellious nobles. James IV (ruled 1488–1513) was killed fighting against the English but had, in 1503, married Margaret Tudor, daughter of Henry VII (ruled 1485–1509). Thus the Stuarts had a legitimate claim to the English throne. This became especially important during the reign of Mary, Queen of Scots (ruled 1542–1567), a feckless schemer who was deposed by her subjects in 1567. Her scheming to depose Elizabeth I of England led to her execution in 1587, but her son, James VI of Scotland, succeeded Elizabeth in 1603 as James I of England. The Stuart dual monarchy never came to terms with ruling two very different realms, and James’s son, Charles I, was executed by his English subjects in 1649. The Stuarts were restored in 1660 but both Charles II (ruled 1660–1685) and his Catholic brother, James VII and II (ruled 1685–1688), proved less than effective rulers. James was deposed in 1688 and replaced by William III (ruled 1689–1702) and Mary II (ruled 1689–1694). William, the Dutch prince of Orange, was the grandson of Charles I, and Mary was the daughter of James II, but, more importantly, they were Protestants. William and Mary had no children, and the thrones of England and Scotland passed to Anne (ruled 1702–1714), younger

daughter of James II. Anne also died childless, and while the English succession had been settled in 1701 on the Protestant Sophie of Hanover, granddaughter of James VI and I, many Scots continued to support the exiled Catholic descendants of James VII and II. In 1714 Sophie's son, the Hanoverian George I, became king of the United Kingdom of Great Britain, thus ending the rule of the Stuarts. The Stuarts still pressed their claim to the throne; however, any pretensions were effectively ended when the pretender Charles Edward Stuart, "Bonnie Prince Charlie," was defeated at the Battle of Culloden in 1746.

DAVID GRUMMITT

SUBLIME, IDEA OF THE. The sublime (from the Greek *hypsous*) entered the language of aesthetic theory from its use in the treatise *Peri hypsous* (On the sublime). The unknown author of this work has been called by tradition "Longinus," and its probable period of composition is the first half-century C.E. Longinus associates the sublime with the feeling of surpassing glory that powerful words may impart. This glory becomes for a reader the evidence of a great soul—the writer's soul, of course, but also the reader's own. The peculiarity of the sublime is that it overwhelms the ordinary distinctions of sense. Its effects come only at moments, even in the greatest writing. It "scatters everything before it like a thunderbolt."

Much of Longinus's book is devoted to analysis of some characteristic verbal traits of sublimity. The exuberance of a great soul may show itself in irregular syntax, and Dionysius of Phocaea is praised for the inversion of logical order in the phrase "Our fortunes are on the razor's edge, men of Ionia," which arrests attention by giving the metaphor be-

fore the circumstance it evokes. The sentence from Genesis, "Let there be light, and there was light," is cited as an instance of a tremendous effect that suggests a tremendous cause, the power of words here becoming indistinguishable from the power of a deed.

The modern revival of Longinus dates from the late sixteenth and early seventeenth centuries. The writings of Nicolas Boileau-Despréaux (1636–1711) and Alexander Pope (1688–1744) reflect much of the new emphasis, and Pope adapted a Longinian sentiment when he wrote in his "Essay on Criticism" (1711) that genius may "snatch a grace beyond the reach of art." The sublime now came to stand at the center of a larger riddle about art: it gives pain as well as pleasure; and yet, knowing this, we are eager for the sensations of art. Edmund Burke (1729–1797) in *A Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful* (1757) explicitly links the sublime with pain. The passion that corresponds to the sublime is astonishment, or "that state of the soul, in which all its motions are suspended, with some degree of horror."

The sublime for Burke is an idea and not a property of objects themselves. Yet certain attributes are consistently associated with the sublime, among them obscurity, power, vastness, and infinitude. Like Longinus, Burke draws his literary illustrations eclectically, from Homer, the book of Job, William Shakespeare, and John Milton. Unlike Longinus, he places the natural on a par with the man-made sublime: a soulless thing may yield as vast an idea as an oration; prominent examples are the sight of the ruins of a great city after an earthquake and the spectacle of the hanging of a state criminal. Burke's *Enquiry* initiated the discussion of the moral and nonmoral foundations of taste that occupied many of the subtlest minds of the later eighteenth century. In response to Burke's sensational and nonmoral theory, Immanuel Kant (1724–1804) in the *Kritik der Urteilskraft* (1790; Critique of Judgment) undertook to relate the sense of the sublime to all that finally exceeds understanding in the experience of human autonomy.

DAVID BROMWICH

SUGAR. The expansion of European involvement in the sugar industry mirrored western Europe's expansion and domination of the Atlantic basin. Sugar, which had long been considered a luxury available only to the elites of medieval and renaissance Europe, was transformed into a household staple by the colonization of the New World. The combination of conquered tropical and subtropical lands, African slave labor, and capital advanced by northern European merchants transformed the European diet. Furthermore, sugar's importance to overseas trade is reflected in contemporary observations that proclaimed the sugar industry to be at the heart of national wealth; it was often noted that the plantation trade created enormous profits for sugar planters and merchants, employment for European laborers, and significant tax revenues for the mother countries. Although it is clear that sugar did indeed dominate colonial policy of the major powers in the seventeenth and eighteenth centuries, economic historians have recently questioned the extent to which sugar generated national riches.

Muslims first introduced sugarcane to the Mediterranean region in the seventh century. While the soils of the Levant, Sicily, Cyprus, Crete, and Malta supported this early cane cultivation, the actual export of sugar to Continental markets did not take place until the Crusades, when Venetian merchants provided the capital and mercantile connections required for regular trade. The historian Noel Deerr has suggested that this coordination of European credit and trade "may be seen [as] the germ of the

colonial system" that was fully developed in the Americas during the early modern period.

The center of the European sugar supply moved west with Portuguese exploration of the Atlantic basin. Iberian settlers on the island of Madeira established commercial sugar production in 1432, as well as on the African coastal island of São Tomé, where African slave labor was used exclusively to produce sugar in the early sixteenth century. During the next hundred years, Portuguese settlers in Brazil replicated this slave-based business plan after briefly experimenting with indigenous labor. With the assistance of Dutch financiers, the Portuguese planters and mill owners of northeastern Brazil developed the most productive sugar-producing region in the world. This symbiotic relationship between the two imperial powers helped generate the lion's share of sugar consumed in Europe, but in 1624 the Dutch gained tighter financial control over the industry by using military force, capturing the richest sugar-growing regions of Brazil. Although the Dutch were eventually expelled, the chaos inflicted by war disrupted Brazilian sugar production, thereby providing an opportunity for English and French West Indian sugar growers to emerge as important competitors in supplying Europe's increasing demand for sugar.

The leading sugar-producing nations expended tremendous resources protecting their colonists and their plantation trade. Laws similar to Britain's Navigation Acts or France's Colonial Pact were implemented by every colonial power as a means of ensuring that the benefits of imperialism would be maximized. Adherents to this political philosophy believed that the colonists' role in the larger economy was subordinate to the home country's drive for riches and power. Thus, each nation's set of mercantilist laws was designed to control colonial trade so that the commerce from the colonies would provide home governments with valuable tax revenues while stimulating each respective nation's merchant navy.

The major sugar-planting zones of Brazil and the Caribbean littoral had an enormous appetite for slave labor. The growing demand for sugar in Europe, combined with the negative natural population growth, fueled an unprecedented demand for labor. Throughout the early modern period, Euro-

Sugar. An engraving from Theodore de Bry's *Grand Voyages*, 1590–1597, shows a colonial sugar processing operation using native labor. THE LIBRARY OF CONGRESS

pean planters expanded total production while simultaneously ignoring the poor nutrition, disease-infested living conditions, and excessive work endured by their slaves. The relatively low cost of importing new African slaves permitted planters to maintain healthy profits despite the regular loss of life. To illustrate the human cost of supplying the European craving for sugar, over half of the 5.7 million slaves transported to the Americas during the eighteenth century were destined to work in the cane fields or in related branches of the industry.

The sheer volume of the slave trade, the capital-intensive nature of sugar planting, and the contemporary assumptions about the importance of sugar colonies have led some modern historians to conclude that sugar and slavery were essential to the economic development of the metropole. Eric Wil-

liams, an Oxford-trained West Indian historian, did the most to promote this thesis in *Capitalism and Slavery* (1944). In this monumental work, Williams argued that the demand for sugar created a highly profitable colonial trade, which enabled slavers from Bristol and Liverpool to dominate the forced migration of Africans during the peak years of the slave trade. He posited that the slave trade generated an important stream of British capital accumulation, and that these funds, combined with the profits generated from the sugar industry, fueled Britain's industrial revolution.

Scholarship since *Capitalism and Slavery* has revised Williams's estimate that the slave trade produced 30 percent returns to investors. Although there were, indeed, examples of slave traders earning significant sums of money on individual

voyages, the slaving business was a very risky and competitive lottery, with many investors losing money. If, therefore, one considers the whole range of returns on slave trading, the average is calculated to have been somewhere between 5 and 10 percent during the eighteenth century. With this more realistic view of slave-trading profits, the economic historian Stanley Engerman calculated that the net national return on the British slave trade represented less than 1 percent of total British income. This deflated view of the slave trade's importance to the British economy has been matched by more moderate assessments of the effect the total sugar industry had on the home country. The most recent research describes the colonial sugar industry as an important sector that contributed to the economic growth of the major sugar-growing nations, but was not essential to the industrial transformation of England or Europe.

DAVID RYDEN

SUICIDE. When early modern authors and intellectuals considered the topic of suicide, they started out with one salient contrast in mind: Whereas the ancient Greeks and Romans had often approved of suicide, Christians did not. For many, this contrast illustrated the superiority of Christian thinking, but throughout the Renaissance and into the seventeenth century, some who admired the ancients drew a more nuanced set of conclusions.

Thomas More's *Utopia* (1516), for example, presents voluntary euthanasia for the terminally ill in a favorable light, although More condemned suicide vigorously in other works. The bishop of Guadix, Antonio de Guevara, took inspiration from the heroic suicides of classical antiquity (for example, Cato, Diogenes, Zeno, Lucretia, Seneca) and praised the nobility of barbarians who did not overvalue life in this world. Similarly, Michel de Montaigne touched on the question of suicide repeatedly and in “A Custom of the Island of Cea” considered the topic at considerable length, thoughtfully assembling moral, religious, social, and legal views. Although he admired the deaths of the noble ancients, he was reluctant to give his blanket approval to all who sought to escape shame or pain through suicide, and in the end he thought one might kill oneself only as a last resort to avoid intense pain or torture.

Shakespeare's characters commit suicide with remarkable frequency (there are fifty-two cases in his plays), and Hamlet's soliloquy (“To be or not to be”) dwells on the topic, presenting arguments both for and against (although ignoring specifically Christian objections), before concluding, famously, that the future was too murky to make self-murder a safe option. In other plays Shakespeare presents suicide as the result of tragic misunderstanding (*Romeo and Juliet*) or as grand examples of freedom or despair (*Julius Caesar*, *Antony and Cleopatra*, and *Othello*). In 1610 John Donne went further, arguing in *Biathanatos* that sometimes suicide was justified or at least excusable. He did not proceed, as others had, from the example of ancient worthies but specifically considered the Christian grounds for condemning suicide. In a nutshell, he concluded that suicide did not necessarily and always violate the laws of nature, reason, or God. Despite the daring independence of this view, Donne forbade the publication of his book, and it only appeared in print in 1647, sixteen years after his death. This fact illustrates the ongoing and deep anxiety early modern Christians felt about suicide as both a crime and as the result of despair, the ultimate sin. Usually Protestants and Catholics united to condemn “self-murder” and to depict the devil as the prime mover or inspiration for most cases of self-destruction. As a result, throughout early modern Europe, suicides were denied burial in hallowed ground and often

suffered desecration of their corpses. The worldly goods of suicides were sometimes confiscated by the crown, as was the case in England and Scotland.

In the seventeenth and eighteenth centuries, however, this legal and moral position decayed, not so much because suicide became positively defensible but more commonly because it seemed increasingly to be the result of melancholy madness. Moralists and theologians had regularly made provision for a sort of insanity defense of suicide. They viewed both sin and crime as actions that proceeded from free and voluntary decisions; condemning actions one could not prevent or avoid did not seem to make moral sense. Indeed, Martin Luther had carried this point so far that he thought suicides were driven to their deaths by the devil, thus extinguishing human responsibility: "I have known many cases of this kind, and I have had reason to think in most of them, that the parties were killed, directly and immediately killed by the devil, in the same way that a traveler is killed by a brigand." Most theologians, however, understood the role of the devil as that of a tempter or seducer, and therefore left ample room for the harsh condemnation of suicide, as long as it seemed clear that the victim had acted deliberately, intentionally, or voluntarily.

THE SECULARIZATION OF SUICIDE

By the late seventeenth century, suicide began to seem so alien to right reason, so much the product of melancholy or delusion (what we might call acute depression), that coroners, villagers, pastors, and magistrates were prepared to grant decent (even if quiet) burials inside the churchyard. Townspeople and villagers alike might also (as in England and Scotland) unite to portray a suspicious death as the result of illness or accident in order to circumvent the crown's efforts to confiscate a victim's estate, a move that usually added to the burdens on local poor relief. Thus from about 1650 onwards, we can mark the "secularization of suicide," that is, the development of medical or other naturalizing explanations and excuses for suicide. This evolution of public sentiment was supplemented during the eighteenth century by the moral philosophizing of the Enlightenment. Montesquieu's *Persian Letters* (1721), for example, sharply criticized the condemnation of suicide. Voltaire went further and saw suicide as a question of liberty. It could not harm

God or society, in his view, to exit the world when one could no longer enjoy life or contribute to the welfare of others. David Hume also defended an individual's absolute right to suicide. Despite hesitations and equivocations, however, many philosophers were drawn to the medical conclusion that suicide was usually the result of madness or bodily disturbances.

THE SOCIAL HISTORY OF SUICIDE

Broadly speaking, this array of opinions on suicide has been well known and well described for several generations. In recent years, scholars have renewed their attention to suicide and have made several noteworthy contributions, not so much to high religious or intellectual history, but to the sociology or social distribution and cultural understandings of suicide. In this work they have often taken inspiration from the foundational work of Émile Durkheim, *Le suicide* (1897), which tried to demonstrate that social dynamics account for almost all the statistical variations in suicide found in modern countries. Roughly stated, Durkheim held that higher rates of suicide were prompted by increasing conditions of social isolation, so that tight webs of social support served to protect populations from the effects of urbanization, individualism, migration, and other conditions of modernity. It seemed to make sense, from this point of view, that Protestants (as part of a "modern," "secularizing," and "individualizing" movement) should always and everywhere have higher rates of suicide than presumably more traditional and more socially cohesive Catholics. This schema has inspired a great deal of modern sociological investigation, and recently scholars have extended these efforts to the early modern period. However, one supreme difficulty has been that neither the numbers of suicides nor early modern populations were reliably recorded, making the calculation of a suicide rate (the number of suicides per 100,000 population) doubly problematic.

Suicide in Britain and Germany. After an extraordinary and energetic attempt to count the number of suicides in early modern England, for example, Terence Murphy and Michael MacDonald abandon the task of calculating the varying suicide rate from place to place and from time to time, turning instead to an examination of the varying

meanings of suicide. In an excellent study of suicide in far northern Germany, Vera Lind draws similar conclusions, heaping criticism on those who have imagined that medieval or early modern rates of self-murder could be calculated unproblematically. In a vast and complex survey, Alexander Murray draws the same conclusion with respect to medieval Europe, but then curiously hazards the guess that whatever the medieval rate may have been, suicide became far more common in the sixteenth century.

Suicide in Switzerland. The most impressive recent attempt to scrutinize all the suicides in a fairly controlled population is Jeffrey Watt's study of early modern Geneva, where suicide remained rare until the end of the seventeenth century and then increased slowly in the early eighteenth century. After 1750, however, the rate jumped up by a factor of five or more, and it went even higher after 1780. Watt has been careful to count not only those cases regarded as suicide by the Genevan authorities, but to look for "disguised" suicides as well, deaths from falls or from drowning that may well have been self-inflicted even if contemporaries declined to label them self-murder. Watt's evidence is so rich and so complete that, at least for this city, a genuine suicide rate can probably be calculated. Recognizing a dramatic escalation after 1750 seems unavoidable. Rejecting an easy equation of Calvinism with higher rates of suicide, however, Watt points out that Geneva during the Reformation had promoted just as tight an integration of society as in any Catholic city or principality. Yet by the late eighteenth century, Genevans from top to bottom had grown more secular in their attitudes, abandoning belief in the devil and often in hell as well. These processes may have developed more quickly or more profoundly for men than for women, which might explain why the disproportion of male suicides became even more pronounced after 1750. On this reading, growing secularization accomplished more than just the decriminalization or medicalization of suicide; increasingly a more secular society relaxed its supportive web as well as its sanctions against self-killing. Taking one's own life became far easier to contemplate.

This finding runs counter to the conclusion of a study of suicide in Zurich, in which Markus Schär connects the rapidly escalating numbers of self-inflicted deaths in the eighteenth century not with

increasingly secular attitudes but with the growth of acute religious despair among people who doubted that they could ever gain God's mercy. Oddly enough, however, both Watt and Schär agree in emphasizing the importance of religious and cultural changes, rather than social changes (such as demography, economy, and urbanization), as crucial stimulants to suicide.

THE EIGHTEENTH CENTURY

As far as eighteenth-century Europeans were concerned, England was the classic land of melancholy and suicide. In the absence of reliable comparative studies, it is not clear that this stereotype was fully deserved. It does seem certain, however, that suicide notes and newspaper publicity about recent suicides first proliferated in England, for reasons well explored by Murphy and MacDonald. In Germany, the popularity of Goethe's *Sorrows of Young Werther* (1774) led to a wave of widely publicized suicides supposedly inspired by the romantic death of that lovelorn protagonist. By the late eighteenth century suicide had been common enough that it seemed symptomatic of the cultural and social disruptions endured by nations undergoing rapid urbanization, industrialization, or secularization.

H. C. ERIK MIDELFORT

SULEIMAN I (1494/95–1566; ruled 1520–1566), tenth Ottoman sultan, born in Trabzon, the son of Hafsa, a Crimean Tatar princess, and the future sultan Selim I (ruled 1512–1520). Under Suleiman, the Ottoman Empire became the Islamic world's Sunni exemplar. Suleiman spent his childhood in Trabzon, where Selim was governor. As a prince, Suleiman himself received the governorship first of Kefe (Fedosiya) and then, in 1513, of Manisa. In 1514–1515 he acted as regent during his father's campaign against Iran. In 1516–1517, he oversaw the defense of Edirne while his father campaigned against the Mamluks in Syria and Egypt.

Suleiman succeeded to the throne in September 1520. In Syria, he immediately suppressed the revolt of a former Mamluk governor, Janberdi Ghazali, and then, using as a pretext the Hungarian maltreatment of his ambassador, he attacked Hungary in 1521, capturing Belgrade. In 1522, he conquered Rhodes, allowing the Knights of St. John to depart freely. In 1526 he invaded Hungary again, defeating and killing King Lajos (Louis II) at Mohács. Following Suleiman's departure, the Hungarian Diet elected János Szapolyai (John Zapolya) as king of Hungary, but later in the year, the Diet of Bratislava elected the Habsburg counter-claimant, Ferdinand of Austria. In 1529, Ferdinand occupied Buda. Suleiman, however, expelled him from Buda, re-enthroned Szapolyai, and unsuccessfully besieged Vienna, the highwater mark of Ottoman expansion efforts. In 1530, Ferdinand again besieged Buda, and Suleiman again invaded, forcing Ferdinand to an agreement that left Szapolyai as king of central and eastern Hungary and himself as king in the west and north, both ruling as Suleiman's tributaries.

The truce freed Suleiman to attack the Shi'ite Safavids of Iran, for which a series of defections on both sides of the frontier gave a pretext. In 1533, Suleiman's grand vizier Ibrahim Pasha reoccupied Bitlis, whose lord had defected to Shah Tahmasb. Next year he occupied Tabriz and, after the sultan

had joined him, Baghdad. By 1536, the sultan had added Baghdad, Erzurum, and, temporarily, Van to his empire. In 1533, recognizing the need to counter the threat especially of Spanish power in the Mediterranean, Suleiman had appointed as admiral the privateer-ruler of Algiers, Hayreddin (Khayr ad-Dīn) Barbarossa, admiral of the Ottoman fleet. The Spanish threat materialized with the conquest of Tunis by Charles V—king of Spain, Holy Roman emperor, and brother of Ferdinand—in 1535. This was a factor persuading Suleiman to agree in 1536 to an anti-Habsburg alliance with France, which lasted until the Franco-Spanish treaty of 1559. A proposed Franco-Ottoman campaign in Italy in 1537 failed to materialize. Instead Suleiman unsuccessfully besieged Venetian Corfu. In 1538, by contrast, Barbarossa captured most of the Venetian islands in the Aegean and defeated a combined Spanish, Venetian, and papal fleet in the Gulf of Prevesa. The war ended in 1540, concluding the period of Suleiman's major conquests.

In Hungary, meanwhile, Szapolyai's death activated Ferdinand's claim, and in 1541 and 1542 he besieged Buda. Suleiman responded by converting central Hungary to an Ottoman province and Transylvania in the east to a kingdom under Ottoman suzerainty for Szapolyai's infant son, John Sigismund. In 1543, he led a campaign to Hungary, securing a line of fortresses along the western border. The war ended in 1547, but Ferdinand's claim to Transylvania continued. It was not until 1556, following campaigns in 1551 and 1552 and the Ottoman occupation of Temesvár, that the king and his mother could return to the kingdom. In the Mediterranean, too, the war with the Habsburgs continued. Charles V's failure to capture Algiers in 1541 encouraged Francis I to renew the Ottoman alliance, and in 1543 a Franco-Ottoman force stormed Nice. The Spanish occupation of Monastir and Mahdia on the Tunisian coast in 1550 encouraged further cooperation, but when in 1551, the French fleet failed to appear for a joint campaign, the Ottoman admiral, Sinan Pasha, instead seized Tripoli from the Knights of St. John. Ottoman expansion in North Africa continued with the capture of Wahran and Bizerta in 1556–1557 and the expulsion of the Spaniards from Jerba in 1560. However, Suleiman's last major naval campaign against the Knights on Malta, in 1565, was a failure.

Immediately after 1547, Suleiman's main concern was the eastern front and Iran. In 1548, the flight of Shah Tahmasb's brother to Istanbul gave Suleiman the opportunity to invade, but again without conquest apart from the recapture of Van. A third Iranian campaign in 1553–1554 was equally unproductive, concluding with the treaty of Amasya in 1555, fixing the borders between the two empires. After 1564, the sultan's attention turned to Hungary again. With the bulk of Ottoman forces at Malta, Ferdinand's son Maximilian pressed his claim to Transylvania: Suleiman's response was to launch a major campaign in 1566. In September 1566 he died during the siege of Szigetvár.

During his reign, Suleiman had added central Hungary, Iraq, and territories in eastern Anatolia, the Aegean, and North Africa to the Ottoman Empire, while from the 1530s his fleets dominated the eastern Mediterranean. The kings of France, Muslim rulers in India, and the sultan of Aceh (Sumatra) sought him as an ally, emphasizing his stature as ruler of a world empire. His reach into the western Mediterranean, however, depended on cooperation with the French and the semiautonomous Algerians. After 1540, Habsburg power in central Europe and the Mediterranean, and the Safavids on his eastern border, together with geographical constraints, limited the scope for further conquest and, in the age of Iberian maritime empires, the Ottoman Empire remained essentially land-based. Despite a memorandum of 1525 urging Suleiman to establish an Ottoman hegemony in the Indian Ocean, efforts to disrupt Portuguese shipping at sea and to dislodge the Portuguese from Diu in 1538 and Hormuz in 1552 were unsuccessful.

Despite incessant warfare, the reign was a period of prosperity in the Ottoman Empire. Tax censuses indicate a rising population, with an increase in the number and size of settlements. The treasury remained in surplus, and the standard of the silver currency relatively stable. There were, however, discontents, particularly in Anatolia, leading to a series of popular revolts in the 1520s. In particular, the Safavid shahs made messianic claims, and their many adherents in the Ottoman East posed a constant threat of rebellion, which the sultan controlled through a network of informers.

Suleiman I. Contemporary Venetian portrait. ©ALI MEYER/
CORBIS

Suleiman's reign brought conflict within the dynasty. The royal family reproduced through concubines: the practice of marriage, abandoned after 1450, had served political, not reproductive ends. It had also been customary to limit each concubine to one son, with civil war and fratricide deciding which one was to succeed. As an only son, Suleiman had succeeded to the throne unchallenged. However, early in his reign Suleiman became infatuated with his Slavic concubine Hurrem (known as Roxelanna in the West) who bore him more than one son and, in 1534, became his wife. In 1553, when rivalry for the succession increased, Suleiman, probably with the collusion of Hurrem and her faction, executed Mustafa, his son by the concubine Mahidevran, leaving Hurrem's sons Bayezid and Selim as sole contestants. After her death in 1558, Bayezid rebelled. Suffering defeat in 1559, he fled to Iran, where, after Shah Tahmasb had extracted a peace agreement and a payment from Suleiman, he was executed, leaving Selim as sole heir.

Suleiman was intensely conscious of his image. A number of European engravings, all deriving from a single original, give a sense of his appearance,

which he clearly tended, applying make-up in his old age to hide blemishes. To his ordinary subjects, however, he would appear only occasionally as a distant figure in a magnificent cavalcade. More enduring are his titles. To Europeans, he is “the Magnificent” in reference to the extent of his empire, and to his youthful ostentation, best known to the Venetians in his commission of a bejewelled triple tiara in 1532. To Muslims he is “the Lawgiver,” a title first attested in the eighteenth century, but presumably used earlier. This reflects his promulgation of a new recension of the “feudal” code compiled circa 1500, under Bayezid II, but more importantly his co-operation with the chief mufti, Ebu’s-su’ud, in systematizing some areas of Islamic law, and Ebu’s-su’ud’s reformulation of “feudal” land law in Islamic terms. It was under Ebu’s-su’ud’s influence that Suleiman became conspicuously pious in the second half of his reign. Suleiman was the first Ottoman sultan to adopt formally the title of caliph, implying leadership of the Islamic world. The impetus for the claim came from his overwhelming power, his status as guardian of the Holy Cities, and the need to counter Safavid claims and to emulate Charles V’s status as Holy Roman emperor. After the Ottoman-Habsburg treaty of 1547, where Charles V no longer used the title “Emperor,” Suleiman also adopted the epithet “Caesar” or “breaker of Caesars.” In the same year, he began the construction of the Suleimaniye Mosque in Istanbul, a masterpiece of his chief architect Sinan, as a monument to his imperial pretensions. Its completion in 1557 coincided with Bayezid’s rebellion, an event that undermined his caliphal-imperial image. Nonetheless, his death on the battlefield secured him the posthumous title of “Holy Warrior and Martyr.”

COLIN IMBER

SULTAN. Sultan, which originally meant ‘power’ or ‘authority’, evolved by the tenth century to its present meaning of the holder of that authority, such as a ruler, lord, or monarch. The most spectacular sultans of history were those of the Ottoman dynasty, who ruled most of the territory of the Middle East and North Africa, as well as large parts of eastern Europe, from 1300 to 1923.

Origins of the term are somewhat obscure. Probably Akkadian, and Syriac, the word appears in Arabic in the Koran with the meaning of empowering of someone over another, and connoting magical or moral authority such as possessed by prophets, or by Satan. In early Islamic societies, “sultan” came to convey political power, and was often applied to lesser rulers who shared power with the caliphs, who were presumed to be the religious head of the community, and, at least until around 1000 C.E., to be descended from the Prophet Muhammad. The hadith, or stories of the prophet, generally employ the word “sultan” for governmental or political power, but occasionally for the power of God. As governance became more complicated in early Islamic societies, and disputes emerged about the rightful leaders of the Muslim community, the term became an honorific, or personal title, most consistently, although not exclusively, applied to rulers of Turkic or Persian stock, and Central Asian origins. Ibn Khaldun, writing just as the Turkic dynasties began to populate and usurp power in much of the Arab and Persian lands, noted with disdain their appropriation of honorifics such as “sultan.” Such was also true, by his account and others, of the Barmakids, an extremely powerful Persian family under the Abbasid caliph Harun al-Rashid (786–809). Most contemporary sources point to Mahmud of Ghazna (998–1030) as the first independent sovereign to be called a sultan by the Abbasid caliphs. Whether or not the caliph conferred the title, it appears certain that after the fall of the Abbasid dynasty in 1258, “sultan” had acquired the meaning of independent sovereign. Thus the Mamluks, a slave elite of Turkish, Circassian, and

Georgian origins, who ruled Egypt from 1250–1517, were so labeled. All such independent dynasties were champions of Sunni Islam, and it is no coincidence that a revitalized Muslim orthodoxy emerged in the eastern Mediterranean in response to the threat, first of all, of the sectarian Shi'ites, but also of the crusaders, whose ventures in the Levant began in 1096. Sunnism was reinvigorated by the Seljuk kingdoms of Turkey and Iraq, between 1051 and 1300. Muslim theorists had by that time evolved a philosophy of rule that designated the Mamluks and their rivals, including the Ottomans, as sultans, the “Shadows of God on Earth,” or the “Caliphs of God on Earth,” in matters of government.

OTTOMAN SULTANATE, 1453–1566

The Seljuks—after 1071 there were two centers of overlapping power, one in Baghdad, and the other in Konya and Alanya—created a courtly style and manner of governance that was Central Asian and Muslim in flavor but influenced by the Byzantines, and was adopted by the later Ottoman Empire. Of the Ottoman sultans prior to 1453, Bayezid II (1481–1512) is said to have requested the title of sultan from the titular caliph in Cairo. Mehmed II (also known as Fatih, ‘conqueror’, of Istanbul, 1451–1481), adopted the title sultan as his own. Nonetheless the preferred term continued to be *padishah*, Persian for supreme sovereign, and sultan generally topped an increasingly long list of titles in official documents.

By the time of the death of Suleiman the Magnificent in 1566, the Ottomans had conquered Egypt and the sacred cities of Mecca and Medina, subdued and colonized Hungary, and threatened the walls of Vienna. Ottoman sultans recast their legitimacy in canonical Islamic terms, as promoters and defenders of Islamic law (*shari'a*), and created an immense religious hierarchy run by the grand mufti (Turk., *Şeyhülislâm*), as he came to be known in Europe. In Turkish, Suleiman acquired the epithet “Law-Giver” precisely because of his consolidation of the imperial offices and law codes. By the time of the conquest of Baghdad by Murad IV (ruled 1623–1640), the Ottoman sultan styled himself “the most glorious Padishah who is the Defender of the faith, whose Majesty is as great as that of Solomon, who is the substitute of God in the

world, and who has justified the maxim that ‘An equitable Sultan is the shadow of God on earth’ . . . the supporter of Islamism and Muslims, the exterminator of heresies and of the polytheists, the Sovereign of the two Orient and the two Occidents, the servant of the two Holy Cities, the Treasure of Mankind and the apple of the age, who is protected by the Supreme Being whose divine assistance men implore, and favoured by the most High and propitious God” (quoted in J. C. Hurewitz, *The Middle East and North Africa in World Politics*, 2nd ed, vol. 1, p. 25).

Suleiman’s long reign (1520–1566) roughly coincided with that of the Habsburg emperor Charles V (ruled 1519–1556), as well as that of Francis I (ruled 1515–1547), and Henry VIII (ruled 1509–1547), and contemporaries equated the terms sultan and emperor as imperial rivals. In this period, lasting impressions of real Ottoman Turkish (Muslim) power were embedded in the European psyche, as well as imaginative, largely fictive representations of imperial institutions such as the harem. “Sultan” thus came to represent absolute power in its most exoticized version, especially in Paul Rycout’s *Present State of the Ottoman Empire* (1660).

Suleiman’s age became the idealized gold standard for subsequent eras, often referred to as the “classical age” of the empire. In later reigns, the striking change was the withdrawal of the sultan into palace precincts, with weekly highly ritualized journeys to Friday prayers. The “sultanic” presence became iconographic and theatrical, as his deputy, the grand vizier, took his place in public spaces, such as on the battlefield, and as head of the Imperial Council (Divan). While that is characteristic of the seventeenth century, in the eighteenth, another change occurred, with the reassertion of power by sultans such as Ahmed III (1703–1730) and Selim III (1789–1807), both of whom, it should be noted, were removed from their thrones by widespread resistance to their attempts at invigorated leadership and reform. Eighteenth-century Europe, especially France, made of the sultan the worst exemplar of the despotic, in the debates on the excesses of the Bourbon monarchy. Creative productions such as Mozart’s *Abduction from the Seraglio*, or Montesquieu’s *Persian Letters*, cemented the im-

age and continue to exert their influence even in contemporary histories of the empire.

VIRGINIA H. AKSAN

SUMPTUARY LAWS. Sumptuary laws regulated clothing, ornamentation, food, drink, and other forms of luxury, imposing a hierarchy of consumption. These laws prohibited certain ranks of persons from wearing specified cloths, garments, or ornamentation. Typically, the rarest furs were reserved for royal families, lesser furs for nobles, and inferior furs for commoners. An English proclamation of 1559 stipulated: “None shall wear in his apparel any cloth of gold, silver, or tinsel; satin, silk, or cloth mixed with gold or silver, nor any sables; except earls and all of superior degrees.”

HIERARCHICAL REGULATION OF CONSUMPTION

Sumptuary laws can be traced back to antiquity, but they proliferated rapidly during the later Middle Ages and Renaissance. These laws embodied a paradox: they distributed luxury by rank by imposing constraints on luxury. They focused on rank, specifying the apparel thought to be appropriate to each social class, at the same time moralizing about the vanity of luxury. Such laws were found throughout Europe and were, despite the repeal of all extant sumptuary legislation in England in 1603, taken by the colonists to the New World, where the critique of luxury was endorsed by Puritan sentiment and

expressed itself in dress rules and injunctions against “tippling” (idle drinking, the enemy of work), testimony to the widespread moralizing linkage of luxury with idleness.

There was a marked variation in the extent to which sumptuary laws targeted the two sexes; in some periods males were the primary target; at other times it was women’s dress. In medieval sumptuary law, men’s apparel was the subject, but with the rise of urban mercantile classes, the focus of sumptuary law shifted to women’s dress. However, the pattern was complex. For example, the period of sharpening tension between old and new wealth in mid-sixteenth-century England was precisely the time when women were exempt from sumptuary restrictions. Both men and women, however, were subject to respectability regulation: female décolletage and male codpieces attracted the legislators’ attention.

Attempts to regulate female dress employed contradictory tactics. The first played on the distinction between the respectable woman and the whore, denying fashionable dress to prostitutes to decrease the attraction of prostitution as a way of life while “rewarding” virtuous women by granting them access to fashionable attire. The second tactic reversed the first: it allowed fashion and luxury to prostitutes in the hope that respectable women would be discouraged from emulating their sinful sisters.

EARLY MODERN SUMPTUARY LAWS

There was much continuity in sumptuary regulation through the Middle Ages into the early modern period, but by the end of the eighteenth century only sparse instances of sumptuary laws remained. However, some significant developments occurred during that time. The sumptuary ethic was strongly implicated in some of the most crucial phases of the expansion of urbanization and the transition from mercantile to manufacturing capitalism. The most extensive and intensive phase of sumptuary law was to be found not only in the great Italian mercantile cities of Venice and Florence, but in the German, Dutch, and English cities as they became the key sites of capitalist development.

Sumptuary regulation came to embrace a variety of objectives in addition to hierarchical ordering, captured in the standard preamble to a number of sixteenth-century English statutes: “the

commons of the said realm, as well Men as Women, have worn and daily do wear excessive and inordinate Array and Apparel to the great Displeasure of God, and impoverishing of this realm of England and to the enriching of other strange Realms and Countries to final the Destruction of Husbandry of this said Realm.” This statement combines issues of luxury, economic protectionism, and a counterposing of consumption and production with a moral admonition.

A new feature of sumptuary discourses also emerged in the sixteenth century: legislators voiced anxieties and complaints about the difficulty of distinguishing the social rank of individuals. In 1530 the Augsburg Diet drew up clothing regulations “to ensure that each class should be clearly recognized apart.” A Nuremberg law of 1657 bluntly stated: “It is unfortunately an established fact that both men and womenfolk have, in utterly irresponsible manner, driven extravagance in dress and new styles to such shameful and wanton extremes that the different classes are barely to be known apart.”

The attempt to regulate appearance came up against the slow but inevitable increase in consumerism. As fashion became accessible to more people, the possibilities of competitive consumption increased. An English proclamation of 1575 reveals a certain desperation by prohibiting anyone from “devising any new forms of apparel.” In the “world of strangers” of urban settings, not being able to “read” rank from apparel must have been perplexing. This has been described as a crisis of recognizability: in a social terrain of competition, the rising bourgeois classes sought to secure their identities in the process of distinguishing themselves from others, while those above them sought to resist their challenge. This strife resulted in still more overtly urban regulation, and new laws included dress rules for burghers (members of the urban middle class) and merchants, and imposed rules that maintained a visible separation between ladies and their maidservants by specifying the length of headdresses and the width of sleeves.

Attempts to promote the work ethic and to further the Protestant Reformation unleashed enormous legislative energy intended to restrain feasting, drinking, and other indulgences. The contemporary importance of sumptuary law is attested by

the fact that the Diet of Worms in 1521, at one of the critical turning points in the political realignment of Reformation Europe, took the time to articulate the urgent need for sumptuary legislation in order to maintain the visibility of social status in attire. When bourgeois interests secured power, they used it to impose sumptuary restrictions or fiscal burdens on the patrician classes, for example, restricting expenditures on weddings, feasts, and funerals; these efforts were also linked with struggles to regulate the size of dowries. Although there is little evidence regarding the degree of enforcement, it is worth noting that a number of Italian cities had officers specifically appointed to enforce sumptuary laws.

It was in Italy that another significant form of regulation, one that had long existed in Florence, spread: it became easier to purchase a license of exemption from sumptuary rules, the harbinger of a shift toward an increasingly fiscal approach. While licensing remained important in Italy, elsewhere economic protectionist motives became increasingly mixed into sumptuary regulation. Protectionism was at the heart of the economic debates during the mercantilist period and sumptuary laws and discourses were increasingly part of these wider economic debates. Hostility to “foreign” goods was woven into sumptuary discourses with the imposition of luxury taxes or prohibitions on the import and sale of foreign goods.

Sumptuary laws did not so much “die” as undergo a process of metamorphosis such that the original is barely recognizable in the result: luxury taxes and import restrictions are the legacy of sumptuary laws. Such laws can perhaps best be regarded as inhabiting the threshold of modernity, without themselves being an active feature of modernity.

SURGEONS. The period between the Renaissance and the Enlightenment witnessed slow, then accelerating progress in surgery. Surgeons made advances in controlling hemorrhage; devised simpler and safer dressings for battle wounds; and improved methods and invented new instruments for amputating limbs, cutting for stone of the urinary bladder, operating for hernias and dilatations of arteries, combating the hazards of giving birth, and repairing certain deformities. In the 1740s, the time-honored procedure of couching for cataracts of the eye gave way to modern extraction, a rare example of radical innovation. Greater attention to cleanliness may have reduced infection, although the unsanitary conditions under which surgery was performed, especially in many hospitals, remained appalling even by standards of the time. Likewise, the pain of operations was likened to torture, even though it was masked in part by suffering due to the ailment. Skilled surgeons needed to work with great dexterity and speed to complete major procedures in just a few minutes. Only relatively few dared to undertake these high-risk interventions, and then infrequently, compared with ordinary tasks—bloodletting, incision of boils, treatment of skin and venereal diseases, reducing dislocations, setting fractures—that made up the ordinary barber-surgeon's stock-in-trade.

Progress in the social status and scientific knowledge of elite surgeons in large cities moved at a much more rapid pace than technical change. By the end of the eighteenth century, surgical guilds in Paris, London, Edinburgh, Madrid, Vienna, Copenhagen, and elsewhere had evolved into professional bodies with distinctive liberal institutions: colleges for education and academies for advancing knowledge. Major surgery in the sixteenth century remained the preserve of exceptional individuals of humble backgrounds—the renowned French barber-surgeon, Ambroise Paré, was the outstanding example of this sort—or bold itinerants, and family

dynasties like the Chamberlens, French/British Huguenots, who managed to keep the secret of their obstetrical forceps for well over a century. By the High Enlightenment, organized professionals shared a repertoire of surgical knowledge and practices. Expertise in the craft conferred exclusively by formal regulation, as well as custom, to guilds, appropriately known as “mysteries,” began to be the province of new, more open institutional structures concerned with scientific progress. Academic surgical societies used publications and correspondence networks to share and propagate their work.

The centralized European state fostered the professionalization of surgery. In France, Louis XIV's surgeon used the occasion of his successful anal fistula operation on the king in 1686 to gain benefits for the guild of barber-surgeons. At the time, the status of royal surgeon was little more than that of a domestic servant. But during the Regency period (1713–1723) the office of premier surgeon to the king assumed an increasingly important professional leadership role. Georges Mareshal and François de la Peyronie, successively premier surgeons to Louis XV, consolidated centralized jurisdiction over guilds throughout the kingdom, established a central school of surgery in Paris in 1724 and a Royal Academy of Surgery in 1731, and secured legislation in 1743 requiring a university degree of surgeons and separating the company or college of surgeons from the barbers' guild. The precedent was emulated by larger provincial communities.

In Great Britain, the surgical profession developed in less centralized fashion. To be sure, kings lent their patronage to the London barber-surgeons guild, as depicted in Holbein's portrait of Henry VIII presiding over the union of the two guilds in 1540. And the London surgeons separated from barbers in 1745, just two years after their Paris counterparts. Capital cities in Prussia, Spain, and Russia followed suit. In Dutch and most German and Italian centers, barber-surgeons' guilds survived, but their members no longer did barbers' work, and they too enjoyed upward social mobility. Rembrandt's collective portrait of the Amsterdam guild in his *Anatomy Lesson* (1632) bears witness to their academic pursuits and bourgeois status.

Surgeons. *The Anatomy Lecture of Dr. Nicolaes Tulp* by Rembrandt, 1632. Tulp was a prominent Amsterdam surgeon who commissioned the renowned Rembrandt to create this portrait. It was Tulp's idea that he should be depicted delivering an anatomy lecture. The Surgeons Guild at the time permitted one public dissection per year and stipulated that the cadaver must be that of an executed criminal. ©FRANCIS G. MAYER/CORBIS

During the second half of the eighteenth century, elite surgeons across Europe achieved a rank in society comparable to that of medical doctors. Since medieval times, medical superiority had derived from the educational attainment of physicians and their collective status alongside law and theology in the university. In principle, and by statute, the medical faculty had jurisdiction over surgical instruction, licensing, and practice. All this came under question and successful challenge when educated surgeons set up autonomous institutions. Surgeons gained admission to prestigious scientific academies in numbers equal to, if not surpassing, physicians. As classical humoral theory, along with the Latin language of medical discourse, declined, surgical

knowledge anchored in sensory experience and anatomical pathology took the ascendancy. Anatomy was the surgical science par excellence. Surgeons performed dissections on the cadaver for various purposes: research, training—especially in private courses where students could purchase cadavers for hands-on learning—and forensic autopsies seeking to reveal the causes of death. Surgical knowledge was associated with empirical epistemology, pathological anatomy, and a localist conception of disease, while medical knowledge, when not abstract and purely theoretical, could point only to chemistry for scientific validation. Given these contrasts, it is not surprising that the eighteenth-century philosophes extolled the practical usefulness of the surgi-

Surgeons. *A Barber Surgeon Tending a Peasant's Foot*, seventeenth-century painting by Isaack Koedijk. ©CHRISTIE'S IMAGES/CORBIS

cal side of medicine. Diderot's *Encyclopédie* reproduced illustrations of operations and instruments recently published by the Academy of Surgery, while the Academy's secretary, Antoine Louis, contributed some seventy articles on his field to the encyclopedia project.

In smaller towns, villages, and the countryside, surgeons were the only licensed medical practitioners available to serve people of modest means. Fragmentary evidence indicates that rural master surgeons, surprisingly numerous in proportion to the population, faced stiff competition from a variety of illegal healers, whose ranks included roving journeymen, empirics and "charlatans," women healers and midwives, clergy, and army and naval surgeons. Surgical guilds, in principle, but not often in practice, had licensing authority over midwives and so-called specialists: oculists, hernia experts, bonesetters, and tooth pullers, who had experience only in their particular craft skill.

At the level of country surgeon, distinctions drawn between external surgical diseases and internal medical ailments had little meaning. Surgeons

and barber-surgeons did not hesitate to dispense purges and other medical remedies. Phlebotomy (bloodletting), for prevention as well as treatment of most ailments, was a mainstay. A medical recourse common to both barbers and surgeons, bloodletting helped perpetuate the link between the two crafts in continental Europe. In Great Britain, apothecary-surgeons, rather than barber-surgeons, took care of the medical needs of common folk.

As in other craft guilds, apprenticeship, followed by a period as a journeyman, constituted the core of training for barber-surgeons. By the eighteenth century, practical experience began to be supplemented by formal courses. In France, during the second half of the century, vast numbers of aspiring young surgeons (*garçon chirurgiens*) from all over the realm attended courses at the Paris surgical school.

Hospitals increasingly became a site for practical training for surgeons as these church foundations for poor relief came under secular administration and adopted medical objectives. Surgeons worked, learned, and sometimes resided in hospitals, where they displaced clerical healers and constituted an elaborate hierarchy of responsibility for patient care. Medical students and physicians seldom took on hospital employment. A similar preponderance of surgeons characterized medical services in European armies and navies. In public health matters, notably in the organized response to plague and other epidemics, surgeons outnumbered their medical counterparts, especially at the grassroots level.

The eighteenth century saw the rise of a subcategory of surgeons, known as man-midwives, who began to preside over childbirth in well-to-do families. To some extent, fashion paved the way for obstetricians (*accoucheurs*) to displace traditional midwives. But men also legitimated their takeover of this lucrative practice by means of demonstrably superior knowledge in anatomy, displayed in magnificent atlases of the stages of pregnancy, and their use of new techniques and instruments for delivery, notably the obstetrical forceps. Because of their systematic exclusion from surgical guilds as well as university medical faculties, women healers could only practice illegally. However, guild custom permitted widows of master surgeons to lease to journeymen the practice of their deceased husbands.

The prevalence of religious and magical healing is difficult to assess. Evidently, it persisted in the eighteenth century and beyond. Among the surgical elite, such beliefs and practices clearly declined. In the sixteenth century, Ambroise Paré had described monsters and marvels, attributed birth defects to maternal impressions, acknowledged witchcraft, and naively repeated accounts of travelers' sightings of mermaids. His eighteenth-century successors adopted a more critical, often skeptical, attitude. By the Academy of Surgery's rigorous criteria, medical miracles were judged to be either errors, products of religious fanaticism, or frauds. Surgical power, based upon pathological anatomy, could explain and often cure conditions heretofore ascribed to supernatural forces. Operations repaired the congenital deformity of harelip, restored sight to those blinded by cataracts, and cured impotence resulting from anatomical lesions of the urogenital organs.

Surgical progress, and more specifically, the social ascension of surgeons in urban centers of early modern Europe, paradoxically, planted the seeds of the demise of surgery as an autonomous profession. Success narrowed the social and cultural gap with physicians and introduced a more empirical and anatomical orientation to medicine in general. Suggestive analogies likened hidden, poorly understood internal ailments to familiar external lesions. Post-mortems took on instructive significance for physicians. By the eve of the French Revolution, reformers had called for the abolition of separate institutions and the unification of medicine and surgery into a single profession. Future practitioners were to be trained in a common "school of health" and to practice the healing art as a whole. Country surgeons would be replaced by a subordinate level of health officers. In 1794 the National Assembly instituted the new professional order, a pattern that was subsequently adopted in other European countries.

SURVEYING. Surveying, initially the geometrical and legal description of local lands and county seats, gained importance throughout the early modern period as legal and economic arguments came to rely on accurate descriptions and, increasingly, on measurement and "plotting." By the late seventeenth century, surveying included the mapping of larger political units; by the eighteenth, military leaders and colonial governors, as well as landed individuals, employed surveyors and cartographers. Techniques and instruments developed throughout the period produced a coherent body of theory and practice used for imperial mapping in the late eighteenth and nineteenth centuries.

At the end of the fifteenth century, surveying consisted largely of written descriptions of fields and estates based on visual inspection of an area. Although landmarks and natural division points were more crucial for determining land ownership, these methods were often accompanied by some sort of measurement. In the first half of the sixteenth century, surveying was often restricted to "viewing" or chain-measuring, and the chain often symbolized the surveyors' profession. As the century progressed, and more standardized techniques of measurement were developed and surveying moved from linear and geometrical methods to those based on angular or trigonometric measurement, surveyors began to produce maps or "plots." Although such advanced mathematical methods were devel-

oped by the end of the century, chain-measuring continued to be used into the eighteenth century.

The introduction of triangulation methods, the plane table, and the theodolite, as well as rules of acceptable practice, transformed surveying into an exact art. Leonard Digges's *Pantometria* (1571), for example, introduced these techniques and instruments into England. Throughout the seventeenth century the new surveying instruments were refined, a number of surveying manuals were published, and surveyors were increasingly trained in mathematics and astronomical techniques. Surveying, unlike mapping on a larger scale or the later colonial and country surveys, such as the Ordnance Survey of Ireland (1824–1846), did not require longitude and latitude placement, and therefore did not use astronomical observations in order to achieve accuracy.

Part of the transformation in surveying that took place during the early modern period was related to the changing awareness on the part of landowners of the desirability of surveying and mapping their lands. As surveyors gradually convinced their patrons of the utility of scale maps, this cognitive shift led to a cartographic revolution. Carefully measured and drawn maps (as opposed to earlier sketch maps) began to be used by landowners as evidence in court cases, by generals planning their military strategies, and by governors interested in inventories and tax collecting. All of this was symptomatic of the developing map culture, driven in part by the increasing study of geography at schools and universities.

By the end of the early modern period, Europeans were surveying their own lands and the other parts of the world they were conquering. They believed that, through measurement and cartographic depiction, they could control the land and the people who lived there. Only the impressive developments of surveying instruments and techniques, and the conceptual acceptance of the scale map as an objective and controllable representation of the land, made that idea plausible.

SWEDEN. The early modern period was particularly important in the formation of Sweden as a state. During this time Sweden played a central role in northern European power politics for more than a century, the country's economy grew in scale and complexity, and it became more closely integrated into the mainstreams of European cultural and intellectual development.

Early modern "Sweden" was not what one sees today on a map. In 1500, the southern provinces of Skåne, Blekinge, and Halland belonged to Denmark, and the border areas of Bohuslän, Jämtland, and Härjedalen were parts of Norway. (Norway gradually lost its status as an independent state in the fifteenth century, and from the mid-1530s was, in all but name, a territory of Denmark.) Northern Sweden was sparsely settled and loosely controlled. Finland, smaller than it is today, was an integral part of the country. The borders of current Sweden date mostly from 1658/60 and 1809. In addition, Sweden, in a broad sense, included a Baltic empire that was built and then lost in this period. In population the country numbered, without Finland, less than a million in 1500 and around two million in 1800.

POLITICAL DEVELOPMENT

In 1397, a federation of the medieval kingdoms of Denmark, Norway, and Sweden was established, called by posterity the Kalmar Union. Denmark was its most powerful member. At several times during the fifteenth century, Sweden broke with the union, and a series of rebellions and wars of reunion punctuated the years down to the early 1520s. The last of these union wars began in 1521 and was led by Gustav Eriksson Vasa. Within three years the Swedes had established their independence, aided by the Hanseatic League and a revolt in Denmark.

Gustav was elected king as Gustav I Vasa in 1523. Since then, Sweden has had an unbroken history of independent development.

Sweden's history was not, however, free of internal conflict. As elsewhere in Europe, a basic constitutional struggle ran through the entire early modern period between crown and nobility, between monarchy and aristocratic constitutionalism. Kings wanted to be kings; nobles wanted to preserve their historic rights and liberties and at least share power with the crown.

A third factor in this history was the Parliament (*Riksdag*), which began to develop in the fifteenth century. Called by kings or factions of great men, it dealt with matters of war, peace, taxation, and succession. Usually, a meeting included representatives from each of the four principal "estates": clergy, nobility, burghers, and freehold farmers. Over time the frequency of meetings increased, procedures were formalized, and its prerogatives grew. It was least important during the absolutist period (1680–1719) and most important during the Era of Liberty (1719–1772).

In a series of episodes that has been likened to a swinging pendulum, Sweden experienced times of strong monarchy, times of balance, and times of noble ascendancy. Gustav I Vasa was able to advance royal power, aided by the fact that many of his likely noble opponents had been executed on order of the Danish king, Christian II, in the so-called Stockholm Bloodbath in 1520. Gustav was a very able politician who played the Parliament to achieve his ends, exploited the Reformation, used the new church as a means of royal propaganda, and enhanced state finances by confiscating church lands. His sons Erik XIV (ruled 1560–1568), John III (ruled 1568–1592), and Charles IX (ruled 1599–1611), as well as his nephew Sigismund I (ruled 1592–1599), were less successful. Each antagonized factions of the nobility. Charles IX was the most ruthless, executing five noble opponents at Linköping in 1600. A new phase began with the succession of Gustavus II Adolphus (ruled 1611–1632). In order to secure the throne, he was compelled to promise to respect the privileges of the nobles. Until his death in 1632 a remarkably amicable cooperation developed between crown and nobility. Each needed and used the other to run

the affairs of state at home and to fight wars abroad. Noble importance grew under Christina, during both her minority (1632–1644) and her active reign (1644–1654). Charles X Gustav (ruled 1654–1660) was an absolutist at heart, but he was unable to accomplish very much during his short reign (1654–1660). During the minority (1660–1675) of Charles XI (ruled 1675–1697), the high nobility recklessly ran the affairs of state. Charles was able to change the system fundamentally, however, by exploiting social discontent between commons and nobles and within the nobility. Between 1680 and 1693, Sweden was transformed into an absolutist state. Although privilege was not challenged, the crown recovered most of the domain lands donated away since the late sixteenth century and asserted the right to rule without either the nobility's advice through the council or that of the Parliament.

Absolutism lasted only until 1719. The enormous costs of war, the obsessive leadership of Charles XII (ruled 1697–1718), and an uncertain succession allowed leaders of the nobility to dictate a new constitution. The order of primacy was inverted during the so-called Era of Liberty (1719–1772). For much of this period the nobility dominated through the council and the Parliament. Toward the end the burghers and farmers played increasingly important roles. From about 1740 to 1772 a fascinating political life developed, centered on two conflicting factions, the Caps and the Hats, which resembled modern political parties. The more reform-minded Hats advocated changes that were revolutionary for the time including press freedom, laissez-faire economics, and an end to privilege. As interesting as this period was, it was fraught with problems. Some of the ideas advanced were simply too radical. More important, political strife was viewed as a way to keep Sweden weak and was encouraged through bribes and influence buying by Russia, France, and England. Gustav III (ruled 1771–1792) ended the experiment in August 1772 with a bloodless palace coup, and strong monarchy returned. Gustav was not content to play a minor role in anything and dreamed of restoring Sweden's greatness. An adventuresome foreign policy was coupled with a drift back toward royal absolutism, and irate nobles conspired to assassinate the king in 1792.

Despite these shifts in power and constitutional balance, Sweden developed as a reasonably well run state. Beginning around 1620, an administrative system was adopted under which responsibilities were assigned to five “colleges,” each headed by one of the “great officers” of state (chancellor, treasurer, steward, marshal, and admiral). This was most clearly spelled out in the 1634 Form of Government and was likely the collaborative work of Gustavus II Adolphus and his chancellor, Axel Oxenstierna. The country’s court system went through several reforms in the seventeenth century and a new national law code was promulgated in 1734. The beginnings of a national bank were created in 1668. Regional government was organized around counties (*län*) headed by governors. Responsibility, accountability, and reporting were standardized. Although the nobility retained its privileged claim to offices and officer appointments, ability and education were factors in selection, especially in the eighteenth century.

Sweden also went from a “domain state” to a tax and/or warfare state during this period. Before the Reformation, the crown owned only about 5 percent of the land and was expected to live from this, in theory at least. There was never enough money, however, and a system of regular taxes, primarily on the lands of freehold farmers, dates from the Middle Ages. (Noble and church lands were exempt.) The crown increased its holdings through confiscations in the Reformation, and Gustav I actually left his sons a budgetary surplus. Fiscal problems grew from the 1560s, driven by foreign policy. Concurrently, the crown’s domain position worsened through donations to the nobility. By 1660, the crown held less than 10 percent of the land, while the nobility held over 60 percent. The state was forced to turn to higher taxes and more effective tax extraction from the commons, which, in turn, undercut the economic position of the freehold farmers. Sweden was spared a social-economic revolution by the radical reduction (reclaiming) of noble holdings carried through by Charles XI after 1680. During the Great Northern War (1700–1721) taxes rose again. They remained high for much of the eighteenth century, while crown holdings diminished through direct sale.

EMPIRE

The imperial phase in Swedish history lasted from about 1560 to 1721. Growth defines the first one hundred years, decline the last sixty. In the growth phase Finland was enlarged, Kexholm, Ingermanland, Estonia, Livonia, Pomerania, Wismar, and Bremen-Verden were added, and the Danish and Norwegian territories bordering the kingdom were annexed. During the 1650s, Sweden also operated a trade fort at Cape Coast (Ghana), and it maintained a colony in North America between 1638 and 1655. The high point in the empire’s history was reached in 1658. Small losses were incurred in 1660. The worst came in the last decade of the Great Northern War (1700–1721), when, except for Pomerania, Wismar, and most of Finland, all the Baltic territories were lost. More of Finland was taken by Russia in the 1740s. In the closing decades of the century, Gustav III dreamed of restoring the empire and Sweden’s importance. A war against Russia in 1788–1790 gained nothing. Finland became a Russian grand duchy in 1809.

The imperial chapter in Swedish history has long attracted the attention of historians. Why did the leaders of this poor and sparsely populated country choose to build and maintain an empire, and how did they manage to do so? Sweden’s assets, relative to the weaknesses of the competitors, made possible its expansive policies. Once begun, the empire became a kind of imperative and for a time even paid for itself. International rivalries also encouraged the establishment of imperial outposts. For survival in a competitive state system, Sweden needed to have places and resources outside the country proper to support its security. There were also economic motives. Merchants sought to control the lucrative Baltic trade, while Sweden’s acquisitive nobility found in the empire a setting for military careers and a source of spoils. In addition, the personal fortunes and careers of individual nobles, support of the Lutherans in Germany and fears of the Catholic Counter-Reformation, exploitation of the empire to enhance the status of the crown, and the competitive nature of the European state system are cited.

ECONOMIC DEVELOPMENT

For the most part Sweden was and remained a poor agricultural state throughout the early modern period. Except for the far south and the area around

Lake Mälaren, soils were generally poor. Tools and methods were centuries old. Yields could be pitifully small. Crop failures and the ensuing famines were frequent. Grains, livestock, milk, butter, and cheese

were the main products. Many farmers supplemented their incomes by working in the forests, mining, or fishing. Whether held by the crown, nobility, or commons, agricultural life was organized around

villages. Land was “owned” in small strips and worked collectively. In a few areas single-owner farmsteads prevailed. Some important changes were initiated in the eighteenth century. Cultivation of the potato became increasingly common after about 1750. Its adoption had important dietary results and symbolized a growing willingness to experiment with new crops. At the same time, an effort to consolidate the small strip holdings of many farmers into fewer fields and to break up the old agricultural villages was begun. This would take nearly a century to complete.

Sweden possessed four great assets beyond its arable land: the riches of the inland lakes and rivers and the seas surrounding the country, coniferous forests (sources of timber, charcoal, and tar), iron ore from the Bergslagen region of east-central Sweden, and copper chiefly from the great mine, Stora Kopparberget, at Falun. These resources were essential to Sweden’s achievements in the period. Herring, bar iron, smelted copper, masts and spars, and tar were vital products in European markets and Sweden’s most important exports. For part of the seventeenth century, Sweden was Europe’s leading supplier of copper. Bar iron became more important in the eighteenth century. Also, these resources attracted technology and investment and stimulated domestic shipbuilding, finished metal production, and armaments industries. The state played important roles in developing and controlling all of these activities through licensing, subsidies, granting monopolies, encouraging immigration, oversight, and direct participation.

Trade operated on four levels: internal, Baltic, European, and global. Internal was the most limited and the most restricted. Baltic and European commerce were inseparably linked, and the struggle for dominance in this sphere is one of the main themes of the period’s history. To control the flow of salt, grains, timber, metals, and other products that flowed through the ports of the Baltic was to become rich. Denmark, Sweden, Russia, the Dutch Netherlands, Poland, and England were some of the players in this competition. Sweden never actually gained control of the trade, but it did control many of the ports that fed it from around 1630 to 1720. In the global economies of the early modern period, Sweden was a minor actor. Hopes of gaining a place in the Africa trade lasted only through the 1650s,

when Sweden maintained a fort at Cape Coast (Ghana). The New Sweden colony, established along the banks of the Delaware River in 1638 on the basis of hopes for a lucrative trade in furs and tobacco, was never profitable. The Swedish East India Company (1731–1813) was more successful.

Connected to the economic and political developments of the period was a gradual trend toward urbanization. Most important was Stockholm. Founded in the mid-thirteenth century, its population grew from around 6,000 in 1500 to nearly 90,000 in 1800. In addition to serving as the capital, it was a center for manufacturing and the country’s most important trade port. From the early seventeenth century, Göteborg developed as an important commercial center. A conscious policy of urban development was pursued, and twenty-eight new towns were founded in Sweden (and Finland) in the seventeenth century.

CULTURE AND INTELLECTUAL DEVELOPMENT

Sweden’s cultural and intellectual life was influenced by growing ties with Europe, a conservative Lutheran church, and the country’s relative poverty for much of the early modern period. In 1500 Sweden was on the fringes of Europe. Except for churches and a network of medieval royal castles, architecture was at best rustic. Schools were few, and the country’s one university at Uppsala, founded in 1477, virtually ceased operation in the late sixteenth century.

Although Sweden never became a leader in cultural or intellectual activity, much of this backwardness faded over the course of the early modern period, and the country produced a number of important scholars, writers, and artists, especially in the eighteenth century. Court life was modeled on European standards from Gustav I on, and was especially vibrant under Christina during the 1640s and Gustav III from 1772 to 1792. Royal palaces copied continental styles. Drottningholm was built between 1665 and 1703. Fire destroyed the centuries-old Three Crowns Castle in Stockholm in 1697, and work began almost immediately on a new rococo palace designed by Nicodemus Tessin the Younger. During the middle decades of the seventeenth century, Sweden’s aristocracy built and furnished fine city and country residences in European

styles. Court painters like David Klöcker (ennobled Ehrenstrahl) produced superb portraits from around 1650; and the eighteenth century saw the work of such masters as C. G. Pilo, Pehr Hilleström, and the sculptor J. H. Sergel.

From the early seventeenth century, education received greater attention. New secondary schools (*gymnasia*), an academy at Åbo; (1640), and new universities at Dorpat (1632) and Lund (1668) were established. Uppsala University received more regular support. It was home to Olof Rudbeck the Elder (1630–1702), a co-discoverer of the lymphatic system and an exponent of Gothicism, an interpretation of Sweden's history that tied it to ancient biblical tribes and linked the country's monarchs to Noah's son Magog. These ideas were first expressed in the fifteenth century and developed most fully in Johannes Magnus's *Historia de Omnibus Gothorum Sveonumque Regibus* from 1554. Placing Sweden at the center of Western cultural development and regarding it as the site of the lost city of Atlantis, Gothicism was used to legitimize both the Swedish nation and the monarchy. In the eighteenth century Sweden produced a number of distinguished scientists including the botanist Carl Linnaeus (Linnaeus; 1707–1778), the physicist and mathematician Anders Celsius (1701–1744), and the multitalented mystic Emanuel Swedenborg (1688–1772).

BYRON J. NORDSTROM

SWEDENBORGIANISM. A religious movement based on the revelations of Emanuel Swedenborg (1688–1772), an eighteenth-century Swedish scientist and religious visionary. The son of a Swedish Lutheran theologian and bishop, Swedenborg was educated at Uppsala, and then traveled through the Continent and England. A visionary theoretical scientist, Swedenborg anticipated many later scientific discoveries, but gradually became convinced that material nature had an essentially spiritual foundation. His religious visions, which began in 1736, climaxed with a vision of Jesus in 1744, and from then on he devoted himself to his extensive spiritual writings. The essence of his thought centered around a correspondence between the physical and spiritual worlds; life on earth is merely preparation for a heavenly existence. The New Jerusalem Church, of which he was the prophet, would be the world's ultimate religion. Swedenborg did not intend, however, to form a separate church, but a fellowship of like-minded individuals. His thought had the most influence in England, where two Anglican priests, Thomas Hartley (d. 1784) and John Clowes (1743–1831), were early disciples. In 1787, a separate New Jerusalem Church was founded in London by former Wesleyan pastors, an organization that now has branches worldwide, mainly in English-speaking countries.

Swedenborg's thought and visions affected several major artists and writers; William Blake was a follower, and Swedenborgian influences have been seen in the works of Samuel Taylor Coleridge and Honoré de Balzac, among others. Immanuel Kant was an early critic of Swedenborg and wrote his "Dreams of a Spirit-Seer" (1766) as a scathing polemic against his thought.

MARK GRANQUIST

SWEDISH LITERATURE AND LANGUAGE. In 1500 the Swedish language had relatively low standing as a vehicle for literature. Latin was the language of the church and of scholarship and would be used as an academic language until the end of the eighteenth century. The Reformation was key to the development of Swedish as a literary language; in Sweden as elsewhere in Europe, it created a need for Scriptures in the vernacular. Foreign influence on Swedish language and literature continued to be strong, with German serving as an important source of loanwords in the 1500s and 1600s, after which French became more influential, especially among the aristocracy. In the sixteenth century, Swedish literary production was centered around the Reformation. During the following century, Sweden's military campaigns and emergence as a major European power provided a focus, with most literary activity in service to the state. And in the eighteenth century, Swedish literature became imbued with Enlightenment impulses imported from France and England.

In 1523 a revolt led by Gustav I Vasa led to the dissolution of the Kalmar Union, which had linked Denmark, Norway, and Sweden since 1397. Gustav I Vasa quickly consolidated his authority, appropriating church property and establishing a state-controlled Lutheran church. Out of these drastic changes came a milestone in Swedish literary history: the translation of the New Testament into Swedish in 1526. It is not known who was responsible for the translation, but Laurentius Andrae and Olaus Petri, both important advisers to Gustav I Vasa, were involved. The translation, based on Desiderius Erasmus's Latin translation of 1516 as well as Martin Luther's German translation of 1522, proved to be crucial for the development

of modern written Swedish. A translation of the entire Bible, popularly known as Gustav I Vasa's Bible, was published in 1541. Revised somewhat in 1618 and 1703, it remained the standard version in Swedish until 1917, and it is the most important Swedish literary work of the sixteenth century. The Reformation also fueled a short-lived burst of literary activity in the form of polemical writings in support of the new Lutheran church (exemplified by Olaus Petri) and hymns, often based on German models.

The brothers Johannes and Olaus Magnus wrote two significant humanistic historical works, both of which were originally written in Latin and later translated into Swedish. Both brothers lived in exile in Rome due to their continued allegiance to the Catholic Church. Johannes Magnus wrote *Historia de Omnibus Gothorum Sueonumque Regibus* (1554; History of all the Gothic and Swedish kings), while Olaus Magnus produced *Historia de Gentibus Septentrionalibus* (1555; History of the Nordic peoples). These complementary works were highly regarded in continental Europe, as well as by seventeenth-century Swedes, who sought evidence of past greatness in the legendary Goths. While most of the writing in schools and universities was in Latin, attempts were made to create dramatic works in Swedish. The most ambitious of these "school dramas" were the plays of the controversial historian Johannes Messenius (1579?–1636).

LITERATURE DURING THE "PERIOD OF GREAT POWER" (1630–1718)

The cultural climate in Sweden improved somewhat under Gustavus II Adolphus (ruled 1611–1632). The country's military successes during the Thirty Years' War (1618–1648) meant the acquisition of important manuscripts as well as renewed contact with European culture, belatedly bringing Renaissance ideas to Sweden. Gustavus II Adolphus died on the battlefield in Germany. His daughter Christina became queen in 1644 but ruled only ten years before abdicating the throne. During her reign the royal court became a center of intellectual activity.

The major literary figure of the time was Georg Stiernhielm (1598–1672), known as "the father of Swedish poetry." Stiernhielm composed works in Swedish during a relatively short period of his life;

like many others of the time, he wrote mainly in Latin and other languages. His major work is *Heracles* (1658), a long hexameter poem based on the mythological motif of the hero at a crossroads in life; it is primarily a dialogue between Fru Lusta and Fru Dygd (Madam Desire and Madam Duty), who represent opposing moral principles. Important figures of the generation after Stiernhielm include Samuel Columbus, author of *Odae Sueticae* (1674; Swedish odes), and Haquin Spegel, author of *Guds Hverk och Hwila* (1685; God's work and rest), both of which proclaim new ideals for Swedish poetry.

Most Swedish literature of the 1600s and early 1700s falls into the category of "occasional poetry"—poems produced for weddings, funerals, or other occasions. Two colorful individuals stand out among the authors of the thousands of poems printed in this genre. Lars Wivallius (1605–1669) was an adventurer and occasional author of songs, such as the well-known "Klagovisa över denna torra och kalla wåhr" (1642; Lament over this dry and cold spring); he composed many of his songs during various prison terms. Lars Johansson (pseudonym "Lucidor"; 1638–1674) was a bohemian figure, a prolific author of wedding and funeral poems, and one of the few who attempted to make a living, albeit meager, from his writing. Gunno (Eurelius) Dahlstierna's *Kunga Skald* (1697; Hymn to the king), written at the death of Charles XI, exemplifies the important genre of panegyric. A type of occasional poem cultivated at court, the panegyric could serve both as political propaganda and as homage to a royal benefactor. Dahlstierna was the foremost Swedish representative of the ornate baroque style then popular in Europe.

The first woman in Sweden to be a professional author, Sophia Elisabet Brenner, (1659–1730) also wrote Sweden's first feminist work, *Det Qwinliga Könetz rättmätige Förswar* (1693; The righteous defense of the female sex). Letter writing, diaries, and autobiographies were increasingly important as a means of expression, though they were seldom printed. A notable example of this type of writing is the autobiography of Agneta Horn, written about 1657.

Most books printed during this period were devotional, while the number of books intended solely for recreation remained small. From the early 1600s

Stockholm's printers were under the watchful eye of an inspector. Censorship of all printed materials was instituted in the 1660s, and the office of *ensor librorum* was established in 1686, hampering the spread of reading material for pleasure rather than for religious or other instruction. The first official hymnbook, compiled by Jesper Swedberg (father of Emmanuel Swedenborg), appeared in 1694 but was immediately withdrawn and revised for republication in 1695. Examples of hymnbooks from religious movements outside the state church include the Pietist hymnbook *Mose och Lambses wisor* (1717; Songs of Moses and the Lamb) and the Moravian *Sions sänger* (1743–1745; Songs of Zion).

ENLIGHTENMENT AND THE GUSTAVIAN ERA (1730–1809)

The death of Charles XII in 1718 signaled the end of the Swedish "Period of Great Power." The period from 1718 to 1772, marked by the change from an absolute monarchy to a parliamentary system, is often called the "Era of Freedom," and it coincides with an influx of Enlightenment ideas, especially from France and England, leading to a cultural renaissance in Sweden by the end of the century.

The use of a simpler, conversational style in written Swedish can be seen in the work of Olof von Dalin (1708–1763). His 1740 political allegory *Sagan om hästen* (The tale of the horse) became a Swedish classic. Previously, from 1732 to 1733, Dalin had published an influential newspaper, *Then swänska Argus* (The Swedish Argus), modeled on Joseph Addison and Richard Steele's *The Tatler* and *The Spectator*. In the pages of his newspaper, Dalin criticized foreign influence on the Swedish language, as had Stiernhielm in the previous century. Most novels in Sweden at this time were foreign imports, but a notable exception was the high-spirited *Min son på gallejan eller en ostindisk resa* (My son on the galley, or An East Indian journey), by a ship's chaplain named Jacob Wallenberg (1746–1778).

In the spirit of the Enlightenment, various learned societies were formed for the advancement of science and the arts. Vitterhetsakademien (Academy of Letters), founded by Lovisa Ulrika in 1753, was a precursor to the Swedish Academy established by her son, Gustav III, in 1786. Literary societies

were organized on Masonic models. Tankebyggargården (Thought Builders), established in 1753, included important poets such as Hedvig Charlotta Nordenflycht (1718–1763), Gustaf Fredrik Gyllenborg (1731–1808), and Gustav Philip Creutz (1731–1785), whose works appeared in the society's publications. The naturalist Carl Linnaeus (1707–1778) wrote his scientific works in Latin, but his accounts of exploratory journeys to various Swedish provinces were written in Swedish. His students continued his work, publishing reports of their far-flung travels, which helped establish the travel account as a popular literary genre in Sweden.

Gustav III was keenly interested in theater and served as a patron of the arts. Many of the most notable poets of the era collaborated with him on works for the theater and opera. Among these was the poet and critic Johan Henrik Kellgren (1751–1795), who also edited the newspaper *Stockholms Posten* for several years. A frequent, though anonymous, contributor to *Stockholms Posten* was Anna Maria Lenngren (1754–1817), whose poems show a keen eye and a satiric edge. Sweden's most popular poet of all time, Carl Michael Bellman (1740–1795), took the popular practice of musical parody (setting words to familiar melodies) to unparalleled heights in the collections *Fredmans epistlar* (1790; Fredman's epistles; with a famous preface by Kellgren) and *Fredmans sånger* (1791; Fredman's songs).

The era of Enlightenment came to a definitive close in 1809. In politics, its end was marked by Sweden's defeat in the Napoleonic Wars and the subsequent loss of Finland to Russia; in literature, it was heralded by the appearance of the Romantic movement.

PAUL NORLÉN

SWIFT, JONATHAN (1667–1745), English satirist, poet, and clergyman. Swift was born in Dublin to English parents, Jonathan and Abigale Erick (or Herrick) Swift. His father had died before Swift's birth, and he was raised by his father's family from the age of three when his mother returned to Leicestershire in England. He attended Kilkenny Grammar School, where William Congreve, the future dramatist, was a fellow pupil, and went on to Trinity College, Dublin, where, because of his infractions of discipline, his degree was conferred on him only by "special grace" in 1686.

Swift went to England in 1689 and became a secretary to the retired statesman Sir William Temple at Moor Park in Surrey. It was here that he met Esther Johnson ("Stella"), who was nine at the time, and became her tutor. They were lifelong friends, and she was the "Stella" of his *Journal to Stella*, written 1710–1713. (Some believe that they were secretly married in 1716, but the evidence is inconclusive.) In 1689, Swift suffered an attack of Ménière's disease, which affects the inner ear and causes vertigo and nausea; the affliction was to plague him for the rest of his life. Swift had taken an M.A. at Oxford, which provided him with the necessary qualification for ordination, and after leaving Temple's service in 1694, he went to Ireland, where he was ordained in the Anglican division of the Irish church and received the small prebend of Kilroot, near Belfast. In 1696 he returned to Moor Park, where he edited Temple's letters and wrote his first important prose works, *The Tale of a Tub* and *The Battle of the Books*, both of which were not published until 1704. The former is an allegorical satire attacking corruption in the church and scholarly pedantry, the latter a mock-heroic satire ridiculing the controversy about the ancients and the moderns that was raging at the time.

After Temple's death in 1699 left him homeless and without a patron, Swift went to Ireland where he received a prebend in St. Patrick's, Dublin, and the living of Laracor. On frequent visits to London he met Joseph Addison, Richard Steele, and Alexander Pope and associated with various Whig writers. During this time he wrote several defenses of Christianity (such as *An Argument against Abolishing Christianity*, 1708), vicious lampoons of public figures, and satirical essays under the pseudonym of "Isaac Bickerstaff" (1708–1709). In 1710 Swift traveled to London to petition against a tax crippling the Irish clergy and remained there for three years. Disenchanted with Whig policies, especially the party's association with Dissenters and what he regarded as its animosity toward the Anglican Church, he became an advocate for Tory politics and edited the party's newspaper, *The Examiner*, in 1710–1711. He also contributed to *The Tatler*, *The Spectator*, and *The Intelligencer* and wrote *The Conduct of the Allies* (1711), a treatise that outlined the Tory plan for ending the War of the Spanish Succession. Swift participated in the intellectual debates and lampoons of the Scriblerus Club, formed with Alexander Pope, John Arbuthnot, John Gay, Thomas Parnell, and Robert Harley, earl of Oxford.

Swift had alienated the establishment in England, and it appears that the influence of his friends in high places was not sufficient to secure his advancement. Bitterly disappointed, he returned to Ireland. He had been awarded a Doctor of Divinity in 1701 and was appointed dean of St. Patrick's Cathedral in Dublin in 1713; except for brief absences, he remained in Ireland for the rest of his life. Biographical detail between 1715 and 1720 is sketchy. In 1708 he had met Esther Vanhomrigh ("Vanessa"), who had fallen in love with him; she followed him to Ireland, where she was disappointed by Swift's lack of response to her feelings for him. His own feelings are reflected in *Cadenus and Vanessa*, a pastoral and comic self-reflection that he wrote around 1713, though it was not published until 1726, three years after Vanessa's death.

The Whigs had returned to power in 1714, and Swift began writing attacks on their unfair policies toward Ireland. His patriotism emerged with the enormously popular *A Proposal for the Universal Use of Irish Manufacture* (1720), a lampoon that

Jonathan Swift. Title page to the first edition of *Gulliver's Travels*, 1726. ©BETTMANN/CORBIS

attacked the England treatment of the Irish poor. Along with *The Drapier Letters* (1724), an exposé of a patent to introduce a new copper coin that would have devalued Ireland's currency, it established Swift as a national hero.

In 1726 Swift spent the summer with Alexander Pope at Twickenham and published his most popular work, *Gulliver's Travels*. An anti-Whig satire, a dazzling adventure story, and a narrative that per-

ceives humanity from four different viewpoints through Gulliver's voyages to Lilliput, Brobdingnag, Laputa, and Houyhnhnmland, the work has profound political implications. Swift's financial security was assured by this time, but ill health and mental problems manifested themselves in the late 1720s, especially after the death of Stella in 1728. In 1729, his bitter and ironic *A Modest Proposal* appeared; it is a parody and an indictment of the amoral economic utilitarianism of the Whigs. The 1730s also saw Swift writing elegiac poems to Stella, and scatological poems such as "Lady's Dressing Room." Between 1730 and 1735, he published *Rhapsody of Poetry* and *Verses on His Own Death*. He also continued to correspond with friends in London. Bookseller George Faulkner published a complete edition of Swift's works, including a corrected edition of *Gulliver's Travels*, in 1735. In the late 1730s, Swift wrote *A History of the Peace of Utrecht* and *Directions to Servants*, both of which were published posthumously.

Swift's great popularity with Dublin's population was secured through his preaching and his writings on the unfair treatment of Ireland, but especially through his generous contributions to charity; at his death he left £11,000 to found a hospital for the mentally ill. His health deteriorated seriously and that, plus memory loss, affected his writing. Beginning in 1742, he suffered from dementia; he died 19 October 1745. He was buried next to Stella at St. Patrick's and was universally mourned by Dublin.

MAX FINCHER

SWITZERLAND. The region and the state known as Switzerland took shape during the late medieval and early modern periods. Before 1300, the country north of the central Alps simply lay within the Swabian and Burgundian parts of the Holy Roman Empire. By 1789, in contrast, the Swiss Confederation possessed a distinct national identity and enjoyed sovereignty under international law. The confederation included thirteen self-governing *Orte* or cantons, several subsidiary but autonomous allies, and various subject territories. Geography played a considerable role in shaping Switzerland over these centuries. The region's central location, spanning western Europe's major language boundaries and containing mountain passes used by traders and travelers, ensured that the Swiss experienced all of Europe's major political and cultural movements. Yet the difficult terrain of the Alps and the area's relative poverty also left Switzerland marginal to Europe's great centers of power and wealth.

Modern Switzerland is known for being multilingual, democratic, neutral, and wealthy. The early modern confederation acquired these characteristics only slowly. All but one of the ruling cantons were German-speaking, although they did have French- and Italian-speaking subjects. Voting by male citizens played an important role in some cantons, but political control mostly rested with a few families, while the subject territories and many areas outside city walls had limited political rights. Especially be-

fore 1550, the confederation was also warlike, playing a major role in the Burgundian Wars of the 1470s and the Italian Wars after 1494. Finally, most early modern Swiss were poor, and even the richest had only modest fortunes by European standards.

POLITICS

Three related processes shaped the Swiss Confederation during the late Middle Ages: the growth of overlapping alliances among the cantons and their associates, the consolidation of internal regimes that controlled well-defined territories, and the development of shared responsibilities and institutions. Switzerland's development also depended on changing relations with the Holy Roman Empire, the Habsburg family of dynasts and emperors, and powerful neighbors to the west and south. The local economy rested on agriculture (including cattle and dairy products for export), transit, and mercenary services; by the eighteenth century, proto-industrial production of textiles and other goods provided further sources of wealth.

The confederation acquired its thirteen full members in two major waves, one before 1360 and the second after 1480. The first took place in an era of weak imperial authority and constant feuding among the region's nobility. This spurred communities to form alliances that could defend the public peace and increase local autonomy. The earliest known Swiss alliance linked Uri, Schwyz, and Unterwalden in 1291; though unusual in having only rural members, it resembled similar leagues across the region. Further alliances with Lucerne in the 1330s and with Zurich, Zug, Glarus, and Bern in the 1350s produced a substantial confederation of rural and urban communities that proved its significance by defeating the key regional dynasts, the Habsburgs, in the Sempach war of 1386.

Internal consolidation in each canton accompanied the growth of the Swiss system. In the rural cantons, the political base broadened as local nobles yielded power to communal assemblies after the 1360s. In Zurich and Basel, guild regimes took power; various accommodations widened political participation in other towns as well. Across the countryside during the 1400s, peasant communes became better organized and increased their economic and judicial authority. Both the urban and rural cantons sought to expand their influence,

though they used very different strategies. Towns like Zurich and Bern became lords over the countryside outside their walls through purchase, mortgage, or conquest. The rural cantons, above all Schwyz, allied themselves with regional peasant movements against lords, notably in Appenzell, thus gaining allies for further expansion. The two methods came into conflict in the 1440s, when the confederation nearly collapsed during a bitter territorial war between Zurich and Schwyz.

The growth of shared institutions helped mute such rivalries. In 1415 and 1460, the Swiss seized the Aargau and the Thurgau from the Habsburgs. Shared rule over these territories led to intensified interaction among the cantons, as did military efforts to expand south of the Alpine passes. Regular meetings of a diet, the *Tagsatzung*, began after the 1430s. Although the diet had little power to enforce its decisions, it did provide a forum for negotiation as the confederation faced new challenges. The alliance's growing power also attracted five new cantons in the late 1400s (Schaffhausen, Fribourg, Solothurn, Basel, and Appenzell) as well as a series of "associates" ranging from rural valleys to the Abbey of St. Gallen. Tensions between the urban and rural cantons led to a 1481 agreement, mediated by Switzerland's later patron saint, Niklaus von der Flüe (1417–1487), that guaranteed each canton's internal autonomy and provided for mutual support in case of social turmoil.

In the late 1400s, a national mythology of liberty and community emerged in Switzerland, centered on the figure of William Tell. In songs, chronicles, popular dramas, and stained-glass decorations the Swiss celebrated how they had expelled their corrupt lords during the 1300s. Often bitterly critical of aristocracy, the liberation sagas praised peasant liberty and virtues and expressed loyalty to the empire. No historical evidence supports Tell's existence, nor did Swiss calls for peasant liberty lead them to abolish serfdom among their own subjects. Nevertheless, this historical mythology reflected a growing awareness that the confederation differed fundamentally from the princely states taking shape around it.

Between 1460 and 1513, Swiss troops played an important role on Europe's battlefields. Unbeatable during the Burgundian Wars (1474–

Switzerland. Helvetia, the Latin name for Switzerland, is derived from the Celtic Helvetii who inhabited the area in ancient times. This often-reproduced map by Aegidius Tschudi, originally compiled in the mid-1500s, is from the *Geographisch Handbuch* of Mathias Quad, published in Cologne in 1600. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

1477), they were in high demand as mercenaries during the Italian Wars (1494–1559). In the Swabian War of 1499, a string of Swiss military victories ended Habsburg ambitions south of the Rhine and brought outlying regions such as Graubünden and the Valais closer to the confederation. The Peace of Basel in 1501 also confirmed that the Swiss were exempt from most imperial laws and courts. Military and political developments after 1500 soon reduced Switzerland’s international importance, however, even as long-term treaties with France and the Habsburgs stabilized Switzerland’s place in the international system. After 1530, moreover, the Swiss split into Catholic and Reformed parties that threatened to tear the confederation apart. From the 1520s until 1798, therefore, Swiss politics were dominated by internal social and religious conflict, while the confederation withdrew

from foreign entanglements. Although tempted to help coreligionists on both sides, the cantons managed to stay out of the Thirty Years’ War, unlike their allies in Graubünden. The Peace of Westphalia in 1648 formally recognized the cantons’ sovereignty within the Holy Roman Empire, and neutrality became their official policy during the long wars that followed—easier to maintain because of the declining importance of Swiss mercenaries. The pre-modern confederation was finally conquered by the French in 1798.

Switzerland became an early center of the Protestant and the Radical Reformation after Huldrych Zwingli (1484–1531) began preaching in Zurich in 1519. Zwingli’s theology rested on evangelical ideas similar to Martin Luther’s, but he also stressed the reform of Christian society along communal lines, in keeping with the region’s values. In the

confederation, he called for an end to mercenary service and rejection of the pensions that foreign rulers paid Swiss politicians. Zwingli quickly gained adherents in many Swiss and south German towns; his ideas spread to Bern, Basel, and Schaffhausen during the 1520s, and gained support in many allied towns and rural areas. Some of Zwingli's associates sought even deeper changes in church and society, laying the groundwork for the early Anabaptist movement. However, the rural cantons in central Switzerland, together with Lucerne, opposed the Reformation. The population there valued the old ceremonies and had confidence in their locally appointed clergy, while their magistrates resented Zwingli's attacks on a main source of their income, foreign pensions.

Zwingli's efforts to evangelize the subject territories provoked rising tensions within the confederation. Civil war was delayed by a 1529 religious peace, but finally broke out in 1531. Lukewarm support from its allies led to Zurich's defeat at the Battle of Kappel, where Zwingli lost his life. The Second Religious Peace of Kappel in 1531 created a lasting framework for religious coexistence. The thirteen ruling cantons and their self-governing allies could choose between Catholic and Reformed adherence; in the subject territories, existing Reformed congregations were tolerated although Catholic worship was often restored. Ultimately, four cantons and two half-cantons became Reformed, while seven and two halves remained Catholic. The close coexistence between two faiths that followed produced endless wrangling that sometimes threatened the confederation's survival. In 1656 and 1712, local conflicts led to significant religious wars. The first preserved the status quo of 1531, but a Reformed victory in the second increased Zurich and Bern's influence.

Religious struggles coincided with growing social tensions in Switzerland. In both cities and countryside, a minority of families increasingly monopolized wealth and political participation. Oligarchy was most visible in the cities, where ever fewer families qualified to sit in the city councils. City authorities also eroded the autonomy of peasant communes under their lordship, despite occasionally violent resistance. In the countryside, high citizenship fees barred many residents from voting or using communal economic resources. In 1653, peasants

around Lucerne and Bern rose up against urban domination, calling for a new "peasant's league" to combat their rulers. The urban elites in Reformed Zurich and Bern and Catholic Lucerne cooperated fully in suppressing the peasant movement.

CULTURAL MOVEMENTS

Swiss thinkers absorbed the main intellectual movements of early modern Europe. Renaissance humanism appeared late in the 1400s. Authors such as Albrecht von Bonstetten (c. 1442–1504) and Felix Hemmerli (c. 1388–1458) described the confederation's political system by mixing humanist-style historiography with the region's rich chronicle tradition, while later Swiss humanists such as the two Glarus scholars Heinrich Loriti ("Glareanus," 1484–1563) and Aegidius Tschudi (1505–1572) wrote polished Latin treatises based on classical sources. Meanwhile, the confluence of Basel's thriving printing industry, its university, and the city's trade links made it the only canton where humanism really flourished, as illustrated by Erasmus of Rotterdam's choice to live there.

The Reformation disrupted the confederation politically and forced thinkers and artists to choose between the faiths. In St. Gallen, the well-known humanist and physician Joachim Watt ("Vadianus," 1484–1551) returned home to lead the local Reformation, while the painter and playwright Niklaus Manuel (c. 1484–1530) of Bern dedicated his work to the cause. In Basel, the Reformation divided the humanists after the city turned Protestant in 1528. Both Erasmus and Glareanus chose to leave, but the city's intellectual life later benefited from learned Protestant refugees such as Sebastian Castellio (1515–1563). Religious questions fully occupied Swiss intellectuals by the mid-1500s as Heinrich Bullinger in Zurich and John Calvin in Geneva struggled to define Reformed Protestant doctrine. Their efforts shaped the Second Helvetic Confession of 1566, and helped make Switzerland an important center for the Reformed church. English, Polish, and Hungarian scholars studied there, often in exile, while Italian dissidents escaped persecution by fleeing through Switzerland.

Increasingly rigid social and religious boundaries after 1600 stifled cultural innovation until the early 1700s, when Swiss thinkers began receiving Enlightenment ideas. Zurich authors such as

Albrecht Haller (1708–1777) and Johann Jakob Bodmer (1698–1783) participated actively in the literary debates of the German Enlightenment; Geneva social philosophers such as Jean-Jacques Burlamaqui (1694–1748) and, above all, Jean-Jacques Rousseau (1712–1778) made major contributions to the French Enlightenment. The presses of French Switzerland became a major source for books banned by French censors, and French intellectuals such as Voltaire found refuge in the Vaud when threatened by the French authorities. Within Switzerland, Enlightenment ideas eventually undermined the barriers between Catholic and Reformed elites through the formation of the Helvetic Society, a forum for intellectual discussion that met annually in Bad Schinznach after 1761.

SWITZERLAND AND EUROPE

Switzerland's existence puzzled many early modern Europeans. Jean Bodin condemned it as anarchic and disorderly, while Niccolò Machiavelli saw it as a model for free and armed city-states. After Swiss troops killed and despoiled Charles the Bold of Burgundy in 1477, aristocratic thinkers encouraged criticism of the “cow-Swiss” who dared to violate the natural order of lords and subjects. In the end, however, Switzerland was less important as a model, positive or negative, than as a crossroads. Neutral, divided by religion, and fragmented politically, the Swiss Confederation offered a haven to many refugees and dissidents, most notably the founders of the Reformed movement. Even if little of what passed through seemed to rub off on the Swiss, the confederation still went through changes parallel to

the ones that transformed all of early modern Europe.

USING THE ENCYCLOPEDIA

Tables of contents. Each volume contains a table of contents for the entire *Encyclopedia*. Volume 1 has a single listing of all volumes' contents. Volumes 2 through 6 contain "Contents of This Volume" followed by "Contents of Other Volumes."

Maps of Europe. The front of each volume contains a set of maps showing Europe's political divisions at six important stages from 1453 to 1795.

Alphabetical arrangement. Entries are arranged in alphabetical order. Biographical articles are generally listed by the subject's last name (with some exceptions, e.g., Leonardo da Vinci).

Royalty and foreign names. In most cases, the names of rulers of French, German, and Spanish rulers have been anglicized. Thus, Francis, not François; Charles, not Carlos. Monarchs of the same name are listed first by their country, and then numerically. Thus, Henry VII and Henry VIII of England precede Henry II of France.

Measurements appear in the English system according to United States usage, though they are often followed by metric equivalents in parentheses. Following are approximate metric equivalents for the most common units:

| | |
|-----------------|-----------------------|
| 1 foot = | 30 centimeters |
| 1 mile = | 1.6 kilometers |
| 1 acre = | 0.4 hectares |
| 1 square mile = | 2.6 square kilometers |
| 1 pound = | 0.45 kilograms |
| 1 gallon = | 3.8 liters |

Cross-references. At the end of each article is a list of related articles for further study. Readers may also consult the table of contents and the index for titles and keywords of interest.

Bibliography. Each article contains a list of sources for further reading, usually divided into Primary Sources and Secondary Sources.

Systematic outline of contents. After the last article in volume 6 is an outline that provides a general overview of the conceptual scheme of the *Encyclopedia*, listing the title of each entry.

Directory of contributors. Following the systematic outline of contents is a listing, in alphabetical order, of all contributors to the *Encyclopedia*, with affiliation and the titles of his or her article(s).

Index. Volume 6 concludes with a comprehensive, alphabetically arranged index covering all articles, as well as prominent figures, geographical names, events, institutions, publications, works of art, and all major concepts that are discussed in volumes 1 through 6.

MAPS OF EUROPE, 1453 TO 1795

The maps on the pages that follow show political boundaries within Europe at six important stages in the roughly three hundred and fifty years covered by this *Encyclopedia*: 1453, 1520, 1648, 1715, 1763, and 1795.

1453. In the years around 1450, Europe settled into relative political stability, following the crises of the late Middle Ages. France and England concluded the Hundred Years' War in 1453; the Ottoman Turks conquered Constantinople in the same year and established it as the capital of their empire; and in 1454 the Treaty of Lodi normalized relations among the principal Italian states, establishing a peaceful balance of power among Venice, Florence, the duchy of Milan, the Papal States, and the Kingdom of Naples.

1520. In 1520, the Habsburg prince Charles V was elected Holy Roman emperor, uniting in his person lordship over central Europe, Spain, the Low Countries, parts of Italy, and the newly conquered Spanish territories in the Americas. For the next century, this overwhelming accumulation of territories in the hands of a single dynasty would remain the most important fact in European international politics. But in 1520 Habsburg power already faced one of its most troublesome challenges: Martin Luther's Reformation, first attracting widespread notice in 1517, would repeatedly disrupt Habsburg efforts to unify their territories.

1648. The 1648 Peace of Westphalia ended the Thirty Years' War, one of the most destructive wars in European history. The peace treaty formally acknowledged the independence of the Dutch Republic and the Swiss Confederation, and it established the practical autonomy of the German principalities—including the right to establish their own religious policies. Conversely, the Holy Roman Empire lost much of its direct power; although its institutions continued to play some role in German affairs through the eighteenth century, the emperors' power now rested overwhelmingly on the Habsburg domain lands in Austria, Bohemia, and eastern Europe.

1715. The Peace of Utrecht (1713) ended the War of the Spanish Succession, the last and most destructive of the wars of the French king Louis XIV. The treaty ended Spain's control over present-day Belgium and over parts of Italy, and it marked the end of French hegemony within Europe. In the eighteenth century, France would be only one of five leading powers.

1763. The 1763 Treaty of Paris ended the Seven Years' War, a war that involved all the major European powers and included significant campaigns in North America and southern Asia, as well as in Europe. The war made clear the arrival of Prussia as a great power, at least the equal of Austria in central and eastern Europe.

1795. By 1795, French armies had repelled an attempted invasion by Prussia, Austria, and England, and France had begun annexing territories in Belgium and western Germany. These military successes ensured the continuation of the French Revolution, but they also meant that European warfare would continue until 1815, when the modern borders of France were largely established. Warfare with France did not prevent the other European powers from conducting business as usual elsewhere: with agreements in 1793 and 1795, Prussia, Austria, and Russia completed their absorption of Poland.

TASSO, TORQUATO (1544–1595), Italian poet. Tasso was born in Sorrento, where his father Bernardo was serving as secretary to the prince of Salerno. Like many courtiers, Bernardo had a peripatetic career, and Torquato's childhood included stays in Naples, Rome, Bergamo, and Pesaro. In 1560 Tasso entered the University of Padua to study law, but soon dedicated himself to philosophy and literary pursuits; two years later he transferred to the University of Bologna, but left when he was held responsible for a lampoon identifying homosexual students and faculty. Tasso returned to Padua in 1564 and entered the service of Cardinal Luigi d'Este, brother to Alfonso II, Duke of Ferrara. In 1572, the poet entered the duke's service and took up residence at the d'Este court.

Tasso's first years in Ferrara were happy and productive. His pastoral play *Aminta* was performed at court to great acclaim in 1573, and by 1575 he had largely completed the epic poem on the First Crusade on which he had been working for over a decade. The poem was eagerly awaited, not least by the duke, but Tasso had doubts about its acceptability on both literary and religious grounds, and sent drafts to several prominent intellectuals, soliciting their suggestions. Hoping for reassurance, Tasso instead received detailed criticisms, which exacerbated his doubts. He became bogged down in revising the poem, and during this period his mental health deteriorated sharply. He grew increasingly paranoid and irascible and was tormented by religious anxieties. In May 1577 Tasso turned himself

in to the Ferrarese Inquisition for spiritual examination; in June he attempted to stab a servant whom he suspected of spying on him. After this incident, Alfonso imprisoned him within the ducal palace; Tasso escaped and spent the next two years traveling around Italy. In 1579 he returned to Ferrara, but after he directed an abusive outburst at the duke, Alfonso had him locked up in the hospital of Sant'Anna, where he was confined for the next seven years. During Tasso's confinement, a pirated, incomplete text of his epic was printed. Tasso subsequently oversaw the publication of a corrected text, published as *Gerusalemme liberata* (Jerusalem delivered) in 1580 and in many editions thereafter. The poem was an immediate pan-European success, although Tasso himself was never satisfied with the *Liberata* and continued to revise his epic until 1593, when he published a substantially new poem entitled *Gerusalemme conquistata* (Jerusalem conquered). The *Conquistata* has never met with the *Liberata's* success. After his release from Sant'Anna in 1586, Tasso spent his final decade in the courts of Mantua, Florence, Naples, and Rome, never remaining long in one place. He died in the monastery of Sant'Onofrio in Rome shortly before he was to be crowned poet laureate.

Tasso wrote prolifically throughout his life. His works include an early chivalric epic, *Rinaldo*; a pastoral drama, *Aminta*; a philosophical poem, *Il Mondo Creato*; two treatises on poetics, twenty-eight dialogues, and hundreds of lyrics; in addition, over a thousand of his letters survive. It is the *Liberata*, however, that secures Tasso's reputation as

Torquato Tasso. Title page from *Gerusalemme liberata*, 1590, with portrait of Tasso.

the greatest Italian poet of the latter sixteenth century. In his poem Tasso strove to reconcile Virgilian epic, chivalric romance, and Counter-Reformation Catholicism; the *Liberata* achieves an uneasy but remarkably successful balance of these three elements. From the moment the *Liberata* appeared, it has been compared to the other great sixteenth-century Italian epic, Ludovico Ariosto's *Orlando furioso* (1516). Since Tasso admired and emulated Ariosto's poem, it is misleading to view them as polar opposites, but they do offer different pleasures. Tasso lacks Ariosto's sense of humor and delight in intricate, multiplotted storytelling; but Tasso reaches greater heights of lyricism, and draws his characters with greater psychological subtlety. Whether one prefers Ariosto or Tasso, the *Liberata* counts among the handful of Renaissance epics of lasting impact. It served as an important model for the two major English Renaissance epics, Edmund

Spenser's *The Faerie Queene* (1590, 1596) and John Milton's *Paradise Lost* (1667).

Apart from his literary influence, Tasso's life became the stuff of romantic legend. A play on "Tasso's Melancholy" was performed in London in the 1590s; Goethe and Byron wrote poetic versions of his story, both attributing the poet's mental disturbance to a hopeless love for Duke Alfonso's sister Eleonora. (Tasso's only definitively attested love affairs were with men.) Even stripped of romantic myth, however, Tasso's career makes a poignant story: that of an immensely talented poet who suffered personally and artistically from the insecurities of a life of courtly dependence, and from the chilly cultural climate of the Italian Counter-Reformation.

TOBIAS GREGORY

TAXATION. Early modern Europe was home to a bewildering array of taxes. The church collected tithes, lords exacted feudal dues, towns imposed

customs duties, and rulers levied state taxes. Although there were multiple channels by which fiscal resources were extracted and redistributed throughout society, this essay will focus on state taxation, which expanded most dramatically in this period. To meet growing costs of war and debt, rulers across Europe raised taxation to unprecedented levels, forming what historians call “tax states.” The tax state was not wholly powered by a modern centralized bureaucracy, but it had a profound effect on early modern politics and society. On the one hand, it reinforced social inequality, as rulers created fiscal alliances with elites and levied taxes on the common people. On the other hand, the tax state shaped early modern politics, as revenue-hungry sovereigns clashed with representative institutions and provoked popular tax rebellions. Even as popular tax revolts subsided in the eighteenth century, ideas linking taxation, citizenship, and political representation fueled revolution in the British colonies and in France.

THE RISE OF THE TAX STATE

Taxation was essential to the development of the modern state. In the Middle Ages, kings mainly “lived of their own,” that is, supported themselves with revenues from the royal domain, which included income from crown lands and various feudal and regalian dues. Over the early modern period, however, European monarchies expanded beyond the medieval domain to levy taxes. Tax revenues mounted steadily across Europe in the sixteenth century, even taking high population growth and inflation into account, and soared to new heights in the seventeenth and eighteenth centuries. Not all European countries followed this trend; Brandenburg-Prussia relied heavily on domain revenue as late as the eighteenth century. But the overall pattern is clear: the early modern tax state eclipsed the medieval domain state and considerably expanded the financial resources of rulers.

The tax state was a child of war. In this period of “military revolution,” as armies grew spectacularly in size and required increasingly intensive training and elaborate supply networks, the costs of war skyrocketed. French military expenses increased five to eight times during the seventeenth century; Spanish war expenditure peaked in the 1650s; the English budget increased, in real terms, at least six-

teen-fold between the late sixteenth and early eighteenth centuries; expenditure in Denmark and the United Provinces also accelerated dramatically. Consequently, rulers across Europe scrambled to find revenue by increasing “ordinary” taxes and creating new “extraordinary” ones that, with time, would be deemed ordinary as well. Monarchs became keenly aware of the fact that projecting power abroad depended on financial strength at home.

For ambitious sovereigns, however, there seemed never to be enough tax revenue available to finance military campaigns. Thus, in the city-states of Italy and the Netherlands, and then in unified monarchies, rulers began to borrow and accumulate debt. This recourse to credit, in turn, contributed to the growth of taxation, because short-term war debt was often consolidated into long-term debt serviced with tax revenue. If, in the sixteenth century, taxes were used principally to pay for burgeoning state administrations as well as war, in the seventeenth and eighteenth centuries, the vast majority of tax revenue was spent on military campaigns and the increasingly large debts they generated. As a result, belligerent states in the seventeenth and eighteenth centuries confronted a spiral of war, debt, and taxation that, as we shall see, profoundly shaped the political life of the age.

Although the fiscal weight of the state grew rapidly in the early modern period, it should not be inferred that states developed modern centralized bureaucracies of the kind associated with “absolutism.” Today, historians stress the limits of the absolute state and emphasize how powerful monarchs like Louis XIV (ruled 1643–1715) had to negotiate with elites and regional and local institutions.

In practice, even “absolute” sovereigns could not tax at will. Although there was little theoretical recognition of the citizen’s right to consent to taxation before the eighteenth century, rulers regularly sought the consent and cooperation of corporate institutions to reduce resistance to the tax levy. In addition to dealing with law courts, church organizations, and municipal governments, monarchs consulted with a host of representative bodies that flourished in the early modern period. The Spanish monarchy negotiated with the Castilian Cortes; the Holy Roman emperor dealt with the Imperial Diet

Taxation. A 1468 painting by Sano di Pietro shows two men paying taxes in Siena. ©ARCHIVO ICONOGRAFICO, S.A./CORBIS

(just as territorial princes in the German lands worked with provincial diets); French kings summoned the Estates-General and provincial Estates; and the English crown consulted Parliament. Representative bodies haggled over the weight and form of taxes but usually found it in their interest to compromise with monarchs, who rewarded their acquiescence with fiscal and administrative privileges. Representative institutions were also willing to compromise at times, because the elite social groups they represented (clergy, nobility, urban notables) were heavily invested in state debt and did not want to interfere with taxes that funded their interest payments. In this respect, there was an inherent tension between the financial interests of ordinary taxpayers, who wished to minimize the tax burden, and those of wealthier state creditors, who feared that poor tax yields might jeopardize returns on their investments.

Negotiations between rulers and corporate bodies did not, however, always run smoothly. In seventeenth-century England, fiscal strife combined with religious conflict to produce a constitutional crisis and civil war. When the early Stuart kings sought to levy new subsidies, forced loans, and ship

money, Parliament reacted by asserting its right to consent to taxation. In 1640, after Charles I refused to work with Parliament, the crisis turned into a bloody civil war in which the king was executed. Ironically, the English Civil War and the Glorious Revolution of 1688, both of which secured for Parliament a central role in the English constitution, ultimately made it easier for the English state to raise taxes. Eighteenth-century England and the Netherlands experienced the highest rates of taxation in Europe, owing in large part to the sense of legitimacy that representative institutions in both countries bestowed on tax levies.

Elsewhere in Europe, the relationship between monarchs and corporate bodies evolved differently. In the Fronde of 1648, the Parlement of Paris challenged the fiscal policies of the crown, but it was not nearly as successful as the English Parliament. The French monarchy not only quelled the Fronde, but stopped calling the Estates-General after 1614–1615 and replaced many provincial Estates with more easily controlled royal officers. But even in “absolutist” France the monarchy did not completely prevail, for the surviving provincial Estates (in Languedoc and Brittany, for instance) continued to drive hard bargains with kings and to administer taxes in their regions down to 1789. Yet another scenario unfolded in Castile, the heart of the Spanish empire, where the once instrumental Cortes faded from power in the seventeenth century as the Spanish monarchy grew weaker.

Just as we should be careful not to infer that the rise of the European tax state automatically reflected the development of absolutist institutions, we should not assume that rising tax levels were the result of increasingly efficient and centralized administrations. On the contrary, early modern tax systems were extremely fragmented. Many rulers relied on tax farming, a practice whereby taxes were franchised to semiprivate financiers who paid fixed sums of money in return for the right to collect taxes. These tax farmers were allowed to pocket the difference between the amounts of revenue they collected and the lump sums they had advanced. Not all taxes were farmed. Rulers also entrusted the task of levying certain taxes to official state administrators, but even in this case administrators could not collect taxes without the active participation of villages and local heads of household. Consider the

example of the *taille*, the main direct tax in France from the fifteenth century to the French Revolution. Every year, the global sum of the *taille* was divided among the kingdom's parishes. Each parish was assigned a lump sum of money and was held responsible for collecting and forwarding that sum to tax receivers. Royal financial officials supervised the levy, pressuring recalcitrant villages and adjudicating disputes, but the crucial tasks of drawing up tax rolls and collecting revenue were left to parish assessors and collectors appointed by local village assemblies. Without the participation of thousands of village assemblies across France, even the mighty French crown would not have been able to levy the *taille*.

FORMS AND SOCIAL INCIDENCE OF TAXATION

The burden of the tax state was not shouldered equally by all social groups. Although it is difficult to determine with precision who paid taxes in early modern Europe, it is safe to say that the two main types of taxes, direct and indirect, were generally regressive. In both cases, common people—the peasants and artisans who made up the majority of the population—paid higher proportions of their income than did wealthy elites.

Indirect taxes, which many monarchs and town magistrates preferred because they were less intrusive than direct taxes, predominated in urban and commercial areas of Europe such as England, Italy, and the Netherlands. Taking the form of tolls, excise taxes on consumer goods, and taxes on salt, tobacco, and other goods sold by state monopolies, indirect taxes fell on consumers in a highly regressive fashion. Levied on such staples as grain, meat, beer, wine, and salt, indirect taxes imposed a proportionally heavy burden on urban workers who had to purchase basic commodities with relatively little disposable income. In the towns of Castile, where excise taxes on wine and oil could double the price of such goods, wage earners suffered a reduction of purchasing power on the order of 30–50 percent. In Paris, whose residents enjoyed privileges with respect to direct taxes, indirect taxation was rather heavy. It has been calculated that in 1789, the average Parisian head of household needed fifty-six days to work off his taxes. During periods of economic growth, indirect taxes were easier to bear,

but in bad times, when wages stagnated or unemployment rose, they could become quite oppressive.

Levied on landed income and property, we might expect direct taxes to have been less regressive. But this was not usually the case, because the wealthy and powerful often held the privilege of exemption. Consider once again the example of the principal direct tax in France, the *taille*. The most remarkable feature of the *taille* was the number of people who did not have to pay it. In much of France, clergymen, nobles, bourgeois, venal officeholders, royal administrators, and residents of certain provinces and towns enjoyed at least partial exemption from the *taille*. This meant that the weight of the tax fell overwhelmingly on the peasantry. It has been estimated that in the late seventeenth century the *taille* and other direct taxes absorbed on average one-fifth of the peasantry's gross production. Wealthier peasants appear to have carried most of this burden, but the poorest peasants had a difficult time scraping together enough cash to pay even the tiniest assessments. In a hierarchical society riddled with privilege, the *taille* was so closely associated with low status that Cardinal Richelieu (1585–1642) believed it unwise to relieve the common people of this burden because “they would lose the mark of their subjection and consequently the awareness of their station.” Similar sentiment existed in Sweden, the German lands, and Castile, where the payment of direct taxes was also a sign of common birth.

If regressive taxation reflected the steep social hierarchy of the early modern period, so too did the ways in which the state spent the tax revenue it collected. As historians have recently emphasized, monarchs not only drew the lion's share of tax revenue from peasants and artisans but, with state spending, redistributed that revenue up the social hierarchy to nobles, officeholders, and other elites. In seventeenth-century Languedoc, as much as a third of the province's tax revenue passed directly to regional notables in the form of pensions, salaries, and interest payments. Extracting and redistributing tax revenue on a massive scale, early modern states doubly reinforced the social inequalities of the age.

POPULAR TAX REVOLTS

Given the weight and incidence of taxation, it may come as no surprise that levies encountered a good deal of popular resistance in the early modern period. The medieval notion that a king was supposed “to live of his own” did not quickly fade, leading many to believe as late as the seventeenth century that regular taxation was a dangerous innovation. In such a climate, any attempt to create a new tax or increase an old one, even when the justification of military defense was invoked, could be met with great skepticism. Ever dubious and resourceful, taxpayers found ways to evade or at least minimize their fiscal obligations. Heads of households escaped full liability for direct taxes by hiding or falsely reporting their wealth or, in the case of powerful individuals, by exerting influence over local tax assessors. As for indirect taxes, smugglers formed vast underground networks that circumvented customs and excise taxes to supply consumers with untaxed commodities at lower prices.

Resistance could also take the more direct form of open revolt. In addition to, and sometimes linked to, the challenges to taxation mounted by representative institutions, popular tax revolts broke out sporadically across Europe throughout the early modern era. From the late sixteenth to the mid-seventeenth century, when intense warfare was coupled with economic and demographic crisis, a particularly destabilizing series of tax rebellions erupted in the German lands, Spain, Portugal, Naples, England, and France. It is important to note that these revolts were not irrational explosions of violence carried out by the hopelessly poor. Rather, as recent research emphasizes, revolts were deliberate political acts in which a variety of social groups participated.

The revolts that shook France in the first half of the seventeenth century are particularly well studied, and they suggest how and why uprisings occurred. It should be stated at the outset that rebellions in this period were not aimed solely at taxes; crowds also gathered to protest military conscription, the billeting of troops, high food prices, seigniorial dues, and religious heresy. But from 1630 to 1660 tax revolts were by far the most prominent form of protest in France. In this period of economic, military, and fiscal turmoil, taxpayers assembled on numerous occasions to submit petitions for

tax relief to authorities. When such acts of protest proved unsuccessful, crowds gathered to keep tax officials at bay—by force if necessary. Moved by a sense of communal justice, taxpayers enacted mock trials and burned tax officials in effigy, broke into or burned down tax collectors’ houses, and verbally or physically harassed collectors to run them out of town. Although the most violent incidents of collective action involved beating or stoning officials, such activity was not revolutionary in the modern sense of the term. Appealing to God, king, and custom rather than revolutionary principle, crowds believed that their attempts to block new taxes (or sudden tax increases) were part of a larger plan to restore the traditional order. “Long live the king without the salt tax,” French protesters cried, looking backward to a time when the crown supposedly did not impose harmful fiscal innovations. Just because revolts were backward-looking, however, does not mean that they failed to achieve practical results. Revolts did achieve temporary successes, when tax collectors were chased out of town or when controversial tax initiatives were withdrawn. But revolts were just as likely to provoke brutal repression by the royal army.

One of the most extraordinary features of tax revolts was the participation of different social groups. It is not surprising that destitute peasants, artisans, and day laborers joined the fray, since taxation threatened to take what little cash they possessed. But in seventeenth-century France, wealthier peasants and artisans, local elites, and even nobles were similarly moved to participate in revolts or at least abet them from behind the scenes. Wealthier peasants paid the bulk of direct taxes and so had a strong interest in stopping tax increases. Noble landlords saw rebellion as a means to retain regional liberties and expand their power, but they, too, had a financial interest in tax revolts, for they competed with the crown for the economic surplus produced by the peasantry. Although nobles paid comparatively little in taxes, they understood that higher taxes on the peasantry would lead to lower rents and feudal dues. Thus, when Louis XIII (ruled 1610–1633) dramatically increased taxes in the 1620s and 1630s, many nobles supported popular sedition. Not all joined in, for some elites feared that revolt would cut off royal revenue and endanger the financial perquisites they received from the

crown, but for many the prospect of losing revenue from their land outweighed other considerations.

REFORM AND REVOLUTION IN THE EIGHTEENTH CENTURY

Although traditional tax revolts died down in the eighteenth century, taxation became a key issue in the American and French Revolutions. In both cases, revolution stemmed from the tremendous fiscal burden that weighed on Britain and France as the two countries engaged one another in a series of protracted, global, and costly wars that have been likened to a second Hundred Years' War. For both countries, the financial response to the burden of war would have far-reaching political consequences.

From the Glorious Revolution of 1688 to the defeat of revolutionary France in 1815, Britain ascended to great power status on the wings of a "financial revolution" in which Parliament guaranteed the security of a permanent and rapidly expanding national debt. Although historians once believed that the spectacular growth of English public credit compensated for the country's supposedly weak tax system, today they attribute much of the success of English credit to the efficiency and reliability of taxes. At bottom, England's tax system was effective because elites consented to taxation through their representatives in Parliament. In the 1690s, for example, Parliament agreed to the levy of a land tax on the propertied classes that would spare no landowner, be he gentleman or cleric. The land tax was significant not only because it touched elites and provided an important source of revenue, especially to 1714, but also because it secured the political power of Parliament—and the landed gentry that the institution represented—in a new constitutional order. The English monarchy learned that it had much to gain financially by consulting Parliament; Parliament learned to tolerate the fiscal and administrative expansion of the English state in return for the right to scrutinize public finances. At the end of the eighteenth century, Parliament replaced the land tax with a modern income tax, a remarkable innovation that required all heads of household with annual incomes above fifty pounds to declare their wealth for assessment.

We should be careful, however, not to exaggerate the fiscal generosity of English elites. The land tax, which Parliament never allowed to be adminis-

tered by a royal bureaucracy, was applied unevenly and fell dramatically over the century in proportion to total tax revenue. Likewise, the income tax was quickly repealed once France was defeated. The two taxes demonstrate that while English elites were willing to contribute direct taxes to a state in which they enjoyed representation, they did not intend to pay too much for this political privilege. Indeed, despite notable innovations in direct taxation, crown and Parliament ensured that indirect taxation, in particular the regressive excise tax, would become the true backbone of the eighteenth-century English fiscal system. Climbing to dizzying heights over the century, the excise tax raised the vast majority of the revenue that funded the loans of the Seven Years' War (1756–1763) and the American War of Independence (1775–1783). Backed by parliamentary statute and staffed by an astonishingly modern bureaucracy, the excise administration made English consumers pay for the nation's international power.

If Britain excelled in the fiscal rivalry that characterized eighteenth-century international relations, it did so despite the rebellion of its North American colonies. In light of the critical role Parliament played in lending legitimacy to English taxes, it is not all that surprising that North American colonials balked when the crown attempted to impose new taxes in the wake of the costly Seven Years' War. In the absence of colonial representation in Parliament, and with the elimination of the French threat in North America, colonials perceived the new taxes and duties of the late 1760s and early 1770s as the work of a despotic government. "No taxation without representation," they exclaimed, insisting that all British taxpayers had a right to national political representation. With the spread of such constitutional ideas, what began as a tax revolt quickly turned into republican revolution.

Taxation was also an important cause of the French Revolution. Because French kings periodically repudiated debts (and were therefore known as risky borrowers), the French royal debt was more expensive to service than English national debt, putting additional stress on the French tax system. As in England, France increasingly relied on indirect taxes over the eighteenth century, but French indirect taxes never reached the proportions of total tax revenue that English indirect taxes did. Direct taxes

remained essential in France, and it was here that the French crown initiated its most ambitious reforms. The crown not only conducted land surveys in certain provinces to improve the repartition of the *taille*; it also created new universal taxes (the *capitation*, *dixième*, and *vingtième*) aimed at individuals, including nobles, who had formerly enjoyed the privilege of tax exemption. (The creation of universal taxes in France was part of a general trend among eighteenth-century European governments to end noble tax privileges; similar reforms were instituted in Artois, Flanders, Luxembourg, Savoy, Holland, and Prussia). Although French universal taxes bolstered direct tax revenues, they were woefully inadequate to the task of funding military expenditure and debt. Even when combined with rising indirect tax revenue, they did not substantially raise the incidence of real, per capita taxation.

Looked at another way, however, the new universal taxes proved all too successful. Because they did indeed strike nobles and other privileged groups, they alienated elites who, unlike their counterparts across the channel but much like Britons in North America, did not enjoy representation in a national legislature. As a result, French courts of law became increasingly sensitive to the issue of taxation and publicized the need for an institutional bulwark against the monarchy. Seeking to fend off increases in universal taxes from the Seven Years' War on, courts disseminated subversive concepts of national sovereignty, political representation, and the rights of citizenship. In 1789, revolutionaries drew on this and other fiscal-political rhetoric to launch both a constitutional revolution, in which a National Assembly would seize the power to tax from the monarchy, and a social revolution, in which the Third Estate would claim political rights based on its tax contributions to the state. Once in power, revolutionaries abolished indirect taxes, expunged vestiges of privilege from direct taxation, and formally linked taxation and citizenship by extending political rights to taxpayers. By the late eighteenth century, taxation had become invested with revolutionary significance.

TECHNOLOGY. Early modern Europeans paid new attention to the machines and technical processes that created most of their material goods. Appreciation of rapidly advancing arts and inven-

tions was not particularly new—the Middle Ages also having been an era in which myriad new technologies appeared in Europe. What was becoming noticeably different by the middle of the fifteenth century was that new technologies were becoming a force in the shaping of Europeans’ intellectual framework—just as they shaped social frameworks through the expanding manufactories in mining, ordnance, papermaking, printing, and textiles. Both the material and the mental landscapes of early modern Europe were dramatically reconfigured over these centuries, and in a very self-consciously interdependent way.

HOMO FABER

“Technology” did not really exist as a concept until at least the seventeenth century; what we see in the early modern period is the attempt to create a realm that constantly straddled growing scientific thought and developing industrial practices. Technology continues today to ambiguously refer both to the practices and tools of material construction, and to the knowledge (the *-ology*) about how these practices and tools operate. In the centuries spanning the invention of the printing press and the first experiments with electricity, technology gave rise to a particular vision of human effort and learning, one whose central image was that of “progress.”

Mechanical arts in the ancient and medieval period had often been disregarded by scholars and philosophers and by the makers of literate culture. To a large extent, the name “mechanic,” because associated with manual labor, remained tainted throughout the early modern period (and remains so today). However, starting in the Renaissance, Europeans began to reframe their concept of learning around the study of human productivity. This reframing contributed significantly to the restructuring of the existing system of Aristotelian natural philosophy. The knowledge of machines and technical processes became clues to the natural forces that govern both natural and artificial processes. Galileo Galilei’s (1564–1642) formulation of kinematic motion, for example, was completed at the end of long years studying projectiles in the context of military engineering. Early modern theorists of science and enlightenment articulated the faith that philosophical knowledge can be derived from technical arts, and then reapplied to organize the techni-

cal world in a more efficacious way. They did not so much dignify craftsmen as seek to appropriate from craftsmen universal principles by which the arts could be directed. The capture of those principles became a major goal of scientific enquiry and underwrote a new professional engineer with status and learning meant to distinguish him from the mere craftsman.

WONDERS OF THE AGE

By 1548, the French physician and astronomer Jean Fernel (1497–1558) could proclaim the inventions that testified to “the triumph of our New Age”: the compass, the cannon, and the printing press. Of these, the printing press, nearly one hundred years old, was the newest. The full impact of the compass, cannon, and printing press was not obvious until the end of the fifteenth century and depended on the development of other technologies.

Compass. The introduction of the magnetic compass gave mariners not only a new way of navigating in open sea, but, perhaps even more importantly, a means of recording their journeys in a readable and fairly precise way. The portolan map, fully developed by the fifteenth century, was produced by drawing coast lines and islands according to constant lines of compass bearing. The remarkable advance this offered can only be appreciated visually. In the middle of the fifteenth century, this advantage to navigation was joined by a new ship design that allowed greater maneuverability. The medieval carrack was replaced by the three-masted ship, which offered more sail area, the ability to sail windward, and larger sterns for cargo and crew. By 1488, Portuguese sailors, who were also learning the system of winds, were able to circumnavigate the Cape of Good Hope. Oceanic voyages quickly opened up new prospects for trade with the East, and, after 1492, a New World.

Cannon. The development of gunpowder artillery changed the balance of power both between Europeans and other peoples, and, intermittently and temporarily, between the emerging nation-states of Europe. Invented sometime in the early fourteenth century as a rather cumbersome, if effective, bombard, gunpowder artillery underwent a great deal of development throughout the fifteenth century. Europeans learned to cast and bore cannons (rather than barrel together hoops of forged metal) to spe-

cific calibers; they designed gun carriages for better mobility; they learned to make nitrates for the saltpeter necessary to gunpowder production, and to corn (or ball) the gunpowder for better storage. The main effect the advent of widespread cannon warfare had on noncombatants was to change the faces of their cities. Older town walls (and often a number of townsmen's houses) were demolished for newer, lower, and thicker geometrical circuits. Polygonal, bastioned fortifications, the *trace Italienne*, were built around numerous continental European cities. A secondary effect of military engineering concerns was to focus attention on the problems of projectile motion, impact, and the resistance of materials—all areas of concern in the establishment of a new physics.

In the field, the integration of small arms worked to further alter the conduct of open battle. The shoulder-carried harquebus or musket, already in use by the 1480s, developed into a common weapon of the infantry, even if pikemen continued to be of essential importance into the seventeenth century. A more sudden transformation took place in the cavalry as a result of the spread of the wheellock pistol in the mid 1500s. Employed by mounted German *Reiters*, and further developed as a cavalry weapon by the French under Henry IV (ruled 1589–1610), the adoption of the pistol led to the dethroning of the armored lance, and “the end of knighthood.”

Printing press. The political theorist Jean Bodin (1530–1596) wrote, “The art of printing alone would easily be able to match all the inventions of the ancients.” Printing had transformed intellectual life. Before its advent around 1450, a personal library of fifty volumes was considered sumptuous; by Bodin's writing, noblemen routinely collected hundreds; pamphlets and other cheap print were available to most literate people.

The printing press relied on a set of standardized raised letters, cast in a matrix that had been impressed with the letter's impression by a steel punch, and then set into a form. The system of punches, matrices, and forms was the most significant (and expensive) aspect of the invention, and established printing as the first industry to employ interchangeable parts. The success of the print trade relied on the earlier development of paper technol-

ogy, which in the previous 150 years had largely replaced parchment (scraped animal skins) and greatly reduced the expense of books. It also depended on sophisticated metallurgy; steel was difficult to produce, and the metals used had to perform properly.

Other arts. Aside from these “revolutionary” technologies, a host of smaller-scale innovations enriched domestic interiors between 1450 and 1550. Venetian glassmakers pioneered a refined clear glass in the late fifteenth century, and Italian potters began to manufacture brightly painted majolica. The European silk industry expanded greatly. In the sixteenth century, the French potter Bernard Palissy (1510–1589) formulated a pure white glaze in imitation of porcelain. All these products offered domestic alternatives to goods that had previously been imported from the Middle or Far East. Meanwhile, techniques for quicksilvering mirrors and the development of oil paints that could capture dramatic lighting effects offered new adornments.

With printing, the techniques of numerous arts were recorded in printed books. By the end of the sixteenth century, books were available on the employments, tools, and “secrets” of trades as diverse as fishing, pyrotechnics, metallurgy, and architecture. Many were written by practicing artisans and mechanics. Some of these books amounted to little more than lists of recipes, while others eloquently discussed the relationship between art and nature, and insisted on the need for both theory and practice in the proper execution of crafts. These discussions offered an alternative discourse on these subjects to that available through elite education. Later promoters, apologists, and organizers of technological knowledge drew heavily on this vast literature.

ARCHITECTS AND HUMANISTS

Renaissance artists created some of the most impressive engineering feats of their day. Filippo Brunelleschi (1377–1446) awed his contemporaries with the construction of the enormous *duomo* atop the Florentine cathedral. The dome was constructed without centering or beams by connecting eight spears above the cathedral. Even Brunelleschi's scaffolding and lifting machine designs were copied by other artists. The most developed mechanical knowledge available was no doubt cultivated by architects. This was particularly obvious in Italian

cities, where architects and other artists were highly trained in practical mathematics, and constantly experimented, at least in sketches, with various combinations of machine elements. Leonardo da Vinci's (1452–1519) well-known breadth of interests—stretching from his designs of ingenious devices to sculpture to painting—was not uncommon. Francesco di Giorgio (1439–1502) also developed great expertise in the fields of engineering and hydraulics, along with his more decorative work. Architects directed sometimes dramatic refigurement of major cities. Rome was largely rebuilt in the sixteenth century and Paris in the seventeenth. Architects also designed dams and waterways, fortifications, and stage machinery.

As works of architecture and engineering gained greater cultural capital as markers of status and power, scholars and patrons themselves often came to seek the knowledge of the architects and to share their literate culture. Leon Battista Alberti (1404–1472) was a humanist who carved a new role for himself as the technical counselor to powerful men. His treatises detailing mathematical and conventional rules for painting, sculpture, and architecture became classics even in manuscript. Cooperation between elites and architects centered on military engineering and the study of ancient technical texts, works that promised the secrets of recreating the splendid world of the ancients. The duke of Urbino, Federigo Montefeltro (1422–1482), himself tried to aid Francesco di Giorgio in a translation of *De architectura* by the Roman architect Vitruvius. Alberti had given up making sense of this text, but the first editions came from practicing architects: Fra Giovanni Giocondo da Verona's (c. 1433–1515) Latin text of 1511, and Cesare Cesariano's vernacular edition in 1521. Other texts considered clues to ancient marvels of engineering were also routed to prominent architects and painters by their patrons. Texts of Archimedes, the hydraulics of Hero, and the mechanical collections of Pappus were books examined by scholars of both elite and artisanal status.

By the end of the sixteenth century, mathematicians such as Federico Commandino (1509–1575) and Guidobaldo del Monte (1545–1607) had developed their own elaboration of a classical rational mechanics. This work remained rooted to the world of the mechanic, but began to address a new sort of

engineering professional that was just then beginning to emerge.

NATURAL MAGIC AND ALCHEMY

No easy category existed during the late Renaissance in which to place figures who performed technological feats. The Syracusan Archimedes (c. 287–212 B.C.E.), for example, was famous as the maker of a wooden bird that flew all by itself, and as the engineer whose special mirrors burned Roman ships in the harbor—both accomplishments that early modern engineers attempted to recreate well into the eighteenth century. In the language of Renaissance Neoplatonism, the term *magus* often served best to characterize such figures. The magus was figured as a wise man whose knowledge of occult (hidden) natural properties allowed him to unleash operative forces and create amazing effects. Scholars of magic—among the most learned of the age—developed a doxography that linked magical, philosophical, and religious figures in historical progressions: from the legendary Egyptian magus Hermes Trismegistus, to Moses, to Pythagoras, to Platonic and Aristotelian philosophers, to Ptolemy as a judicial astrologer, and thence to the Hellenistic mathematician and reputed engineer Archimedes.

Meanwhile engineers themselves, military engineering writers such as Conrad Keyser (1366–1405) and Giovanni da Fontana (1395?–1455?), had cultivated a mixture of technology and magic. “Natural magic” pointed to the operative power inherent in technology, and offered a framework outside that of Aristotelian causality. By the turn of the seventeenth century, discussions of technology often adopted the name “magic” as “the practical part of natural philosophy.” Influential writers such as Tommaso Campanella (1568–1639) and Giambattista della Porta (1535?–1615) continued to configure technological work as natural magic. Della Porta in particular had himself demonstrated success experimenting with lenses and was a key member of the Accademia dei Lincei before Galileo, with his mathematical-philosophical approach to technology, gained center stage among the academicians. In England the connection remained intact through Robert Fludd (1574–1637), whose work explicitly drew together mechanical technologies and divinatory arts within a mystical Christian framework. The work of John Wilkins (1614–

1672) is a late echo of the connection between mathematics, technology, and magic. His compendium of the most current work in rational and practical mechanics was entitled *Mathematical Magic*, but the “magic” was completely removed from occult overtones, and merely captured the transformative power of technology.

Another tradition of natural magic ran from Hermes to alchemical thinkers such as the medieval Islamic alchemist Geber and the learned friar Roger Bacon (c. 1220–1292). Alchemy was a repository of knowledge for a variety of distillation and metallurgical techniques. Before a more rationalized nomenclature could be instituted, alchemical lore was often veiled in occult language and bizarre images. Alchemy enjoyed something of a vogue in the sixteenth and seventeenth centuries and occupied some of the finest minds of the age, including the twenty-year concentrated studies of Isaac Newton (1642–1727). Alchemy consisted of distillation and metallurgical techniques, and created seemingly new substances through the combination and heating of reagents. These practices were often conceived within a theory of metals and a religious-spiritual view of nature and human labor. Probably due to the shapes of mineral veins, metals were believed to grow inside the earth; over long periods of time all metal would mature into gold. Alchemy was the art and labor by which nature could be hastened and perfected. While alchemists did indeed believe it was possible to turn base metals into gold, the operations of alchemy also provided both consumable products and an observable, experimental analog to the processes of nature. Metallurgists utilized the literature and techniques of alchemy, and Paracelsus (Philippus Aureolus Theophrastus Bombastus von Hohenheim, 1493–1541) developed a chemical medicine and alchemical view of nature that found numerous followers throughout the sixteenth and seventeenth centuries.

BACONIANS AND THE DIRECTION OF PROGRESS

Francis Bacon (1561–1626) spent much of his forced retirement from politics writing on a reform of knowledge that would account for and extend the success of technological traditions but avoid the drawbacks of its current practices. His *Novum Organum* (1620; New organon) detailed both criti-

cisms of the current state of knowledge and remedies. Bacon advocated the redirection of philosophy away from erudition and logical terminology, toward experience and the advancement of material wealth. Mechanics, mathematicians, physicians, alchemists, and magicians, Bacon noted, had hands-on knowledge of nature, “but all [have met with] faint success.” Bacon had patience neither to wait for the happenstance of a lucky discovery or invention, nor to suffer the “fanciful philosophy” advanced by alchemists and others who presumed too much based on a narrow base of technical knowledge. “Knowledge and human power are synonymous,” he proclaimed. While he advocated a program of experimentation, he was decidedly more articulate about a more descriptive collection of facts from the natural and technological worlds. For example, from a “history of trades” that would chart information from all manner of tradesmen, the philosopher would draw out axioms of principal import. The axioms could then be used to organize and further the trades.

Bacon’s program, with the approach of the 1640 Puritan Revolution, appeared to some to offer the prospect of a “new Albion,” an Edenic England created through technology in a great reform of religion, mind, and social organization. Samuel Hartlib (c. 1600–1662), for example, worked toward such a vision. Hartlib was in fact central to the circle of men who later founded the Royal Society.

The Royal Society, founded on explicitly Baconian inspiration, at first tried to fulfill the role of collectors of histories of trades. While this project was not successful, the society often centered around the experiments made by its curator. Information on mines, machines, and other technological news was assiduously collected along with accounts from physicians, mathematicians, and naturalists, and was printed in the *Philosophical Transactions*. Exhaustive histories of trades were finally realized at the end of the eighteenth century in France. The overt Baconians Denis Diderot (1713–1784) and Jean Le Rond d’Alembert (1717–1783) and the more staid Académie des Sciences both produced encyclopedias of arts and trades in the decades before the French Revolution.

TECHNOLOGIES FOR SCIENCE; SCIENCE FOR TECHNOLOGIES

While Bacon had fully recognized the mutual relationship between the reform of natural philosophy and the progress of the arts, he had paid relatively little attention to the technologies that were themselves transforming the practices of science. While mechanics, architects, and craftsmen had always used mathematical measuring instruments in their work, and these themselves underwent great refinement in the sixteenth century, the new scientific instruments of the seventeenth century—the telescope, microscope, air pump, and to a lesser degree thermometers and barometers—depended on technologies and offered possibilities on a whole new level. The telescope and the microscope extended human vision enormously and produced experiential evidence in debates such as that over the Copernican hypothesis. The air pump, as it was developed by Robert Boyle (1627–1691) and his mechanic-client, Robert Hooke (1635–1703), consisted of a ratchet and piston system that could evacuate a glass receiver one cylinder-volume at a time. This served as a stage of observation for an artificial environment of evacuated air and allowed Boyle to make claims concerning the nature of the tiniest units of matter. This was a sort of instrument that had never been used in natural philosophy before. Such instruments were difficult to get to work dependably, and often relied on the skills of a mechanic like Robert Hooke.

Meanwhile, both elite and practical mathematicians developed mathematical skills that were meant to aid the design of ever more complicated technical tasks. Vernacular editions of Euclid had been available since Niccolò Tartaglia's (1499–1557) 1543 Italian edition. Above all, these editions spread and popularized geometrical proportioning techniques. Simultaneously, in the early seventeenth century the Scottish nobleman John Napier (1550–1617) and the Swiss watchmaker Joost Bürgi (1552–1632) developed logarithms that would make trigonometrical computations much easier. Napier in particular drew explicit attention to the ways logarithms would ease tasks in military engineering and survey. Napier also employed the decimal notation developed by the Dutch engineer and counselor to Maurice of Nassau (1567–1625), Simon Stevin (1548–1620). Decimal notation eased work with fractions. Proportional compasses and calculating sectors also

eased practical calculations. The foundations of algebraic analysis were meanwhile made by Pierre de Fermat (1601–1665), and a century later the use of analysis became essential to the cadets of France's technical institutes, and made possible a new style of engineering. Meanwhile, projective geometry, always to some extent a tool of architects and engineers, had been highly developed and integrated into perspective by Gérard Desargues (1591–1661). Descriptive geometry was institutionalized in technical drawing, again at the French *écoles*, by Gaspard Monge (1746–1818).

PROJECTORS, ARTIFICERS, AND THEIR PATRONS

In his fable of the ideal technological and moral society, the *New Atlantis* (1627), Francis Bacon had presented a kind of intellectual mirror opposite of mercantilist programs. In his imaginary Benthalem, technological secrets were constantly imported by explorers and developed by technicians; no technologies, however, would be exported to other nations. This speaks both to concerns about industrial espionage and difficulties caused by undeveloped patent laws that infected all states in Europe. It also indicates some of the enthusiasm political and cultural leaders had in the wholesale collection of technical knowledge, and their reliance on mechanical workers to feed their interests.

European rulers had long tried to prohibit the export of technologies on which their economies depended. Venice, for example, forced glassmakers to swear they would not take their art outside of the city's dominion. The importance of technological transference through the migration of skilled persons is most forcefully demonstrated in the case of Lucca's silk-throwing machine, the *filotoio*. Anyone carrying knowledge of this machine outside the confines of the city was threatened with death. Meanwhile, a design of the machine had been publicly available for years in Vittorio Zonca's *Novo Teatro di Machine et Edificii* (1607). It was not until the eighteenth-century industrial spy John Lombe spent two years studying the machine in Italy that the machine could be reproduced and operated.

Semi-itinerant mechanics often haunted baroque courts. Mechanics such as Dutch-born Cornelis Drebbel (1572–1633) attracted attention

in England (and for a short time in Prague) with perpetual motion machines, inventive skills for such devices as diving bells, and technical know-how for such major works as the draining of fens. As a projector in various German courts, the alchemist and mechanic Johann Joachim Becher (1635–1682) rose to something of a patron himself. He solicited secrets from a range of artificers, and probably used his alchemical skills to advertise his ideas for a new political economy based on trade and technology rather than agriculture. Numerous enthusiasts and scientific gentlemen cultivated relationships with their own artificers to construct machines.

CLOCKS AND WATCHES

The first town clocks were constructed in the Middle Ages, usually as way of letting workmen know when shifts should change in new textile factories. While watchmakers themselves continually refined methods of gear-cutting throughout the period, scientists dramatically innovated clocks in the mid-seventeenth century. Clocks became more accurate and more convenient and promised a solution to the problem of determining longitude at sea—one of the most long-standing obstacles to navigation—as well as offering advantages to positional astronomy. If one could accurately keep track of the time of the home port and local time, longitude could easily be calculated. In 1656, the Dutch scientist Christiaan Huygens (1629–1695) designed a clock using a pendulum oscillator with a tautochronic, one-second period. The pendulum clock, however, proved inappropriate for the pitching deck of a ship. In the mid 1660s, Huygens turned to oscillators formed of a spiral hair spring—just as Robert Hooke was also investigating the use of a hair spring. This gave rise to a bitter, ultimately unresolved controversy over patents. However, neither watch proved accurate enough to serve the purposes of a marine chronometer. The government prize for the solution of the longitude problem, £20,000, was finally awarded in 1765 after the Yorkshire watchmaker John Harrison (1693–1776) improved accuracy through advances in workmanship rather than design.

AUTOMATONS AND POPULAR DEMONSTRATIONS

In the sixteenth and early seventeenth centuries, mechanical devices for delight had largely been cul-

tivated in personal collections and gardens. Self-moving statues, ingenious fountains, and hydraulic devices designed by architects like Salomon de Caus (1576–1626) delighted visitors. Mechanical marvels were often placed next to exotic naturalia and antiquities. In the eighteenth century, automatons, such as those designed by Jacques de Vaucanson (1709–1782), were exhibited in shows and fairs.

More serious forms of enlightened infotainment were provided by popularizers of Isaac Newton's work. Jean Theophilus Desaguliers (1683–1744), for example, offered ten-week courses at a cost of two guineas a head. Demonstrators of "Newtonian" devices showed their wares from town to town. The abbé Jean-Antoine Nollet (1700–1770) made presentations of the new physics, and was a favorite in French salons. These popular mechanical demonstrations and lectures were probably one of the best venues in which to learn about applied mechanics. The automatons and demonstration devices, however, belonged to a larger cultural context in which machinery powered more tasks, and automation of labor was becoming more prevalent.

MILLS: AGE OF WATER AND WOOD

If the nineteenth century was predominantly an age of coal and iron, the preceding centuries were largely characterized by water and wood. The vertical water wheel and the windmill were both imported to the Latin West in the Middle Ages. By 1450, these sources of power were already applied to brewing, hemp production, fulling, ore stamping, tanning, sawmills, blast furnaces, paper production, and mine pumping. Their use and development continued throughout the early modern period. The principle of translating circular wheel motion into other forms of translational motion was also applied through human or animal labor. Concern for milling and water-lifting machines is testified by the printed machine books of Agostino Ramelli (1531–c. 1600), Jacques Besson (1540–1576), and Vittorio Zonca (born c. 1580). These books present the intricate connection of wheels, gears, cams, and winches. Concurrent with the pressing need for machines to power manufactories was the need for machines that could pump or raise water. The latter were everywhere employed for

drinking-water, for evacuating deep mines, for draining swamps, and for building canals.

The Netherlands, not surprisingly, led Europe in these technologies, both because of the superabundance of water and the need to drain the land and dredge ports. Because prevailing westerlies dependably blow over its lands, the Dutch also perfected windmills. Top sails could be rotated (either because mounted on a rotating cap or because the bottom of the tower could be rotated on wheels) to face wind. The *Wimpolen* drove bucket chains that drained water from the soil, then dumped it into the canals, and was part of land reclamation projects. Dutch experts in water reclamation and water wheel machinery were in high demand throughout the seventeenth century.

The main drawback of these early modern machines was that they were made of wood. By the late sixteenth century, Europe had been largely deforested, and wood became increasingly expensive. Wood also was a material in which precision tooling was limited, and which broke easily and required much maintenance.

TEXTILES

Textiles were among the first products to be produced on a large scale through division of labor and mechanization. Important textile manufactories were well established in Italy and the Netherlands by the thirteenth century. In the sixteenth and seventeenth centuries, modest mechanized advances in ribbon weaving were introduced. In the 1730s, John Kay's (1704–1764) “flying shuttle” made weaving much faster and allowed broader cloth. This invention was soon followed by methods that mechanized jacquard weaving and repetitive pattern weaving.

Increased speed in weaving put heavier demands on the spinning of the yarns. Richard Arkwright (1732–1792) became one of the richest men in late-eighteenth-century England by mechanizing the spinning process of newly exploitable cotton imports. Arkwright's “waterframe” managed to imitate the touch of spinning and drawing out yarns by hand. Cotton fibers were drawn along through three pairs of rollers, each pair spinning at an increasingly faster rate. Arkwright began a spinning mill powering his invention with one horse in 1769, but established a water-powered mill only two years

later. He continued to mechanize the industry with carding machines and a drawing frame.

MINING, METALLURGY, AND THE STEAM ENGINE

With a demand for more intensive mining, and often entrepreneurial investment, sixteenth-century mining employed a vast array of machines and techniques, including the first form of the railroad. These were detailed in the elaborately illustrated volume *De Re Metallica* by the humanist Georgius Agricola (1494–1555). Deep ore deposits required pumps to evacuate water; the ore had to be raised; it was then roasted to make crushing easier. By the sixteenth century, most crushing was done by power-driven stamping mills. Ores were then fired in a blast furnace to extract the metals, and finally refined through a variety of metallurgical techniques, depending on the metals present.

The blast furnace was introduced by the beginning of the sixteenth century, and adopted across Europe. It was larger than its predecessor and required mechanical power to work the large bellows that provided the “blast” of hot air across the smelting metals. The furnace also had to be kept going around the clock. These alterations meant that blast furnaces needed to be built where there were plentiful supplies of water to run the water wheel, timber to make charcoal and fuel the furnace, plentiful labor, and exploitable ores. The blast furnace also made possible a new product: cast iron. While cast iron, particularly English cast iron, had a use in the making of ordnance, most cast iron was formed into wrought iron in a secondary process.

The iron trade was freed from the expense of charcoal fuel and the necessity and drawbacks of water-driven wheels in the mid-eighteenth century by the innovations of Henry Cort (1740–1800) and James Watt (1736–1819). Henry Cort developed a new style of furnace that made possible the use of coal in smelting iron by designing a way in which the sulfurous coke was kept out of direct contact with the metal. Watt improved the Newcomen steam engine used in mine drainage so that it was far more powerful. Thomas Newcomen's (1663–1729) steam engine was itself a variation of a philosophical curiosity invented by the mechanic Denis Papin (1647–1712?). The principle of both was to raise a piston in a cylinder by forcing it up with

steam, then allowing condensation to create a vacuum so that atmospheric pressure would push the piston down. Watt added a separate condenser and a steam jacket around the cylinder, thus creating a far more rapid and powerful engine. Watt's steam engine was later adapted for use in many other manufacturing, notably in textile and brass production, and made possible many new technologies. By the end of the eighteenth century, an average furnace consumed at least 2,000 tons of coke, processed 3,000 to 4,000 tons of iron ore, and produced 1,000 tons of iron per year.

ENGINEERS, ENTREPRENEURS, AND ENLIGHTENMENT

As a generalization, one might say that the Renaissance gave rise to the great Italian architect-engineers; the baroque hailed the itinerant skilled mechanic from German and Dutch lands; and the Enlightenment saw the development of the highly trained French engineer and fostered the activities of the English entrepreneurial engineer.

By the end of the seventeenth century, Edmond Halley (1656–1742), otherwise beholden to various patronage networks and government service, set up his own ship-salvaging firm based on his innovative diving bell and diving suit. James Watt was one of the most successful (in part due to his association with Matthew Boulton [1728–1809]) and prominent of a number of engineers and inventors whose businesses flourished in eighteenth-century England. His association with the Birmingham “Lunar Society” is also instructive: a group composed of Watt, Boulton, the ceramics manufacturer Josiah Wedgwood (1730–1795), the botanist Erasmus Darwin (1731–1802), chemists James Keir (1735–1820) and Joseph Priestley (1733–1804), among others. These men saw the power of the connection between science and industry, and its possibilities for the improvement of society. They themselves had become engineers, curators of craftsmen, and scientists in eighteenth-century England's free mix of popular science and artisanal mechanics; however, they advocated a more rigorous scientific education for following generations. Whatever the workers in the mills, mines, and manufacturing might have thought, members of the Lunar Society saw the values and products of science and technology as those most likely to lead to the moral, intellectual, and material liberation of hu-

manity. This ideology they shared with many French Revolutionaries. Indeed, their forces were scattered in 1791 when a mob sacked the house of Priestley and others for their support of the French Revolution.

Teresa of Ávila. Sixteenth-century gouache portrait. THE ART ARCHIVE/CARMELITE COLLECTION CLAMART/DAGLI ORTI

TELESCOPE. *See* Scientific Instruments.

TERESA OF ÁVILA (1515–1582), founder of the Discalced Carmelites and a patron saint of Spain. Teresa of Ávila was born Teresa de Cepeda y Ahumada in Ávila, Spain, to Beatriz de Ahumada and Alonso Sánchez de Cepeda. Her mother came from an Old Christian family with a small estate in Gotarrendura, a village near Ávila. Her paternal grandfather, once a prosperous textile merchant in Toledo, moved to Ávila after the Inquisition convicted him of Judaizing, or practicing the Jewish religion or customs after having converted to Christianity, and sentenced him to a humiliating public ritual of penitence that usually resulted in loss of social reputation and business failure. In Ávila, Teresa's grandfather and his sons employed legal and financial routes to establish their right to the privileges of gentlemen, including a tacit agreement to overlook their genealogy. Teresa's contemporaries would have known of her *converso* heritage, but it was not publicly acknowledged until 1946. Teresa was the third child and first daughter born to Alonso and Beatriz, whose ten children joined two surviving offspring from Alonso's first marriage.

Teresa came to her career as a religious reformer relatively late in life. She joined the Carmelite Convent of the Incarnation just outside Ávila in 1535 and took vows in 1536 as Teresa of Jesus. In the *Book of Her Life* (1562–1565) she wrote that she withheld her wholehearted consent to the vocation until 1556, when she had two spiritual experiences that definitively turned her away from secular life. For these twenty years of irresolution, during which she suffered serious illnesses and experienced frightening visions that some confessors attributed to the devil, Teresa blamed the mitigated or relaxed rule in Carmelite convents, which among other liberties permitted nuns to come and go freely and to receive unlimited visitors. In condemning such lapses in monastic enclosure, Teresa participated in sixteenth-century movements to reform the Roman Catholic Church from within, or the Counter-Reformation. In 1560 Philip II (ruled 1556–1598) called on Spanish monasteries to contribute to his war against the Protestant Reformation by intensifying religious discipline.

On 24 August 1562 a house in Ávila was consecrated as the Convent of Saint Joseph under a constitution Teresa based on the 1247 formulation of Carmelite rule requiring strict asceticism and complete poverty. For the austere dress Teresa designed—habits of coarse fabrics and straw sandals—initiates were labeled Discalced (Barefoot) Carmelites. The new convent faced immediate threats to its existence. Some church officials considered that Teresa, known to practice a spirituality based on contemplation, might lead her nuns to abandon vocal prayer for mental prayer, which threatened both ecclesiastical authority and ecclesiastical income. Municipal officials of Ávila brought a lawsuit that was probably motivated by concern that a convent without an endowment could become dependent on civic financial resources.

Teresa's project of religious reform brought her allies as well as enemies in the church, monastic orders, and aristocracy. Giovanni Battista Rossi (1507–1578), the Carmelite prior general from Rome, found Saint Joseph's so impressive on his 1567 supervisory visit that he gave Teresa permission to found monasteries throughout Spain, with the explicit exception of Andalusia. Having secured this credential, Teresa began her travels around Spain in horse-drawn wagons. She eventually founded fifteen convents and monasteries herself and authorized other Discalced Carmelites to found two more. Teresa garnered much of her financial support and numerous recruits from *converso* families, who found most monastic orders, including the Carmelites after 1566, closed to them.

Teresa also continued to provoke controversy. Rossi eventually had to reprimand her for making foundations in Andalusia at Beas and Seville. By late 1575 the Inquisition was investigating her on several charges, and Carmelite officials had divested her of all leadership roles and had ordered her to stay in a Castilian convent. She probably owed permission to make more foundations, which came with the 1580 recognition of the Discalced as a separate province, to aristocratic friends holding high church and state positions.

Around 1562, Teresa began writing prolifically, both at the command of confessors and for her own purposes: first, the autobiographical *Book of Her Life* (composed 1562–1565; published 1588), fol-

lowed by the devotional instruction in *Way of Perfection* (composed 1566–1569; published 1588), descriptions of her mystical experiences in *The Interior Castle* (composed 1577; published 1588), a chronicle of the origins of the Discalced Carmelites in *The Foundations* (composed 1582; published 1610), and several short works and numerous letters.

Teresa probably would be remembered only as a charismatic reformer but for reports that her body, when exhumed nine months after her death, had not deteriorated. Stories of other miracles accumulated, and in 1591 the bishop of Salamanca initiated the process that in 1622 made her a saint. In 1970 she became the first female doctor of the church.

CAROLE SLADE

TEUTONIC KNIGHTS. The Teutonic Order was founded as a hospital in Acre (now 'Akko) in 1190. It became a military order in 1198 and expanded rapidly, particularly under the leadership of Hermann von Salza (1210–1239). In 1226 Frederick II's Golden Bull of Rimini granted Prussia

to the Teutonic Order and this, together with the bulls of Gregory IX in 1230, laid the basis for the order's territorial power. Wars of conquest continued throughout the thirteenth century, and by 1290 the order had subjugated both Prussia and Livonia. After the fall of Acre in 1291 and the loss of the Holy Land, the order's headquarters moved to Venice, and then in 1309 to Marienburg. During the fourteenth century the focus of warfare switched to Lithuania, ruled by Grand Duke Gediminas (ruled 1315–1341) and his successors, and the order consolidated its power, which reached its apogee under Grand Master Winrich von Kniprode (1351–1382).

Prussia became the main resort for members of the European nobility intent on continuing the crusading tradition, notably King John of Bohemia in 1329 and Henry Bolingbroke (later Henry IV of England) in 1390 and 1392. By the end of the fourteenth century, however, the order was faced with rising unrest in the towns in Prussia, while the wars against the Turks, which began in 1396, diverted the flow of crusaders away from northern Europe. The baptism of Gediminas's grandson, Jogailo, and his election as Władysław II Jagiełło of Poland (1386–1434), saw the beginning of an attack by Poland and Lithuania on the order's territorial expansionism and on the legitimacy of the concept of military orders as such. The conflict culminated in the order's decisive defeat at the battle of Grünwald (Tannenberg) in 1410. The treaty of Toruń in 1466 compelled the order to return to Poland all the land on either side of the Vistula that it had conquered since 1309 and parts of Prussia conquered since 1250, including its headquarters at Marienburg. The remnants of East Prussia were ruled from Königsberg, but the grand masters had to swear an oath of allegiance to the kings of Poland. Finally, in 1525 the Grand Master Albert of Brandenburg implemented Luther's recommendation that he should establish a secular duchy in Prussia and that the knights there should renounce their vows and marry. A Catholic remnant of the order regrouped in Franconia with a new grand master and a residence in Mergentheim.

The order survived in Livonia until 1562, but the impact of the Reformation meant the loss of much of its land and infrastructure in the empire. During the second half of the sixteenth century it

began fighting the Turks from its commanderies in eastern Austria, notably under Grand Master Archduke Maximilian of Austria (1585/1590–1618). However, the order suffered further losses in Alsace and Lorraine during the French Revolution and was abolished at the Peace of Pressburg in 1805. It was revived in Austria in 1834 and took on a charitable role, providing field hospitals and convalescent homes for soldiers until 1918. Following the collapse of the Austrian monarchy after World War I, it was recognized as a spiritual order by the Austrian state and the papacy, and it survives in that form.

TEXTILE INDUSTRY. Between 1450 and 1800, textile production was second only to agriculture in economic importance. It employed more people and produced more profit than any other manufactured product. Production and trade existed at two levels. Everywhere peasants and villagers turned locally grown wool and flax into fabric and clothing for themselves and their neighbors. The cloth they produced was of poor quality and not designed for export to distant markets. On top of this local market sat a large and lucrative luxury trade in silk, wool, linen, and (eventually) cotton fabric, the most important of which were heavy woolens. The customers for these fabrics were wealthy landowners, government and church officials, merchants, financiers, aristocrats, and master craftsmen in Europe, Asia and the Levant.

Ireland and the Baltic region supplied much of Europe's flax, although it was widely grown and available. In the sixteenth century, Venice and other Italian cities acquired silkworms and mulberry trees, and began silk manufacturing. From there, the silk industry made its way north to Holland, Zurich,

Lyon, Cologne, and Spitalfields (East London), England. At the same time, cotton thread and fabric began to arrive from India and became wildly popular.

Most important of all the textile industries was the trade in raw wool and wool fabric. Sheep raising abounded everywhere. In the fifteenth century, the best fleeces came from England. In the sixteenth century, Spanish merino sheep knocked English sheep into second place. French sheep were considered to produce the third best wool. Two types of wool fabric were produced in Europe—woolens and worsteds. Of the two, the market for woolens was by far the larger. Woolens were made from short-staple wool fibers that were swirled together before spinning. The cloth had a soft-textured appearance and feel. Worsteds were made from long-staple wool and had a harder, smoother finish. Soft woolens were considered far more desirable than the harsher worsteds and dominated the wool trade.

Turning raw wool into fabric was a long, complicated process. The sheep's fleece was sheared in one continuous piece, rolled, sacked, and sold to merchants (drapers) or clothiers or their agents. The fleeces were dirty and greasy, not uniform, and far from ready for spinning and weaving. Fleece breakers opened up the fleece and removed the large pieces of debris that were caught in it. The fleece was then pulled apart, and the wool was sorted into three or four grades. Next, the sorted wool was cleaned. Any remaining debris was removed from the fleece by beating it with sticks, and then it was washed in alternating hot and cold, soapy and clean water. Some fleeces were dyed at this point, but dyeing raw wool produced dull colors, and it was common to dye fabric after it was completed rather than when the wool was raw. Whether it was dyed or not, the fleece was now lubricated with butter or oil to make it easier to work.

After breaking, cleaning, and oiling, the wool passed into the hands of combers and carders. Their task was to convert a mass of tangled, curling wool into long, straight, smooth fibers for worsteds by combing, or into a smooth ball of short wool fibers for woolens by carding. Spinners converted the combed or carded wool into continuous lengths of yarn by pulling, twisting, and turning it into a thin, continuous thread. This was the most labor-inten-

sive part of the process. Estimates vary, but six spinners (or more) seem to have been required for every loom that was in operation. Yarn that was spun with a drop spindle was stronger than wheel-spun yarn and was used for the looms' warps. Wheel-spun yarn was wound onto bobbins and used for the weft.

Weavers usually wound their own warps and prepared their own bobbins for the loom. The best woolens were woven on broadlooms that produced fabric that was $1\frac{1}{4}$ meters wide and 22 to 23 meters long. It commonly took two men and one child (most often, probably, a boy in training) to operate a loom and weave the cloth. Once the woolen cloth was woven, it passed into the hands of fullers who cleaned and softened it by dunking it in water that contained various kinds of detergents and soaps that dissolved or absorbed the fat that had been added to the wool before it was carded or combed. Lye, stale human urine, ashes, and fuller's earth were commonly used. Fullers placed the folded cloth in a vat and trod on it with their feet, periodically removing and refolding the cloth so it would be evenly full.

After fulling, the cloth was dried, stretched, bleached, and perhaps dyed. Teaselers raised the nap by brushing the cloth with the burr of the teasel plant to impart a soft finish. It was clipped smooth by shearmen, pressed, and returned to the merchant for sale. The entire process involved twenty people (not including dyers) for each piece of cloth produced and took at least six weeks. Women worked as carders, combers, and spinners, while men performed most of the other tasks. The finer the cloth, the larger the labor force and the longer the time it took to produce it. (More finely spun yarn required more spinners, for instance). The finishing of worsteds was much simpler (they did not require fulling, teaseling or shearing, for instance), but the market for them was much smaller.

In the fifteenth century, textile manufacturing was an urban industry, controlled by wealthy merchants (drapers) who purchased raw wool, had it turned into cloth, and then sold it, often to other craftsmen who performed the final finishing steps, including dyeing and teaseling. These were capital-intensive crafts, and cloth merchants often preferred not to be involved in them. Before the seventeenth century, most English cloth was dyed and finished in Holland. In England, in addition to merchants

who only bought and sold, clothiers, themselves often master weavers, controlled a great deal of the woolen trade.

In the fifteenth and sixteenth centuries, textile workers dominated the population of towns like Venice and Leiden. By the sixteenth century, however, merchants had discovered that they could avoid the high wages, labor shortages, and quality controls imposed by urban guilds and governments by hiring peasants to do manufacturing work in their homes. Urban merchants continued to control production, but much of the work force was spread out through the countryside. Alternately referred to as the putting-out system, cottage manufacturing, and the *Verlag* system, merchants (*Verlagers*) found they could save money (rural workers could work for less because they produced much of their own food) and increase production at the same time. Trained cottage workers could be as skilled as urban workers, but many alternated farming and manufacturing and produced goods of lesser quality. The high-end woolen trade remained important, but many merchants began to reorient their businesses away from the luxury market and toward lower-quality, lower-priced, and more rapidly produced goods.

The building of fulling mills (first mentioned in accounts c. 1000) that beat the woven cloth with hammers raised by water wheels to replace the labor-intensive hand (or foot) fulling provided another incentive for merchants to put work out into the countryside and was a major determinant of the location of woolen production. In the eighteenth century, when merchants expanded employment to increase production, many rural villages became as much, or even more, dependent on the textile industry as they were on farming. Following the lead of Franklin Mendels, historians now call this intensification of cottage industry proto-industrialization to distinguish it from its earlier, perhaps more benign, manifestation, when cottage workers toiled fewer hours and produced goods for local markets.

NEW MARKETS AND NEW FABRICS

Success in the textile industry was never permanent in the early modern world, and even the seemingly most secure industrial cities could watch their predominance and control of trade decline precipitously. Survival and growth depended on a host of

factors: access to raw materials, including raw wool and chemicals for dyeing; labor supply; access to trade routes and transportation systems, including ships and overland carriages; changing political allegiances; warfare; access to water for washing and fulling; demographic growth or stagnation; consumer demand; government laws and guild regulations; entrepreneurship; and fluctuating international markets.

In the sixteenth and seventeenth centuries, combinations of these factors inaugurated a series of important changes in the textile industry. Flanders, northern Italy, and southern Germany lost their dominance of woolen production to England, the Netherlands, and the Walloon region between the Meuse and Rhine Rivers. The woolen industries of Lille and Hondschoote disappeared rapidly. Venice, the largest producer of luxury broadcloths in the sixteenth century, saw its woolen industry wither away. One region's loss was often another's gain. England's woolen and worsted industries grew markedly with the government's decision to stop exporting wool fleeces in 1660. Leiden, adapting to a growing demand for lighter-weight fabrics, grew from a town of 12,000 in 1600 to a city of 80,000 in 1640, and then was outstripped by the nearby cities of Liège and Verviers, where labor costs were lower.

Often, the key to success was adaptability, especially in the eighteenth century. The economic downturn of the seventeenth century and changing consumer tastes had dampened demand for luxury woolens. Regions that had access to a variety of wool thread and flax or cotton began to produce "the new draperies," hybrid cloths made of both long and short staple wool (serges and says), wool and flax, wool and cotton, and cotton and flax (fustians and siamoises—that is, cotton and linen fabric produced in Normandy). Worsteds production also profited from the demand for lighter-weight cloth.

Cotton fabrics from India and the Levant arrived in Europe in the sixteenth century or earlier. By the eighteenth century, the Dutch and English East India Companies began to import substantial amounts of pure cotton cloth (calicoes) from India and the Levant to Europe. To protect the woolen industry, England forbade the importation of pure cotton cloth in 1700. Other countries followed suit.

Textile Industry. An illustration of a loom for making passementerie lace and a template for a lace pattern, from the *Encyclopédie*, 1751–1772. Lace became popular in the mid-sixteenth century; by the mid-seventeenth century it was being produced commercially and was a particularly important textile product in several regions of France. THE ART ARCHIVE/DAGLI ORTI (A)

Raw cotton and cotton thread continued to arrive, however, imported not only from the Middle East and India, but also, beginning in the early eighteenth century, from the West Indies. The woolen industry remained the largest of the textile industries throughout the eighteenth century, but the market for cotton and linen fabric grew as fast as or faster than the supply of raw cotton. (Europeans were unable to spin cotton thread that was strong enough for warp threads until the introduction of the spinning frame in the 1770s.) The markets for these hybrid cloths of relatively modest quality were substantially different from those for woolen broadcloths. Many cloths were sent to Africa; others were purchased by European peasants, farmers, and urban workers. In both cases, the more brightly colored the cloth, the more it resembled the illegal calicoes and the more popular it was.

In English and Continental cities, woolen and worsted production continued to increase in the eighteenth century, despite the competition of the new draperies. In England this growth was fostered by the creation of urban cloth halls where the clothiers who oversaw the manufacturing of cloth sold their wares to merchants who, in turn, oversaw the finishing, transportation, and marketing of them. The most dynamic sector of the textile industry, however, was in cotton. The supply of raw cotton was far more elastic than the supply of wool and hence less expensive to purchase even though it had to be imported from Asia or the Western Hemisphere. The bulk of the heretofore untapped markets for European textiles lay in warm or temperate zones with hot summers—North America, Africa, south and east Asia, and the West Indies, where lightweight cloths were clearly more desired than heavy woolens.

NEW TECHNOLOGIES

As the eighteenth century progressed, the invention of machines designed primarily to increase both the quantity and quality of cotton yarn made the manufacture of pure cotton fabric possible. Textile machines were not new in the eighteenth century. In 1598 William Lee invented a stocking frame for knitting. By the end of the seventeenth century, it had all but eliminated hand knitting. In 1604 William Dircxz van Sonnevelt invented a ribbon frame that allowed one person to weave twelve ribbons at

a time, and in the 1600s, Italians invented a machine for throwing silk that revolutionized silk manufacturing. At considerable risk, the plans for these machines were smuggled into England in 1717. Not all machines were immediately successful. John Kay's flying shuttle (1733) was slow to catch on because it speeded up weaving, which already consumed yarn faster than women could spin it. John Wyatt's and Lewis Paul's spinning frame (1738) was equally unsuccessful, but by mid-century the cultural climate was ready for innovation. The carding machines invented by Paul and others in the 1750s, James Hargreave's jenny (1765), Richard Arkwright's spinning frame (1769) (also known as the water frame), and Samuel Crompton's mule (1779) made it possible to produce stronger and finer cotton thread than ever before. With machinery came factories and the growth of cotton cities. Between 1760 and 1830, for instance, the population of Manchester, England, increased from 17,000 to 180,000. Edmund Cartwright devised a power loom in the 1780s, but its advantages over hand weaving were slight, and adoption of mechanical weaving came much more slowly than the adoption of mechanical carding and spinning. Finishing processes were also transformed. Chemicals replaced the sun as bleaching agents (sulfuric acid in 1756; chlorine in the 1790s) and cylinder printing replaced the old block press (1783).

Almost all of these machines were invented for the cotton trade, but they could be and were adapted for use in the production of wool fabric. Worsteds adapted more easily to the new technology than woolens did. The spinning frame was used to spin long-staple wool for worsteds. Short-staple wool used in woolens was more fragile and much more difficult to spin by machine, although it, too, was being spun by jennies by the 1780s. The same was true of mechanical weaving when it spread in the nineteenth century. Stronger threads made it easier to weave worsteds than woolens.

At the end of the eighteenth century, the textile industries of Europe were moving rapidly into the industrial era. The era of cotton had begun; worsteds were outpacing woolens; factory production was returning manufacturing to the cities; and markets had expanded well beyond the luxury trade of the fifteenth, sixteenth, and seventeenth centuries.

THEOLOGY. The common impression that the theological climate of late medieval and early modern Europe was monolithic is far from the reality. On the eve of the Renaissance and Reformation, theology was marked by a pluralism that created a state of ambiguity. The various theological schools of the day—nominalism, Scotism, Thomism, Augustinianism, Franciscanism, humanism, and

others—vied for influence and dominance. On many levels, the differences among these schools were minimal, while on others they were profound, resulting in significant disagreements over church teaching.

As the changes of Renaissance society began to take hold, the theological approach of the Middle Ages no longer met the needs of the times and the spiritual longings of the people. The spirit of renewal that characterized the Renaissance called for an adaptation of traditional teaching, an appreciation of the historical context in the study of the Scriptures and the church fathers, and the application of the Gospel to the personal needs of the faithful. Scholasticism, which sought to bridge the gap between faith and reason by bringing reason to bear on theological matters, seemed to many in the Renaissance to be out of touch with contemporary realities. As Scholasticism immersed itself in dialectical speculations, it became more irrelevant, failing to move individuals to a more genuine living out of their Christian commitment. It was Scholasticism’s orientation toward the abstract that drew the criticism of Renaissance thinkers such as Francesco Petrarch (1304–1374) and Desiderius Erasmus (1466?–1536), who proposed the “New Learning” associated with humanism as a means of revitalizing theology. For Erasmus, learning was to lead to virtue, scholarship to God, and thus, the restoration of theology was to be the means toward the revival of a living and lived Christianity.

THOMISTIC REVIVAL

Besides the humanist critique, Scholasticism also came under assault by the Protestant reformers. The *Summa Theologica* of Thomas Aquinas (1225–1274) was criticized for its treatment of Aristotle and the Holy Scriptures. Ironically, the polemical engagement with Scholasticism that came to characterize the Renaissance and the Reformation resulted in a rehabilitation of Thomism itself. Leading this rebirth of Thomism was the Dominican Jean Capréolus (c. 1380–1444), whose defense of the theology of Thomas sparked a new interest in his thought in the late fifteenth century. More important for this revival of Thomism was the work of another Dominican, Tommaso de Vio (1469–1534), known as Cajetan. Between 1507 and 1520 Cajetan wrote what was to become an extremely

influential commentary on the *Summa Theologica* of Thomas, which exhibited a refreshing originality.

Thomism received a powerful stimulus and a wide dissemination from the Salamanca School, especially with the work of the Spanish Dominican Francisco de Vitoria (1486?–1546), who based his teaching largely on the *Summa Theologica*. Vitoria evolved his own method by considering questions rather than particular sayings of the *Summa Theologica*, initiating a new school of Thomistic thought. The popularity of his lectures and conferences allowed him to have far-reaching influence.

The new Scholasticism that resulted from the revival of Thomism sought, like its medieval counterpart, to reconcile faith and reason. But, unlike the abstractions and speculations of late medieval Scholasticism, it sought a theology that was simpler, clearer, and more relevant to the lives of people. In many ways it was more practical as it reexamined the method of theological proof, confronted the issues raised by the reformers, sought answers to the ethical issues raised by the colonization of the New World, and emphasized popular religious instruction and preaching. By the middle of the sixteenth century, Thomism seemed to have triumphed over other theological schools. Not only did Thomists dominate the Spanish universities, but at the Council of Trent (1545–1563), Thomism was clearly in ascendancy. Many of the Tridentine decrees reflected the teaching of Thomas, as did the Roman catechism and the theological manuals used by the seminaries. Many of the new religious orders of the period, especially the Society of Jesus, declared Thomas to be their official teacher. The constitutions of the society legislated Thomas, along with the Bible, as the basic text in theology. Given this Thomistic emphasis within the Society of Jesus, many of the leading Thomists of the late sixteenth-century were Jesuits—Robert Bellarmine (1542–1621), Francisco de Toledo (1515–1582), and Francisco Suárez (1548–1617). The climax of this Thomistic revival came with the declaration of Thomas as a “Doctor of the Church” by Pope Pius V in 1567.

DOGMATIC THEOLOGY

Humanism’s critique of Scholasticism along with its desire for a scripturally based theology led to the development of dogmatic theology as a distinct

theological discipline. The major figure in this development was the Dominican theologian Melchior Cano (1509–1560). In his *De Locis Theologicis* (1563), he put forth the essential role of what he called *auctoritates* (‘positive sources’) in the work of theology—Scripture, the church fathers, and the councils. He demonstrated that theology took its principles from these sources. Thus, the quality of the conclusions in theology was determined by the quality and certitude of these sources. Cano’s work looked to formulating these sources, establishing the criteria for assessing their value, and to positing the conditions under which they best served their purpose. The work created a theological methodology that was decisive in the development of a dogmatic theology that was positive in nature.

Dogmatic theology received an important impetus from the Council of Trent, which saw the need to provide an organized body of common doctrine. This need, together with the concern for the sources and the strong sense of dogma emerging from Trent, constituted the first stage of a recognizable dogmatic theology. The first aim of such a theology was to present the actual teaching of the church together with the theological note proper to it, followed by the exposition of that teaching. Hence its aim was pedagogical.

PATRISTIC AND BIBLICAL THEOLOGY

Humanism’s call for a return to the sources opened up new possibilities for theology. The importance placed on the study of the Bible, along with the revival of the writings of the church fathers, had a significant effect on theology in the Renaissance and the Reformation. In the Scholastic approach to theology, the Scriptures had lost their centrality and were relegated to an arsenal of evidence called upon to buttress the speculative arguments of the theologians. However, for the humanists, the concern was to restore Scripture to its place of centrality from which theology itself would emerge. For this to happen, theology needed to rely not on the Latin Vulgate, but rather on the original text of the Scriptures. Erasmus, in *Education of a Christian Prince* (1516), argues that the great weapon of the Christian is the knowledge of Holy Scripture, since it is the wellspring of Christian piety. Through a return to Scripture, theology would be reformed. In turn,

this scriptural revival would lead to a reform of Christian life and society.

The recovery of the patristic sources was an equally important contribution of humanism to theology. Here again, Erasmus played a significant role. He saw the fathers as engaged in genuine theology as opposed to the theologians of the day. Their authority derived from their closeness in time as well as in spirit to the divine source, and their chief value lay in their interpreting and helping to understand the Scriptures. Moreover, the writings of the fathers instructed and inspired individuals in living a Christian life. This reflects Erasmus's understanding of theology as practical in nature, as a guide to life rather than a subject for debate, and as a matter of transformation rather than speculation. Since Erasmus saw in the church fathers a more authentic and effective transmission of the teachings of Christ, he sought to make them better known through his patristic editions.

Besides the restoration of theology, the writings of the church fathers became the arsenal for controversial theology. This form of theology, which was seen as a first step toward the renewal of Catholic theology, developed as an answer to the doctrinal novelties of the reformers. The fathers provided the necessary witnesses for those aspects of Catholicism that were being challenged by the reformers. Controversial theology set a clear line of demarcation between the Catholic faith and the teachings of the reformers. Consequently, the teaching of theology entailed discriminating the true from the false—that is, that which is Catholic from that which is heretical—in order to prepare for the battle against the adversary. Controversialists rose up not only in Germany with Johann Eck (1486–1543) and Peter Canisius (1521–1597), but also in England with John Fisher (1469–1535) and Cardinal Reginald Pole (1500–1558). The most famous of the controversialists was Robert Bellarmine, who held the chair in controversial theology at the Roman College run by the Society of Jesus. Bellarmine's method was highly influential as he surveyed the whole field of Protestant-Catholic differences. A similar approach was employed by Francisco Suárez, who also taught at the Roman College. Suárez made clear distinctions between traditional church teachings and the novelties of the reformers. Suárez, along with Bellarmine, came to symbolize the long

line of controversialists who championed the cause of the Counter-Reformation.

MYSTICAL THEOLOGY

Another offshoot of the return to the sources was the deepening of mystical theology. The renewed interest in Pseudo-Dionysius (c. 500 C.E.), along with the scriptural revival, particularly of the Old Testament, fostered the mystical theology of the Renaissance. The mystical theologian focused on those Christians who, having conquered sin and its evil inclinations, and having grown in grace, drew near to Christ and were united to him. Mystical theology was not concerned with the good or the better so much as what was the best, which consisted in intimate union with God. Thus, mystical theology emphasized conforming the human will to the will of God through the successive stages of purgation, illumination, and contemplation. Mystical theology was especially vital in the life of St. Teresa of Ávila (1515–1582) and St. John of the Cross (1542–1591).

MORAL THEOLOGY

Throughout the Middle Ages practical handbooks for confessors were always available to assist the faithful in the living out of a good life. The Thomistic revival of the fifteenth and sixteenth centuries was a step of considerable importance in the evolution of moral theology, which differed from its medieval counterpart. Moral theology came to be understood as the science of Christian life and action. It treated of the last end of the human person, of the morality of human acts, of natural and positive law, and of ecclesiastical sanctions within the context of theological reflection. Thus, it became a science distinct from dogmatic or speculative theology, embodied in a new literary genre, the *Institutiones morales* (Moral instructions).

Distinct from moral theology is ascetical theology, which is less concerned with the good and the evil, the licit and the illicit, the permitted and the forbidden, but is more interested in the greater and lesser good. The proper function of this branch of theology is to deal with the illuminative way.

MARTIN LUTHER (1483–1546)

Overthrowing the Scholasticism that he knew, which was mostly nominalist in orientation, Martin Luther went back to the Scriptures to rediscover the

message of salvation. Distrustful of human reason in fallen humanity, he sought to substitute for Scholastic theology a theology that was devout and scriptural. Proceeding from the authority of Augustine, Luther initiated a movement for reform of Christian doctrine and life that shattered the unity of Christendom.

The theological reformation initiated by Luther resulted from a rediscovery of God through Christ in the Scriptures. This rediscovery culminated in the twin banners of the Protestant Reformation—*sola fide* (by faith alone we receive Christ and his righteousness) and *sola scriptura* (authority resides in the Bible alone). The problem that plagued Luther was the concept of the *iustitia Dei*, which he understood as a punitive justice. In his view, God was a stern judge who weighed merit against sins. It was impossible, in Luther's mind, for sinners to stand before God in righteousness. This was the theological dilemma that culminated in the tower experience, so called because his new insight into the Gospel came to him in the tower of the Augustinian monastery in Wittenberg. The insight he gained in this experience led Luther to understand God's righteousness not as a demanding justice, rather as his mercy. The righteousness of God is no longer a demanding justice before which an individual may stand by virtue of his or her own good works and the forgiving grace of God. The righteousness of God is now primarily the grace which transforms and makes one righteous. Human activity no longer has any part in the ultimate determination of one's destiny. Grace alone enables one to stand before the righteousness of God. Humanity is righteous before God because of the atoning sacrifice of Christ. Belief in that act makes one just.

The essence of Luther's theology rested upon a different conception of the relationship between God and humanity. From his view of salvation based on faith grew most of the other doctrines of Protestantism. Good works played an important role in Luther's theology, but always as a result of faith, not the cause of it. Faith frees the individual by separating works from salvation. Once freed from the continual concern over salvation, the true believer could devote his or her life to doing good out of gratitude to God and not because it would contribute to salvation. Therefore, faith is not the end of Luther's theology, rather its beginning. From faith

grows love, the active expression of the true Christian's faith. Thus, many elements of Catholicism were rejected as unnecessary.

JOHN CALVIN (1509–1564)

The heart of John Calvin's theology, the core of which he acquired from Luther, was belief in the transcendent majesty and absolute sovereignty of God. The knowledge of God was the ultimate aim of life for Calvin. This knowledge was not an abstract knowledge, rather knowledge of God in relation to humanity; it could be acquired through creation and through Scripture. In the Scriptures we know God through Jesus and thus, Calvin understood the Bible as the only authority for our knowledge of God, which reveals all that should and can be known about Him.

However, Calvin insisted that the essence of God is inscrutable and that an infinite chasm separates the divine from the human. Due to the Fall, all humanity is corrupt and spiritually deformed. Therefore, humans are worthless in the sight of God. Yet, despite humanity's depravity, God did not abandon humans. The only mediator possible between God and humanity is Jesus. Through his atoning death on the cross, reconciliation was made possible. Through the redemptive grace of Christ and the gift of faith received from the Holy Spirit comes a spiritual union with Christ. This union brings about a regeneration or sanctification that renders the believer "born again," becoming a new creature in Christ and the inheritor of salvation. This results not from any human merit or effort but from faith in Christ.

Calvin took this idea one step further. The justifying grace of Christ is not for everyone, only for those whom God preelects. God's word germinates only in the elect, those whom he has already chosen for salvation even before their creation. Only on these individuals does Christ's redemption have any effect. The rest of humanity is predestined to perdition.

CONCLUSION

Despite the critiques launched against the church by many Renaissance humanists, most remained within the institutional framework of Catholicism. Lutheranism and Calvinism diverged from the mainstream of the Renaissance when it exaggerated the Augus-

tinian focus on the depravity of humanity and the servitude of the human will.

THIRTY YEARS' WAR (1618–1648).

The Thirty Years' War was one of the greatest and longest armed contests of the early modern period. Some historians have argued that it was a series of separate wars that happened to overlap in time and space rather than one coherent sequence of military campaigns in which a clearly defined set of issues

was at stake throughout. If one looks at the Thirty Years' War in a European context, there is some truth in this argument. However, in central Europe, in particular in the Holy Roman Empire, the military and political events of the thirty years between the defenestration of Prague in May 1618 and the signing of the Westphalian peace treaties in October 1648 formed one continuous conflict and were in fact already perceived as such by most contemporaries.

THE CAUSES OF THE WAR

For the outbreak of the war the deepening crisis of the Holy Roman Empire was of crucial importance. The crisis had a constitutional and political as well as a religious dimension. The emperor's prerogatives had never been clearly defined; a ruler who knew how to exploit his considerable informal powers of patronage could enjoy a great deal of authority, but a weak monarch could easily be reduced to a mere figurehead. This was very much Rudolf II's (ruled 1576–1612) fate during the last decade of his reign. The aging emperor, who was increasingly mentally unstable, was distrusted by both Catholics and Protestants. Moreover, he had managed to antagonize his own family. The power vacuum created by the collapse of his authority enabled ambitious princes such as Maximilian I, the duke of Bavaria, or Frederick V, the elector palatine, to pursue their own agenda. Their attempts to exploit the simmering religious conflict in Germany, which found its expression in the foundation of the Protestant Union, led by the Palatinate, in 1608 and the Catholic League (*Liga*), led by Bavaria, in 1609, were bound to undermine peace and stability. Germany had in the past been largely spared the horrors of religious warfare, thanks to the Religious Peace of Augsburg (1555). However, many problems had been left unresolved in 1555, such as the status of the ecclesiastical principalities that were ruled by Protestant prince-bishops, and of ecclesiastical property confiscated and secularized after 1555. The status of the Calvinists, who almost all Catholics and many Lutherans wanted to exclude from the benefits of the peace settlement as heretics, was also controversial. Initially the Imperial Chamber Court (*Reichskammergericht*)—one of the two highest law courts in Germany—had managed to settle disputes between the religious antagonists, but from the 1580s onward it became increasingly paralyzed, and the Im-

perial Diet (*Reichstag*) equally failed to provide a forum for compromise. The confessionalization of politics, culture, and society in the later sixteenth century had in fact created a climate of all-pervasive distrust that made such a compromise almost impossible. The enthusiastic adherents of both Counter-Reformation Catholicism and the eschatological worldview that most Calvinists and some Lutherans subscribed to saw the outbreak of armed conflict in the long run as both inevitable and even to some extent desirable.

However, whereas such mental attitudes were an important ingredient in the generally belligerent atmosphere that formed a crucial precondition for the outbreak of hostilities, their more immediate cause was the confrontation between the emperor and the Estates of Bohemia and its neighboring principalities, in particular Moravia and Upper Austria. Whereas Emperor Matthias (ruled 1612–1619) and his advisers wanted to recover the ground that had been lost by the Catholic Church and the ruling dynasty alike in the preceding years of domestic crisis, the Protestant opposition emphasized the elective character of the monarchy in Bohemia and its subjection to the control of the Estates. They vigorously defended the privileges of the Protestant Church that had been confirmed and extended during the last years of Rudolf II's reign. Reacting to the relentless Counter-Reformation offensive, which had, by a combination of missionary activity, generous imperial patronage for converts, and brute force already been successful in Styria, Carinthia, and elsewhere, they decided to kill the emperor's governors in Prague in the spring of 1618 by throwing them out of the windows of the imperial palace during a meeting of the Estates. The governors miraculously survived this defenestration, but armed conflict had now become unavoidable. Soon both sides tried to find allies both in Germany and in Europe. In Spain the fall of the duke of Lerma as royal favorite in 1618 marked the victory of those factions at court that favored a more assertive and warlike policy in central Europe, whereas at the same time in the Netherlands the adherents of rigid Calvinism and of an aggressively anti-Spanish policy gained the upper hand in 1618–1619 during and after the Synod of Dort (Dordrecht). Thus a renewal of the twelve-year truce between Spain and the Netherlands that had been signed in 1609 be-

came unlikely at the very moment when the Bohemian Estates rose against the Habsburgs. A war in Bohemia and Germany was therefore bound to become part of a wider European conflict sooner or later.

THE FIRST DECADE OF THE WAR

In August 1619 the Estates of Bohemia deposed Ferdinand II, who had officially succeeded Emperor Matthias as king of Bohemia in March, and elected Frederick V, elector palatine, the leader of the Calvinists in Germany, in his stead. However, Frederick's rule was short lived. In November 1620 his army suffered a crushing defeat in the Battle of the White Mountain near Prague against the emperor's army, which had been reinforced by troops from the Bavarian-led Catholic League and by Spanish regiments. Whereas the Catholic League had decided to support Ferdinand, the Protestant Union preferred to stay neutral and was soon dissolved. In fact, some Protestant rulers, in particular John George of Saxony, openly supported the emperor. The fact that Ferdinand had managed to have himself elected emperor in the summer of 1619 gave him an authority that few German rulers dared to challenge openly for the time being. The next years were marked by an almost unbroken series of Catholic victories in central Europe. The Palatinate was occupied by Bavarian and Spanish troops in 1622, the palatine electoral dignity was transferred to Maximilian of Bavaria, and the army of the Catholic League led by Count Johann Tserclaes of Tilly threatened to dismantle the remaining Protestant strongholds in northern Germany. The troops of the Dutch Republic were too busy defending their own country to intervene in Germany. In fact, the important Dutch fortress of Breda had to surrender in 1625 to Spanish troops, a victory immortalized by Velázquez in his famous painting, *La rendición de Breda* (1634–1635; The surrender of Breda). However, King Christian IV of Denmark, who was also, as duke of Holstein, a prince of the empire and who hoped to acquire various prince-bishoprics in northern Germany for members of his family, decided to stop Tilly's advance in 1625. Hoping for financial and military support from the Netherlands and England—Charles I of England was the exiled elector palatine's brother-in-law—he mobilized the Imperial Circle (*Reichskreis*) of Lower Saxony for the Protestant cause. However, he had not antici-

pated that the emperor would raise an army of his own (counting initially 30,000 soldiers and growing fast), commanded by Albrecht von Wallenstein, a Bohemian nobleman and the greatest military entrepreneur of his age. Christian's troops were routed at Lutter am Barenberge (1626). Christian's ally Charles I of England was equally unsuccessful in his fight at sea against Spain, and France, which might have given support to the opponents of the Habsburgs, was paralyzed by a Protestant revolt during the years 1625–1628, in which England became involved in 1627. Thus Ferdinand II was able to crush his enemies. Christian had to withdraw from the conflict and signed the Peace of Lübeck in 1629, giving up his claims to several prince-bishoprics in northern Germany but retaining Holstein and Schleswig. However, Ferdinand failed to exploit his success adequately. His allies in Germany, in particular Maximilian of Bavaria, were, in fact,

increasingly apprehensive about the predominance of Habsburg power and the close cooperation between Ferdinand II and Spain. Moreover, they resented the arrogant and ruthless behavior of Ferdinand's commander-in-chief, Wallenstein, who had imposed enormous financial burdens on friend and foe alike, raising contributions for his 100,000-man army almost everywhere in Germany. Wallenstein had to resign in 1630 under pressure from Maximilian of Bavaria and other princes. Ferdinand tried to rebuild a united Catholic front in 1629 by passing the Edict of Restitution, which was designed to give all ecclesiastical property secularized since 1552/1555 back to the Roman Catholic Church. The potential consequences for Protestantism were disastrous. Protestantism was not outlawed but was likely to be reduced to the status of a barely tolerated and marginalized religious community in Germany.

FROM CATHOLIC AND HABSBERG TRIUMPH TO ABORTIVE COMPROMISE, 1629-1635

At this stage, however, the Habsburg ascendancy in Europe, successfully reasserted in the early 1620s, was seriously challenged by France and Sweden. In 1628 La Rochelle, the stronghold of the French Huguenots, had been taken by a royal army led by Louis XIII and the prime minister, Cardinal Richelieu, in person. France was now free to intervene in central Europe. Initially, however, French troops confronted Spain only in Italy (the War of the Mantuan Succession, 1628-1631). Here they defied Spanish attempts to occupy the Duchy of Mantua after the main line of the native dynasty, the Gonzaga, had died out in 1628. The emperor had sent troops to northern Italy to help Spain, but withdrew these troops in late 1630. The troops were now badly needed in Germany itself, where Gustavus II Adolphus of Sweden landed his army on the coast of Pomerania in July 1630. Sweden felt threatened by plans to build an imperial fleet in the Baltic and by Habsburg support for its old enemy Poland. Moreover, the fight for Protestantism was an essential part of the claim to legitimacy of the Swedish dynasty, the Vasas, which had won the crown in the 1590s by ousting the older, Catholic branch of the family, which continued to rule in Poland.

The Edict of Restitution had antagonized even those Protestants who had preferred to stay neutral or had in fact supported the emperor for most of the 1620s. Their last doubts were dispelled when Magdeburg, a town of great symbolic importance to Protestants (it had resisted a long siege by Catholic armies in the late 1540s) was besieged by Tilly, taken by assault, sacked, and set on fire in May 1631. Brandenburg and Saxony now joined the king of Sweden in the fight against the Catholic forces. Having lost the battle of Breitenfeld in Saxony in September 1631, Tilly retreated to southern Germany and was decisively beaten at Rain am Lech in April 1632. Even Munich was now briefly occupied by Swedish troops, and an army from Saxony evicted the imperial garrisons from Silesia and Bohemia. In despair Ferdinand II decided to recall Wallenstein to reorganize his army. In the battle of Lützen in November 1632, Gustavus Adolphus won a last victory against Wallenstein but died in action. Sweden, however, maintained its superiority for a further two years. In 1634 Spain sent a fresh army to Germany across the Alps under the com-

mand of one of Philip IV's brothers, the Cardinal Infante Ferdinand. In February Wallenstein, who was reluctant to cooperate with Spain and was suspected of treasonous dealings with the enemy, was assassinated in Eger on the emperor's orders. Together with the future Emperor Ferdinand III, the Cardinal Infante inflicted a crushing defeat on the Swedes at Nördlingen in southern Germany in September. As far as Germany was concerned, Nördlingen might have been the end of the war. Ferdinand II did not repeat the mistakes he had made in 1629 by pursuing an Ultra-Catholic policy. Instead he reached a compromise with the moderate and essentially loyal Lutherans led by Saxony. The Peace of Prague (1635) did not revoke the Edict of Restitution, but suspended it for forty years. The position of Protestantism in northern and eastern Germany was now reasonably safe once more. However, no satisfactory settlement was reached in the Palatinate, in Hesse, or, for the time being, in Württemberg. In constitutional terms the emperor's authority had been considerably strengthened. He was now officially commander-in-chief of all armed forces in the empire. The Catholic League was dissolved, and only Saxony and Bavaria continued, with the emperor's permission, to maintain armies, which remained semi-independent. This change in the constitutional balance, however, was silently resented by many German princes and duly revised in 1648. In any case the Peace of Prague was deficient because it had failed to make provision for buying off the Swedes, who still maintained troops in many parts of Germany—in particular in the north—with territorial or financial concessions. In fact, the settlement of 1635 proved abortive, as it was rejected by both Sweden and France.

THE LAST PHASE OF THE WAR AND THE ROAD TO SETTLEMENT

France was now faced by the prospect of a Spanish offensive supported by the emperor's army against the garrisons it had placed beyond its frontiers, in Lorraine, Alsace, and along the upper Rhine and Moselle rivers in the preceding years. In answer to an attack on the prince-bishop of Trier, who had become a French ally and client in 1632, Louis XIII declared war on Spain in May 1635. With the emperor's own declaration of war on France in March 1636, the war in Germany had, it seemed, finally

fused with the all-European conflict between Spain and its enemies, which had already decisively influenced events in the empire in the past. Whereas French financial subsidies helped Sweden gradually recover from the defeat of Nördlingen, Spanish resources became increasingly inadequate to finance the worldwide war effort of the monarchy in the early 1640s. Spain suffered important naval defeats against the Dutch off the English coast in 1639 (Battle of the Downs) and near Recife in Brazil in 1640. Moreover, in 1640 both Catalonia and Portugal revolted against Castilian rule in an attempt to shake off the fiscal and political burden imposed on them by warfare. Spain did not recognize Portugal's independence until 1668 and managed to reconquer Catalonia in the 1650s. Nevertheless, it was no longer able to launch major offensive operations in central Europe. Emperor Ferdinand III (ruled 1637–1657), reluctantly supported by the majority of the German princes, was now virtually on his own in his fight against both France (which had committed a major army to operations in southern Germany) and Sweden. Nevertheless, the war dragged on for another eight years.

The logistics of warfare in a country that had been utterly devastated by continuous fighting and lacked the most essential provisions proved a major obstacle to large-scale offensive operations. For this reason, victories won in battles could rarely be fully exploited. Moreover, a war between Denmark and Sweden (1643–1645) gave the emperor's army time to recover after the devastating defeat it had suffered in the second battle of Breitenfeld in November 1642. However, in March 1645 the Swedes beat the imperial army decisively at Jankov in Bohemia. Although Ferdinand III was able to buy off Sweden's ally Transylvania, which had once more, as in the 1620s, intervened in the war (supported halfheartedly by the sultan), by territorial and religious concessions in Hungary, he was now forced to come to terms with his opponents. His allies in Germany became increasingly restless and either withdrew from active participation in warfare altogether or insisted on ending the war. Reluctantly the emperor entered into negotiations with Sweden in Osnabrück and with France in neighboring Münster in autumn 1645. Against his wishes, the German princes and Estates were allowed to participate in the peace conference, sending their own

envoys to Westphalia. Partly because Ferdinand hesitated to abandon his old ally Spain, it was nevertheless three years before a settlement was reached. Peace between France and Spain proved elusive. So when the peace treaties were signed at Münster and Osnabrück on 24 October 1648, the Franco-Spanish conflict was deliberately excluded from the settlement. The treaties, known as the Peace of Westphalia, therefore failed to provide the basis for a truly European peace. The complicated legal arrangements that dealt with the various constitutional and religious problems of the Holy Roman Empire, on the other hand, proved remarkably long-lasting and stable, being invoked right up to the end of the empire in 1806.

THE NATURE AND IMPACT OF WARFARE

Most countries—the Dutch Republic, which benefited from a flourishing economy in the midst of military conflict, was probably one of the few exceptions—waged war between 1618 and 1648 with financial resources that were grossly inadequate. Some countries such as Sweden nevertheless managed to finance their armies for long periods of time primarily out of contributions raised in areas under military occupation. Others tried, with limited success, to rely on taxation. France, for example, managed to double its income from domestic revenues in the 1630s and early 1640s. However, the enormous fiscal pressure provoked a series of popular revolts in France that prevented further increases in taxation and finally led to bankruptcy and civil war in 1648–1652. Most participants in the war entrusted the raising and maintaining of troops at least to some extent to military entrepreneurs who had their own sources of income and credit, thereby complementing the insufficient resources of the state. These entrepreneurs hoped to recoup their investments and to make a profit by extorting payments, not to mention downright plunder and confiscation, from occupied provinces. The hardship this involved for the civilian population was considerable. France, however, which was reluctant to rely on military entrepreneurs because of the dangerous domestic implications of such a system, was hardly more successful in asking noblemen to pay for the units under their command partly out of their own pockets without giving them, in compensation, full legal ownership of their regiments. Spain initially had a fairly sophisticated state-controlled system of

organizing and financing warfare, but gradually more and more responsibilities such as the recruitment of soldiers were delegated to local magnates and urban corporations, and thereby decentralized. This phenomenon may be seen as a wider-ranging process of administrative refeudalization, as some historians have argued.

The often chaotic way in which armies were recruited and financed was at least in part responsible for the widespread lack of discipline among soldiers often remarked upon by contemporaries. Although some of the accounts of wartime atrocities, such as most or all tales of cannibalism, for example, have to be dismissed as unreliable, the excesses soldiers regularly committed when dealing with the local population in friendly as much as in enemy provinces were sufficient to severely disrupt civilian life. Combined with the rapid spread of infectious diseases among soldiers and civilians alike and the partial breakdown of trade, commerce, and agriculture, these effects of warfare had serious demographic consequences. This was true in particular for the Holy Roman Empire but to a lesser extent also for some areas of northern Italy and of France. In the empire population figures were reduced by at least 25 percent and possibly by up to 35 to 40 percent (about 6 million) during the course of the war. Some regions in northeastern Germany such as Pomerania and parts of Brandenburg, but also Württemberg in the southwest, had hardly more than a third of their prewar population in 1648. It took Germany almost a hundred years to recover demographically from the war. Nevertheless, older accounts that have seen the war, and also the Peace of Westphalia, as responsible for a general decline of the Holy Roman Empire and the German states no longer command widespread assent. Not only did the empire survive as a political and legal system providing reasonably effective protection and security to its members, but the rise of the Habsburg Monarchy after 1648, for example, and the flourishing baroque culture of many German courts in the later seventeenth century, show that in some areas at least the war had brought about changes that stimulated rather than stunted new growth once peace had been regained.

THIRTY-NINE ARTICLES. See *Church of England*.

THOMASIVS, CHRISTIAN (1655–1728), German philosopher. Christian Thomasius was the leading legal theorist and university reformer in Protestant Germany during the early Enlightenment. A self-consciously controversial figure who built on the writings and influence of his mentor Samuel von Pufendorf (1632–1694), he developed a new philosophical outlook, eclecticism, which united all of his contributions to many intellectual fields. It also underpinned his high-profile assaults both on the outmoded Scholastic pedantry of German university life and on several contemporary instances of what he took to be intolerance and superstition in wider society, notably witchcraft prosecutions and the use of torture to extract confessions.

He was the son of Jakob Thomasius, himself an influential Aristotelian moral philosopher of the Altdorf School, which sought to introduce some of the ideas of Francisco Suárez (1548–1617) into German Protestant Scholasticism. Trained and educated at the Universities of Frankfurt an der Oder and Leipzig, he was a product of the intellectual synthesis between Lutheran Protestantism and Scholastic Aristotelianism, which had been brokered originally by Philipp Melancthon (1497–1560). But Thomasius broke decisively with this intellectual orthodoxy when appointed as a young *Privatdozent* at Leipzig in the 1680s: he was the first academic to regularly give lectures in German as opposed to Latin, a practice he later carried through into his published writings. He was required to leave Leipzig in 1690 and sought employment in Prussia at the newly founded University of Halle, where he went on to hold senior chairs in philosophy and law. During this transitional period he developed his "practical philosophy" and initial proposals for reform of the traditional university curriculum. In a series of works, notably *Institutiones Jurisprudentiae Divinae* (1688; Institutes of divine jurisprudence) and *Introductio ad Philosophiam Aulicam* (1688; Introduction to court or civil philosophy) he transformed the innovative epistemological insights of Samuel Pufendorf's *De Jure Naturae et Gentium* (1672; On the law of nature and of nations) into a radical separation of moral philosophy from theology.

What drove this program was not a commitment to "Enlightenment rationality," as has been argued anachronistically by some historians, but a perception that the mingling of theology and moral and political sciences within the framework of metaphysics had produced a fundamental form of institutionalized corruption that was damaging both to true religion and to healthy philosophy. Only by separating theology and ethics could religion be saved from mere dogmatism, and a useful preparatory curriculum devised that would produce the jurists, administrators, and pastors appropriate for a coherently governed and properly ordered absolutist state. Educational reform, stemming from a revision of the traditional responsibilities of the faculties of philosophy, law, and theology, would thus usher in substantial changes for ecclesiology, political responsibility, and confessional coexistence. On this

account Thomasius offered a powerful program for completing the desacralization of state forms, a process left incomplete in the political and philosophical debates that had followed the Peace of Westphalia in 1648. Yet this was undertaken not on behalf of the cause of secularization but rather so that Protestant Christianity could acquire once more a purified spiritual identity free from the accretions of “priestcraft.” True religion was to be a matter of promoting the inward relationship of the individual with Christ in the manner of the early church. At first, these convictions naturally drew Thomasius close to the contemporary doctrines of the Pietists. However, he and his followers drew back from this assimilation once it became clear that Pietism would not accept his radical reduction of the state’s right to intervene in religious affairs to the minimal level of threats to civil safety. In this respect too, Thomasius went well beyond the more conservative positions of Pufendorf.

Thomasius was considered as a thinker of weight and significance for much of the eighteenth century, and until the 1750s his views were propounded at German universities against the doctrines of Christian Wolff (1679–1754), Leibniz’s most distinguished follower. However, the restriction of the publication of many of his works to German limited his intellectual influence beyond German borders, as was not the case with Pufendorf’s Latin texts. Moreover, the antisystematic, practical, and problem-solving bias of his work left it more vulnerable to supercession once the debates of his own day had faded from the forefront of political and intellectual discussion. In sum, Thomasius can be considered as one of the first writers in Germany to place the individual at the heart of moral and legal theory, although he did not draw the same liberal consequences for political theory as were extracted elsewhere by John Locke (1632–1704) and other contemporary philosophers. In this respect, together with other thinkers in the German Enlightenment, he did not substantially shift his account of sovereignty far from that of Thomas Hobbes (1588–1679), a balance that emphasizes his transitional status between the thought-world of the baroque and the fully mature Enlightenment.

TIMOTHY HOCHSTRASSER

3 MAY CONSTITUTION. The first Polish constitution was adopted by the Four-Year Sejm (parliament) on 3 May 1791. It was the first such basic law in written form in Europe and the second in the world after the constitution of the United States (1787). The Constitution of 3 May was drafted at the Four-Year Sejm (1788–1792) by reformers led most actively by King Stanisław II August Poniatowski, Hugo Kołłątaj, and Ignacy Potocki. The constitution was preceded by two acts regarded as integral to it: the Reorganization of the *Sejmiki* [provincial diets] Act (adopted on 24 March 1791) and the Act on the Status of Towns and Townsmen’s Rights (18 April).

In accordance with Enlightenment ideas, the Constitution and these two related documents introduced the principle of the nation’s sovereignty and the separation of the legislative, executive, and judicial powers. Landless noblemen (usually dependent on magnates) were excluded from the Sejm and the *sejmiki*, and townsmen were given the opportunity to acquire nobility through the purchase of a landed estate or by virtue of services rendered to the country or professional work. The citizens of royal towns were guaranteed personal immunity and were granted the right to purchase landed estates and hold junior official posts. The towns received the right to send their representatives to the Sejm, where they would have an advisory voice on matters concerning towns. State protection of the Jews was confirmed. The constitution maintained serfdom, but peasants were to be put under the protection of the law and the government, *inter alia* with regard to contracts concluded with landowners.

The constitution abolished the election of kings; after the death of the current king, the throne

was to be hereditary in the Saxon dynasty. Legislative power was vested in a bicameral Sejm (with a Chamber of Deputies and a Senate), which was to be responsible for legislation and taxation and would have broadly conceived control over the government as well as jurisdiction in offenses against the nation and the state. Laws were to be adopted by a majority vote; the deputies (204 plus 24 plenipotentiaries of towns) were to be elected for a term of two years. The competency of the Senate was restricted to a suspensory veto; if the Chamber of Deputies upheld its decision, the bill became law without the consent of the Senate. The role of the *sejmiki*, and indirectly also of the magnates, was restricted. The executive was strengthened: confederations (a form of legal rebellion) were banned and the *liberum veto* (the principle of unanimity that allowed a single deputy to dissolve the Sejm and invalidate its decisions or even to prevent it from assembling) was abolished.

The Council of Ministers, called the Guardians of the Laws, was to be the highest executive body. It was to be composed of the king, who had the decisive voice, the primate, and five ministers, and was to direct the central administration and supervise five commissions (ministries)—education, foreign affairs, justice, war, and treasury. The monarch was responsible to no one, while the ministers were responsible to the king and the Sejm for their policies and could be brought before the Sejm court if they broke the law—this was thus the world's first legally formulated principle of ministerial responsibility. The reform of the judiciary united the various noblemen's judicial courts into uniform collegiate country courts of first instance; courts of appeal were set up in towns. The constitution was a great step forward toward a centralized government. It laid the foundations for cooperation between landowners and rich burghers and opened possibilities for the further political and legal transformations that would be indispensable for the development of Poland's fledgling capitalism.

The Constitution of 3 May was supplemented on 20 October 1791 by the Mutual Pledge of the Two Nations, which emphasized the federal character of the state and the equal status of the Grand Duchy of Lithuania and the Polish Kingdom. The Duchy was to have the same ministerial posts as Poland, and it retained its separate system of laws.

This was a compromise between the Lithuanians' aspiration for sovereignty and reform of the political system, on the one hand, and the tradition of union between the two states and the preservation of the Commonwealth's federal character, on the other. The constitution gained the support of the majority of the nobility, townsmen, and many magnates. In 1792 its opponents set up the Targowica confederation in defense of the old system and asked Russia to intervene militarily. The achievements of the Constitution of 3 May were canceled by the fall of the Commonwealth with the Third Partition in 1795.

MARCIN KAMLER

TIEPOLO, GIOVANNI BATTISTA (1696–1770), Italian painter, master of Venetian school. Tiepolo was famous in his own lifetime as a superb painter in fresco and a brilliant draftsman. A highly inventive artist, he could create spectacular effects in difficult sites, from the narrow gallery at the patriarchal palace at Udine in the mid-1720s to the vast staircase ceiling in the Residenz at Würzburg in the early 1750s. Contemporaries recognized his spirited, dynamic approach to subject matter and his frankly sensuous manner of painting. Tiepolo is comparable in his restless energy and imaginative power to Peter Paul Rubens, and essentially he worked with a similar baroque language of myth, allegory, and history, which he infused with a sense of freshness and modernity. His approach to religious art is characterized by candor and naturalism, while he was responsive to the different concerns of patrons and viewers at a time when the church was faced with new kinds of devotion and

criticism. With the advent of neoclassicism, Tiepolo's art fell from favor: In an age that prized archaeological correctness, rationality, and ideals of improvement, his witty, Veronese-inspired conception of historical or classical subjects seemed frivolous, while his visually seductive qualities were seen as inimical to the serious intellectual aims of the new art. Nevertheless, his drawings and oil sketches continued to appeal to collectors, including Antonio Canova.

The son of a Venetian shipping merchant, Tiepolo was apprenticed in 1710 to Gregorio Lazzarini (1655–1730), an artist of international reputation patronized by prominent Venetian families. Before becoming an independent master, he worked in the household of Doge Giovanni Corner; members of the Corner family were to be his most steadfast and liberal patrons. Lazzarini encouraged his pupils to study Venetian sixteenth-century art, and Tiepolo made drawings of some famous works for publica-

tion in Domenico Lovisa's *Gran Teatro di Venezia* of 1717. His early involvement with the thriving Venetian engraving and publishing world was renewed in 1724 when he made drawings of antique sculpture as illustrations for Scipione Maffei's *Verona Illustrata*, an experience that gave Tiepolo an imaginative empathy with fragmentary antique remains, which recur in his drawings, etchings, and paintings. As well as studying the art of the past, Tiepolo looked to the tenebrism of Federico Bencovich (1677–1753) and the realism and monumentality of Giovanni Battista Piazzetta (1682–1754). In 1719 Tiepolo married Cecilia Guardi, with whom he was to have nine children. By then, the artist was working for a network of mercantile and noble patrons on religious and secular subjects.

Tiepolo's reputation was assured, however, with the success of his employment by Patriarch Dionisio Dolfin on a complicated iconographic program of fresco decoration at the patriarch's palace in

Giovanni Battista Tiepolo. Apollo and Europe, detail from the fresco cycle *Apollo and the Continents* in the main staircase at Würzburg Palace, created 1753. ©SANDRO VANNINI/CORBIS

Udine around 1725–1727; other members of the family commissioned a series of large oil paintings on martial Roman themes for the Ca'Dolfìn in Venice, painted in 1726–1729. A variety of commissions followed in the north of Italy, with fresco decoration at the Archinto and Dugnani palaces in Milan (c. 1729–1731) and at the Villa Loschi near Vicenza (1734) of particular importance, generating further commissions from Milanese and Vicentine patrons. By 1736 Tiepolo was sufficiently renowned for the Swedish ambassador in Venice to invite him to decorate the new royal palace in Stockholm. Both local and foreign clients appreciated how his distinctive qualities of lucidity, gracefulness, and spirited handling contrasted with Piazzetta's more intense and rugged style. Thus, the newly elected archbishop elector of Cologne, who visited Venice in 1734, was to commission altarpieces from both artists. Among Tiepolo's celebrated works in Venice are the frescoes of 1737–1739 at the Dominican church of S. Maria del Rosario, and those of 1743–1745 at the Discalced Carmelite church of S. Maria di Nazareth (later destroyed), together with the decoration of the grand salon at the Palazzo Labia (c. 1746–1747) with sumptuous scenes from the story of Antony and Cleopatra. Francesco Algarotti became a close friend in the early 1740s, commissioning paintings and seeking his artistic advice; they shared a passion for the art of Paolo Veronese (born Paolo Caliari). Around this time, Tiepolo worked on two series of etchings, the *Vari Capricci* and the *Scherzi di Fantasia*, which contemporaries compared to the work of Rembrandt and Giovanni Benedetto Castiglione. He ran a busy studio, with his sons Giovanni Domenico (1727–1804) and Lorenzo (1736–1776) gradually taking on important roles.

In late 1750 Tiepolo traveled to Würzburg with Domenico and Lorenzo, working over the next three years on fresco decoration at the prince-bishop's residence and on a variety of altarpieces and cabinet paintings. After his return to Venice, Tiepolo's achievements included fresco decoration at the Villa Valmarana near Vicenza in 1757, where he painted themes from epic poetry, side by side with son Domenico's enchanting genre scenes, and the large, majestic Saint Thecla altarpiece (1759) for the cathedral at Este. Invited to Madrid in 1761 to decorate the throne room of the new royal palace at

a time when he had numerous commissions in hand, Tiepolo was pressed by the Venetian government to accept. With Domenico and Lorenzo, he worked on various frescoes at the royal palace from 1762, and on religious commissions, until his death in Madrid in 1770.

CATHERINE WHISTLER

TILLY, JOHANN TSERCLAES OF (1559–1632), general of the army of the Catholic League (1620–1632). Johann Tserclaes of Tilly was probably born in February 1559 (we do not know the precise date) in Brabant (in the Spanish Netherlands), the son of Martin Tserclaes and Dorothea von Schierstädt. Because his father had been involved in the uprising of the Dutch noblemen (known as the "Gueux") against the Spanish crown, he spent his early years in exile. With his brother Jacob, young Tilly attended the Jesuit College at Cologne for a brief period. He did not join the order, but became a fervent supporter for the rest of his life.

After his family reconciled with the Habsburgs, Tilly entered military service. He began as a private but soon rose to higher ranks. Having fought under Alexander Farnese, duke of Parma, against the rebellious Dutch, he went to Hungary and led an imperial regiment against the Turks. He supported Rudolf II (ruled 1576–1612) in his struggle with his brother, Archduke Matthias (who succeeded Rudolf as emperor in 1612 and ruled until 1619), but in 1610 he left Prague and entered Bavarian service. Duke Maximilian I of Bavaria made him general lieutenant—commander in chief. In the Thirty Years' War, Tilly led the army of the Catholic League, while Maximilian was its political spirit.

Although we know little about his early years, the details of Tilly's life become more accessible with the beginning of the Bohemian campaign (1620). In the 1620s his victories helped to establish the military and political dominance of the imperial-Catholic rule throughout most of the Old Reich. He won the Battle of White Mountain (at Prague, 8 November 1620), had several encounters with Ernst of Mansfeld (he lost at Wiesloch/Mingolsheim, 27 April 1622, but won at Wimpfen, 6 May 1622), crushed the army of Christian of Brunswick twice (Höchst near Frankfurt am Main, 20 June 1622, and Stadtlohn near the Dutch border, 6 August 1623), forced the Danish King Christian IV (ruled 1588–1648) to retreat (Lutter am Barenberge, 27 August 1626), and gained control of northern Germany. After A. W. E. von Wallenstein's dismissal in 1630, he took command of the imperial troops as interim general. In the Swedish campaign of 1631 he captured Magdeburg (20 May), but lost the battle of Breitenfeld against Gustavus II Adolphus (17 September). Trying to stop the Swedish invasion of Bavaria, he was defeated again at Rain am Lech (15 April 1632), where he was fatally wounded (he died at Ingolstadt on 30 April 1632).

Tilly's fame as a general derived from his successful campaigns throughout the 1620s, when he developed a unique battle-seeking strategy. The disastrous outcome of the Swedish war, however, tarnished his military reputation. Though he is normally characterized as belonging to the Spanish school (regarded as obsolete at the time) of military strategy, his failure against the Swedish cannot be adequately explained by invoking the more modern

tactics of the Swedish army. Those defeats were at least partly due to the political tensions within the Catholic party, which prevented him from executing his planned offensives.

Tilly was also blamed for the sacking and burning of Magdeburg (20 May 1631), a catastrophe that did not reflect well on his military skills. Contemporary critics held him responsible for this disaster, but modern historians have refuted this verdict, pointing out that he would never have willingly destroyed a stronghold of such importance to his forthcoming campaigns.

Tilly can be regarded as a transitional figure, balanced between the classic type of military enterpriser and the emergent type of modern officer. Along with Wallenstein, he developed into one of the most successful enterprisers to make his fortune in a time of war. For his services, Tilly was remunerated with money and property (the most important was Breitenegg, a lordship in the Upper Palatinate), and in 1623 he was made a count. In contrast to Wallenstein, he confined himself strictly to military affairs and did not try to gain political influence. He remained absolutely loyal to his prince and was willing to obey even in controversial matters. Maximilian of Bavaria, as the undisputed political leader, and Tilly, as successful military commander, formed one of the most successful teams in the Thirty Years' War.

Because he never married and remained childless, Tilly's nephew Werner von Tilly continued his line in Bavaria.

TIME, MEASUREMENT OF. From being important in the mid-fifteenth century only to structured communities (monasteries, military camps, universities) and large-scale industrial undertakings (quarries, building sites, textile manufacturing), measured time by the late eighteenth century had become the fundamental structural element of European social life. If the incidence of time control was felt more strongly in towns and industrial units than in the country, the sonorous hour indications of village church bells nonetheless brought it even to remote agrarian regions. This extension of time control in society was paralleled by major advances in the reliability and precision of time-measuring machines, but the causal relationship between the two is complex and only beginning to be investigated.

Time measurement was available in early modern Europe through the use of shadows (sundials and moon dials), gravity (water clocks, sandglasses, weight-driven clocks), or artificial force (spring-driven clocks and watches). Sundials and waterclocks derived from antiquity, mediated by humanist scholars; weight-driven clocks were an invention of medieval craftsmen, probably in the mid-thirteenth century. Spring-driven timekeepers can be claimed as an early modern invention, a response in the mid-fifteenth century to need for a portable timekeeper comparable with pocket sundials, which, known since antiquity, multiplied from the fourteenth century onward. Sandglasses were probably invented in Europe at about the same time as weight-driven clocks, in the mid-thirteenth century. For all, the ultimate time standard was that determined by the Earth's movements in relation to the Sun.

The various time-measuring instruments available had complementary functions. Sundials find time and display it; even if interrupted in their operation by lack of sunshine, they will immediately show time again once sunlight reappears. Weight-

and spring-driven clocks and watches are timekeepers and time showers. Once set functioning, they count and display time without interruption. If deranged, however, they cannot of themselves find time again, but have to be set against a sundial. Throughout the early modern period, therefore, there was an essential complementary relationship between clocks, watches, and sundials, which are frequently found combined, or in close proximity to each other. Sandglasses are timekeepers but restricted to specific short periods, usually up to sixty minutes. They were used for measuring the often predetermined length of tasks such as university lessons, sermons, naval or military watches, and industrial activities.

Technical innovations in time-measuring machines during this period were many and fundamental. Although the usefulness of the force exerted by a coiled metal strip was recognized from at least the thirteenth century, it was not until the invention in the mid-fifteenth century of devices such as the fusee and the stackfreed, which equalized the force exerted as the spring uncoiled, that it could be useful in time measurement. Despite this, the behavior of sixteenth-century clocks and watches was affected by so many mechanical insufficiencies as to be highly erratic if not closely surveyed by the clock keeper, who was a regular appointment in towns and royal and noble establishments. Watches in the sixteenth century were as much valued as jewels as timekeepers, and public clocks were as important as symbols of social and economic status and for the astronomical/astrological indications they offered as they were for telling time. Indeed their behavior in the latter respect is frequently criticized in late-seventeenth and eighteenth-century literature.

The mathematical analysis of natural phenomena that characterized seventeenth-century research into the natural world, however, led to important innovations. Galileo (1564–1642), having recognized the isochronous nature of a pendulum, also recognized its potential as a controller for clock mechanisms and produced initial designs. Concurrently, but probably independently, Christiaan Huygens (1629–1695) produced different designs for this purpose and not only published its theory in his *Horologium Oscillatorium* (1672) but in 1676 revealed the isochronal properties of a flat spiral spring when applied to a watch balance.

These two fundamental innovations reduced the running error of clocks and watches from some twenty to thirty minutes a day to only a few minutes. Such precision allied with increased reliability in the performance of timekeepers, resulting from improvements in lubrication, bearings, and tooth profiles, meant that timekeepers now became viable machines for use in longitude determination, a task that had been proposed for them as early as 1532. Although immense technical difficulties remained to be overcome, by the 1780s viable longitude timekeepers existed and could be simplified for general use. Similarly, in the late eighteenth century, newly reliable timekeepers became an integral part of the development of timed industrial activity, and of the development of interlocking, time-tabled transport systems. None of this affected the watch as a status symbol, but it did transform its appearance as emphasis shifted from the watch as conspicuous jewel to the watch as elegant precision timepiece. Precision in the eighteenth century became the hallmark of quality, the equitable operation of the new timekeepers, of which Paris, London, and Switzerland were the chief producers, being both source and reflection of a new, absolute, Newtonian time.

A. J. TURNER

TIME OF TROUBLES (RUSSIA). The Time of Troubles (1598–1613), a complex political crisis manifested in repeated palace coups, civil war, and foreign occupation, nearly resulted in the shattering of the Muscovite state. The Time of Troubles (*smutnoe vremia*) had three interconnected causes.

The first and most crucial cause was the temporary delegitimation of royal authority following the extinction of the Riurikid dynasty in 1598, when Tsar Fedor Ivanovich died without an heir. Fedor's successor, Tsar Boris Godunov (ruled 1598–1605), was never able to fully legitimate himself because of court factionalism, his failure to marry into an eminent boyar family, and the suspicion that he had engineered the mysterious death of Tsarevich Dmitrii Ivanovich in 1591.

A second cause was economic dislocation and social unrest in Muscovy's northwestern and southern provinces. In the northwest, the Livonian War, border wars with the Swedes, and overtaxation had stripped the gentry of most of their peasant tenants. This greatly hampered Moscow's ability to mobilize troops from this region, traditionally the largest reservoir of military manpower. By contrast, the entire southern frontier from Seversk in the west to the Volga in the east was experiencing accelerated military colonization to protect against Crimean Tatar raids. Because the colonists were given smaller land and cash entitlements than prevailed in central Muscovy and because they settled among state peasants on crown frontier lands who paid *corvée*, considerable social discontent arose on the southern frontier. The upper stratum of the middle service class in Riazan' region was also increasingly alienated from Godunov's government because it felt denied the precedence honor and promotion opportunities due it.

The third cause was Muscovy's vulnerability to entanglement in the conflict between Sweden and the Polish-Lithuanian Commonwealth. War between King Sigismund III Vasa of Poland and Charles IX of Sweden (ruled 1604–1611) had broken out in 1600. This war eventually spilled over into northwestern Muscovy, because that region had been weakened during the last Livonian War and because of the growing weakness of Boris Godunov's regime.

The first phase of the Troubles (1598–1606) was primarily a dynastic crisis after the death of Tsar Fedor and took the form of boyar intrigues and then mass revolt against the "usurper" Boris Godunov. The spread of famine and banditry in 1601–1603 finally provided Godunov's old enemies—the Romanovs, Nagois, and other boyar clans—with the

opportunity to turn the populace against him. They began circulating rumors that Tsarevich Dmitrii Ivanovich had not after all perished at Uglich in 1591 but had escaped Godunov's assassins and was returning to reclaim the throne. In 1603 a pretender Tsarevich Dmitrii surfaced in the grand duchy and received recognition and military support from several powerful Polish and Lithuanian magnates. This False Dmitrii invaded in 1604 and quickly won support across the southern frontier and into central Muscovy. When Tsar Boris died suddenly in April 1605, his generals came over to the False Dmitrii, abandoning Boris's heir Fedor Borisovich and allowing the False Dmitrii to take the throne in June 1605. The First False Dmitrii ruled less than a year. In May 1606 the boyar Vasiliu Shuiskii, the Golitsyns, and Metropolitan Hermogen incited riots in Moscow against the presence of the large Polish retinue of Dmitrii's bride, Marina Mniszech, and in the course of these disorders Dmitrii was assassinated.

The second phase of the Troubles (1606–1610) was marked by a series of regional outbreaks against Tsar Vasiliu Shuiskii, which ultimately provided both the Swedes and Poles grounds for military intervention. The first such insurrection began in Seversk in 1606 and spread across the south and into central Muscovy, much like the movement that had supported the late False Dmitrii. Although led by Ivan Bolotnikov, a former military slave, and involving a significant number of peasant insurgents, it was not a “peasant war” but included many gentry. Bolotnikov was defeated at Tula in 1607, but his forces regrouped and joined with Cossacks and Polish and Lithuanian mercenaries to form a new army under the nominal leadership of a Second False Dmitrii. After an unsuccessful siege of Moscow, they established a rival government at nearby Tushino (1608). Several powerful boyars, most significantly the monk Fedor Romanov (who had been tonsured under Boris Godunov), abandoned Tsar Vasiliu and went over to the Tushinites. Vasiliu responded by launching a counteroffensive using troops levied from Novgorod and the far north and a large number of Swedish mercenaries. The Second False Dmitrii was put to flight. But by inviting in Swedish mercenaries Tsar Vasiliu had now given King Sigismund III pretext to invade Muscovy and place Smolensk under siege. Fedor Romanov and

those surviving Tushinite elites unwilling to seek Vasiliu's forgiveness entered into negotiations with Sigismund and invited him to send Crown Prince Władysław to rule Muscovy. A Polish army under Hetman Stanisław Żółkiewski routed Tsar Vasiliu's Russo-Swedish forces at Klushino (June 1610). The next month Vasiliu was deposed by the Golitsyns, Riazan' gentry leaders, and agents of Fedor Romanov.

After the overthrow of Tsar Vasiliu a council of seven boyars holding power in Moscow accepted the bargain offered by the Tushinites and Polish commanders and invited Władysław to rule on the condition that he take the Orthodox faith. But instead of Władysław they were sent a Polish occupation army. In this third phase of the Troubles (1610–1613) no tsar ruled in Moscow, but rather a Polish military dictatorship under siege by a succession of national liberation militias raised by Muscovite provincial elites (military town governors, wealthy merchants, Riazan' gentry) in uneasy alliance with cossack leaders. Smolensk fell to King Sigismund; a Swedish army occupied Novgorod. The Second False Dmitrii was assassinated by his own lieutenants; more new pretenders appeared (including an Infant Brigand, the son of the Second False Dmitrii and Marina Mniszech) but were unable to attract large followings. In 1611 a liberation militia led by Prince Dmitry Pozharsky established a provisional government at Iaroslavl; with Cossack support it finally drove the Poles from Moscow in October 1612. An Assembly of the Realm (*Zemskii Sobor*) in early 1613 elected Fedor Romanov's sixteen-year-old son, Michael, as tsar.

Incursions by Polish forces acting in the name of Władysław continued for another five years. An armistice signed at Deulino in 1618 required that Smolensk and parts of Seversk and Chernigov be restored to the commonwealth. Karelia was ceded to Sweden in return for the recovery of Novgorod. Much of northwestern and central Muscovy had been depopulated, and political reconstruction was hampered by the loss of several important chancellery archives in the great conflagration at Moscow in 1612.

The Troubles did not permanently alter the political and social order, however. The consultations of Tsar Michael with the *Zemskii Sobor* did not mean

that patrimonial autocracy had given way to estate-representative monarchy; the power of the boyar elite had not declined, and there was no “ascendancy” of the provincial middle service class. Reconstruction (under the guidance of Tsar Michael’s father, now patriarch) involved the expansion and refinement of mid-sixteenth-century institutions: the central chancelleries, the military town governors, and the *pomest’e* system of service-conditional land tenure.

BRIAN DAVIES

TINTORETTO (Jacopo Robusti; c. 1518–1594), Italian painter. Jacopo Tintoretto was easily the most prolific painter in late-sixteenth-century Venice. The son of a Venetian cloth dyer, he advertised the fact in his professional nickname. Unlike certain other leading artists of the time, Tintoretto—“the little dyer”—did not seek to conceal his lower-class social origins. He was trained in an unidentified Venetian workshop during the 1530s. Early reports that he was summarily ejected from Titian’s shop may represent nothing more than flattering legend. But the older master’s professional hostility is nonetheless corroborated by a number of other early sources and was probably an important shaping factor in Tintoretto’s career.

In very early works, such as the dramatic *Christ among the Doctors* (c. 1541–1542, Museo del Duomo, Milan), Tintoretto’s style and technique pointedly depart from Titian’s long-established naturalistic idiom. Forms twist and writhe in arbitrary fashion within a vertiginous spatial recession that relegates the protagonist to the far distance. In many of his earlier works, the painter’s debt to the art of central Italy, and particularly to Michelangelo,

is evident. But Tintoretto’s conceptual and formal individualism, like his penchant for leaving the broad (although thinly loaded) marks of his brush exposed on the picture surface, took his art beyond such sources and also beyond anything yet seen within Venetian Renaissance art. His production of paintings at high speed and in great volume, and his readiness to offer them at a low price, quickly became notorious. But the strategy proved very successful at a time in which demand for paintings was rapidly increasing.

Tintoretto did not select between patrons as Titian did: rather than prioritizing prestigious foreign clients, he concentrated on fulfilling local demands. By 1560 he was already the dominant painter across the city. From this point onward, he was almost constantly at work in the Ducal Palace. Following two disastrous fires in the palace (1574 and 1577), Tintoretto and his workshop undertook a series of large-scale commissions, culminating in the vast *Paradise* (c. 1588–1590) for the main State Room. He also produced many paintings for the city’s non-noble lay confraternities (the so-called *Scuole*, or Schools). In 1548 he made his name with the startling *Miracle of the Slave* (Accademia, Venice) for the Scuola di San Marco, and between 1564 and 1588 produced more than sixty paintings for the meeting house of the Scuola di San Rocco.

These included wall paintings showing scenes from the Life of Christ and the Virgin, and typologically related scenes from the Old Testament on the ceiling of the upper room (Sala Superiore). The enormous *Crucifixion* (1565) is the most important work of Tintoretto’s maturity, painted in an epic narrative style that brilliantly combines passages of earthy naturalism with more idealized formal sequences. In later paintings such as *The Baptism* and *The Agony in the Garden* (both 1578–1581), complex formal masses are cloaked in brownish shadow, illuminated only at certain points by angled shafts of golden light, which imply the immanent presence of the divine. But this spiritualized schema is brought alive by the inclusion of startling passages of naturalism, for example in the extraordinary *Annunciation* (1581–1582). The unprecedented formal manipulations exacted at San Rocco reflect Tintoretto’s mature commitment to an ideal of sacred poverty, which brings together the selfless spiritual ideals of the commissioning confraternity with

Tintoretto. *The Crucifixion*, 1565. ©ARTE & IMMAGINI SRL/CORBIS

those of the wider Catholic Counter-Reformation, but also refers to his own lowly artistic identity as the “little dyer.”

Tintoretto’s dynamic manner dominated for only a short while in Venice: Veronese and even the old Titian were influenced by his art in certain ways, while El Greco and Palma Giovane were probably members of his workshop. After his death in 1594, the Tintoretto workshop continued to operate into the 1630s under the control of his painter sons, Domenico and Marco. But Tintoretto’s artistic individualism, particularly in matters of technique, meant that his style was not easily emulated, and it was increasingly perceived as antithetical to the classicism of European artistic tradition. Despite John Ruskin’s ecstatic appreciations in the post-Romantic era, Tintoretto has continued to be an elusive figure in the history of art. Recent attempts to see his work as mannerist typically founder on the passionate drama of his style and the radical abbreviations of his brushwork. And while his exposed paint surface owes something to the earlier Venetian Renaissance tradition of coloring (*colorito*), his ap-

proach is very different from that of artists such as Giorgione or Titian. It is, though, the very resistance of Tintoretto’s manner to an easy integration within artistic tradition that makes it so interesting for the contemporary viewer.

TOM NICHOLS

TITIAN (Tiziano Vecelli; 1488/1490–1576), Italian painter. Born in the Dolomite village of Cadore about 1490, Titian was trained in the Venetian workshops of Gentile and Giovanni Bellini in the early years of the sixteenth century. It was, however,

the younger and more progressive Giorgione who had the greatest influence on his development. Titian's early paintings (for example, *Three Ages of Man*, c. 1512–1513, National Gallery, Edinburgh) are often set in lush pastoral landscapes and have a brownish Giorgionesque tonality. Titian also adopted Giorgione's improvising approach to painting, exploiting the special translucency of oil paint in building up forms and colors. Titian did, on occasion, make drawings, but typically preferred to work out his compositions in color on the picture surface.

Despite the similarities, Titian's early paintings are increasingly distinct from Giorgione's in their muscularity of form, clear placement of figures in space, and typically precise definition of surface texture. In the great altarpiece showing the Assumption of the Virgin (1516–1518, Sta. Maria dei Frari, Venice), the bulky forms of the protagonists recall the idealized figure types of Michelangelo and Raphael. But the intense vibrancy of Titian's color,

based on subtle modulations of red, gold, and silvery gray, nonetheless controls our apprehension of form. Titian went on to revolutionize the Venetian altarpiece in a sequence of outstanding paintings, culminating in the lost St. Peter Martyr altarpiece (1526–1530, destroyed 1867; formerly SS. Giovanni e Paolo, Venice). In the Pesaro altarpiece (1519–1526, SS. Giovanni e Paolo), he subverted the standard Venetian type of the *sacra conversazione* (sacred conversation) by making the donor family central to the iconography and spatial organization.

Between 1518 and 1524 he completed three so-called Bacchanals (*The Worship of Venus*, *The Andrians*, both Museo del Prado, Madrid; *Bacchus and Ariadne*, National Gallery, London) for Alfonso I d'Este, duke of Ferrara. The paintings were conceived as re-creations (*ekphrases*) of classical works of art described in literary texts by Philostratus, Catullus, and Ovid, and feature complex

Titian. *The Venus of Urbino*, 1538. ©ERICH LESSING/ART RESOURCE, N.Y.

nude or seminude figures that insistently recall classical friezes and relief sculptures. The antique world is here imagined as a place of sensual delight, the lighthearted tone owing little to the learned allegorical approach to mythological painting championed by earlier masters such as Sandro Botticelli or Andrea Mantegna.

It was Titian's brilliant transformation of the field of portraiture, however, that made his name with the aristocratic and royal houses of Europe. In portraits such as *Federico II Gonzaga, Duke of Mantua* (1529, Prado) Titian depicted his high-ranking sitter with an unprecedented degree of intimacy, showing him gently caressing a favored pet dog. Pendant portraits such as *Duke Francesco Maria della Rovere, Duke of Urbino* and his wife, *Eleonora Gonzaga* (both 1536, Galleria degli Uffizi, Florence) were more formal. But the duke's son Guidobaldo also acquired a mysterious erotic painting known as *The Venus of Urbino* (1538, Uffizi). Titian here referred directly to Giorgione's *Sleeping Venus*, a painting he himself had completed about 1510. But in the Urbino painting, the reclining woman is relocated to a contemporary bedroom, her knowing glance at the viewer and the bravura painting of her exposed flesh combining to generate an image of unprecedented erotic immediacy.

The painting is typical of the confident originality that characterizes Titian's mature work. In paintings such as *The Vendramin Family* (1545–1547, National Gallery, London) and *The Martyrdom of Saint Lawrence* (1547–1556, Gesuiti, Venice), Titian refers to existing visual and iconographic types in Venetian painting. But these are transformed by the master's brilliant awareness of the expressive possibilities of oil paint, and the sensual and emotive power of color. In the same period, Titian also worked for the Holy Roman emperor, Charles V (as in *Charles V at the Battle of Mühlberg*, 1548, Prado), and the patronage of the Habsburg family increasingly came to dominate his career. In 1551 Charles's son (the future king of Spain, Philip II) commissioned Titian to paint a series of mythologies (known as the *poesie*) based on Ovid's *Metamorphoses*. The resulting paintings are among the masterworks of sixteenth-century painting. But their relation to one another and their more precise meaning remain unclear. It appears that Titian enjoyed an unusual degree of autonomy in fulfilling

Philip's commission, and this may have encouraged him to take an open-ended approach in which the free "poetic" association of ideas is preferred to more traditional iconography.

The paintings are loosely conceived in pairs, showing contrasting views of female nudes. But rather than being simply erotic, the *poesie* draw attention to the pain and suffering associated with sexual desire and love. This is the case, for example, in the extraordinary *Venus and Adonis* (1551–1554, Prado), in which the traditionally supine goddess of love turns puce-faced in restraining her mortal lover from his doom. As in many of the other *poesie*, her figure is modeled directly on a classical relief, yet the translation of the form into paint yields a new expressive intensity to her straining posture. Titian's abandonment of the Renaissance sense of the classical world as a place of innocent sensual delight is also evident in the *Diana and Acteon* and *Diana and Callisto* (both 1556–1559, National Gallery, Edinburgh). Here the dire consequences of crossing (even inadvertently) the goddess of chastity are made apparent. And yet these paintings possess an existential force that takes them beyond the redemptive schema offered by orthodox Christianity.

The two Diana paintings, along with subsequent *poesie* such as *The Rape of Europa* (1559–1562, Isabella Stewart Gardner Museum, Boston) and *The Death of Acteon* (c. 1560–1562, National Gallery, London) are painted in a remarkable summary manner that threatens to dissolve form into a myriad dabs of broken color. The mosaiclike effect provides a kind of technical analogue to the process of cataclysmic physical and emotional change described in the paintings. But Titian also used the technique in his religious imagery and portraiture from about 1560 onward (for example, *Portrait of Jacopo Strada*, 1567–1568, Kunsthistorisches Museum, Vienna; *Pietà*, 1575–1576, Accademia, Venice). Despite doubts about the status, or even the very existence, of Titian's "late style," it seems clear that it is best taken as a kind of intensification of the *colorito* (coloring) he had long practiced. The style developed organically as a result of his deepening response to the subject matter of his paintings.

Titian, who died in 1576, was easily the most successful painter in sixteenth-century Venice. The

Titian. *Assumption of the Virgin*, 1518, Santa Maria Gloriosa dei Frari, Venice.

international scope of his patronage meant that his influence was quickly transmitted across Europe, and his work had a major impact on painters as different as Peter Paul Rubens, Nicolas Poussin, Diego Velázquez, Rembrandt van Rijn, François Boucher, and Sir Joshua Reynolds. In the age of modernism, Titian's popularity has hardly diminished, the sensuous and emotional naturalism of his style, along with his experimentalism in matters of technique, assuring that his paintings continue to speak to a very wide audience.

TOM NICHOLS

TOBACCO. Tobacco first attracted attention in Europe as an Amerindian curiosity. Christopher Columbus, Amerigo Vespucci, Jacques Cartier, and other European explorers reported the apparently omnipresent but varied use of a green herb by the people they encountered. For recreational, spiritual, and medicinal reasons, tobacco was externally applied to wounds, chewed (alone or with other substances), inhaled as a powder, or smoked (through canes, as rolled up leaves, or stuffed into a reed or a pipe). In the mid-sixteenth century, European scholars described the strange New World plant as part of the botanical renaissance. By the late 1560s, tobacco's medicinal properties were being widely investigated by people such as Conrad Gessner in Zurich, Pietro Mattioli in Bohemia and, most famously, by the French ambassador to Lisbon, Jean Nicot. In 1571, Nicolás Monardes, a physician of Seville, presented an influential assessment of the medical use of *Nicotiana*. His text, the English translation of which was entitled *Joyfull Newes out of the Newe Founde Worlde* (1577), became a standard medical textbook across Europe. Monardes told

physicians that tobacco had antiseptic and analgesic properties and could tackle a host of conditions from chilblains to intestinal worms and from halitosis to gout. Tobacco was used in a variety of ointments and poultices, formulas, and concoctions.

SMOKERS AND SMOKING

While European science was discovering the medicinal potential of tobacco, Europeans in the New World were experimenting with more medicinally ambiguous patterns and modes of ingestion by smoking, snuffing, and chewing tobacco as part of their everyday lives. By 1550 smoking was prevalent in Spanish, Portuguese, and French colonial outposts. Sailors and adventurers returning from the New World brought their tobacco-consuming habits back with them to European ports. Particularly in London in the 1590s, putting dried leaves from a faraway land “in a pipe set on fire and suckt into the stomacke, and thrust foorth again at the nostrils” became a popular pastime (Gerard, p. 287). Smokers such as Sir Walter Raleigh and Christopher Marlowe made smoking fashionable, particularly in male society. Numerous depictions of smoking soon appeared in poems and plays, such as Ben Jonson's *Every Man out of His Humour* (1600), in which smoking was often seen as a gentlemanly recreation. Perceptions of women smoking were generally negative but, as numerous seventeenth-century Dutch paintings, and plays such as Jonson's *Bartholomew Fair* (1611) illustrate, some women did smoke.

Smoking spread in England as a social activity (often in alehouses) and was commonly referred to as “drinking” tobacco. The practice quickly became controversial, prompting a medical and moral debate in the early seventeenth century. Smokers proclaimed tobacco's medicinal benefits: “nothing that harmes a man inwardly from his girdle upward, but may be taken away with a moderate use of Tobacco” (Chute, p. 19). Critics such as King James I & VI, who wrote *A Counterblaste to Tobacco* in 1604, condemned smokers for their wanton abuse of the new medicine and for their patently non-medicinal, wasteful, and apparently compulsive consumption. Smoking had been identified as a vice. English physicians, while confirming the medicinal power of tobacco, warned against unnecessary and excessive smoking because it could disrupt humoral

balance, provoking death “before either Nature urge, Maladie enforce, or Age require it” (Gardiner). Some commentators argued that smoking bred soot and cobwebs in the body, leading to enfeeblement, infertility, and a thirst for alcohol.

Despite such warnings, in the first half of the seventeenth century smoking and other recreational forms of tobacco use continued to spread in England and across Europe. The Dutch were particularly avid smokers and were soon growing tobacco and manufacturing distinctive pipes, such as the meerscham. In France, state-regulated tobacco cultivation supplied French smokers and snuff-takers. By 1650, the use of tobacco as a medicine was widely accepted throughout Europe, but in many countries attempts were made to curb its recreational use. In Sicily, the pipe was declared illegal. In Denmark, Sweden, parts of Germany, Switzerland, Austria, and Hungary attempts were made to prohibit smoking, prevent tobacco cultivation, and inhibit its importation. The Russian patriarch considered smoking a deadly sin and in 1634 banned it on pain of execution for persistent offenders. In 1642, following a complaint by the dean of Seville that the entrance to his church was being defiled by tobacco juice, Pope Urban VIII threatened both clergy and congregation with excommunication if they smoked, chewed, or snuffed tobacco in church. Pope Innocent X issued another antismoking bull in 1650.

TOBACCO AND ECONOMIES

Persistent and growing demand for tobacco in Europe promoted increasing crop cultivation in the New World. Spanish, Portuguese, and English colonies thrived by exporting vast quantities of the plant grown by slaves and indentured servants on large plantations. In 1626, 500,000 pounds of Virginia tobacco reached England. By the late 1630s, millions of pounds of tobacco were being shipped each year from Virginia, Maryland, and the English Caribbean, much of it re-exported to mainland Europe and beyond. As production increased, prices fell, making tobacco more readily available to all social classes. The growing international trade in tobacco attracted mercantile investment and presented governments with tax-raising opportunities. In England, where tobacco growing had been prohibited since 1619 (to aid colonial producers), substantial

revenues were generated from customs and other duties on tobacco. Ongoing complaints about the dangers of smoking to body and soul were subsumed by the vested interests of the governments, colonists, and merchants responsible for supplying tobacco to consumers.

Throughout the seventeenth and eighteenth centuries, Europeans continued to find medical uses for tobacco and to consume it for pleasure. Ornate tobacco pipes and snuffboxes were produced, offering opportunities for the display of status and refinement. In eighteenth-century England, snuff became particularly popular. Later, the cigars favored by Spanish consumers distinguished the gentlemen from the more plebeian smokers of clay pipes. Whatever the status of the consumer or the mode of ingestion, tobacco had become as integrated into European culture and society as it had been in pre-Columbian America. Like tea, coffee, and sugar, tobacco had become an integral part of European lifestyles.

A. R. ROWLEY

TOLEDO. Toledo was an important city of Spain for much of the early modern period. Symbolic of this prominence are the large fortress (alcázar) built by the monarchs, the vast and richly decorated cathedral, and the impressive archdiocesan palace built by the prelates of Toledo, primates of the Spanish church.

Toledo's importance owes much to its geographic location. Security from outside attacks was enhanced by the deep, fast-flowing Tagus (Tajo) River, which offered a natural protective border on two-thirds of the city's perimeter and amplified the resistance offered by sturdy city walls and the heights of the interior space. Also, Toledo was at the center of the Iberian Peninsula, so it was a natural stopping-off point for travelers and merchandise, whether from Lisbon to the west or on the north-south routes in the crown of Castile. Within the region of New Castile, Toledo was the largest city and dominated the economy for much of the sixteenth century. This changed after Philip II (1527–1598) settled his court in the nearby city of Madrid in 1561. By the 1580s the two cities were competing for grain in local villages, and in the 1630s they competed over rights to plant vines and sell wine.

The population of Toledo expanded during the first three-quarters of the sixteenth century. According to the first census of 1528, some 30,000 people (5,898 households) lived in Toledo, and this figure doubled to approximately 62,000 people (12,412 households) by 1571. This appears to be the high point of the city's demographic expansion, as in 1597 only 54,665 people (10,953 households) were recorded. Baptismal records indicate a decreasing number of births in the first decade of the seventeenth century, when the city was struck by plague and then a subsistence crisis in 1605–1606. Population was also lost through emigration, especially to Madrid. Finally, among the city's wealthy families, fewer marriages were celebrated, in part because the crown's chaotic monetary policies ruined many and in part because numerous individuals of both sexes preferred celibacy and a church career. By 1632 the population had contracted to only 22,686 inhabitants, fewer than those recorded in the first census of 1528.

The oligarchy that governed Toledo consisted of a council of *regidores* and another council of

jurados, both of which were supervised by a crown-appointed *corregidor*. The *jurados* did not vote on issues, but they could protest to the crown about injustices. They formed part of the small committees that did much of the actual work for the city, and they were entitled to supply one of the two deputies who attended the Castilian Cortes, the representative assembly. The *regidores* were divided into two benches, citizens and the more prestigious nobles, and into two factions according to the side on which they sat, the Silva on the right and the Ayala on the left. Frictions between the two benches and the two factions were constant, although after the *Comuneros* Revolt, which took a heavy toll on the Ayala faction, the battles were largely verbal and legal rather than physical. The crown added yet another division among the *regidores* in 1566, when a pure-blood statute was imposed on the citizens' bench. This ruling was directed against *conversos*, Jews who had converted to Christianity, whose bloodlines were seen as impure. Many citizen *regidores* were *conversos*, and a few openly protested to the crown about the new ruling, but to no avail. By 1639, however, the citizens bench was abolished, thus eliminating two of the three divisions that had previously divided the *regidores*.

Toledo had an active *converso* population that was especially visible in certain occupations. They accounted for two-thirds of the public notaries, probably a majority of the city's *jurados*, and certainly a majority of the local merchants and tax farmers. They built up the textile industries, most prominently silk and wool, of their native city. Many merchants kept a flock of sheep, and wool was sold to Toledo weavers, including cap makers, whose products were sold locally and were exported. Some merchants traveled to local fairs to buy wool cloth woven by villagers, which they took to Toledo to be finished. But Toledo is best known for the manufacture of silk products. Toledo families farmed the royal tax levied on Granada silk, and this post afforded Toledo merchants the opportunity to obtain the best silk of the Iberian Peninsula, although silk was also bought in Murcia and Valencia. In 1562 the master silk weavers of Toledo numbered 423. Unfortunately Toledo's textile industries followed the same downward path as the population.

TOLERATION. Toleration (or its cognate, tolerance) denotes the readiness of an individual or a community to permit the presence and/or expression of ideas, beliefs, and practices differing from what is accepted by that individual or by the dominant part of the community. Toleration demands forbearance only; it does not require approval or endorsement of the tolerated ideas, beliefs, and practices. A tolerant person respects differences between him- or herself and other people; a tolerant

community respects differences between groups and/or among individuals within the social totality. Toleration is thus antithetical to the persecution or repression (systematic or individualized) of ideas, beliefs, and practices that differ from one's own. Indeed, a tolerant person or society will protect the ability of such ideas, beliefs, and practices to persist even while acknowledging disagreement with them.

In early modern Europe, the main object of toleration in reality and as an ideal was difference of confession among religious communities, all of which claimed to be Christian. The Protestant Reformation had fragmented—permanently, as it turned out—the institutional and doctrinal unity of the Latin Christian Church that the faith had supposedly upheld since the time of St. Paul. During the sixteenth century, under the impact of Lutheran and Calvinist condemnations of the impurity of the visible Roman Church, not to mention the English Church's institutional break with Rome and the emergence of extreme sects such as the Anabaptists, Christianity was forced to reinvent itself as a creed united in faith but divided in rite. This situation has commonly led scholars to conclude that only in the

post-Reformation context did the ideal vision and real conduct of tolerance enter into Europe, expressed by various proclamations of toleration as well as by the theoretical statement found in the *Epistola de Tolerantia* (1689; Letter on toleration) of John Locke (1632–1704).

Yet the assertion of the singular modernity of toleration, arising in the aftermath of the Protestant Reformation, masks the complexity of its history. Prior to the sixteenth century, certain voices at the core as well as on the periphery of European society were prepared to countenance the presence of dissenters and even heretics within Christianity as well as the existence of various non-Christian convictions. Moreover, other important issues, such as the discovery of the New World with its large population previously unexposed to the Christian faith, also drove the debate about the extension of forbearance to cultures and religious rites utterly alien to Europe. Finally, no particularly compelling evidence suggests that the desire to persecute forms of difference and dissent—in religion as in other fields of human endeavor—abated with the rise of modern Europe. Even those prepared to tolerate certain divergent Christian confessions were equally ready to exclude and brutally suppress other self-identified Christians—Roman Catholics, Anabaptists, Hutterites, millenarians—not to mention deists, atheists, and similar free thinkers.

This context needs to be considered when assessing the strengths and weaknesses of the modern European approach to toleration. Even before the monk Martin Luther (1483–1546) nailed his Ninety-Five Theses to the church door at Wittenberg in 1517, Europeans were grappling with the consequences of their encounter with the indigenous peoples of the Americas following the discoveries of the 1490s. Spain and Portugal in particular sought and received the authorization of the Roman Church to conquer and settle the lands of the Caribbean and Central and South America under the guise of evangelizing and converting the native populace. Some thinkers recoiled with considerable horror from the slaughter and enslavement that ensued. The towering figure of the School of Salamanca, Francesco de Vitoria (c. 1486?–1546), objected to the appropriation of the Aristotelian categories of barbarism and slavery by nature. Following de Vitoria, the Dominican bishop and former con-

quistador Bartolomé de Las Casas (1476–1566) composed a series of writings in Spanish as well as Latin defending the rights of the native population to maintain their cultural, political, and religious traditions and practices—even such controversial rites as human sacrifices, not to mention refusal of Christian missionaries and resistance to conquest. In a famous debate with the Scholastic advocate of Spanish dominion over the Indians, Juan Ginés de Sepúlveda, held at Valladolid in 1550, Las Casas used the materials of Aristotle’s corpus, Thomism, and canon law to refute the assertion by the Spanish crown of its right to impose religion and civilization at swordpoint upon indigenous Americans. Rather, a Christian attitude toward the Indians—rooted in divine and natural law as well as the teachings of the pagan philosophers—demanded forbearance of their way of life, even if Europeans found their faith and rituals abhorrent.

At one time, scholars viewed the Reformation as a singularly positive stimulus to the promotion of toleration. It is true that Martin Luther, at least in some contexts, appears to defend tolerance on the grounds that the magistrate should be concerned only with the care of the body and does not have the tools at his disposal to control or alter the state of a person’s soul. But other reformers, most notably John Calvin (1509–1564), were inclined to deny any measure of forbearance for religious positions that did not strictly conform to their new orthodoxy. Indeed, one of the important early defenders of toleration during the sixteenth century, Sebastian Castellio (or Sébastien Châteillon) (1515–1563), published pseudonymously a treatise entitled *De Haereticis, an Sint Persequendi* (‘Of heretics, whether they should be persecuted’) in reaction to Calvin’s instruction to the city of Geneva in 1553 to burn a visiting Spanish heretic theologian, Michael Servetus, who opposed the doctrine of the Trinity. Castellio argued that coercion is an inappropriate tool for effecting a change of religious views, since Christian belief must be held with sincere conviction. Hence, clerics and magistrates must refrain from the persecution of convinced Christians who cling to doctrines that do not coincide with official teachings. While Castellio did not go so far as to license broad dissemination of heterodox theology, he maintained that a Christian’s duties extended to tolerating the free and honest faith of fellow be-

lievers even in the face of disagreements of understanding and interpretation.

In the short term, voices such as Castelleo's went unheeded. Rather, in places such as France and Germany, where the Reformation enjoyed greatest support, violent harassment of religious minorities—Catholic or Protestant—persisted and often threatened to erupt into full-scale religious warfare. It is true that some rulers and regions found ways to stamp out conflict, either by fiat or by negotiation. The most famous resolutions, such as the Religious Peace of Augsburg (1555) and the Edict of Nantes (1598), tended to be short-lived. But in Switzerland, where Reformed and Catholic communities often lived side-by-side, accommodation concerning the sharing of power and mutual respect for different rites succeeded in eliminating persecution in many areas. The Dutch Republic managed to achieve a similar arrangement, as did a number of eastern European states, including Poland, Transylvania, and Moravia.

These tolerant practices were certainly approved by many thinkers who subscribed to a range of confessions. Desiderius Erasmus (1466?–1535), one of the leading humanists of the age and a Catholic who nonetheless sympathized with the cause of reform, promoted a vision of toleration that he derived from the principles of classical rhetoric. According to Erasmus, violence was an inadequate, as well as un-Christian, means of dealing with unbelief. Only by speech might those who strayed from truth be convinced of the error of their ways. And both preaching and conversation—the two predominant ways in which the orthodox express truth to the errant—demanded that one tolerate the heterodox, if only in order to achieve conversion. Another humanist, Jean Bodin (1529/30–1596), pushed this discursive paradigm of tolerance even further. In his *Colloquium Heptaplomeres de Rerum Sublimium Arcanis Abditis* (1588; Colloquium of the seven about secrets of the sublime), Bodin adapted the standard literary genre of the interreligious dialogue, in this case between advocates of the major world religions and of various philosophical interpretations of divinity. Unlike previous texts of interreligious dialogue, however, Bodin's discussion produced a stalemate: no one changed his mind and no conversions occurred. Bodin's point has been understood as the promo-

tion of tolerance, either because the relative merits of creeds cannot ultimately be demonstrated or because dialogue makes us realize that all religions have their merits and demerits. The text of the *Colloquium* was passed around secretly in manuscript for centuries, none daring to publish until the middle of the nineteenth century such a reputedly notorious challenge to the self-evident superiority of Christianity.

The cause of toleration became more visible as a political and intellectual force during the seventeenth century. As a practical aim, the Levellers in England during the 1640s made freedom to dissent from the established religion a central plank of their political program. Likewise, major figures in European philosophy weighed in on the side of freedom of religion. Thomas Hobbes (1588–1679) recognized the mischief that religion caused to the maintenance of public peace and order. His solution to the potential for religious conflict was not persecution of dissent but acknowledgment that, since faith was an inward matter, coercion of belief pertained to neither church nor state. So long as one's convictions about God and the afterlife did not produce external political dispute, Hobbesian logic required that the sovereign permit subjects to embrace whatever confession they liked. Baruch Spinoza (1632–1677) followed Hobbes in recognizing the inability of the government to control the inward faith of individuals. He therefore claimed a broad application for a right to liberty of thought and conviction without inference from a sovereign's (or a church's) determination of the truth or falsity of an individual's ideas. On the one hand, Spinoza proposed to employ the armed might of the state to rein in the activities of intolerant clergymen and mobs. On the other hand, he set clear limits on the power of the magistrate to persecute all forms of religious and intellectual dissent. The German jurist Samuel Pufendorf (1632–1694), too, advocated the protection of religious freedom in the name of the interests of the state. The sovereign must exercise control over the affairs of religion, not in order to impose “true” religion, but in order to ensure that “hotheads, pride, fame, and ambition” do not lead to civil conflict and sedition.

When viewed from the perspective of this intellectual backdrop, the concept of tolerance proposed by John Locke does not appear especially innovative

or creative. Locke built his theory on a clear distinction between the aims of the church and the purposes of government. The church seeks to care for souls, whose condition cannot be changed by force but only by persuasion. Since the role of government is the protection of the life, liberty, and estate of subjects, its work cannot extend to the business of religion. For Locke, the magistrate should maintain public tranquility and defend individual rights. Thus, liberty of conscience was justified in the case of most Christian (and perhaps some non-Christian) rites. Of course, Locke insisted that government must take an appropriate interest in religious ideas and rites when they were capable of undermining social trust and political obedience. For this reason, he sought to exclude atheists and to ban any religious institutions that taught the superiority of the church to the temporal magistrate in civil affairs.

While Locke's account of toleration has received by far the most attention, the version proposed by the pre-Enlightenment thinker Pierre Bayle (1647–1706) is perhaps the most consistent and thoroughgoing of the late seventeenth century. Bayle is sometimes termed a *Calvinist* advocate of tolerance. Seeking to refute a range of arguments for persecution, Bayle baldly asserted that all forms of suppression of religious diversity encourage hypocrisy and erode social order. Indeed, to harass religious dissenters constitutes an affront to God. An erring conscience, if it be held in good faith, deserves as much protection as a correct one—a principle that Bayle extended even to atheists. Unlike many of his predecessors, he did not embrace a strict distinction between the inward and the outward, and he thus took seriously the ability of the threat of coercion to weaken the beliefs of individuals. But should a person be forced to surrender his or her inner convictions, an act of sacrilege has been committed because God forgives error on account of the purity of the intention. A false belief sincerely held was regarded by Bayle to be superior in the eyes of God to a true conviction held only as a result of external compulsion. Bayle did admit that rites which are likely to detract directly from civil order may be constrained or excluded, but his main concern seems to be fanatical sects that inspire their adherents to engage in conduct that endangers the health and well-being of other inhabitants of the community.

The themes highlighted by seventeenth-century proponents of toleration received further elaboration during the eighteenth century, in particular, the problem of balancing personal liberty of conscience against the need for public order and obedience. For instance, the journalist and novelist Daniel Defoe (1660–1731) railed in his writings against conformity, and he was only too happy to satirize the foibles of the persecutorial impulse. Although a dissenter himself, he once dared to publish a hoax pamphlet, “The Shortest Way with Dissenters” (1702), purportedly written by a High Church spokesman, that called for the hanging en masse of religious nonconformists.

The two most intellectually powerful eighteenth-century proponents of toleration were Christian Thomasius (1655–1728) and Immanuel Kant (1724–1804). Thomasius, a central figure of the so-called “civil Enlightenment,” adopted a jurisprudential approach according to which all supposed heresies were framed in a historical light, and the charge of dissent was viewed simply as a means for different sects to vilify one another. Theological and metaphysical questions should be set aside in favor of a prudential law of religion (*Staatskirchenrecht*) that permitted and regulated expressions of religious diversity. Like Hobbes, Thomasius showed how an absolutist conception of government might yield a thoroughgoing principle of tolerance. Kant was certainly the more famous figure in the promotion of tolerant attitudes. His essay *Was ist Aufklärung?* (1784; What is enlightenment?) pronounced a human duty to become liberated from self-imposed mental chains and to develop an independent capacity for critical reflection. This requires a public sphere that is fully tolerant of differences in thought and action among individuals. Yet Kant also asserted the overriding duty that each person has to obey government, so that the subjects of a ruler have a supererogatory responsibility to refrain from public expression of ideas or doctrines that might promote disobedience to the sovereign will. For Kant, too, toleration did not necessitate the institutional primacy of rights associated with political liberalism.

Despite Kant's insistence upon obedience, a considerable number of Enlightenment thinkers in fact defended various forms of toleration in the eighteenth century. Thomas Paine (1737–1809)

dismissed the terminology of “toleration” itself as inherently intolerant, since it depended upon the grant of the state, preferring to speak of basic rights associated with freedom of conscience and thought. The French philosophes, who were the main champions of enlightenment, likewise announced themselves to be defenders of tolerance. But perhaps it was with the “Declaration of the Rights of Man and the Citizen,” approved by the National Assembly of France on 26 August 1789, that such a basic liberal conception of liberty of belief and worship received its characteristic statement.

TOPKAPI PALACE. The palatial complex built by the Ottoman Turkish sultan Mehmed II (ruled 1444–1446 and 1451–1481), completed in 1465, Topkapi occupied the site of the ancient acropolis of Byzantium at the northeastern tip of the Istanbul peninsula. Designed as the administrative center of a highly centralized imperial polity and as a royal residence, the Topkapi was inhabited by the Ottoman dynasty until the 1850s.

Located within a walled enclosure, Topkapi was built around three consecutive courtyards, each of which was entered through a monumental ceremonial gate. The layout and architecture of the structure were determined by several factors: notions of imperial seclusion, which underlined the divine and absolute authority of the sultan, and division of the structure into outer (public) and an inner (private) spaces, with strict rules governing the uses of all rooms and spaces. The administrative buildings in the second court, the council hall, the chancery, and the public treasury housed the government offices; architecturally these spaces bespoke the administration of justice by the sultan’s extended household. Beyond the northern gate lay the inner palace, which featured the sultan’s audience hall, the palace school and the dormitories for pages, a mosque, the privy chamber, and a treasury-bath complex where a lofty gallery offered spectacular views of the city. Lacking a strictly axial, geometric layout, Topkapi conveyed messages of imperial power through the use of symbolic elements such as the monumental

Topkapi. Aerial view of the palace. ©YANN ARTHUS-BERTRAND/CORBIS

gates and the belvedere tower, through the strictly codified and hierarchical use of space, and through rooms that commanded sweeping views, reflecting the monarch's dominion over the territories of the empire.

The main layout of Topkapi changed little throughout the following centuries. Nevertheless it became a repository of styles that reflected the changes in tastes and structure of the Ottoman house. The privy chamber was remodeled after 1517, to house the relics of the prophet Muhammad and his companions brought to Istanbul following the Ottoman conquest of Egypt. The expansions of the harem section during the reigns of Suleiman and Murad III corresponded to the royal family's move into the palace and to the growing role of women in the political realm. New kiosks and seaside residences were built beyond the central core, and former ones were replaced with more lavish structures, from the later sixteenth century onwards. In 1719 Ahmed III built a library in the third court, to house the palace's manuscript collection. The eclectic and westernized taste of the eighteenth

century was reflected in the extensive redecorations of this period. After being converted to a museum in 1924, Topkapi now also houses the palace archives and library.

TORTURE. Torture (in Latin: *quaestio*; in German: *peinliche Frage, Folter*, or *Marter*; in French: *la question, gehene, gene*) was an integral part of medi-

eval and early modern criminal procedure. Because a voluminous body of law covered every stage of torture, the system is called judicial torture. During the early modern period torture gradually lost its importance, and it was finally abolished at the end of the period.

THE BACKGROUND OF JUDICIAL TORTURE

Judicial torture was no medieval or early modern invention. The Roman third-century lawyer Ulpian defined torture as “the torment and suffering of the body in order to elicit the truth.” The actual jurisprudence of torture, however, only developed in connection with the twelfth-century “legal revolution,” as the revival of Roman law at the newly founded universities of Northern Italy is often called. Before this, crimes were mostly prosecuted privately, with no public officials taking an active role in criminal investigations. The predominance of private prosecution came under threat as popes, kings, and princes increasingly centralized their political authority in the twelfth century. The process began in Northern Italy in the twelfth century and gradually spread to most other parts of Europe in the remaining centuries of the Middle Ages.

The inquisitorial procedure (*inquisitio*), as against the older accusatorial procedure (*accusatio*), was introduced to papal legislation as a means of controlling errant churchmen in the late twelfth century. In the inquisitorial procedure, the initiation of an action was entrusted to the court official, and the judge was actively involved in the investigation of the case. Inquisitorial procedure had been used in ancient Rome, and Charlemagne had also made use of it, but this type of procedure had fallen into disuse since the ninth century. In the thirteenth century, inquisitorial procedure was soon extended to the crime of heresy and other serious canon law crimes and soon spread to secular crimes as well. A parallel development (although not as yet thoroughly researched) was that serious crimes were categorized as exceptional (*crimen exceptum*), to which the normal rules of procedure did not apply.

The early medieval law of proof had left difficult cases to be decided by ordeal, oath, and judicial combat. Behind these archaic, “irrational” modes of proof lay the belief that God continuously intervened in the lives of the people and would let truth prevail in court as well. Leaving judicial problems

for God to decide, however, ill suited the emerging conception of a rational, hierarchically organized judicial system. The result of the ordeal could not be challenged, nor could it be changed by the higher courts. The centralization of political power undermined the old European judicial systems, replacing lay judges with professional jurists. These professional judges were learned in Roman and canon law, distinct and alien from the system of proof based on ordeals, oaths, and combat. Many judges were probably familiar with formal logic and saw it as a basis for all legal decision making and law drafting. One of the most widespread forms of medieval legal scholarship became the so-called *ordines iudicarii*, manuals of procedural law, in which both civil and criminal procedure, including the law of proof, were laid out in the minutest detail. The new procedure was based on learned law and written documents.

TORTURE AS PART OF THE STATUTORY THEORY OF PROOF

A new law of proof emerged, then, as part and parcel of these developments. The Roman canon law of proof drew its elements, like medieval Roman law in general, from the materials of Emperor Justinian’s *Corpus Juris Civilis* (*Corpus of Civil Law*; also spelled *Corpus Iuris Civilis*), which had originated in the sixth century. In canon law, ordeals were expressly prohibited at the Fourth Lateran Council in 1215. The building blocks of Roman law were combined with those produced by the emerging canon law to build what has been called Roman-canon law of proof, or the statutory or legal theory of proof. The theory then came to circulate as part of the European *ius commune*, ‘common law’, in the procedural law treatises of writers such as Albertus Gandinus (d. c. 1310) and William Durandus (c. 1237–1296). In contrast to the archaic system of oaths, ordeals, and combat, the new system assigned the decisions on evidence to human judges, not God, thus placing decisive emphasis on judicial torture. However, the change from one painful stage of criminal procedure to another—from ordeal to torture—may not have seemed as significant to ordinary people as it was to the theoretician.

Because the statutory theory of proof reached its maturity in the thirteenth century and remained virtually unchanged until the early modern period, it is convenient to describe the theory as it appears in sixteenth-century jurisprudence and legislation.

Torture. Engraving c. 1500 shows a prisoner being tortured on the wheel by clerics of the Spanish Inquisition. In this version of the widely used torture method, a fire below the wheel is used as the source of pain and injury. In other versions, the wheel was used simply to hold the victim while torturers beat him or her with metal bars. In some cases, the wheel was fitted with spikes. GETTY IMAGES

Among the many influential writers on criminal evidence embracing the statutory theory were the Italian Prosperus Farinaccius (1544–1618), the Dutchman Joost van Damhouder (1507–1581), and the German Benedict Carpzov (1595–1666). All these writers further elaborated and refined the theory of torture. The last important doctrinal defense of judicial torture was written by a Frenchman, Pierre François Muyart de Vouglans (1713–1791), in 1780.

Statutory theory of proof, as it was received from medieval literature in the works of Farinaccius, Damhouder, Carpzov, and their colleagues, was based on the notions of full proof, half proof, and

circumstantial evidence (*indicia*). Full proof could consist only of the statements of two eyewitnesses or the defendant’s confession. Circumstantial evidence, no matter how plentiful, could only amount to partial proof, and combination of one eyewitness and circumstantial evidence did not constitute full proof. Without full proof, however, the accused could not be convicted of a capital crime.

Sacramental confession had gained significance in the twelfth-century canon law and had been made an annual obligation on all Christians at the Fourth Lateran Council of 1215. Because of its increased cultural significance, it is no wonder that confession had become “the queen of proofs” (*re-*

gina probationum) in criminal procedure as well. The problem, however, was how to obtain full proof if no eyewitnesses were available. This is where judicial torture offered a solution. Judicial torture was never evidence in itself, but was a means of acquiring evidence in the form of confession.

THE THEORY OF JUDICIAL TORTURE

At the beginning of the early modern period, the *ius commune* theory of torture was basically the same as it had been in the works of Gandinus and Durandus. The basic rules were similar across Europe. The use of torture was confined to capital crimes, for which the death penalty or mutilation could apply. Torture was intended as the last resort in situations in which no other means of gathering evidence was available. If there was already full proof in the form of two eyewitnesses or voluntary confession, torture was not necessary. The accused was to be threatened with torture before it was actually applied, for instance, by showing him the instruments of torture. The investigating judge was to follow the accused to the torture chambers and interrogate him as he was being tortured, while a notary recorded the findings. Sometimes a doctor's presence was also required; no advocate, however, was allowed for the accused.

Torture was meant to establish whether the accused had committed the crime, the commission of which (*corpus delicti*) had already been established by other means. This legal safeguard did not, however, apply to witchcraft cases. They were regarded as *crimina excepta*, 'exceptional crimes', in that their "traces disappeared with the act" (*facti transeuntis*). The law excluded certain classes of people from liability to judicial torture. Pregnant women, children below the age of twelve or fourteen, and old people (if torture might put their lives at risk) could not be tortured. Noble persons, public officials of a certain standing, clergy, physicians, and doctors of law were exempt from torture in some parts of Europe. Torture could not take place on Sunday or other legal holidays.

The most important legal safeguard in restricting the use of torture had to do with the amount of circumstantial evidence required to initiate it. According to the law, half proof in the form of the testimony of one eyewitness or a sufficient amount of circumstantial evidence was necessary to initiate

torture. Both in theory and in practice it was, however, largely left to the judge's discretion to determine when there was enough circumstantial evidence, although literature provided examples and guidelines. Compared to modern standards of proof necessary for conviction, the standard of evidence required for torture was often higher.

Other safeguards were provided to help material truth prevail as well. Contemporaries were well aware of the dangers that torture entailed from the point of view of finding out what had actually happened. Leading questioning was thus prohibited, and the confession extracted under torture was to be repeated in court within a certain time limit. Only the voluntary confession given thereafter, within twenty-four hours or so, served as proof, and not the confession given under torture. The practical significance of this safeguard was seriously undermined by the fact that the accused could be taken back to the torture chamber should he or she decide to recant the confession. Much of the literature recommended the practice of verifying the information obtained through torture, but many legal experts complained that courts paid too little attention to verification in practice. If the accused, nevertheless, managed to resist torture and did not confess, he or she had to be acquitted, at least until new incriminating evidence appeared.

The statutory theory of proof, together with judicial torture, was not only limited to legal literature but was incorporated into some of the major European legislative pieces of the early modern period, for example, the *Constitutio Criminalis Carolina* of imperial Germany (1532), the French *Ordonnance Royale* (1539) and *Grande Ordonnance Criminelle* (1670), and the *Nueva Recopilación* of Spain (1567). In some parts of Europe torture was used not only on the accused, but also on those against whom full eyewitness proof had already been produced. The idea was to secure confession, considered necessary for salvation, or to obtain evidence about possible accessories.

The legal literature was not greatly concerned with the form that judicial torture could take; this was largely a matter of local custom. In each case, the individual judge selected the method of torture, supposedly taking into consideration the seriousness of the charge. The most widespread torture

device was the *strappado (corda, cola)*, “the queen of torments,” in which the accused’s hands were tied behind the back, and he or she was lifted up with a rope, sometimes with weights attached to the ankles. Or metallic devices, such as leg-braces, leg-screws, and thumbscrews, were used to press the accused’s limbs or fingers and to crush them. Other widely used methods included keeping the accused awake; being stretched on the rack; and inducing the sensation of drowning by wetting a rag stuffed into the accused’s throat.

THE DECLINE OF TORTURE

In the seventeenth century, the system of judicial torture began to lose its practical significance, although it formally remained part of the law in most European countries until the late eighteenth and early nineteenth centuries. An important reason for its gradual disappearance was the erosion of its theoretical basis, the statutory theory of proof. In the sixteenth and seventeenth centuries, new forms of punishment were introduced as alternatives to death to cope with serious criminality, the most important being the galley, the workhouse, and the practice of exile and transportation. The new punishments called for more discretion in choice of punishment and sentencing. When the increased range of punishments and sentencing was combined with the different amounts of evidence available in practice, a revolution in the law of proof occurred. As John Langbein has shown, the “punishment upon suspicion” or “punishment for lying” (*Verdachtstrafe, Lügenstrafe*) developed as a result of this. For lesser evidence, a lesser punishment now followed. Although the death penalty still required full proof, both executions and incidents of judicial torture decreased from the sixteenth and seventeenth centuries in many European regions.

Thus, Sweden, where the statutory theory of proof was only adopted in the seventeenth century, and in its already changed form, could always boast of not having accepted judicial torture. In practice, however, torture was not completely unknown there. The same can be said of Aragón, another state that did not formally allow the use of torture. The English experience demonstrates particularly clearly the close connection between torture and the law of proof. The English jury system began to develop before the reception of Roman law in Europe. It

was thus the jury, not the Roman canon law of proof, that replaced the archaic modes of evidence in the Middle Ages in England. The jury developed considerable freedom in evaluating evidence and condemning on circumstantial evidence, making torture to extort confessions unnecessary. A regularized system of judicial torture thus never developed, and its use was limited to political cases. Another reason for England’s rejection of torture was that, unlike the Continent, England’s judicial system developed on the basis of unpaid lay judges, to whom it would have been dangerous to entrust a system of torture.

THE ABOLITION OF TORTURE

When Muyart de Vouglans wrote his treatise on criminal procedure in 1780, the medieval law of proof that had formed the basis of judicial torture had been eroded, and the philosophical and legislative attack on torture was already well under way. The best known critique of torture is Cesare Beccaria’s (1738–1794) *On Crimes and Punishments* (1764), to which Muyart de Vouglans’ work was in fact a response. Voltaire (1694–1778) joined Beccaria in fiercely condemning torture in some of his essays. According to the philosophes, torture could not secure correct judgments, since so much depended upon the ability of the accused to resist the physical pain involved. Torture was also wrong because it inflicted pain on people who had not been shown to deserve it. However, as Piero Fiorelli has demonstrated, these arguments were not the discoveries of the eighteenth-century philosophers, having been voiced by individual critics since the Middle Ages. Recent scholarship, especially the works of Fiorelli, Langbein, and Peters, has indeed shown that the historian of torture must look beyond the writings of the Enlightenment philosophers to understand why judicial torture was abolished.

European states abolished torture from their statutory law in the late eighteenth and early nineteenth centuries. Prussia was the first to abolish it in 1754; Denmark abolished it in 1770, Austria in 1776, France in 1780, and the Netherlands in 1798. Bavaria followed the trend in 1806 and Württemberg in 1809. In Spain the Napoleonic conquest put an end to the practice in 1808. Norway abolished it in 1819 and Portugal in 1826. The

Swiss cantons abolished torture in the first half of the nineteenth century. By the mid-nineteenth century, European legislators had thus harvested the fruits that the early modern revolution of proof, followed by Enlightenment philosophy, had produced. As Langbein and Peters observe, the final abolition of torture occurred gradually and in close connection with a general revision of criminal law. Legislative reforms took place partly simultaneously with, but in general slightly after, the Enlightenment philosophers' attack on judicial torture.

TOURNAMENT. Medieval tournaments had originally been serious exercises in martial training. As the introduction of firearms into warfare gradually made knightly armor obsolete, however, jousting lost much, although not all, of its practical rationale. The 1559 tilt at Paris in which French King Henry II received a fatal blow was already a

Tournament. Woodcut of knights practicing in the tilting ring, 1592. ©BETTMANN/CORBIS

somewhat archaic contest. Although tilts and other man-to-man encounters (often with blunted lances) continued to be held here and there into the eighteenth century, noncombative contests, such as runnings at the ring or at the head, became more common. With the decline of serious martial encounters, the medieval tournament tradition gave birth to several new theatrical genres that would flourish in early modern times.

The new genres, meant almost exclusively for courtly, aristocratic circles, may be said to have come into being by way of chivalric literature, whose popularity was undimmed by the progress of classical revival. Romances such as Sir Thomas Malory's *Le morte d'Arthur* (1485; *The death of*

Arthur) and Ludovico Ariosto's *Orlando furioso* (1515–1533; *The madness of Roland*) included episodes of jousting or tilting at the barrier. Planners of new, less earnest tournaments began to imitate situations or plots like those of the romances, so there were many variations on chivalric themes. For example, at Whitehall in 1581, courtier and poet Sir Philip Sidney (1554–1586) and three other knights apparently acted out a prearranged failure to capture the Fortresse of Perfect Beautie, which symbolized Queen Elizabeth's virginity and integrity. In 1605, after a poetic debate between allegorical ladies representing Truth and Opinion, sixteen knights who supported the proposition that marriage is superior to the single life tilted on foot across a barrier with sixteen others championing the opposite view. English contest was planned by the poet Ben Jonson (1572–1637) and the architect Inigo Jones (1573–1652) as the second part of a whole entitled *Hymenaei: or the Solemnities of Masque and Barriers at a Marriage*. On the first day of the grand 1664 entertainments at Versailles, remembered as *Les Plaisirs de l'Île Enchantée* (Pleasures of the Bewitched Island), a troop of actors and dancers, including the young King Louis XIV, interpreted a chivalric episode of Ariosto's *Orlando*. The Versailles entertainments were apparently inspired in part by others held two years earlier at the court of Bavaria, the planners of which had been, in turn, inspired by Italian examples.

Despite such cross-influences, the evolution of tournament forms varied enormously across Europe. There were dramatic or literary tournaments, operatic tournaments, and many hybrids of tournament and ballet, including horse ballets, in which specially bred and highly trained horses executed graceful movements that sometimes simulated combat. Two of the most elaborate performances of the last kind, both of them put on at the Medici court in Florence during 1616, are handsomely represented in engravings by the artist Jacques Callot (1592–1635). By now, the grandest theatrical tournaments, having been extremely expensive to produce, were usually recorded in engravings and published accounts. There were also books on the art of planning such fêtes, the best-known of them being Claude-François Ménéstrier's *Traité des tournois* (1669; Treatise on tournaments).

TRADING COMPANIES. The early seventeenth century saw the foundation of Dutch and English trading companies with exclusive rights over vast areas in various parts of the globe. These organizations were essentially merchant guilds that represented an "institutional innovation" that enabled them to conduct large-scale trade with distant shores. They came to exercise functions that were usually the prerogative of national states. The main companies were the East India Company, or EIC (1600–1858), the Hudson's Bay Company (founded in 1670 and still active) and the Royal African Company (1672–1750), all English, as well as the Dutch East India Company, or VOC (Vereenigde Oost-Indische Compagnie, 1602–1799) and the Dutch West India Company, or WIC (1621–1791). Imitation companies were established in numerous states, including Denmark, France, Genoa, Portugal, and Sweden.

The commercial success of Dutch fleets in Asia led to the foundation of the two foremost East India companies. The return of four Dutch ships from the Indian Ocean in 1599 laden with spices prompted the English Parliament to award a monopoly of trade with the East Indies to the EIC (31 December 1600). Whereas the English Russia and Turkey Companies had previously failed to get access to spices through the Asian land routes, the English would henceforth use only the route around the Cape of Good Hope. Across the English Channel, the so-called pre-companies, regionally based Dutch organizations that had actively traded with

the East Indies since 1595, were liquidated to make way for the VOC. On 20 March 1602, the Dutch States-General granted the VOC a national monopoly that was similar in nature to that of the EIC.

THE EAST INDIA COMPANIES

The Dutch and English East India Companies followed in the footsteps of the Portuguese merchants in Asia and learned from their experiences. Adopting the model that the Portuguese had successfully pioneered, the VOC created a string of “factories,” fortified trading posts defended by garrisons, from Java to Japan and from Persia to Siam. These posts were linked by a regular exchange of information and commodities. The EIC established its own factories across a more limited area.

The EIC and VOC were not the first companies to enjoy national monopolies, but as chartered companies they did display some novel features. Investment in long-distance trade was no longer limited to overseas traders, as had been the case with regulated companies such as the Turkey Company, but the charters allowed domestic merchants to take part as well. What is more, the chartered companies evolved into joint-stock companies. This meant that shares were freely alienable and merchants no longer raised capital for one voyage, but created a permanent capital committed to the enterprise. Long-term considerations thus determined marketing policies. Nor was the working capital of the companies limited to their capital stock, since both resorted to the capital market to finance their operations.

A sound commercial policy underlay the VOC’s remarkable performance. By minimizing its dependence on markets that it did not control, and becoming the largest buyer and seller, the company drastically reduced its risk. Success did not come overnight, but took decades to achieve. The company benefited from the general commercial crisis rocking Southeast Asia in the mid-seventeenth century, just as the Dutch partly owed their commercial hegemony in Europe to the prevailing regional political and economic crises. Yet the VOC was not universally successful. Its huge overhead costs proved detrimental when competing with Indian traders who operated at low cost and could accept a lower profit margin.

Military expenditures were one factor that raised overhead costs. From the outset, the VOC used force to further its objectives vis-à-vis Moluccan natives, Indian merchants, and Portuguese and English rivals to secure footholds, preempt foreign European settlement, and obtain spice monopolies. Superior military strength enabled the Dutch to conquer the spice islands, seize Portuguese forts, and oust the EIC from the Indonesian archipelago around 1623, the year in which the Dutch governor had ten English nationals tortured and executed. This “Amboina massacre” was a popular English propaganda tool against the Dutch in the years to come. Other noneconomic means helped the VOC to achieve near-total control of the production and marketing of nutmeg, mace, and cloves by the late 1660s. Clove production was, for instance, restricted to the island of Amboina, and trees and surplus stocks were destroyed. The spice monopoly, which enabled the VOC to fix prices, left the company with huge profits. By contrast, pepper remained elusive, since it was cultivated over a vast area. Besides, local princes did not always honor their agreements.

For lack of sufficient financial means, the EIC operated in the shadow of its Dutch counterpart for most of the seventeenth century. Its directors, however, made the best of the EIC’s removal from the Spice Islands by concentrating operations on India, where the VOC’s presence was small. While the VOC achieved some of its original aims, the EIC proved masterful in reinventing itself. In the eighteenth century, it discovered the marketability in Europe of Indian cloth and Chinese tea. In military matters, the EIC underwent a similar metamorphosis. Founded not as a war instrument like its Dutch rival, its fleets were relatively poorly equipped and offensive actions against Asians or Europeans virtually impossible. However, the company’s new charter of 1661 stipulated that it could make war or peace with non-Christian princes or people, and very gradually, a more assertive line was adopted, in particular on the Indian subcontinent. By the 1760s, the EIC may be said to have assumed the role of a nation-state in India. It is debatable whether this expansion was based on a master plan, or whether the company was sucked into local power politics. The theory of reluctant imperialism has also been applied to the VOC, which was unable

to achieve its objectives on Java without involving itself in a complex indigenous power struggle.

Wherever the chartered companies conducted a profitable trade, fellow nationals tried to benefit as interlopers. Exchanging goods from one part of Asia in another, EIC factors and private individuals carved out a niche for themselves. Although the EIC initially forbade such trade, considering those involved as rivals of its own intra-Asian trade, the costs that it entailed made the company withdraw from the trade, and its attitude toward the interlopers changed accordingly. “Free” merchants could begin to settle in port cities under English rule, after the EIC issued a series of indulgences, starting in 1667. Subsequent English commercial success in Asia cannot be understood without taking into account private “country trade.” The VOC showed no such lenience, despite a statement by the secretary of its largest regional body, the Amsterdam Chamber, in the 1650s that intra-Asian trade were better left to private traders, whose overhead costs were modest compared with the company’s, with its heavily armed ships. Not until 1742 did the VOC allow breaches in its monopoly. On the other hand, company employees enriched themselves by conducting private trade side by side with official company trade. Fraud and corruption were rampant in the Dutch factories.

In intra-Asian trade, the Portuguese had shown the way. Their country trade was more important than their trade to Europe. Like the Portuguese and the English private merchants, the VOC became active in this trade. Between 1640 and 1688 the Dutch company procured substantial amounts of Japanese silver and Taiwanese gold for the purchase of Indian textiles, which were then exchanged for Indonesian pepper and other spices, although some were sent to Europe. Most pepper and other spices were also sold in Europe, but a certain percentage was invested in Persia, India, Taiwan, and Japan. The profits made in the intra-Asian trade paid for Asian products, the sales of which in Europe yielded more than the dividend that the VOC paid to its shareholders in this period. The company’s role in intra-Asian trade was eroded in the last quarter of the seventeenth century, when Indian merchants emerged as serious rivals in the trade to Java, Sumatra, and the Malay Peninsula. In addition, Japanese authorities curbed Dutch trade, effectively ending

the VOC’s role as chief supplier of precious metals in various Asian markets. Still, while the English became the main nation involved, the VOC easily remained the leading European company participating in intra-Asian trade.

What was the relationship between private trading companies and the home governments? Local magistrates were closely connected to VOC affairs in the United Provinces. They elected the directors of the regional chambers from among the principal investors. The States-General, for its part, had not only delegated sovereign powers to the VOC at the company’s inception, but financially supported it afterward in time of need. This aid proved crucial in the VOC’s early years, enabling the struggling company to make long-term investments in infrastructure and in military, maritime, and commercial affairs, which eventually paid off. The British government, on the other hand, arbitrarily exploited the financial resources of the EIC on several occasions. At the same time, it grew increasingly alarmed about the way the EIC conducted itself in India. Concluding alliances and treaties with native princes, and leading territorial expansion, the company resembled more a sovereign state than a trading company. Warfare was also thought to cut into profits from Asian trade, which was supposedly the company’s chief business. The Dutch also debated the advantages of territorial expansion, but here it was the VOC’s central board, not the States-General, that challenged the wisdom of company employees on the ground in Java.

Both companies contributed to national prosperity by employing thousands, stimulating the domestic shipbuilding and textile industries, and offering investment outlets. British financial leaders became involved in the EIC, while company men advised the British government on financial affairs. No such systematic crossovers occurred in the Dutch Republic, not even when the VOC faced serious financial problems in the second half of the eighteenth century. The fourth Anglo-Dutch War (1780–1784), in particular, had disastrous financial consequences. The curtain finally came down for the VOC following the French invasion of the Dutch Republic (1795). On 1 March 1796 a Committee of East Indian Trade and Possessions replaced the company directors. The EIC did not emerge as the great beneficiary of its rival’s demise.

Not only had the French and Danish East India Companies emerged as competitors, the home front grew increasingly critical of the company's moral and economic record. In 1813 the British government stripped the EIC of all its monopolies, except for the tea trade with Canton, and in 1833 all company trade ceased. After the Great Rebellion in India (1857–1858), the British state assumed the company's affairs.

THE ATLANTIC WORLD

Very different conditions obtained in the Atlantic world, where plantation companies such as the Virginia Company, licensed to establish colonies, were more prominent than pure trading companies, although in actual practice it is difficult to distinguish between the two. In 1621 the Dutch West India Company received privileges similar to those the VOC had in Asia. Founded expressly as a war machine that targeted Spanish and Portuguese ships and settlements, the WIC attracted little investment, as Dutch citizens feared the risks to which the company ships were exposed. They were proven wrong in the company's early days, in particular after the celebrated capture of the Spanish silver fleet of 1628, when the company paid a 50 percent dividend to its shareholders.

Soon, however, financial problems troubled the WIC and proved almost insurmountable. The company faced entirely different circumstances in the Atlantic from those experienced by the VOC. The creation of an intricate network of factories did not make sense in the Atlantic world. There was no Atlantic counterpart to the centuries-old intra-Asian trade in which to participate. Nor was the WIC able to obtain monopsony of the New World commodity it prized most: sugar. Not even the occupation (1630–1654) of northeastern Brazil, the world's largest producer, helped the company achieve that goal. The Dutch discovered that marketing Brazilian sugar was more difficult than was the case with East Indian spices, precisely because of the competition from other areas of sugar cultivation, including Java, Bengal, and the island of São Tomé off the African west coast.

Unlike its Asian counterpart, the WIC was unable to combine a vigorous commercial enterprise with warfare. The costly war with Habsburg Spain over Brazil, which began in 1630, forced the com-

pany to abandon some of its monopolies. By 1638, only the export of slaves from Africa and ammunition from the Netherlands, and the import of Brazilian dyewood, remained in company hands. Private merchants soon dominated the Brazil trade, although the dividing line between company interests and private concerns was, once again, not as clear as might be expected; WIC directors were among the principals of the free traders.

One argument used by advocates of the liberalization of trade was the need to people Dutch Brazil. The immigration of “free” settlers—artisans, merchants, and other colonists not in company service—so the argument ran, did more to guarantee the survival of a colony than the presence of soldiers. Besides, without trade the military was bound to become a liability, since soldiers' salaries and rations would eat away the company budget. A “free” population would create economic activity and pay import and export duties, as well as bear the burden of the soldiery. Free trade was also necessary to lure free settlers from the Dutch Republic.

At a slightly earlier stage, a similar discussion had erupted over New Netherland, the company's colony in North America. After the WIC assumed control of the colony in 1623, Manhattan and Fort Orange (now Albany) were established as trading posts to tap the vast hinterland for peltries. These posts resembled the VOC factories in Asia. A factory would seem to rule out large-scale migration, if only to curtail defense expenditures, as one company faction argued. Advocates of migration among the WIC directors emphasized the positive long-term effects of investments in agriculture and settlement. Their arguments carried the day, and by 1640 the company's fur monopoly was abolished.

The WIC remained in chronic financial trouble, as the war with the Iberian countries dragged on. In 1644 even a merger with the VOC was discussed, but the VOC refused, although it was forced by the States-General to pay its counterpart 5 million florins. In 1674, the WIC went bankrupt and was replaced by a new one with capable directors, recruited from the ranks of the shareholders. Outstanding shares and bonds were converted into new shares at a small percentage of their nominal value. In the eighteenth century, the WIC was transformed into an organization that managed the

Dutch colonies, after it lost its last monopolies, including the slave trade.

Whereas the WIC originally monopolized commerce in several products in the Atlantic world, monopolies in England were granted to various corporations. The English slave trade was exclusively conducted by the Royal African Company from 1672 until Parliament in 1698 yielded to the demands of other merchants and opened the slave trade to everyone. The Hudson's Bay Company started out as a fur-trading enterprise before undergoing a peculiar metamorphosis. It took up exploration on the west coast of North America and in the Arctic, branched out into land development and real estate, and remains to this day one of Canada's largest retailers.

IMITATION COMPANIES

If the Dutch and the English invented the typical chartered company, other Europeans were not far behind. Drawing inspiration from the pioneers, they imitated their examples down to the last detail. For example, the management of the Danish East India Company, founded in 1616, was entrusted to nine directors who received the Dutch title *bewindhebbers*. What may help to account for the adoption of Dutch terms was the role played by immigrants from Amsterdam and Rotterdam in establishing the Scandinavian companies. Nor was imitation confined to northern Europe; the Dutch West India Company served as the model for a Spanish privileged trading company, which was discussed at various times during the seventeenth century.

The imitation companies had one element in common. Their founders were obsessed with the particular structure of the English and Dutch models. They found to their cost that elaborate government initiatives only paid off when buttressed by mercantile activities. The latter, however, were often conspicuously absent. And even where there was sufficient support from merchants, undercapitalization prevented the companies from yielding the expected profits. In either case, private traders were allowed to break up the company monopolies within a few years.

What also stood in the way of success was the large degree of royal control over the imitation companies. The French East and West India Com-

panies, in particular, were designed to increase state power abroad instead of running a business enterprise. The Portuguese East India Company (1628–1633) faced another problem. While the Dutch and English companies had set up the administrative apparatus in Asia from scratch, Portuguese company officials had to defer to existing authorities. They were forced to operate in a trading empire that had functioned for more than a century under its own political and military administration, which was not going to yield.

TRAVEL AND TRAVEL LITERATURE. Travel writing was perhaps the most diverse genre of literature in early modern Europe. A single travel account contained nautical information including wind direction and speed, ocean depth, latitude and longitude, astronomical observations, and distance traveled each day. Coastlines were mapped, interiors explored, exotic plants and animals described for the first time by Europeans, or the observations of previous explorers confirmed. Accounts contained military intelligence regarding city fortifications, water supplies, populations, points of dissent that might be exploited, and notes on local commerce. Of great interest to European audiences were the customs and manners of indigenous populations encountered. All of this was rolled together and given a narrative form combining both adventure and philosophical reflection on Europe in the mirror of the other. European audiences were enthralled. Travel literature was the second-best-selling genre in the early modern era, behind only history.

Already in the sixteenth century enterprising editors began collecting the accounts of navigators and voyageurs. Richard Hakluyt's (1552–1616) *Principal Navigations, Traffiques and Discoveries* (1589) celebrated the English maritime tradition from the sixth to the sixteenth century; in a second edition he expanded his collection to include translations of French and Italian voyages as well. It is only through Hakluyt's edition that Sir Francis Drake's report of his privateering and circumnavigation of the globe survives, as the original report disappeared without being published shortly after he submitted it to Queen Elizabeth I. Hakluyt him-

self drew on the English precedents of Richard Eden's *Decades of the New World or West India* (London, 1555), which had been revised and expanded by Richard Willes in *The History of Travayle* (London, 1577). These in turn can be traced to the Italian collection by Giovanni Battista Ramusio, *Navigazioni et viaggi* (Navigations and voyages, 3 vols; Venice 1550–1556). Hakluyt inspired several other collections and continuations of travel literature over the centuries, and in the nineteenth century a “Hakluyt Society” was founded, dedicated to the history of navigation and discovery, which exists to this day.

Useful for popular entertainment, moral edification, and scientific inquiry, travel literature also exerted direct influence on national policy. While neither Alvar Nuñez Cabeza de Vaca's (c. 1490–1557) urging of the Spanish crown to take a greater interest in proselytizing in Central America nor Sir Walter Raleigh's (1552–1618) advocacy of British exploration in greater Guiana were of direct consequence to national policy, other authors managed to get their message heard. William Dampier's *A New Voyage round the World* (1697), *Voyages and Descriptions* (1699), and *A Voyage to New Holland* (1704) were instrumental in directing England's attention to the Pacific, which previously had been ceded to the Spanish and the Dutch. John and Awnsham Churchill's *Collection of Voyages and Travels* (1704), modeled on Hakluyt and inspired by Dampier's commercial success, was a comprehensive plan for establishing naval bases in the Pacific for further exploration, commerce, and warfare. As the influence of Holland and Spain declined in the Pacific in the eighteenth century, England and France enjoined rivalry over Pacific hegemony.

England and France raced to be the first to discover the *Terra Australis incognita*, the southern continent believed to be a geographic necessity to balance the landmass of the northern hemisphere. In the late 1760s the British and French happened upon Tahiti nearly simultaneously. In 1767 Samuel Wallis landed on the islands first, but Louis Antoine de Bougainville was in the area also from 1766 to 1769. He dispatched his scientific team to collect plant and animal specimens from the islands, and he even brought a native Tahitian named Ahutoru back to Paris. Immediately upon his return to France in 1769 Bougainville announced the discov-

ery of the islands he named New Cythera, after the Aegean island where the goddess Venus first washed ashore. The discovery showed that the French navy could still compete with the British in the wake of the Seven Years' War (1756–1763), and thus it occasioned a great deal of national pride. The British responded with James Cook's first voyage (1768–1771), underwritten by the Royal Society, and in a separate expedition in 1774 Tobias Furneaux brought to London the Tahitian Omai, in answer to Ahutoru. Whether French, British, or Spanish, the voyages of discovery were always patriotic endeavors in addition to having geopolitical, military, and economic significance.

Travel literature created an odd association between men of action and men of letters. Shakespeare set his *Tempest* (c. 1611) on a spooky island, perhaps inspired by William Strachey's "True Repertory of the Wracke and Redemption of Sir Thomas Gates" in Bermuda (written 1610, published 1625). Strachey's shipmates initially found the island a desert, "onley fed with raine water, which neverthelesse soone sinketh into the earth and vanisheth away." Other places were populated by bats and indigenous people who did not respond well to the castaways' kindnesses. Shakespeare's "island seem to be a desert," (II. 1), Sebastian proposed to "go a bat-fowling" (II. 1), and the native Caliban returned Prospero's generosity by attempting to rape his daughter Miranda (I. 2). Even the sprite Ariel appeared in Strachey's account of "an apparition of a little round light, like a faint starre, trembling, and streaming along with a sparkeling blaze, halfe the height upon the Maine Mast, and shooting sometimes from Shroud to Shroud, tempting to settle as it were upon any of the four Shrouds." It remained half the night and finally disappeared at dawn. Nevertheless Strachey wanted to disabuse the English of the image of Bermuda as islands that "can be of no habitation to man, but rather given over to devils and spirits"—but this is precisely the legend Shakespeare built upon.

In 1708–1711 one of the most influential travel writers, William Dampier, circumnavigated the globe with the privateer Woodes Rogers, who returned with both ships intact and his holds filled with exotic and expensive items, matching the success of Sir Francis Drake a century and a quarter earlier. Along the way they rescued Alexander

Selkirk, who had been put ashore in the Island of Juan Fernandez in 1704 and marooned there for five years. They found Selkirk clothed in goat skins, looking "wilder than the original owners of them." He had survived by hunting and fishing and had passed the time "reading, singing Psalms and praying, so that he said he was a better Christian while in this solitude, than he ever was before." Selkirk was hailed in William Cowper's 1782 poem "The Solitude of Alexander Selkirk:" "I am monarch of all I survey." Selkirk's experience also formed the outline of one of the first English novels, Daniel Defoe's *Robinson Crusoe* (1719). Selkirk's island, some 500 miles west of Santiago, Chile, is still officially named Isla Robinson Crusoe. Even Samuel Taylor Coleridge's "Rime of the Ancient Mariner" (1798) has a core of truth, adopted from an episode described by George Shelvocke (*Voyage round the World*, 1726) of being stuck in the doldrums off Cape Horn, the only sign of life "a disconsolate black albatross, who accompanied us for several days, hovering about us as if he had lost himself, till Hatley, my second captain, imagining from his color that it might be some ill-omen, after some fruitless attempts, at length shot the albatross, not doubting, perhaps, that we should have a fair wind after it." Instead that minor atrocity brought Hatley no better luck than Coleridge's ancient mariner.

James Boswell caught the travel bug while speaking with Captain Cook between Cook's second and third voyages in 1776. He told Samuel Johnson that "while I was with the Captain, I caught the enthusiasm of curiosity and adventure, and felt a strong inclination to go with him on his next voyage. JOHNSON: 'Why, Sir, a man does feel so, till he considers how very little he can learn from such voyages.' BOSWELL: 'But one is carried away with the general and distinct notion of A Voyage Round the World.' JOHNSON: 'Yes, Sir, but a man is to guard himself against taking a thing in general.'" (Boswell, *Life of Samuel Johnson*, 3 April 1776)

"The enthusiasm of curiosity and adventure"—these were the allure of travel literature in the early modern period. Hardship and desperation brought out the best of human perseverance and intrepidity, whether it was the drama of Cook's crew desperately bailing water while trying to hoist the *Endeavor* off the Great Barrier Reef in 1771 or the exhilaration of William Bligh's arrival at Timor after

sailing 1,200 leagues across the South Pacific with seventeen men in a twenty-three-foot open boat, after having been cast adrift by a mutinous crew of the *Bounty*. Just as exciting was George Anson's four-year *Voyage round the World* (1748), fraught with near disaster at every step. Storms off Cape Horn reduced a fleet of six raiders to one; raids on Spanish settlements on the west coast of South America as part of the War of the Austrian Succession (1740–1748) were beaten back; a treasure ship was captured; typhoon winds were so fierce that men lashed themselves to the fore-rigging to serve as sails, and one of the best was blown overboard and last seen treading water in the distance with no chance of rescue; advanced scurvy was healed with miraculous swiftness by fruit and fresh water on a South Pacific island. In scene after scene voyage accounts were a read as engaging as any modern thriller.

Only in rare cases like Dampier and Sir Walter Raleigh did men of action double as men of letters. Usually accounts of voyages around the world were ghostwritten (if not overtly so) by another author, and in the eighteenth century it was the policy of the British Admiralty board to confiscate the captains' logs and other officers' journals and turn them over to an author who collated the information and turned it into literature. In 1771, for example, John Hawkesworth was given a £6,000 advance to compile the scientific journals of Joseph Banks and Daniel Solander and Cook's logs in order to produce "the official" account of the voyage. J. Reinhold Forster thought he bore the right to fill Hawkesworth's role on Cook's second voyage for which he himself was the chief science officer, but after Hawkesworth's performance was panned in the British press, Cook asserted control over his logs and produced his own account. But even here the naval captain had considerable help from John Douglas, a canon of Windsor, in composing the narrative. Richard Owen Cambridge was assigned by the Admiralty to assist Forster, but Forster pulled out of the deal and turned his notes and journals over to his son George, who had also sailed with his father and Cook.

Not all travel in the early modern period involved overseas navigation, and many overland expeditions were specifically scientific in intent. Scientific travel marks a major change between the

curiosity cabinets of the seventeenth-century collectors and the eighteenth-century project of botanical and zoological (and human) taxonomy. Following the lead of his teacher Olof Rudbeck, who in 1695 had made an overland journey to Lapland, in 1732 Carl Linnaeus crossed the Arctic Circle to the north coast of Norway, chiefly in search of plant specimens, the results of which were published as *Flora Laponica* (1737). Several of Linnaeus's students traveled the globe in the taxonomic effort: Daniel Solander explored the South Pacific on Cook's first voyage; on his second voyage Cook picked up Anders Sparrmann at the Cape of Good Hope and took him around the world; Karl Peter Thunberg was the first European to visit Japan in over a century, where he offered medical information to the Japanese and took home numerous plant specimens; and Peter Forskål, traveling with a Danish Hebrew scholar and a German geographer funded by the Danish crown, sent home drawings and specimens from Egypt and Arabia before the expedition was wiped out by malaria in Yemen. J. G. Gmelin spent ten years (1733–1743) observing the flora and fauna of Siberia on the Russian payroll and published both a travel narrative and a scientific treatise, each in four volumes. The French also sent an expedition to Lapland in the 1730s, led by Pierre Louis Moreau de Maupertuis (1698–1759) not to collect plant specimens but to make astronomical observations to confirm the theory that, due to its rotation, the Earth is slightly flattened at its poles. These observations were coordinated with a simultaneous expedition to equatorial Peru led by Charles Marie de la Condamine (1701–1774). Most of the research journeys were government-funded and of national interest to the funding monarch, implicitly pitting the scientists against one another in competition. Yet there was a clear sense among the scientists themselves that they were members of an international republic of letters, and through their published travel narratives they shared their findings with each other.

As the volume of travel literature increased rapidly in the late eighteenth century, scholars began to put it to systematic use. Here the observations of travelers constituted the raw scientific data of geography and climate, of flora and fauna, and of human society and customs. In France Abbé Guillaume Thomas François Raynal (1713–1796) assembled a

philosophical and political history of the settlements and trade of the Europeans in the East and West Indies on the basis of travel literature. Earlier in the century Anton Yves Goguet (1716–1758) brought a wealth of anecdotes from modern travelers to bear on ancient authors to construct a history of humanity in its earliest stages. Montesquieu's *Spirit of the Laws* (1748) was heavily dependent on travel reports. In Britain Henry Home, Lord Kames (1696–1782) and William Falconer (1744–1824) produced histories of global humanity from travel reports. In Germany the first glimmer of modern anthropology emerged in the reading of travel literature by Isaac Iselin (1728–1782), Johann Gottfried Herder (1744–1803), and Christoph Meiners (1747–1810), whose *Grundriß der Geschichte der Menschheit* (1785; Outline of the history of humanity) contained an eighty-page bibliography of cited travel literature.

MICHAEL CARHART

TRENT, COUNCIL OF. Considered the nineteenth general council of Western Christendom, the Council of Trent met after much delay in response to the call of both Lutherans and Catholics at the Nuremberg Reichstag of 1524 for “a general free Christian council in German lands” to reform the church. Paul III (reigned 1534–1549), having failed to assemble a council in the imperial city of Mantua in 1537 due primarily to inadequate security arrangements and in Venetian Vicenza in 1538 due to the attendance of only five bishops, ordered the council to meet in 1542 in Trent. This Holy Roman Empire city had a population of about six thousand, of whom a quarter were German-speaking, was ruled by a prince-bishop, and was situated on the Italian side of the Alps about eighty miles south of an imperial residence in Innsbruck. Hostilities between France and the empire delayed the opening of the council until 1545.

GOALS AND SESSIONS OF THE COUNCIL

The goals formally assigned to the council by Paul III in 1542 were to define doctrine, correct morals, restore peace among Christians, and repel infidels. Pius IV in 1560 made explicit the goal that “schisms and heresies may be destroyed.” The pope initially gave priority to a clarification of Catholic doctrine,

Council of Trent. Painting by Hermanos Zuccarelli, c. 1560–1566. ©ARCHIVO ICONOGRAFICO, S.A./CORBIS

the emperor to a reform of abuses. The compromise was to treat simultaneously the removal of any abuses related to a teaching that was defined.

Period I. The council can be divided into three periods. Period I, under Paul III, consisted of sessions 1 to 8 (13 December 1545 to 11 March 1547), which met in Trent. Claiming an outbreak of typhus, the pope had the council transferred to Bologna in the Papal States despite the opposition of the 27 bishops from Habsburg lands, who remained in Trent. Sessions 9 and 10 (21 April and 2 June 1547) issued no doctrinal or disciplinary decrees, and after the general congregation of 29 February 1548 the council was suspended. In subsequent periods the council would return to Trent. In

the first period, attendance varied from about 30 to 70 prelates per session; in all there were about 100 members with a deliberative vote: 5 cardinals, 12 archbishops, 76 bishops, 3 abbots, and 6 generals of religious orders, plus two procurators of absent German bishops who had only a consultative voice. Most prelates were Italians, the Spanish were well represented, and only a few came from other Catholic lands. During this period the prelates focused on the teachings of Martin Luther (1483–1546), Huldrych Zwingli (1484–1531), and their followers in Germany and Switzerland.

Period II. Period II, under Julius III (reigned 1550–1555), included sessions 11 to 16 (1 May 1551 to 28 April 1552). Attendance varied between

44 and 51 prelates, with a total of about 59 prelates. As many as 13 German bishops were represented, including the personal presence of the powerful electoral archbishops of Mainz, Cologne, and Trier. Lutheran states agreed to send delegations: that from Brandenburg accepted the authority of the council and was incorporated at the 13th session; those from Württemberg and the imperial cities led by Strasbourg were allowed to read their mandates at the general congregation of 24 January 1552. Hopes that agreement could be found with so many Germans present were dashed by the reopening of military conflict.

Period III. Period III, under Pius IV (reigned 1559–1565), consisted of sessions 17 to 26 (18 January 1562 to 3–4 December 1563) and was noteworthy for the arrival of a delegation of 13 bishops, 3 abbots, and 18 theologians from France and for the increased attention to the teachings of John Calvin (1509–1564) and the situation in France. There were 117 prelates at the 17th session, which rose to 228 at the 24th. About 270 bishops in all attended during this period, the vast majority being Italians (187), but Spanish (31) and French (26) were also well represented, and bishops from other Catholic lands attended too. The final decree was signed by 255 prelates and procurators. Altogether, the council sat for five years and one month.

ORGANIZATIONAL STRUCTURE AND ATTENDEES

The organizational structures given to the council allowed it to achieve most of its goals. The popes were usually represented by cardinal legates, who served as council presidents and were in regular communication with the pope and congregation of cardinals in Rome, who set the agenda and at times made crucial decisions. “The Holy Spirit arrived in the saddle bags of papal couriers,” quipped the historian Paolo Sarpi (1552–1623). The most important presidents were Cardinals Giovanni Maria Ciocchi del Monte (1487–1555, Tuscan canonist, administrator, and future Julius III), Reginald Pole (1500–1558, cousin of Henry VIII, friend of Sir Thomas More, conciliatory theologian, and archbishop of Canterbury under Mary Tudor), Girolamo Seripando (1493–1563, Neapolitan, conciliatory theologian, reformer, former general of the Augustinian friars, and archbishop of Salerno),

Stanislaus Hosius (1504–1579, Polish controversialist theologian and bishop of Warmia), and Giovanni Morone (1509–1580, Milanese diplomat, conciliatory theologian, former bishop of Modena, and target of the Roman Inquisition, whose diplomatic skills rescued the council after the deadlock over episcopal residence in 1563). The council presidents had the difficult task of resolving disputes—traditionalists versus conciliationists, papalists versus conciliarists and episcopalists, curialists and exempt religious versus diocesan bishops, Scholastics versus humanists, Scotists versus Thomists versus Augustinians, and rival national delegations eager for uniformity in teaching and practice (Spanish and Italians) or for reconciliation with the Protestants in their lands (Germans and French) or for preserving their ruler’s patronage rights and prerogatives (Spanish, Portuguese, and French).

Among the other leading prelates at the council were the Italians: Pietro Bertano, O.P. (Fano), Tommaso Campeggio (Feltre), Giulio Contarini (Belluno), Cornelio Musso, O.F.M. (Bitonto, then Bertinoro), and Tommaso Stella, O.P. (Salpe, then Lavello, and finally Capodistria); the Spanish: Martín Pérez de Ayala (Guadix, then Segovia), Pedro Guerrero (Granada), Pedro Pacheco (Jaen), and Melchor Álvares de Vozmediano (Guadix); the Portuguese Bartolomé dos Martires, O.P. (Braga) and João Soares, O.E.S.A. (Coimbra); the Frenchmen Antoine Filheul (Aix), Charles de Guise (Reims), and Nicolas Psaume (Verdun); the Germans Friedrich Grau [Nausea] (Vienna) and Julius von Pflug (Naumburg); the Scot Robert Wauchop (Armagh); the Croatian Georg Draskovich (Pécs); the Moravian Anton Brus von Müglitz (Prague); and the exiled Swede Olof Månsson Store (Uppsala).

Theologians, who had only a consultative vote in the proceedings, were sent by the pope and Christian rulers or brought along as advisers (*periti*) by the bishops and generals of religious orders. Known as “minor theologians” (*theologi minores*) to distinguish them from prelates who were also theologians, the vast majority were members of religious orders, and of these over half were Franciscans and about a quarter Dominicans. In the first period they numbered about 35; their numbers rose until in the last period there were about 100, of whom only 34 were allowed to speak on a topic, for a half-

hour each; the others could submit their thoughts in writing prior to a debate. Among the leading theologians were the Jesuits and papal theologians Diego Lainez and Alfonso Salmeron; the Dominican Thomists Melchor Cano, Domingo de Soto, Bartolomé Carranza de Miranda, and Ambrogio Catarino (Lancellotto de' Politi); the Franciscan Scotists Alfonso de Castro and Andrés Vega; and the secular priests Johann Gropper, Francisco de Torres, and Ruard Tapper.

The council developed its own organizational structures. It began with classes or group meetings in which bishops and theologians together debated the theological issues, frequently in the form of suspect quotations extracted from the writings of the Protestants. When the bishops soon came to hate this procedure (*odiossima*), the legates had the theologians debate the topics on their own with the bishops listening. Once ideas were clarified and a consensus emerged, the bishops met on their own in particular congregations to draw up draft decrees. Reform decrees were drafted by commissions (nominated by the legates and approved by the prelates) from various proposals submitted by bishops and ambassadors. Drafts of decrees were debated in general congregations, where they were modified and approved. Formal approbation was done at a session, a liturgical ceremony with a mass, sermon, and formal vote on the decree. The decrees were issued in the name of the council with the papal legates presiding and not in the name of the council representing the universal church, as the more conciliarist types preferred. Beginning with the fifth session, the council condemned certain theological statements as anathema (contrary to Catholic teaching and practice) and then gave the reasons for the condemnation. From the sixth session onward the doctrinal decrees began with chapters that stated positively the Catholic position and ended with canons that condemned unacceptable teachings. The canons had the greater doctrinal weight.

DECREES

The council issued a number of important doctrinal decrees. It affirmed that all the books of the Bible, including the Apocrypha or deuterocanonical books not found in the Hebrew bible and rejected by Luther, were inspired and that the Vulgate version was “authentic,” that is, could be used in sermons

and disputations. Critical editions and translations were subject to ecclesiastical censorship. The Bible was to be interpreted according to the sense given to it by the church over the centuries. Unwritten apostolic traditions, whether dictated orally by Christ or by the Holy Spirit, were also a source of saving truths and rules of conduct. It restated the teaching of the Council of Orange (529) on the existence, nature, and effects of original sin, rejecting both Pelagian optimism and Lutheran pessimism. It taught that justification, whereby one's sins were remitted and one became just and could grow in holiness through good works “done in God,” was an unmerited gift of God, but that those with the power of discretion must freely cooperate with grace. The traditional seven sacraments (baptism, confirmation, Eucharist, penance or reconciliation, extreme unction or anointing of the sick, holy orders, and matrimony) were taught as having been instituted by Christ (whether immediately or mediately is not defined), to contain the graces they signify, and in the case of baptism, confirmation, and holy orders to leave an indelible mark on the soul so that they could not be repeated. Baptism by water even of children was necessary for salvation. In the Eucharist the bread and wine were changed into the true Body and Blood of Christ (transubstantiation), the pope was to decide when and where it was prudent to allow reception of the Eucharist under both forms, the Mass was a sacrifice, auricular confession of one's mortal sins to a priest was required, and marriage to be valid was henceforth to be contracted before a priest and witnesses. The existence of purgatory and the veneration of saints, relics, and sacred images were also decreed.

Among the principal reform decrees were those requiring a bishop to preach and reside in his diocese. A bishop was to conduct a visitation of his diocese and celebrate a synod annually. He was also to establish a lectureship on the Bible and to see that catechetical instruction was provided for the laity in parishes and that his clergy were properly trained in ecclesiastical disciplines in colleges—this led to the establishment of seminaries. Parish churches (and not confraternity churches and private chapels) were to be the settings for the laity's regular religious worship and instruction. Books were not to be published until their orthodoxy had been determined by the local ordinary or pope—this led to the issu-

ance of lists or indices of forbidden books. Religious art was encouraged as a means for instruction and incitement of piety, but care was to be exercised that no false doctrine or unbecoming and confusing scene was depicted and no superstitious practices allowed. Avoiding more restrictive prescriptions, the council decreed that music was allowed in church provided it was not “base and suggestive,” and it ordered seminarians to be taught to chant. The council entrusted to the pope the completion of a number of tasks it was unable to finish, and asked him to confirm its decrees.

By the bull *Benedictus Deus*, dated 26 January 1564 but issued on June 30th, Pope Pius IV confirmed all the decrees of the council unaltered and ordered their implementation. The first official edition of the decrees had been printed in Rome by Paolo Manuzio on 18 March 1564. The pope forbade the publication of any glosses or commentaries on them and established the Congregation of the Council on 2 August 1564 to interpret them. The principal doctrinal teachings of the council he summarized in the *Professio Fidei Tridentina*, to which all university professors (10 November 1564) and prelates (13 November 1564) were required to swear. Support for implementing the decrees was sought and secured from the rulers of Catholic states: Spain, Portugal, Venice, and Poland-Lithuania in 1564, the Catholic Swiss Cantons in 1565, and the Catholic Estates of the Empire in 1566. When the king and Estates-General of France repeatedly refused to confirm the decrees of Trent, French bishops met on their own and did so in 1615. Provincial councils applied Trent’s decrees on the local levels. The decrees of the six Milanese provincial councils (1565–1582) held under Carlo Borromeo (1538–1584) and published together in 1582 as *Acta Ecclesiae Mediolanensis* became the model throughout Catholic Europe for much of the implementing legislation on the provincial and diocesan levels. The papacy brought to completion the tasks assigned to it by the council, issuing revised indices of forbidden books (1564 and 1596), the first Roman Catechism (1566), and corrected editions of the Breviary (1568) and Missal (1570). The decisions of the Congregation of the Council imposed on Catholicism a uniformity and passive deference to Rome that became known as Tridentinism. The implementation of Trent’s decrees

on the local level, pushed forward by papal nuncios, reforming bishops and religious, and dedicated Catholic rulers, took many generations to effect.

TRIANGULAR TRADE PATTERN.

The transatlantic slave trade involved more than the European purchase of slaves in Africa and their sale in the New World. Historians have identified as a triangular trade pattern a typical voyage of a slave ship consisting of three distinct legs: in the first, the ship would sail from a European port to coastal Africa and exchange its goods for slaves, who were then taken to the New World and sold for colonial produce. The ship then returned home to Europe laden with colonial cash crops, completing the triangle. The triangular trade found its classic, although not its original, expression in Eric Williams's seminal *Capitalism and Slavery* (1944). Williams argued that the triangular trade was Great Britain's primary trade in the seventeenth and eighteenth centuries, and gave a triple stimulus to British industry. British manufactures were used to buy slaves in Africa, and once the slaves were put to work on American plantations, they were dressed—along with their owners—by British industries and fed by New England agriculture and Newfoundland fisheries. Finally, the New World commodities that the slaves produced were processed in Britain, thus giving rise to new industries.

Williams went on to suggest that this multiple stimulus was so significant that the British triangular trade paved the way for the industrial revolution. There was a link, he argued, between the capital accumulated in the slave trade of Liverpool, Britain's largest slave-trading port, and the emergence of manufactures in Manchester. Up to 1770, one-third of Manchester's textiles exports went via Liverpool to the African coast, and one-half to the American and West Indian colonies. Other historians have pointed out that long-term credits from Manchester manufacturers were used to finance Liverpool's trade. However, it has not been possible to determine the extent to which industrial development was linked directly to the slave trade.

Africa was always the first stop in the triangular trade, and the Europeans quickly learned that they needed a variety of goods in order to do business there. The specific merchandise brought to barter differed according to the place of trade, and it was important for slaver merchants to keep up with local demand. European goods were highly valued in the local African economies, both for their usefulness

and their exchange value. Cloth, for example, was popular in Senegambia (the area of modern day Senegal and Gambia), because it could serve as a kind of money or be made into clothes. The same was true of iron, which had a high exchange value but could also be made into tools, utensils, and weapons.

For lack of facilities to intern the slaves on the coast, the European purchase of slaves could take a long time. The average slaving vessel spent several months in Africa, the captain sailing up and down the coast or traveling inland until the ship's hold was filled. Once the so-called Middle Passage (the Africa-Americas run) had been completed, the slaves were sold. Payments were a perennial problem in the New World, since ships often arrived outside of the harvest season and, even when they arrived at the opportune time, most of their customers were heavily indebted planters. Due to the delay of payments, slave merchants were frequently compelled to advance credit to the planters, the interest for which was credited to the slave trader. Under this system, slave factors—traders in the employ of European merchant houses—served as intermediaries between the trader and the planter by arranging for the sale of slaves. In the British slave trade, the debt problem led to the adoption of a new system of remitting the proceeds of slave sales to England. This system, first introduced in the Caribbean in the 1730s, forced the slave factors to pay outstanding debts at specific times and to remit the proceeds of the slave sales in either cash, produce, or bills of exchange, effectively shifting the burden of supplying credit from the trader to the planter. If the factor cleared a debt with a bill of exchange, it had to be drawn against a British mercantile firm or guarantor.

Slave traders relied increasingly on these bills of exchange, as well as on the transport of produce on board ships other than slavers. The third leg of the triangular trade thus deviated from the model in that slave vessels did not usually carry large amounts of slave-produced goods from America to Europe. Many of the ships returning to the United Provinces from Suriname sailed in ballast, weighed down by sand and water. On the other hand, it was exceptional for slave vessels returning to British ports from Virginia and Jamaica to sail in ballast. Overall, it is hard to establish what percentage of the goods

carried back represented payment for the slaves, although it is clear that the volume of goods that slavers transported from the New World to Europe was relatively small.

SHUTTLE OR ROUND-TRIP VOYAGES

In Atlantic trade generally, it was actually not the triangular trade that predominated, but the shuttle (also called round-trip) voyage, which did not include the New World–Europe leg of the triangle trip. Round-trip voyages produced experienced captains and increased the chance of a punctual delivery and of a landing around harvest time. By the last quarter of the seventeenth century, the transport of African slaves in the South Atlantic was partially a shuttle trade, in which the tobacco planters near Brazil's capital of Bahia exchanged their crop for bonded Africans on the Gold Coast. A similar bilateral trade developed between Rio de Janeiro and Angola. The largest of all slave trades, that of Brazil, was therefore not triangular at all.

Nevertheless, although the African slave trade was often conducted separately from the trade between Europe and the Americas, the services it supplied to the latter were indispensable. And while doubt has been cast on the overall effect of the triangular model on British industrialization, the triangular trade pattern forms part of the web of dependence that connected Europe, Africa, and the New World in the age of the slave trade.

TUDOR DYNASTY (ENGLAND).

Henry Tudor (ruled 1485–1509) traced his royal blood through his mother, Margaret Beaufort, who was a descendant of John of Gaunt, the younger son of Edward III (ruled 1327–1377). After the death of Henry, Prince of Wales, son of Henry VI (ruled 1470–1471), in 1471, Henry Tudor was the surviving male heir of the house of Lancaster. In 1485 he deposed the usurper, Richard III (ruled 1483–1485) at the Battle of Bosworth Field, and was crowned Henry VII. Henry survived numerous plots early in his reign but seemed secure on the throne by 1500. His heir, Prince Arthur (born 1486) died in 1502 and his brother, Henry, duke of York, succeeded to the throne in April 1509 as Henry VIII, shortly after marrying his brother's widow, Catherine of Aragón. Henry's desire for a male heir led him, in the late 1520s, to seek a divorce from his wife. This could only be achieved by breaking with the Roman Catholic Church and thus heralded the beginning of the English Reformation.

Henry died in 1547, leaving the throne to Edward VI, his nine-year-old son by his third wife, Jane Seymour. Edward actively supported Protestant reform but on his premature death in 1553, the throne passed to his elder sister, Mary, the daughter of Catherine of Aragón, despite efforts to place the Protestant Lady Jane Grey on the throne. Mary restored Catholicism and in 1554 married the Spanish prince, who became King Philip II in 1556. Mary died childless in 1558 and the throne passed to Elizabeth, Henry VIII's daughter by his second wife, Anne Boleyn. Elizabeth again broke from Rome and asserted her authority by refusing to marry or name her successor. The second half of Elizabeth's reign was dominated by war with Spain from 1585 over English support for Philip's rebellious Dutch subjects. Elizabeth survived the plots of her Stuart rival, Mary, Queen of Scots (whom she had executed in 1587) and the Spanish Armada of 1588. Despite a decade of war, factional intrigue at court, and economic crisis, it was Elizabeth's greatest achievement to pass the throne peacefully to her

chosen successor, James VI of Scotland, who became James I of England in 1603.

TULIP ERA (OTTOMAN EMPIRE).

Lasting from 1718 to 1730, the Tulip Era was a transitory period in the Ottoman Empire that was marked by cultural innovation and new forms of elite consumption and sociability. The Tulip Era (in Turkish, *Lâle Devri*) coincides with the latter half of the reign of Sultan Ahmed III (ruled 1703–1730), specifically the twelve-year grand vizierate of Ahmed's son-in-law (*damad*), Nevşehirli Ibrahim (d. 1730). The period is known for several breakthrough achievements, including the first Muslim printing press in the empire, various innovations in the arts and urban design, and the first cultural embassies to Europe. It is also remembered for the extravagance of the imperial court and the emergence of a Western-inspired, elite pleasure culture. The period gets its name from court society's passion for tulips, which were especially prized as a cultivar and artistic motif. Grandees imported tulip bulbs at great expense, experimented with hybridization, and, planting them by the thousand, celebrated their blooms in candlelit "tulip illuminations" in gardens throughout Istanbul.

COURTING EUROPE

In both domestic and foreign affairs, the sultan followed the lead of his grand vizier. Since the empire's disastrous defeats at the end of the seventeenth century, the Ottomans had been obliged to recognize the importance of diplomacy. Under Ibrahim's leadership, the regime pursued a policy of peace on the western front. Diplomatic relations with Europe were expanded, and European delegations in Istanbul were allowed to circulate more freely in Otto-

man society. The vivid account of Ottoman women by Lady Mary Wortley Montagu (1689–1762), wife of the British ambassador, is based on her unusual access to the harems of privileged Ottomans when she was in Istanbul with her husband, 1717–1718. It was France, however, that the regime regarded as a kindred state and looked to as a model during this period. The empire's most important embassy, to France in 1720, created a sensation in Paris—one of the earliest demonstrations of European "turcomania." In a reciprocal effect, the Ottoman court flirted with European exotica. Among the wealthy, and to some extent in society at large, there was experimentation with European entertainment styles and clothing fashions. The changes that Ottoman women introduced into their outdoor attire seemed minor to outsiders, but they provoked criticism in conservative circles, including the established guilds.

FROM OPPOSITION TO REBELLION

The return of the Paris embassy fed the court's consumerist appetites with luxury goods, reports of French manners, and drawings of palaces and waterworks displays. Some features of the pleasure culture were extended to the larger public, which was treated to new amusement parks and new, non-religious holidays on which to enjoy them. As with clothing fashions, the spread of public entertainments—in particular women's presence in mixed company—led to moralist objections. In 1727, prior to establishing the first Ottoman Muslim press under the direction of a Hungarian convert to Islam, Ibrahim Müteferrika (1674–1745), Ahmed III and Ibrahim took care to obtain an authorizing *fetva* ('edict') from the chief *mufti* ('judge') in order to hold down opposition to their innovation. In a further compromise, the press was restricted to publishing nonreligious works, such as historical chronicles, maps, and dictionaries. The regime's unpopularity increased during the late 1720s. The court's spending habits and social style became more and more contentious as economic problems worsened and the empire became enmeshed in war with Iran (Persia, as it was known to Westerners). When the empire suffered a military defeat on the eastern front and the government failed to act in 1730, there was a seditious uprising led by an Albanian seaman, later a bath attendant and janissary, Patrona Halil, and the regime was overthrown. The

sultan was forced to abdicate, and along with his family was put under house arrest; Ibrahim and his closest associates, the main targets of the rebellion, were killed. The excesses of court society served as rallying cries for the mob, but the regime's other ventures—ill-conceived reforms and wartime misadventures—had already created important enemies, particularly within the military. Ahmed's successor, Mahmud I (ruled 1730–1754) all but closed the Tulip Era's cultural openings. Further experimentation with Europe as a cultural site would have to wait until the end of the century.

MADELINE C. ZILFI

TULIPS. The tulip made its first impact on European history in 1389 in Kosovo, when the son of the Ottoman sultan rode into battle against the Serbs wearing a shirt embroidered with tulips. The tulip is a plant native to Turkey and much revered in that country, where it is known as *lâle*. The Western name probably derives from a mispronunciation of the Turkish word *tulband*, 'turban', which was reported back by early travelers as *tulipam*. It is possible that the similarity of the shape of the turban and the flower caused the linguistic confusion. In 1559 a Swiss physician and botanist, Conrad Gessner (1516–1565), published the first account and the first picture of tulips in western Europe.

In the sixteenth century tulips were cultivated in Europe by a mere handful of botanists. Most notable among them was Charles de L'Écluse, or Carolus Clusius (1526–1609), a native of Arras in the

Tulips. Illustration of *Tulipa gesaeriana* by Jacopo Ligozzi (c. 1547–1632). ©SCALA/ART RESOURCE, N.Y.

Habsburg Netherlands. Clusius helped establish the Imperial Botanical Garden at Vienna at the behest of Emperor Maximilian II and then created another botanical garden in Frankfurt before his appointment as Horti Praefectus at the recently established University of Leiden in the Netherlands in 1592. Clusius had the largest collection of tulip bulbs in Europe and ensured that the university's botanical garden included numerous varieties of tulips.

By then the tulip had already become a fashionable item in aristocratic gardens; in the Dutch Republic it was to become a truly popular flower. In 1612 Emanuel Sweerts (1552–1612) of Amsterdam published his *Florilegium*, the first sales catalogue that included tulips. Dutch agriculture was already highly commercialized and quick to pick up this new product. As it was, the soil directly behind the dunes in the vicinity of Haarlem proved exceptionally suitable for the growing of bulbs. The interest in tulips reached fever pitch during the 1630s, when a single bulb could change hands for the price

Tulips. *Flower Bouquet with Tulips*, painting by Ambrosius Bosschaert, 1609, Kunsthistorisches Museum, Vienna.
©ERICH LESSING/ART RESOURCE, N.Y.

of a sizable house on one of Amsterdam's fashionable canals. Especially in demand were the so-called broken varieties, which displayed flamed patterns of many colors, instead of the more common solid coloring. Twentieth-century laboratory tests would reveal that breaking occurred as the result of a viral infection of the bulb. In the seventeenth century it was only understood that the broken varieties were rare, and therefore valuable. Of the *Semper Augustus*, perhaps the rarest of them all, only twelve bulbs were known to exist, and at a certain point they were all owned by Adriaen Pauw (1581–1653), who was the pensionary, the most important civil servant, first of Amsterdam and later of Holland.

In 1637 the tulip bubble burst, and it took the Dutch authorities years to sort out the financial

mess, which left numerous people bankrupt. Although observers at home and abroad insisted it had taught the speculators a lesson, the tulip mania turned out to be a publicity scoop. It would establish in the public mind, for centuries to come, the closest possible connection between Holland and bulbs. Thanks to its flowers, Dutch agriculture is still one of the largest exporters in the world.

MAARTEN PRAK

TURKISH LITERATURE AND LANGUAGE.

The term *Turkish literature* refers to the literature produced in the Asian and Eastern European lands of the Ottoman Empire and composed in the Western Turkic, Oghuz-Turcoman dialects, of which the literary languages were Ottoman and Azeri Turkish. *Ottoman literature* here refers to the high-culture literature of the Ottoman period (c. 1326–1860). During early modern times, the Eastern Turkic, Kipchak-Chaghatai dialects produced their own distinctive literature, which flourished in Central Asia and the eastern parts of the Middle East. This literature is conventionally referred to by the general term *Turkic literature*, of which the predominant high-culture manifestation is called *Chaghatai literature*.

OTTOMAN ORIGINS

Late in the eleventh century, Muslim Oghuz-Turcoman armies coming from the East had driven the Byzantines out of much of Asia Minor and established the Persianized sultanate of the Seljuks. In the aftermath of the Mongol invasions of the thirteenth century, Seljuk hegemony ended, and Asia Minor disintegrated into a hodge-podge of fiefdoms headed by local dynasts who favored the Turkish culture of their nomadic power base rather than the Persian high-culture focus of their Seljuk predecessors. The early Ottoman state originated in

western Anatolia on the borders of Byzantium during the late thirteenth century as an assemblage of Turcoman seminomads under the command of a chieftain named Osman (Arabic *ʿUṯmān*, from which the name “Ottoman” derives). Successful incursions into Byzantine territory brought a flood of recruits into the Ottoman army and expanded Ottoman domination throughout western Asia Minor and into eastern Europe. With the capture of Constantinople (Turkish, Istanbul) in 1453, the Ottomans stood poised on the threshold of becoming the largest and arguably the most powerful empire of early modern times.

LITERARY CURRENTS

Implicit in the origins of the Ottoman state are linguistic, literary, and cultural currents that resonate through almost six hundred years of Turkish literary history. The Turkic peoples who entered the Middle East in migratory military waves from Central Asia brought with them traditional literary forms, which had taken on an Islamic overlay. The territories they entered were dominated by a Perso-Arabic high culture that had developed in concert with the expansion of Islam. Legitimacy for any ambitious ruler depended upon his being perceived as the defender of the Islamic community and its traditions, which included Islamic high culture and its canonical languages—Persian and Arabic. Thus, the early Turkish rulers of Asia Minor drew their military support from the nomadic Turcoman tribes and therefore needed to speak their language and respect their traditions. However, as their domains extended, successful Turkish rulers came under increasing pressure to conform to the cultural norms associated with Islamic monarchical models.

As a result, Western Turkish literature diverged early onto two main trajectories. The leadership—the court, the court-dependent elites, the educated, educating, and administrative classes—adopted the genres, forms, themes, and rhetoric of the Islamic Perso-Arab tradition. Educated people were often trilingual and tended to think of the elite literary culture of what they called “the three languages” (Arabic, Persian, Turkish) as a single global culture with three voices. Ottoman poets wrote verses in Persian and Arabic as well as in Turkish, and the Ottoman court was lavish in its support of visiting Persian poets. Elite literature extensively employed

Arabic and Persian vocabulary and elements of syntax within an overall Turkish grammatical scheme. As the Ottomans expanded into the Balkans and Greece, Turkish became a European language and imported some vocabulary from the many languages of the empire. Although a number of conquered Europeans adopted Ottoman language and culture, and former captives became noted Ottoman poets and authors, literary influences coming directly from Europe are impossible to trace with any certainty. The common people—villagers, nomads, urban non-elites, low-level military—continued a popular tradition of Central Asian Turkic literatures that was generally monolingual (Turkish), largely oral, most often sung, conservative, and local or tribal. However, despite the differences between these two trajectories, differences exaggerated by the tendency of academic institutions to distinguish between “literature” and “folklore,” there was continual commerce between them, as exemplified by poet-musicians (*aşik*, ‘lover’), who performed in both villages and urban areas, composing relatively accessible verses that moved easily between the forms, styles, themes, and base vocabulary of both traditions.

THE POPULAR TRADITION

The literature of the village, the countryside, and the lower classes was based on a long tradition of Turkic poetry predating Islam. Popular poetry employed “syllable counting” rhythms (in Turkish, *parmak hesabi*, or ‘finger counting’), which identified groups of syllables separated by minor caesuras (for example, the pattern 4 + 4 + 3 syllables). The folk poet (*aşik*, or *ozan*) most commonly composed in stanza forms, which were sung to the accompaniment of the “long lute” or *saz* and were often extemporized. The elite poetry of the Turks was urban and set in private gardens, parks, and taverns, while the popular poetry sang of mountains, forests, and fields, where a wandering minstrel sought his dream beloved and flirted with enticing village maids or sought mystical union with the Divine, who was imagined as a coy and inaccessible beauty. Popular literature included love songs, folk songs particular to various regions, poems about military heroism, religious verses reflecting the popular mysticism of villagers and nomads, songs of passages such as weddings and death, and a host of oral prose tales. The folk poet’s verses had a counterpart in the prose

of the *meddah* or ‘storyteller’, who enthralled audiences in villages, coffeehouses, bazaars, and taverns with a repertoire of tales in a variety of rhetorical styles. Although it is possible to discern when the elite early modern Ottoman literary tradition gave way to a distinctly modern literature, much of the popular tradition persisted substantially unchanged into the modern period, where it had a profound influence on the language, style, and themes of modern authors and poets who turned from the elite tradition.

THE ELITE TRADITION: OTTOMAN LITERATURE

To the Ottoman elites, “literature” was, first and foremost, poetry. The elite literature adopted the genres of the Perso-Arab poetic tradition, including the rhythmical scheme, called *aruz*, which, via Persian, depended on metrical feet formed by the regular alternation of “long” and “short” syllables, which do not exist naturally in Turkish. A “long” syllable consists of either a consonant and a long vowel or a “closed” syllable (consonant-vowel-consonant); a “short” syllable is an “open syllable,” a consonant, and a short vowel. The metrical feet are conventionally expressed as mnemonic word forms derived from the Arabic root meaning “to do.” For example, one common metrical foot is symbolized by the word *fāilātun* (fā’i-lā-tun, long, short, long, long). The basic formal unit of elite poetry is the couplet (*beyt*), which is composed of two hemistiches (*misra*), based on set patterns of metrical feet. The most common rhyme scheme for lyric poetry and its relatives is a monorhyme with a rhyming first couplet (aa, ba, ca, da, etc.). There also exist stanzaic forms, which are thought of as expansions of couplets created by adding hemistiches to a base couplet. Longer narrative poems were written in rhyming couplets (aa, bb, cc, etc.). It was the custom for a poet’s work, exclusive of narrative poems, to be collected into a single volume called a *divan*, which would contain hundreds and often thousands of poems. For this reason, elite Ottoman poetry is often referred to, especially in modern Turkey, as “Divan Poetry.”

The dominant poetic genre of Ottoman literature was the short, approximately sonnet length (most often ten or fourteen hemistiches, five or seven couplets), erotic (and erotic-mystical) love poem called the *gazel* (Arabic, *ghazal*). A respected

poet’s collected works (*divan*) would commonly contain from a few hundred to thousands of *gazels*. Rooted in a generic Islamic mysticism expressed in the Neoplatonic imagery and understanding of love—differing only in minor details from what one would find, for example, in Ficino’s *De Amore*—*gazel* poetry features a love-crazed, melancholic lover tormented by desire for a cruel and indifferent beloved who is at times a beautiful boy or (far less often) a beautiful girl, at times a beloved patron or ruler, at times God in the form of the mystical Divine, and many times a conflation of all three. The interactions of lover and beloved are carried out and reflected in conventional settings with a conventional cast of characters. Typically, there is a wine party, attended by a group of close friends who share an esoteric understanding of the universal, mystical meaning of the intoxications of passionate love and wine, which are misunderstood by ignorant and censorious outsiders. In the party, the carouser is served wine by an attractive boy in a tavern or in a secluded garden where each flower and tree, bird and animal also acts out the drama of lover and beloved. Beneath the esoteric and mystical pretenses of *gazel* poetry, however, lay direct connections to the actual erotic lives and entertainments of educated urban elites. Many *gazels* were composed to honor or attract famous beautiful boys. Poets caroused in taverns run by Jews or Europeans, who were not bound by Islamic prohibitions against wine.

The *kaside* (Arabic, *qasīdah*) is a long (often running to more than one hundred couplets), monorhyming, occasional poem, usually in praise of God, the Prophet Muhammad, the monarch, a highly placed official, or a patron. In addition, some *kasides* were composed to commemorate holidays, festivals, military victories, weddings, circumcisions, deaths, or buildings and monuments. A *kaside* usually begins with a prelude referencing a theme from erotic love poetry: love, a garden, a wine party, the heavens, a festival, and so forth. It then makes a transition linking the prelude to praise, which is followed by mention of the poet and, in many cases, by a specific request for favors. The *kaside* was expected to be a tour de force and *kasides* formed the second largest section in a poet’s *divan*.

The narrative poem is known generically as *mesnevī* (Arabic, *mathnawī*), which means “rhym-

ing couplets” and distinguishes this kind of poem from the monorhyming genres. Narrative poems in rhyming couplets told and retold the classical romantic tales of the Perso-Arab tradition, most of which, by Ottoman times, had taken on a distinct mystical, theosophical overlay. Poets also composed works such as verse histories, mystical and theological treatises, Islamic legends and tales of the Prophet, didactic works, and advice for princes in *mesnevî* form.

The minor genres of poetry included satire and invective, religious verse, riddles and enigmas, war poetry, and chronograms (verses in which the numerical values of Arabic script letters add up to a target date). Prose genres, like the poetry, contained a heavy burden of Persian and Arabic vocabulary and were generously larded with poetic interpolations. Some of the prominent prose genres were historical works, biobibliographical compendia, travel literature, legendary tales, interpretation of the Koran, essays, manuals on style, and treatises on religious, scientific, ethical, political, geographical, grammatical, and philological topics.

HISTORICAL TRENDS

Mehmed II (the Conqueror, ruled 1451–1481) initiated a practice of lavish support for poets and litterateurs. He not only supported Ottoman poets but also is known to have patronized the master poets of the Timurid court in Herat: the Persian poet Djami and the famed Chaghatai poet Mir Ali Şir Nevayî. Through the early glory years of the reign of Suleiman (the Magnificent, 1520–1566), support for literary art remained high and literary talent was a key to upward mobility. For example, Necatî (d. 1509), considered the first great voice of Ottoman *gazel* poetry, began as a slave. One of Necatî’s contemporaries was a woman named Mihrî (d. 1512), whose poems—delivered to the court by male intermediaries—won substantial cash rewards from the royal treasury. Bakî (d. 1600), the sixteenth century “sultan of poets” and model of rhetorical complexity for subsequent generations, was a low-level mosque functionary’s son who became a chief magistrate. Hayalî (d. 1557), whose *gazels* married mysticism, eroticism, and libertinism, started as a mendicant dervish youth and ended a provincial governor. The reach of Ottoman literature is attested to by the case of Fuzulî (d. 1556), an attendant of a shrine in Iraq,

who is considered today as one of the greatest Ottoman poets. Fuzulî compiled major poetry collections in Persian and Arabic and wrote in the Azeri dialect of Western Turkish.

The latter half of the sixteenth century and the early years of the seventeenth saw extensive regularization of appointments to the bureaucracy, economic crises, and social unrest, all of which served to lessen opportunities for literary talents from outside the educated and bureaucratic classes. This was the age of the greatest of the Ottoman court panegyrist, Nef’î (d. 1635), whose magnificent *kasides* could not save him from being executed for indulging in the vicious lampooning of powerful courtiers. During the seventeenth century, the center of literary production moved from the court in the direction of the dervish lodges and the educated elites. High-culture poetry tended toward the complex mystical esotericism of the Persian “Indian Style,” exemplified by the poetry of Na’ilî (d. 1666) and away from the cultural synthesis and public entertainments of the fifteenth and sixteenth centuries that had seen beloved shop boys and young soldiers as the recipients of rhetorically refined love poems. The synthesis was left to the burgeoning number of popular *aşiks* who performed in coffeehouses and taverns in both the elite and folk styles. During the so-called Tulip Era of the early eighteenth century—named after the tulip craze that swept the Empire—the court attempted to recapture the earlier synthesis and the support of a growing class of wealthy entrepreneurs by patronizing lavish entertainments, pleasure parks, and the work of such poets as the brilliant Nedim (d. 1730), who moved easily between the elite style and genres that reflected popular verses in simpler Turkish. The latter years of the eighteenth century saw the last great original mystical narrative poem *Beauty and Love* by Sheyh Galip, a Sufi master extensively patronized by the court. For the Turkish literature of the elites the early modern period does not end until the middle of the nineteenth century, when Ottoman intellectuals begin to adapt to European modernism.

TYRANNY, THEORY OF. The characteristics of tyranny were defined by Aristotle (384–322 B.C.E.) in his *Politics*. Tyranny was seen as a corrupt form of monarchy where the ruler acted despotically and preferred his own profit and pleasure to the common good. Tyrants were reputed to be greedy, lustful, and distrusting. They provoked flattery and conspiracy and employed foreign guards.

Among medieval thinkers whose writings on tyranny remained influential in early modern times were the jurists Bartolus of Sassoferrato (1314–1357) and Baldus de Ubaldis (1327–1400); the papal agent John of Salisbury (1115/1120–1180), whose *Policraticus* (1159) made the important distinction between a tyrant-usurper and a legitimate king who chose to rule by force rather than law; and the great Dominican theologian St. Thomas Aquinas (1225–1274), who allowed tyrannicide in extreme cases, but only if the consequences were likely to be better than the preceding oppression. A

less inhibited attitude to tyrannicide was held by another Dominican, Jean Petit, who justified the 1407 murder of Louis of Orléans, brother of Charles VI of France. Petit's assertions were criticized by the chancellor of the University of Paris, Jean Charlier de Gerson (1363–1429), who persuaded the ecclesiastical Council of Constance (1414–1418) to ban tyrannicide except in the circumstances outlined by Aquinas.

THE SIXTEENTH CENTURY

Little was said about tyranny in the century following Petit, but the doctrine again became important during the Reformation, even though Martin Luther (1483–1546) taught that a tyrant was God's punishment for a sinful people, who should suffer and obey. Two Protestant exiles during the restoration of Roman Catholicism in England under Queen Mary I (ruled 1553–1558) had a different view. John Ponet, bishop of Winchester (1514–1556), was the author of *A Short Treatise of Politic Power* (1556), and Christopher Goodman, professor of divinity at Oxford (c. 1520–1603), wrote *How Superior Powers Ought to be Obeyed* (1558). Ponet answered his own question "whether or not it is lawful to depose an evil governor and kill him?" in the affirmative, and Goodman expressed similar views. A tyrant was defined not only as one who despoiled the people and refused them justice, but also as one who broke divine law.

Another advocate of tyrannicide was the Scottish Presbyterian humanist George Buchanan (1506–1582), who composed *De Jure Regni apud Scotos* (1579; Concerning the law of the kingdom among the Scots) when Mary, Queen of Scots, was deposed in 1567. Buchanan repeated the Aristotelian marks of tyranny and defined the concept as the treatment of a free people as if they were slaves. Among his classical authorities was Marcus Tullius Cicero (106–43 B.C.E.). His examples of tyrants were drawn from the Old Testament and Scottish history. In his posthumous *Rerum Scotticarum Historia* (1582; History of Scottish affairs), he made much of the deposition and killing of Scottish tyrants. He described tyrants in general as predatory wolves that any private individual could put to death.

During their armed resistance in the 1560s, the Huguenots made little use of the rhetoric of tyr-

anny. However, their foremost polemicist, the Calvinist jurist François Hotman (1524–1690), employed such language against the Ultra-Catholic statesman Cardinal Charles de Lorraine in his *Epistre envoyée au tigre de la France* (1560; Letter sent to the tiger of France). In the late 1560s he drafted his celebrated *Francogallia*, demonstrating the long continuance of an ancient constitution in which the assembly of the realm could judge and depose tyrannical kings. Hotman cited several Frankish depositions, but his principal tyrant was a more modern king, Louis XI (ruled 1461–1483), who had allegedly subverted the constitution. When the *Francogallia* was published in 1573, the year after the massacre of St. Bartholomew, he added a preface listing the tyrants of classical antiquity and suggesting the relevance of tyranny to his own times.

The massacre of the Huguenots endorsed by Charles IX shifted their theory of resistance into a radical phase. However, the two other best-known works in this vein, *Du droit des magistrats* (1574; The right of magistrates) by Calvin's lieutenant Théodore de Bèze (1519–1605) and *Vindiciae contra Tyrannos* (1579; The defense of liberty against tyrants) by the Huguenot statesman Philippe Duplessis-Mornay (1549–1623), both displayed some caution about tyrannicide. Although Bèze said he would not discuss the Old Testament idea of God summoning an individual to kill a tyrant, he did provide some examples to this end. He distinguished between the tyrant-usurper and the legitimate king who became a tyrant, but he insisted that private individuals could not act without the leadership of lesser magistrates. In the case of the usurper, however, they might take arms if the magistrates failed to do so. Mornay's argument was similar in many respects. His greater juristic subtlety was probably due to the influence of Bartolus. While he stressed the need for collective action, he allowed greater freedom to private individuals under the natural right of self-defense.

Other Huguenot tracts responding to the massacre were less reticent about tyrannicide. The many-authored *Le reveille-matin* (1574; Alarm bell) directly attacked Charles IX as a tyrant and compared his mother, Catherine de Médicis, to Jezebel in the Old Testament, who had been killed by Jehu, the instrument of God in several tyrannicides.

The Italian queen mother was also denounced for introducing the supposedly perfidious doctrines of Niccolò Machiavelli (1469–1527), whose *Prince* was seen as a guidebook for tyrants. Perhaps the most remarkable tract on tyranny at this time was the *Discours de la servitude volontaire* (Discourse on voluntary servitude, also known as the *Contr'un*) by Michel de Montaigne's friend, Étienne de La Boétie (1530–1563). La Boétie's humanist essay was composed well before the religious wars. It was called into the service of Huguenot propaganda when it was published in part in the *Alarm Bell* and in full in a collection of resistance tracts titled *Mémoires de l'estat de France sous Charles neufiesme* (1576; Memoirs of the state of France under Charles IX). La Boétie rehearsed the vices and cruelties of the tyrants of antiquity, concentrating on the Roman tyrants portrayed by Cornelius Tacitus (c. 55–c. 120 C.E.).

In the second half of the religious wars the Holy Catholic League replaced the Huguenots as the main opponent of the French crown. After the murder of its leaders in 1588 by Henry III, the league's polemicists became enthusiastic proponents of tyrannicide. The league's best-known work on the theme was *De Justa Henrici Tertii Abdicatione* (1589; The just deposition of Henry III) by Jean Boucher (c. 1548–1644), rector of the Sorbonne. Apart from its religious and secular arguments about tyranny, the book was a violent personal diatribe against the last Valois king, who had in fact been assassinated by Jacques Clément shortly before it was published. In 1594 Boucher came out with his *Apologie pour Jean Chastel* (Apology for Jean Chastel), who had failed in his attempt to kill the next king, the Bourbon Henry IV. At this time the Jesuits were somewhat unjustly accused of preaching tyrannicide. The practice was, indeed, endorsed by the independently minded Spanish Jesuit Juan de Mariana (1536–1624) in his *De Rege et Regis Institutione* (1599; On the king and the education of the king). Henry IV was to be murdered by a fanatical believer in the doctrine, François Ravailac, in 1610.

THE SEVENTEENTH CENTURY

The next notorious regicide was the execution of Charles I of England in 1649. The theory of tyranny, however, was seldom invoked against him before his trial, although it received mention in

general works on political authority. Some so-called “Levellers,” such as John Lilburne (1615–1657) and William Walwyn (1600–1680), made use of the concept, but they applied it to all and sundry—king, Parliament, church, and Cromwellian army council. In his *An Arrow against All Tyrants* (1646), for instance, Richard Overton (c. 1600–c. 1664) chose as his main targets the House of Lords and the Presbyterian clergy.

The strongest attack upon Charles I as a tyrant came from the pen of the republican poet John Milton (1608–1674). His *Tenure of Kings and Magistrates* (1649) was followed by his *Pro Populo Anglicano Defensio* (1650; Defense of the people of England), written in answer to the justification of Charles I by the French scholar, Claude de Saumaise (1588–1653). Milton discussed the tyranny and deposition of other kings, including those listed in the *Francogallia*, but his venom was reserved for Charles I and his champion.

In the next generation two renowned Whig republicans discussed tyranny in the context of the attempt to exclude Charles II’s brother, the future James II, from the succession because of his Catholicism. *Plato Redivivus* (1680; expanded in 1681) by Henry Neville (1620–1694) and *Discourses concerning Government* (composed 1681–1683, first published 1698) by Algernon Sidney (1622–1683) showed familiarity with the Aristotelian tradition and the French resistance literature of the preceding century. They supported what had become known as “the Gothic constitution,” based on Hotman’s idea of the control of government by the sovereign assemblies of the Germanic peoples who had invaded France, Spain, and England in the fifth century. Like Milton, they both cited Hotman on the subversion of the ancient French constitution by Louis XI. They saw the tyranny of Charles II and his brother as likely to lead England to a regime comparable with Louis XIV’s in France. Sidney had long been obsessed with tyranny. In 1660 he had inscribed the visitors’ book at the court of Denmark with his Latin motto: “This hand, opposed to the sword of tyrants, seeks peace under liberty” (frontispiece to *The Works of Algernon Sidney*, 1772). Peace was not his forte. In 1683 he was tried and executed for plotting the assassination of Charles II, leaving to posterity the manuscript of his summa-

tion of the long tradition of the Aristotelian concept of tyranny in his *Discourses*.

THE EIGHTEENTH CENTURY

In the eighteenth century it was the writings of John Locke (1632–1704), rather than those of Sidney, that influenced the political thought of the Enlightenment. Locke described the tyrant as one “whose commands and actions are not directed to the preservation of the properties of his people, but the satisfaction of his own ambition, revenge, covetousness, or any other irregular passion” (*Two Treatises of Government*, 1690). However much they admired Locke, the French philosophes tended to discuss the theme with a certain irony. In his *De l’esprit des lois* (1748; Spirit of the laws), Charles-Louis de Secondat, baron de Montesquieu (1689–1755) suggested that there was another kind of tyranny beside monarchical oppression: the force of cultural tradition. Voltaire (1694–1778) declared in an entry on tyranny in his *Dictionnaire philosophique* (1764; Philosophical dictionary) that there were no tyrants left in the Europe of his day, and in any case he preferred a royal tyrant to the tyranny of an assembly.

Thomas Paine (1737–1809) took tyranny more seriously in the context of the American and French Revolutions. His *Rights of Man* (1791) reduced all governments to two types, the hereditary ruler and the representative assembly. All hereditary government, he argued, was intrinsically a tyranny that had repressed natural rights in past centuries. Far more extreme were the ferocious accusations of tyranny leveled by the Jacobins Antoine Saint-Just (1767–1794) and François-Maximilien Robespierre (1758–1794) against Louis XVI in the proceedings that led to the king’s execution in 1793. In the following year the accusers were themselves labeled tyrants and sent to the guillotine, an event that rendered Voltaire’s preferences prophetic.

UKRAINE. Ukraine entered the fifteenth century with no independent state of its own, as the formerly powerful principalities of Galicia and Volhynia—heirs of the once mighty Kievan Rus’—succumbed to the rule of the Kingdom of Poland and the Grand Duchy of Lithuania. While the Rus’ elites of the Galicia and Kholm regions, annexed by Poland in 1387, played little if any role in the political life of the Polish state, their counterparts in the rest of the Ruthenian (Ukrainian and Belarusian) territories, which were taken over by the Lithuanian princes in the course of the fourteenth century, became the most influential political force in the Grand Duchy of Lithuania. Their political clout was translated into cultural dominance, which was reflected in the status of the Ruthenian as the official language of the realm and in the conversion of numerous members of the Lithuanian ruling dynasty to Orthodoxy. The political, economic, and cultural dominance of the Ruthenian elites in the Grand Duchy of Lithuania was, nevertheless, short-lived, as Lithuania, threatened by its northern and eastern neighbors, strengthened its ties with the Kingdom of Poland.

A number of agreements proclaiming the union of the two states opened the door to growing Polish political, religious, and cultural influences in the Grand Duchy of Lithuania. The Union of Lublin (1569) concluded the process of the amalgamation of the two polities into one state, the Polish-Lithuanian Commonwealth. The union was opposed by the Ruthenian princes, as it significantly curtailed

their traditional powers in the region. It was supported nevertheless by the nobility, which as a result of the union received same political status as the Polish nobility (*szlachta*). After the conclusion of union, the Kingdom of Poland effectively took control of most of Ukraine, adding to its earlier Ukrainian possessions the Podlasia, Volhynia, Kiev, and Bratslav regions. All of the Belarusian lands remained within the boundaries of the Grand Duchy of Lithuania. The border between the new Commonwealth partners, in the Pripet River basin, laid the foundations for the modern Ukrainian-Belarusian border. One of the consequences of the union in the cultural sphere was the gradual replacement of Ruthenian as the official language of the area by Latin and Polish. The Union of Lublin increased the Polish presence in Ukraine, as kings granted large latifundia there to Polish nobles. It also helped to initiate a mass migration of the Jewish population into central and eastern Ukraine.

From the late sixteenth century, the union of the Orthodox and Catholic Christians of the Commonwealth became the leitmotif of a controversial government policy. The union was proclaimed at the church council of Brest in 1596, and it provoked a strong negative reaction on the part of Ruthenian princes, Orthodox brotherhoods, and the majority of the monastic clergy. These groups had, in the decades leading to the Union of Brest, worked hard for the revival of Orthodox religious tradition and culture. The leading role in promotion of Orthodox learning was played by Prince Kostiantyn Ostrozky, who founded the Ostrih Academy (c. 1576) and

sponsored the publication of the Church Slavonic Bible in 1580–1581. The Union of Brest provoked the rise of religious polemics in Ukraine. The writings of Catholic authors, among whom Piotr Skarga was most prominent, and Uniate writers, led by Metropolitan Ipatii Potii, were countered by Orthodox polemicists, who included the author of the first Church Slavonic grammar, Meletii Smotrytsky. In 1620 the Orthodox managed to restore their church hierarchy, and by 1633 they assured its recognition by the authorities. Peter Mohyla, the first “legitimate” Orthodox metropolitan of Kiev since the proclamation of the Union of Brest, played a leading role in the reform of Orthodox Christianity. He helped establish the Kiev College to raise the educational level of the clergy, standardized liturgical practices, and sponsored the composition of the Orthodox confession of faith, which was approved by the eastern patriarchs in 1643. The Kievan met-

ropolitanate under Mohyla led the entire Orthodox Church along the way to confessionalization.

THE COSSACKS

An important role in the Uniate-Orthodox conflicts of the first half of the seventeenth century was played by the Ukrainian Cossacks, whose military clout assured the restoration of the Orthodox hierarchy in 1620. The Cossacks, whose existence is first recorded in historical sources at the end of the fifteenth century, grew by the mid-seventeenth century into an influential military and political force, which often raised the banner of Orthodoxy in its fight against the authorities. The growth of Cossackdom was closely associated with the colonization of the steppe areas of Ukraine, the construction of border castles and towns, and the advance of the magnates’ latifundia, which resulted in the gradual enserfment of the peasantry. The transformation of Ukrainian Cossackdom from bands of fishermen,

hunters, and freebooters to military formations in the service of Polish kings and a new social group striving for recognition on a par with the nobility was marked by a number of violent conflicts with the authorities. The latter tried to limit the number of Cossacks in the royal register and thus to curb the access of burghers and peasants to this socially and economically privileged group. Another reason for the authorities' desire to curb the growth of Cossackdom was constant Cossack interference in international affairs. The Cossacks' seagoing expeditions to the Ottoman possessions of the Black Sea littoral, their raids into the Crimea, and their interference into the internal affairs of Moldavia put the Commonwealth on a collision course with the High Porte and forced the Polish authorities to take a hard line against the Cossacks.

Between 1591 and 1638 there were five major Cossack uprisings against the Commonwealth and a number of smaller conflicts. By far the largest Cossack uprising started in the spring of 1648 under the leadership of the Cossack officer Bohdan Khmelnytsky. As with many earlier revolts, this one began at the Zaporozhian Sich—the Cossack headquarters in the lower Dnieper area. In a surprising move, the Cossacks united their forces with their traditional adversaries the Crimean Tatars and in the course of 1648 and 1649 scored a number of impressive victories over the armed forces of the Commonwealth. The Cossack military successes were accompanied by the massacre and expulsion of the Polish and Jewish population from the Cossack-controlled territories, as both groups were viewed by the rebels as close associates of the oppressive regime in Ukraine. In August 1649, after a successful battle against Commonwealth forces at Zboriv, the Cossacks made an agreement that recognized their control over three eastern palatinates of the Commonwealth and led to the foundations of a Cossack state known as the Hetmanate. Khmelnytsky's search for allies in his struggle with the Commonwealth led him first to the formal acceptance of Ottoman suzerainty in 1651. When the sultan failed to deliver the expected military assistance, Khmelnytsky turned to a Muscovite protectorate in 1654. He also sought other allies in his war against the Commonwealth, establishing especially close links with Sweden.

Khmelnytsky's policy of conducting an independent foreign policy irrespective of the wishes of Muscovy culminated during the tenure of his successor as hetman, former General Chancellor Ivan Vyhovsky. Disappointed with Muscovite policy, Vyhovsky turned to the Commonwealth, signing an agreement in September 1658 at Hadiach. This "union" would introduce the Ruthenian nation as a third partner in the Commonwealth, along with the Poles and Lithuanians. It expressed the strivings of the Ukrainian nobility but did not sit well with the Cossack rank and file. And the Polish side was not ready to accept the rebellious Ruthenians as equals. Both factors led to the collapse of the Hadiach agreement and the loss of power by Vyhovsky in 1659.

"RUIN"

The new hetman, Bohdan Khmelnytsky's son Iurii, initially sided with Muscovy, but in 1660 switched allegiance to the Commonwealth, thereby creating a split within the Cossack officer stratum. Some, led by Colonel Iakiv Somko, denounced the younger Khmelnytsky and remained loyal to the tsar. What followed was the period which in Ukrainian historiography is known as the "ruin." Muscovy fought Polish-Lithuanian and Ottoman armies, each side assisted by competing Cossack factions led by their own hetmans. The signing of Andrusovo agreement (1667) between Muscovy and the Commonwealth effectively divided Ukraine into two parts: territories on the left bank of the Dnieper together with Kiev (first temporarily and then permanently) went to Muscovy, while the rest of Ukraine remained under Polish control. An attempt to reestablish Cossack control over both parts of Ukraine was led by Hetman Peter Doroshenko, who relied on Ottoman help to achieve this goal. His attempt ended in failure in 1676 when Doroshenko was forced to abandon his office and surrender to the pro-Muscovite hetman of Left Bank Ukraine. The decades of continuous war brought devastation to Ukraine. The Right Bank, which was turned into a battleground between the competing Ottoman, Polish, and Cossack armies, suffered especially. Between 1672 and 1699 Podillia and parts of Right Bank Ukraine were ruled by the Ottomans, but they then returned to Polish control.

Cossack statehood and autonomy survived only in Muscovite-controlled Left Bank Ukraine. The relative security and stability of the region attracted numerous immigrants from Right Bank Ukraine. Among these was the Cossack officer Ivan Mazepa, who became hetman in 1687. Mazepa's name is linked to the Hetmanate's last attempt to play an independent role in international politics. Unhappy with the policies of Peter I of Russia, which aimed to further limit the Hetmanate's autonomy, in 1708 Mazepa joined the invading army of Charles XII of Sweden. Only part of the Cossack officers followed their hetman, and the defeat of Charles XII and Mazepa's forces at the hands of the Russian army in the battle of Poltava in 8 July (27 June o.s.) 1709 firmly reestablished Russian control over Left Bank Ukraine. Mazepa's "treason" was used by Peter to launch a decisive attack on the remnants of the Hetmanate's autonomy. The capital of the Hetmanate was moved closer to the border with Russia, the tsar took over the right to appoint Cossack colonels, his representative took up permanent residence at the hetman's court, and eventually the office of the hetman itself was abolished and replaced in 1722 by the rule of the Little Russian Collegium.

ABSORPTION INTO RUSSIA AND THE RISE OF "LITTLE RUSSIAN" IDENTITY

In the course of the eighteenth century the Left Bank Cossack officer stratum developed a new identity, defined by loyalty to the "Little Russian" nation. That identity was deeply rooted in the loyalty to the Hetmanate's political traditions and institutions. It stressed cultural differences between Russia and Ukraine, but in most cases complemented the all-Russian identity of the Hetmanate's elite. The sons of Little Russia were among the architects of the all-Russian identity through most of the eighteenth century, and although they resented the abolition of their autonomy, after Mazepa they were reluctant to rebel against the tsar. Taking advantage of the change of rulers in St. Petersburg, the Cossack officers managed to restore the hetman's office twice, in 1727–1734 and 1750–1764. Nevertheless, these temporary successes in preserving the symbol of Cossack statehood could not reverse the slowly but evenly advancing process of the imperial absorption of the Hetmanate. This process culminated under Catherine II, who in the 1760s–1780s permanently abolished the hetman's office; liqui-

dated the Zaporozhian Sich, an autonomous Cossack Host in Lower Dnieper; and finally liquidated the Hetmanate altogether.

The successful wars with the Ottomans in the second half of the eighteenth century and the annexation of the Crimea by the Russian Empire in 1783 opened the steppes of southern Ukraine to further colonization and brought numerous settlers of Russian, Serbian, German, and Mennonite extraction into the region, apart from Ukrainian Cossacks and peasantry. The partitions of Poland (1772–1795) brought under Russian control most ethnic Ukrainian territories, with the exception of Galicia, Bukovina, and Transcarpathia, which were ruled by the Habsburgs. The Russian Empire took over territories settled mostly by Ukrainian and Belarusian peasants, the majority of whom adhered by that time to the Uniate church and were ruled by Polish, or heavily Polonized, Roman Catholic nobility.

SERHII PLOKHY

UKRAINIAN LITERATURE AND LANGUAGE. The history of a literary language in Ukraine begins with the Christianization of Kievan Rus' about 988 and the adoption of the Church Slavonic language for use in liturgy and literature (chronicles, saints' lives, sermons). The Mongol Tatar destruction of Kiev in 1240 and the fourteenth-century partition of Ukrainian lands, chiefly among Lithuania and Poland, had profound effects on the development of languages and literatures in the area. In 1433 the Polish king Władysław II Jagiełło introduced Polish usage in Galician chanceries (at first Latin, then Latin and Polish) for court records and documents of state. In the Grand Duchy of Lithuania, on the other hand (which included what would become the Kiev Palatinate at this point), Ruthenian (*ruskii*) was employed in the chancery. Although the language came to have Belarusian features at its base, it tolerated Ukrainian dialect features as well and could serve as the “vulgar tongue” (*prostyi iazyk, prostaiia mova*) for a “Ruthenian nation” that had not yet differentiated into Ukrainians and Belarusians.

After the “silence” of the late fifteenth and early sixteenth centuries, Ukrainian intellectuals helped to mount a Ruthenian revival. These activities came in reaction to the confessional and cultural challenges posed by the Reformation and Counter-Reformation in the Polish-Lithuanian Commonwealth. Among other things, the then Calvinist (and future Antitrinitarian) minister Szymon Budny

had published a Ruthenian catechism at Niasvizh (Nieśwież) in 1562. The architect of the Union of Brest, the Polish Jesuit Piotr Skarga, had asserted in 1577 that only Greek and Latin could function as languages of learning and religion, because only they possessed grammars and lexicons and thus “are always the same and never change.” Responses came from centers in Ostrih (the Slavic-Greek-Latin Academy) as well as Lviv, Vilnius, and Kiev, where brotherhoods, schools, and printing presses were employed in the “national” cause.

Ruthenian scholars sought to answer Skarga's challenge by writing grammars and dictionaries of Church Slavonic, in which they wished to see a Ruthenian Latin. First attempts to produce a grammar (*Adelphotīs*, a Greek grammar with facing Slavonic translation, 1591; Lavrentii Zyzanii's *Slavonic Grammar*, 1596) culminated in Meletii Smotrytskyi's *Collection of Rules of Slavonic Grammar* (1618–1619), which served as the norm throughout the Orthodox Slavic world until the early nineteenth century. Pamvo Berynda (1627), Iepifanii Slavynetskyi (1642), and Slavynetskyi together with Arsenii Koretskyi (1649) would offer lexicons and dictionaries.

Editions of Holy Scripture and liturgical books were a part of the revival. The Peresopnytsia Gospel (1556–1561), a sort of Slavonic-Ruthenian hybrid, remained in manuscript form. A Church Slavonic apostol (Acts and Epistles) was printed at Lviv in 1574, and a Bible, the first complete printing in the language, at Ostrih in 1580–1581. Metropolitan Peter Mohyla directed a project of correction and edition of Church Slavonic liturgical books in the 1630s and 1640s.

With the growth of Catholic and Protestant confessional propaganda and devotional literature (in both Polish and Ruthenian) came attempts to establish Ruthenian as a “national” vulgar tongue. Borrowing the argumentation of Protestant and Catholic discussions on the licitness and range of uses for popular languages, Meletii Smotrytskyi motivated his decision in 1616 to offer a Ruthenian translation of the old Slavonic Homiliary Gospel (a collection of sermons he hoped would stand in as an Orthodox postil) with the argument that, although he would rather use “the more noble, beautiful, concise, subtle and rich Slavonic language,” he had

listened to St. Paul and offered the work now in the “baser and more vulgar tongue,” since “it is a more useful thing to speak five words in an intelligible tongue, than ten thousand in an unknown tongue (especially for the instruction of the people)” (1 Cor. 14:19). Although a certain number of works related to confession and devotion continued to appear in Ruthenian, Polish soon dominated in these areas of Ruthenian letters. The effects of the increasing Polonization that followed the Union of Lublin (1569) can be seen clearly in the history of the polemic leading up to and following the Union of Brest (1596). In the early stages, Orthodox, Uniates, and Catholics often employed Ruthenian in their tracts, sometimes issuing parallel Polish versions. By 1597 the Orthodox side had issued a first polemical treatise in Polish, and after 1628 all sides used Polish exclusively.

Thus by the early seventeenth century Ukrainians were using three literary languages: Church Slavonic in its new Meletian codification, Polish, and Ruthenian. Ruthenian usage began to accept more and more recognizably Ukrainian features; at the same time, Ruthenian texts came to look more and more like Polish written with Cyrillic letters. The program of Smotrytskyi and others had been to set Church Slavonic on a level with Latin as the language of Ruthenian culture, education, and high literature (including poetry), and to set Ruthenian next to Polish as a “vulgar tongue” with a wide range of usage in literature and private devotion. The program reached far beyond practice. Nonetheless, literature in Ruthenian experienced a modest flourishing in the seventeenth century. The archimandrite of the Kiev Caves Monastery Zahariia Kopystenskyi produced a monumental statement of the Orthodox position on the confessional debates in his *Palinodia* of 1620–1624, which, however, remained in manuscript until 1894. Monk Ivan Vyshenskyi used Ruthenian in the polemical tracts and epistles he sent to Rus’ from Mt. Athos. The churchmen Leontii Karpovych, Meletii Smotrytskyi, Kyrylo Trankvilion-Stavrovetskyi, Ioannikii Haliatovskiy, Antonii Radyvylovskiy, Lazar Baranovych, Dmytro Tuptalo, and Stefan Javorskyi published Ruthenian sermons, individually and in large collections. Among exemplars of Ruthenian baroque poetry we may note Kasiian Sakovych’s *Verses on the Sorrowful Funeral of the Noble Knight,*

Petro Konashevych-Sahaidachnyi, Hetman of the Zaporozhian Army of His Royal Grace (1622), as well as the many encomiastic poems with which Ruthenian churchmen and scholars prefaced their works. Among Cossack histories, the *Eyewitness Chronicle* (late seventeenth century) and the works of Hryhorij Hrabjanka (after 1709) and Samiilo Velychko (c. 1720) deserve mention. Ruthenian was also used in school dramas and intermedia. Still, it is important to note that Polish continued to function as a literary language for Ruthenians, even for the Orthodox: it was in this language that Mohyla printed Sylvester Kosiv’s version of the lives of the Kievan Caves Fathers (1635) and Afanasii Kolnofoiskiy’s collection of miracles connected with the Caves Monastery (1638).

Ukrainian Ruthenian was employed in the chancery of the Cossack Hetmanate, but its use declined in all areas with the now increasing Russianization of left-bank Ukraine and the continuing Polonization of the right bank. With Hetman Ivan Mazepa’s defeat at Poltava in 1709, the Hetmanate became more and more a Russian province. In 1720 Tsar Peter I banned printing of church books in Ukraine. In 1723 the Cossack state lost the right to choose hetmans. In 1775 the Zaporozhian Sich was liquidated; in 1783 serfdom was introduced; and in 1785 the Cossack *starshyna* was incorporated into the Russian nobility. Church Slavonic was eventually replaced (except for liturgical uses) by the Slaveno-Russian that Ukrainian philologists helped to create. The Ruthenian vulgar tongue continued to find some use in Ukrainian administration until about 1780, during the reign of Catherine the Great; from that point the language would be relegated to mostly private use, allowed, with the advent of classicism’s theory of the three styles, to function only in the “lowest” genres of belles lettres.

DAVID FRICK

UNIATES. Throughout the early modern period, the papacy received into communion with the Roman Catholic Church groups of Eastern Christians that retained their ecclesiastical structures and local practices. Unlike Protestants, whom the papacy viewed as break-away believers organized in sects devoid of sacraments and who should be reintegrated as individuals into the Latin Church, Orthodox and Oriental Orthodox Christians were considered bearers of the apostolic succession of bishops and valid sacraments; thus, these Christians could retain their traditions and ecclesiastical structures when reconciled with the Catholic Church. In contrast to the attempts for a universal union with the Orthodox Church attempted at the Second Council of Lyons (1274) and the Council of Florence (1439–1442), the unions of the early modern period were local unions of hierarchies, bishoprics, and even groups of believers. Post-Tridentine Catholicism viewed these groups not as local churches, but as Christians following specific rites that could be retained after proper submission.

The major stimuli for the unions were the policies of Catholic states that ruled over Orthodox and Oriental Christians, the desire of Eastern Christians to improve their situation under Catholic or even Islamic rulers by receiving the support of the papacy or Western Christian powers, and the attraction to the well-organized and dynamic Latin Christian world at a time of relative stagnation in Eastern Christendom. In most cases, programs for union initiated by either Rome or Eastern Christians were rejected by at least part of the clergy and laity, giving rise to competing ecclesial structures and fierce polemics. Orthodox responses to unionizing attempts

often constituted a sharper definition of ecclesial traditions and dogmas, at times by adopting the tools and methods of their opponents.

The first and major union of the early modern period was that at Brest in the Polish-Lithuanian Commonwealth in 1596. Initiated by the metropolitan and bishops of the Kyiv metropolitanate, the Union of Brest held forth the promise of improving the situation of the Ruthenian (Ukrainian-Belarusian) Church in a Catholic-dominated state. Although supported by the monarch Sigismund III Vasa (ruled 1587–1632), the Uniates were unable to win over all the bishops to the union synod and were opposed by powerful nobles, the urban brotherhoods, numerous monasteries, and the Cossacks. They also suffered from the derisive attitude of many Latin clergy, who preferred outright conversion. Increasingly dependent on the civil authorities and Rome to combat the Orthodox opposition, the Uniates took on the spirit and institutions of the Latin Church, especially through the training of clergy in Roman and central-European seminaries. Led by dedicated hierarchs such as Metropolitans Ipatii Potii and Iosyf Rutsky and the Basilian Order, established in 1613 from the monastics who accepted the union, the Uniates survived the reestablishment of the Orthodox Metropolitanate in 1621 and the compromise of 1632, in which the state recognized the legality of the Orthodox and tried to divide the eparchies and churches between the two metropolitanates. The 1623 murder of Iosafat Kuntsevych, the archbishop of Polatsk, by the burghers of Vitsebsk who resisted his attempts to impose the union gave the Uniates a martyr and cult figure.

The Khmelnytsky Uprising, which began in 1648, put the very existence of the Uniate Church in question: in 1650, the king promised the rebels to return eparchies and churches to the Orthodox. Its situation worsened in 1654, when Muscovite and Ukrainian Cossack armies invaded the Grand Duchy of Lithuania and destroyed many Uniate centers on Belarusian territories. From 1655 to 1665 the Uniate Kyiv metropolitan see was left vacant; during the negotiations for the Union of Hadiach (1658) the Ukrainian side demanded the commonwealth abolish the union. Yet with the support of Rome and the restoration of Polish rule in the Belarus and right-bank Ukraine, the Uniates

survived and increased in number in the late seventeenth century. By the turn of the century all the western Ukrainian eparchies accepted the union, and at the Synod of Zamość of 1720 the church's structure was strengthened, though Latinized at the same time. In the eighteenth century the Uniates comprised the overwhelming number of Eastern Christians in the commonwealth (approximately 4.6 million in the 1770s) and maintained a well-developed network of schools and printing presses. The partitions of the commonwealth in 1772, 1793, and 1795 radically worsened the Uniates' situation. Most came under Russian rule, and Catherine II (ruled 1762–1796) persecuted the church. Her successors in the nineteenth century abolished all the Uniate eparchies and converted all believers to Orthodoxy. In the western Ukrainian lands that went to the Habsburgs in 1772, the Uniates benefited from grants of equality with the Latin Church and were renamed the Greek Catholic Church and reorganized in the metropolitan province of Galicia in 1808. In the seventeenth century the Armenian archbishop of Lviv also entered into union with Rome.

The extension of Habsburg rule into central Europe and the Balkans created numerous Uniate communities. In 1610 a bishop was designated for Uniates in Croatia, and in 1646, at the Union of Uzhhorod, the Ukrainians of Hungary became Uniate. The most significant union was that of the Romanians of Transylvania at Alba Julia in 1700. Under the distinguished leadership of Bishop Ion Inochentie Micu-Klein (bishop 1729–1751), the church played a major role in defending Romanian cultural and political rights. Not all Transylvanians accepted the union, and Maria Theresa (ruled 1740–1780) was forced to permit them to have their own bishop in 1759.

In western Europe the major Uniate group was the Italo-Albanian, which was formed by the migration of Orthodox Albanians to southern Italy in the fifteenth century and later. In 1717 the Uniate Armenian Mechtarist fathers took up residence in Venice. Uniates also emerged in European colonies; one of the most important Uniate communities originated with the Christians of St. Thomas in the Malabar area of India, who were subordinated to the Latin Church by the Portuguese in the late sixteenth century. Missionary activities, some dating

back to the Middle Ages and renewed in the early modern period, resulted in unions and the creation of ecclesiastical structures for Orthodox and Oriental Orthodox Christians, such as the union of parts of the Assyrian Church of the East in 1553, the election of a Catholic patriarch among the Syrian Orthodox 1662, the creation of an Armenian Patriarchate in Cilicia in 1742, and the creation of the Melkite Catholic Church in the early eighteenth century.

Current Catholic thinking has rejected the early modern form of conversion through union in deference to ecumenical contacts with the Orthodox. Nevertheless, Uniate groups have proved resilient in the Middle East and especially in eastern Europe, where they have reemerged after suppression by Communist governments. Most of these groups now view the term *Uniate* as derogatory.

UNION OF BREST (1596). The Union of Brest (Berestia) constituted the adherence of a major part of the hierarchy and part of the clergy and faithful of the Kyiv metropolitan see to the Church of Rome and its dogmas on condition of retaining its rites and elements of autonomy. In the late sixteenth century the Orthodox Church in the Polish-Lithuanian Commonwealth consisted of a Kyiv metropolitan subordinate to the patriarch of

Constantinople and seven bishops who had vast dioceses with millions of faithful. The subject of discrimination and of proselytization by Catholics and Protestants, the church was losing elements of its essential protectors, the Orthodox magnates and princes, to other creeds.

The arrival of Jesuits into the commonwealth in the 1560s revived discussion of church union, last attempted at Florence in 1439, prior to the fall of Constantinople. At the Florentine Union the Orthodox Church had accepted Roman dogmas on purgatory, the *filioque* (the procession of the Holy Spirit through the Son), the primacy of Peter's see, and the legitimacy of the form of Latin Communion but retained its ecclesiastical structure and rituals. The Florentine Union failed largely because it did not bring promised Western Christian support for beleaguered Byzantium. Temporarily accepted in the Ukrainian and Belarusian lands of the kingdom of Poland and the grand duchy of Lithuania but rejected in the Muscovite state, it resulted in the division of the Kyiv metropolitan see, with a separate metropolitan created in Moscow and the Russian church breaking away from the patriarchate of Constantinople. The calls of the Jesuits Piotr Skarga (1536–1612), Benedykt Herbst (c. 1531–1598), and Antonio Possevino (1533–1611) to make up Catholic losses to the Reformation by converting Eastern Christians found more favorable resonance at the court with the election of Sigismund III Vasa (ruled 1587–1632) as Polish king in 1587. At the same time the Orthodox bishops found themselves increasingly challenged by their laity (above all by newly forming urban brotherhoods) and by the interventions of the mother church, especially after the trip of Patriarch Jeremiah II (c. 1530–1595) through Ukraine and Belarus on his way to Moscow in 1588–1589, where he healed the breach with the Russian church and declared the Moscow see a patriarchate.

Religious ferment also followed the introduction of printing of Eastern Christian religious books (including the Ostrih Bible in 1580–1581) and the formation of an Orthodox academy under the patronage of the Volhynian magnate Prince Kostiantyn Ostrozky (1526–1608), who was open to the idea of ecumenical discussions among the churches. In the 1590s the Orthodox bishops met at a number of reform synods and, led by Bishops Ipatii Potii

of Volodymyr (1541–1613) and Kyrylo Terletsky of Lutsk (d. 1607), conceived a plan for strengthening the church and the role of the hierarchy within it through union with Rome. All hierarchs signed a letter to Pope Clement VIII (reigned 1592–1605) empowering the two bishops to negotiate for them in Rome.

After the bishops' profession of faith, the papal bull *Magnus Dominus* of 23 December 1595 declared the acceptance of the bishops and their flock, and the bull *Decet Romanum Pontificem* of 23 February 1596 guaranteed the terms. In return for accepting the Catholic interpretation of the *filioque* and purgatory and the primacy of the pope, the rites and traditions of the Ruthenian Kyivan Church, including the Slavonic liturgical language, married clergy, and local election of bishops and metropolitan, were permitted. Rome undertook to become an advocate for the Eastern Church to attain equality with the Western Church in the commonwealth, including admission of the Ukrainian-Belarusian bishops into the senate. While in practice the Union of Brest was a union of a local church with the see of Rome, post-Tridentine Rome's understanding of it was as a reception of a lost and sinful flock into the church, with a beneficent church permitting certain local customs.

The bishops from the first faced opposition to the union. Two of their ranks had earlier withdrawn their support when it became clear that Prince Ostrozky was opposed to any negotiations that did not include the patriarch of Constantinople and other Eastern churches. The Eastern patriarchs expressed their opposition, as did the urban brotherhoods and many monastic communities. Thus the council called to Brest in October 1596 soon split into two factions, one supporting and one opposing the union. The king's confirmation of the union and the presence of Roman Catholic bishops as papal emissaries did not intimidate the opposition, and the two opposing councils (synods) anathematized each other. Conflict between those who accepted the union, or Uniates, and those Orthodox who rejected it went on for generations, but through periods of advance (the late seventeenth century and early eighteenth century) and regress (the mid-seventeenth century and late eighteenth century) the union remained an enduring element in East

European church affairs and created the largest Eastern Christian community in union with Rome.

UNIVERSITIES. Universities played a vital role in the intellectual life of Europe from 1500 to 1789. They educated the intellectual elite and professional classes of Europe. An enormous number of political and religious leaders obtained university degrees or studied in universities without taking degrees even though the percentage of the population attending universities was extremely low. Universities provided the institutional home in which scholars carried on advanced research and created most of the humanistic, medical, legal, and scientific advances. The period from 1500 to 1650 was an era of unprecedented achievement for universities. They remained important, but to a lesser degree, from 1650 through the end of the eighteenth century.

CHARACTERISTICS

A university had several linked components. Professors conducted research and taught theology, canon

law, civil law, medicine, and the arts subjects of grammar, rhetoric, the classics of ancient Rome and Greece, logic, philosophy, mathematics, and astronomy, plus other subjects on occasion, such as medical botany and Hebrew. Written statutes told them which texts and disciplines to teach. A limited formal academic structure provided rules for instruction and student conduct. Students came, lived, studied, and obtained degrees. The university awarded degrees certifying that the recipient had a high level of expertise in a discipline with the approval of a supreme legal authority, such as emperor, pope, or the ruler of the state in which the university existed.

Europe had forty-seven universities in 1500, then added another twenty-eight new universities that survived by 1650. Thereafter the number of new university foundations slowed considerably, while some older ones were closed or merged. The net gain between 1651 and 1790 was ten, making a total of about eighty-five European universities in 1790. The lands that are now Germany, Italy, France, and Spain had, in that order, the largest number of universities, while another fifteen were to be found in the rest of Europe. Although any designation of the most important universities is open to disagreement, the list would include Bologna, Padua, Pavia, and Pisa in Italy; Paris in France; Cologne and Heidelberg in Germany; Vienna in Austria; Louvain in Belgium; Leiden in the Netherlands; Oxford and Cambridge in England; St. Andrews in Scotland; Alcalá de Henares and Salamanca in Spain; Coimbra in Portugal; and Cracow in Poland.

Universities were not the same across Europe. Universities in northern Europe and Italy differed greatly in the importance given to different disciplines, the level of instruction, and the age of students. Paris and Oxford, the prototypical northern universities, emphasized instruction in arts and theology. Most northern European universities had a majority of young students fourteen to eighteen or nineteen years of age studying for the bachelor's degree in arts, plus a smaller number of advanced students, often future clergymen seeking master's and doctoral degrees in theology. They had a handful of students studying for doctorates in law and medicine. Most northern European universities, es-

pecially those in German-speaking lands, had only one or two professors each for medicine and law.

Italian universities emphasized law and medicine at an advanced level and had many professors for these subjects. For example, the University of Bologna had an average of forty professors of law and twenty to twenty-five professors of medicine in the sixteenth century. They taught arts subjects such as logic and philosophy as well as preparation for medicine and law. But they taught little theology and did not award bachelor's degrees. The greatest number of students obtained doctorates in law, the next largest number doctorates of medicine, followed distantly by students winning doctorates of arts or theology. The master's degree with the right to teach was awarded with the doctoral degree without a separate examination. Students at Italian universities were typically eighteen to twenty-five years of age. Because of the emphasis on law and medicine at the doctoral level, many northern Europeans, especially Germans, obtained bachelor's degrees in the north, then came to Italy to obtain doctoral degrees in these disciplines.

The size of universities varied greatly, partly because the age of students differed. Paris, with an estimated 12,000 to 20,000 students, most of them young, was undoubtedly the largest university. Up to 500 teachers, the vast majority in arts instructing younger students while studying for advanced degrees, taught at Paris. Salamanca also had several thousand mostly younger students. The University of Bologna, the largest Italian university, had about ninety professors and 1,500 to 2,000 students, all studying for doctorates, in the sixteenth century. But the vast majority of universities were smaller: thirty to forty professors taught 300 to 800 students. Some universities had only ten to twenty professors teaching 100 to 300 students. Student enrollment fluctuated from decade to decade as war, disease, and the presence or absence of a famous professor caused students to move from one university to another. Students frequently began at one university and took a degree at a second or third. They could do this easily because the texts studied were the same from university to university, and all lectures, texts, disputations, and examinations were in Latin.

A course met five days a week, typically Monday, Tuesday, Wednesday, Friday, and Saturday, with the professor lecturing for an hour or longer. In a typical lecture, the professor began by reading a section from a standard authority, such as a scientific work of Aristotle, a medical text of Galen (c. 130–c. 200), a legal passage from the *Corpus iuris civilis*, the collection of ancient Roman law, or the New Testament for theology. The students sitting on benches normally had copies of the text or passages. The professor next delivered a detailed analysis of the text, explaining how it should be interpreted, rejecting some interpretations, reconciling others, bringing to bear other texts, and explaining its larger meaning. He might range far beyond the original text. This was the heart of university instruction. In due time the professor published these detailed analyses of authoritative texts. Other professors used them in their own research and teaching or published contrary interpretations. Students taking notes and annotating the passage in their own copies had useful professional information, such as a full explanation of a legal text and guidance about how it might be used in cases. The lecture concluded with questions and answers between stu-

dents and professors. They sometimes moved into the piazza or atrium for this less formal part of teaching.

Another important academic exercise was the disputation. A student or professor posted a notice announcing that he would defend a series of positions in his discipline at a certain time and place. Anyone was free to come and argue. Disputations offered practice in learned argument, which was considered a valuable skill in all disciplines and professions. For medical students, the annual public anatomy was also essential. Students stood in tightly packed rows to watch as a dissector cut open a body as a professor explained the organs. Public anatomies were scheduled for the coldest time of the year and went on without stop until the body putrefied days and weeks later.

After three or four years of study, the student presented himself before a committee of examining professors as a candidate for the bachelor's degree. Examinations for the doctoral degree were more complex. After four to seven years of additional study, the candidate presented himself to an examining committee, appointed by a college of doctors of law, medicine, arts, or theology. Colleges of doctors consisted of professors and other local men holding doctoral degrees in a subject. A typical examination required the student to explain several passages (called *puncta* or points) chosen at random from the required texts in the discipline, followed by wide-ranging questions from the examiners. A candidate for a medical degree might also be required to give his opinion on a medical case proposed to him. Students who satisfied the examiners of their competence were awarded doctoral degrees recognizing them to be experts in a subject and authorized to teach it. The degree was conferred in public ceremonies marked by much rejoicing and considerable expense.

HUMANISM

The introduction of humanism was the most important curricular change in the sixteenth century, and it involved much more than teaching the literary and historical classics of ancient Rome and Greece in their original languages. Humanists and professors with humanistic training transformed the study of several disciplines because they used their linguistic and historical skills and critical outlook of hu-

manism in their research and teaching. The use of the Greek text of Aristotle and ancient commentaries in place of medieval commentaries offered new insights in philosophy. The rediscovery of ancient mathematical texts aided mathematicians, including Galileo Galilei (1564–1642), a professor of mathematics at the University of Pisa (1589–1592) and the University of Padua (1592–1610). Applying the techniques of humanistic textual criticism to the *Corpus iuris civilis* led to a better understanding of the historical context of Roman law. Called humanistic jurisprudence, this new approach had great influence in French and German universities but little in Italian universities.

Humanism had the greatest impact in medicine through a series of developments sometimes called “medical humanism.” Professors of medicine used humanistic skills to examine the medical texts of Galen and other ancients in the original Greek. They found the medieval Latin translations of Galen wanting, so they produced better Latin translations for classroom use. Their enhanced understanding of the texts soon led them to find fault with Galen himself. The medical humanists also placed greater emphasis on anatomical study achieved through more frequent and more knowledgeable dissections of human bodies. Italian universities added professorships of medical botany in order to improve the study of the medicinal properties of plants. The universities of Padua and Pisa simultaneously founded the first university botanical gardens in 1543. Henceforward, students came to the garden in springtime to examine plants and learn about their medicinal properties. Clinical medicine began in the 1540s when a Paduan professor took students to hospitals in order to lecture on a disease at the bedside of the ill patient. Even though universities remained dedicated to lecturing on authoritative texts, these innovations gave greater emphasis to hands-on study, a tendency that continued in the following centuries. Universities in Italy, especially Padua, pioneered the changes in teaching and research, while universities elsewhere quickly followed.

In many northern European universities, especially in Germany, the introduction of humanists and humanistic studies into universities at the beginning of the sixteenth century produced bitter conflict with theologians. The fundamental issue

was, how should the sacred texts of Christianity be studied and interpreted? The theologians answered by traditional medieval Scholastic methods, using the tools of logic, the philosophical framework of Aristotle, and guidance from Thomas Aquinas, Duns Scotus, and other great medieval theologians. Only in this way could God's truth be uncovered and error avoided. The humanists answered, not through Scholasticism and medieval commentaries, but through careful linguistic, grammatical, and rhetorical analysis of the texts in their original language, Latin, Greek, or Hebrew. This enabled man to understand God's personal message and to be persuaded to follow him. The two sides fought bitterly. The humanists heaped scorn on university theologians for confusing the word of God with man's interpretations, while the Scholastic theologians dismissed the humanists as grammarians lacking the theological training to understand what they read. The differences were great, because the stakes were university positions in this life and salvation in the next. The advent of the Protestant Reformation exacerbated the conflict as many, but not all, younger German humanists joined Luther while older humanists and most Scholastic theologians remained Catholic. In Italian universities, by contrast, humanists and the few theologians who taught in universities there mostly ignored each other.

The sixteenth was a century of enormous achievement for universities. It is difficult to name another century in which university professors produced so much important scholarship. Numerous major religious leaders also held university professorships. Martin Luther (1483–1546), professor of theology at the modest, newly founded (1502), and geographically isolated University of Wittenberg, began a religious revolution. His chief lieutenant, Philipp Melancthon (1497–1560), was a professor of Greek at Wittenberg. And many of their Catholic opponents were professors. Leaders with university training from other areas of life were equally important.

The eruption of the Protestant Reformation had both negative and positive impact on universities. Enrollment initially dropped sharply in German universities, especially those in lands that became Lutheran. But enrollment recovered by the end of the sixteenth century, and a few new universities, both Catholic and Protestant, were established. De-

spite their differences, students continued to move from university to university across religious boundaries. For example, German Protestant students continued to study and to get degrees in law from the Italian universities in Bologna, Padua, Pavia, and Perugia because the most famous professors of law taught there and because Italian civil governments protected them from prosecution for their religious beliefs.

DECLINE: 1650 TO 1790

Universities continued to lead Europe in research and training leaders into the seventeenth century. But then new and different institutions of higher education rose to challenge them.

Protestants needed schools to train their clergymen in the new doctrines. Catholic universities obviously would not do this, and establishing new Protestant universities was difficult and expensive. Hence, small schools for theology and arts sprang up in the Protestant world. The Calvinist Genevan Academy (founded in 1559) was a famous example. It had seven or eight teachers for theology, Greek, Hebrew, arts, and law. The majority of the graduates became ministers. Some of these new schools sought to become universities teaching a broad range of subjects, but few succeeded.

In the Catholic world the new religious orders of the Catholic Reformation, led by the Jesuits, did the same on a much larger scale. The Society of Jesus, founded in 1540, originally established schools to train boys aged ten to sixteen in the humanities. A handful of Jesuit schools began to add upper-level classes in philosophy and theology in order to train members of the society. These schools, which were open to lay students, proved to be very popular because the Jesuits were excellent scholars and teachers and because the schools were free. Thus, a growing number of Jesuit schools with classes in logic, metaphysics, natural philosophy, mathematics, and theology appeared. Occasionally a Jesuit school also offered an introductory law course. Other religious orders of the Catholic Reformation followed the lead of the Jesuits.

Prodded by princes, the Jesuits also established boarding schools for noble boys and youths from about the ages of ten to twenty. These schools added classes in French, dancing, and horsemanship, all necessary skills for sons of the ruling classes,

to the humanities, philosophy, and religion classes. Schools for nobles offering the opportunity to mix with peers attracted students who would otherwise have attended universities. They were expensive, but so were universities. Other Catholic Reformation religious orders again imitated the Jesuits.

Religious order schools offered a structured education in a morally upright and safe environment. By contrast, universities had loosely organized curricula, a licentious life style, and brawling students. Most university students carried swords, and many carried firearms. It is small wonder that many parents preferred religious schools, especially the boarding schools, for their sons. For example, the school for nobles at Parma, founded in 1601, rose from 550 students in 1605 to 905 in 1660, and a minority of the students were non-Italian. Approximately one-third of the students attended the higher classes, which duplicated the first year or two of university studies. Every young male from the ages of eighteen to twenty who attended a religious order school was a possible enrollment loss for universities. Protestant lands also established numerous highly regarded and socially selective schools that taught part of the arts curriculum of universities.

Learned societies offered intellectual and financial competition to universities needing scholars. A famous example was the Royal Society of London for the Advancement of Natural Knowledge, founded in 1662. Financially underwritten by member subscriptions, it supported scientific research, provided opportunities for contacts with other scholars, and published the results of research. Learned societies proliferated. Most Continental societies received funding from governments; some offered salaries to members who carried on studies in mathematics, astronomy, chemistry, and other subjects. And they did not have to teach. Overall, scientific societies offered attractive nonuniversity alternatives to scholars needing support. Scientific societies created an international network enabling scholars in a discipline to communicate their research.

The philosophes of the eighteenth-century Enlightenment attacked universities as not useful to society. They judged the traditional university curriculum to be incapable of training citizens to contribute knowledge to improve the state. So they per-

sueded rulers to create new, specialized institutions of higher learning to teach practical subjects, such as agricultural technology, engineering, military tactics, surgery, even the fine arts. These highly specialized and practically oriented schools competed with universities for students.

Some of the criticism of the philosophes was justified, but much was not. Universities had kept up with innovations in learning. Although Latin remained the common language of instruction and writing, and universities continued to teach traditional subjects, they had added professorships in new subjects such as history and geography. They had discarded Aristotelian science in favor of Galileo's mathematical physics and had then adopted experimental science, all in the course of a century. And university research in medicine continued to lead the way, as university professors produced all of the important medical advances of the seventeenth and eighteenth centuries. Professors in traditional subjects produced nontraditional works of scholarship. For example, Adam Smith (1723–1790), who taught logic and moral philosophy at the University of Glasgow from 1751 to 1764, produced *An Inquiry into the Nature and Causes of the Wealth of Nations* in 1776. Universities continued to award degrees certifying that the lawyer, judge, physician, clergyman, teacher, and civil servant were qualified to practice their professions. Learned societies, religious schools, and specialized schools could not do this. Overall, universities played essential intellectual and social leadership roles in European life that no other institution could replace.

PAUL F. GRENDLER

URBAN VIII (POPE) (Maffeo Barberini; 1568–1644; reigned 1623–1644), Italian pope. After studies at Jesuit schools in Florence and Rome, he read law in Pisa (doctorate “in utroque jure” [both canon and civil law] in 1588), and entered the Roman prelature, backed by his uncle Francesco Barberini. He worked at the *Signatura* Tribunal, becoming prothonotary apostolic upon his uncle's resignation (1593) and then clerk of the Apostolic Chamber (1599). In 1592, his countryman Clement VIII appointed him governor of Fano, sending

him later on important diplomatic missions. In 1604, he was consecrated titular archbishop of Nazareth and sent as nuncio to Paris. In this capacity, he was able to gain support for the Jesuits in France, but could not secure acceptance of the Tridentine decrees. Created cardinal by Paul V in 1606, he returned to Rome (1607), soon to be appointed bishop of Spoleto, a charge he held until 1617, adding for a time (1611–1614) the legation to Bologna. In both positions, he showed himself a strict administrator and a diligent reformer. In 1617, he resigned his diocese and returned to Rome as prefect of the *Signatura* Tribunal. A member of several important Roman congregations, he was also active in the intellectual and artistic circles of the city. His election to the papacy in the summer of 1623 was the result of a compromise between the different factions that supported stronger candidates, although he was perceived as favorable to France.

Soon after his elevation to the see of Peter, he manifested his intention to take charge as both a spiritual and a secular leader. This he achieved through nepotism, elevating to the cardinalate his brother Antonio and his nephews Francesco and Antonio, and giving administrative positions to his brother, Carlo, and his nephew Taddeo. As “Cardinal Nephew,” administrator of the pontifical state, Francesco Barberini was to exert a great influence under the strict control of his uncle. Urban VIII was an absolute pope who wanted to ignore the college of cardinals, which he viewed as overly influenced by European powers (to compensate, the cardinals received the title of “Eminence” in 1630). In order to foster the independence of the Holy See, he strengthened the Papal States, building the stronghold of Castelfranco near Bologna, reinforcing Castel Sant'Angelo in Rome, and fortifying Civitavecchia's harbor. He was able to annex (1625–1631) the duchy of Urbino; however, his attempt to take over neighboring territories in Parma and Piacenza were thwarted by an Italian coalition (1644) that forced him to surrender the cities of Castro and Montalto, which had been occupied by papal forces in 1641.

Urban VIII's pontificate coincided with the Thirty Years' War (1618–1648). From the beginning of his pontificate, he had attempted to maintain a strict neutrality between the Habsburg and the Bourbons (Valtelline War, 1624–1626, War of

Pope Urban VIII. Portrait by Gian Lorenzo Bernini. THE ART ARCHIVE/PALAZZO BARBERINI ROME/DAGLI ORTI (A)

the Mantuan Succession, 1627–1631) as “Common Father” of all Catholics. During the war in Germany, he refused to support the imperial armies, seeking through his representatives to influence and control the process of re-Catholicization. Only in 1632 did he intervene by offering limited financial support and seeking diplomatic action. But the Holy See’s efforts were hindered by the French alliance with Protestant powers and Urban’s rejection of direct negotiation with heretics; on the eve of his death, the pope was able to foster a peace conference at Münster (1644).

On the religious level, Urban VIII took several important decisions. Probably the most famous one was to have his former friend Galileo Galilei prosecuted by the Roman Inquisition in 1633. He had to recant his heliocentric theories and was kept under house arrest until his death in 1642. By the bull *In Eminenti*, dated 1642, but published in 1643, Urban initiated a series of papal interventions in the Jansenist conflict, proscribing both Cornelius Jansenius’ book *Augustinus* and the Jesuit theses that attacked it. The Barberini pope is associated with

the reform of the liturgical books (Breviary, Martyrologium, Missal, Pontifical); by revising the beatification and canonization processes he rendered sainthood more difficult to achieve. Urban VIII strengthened and expanded the competence of the *De Propaganda fide* congregation, giving his name to the college established to educate priests for mission territories.

More a prince than a pastor, Urban VIII was criticized during his lifetime for his visions of grandeur as manifested in the art work he commissioned (exemplified by Bernini’s baldachin in St. Peter’s). He was above all a political pope, whose goal was the independence of the Holy See through a strong papal state and active diplomacy. This goal was not achieved because of Urban VIII’s resistance to confessional divisions in Europe and his deep misgivings about Habsburg Spain and Germany.

UTOPIA. The impulse to wonder about a more perfect world is at least as old as Gilgamesh's search for the garden of Dilmun (c. 2500 B.C.E.). The dream of an earthly paradise seems to be widespread among the peoples of the earth, as a way of both imagining the ideal and expressing dissatisfaction with the here and now. Gilgamesh's perilous journey is prompted by his shock at the loss of his boon companion Enkidu and his own looming mortality. The propensity for utopian speculation is in part nostalgia for an idealized human existence, believed in the Islamic and Judeo-Christian tradition to have once existed in a paradise now lost. In times of social and political upheaval, such as existed in early modern Europe, authors also used the ideal for satiric purposes. As a result, utopian literature has flourished as a genre.

The first and most significant work of this kind is Sir Thomas More's *Utopia*, published in Latin at Louvain in 1516 (1551 in the first English translation). In letters to friends, More called his planned work "Nusquama," from the Latin adverb for 'nowhere'; however, when he chose the title, he transliterated the Greek negative *ou* into the Latin *u* and combined it with the Greek *topos* to create a new word, "utopia," or 'nowhere'. In the commentary letters from his humanist circle printed with early editions of the work, several observed that this country also ought to be called "Eutopia" (from the Greek *eu* for 'good'). Thus "utopian" was seen at once as an intriguing but impossible ideal.

More (1478–1535), who served Henry VIII as an adviser and became chancellor in 1529, wrote his classic in the turbulent years just before the beginning of the Reformation. He cast his imaginative flight in the form of a dialogue, a rhetorical strategy that allowed him to express dissatisfaction with current social conditions while maintaining a comfortable distance rhetorically from such dangerous ideas as the abolition of private property. The first part is a discussion between Raphael Hythloday ('babbler of nonsense'), a mariner who had chanced upon a fabulous land where all goods were held in common, and More himself, about the problems of Christian Europe, which was plagued by greed and corruption. Part two (which was written first) is the actual discussion of the ideal society, where Christianity takes root among the Utopians with surprising ease because it is so consistent with the Utopians' communal way of life. At the end, the character More finally admits that he would like to see some aspects of Utopian society put into practice in England, but states that he believes it is unlikely ever to happen. Ultimately, *Utopia* attempts to negotiate a course between the ideal and the actual and implicitly recognizes that, given the fallibility of mankind, perfection is impossible.

In the aftermath of *Utopia*, which earned great renown for More, other descriptive works appeared that made use of some of the same literary devices: a shipwreck or other chance encounter with an ideal community, followed by a return to Europe. Ortensio Lando and Anton Francesco Doni's collaborative *Eutopia* in 1548 (its full title is *The Newly Discovered Republic of the Government of the Isle of Eutopia*) reverses this scenario by having a Eutopian citizen visit Italy to comment directly upon its excesses, which sparked interest in other utopian imitations.

CHRISTIAN UTOPIAS OF THE SEVENTEENTH CENTURY

In the seventeenth century Francis Bacon's (1561–1626) advocacy of a "new" science based on inductive reasoning led others to dream of synthesizing human knowledge with religion to produce a universal knowledge, or "pansophia." This "utopian" myth became the driving force for a new vision of a Christian commonwealth. Bacon's utopian work, *The New Atlantis* (written c. 1614 and published posthumously in 1627) was a coda to *The Great*

Instauration (1620). It took the form of a voyage to the island of Bensalem, the centerpiece of which is Salomon's House, a research college where the new scientific method leads to discoveries and inventions that greatly enrich the commonwealth. A belief in pansophia had similarly inspired Tommaso Campanella (1568–1639) to put forth his vision of *The City of the Sun* (1623), a sea captain's account of an ideal Christian community, where a single ruler named Sun is assisted by three aides, Power, Knowledge, and Love (with an obvious indebtedness to the Christian Trinity of Father, Son, and Holy Spirit). The role of science is paramount, with the seven concentric walls that ring the city displaying pictorially the unity of all knowledge. By naming these walls for the seven planets orbiting the sun, Campanella clearly stands with Copernicus on the most important scientific debate of the age.

The vision of a Christian commonwealth founded on scientific principles is at the heart of one of the century's more influential utopianists, Johann Valentin Andreae (1586–1654), a Lutheran churchman who produced several works, notably *Christianopolis* (1619, published as *Reipublicae Christianopolitanae Descriptio* [Description of a Christian republic]), which garnered praise from learned readers such as Robert Burton. Framed as a traveler's tale, it describes a Christian city in which an elite brotherhood possesses a secret wisdom and oversees the further exploration of nature's secrets through scientific experimentation. Andreae had been part of a youthful circle at the University of Tübingen that had produced a series of utopian pamphlets around 1610 (*Fama Fraternitatis* and the *Confessio Fraternitatis* [The Fame of the Fraternity and the Confession of the Fraternity]), advocating a Protestant brotherhood to bring about reform within the Lutheran church. These pamphlets caused an extraordinary sensation when published in print, often called the Rosicrucian furor. Andreae's ideas greatly influenced the Moravian reformer Jan Comenius (c. 1592–1670) and passed into England through Samuel Hartlib (c. 1600–1662), who brought out an English translation of another treatise by Andreae (*A Modell of a Christian Society* [London, 1647]) to help reform England in the aftermath of the Civil War. With some justification, the Royal Society (founded in 1660) can be

considered the fruition of the dream of a Baconian research college to aid the commonwealth.

UTOPIAN THOUGHT AMONG THE PHILOSOPHES

The rationalists of the Enlightenment who helped prepare the way for the revolutions of 1776 and 1789 did not produce any recognized utopian classics. There were, however, utopian elements in various works, such as Fénelon's *Adventures of Telemachus* (1699), Montesquieu's *Persian Letters* (1721), the sketch of El Dorado in Voltaire's *Candide* (1759), and Condorcet's *Esquisse* (1794), that were influential at the time.

DONALD R. DICKSON

UTRECHT, PEACE OF (1713). The Peace of Utrecht consisted of twenty-three treaties and conventions that ended the War of the Spanish Succession (1701–1714). Most, but not all, were signed in Utrecht in the Netherlands in 1713.

France and Austria ended hostilities with the Treaty of Rastatt in March 1714; the Treaty of Baden (September 1714) ended war between France and the Holy Roman Empire; Portugal and Spain concluded negotiations in Madrid in February 1715. Austria and the empire did not sign treaties with Spain until 1725, despite the cessation of fighting a decade before, largely because of Habsburg unwillingness to concede the Bourbon succession in Spain.

The contested Spanish succession fed fears of French hegemony after a Bourbon prince, Philip d'Anjou, grandson of Louis XIV, became Philip V of Spain in 1700. A Grand Alliance, comprising England, the Dutch Republic, Austria, and many smaller European powers, commenced war against France and Spain in 1702. Particularistic complaints underlying the allies' shared concerns made peace elusive. The French troops' occupation of towns in the southern Netherlands in 1701 threatened the security of the Dutch Republic. The English and Dutch feared French trade restrictions in Spanish

America after France received an *asiento* ('contract') to supply slaves to Spanish colonies, in 1701. An Austrian Habsburg prince, Archduke Charles, second son of Emperor Leopold I (ruled 1658–1705), was Philip V's chief rival for the Spanish throne.

Attempts at peace commenced in 1706 but faltered repeatedly. Negotiators failed to craft terms acceptable to multiple parties, and the fickle fortunes of war frequently reconfigured bargaining positions. In 1710, a change of government in Britain broke the impasse. War-weary Britons voted out the Whigs, and a Tory ministry headed by Robert Harley assumed power. Henry St. John, a new secretary of state, abandoned multilateral negotiations for bilateral negotiations with the French, and soon Britain and France had cut deals that promised peace but compromised the interests of Britain's allies.

On 29 January 1712, an international congress convened in Utrecht to negotiate a general peace between France and some members of the Grand Alliance. St. John wanted the semblance of a general

Peace of Utrecht. Under the treaty, France promised to demolish the fortifications at Dunkirk which were used as a base for attacks on English and Dutch shipping. This map from the October 1758 issue of *London Magazine* accompanied an article that accused the French of violating the treaty by refortifying the city: "It is too notorious, with how much chicanery they have been stealing work upon work, at this place, contrary to the most solemn engagements to the contrary." MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

settlement, even if most negotiating was bilateral rather than in congressional sessions. One of Britain's war aims was a balance of power in Europe, a goal that St. John suspected the French did not heartily support. A general peace between France and the allies, he believed, would forward that goal more than would a separate peace between France and Britain. By early 1713, the plenipotentiaries of Britain, the Dutch Republic, Savoy, Portugal, and Prussia had agreed to terms with France, and on 11 April signed treaties ending their participation in the war.

Spanish involvement in the congress was delayed until the April treaties acknowledged Philip V and his delegates' rights to negotiate for Spain, but treaties with some allies soon followed. Representatives from Austria and the empire left Utrecht without treaties because of unresolved differences with France or Spain. The Spanish succession remained their primary stumbling block, but its context had changed dramatically between 1702 and 1713. During those years, two Austrian emperors had died, Leopold I in 1705 and Joseph I in 1711. Archduke Charles, the contender for the Spanish throne as Charles III, was crowned Emperor Charles VI. In the Bourbon line, deaths claimed the French dauphin in 1711, putting Philip V of Spain fourth in line for the French throne. Two Bourbon deaths in 1712 left only a sickly boy between Philip and the French throne. These untimely deaths left both Charles and Philip with multiple dynastic claims, which, as the primary Spanish claimants, made them unattractive to many powers unless they renounced some of them. In 1712, Philip V renounced his French claims, which five allies, but not Austria and the empire, recognized in 1713.

The Peace of Utrecht redefined numerous dynastic conflicts. In addition to Philip V of Spain's renunciation of his French claims, the dukes of Berry and Orléans and their heirs were excluded from claims to the Spanish throne, thus precluding a future royal union of France and Spain. International acknowledgment of Philip V effectively ended a possible Habsburg union of Austria and Spain. France recognized the Protestant succession in Britain and agreed that the Stuart Pretender, James Francis Edward Stuart, and his heirs could not live on French soil. Frederick William I was acknowledged as king of Prussia. The house of Savoy re-

ceived Sicily from Spain (despite Austria's claim), and assurances that, if the Spanish Bourbon line failed, the Savoy line would succeed it. Emperor Charles VI received the other Spanish territories in Italy and the Netherlands. These arrangements curbed the hegemonic tendencies of dynastic unions, elevated state and national interests, and made a balance of power a shared European objective, if not a reality.

Colonial and commercial issues figured prominently in the Peace of Utrecht. France returned Rio de Janeiro in Brazil to Portugal and agreed to clarify the border between Portugal's and France's American claims. Rather than cede Iberian border towns, Spain gave Sacramento in South America to Portugal and acknowledged its Brazilian claims. France ceded Newfoundland, Acadia, St. Christopher, and the Hudson Bay territory to Britain, but insisted on exclusive seasonal shore rights in Newfoundland to exploit the cod fishery. The Anglo-Spanish treaty protected Spain's interest in the Newfoundland fishery. Spain transferred the *asiento* from France to Britain for thirty years, and allowed British trading stations on the Río de la Plata in South America. Gibraltar and Minorca, former Spanish possessions, guaranteed British commercial access in the Mediterranean.

Despite the achievements of the Peace of Utrecht, British machinations by Henry St. John, backed by Robert Harley, haunted European affairs for decades. In Britain, vitriolic criticism of St. John and Harley's treatment of allies forced both men into exile. British disregard of Dutch interests probably sped the Dutch Republic's decline as a European power. British abandonment of the Catalans left them vulnerable to Philip V's revenge for their support of the Grand Alliance. Newfoundland fishing concessions incensed opposition critics in Britain, and created international tensions that continue to the present. A fortified barrier in the southern Netherlands failed to hold back French forces in 1745, and festering boundary disputes in the colonies fueled the conflicts leading to the Seven Years' War. All contributed to the contested legacy of the Peace of Utrecht.

ELIZABETH MANCKE

VAGRANTS AND BEGGARS. With the increase in the ranks of paupers in the late fifteenth and early sixteenth centuries, contemporary legislation began to discriminate between the deserving and the undeserving poor. The definition of the “true” poor (children, the aged, the sick, and the infirm) reflected the new policy of early modern governments all over Europe of refusing to recognize unemployment per se as an excuse for beggary. The magistrates held that, apart from those who were rendered incapable of earning a living by age or physical condition, all who begged should be considered willful idlers and treated severely. It was therefore declared that the beggary of the able-bodied poor was criminal. The intention was to help those unable to take care of themselves, whereas able-bodied persons unwilling to work were not entitled to poor relief, but, on the contrary, were subject to a variety of disciplinary measures. The dangerous poor were, according to a stereotype that developed in the sixteenth and seventeenth centuries, typically rootless, masterless, and homeless. The beggar who took to a life of crime, and abused the conventions of a Christian society of “orders” and “callings,” became defined as a member of a deviant subculture, who had to be punished. In its justification of these punishments, which became even more severe during the seventeenth and eighteenth centuries, governments stressed the connection between beggary and criminality.

The equation between begging and crime became a commonplace in poor law legislation from

the sixteenth century onward. It was used to justify harsh but futile measures against those who supposedly showed an ingrained laziness and a stubborn preference for living from charity, and, inevitably, went astray, becoming used in the end to a disorderly and criminal style of life (vagrancy, theft, smuggling, and prostitution).

THE GROWING NUMBERS OF BEGGARS AND VAGRANTS

Vagrancy was a socially defined offense that reflects the dual problem of geographical and social mobility in early modern Europe. Offenders were arrested and punished not because of their actions, but because of their marginal position in society. The implication was that vagrants were not ordinary criminals but were regarded as a major threat to society, and therefore pursued by all authorities and stigmatized as deviants. The offense of which they were accused posed a serious challenge to the moral and physical well-being of the Christian commonwealth. Vagrants should not be confused with the outsiders known in medieval Germany as *fahrende Leute*, ‘wayfarers’. Those included a variety of people, from wandering scholar to minstrels and knifegrinders. Many of them were engaged in itinerant trades or professions whose form of work involved wandering (entertainers, transient healers, hawkers, tinkers). They were also despised, ridiculed, stigmatized, and marginalized, but not prosecuted for their deviant way of life.

During the course of the fifteenth century a new social phenomenon grew up alongside these tradi-

tional “vagrants”: the fraudulent beggar and the idle, sturdy vagabond. Their advent caused governments to react accordingly. In early modern Württemberg, for example, all officials were put on alert for idle vagrants from 1495, and by 1508 those arrested were increasingly charged with “suspicious wandering.” The legal concept of vagabondage is based on the distinction between able-bodied and “impotent” poor, which had been propagated by the critiques of the traditional view of poverty since the later Middle Ages, but was only fully accepted by governments of all persuasions from the sixteenth century onward. The ideological underpinning was provided by the rhetorical flourishes of humanists and preachers and the attacks upon vagrants in popular literature.

The omnibus statutory definitions of vagrancy, and even those found in the learned or popular tradition, were not purely theoretical. Not every offender, of course, showed all the characteristics of the stereotype, nor were these traits absolutely necessary for prosecutions or arrests to take place. According to contemporary sources the number of vagrants had been increasing over the sixteenth century, but it is difficult to substantiate these estimates statistically. The clearest evidence of a real growth in vagrancy during the early modern period is the figures that refer to people who were arrested, convicted, or punished for vagrancy alone, and not for any other crime. In late-sixteenth-century England, vagrants numbering only in the hundreds were found in the special searches after the Rising in the North (1571–1572), while sixty years later reports to the Privy Council recorded the local arrest and punishment of many thousands of wandering rogues and sturdy beggars (nearly 25,000 in thirty-two English counties between 1631 and 1639). It is likely that the number of people that could be labeled as vagrants continued to increase well into the seventeenth century, not only in England but also in other European countries. But there was worse to come. In the eighteenth century vagrancy was exacerbated not only by deteriorating demographic and economic conditions but also by growing government efforts to eradicate the problem. Comparative statistics for the total number of vagabonds in various European countries are complicated by the variety of ways in which vagrants could be punished. Despite numerous uncertainties, it is possible, for

example, to compare the number of people detained as vagrants (broadly defined) and interned in “houses of correction” or *dépôts de mendicité* in England and France, respectively, in the later eighteenth century. While in England three to four thousand vagrants and idlers were interned annually, the French police arrested in the same period (1770s and 1780s) between ten and thirteen thousand vagrants each year. Comparing the rates of internment for every 10,000 inhabitants in the two countries, shows that, as far the repression of vagrancy was concerned, the French government was obviously more successful and its police more efficient in enforcing the vagrancy laws that had been in force in both countries since the sixteenth century. These numerical results are thus quite significant in terms of the capabilities of the two most powerful eighteenth-century European states and their respective policing organizations, but there can be no doubt that other countries made similar efforts to suppress vagrancy.

THE STRUCTURE OF VAGRANCY

The sources also tell us something about the structure of vagrancy. Vagrants were more mobile and traveled longer distances than other migrants. According to an English study, the large majority of apprentices and journeymen moved less than forty miles, while among the vagrants whose place of origin can be determined, more than seventy percent had gone farther; a substantial number of them (22 percent) had even covered a distance of more than one hundred miles. It is often impossible to state the average age of those arrested as vagrants, because of the incompleteness of the data. The few statistics that we have for the sixteenth to eighteenth centuries, however, leave no doubt that vagrancy was mainly a young person’s crime. In Tudor and Stuart England the proportion of vagrants below age twenty-one declined from 67 to 47 percent in the years 1623–1639 as compared to 1570–1622, but was still rather high. Most vagabonds were single and male. That is precisely the group that is underrepresented in listings of the resident respectable poor. The vagrants were distinguished from the latter also in being predominantly young.

Almost unanimously, contemporary observers and legislators assumed that vagabonds chose to be unemployed. The evidence of vagabonds’ previous

and present occupations suggests that unemployment was a growing problem and that opportunities were contracting, and that as a result the poor were taking up less secure positions such as casual labor, soldiery, and entertainment, which had at that time close links with vagabondage. According to a study on the profile of vagrancy in England in the sixteenth and seventeenth centuries, roughly one-third of all vagabonds who could report work histories were engaged in the production of food, leather goods, or cloth and metal wares, or in mining or building; at least one-quarter were servants, apprentices, journeymen, laborers, and harvest workers; almost one-fifth were petty tradesmen and tinkers; and one-tenth were soldiers and mariners. This profile of occupations is strikingly similar to that established for vagrants arrested in eighteenth-century Bavaria. The other major group that figures prominently in the German reports of arrest was a medley of tramping artisans and members of “dangerous trades,” consisting largely of flayers and knackers’ men and their families.

All these features and social traits provided ample grounds for abhorrence of the idle rogue and sturdy beggar and for his accidental confusion with the simple migrant or pauper.

STIGMATIZATION

In early modern legislation the sturdy beggar was characterized as the incarnation of idleness. Flogging, branding, hard labor in the galleys, and all other penalties introduced against begging and vagrancy that involved public disgrace, were justified because they were meant to constrain the poor from following their unlawful and unchristian inclinations and impel them toward their moral and social duty, that is, to work. Branding and ear boring were ritual punishments that left everlasting marks of infamy on the body of the offender. According to the Edwardian statute of 1547 vagrants were to be branded with a V on their breasts. Ear-boring is first mentioned in a statute passed in 1572. In France beggars and vagrants brought to court were subjected to the ritual of corporal punishment including branding (M for *mendiant*, V for *vagabond*) and public flogging. Both police and judges examined suspects’ bodies for the marks of branding and whipping when they took their disposition. Sometimes the most obscure mark (e.g., the fact that a patch of skin on the

shoulder was lighter and of different texture from the rest) was used as proof of a criminal record.

Further forms of corporal punishment for deviant paupers included hair polling, the pillory, and ear cropping. Each of these rituals implied various degrees of public disgrace. The pillory, for example, had been employed against fraudulent beggars since the late Middle Ages. Other forms of degrading punishments for vagrants were of local origin, as for example the “ducking-stool,” which was in use in some early modern English towns. This was a special instrument of punishment for prostitutes or dishonest tradesmen but also for other offenders, consisting of a chair in which an offender was tied and exposed to public derision or ducked in water.

Whipping, branding, and ear boring were for a long time and until the eighteenth century the easiest way of dealing with sturdy beggars and vagabonds. Whether these corporal punishments alleviated the problem of poverty and its concomitant, vagrancy, is doubtful. But it had at least one great advantage: it gave the local governments the feeling that they were at least doing something against the rising number of “masterless men” on the road.

EXPULSION

Local authorities rather seldom used their legislative powers to lock up the wandering or deviant poor (confinement) or to restrict their freedom to move within the municipal area (segregation). More often than not, magistrates turned to the ancient remedy of expulsion. There was almost no town in early modern Europe that at one time or another did not prohibit begging and order the removal of all sturdy beggars and vagabonds. Gatekeepers and constables were admonished to redouble their efforts in order to keep the unwelcome poor outside the city. Some municipalities (e.g., Cologne and Bordeaux) were less successful in barring foreign beggars from entering the city because of the lack of police forces and gaps in their fortification systems. Other European cities managed better in keeping an eye on the floating populations.

In view of the various weaknesses connected with the expulsion or mass banishments of beggars, national governments tried more effective forms of removal for outcast rogues and sturdy beggars. In England the transportation of vagabonds to the colonies dates back to Elizabeth I’s reign. The Va-

grancy Act of 1597 stipulated that dangerous rogues should be banished overseas. A Privy Council order of 1603 mentioned various destinations: Newfoundland, the East and West Indies, France, Germany, Spain, and the Low Countries. Most of those exiled for vagrancy and other crimes were, however, sent to the American colonies.

THE GREAT CONFINEMENT

Compared to stigmatizing corporal punishment and other traditional measures of social control such as expulsion and transportation, a new reformatory policy of punishment in the form of so-called proto-penal institutions offered the authorities a kind of control over the offender without abusing his body. One should not forget, however, that despite this humanitarian impetus, in most “bridewells,” houses of correction, or similar institutions founded in many European countries during the late sixteenth and early seventeenth centuries, chaining and beating of the inmates were common practice until the end of the *ancien régime*.

The most distinctive product of early modern thinking on social welfare was the creation of a new kind of hospital. The practice of confining beggars in jail-like institutions certainly gained favor in the eighteenth century, but as a means of providing work for the needy and punishing the disreputable and deviant, it had a long history, dating back to the second half of the sixteenth century. In 1553 Edward VI, influenced by Bishop Nicolas Ridley, conveyed an old, decayed palace, the Bridewell, to the city of London, for the purpose of safekeeping, punishing, and setting to work the idle poor and vagabonds. Other English towns (such as Norwich and Ipswich) followed in the 1560s. The poor-relief act of 1576 ordered the establishment of so-called houses of correction in all counties and corporate towns of the realm. In this prototype of an institution that was later to become known as the “workhouse,” punishment by imprisonment was given a new importance. This means that labor was, for the first time, introduced as corrective discipline. The English statutes of 1576, 1597, and 1610 all listed punishment, work, and discipline as reasons for the establishment of such houses.

At about the same time when Bridewell became the English model for a new type of institution to combat vagabondage, the magistrates of the city of

Amsterdam decided to establish a *tuchthuis* for men, to be followed by a similar institution for women known as a *spinhuis*. The name of the institution derived from the type of labor the inmates were compelled to perform. The men were forced to chop and rasp Brazilian dyewood, while the women and young children were required to spin, knit, or sew. The reformatory program attached great importance to personal hygiene, industriousness, and piety.

The foundation of the Amsterdam *tuchthuis* was a landmark in the history of a vast program of social engineering, known since Michel Foucault’s work in this field as “the Great Confinement.” Whether or not one agrees with Foucault’s theory of continuity of incarceration and the common disciplinary features of workhouses, asylums, prisons, and factories, there can be little doubt that all those institutions attempted to repress vagrancy and mendicity by segregating and putting to work those caught begging without permission. In the sixteenth century, labor still had strong religious-moral connotations as a remedy against sinful idleness. By the seventeenth century, when the workhouse movement had gained momentum all over Europe, the earlier quality of labor as the means to fight the supposed main cause of poverty (idleness) had been overlaid by a more pragmatic concept in which confinement and compulsory labor were seen as the appropriate instrument to punish and correct beggars and other deviants. Consequently, the workhouse became the distinctive feature of poor relief right to the nineteenth century, even if this English institution and its European adaptations and mutations failed to meet the high expectations of contemporaries.

ROBERT JÜTTE

VALOIS DYNASTY (FRANCE). From its accession to the French throne in 1328 through its end in 1589, the Valois dynasty included thirteen kings: Philip VI (ruled 1328–1350); John the Good (1350–1364); Charles V (1364–1380); Charles VI (1380–1422); Charles VII (1422–1461); Louis XI (1461–1483); Charles VIII (1483–1498); Louis XII (1498–1515); Francis I (1515–1547); Henry II (1547–1559); Francis II (1559–1560); Charles IX (1560–1574); Henry III (1574–1589).

Over this period, the dynasty presided over some of the most violent years in French history. Its reign included the Hundred Years’ War (1337–1453) and the Wars of Religion (1562–1598), two periods in which it seemed that France itself might break apart; and from 1495 through 1557 there were a series of wars with the kings of Spain, with each side seeking hegemony in Italy. The sixteenth-century Valois also confronted the advent of Protestantism, and their response to it continued to influence French society well into the nineteenth century. Despite the advantages that converting to Protestantism might have offered, Francis I and Henry II vigorously prosecuted all forms of heresy; and Charles IX endorsed the St. Bartholomew’s Day Massacre of Protestants in 1572. As a result, to the end of the Old Regime the French monarchy would remain closely allied with Catholic ritual and belief.

The Valois included colorful characters to match the dramatic times in which they ruled. A patron of the arts and ambitious warrior, Francis I was a Renaissance monarch well suited to compete with his contemporaries Henry VIII of England (ruled 1509–1547) and the Emperor Charles V (ruled 1519–1556). But several other members of the dynasty showed signs of mental instability, and in both the fifteenth and the sixteenth centuries these had dire political consequences.

JONATHAN DEWALD

VAN DYCK, ANTHONY (1599–1641), Flemish painter. Born in Antwerp, Anthony van Dyck divided his career between his native Southern Netherlands, Italy, and England. Before he died at the age of forty-two, he had become the most influential portraitist in Europe. His portraits evoke the sitters' actual or desired rank as well as a sense of individuality, despite their idealization. Although he remains best known for his portraits, Van Dyck's ambition and talent extended to more prestigious history subjects, including religious and secular narratives in which he emphasized psychological states and relationships (for example, *The Mystic Marriage of the Blessed Herman Joseph*, 1630, Vienna, Kunsthistorisches Museum). Throughout his career Van Dyck departed from gender stereotypes more often than other artists, favoring subjects with passive men, and innovatively portrayed several women as glancing down at the viewer (for example, *Marchesa Elena Grimaldi*, 1623, National Gallery of Art, Washington, D.C.).

The son of a silk merchant, Van Dyck began his professional training at the age of ten with Hendrik van Balen, the most expensive figure painter in Antwerp. While still in his teens he produced accomplished works and apparently even ran his own studio at the age of sixteen before officially becoming a master in the Guild of St. Luke. Because the young Van Dyck shifted easily between different styles, the dating of his early works remains disputed. He could adapt to the style of the older Rubens, in whose studio he worked as an assistant helping in the execution of such works as the cartoons for tapestries illustrating the history of the Roman general Decius Mus. In such cases he applied paint smoothly and depicted massive, muscular figures in a more ambiguous space than was typical of Rubens. Spatial ambiguity remained a stylistic characteristic throughout Van Dyck's career as a means of intensifying his emphasis on psychological rather than corporeal presence. Early paintings done in his own style, with oil paint applied in broader, looser strokes, reveal his lifelong admiration for the work

Anthony Van Dyck. Self-portrait, c. 1630. HERMITAGE, ST. PETERSBURG, RUSSIA/BRIDGEMAN ART LIBRARY

of Titian (*Betrayal of Christ*, Prado, Madrid). Multiple versions exist of several early narrative subjects, the betrayal of Christ being a case in point. In planning such compositions, he made drawing after drawing to test alternative possibilities.

Portraits painted in Antwerp before 1620 (and again in 1628–1632) tend to be three-quarter length or smaller, a size suitable for the dwellings of Flemish burghers (*Frans Snyders*, The Frick Collection, New York). Props such as columns and flowing drapes, however, evoke the palatial settings of nobility, a status to which many of his fellow citizens aspired.

By the time Van Dyck left Antwerp in 1620, his works were as highly valued as Rubens's. He first went to England but by the end of 1621 had moved to Italy, remaining there for seven years and traveling extensively. His sketchbook (London, British Museum) records that he paid special attention to Titian. In Genoa, where he spent the most time, Van Dyck portrayed the city's nobility, such as Marchesa Elena Grimaldi (1623, National Gallery of Art, Washington, D.C.). Often shown full-length, they look down at the viewer, increasing the

sense of elevated rank suggested by their reserved demeanor. Faces and hands stand out against the tonalities dominated by rich reds and blacks.

In 1628 Van Dyck resettled in his native Antwerp. Visitors to his house mention a “Cabinet de Titian” in which he displayed originals by and copies after Titian. Working with softer value contrasts, Van Dyck expanded his repertoire of portrait poses for compositional reasons and to characterize sitters more fully. This is especially evident in the *Iconography*, a print series portraying selected European notables, including heads of state, military leaders, scholars, and, unprecedentedly in such a prestigious context, fellow artists such as Jan Brueghel the Elder. At first Van Dyck etched the portraits himself, but had the prints made by engravers after his models.

In 1632 Van Dyck moved once again to England, where art patronage now flourished at a court ruled by Charles I, a discriminating and avid art collector. The king appointed Van Dyck his “principalle” painter and knighted him, raising the artist’s status closer to that of the nobility he portrayed as well as entertained. The English portraits (*Portrait of King Charles I*, 1635, Louvre) differ from their Genoese counterparts in having a brighter palette, a tendency to more relaxed poses, and occasional pastoral associations. They were to have an enormous influence on later English painting. In 1634–1635 Van Dyck considered resettling permanently in Antwerp but returned to England, where he lived the rest of his short life. His works remain as integral to the history of painting in England and in Italy as in his native Southern Netherlands.

ZIRKA ZAREMBA FILIPCZAK

VASA DYNASTY (SWEDEN). The Vasa Dynasty, which ruled Sweden from 1523 to 1654, included Gustav I Vasa (Gustav Eriksson), Erik XIV, John III, Sigismund I Vasa, Charles IX, Gustavus II Adolphus, and Christina. During their reigns, Sweden left the Kalmar Union and became an independent state, adopted Lutheranism, developed a more complex economy, built a Baltic empire and a place of importance in European affairs, and became increasingly European culturally. (The Vasa name derives from the *vase*, a sheaf of grain in the family’s insignia or shield. The family’s noble roots lie in the fourteenth century.)

Gustav I Vasa (ruled 1523–1560) established the dynasty. Aided by the Hanseatic League and important elements of the Swedish commons, he led the last of Sweden’s rebellions against the Danish-controlled Kalmar Union. He became king in June 1523, and for thirty-seven years worked diligently and ruthlessly to ensure Sweden’s independence and development. He made and maintained peace with Denmark, encouraged the Reformation, expropriated the properties of the Catholic Church to the crown’s benefit, supported economic developments, built up a modest army and navy, curbed the Hanseatic League’s influence, used the Parliament to ratify his actions, made Sweden a hereditary monarchy (1544), crushed domestic disturbances, and fostered the growth of a central administration. One of Europe’s “new monarchs,” he enhanced the power of the crown and curbed that of the nobility. Following his death in 1560, many of his achievements were eroded by the half-century of internal turmoil and foreign wars initiated by his sons Erik, John, and Charles.

Erik XIV (ruled 1560–1568) was temperamental, suspicious, and mentally unstable. He squandered the fiscal and political assets his father had bequeathed him. He launched Sweden’s age of imperial adventures in the Baltic, helped to precipitate the Northern Seven Years’ War (1563–1570) with Denmark, and even sought the hand of Elizabeth I of England. He also engaged in a running conflict with his half-brother, Duke John, who, from his duchy in Finland, acted like a king in his own right. This conflict peaked in 1568, when John, with the aid of their brother Charles, deposed Erik and imprisoned him in Gripsholm Castle, where he died in 1577.

John III (ruled 1568–1592), more stable, cultured, and politically astute than Erik, worked to restore peace and stability. His efforts were undermined by religious strife. His marriage to Catherine, daughter of Sigismund II Augustus of Poland, led to a drift towards Catholicism, and this was reinforced when their heir, Sigismund, who was raised a Catholic, became king of Poland as Sigismund III Vasa in 1587.

When Sigismund (ruled Sweden as Sigismund I Vasa 1592–1599) succeeded his father as king of Sweden, a political arrangement was forged to balance the interests of the crown, those of the last of the Vasa sons (Charles), and those of the high nobility. Fear of the king's Catholicism led to a reaffirmation of Lutheranism at Uppsala in 1593. Sigismund stacked the administration with his favorites, which alarmed Charles, and civil war erupted in 1597. Sigismund was defeated at Stångebro the following year and deposed in 1599. He remained king in Poland, however, until his death in 1632, and for over half a century the two lines of the Vasa dynasty were in conflict.

Charles IX (ruled 1599–1611) acted as regent until 1604, and he was not crowned until 1607. He ruthlessly eliminated his opponents (Linköping Bloodbath, 1600) and ruled personally or through favorites. He ignored complaints that he was violating the nobility's privileges. Following his death in 1611, the nobles took their revenge. Charles's heir, Gustavus II Adolphus, was only seventeen, and the price of his recognition was an accession charter that guaranteed noble power in the country.

Until relatively recently, Gustavus II Adolphus (ruled 1611–1632) has been viewed as one of Sweden's greatest kings—architect of Sweden's age of greatness; author of creative and positive developments in government, administration, economics, and education; one of history's best military leaders; and the man most responsible for the survival of Lutheranism in Germany. This interpretation usually paired him with his adviser and chancellor, Axel Oxenstierna. More recent assessments tend to assign greater influence to Oxenstierna in political, economic, and administrative matters. In military matters he was less a creative thinker than an efficient and effective applier of ideas originating elsewhere. Gustavus II Adolphus spent almost his entire

reign at war (successively with Denmark, Russia, Poland, and the Catholic-Imperial forces in Germany). He died at the Battle of Lützen on 6 November 1632.

Christina (ruled 1632–1654), Gustavus II Adolphus's only legitimate heir, was six when her father was killed. Power therefore passed to a regency dominated by Axel Oxenstierna, and for the next twelve years the influence of the nobility was enhanced. Christina's personal rule covered a decade, and her importance has been variously interpreted. Oxenstierna's influence declined, and she effectively played competing factions against each other to achieve her desire for peace in Germany and the recognition of her cousin, Charles X Gustav, as her heir. Unwilling to marry, she abdicated and left Sweden in 1654. She converted to Catholicism and lived the rest of her life in Rome, where she pursued her cultural interests and dabbled in politics. She died in 1689.

The Vasa dynasty ended with Christina's abdication, as the crown passed to Charles X Gustav (ruled 1654–1660), son of Gustavus II Adolphus's half-sister, Katherine, and John Casimir of Pfalz-Zweibrücken.

BYRON J. NORDSTROM

VASARI, GIORGIO (1511–1574), Italian biographer, painter, and architect. Born in the Tuscan town of Arezzo, Giorgio Vasari was brought in his early years to Florence, where he eventually became a prolific painter and highly accomplished ar-

chitect. As an artist he is best known for his extensive historical and allegorical fresco decorations in the Palazzo Vecchio, made to celebrate the ruler of Florence, Duke Cosimo de' Medici. As an architect his most celebrated building is the Uffizi, the government "offices" built for his Medici patron.

Vasari's art and architecture are eclipsed, however, by his work as a writer. His monumental *Lives* (commonly known as *Lives of the Artists*), was first published in Florence in 1550 and was reprinted in a much revised and amplified version in 1568. Composed as a series of biographies, Vasari's book is a history of the progress of art, after its "rebirth," from Cimabue to the perfection of Michelangelo. Considered to be the first "history of art" as such, the *Lives* powerfully shaped the emergence of art history as a scholarly discipline in the modern era. Vasari's book is also a rich source of information about Renaissance artists and the world in which they worked. It is a valuable font concerning the theory, practice, criticism, and techniques of art.

Given the vast amount of attention Vasari's writing has received, what is still underestimated at this late date is the status of Vasari's book as an enduring masterpiece of imaginative literature and of historical art. Literary scholars have been insufficiently attentive to Vasari's relations to Homer, Ovid, and Virgil, to Dante, Petrarch, and Giovanni Boccaccio, to Politian, Marsilio Ficino, and Ludovico Ariosto, to Baldassare Castiglione, Pietro Bembo, and Pietro Aretino, and art historians are totally indifferent, if not hostile, to the literary virtues of the *Lives*.

Writing before the modern distinction between scientific history and historical fiction, Vasari produced a book that combined both—fables and *novelle* on the one hand and "factual documents," as we might call them, on the other. Although scholars have become increasingly attentive to the fictive character of the *Lives*, they have remained remarkably insensitive to the virtues of such fiction. Sometimes they still ignore or refuse to acknowledge the presence of fiction in Vasari's book, as when, for example, they treat his fable of Leonardo's fabulous buckler or his tale of Michelangelo's smiling faun made in the Medici garden as true stories, as documentation of what really happened. What is lost here is an adequate critical appreciation of Vasari's

art, the poetic art and inventiveness of these and other stories.

The blind reading of Vasari, which talks around the fiction of his book or refers to it only as "poetic embellishment" when it is far more than that, is based on the misguided belief that history is an accumulation of facts when it is, in fact, shaped or formed, hence "fictive" in the root sense of the word. Fiction in Vasari is inevitably written in the service of the historical truth. Vasari reports, for example, that Piero di Cosimo was a "wild man," a fiction that is true to the character of the artist's primitive subjects, which are the inventions of a highly cultivated artist. The power of Vasari's fiction is so great that even modern scientific art historians have imagined him as a kind of caveman. Although Piero becomes a fictional character in the pages of Vasari, he is obviously not an invented character. Rather, he is a real person whose life is poetically imagined.

The poetry of Vasari endures in the modern fable of art, in Honoré de Balzac's *The Unknown Masterpiece*, the tale of a painter whose inability to complete a masterpiece echoes Vasari's portrayal of Leonardo's unfinished work. Vasari is alive in Robert Browning's poems on Fra Filippo Lippi and Andrea del Sarto, and in George Eliot's portrayal of Piero di Cosimo in *Romola*. The extent of Vasari's influence on the modern imagination is far greater than the provincial historiography of art history allows. Vasari's book is a classic of world literature in which the mythologized Piero di Cosimo, Leonardo, Raphael, and Michelangelo are characters of historical fiction who take their place as the subjects of history and the modern novel alike. Vasari often appropriated materials from other writers, far more than is generally realized; but, in the end, he was the superintending intelligence responsible for the making of a great literary and historical masterpiece, which will forever remain "Vasari's *Lives*."

PAUL BAROLSKY

VASILII III (MUSCOVY) (1479–1533; ruled 1505–1533), grand prince of Muscovy. Vasilii III Ivanovich was the second son of Ivan III. His mother was the Greek princess Sofia Paleologue. Coming to the throne in 1505, he pursued his father's policy of expansion and consolidation of territory. In 1510 he annexed the trading town of Pskov and in 1514 captured Smolensk from Poland-Lithuania. In 1520–1521 Vasilii imprisoned the last Ryazan prince for treasonous relations with the Tatars and absorbed his territory. Repeated raids by the Crimean Tatars on the southern border posed serious problems but did not prevent him from repeatedly trying to establish his candidates as khans of Kazan' on the Volga. A truce with Lithuania in 1522 allowed him to consolidate his gains, establishing Russia's western frontier for a century.

Internally Vasilii inherited the apparatus of his father's state and maintained it, at the same time asserting control over the small appanages of his junior kinsmen. His marriage to Solomoniia Saburova, the daughter of an important boyar clan, produced no heirs in twenty years, and in 1525, with the support of the church, Vasilii dissolved the marriage and forced her to become a nun. He quickly married Princess Elena Glinskaia, the daughter of a refugee prince from Lithuania whose uncle, Prince Mikhail Glinskii, had led a revolt against his sovereign, Sigismund I of Poland-Lithuania, in 1508. The Glinskii family were great magnates of Tatar origin who came to play an important role at the Russian court.

Religious issues intertwined with court rivalries marked the politics of Vasilii's reign. In 1507 Vasilii took Joseph of Volokolamsk and his monastery under his personal protection and supported Joseph in his conflicts with the church hierarchy. From 1509 Joseph's critic, the monk Vassian Patrikeev, son of the exiled prince Ivan Patrikeev, was also prominent at court, and he remained influential until about

1522. In those years Vasilii and Metropolitan Varlaam brought Maximus the Greek (Michael Trivolis, c. 1480–1556) to Russia to correct the Slavonic translations of Greek liturgical texts. Maximus combined philological skills acquired in Venice and Florence with traditional Orthodox belief, but he and Vassian both fell afoul of the new metropolitan, Daniil (1521–1539). Maximus was tried for heresy as well as for political comments in 1525 and again, with Vassian, in 1531, after which both were removed from their positions and sent into monastic exile. Maximus left a large body of devotional and theological writings. Though he was critical of excessive monastic wealth, his views remained within conventional teachings. During the same period Vasilii exiled several prominent boyars, the princes Shuiskii, Vorotynskii, and others, and Maximus's ally Ivan Nikoforovich Bersen'-Beklemishev was executed in 1525 for criticism of both the metropolitan and the grand prince.

The birth of an heir, Ivan Vasil'evich—the future Ivan IV, the Terrible—in 1530 ensured the succession, but Vasilii died in 1533. A regency, with its accompanying political instability, followed his death.

VAUGHAN, THOMAS (Eugenius Philalethes; 1622–1666), Welsh alchemist, Rosicrucian, Hermeticist, and Paracelsan. Twin brother of the poet Henry Vaughan, Thomas Vaughan was born in Newton, Wales. He studied at Jesus College, Oxford, graduating with a B.A. in 1642. Thereafter he became rector of Llansaintfraid and supported the Royalist cause in the Civil War. Ejected from his living by a parliamentary commis-

sion in 1649, he practiced as an alchemist, or chemical philosopher, in London. He published several books under the pseudonym Eugenius Philalethes: *Magia Adamica* (1650), *Anthroposophia Theomagica* (1650), *Anima Magica Abscondita* (1650), and *Lumen de Lumine* (1651). He was also responsible for publishing an English translation of the Rosicrucian manifestos *Fama* and *Confessio* in 1652. During the 1650s he became acquainted with Samuel Hartlib and two future fellows of the Royal Society: Thomas Henshaw, dedicatee of *Anima Magica Abscondita*, and Sir Robert Moray, with whom he conducted alchemical investigations. Vaughan is best remembered for his controversy with Henry More, who attacked him under the pseudonym *Alazonmastix Philalethes*. The vituperative character of the exchange can be gauged from the titles of Vaughan's replies: *Man-Mouse Taken in a Trap* (1650) and *The Second Wash, or the Moore Scour'd Once More* (1651).

SARAH HUTTON

VEDUTA (VIEW PAINTING). The golden age of *Vedutismo*, the art of painting views of Italian cities, towns, and villages, falls with some precision within the confines of the eighteenth century. The roots of the genre lie in printed and drawn topographical images produced in the previous century, particularly in Rome, of which the Flemish artist Lieven Cruyl produced an impressive series of drawings in the 1660s, and where landscape painters such as Paul Bril (1554–1626) and painters of ruins such as Viviano Codazzi (1603/4–1670) had important sidelines painting views of real locations. It was appropriately in Rome that the first specialist view painter, and the founding father of the Italian school of view painting, Gaspar van Wittel (1652/53–1736), known in Italy as Gaspare Vanvitelli, settled in the 1670s, and produced his first views, in gouache and oil, in the 1680s. Born at Amersfoort in Holland, Vanvitelli shows a Dutch sensitivity to light, meticulous technique, and delicacy in the treatment of detail, combined with a convincing perspective, which distinguish it from earlier, isolated examples. He also worked in Naples and Venice, where he similarly inspired the emergence of indigenous schools of view painting.

All the main practitioners of *Vedutismo* were also involved in the painting of *capricci*, imaginary assemblages of buildings, especially classical ruins, and it was from this tradition that Vanvitelli's greatest successor in Rome, the neoclassicist Giovanni Paolo Panini (1691–1765), emerged in the 1730s as the leading Roman view painter of his generation, his work being especially popular among the French. In addition, Naples had a significant school of view painters, unusual in that not only were few of its members Neapolitan by birth but many were not even Italian. Vanvitelli's views, second only to those he made of Rome, were followed by similar series of the city by the Modenese Antonio Joli (c. 1700–1777), the most widely traveled of all the Italian eighteenth-century view painters, and of towns on the Bay of Naples by the German Jakob Philipp Hackert (1737–1807).

It was in Venice that, following a visit by Vanvitelli in the 1690s, the one truly native school of view painting grew up. Luca Carlevaris (also Carlevaris; 1663–1730), born in Udine but Venetian by adoption, published an influential set of 104

Veduta. *The Arch of Constantine* by Gaspar van Wittel. ©CHRISTIE'S IMAGES/CORBIS

engravings of Venetian views in 1703, and during the first decade of the century he painted a number of often large representations of particular events, the grandest form of view painting, for foreign visitors to the city. From this moment on, the development of view painting in Venice is inextricably linked to the demand for such work by foreign visitors, especially Englishmen on a grand tour. The career of Canaletto (born Giovanni Antonio Canal, 1697–1768) was established in the 1720s through his links with the Irish impresario Owen McSwiney, and above all with the English merchant banker, and later British consul, Joseph Smith, who was to be his greatest patron as well as his agent, ideally placed to organize commissions for souvenirs from eminent visitors to the city. By the late 1720s Canaletto had abandoned the vivid brushwork and dramatic light effects of his early work in favor of more precisely defined scenes invariably bathed in warm sunshine, presumably to cater better to his clients' tastes, and his tendency to work on an increasingly small scale was also motivated by commercial concerns. Much has been made of Canaletto's use of the camera obscura, but evidence of

this is limited, and Canaletto's views, despite appearances, often involve extensive distortions and lack topographical accuracy.

Although Canaletto showed a reluctance to leave his native city, he did visit Rome in his youth (1719–1720) and spent nine years in England (1746–1755). His nephew Bernardo Bellotto (1720–1780), no less an artist although one of a very different character, also left Italy in the 1740s, but in his case this was to be permanent. The cold light and dark brooding quality of his paintings, even his early views of Italy, were particularly well suited to his views of the northern cities, which he portrayed in series of large canvases during his residence at the courts of Dresden (1747–1758 and 1762–1766), Vienna (1759–1760), Munich (1761), and Warsaw (1767–1780). With the early death of Michele Giovanni Marieschi (1710–1743), the most talented of Canaletto's rivals in the 1730s, and the departure of Bellotto, Venice found itself without a significant view painter during Canaletto's years in England. It was left to Francesco Guardi (1712–1793), the last of the great Venetian view painters who only turned to view painting in

the second half of the 1750s, to develop a highly individual new style, one of dramatic atmospheric effects over topographical representation, that carried the genre through to its conclusion on the eve of the fall of the Venetian Republic in 1797.

CHARLES BEDDINGTON

VEGA, LOPE DE (1562–1635), Spanish dramatist. Lope Félix de Vega Carpio, the best-known and most influential dramatist of Spain's Golden Age of literature, was known as the "Freak of Nature" for the astonishing quantity and quality of his poetry, drama, and prose. His greatest legacy was to establish the genre of the *comedia*, a secular three-act play that reached enormous popularity on the public stages of Spanish cities in the late sixteenth and early seventeenth centuries.

Though Lope's family origins were humble, he soon drew attention for his unusual talents, being able to read Latin and compose poetry at an early age. He studied with the Jesuits in Madrid and at the University of Alcalá, served in a series of military expeditions, and performed occasional secretarial duties for a variety of marquises and dukes. Defining himself above all as a writer, he was one of the first Spanish playwrights to make a living from his art, although it generally brought him more fame than fortune.

Lope's life contained as much romance, adventure, and conflict as that of any of his fictional characters. He engaged in a series of tempestuous relationships, many of them adulterous, the earliest of which resulted in his exile from Castile for two

years. He served on the ill-fated Armada expedition against England in 1588 and not only survived but composed poetry throughout the voyage. As a young man, Lope had considered the possibility of a religious calling, and he finally entered the priesthood in 1614 after the death of his second wife. He also served as an officer of the Inquisition and earned the favor of Pope Urban VIII. Passionately sensual and deeply religious, Lope often suffered the contradictions of his own personality. After his ordination, he continued to have a series of highly publicized affairs, and was said to have been in the habit of furiously scourging himself in penitence. He married twice and fathered more than a dozen children (legitimate and illegitimate). The turbulence of his life was echoed in his family: his last mistress suffered from blindness and fits of insanity, one of his daughters was seduced and abandoned, and a son who demonstrated great poetic talent suffered an untimely death at sea.

However unfortunate, the intensity of his personal experiences enriched Lope's art. Nearly all of the women with whom he was involved appeared in some incarnation in his poetic works: the "Filis" of his ballads was his first love, Elena Osorio; his first wife, Isabel de Urbina, appeared in verse as "Belisa"; Micaela de Luján, a longtime mistress, was immortalized in his sonnets as "Lucinda"; and "Amarilis" represented his last great love, Marta de Nevares. Lope's spiritual anguish was expressed most beautifully in his collection of sacred sonnets, *Rimas sacras* (1614; Sacred verses), and his best prose was encompassed in the largely autobiographical novel *La Dorotea* (1632).

As Lope's personal life was closely interwoven with his art, so was his literary career inseparable from the rise of the dramatic genre known as the *comedia*. Drama in sixteenth-century Spain had roots in a variety of traditions including classical Latin plays, medieval liturgical ceremony, folk traditions, and the Italian *commedia dell'arte*. Lope drew on all of these to create the *comedia*, mixing popular and erudite elements, favoring action and clever dialogue over character development, and disregarding the traditional distinction between comedy and tragedy. Though he was well trained in traditional literary techniques and the classic unities of time, place, and action, he argued that these were irrelevant to audiences who simply wished to be enter-

tained. In 1609, he published *The New Art of Writing Plays in Our Time*, a tongue-in-cheek treatise written for the Academy of Madrid in which he criticized the uneducated tastes of the common people but argued that the style of popular drama must yield to the “tyranny of the audience.” This approach was scorned by those who defended the Aristotelian precepts of drama, but it won Lope the adoration of the public. His dramatic career coincided with the opening of a number of public stages in cities across Spain, and under his guidance, the *comedia* gained enormous popularity and became the standard dramatic form of the Golden Age.

Lope claimed to have written nearly two thousand *comedias*, of which approximately five hundred survive. With a rich variety of subjects drawn from history, romance, religion, mythology, and adventure, their themes always reflected the principal concerns of early modern Spaniards: the tensions between love and honor, power and responsibility, and the individual and society. In a world very sensitive to status, Lope frequently demonstrated his sympathy for those who were excluded from the ranks of wealth and power. *Fuenteovejuna* (1614; *The sheep well*), *Peribáñez* (1621) and *El mejor alcalde, el rey* (1621; *The best magistrate, the king*), all portrayed the dignity and honor of rural villagers struggling against the tyranny and corruption of the nobility. Similarly, in plays such as *El perro del hortelano* (1613; *The dog in the manger*), Lope’s spirited female characters resisted the expectations of the patriarchal world in which they found themselves (though his conclusions always reinforced the necessity of socially acceptable marriage). All of Lope’s plays dealt with these themes in a vivid, energetic, and spontaneous style, demonstrating his preference for the passions and conflicts of real life over the academic abstractions and ideals favored by many of his contemporaries.

Lope’s genius was best expressed in drama and lyric poetry, but he composed in nearly every literary genre, including sonnets, epic poems, prose, fables, treatises, short stories, and novels. In spite of his talent, his humble origins (and perhaps his scandalous behavior) prevented him from earning the patronage of the court that he had always hoped for, and he faced financial difficulties throughout his lifetime. This talent did, however, earn him the love of his audiences, both in his own time and in the

Lope de Vega. ARTE PUBLICO PRESS ARCHIVES, UNIVERSITY OF HOUSTON. REPRODUCED BY PERMISSION

centuries since his death, and it has guaranteed him a place among the greatest figures in literary history.

JODI CAMPBELL

VELÁZQUEZ, DIEGO (Diego Rodríguez de Silva y Velázquez; 1599–1660), the most important artist of the Spanish Golden Age. The son of parents of the lower nobility, Velázquez was born in Seville, where he lived until he was twenty-four. Between 1610 and 1616, he studied with Francisco Pacheco (1564–1654), the leading painter of the city. In 1618, he married Pacheco's daughter, Juana. Although profoundly influenced by Pacheco's commitment to the ideal of the learned painter, he did not imitate his master's dry, Italianate style.

His early genre scenes, including *An Old Woman Cooking Eggs* (1618, National Gallery of Scotland, Edinburgh) and *Waterseller* (1619, Wel-

Diego Velázquez. Self-portrait, 1623. ©ARCHIVO ICONOGRAFICO, S.A./CORBIS

lington Museum, London), constitute the first coherent group of secular figural paintings by a Spanish artist. These works probably were influenced by pictures of religious subjects with elaborate still life details by Flemish and north Italian artists such as Pieter Aertsen (c. 1508/09–1575) and Vincenzo Campi (1536–1591). However, in contrast to these prototypes, Velázquez reduced the scenes to their essentials and focused upon a few naturalistically rendered figures and objects, strongly illuminated against a neutral background. The quiet dignity of the figures, and the monumental nature of the compositions, endow these images with a sense of transcendent importance.

In 1623, aided by courtiers from Seville, he obtained the opportunity to execute a portrait of Philip IV (ruled 1621–1665), which he revised a few years later (1623–1626, Museo del Prado, Madrid). Velázquez avoided the appearance of pomp so typical of baroque court portraiture of the time. The elegant pose, aloof gaze, and smooth, even illumination suffice to indicate the dignity of a king. Philip immediately appointed Velázquez royal painter; during subsequent decades, the two developed a close friendship, unprecedented between an artist and a Spanish monarch.

Interaction with Peter Paul Rubens (1577–1640) during Rubens's visit to Madrid in 1628–1629 decisively influenced the young artist, who sought to emulate the example of the painter-courtier. Rubens stimulated Velázquez's interest in the royal collection of Venetian paintings and encouraged him to expand his range of themes. Velázquez's first history painting, *The Feast of Bacchus* (1629, Museo del Prado, Madrid), introduced an unexpected melancholy note into the popular mythological subject. The beggar, seeking alms from the peasants gathered around Bacchus, evokes the transience of the pleasure of wine. Despite its originality, the uncertain definition of space and the overcrowded composition reveal artistic deficiencies.

To give him the opportunity to improve his skills, Philip sent Velázquez to Italy for over a year (1629–1630). In Rome, he met leading artists and studied ancient and Renaissance works. *The Forge of Vulcan* (1630, Museo del Prado, Madrid) demonstrated mastery of fundamental qualities of the Ital-

Diego Velázquez. *Las Meninas* (The Family of Philip IV). ©ERICH LESSING/ART RESOURCE, N.Y.

ian classical tradition, including accurate anatomy, dramatic expressions and gestures, and spatial perspective. Also in Rome, he produced two views of the gardens of the Villa Medici (both 1630, Museo del Prado, Madrid), among the first European paintings to have been created directly from nature. Superimposing “broken” brushstrokes over a reflective lead-white ground, he infused these seemingly casual images with a sense of atmosphere.

Returning to Madrid in 1631, Velázquez began the most productive decade of his career. By mid-decade, he had devised a highly original method of creating optical effects through the application of short, thick strokes of endlessly varied shapes and sizes. Thus, for example, when viewed from a distance, the jumbled brushwork covering the king’s garments in *Philip IV of Spain in Brown and Silver* (1635, National Gallery, London) becomes resolved into a convincing record of the appearance of embroidered fabric. Although enlivened by free handling of paint and a brighter range of colors, the later royal portraits retain the directness and naturalness of his first works at court.

Throughout the 1630s, he supervised important decorative projects at royal palaces. For the Hall of Realms in the Buen Retiro, Madrid, he devised a coherent program of battle paintings, mythological images, and portraits. For this series, he produced the *Surrender of Breda* (1635, Museo del Prado, Madrid), the masterpiece of the period. By depicting the Spanish general with his arm upon the shoulder of the defeated Dutch leader, he visualized the ideal of mercy in victory, treated in several contemporary works by the court playwright Pedro Calderón de la Barca (1600–1681). Velázquez carefully studied portraits, battle plans, and other documentation in order to endow this imaginary conception of the event with an aura of authenticity. His paintings for the Torre de la Parada, a hunting lodge near Madrid, included two sympathetic and psychologically insightful portraits of dwarfs, Francisco Lezcano and Diego de Aceda (both 1636–1640, Museo del Prado, Madrid). Also created for the Torre, *Mars* (1640, Museo del Prado, Madrid) wittily depicted the ancient god of war contemplating his frustrations in love.

In the last two decades of his career, Velázquez reduced the scope (though not the quality) of his

artistic production as he devoted himself to personal service to the king. His *Venus and Cupid* (c. 1648, National Gallery, London) is one of the few female nudes by a Spanish artist of the early modern era. The sensual pose, provocative use of the mirror image, and rich, luminous colors contribute to the erotic allure of this image. Between 1649 and 1651, Velázquez traveled in Italy to purchase art for the royal collection. His *Innocent X* (1649–1650, Galleria Doria-Pamphili, Rome) expressed the intense psychological energy of the aging pontiff. At the 1650 exhibition of *Congregazione dei Virtuosi* in Rome, he exhibited the recently completed *Juan de Pareja* (1650, Metropolitan Museum of Art, New York). Utilizing compositional formulae associated with aristocratic portraiture, he emphasized the dignity of his Moorish servant.

The exceptionally large *Las meninas* (1656; Maids of honor, Museo del Prado, Madrid) is regarded as the quintessential expression of his artistic aspirations. Velázquez depicted himself standing confidently at his easel, in the company of Princess Margarita and her attendants. Reflected in the mirror on the back wall are the king and queen, whose visit to his studio signifies royal approval of his art.

Intrigued by *Las meninas*, Pablo Picasso (1881–1973) created forty-four variations upon it in 1957 (all in Museo Picasso, Barcelona). Édouard Manet (1832–1883) is among the many other modernist artists who found inspiration in Velázquez’s works.

VENICE. One of the first cities in Italy to engage in international commerce after the devastations of the early Middle Ages, Venice established a maritime empire by 1300 and a territorial empire from the early 1400s. Its unique form of government, although not as perfect as its apologists claimed, was a model of a “mixed” constitution for the early modern world. Adapting to changing circumstances, its economy remained vibrant into the seventeenth century. It experienced little social turmoil, while its literary and artistic achievements were rivaled only by those of Florence and Rome. For most of its thousand years of existence, Venice

was free and independent. One of the most successful states in Europe, it fell at last to Napoleon in 1797.

MARITIME EMPIRE

Venice's unusual location and circumstances permitted its enterprising merchants to build a maritime empire by 1300. It was founded in the sixth and seventh centuries by refugees from the mainland, who had been forced by the invasions of the Germanic Lombards to flee northern Italian towns. They settled on a cluster of low, sandy islands in the Adriatic, where they were protected by the sea yet had access in their boats and barges to the river mouths that led to inland cities. Primarily fishermen, they also traded locally in fish and salt, which they manufactured from seawater. During the era of the Crusades (eleventh through fourteenth centuries), Venice (as well as Genoa, on the western coast of the Italian Peninsula) entered into Mediterranean commerce, establishing merchant depots on islands and seacoasts along the route to the Levant (Near East). In the late fourteenth century the rivalry between Venice and Genoa exploded into war. Venice

was victorious and retained mastery of its maritime empire.

The Ottoman conquest of Constantinople in 1453, however, signaled the beginning of the decline of Venice's maritime enterprise. Despite the victory by Venice and allies at the Battle of Lepanto (1571) against the Turkish fleet, the city's seaborne commerce was gravely injured. It was a commerce, moreover, based on the import of luxury goods from Asia, especially spices. By 1600 the tastes of European consumers were shifting. Sugar, tea, and tobacco became, more than pepper, the staples of world trade. In those markets Venice had no role.

TERRITORIAL EMPIRE

In the meantime, however, Venice had won a territorial empire, beginning with the conquests of nearby Padua and Verona in 1405. By 1454 Venetian conquests reached far west on the Lombard Plain of northern Italy to Bergamo and Crema, almost to Milan, and northeast along the arc of the Adriatic Coast to Friuli and beyond to Dalmatia (modern Croatia). These territories included wealthy trading centers, drawing on the fertile lands

bordering the Po River, and gateways to the passes over the Alps and the commercial possibilities of the north. These conquests were made possible by the admirable military organization Venice developed. Heretofore, with only a maritime empire, Venice had provided both commanders and sailors, who also served as armed marines. On land Venice did not attempt to raise a citizen militia. Instead, it hired the best of the mercenary commanders (*condottieri*) then available but coordinated and systematized their efforts through a network of supervisors (*proveditori*) drawn from the governing elite. Venice was thus a pioneer of the rethinking of military organization that, in the sixteenth and seventeenth centuries, is sometimes considered a "military revolution."

The Peace of Lodi (9 April 1454) put an end, for the moment, to the rivalries among the great Italian powers, Venice, Milan, Florence, Naples, and the papacy, that had emerged from the crucible of warfare. The Italian League of the following year sought to maintain peace for a renewable twenty-five-year term by establishing a balance of

Venice. A sixteenth-century German bird's-eye view of Venice, with many buildings identified. The city, known as Queen of the Seas, reached the height of its commercial power in the fifteenth century, and at the time of this map was at the peak of its artistic glory. power. Some historians note that this agreement foreshadows the peace sought by the Congress of Vienna in 1815. Venice continued to seek commercial and political advantage where it could and fell into a damaging war with Ferrara (in the Papal States) from 1481 to 1484 that confirmed the impression of the larger city's aggressive behavior. When French, imperial, and Spanish armies began their long invasion of Italy in 1498 (with a pause in 1530 and no final resolution until the Treaty of Cateau-Cambrésis in 1559), Venice shifted its allegiance from side to side, attempting at times to maximize its advantage, at others simply to preserve the state.

In 1508, at the nadir of these conflicts, Venice faced the League of Cambrai. All of its sometime friends and enemies—France, Spain, the pope, and

the empire—were united against the crafty republic. During a war that lasted from 1509 to 1517, Venice lost but then regained all of its mainland territories. It was saved by the commitment of its own people and the loyalty of mainland subjects. When the fog of war lifted at mid-century, Venice alone of the Italian states was capable of proceeding briskly to assume its accustomed preeminence. Venice withstood the Reformation and Counter-Reformation alike, weathering a papal interdict in 1606–1607. It remained an international power, although a waning one, until its 1797 demise.

Venice's success was due in part to its unique location and its energetic people. But it was the result as well of its system of government, which was sufficiently inclusive and sufficiently just to win the broad support of the citizenry.

GOVERNMENT

By 1000 C.E. Venice’s island communities had united into a single state ruled by an elected doge, whose election was a central part of Venetian political ritual. Soon thereafter the nominal obedience the Venetians paid to their presumed overlord, the Byzantine emperor, dropped away. By the thirteenth century the *Maggior Consiglio*, or ‘Great Council’, of prominent families made major decisions and limited the doge’s effective power. In 1297 those families declared the *serrata*, or ‘closing’, of the Great Council. By that move, which took decades more to take full effect, they instituted a hereditary nobility of about 1,200 adult males (from some 150 families) with exclusive access to political power. With the exception of some eighty families admitted for exceptional service in 1388, there were no additions to the roster of noble fami-

lies until the seventeenth century (when nobility could be obtained by purchase).

The Great Council elected members from the same noble stratum to a senate, and the council or the senate elected members to a number of other councils, including the “Forty” of justice and the “Ten” for state security. They also elected the *avogadori di comun* (state attorneys), ambassadors, and military and other *provveditori*. Venetian government had many branches. A large part of the nobility spent a significant part of its time on the business of government, while a smaller elite of perhaps one hundred to two hundred exceptionally powerful men rotated in high office.

This government structure was by no means democratic. Yet it was admirable in many regards. It included elements of monarchy, of aristocracy, and

of republican process. In the 1490s, when Florence was redesigning its government, it imitated the Venetian Republic, which also inspired English statesmen in the seventeenth century and even some of the American founders in the eighteenth century. Exaggerated statements of the justice and serenity of the Venetian state were made by proponents of the “myth of Venice” beginning in the fifteenth century. At the same time there prevailed a countermyth, voiced by the enemies of Venice, about that state’s unique duplicity and cruelty.

VENETIAN SOCIETY

A unique state was based on a unique society, of which no feature is more striking than the role of the nobility. From 1300 to 1500 the number of adult male nobles ranged from twelve hundred to twenty-five hundred and constituted 6 to 7 percent of the city’s population. The population of Venice dipped to 50,000 after the plague of 1348 and reached a high of 190,000 around 1570, after which further rounds of epidemics took severe tolls. A secondary elite of *cittadini originari* (‘original citizens’, either native-born or so ranked by grant of privilege) provided the huge numbers of bureaucrats and secretaries (as well as merchants and pro-

fessionals) that a city of the complexity of Venice required. The artisan stratum was grouped in guilds that were less powerful than in some other cities but that were an important force for social cohesion. In addition the *scuole*, a uniquely Venetian version of the confraternity, provided charity and consolation for both members (of all social classes) and outsiders. A large pool of workers was employed by the Venetian state shipbuilding industry of the *Arsenale* (Arsenal). Below the strata of ordinary workers were the groups of prostitutes, beggars, and the poor found in most early modern cities. In addition Venice had a large population of resident foreigners, merchants in transit, visiting scholars, travelers, and refugees.

Women in Venice, as elsewhere in Italian society, were expected to obey their fathers and their husbands and dedicate themselves to childbearing, charity, and piety. Women of the middle and lower social ranks had more freedom than those of the nobility and high bourgeoisie. They were able to own property, participate in the public life of the marketplace, and defend themselves in court. Prostitutes and courtesans were numerous in a city with a large and mobile population, a large group of

Venice. A small engraved view of Venice as it was in 1765, from an early-nineteenth-century book published in New York. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

foreigners, and an elite of unmarried noble males (who remained bachelors so family wealth would flow to the next generation undivided). Venice also had a large number of women, committed nuns (including many forced as children into the convent as a cheaper alternative to marriage), abandoned children, widows, and former prostitutes, who lived in convents.

In this heterogeneous society there were also present those who dissented from the majority established religion, Catholicism. During the sixteenth century Venice was in many ways tolerant of heterodoxy. Its bookshops and taverns were homes to forbidden ideas. Venice cooperated with the Inquisition yet insisted on retaining its own investigators of religious dissent. In sum, in a diverse society the repressive hand of the Counter-Reformation was seen in Venice but could not act unrestrainedly.

INTELLECTUAL AND ARTISTIC ACTIVITY

During the same centuries of religious exploration, economic innovation, and empire building, Venice also was a center of intellectual and artistic activity. Historians, philosophers, mathematicians, and even humanists flourished from the fifteenth through the seventeenth century, although it was a humanism less critical of traditional structures of power than elsewhere. Venice became the major printing center of Italy, which means the most important printing center anywhere in the early years of that technological explosion. The work of Aldus Manutius (also Aldo Manuzio) (1449–1515), who opened his print shop in Venice in the 1490s, is especially notable. Among the many elegant Aldine editions are those of Greek and Roman authors thus printed for the first time anywhere in formats that made them accessible to scholars and amateurs. Venice participated in the artistic Renaissance in its own way, blending Gothic and classical styles in architecture and remaining loyal to traditional genres until fairly late. From the late fifteenth century to the sixteenth century, however, the Venetian masters Giovanni Bellini (c. 1430–1516), Giorgione (c. 1477–1511), Titian (1488 or 1490–1576), Tintoretto (c. 1518–1594), and Paolo Veneziano came to the fore with their characteristic sensitivity to color and light. In music, where Italy generally was laggard in the fifteenth century, needing to import composers and musicians from the Netherlands, Venice took a

leading role from the sixteenth century. The city itself was a work of art. Its unique cityscape of breathtaking beauty, its ritual displays, and its interplay of costume and performance during the season of Carnival were magnets for all of Europe.

MARGARET L. KING

VENICE, ARCHITECTURE IN.

According to Giorgio Vasari, the first historiographer of Italian Renaissance art, the modern era penetrated into Venice only with the arrival of the Florentine Jacopo Sansovino in the 1520s. Indeed, together with the Veronese Michele Sanmicheli and the Bolognese Sebastiano Serlio, who also arrived in the capital of the Venetian republic in the wake of the Sack of Rome of 1527, these architects were responsible for its Roman Renaissance. This is not to say that later fifteenth-century Venetian architects had not aspired to create a style *all'antica* or sought to bring glory to the city by emulating the

architecture of the ancients. However, in its close trading ties with both Byzantium and the Levant, it is to Constantinople, as the second Rome, that Venice had traditionally looked. If the proud display of *spolia* such as the horses from the Hippodrome (looted from Constantinople and placed on the facade of San Marco) represented this veneration of antiquity, the lacy and ornate late Gothic style nevertheless persisted into the fifteenth century (Ca' d'Oro, begun 1421). This survival was due to a taste for rich materials and lavish decorations that was imported from the East and to the practices of stone masons imported from the West who had been trained in the tradition of a flamboyant Lombard Gothic style. Such was the case with architects like Mauro Codussi (St. Michele in Isola and the clock tower in the Piazza San Marco) and Pietro Lombardo (Santa Maria dei Miracoli), who were responsible for some of the most original buildings of the late fifteenth century in Venice.

SIXTEENTH CENTURY

It is against this tradition favoring lavish surface decoration, colorful marble veneers, and effects of light and shade that the work of the great sixteenth-century architects must be understood. Although the fifteenth century saw the rise of Venetian economic power and the zenith of its maritime influence and the sixteenth the beginning of its gradual decline (after the wars with and defeat by the League of Cambrai between 1508 and 1529), it is paradoxically in the latter period that the most important monuments of the republic were built. The state sponsored major building campaigns—among which the complex surrounding the Piazza San Marco was the most conspicuous and important—precisely with the object of maintaining morale and projecting an image of security, power, and wealth at a difficult moment in its history. The architect of this *renovatio urbis* was Jacopo Sansovino (1486–1570), whose Zecca (the mint, begun 1536), Library of San Marco (begun 1537), Loggetta facing the Doge's palace (begun 1538), and Fabbriche Nuove di Rialto (market buildings, begun 1554), with their opulent and assertive classical style, displayed convincingly the importance and stability of the republic. The palaces he built for the patrician families (Dolfin, begun 1538, and Corner, begun 1545) as well as those by his contemporary Michele Sanmicheli (1484–1559) (Palazzo Grimani, begun

1556) which similarly relied on sequences of columns, tall facades, rich ornamentation, and equilibrium between horizontals and verticals, extended this image into the private domain.

In a city that had taken an early lead in the book publishing industry and where most of the principal Renaissance architectural treatises had first seen print (commentaries of *De architectura* by Vitruvius, the books on the orders and antiquities by Serlio, the treatises of Andrea Palladio, Giovanni Antonio Rusconi, and Vincenzo Scamozzi), patrons were both knowledgeable in matters of “modern” architecture and eager to see it built. This enthusiasm was reflected not only in the city but also in the countryside, toward which the patrician economic interests had turned after the mercantile fortunes of the republic had been threatened. Starting in the sixteenth century, the construction of villas, both as rural retreats and centers of estate management, rose dramatically. It is in villas such as Emo and Badoer, with their arcaded granaries flanking frescoed and meticulously proportioned central blocks set on a podium, that the Vicentine architect Andrea Palladio (1508–1580) consecrated the confluence of working farm and classical allusion that characterized the genre thereafter. Palladio's restrained interpretation of the temple front as church facade (San Giorgio Maggiore, begun 1566, and Il Redentore, begun 1577) also set the stamp on Venetian religious architecture of the late Renaissance and provided a model for churches into the eighteenth century. His intervention must be seen in contrast to the tradition of flamboyant facades particularly associated with the seats of lay confraternities attached to churches, such as the Scuola di San Rocco by Bartolomeo Bon and Antonio Scarpagnino (begun 1515).

BAROQUE AND NEOCLASSICISM

If in the sixteenth century Venice was a center of architectural innovation and learning that could boast a great number of prominent architects, in the seventeenth century the uncertain fortunes of the elite and of the state led to something of a slowdown. Scamozzi, who succeeded Palladio, taking on the role of chief architect of the city, completed the remaining side of the square of San Marco with the Procuratie Nuove (the seat of the administrators of San Marco). Indeed, it was mainly the state and a

Architecture in Venice. *The Redentore Viewed from the Giudecca Canal*, by Canaletto. ©CHRISTIE'S IMAGES/CORBIS

few of the richest families who commissioned buildings of importance in this period. In this context the work of Baldassare Longhena, architect of Santa Maria della Salute (begun 1631) and of the Pesaro and Rezzonico palaces (begun 1652 and 1667, respectively), towers above the rest. His vocabulary drew on the Venetian traditional love of surface ornament and displayed rich sculptural decoration, heavy rustication, balustrades, masks, volutes, and keystone heads as well as dramatic effects of light and shade. Nevertheless, his architecture remained disciplined (drawing on Sansovino and Palladio) and resisted the scenographic effects associated with the Jesuit-inspired ecstatic religiosity current in Rome. His successor, Giuseppe Sardi, took the church facade type inherited from Palladio and re-fashioned by Longhena to an extreme of excessive ostentation from which no further development was possible (Santa Maria degli Scalzi, begun 1672, and Santa Maria del Giglio, begun 1678).

In the eighteenth century the economic fortunes of patrician families continued to decline and important architectural commissions came mainly from religious orders such as the Carmelites, Do-

minicans, and Jesuits. This reduction in wealth also led to a restraint in architectural vocabulary. Unlike other European countries where the baroque gave way to the rococo, in the Venetian republic this was only true of interiors. Their architecture, however, became increasingly sober and simple, and architects and theoreticians reacted more and more vociferously against the excesses of the baroque. Author-architects such as Antonio Visentini and Tommaso Temanza initiated a tradition of criticism as well as a renewed interest in the work of the great Renaissance architects. This Palladianism flowed easily into an incipient neoclassicism and marked the work of architects like Andrea Tirali, Giovanni Scalfarotto, and Giorgio Massari. Their buildings (San Nicolò da Tolentino, begun 1706, San Simeon Piccolo, begun 1718, and the Palazzo Grassi, begun 1748, respectively) display a move toward rationality, rigor, rules, and simplicity not only in the handling of ornament but also in floor plans and volumes.

Simultaneous with this trend was a rise in interest in the science of architecture. The tradition of military engineering (going back to the maritime

power of the republic) and the work of Sanmicheli on the Arsenal, as well as the importance of hydraulic engineering in the city, contributed to this development. The work of Carlo Lodoli and Giovanni Poleni promoted an understanding of building science that ultimately saw a standardization of architectural training in Venice (as well as in Verona and Padua) and the development of a corps of military engineers educated on a model drawn from the French *École des Ponts et Chaussées*. Gianantonio Selva's theatre of La Fenice (finished 1792), severe and heavily dependent on the aesthetic of the plain wall, thus closes the century as a perfect illustration of the new classical sobriety and rationalism that pervaded both theory and practice.

ALINA PAYNE

VENICE, ART IN. In about 1500 Venetian art bore an intimate relationship to its economic and political context. The traditional society of the Republic of Venice remained tied to the past, its conservative ideology reflected in well-established artistic conventions. Leading painters such as Giovanni Bellini (c. 1438–1516) worked mainly for local patrons, producing predominantly religious paintings of well-defined types (such as half-length devotional paintings and altarpieces). Their work was essentially public and patriotic in nature and reflected the nexus of religious and political values common to

the wider populace of the city. The Venetian painter or sculptor was understood less as an individualistic genius than as a respectable civil servant. To a greater extent than elsewhere in Renaissance Italy, his professional life was controlled by the twin agencies of family workshop and guild. Certain of these traditional “core” conditions for the activity of artists in Venice did not change much over the following centuries (it is significant that a Venetian academy of painting was not founded until as late as 1754). And yet the history of Venetian art from 1500 onward must nonetheless map the gradual breakup of the integrated relationship between art and society in the city.

Giorgione (c. 1477–1511) was the first Venetian artist to radically challenge the traditional model for artistic activity in Venice. The small body of highly original paintings he produced in the first decade of the sixteenth century opened a new world for a generation of younger painters, including Palma Vecchio (c. 1480–1528), Vincenzo Catena (c. 1470/80–1531), Lorenzo Lotto (c. 1480–1556), Sebastiano del Piombo (1485–1547) and Titian. Perhaps most significant in this regard was Giorgione's partial withdrawal from the kind of painting that had previously tied Venetian artists to the cultural mainstream. Working primarily for a narrow elite of high-ranking patrons, Giorgione produced sophisticated “private” paintings, in which meaning was frequently rendered deliberately opaque or ambiguous. Giorgione's creation of a more intimate and secular kind of painting proved immediately inspirational. Artists made “portraits” of classical goddesses and courtesans in states of erotic dishabille (Palma, *Flora*, c. 1520–1525, National Gallery, London), or arcadian landscapes peopled by poeticized figures. A new type of Giorgionesque devotional imagery emerged, showing the Holy Family or *sacra conversazione* (sacred conversation) in wooded landscapes, often with a donor in attendance (Titian, *Madonna and Child, Saint John Baptist, and a Donor*, c. 1515, Alte Pinakothek, Munich). Titian, in particular, responded to Giorgione's exploitation of the special potentials of oil paint, adopting a similarly spontaneous approach, which ignored preparatory drawing on paper in favor of the manipulation of paint on the picture surface. It was through this special emphasis on coloring (*colorito*) that Venetian paint-

Art in Venice. *Bacchanal: The Andrians*, by Titian, painted c. 1516–1518. ©ARCHIVO ICONOGRAFICO S.A./CORBIS

ing of the early sixteenth century increasingly differentiated itself from that practiced elsewhere in Italy.

Titian, though, quickly developed a figure style that demonstrated his understanding of the monumental classicizing form of High Renaissance art in contemporary Florence and Rome. His frequent reference to antique and contemporary works in three dimensions may in part have been intended to show the ultimate superiority of painting to sculpture. But in works such as the *Bacchanals* (1518–1523, Museo del Prado, Madrid; National Gallery, London) he also responded to the developed classical taste of his high-ranking patron, Alfonso I

d'Este, duke of Ferrara. Titian's interest in classical form was fully shared by Tullio and Antonio Lombardo (c. 1455–1532; c. 1458–c. 1516), younger representatives of the family that had dominated the field of Venetian sculpture since about 1470. In a number of double bust-length portraits of young couples, for example, Tullio effectively bridged the gap between Giorgione's poetic mood and the revival of antique types: his so-called *Bacchus and Ariadne* (c. 1500, Kunsthistorisches Museum, Vienna) was clearly inspired by Roman reliefs. Antonio, meanwhile, carved more than thirty marble reliefs with classical subjects for Alfonso's private

apartments in Ferrara (c. 1506–1516, State Hermitage Museum, St. Petersburg; Bargello, Florence). These works may not have been intended for the so-called Alabaster Room housing Titian's *Bacchanals*, but they are very similar in their attempt to revive an antique form of domestic decoration.

The d'Este commissions at Ferrara indicate that the developing interest in classicizing form was closely linked to the expansion of artistic patronage beyond the confines of Venice itself. The new type of courtly portraiture that Titian developed in the 1520s and 1530s was dependent on his contact with an increasingly international clientele of high-ranking aristocratic and royal families. But the new cosmopolitanism in Venetian art was certainly not confined to the work of Titian. Peripatetic painters such as Lotto and Pordenone (c. 1483–1539), who arrived in the city in 1527, brought styles that integrated formal ideas from other parts of Italy with more local conventions. The repeated references to antique sculpture and steep formal foreshortenings in Lotto's *Portrait of Andrea Odoni* (1527, Queen's Collection, London) reflect his experience of the art of central Italy, although the soft handling and warm palette recall the recent portraits of Titian. Pordenone's *Blessed Lorenzo Giustiniani* (c. 1532–1535, Gallerie dell'Accademia, Venice) refers pointedly to the quattrocento Venetian tradition of the *sacra conversazione* altarpiece. But Pordenone, who became an aggressive rival to Titian's hegemony in Venetian painting during the 1530s, shrinks the pictorial space and exaggerates the bodies of the main actors in a manner that pointedly recalls the Michelangesque art of contemporary Florence and Rome.

The work of Jacopo Sansovino, the Florentine sculptor and architect who immigrated to Venice in 1527, owes relatively little to the kind of meticulous and prosaic classicism practiced by the Lombardi family in Venice in the early decades of the century. In works such as the bronze classical gods erected on the Loggetta in St. Mark's Square (1537–1542), Sansovino's manner is closer to the delicate and sophisticated mode of his Florentine contemporaries. Moreover, from about this time onward Venice was flooded with reproductive prints and statuettes after famous works by Raphael, Michelangelo, Parmigianino, and others. Perhaps inevitably, a "mannerist" phase followed, with even Titian's

painting briefly affected. But it was in the work of young painters such as Jacopo Bassano (c. 1510–1592), Andrea Schiavone (c. 1510–1563), and Jacopo Tintoretto that the mode really took root. These painters developed aggressively unorthodox styles, featuring complex, twisting figure groups, decentralized compositions, and heightened, sometimes non-naturalistic colors (Schiavone's *Adoration of the Magi*, c. 1547, Pinacoteca Ambrosiana, Milan).

It is no accident that this new intensity of response to foreign models coincided with the first concerted attempts to define a specifically "Venetian" tradition of art. Writing in response to the Tuscan Giorgio Vasari's disparagement of Venetian art in his *Lives of the Artists* (1st ed., Florence, 1550), local patriots such as Paolo Pino (fl. 1534–1565) and Ludovico Dolce (1508–1568) sought to define the local tradition. In his *Dialogue on Painting* (Venice, 1557), Dolce argued that Venetian art was quintessentially naturalistic and that this was achieved through the special skill of the city's painters in the use of color (*colore*). But while the idea of Venetian tradition as internally coherent and as essentially independent of the more idealizing design-based art of central Italy has often been restated, it does not really account for the wider diversity of manners practiced in the city after 1550. Tintoretto's work was deeply influenced by the formal idealism of Michelangelo, and careful preparatory drawings were central to the restrained manner of Veronese. Titian himself was soon to develop an unprecedented "late" style in which naturalistic features such as correct perspective and anatomical proportion were increasingly abandoned.

Many artists in mid- and later-sixteenth century Venice were visual opportunists, readily modifying their manner according to patron or picture type. Bonifazio de Pitati (1487–1553), for example, who ran a busy and influential workshop from the 1530s onward, took a pragmatic approach to painting in which consistency of style was sacrificed to flexibility. As the demand for visual imagery of all types increased (the vast majority of Venetian households possessed visual images by 1600), so artists diversified their products and devolved responsibility within their workshops to maximize production. Sansovino's own part in his later sculptural commissions was small: after sketching in clay, he typically

Art in Venice. *View of the Canal in Front of St. Mark's* by Canaletto. ©ARCHIVO ICONOGRAFICO S.A./CORBIS

left the execution to his pupils, Alessandro Vittoria (1525–1608) and Danese Cataneo (c. 1509–1572). In like manner, Tintoretto employed specialist assistants to paint landscapes, still lifes, and even figures in his paintings as the scale of his pictorial commissions increased in the 1570s and 1580s. Artists, increasingly, marketed their work: Tintoretto may even have used his professional identity as “the little dyer” in this way, to suggest his readiness to paint for less prestigious patrons.

Two disastrous fires in 1574 and 1577 destroyed the main state rooms in the Ducal Palace and their pictorial decoration, resulting in an enormous commission for replacement ceiling and wall paintings for the workshops of Veronese and Tintoretto during the later 1570s and 1580s. But their work on this patriotic commission, devoted to the

“myth” of Venice as home of justice, peace, and liberty, ran alongside an increasing demand in the city’s churches and lay confraternities for sacred imagery stressing the centrality of Christ and his sacraments to the faith. Under the impact of the Catholic Counter-Reformation, there was a marked upturn in commissions for paintings showing the heroic martyrdom of the saints or their acts of charity (Titian, *The Martyrdom of Saint Lawrence*, c. 1547–1556, Gesuiti, Venice; Bassano, *Saint Roch Healing the Plague-Stricken*, c. 1570–1573, Brera, Milan). In these works the Tridentine theologians’ call for greater clarity of presentation was only partially answered. But the fiery spirituality of the imagery nonetheless reflects the deepening Catholicism of the age. Dramatic reduction in color, a lowering chiaroscuro, and a rough or unfinished painting sur-

face combine to obscure all worldly form, as if to deny the viewer any enjoyment in mere external display.

The massive oeuvre of Palma Giovane (c. 1548–1628) is dominated by religious paintings. In works such as the cycle for the Oratory of the Crociferi hospital (1583–1592), Palma combined Titianesque naturalism in portraits and landscape with more idealized forms for the allegorical and sacred actors based on Tintoretto. Palma's stylistic pragmatism, like his constant reference back to the older generation of painters, was destined to become a kind of leitmotif of Venetian art in the seventeenth century. Pietro della Vecchia (1603–1678) made his name producing mock "Giorgionesque" paintings for collectors (*The Concert*, undated, Gemäldegalerie, Berlin), while the Fleming Nicolas Régnier (Niccolò Renieri, 1591–1667) combined painting with art dealing and collecting. But the internationalism of Venetian art also greatly intensified. The fame of the city's artistic tradition attracted important painters such as Bernardo Strozzi (1581–1644) from Genoa, along with Germans such as Johann Liss (c. 1595/1600–1631) and Johann Carl Loth (1632–1698). Strozzi and Liss, who arrived in the 1620s, used strong and varied color to produce an emotive stylistic hybrid of Venetian colorism and the international baroque. Later, in the 1660s, Loth, along with Giovanni Battista Langetti (1635–1676), introduced a darkened tenebrist manner, probably derived from paintings in Venice by Luca Giordano. But this in its turn quickly gave way, on the one hand, to the studious academism of Gregorio Lazzarini (1655–1730), and on the other to the decorative early rococo of Sebastiano Ricci (1659–1734).

The resulting stylistic potpourri has usually been seen as a reflection of the decline of Venetian artistic authority relative to other centers such as Bologna, Rome, and Naples. But art in Venice had long been responsive to other traditions, and the evident decline in quality in the seventeenth century had deeper causes. The aesthetic malaise reflected a more general social and economic one and is characterized by a kind of intense but ultimately debilitating retrospectivity. Early in the seventeenth century, Sansovino's pupil Vittoria was already busy collecting self-portraits of the famous Venetian masters, and later painters such as Carlo Ridolfi (1594–

1658) and Marco Boschini turned their efforts to writing ecstatic histories of the great Venetian tradition. The glorification of the Renaissance meant that the present constantly had to defer, and to this extent Venetian art of the seventeenth century became the victim of its own celebrated past.

If Venetian art had previously enjoyed a vital relation to the communal institutions and ideologies of the Republic, this was increasingly not the case. It is symptomatic that painting of the eighteenth century was dominated, on the one hand, by view painters working for a predominantly foreign clientele; and on the other, by those working in a decorative style in which form was more significant than content. The brilliant naturalism with which Giovanni Antonio Canaletto (1697–1768) and Francesco Guardi (1712–1793) represented Venice nonetheless served a growing pan-European idea of the city as a kind of miraculous survival or relic from a past age, whose special allure lay precisely in its "otherness." The intensely decorative paintings of Ricci, Giovanni Battista Piazzetta (1683–1754), and Giovanni Battista Tiepolo (1696–1770) similarly work their magic by detaching the viewer from the real and the present. Like their seventeenth-century predecessors, these artists were, in an obvious sense, deeply retrospective, their intense color harmonies referring back to the art of the Renaissance past, especially to that of Paolo Veronese. But in the case of Tiepolo, at least, the result was an art of revision rather than reversion, which transformed the conventions of Renaissance naturalism into an intensely self-contained decorative idiom that had no real precedents in Venetian art. In his vast decorative scheme for the Kaisersaal and grand staircase of the prince-archbishop's palace at Würzburg (1750–1753), Tiepolo's aesthetic dominance over the pretensions of his subject matter seems directly to anticipate the artistic autonomy of the artist of modern times.

TOM NICHOLS

VERMEER, JAN (or Johannes, 1632–1675), Dutch painter. In 1653, Vermeer entered the Delft Guild of St. Luke as a painter, joining his father, who had registered with the guild as a picture dealer in 1631. It is not known with whom Vermeer learned his craft, but scholars have speculated that he studied either with Leonard Bramer (1596–1674) in Delft or with one of the Dutch followers of the Italian master Caravaggio who were active in Utrecht.

Only months before joining the guild, Vermeer married Catharina Bolnes (c. 1631–1688), a Roman Catholic from a distinguished family in Gouda. Vermeer, who was born to Protestant parents, probably converted to Catholicism at this time. *Allegory of Faith* of c. 1672–1674 is Vermeer's only painting with a specifically Catholic message. Here, the personification of faith takes communion before a painted crucifixion. An apple (signifying original sin) and a snake crushed by a stone (emblematic of the victory of Christ, the cornerstone of the church, over Satan) lie at her feet. As this work was likely tailored to adhere to the taste of the Catholic patron who commissioned the work, it is unwise to ascribe the meaning of the image to Vermeer's personal beliefs. It is not clear what, if any, impact Vermeer's religious orientation had upon his work.

The classical subject and large format of Vermeer's early *Diana and Her Companions* of c. 1655 suggest that Vermeer initially aspired to become a history painter, but by the late 1650s he shifted his focus to the genre interiors that would dominate his mature works. Vermeer first calmed the boisterous tavern scenes and curtailed the overtly sexual overtures of musical companies pictured by earlier Dutch genre painters. The girl in *Officer and Laughing Girl* (Frick Collection, New York), for example, sits calmly cupping her beverage in both hands; only her broad smile, and the soldier's bravura body language, indicate any attraction in this encounter. Similarly, Vermeer dispensed with melodramatic lighting in favor of more subtle plays of light. Many of Vermeer's early genre paintings are heavily dependent on the work of Pieter de Hooch (1629–after 1684), who was active in Delft until c. 1661. Vermeer followed de Hooch's innovative and illusionistic spatial recessions and surface effects sculpted from natural light before developing a personal aesthetic in the late 1660s based upon abstracted light and coolly crafted distances between viewer and subject. These later works, such as *Lady Writing a Letter with Her Maid* (National Gallery of Art, Dublin) that focus on women in domestic interiors seemingly provide entrée via the empty foreground but pen the figures behind middle ground obstructions. The light that pours in from the window fails to warm as it illuminates opaque, porcelain features and cool gray-green fabrics that hang straight in crystalline folds while it dissolves the table carpet into pools of unmodulated color. In this way, Vermeer gradually traversed the gulf between illusion and artifice.

Responses to Vermeer's paintings have focused most frequently on moralizing interpretations. Suspended from a larger narrative context, Vermeer's figures have been seen as behavioral models. Vermeer's women who entertain men away from Dutch society's watchful eye, like those in *The Concert* (Isabella Stewart Gardner Museum, Boston) may have been examples of unacceptable behavior, while his solitary, domestic women like *The Milkmaid* (Rijksmuseum, Amsterdam) may have been viewed as what Wayne Franits termed "paragons of virtue." Readings of this kind gain credence when positioned in relation to Vermeer's *Woman Holding a Balance* of c. 1662–1664, in

Jan Vermeer. *The Concert*. (See also the cover of Volume 5.) THE GRANGER COLLECTION

which the subject's ordinary activity takes on moral implications: her action is overshadowed by the representation of the biblical weighing of souls pictured immediately behind her.

Modern scholars have been as interested in how Vermeer painted as they have been in what he painted. Vermeer's spatial compressions and blurred perimeters suggest the influence of the camera obscura, a device that translated, but could not record, three-dimensional vignettes into two-dimensional reflections. Scholars concur that Vermeer was familiar with the device's optical effects, but a debate has arisen around the extent of Vermeer's use of the instrument. Some argue that Vermeer reproduced the camera's image in paint, while others have stressed a less dependent relationship. Delft was a center of optical experimentation due in part to the presence of the scientist Antoni van Leeuwenhoek (1632–1723), but as seventeenth-century Dutch art theory encouraged verisimilitude to be combined with artfulness, it seems unlikely

that an artist of Vermeer's stature merely replicated what was before him. In either case, Vermeer's canvases exhibit a meticulous buildup of forms and tones executed with a highly controlled brush.

Vermeer may have been able to practice such a labor-intensive method because he benefited from patronage, a rarity for Dutch painters of the period. John Michael Montias posited that as the Delft citizen Pieter Claesz van Ruijven (1624–1674) owned twenty of the approximately thirty-five known paintings by Vermeer, van Ruijven must have functioned as at least a de facto patron. He might, for example, have paid Vermeer for the right of first refusal on the artist's paintings. Such economic support would have freed Vermeer from the demands of the open market by enabling him to labor over each painting, confident that he would be adequately compensated for his efforts. Vermeer may have supplemented whatever income he generated from his painting by operating as an art dealer. These reasonably reliable sources of income would

also explain Vermeer's extremely limited output, as he must not have felt pressure to produce his paintings in volume for the market.

The benefits of patronage apparently were not able to see Vermeer through the recession that followed the French invasion of the Netherlands in 1672. In 1676, a year after his death, his widow testified to her husband's creditors that Vermeer had amassed considerable debt in the 1670s because he had been unable to sell either his own paintings or those by other painters. She also stated that supporting their eleven children, all still minors, had exacerbated the family's financial situation. Like his fellow painters Rembrandt and Frans Hals, Vermeer apparently died in the throes of financial turmoil.

CHRISTOPHER D. M. ATKINS

VERONESE (PAOLO CALIARI) (1528–1588), Italian painter. Paolo Veronese (alongside Titian) was the most influential painter of the Venetian Renaissance. Trained in the 1540s in his native Verona by Antonio Badile and Giovanni Caroto, Veronese moved to Venice about 1551. He brought with him an intimate understanding of both Andrea Mantegna's spatial and structural precision in painting and Giulio Romano's more contemporary decorative mode (which drew heavily on the art of High Renaissance Rome, especially that of Raphael). These influences are already at play in early works such as *The Temptation of Saint Anthony* (1552–1553, Musée des Beaux Arts, Caen). But Veronese also proved immediately responsive to local artistic tradition in Venice. His first major commission in the city (the Giustiniani altarpiece of c. 1551, S. Francesco della Vigna, Venice) was

modeled directly on Titian's Pesaro altarpiece, and many of his subsequent paintings of this type continue to refer to this seminal work. A few years later Titian recognized Veronese's deferential attitude by awarding him a golden chain for his contribution to a ceiling in the newly built Marciana Library (*Music*, 1556–1557).

Veronese quickly won favor with leading families among the Venetian nobility, and it was probably this connection with the upper classes that led him to change his name from Spezapreda (stonecutter) to Caliari (the name of a leading aristocratic family in Verona). His sensitivity to the values of Venetian patricians is evident in such portraits as *Giuseppe da Porto with His Son Adriano* (c. 1556, Contini-Bonacossi collection, Florence), which is characterized by a restrained magnificence. About 1560 the patrician brothers Daniele and Marcantonio Barbaro invited Veronese to fresco their new country villa at Maser, recently built by Andrea Palladio. Linking his images to one another—and also to the real space of the villa—by means of fictive architecture, Veronese provided a modern reconstruction of the kind of pictorial decoration found in ancient Roman country villas. To the somewhat obtuse allegorical program of his patrons, Veronese applied his usual light touch. His imagery manages to allude to all the main cultural, social, and economic functions of the house: as place of rural retreat, intellectual contemplation, family life, and agrarian productivity. But this content is constantly enlivened by playful trompe-l'oeil effects, intimate human and animal portraits, and humorous visual asides. The overt reference to classical models of domestic decoration is constantly underpinned (although never undermined) by the painter's special understanding of Venetian naturalism.

Between 1555 and 1565 Veronese worked on a series of paintings for the Hieronymite church of S. Sebastiano in Venice. Taken together, this ensemble (ceiling paintings, wall paintings on canvas and in fresco, painted organ-shutters, and an altarpiece) represents Veronese's masterwork in the field of sacred imagery. The nave paintings, showing scenes from the Book of Esther, offer a tour de force in illusionism and perspective foreshortening, but the tone remains festive and triumphal, and despite their religious content the compositions could serve well as models for subsequent works in a secular

Veronese. *Donna Giustiniani Barbaro with Old Nurse*, from the fresco cycle at Villa Barbaro, c. 1561. ©ARALDO DE LUCA/CORBIS

context. Veronese himself drew on these paintings in his later work for the Ducal Palace (for example, *Faith*, 1575–1578), while Peter Paul Rubens, Giovanni Battista Tiepolo, and many other painters over the next two centuries used the S. Sebastiano ceiling as a model.

Veronese's confident elision of secular and sacred modes in his paintings is most evident in privately commissioned works such as *The Supper at Emmaus* (c. 1559–1560, Musée du Louvre, Paris) in which patronal portraits crowd around the sacred figures under a Palladian loggia. In *The Marriage at Cana* (1562–1563, Louvre) for San Giorgio Maggiore, Veronese produced a scene of lavish contemporary feastmaking in an idealized Palladian setting. Among the group of finely dressed musicians are portraits of leading Venetian painters: Veronese shows himself (playing a viol) as prominent, along-

side the elderly Titian just to the right (playing a viola da gamba).

But such playful visual asides soon threatened to get the painter into trouble with the religious authorities. His inclusion of buffoons, dwarves, and German soldiers in the foreground of his *Last Supper* of 1573 (Gallerie dell'Accademia, Venice) landed him in front of the Catholic Inquisition who questioned the decorum of such additions. In response, the painter merely added an inscription identifying the subject as a less important one (the *Feast in the House of Levi*) and did not remove any of the offending figures.

Veronese's visual flamboyance did not markedly diminish in the 1570s, and it was only in the last decade of his life that he moved toward a more emotionally expressive approach (for example, *The Last Communion of Saint Lucy*, c. 1585–1586, Na-

tional Gallery of Art, Washington, D.C.). But it was the integrated compositions of his earlier manner that were destined to be so influential on European artistic tradition over the following centuries. His sumptuous approach to picture making, underpinned by a clear grasp of perspective construction, offered a vital bridge between the scientific and naturalistic art of the early Renaissance and the decorative manner of the baroque and rococo periods. From the outset of his career, his pictorial lucidity reflected his special capacity for the absorption and integration of differing stylistic tendencies, and this gift for stylistic synthesis never deserted him.

TOM NICHOLS

VERSAILLES. The seat of the French monarchy from 1682 to 1789, Louis XIV's chateau at Versailles had its origins in a modest hunting lodge built in 1623 for his father, Louis XIII. When Louis XIV (ruled 1643–1715) assumed personal control of the government in 1661, he embarked upon a building program at the site that continued almost unabated until his death. Versailles was first an intimate retreat for the king and then a royal residence for a still itinerant court before it became the permanent seat of the French royal family, court, and government in 1682. Jean-Baptiste Colbert (1619–1683), Louis XIV's indefatigable finance minister, was responsible for procuring the staggering sums needed to build the chateau that became the model for royal palaces across Europe.

ARCHITECTURAL HISTORY

Louis XIV's magnificent chateau evolved in three major phases. The Sun King first intended Versailles to be a retreat from the responsibilities of government. Between 1661 and 1668, the architect Louis

Le Vau (1612–1670), the gardener André Le Nôtre (1613–1700), and the painter Charles Le Brun (1619–1690) collaborated to create a palace suitable for the Sun King to entertain favored courtiers. When Louis XIV decided in 1668 that Versailles was to become a royal residence, able to house his full court for months at a time, he ordered extensive additions. Le Vau drew up plans to frame the Old Chateau in a terraced “envelope” of white stone. The envelope included state apartments for the king and queen, the salons of which were each dedicated to one of the seven planets known to orbit the sun. The king's own bedchamber, echoing the theme articulated in the chateau's gardens, depicted scenes from the myth of Apollo.

Work on the chateau and its gardens was by no means complete when Louis XIV permanently installed his family, court, and government at Versailles in 1682. Jules Hardouin-Mansart (1646–1708) oversaw the final enlargement of the palace and adjacent buildings that would eventually house five thousand courtiers and as many government officials, guards, and servants. It was Mansart who designed the legendary Hall of Mirrors. Running almost the entire length of the chateau's western facade, the gallery was sheathed in mirrors, furnished with solid silver chandeliers, and crowned by ceiling panels by Le Brun that depicted pivotal episodes from the Sun King's life. Meanwhile, Le Nôtre continued to expand the gardens, adding grottoes, ornamental lakes, and a Grand Canal so vast the navy could perform maneuvers on it. Construction on Louis XIV's palace ceased only with the completion of the Chapel Royal in 1710.

The exterior of Versailles changed little over the course of the eighteenth century. Louis XV (ruled 1715–1774) came to loathe his great-grandfather's formal palace and added little to it. Although he commissioned the Royal Opera designed by Jacques-Ange Gabriel (1698–1782), he was far more interested in increasing the privacy of his own apartments. Louis XVI (ruled 1774–1792), the last of the Bourbons to rule at Versailles, also concentrated on interior renovations. His queen, Marie Antoinette (1755–1793), concerned herself with the Petit Trianon, a bucolic palace on the grounds of Versailles. After a revolutionary crowd triumphantly carried the ill-fated king and his family back to Paris in 1789, the chateau fell empty. The history

of Versailles as the residence of the French kings officially ended in 1837, when Louis-Philippe declared that the royal chateau was to become a museum celebrating “all of France’s glories.”

TOWN OF VERSAILLES

The fortunes of the town of Versailles waxed and waned with the presence of the court. Louis XIV razed the original village to make room for his chateau’s grand avenues and parks. He rebuilt the town on a new site, decreed that it was to become “the most frequented and flourishing in the world,” and strictly regulated even the colors of building materials and decorations for its houses. With the court in permanent residence, Versailles became the administrative capital of France, the seat of all branches of

government except the judicial. By the end of the seventeenth century, the town’s population—swelled by those whose occupations or interests brought them to court—stood at over 30,000, and its inns could house hundreds more. With the death of Louis XIV in 1715, the court departed for Paris, and Versailles soon became a ghost town. It enjoyed a revival after 1722, when Louis XV returned to his great-grandfather’s palace. Versailles lost its position as the administrative capital permanently in 1789 with the forced departure of Louis XVI for Paris.

NOBLE LIFE AT COURT

For many years, Versailles was seen as a gilded theater upon whose stage an all-powerful absolute

Versailles. The Galerie des Antiques at the Chateau of Versailles, c. 1688, painting by Martin des Batailles. THE ART ARCHIVE/
MUSÉE DU CHÂTEAU DE VERSAILLES/DAGLI ORTI

monarch entertained a captive audience of domesticated aristocrats. Recent research has shown, however, that Louis XIV could not arbitrarily dominate his subjects. His rule was limited by the fundamental laws of the realm, tradition, and the practical difficulties of enforcing his will on an extended country of twenty million people. Furthermore, without a police force or a standing army, the king relied upon his noble subjects to ensure order in the

kingdom. Louis XIV's reign was consequently marked by cooperation with, rather than control over, the aristocracy. Similarly, the court of Versailles was a site of mutually satisfactory exchange between king and nobility. The king required the great nobles to attend court because he sought to ensure their loyalty. They came because they considered it their right and privilege and because they received social and material rewards for doing so.

The vast majority of the French nobility did not live at Versailles. Only the *grands*, the highest-ranking French nobles, were in residence. Even at the peak of noble attendance, the ten thousand court nobles represented only 5 percent of the hereditary nobility. Attendance was on a system of quarters that entailed residences of three months, twice a year. The privileged among this number were granted rooms within the chateau itself (which contained 220 apartments and 450 surprisingly small rooms); the less fortunate lived in the town of Versailles or were forced to travel back and forth to Paris each day. At the palace, the Sun King provided a continuous whirl of ballets, operas, fêtes, plays, and thrice-weekly gambling nights. While Louis XIV prevented members of the hereditary nobility from participating in affairs of state, courtiers did have more to do than attend entertainments, for many held offices in the royal households.

The primary duty of every courtier, however, was to attend the king. Accompanying the king conferred prestige but, even more important, allowed nobles to gain access to royal patronage. To secure the allegiance of his nobility and to prevent anyone else from gaining too much influence and power, Louis XIV distributed all royal patronage personally—no chief minister had control over the treasury, the distribution of estates, or the assignment of lucrative church posts or military commands. Those nobles who did not attend court seldom received any reward. Louis was known to say, when solicited for a favor on behalf of a noble who did not come to Versailles as often as the king liked, “I do not know him.”

Louis XIV subjected his courtiers to a strict etiquette that governed their comportment, manners, and dress. This precisely graded code meted out privileges according to a noble’s position in the court hierarchy. It determined, for example, who was allowed wear a hat and when, and who could sit in the presence of the royal family. The sociologist Norbert Elias has famously argued that the intricate rules and rituals that governed the members of Louis XIV’s court facilitated the creation of the modern centralized state. The ordered society of Versailles became the European ideal of the well-run state.

Louis XIV performed the role of sacred kingship like an actor who never broke character. He calibrated his movements, gestures, and expressions at all times. The activities of his day—waking, dressing, socializing, eating—all followed a regimen so exacting that his every gesture took on a ritual status. This ceremonial elevated the status of the monarch at the same time that it limited access to him. The *lever*, the king’s ceremonial awakening, serves as an example. During this daily “kingrise,” six strictly designated sets of noblemen entered the royal bedchamber to dress the monarch. The highest-ranking noble present received the greatest privilege, that of handing the king his shirt. Courtiers vied to attend the *lever* (or its evening counterpart, the *coucher*) because it provided an opportunity to ask favors of the king. Those excluded could importune the monarch only as he traveled in his ritualized orbit from bedchamber to chapel to council chamber over the course of the day.

Without a monarch dedicated to the public performance of monarchy, the court of Versailles could not function so effectively as an instrument of rule. Through force of personality (and a renowned capacity for hard work), Louis XIV created a court that was simultaneously an irresistible social center for the high nobility and a seat of government for his ministry. This system, however, was largely dependent on the personality and abilities of the ruler. Louis XIV tirelessly performed the rituals of kingship, but neither Louis XV nor Louis XVI was willing to maintain such strict ceremonial. They also proved less able to divert members of the high nobility away from affairs of state or to maintain as effective a control over their ministers and state policies. Over the course of the eighteenth century, the court of Versailles, which had once been a celebration of divinely appointed monarchy, instead came to represent a center of despotism.

LYNN WOOD MOLLENAUER

VESALIUS, ANDREAS (1514–1564), Belgian anatomist. Born in Brussels, Vesalius came from a family of physicians with professional links to the courts of Austria and Burgundy. Between 1530 and 1536 he studied at the universities of Louvain and Paris. He acquired skill in the technique of dissection and a thorough comprehension of Galenic anatomy in Paris, where a deep philological and hermeneutical reassessment of the Galenic corpus was under way. Due to the outbreak of the war between Charles V and Francis I, Vesalius returned to Louvain in 1536, and there he published the *Paraphrasis in Nonum Librum Rhazae* (Paraphrase of the ninth book of Rhazes). After a brief stay in Venice as a surgeon, he settled in Padua, where he took a degree in medicine in 1537. In the same year he was appointed lecturer of surgery. As a teacher, he combined in a revolutionary way the functions of lecturer, demonstrator, and dissector. Between 1538 and 1539 he published the *Tabulae Anatomicae Sex* (Six anatomical plates), a set of six large sheets of anatomical woodcuts accompanied by brief explanatory notes, and the so-called Venesection letter, a defense of the humanist and Greek view on bloodletting against medieval and Arab interpretations. On the basis of both his outstanding knowledge of Galen’s texts (Vesalius also collabo-

rated to the Giunta edition of Galen’s *Opera Omnia*, published between 1541–1542) and his anatomical findings, he wrote *De Humani Corporis Fabrica Libri Septem* (Seven books on the structure of the human body), published in Basel by Joannes Oporinus in 1543. After the publication of the *Fabrica*, Vesalius sought employment in the imperial medical service. He became military surgeon and personal physician to Emperor Charles V (ruled 1519–1556). Between 1543 and 1544 he returned briefly to Italy, giving public anatomies in Padua, Bologna, and Pisa. In the *Epistola Rationem Modumque Propinandi Radicis Chynae Decocti* (1546; Letter on the manner of administering the china-root), he investigated the therapeutic value of the china-root. After Charles V’s abdication in 1556, he was appointed physician to the Netherlanders at the Spanish court by Philip II. In the same year he published a revised edition of the *Fabrica* containing some relevant additions on cardiovascular physiology. He died in 1564 during a pilgrimage journey to Jerusalem.

De Humani Corporis Fabrica represents an extraordinary intellectual accomplishment that combines anatomical investigation, artistic ingenuity, woodcut craftsmanship, and typographical expertise. Vesalius’s intention was to give a most detailed and reliable account of the human body, an account purged of previous errors, based on direct reference to cadavers, and corroborated by the use of animal vivisection and comparative anatomy. The *Fabrica* can be viewed as both the foundation of modern anatomy and as a reference handbook for those practitioners who could not have direct access to dissection material. The anatomical illustrations were in all likelihood the product of artists and draftsmen from Titian’s studio. Vesalius planned the enterprise and directed the execution, and it can be assumed that he had some share in the actual draftsmanship.

The *Fabrica* is more a correction of errors in Galen than it is an announcement of revolutionary discoveries. Vesalius was a formidable teacher and an outstanding performer of anatomical demonstrations, capable of entrancing observers with his manual dexterity. The importance of his work lies in his advanced pedagogical techniques and in his methodological views about anatomy. He introduced the use of anatomical drawings as a teaching device,

mnemonic aid, and alternative source of information in the absence of a sufficient supply of cadavers. He revolutionized anatomical practice by establishing a reliable correspondence between the dissected body, the text of reference, and the illustrations. He contributed significantly to the standardization of anatomical nomenclature. From the religious point of view, Vesalius's work touched on some highly critical points in contemporary theological debates, such as the location of the faculties of the soul, the physical similarities between human and animal brains, the existence of the reticular plexus at the base of the brain, and the manufacture of animal spirits.

GUIDO GIGLIONI

VICO, GIOVANNI BATTISTA (Giambattista Vico; 1668–1744), Italian philosopher of history, law, and culture. Vico was born in Naples on the eve of the Feast of St. John the Baptist (23 June). He lived all his life in and near Naples, where his father was the proprietor of a small bookshop, above which the family lived in a single room. Vico's mother was illiterate. In a society dominated by wealth, political power, aristocracy, and clergy, Vico was self-made and self-taught. From grammar school on he spent only short periods in formal instruction. The center of his mature education was a self-devised program of reading the ancients against the moderns, carried out while tutoring the children of the Rocca family for nine years at Vatolla (1686–1695). In 1699 he

won the concourse for the professorship of Latin eloquence (rhetoric) at the University of Naples, a position he held until succeeded in 1741 by his son Gennaro. As part of his duties Vico presented a series of orations to inaugurate the academic year, the two most prominent being "De nostri temporis studiorum ratione" (1709; On the study methods of our time) and "De mente heroica" (1732; On the heroic mind). This series of orations taken collectively constitutes a full doctrine of pedagogy.

In 1710 Vico published *De Antiquissima Italorum Sapientia* (On the most ancient wisdom of the Italians), the first part of a system of philosophy directed against Cartesianism. (The planned second and third parts were never completed.) The work contains one of Vico's best-known principles, "that the true is the made." He first applied this as a principle of mathematical reasoning; later he applied it in his science of history—because human beings make history, they can make a complete knowledge of it. In 1720–1722 Vico published a large, three-part work, *De Universi Juris Uno Principio* (Universal law), in anticipation of qualifying for a university chair in civil law. In 1723 he suffered the greatest disappointment of his career, his failure to succeed in the concourse for this position, described in his *Autobiografia* (1728–1731).

Universal Law was a prelude to his magnum opus, *Principi di una scienza nuova d'intorno alla comune natura delle nazioni* (1725, 1730, 1744; Principles of new science concerning the common nature of the nations). Failure of the concourse left him free to develop the versions of this work. Through an analysis of Roman law begun in *Universal Law* and in particular the concept of *ius gentium* (the law of the peoples)—that part of Roman law which it has in common with the laws of all other nations—Vico developed his conception of "ideal eternal history," according to which all nations develop through a natural law of three ages. The age of gods, in which all of nature and basic social institutions are ordered in terms of gods, is followed by the age of heroes, in which all virtues necessary to society are embodied in the character of the hero, followed by the age of humans, in which custom is replaced by written law and thought becomes abstract and rational.

This ideal eternal history stands against the seventeenth-century natural-law theories of Hugo Grotius (Huigh de Groot [1583–1645]), Samuel von Pufendorf (1632–1694), John Selden (1584–1654), and Thomas Hobbes (1588–1679). In place of a state of nature, from which human beings form a covenant, passing from a state of war of all against all to a state of rationally governed civility, Vico formulates his conception of “poetic wisdom” or, in modern terms, “mythical thought.” Societal life first depends upon the human power of *fantasia* (imagination) to narrate the meanings of events through myths. From mythical commonalities, rational forms of understanding gradually develop. Against the Enlightenment principle of progress, Vico sees history as cyclic, that is, each nation passes through a *corso* (course) of the ages of ideal eternal history and falls, only to rise again in a *ricorso*.

Vico’s influence on later thinkers is sporadic. Johann Gottfried von Herder (1744–1803), Karl Marx (1818–1883), Samuel Taylor Coleridge (1772–1834), and William Butler Yeats (1865–1939) discovered Vico and realized their connection to him after their own views were largely formulated. The major figure of the nineteenth century fully influenced by Vico was Jules Michelet (1798–1874), who translated Vico’s works into French, making them the basis of his own philosophy of history. The two figures most influenced by Vico in the twentieth century and who in turn introduced Vico to many readers were Benedetto Croce (1866–1952) and James Joyce (1882–1941). Croce merged Vico’s conception of history and society with his own philosophical idealism, making Vico into the Italian Georg Wilhelm Friedrich Hegel (1770–1831). Joyce was influenced by Vico throughout his career. Most prominently Joyce based the cycles of *Finnegan’s Wake* (1939) on Vico’s *New Science*, as he had based *Ulysses* (1922) on the ports of call of Homer’s *Odyssey*.

DONALD PHILLIP VERENE

VICTORIA, TOMÁS LUIS DE (1548–1611), preeminent composer of the Spanish Renaissance. Rivalled only by Giovanni da Palestrina and Orlando di Lasso among his European contemporaries, Victoria produced an important body of work that was widely distributed, often reprinted, and highly praised from his time to ours. He is not only the most famous of the sixteenth-century Spaniards such as Cristóbal de Morales and Francisco Guerrero, but is arguably the most famous Spanish composer of all time.

An apparently proud Ávilan, who appended his name with “Abulense” in his publications, Victoria received his early musical training as a choirboy at Ávila Cathedral under Gerónimo de Espinar and Bernardino de Ribera. He may have known the illustrious organist Antonio de Cabezón during his Ávilan residence. With the help of his patron Cardinal Otto von Truchess of Augsburg, he went to Rome to study music and theology at the Collegium Germanicum in 1565. Four years later, he took charge of music at the Aragonese Church of Santa Maria di Monserrato, and soon afterward he took up positions at the two Jesuit colleges: the

Collegium Germanicum (1571) and the Collegium Romanum (1573, where he succeeded Palestrina, whom he knew and with whom he possibly studied), thus situating him at the intellectual and artistic heart of Jesuit activity during the height of the spiritual renewal sparked by the Council of Trent (1545–1563). His compositional and directorial activities in Rome and his association with Palestrina have led many historians to classify him as a “Roman School” composer, while others have emphasized his Spanish identity.

In 1572, Victoria published a collection of motets that would establish his fame, including “O magnum mysterium,” “O vos omnes,” and “Vere languores.” His early motets were reprinted several times in his own lifetime. Ordained to the priesthood in 1575, he joined the Congregazione dei Preti dell’Oratorio (Congregation of the Oratory), and from 1578 to 1585 served as chaplain of S. Girolamo della Carità, where, free from the demands of a musical position and supported by lucrative Spanish benefices provided by Pope Gregory XII, he published several important collections of music while living in daily contact with Rome’s great pastor, St. Philip Neri, for five years.

Victoria returned to Spain in 1587 to take up the position of chaplain to the Dowager Empress Maria at the Monasterio de las Descalzas de Santa Clara de la Cruz in Madrid, to which he was appointed by Philip II. He spent the rest of his life at the monastery, first as *maestro di capilla* and, after Maria’s death in 1603, as organist. His return to his Castilian homeland saw him turn down prestigious positions at Spanish cathedrals in favor of his position at the royal monastery, where his music was performed by an expert choir and where he was allowed to oversee his publications abroad. He died in Madrid in 1611.

Victoria’s reputation is based mostly on a somber collection of motets, a collection of music for Holy Week, and his Office for the Dead. These paint an unfairly morose picture of the composer whom some would regard as typically Spanish. His Masses paint a very different picture, being mostly based on motets with exultant texts. His cycle of sixteen Magnificats puts him in league with other Spaniards, such as Morales, Guerrero, and Alonso Lobo, who were unmatched in their attention to

the Canticle of Mary. His *Officium Hebdomadae Sanctae* (Office of Holy Week) was the first of its kind, and the Passions of Saints Matthew and John it contained were in constant use by the papal chapel into modern times. It also included his well-known *Lamentations of Jeremiah* and eighteen responsories for Tenebrae.

Like Claudio Monteverdi, Victoria stands at the end of the Renaissance and the beginning of the baroque period. His writing contains (indeed, exemplifies) much of the traditional church polyphony, consisting of several melodies that intertwine in a complex, harmonious web, but he also wrote simple psalm settings in the *falsobordone* style (such as Psalm 50 in the *Officium Hebdomadae Sanctae*) and polychoral works such as the *Missa Pro Victoria* (for double choir), which show the emergence of the baroque style with its emphasis on pitting parts of the ensemble against other parts. Beginning in 1600, he became the first significant composer to write independent keyboard accompaniments, anticipating the publications of the Venetian Giovanni Gabrieli by fifteen years. His later progressive compositions never achieved the fame of his early works, with the exception of the beloved *Officium Defunctorum* (Office of the dead, 1605), written upon the death of Empress Maria.

A genuinely religious man, Victoria wrote only sacred works. His output, while often understood as reflecting the mystical spirituality of El Greco and his fellow Ávilan St. Teresa de la Cruz, might be better understood in relation to the popular devotional spirituality of Neri and the Council of Trent’s program of spiritual renewal, which was promoted with special zeal by the Jesuits who were responsible for his intellectual and musical formation.

LEE MATTHEW ESCANDON

VIENNA. From the later thirteenth century, when Vienna and its surrounding territories were claimed by the Habsburg Dynasty, until the mid-fifteenth century, the Habsburgs slowly built up the old residence of their predecessors, the Babenbergs, and the one-time Roman legionnaires' camp into a sizable city complete with a church dedicated to Saint Stephen as well as a university and a castle residence built next to one of the old Roman roads leading to this important Danube River crossing. By 1500 the city may have had a population of approximately twenty to thirty thousand.

For some time during the fifteenth century, the Styrian branch of the Habsburg Dynasty held the upper hand among the Habsburg relations in central Europe, and their city, Wiener Neustadt, was the preferred residence of many of the Austrian dukes, including the important Habsburg Duke Frederick who was crowned Holy Roman emperor in Rome by Pope Nicholas V in 1452 and ruled until 1493. The emperor was able to achieve the long-standing Habsburg goal of elevating their church in Vienna, St. Stephen's, to episcopal status through papal permission in 1469. (The rival residence city of Wiener Neustadt was similarly honored in the same year.) Now Vienna would be not only a trading city, university town, and sometime archducal residence. It was the center of a modest ecclesiastical jurisdiction as well, one which often unhappily shared religious responsibilities with its

Vienna. A view of the city and the surrounding area based on a map by Nicolas Sanson, from a French atlas issued in 1692. The map shows the city's strategic location on the Danube, and identifies the neighboring cities and towns. Long the seat of the Habsburg Empire, Vienna had recently survived a bitter siege by the Ottoman Turks in 1683, and it was later transformed into a city of palaces and stately homes. A second line of fortifications was built in 1704–1706. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

much more powerful neighbor, the Diocese of Passau, which also had administrative offices in Vienna.

For Vienna, the later fifteenth century meant a change in regimes: renewed claims over this area by the kings of Hungary led to an occupation of the city by the Hungarian King Mathias I (“Corvinus”) Hunyadi beginning in 1485. King Mathias died in the city in 1490. The turbulent and multifaceted relationship with Hungary is an important aspect of Viennese history in this period.

The city on the Danube was again brought under Habsburg control through the efforts of Emperor Frederick’s son, Archduke and later Emperor Maximilian I (ruled 1493–1519), who spent much of his time arranging Western marriages and residing in the Habsburg city of Innsbruck in Tyrol, among many other locations. For some time, the exact position of Vienna in the Habsburgs’ plans was unclear. The Iberian and Burgundian inheri-

tances engineered by Maximilian necessarily meant that the dynasty’s representatives were more tied to cities such as Ghent or kingdoms such as Castile than to the rather forgotten city on the Danube River.

When Maximilian’s grandson and younger brother of Emperor Charles V, the Spanish-born Archduke Ferdinand (who ruled 1558–1564 as Holy Roman Emperor Ferdinand I) chose Vienna as his residence, the city fathers had already established a local regime with its own sense of autonomy. In the 1520s this urban regime was harshly suppressed by the archduke and his officials, and the city administration was reorganized under stricter dynastic control. Ferdinand had arrived in the city with a sizable retinue of Iberian nobles, military personnel, and other assorted hangers-on, and the Spanish-speaking community in the city and at the court endured at various levels for two centuries,

Vienna. A striking map from Mathaeus Seutter's 1745 *Atlas Novus* showing the imperial city of Vienna, the official residence of the Habsburgs. At bottom is a view of the skyline from across the Danube River. The new circle of fortifications around the outskirts of the city was built in the early eighteenth century; to the left of the old walled city is the Leopoldstadt, or second district, the center of Vienna's large Jewish community. MAP COLLECTION, STERLING MEMORIAL LIBRARY, YALE UNIVERSITY

reflecting the resident rulers' close ties to their dynastic kin in the West.

One of the pivotal years for the history of early modern Vienna was 1529, when Ottoman troops besieged the city, following on their successful campaigns of the previous years, which had succeeded in defeating the Hungarians and in advancing the Ottomans' control well into that nearby kingdom. The siege was successfully resisted, but the results of the destruction in the suburbs and the economic dislocation the siege had brought lasted for much of the century. The economic foundations of many of the

city's religious houses, which controlled properties outside of the old city walls, for example, were wrecked, and this, together with the increasing popularity of the teachings of Martin Luther and his followers, made the culture of the city increasingly Protestant, much to the dismay of Archduke Ferdinand, who resided in the Hofburg, the fortified Habsburg residence in the city.

Following the extinction of the Hungarian ruling dynasty in 1526, Habsburg claims to the Hungarian crown meant that Vienna maintained a certain dynastic importance because it was located so

near to Bratislava, the newly relocated capital of Hungary, just down the Danube River. Military operations in the Hungarian kingdom were planned and administered from Vienna, even while the Habsburg rulers themselves increasingly gave in to the allures of Vienna's long-time rival, Prague, as their preferred place of residence. (Ferdinand and his two successors as Holy Roman emperor, Maximilian II and Rudolf II, were all buried in St. Vitus's cathedral in that Bohemian capital.) Ferdinand's grandson, the emperor Rudolf II (ruled 1576–1612), officially moved his residence up to the castle in Prague in the 1580s, leaving his brother Archduke Ernst and his sister Archduchess Elisabeth, the widowed queen of France, to reside in Vienna and attempt to regulate the increasingly unruly and Lutheran city population.

Conflicts over the Habsburg succession in Bohemia and Hungary eventually degenerated into the Thirty Years' War (1618–1648), but they had little direct effect on Vienna. For the most part, the fighting took place well away from the city, although in its earliest stages in late 1618 and early 1619, enemy troops reached the city's vicinity, as did Swedish troops in 1645. The continued rather uncertain status of Vienna in its rulers' imaginations was reflected in the decision of Emperor Ferdinand II (ruled 1620–1637) to return to his ancestral homeland, Styria, to be buried in 1637.

The true blossoming of Vienna as the baroque capital of central Europe and the undisputed capital of the Habsburg Dynasty came only later, in the eighteenth century. The city was once again besieged by Ottoman troops in 1683 and once again successfully withstood their attacks, with the help of King John III Sobieski of Poland. Unlike the aftermath of 1529, however, subsequent Habsburg military campaigns pushed the Ottoman frontier well into Hungary and farther to the southeast. Vienna changed in character from a border fortress to a centrally located administrative and trading center, well located on the Danube for trading downstream with the newly conquered Hungarian territories. The Habsburgs' loss of their Iberian inheritance through the War of the Spanish Succession (1701–1714), as well as their earlier setbacks in the Holy Roman Empire during the Thirty Years' War, combined to redirect the dynasts' attention toward the

south and east. Vienna was well situated to benefit from this reorientation.

The alliance of the Habsburgs and their supporters with a reinvigorated Roman Catholicism during the Counter-Reformation also provided an ideology and a cultural program that were physically reflected in the triumphant, new post-1683 city. New convents and monasteries abounded, and a much more extensive (although less militarily effective) wall (the 1704 *Linienwall*) was constructed. Noble palaces and Habsburg summer residences were constructed outside the confines of the walls as well, reflecting a new optimism and sense of security that would only be challenged when Napoleon's troops neared the city in the early nineteenth century. Vienna was now the capital of one of Europe's most important powers. It remained so until the demise of that power in the early twentieth century.

JOSEPH F. PATROUCH

VIENNA, SIEGES OF. The city of Vienna was the object of two unsuccessful sieges by Ottoman forces during the early modern period.

THE FIRST SIEGE, 1529

When, at the battle of Mohács in 1526, the troops of Sultan Suleiman I (ruled 1520–1566) wiped out the Hungarian army and killed King Louis II, they cleared the way to the Hungarian throne for their main rival, the Habsburgs. After Suleiman's protégé, János Szapolyai (ruled 1526–1540), was ousted from Hungary by his rival, Ferdinand I of Habsburg, also elected king of Hungary (1526–1564), Suleiman was eager to redress the unintended consequences of his victory at Mohács. The Ottoman army of 80,000 to 100,000 men retook Buda, Hungary's capital, from the Habsburgs in September 1529 and gave it back to their ally János. Suleiman, however, wanted to resolve the Habsburg-Ottoman rivalry in Central Europe by conquering Vienna, the capital of the Habsburgs' Danubian Monarchy. Vienna was defended by some 18,000 to 25,000 soldiers under the able leadership of Niklas Graf zu Salm and Wilhelm Freiherr von Roggendorf, who had ordered the city's medieval and obsolete defenses substantially strengthened. The siege lasted for some two weeks (27 September–15 October 1529). The Ottoman bombardment was not effective, for the attackers had had to leave their siege artillery in Bulgaria and Hungary owing to unusually rainy weather and muddy roads. The defenders discovered or disarmed most of the Ottoman mines, and when some mines did succeed in opening significantly large holes, the attackers were repulsed by pikemen and harquebusiers. With winter approaching, the Ottomans raised the siege. After another failed attempt in 1532, when the small Hungarian castle of Kúszeg (Güns) stopped Suleiman's army, the sultan and Ferdinand accepted the status quo in Hungary.

THE SECOND SIEGE, 1683

In 1683 Vienna was besieged for the second time by the Ottomans, who by 1541 had conquered central Hungary, bringing the frontier dangerously close to the Austrian capital. The 1660s saw new Ottoman conquests in Hungary (1660 and 1663), Crete (1669), and Poland-Lithuania (1672 and 1678) under the able leadership of the Köprülü grand viziers. The recent revival of Ottoman military fortunes, the renewed Franco-Habsburg rivalry, and, more importantly, the weakness the Habsburgs had shown in Hungary against Imre Thököly's *Kuruc* insurrection (1681–1683), persuaded Kara Mustafa

Paşa, the ambitious grand vizier (1676–1683), that the time had come to conquer Vienna. With the auxiliary troops of Crimean, Walachian, Moldavian, and Transylvanian vassals, the army that reached the outskirts of Vienna by early July numbered some 150,000 men, although only 40,000 were central troops of the standing army and although, as in 1529, the Ottomans lacked heavy siege artillery. Count Ernst Rüdiger von Starhemberg ably directed the 15,000-strong defense forces, but by early September heavy Ottoman bombardment and mining opened numerous breaches in the walls, and the defenders were running short of supplies. The fifty-nine-day siege ended with the arrival of the imperial and Polish relief army under the command of Charles V, duke of Lorraine, and King John III Sobieski (ruled 1674–1696) on 11 September 1683. The decisive battle of Kahlenberg, at the edge of the Vienna Woods, took place the next day when the relief army of 75,000 destroyed the unprotected attackers' camp. Kara Mustafa and his army fled, leaving rich booty for the Christians. Vienna was saved by a coalition of Central European countries, whose army proved to be tactically superior and was, for the first time in the history of Ottoman-European confrontations, able to match the Ottomans in terms of deployed manpower and weaponry, as well as in logistical support.

GÁBOR ÁGOSTON

VIÈTE, FRANÇOIS (1540–1603), French mathematician. Viète is widely viewed as the founder of modern algebra. Born in Fontenay-le-Comte in the province of Poitou, he studied law at the

University of Poitiers and received his degree in 1560. Shortly thereafter he entered the service of the noblewoman Antoinette d'Aubeterre and served as legal adviser as well as educator of her daughter, Catherine of Parthenay (later Rohan). His position in the household of this leading Huguenot family involved him with increasing prominence in the tense religious rivalries of the time. In 1573, following several years in Paris, he was appointed counselor to the Parlement of Brittany in Rennes by King Charles IX, and in 1580 he became a member of Henry III's privy council. Following a period of political eclipse in the late 1580s, he was recalled to court in 1589 and served as counselor to Henry III and Henry IV until his death on 23 February 1603. During his years as royal counselor Viète specialized in cryptanalysis, becoming one of the leading code breakers in Europe. His success in decoding secret Spanish communications famously brought upon him the accusation of being in league with the devil.

Despite his active career at court, Viète found time to research and publish an impressive number of mathematical works in a range of different fields. His most influential work, however, was undoubtedly in algebra. The field known as “algebra,” he contended, was not, in fact, an achievement of Arab mathematicians, but was a corruption of the ancient “Art of Analysis” which was known in classical times. Unlike synthesis, which begins with self-evident assumptions and proceeds deductively to necessary conclusions, analysis proceeds in the reverse direction. In analysis, one assumes that the desired conclusion is true and then proceeds to deduce the implications of this assumption. If this leads to a known true relationship, it is a good indication (although no proof) that the original assumption was true. The mathematician can then reverse course and use the analysis as a guide for a synthetic proof of the theorem. If, on the other hand, the assumption leads to a falsehood, it is also necessarily false.

Classical mathematicians, Viète believed, used analysis extensively in their research. Unfortunately, as they only considered synthetic proof to be proper and incontrovertible, they proceeded to suppress the analytic part of their research in their published works. This left their modern-day successors with beautiful and elaborate synthetic constructions, such as can be found in the writings of Euclid and

Archimedes. The method used by the ancients to discover their theorems—namely analysis—appeared to be lost. Viète set out to correct this unfortunate state of affairs by recovering the ancient “Art of Analysis.” Beginning with his *Introduction to the Analytic Art* of 1591, and continuing in a series of subsequent works, he laid down the basic outlines of the ancient method as he perceived it.

Viète's fundamental insight was that the “Art of Analysis” was none other than the algebra. In algebra, he pointed out, one proceeds analytically: when presented with a mathematical problem, one assumes that the solution has already been found, and sets up a mathematical relationship accordingly. One then proceeds to analyze this relationship, arriving ultimately at a true solution if such exists. This, he claimed, was precisely the approach used in ancient analysis.

Viète realized, however, that the algebra of his time was inadequate to the task. It consisted of a long and increasing list of solutions to specific problems and practical rule-of-thumb methods to help with the solution of others. This, for Viète, was evidence of the corrupt state of algebra and the need for restoration. He therefore sought to replace the haphazard algebraic practices with general rules of analysis that would guide the solution of all problems.

To accomplish this, Viète proposed a novel system of notation. For the first time, he distinguished between the given magnitudes of a problem and the unknown ones, which must be sought out. The given magnitudes, he proposed, should be signified by consonants (B, C, D, F . . .) and the unknown ones by vowels (A, E, I, O, U, Y). This simple innovation enabled Viète to write down not just specific linear, quadratic, and cubic problems, but general types of linear, quadratic, and cubic equations. Consequently, once a general type of equation was analyzed and solved, any particular instance of this type could be solved as well. With considerable justification, Viète referred to his “recovered” Art of Analysis as “the doctrine of discovering well in mathematics” (*doctrina bene inveniendi in mathematicis*).

In addition to algebra, Viète contributed to numerous other mathematical fields including trigonometry, conic sections, and astronomy. His endur-

ing reputation, however, rests firmly on his algebraic work. Despite his claim that he was merely recovering an ancient method, his approach was in fact very different from the geometrical analysis practiced in antiquity. It is ironic, but telling, that Viète, who sought to replace the corrupt “algebra” with pure “analysis,” has become known to subsequent generations as the father of modern algebra.

AMIR ALEXANDER

VIGÉE-LEBRUN, ELISABETH (1755–1842), French painter. Known primarily for her portraits, Vigée-Lebrun was a favorite artist of aristocratic patrons throughout Europe at the end of the eighteenth century, the most famous of whom was Queen Marie Antoinette of France (1755–1793). Vigée-Lebrun was born in Paris, the daughter of a hairdresser from the province of Luxembourg, Jeanne Maissin, and a minor portraitist, Louis Vigée, who was a member of the Académie de Saint-Luc. Her father gave her drawing lessons in his studio when she was twelve, although he died shortly after they began. She then studied drawing with two minor artists, Blaise Bocquet and Gabriel Briard. By her own account, she was largely self-taught, copying Old Master paintings in private collections she visited in the company of her mother. By the age of fifteen, she had established herself as a professional portraitist but practiced without a license. In 1774, after her studio had been seized by officers of the Châtelet (royal tribunal in Paris), she applied for membership in the Académie de Saint-

Luc, exhibiting several works in the Salon de Saint-Luc that same year. Her ambition, however, was to be received as a history painter by the Académie Royale de Peinture et de Sculpture.

During the late 1770s, Vigée-Lebrun completed several history paintings but remained barred from acceptance into the Académie Royale because of the commercial dealings of husband, Jean-Baptiste-Pierre Lebrun, an art dealer. Upon Marie Antoinette’s intervention, however, the honor of full membership was granted on 31 May 1783. (Her reception piece, *Peace Bringing Back Abundance* (1780), is now in the collection of the Louvre Museum). The minutes of the meeting at which Vigée-Lebrun was accepted for membership state that the academicians acted to execute “with profound respect the orders of its Sovereign.” However, her painting was assigned no category.

Although Vigée-Lebrun was never apprenticed to a master painter and was prohibited by her sex from becoming a student at the Académie Royale, she nevertheless profited from her study of leading artists from the French school. She was greatly influenced by Jean-Baptiste Greuze (1725–1805), particularly in terms of her technique, which uses a buildup of transparent glazes to generate highly polished surface textures in areas of flesh and drapery. As with Greuze, her lack of academic training contributed to this reliance on the use of color, rather than line, to define form. Her approach to composition in many of her large state commissions, such as the *Portrait of Marie Antoinette* (1778; Musée national du Château de Versailles) follows the illustrious examples of portraits by Hyacinthe Rigaud and Jean Marc Nattier, favorite court artists during the reigns of Louis XIV and Louis XV, respectively.

Vigée-Lebrun’s debt to the Old Masters is evident in her highly sought-after *maternités* (mother and daughter images), which register a direct lineage back to the Madonnas of Raphael, and in her *Self-Portrait in a Straw Hat* (1783; National Gallery of Art, London), which deliberately quotes a portrait by Peter Paul Rubens. While some scholars consider this work to be a straightforward tribute to the celebrated courtier-artist, others regard it as a clever assertion on the part of Vigée-Lebrun of her ability to assume a similar place in history. Indeed,

Elisabeth Vigée-Lebrun. Marie Antoinette with her children, 1787. THE ART ARCHIVE/MUSÉE DU CHÂTEAU DE VERSAILLES/DAGLI ORTI (A)

her aspirations to enjoy the elevated status of a history painter would be satisfied not by following the usual paths of academic progress, but through her novel conceptions in the realm of portraiture that challenged notions of conventional subject hierarchies and divisions between genres.

PATRONAGE AND PRESTIGE

Vigée-Lebrun received her first royal commission in 1776, executing several portraits of the king's brother, the comte de Provence (whereabouts unknown). Two years later, she was called upon to paint the queen. Marie Antoinette had been searching for an artist who would best capture her likeness, and she responded to Vigée-Lebrun's singular ability to lend an informal air to the requirements of royal portraiture. Her *Portrait of Marie-Antoinette with Her Children* (1787; Musée national du Château de Versailles) is a brilliant combination of tradition and innovation. In this painting, Vigée-Lebrun follows the conventions of state portraiture by looking back to Nattier's portraits of Queen Marie-Leczinska and Madame Adélaïde (the wife and daughter of Louis XV) in the construction of her composition; however, she adds a contemporary reference to the popular idea of the "good mother" by merging the ceremony of state with the intimacy of family. This painting also transcends the limitations of a single genre by treating the portrait as both a history painting and a scene of everyday life.

Equally novel was the *Portrait of Marie-Antoinette* (1783; private collection, Germany) *en chemise* in which the sitter wears a simple, sheer white muslin dress and straw hat. This remarkably casual portrait caused a sensation at the salon, where it was said that the queen appeared in her underwear. While many critics commented on the impropriety of such a representation, which was not formal enough to suit contemporary standards, this painting and others like it influenced the course of costume development in France. Such portraits popularized a new look of loosely constructed garments, unpowdered hair, and natural curls—as opposed to the conventional French dress that required corsets and ornate wigs.

In addition to her activities as a painter, Vigée-Lebrun hosted one of the most fashionable salons in Paris, where music, literature, and the arts were topics of conversation. Her famous *souper grec*

(Greek supper) took place in 1788, an impromptu event inspired by literary recitations at which guests donned Greek attire and dined on a menu prepared from ancient recipes, served on a collection of archaic pottery. The entire affair was orchestrated by Vigée-Lebrun and took on the character of a *tableau vivant* (living painting). The expense of the event was greatly exaggerated by rumors, resulting in her vilification in scandal sheets. In the late 1780s, she increasingly became a figure of controversy.

A staunch royalist throughout her life, Vigée-Lebrun profited from her service to the French court, but this allegiance also forced her into exile during the Revolution of 1789, accompanied by her only child, Jeanne Julie Louise (born 12 February 1780). Her prestigious reputation did not fail her, and she continued to work in aristocratic circles, traveling first to Italy, then Austria, Germany, and Russia. She enjoyed great success at these foreign courts, securing her fortune before she was repatriated in 1801. While she continued to paint late in life, the energies of her last years were devoted to composing her memoirs, the first installment of which was published by Hippolyte Fournier in 1835. Vigée-Lebrun died in Paris at the age of eighty-seven.

VILLAGES. The village, alongside the parish and the family, was the most widespread unit of social organization throughout the early modern period. There were well over 130,000 villages in western Europe, each a largely self-sufficient rural community with a population that averaged between 100 and 500 inhabitants. Flexibly adapted to a wide range of state structures and environments, villages often enjoyed high degrees of self-government. Many also performed essential state services, including tax collection, poor relief, and the maintenance of order. Although far from democratic in modern terms, village assemblies at times displayed the most broad-based political participation of any governing institution in western Europe. Villages were anything but static communities; rates of mobility and exogamy were significantly higher than once thought. This mobility in turn reflected major changes in land exploitation patterns and in world markets, which permanently altered the economic balance of communities between 1450 and 1789. By 1550, the polarization of villages into a minority of prosperous peasants exploiting large holdings and a majority of nearly landless rural laborers had dramatically changed the social landscape. By the end of the seventeenth century, the economic division of Europe into regions closely connected to the Atlantic and world economies and regions left behind affected patterns of wealth and power within villages.

VILLAGE ORGANIZATION AND SOCIAL STRUCTURE

Social hierarchy in the village was well defined in most regions. As serfdom or villeinage declined by 1450, a new pyramidal social structure had emerged over a broad swath of western Europe. At the base of the peasantry were landless day laborers, joined by cottagers who rented or sharecropped less than enough land to live on in bad years. In many regions they constituted 50 to 60 percent of the village population, and increasingly depended upon weaving and cottage industry to eke out a subsistence

living. One grade above were those who leased, rented, or sharecropped a self-sufficient holding. In upper Normandy, a relatively prosperous region, these modestly independent farmers represented only about 20 percent of the village households in the late seventeenth century, and they leased fewer than twenty-five acres apiece. But this middling sort (in England, husbandmen) were universally shrinking in numbers. Provinces as diverse as Languedoc and Normandy in France, as well as much of England and Scotland, the maritime provinces of the Dutch Republic, and northwestern Germany, all experienced significant losses of middling peasantry beginning in the mid-fifteenth century.

At the pinnacle of village society a new peasant elite had fully developed by 1550, composed of large leaseholders (copyholders) or freeholders (owners). Known as *laboureurs* in France, yeomen in England, or *Vollbauern* in Germany, they typically owned their own plow and team, employed other villagers as day laborers, and exploited a minimum of about 50–100 acres. Strongest in wealthier regions along the cereal plains of Europe and in England, these substantial peasant exploiters typically represented between 5 and 15 percent of village households. But they were surprisingly evident in poorer regions as well; they made up nearly 10 percent of the population in parts of Naples, for example. This peasant elite was essential to the stability of the community as a whole. They often lent seed, livestock, and cash to their poorer neighbors, though often at ruinous interest rates. Landless villagers in turn depended upon casual wage labor from wealthy peasants and landlords for their survival. In larger villages, the nucleus of cultivators and laborers was complemented by a small group of rural artisans (especially coopers and blacksmiths) and service providers (millers and innkeepers).

This core of peasants, artisans, and wage laborers was topped by a thin layer of privileged rural elites. These were men (and occasionally women) who were of the village, but not entirely in it. Noble lords or seigneurs resided in some villages, although they were increasingly absentee landlords by the seventeenth century. Their estate stewards and seigneurial court judges, along with well-to-do landlords who were not yet noble (gentry or *sieurs*), priests and pastors, royal judges, and rural merchants all exercised substantial control over land use

Villages. *A Village Street with Peasants and Travelers, a Canal Beyond*, by Jan Brueghel the Younger. ©CHRISTIE'S IMAGES/CORBIS

and wages in the village. This group also collectively controlled civil, canon, and customary laws; criminal punishment; public works; and some poor relief—powers that affected villagers on a daily basis.

The physical maps of western European villages varied greatly, but tended to fall into two main patterns. Across the broad band of open cereal plains like the Beauce, the nucleated village with its outlying fields cut up into plow strips or furlongs was typical. In wooded areas like Shropshire, England, or mountainous regions like the Pyrenees, Alps, and Apennines, isolated farms and scattered hamlets were common. They enjoyed some of the highest levels of autonomy and self-government, remote as they were from the central state. But these scattered settlements were intimately tied together by common social institutions, particularly the parish church, the local market, and the law courts.

From the sixteenth through the eighteenth centuries, however, the twin processes of enclosure and engrossment (consolidation) of fields wrought sig-

nificant changes in village land-use patterns. The English enclosure movements of the sixteenth and eighteenth centuries, like the notorious highland clearances in Scotland, fenced off common lands for sheep runs or agricultural improvements. Engrossment allowed larger blocks of fields to be brought under the management of one owner or lessor, which made enclosures easier. The social consequences were often dire: increasing pauperization or flight of villagers who no longer had crucial access to the common lands. Even without these new stresses, village communities were the sites of a delicate balancing act between resources and population throughout the early modern period. Late marriages, low rates of illegitimacy, and limitation of family size were the key factors that allowed villages to survive under near-subsistence conditions.

Despite their small size, there was a high degree of social and economic mobility bubbling below the surface of western European villages. Some was downward mobility, driven by growing rural stresses from the mid-sixteenth to the eighteenth

century. Economic polarization that pushed more peasants into the landless category, population growth that overburdened villages, and the enclosure and engrossment of land caught many in the economic downdraft. Villages across Europe expressed increasing concerns about (and often a hardening of attitudes toward) vagabonds, “sturdy beggars,” and the settled poor. Expanding cities like London and Paris were one of the safety valves for the rural needy. The resultant rates of mobility are sometimes striking: One English village in Northamptonshire experienced a 52 percent turnover in households in just the twenty years before 1638.

Upward mobility was still in the grasp of other village groups, however. Prosperous peasants became the feeder school for the gentry. Those who had acquired roughly a hundred acres or more could begin the delicate process of insinuating themselves into the landlord class of the village by ceasing to work with their hands, educating sons in the law, marrying into gentry families, and having themselves duly noted down in the parish records as *sieurs* or “gentlemen.” Indeed, the wealthy peasantry and the gentry often formed a kind of social convection zone in the village, where gentry who failed to maintain their position sank back into the peasantry, and careful peasants moved up to replace them. In the parish of Myddle in seventeenth-century England, only half the gentry were able to maintain their status over two or three generations; the rest were replaced by yeomen and merchants. The most difficult step upward was from the day laborer or cottager class into the ranks of the wealthy peasantry. One expert has estimated that it required an English day laborer’s wages for a hundred years to acquire a self-sufficient farm holding. Moreover, the numerous advantages held by village elites made it difficult to become a self-sufficient landowner. Through strategic marriages, command of property law, control of the village assembly and common lands, and usurious loans secured by farms, land was magnetically attracted toward those who already had land.

COMMUNAL BONDS

The organization of western Europe into villages, as opposed to tribal or kinship organization, was based on neighborhood solidarities among distinct fami-

lies. This sense of neighborhood emerged in the language as *voisinage* in France and *Nachbarschaft* in Germany, and it was cemented by a number of institutions and traditions. At the center was the parish church, which united even scattered farms and hamlets into the village community. (In many regions parish and village boundaries were largely coterminous, but they were not always so.) Sunday services were only one of the occasions for creating parish bonds. Religious confraternities, celebrations of holy days, marriages, and baptisms all helped to cement communal bonds across family lines. The parish church, in tandem with the village assembly, organized poor relief for the community. Even the arrangement of the church served to remind villagers of their assigned place in the social hierarchy: church benches, for those important enough to sit during services, were strictly arranged according to rank.

Beyond the doors of the parish church, taverns, alehouses, and weekly markets served as vital centers of sociability. On winter evenings, villagers often congregated together to save light, repair tools, and tell stories. Seigneurial and royal assizes regularly brought villagers together to resolve (or occasionally inflame) their disputes in court. Many of these institutions and traditions cut through social hierarchies and regularly brought poorer and wealthier members of the village into contact with each other. But villages were also arenas of conflict, which was expressed in endemic lawsuits, physical violence, *charivaris*, and witchcraft accusations. The inherent tensions created by wide gulfs in economic, honorific, and power status were always latent. Even a relatively small community of forty or fifty families might encompass a family of supernova aristocrats and landless paupers.

The village in turn was more deeply embedded in larger economic and social circuits than was once believed. Annual fairs brought into the village country dwellers from a wide circumference, as well as merchants from urban areas; in France these often included theater troupes and peddlers of cheap popular books (the famous *Bibliothèque Bleue*). Royal courts on the Continent, and circuit assizes in England, drew university-trained lawyers and judges into the countryside. English justices of the peace, drawn almost exclusively from the rural gentry class, had become fixtures in the House of Commons by

Villages. A seventeenth-century engraving depicts commercial activities at the edge of a village. THE GRANGER COLLECTION, NEW YORK

the seventeenth century and were expected to help control elections to Parliament in the county. Aristocrats and nobles took rural servants, particularly women and girls, into the cities with them; many of them returned to the village as young women with dowries. In transhumance areas and coastal regions, it was the young men who typically left home for months at a time, to follow herds of sheep or to fish as far away as Newfoundland. Above all, the production of both bulk goods and luxury goods for the Atlantic trade tied villages into global cycles of boom and bust. Production of cotton, linen, and flax, the weaving and dyeing of fabric and lace, cheese making, wine making, and glassmaking became central to village economies from the Veneto in Italy to western France to Flanders and the Dutch Republic. As both the state and impersonal economic forces made a wider impact on village life, they became the source of new discontents.

Their solidarity helped to make villages the natural locus of rural riots and protests against these wider powers. Enclosure riots in England and Scotland, periodic tax and bread riots, and poaching and smuggling everywhere expressed the villagers' firm sense of their customary rights against landlords, tax

officials, and grain suppliers. One need only think of the German Peasants' War of 1524–1525, the revolt of the Nu-Pieds in Normandy in 1639–1640, or the rebellion of the *Bonnets Rouges* in Brittany in 1675 to see that grievances over seigneurial exactions and innovative tax schemes were always simmering in rural communities. Moreover, these disturbances were almost never led by the landless poor, but rather by those who had something to lose in the village: the natural peasant leadership.

VILLAGE GOVERNMENT AND FUNCTIONS

Villages were composite entities made up of overlapping institutions, above all the family, the parish, the seignior (or lordship), and the village assembly. This last institution is what gave the village community its formal coherence; it developed special characteristics in the West. In France, village communes or assemblies (*communautés, assemblées*) had received formal charters by the thirteenth century in some areas; in others, they remained informal but recognized institutions. They were composed of heads of households, since the household, not the individual, was the fundamental social unit. But within the assembly, the hierarchical village social

structure was instantly apparent. The households of *laboureurs* or yeomen normally dominated land-use issues, tax matters, and village offices. Assemblies were predominantly male, although evidence indicates that widows with substantial holdings were sometimes admitted.

Although the constellation of powers in any given village was unique, their local functions were quite similar. The *Gemeinde* in northwestern Germany, like the assembly in England and the commune in France, met periodically after Mass to elect syndics or council members and other minor officials. They managed most communal aspects of life, from grammar schools to ale quality, by appointing schoolmasters, aleconners, shepherds, and harvest guards. Through the *fabrique* (vestry), they jointly shouldered responsibility for the upkeep of the parish church. Above all, the assembly controlled crucial aspects of land use and labor. They set the dates of the grain or wine harvest, fixed wages for day laborers, and controlled the sale, lease, or rental of the common lands. Waters, woods, wastelands, and meadows were collectively managed, which provided a crucial margin of survival for many villagers.

The village assemblies also performed critical functions for the early modern state, which had only a thin presence at the local level. By far their most contentious task in regions like France and the Italian city-states was apportioning and collecting royal taxes in the village. In France, the community was then burdened with collective responsibility for making up any shortfall in uncollected taxes. Villages often exercised important legal and policing powers at the local level. Some German assemblies were allowed to set their own weights, measures, and prices. French assemblies increasingly used lawsuits in the seventeenth and eighteenth centuries to contest their rights with other villages, their lords, or even with royal officials. Drunken or disorderly behavior, domestic fights, scolding, and marketplace fraud were typically handled through local seigneurial courts, in petty sessions, or by village arbiters.

While communes or assemblies provided a significant measure of self-government under normal conditions, they were nevertheless sharply circumscribed in their ability to protect the village from environmental or political disasters. Cycles of fam-

ine and disease, escalating tax demands from the central state, and marauding armies spawned by the civil, religious, and international warfare of the age regularly decimated individual villages. Nevertheless, villages collectively remained a resilient and adaptable social unit throughout the early modern period, and one on which the wealth of most of Europe depended.

VILNIUS (Polish, Wilno; Yiddish, Vilna). Vilnius was the capital of the Grand Duchy of Lithuania, thus the second capital of the Commonwealth of Poland-Lithuania. Established at a crossroads between East and West, it imported Muscovite furs and reexported them, along with local forest products, by river to the Baltic (Königsberg, Riga, and Gdańsk were among its trading partners), whence it imported fabrics, salt, spices, fruit, and metals. Vilnius received the Magdeburg Law for municipal self-government in 1387 following the Grand Duchy's acceptance of Christianity and entry into federation with Poland. The city had long had a mixed population (pagan Lithuanians, Orthodox Ruthenians [Ancestors of Ukrainians and Belarusians], Catholic Germans). In 1536 a royal decree established "Greek" and "Roman" parity for elections to the magistracy. Lutherans (largely burgher and German in origin) date their continuing presence from 1555, Calvinists (led by increasingly Polonized nobles) from the 1560s, and Greek Catholics from the Union of Brest (1596). Islamic Tatars had settled in the Lukiškės (Łukiszki) suburb around 1400. Jews came relatively late, receiving their first privilege for settlement within the walls in 1593.

All five recognized Christian confessions competed for office in the magistracy under Greek (Orthodox and Uniate) and Roman (Catholic, Lutheran, Calvinist) rubrics until 1666, when a royal decree limited membership in the ruling elite to Catholics and Uniates. "Dissidents" (Orthodox, Lutherans, Calvinists) remained a significant presence in the merchants' and artisans' guilds, where parity arrangements mirroring those of the magistracy continued to function without the new restrictions. The competing Uniate and Orthodox confraternities made the city an early center of a Ruthenian spiritual and cultural revival. Jews governed themselves autonomously through their *kahal* and the *vaad* or Council of the Chief Lithuanian Communities. Tatars went to their mullah for decisions on internal affairs. Both Jews and Tatars turned to the nobles' Castle Court (rather than the burghers' magistracy) for law in cases involving the Christian world.

Although Vilnians spoke Polish, Ruthenian, Lithuanian, German, and Yiddish, Polish was the

city's lingua franca by the early seventeenth century, and all Christians (and some of the Tatars who tended toward assimilation) felt the draw of Polish cultural norms.

Lutherans and Calvinists established schools in the middle of the sixteenth century, but the Jesuits (introduced here in 1569) soon offered effective competition. Stephen Báthory made their *collegium* (established in 1570) into an academy in 1578. It would become Poland-Lithuania's second university (after Cracow), eventually bearing the name of its royal founder. The academy welcomed the sons of the grand duchy's "dissidents" and played an important role in the Catholicization of society in the seventeenth century.

Vilnius was home to early Cyrillic printing houses (the earliest that of Francysk Skaryna, in 1524), and a Calvinist shop (Daniel of Łęczycza) functioned in the years 1581–1607. Here, too, the Jesuits' Academy Press (1592–1804) soon took over the local market, also printing for Vilnius Uniates. Vilnius became a center of Jewish culture in the eighteenth century, during the life of the Gaon Rabbi Elijah (1720–1797).

The general decline of Vilnius began with the Muscovite occupation of the city (1655–1661) and was deepened with the depredations of the Northern War (1700–1721). Vilnius's status as capital of the Grand Duchy of Lithuania ceased with the third partition of Poland (1795), when it became a provincial city of the Russian Empire.

DAVID FRICK

VINCENT DE PAUL (1581–1660), founder of the Congregation of the Mission and of the Daughters of Charity. Vincent de Paul was not only one of the main figures of the Catholic Reformation but also one of the most popular French saints of the seventeenth century. His reputation as philanthropist and pragmatic protector of the underprivileged, already secured during his life, somewhat overshadows the political, spiritual, and mystical aspects of his life, revealed in his extensive correspondence.

Born in 1581 in a modest peasant family of Pouy (Aquitaine), Vincent found in the church the most likely means of social promotion. Subsidized by the judge of his hamlet, Monsieur de Comet, he was sent to the Cordeliers' college of Dax (1595–1597). In 1600, he was ordained priest and in 1604, he vanished for two years. Many historians speculate on this disappearance. According to what Vincent de Paul himself wrote to his protector Comet, during a sea trip from Marseille to Toulouse, he was captured and sold as a slave in Tunis, where he stayed for two years. He managed to convert his slave master, a renegade, and to flee with him back to France. After traveling to Rome and Avignon, he finally settled in Paris in 1608, was made chaplain to the queen Marguerite de Valois (1610), and began to move in the *dévo*t circles, becoming very close to Pierre de Bérulle and the Oratorians. In 1612, he became the parish priest of Clichy, following the post-Tridentine line: renovating the church, catechizing its people, erecting the Confrérie du Rosaire (brotherhood of the Rosary). A year later, he became chaplain to the family of Philippe-Emmanuel de Gondi, and his life changed.

In 1617, Vincent de Paul was shocked by the deep ignorance of the faith he found among the inhabitants of the hamlet of Folleville, on the domain of De Gondis's family. This awareness, described by many as a true conversion, seemed to dictate his calling. He decided to instruct the poor and become a missionary. Contrary to Pierre de

St. Vincent de Paul. Nineteenth-century portrait engraving. GETTY IMAGES

Bérulle and François de Sales, whom he considered his most influential masters, Vincent de Paul was less speculative and more inclined toward action. He considered that true Christian perfection did not consist of mystical ecstasies but of charitable field enterprises. With De Gondi's financial help, Vincent de Paul founded the Congregation of the Mission. The so-called Lazarists (named after the priory of Saint-Lazare where the community settled in 1632; approved by pope Urban VIII in 1633) devoted themselves to the parish missions (described by Vincent de Paul in his letters as "the salvation of the poor people of the countryside") and to the training of the local priests, for it was seen "necessary to maintain the people and to keep the fruit of the missions made by good ecclesiastics, imitating in this the great conquerors, who leave garrisons in the places they take, by fear to lose what they have acquire with so much effort." To this end, the Tuesday Conferences were launched in 1631—a kind of continuing education for priests that allowed them to reflect, pray, and work in common and that gathered the elite of the Parisian clerics. The same ideal guided the opening of the Lazarist

seminary for ordinands in 1642 in the College des Bons Enfants. The idea was less to give a high theological culture than to give a solid moral, spiritual, and pastoral education to the future priests who would be called, as Vincent de Paul wrote in his *Colloquium to the Missionaries*, “to preach simply and familiarly as did the apostles.” The expansion of the Lazarists was remarkable, first in France (in 1660, 131 priests and 52 coadjutors lived in 25 residences and had organized some 840 missions in the countryside) then in the field of the foreign missions (Madagascar in 1648), for the Lazarists added to their former objectives the conversion of the “pagans.”

From the beginning, each Lazarist mission concluded with the creation of Confréries de Charité (Brotherhoods of Charity), which gathered and organized local noblewomen to care for the poor. In 1633, Vincent de Paul and his closest collaborator, the widow Louise de Marillac (1591–1660), founded the Daughters of Charity in order to support the Brotherhoods of Charity and to achieve charitable work on a larger scale, combining spiritual salvation with material help in keeping with the recommendations of the Council of Trent. Non-cloistered and dressed as peasant women, the “grey nuns” contributed to implement in France the basis of health and social service (there were sixty houses in 1659). Similarly, Vincent de Paul founded L’Oeuvre des Enfants Trouvés (Care of Foundlings), which aimed to rescue abandoned children, and he supported various charitable undertakings for the sick, the disabled, and beggars, activities that were centralized in the network of the general hospitals that developed in the 1650s.

Until his death in 1660, the influence of “the father of the poor” was considerable. He was associated with the main *dévo*t circles, in the secret Compagnie du Saint Sacrement (Company of the Holy Sacrament), and in the Visitation Sainte Marie (where he replaced François de Sales as superior). Queen Anne of Austria chose him as her confessor and placed him in 1643 at the Council of Conscience initiated by Cardinal Richelieu, who, like King Louis XIII, had held him in great esteem. Since he avoided the various spiritual conflicts of his time, he managed to stay close to parties who were adversaries: the old families of the Catholic League such as the Marillacs, the abbot Saint-Cyran (1581–

1643)—though he vigorously condemned his Jansenist ideas—and the Jesuits, with whom he never hesitated to collaborate and among whom he found inspiration.

DOMINIQUE DESLANDRES

VIOLENCE. Violence was endemic in early modern Europe, from Scandinavia to the Mediterranean, and from the Urals to the British Isles. Serfs and peasants wielded knives and staffs, most gentlemen and merchants wore swords and/or pistols, and nobles and their numerous retainers were similarly armed. Even teenaged students carried knives in their schools, brawled in the streets, and operated as gangs. The weapons used were often determined by class, as were the instruments of public death. Thus while serfs and peasants were hanged, the aristocracy had the privilege of death by the sword; women were burned alive or drowned. Tempers were short in this society, and weapons were easy to hand. The propertied classes, especially, lacked self-

control until the waning of the seventeenth century. They encouraged gangs of retainers or hired thugs, or they formed groups of brigands, to assault enemies in paying off grudges or pursuing local or political power.

Rates of violent activity that can be quantified from official records in western Europe suggest a large rise from the fifteenth to the seventeenth centuries, followed by a long decline to the late eighteenth century. Rates of violent crime based on indictments and inquests rose sharply from the 1560s to the 1620s, peaking at the turn of century at ten per hundred thousand. They then declined greatly in the mid-seventeenth century, when they reached six per hundred thousand, drifted lower in 1700, when they reached three per hundred thousand, and then declined significantly in the mid-eighteenth century, when they reached two per hundred thousand. In all countries, however, rates were highest in the borderlands and lowest in central urban areas.

PERSONAL VIOLENCE

The sixteenth century represented the apex of a long-term acceleration in personal violence that began in the decades following the Black Death of the mid-fourteenth century. Social, economic, and religious conflict nurtured violent solutions in an age where there were few institutions to control human activity. Thus personal violence rose in the midst of the decline of medieval institutions and the cobbling together of new ones that would form the early modern state. Personal violence, whether reactive, instinctive, or ritualized, became an acceptable form of human behavior.

However, a growing intolerance of brutality marked a shift in social psychology that developed in England, the Low Countries, Scandinavia, France, and Switzerland, and which later spread first throughout western Europe, and more slowly across the Mediterranean, in the course of the seventeenth and early eighteenth centuries. An increasingly civilized and sophisticated view of the behavior of middle class citizens, together with a stronger sense of “the peace of God” in Catholic and Protestant churches of the Reformation and Counter-Reformation, caused a movement away from violence as a means for the resolution of personal quarrels and disputes. Distressed by sensa-

tionist literature boasting graphic representations of murder and mayhem, the aristocratic and middle classes of Europe began to reform their behavior in what Norbert Elias termed “a civilizing process.” Without social support, many traditional forms of personal violence inevitably declined. At the same time, growth in the state’s control of violence through policing (particularly in France and Spain) and weapons licensing had a profound effect on communities, limiting opportunities for violence. Finally, with the decay of a popular culture grounded in violence and new expectations of social comportment enforced by the state’s judicial system, both group and interpersonal violence receded into the background.

However, perceptions of violence were not easily changed. The late seventeenth and early eighteenth centuries witnessed a surge of popular literature in the form of pamphlets and ballads that told gruesome tales of horrid violent acts; these materials were republished throughout the eighteenth century. This perception was also promoted by women who wrote best-sellers on sensational and scandalous violent acts by women, which became stereotypes in the literature of the era. Moreover, while group violence at the hands of the aristocracy was in decline, the rise of the duel among aristocrats came into vogue in the course of the seventeenth century, most significantly in France, Italy, and England, in spite of the admonitions of churchmen, lawyers, judges, and moralists. And while plebeian and gentlemanly delinquency was on the decline, individual aristocratic delinquency in the form of sexual and roisterous debauchery was on the rise. Thus while interpersonal violence had declined sharply in the overall population by the mid-eighteenth century, in its growing absence the public appetite for stories of violence had increased dramatically.

Much violence, however, was spontaneous. The Paduan artist Niccolò Pizzolo was murdered in a quick-tempered argument; the Mantuan painter Andrea Mantegna hired thugs to beat up rivals who pinched his designs; the Swiss artist Urs Graf displayed bouts of brutal beatings; the sculptor-painter Michelangelo of Florence had his nose broken in a fight with a fellow sculptor; and Christopher Marlowe was stabbed to death in a tavern brawl, as was the actor Gabriel Spencer by the London playwright Ben Jonson. Fencing grew in popularity in the six-

teenth century as the rapier became a favourite weapon of fashionable society because of its more flexible and lightweight qualities in violent confrontations. Many towns enacted legislation to ban the carrying of arms in public places, all to little avail. But most standards of behavior were flaunted, especially by youths at a time (late sixteenth and early seventeenth centuries) when male adolescents and young bachelors comprised a significant proportion of the population increase.

Violence was also embedded in the extreme passions of the fifteenth century, which continued into the sixteenth. Rapes, murders, fisticuffs, and knifings followed adulteries or rejections, as recounted in the stories of Margaret of Angoulême, Queen of Navarre, in the 1530s and 1540s. These passions also influenced perceptions that violent crime was “situationally determined”: they can be seen in the activities of cunning women in England, *muchachos* and *caballeristas* in Spain, *strollica* in Italy, *znakhar* in Russia, and *charivari* in France. They also can be found in the activities of people on the margins, such as suicides and witches, and the unrecorded inhabitants of marshes, forests, and moors.

Other examples of personal violence were clearly ritualized. These included, for continental Europe, punching a debtor until he agreed to pay, hiring assassins in family vendettas, and gathering armed bands to redress wrongs real or imagined. In German towns, initiation riots for journeyman aspirants to the Hanseatic merchant guilds included being hanged from a chimney until out of breath, thrown three times from a boat in the harbor and pushed back into the sea upon climbing in each time until the last, and being whipped bloody in the guildhall. Erasmus noted from his enlightened Rotterdam and Paris that the initiation ceremonies for schools were “fit for executioners, torturers, pimps or galley-slaves.”

Youth were often regarded by authorities as primary agents of personal violence. In Swiss and Italian towns, youthful vigilantes used violence upon older citizens who committed immoral sins such as gambling and the ostentatious display of wealth. In French towns, intervillage combat games led to beatings and killings, which were regarded as part of the culture of sport. In England, there are recorded examples of youthful cricketers beating one another

with their bats, and a statute from 1563 stated that a man under age twenty-four “is wild, without judgment and not of sufficient experience to govern himself.” Much of this violence was conditioned by their exposure to extreme cruelty early in life. Throughout Europe, cats were stoned to death, and bulls and bears were baited and maimed, as were individuals accused of criminal offences. It was not unusual for crowds to see impaled men on stakes thrown to the ground to be eaten by dogs and crows. As Juan de Mariana of Toledo wrote in 1599, killing beasts brutally was a short step from killing men.

Finally, women throughout Europe were responsible for their own violent acts. These acts were accepted because of the perception of sex: women, ruled by their physical body rather than by rational capacity, and aggressive in their actions, possessed magical powers over men. This was seen in the role of women in murder, rape, and suicide in contemporary writing, prose fiction, and drama. Sexual violence became a defining element in male-female relations through rape, ravishment, and seduction. Older women were also active in violence, especially in Ireland, Holland, and France in riots and rebellions against communities and the state. In Germany they were as apt as men to be tortured by church or state for acts as of ill conduct. Their violence, however, was more pronounced in towns than in the countryside.

STATE-SPONSORED VIOLENCE

Meanwhile, institutions of the state, through war, interrogation, and the courts, became major players in dispensing acts of violence against their own and neighboring peoples. While unquantifiable, it would be safe to assume that interpersonal relations became more peaceful in the course of the early modern era, especially in the second half of the seventeenth century, but that society as a whole became more violent with the actions of city- and nation-states from the late sixteenth to the early eighteenth centuries.

The sixteenth and seventeenth centuries were a time of ubiquitous violence unleashed by new nation-states. This was violence inflicted upon civilians by employed or discharged soldiers living in their midst; institutionalized violence such as torture and execution; violence associated with extra-legal dis-

pute resolution in the form of duels, feuds, and arbitration; interpersonal violence as assault, homicide, domestic violence, rape, and infanticide; group violence in the rituals of youth gangs, carnival, and sports; popular protest displayed in enclosure, food, and tax riots; and the organized crime of bandits and highwaymen. In the end, violence was never far from the consciousness of early modern Europeans.

War could be especially violent for civilian noncombatants. As Francesco Guicciardini wrote in 1525, “all political power is rooted in violence.” In the Schmalkaldic War of 1546–1547, Spanish troops suspended male civilians by their genitals, then tortured them to reveal where they had hidden their money and valuables; women and girls were raped. The link between personal and public violence was well expressed by Pierre de la Primaudaye in 1577: out of quarrels and dissension come sedition, civil, and open wars, and men, under the influence of war, “become savage.”

Violence was also a result of the growth of wealth in the era as it came to a few, while poverty worked its way into the many. Enclosure and the commercial cultivation of land caused rural depopulation and dearth, while swelling populations in towns and cities caused job competition and low salaries in an age of rising prices for food. Thus Leonardo da Vinci’s plan for an ideal town had upper walks for the gentility to protect them from the plebs. This idea came to symbolize one of the primary aims of the new seventeenth-century state: the suppression of disorder and the monopolization of violence in the form of ritualized public punishment. It proved workable in the new monarchies of France, Netherlands, and the British Isles, moderately feasible in Italian and German areas, and only partly possible in the Iberic world, Helvetic cities, and Nordic countries.

In the end, the dawn of the modern era of violence occurred in the late eighteenth century with the disintegration of monarchical governments and the rise of secular nation-states, organized bandits and brigades, and modern warfare. These institutions precipitated a professional police, central courts, and the prison as the royal power of the early modern era gave way to the state power of modern times. Thus the growth of the modern state from the sixteenth to the early eighteenth century con-

tributed to a shift in violence from personal to state controlled.

REGIONAL VARIATIONS

Europe comprises an area of diverse regions, and its geography has led to the work of the Annales School of quantitative research that has included violence as one of its subjects. In France and Italy, each region has a research leader and team. In other regions the focus has been on towns, as with the Burgundian, Flemish, Helvetic, Dutch, German, and Swiss. In the British Isles and Scandinavia, it has been a combination of both regions and towns. Most of the published research, however, has been on Italy, France, the Netherlands, Swiss and German towns, the British Isles, and Nordic countries. Results reveal that England, France, and the Netherlands were the most violent societies from the sixteenth to the mid-eighteenth century.

In England, there were various high points from the alleged execution of 70,000 rogues during the reign of Henry VII to the “crime wave” of the early 1600s. While criminal gangs were being eliminated and the violence of private warfare waged by the nobility was replaced with war in the courts (litigation), petty violence seems to have continued unabated, stimulated by the social and economic dislocations of the first agricultural and industrial revolution beginning in the late sixteenth century. In criminal acts, there was also a significant change from violent acts against persons (personal crime) to acts against property (property crime). But while noble violence was diluted by resort to the courts, violence was waged incessantly among the peasantry.

In Scandinavia, violence stemmed from personal conflicts, as is visible in the famous witch trials of the 1660s and 1670s that involved mostly old women. Here, in the Nordic countries, crimes of violence, especially lethal violence, underwent a major decline during the late seventeenth and early eighteenth centuries. As in England, violence became more tied to economic disputes, both rural and urban. Much of the violence caused by “honor” disappeared as disputes came to be resolved in nonviolent ways. However, by the late seventeenth century women came to be charged with one-third of all offenses because of sexual crimes that were first prosecuted during Reforma-

tion efforts to curb extramarital sex, infanticide, and witchcraft. Violent offenders were often goldsmiths, shoemakers, peasants, and farmhands; only soldiers were overrepresented after wars.

In poor and isolated regions of France, violence was directed downward, rarely upward, in the social order. Much of the violence was that of a riposte—informal justice administered by someone provoked into violent action. Here magistrates showed little interest in investigating popular traditions of “self-help.” A similar situation existed in Italy with the popular vendetta. This was demonstrated by the Zambardini family, who turned their victims into “dogmeat.” They dismembered corpses, leaving them unburied to be consumed by dogs or pigs, thereby denying their victims the rites of Christian burial and the hope of eternal salvation.

Regional variations also involved distinctions between violence in rural and urban settings. In the county of Essex, England, for example, the rate of interpersonal violence has been estimated as three times the national average. However, that may be due to the fact that Essex was the center of the Puritan movement, where local clergy were vigilant in having acts of violence reported, and where human acts previously regarded as nonviolent (such as child- and wife-beating) were now regarded as violent in nature and to be strongly condemned and eliminated. In major urban areas such as London, however, local authorities took a strong hand in highlighting major violent acts and creating institutions to reduce violence. Therefore, Londoners came to recognize the limits of terror with a new concern over violence associated with public hangings and their processions and public whippings in the streets; Londoners thus became advocates of the end of state-sponsored violence.

CONCLUSION

The historiography of violence has seen parallel developments with social history since the mid 1970s, where there are distinct typologies linked to politics and society and integrated into the wider historical context. Currently, there is an outpouring of theses, mostly on violence associated with homicide, infanticide, sexual offences, gender, dearth, and forms of punishment. Recent publications emphasize the role of the state, the deployment of central authority, and ideology. But there are few studies of vio-

lence from the view of the perpetrator, apart from London historians who have interpreted violent acts as strategies of the poor to aid their quest for survival in the eighteenth-century city.

LOUIS A. KNAFLA

VIRTUE. Virtue refers to a valued human characteristic or to excellence, or to the sum of such qualities. Hence, the term has an inherently normative or evaluative connotation, since it selects out forms of knowledge and action that are approved and commended. The notion of virtue in Western thought stems from the Greek word *arete* as translated into the Latin *virtus*. The concept has a long history in Europe and was widely employed in a

number of contexts—social and political as well as moral—during the early modern period.

In its earliest Greek expressions, “virtue” denoted the superlative prowess of the heroic warrior and thus possessed both highly individualistic and gendered implications. Although the latter never fully disappeared (hence the etymological connection between virtue and virility, both derived from the root *vir*, ‘man’), the former was subsumed into the communal sphere with the rise of the classical polis. Virtue and the virtues came to be regarded in the city-states of the ancient world as coordinate with the laws and customs of a given community. Thinkers as diverse as Pythagoras, Plato, and Aristotle agreed that the moral character of the individual constituted a microcosm of the political character of the city. The Greeks commonly identified four so-called cardinal virtues—courage, wisdom, justice, and temperance—although they also upheld the worthiness of many other qualities.

The ancient Romans and the European Christians generally embraced both the private and the public aspects of virtue. The popularity of philosophical schools such as Stoicism and Epicureanism among cultivated Romans and the other-worldliness and asceticism of Christianity tended to locate forms of virtue in the individual and to promote the priority of personal happiness over public good. Yet the Romans (particularly in the period of the Republic) also hailed the sacrifices of leaders and fellow citizens who were motivated by purely civic goals. Likewise, medieval Christians expected that government would be conducted by rulers whose actions fully accorded with standards of earthly rectitude, justice primary among them. To the list of cardinal virtues came to be added the so-called Christian or theological virtues of faith, hope, and charity.

The conventional wisdom about the fate of virtue in modern Europe charts an arc of its repoliticization during the Renaissance (in the guise of so-called civic humanism), followed by a period of redefinition and disappearance from the public sphere occasioned by the Protestant Reformation, the emergence of liberalism, the rise of commercial society, and the spread of Enlightenment values. This interpretation requires some qualification, however, inasmuch as the process was less one of

straightforward decline than of complex transformation.

The association of the Renaissance itself (especially in Italy) with the glorification of civic-minded virtue—the ethos of sacrifice for the sake of one’s fellow citizens and city—shared by members of a community (the so-called “civic humanism” thesis pioneered by Hans Baron) has come under serious and deserved challenge. While it is true that many of the greatest humanists of the fifteenth and sixteenth centuries embraced citizenship as the fullest expression of a virtuous human life, taking the Roman statesman-orator Cicero as their exemplar, others adopted alternative views. Praise of Caesar and the Roman Empire, and hence devaluation of civic virtue, was quite common among leading humanists. A further group of Renaissance thinkers maintained a more orthodox Christian account of virtue as essentially a mark of God’s grace or a trait that demonstrated one’s worthiness for salvation. Moreover, there was nothing essentially urban about the idea of public virtue as the foundation for a good state; such a view was as widespread at the courts of territorial monarchs as in the cities of the Italian peninsula. Conceptions of virtue in Renaissance thought simply lacked the uniformity implied by the civic humanism thesis as commonly stated.

Early modern Europe witnessed numerous attempts to redefine, challenge, or criticize both conventional public and private ideals of virtue. Perhaps the most famous example of this is Niccolò Machiavelli (1469–1527), who enjoys an infamous reputation for his attack on virtue, especially in its standard classical and Christian versions. In his *Il principe* (1513–1514; *The prince*), Machiavelli argues that virtue as taught by ancient philosophers and preached from pulpits is very often incompatible with effective use of political power. A ruler who seeks to govern according to the cardinal and theological virtues will lose his office, since others who are prepared to employ tactics that lack moral sanction will oust him in their own quest for position and glory. Machiavelli peppers his little book with tales of virtuous magistrates who have been ruined and vicious ones who have succeeded. According to Machiavelli, the only assurance that the prince can overcome the vicissitudes of politics is a readiness to act in a manner inconsistent with virtue when circumstances require it. The Machiavellian ruler is not

above counseling murder, deception, manipulation, and nearly every other mode of conventionally immoral conduct, if these acts prove efficient in maintaining hold on the levers of power. Machiavelli calls this moral flexibility *virtù* (the standard Italian word for ‘virtue’), thus apparently turning the conventional discourse of ethics on its head.

Yet Machiavelli is not guilty of “teaching evil,” despite the accusation made against him. In fact, his conception of *virtù* suggests that the ruler should always act according to commonplace virtue whenever he can do so without undermining his own power. Conventionally evil means should only be used when absolutely necessary, and even then the prince must do his best to ensure that people do not perceive him to be acting immorally, lest his reputation be harmed. Moreover, Machiavelli seems to think that this advice pertains only in the case of holders of public office; Machiavellian *virtù* is, one might say, a distinctively political way of acting, not to be commended to private persons in their interactions with one another. Nor ought it be forgotten that in his own political loyalties and other political writings, Machiavelli stood for a republican conception of civic virtue that lauded the sacrifice of personal goals and desires for the sake of attaining the communal glory of one’s city.

Machiavelli was not alone among early modern European authors in reformulating ideas about virtue inherited from the classical and Christian past. For example, many humanists posed questions about the connection between virtue and nobility as it had customarily been conceived. In this period, as in early times, blood and birth were regarded as bestowing nobility upon an individual, and nobility in turn qualified a person to wield power and rule over natural inferiors. But humanist writers proposed that virtue alone prepared men for political office, since those who were most virtuous were most likely to act for the common good. Hence, it was the virtuous who possessed true nobility (*vera nobilitas*), and virtue was by no means coextensive with paternity and landed wealth. In Italy and even more noticeably in northern Europe, invocations of virtue could easily be translated into challenges to the cherished principle that some people were “naturally born” to rule.

Another modification of traditional conceptions of virtue came with the continuing commercialization of European economic relations and social values. Whereas for the ancient philosophers and medieval Christian theologians the private accumulation of liquid wealth had been widely viewed as incompatible with virtue, early modern authors began to reevaluate this doctrine. Some thinkers, such as the Italian civic humanists Leonardo Bruni (c. 1370–1444) and Gian Francesco Poggio Bracciolini (1380–1459), contended that citizens should proudly acknowledge industriousness and self-acquired possessions as the foundation of morality and the greatness of their cities. Other authors went further. The Dutch-born Bernard de Mandeville (1670–1733) proposed in his *Fable of the Bees* (1714/1729) the famous principle that private vices yield public goods, which is to say that the pursuit of personal gain, and indeed the desire for comfort and luxury, lead directly to the enrichment of society as a whole and the consequent benefit of all its members.

In spite of recent claims that the Enlightenment project of grounding morality on human reason alone led to the erosion of virtue-based ethics, thinkers of the eighteenth century continued to uphold virtue as central to the worthwhile human life. The central document of the Enlightenment, the *Encyclopédie* (1751–1758) compiled by Denis Diderot and Jean Le Rond d’Alembert, treated virtue as an indwelling sense given to all members of mankind universally and without exception and thus invariable in its content across time and place. While the *Discours sur l’origine et les fondements de l’inégalité parmi les hommes* (1755; Discourse on the origins of inequality) and the *Émile* (1762) of Jean-Jacques Rousseau (1712–1778) seem to treat the conventional virtues as affectations imposed artificially and detrimentally upon naturally good humanity, their author still insisted upon virtue as indispensable for a free society. Using language that any civic republican might endorse, Rousseau stipulated in *Discours sur l’économie politique* (1755; A discourse on political economy) that virtue is realized when citizens conform their particular wills to the determinations of the general will. While the discourse of virtue may have been further transformed during the early Enlightenment, it by no means disappeared.

VITALISM. See Matter, Theories of.

VIVALDI, ANTONIO (1678–1741), Venetian composer and violinist. Vivaldi produced numerous instrumental and vocal works during his lifetime, but he is best known for his concertos for a diverse group of instruments. An important and influential musician during his career, his music figured prominently in the baroque revival of the 1950s and 1960s.

Born in Venice on 4 March 1678, Vivaldi suffered from what was described as *strettezza di petto* (tightness of the chest), which was probably bron-

Antonio Vivaldi. Portrait by an unknown artist. DAMIANO/GETTY IMAGES

chial asthma. This illness plagued him throughout his life and exerted a strong influence on his personal and professional behavior. Vivaldi studied the violin with his father, and he was also trained as a priest, but his asthma prevented him from effectively saying mass. Because of the red hair he inherited from his father, Vivaldi was known throughout his career as *il prete rosso* ('The Red Priest').

In September 1703, Vivaldi accepted his first position, as *maestro di violino* for the Pio Ospedale della Pietà, one of four "hospitals" established in Venice to care for poor orphaned children, and he would remain intermittently associated with this institution for much of his career. Musical training was an integral part of the curriculum for the young girls at all of the *ospedali*, and Vivaldi's responsibilities included teaching violin, buying new instruments, and maintaining the collection. He was dismissed from this position on 24 February 1709—the first of several dismissals and rehiring, largely the result of the precarious financial conditions at the hospital—but used the freedom to meet both

George Frideric Handel (1685–1759) and Domenico Scarlatti (1685–1757), who were in Venice at the time, and to begin writing operas. He returned to the Pietà in 1711, becoming *maestro de' concerti* in 1716, and successfully produced sacred and instrumental music, including trio sonatas, violin sonatas, the set of twelve concertos for one, two, and four violins called *L'estro armonico* (1711), and the oratorio *Juditha Triumphans* (1716).

Vivaldi spent 1718–1720 in Mantua, devoting himself to opera composition, and later traveled to Rome to produce three operas for the 1723 and 1724 carnivals, but he also wrote 140 concertos for the Pietà. Among these are *Il cimento dell'armonia e dell'invenzione* (in which we find his most famous work, the violin concerto *The Four Seasons* [*Le quattro stagioni*]), *La Cetra*, flute and string concertos, and *Il pastor fido*.

Vivaldi's questionable relationship with the singer Anna Girò and her half-sister Paolina dates from this period. Vivaldi vigorously denied all accusations of sexual impropriety, but the widespread rumors had a detrimental effect on his career and reputation.

Between 1729 and 1735 Vivaldi traveled widely to Vienna, Prague, and several Italian cities to supervise productions of his operas, and he ultimately returned to Vienna at the age of sixty-two, in the hope of securing patronage from Charles VI. His efforts met with limited success, and he died on 28 July 1741, receiving a pauper's funeral at Vienna's Cathedral of St. Stephen.

Vivaldi was extraordinarily prolific, producing over five hundred concertos for almost every combination of instruments, solo and trio sonatas, instrumental sinfonias, and an impressive body of sacred music, including oratorios, masses and motets. Twenty-one of his operas have survived, at least in part, although their full artistic and dramatic power has yet to be evaluated.

Vivaldi's highly distinctive and recognizable musical style had a profound impact on his contemporaries and future composers such as Giuseppe Tartini (1692–1770). His greatest influence was in the development of the concerto. Vivaldi has been credited with inventing or at least regularizing “ritornello form,” usually employed in fast movements, in which a “refrain” played by the full en-

semble alternates with freer, modulatory episodes played by the solo instruments. His deft coordination of melody and harmony was much admired by Johann Sebastian Bach (1685–1750), who absorbed Italian style through his study and transcription of Vivaldi's concertos and trio-sonatas; this influence is particularly apparent in Bach's *Brandenburg Concertos*. Other distinctive elements of Vivaldi's style include a fluid alternation of major and minor tonalities, a highly progressive use of dissonance and rich harmonies, and an innate melodic gift, particularly in slow movements. His vocal music has been criticized for perfunctory text-setting and violinistic vocal writing, but there are examples of great skill and inspiration in this genre, such as his *Gloria* (RV 588) or *Magnificat* (RV 610), and his virtuosic and highly expressive motets for solo voice. Vivaldi was unquestionably a master orchestrator who explored the idiomatic potential of the many instruments for which he wrote. *The Four Seasons*, for example, not only illustrates his skill in writing for the virtuoso violinist, but also his ability to depict extramusical or programmatic ideas in a manner that anticipates the Romantic era.

WENDY HELLER, MARK KROLL

VIVES, JUAN LUIS (1492–1540), sixteenth-century Spanish humanist. Juan Luis Vives spent most of his life outside Spain. Born in Valencia to a family of Jewish converts to Christianity, Vives began his studies in his native city but eventually chose to move to Paris in 1509, possibly fearing the Inquisition, whose severity would eventually take a toll on his family. In Paris he studied in the colleges

of Beauvais and Montaigne along with other Spanish scholars like himself. In 1512 Vives left Paris and settled in Bruges, which he would call his home for the rest of his life. In 1516 the scholar from Valencia met Erasmus of Rotterdam, an encounter that initiated a decades-long association between the two and helped bring Vives into the circle of humanist thought.

In 1519 Vives was teaching at the University of Louvain, where, under Erasmus's influence, he undertook one of his most important works, a commentary on St. Augustine's *City of God*, published in Basel in 1522 and dedicated to Henry VII of England. It seems Vives's fame was extensive, for that same year he was offered a chair at Spain's prestigious University of Alcalá, recently vacant due to the death of the godfather of Spanish humanists, Antonio de Nebrija. He refused the honor and instead found himself one year later in England, teaching at Corpus Christi College, Oxford. He was named tutor to the princess Mary and reader to the queen, Catherine of Aragon, by Henry VIII. In 1523 he dedicated his *De Institutione Feminae Christianae* (On the education of a Christian woman) to the queen. His relationship with the royal family would become complicated, however, when he sided with Catherine in the dispute over Henry VIII's wish to divorce her for Anne Boleyn. Although he did not lose his life, as did his friend Sir Thomas More, Vives was eventually banished from England by the king. By then a married man, Vives returned to Bruges in 1528, where he would remain until the end of his life, resuming his post as professor at Louvain.

A prolific writer, Vives focused his formidable intelligence on a wide range of subjects. He had specific ideas about education, to which he devoted a number of works, railing against the utilitarian concept of knowledge as information as well as the idea of studying in order to obtain fame. In *De Institutione Feminae Christianae*, he defended the education of women, but it would be an exaggeration to label him a proto-feminist. Perhaps one of the best-known traits of Vives's thought is his criticism of a type of Scholasticism that had degenerated into a fixation on dialectics and syllogisms. In his monumental encyclopedia *De Disciplines Libri XX* (1531; Twenty books on the disciplines) Vives insisted that dialectics be subordinated to the other

Juan Luis Vives. Anonymous sixteenth-century portrait.
©ARCHIVO ICONOGRAFICO, S.A./CORBIS

branches of philosophy such as morals and metaphysics. He also leveled frequent criticisms at his contemporaries' slavish reliance on ancient philosophical authorities to the detriment of the exercise of human reason, though he always did so with a genuine respect for Aristotle and his commentator Thomas Aquinas.

Vives's treatise *De Anima et Vita* (1538; On the soul and life) is recognized as a foundational text in the study of the inner life of the human being. In Vives's view, in order to know the soul, one must study its operations and functions, a study that is founded on a thorough knowledge of earthly life in its different forms. The third book of *De Anima et Vita*, an examination of the passions, takes much of its inspiration from the Scholasticism of Thomas Aquinas, but it has also gained Vives a place among the precursors of modern psychology, thanks to its employment of introspection and self-observation.

Thoroughly interested in the affairs of his times, Vives was an avid letter writer and corresponded with kings, cardinals, and emperors. Later dubbed a pacifist because of his desire for peace among peo-

ples and his special concern for ending the fratricidal wars afflicting Europe, Vives also pointed out the threat to Christendom posed by Turkish expansion in the Mediterranean in works such as *De Conditione Vitae Christianorum sub Turca* (On the conditions of Christians under the Turks).

Though an educator by vocation, Vives was also a commercially successful author, and some of his most popular works were dedicated to the subject of Christian apologetics and devotion. His last book, which he was working on at the time of his death in 1540, was entitled *De Veritate Fidei Christianae* (On the truth of the Christian faith).

DAMIAN BACICH

VIZIER. Vizier, ‘helper’ or ‘deputy’, a term first employed in the Koran, evolved to mean ‘chief minister’ in early Islamic history, possibly becoming an office of Arab administration with the Abbasid Caliph al-Mahdi (775–785). The title vizier was applied widely as an honorific for representatives of the caliph or sultan. The term “grand vizier” denoted those chief, or prime, ministers who served the Ottoman sultans from 1300 to 1923.

ORIGINS OF THE INSTITUTION

The Perso-Turkish word vizier (also “vezir,” or “vizier”) originates in the Arabic *wazīr*, and appears in the Koranic verse “We gave Moses the book and made his brother Aaron his wazīr,” (Koran, chapter XXV: 35), denoting a helper. Viziers quickly assumed the role of second-in-command in early Islamic history, the most famous among the Abbasids being the Barmakid family of advisers and secretaries under Caliph Harun al-Rashid (786–809). By the eleventh century, the power and obligations of the vizier were delineated in Muslim administrative manuals, which frequently described the office as subordinate only to the caliph or sultan. Vizierial households, in imitation of those of caliph or sultan, became centers of tremendous wealth, ostentation, and intellectual and artistic patronage. The tension between the two most powerful figures of Muslim courts, the ruler and his vizier, is one of the most common struggles represented in early histories and transmitted into western literature, as Shakespeare’s *Othello* attests.

The title of vizier could be differentiated, as it was under the Fatimid dynasty in Egypt (969–1171), and was sometimes carried by military officials, who developed an independence of action in the latter years of that dynasty. In Muslim Spain (Andalusia), where the term *bājīb* was the equivalent of vizier, multiple viziers abounded, with as few as ten or as many as twenty-nine in place at one time

In Persia, viziers were perceived as servants of the ruler rather than the state, and often they were charged with overseeing financial affairs. Mahmud,

founder of the Ghaznavids (998–1030), had six viziers, of whom three were dismissed and died violently, two were dismissed and stripped of their wealth, and the sixth executed; such treatment was testimony to the hazards of the position. Inheritors of Ghaznavid court practices, both the Seljuk and the Ottoman dynasties maintained the office as a well-defined and extremely powerful position. Of special note is Nizam al-Mulk (vizier 1063–1092), who served two Seljuk sultans and exercised the greatest of powers of any vizier up to that time. Beyond tending to the general affairs of the sultan, Nizam al-Mulk was also responsible for religious affairs and for diplomatic relations with foreign rulers. He also on occasion led the army on campaign. Nizam al-Mulk amassed legendary wealth and armies of slaves, founded an educational system known as the Nizamiya, and compiled one of the best-known pre-Ottoman manuals on administrative practice, *Siyasetname* (The Book of government).

GRAND VIZIERS UNDER THE OTTOMAN EMPIRE

Historians have made much of the Seljuk and Ottoman practice of staffing the administration from non-Turkish stock, as was the case with Nizam al-Mulk. The Ottomans, especially after the conquest of Istanbul in 1453, were also inclined to choose the grand vizier from its officials who had been conscripted and converted from the Christian populations of the Balkans (called *kul kapikulu*, ‘slaves of the court’); these were mainly Albanian or Serbian peoples. After the 1550s, when the Ottomans colonized Hungary, Croats and Hungarians populated the *kul* ranks. Similarly, in the eighteenth and nineteenth centuries, sultans Selim III (ruled 1789–1807) and Mahmud II (ruled 1808–1839) preferred Georgians or Circassians for their grand viziers, since the trans-Caucasus region was then a ready source of slaves. Ethnic preferences may have influenced the sultans’ choice of servants, but at least in the early days of the empire, the administrative experience of the non-Turkic populations was especially valued. In any case, unquestioning loyalty was seen as more forthcoming from slave converts than from freeborn Muslims.

Under the Ottomans, as elsewhere, the title of vizier distinguished lesser officers of the empire, often in hierarchical order (as part of the *erkân-i*

devlet, ‘pillars of the state’, of the *divan-i hümayun*, ‘imperial council’), but grand vizier or *sadrâzam* (also *vizier-i azam*) was the most powerful officer after the sultan. Before 1453, the grand vizier was appointed from among the religious class and was often a judge (*kadi* or *kazi*). Between 1385 and 1453, the Candarli family held the office, and all were judges. After 1453, the *kul*, military rather than religious men with expertise in financial and chancery affairs, dominated the office (Inalcik, p. 195). Palace factions of new sultans tended to influence the appointments of the grand vizier, and there was frequently a complete restaffing of the bureaucracy after a new accession. In the second half of the seventeenth century, a severe crisis led the sultan to grant Grand Vizier Mehmed Köprülü extraordinary powers, and a separate administrative office, the Babiali (the Sublime Porte), was created to restore the stability of the empire. For half a century, the Köprülü family dominated the office, reorganized the economy, restored order throughout Ottoman territories, and dealt increasingly with foreign affairs. Grand viziers in the eighteenth century were often appointed after serving as *reisülküttab* (head of the chancery, later foreign affairs minister). Especially notable was Koca Ragib Pasha (ruled 1757–1763), who served two sultans after negotiating earlier treaties with Nadir Shah of Persia and the Habsburgs at Belgrade in 1739. Koca Ragib associated with a large circle of intellectuals and built his personal library, which was opened to the public and still operates in Istanbul.

The grand vizier led all military campaigns after 1700 and served as head of the imperial council, where he and the other viziers, as the primary representatives of the sultan’s authority, discussed state affairs. Many viziers married daughters and sisters of the sultan and were subsequently called *damad*, ‘bridegroom’, acquired rights to revenues of vast estates, and were granted stature matched only by that of the royal house. Some, such as the famous Damad Ibrahim Pasha, who was grand vizier to Suleiman the Magnificent (ruled 1520–1566) from 1523 to 1536, lost their lives when they overstepped their bounds in emulating the sultan. The office was always precariously secured and held and very often ended with confiscation of wealth, exile, and/or death. By the mid-nineteenth century, the power and prestige of the vizier had declined; the

office had assumed the proportions of a modern-day minister.

VIRGINIA H. AKSAN

VOLTAIRE (François-Marie Arouet; 1694–1778), French philosopher, historian, dramatist, and poet. Voltaire was born in Paris 21 November 1694, the son of a successful notary. A prolific philosopher, historian, and writer in numerous genres and a tireless champion of freedom of thought and expression, no figure better represents the spirit of the French Enlightenment than Voltaire.

Three years after the death of his mother (née Marguerite Daumard), Voltaire entered the Jesuit Collège Louis-le-Grand in Paris, in 1704, where he spent the next seven years. Following his studies, Voltaire frequented the libertine society of the Temple and began to exercise his literary talents by composing satirical light verse as well as his first play, *Oedipe*, completed in manuscript in 1715. In 1716 Voltaire was exiled from Paris because of an epigram against the regent, and in May 1717 was sent to the Bastille, accused of further inflammatory writings. Shortly after his release, *Oedipe* was staged

in November 1718, its brilliant success making him an overnight celebrity, considered France's preeminent poet. It was at this point that he adopted the name Monsieur de Voltaire, not only a *nom de plume* but also an index of his lifelong aristocratic aspirations.

The self-styled nobleman received a harsh but transformative lesson in 1726, when following a quarrel with the chevalier de Rohan, Voltaire once again found himself imprisoned in the Bastille and then was exiled to England for two years. Rightly or wrongly, Voltaire saw in England a model of political freedom and, above all, religious tolerance, which was to result in his hugely popular and influential *English Letters* (published first in England in 1733, in English and French versions, then in France in 1734). During his British sojourn, Voltaire, having acquired reasonable competence in English, read numerous English writers and thinkers, but it was above all the works of John Locke and Isaac Newton that earned his enduring admiration.

While a number of biographers and critics have overstated the intellectual impact England was to have on Voltaire—his deism and skepticism certainly predated his exile—it is clear that England had the effect of consolidating his militant opposition to intolerance and dogma in politics and religion, and just as importantly, made him a partisan of British sensualism (in Locke), and the "new philosophy" of scientific method (in Newton and his precursor, Francis Bacon). In France Voltaire became the greatest popularizer of Newtonian physics (publishing *Elements of Newton's Philosophy* in 1738) and a driving force behind the Enlightenment's anti-metaphysical, positivistic, and scientific bent in which the Cartesian rationalism of the French classical age gave way to the influence of English empiricism.

The English exile set the stage not only for Voltaire's abiding philosophical concerns but also for a life spent mostly outside Paris. From 1734 he lived at Cirey with his mistress, Émilie du Châtelet, until her death in 1749. For a number of years prior to her death, Frederick the Great of Prussia (ruled 1740–1786) had sought to bring Voltaire to Potsdam and Berlin, and in 1750 Voltaire took up the offer; but the nearly three years he spent with Frederick ended in bitter disillusionment for both par-

Voltaire. Portrait after Maurice Quentin La Tour. THE ART ARCHIVE/MUSÉE DU CHÂTEAU DE VERSAILLES

ties. After five years moving from one side of the Franco-Swiss border to the other, in 1759 he purchased the chateau of Ferney, just outside Geneva, which over the years he built into a sprawling estate, home to various cottage industries that added to his already considerable fortune, and a cultural crossroads where Voltaire hosted innumerable guests. He lived and worked there until the last year of his life. In February 1778, he returned to Paris to produce his last play, *Irène*, and his triumphant return to the capital was a legendary moment in French cultural history, so overwhelming that the eighty-four-year-old Voltaire remarked that he was being “killed with glory.” After a long life of notorious ill health and hypochondria, he died during the night of 30 May.

Today Voltaire is read above all as a philosopher—in the restricted sense that word had in the French eighteenth century—and as an acerbic social critic who railed against injustice, metaphysical absurdity of every ilk, clerical abuse, prejudice, and superstition. Those threads came together bril-

liantly in his 1759 philosophical tale, *Candide*, in which he lambasted the idealist doctrine of pre-established harmony and the “best of all possible worlds” promulgated by Gottfried Wilhelm Leibniz and his followers Alexander Pope and Christian Wolff. *Candide* was written largely in response to the death of thirty thousand victims of the 1755 Lisbon earthquake and as an exposition of the problems raised in his hastily drafted 1755 *Poem on the Lisbon Disaster*. In response to the question of evil, Voltaire abandoned any claim on a metaphysical explanation of human affairs, proposing instead that we “cultivate our garden,” that is, that we focus on local and practical concerns, faced with an order of experience that may in some sense be providential but whose mechanism escapes our reason. Voltaire had explored the problem of theodicy and providence in his earlier tale, *Zadig* (1747), which along with *Micromégas* (1752) and more than twenty other philosophical tales, made Voltaire the master of one of the French Enlightenment’s most fecund and innovative literary forms.

Yet Voltaire thought of himself perhaps more as a poet, playwright, and historian than as the mordant satirist acknowledged today. His career began and ended with the theater; in between, he produced a dozen or so plays, with varying degrees of success. Today they are rarely read or staged. From the light verse of his youth to the epic *Henriad* and the bawdy *Maid of Orleans*, the epicurean *Mondain*, and his *Poem on Natural Law*, among many others, poetry also held a central place in his oeuvre. In the domain of history, Voltaire (who was appointed royal historiographer in 1745 and elected to the French Academy in 1746) composed works on Charles XII, Louis XIV, and Louis XV. As with his plays and poetry, these books are today little read. Other works of nonfiction have fared better: the *Essay on Manners* (1754), the *Treatise on Tolerance* (1763, written after Voltaire had intervened in the Calas affair, in which a Protestant man was wrongfully executed on the charge of killing his son who wished to convert to Catholicism), and the *Philosophical Dictionary* (first volume published 1764) remain enduring classics.

Voltaire’s overwhelming importance and influence in the eighteenth century lie in his promotion of the force of reason and justice, his ironic wit, and his unparalleled skills as a propagandist of the ideals

of the Enlightenment. In a career ranging from the end of the reign of Louis XIV to the reign of the last king of the *ancien régime*, Voltaire was France's clearest, most prolific, and most enduring voice of dissent.

PATRICK RILEY, JR.

VOUET, SIMON (1590–1649), French painter. Since the late seventeenth century, most historians of French art have justifiably considered Vouet to be the founder of the early modern school of French painting. Born in Paris, the son of a minor court painter and grandson of the Master of the King's Falcons, Vouet was a child prodigy who was perfectly situated to receive the best possible exposure to great works of art, and the best training, which probably began with his father. At the age of fourteen he was already recognized as a successful portraitist, and at the age of twenty-two he was

selected by the crown to travel to Constantinople with the French ambassador to paint portraits of important foreign dignitaries.

On his return from the Near East, Vouet traveled through Italy and settled in Rome, which was at that time the center of the art world. There, like so many artists of his generation, he painted in a Carravaggesque mode, but one that sought to infuse this tenebrist approach with delicacy and refinement (*St. Jerome and the Angel*, c. 1622, National Gallery of Art, Washington, D.C.). His commissions at this time included altarpieces or complete decorations for the Raggi Chapel of the Gesù in Genoa, the Alaleoni Chapel in St. Lorenzo in Lucina in Rome, and the Charter House of St. Martin in Naples. He achieved so much success in Rome that in 1624 he became the first non-Italian to be elected director, or prince, of the Accademia di San Luca, where his insistence on a solid grounding in principles of good draftsmanship—that is, figure drawing—was greatly admired. Cardinal Richelieu and Louis XIII kept a close watch on this precocious talent by supporting him in Rome, and by 1626, he was offered a *brevet du roi*, accompanied by a lucrative pension and suitably noble housing in the Louvre for himself, his family, and his atelier.

Upon his return to Paris in late 1627, knowing that Carravaggio (1571–1610) and his followers were never really appreciated in the French capital, Vouet gradually altered his manner. During his four-month stop in Venice on his return journey from Rome, he modified his heavy chiaroscuro with the grace, fluidity, and color of northern Italian painting. As a result, Vouet became unequaled in Paris for grand decorative painting, where slightly elongated monumental figures with swirling draperies slowly float across the surfaces of his large canvases (*Allegory of Wealth*, Louvre, Paris). His manner was an astute blend of sixteenth-century mannerist French court art at Fontainebleau, the Romano-Bolognese classicism of the Carracci, the naturalism of Carravaggio, and the extravagant color, lively facture, and dazzling light of sixteenth-century Venetian artists. The genius of Vouet's elegant inventions was conveyed by the power of his draftsmanship, as is evident in the numerous drawings that survive. Most of them are elegant figure studies that reveal his use of firm, sweeping contours

Simon Vouet. *St. Jerome and the Angel*, c. 1622. NATIONAL GALLERY OF ART, WASHINGTON, D.C.

that effortlessly render the human form in motion. Only a small number of composition studies enable us to comprehend the genesis of his designs.

Vouet's ever-increasing success led to numerous ecclesiastic commissions for altarpieces (St. Nicolas-des-Champs, St. Eustache, and the Novitiate of the Jesuits), and an even greater number of royal and private commissions for both religious and secular decorations at the Louvre, the Palais Royal, the Palais du Luxembourg, the Hôtel Séguier and the chateaux at Chilly, Chessy, Fontainebleau, Poitou, Rueil, Saint-Germain-en-Laye, and Wideville. Being in such demand required an increasing number of skilled hands in a remarkably organized studio. His extraordinarily busy atelier utilized, trained, and influenced more than a generation of painters and printmakers. These artists included François Perrier, Nicolas Chaperon, Charles Poërsen, Pierre Daret, Michel I Corneille, Noël

Quillerier, François Bellin, Pierre Patel l'aîné, Eustache Le Sueur, Michel Dorigny (1616–1665), and François Torteбат (1616–1690). These last two became his sons-in-law and made etching or prints of many of his works. As each of these artists matured, they actively participated in the master's vast decorative campaigns. A generation later, the possibilities of this well-run enterprise would be taken to even greater heights by his most famous student, Charles Le Brun, in the service of Louis XIV.

Unfortunately, most of Vouet's decorative ensembles have been destroyed or dismantled. However, well aware of his posterity, Vouet owned his own printing press and was granted a royal privilege to replicate his designs. This encouraged an atmosphere of experimentation with printmaking that led Perrier, Dorigny, Torteбат, and others to inter-

pret in etchings and engravings a large portion of his most celebrated commissions.

ALVIN L. CLARK, JR.

WAGES. The history of wages in early modern Europe is a study of contrasts. To begin with, most people toiled on family farms or in family enterprises. Hence wages were a dominant part of income for only a small fraction of the population. Nevertheless, hiring workers for wages and working for someone else part of the time were extremely common. The tension between these two facts has informed the two key debates about wages in the early modern period. The first debate, accepting the ubiquity of paid labor, uses wages to infer standards of living and thus examine Malthusian cycles. The second debate involves both the extent of wage labor and the institutions that made it respond or not respond to the laws of supply and demand.

In 1798, the British social theorist Thomas Malthus (1766–1834) argued that in agrarian economies (agriculture absorbed two-thirds of all workers in nearly all European regions prior to 1800) incomes depended on the ratio of land to population. More land allowed higher output per person; more people drove down the output per person. Because land rents increase when land is scarce, wages are even more sensitive to scarcity than output per person. This narrative has been adopted, with slight variation, by many different scholars who believe that these iron laws held firm for millennia. For some, these shackles were eventually broken by the increased use of coal, for others by access to the agricultural output of the New World, or even by technical change broadly defined and dated to sometime in the mid-eighteenth cen-

tury. From the time of the Black Death (mid-fourteenth century) to the 1750s, wage series did follow a broad Malthusian pattern. In England, for instance, wages started from a low in the mid-1300s, rose for nearly a century and a half in response to the epidemic's massive mortality rate, then fell for an equally long time, bottoming out in the seventeenth century. The rise of wages in the eighteenth century was not pronounced, but wage stability in the face of massive population growth was nonetheless an important achievement. Bits and pieces of this story can be seen in all European countries, though each in its fashion raises questions about the standard Malthusian model.

In recent years, Malthus has been under strong challenge. First, as Van Zanden states, wages are not income. At the individual level, nonwage compensation—from common rights, or home manufacture, for instance—was an important element of most families' income in the early modern period. At the national level, earnings from land, capital, skills, and entrepreneurship were of considerable value, even though their distribution was quite different from that of wages. As the recent historical record suggests, economies can experience massive growth without witnessing much real wage increase for the unskilled. In the past as in the present, one should investigate wages with some concern for inequality.

Second, and more problematic, is the evidence that comes from examining regional patterns in wages. Regional variation in wages at any point in time is of the same order of magnitude as the two-

century variation in wages of a local Malthusian cycle. If we compare high wage regions to low wage regions Malthus's theory fails again. In fact, high population areas did not have low wages. On the contrary, economically leading areas were most often very densely populated relative to the European hinterland. Northern Italy, the Low Countries, and England all were or became densely populated in their period of economic leadership; and they were all also high wage economies. Economic historians now argue that Malthus's emphasis on endowments and demography explained in part the evolution of economies and wages. Political institutions and economic institutions have at least as much importance.

The second debate arrays two sides. On one side scholars argue that families in the early modern era preferred self-sufficiency to the uncertainty or unfairness of market interaction. Therefore they avoided labor markets. These scholars also argue that, unlike in modern society, workers and their employers were enmeshed in a web of social relations that only capitalism would break. In this view, labor exchange was relational rather than market-driven. In such a situation, one would prefer to employ an acquaintance at a higher wage rather than hire an outsider for less. In contrast, the argument continues, modern factory workers have no social relations either with management or with the distant shareholders of the corporation they work for; hence wages are free to reflect the iron law of supply and demand.

That view has come under repeated challenge. In part, this is because the arguments that seek to differentiate early modern from modern labor markets have been made on unsound quantitative evidence and are based on a very naive view of how labor markets operate. When scholars take into account that labor markets are always imperfect, differences between those of the preindustrial and contemporary eras cease to be differences in kind.

The market-avoidance argument fails for empirical reasons: only a small fraction of farms and enterprises were the right size to have an exact balance between their labor demand and their family labor supply. Imbalances arose for different reasons, including seasonal peaks in labor demand at harvest, the demographic cycle in crafts, and the difficulty of adjusting farm size to family size. Therefore many,

probably most, families either bought or sold days of labor, earning or paying wages. These wages did reflect supply and demand, rising in summer as demand for labor increased, and falling when population growth was rapid and during bad harvests, when the amount of work was reduced, and so on.

There were some important exceptions. For instance, in eastern Europe the strengthening of serfdom stymied labor markets. But there were other areas, like the Low Countries, where wage labor was quite prevalent by the end of the Middle Ages. Overall, the extent of wage labor seems to have paralleled the extent of markets in general: where trade and commerce were more active, one could observe more active labor markets.

JEAN-LAURENT ROSENTHAL

WALLENSTEIN, A. W. E. VON (originally Waldstein; 1583–1634), Bohemian noble, soldier, and statesman who played an important role in the Thirty Years' War (1618–1648). Albrecht Wenzel Eusebius von Wallenstein was born in Bohemia (today the Czech Republic). Given a Protestant upbringing, he converted to Catholicism in 1606. In 1609, his Jesuit confessor arranged his marriage to a wealthy widow who may have been some ten years his senior. When she died in 1614, he inherited all her estates. During the Bohemian rebellion that began in 1618, he remained loyal to the ruler, the Holy Roman emperor Ferdinand II (ruled 1619–1637), and profited enormously from the latter's victory over the rebels. He was appointed governor of the kingdom of Bohemia and bought up a large number of confiscated estates so that he came to possess most of northeastern Bohemia. These estates were consolidated into Friedland, of which he became duke in 1623.

In 1625, when the emperor decided to raise an army of his own to counter the threat from Christian IV of Denmark (ruled 1596–1648), Wallenstein was the obvious choice to be commander in chief; he was appointed on 7 April. It is often said that he raised and paid for this army at his own expense, and there is certainly some truth to it: he was able to put together a force of over 24,000 without recourse to the imperial treasury. His great

personal wealth and his ability to obtain loans were important factors, but Wallenstein's primary aim was to sustain his forces with requisitions from any territory they occupied. He also used his duchy of Friedland as a source of supplies.

During the Danish phase of the war (1625–1629), Wallenstein enjoyed considerable military success. He defeated the Protestant commander, Count Ernst of Mansfeld, at Dessau in 1626, and early in 1627 he marched into Holstein and Jutland (the Danish mainland) before turning east into Mecklenburg and Pomerania. The dukes of Mecklenburg had supported Christian IV, so the emperor deprived them of their titles, transferred their confiscated estates to Wallenstein (February 1627), and the following year made him the sole duke of Mecklenburg (January 1628). This arbitrary move caused some disquiet among all hereditary rulers.

The campaign of 1628 was anticlimactic. The complete defeat of Denmark turned out to be an impossibility: although the emperor appointed Wallenstein "General of the Oceanic and Baltic Seas" in February 1628, without a fleet the Danish islands were beyond his reach. He attempted to capture the port of Stralsund in the summer of 1628 (May–July), but without success. Although he defeated Christian again at Wolgast in September, Wallenstein warned the emperor that if peace were not made, Sweden might undertake a full intervention. He also warned that the cost of maintaining his 100,000-strong army was placing an intolerable burden on the north German states. Peace was made at Lübeck (July 1629).

Wallenstein's success and his financial exactions from friend and foe alike created enormous resentment and, with the coming of what was thought to be peace, the princes turned on him at the Electoral Diet in Regensburg and made a formal request for his dismissal on 16 July 1630. Surprisingly, Ferdinand agreed to comply; the general was dismissed on 13 August. Equally surprising was the fact that Wallenstein also complied. Indeed, it would appear that he had come to feel that the maintenance of such a large army was unsustainable and greeted the end of his responsibility with relief. Although there are some indications that Ferdinand had come to distrust his general, his dismissal deprived the em-

peror of military power just as he faced invasion from the Swedish king, Gustavus II Adolphus.

The success of Gustavus II Adolphus in 1631 forced the emperor to recall Wallenstein, and he was appointed commander in chief (with considerable powers) once again in April 1632. Although he was not victorious at the Battle of Lützen in November, the death of the Swedish king in that battle created a new political situation. Surprisingly, Wallenstein did not go on the offensive, but sought to conduct negotiations with all concerned parties in an effort to bring peace (and probably to obtain territory and titles for himself). However, his independence, his alleged double-dealing, his reliance on astrological predictions, and his bizarre behavior (it was asserted that on arrival in any town he ordered all dogs and cats to be killed because he did not like the noise they made) undermined his credibility with everyone. By now he had become a liability to the emperor, who saw him as a traitorous conspirator (and dispensable now that Spanish aid was imminent). Accordingly, in January 1634 he ordered Wallenstein's capture (or liquidation), and the following month he was assassinated—by an Englishman, an Irishman, and a Scotsman.

Wallenstein was the most important military entrepreneur in the Thirty Years' War, and his alleged treason and murder have overshadowed the considerable success he had in his first imperial generalship (1625–1630), when he raised the emperor to the zenith of his power. An enigmatic figure, his life became the subject of a dramatic trilogy by the German poet, Johann Christoph Friedrich von Schiller.

GRAHAM DARBY

WALPOLE, HORACE (1717–1797), English statesman and man of letters. Although Horace Walpole sat in the House of Commons from 1741 to 1768, he did not pursue an orthodox career as a statesman. An intense and acutely sensitive man, Walpole was temperamentally unsuited to the cut and thrust of political battle, and preferred to work behind the scenes as a pamphleteer, a gossip, a networker and, ultimately, a historian.

Walpole was fiercely loyal to his family and friends, and herein lies the key to all his politics. He never failed to support his friend and cousin, Henry Seymour-Conway, while disliking all critics and enemies of his father (Sir Robert Walpole). All but one account of Horace Walpole's political career have been marred by a failure to recognize his homosexuality, without which it is impossible to understand the depth of his hatred for Henry Pelham and the duke of Newcastle, the brothers of Catherine Pelham, whose arranged marriage to Walpole's one-time lover Henry Fiennes-Clinton, earl of Lincoln, took place in 1744.

Horace Walpole's hostility to the Pelhams has usually been explained in terms of his belief in their disloyalty to Robert Walpole, whom they "deserted" when his ministry began to crumble. Although the Pelhams succeeded Robert as leaders of the Court Whigs, Horace did not join them after his father's death, aligning himself instead with Richard Rigby and Henry Fox. When Fox joined a ministry in partnership with Newcastle in 1756, Walpole operated behind the scenes to annoy and frustrate both while remaining on ostensibly

friendly terms with Fox. Walpole's unsuccessful attempt to prevent the execution of Admiral John Byng for failing to prevent the loss of Minorca may have been partly motivated by the desire to embarrass Fox and Newcastle, suspected by many of having found a scapegoat for a more serious error of military judgment. At any rate, Walpole's *Letter from Xo Ho, a Chinese Philosopher at London, to his Friend Lien Chi at Peking* (1757), which pithily summarized the hypocrisies of Byng's impeachment, established Walpole as a witty and dangerous pamphleteer.

Walpole was most active from 1763 to 1767, when he acted as a political mentor to Conway. Both men had voted against George Grenville's ministry to defend the freedom of the press, then threatened by government action against the opposition M.P. John Wilkes, an outspoken critic of the crown, and the *North Briton*, a newspaper that printed his articles. George III, angered by what he perceived as insubordination, ordered Conway's dismissal from his regiment and court position, whereupon Walpole joined the opposition and began intriguing to bring down the Grenville ministry. When the Rockingham Whigs took office in 1765, Conway became secretary of state for the Southern Department and leader of the House of Commons. Walpole, however, was offered nothing, and a brief estrangement took place between the two. In April 1766, he resumed his place as Conway's adviser, notwithstanding the latter's cooling enthusiasm for politics, and became an inside observer of the Rockingham and Chatham ministries. When Conway decided to resign the lead in the Commons at the end of 1767, Walpole also decided to leave political life, and returned to his other occupations as author, publisher, art critic, and antiquarian.

Although Walpole is one of England's greatest letter writers, whose correspondence is an invaluable source for the political, social, and cultural history of mid-Hanoverian England, his *Memoirs of the Reign of George II* and *Memoirs of the Reign of George III*, written for posterity and published after his demise, provide a lively narrative of political events and personalities from 1751 to 1772. Both were much maligned—unjustifiably so—by nineteenth-century critics. Of the two works, the *Memoirs of the Reign of George III*, written between 1766 and 1772, are the more valuable, for they describe

Horace Walpole. Portrait engraving by J. McArdele after a painting by Sir Joshua Reynolds. ©BETTMANN/CORBIS

events in which Walpole was a central participant. Although the *Memoirs of the Reign of George II* are less reliable, they still constitute the most important source in existence for the parliamentary debates of 1754–1761.

The memoirs are not without bias. Walpole's loathing of the Pelhams manifests itself in the representation of the Duke of Newcastle as a time-serving incompetent. Henry Fox was traduced as a greedy and unscrupulous careerist. Walpole was also responsible for creating the myth of a sinister plot hatched by the princess dowager and Lord Bute, George III's first prime minister, to revive the royal prerogative and employ it against opponents of the crown. The memoirs, in effect, encapsulated the Whig perspective on crown and Parliament usually attributed to English historians of the nineteenth century.

WARS OF RELIGION, FRENCH. The rapid growth of Protestantism in France that began in the 1530s reached a climax around 1560, when roughly one in every twenty French men and women had converted to the new faith. This extraordinary growth resulted in a predictable backlash by French Catholics, whose church and monarchy declared all Protestants—and in France they were overwhelmingly Calvinists, who came to be called Huguenots—to be heretics. For Catholics, Protestants living in their midst not only threatened their eternal souls, but were believed to threaten their earthly existence as well. In an age when every major outbreak of plague, famine, and disease tended to be interpreted as a sign of God's punishment for their sins, most French Catholics believed that heresy within their midst was an open invitation for God's wrath to be visited upon them. Thus, the majority of French Catholics were openly hostile to the Reformation. These popular feelings were reinforced by the French monarchy, as kings Henry II (ruled 1547–1559) and Francis II (ruled 1559–1560) sought to eliminate heresy in their kingdom via both persecution and prosecution. The surge in Protestant growth in the late 1550s, however, meant that the official royal policy of suppression was never likely to succeed. And when the Huguenots seized several major towns by force in 1561–1562, it was clear that suppression had not worked.

Moreover, by 1562 several key members of some prominent noble families such as the Bourbons and the Albrets had converted to the new religion, further exacerbating political tensions and rivalries at court. Their chief rivals, the Guise family,

had long championed the Catholic cause; and since the young King Francis II's wife was Mary Stuart of Scotland, whose mother was Mary of Guise, the Guises found themselves in a position of authority during Francis's reign. When the king died of an ear abscess in December 1560, however, his successor was his nine-year-old brother, Charles IX (ruled 1560–1574). The unwritten French constitution required a regent to be appointed until the young king reached his fourteenth year, when he could then govern in his own right. Catherine de Médicis, Henry II's widow, as queen mother of both Francis II and Charles IX, accepted this position, and it was she who had to face the prospect of dealing with the Protestant problem, given that suppression as a policy had simply not worked. Although she was not in favor of religious toleration in principle—indeed, it was very difficult in the sixteenth century even to imagine such a concept—Catherine attempted to work out some kind of limited coexistence. First, she called together leaders of both the Huguenot and Catholic churches at the Colloquy of Poissy in 1561 to see if a compromise were possible. But both the cardinal of Lorraine on the Catholic side and Théodore de Bèze, Calvin's lieutenant from Geneva on the Protestant side, recognized that significant compromise on either the doctrinal or liturgical issues that divided them was impossible. Despite the lack of success at Poissy, however, Catherine went ahead and issued an edict in January 1562, recognizing the legal right of French Protestants to exist and even worship in a few limited areas of the kingdom for the first time. This milestone was far from religious toleration, but it marked a sharp break with the previous royal policies of persecuting Protestants as heretics. French Catholics, however, refused either to accept or enforce the edict. When the prince of Condé, a Protestant member of the Bourbon family, raised troops to enforce the edict on his own, civil war was the result. Over the next thirty-six years, not only did French Huguenots and Catholics raise armies to fight each other on the battlefield, they also fought each other as civilians in towns and cities across the kingdom. Thus, violence in the streets among civilians became a hallmark of the French Wars of Religion for an extended period, imposing on France an experience unmatched by other territories affected by the Reformation: two generations of civil war.

French Wars of Religion. The massacre of Huguenots by Catholics in Sens, Burgundy, April 1562; engraving by Hogenberg, late sixteenth–early seventeenth century. THE ART ARCHIVE/UNIVERSITY LIBRARY GENEVA/DAGLI ORTI

The outbreak of civil war in the spring of 1562 began a long series of armed conflicts, followed by brief periods of siege or battlefield confrontation between the two armies, and concluded by extended peace negotiations and a peace treaty. Each of these successive civil wars followed a similar pattern. While one side might manage to defeat the other's army on the battlefield, there was no way that either could effectively administer a heavy enough defeat to disarm all the civilians and nobles on the other side, much less occupy its opponent's cities and towns. Thus, each successive peace treaty had to be a forced compromise, offering very limited rights and legal guarantees that were never enough to provide complete security and freedom of worship for French Protestants. But even limited rights were far too numerous for French Catholics, and each period of peace was soon followed by

another outbreak of war. In all, France was to suffer through eight separate civil wars between 1562 and 1598.

THE ST. BARTHOLOMEW'S DAY MASSACRES

The first major turning point in the religious wars came in August 1572 with the massacres in Paris that began in the early morning hours of 24 August, St. Bartholomew's Day. Two days earlier, members of the Guise family, probably with the tacit support of Catherine de Médicis, had come to the decision to assassinate Gaspard de Coligny, admiral of France and the military leader of the Huguenots, because of fears of a Huguenot military reprisal in Paris, where many Protestant nobles had gathered for the royal wedding between the king's sister Margaret and Henry of Navarre, son of the Protestants Anthony de Bourbon and Jeanne d'Albret, king and

queen of Navarre. Though there was no Protestant coup being planned by Coligny, the assassination attempt nevertheless took place. Because it failed, however, only seriously wounding Coligny, the many Huguenot nobles in Paris began to fear for their lives. This only exacerbated the fears of the Guise family and the queen mother, who managed to persuade the king, Charles IX, and the rest of his council on 23 August to undertake another murder attempt on Coligny, this time accompanied by the killing of roughly two dozen of the leading Huguenot nobles in Paris. When these murders were duly carried out in the early morning hours of 24 August, the feast day of St. Bartholomew, many Catholics in Paris misunderstood the killings as a sign that the king wished all Huguenots in Paris to be killed. Since there had already been violence between Protestants and Catholics in Paris the previous year, it did not take much to set off widespread attacks against all Huguenots in the capital. Over the next two days Parisian Catholics killed upwards of 2,000 French Protestants. The events in the capital sparked similar massacres in a dozen provincial towns across the kingdom over the next few weeks. By October 1572 as many as six to eight thousand Huguenots had been killed. These massacres marked an end to Protestant growth in France, not so much because of the loss of life, as considerable as it was, but because of the chilling symbolic impact of the massacres. It appeared to many that the crown had returned to a policy of cruel suppression, while many Huguenots saw the massacres as a sign that God had abandoned them. A significant number of them began to abjure their religion and convert to Catholicism as a result. Most Huguenots did not convert, however, and the intermittent cycle of war and peace soon commenced once again.

THE CATHOLIC LEAGUE

The second major watershed in the civil wars occurred in June 1584 when the last surviving Valois heir to the throne, Francis, duke of Anjou, died from tuberculosis at the age of 29. King Henry III (ruled 1574–1589), who had succeeded his brother Charles IX two years after the St. Bartholomew's Day Massacres, was childless. The death of his younger brother Anjou, who was the last and youngest of Catherine de Médicis's and Henry II's four sons, meant that the next in line to the throne was Henry of Navarre, a Protestant. This unfortunate conse-

quence resulted in the Guise family's organizing a Holy Catholic League, backed by money and troops from King Philip II of Spain, to pressure the king to disavow Navarre, who, despite his legitimacy as heir by birth, was rendered illegitimate because of his religion. The political pressure mounted by the league was so great, in fact, that in 1585 these militant Catholics even managed to get Henry III to issue an ordinance making it illegal to be Protestant in France, revoking all the limited rights of existence that Huguenots had won since Catherine de Médicis's original edict in January 1562. It certainly appeared that the policies of suppression of the 1550s had returned once again. Moreover, when Henry, duke of Guise, entered Paris against Henry III's will in May 1588, Guise's reception was so warm and his popularity among the Parisian people so great that the king was forced to flee his own capital. He gained his revenge by having Guise and his brother murdered in December 1588. Victory was only temporary, however, as Henry III himself was murdered the following August by a disgruntled Catholic monk. Thus, from August 1589 Henry of Navarre was recognized as the legitimate king of France—as King Henry IV (ruled 1589–1610)—only by French Protestants and a small minority of Catholics who were willing to place his legitimacy by birth above his Calvinist religion. The overwhelming majority of French Catholics, however, urged on by the league, refused to accept Navarre's claim to the throne and held out against him. The cycle of civil war was destined to continue.

THE EDICT OF NANTES

The final watershed in the French Wars of Religion occurred in July 1593, after four long years of indecisive fighting between the armies of King Henry IV and the Catholic League. The city of Paris had been besieged by the royalist forces of the king in 1590, and some Parisians even starved to death in a long, ruinous summer. The turning point came when Henry made the decision to abjure his Protestant religion and take instruction in the Catholic faith. It was certainly not a cynical decision, as his enemies claimed, nor one made lightly. Henry had been a devout Calvinist ever since he was first instructed in the faith by his mother. He was forced to recognize, however, that the French constitution required the king to be Catholic. To resolve the long religious conflict and bring the disorders in the kingdom to

French Wars of Religion. Assassination of Duke Henry of Guise by the guard of King Henry III, 23 December 1588, engraving by Hogenberg, late sixteenth–early seventeenth century. THE ART ARCHIVE/UNIVERSITY LIBRARY GENEVA/DAGLI ORTI

an end, Henry publicly converted to Catholicism in the summer of 1593. When the pope formally absolved the king shortly thereafter, the many nobles and towns loyal to the league began to submit to his authority and accept him as their new monarch. But Henry IV still faced the same problem as all his predecessors: how to produce a peace treaty that was acceptable to both sides with a chance of survival. The Edict of Nantes, published in the spring of 1598, looked on paper to be very similar to many of the numerous earlier edicts of pacification, none of which had proved very durable. France had suffered horribly during the wars of the league, however, as increased warfare combined with economic and agrarian crises in the 1590s to create loud demands from within various elements of the population to stop the fighting. Bands of armed peasants in

Burgundy, Perigord, and Limousin, some of whom may have been organized by elites, organized to keep soldiers out of their villages whether they were Huguenots or Catholics. Thus, the situation was very different from the earlier peace edicts, as the entire kingdom's resolve to continue to wage war in such dire economic circumstances began to waver.

Another principal difference between the Edict of Nantes and the seven earlier edicts of pacification is that Henry IV explicitly appealed to both sides. To the Catholic majority, he promised in the preamble of the edict that France would forever remain a Catholic country, and that one day God would bless his kingdom by reuniting all French men and women in the one true Catholic faith. The various articles of the edict spelled out that the monarchy, the state, and all French institutions would also

remain Catholic, thus ensuring that Catholicism would never be jeopardized as the official religion of the kingdom. The edict also restored the Catholic Mass in all Protestant areas where it had been banned, introducing it into some areas for the first time in forty years. In addition, the edict required all Huguenots to begin paying the ecclesiastical tithes to the Catholic Church, just as their Catholic counterparts had always done, in order to provide for the salaries of parish priests throughout the kingdom. On the surface, then, the Edict of Nantes was meant to appease French Catholics, especially those former members of the league who had opposed the king prior to his conversion.

On the other side, the edict made clear that Huguenots had freedom of conscience in France,

meaning they would not be persecuted for simply being Protestant. Their right to freedom of worship, however, was severely restricted, limited to those towns mainly in the south of France already under Huguenot control in August 1597. Moreover, all former Catholic churches in these areas were to be turned back over to the French Catholic Church. The Huguenots would have to build their own churches, or worship in private (meaning largely aristocratic) homes in the towns they controlled. But the king also granted the Huguenots concessions not made public in the edict. First, they were given a special subsidy to pay the salaries of their ministers, offsetting the ecclesiastical tithes required in the edict itself. More importantly, Henry granted the Huguenots the right to garrison troops in the towns they controlled, thereby guaranteeing

French Wars of Religion. Dijon, Burgundy, surrenders to King Henry IV, May 1595, engraving by Hogenberg, late sixteenth-early seventeenth century. THE ART ARCHIVE/UNIVERSITY LIBRARY GENEVA/DAGLI ORTI

their own safety and defense. Thus in a variety of ways, while the Edict of Nantes initiated a period of religious coexistence, it was far from a policy of religious toleration. And for most among the French Catholic majority, even this religious coexistence was thought to be only temporary, until those remaining Protestants might be won back to the true faith, following the example set by King Henry IV. For them, the future of France was as a kingdom of Catholic uniformity of religion. The Huguenots, however, recognized that their gains in the edict would last only as long as they were loyal to the crown and only as long as their newly converted king chose to enforce them. Henry's son Louis XIII (ruled 1610–1643) sought to dismantle the subsidies and military protection of the Huguenots, while Henry's grandson Louis XIV (ruled 1643–1715) revoked the Edict of Nantes altogether in 1685.

WARSAW (Polish, Warszawa). A small late medieval settlement on the left bank of the middle Vistula, Warsaw became the capital of the Principality of Mazovia during the reign of Janusz I the Elder (ruled 1374–1429). “Old Warsaw” was founded c. 1300 on the escarpment overlooking the Vistula, just north of an existing castle. By 1408 a “New Warsaw,” lying due north of Old Warsaw, had established its own autonomous municipality, with a separate magistracy and market square. Old Warsaw was the more populous and affluent, with the bricked houses of the patriciate and wealthier tradesmen. Artisans, shopkeepers, and small farmers occupied the mostly wooden structures of New Warsaw.

The last Mazovian prince, Janusz III, died in 1526, and from that time Mazovia and Warsaw came under the Polish crown. No longer the small capital of an independent principality, Warsaw nonetheless continued to grow modestly, thanks partly to its expanding ties with Cracow and the kingdom. In 1527 and 1529, Sigismund I (ruled 1506–1548) granted charters to eleven Warsaw guilds, removing them from the jurisdiction of the Cracow brethren. By 1564, Old Warsaw encompassed 486 stone houses, New Warsaw 204 still mostly wooden houses. Jews were expelled from Warsaw in 1483, and a privilege *de non tolerandis Judaeis*, granted its burghers in 1527, forbade Jewish settlement in the town itself, relegating them to the suburbs for most of the early modern period.

Warsaw grew quickly in significance toward the end of the sixteenth century. From 1569 it was the site for meetings of the General Parliament, and from 1573 for the Election Parliaments that chose the kings of Poland and the grand dukes of Lithuania. A fire in the Wawel Castle in Cracow in 1596 moved Sigismund III Vasa (ruled 1587–1632) to begin expanding the Warsaw castle and to make it into the residence of Polish kings and their courts beginning in 1611. (Cracow would remain the capital and coronation city.) With the transfer of the royal court to Warsaw, the city began to draw magnates and gentry, who established residences in privately owned suburban “jurisdictions,” which formed a chain of autonomous towns around Old and New Warsaw and offered competition to Warsaw's patriciate and guild artisans. The right-bank

Praga suburb, the site of breweries, warehouses, and granaries, received its municipal privilege in 1648.

The wars of the mid-seventeenth century interrupted Warsaw's rapid growth from modest sixteenth-century numbers (its population had reached 20,000 by 1655). Swedish and Transylvanian armies finally left the city on 23 June 1657, and the rebuilding of Old and New Warsaw was largely completed by 1670. Under John III Sobieski (ruled 1674–1696) the center of gravity moved to the west, beyond the old walls, and settlement expanded into the magnates' suburban jurisdictions to the north and south along the river. The city again rebuilt after the Northern War (1700–1721). Warsaw became the center of Polish commerce and enlightenment under the last Polish king, Stanisław II Augustus Poniatowski (ruled 1764–1795). A "Black Procession" of burgher leaders to the Royal Castle on 2 December 1789 paved the way for belated urban reform in the Commonwealth of Poland-Lithuania. The autonomy of the "jurisdictions" was finally abolished, and Old and New Warsaw, plus the suburbs, now formed one urban legal unit. Warsaw's growth (to 110,000 in 1792) was delayed with the sacking of Praga by Russian armies on 5 November 1794 and the third partition of Poland (1795), which initially gave part of Mazovia, including Warsaw, to Prussia. In 1799, the city's inhabitants numbered 64,000.

WATCHES. *See* Clocks and Watches.

WATTEAU, ANTOINE (born Jean-Antoine; 1689–1721), French painter. Antoine Watteau was born in Valenciennes in northern France in

humble circumstances. By the end of his short life (he died at 32 of tuberculosis), he was a celebrated painter in Paris. Today, he is generally considered to be the father of the rococo style because he developed the *fête galante*, 'gallant party', as a subject; it became a hallmark of the era's painting. Watteau's work in particular, and the rococo style in general, reflect a major transformation of the French art world. At the beginning of Watteau's lifetime, King Louis XIV (ruled 1643–1715) controlled the production of culture through the establishment of academies and state-supported patronage of the arts. By the time of his death, patronage of the arts had shifted to private individuals who were no longer interested in the highly didactic and often propagandistic art demanded by royal patronage. Although Watteau was a member of the Royal Academy of Painting and Sculpture, it was a group of private collectors who collected his work and cultivated his reputation.

The *fêtes galantes* were contemporary scenes of elegant men and women, usually in an outdoor setting and sometimes dressed in masquerade, engaged in conversation, flirtation, music making, and dancing. Watteau's *fêtes galantes* were intimate in scale; the pictures were the appropriate size to be enjoyed in a private space, rather than the monumental paintings of subjects taken from classical mythology and history that decorated the public spaces of Louis XIV's palaces. The *fêtes galantes* mirrored the kinds of social activities enjoyed by Watteau's elite collectors and also reinforced their image of themselves.

The appearance of some figures dressed in theatrical costumes and others in contemporary everyday garb is another trait of Watteau's *fêtes galantes*. Watteau absorbed the theatrical milieu under the tutelage of his first teacher in Paris, Claude Gillot (1673–1722), who illustrated theatrical troupes. Claude Audran (1658–1734), who did decorative painting in the homes of Parisian high society, taught Watteau his highly ornamental style and introduced him to his future patrons. Watteau himself later had two students, Nicolas Lancret and Jean-Baptiste-Joseph Pater, who also specialized in *fêtes galantes*.

Perhaps Watteau's most famous *fête galante* is *Pilgrimage to Cythera* (1717, Louvre). The painting

Antoine Watteau. *The Pilgrimage to Cythera*. ©ARCHIVO ICONOGRAFICO S.A./CORBIS

represents a lighthearted topic that was popular in theatrical and musical performance—a pilgrimage to Venus’s Island of Cythera, where everyone would fall in love. In Watteau’s painting, a statue of Venus indicates the pilgrims are on the island of Cythera. Three couples are arranged on a hillock and this can be read as a narrative of departure. The couple closest to the statue is most fully under Venus’s spell of love; the next couple to the left is getting up, emerging from the spell of love; and the third couple is already standing. The woman glances back, as if wistfully remembering the spell of love already gone. On the other side of the hillock, a group of people heads toward a boat. Their pilgrimage is over and they will return to the real world. Watteau’s *fêtes galantes* have often been characterized as melancholy, containing a subtext that alludes to the passing of love and of life.

The passing of the era of King Louis XIV is represented in another of his celebrated works, *The Signboard of Gersaint* (1721, Staatliche Museum,

Berlin). This work shows the interior of the shop of Watteau’s friend, the art dealer Edmé Gersaint. On the left side, workmen pack away a portrait of Louis XIV, and the walls are covered with paintings representative of an older style associated with his reign. On the right side, elegantly dressed customers admire paintings representative of the new, or rococo, style preferred by elite private patrons. This painting also celebrates the collection and enjoyment of art, which had become part of the social rituals enacted among the elite.

Watteau’s paintings are often very witty. In *The Signboard of Gersaint*, the painting of Louis XIV being stored not only represents the passing of an era, but is also a visual pun, referring to the name of Gersaint’s shop, “The Grand Monarch.” In *Pilgrimage to Cythera*, the cherubs who flutter above the ship cavort erotically, perhaps acting out what the more decorous pilgrims below are thinking about. Wittiness, whether in art or in conversation,

was a trait much esteemed in eighteenth-century high society.

Today, as in the eighteenth century, Watteau's works are highly prized. He managed to combine superb draftsmanship with deft painting to subtly represent facets of both the complex social life and the attitudes of those who came to dominate early modern European society.

WEATHER AND CLIMATE. The history of the climate during the early modern age is largely centered on the climatic deterioration known as the “Little Ice Age.” Much evidence testifies to a significant degradation of atmospheric conditions from the perhaps uniquely favorable circumstances of the High Middle Ages to the cooler, wetter, and less stable weather of the early modern period. No consensus exists with regard to the nature or the chronology of this phenomenon, the value of the sources available to investigate it, or its impact upon European societies. Nevertheless, the recognition of the importance of climate as a historical factor has led researchers to revisit many well-traveled paths of European history. Their efforts have become particularly relevant considering twenty-first-century fears of global warming.

The sources that historians draft to document the climate of the fifteenth to eighteenth centuries may be arranged in two main categories: literary and

iconographic documents and serial and/or quantifiable data. In turn, this second group of sources may itself be divided into direct and indirect records. The value and the limitations of all relevant sources are still debated. References to weather conditions are found in many diaries, almanacs, chronicles, letters, professional accounts, and scientific and military logs. Yet this information is very heterogeneous and thinly and unevenly distributed across the continent and the centuries. It is inevitably subjective and likely to recall extreme or rare occurrences (similar comments may be directed at the pictorial records that testify to various effects of the weather). More systematic and more intentional direct records of weather conditions are rare, particularly early in the period. Their great merit is to enable the construction of data series, yet the lack of standardized measures of temperatures and other climatic variables greatly complicates the task of researchers.

To complete this rich yet insufficient medley of references, historians turn to indirect evidence. Some of it requires refined scientific analyses, ranging from the mapping of tree rings to carbon dating and the assaying of soil or ice cores. A second category of proxy sources includes evidence of weather-dependent economic output, principally crops. Municipal rolls of market prices, institutional accounts of harvests, church tithes registers, or seigneurial records may all reflect variations in local weather conditions. However, both agricultural production itself and the transactions that produced these records were also shaped by economic, political, and cultural tensions. (Agronomists also warn of the intrinsic complexity of the relation between weather and output.) For instance, the dates of grape harvests have always been linked to competitive pressures and evolving tastes as well as spring and summer conditions, just as flood reports are shaped by water levels but also by demographic pressures, hydraulic works, or fiscal imperatives. Increasingly rigorous standards have been applied to the reconstitution of early modern climates, demanding advanced dissections of the effect of weather upon the documented variables and sophisticated statistical testing of the resulting figures.

Several significant cross-disciplinary collaborations substantiate the existence of a negative turn in the weather during the early modern era and also expose its complexity. Its outside limits range from

the fourteenth to the nineteenth centuries, although its beginnings are obviously less documented than its end. Naturally, no uniform weather pattern stretched across this long period or across all regions of Europe; this calls for the study of fine regional and chronological distinctions. Temperatures are perhaps better known than precipitation amounts, and great variability as well as episodes of extreme weather are emerging as key findings. Charts of growing seasons and growing ranges have been drawn and compared with the more favorable conditions of the High Middle Ages and the well-documented contemporary era. To date, the geography and chronology of the early modern climate “pessimum” (severe deterioration) remain the object of much valuable work.

Historians speculate on the origins of this climatic deterioration, notably turning to factors such as solar, volcanic, or even human activity, but they are chiefly interested in its consequences. Its impact upon food production is at the center of many debates, because of its crucial importance to many aspects of early modern social, economic, and even political life. Inquiries into the demographic impact of the Little Ice Age continue to enrich our understanding of related subjects such as famines, epidemics, and epizootics. Increasingly, historians separate the consequences of sharp and brutal but short events from those of medium-term, interannual, and decadal or secular trends and underscore the distinctions to be made between the great climatic zones of Europe. They also contrast the impact of weather in secure agricultural areas with that in marginal lands of all sorts and have started to acknowledge the importance of microclimates. New knowledge of climatic patterns is also being applied to many long-standing historical concerns: the “general crises” of the fourteenth and seventeenth centuries; large-scale migration patterns, and, occasionally, the disappearance of whole communities; popular rebellions; economic trends ranging from the southward retreat of vineyards to the shifting of fishing grounds and the great inflation of the sixteenth century; and some of the key advances of the early modern age, such as the agricultural revolution. Finally, climate history has also entered the field of cultural studies, with explorations of the role of climate in shaping popular beliefs and traditions

reflected in language, ceremonies, superstitions, and even witch-hunts.

The implications of research on the history of climate are many. Even those who remain skeptical of the solidity of such probes will agree that they serve to highlight and explain the importance and the diversity of human responses to environmental challenges. Research devoted to the early modern climate can also speak to early modern communities’ ability to diversify their crops, their landholding patterns, the attempts of authorities to mitigate the impact of brutal episodes, the role played by growing commercial networks and related levels of specialization, the flexibility or rigidity of certain social structures, and the reasons behind important evolutions of landscapes. In the course of these investigations, several fundamental assumptions have been questioned, such as the vulnerability of preindustrial communities to climatic fluctuations, and even the stability of the natural environment in which they functioned.

The strongest objections to the work of climate historians revolve around the value of the data and methods used. But there are also regular denunciations of the risks of determinism associated with these (and other) probes into environmental history. This is particularly so because of a long-standing tradition linking the supposedly favorable climate of Europe with the successful projection of European power across the oceans. Many aspects of the European environment have been and are still advanced to justify what has been called the “European Miracle,” ranging from its (mostly) temperate nature and the (relative) absence of large-scale destructive episodes, to its very diversity. All such theses stand accused of ignoring or underestimating the historically crucial element of human agency and, most significantly, of simplifying the great complexity of climate patterns and their impact upon land and people.

Such Eurocentric interpretations of the influence of climate upon societies are not new. Emboldened by the growing reach of their information networks, early modern thinkers linked geography and climate with social and cultural development in several ways, just as they started to reflect on the possibility of climatic variations over time. These reflections could join speculations on the relative

merits of ancient and modern societies, or the clustering of geniuses. They could also enter the realm of religious thought, through hypotheses on “geological times” or the universal decline of the earth’s ability to support life, as well as daring interpretations of some key episodes of the Scriptures; those, on the contrary, who argued the immutability of climate opened the door for more enlightened plans for improving lives. The same period also marked the beginnings of a more systematic and more scientific interest in recording weather patterns. This trend made clear the need for more reliable thermometers and other instruments and heralded the eventual science of meteorology, although, as is common during the early modern era, cultural groups other than the elite of princely scientific societies remained active in their own ways. The interest in climate, like that in many other aspects of nature, helped mark social and regional identities. Late in the period, attention turned to the potential impact of human activities upon the natural environment and climate. Large-scale or particularly acute instances of deforestation fueled the theory of desiccation, predicated upon the idea that forests attracted, retained, and redistributed atmospheric moisture. Some applied it on a grand scale, speculating, for instance, on the decline of Classic societies or the future of the North American climate after settlement. Others turned to the small but revealing scale of tropical islands. In these settings, free of some of the traditional bounds that had developed in Europe, novel measures emerged that may be seen as forerunners of the science of ecology and the protectionist measures that would grow in the nineteenth and twentieth centuries.

Research in climate history is an established component of environmental history. Like other aspects of this new field, it calls for decidedly multidisciplinary approaches, and it struggles to overcome the fundamental objections associated with the ever-recurrent temptation of deterministic interpretations of history. In the context of an early modern era rich in sources, it greatly enriches our understanding of material and social life and contributes to the development of ever more refined models of the links between nature and culture.

PIERRE CLAUDE REYNARD

WEIGHTS AND MEASURES. Weights and measures throughout Europe during the early modern period were characterized by complexity and confusion and dominated by customary practices. Numbering in the hundreds of thousands, they arose originally from Greek, Roman, Celtic, Germanic, Slavic, and other roots and multiplied on local, regional, and state levels at a rapid pace after 1450. Among the principal causes for this proliferation were economic development, commercial competition, population growth, urbanization, taxation manipulations, territorial expansion, and technological progress. Contributing also were ineffective governmental decrees and legislative acts, the paucity and inferior workmanship of the physical standards manufactured to serve as prototypes, and the overwhelming number of poorly trained officials entrusted with inspection, verification, and enforcement duties.

Central governments contributed to weights and measures proliferation by promulgating multiple state standards for individual units, depending on where they were used and by whom. Sizes of units in capital cities were often different from those in the provinces or in rural areas. They even differed among social classes. On the other hand, common local units occasionally became so popular that they

gained unit standardization. They then competed with state units, producing further confusion.

With the rapid growth of cities, weights and measures frequently separated into different standards depending on whether they were employed within the cities or outside their walls. A sharp division arose between urban and suburban measures. Similarly, some measuring units differed according to their use on land or on sea. A general rule throughout Europe was that measures always increased in size or distance once land was no longer in sight.

Product variations were the most important source for metrological proliferation. Those based on quantity measures varied by number or by an odd assortment of human, animal, and other capabilities. Even when these measures had standardized counts, capacities, or weights, the actual sizes depended on the characteristics of the products involved. Compounding this situation was the centuries-old practice of dividing existing units into halves, thirds, and fourths or into an irregular assortment of diminutives. Similar problems were assigning the same name to different units, basing one unit on a multiple or submultiple of another, bestowing more than one name on the same unit, and authorizing various methods of submultiple compilations for a given unit.

Further examples were units of account that were simply computational units for record keeping and other business purposes. Similarly, there were measures reserved for wholesale trade that referred to any number of other better-known units without any correlation to existing standards. Measures were also based on the monetary values of coins, on units of income derived through production, on crop yields and tax assessments, and on work functions, dimensions, and time allotments of humans and animals. The sizes of such units rested on a myriad of imprecise factors.

Regardless of such conditions, Europe in the seventeenth and eighteenth centuries produced a climate of change ushered in by the age of science and the Enlightenment. During this critical period, a number of developments occurred that altered metrological history profoundly, and eventually led to the creation and implementation of the metric

system in France in 1793 and the imperial system in England in 1824.

First, there was the dynamic of scientific and technological invention and innovation that overthrew the rigid reliance on past traditions. The introduction of numerous new concepts, instruments, and procedures linked theoreticians with craftsmen for the first time and led to profound advancements in lenses, magnification glasses, microscopes, navigational, astronomical, and triangulation instruments, and clocks. These and hundreds of other breakthroughs, spearheaded chiefly by English, French, and Italian scientists, played a critical role in the reformation of weights and measures.

Second, many of these successes received stimulus and support from the European scientific societies that developed rapidly during the 1600s. By the end of the century, most serious scientists in Europe had become members of these societies, and their journals disseminated knowledge of new discoveries and inventions. In Italy the Roman Accademia dei Lincei and the Florentine Accademia del Cimento made significant scientific strides, the latter especially in its technological apparatus.

The most important societies for the future development of metrology, however, were the Royal Society of London and the Academy of Sciences of Paris and their offshoots, the Greenwich and Paris observatories. The English organizations cast their scientific net far and wide and made giant advancements in physics, astronomy, chemistry, and natural science which, coupled with their pioneering work in technological instruments, helped create a new era in weights and measures. Even more important were the Parisian groups whose scientists introduced the practice of using telescopes in conjunction with graduated circles for the precise measurement of angles. This led to measurements of the meridian arc and the computation of the radius of the Earth. This seminal work provided metrologists with possibilities for a natural physical standard that eventually became the basis for the metric system.

These and other advances led to the creation of hundreds of metrological reform proposals. In England the pendulum was given special emphasis. Since the second unit (of time) is determined by the motion of the earth, it was believed that the length

of the second's pendulum in a given latitude would be an invariable quantity that could always be recovered or duplicated. Others proposed altering the existing system to conform to a decimal scale, eliminating all units except for a select few, and coordinating all units to a strict series of ratios. Unfortunately, the revamped English system of 1824 excluded any natural standard and opted only for streamlining the old system and establishing more accurate physical standards. The French proposals concluded far more successfully. After numerous experiments, France settled on a standard determined by the triangulation measurements of that portion of the meridian arc that ran from Dunkirk through Paris to Barcelona. In the process they established a new measure—the meter—as one ten-millionth of the distance from the North Pole to the equator. Even though there eventually were some problems with the final measurements, a new era in world metrology had begun.

RONALD EDWARD ZUPKO

WESLEY FAMILY. The Wesley family included John Wesley (1703–1791) and his brother Charles Wesley (1707–1788), leaders in the eighteenth-century evangelical movement in England called Methodism. The Wesleys' ancestry included Puritans and Nonconformists on both sides, although their parents were staunchly committed to the Church of England. Their paternal great-grandfather Bartholomew Westley (c. 1596–1671), grandfather John Westley (c. 1636–1770), and maternal grandfather Samuel Annesley (c. 1620–1696) were clergy removed from their positions after the Restoration because they were Anglican dissenters.

The parents of the brothers were Samuel Wesley (1662–1735) and Susanna Annesley Wesley (1669–1742). An ordained Anglican priest, Samuel Wesley became rector of Epworth parish in Lincolnshire in 1695. Although he was a talented scholar and poet, he was unpopular with his parishioners because of his strict demands that they live holy lives. It is believed that disgruntled parishioners, among other spiteful acts, set fire to the rectory in 1709. The building was destroyed with no loss of life.

The Wesley family included nineteen children, ten of whom lived into adulthood. With a large family, life in the Epworth rectory was busy. Susanna Wesley possessed considerable intellectual ability and skillfully managed the household. She supervised the children's earliest education, teaching each how to read and write. Circumstances for Susanna became quite difficult in 1705, when Samuel was imprisoned for several weeks in Lincoln Castle for debt he could not pay. Both parents instructed their offspring in the essentials of the Christian faith, including respect for the Bible and the traditions and practices of the Anglican Church. It would be difficult to underestimate the lasting influence of Samuel and Susanna on their children.

The three sons Samuel Jr., John, and Charles were ordained into the ministry of the Church of England. They were graduates of Christ Church College, Oxford University. After service on the staff of Westminster School in London, Samuel Jr. was named headmaster of Blundell's School in Tiverton. John, who was elected a fellow of Lincoln College, Oxford, in 1726, also served as his father's

parish assistant and was a missionary to the American colony of Georgia in 1736–1737. His ministry among the settlers and Native Americans was disappointing. He returned to England in 1737 in spiritual despair. His despondency ended with his evangelical conversion on 24 May 1738. Charles accompanied John to America and for a short time was secretary to General James Oglethorpe (1696–1785), Georgia's colonial governor. Ill health and misunderstandings with the governor and colonists forced Charles to return to England in 1736 and laid the groundwork for his conversion on 21 May 1738. In the months that followed their religious renewals, John and Charles became principal leaders in that part of the evangelical revival known as Methodism.

The lives of the seven daughters, Emilia, Susanna, Mary, Mehetabel, Anne, Martha, and Kezia, were mostly marked by difficulty and unhappiness. Mehetabel, or Hetty, the most talented of the daughters, published poetry in various magazines. The Wesley family was noteworthy in eighteenth-century England largely through the evangelical ministry of John Wesley and Charles Wesley.

CHARLES YRIGOYEN, JR.

WESTPHALIA, PEACE OF (1648).

The Treaties of Münster and Osnabrück, which ended the Thirty Years' War, are known collectively as the Peace of Westphalia. The main obstacles to a general peace in Germany after 1635 were the ambitions of France and Sweden and changing military fortunes. Sweden wanted territorial and financial

compensation while France, under the cardinals (Richelieu to 1642, Mazarin thereafter), envisaged something altogether more ambitious that involved a considerable reduction in both Spanish and Austrian Habsburg power. In addition, matters were complicated by the individual ambitions of various German princes and separate negotiations between the Spanish and the Dutch. Ultimately, 176 plenipotentiaries representing 196 rulers attended the peace negotiations.

Despite these problems, talks began in 1643 at Münster and Osnabrück, the two cities specified for negotiations by the Franco-Swedish Treaty of 1641. France, Spain, and the other Catholic participants were based at Münster, Sweden and her allies at Osnabrück. Although Emperor Ferdinand III (ruled 1637–1657) initially delayed negotiations, the collapse of his military position in 1645 forced him to undertake serious discussions in 1646. However, that a settlement was not reached until the autumn of 1648 was largely due to Mazarin rather than the emperor. In fact, the war only really came to an end at that time because of France's inability to carry it on.

NEGOTIATIONS

With so many participants and so many conflicting interests, it is hard to discern any pattern of negotiation, but the aims of the major participants can be identified. The emperor clearly wanted a full and final peace settlement. Because his situation was desperate, he was prepared to make far-reaching religious and territorial concessions if necessary. Mazarin's wish for a universal peace was scuttled by the collapse of negotiations with Spain in 1646. The Spanish preferred to work out a deal with the Dutch (achieved in January 1647, ratified at Münster in January 1648) and keep fighting. As far as Germany was concerned, France wanted to destroy the emperor's influence by strengthening the autonomy of the individual princes and by replacing the existing imperial institutions with a French-led federation. However, these plans were unpopular with the German princes, who valued the Holy Roman Empire and preferred an emperor limited in authority to dominance by France and Sweden. Count Maximilian von Trauttmanssdorf, the imperial envoy, had little difficulty in resisting these French demands. French demands for most of Alsace and parts of

Lorraine, on the other hand, were quite modest because France mainly wanted Spanish territory. Mazarin was able to obtain Habsburg domains in Alsace in return for 1.2 million thalers in a deal with the emperor in September 1646.

The Swedes were prepared to compromise because Queen Christina was eager for a quick settlement. In any event her erstwhile allies, the French, did not want to see Sweden become too powerful. Accordingly, Mazarin decided to build up Brandenburg as a counterweight to Swedish power, and in February 1647 the Swedish envoys were persuaded to agree to a partition of Pomerania with the elector. Trauttmansdorf was able to exploit this tension between the allies in other ways, too. For instance, Sweden demanded religious toleration within the Habsburg lands, for the Bohemians in particular. Knowing that the French had little sympathy for Bohemian Protestants, and would not support Sweden on this issue, the emperor resisted this demand quite firmly.

As far as religion was concerned, matters of territory and allegiance had been addressed in the Peace of Prague and at the Diet of Regensburg, but the status of Calvinism and secularized lands still had to be resolved. Although the delegates were divided according to confessional lines, even within the same denomination there was no agreement. However, because the Protestants proved to be more united overall, the final agreement on religious issues reached in March 1648 was more favorable to them.

Final agreement was postponed because Mazarin, unnerved by Spain's deal with the Dutch (which he had tried to sabotage), decided to increase French demands. This rekindled the war, though with the onset of civil unrest in France in the summer of 1648 (the Fronde), Mazarin reluctantly changed his tune and by August was convinced of "our need to make peace at the earliest opportunity." Consequently, he dropped his extra demands and agreed to a settlement (though the emperor did agree not to aid his Spanish cousin).

TERMS

The Peace of Westphalia was signed simultaneously at Münster and Osnabrück on 24 October 1648 and consisted of 128 clauses. The main parts can be summarized as follows:

1. The principle of *cuius regio, eius religio* ('whoever rules the territory determines the religion') was reaffirmed, but construed to relate only to public life.
2. Calvinism was finally recognized within the Confession of Augsburg and, except within the Bavarian and Austrian lands (including Bohemia), Protestant retention of all land secularized before 1624 was guaranteed.
3. In matters of religion there were to be no majority decisions made by the diet. Instead, disputes were to be settled only by compromise.
4. To all intents and purposes, the separate states of the Holy Roman Empire were recognized as sovereign members of the diet, free to control their own affairs independently of each other and of the emperor.
5. Maximilian of Bavaria (1573–1651) retained his electoral title and the Upper Palatinate.
6. A new electoral title was created for Karl Ludwig (1617–1680), the son of the former elector palatine, on his restoration to the Lower Palatinate.
7. John George of Saxony, a leading German Protestant prince who had supported Ferdinand, was confirmed in his acquisition of Lusatia (a region of eastern Germany and southwest Poland).
8. Frederick William of Brandenburg (1620–1688) acquired Cammin, Minden, and Halberstadt, along with the succession to Magdeburg.
9. The emperor's claim to hereditary rights in Bohemia, Moravia, and Silesia was established. The Habsburg Sundgau was surrendered to France.
10. The Peace of Westphalia confirmed Swedish control of the river mouths of the Oder, the Elbe, and Weser—virtually the entire German coastline—by the occupation of western Pomerania, Stettin, Stralsund, Wismar, the dioceses of Bremen and Verden, and the islands of Rügen, Usedom, and Wollin. Sweden was also paid an indemnity of 5 million thalers.
11. France acquired Habsburg territory and other jurisdictions in Alsace. Other acquisitions included Pinerolo in Savoy and Breisach and Philippsburg on the right bank of the Rhine.
12. The United Provinces of the Netherlands (Dutch Republic) were declared independent of both Spain and the Holy Roman Empire (Switzer-

land was also acknowledged as independent of the empire).

13. No prince of the empire, not even the emperor, could ally with the Spanish monarchy.

ASSESSMENT

An overall assessment is not easy to make. By and large the treaties defused those problems largely responsible for the war. Although confessional loyalties remained important, the age of religious wars was over in Germany. The religious settlement proved to be realistic and lasting, though the pope, Innocent X (reigned 1644–1655), was unambiguous in his condemnation. Whether or not this was the “last religious war,” as some claim, and whether or not religion ceased to be so important in political and international affairs after this war, are moot points.

As far as the political settlement is concerned, the peace was remarkably conservative and legalistic. It was intended more as a restatement of old rights than as anything new. Much that had been a matter of fact or common practice, such as the autonomy of the princes, was now *de jure* (legal). Of course, that is not to say there were no innovations—the creation of an eighth electorate was new, the first extension of the number of imperial electors since 1356—but established custom and legal rights were usually preferred.

Within the empire, Saxony, Bavaria, and Brandenburg had all grown in size and importance. The tendency was toward fully sovereign independent states. However, these larger states were still not a match for the emperor, who among other things retained the prestige of precedence. Ferdinand III undoubtedly lost power—for instance, he lost the right to levy taxes outside his homelands and to declare war without the consent of the diet—but he remained the foremost prince in Germany. Moreover, many of the smaller states were too small to exploit the rights and liberties they had been granted; they preferred the security of the Holy Roman Empire. They relied on the emperor and were happy to seek his protection, particularly now that he could not be a predator. For these reasons Franco-Swedish attempts to destroy imperial institutions had been resisted. After 1648 the imperial bureaucracy became more cumbersome and made Habsburg control less practical; however, recent re-

search is beginning to question the idea that Westphalia fixed the empire’s constitution in its final form. It is now thought to have been more adaptable to change, and, in fact, imperial policy continued to be decided by the emperor.

The emperor himself was now very much strengthened within his hereditary territories: both religious and political opposition in Bohemia and Austria had been crushed and the hereditary lands were now ruled as a single unit. Accordingly, the emperor was in a far better position than he had held in 1618. Of course, compared with the dizzy heights of 1629 there had been reverses—Ferdinand III had undoubtedly lost the last part of the war—but he managed to retain some of his father’s early successes. Given his dire military situation at the end, the final settlement was not completely unfavorable to him; he had, in fact, gotten off quite lightly. The failure of many Habsburg objectives during the war, together with the (allegedly) improved position of the princes following the Westphalian settlement, used to be taken as evidence for the general decline in imperial power and as an explanation for the emperor’s apparent growing concentration on purely dynastic interests. However, scholars are beginning to call this reasoning into question, although this debate has just started. The Holy Roman Empire was far from moribund after 1648. It not only survived but revived during the long reign of Leopold I (ruled 1658–1705).

Despite huge expenditures and much effort, France had achieved little. Mazarin failed to reduce the power of the emperor significantly, and he failed to increase French influence in Germany to any degree. Some historians gloss over this by suggesting that Mazarin laid the foundations for future success by obtaining territory with ill-defined jurisdictions over adjacent lands. Still others praise him for excluding Spain from the settlement, but this was not the case, because Spain had not wanted to be part of the treaty anyway. Mazarin himself was clearly disappointed with the peace; he wanted the war to continue. The real reason for the hurried nature of the settlement was the collapse of governmental authority and the outbreak of civil disorder in France itself, events for which Mazarin must, to some extent, take the blame. As far as Sweden was concerned, Queen Christina’s desire for a quick set-

tlement did undoubtedly lessen her country's chances of a satisfactory outcome, but compared with, say, Swedish aims in 1630 or the difficult times between 1634 and 1638, the outcome was highly satisfactory. Sweden was now more secure, although it could be argued that Christina had simply extended her responsibilities and given herself more problems. The Peace of Westphalia created a loose framework for religious and political coexistence in Germany that stood the test of time remarkably well, though after 1648 Germany was further away than ever from economic and political unity (if that was a desirable, or even desired, outcome). Clearly, whether or not the Thirty Years' War retarded German development is itself a moot point. Political divisions were perpetuated and, religiously, Germany was divided roughly into a Protestant north and a Catholic south (although Münster and Cologne in the north and Württemberg in the south were major exceptions). In the process Protestantism had survived and the Counter-Reformation had been checked.

The Peace of Westphalia was actually innovative in many ways. It was the first pan-European peace congress, and there was a genuine attempt to resolve a multitude of disputes in the hope that there would be a general settlement and lasting peace. Most experts believe it was a success.

WIDOWS AND WIDOWHOOD.

Vedova, viuda, veuve, Witwe, widow: all are words derived from the Indo-European base meaning 'to separate', and early modern Europeans were very familiar with the grief of a separation by the death of one's spouse. But these words also represent something else about widowhood. They are female forms, for widowhood affected women far more than it did men. Male words for widowhood—for example the English *widower*—derived from the female form and were infrequently used in the early modern period. Widows always outnumbered widowers: in Castile by up to 12 to 1, in Tuscany by more than 5 to 1, in England by 2 to 1. Wives, generally younger than their husbands, usually outlived them, and the dangers of childbirth were more than balanced by violence and occupational hazards experienced by men. Widowers were also at least twice as likely to remarry, and remarry quickly, driven by the domestic problems consequent on the absence of a wife. Their marital status was rarely remarked in literature and legal records, their occupational, financial, and public roles little altered by bereavement.

On the other hand, great cultural and economic change usually marked a woman's transition to widowhood. Widows were a large, identifiable, and problematic social group. In fifteenth-century Florence, for example, a quarter of females over age twelve were widows. Even in England, where age differences between husbands and wives were usually relatively small, widows constituted almost a tenth of the female population.

CULTURE AND IDEAS

For a few of these women, widowhood conveyed wealth and independence; for most, it meant increased poverty. But whether rich or poor, widows challenged the fundamental premise of patriarchal order. Not only did every widow remind each man of his own mortality, a widow heading her own household also represented a lapse of the universal idea that women should be controlled by men. There were alternatives to this dangerous independence. Where Roman law was influential, widows sometimes, at least in theory, continued under male guardianship of father or brother or brother-in-law. Traditional Christian admiration for celibacy extended to chaste widowhood, and some Catholic widows took the opportunity of bereavement to enter (and in the case of some wealthy widows, to found) religious houses to secure an honorable home. Remarriage was another solution, but it suggested disloyalty to the dead husband, threatened his property and his children, and was generally criticized except for young childless women. The remarrying widow was a standard subject for jokes, satire, and gossip. But widows who did not marry were equally subject to criticism: as sexually rapacious, as subversive advisors to potentially rebellious wives, as aggressive and irritating borrowers and beggars, or, at best, as pathetic objects of charity. In the eighteenth century this last idea developed into the sentimentalized image of the permanently grieving and helpless widow, replacing the disorderly crone. Works of advice for widows prescribed a private life of chaste loyalty to the dead husband as the only defense against these negative images.

PROPERTY AND WORK

Of course, most widows did not and could not retire into helpless passivity. How did they live? Across Europe, most widows had some rights by law or custom, but variations were complex. One factor was the nature of conjugal estate in the area. Where tradition emphasized the separated unit of husband, wife, and children, the widow was more likely to succeed to headship of an independent household, with all the opportunities and problems that implied; where integration of the conjugal unit into a lineage was stronger, the widow would more likely make her home with her dead husband's successors, or return to her own male kin. Widows' rights to the

couple's property also varied. At one extreme, a wife's estate (that is, the wealth she brought to the marriage as dowry, the parallel gift from her husband's family to her, and what she earned) remained all or partly under her own control during and after the marriage. Wives who traded in their own right in London, women in the Netherlands who chose to manage their own wealth (like many Jewish and Muslim women), and noble wives in Russia who gained the right to acquire their own lands during the eighteenth century probably experienced very little economic change in the transition to widowhood. In other systems, for example in Valencia, the property that a bride brought to her marriage remained hers but under her husband's control, until his death allowed the wife/widow to reclaim her contribution. In Florence a widow could, if she chose, take her wealth back and return to her own kin. But her children, part of her husband's lineage, stayed with his family, and by retrieving her wealth, she was potentially depriving them of both herself and her wealth. Even where, as in England, the wife's contribution in cash or goods belonged, notoriously, to her husband, some latent tradition remained by *legitime* of a guaranteed customary widow's share of the husband's goods. A widow could also claim a share of his real property (one-third by common-law dower, sometimes more, according to local custom). It was hers for life, but she could not sell it or bequeath it by will. An English husband had a corresponding right to his dead wife's real property, provided a child had been born to the couple. Similar rules of life estate have been studied in Paris, in parts of the Netherlands, and in Poland and elsewhere. For many wives the crucial document was the husband's will. A large, but declining, proportion of husbands conveyed substantial control by making their wives executors; but a will could also be used to reduce customary rights. Indeed, during the early modern period, widows' traditional rights tended almost everywhere to become more attenuated, sometimes replaced by negotiated contractual protections. Historians have been surprised by the energy with which widows used the courts, often successfully, to defend their customary or individual rights.

Rural widows thus sometimes had access to land and continued to farm. In some localities, up to a quarter of the land might be under widows' control.

In towns and cities, wives of craftsmen and merchants also commonly carried on their husbands' businesses. Glikl bas Judah Leib of Hameln, whose memoirs have made her one of the best known of early modern widows, continued her Jewish family's trade in jewels during her first widowhood. Tax records and family letters reveal the lives of many other economically active widows. Even where there was no custom of wives' separate trading, most women had their own occupations that they continued in widowhood. Access to work encouraged widows to migrate and perhaps discouraged make-do remarriage; thus, the proportions of widows in lace-making communities, for example, tended to be higher than in other parts of rural France. But like rights of succession to land, widows' rights to practice their husbands' trades became more circumscribed through the period, and women's opportunities to be trained for a profitable separate occupation were also reduced.

HOME AND CHILDREN

The presence or absence of children made a huge difference. The desire to protect children's inheritances sometimes discouraged widowers from remarrying, despite the problems of single parenthood. Although patriarchal ideals theoretically favored a dying husband's right to control the guardianship of his children, in practice, respect for mothers' capabilities and high male mortality meant that widows often found themselves responsible for at least some young children, for educating them and arranging good marriages. It might be presumed that adult children would ease a widow's problems, but widows competed with children for resources, residence in a child's home was not necessarily attractive, and in the mobile early modern world adult children were often far away.

Widow-headed households were common (almost 14 percent in fifteenth-century Florence, 12 percent in sixteenth-century Paris, 13 percent in England) and although very few widows acquired any public authority by their headship (royal widows such as Catherine de Médicis and Anne of Austria were uniquely famous exceptions), having her own home could give a widow a novel opportunity for informal power in her family and community. But most widows succeeded to little property. If they headed their own households, they would

inevitably be poor, and widow-headed households are overrepresented among the poorest groups in most communities for which we have records.

POVERTY

However much widows were vilified in popular literature, in practice, early modern societies generally also regarded poor widows as deserving objects of charity and relief. Asylums and almshouses were endowed to care for them; giving charity to one's widowed neighbor was a duty. Where state-funded poor relief was established, widows were among those deemed, almost by definition, eligible recipients, and they dominated the relief lists. While wills, deeds, tax lists, and the records of law courts record the lives of propertied widows, the lives of the poorest are documented in the records of the asylums that gave them shelter or in the tiny sums doled out week after week to support a few widowed men, and a vast group of widows. These records evoke the generosity of early modern communities and, at the same time, mark the consequences of patriarchal structures that subordinated women and made most widows poor and vulnerable.

BARBARA J. TODD

WIELAND, CHRISTOPH MARTIN

(1733–1813), German writer, publisher, and classicist and one of the most influential literary figures of the German Enlightenment. The son of a Lutheran minister, Christoph Martin Wieland was born in Oberholzheim, Upper Swabia, near the imperial city of Biberach on 5 September 1733. At the age of thirteen, after attending the local public school of Biberach, Wieland was sent to Klosterbergen in the vicinity of Magdeburg, one of the most prestigious boarding schools of the time. Already an avid reader, Wieland acquired the reputation of a freethinker and, not surprisingly, his literary interests proved stronger than his dedication to his law studies at Tübingen (1750–1751). From 1752 to 1759, he was a student of the literary polemicist Johann Jakob Bodmer (1698–1783) in Zurich. After working as a private tutor in Bern (1759–1760) and as a professor of philosophy at the University of Erfurt (1769–1772), Wieland became the tutor of Karl August, the future duke of Weimar, in 1772.

Many of Wieland's works reflect his love of the classics and his profound knowledge of European literature, both of which become evident through his numerous commentaries and his often-criticized Shakespeare translations. Influenced by Bodmer (the teacher of the German poet Friedrich Gottlieb Klopstock [1724–1803]), Wieland's early works such as *Die Natur der Dinge* (1751; The nature of things) are profoundly religious in character, whereas his later works become more frivolous and suggestive in tone. Autobiographical elements appear with striking frequency in most of Wieland's writings. From 1760 to 1769, for example, Wieland

served as municipal administrator in Biberach. Some of his experiences as a public administrator reappear in comic form in his later work *Die Geschichte der Abderiten* (1781; translated as The republic of fools, 1861), which belongs to the category of fools' literature and pointedly ridicules bourgeois pettiness and the fruitlessness of religious quarrels. Probably the first socially critical novel, *Die Geschichte der Abderiten* systematically portrays life in the Republic of Abdera, the ancient Greek symbol of folly, where things happen in reversal of what one would consider normal. His earlier works *Der Sieg der Natur über die Schwärmerey, oder die Abenteuer des Don Sylvio von Rosalva* (1764; translated as Reason triumphant over fancy, exemplified in the singular adventures of Don Sylvio de Rosalva, 1773) and *Der goldene Spiegel* (1772; The golden mirror) reveal Wieland's potential as a future novelist. Scholars view his most famous work, *Die Geschichte des Agathon* (1766/1767; The history of Agathon), which appeared in several revised editions between 1773 and 1793, as the first and one of the finest examples of the genre of the Bildungsroman (novel concerned with the intellectual or spiritual development of the main character). Influenced by Euripides's play *Ion*, *Die Geschichte des Agathon* uses a classical setting and focuses on the discrepancy between youthful idealism and the harsh realities of life. Kidnapped by pirates from his sheltered home at Delphi, its hero Agathon, who arguably could be seen as a reflection of Wieland's own youthful self, endures a long odyssey of fruitless searching for wisdom and happiness. As a disillusioned old man, Agathon eventually realizes that human beings rarely act the way they should and that the purpose of life must be to find a compromise between head and heart, which means between rational thought and human passions.

Many of Wieland's works, such as his *Die Geschichte der Abderiten*, first appeared as sequels in his own literary journal *Der teutsche Merkur* (The German Mercury). Wieland had cultivated the idea of creating a literary journal for a considerable time and was able to realize this goal with the help of the Jacobi brothers in 1772, during his time in Weimar. Wieland's presence at Weimar contributed to the duchy's rise to prominence as Germany's cultural capital because it attracted figures such as Johann Wolfgang von Goethe (1749–1832) and Friedrich

von Schiller (1759–1805) as well. Wieland's relationship to Goethe and Schiller became strained over the years and eventually culminated in a polemic campaign against the aging poet. Proponents of the Sturm und Drang (Storm and Stress) movement initiated the campaign against Wieland and were joined at a later stage by adherents of the rising Romantic movement. Nonetheless, during his final years, Wieland's residence at Weimar became a place of pilgrimage for Germany's most noted and promising writers.

Wieland's reputation as one of the most prominent writers of his age is probably best illustrated by the poet's decoration with the Cross of the Legion of Merit in 1808 by Napoleon Bonaparte. Celebrated as the "German Voltaire" during his lifetime, Wieland's literary contribution fell into near oblivion in the nineteenth century, and scholars have only recently come to view him as one of the most important literary figures of the German Enlightenment as well as a precursor of German classicism and Romanticism.

ULRICH GROETSCH

WILKINS, JOHN (1614–1672), an important figure in the history of science, religion, literature, and linguistics. As his many publications suggest, Wilkins possessed a wide-ranging intellect. His contributions to natural philosophy include the popularization of science, development of English scientific organization, creation of a universal language, and demonstration of the compatibility of religion and science. *The Discovery of a World in the Moone* (1638) and *A Discourse concerning a New World and Another Planet* (1640) introduced lay readers to Copernicanism and the implications of Galileo's telescopic observations, but literary figures satirized his speculations about the possibility of lunar flight and lunar inhabitants. He also proposed solutions to possible conflicts with Scripture, which he suggested God had "accommodated" to the capacity of the common people. Natural knowledge was determined by "Sensible Experiments and Necessary Demonstration"; science was an independent body of knowledge verifiable by its own standards of investigation. *Mercury, or the Secret and Swift Messenger* (1641) explores the nature of codes and secret communications and proposes a "Universal Character" and language. *Mathematical Magick, or the wonders that may be performed by mechanical geometry* (1648) explains fundamental principles of mechanics and suggests both practical and fanciful devices utilizing these principles.

While warden of Wadham College, Oxford, Wilkins defended universities against the attacks of Thomas Hobbes and the radical sects, and insisted that the universities were hospitable to recent developments in natural philosophy. He recruited to Wadham a group of naturalists of differing religious and political persuasions to pursue a wide-ranging, cooperative, and experimental program that was the forerunner of the Royal Society, which he helped to found, serving as one of its secretaries and supervising the composition of Thomas Sprat's *The History of the Royal Society* (1667). His long-standing interest in language and linguistics culminated in *An Essay towards a Real Character, and a Philosophical Language* (1668), which describes a universal language he designed to facilitate scientific communication and trade and reduce religious misunderstanding.

Wilkins also made important contributions to religion and wrote frequently reprinted works on the organization and presentation of preaching and prayer. In *A Discourse concerning the Beauty of Providence and All the Rugged Passages of It* (1649) he advised acceptance of recent political changes. During the Restoration he became a key figure in the development of latitudinarian theology and natural religion and a staunch advocate of comprehension, a policy intended to broaden the established church. His adoption of an epistemology that emphasized the probabilistic nature of human knowledge led him to advocate tentativeness and moderation in both religion and natural philosophy, and he expounded these views from the pulpit of St. Laurence Jewry, London, as Dean of Ripon and as Bishop of Chester, and in his *Sermons Preached upon Several Occasions before the King at White-Hall* (1677) and *Of the Principles and Duties of Natural Religion* (1675), completed by his son-in-law, John Tilotson.

Wilkins's diverse interests made him a significant figure in the intellectual and cultural life of his time, and his contributions to Interregnum and Restoration natural philosophy and scientific organization remain important. Historians interested in the relationship between religion and science have investigated his religious views, variously identified as Puritan or latitudinarian, while literary scholars and linguists read his work in connection with the development of prose style and linguistics.

WILLIAM AND MARY (William III, 1650–1702; ruled 1689–1702), king of England, Scotland, and Ireland; (Mary II, 1662–1694; ruled 1689–1694), queen of England, Scotland, and Ireland. William III of Orange, stadtholder of the United Provinces, was born 4 November 1650, the son of William II of Orange (1626–1650), who died shortly before the birth, and Mary Stuart (1631–1660), eldest daughter of Charles I of England. Fiercely anti-French, the future William III led the Dutch in the war against France of 1672–1678 following the revolution of 1672 that revived the stadtholderate. The future Mary II was born on 30 April 1662, the eldest daughter of James, duke of York (James II; ruled 1685–1688), and his first wife, Anne Hyde (1638–1671). William and Mary were married on 4 November 1677 as part of the scheme of Thomas Osborne (1632–1712), earl of Danby, to move England out of the French orbit and to secure the Protestant succession in the wake of York's conversion to Catholicism. At the time Mary was second in line to the throne after her father, and William was fourth.

Alarmed by political developments under James II after 1685 and determined to bring England into

his anti-French alliance, William offered to invade England by April 1688 if he could be assured of the necessary support. The birth of a Prince of Wales to James II's second wife on 10 June 1688, however, provided the immediate cue for action. A group of seven Whig and Tory politicians sent William a signed invitation to come to England's rescue. William, using the rumor that the baby was not really the queen's but had been smuggled into the bedchamber in a warming pan as a pretext, alleged that James therefore was guilty of trying to defraud William and his wife of their inheritance rights. The Glorious Revolution of 1688–1689 that followed resulted in the overthrow of James II and the installation of William and Mary as joint sovereigns of England, Scotland, and Ireland, though with full regal power invested in William alone.

William's accession brought England into the Continental alliance to prevent the expansionist ambitions of Louis XIV (ruled 1643–1715) in Europe. William first secured Ireland, defeating James II's Franco-Irish army at the River Boyne on 1 July 1690 (though Jacobite resistance in Ireland did not finally collapse for another year). William then led the Continental campaign in the Low Countries, but the War of the League of Augsburg (1688–1697) ended inconclusively with the Treaty of Ryswick (Rijswijk) in 1697, leaving the crucial question of the fate of the Spanish inheritance undecided. In 1698–1700 William negotiated two treaties with France to partition the Spanish empire upon the death of the Spanish king Charles II (ruled 1665–1700). But when Charles died in October 1700, leaving his entire empire to Louis XIV's grandson Philip of Anjou (ruled 1700–1724, 1724–1746 as Philip V), Louis reneged on the agreement, prompting William to forge a new Grand Alliance (August 1701) to secure partition by force. The War of the Spanish Succession (1701–1714) broke out shortly after William's death.

The expense of war necessitated a financial revolution and the establishment of the Bank of England in 1694. Setting up the national debt, which needed to be serviced by regular grants of parliamentary taxation, did more than anything else to make the English monarchy dependent on Parliament. William's reign also saw the passage of the Triennial Act in 1694 (guaranteeing new Parliaments every three years) and the lapsing of the Licensing Act in 1695

(thereby establishing freedom of the press), while William's repeated absences in conducting war on the Continent led to the beginnings of the cabinet system of government. However, Mary was not a complete political nonentity. An act of May 1690 made her regent during her husband's absences, and she showed considerable adroitness in dealing with various crises that emerged until her premature death from smallpox in December 1694. Mary died childless, and her sister Anne's sole surviving child, the duke of Gloucester, died in 1700. Consequently in 1701 Parliament passed the Act of Settlement, which conferred the succession on the house of Hanover once the Protestant Stuart line died out, established that future monarchs had to be communicating members of the Church of England, and placed limits on the crown's ability to involve England in war fought in defense of the monarchy's possessions abroad.

In Scotland, William achieved notoriety for authorizing the massacre of the MacDonald clan at Glencoe in 1692, when the clan accidentally missed the deadline for swearing allegiance to the new regime by five days. In Ireland, William's regime presided over the passage of a series of penal laws designed to strike at the Catholic faith that were in clear breach of the Treaty of Limerick, which had ended the Jacobite War in 1691. With his health already deteriorating—he had long suffered badly from asthma—William fell and broke his collarbone when his horse stumbled on a molehill in Hampton Court Park on 20 February 1702. He died from pleurisy on 8 March. Jacobite legend attributes his demise to “the little gentleman in black velvet.”

TIM HARRIS

WILLIAM OF ORANGE (1533–1584), Dutch statesman, leader of the Dutch Revolt, and founding father of the Dutch Republic. Also known as William the Silent, William of Orange was the oldest son of the German count of Nassau, William the Rich, and Juliana of Stolbergen. His life was changed by the cannonball that killed his childless uncle René of Chalons during the Habsburg siege of the French town of Saint-Didier in 1544. As the last representative of the house of Nassau-Breda, Chalons had appointed his young nephew as his heir. The heritage included not only large possessions in the Netherlands, but also the principality of Orange in southern France. From now on, William was no longer the son of an insignificant German count, but a prince by blood. Emperor Charles V (ruled 1519–1556) summoned the young boy from his family’s castle at Dillenburg to the Netherlands, where he became a page at the imperial court and was raised as a loyal and Catholic nobleman. The years that followed saw the remarkable transformation of the son of a Lutheran German count into a French-speaking Burgundian *grand seigneur*, ready to serve the Habsburgs. A brilliant career followed, with honorable military charges, an appointment in the Council of State, admittance to the Order of the Golden Fleece, and, in 1559, the office of governor or stadtholder of Holland, Zeeland, and Utrecht. William of Orange had become one of the wealthiest and mightiest noblemen in the Netherlands. His 1558 marriage to Anna van Buren of the Egmont family confirmed his new standing.

William of Orange. LIBRARY OF CONGRESS

In the 1560s, under the regime of Charles V’s successor, Philip II of Spain (ruled 1556–1598), everything changed dramatically. From being a central pillar of royal authority, William of Orange became the leader of an armed opposition to Habsburg rule in the Low Countries. In hindsight, it is clear that the split between Orange and the regime started in 1561, with William’s second marriage to Anna of Saxony, the niece of the elector of Saxony. It was a prestigious but hardly tactful marriage. Anna had many powerful relatives, but they were all Lutherans, and most of them were old enemies of the Habsburgs. In order to profit fully from his new German connections, Orange was, according to some historians, forced to become more critical of the persecutions and executions of Protestants in the Netherlands and, in the end, of Catholicism itself. Certainly, the marriage heightened the suspicions in government circles concerning the prince’s religious loyalty. Lacking strong commitment to any confession, Orange himself became more and more convinced of the disastrous consequences of Philip II’s stubborn religious policy. Instead, he championed a policy of religious compromise. In December 1564, in a famous speech to the mem-

bers of the Council of State, Orange criticized frankly those rulers who sought to force the consciences of their subjects.

In politics William of Orange was above all an ambitious nobleman, seeking power and prestige. And as a natural advisor in military and political issues, he felt himself under the new regime more and more excluded from all-important decision making. In the figure of Philip II's new right-hand man in Brussels, Antoine Perrenot de Granvelle, Orange and his noble friends found their *bête noire*. For a traditional nobleman such as Orange, Granvelle was nothing more than an upstart civil servant from the Franche-Comté, an example of the rising new bureaucrats of non-noble background. And as the new archbishop of Malines, he was the personification of the new bishoprics, by many falsely associated with the Spanish Inquisition.

Orange and other nobles formed an anti-Granvelle league. By the end of 1563 Granvelle had lost the game in Madrid, and on 13 March 1564 he left the Netherlands. But William of Orange and his fellow noblemen never managed either to overcome the paralysis into which the government had fallen or to moderate Philip's policy. In the end, the king's reinforced religious persecutions sparked rebellion: in 1566 the Netherlands witnessed a profound political crisis, with rebellious Protestant members of the middling and lower nobility (the League of Compromise), a wave of iconoclasm (the *Beeldenstorm*), and military actions of the league of armed nobles known as the *Gueux* ('beggars').

As a *politique*, 'mediator between extremes', Orange tried to steer a middle course during the upheaval. He supported the political opposition but tried at the same time to prevent social unrest and chaos and to maintain good relations with the government. His attempt failed. Both sides mistrusted him. In April 1567, with the opposition in the Netherlands losing momentum and Don Fernando Alvarez de Toledo, third duke of Alba, at the head of ten thousand Spanish troops on the way, William of Orange fled to the Dillenburg to find rest and peace among his friends.

He was not to find it. His property was confiscated when he refused Alba's summons to appear before the Council of Blood, and his eldest son, Philips William, had been seized by the royalists at

the university town of Louvain and taken to Spain. William of Orange had become a dishonorable exile. In an attempt to redeem his lost reputation, and that of the house of Nassau, Orange decided on armed opposition to Habsburg rule in the Netherlands, and in 1568 he launched a military campaign. It was accompanied by a stream of well-crafted propaganda, elaborating on "Spanish cruelty" and tyranny, and stressing the godliness and heroism of William of Orange. In military affairs, however, Orange was no match for Alba. The campaign was a failure, and in the years that followed Orange was unable to mount further large-scale invasions to save the "worthy inhabitants who enjoyed freedom in former times from unbearable slavery," as he had promised.

On 1 April 1572, however, six hundred Sea Beggars, pirates carrying letters of marque by William of Orange, seized the small port of Brill. In the months that followed, one town after another in Holland and Zeeland opened its gates for Orange and the Sea Beggars, with the notable exception of Amsterdam, which stayed in the royalist camp until 1578. Alienated by Alba's tax policy and unwilling to billet Spanish garrisons, the citizenry choose what they thought was the lesser of two evils. At least the troops of the Sea Beggars included some countrymen and exiled townsmen who had fled the Netherlands in 1567. The Estates of Holland took matters into their own hands. On 19 July the Orangist Holland towns assembled at Dordrecht and accepted William of Orange as their stadtholder, recognizing him "in the absence of His Royal Majesty" as "Protector" of the Netherlands as a whole. In exchange, Orange promised through his secretary Philips Marnix, Lord of St. Aldegonde, that he would not govern Holland without the consent of the States. In the autumn of 1572, Orange, whose own efforts to stir up the cities of Brabant and Flanders had failed, decided to withdraw to Holland, convinced that he would find his grave there.

Dark years of civil war followed, including religious cleansing, mutual atrocities, and massacres of nuns, monks, and priests. Orange was powerless to prevent the elimination of Catholicism in Holland and Zeeland as an officially tolerated church, in spite of his own tolerant attitudes in religion. In the autumn of 1573 he became a Calvinist.

As a political leader, however, William of Orange experienced his finest hour. He proved to be a charismatic leader, pragmatic, keen, unwilling to compromise, and provided with an unflagging faith in God. It was largely as a result of his leadership that the rebels overcame their differences and continued their military struggle. Seizing the opportunities caused by the large-scale mutinies of the unpaid and unsupplied Spanish troops, the rebellious provinces of Holland and Zeeland in 1576 signed a treaty with the States-General, the Pacification of Ghent. It seemed a victory for Orange, the first step toward a reunification of the Netherlands under a new constitution. In September 1577 Orange entered Brussels in triumph, as a new “messiah.” But the new coalition was too fragile; Orange never managed to overcome the differences between Holland and the moderate noblemen in the south, or to moderate the demands of the radical Calvinists in Brabant and Flanders. In the end, north and south drifted apart, as was illustrated by the two “Unions” concluded in 1578: the Union of Arras, which aimed to reconcile the State of the Catholic-dominated provinces in the southern Netherlands with the king of Spain, and the Union of Utrecht, which was meant as a military alliance among the rebellious provinces “for all time.”

In September 1583 William of Orange returned to Holland from Antwerp. Declared a traitor and outlawed by Philip II, who had in 1581 promised a reward for the assassination of the prince, and confronted by the steady military advance of the new governor-general, Alexander Farnese, duke of Parma, Orange faced an insecure future. He defended himself in a fierce *Apologia*, but his popularity had reached rock bottom, largely because of his disastrous pro-French policy. He had always been convinced that the revolt could only succeed with the help of the French and had in 1580 offered the governor-generalship of the Netherlands to Francis, the duke of Anjou and Alençon, who was the brother of the French king. The eventual result was political crisis and mutinous soldiers (the French Fury of January 1583). Orange’s pro-French politics was symbolized in his private life by his marriage with Louise de Coligny in 1582. It was his fourth marriage, after Anna van Buren, the disastrous affair with Anna of Saxony, from whom he was divorced in 1575, and Charlotte de Bourbon. Louise de Col-

igny would give birth to Frederik Hendrik, Orange’s youngest son, after Philips William from his first marriage and Maurice from his second. He had six daughters with Charlotte de Bourbon.

When on 10 July 1584 the French Catholic zealot Balthazar Gérard fired his fatal pistol shots in Delft, the realization of Orange’s goals for the Netherlands seemed farther away than ever. No wonder therefore, that an English visitor, Fyne Moryson, described the original grave of the prince as “the poorest that ever I saw for such a person, being only of rough stones and mortar, with posts of wood, colored over with black, and very little erected from the ground” (quoted in Swart, forthcoming). It was only some twenty years later that the newly founded Dutch Republic erected the monument that William of Orange deserved as the founding father of a new state and the advocate of religious tolerance—Hendrick de Keyser’s monumental tomb in the Nieuwe Kerk in Delft.

WINCKELMANN, JOHANN JOACHIM (1717–1768), German art historian, archaeologist, and philosopher of aesthetics, and one of the leading proponents of neoclassicism. Winck-

emann is regarded as the first modern historian of art for his systematic treatment of ancient art as an expression of historical conditions, rather than as a tradition of artistic skills and ideas passed from one generation of artists to the next, which was the art-historical approach practiced by Giorgio Vasari (1511–1574), Karl van Mander (1548–1606), and Giovanni Pietro Bellori (1613–1696) in their *Lives* of artists.

Winckelmann was born on 9 December 1717 in Stendal, a town between Hannover and Berlin. The son of an impoverished cobbler, he sought, as a young man, to better his conditions through devotion to academic study, and fell in love with the literature of classical antiquity. In hopes of securing a measure of financial security, and on the advice of his father, Winckelmann pursued a course of study in theology, mathematics, and medicine, as well as Greek and Latin, at the Universities of Jena and Halle. At Halle, Winckelmann was a student of Alexander Baumgarten (1714–1762), the founder of

modern aesthetics, and developed his own philosophy of beauty, involving the direct experience of beautiful objects, in reaction to Baumgarten's rather cold (in Winckelmann's own opinion) philosophical formalism.

Not finding theology or medicine his calling, Winckelmann left the university and continued to pursue the study of ancient literature and contemporary aesthetics privately, while serving in various positions as a tutor and schoolteacher. A student tutored by him, F. W. Peter Lamprecht, became one of the great loves of his life and followed him to Seehausen after Winckelmann accepted a position as a teacher of Classics there in 1743. In 1748 Winckelmann left Seehausen to work as a librarian and researcher for Count Heinrich von Büнау in Nöthnitz, near Dresden. Lamprecht did not follow, although Winckelmann would continue to lavish his affections upon his former student in private correspondence for years to come. In 1754 he moved to Dresden to work as librarian to Cardinal Passionei, a position that afforded him access to works of literature, art objects, and contemporary cultural debate previously unavailable to him in the provinces where he had been raised and schooled. It was during this period in Dresden that Winckelmann wrote what would, in retrospect, count as the manifesto for the rest of his scholarly life: the brief but powerful and influential essay *Gedanken über die Nachahmung der griechischen Werke in der Malerei und Bildhauerkunst* (1755; Reflections on the imitation of the painting and sculpture of ancient Greeks). The essay took up a long-running debate in eighteenth-century European intellectual circles, called “The Battle of the Books” in London and the “Querelle des Anciens et des Modernes” in Paris, about which culture was superior—ancient or modern—and why. Winckelmann argued that ancient art was clearly superior and that, for the moderns, the only art worth making is the imitation of the art of the ancients, but added (in a rhetorical flourish typical of Winckelmann's style of argument) that the art of the ancients is so superior to the moderns that it is inimitable. He therefore counseled his artistic contemporaries that, since they are doomed to the ineradicable falseness of painting and sculpture in modern times, they should imitate that which is inimitable. Winckelmann reinforces his valuation of the impossible imitability of the Greeks by

Johann Joachim Winckelmann. LIBRARY OF CONGRESS

being the first art historian to discriminate between Greek originals and their inferior Roman copies.

Winckelmann's *Reflections* were quickly translated into several languages and found a wide audience. In 1755, with his intellectual reputation established, Winckelmann, encouraged by a group of Jesuit dignitaries visiting Dresden, moved to Rome, where he would be able to pursue his studies and personal inclinations more freely. By 1763, with Cardinal Alessandro Albani (1692–1779), the Vatican's chief librarian and a leading patron of the arts, as his sponsor and confidant, Winckelmann became papal antiquary, a position that included escorting visiting dignitaries through Rome's art and antiquities collections. In Rome, Winckelmann set to work on his most important book, *Geschichte der Kunst des Altertums* (1764; The history of ancient art), an ambitious, multivolume account of the art of antiquity in Egypt, Greece, and Rome, written in a style that mixes the sentimental with the clinical and the platonic. Winckelmann narrated the course of each of these cultures as a kind of life cycle showing "the origin, progress, change and downfall of art, together with the different styles of nations, periods and artists," and drew for his studies upon the concentrations of collections of antique art and artifacts in Rome. Elaborating on the thesis first offered in his *Reflections*, he argued that the felicitous cultural situation of ancient Greece—including political freedoms and unfettered opportunities to view and appreciate the naked body—could not be repeated in modern times. Following a logic reminiscent of the Socratic doctrines of love and beauty, he lamented the passing of Greek art and the beautiful male bodies that inspired it, but found consolation in the historian's ambition to know about it.

Winckelmann met with an untimely death at the hands of an unemployed cook and thief, Francesco Arcangeli, in a hotel in Trieste on 8 June, 1768, while on a diplomatic mission. The motive for the murder was never determined, although speculation about this and other details of Winckelmann's very public private life has inspired numerous literary treatments and plays.

WITCHCRAFT. Despite a generation of excellent research, the history of witchcraft remains bedeviled by a host of misperceptions. Ordinary readers often assume that the major witch-hunts occurred in the Middle Ages, that they were conducted by the Catholic Church, and that they reflected the prescientific notions and sexual fantasies of fanatics and neurotics. Elsewhere one can read that huge chain reaction witch trials constituted a "women's holocaust" accounting for millions of deaths, and that the witch-hunters especially targeted midwives and female healers. All of these conclusions are both wrong and misleading. The great age of witchcraft trials came after 1430, and primarily after 1570. The prosecuting magistrates were almost always secular officials, imbued with the best thinking of prominent theologians, philosophers, and even scientists. The numbers of those executed have often been exaggerated by a factor of one or two hundred. Men made up perhaps a quarter of those executed, and there is little evidence that midwives or healers were singled out for suspicion anywhere. But historical prejudices are hard to uproot.

UNDERSTANDINGS OF WITCHCRAFT

Depending on one's definition, various histories of witchcraft are defensible. It was once common, for example, to understand the crime of witchcraft as consisting essentially of having a pact with the devil, an agreement in which one exchanged one's eternal soul for monstrous powers. Such a crime of diabolism had not existed in the ancient world and only slowly emerged from the medieval campaign against magic and heresy, especially against medieval heretics such as the Cathars and Waldensians, groups who challenged both Catholic doctrines and papal jurisdiction. By the late fourteenth century, however, canon lawyers, prominent inquisitors, learned academics, and several popes came to agree that by means of a contract with the devil, whether explicit or only implicit, a magician might work genuine harm in this world. These theorists also gradually worked out a composite view of all the different sorts of crimes and activities their heresy involved. It was increasingly believed that witch-heretics flew off to a "sabbath" where they renounced their Christian faith and baptism, worshipped the devil, danced together, and enjoyed a cannibalistic feast, devouring children whom they had killed while using their fat or other body parts to make loathsome potions. They were also thought to receive instruction in working harmful magic by which they might destroy their neighbors' crops, interfere with the fertility of their cattle, and with the sex lives of those around them. Most luridly, witches were thought to have sexual relations with the devil or with lesser demons. During the fifteenth century large numbers of heretical "witches" or sorcerers began to be discovered, and increasingly they were women.

Another definition of witchcraft emphasizes the continuity of magical practices that witches had used in the West ever since classical times and the similarities between such practices and those found all around the world. On such an understanding, witchcraft is the belief in and use of unusual, secret, or even supernatural forces in order to force or promote specific desired ends. The ancient Greeks had believed in such magic but had not seen it as much of a daily threat. They originally thought that "magic" (*mageia*) was the strange, foreign religious practice of Persian priests (the magi) and of beggars or other dishonorable Greeks. Magic

seemed both alien and disreputable. In Greek literature, the figure of the witch included characters such as Circe and Medea, women who used destructive magic to express their anger, lust, and frustration, but magic does not seem to have been a prominent fear among the Greeks. With the ancient Romans, however, harmful magic (*maleficium*) was forbidden in the earliest set of laws (the Twelve Tables, 451 B.C.E.) and was punished with increasing severity. The Roman historian Livy (*History* 39.41.5 and 40.43.2f) recounts episodes when apparently thousands of persons were executed by jittery judicial officials, and, in the late first century C.E., the Romans began to crack down on fraudulent *magicae vanitates* ('worthless magic'), practices that included healing, divination, and astrology. Thus, this understanding of witchcraft did not require a devil or a pact but insisted on the dangers lurking in the hidden practices of lustful and vengeful witches.

A third notion of witchcraft may be found in the injunctions of the Old Testament, in which the authors of Exodus, Leviticus, Deuteronomy, and Kings, for example, forbade necromancy and divination, practices that competed with the rituals of the Levites and sacrificial priests while also challenging God's sovereignty over the dead and the future. From this point of view, witchcraft represented not diabolism or a physical danger but an abomination, not a conspiracy in league with the devil but impiety, a denial of God's omnipotent control over blessings, punishments, and history (and hence the future as well); such witchcraft constituted an attempt to gain knowledge or advantages that were for God alone. Over time the Israelites intensified their prohibitions against magic, sorcery, divination, and consulting the dead (necromancy), which all hinted at popular polytheism during the exilic and post-exilic period.

All of these notions of witchcraft blended together in various proportions during the late Middle Ages and early modern periods. Some jurists and demonologists were more concerned about a supposed Satanic conspiracy, whose goal seemed to be the destruction of humankind and Christianity. Others remained convinced that witches were primarily a physical danger to their neighbors. Still others were inspired by the image of idolatrous or irreligious magicians who did not constitute a physi-

cal danger to anyone and were not members of some hideous conspiracy, but were committed to “heathenish practices” and to foretelling the future by means of astrology, numerology, or other illicit means. In the seventeenth century some writers began to think that the basic crime of witchcraft consisted in being antisocial, regardless of any actual harm done or religious error.

THE GROWTH OF FEARS OF WITCHCRAFT

In the early Middle Ages, these components had not yet blended to any extent, and so one finds approaches to the crime of witchcraft concentrating on the old Roman or Germanic fear of harmful magic, while churchmen felt free to express deep skepticism about other elements of witchcraft. In perhaps the most important early medieval text, the *Canon Episcopi* (c. 910; “Bishops,” a title taken from the first word of this admonition), Regino of Prüm condemned *maleficium* (‘wrongdoing’) and *sortilegium* (harmful magic and ‘fortune-telling’) harshly in his first paragraph, but also went on to express deep doubts about the stories told of women who supposedly went out at night to ride on the backs of beasts with the goddess Diana. Such persons were dreaming or hallucinating, he thought, and any Christian who believed these tales was guilty of conceding too much power to a pagan goddess. This canon found a prominent place in Gratian’s *Decretum* (1140; Resolution), the most important medieval codification of canon law. From then on, all commentators had to concede that anyone who thought he or she flew might well be deluded.

Following the notion of witchcraft as diabolical heresy, one can trace the rise to prominence of an ecclesiastically flavored fear of a new and growing sect of witches. In the early fourteenth century, Pope John XXII (reigned 1316–1334), for example, repeatedly condemned his enemies for using charms, wax figures, and incantations in their efforts to kill him. In a couple of papal bulls aimed at combating these threats, Pope John widened the understanding of heresy to claim that sorcery involved heresy and a pact with the devil. It was once thought that his reign also witnessed the beginnings of large-scale witchcraft trials with hundreds of executions in southern France, but research in the mid-1970s established that the sources purportedly de-

scribing these trials are in fact nineteenth-century forgeries. Consequently, historians over the past twenty-five years have relocated the beginnings of major witch-hunts to the fifteenth century, and especially to the 1430s.

THE EARLIEST WITCHCRAFT TRIALS

The earliest trials seem to have sprung up around Lake Geneva, to the east in the Valais and Vaud, to the north in Fribourg, Neuchâtel, and Basel, and to the southeast in Leventina (Ticino) and Valle d’Aosta (Italy). During that decade, several authors elaborated the notion of the witches’ sabbath and expressed a sharpened sense of the dangers of a witches’ conspiracy. For example, the Dominican Johannes Nider (c. 1380–1438) wrote extensively in favor of church reform and against witchcraft. Although he maintained a skeptical attitude toward the flight of witches, he helped propagate the view that witches assembled for dancing, feasting, and sexual orgies and for murdering babies and eating their flesh. Gradually the notion took hold that witches gathered regularly at meetings called *sabbaths* or *synagogues*, terms that make the parallel with Jewish assemblies obvious. Frequently, however, these newly detected witches were seen as analogous to medieval heretics, especially to the Cathars and Waldensians. One treatise (c. 1450) described the “heresies” of the witches under the title *Erroris Gazariorum* (The errors of the Cathars, referring to the dualist heretics), while many texts referred to fifteenth-century witches as Vaudois (Waldensians, another prominent medieval heresy). Although the concept of witchcraft drew on ideas of how medieval Jews and heretics were organized, there is no credible evidence that the European witchcraft trials were actually directed at Jews or surviving pockets of heresy or paganism.

THE MALLEUS MALEFICARUM

By the late fifteenth century many ecclesiastical writers had concluded that witchcraft was a fairly new heresy with its origins in the 1380s. In 1484 Pope Innocent VIII (reigned 1484–1492) issued a papal bull, *Summis desiderantes affectibus*, reporting the wide extent of the threat and authorizing two Dominicans, Jacob Sprenger (c. 1436–1495) and Heinrich Kramer (for centuries called *Institutoris* [Latin for ‘merchant’]; c. 1430–1505) as inquisitors to root out the heretics, especially in southern

Germany and in the alpine regions of Tyrol. Secular magistrates were to cease obstructing their efforts and offer their assistance. Despite the bull, Kramer continued to have trouble prosecuting witches, partly because of continued secular and ecclesiastical resistance to his haughty and brutal methods. In the diocese of Constance, Kramer seems to have overseen the conviction and execution of at least forty-eight women, but at Ravensburg he secured the conviction of only two, while many other suspects were released. In 1485, Bishop Georg II Golser of Bressanone quashed Kramer's investigations at Innsbruck and exiled Kramer, noting that he seemed credulous, unethical, and perhaps crazy in his use of torture and in his wild imaginings of what witches did.

While licking his wounds, Kramer composed what is perhaps the most famous treatise on witchcraft, the *Malleus Maleficarum* (late 1486 or early 1487; The hammer of witches), in an effort to justify his fear that witchcraft was gaining ground against Christendom and that lustful women were naturally attracted or seduced into a life of devil worship, demonic sex, and harmful magic. Historians have often thought that the more distinguished Cologne theologian and coinquisitor, Jacob Sprenger, was the coauthor of this book, but the evidence for this collaboration is thin. It is worth noting that Kramer's *Malleus* never embodied accepted Catholic doctrine and that Kramer himself, after being banned from Innsbruck, was rusticated to the mission fields of Bohemia, where he died in obscurity in 1505.

In the *Malleus* Kramer laid out both the new theological understanding of witchcraft and the harsh inquisitorial methods by which one could force suspects to confess and to implicate others in their heresy-crime. Kramer also pleaded successfully for the intervention of secular officials in the prosecution of witchcraft, and, indeed, after 1500 most of the trials north of the Mediterranean were run by secular magistrates and according to secular laws. The vast majority of witchcraft executions came at the hands of ordinary secular magistrates who enforced secular laws and did not follow the prescriptions or share the peculiar phobias of the *Malleus*.

HERESY OR HARM?

Those who define *witchcraft* as a sort of heresy have often argued that by the end of the Middle Ages the construction of the crime was complete and that the great witch-hunts that followed in the sixteenth and seventeenth centuries were only the automatic result of this late medieval construction. On this view, common among certain medievalists, the "great witch craze" merely combined this fantastic crime with the supposedly relentless procedures of the Inquisition. Those who have emphasized the nature of witchcraft as harmful magic, however, have thought that the emphasis on heresy and inquisition seriously underestimates the fear of witchcraft among humble villagers, who were always more concerned about their crops, herds, and families than any supposed deviations in belief, and point to the slow adoption of witchcraft statutes by the civil authorities of northern Europe. Emperor Charles V's (ruled 1519–1556) imperial penal code (*Constitutio Criminalis Carolina*, 1532; The criminal code of the Emperor Charles), valid for the whole Holy Roman Empire, described the crime in these words: "When someone harms people or brings them trouble by witchcraft, one should punish them with death, and one should use the punishment of death by fire. When, however, someone uses witchcraft and yet does no one any harm with it, that person should be punished otherwise, according to the custom of the case" (Article 109). There was no mention of pacts with the devil, no sabbath, cannibalism, flight, or heresy. This secular code was obviously most concerned with *maleficium*, 'harmful magic'.

A similar emphasis is visible in the English statute of 1563, which threatened the death penalty for any witchcraft, enchantment, charming, or sorcery if it resulted in the death of a human being; but if these dark arts were less successful (if the victim was maimed or if animals were killed), the witch was to be punished with only a year's imprisonment. Reduced penalties were introduced for the lesser crimes of using magic to find lost or stolen goods, or to incite someone to illicit love. Other secular states also continued to consider witchcraft as first and foremost an attack on others by magical, supernatural means; it was only in the seventeenth century that some of these northern European states finally adopted a fully diabolized understanding of witch-

craft, one that made it a capital crime to “consult, covenant with, entertain, employ, feed, or reward any evil and wicked spirit to or for any intent or purpose,” as the English statute of 1604 put it. Just as most secular states in northern Europe continued to place *maleficium* at the heart of witchcraft accusations, so too most jurisdictions under an ecclesiastical law (for example, the Mediterranean regions of Italy, Spain, and Portugal) persisted in the sixteenth and seventeenth centuries in seeing witchcraft mainly as a spiritual offense. But that did not mean that the inquisitorial regimes were fiercer. Rather, it meant that throughout southern Europe the scrutiny of witchcraft rumors, accusations, and confessions was more intense, and executions for the crime of witchcraft correspondingly scarce.

VARIATIONS IN TIME AND SPACE

The wave of recent research into witchcraft trials across Europe has underscored dramatic variations from time to time and from place to place. No region was ever subject to a hundred years of terror; the worst witch-hunts came in waves or spasms, starting in the 1560s and 1570s in southern Germany and in Lorraine, rising again in the 1590s, again in the 1610s and late 1620s, and coming to an end in the 1660s. Across the Holy Roman Empire, the largest persecutions occurred in smaller territories, especially those under the secular jurisdiction of a prelate, an imperial abbot, or some other ecclesiastical administrator. The bishoprics and archbishoprics of Trier, Mainz, Cologne, Augsburg, Würzburg, Bamberg, and Eichstätt were among the fiercest in all of Europe, while the Duchy of Lorraine was perhaps the worst secular territory. Together they accounted for about 10,000 executions.

It was not only Catholic territories that proved to be zealous prosecutors of witchcraft. The Swiss territory of Vaud (under the general control of Bern) conducted perhaps the most extensive witchcraft trials in any Protestant land (perhaps 2,000 executed in all), but the reformed courts of Scotland probably executed 1,000 witches as well. Lutheran Mecklenburg, a land of splintered jurisdictions and widespread noble autonomy, may well have executed 2,000 of the approximately 3,700 persons tried there for witchcraft. In these large persecutions, village accusations of witchcraft usually proliferated in the wake of some climatic disaster, a late

frost or a cold, rainy summer that ruined crops, as was common in Germany in 1626, “the year with no summer.”

Magistrates responded to local pressures demanding punishment for the witches thought responsible for these disasters; by the seventeenth century some magistrates were ready to interpret such crop failures and the resulting famine as the consequence of a satanic conspiracy. Thus, village suspicions were reinforced by elite fears. In general, however, it appears that larger secular territories with better-developed appeals courts were able to contain the panic of witchcraft more effectively. The Electoral Palatinate, for example, never carried out witch-hunts of any magnitude, and Bavaria after the 1590s also displayed an increasing skepticism. The Parlement of Paris, the appeals court responsible for a huge jurisdiction that took in most of northern France, became increasingly skeptical from the 1580s onward and, after 1624, made the prosecution of witchcraft almost impossible. After a high point in much of Central Europe in the 1620s, another wave of witchcraft trials erupted in the 1660s from Germany north to Sweden, but then became rare except in Poland, where trials continued until about 1725. By then, witchcraft trials were long over elsewhere. It was long supposed that the last German execution for witchcraft occurred in 1775 in Kempten, but it is now known that the suspect there, though condemned, was not actually executed. In 1782 the Protestant canton of Uri executed a woman as a witch, and a few Polish trials resulted in executions even after that.

Witchcraft remained a crime mainly prosecuted in Catholic and Protestant Europe. The thoroughly developed notion of the pact with the devil was never introduced into the lands of Eastern Orthodoxy, so there were basically few trials (and no massive chain-reaction trials) in Russia. Even in Catholic Poland it appears that earlier accounts of huge witchcraft trials are seriously exaggerated. Suspicions of magic and a variety of other popular spiritual beliefs remained common among the Russian peasantry, however, right down to the twentieth century. Altogether, for all of Europe and over a period of about 300 years, scholars now estimate that perhaps 40,000 to 50,000 people were executed for the crime of witchcraft, a large number to be sure, but small compared to estimates that sug-

gest nine million executions, a number for which there is no basis.

Variations in the severity of witch-hunts and punishments imposed on those accused of the crime-heresy of witchcraft seem to have depended on whether local convictions could be appealed to a distant (and usually more skeptical) court. Where local courts could act autonomously, local excesses were difficult to moderate. It may even be that the term *witch-hunt* is misleading because, in many of the worst cases, magistrates were not actively hunting anyone but were, instead, responding to accusations that bubbled up from neighborhood suspicions. In a surprising number of cases, the original accusations were launched by village women against one or more other women suspected, sometimes for decades, of causing local harm.

WITCHCRAFT AS “SUPERSTITION”

The third definition of *witchcraft* as impiety surfaced in early modern Europe among magistrates who reacted in horror at the “superstition” of common villagers whose impious attitudes, magical practices, illicit charms, and devotion to local magical healers or shamanlike prophets seemed to prove their adherence to irreligion and witchcraft. Such “superstitious” peasants seemed to deny God’s omnipotence, omniscience, and sovereignty over the future and over all blessings and troubles. From this point of view, witchcraft accusations seem connected to efforts of churchmen and magistrates to enforce severe reforms of parish and devotional life. This pattern has been found in Friuli, north of Venice, among villagers who confessed that some of their neighbors regularly went forth “in the spirit” at night to combat the witches who threatened their fields.

Another study has examined the similar case of an alpine horse wrangler who confessed that he traveled with the “phantoms of the night” to learn the secrets of life and death and to gain healing powers. Pastors and priests, however, complained that their parishioners were too quick to blame their pains on witchcraft instead of recognizing the ways that God tested and punished them for their deviation from the devotion expected of them. So the common notion that ordinary people were “superstitious” did not automatically lead to charges of witchcraft among them. Instead, it often happened

that elite judges sitting in provincial or national capitals disdained to take seriously accusations or convictions at the village level.

SOCIOLOGY OF WITCHCRAFT TRIALS

Much recent research has concentrated on the sociology of the victims of witchcraft trials. The old notion that midwives and popular healers were singled out for repression has faded in the light of evidence that most of those convicted were more often women and men who failed in their neighborly obligations. The fantasies and tensions that led some women to accuse other women of witchcraft, for example, have been examined. In the German lands and in Britain about three-quarters of the executed were women, but elsewhere the proportion of men could be higher. In northern France men and women seem to have been executed in about equal numbers, while in Iceland and Finland men made up the majority of convictions. It was once held that women were the targets of misogynistic (and supposedly celibate) inquisitors, but it has become clear that most magistrates responded to pressures for witch trials from below and that the Mediterranean lands of the Inquisition (together with Ireland) were among the safest places to suffer local suspicions. There is also little evidence that those suspected of witchcraft were mentally ill or “hysterical.” Many of those convicted may, however, have seemed like “bad neighbors,” quarrelsome or dangerous, isolated and suspected of harboring vengeful feelings toward fellow villagers.

THE RISE OF SKEPTICISM

There was never a time when “everyone believed in witchcraft.” Even at the height of witchcraft trials, some people expressed doubts about the crime itself, about details (for example, whether witches could really fly to the sabbath), or about judicial procedures (whether torture could reliably force suspects to confess the truth). Johann Weyer (Wier; 1515–1588), personal physician to the Duke of Jülich-Cleves-Berg, reacted to the renewal of witchcraft trials by publishing *De Praestigiis Daemonum* (1563; On the deceits of demons), which questioned whether the crime of witchcraft was even possible. Although Weyer conceded large powers to the devil, in his view magic could never be effective (and therefore *maleficium* could never harm anyone); no one could really have a binding pact with

the devil, and so confessions of guilt suggested that the suspected witch (usually an old woman) was actually melancholy (mad). In 1584 Reginald Scot (1538?–1599), a Kentish gentleman, published his *Discoverie of Witchcraft*, an even more radical rejection of witchcraft that questioned even the power of demons to produce wonders or harm of any sort. During the seventeenth century these sorts of skepticism were reinforced by a growing procedural skepticism of the sort expressed anonymously by Frederick Spee, S.J. (1591–1635), in his *Cautio Criminalis* (1631; A warning concerning criminal cases). Spee movingly criticized the brutal employment of torture, the reliance on perjured testimony, and twisted interpretations of the law, so that in his view no one once accused could expect to escape conviction. Doubts like these finally made an impression all across northern Europe, so that the secular courts there became as skeptical as the Roman and Spanish Inquisitions had been ever since the mid-sixteenth century. Only after witchcraft trials had almost died away did a more fundamental skepticism spread, a philosophical or theological doubt that spirits of any sort could have any physical effects in this world. Here we may point to the example of Balthasar Bekker (1634–1698), the Dutch reformed theologian, whose *Betoverde Weereld* (1691; The world bewitched) did not challenge the existence of demons but tried to show that they could not affect human affairs or the natural world. In his view the doctrine of demons had crept into Catholic Christianity from the pagans and needed to be thoroughly reformed. Christian Thomasius (1655–1728), a celebrated jurist of the University of Halle, took a similar position in *De Crimine Magiae* (1701; Regarding the crime of magic).

It is noteworthy that witchcraft remained controversial, at least among theologians, well after the crime of witchcraft was essentially no longer pursued. The Netherlands had ceased prosecuting this crime around 1600 and the Parlement of Paris had made witchcraft hard to prove by the early seventeenth century, but it was not until 1682 that King Louis XIV (ruled 1643–1715) prohibited witchcraft trials in France, while England did not abolish the crime until 1736, and Austria and Hungary waited until 1755 and 1768, respectively, for this step. Even after these legal reforms were imposed,

certain theologians and many villagers continued to believe in magic and to fear the powers of witchcraft.

H. C. ERIK MIDELFORT

WITT, JOHAN AND CORNELIS DE (Johan 1625–1672; Cornelis 1623–1672), Dutch statesmen and patriots. The de Witt brothers, leading statesmen of the Dutch Republic and opponents of the House of Orange from 1653 to 1672, were born in Dordrecht, a city in the south of the province of Holland, where their father, Jacob de Witt, had already served several times as alderman and burgomaster. Together Johan and Cornelis went to the Latin School and studied law at the University of Leiden. They completed their education with a grand tour through France and England. About this time it was evident that Johan possessed extraordinary mental powers, notably in the field of mathematics. In the course of his busy life he would find time to publish a pioneering work on geometry, *The Elements of Curved Lines* (1659), and his masterpiece, *The Worth of Life Annuities Compared to Redemption Bonds* (1671), which is regarded today by historians of insurance as the foundation of modern actuarial science.

The brothers started their careers in a turbulent time when international developments and national events created unprecedented opportunities. First there was the Peace of Westphalia (1648), which ended the wars the Dutch had fought for eighty years (1568–1648) against the Spanish oppressor. The treaty was an official recognition of the Dutch territory as the United Provinces. The treaty also brought peace, and it was precisely this peace that caused havoc. The princes of Orange had led the army against the Spanish, and the cities had provided the funds, but now the peace broke up their confluence of interests. The merchants wanted to reduce the army budget and use their money for investments in trade and for the reduction of their enormous debts, but the young prince of Orange, William II (1626–1650), could not accept the prospect of being stripped of this glamorous part of the family heritage.

The second development took place across the English Channel, where Oliver Cromwell had put an end to the kingship of Charles I, William II's father-in-law. When Charles was beheaded in 1649, William wanted to bring the Stuarts back to power, which meant starting a new war. This was anathema to the regents of Holland, the wealthy non-noble patricians of the cities. The conflict between the prince of Orange and the cities of Holland therefore escalated rapidly. In 1650 William incarcerated several leading regents, one of whom was Jacob de Witt, and tried in vain to conquer Amsterdam. William died of smallpox that same year, and a collective aversion to monarchical power surfaced among the regents. This mood was not tempered by the birth of William III eight days after the death of his father. Holland and the six other provinces decided that the Dutch Republic could do without a singular authority, that the state would be governed by the city aristocracies, and proudly called this "True Freedom" (*de Ware Vrijheid*). Along with it came a tolerant attitude toward various religious groups and a keen eye for the connection between peace and prosperity. Of this set of values Johan de Witt became the eloquent spokesman.

Johan and Cornelis went separate ways, but both achieved powerful positions. Cornelis became a foremost member of the administration of his hometown of Dordrecht and married the daughter of an important aristocrat from Rotterdam. With the help of his brother, he became chief justice of a large area. Johan's star rose higher. On 30 July 1653, at the age of 28, he was appointed *raadpensionaris* or grand pensionary of Holland, chairman of the assembly of the States of Holland. Because this province was by far the wealthiest and most powerful of the Dutch Republic, it dominated the assembly of the States-General, so Johan became in fact the political leader of the nation. In 1655 he married Wendela Bicker, whose father was the most influential regent of Amsterdam and had been the leader of the resistance against William II.

Before Johan started his term as grand pensionary, the First Anglo-Dutch War (1652–1654) broke out. Johan managed to strengthen the navy and to conclude the war as quickly as possible, but he paid a high price for the peace: the Act of Seclusion (1654), a secret concession to Cromwell, which stated that no prince of Orange was to be

stadtholder or captain-general. When the other six provinces learned about it, a storm of indignation came down on Johan's head. Much of the hatred that was later directed at him originated from this act. During the twenty years of his rule, Johan tried to curtail the power of William III. But the older the prince became, the more difficult it was to contain support for him. The gap between the proponents of the "true freedom" and the supporters of the prince, many of whom saw him as a kind of messiah, became unsurmountable.

The Restoration (1660) in England brought Charles II, William's brother-in-law, to power. Charles grew into a dedicated enemy of the Dutch Republic and of Johan personally, whose domestic position he tried to undermine by persuading the Orangist party that the grand pensionary had denied William his family rights. When the Second Anglo-Dutch War (1665–1667) broke out, Johan sailed several times with the fleet to encourage the commanders to take offensive action. In the summer of 1667 Cornelis de Witt executed a bold plan devised by Johan: with a flotilla he raided the Chatham Dockyards and not only destroyed the biggest ships, but also towed home the *Royal Charles*. After this humiliation, Charles was forced to sign the peace, the Treaty of Breda.

Meanwhile, Louis XIV of France was usurping large parts of the Spanish Netherlands in the War of Devolution; this was the territory that Johan wanted to keep as a buffer against mighty France. On 23 January 1668 he concluded the Triple Alliance with England and Sweden, and the war ended with the Treaty of Aachen (Aix-la-Chapelle) in May 1668. But two years later Louis and Charles entered into the secret Treaty of Dover, by which the latter promised the former to assist in a full-scale attack on the Dutch Republic.

For more than a year Johan did not recognize the bad omens. He was too much of a rationalist and counted completely on the balance of power, believing that both France and England would be at a disadvantage when the other got hold of the United Provinces. He was incapable of understanding that the French and English kings would work together in destroying the Dutch Republic, because he thought it would be fatal to their own interests. He also did not grasp the fact that kings could start

wars out of injured pride. When the assault came in June 1672, it was too late. Louis XIV invaded Holland and began the third of the Anglo-Dutch Wars. The Dutch defeated the English and French navies, but the immense French army crushed its opponent in a matter of weeks. Panic raged through the republic and a hunt for scapegoats ensued. Popular feeling suddenly turned in favor of William III, and he was made stadtholder by popular acclaim. Hatred against the De Witt brothers resulted in an attempt on Johan's life and the detention of Cornelis, who was accused of planning to assassinate William III. On 20 August Johan, who was visiting his brother in prison, and Cornelis were lynched by the people of The Hague; in the frenzy the bodies were mutilated, bowels were eaten, and fingers and tongues collected as souvenirs. Among scholars it is still a matter of dispute whether Prince William III was behind the bloodbath.

LUC PANHUYSEN

WITTELSBACH DYNASTY (BAVARIA). The Wittelsbachs were one of the more important dynasties in European history. They ruled Bavaria (1180–1918), the Palatinate (1214–1918), and Electoral Cologne (1583–1761), as well as half a dozen prince-bishoprics (Freising, Liège, Münster, Osnabrück, Paderborn, and Regensburg), and they held up to three electoral votes in the Holy Roman Empire during the early modern period. Three Wittelsbachs were elected Holy Ro-

man emperor (1314–1347, 1400–1410, 1742–1745), some ruled as counts of Holland and Friesland (1349–1425), one became king of Denmark, Sweden, and Norway (1440–1448), two became kings of Bohemia (1619–1620, 1741–1745), four succeeded to the throne of Sweden (1654–1720), and one was made king of Greece (1832–1862). An attempt to succeed the Habsburgs in Spain failed in 1699, as did other attempts to assume the status of a major dynasty. The Wittelsbachs rose to princely status as supporters of the Hohenstaufen dynasty in the twelfth century, deriving their name from the tiny castle of Oberwittelsbach in Bavaria (in the district of Aichach, near Augsburg).

THE BAVARIAN WITTELSBACHS

The Wittelsbachs molded the history of Bavaria, which they ruled as dukes (1180–1623), prince-electors (1623–1806), and later kings (1806–1918). Otto I von Wittelsbach, appointed by Emperor Frederick I Barbarossa in 1180, and his son Louis I, who received the Palatinate in 1214 from Emperor Frederick II von Hohenstaufen, were the founding fathers of the dynasty. The Wittelsbach coat of arms, assembled during this period, includes the Hohenstaufen lion as well as the colors white and blue from the counts of Bogen, inherited through Ludmilla of Bogen (daughter of Frederick Přemysl, duke of Bohemia), and Elisabeth of Hungary, the wife of Louis I.

The first Wittelsbach emperor, Louis IV (ruled 1314–1347), attracted Franciscan celebrities and philosophers like William of Ockham and Marsilius of Padua to his court at Munich; Pope John XXII disdainfully branded him *Ludovicus Bavarus* (Louis the Bavarian). The emperor married Margaret of Holland, and his numerous children married into the dynasties of Lancaster, Cleves, Denmark, Mecklenburg, Poland, Brzeg, Bohemia, Hungary, Nuremberg (the Hohenzollerns), Hohenlohe, Lower Bavaria, the Tyrol, Verona (the della Scala, or Scaliger, family), and Sicily. The emperor's attempt to spread Wittelsbach rule over large parts of Europe—with his sons ruling over Holland, Zeeland, Friesland, Hainaut (Hennegouwen), Brandenburg, Bavaria, and the Tyrol—failed, but Louis's legacy influenced Bavarian politics in the early modern period, raising ambitions and inspiring historiography.

More concretely, the Treaty of Pavia (1329), in which Louis divided the Wittelsbachs into a Bavarian and a Palatine branch, actually maintained dynastic unity in order to secure mutual succession, concluding with the unification of the house of Wittelsbach in 1777 and 1799.

Throughout the early modern period the Bavarian Wittelsbachs based their politics on their core territory, securing it carefully with dynastic and religious alliances. They managed to bring about sustained development and to create not only a modern territorial state, but even a Bavarian nation. Albert IV the Wise of Bavaria-Munich (ruled 1465–1508), married to a Habsburg princess, obtained territorial unity in the Bavarian War of Succession (1504) and by issuing a law of primogeniture (1506). William IV (ruled 1508–1550) molded a policy of absolute Catholicity in the period of the Reformation. Bavarian princes married exclusively Catholic princesses, primarily of the houses of Habsburg, Lorraine, and Savoy. The dynastic alliance of Albert V (ruled 1550–1579) and Anna of Austria guaranteed an austere Counter-Reformation. Catholicism was indeed transformed into a state ideology. William V the Pious (ruled 1579–1597) compensated for his weak character with religious determination, guided by Jesuit advisers. He intervened in the Cologne War (1583), leading his territory close to bankruptcy, and had to resign. However, he secured the Bavarian secundogeniture in the Lower Rhine region and Bavarian rule over the ecclesiastical lands of Cologne, Münster, Hildesheim, Paderborn, Osnabrück, Liège, and the abbacies of Stavelot and Malmedy.

Maximilian I (ruled 1597–1651) was the most powerful of all the Wittelsbachs. Like his Lorraine cousins in France, he managed to assume leadership, and he forged a Catholic League in Germany (1610). He defeated his Wittelsbach cousin in Bohemia (1620), gained the Palatine dignity of prince-electors (1623), and annexed the Upper Palatinate (1628), leading his country through the horrors of the Thirty Years' War and eventually supporting the Peace of Westphalia. His son Ferdinand Maria (ruled 1651–1679) consolidated the country during the postwar depression and introduced the culture of the baroque, together with his wife Henriette Adelaide of Savoy. Maximilian II Emanuel (ruled 1679–1726), the “blue prince,” fought

successfully in the wars against the Turks and served as a governor in the Spanish Netherlands from 1691, but failed in his aspirations to secure the Spanish succession for his son by Maria Antonia of Spain, prince Joseph Ferdinand (1692–1699), who died at the most unfavorable moment. Charles Albert, Maximilian II's son by a Polish princess, was elected king of Bohemia and became Emperor Charles VII (ruled 1742–1745), his rule marked by war and financial exhaustion. Maximilian III Joseph (ruled 1745–1777), an enlightened prince and astute reformer, became the last prince-elect of the Bavarian line. According to the Treaty of Pavia (1329), he was succeeded by a Palatine prince.

THE PALATINE WITTELSBACHS

The history of the Palatine Wittelsbachs is much more complicated and confused, as their territory remained fragmented throughout the early modern period, and the dynasty suffered from endless divisions. This creative chaos had its positive sides, as it guaranteed a plurality of voices and eventually secured the survival of the Wittelsbach dynasty. The Wittelsbach electoral vote was given to the Palatines by the Golden Bull of 1356. Rupert III managed to become German king (Rupert I von der Pfalz, or 'of the Palatinate'; ruled 1400–1410). As in the case of the Bavarian emperor, after his death the land was divided into four lines—the electoral line (*Kurpfalz*, or Electoral Palatinate), Palatinate-Neumarkt, Palatinate-Simmern, and Palatinate-Mosbach—with a good number of subdivisions. Of growing importance were the line Palatinate-Simmern, which succeeded to the electoral line with Frederick III (ruled 1559–1576), and its sideline Palatinate-Zweibrücken (founded 1459), which branched out into Palatinate-Neuburg (1614), Palatinate-Zweibrücken-Birkenfeld (1569), and Palatinate-Sulzbach (1614).

Some of the Palatine Wittelsbachs adopted Protestantism, and the elector palatine assumed leadership of the Protestant party (Heidelberg Catechism, 1563) in the Holy Roman Empire. The Calvinist Frederick V (ruled 1610–1632), son-in-law of James I of England through his 1613 marriage to Elizabeth Stuart, was elected king of Bohemia (4 November 1619) but—despite Dutch, English, and Danish support—was deposed by his Bavarian cousin in 1620; he is thus remembered as the

“Winter King.” His son Rupert (1619–1682) fought as a general in the English Civil War, became privy councillor to Charles II, and discovered Rupert's Land (the drainage basin of Hudson's Bay) in Canada. The Palatine Wittelsbachs won back their territory in 1648, along with an additional (eighth) electoral vote. Charles I Louis (ruled 1648–1680) introduced toleration, admitting Lutherans, Mennonites, Jews, and Catholics to the Palatinate. His son remained childless, however, and his daughter Elizabeth Charlotte's (1652–1722) marriage to Duke Philip I of Orléans was utilized by France as a pretext to invade and devastate the Palatinate in the War of the Palatine Succession (1688–1697).

In 1685 the Electoral Palatinate was inherited by the Catholic Palatinate-Neuburg line. Wolfgang William of Palatinate-Neuburg (ruled 1610–1653), who had been raised as a Lutheran, had maintained his claims in the Jülich-Cleves Succession War and converted to Catholicism after marrying a sister of Maximilian of Bavaria in 1613. The new Palatine ruler in Düsseldorf, the ruler of the duchies of Jülich and Berg, married a princess of Palatinate-Zweibrücken, confirming his line's claim of succession in the Electoral Palatinate. The Neuburgers eventually succeeded to the main electoral line in Heidelberg in 1685/1699 with Elector Philip William. Their policy of re-Catholicization drove many subjects to emigrate, some to North America. When the Neuburger line ended with Elector Charles III Philip in 1742, they were succeeded by the princes of Palatinate-Sulzbach, a sideline of the Neuburgers, famous for their Rosicrucian commitment under Prince Christian August (1622–1708). Although married to a Calvinist princess of Nassau, Christian August personally converted to Catholicism but admitted all confessions and invited the Jews into his territory.

The Sulzbacher elector palatine Charles Theodore (ruled 1743–1799) inherited Bavaria in 1777 and shifted the Palatine court to Munich, but he remained childless. In the end the count of the tiny Palatinate-Zweibrücken-Birkenfeld inherited not only all the Palatine lines (1795 Zweibrücken, 1799 Electoral Palatinate), but also the throne in Munich. For the first time since 1329 all the Wittelsbach territories were united under one single ruler, after 470 years. After the collapse of the Holy Ro-

man Empire in 1806, Maximilian IV Joseph (ruled 1799–1825), supported by Napoleon I, gained territorial independence and became King Maximilian I Joseph of Bavaria. His descendants stayed in power in an enlarged kingdom of Bavaria (with added lands from Swabia and Franconia) until the revolution of 1918. The Wittelsbach family, despite the official abolition of nobility, is still honored by the Bavarian government to the present day.

An offshoot of the Palatine Wittelsbachs became kings of Sweden in the seventeenth century, when the younger son of the Calvinist prince John I of Palatinate-Zweibrücken, John Casimir of Palatinate-Kleeburg in Alsace, married Catherine, a daughter of King Charles IX of Sweden. After Queen Christina Vasa converted to Catholicism and abdicated in 1654, the son of John Casimir and Catherine, educated as a Lutheran, came to the Swedish throne as Charles X Gustav (ruled 1654–1660). Under the Wittelsbach ruler Charles XI (ruled 1660/1672–1697) Sweden became the hegemonic power in northern Europe, ruling over Finland, Estonia, Latvia, Livonia, and Pomerania. Charles XII (ruled 1697–1718) maintained this position in the Great Northern War, but remained without an heir and was briefly succeeded by his sister Ulrika Eleonora (ruled 1718–1720). Her husband Frederick of Hessen-Kassel (ruled as Frederick I, 1720–1751) was elected Swedish king in 1720. All Wittelsbach rulers, even the Swedish kings, shared the titles of duke of Bavaria and Count Palatine of the Rhine.

WOLFGANG BEHRINGER

WŁADYSŁAW II JAGIEŁŁO (POLAND) (Lithuanian: Jogaila; c. 1351–1434), grand duke of Lithuania (1377–1401) and king of Poland (1386–1434); son of Grand Duke Algirdas of Lithuania (d. 1375) and Yuliana, princess of Tver; and founder of the Jagiellon dynasty in Poland. In 1382 Jogaila imprisoned his uncle Kęstutis, with whom he had ruled jointly, and assumed full power in Lithuania; he later had Kęstutis murdered. That same year, threatened by the Order of Teutonic Knights, he concluded an armistice with them on the Dubysa River, in which he gave up the western part of Samogitia and promised to adopt the Christian faith. The agreement was broken in 1383 and Jogaila, seeing that a union with Poland would give him support against the Teutonic Knights, negotiated a union between the Grand Duchy of Lithuania and Poland at Krewo (14 August 1385). In return for the hand of Queen Jadwiga of Poland, he promised to Christianize the Grand Duchy, associate (*applicare* in Latin) its territories with Poland, and recover the territories lost by Poland (Gdańsk, Pomerania, Kujavia, Silesia, Halicz Ruthenia).

In 1388 Jogaila, now King Władysław Jagiełło, restored Mazovia's feudal dependence on Poland. From 1388 to 1392 he waged war against the Teutonic Knights and their ally, his cousin Vytautas (Witold). The war was brought to an end in 1392 by an agreement making Vytautas viceroy of the Grand Duchy of Lithuania. The Teutonic Order's attempts to conquer Lithuania and sever its union with Poland achieved partial success when Vytautas gave up Samogitia in 1398 (confirmed by treaty at Raciąż in 1404). In 1409 the Teutonic Knights resumed the war but were routed by Polish-Lithuanian forces under Jagiełło's command at the battle of Grunwald (Tannenberg; 15 July 1410). Even though the Poles did not take advantage of their victory militarily or politically (the Treaty of Toruń, concluded in 1411, was unfavorable to Poland), the battle marked the beginning of the decline of the Teutonic state's power. The fighting against the Teutonic Knights in the years that followed proved successful for the Polish-Lithuanian side.

The childless death of Queen Jadwiga (1399) weakened Jagiełło's position as king of Poland and made it necessary to renew the union with the Grand Duchy of Lithuania and settle the question

of succession to the throne. The Treaty of Vilnius (1401) confirmed the union of the two states and recognized Vytautas as grand duke of Lithuania; the union was further strengthened by a new treaty concluded at Horodo on 2 October 1413. Jagiełło's second marriage, with Anna, princess of Cilli (1402) and granddaughter of King Casimir III the Great, was meant to strengthen his legal position in Poland.

In 1421 the Hussites urged Jagiełło to accept the Bohemian throne, but he declined the offer and in 1424 issued an edict condemning Hussitism and threatening severe punishment for its believers and adherents. Having no male heir (Anna died in 1416, and his third wife, Elizabeth Granowska, died in 1420), Jagiełło contracted a fourth marriage (1422) with Sophia Holszańska, who bore him two sons, who became Władysław III Warneńczyk (ruled 1434–1444) and Casimir IV Jagiellończyk (ruled 1447–1492). In order to gain the nobility's support and secure the throne for his dynasty, the king confirmed the nobles' privileges in an act signed at Jedno (1430). In addition to his successes in foreign policy, Jagiełło also deserves credit for the restoration of the university in Cracow (1400). He was buried in the cathedral on Wawel Hill.

MARCIN KAMLER

WOLFF, CHRISTIAN (1679–1754), German philosopher. Born on 24 January 1679 in predominantly Catholic Breslau, Silesia (now Wrocław, Poland), the son of a Lutheran tanner who wanted him to become a minister, Wolff soon developed an interest in philosophy. After receiving a solid grounding in Scholasticism and Cartesianism under Jesuit supervision at the local *Gymnasium* (college preparatory school), Wolff began to study theology, mathematics, and philosophy at the University of Jena. He eventually earned his master's degree from the University of Leipzig in 1703, where his interest

had shifted increasingly toward mathematics and philosophy, both of which he regarded as useful disciplines to solve religious disputes. His dissertation, *De philosophia practica universali methodo mathematica conscripta* (1702; Practical philosophy according to mathematical methods), drew the attention of Gottfried Wilhelm Leibniz (1646–1716), whose letter of recommendation helped Wolff secure a professorship in mathematics at the University of Halle in 1706.

Although officially a professor of mathematics, Wolff lectured on experimental and theoretical physics, metaphysics, moral philosophy, and logic. At Halle, he published his most important works in philosophy including *Vernünfftige Gedancken von den Kräfte des menschlichen Verstandes* (1713; Rational thoughts on the powers of human understanding), *Vernünfftige Gedancken von Gott, der Welt, und der Seele des Menschen, auch allen Dingen überhaupt* (1720; Rational thoughts on God, the world, and the human soul, and all things in general), and *Vernünfftige Gedancken von der Menschen Thun und Lassen, zu Beförderung ihrer Glückseligkeit, den Liebhabern der Wahrheit mitgetheilet* (1720; Rational thoughts on human conduct for the purpose of their happiness, told to those who love the truth), all of which were written in German. Ever since, Wolff has been regarded as the founder of a German philosophical language. His fame, however, did not save him from attacks by leading Pietist members of the theological faculty at Halle, such as Joachim Lange (1670–1744), who viewed Wolff as an advocate of a deterministic universe and as a potential danger to Christian dogma. The conflict escalated on the occasion of Wolff's public lecture, "De Sinarum philosophia practica" (1721; On the practical philosophy of the Chinese), which emphasized that revelation was not essential for arriving at sound moral principles. His opponents successfully appealed to King Frederick William I of Prussia (ruled 1713–1740), who issued an official warrant on 8 November 1723, demanding his departure from Halle within forty-eight hours under the threat of death by hanging. Wolff subsequently accepted a position as professor of philosophy at the University of Marburg until 1740, when the new King Frederick II of Prussia (ruled 1740–1786) invited him to return to Halle. At the time of his death on 9 April 1754, Wolff held the position of

chancellor of the University of Halle and was privy councillor of Prussia, vice president of the Academy of St. Petersburg, and baron of the Holy Roman Empire.

Wolff's philosophical system builds on mathematical principles. He regarded the "mathematical method" as a guarantor for clarity because it connected premises and deductions into a chain of closely intertwined demonstrations. Although his philosophy was labeled as "Leibniz-Wolffian" as early as 1724—probably by one of his students, Georg Bernhard Bilfinger (1693–1750)—Wolff himself rejected this adjective without denying Leibniz's profound influence on him. He surpassed his famous predecessor by developing a more comprehensive system of philosophy, thereby linking all the individual disciplines with each other. He viewed philosophy as the science of all possible things. By *possible* Wolff meant anything that does not contain a logical contradiction, which is a lack of sufficient reason. In contrast to theology, which concerns itself with the supernatural, philosophy represents world wisdom. This marked a shift away from his predecessor Leibniz, who had always tried to prevent philosophy and theology from going their separate ways. Because, according to Wolff, attributes of the visible world proved God's existence, one branch of theology, the *theologia naturalis* ('natural theology') can, in accordance with the laws of reason, engage in determining God's qualities. Although he asserted that Christianity is based on the only true revelation, he nonetheless claimed that, at least in theory, certain standards must apply as well in order to distinguish it from false revelation. By making this suggestion, Wolff laid the foundation for a critical (rational) examination of revealed religion.

Christian Wolff was certainly the most important German philosopher between Leibniz and Immanuel Kant (1724–1804). In his *Kritik der reinen Vernunft* (1781; Critique of pure reason), Kant praised him as the "founder of the spirit of thoroughness in Germany." Wolff was the first modern thinker to write extensively in German. The rigor and clarity of his methodology helped emancipate philosophy from theology as an independent discipline. Wolffian principles, such as his emphasis on sufficient reason, encouraged radical biblical critics such as Johann Lorenz Schmidt (1702–1749) and

Hermann Samuel Reimarus (1694–1768) to examine and reject Christian revelation by subjecting Scripture to its rational principles. Nonetheless, one should not forget that Wolff's incorporation of Scholastic elements in his system and his conservative metaphysics made his philosophy equally appealing to Protestants and Catholics alike, both of whom viewed it as a useful defense against atheism and deism.

Wolff's influence reached even beyond the German territories. The concept of philosophy, as it appears in Diderot's and d'Alembert's *Encyclopédie*, can almost be called a precise copy of his definition of philosophy from his *Discursus praeliminaris de philosophia in genere* (1728; Preliminary discourse on philosophy in general).

ULRICH GROETSCH

WOMEN. As they have in all the world's cultures, women made up about half the population in early modern Europe, and their experiences were thus nearly as varied as those of men. Like those of men, women's experiences differed according to social class, geographic location, religious affiliation, ethnicity, and rural or urban setting. The life of Queen Elizabeth of England—probably the most powerful and famous woman from this period—was far more like that of her male relatives than like that of a peasant woman in Poland or the Ottoman Empire, or even a peasant woman on one of Elizabeth's own estates. She was highly educated, spoke many languages, held legitimate authority over many people, ate well, and lived quite comfortably, while peasant women—and men—had none of these advantages.

The great changes of the period had widely varying effects on women, creating greater opportunities for some women in some places while lessening opportunities for other women elsewhere. The expansion of rural cloth production, for example, created better-paying work for single women in parts of France, but lessened the demand for cloth made by married Irish women. Leaders of the Protestant Reformation supported teaching girls to read the Bible, but also advocated the closing of convents that provided a place where learned women could study and teach. Urban women in western Europe were increasingly able to obtain cheaper and more diverse consumer goods, but these were often produced in Europe's overseas colonies by men and women working in horrific conditions.

Despite this variety, however, all women in Europe lived in a society that regarded women as inferior to men. This idea undergirded and shaped legal systems, family relationships, inheritance patterns, religious doctrine and institutions, educational opportunities, and structures of work throughout all

of Europe. Even Queen Elizabeth was not excluded from this, for her life—and the course of English history—would have been very different had she been a man. Many women, from Queen Elizabeth on down, were able to shape their lives to a great extent despite restrictive ideas and systems, but their actions did not upset the underlying hierarchy of gender. This essay will first examine trends in the way that women's history of the early modern period has been conceptualized and studied, and then explore three realms of life that were especially important in shaping early modern women's situation and experiences: legal systems, work, and religious life.

EARLY MODERN WOMEN'S HISTORY

Intensive study of women in the early modern period, as in most periods, began in the 1970s by asking what women contributed to developments regarded as central to the period, such as the Renaissance, the Reformation, the development of capitalism, the creation of colonial empires, or the rise of the centralized state: Who were the great women artists/musicians/scientists/rulers? How did women's work serve capitalist expansion? What was women's role in political movements such as the English Civil War or other seventeenth-century revolts? Along with this, historians investigated what effects the developments of the early modern period had on women: What was the impact of the Reformation on women's lives? How did the scientific revolution or the Enlightenment shape ideas about women's place? What new products or opportunities were offered to women because of overseas empires?

Both these original lines of questioning continue, particularly for parts of Europe or groups of women that were slower to be studied, such as eastern Europe, Jewish women, or peasant women. They have been augmented more recently by quite different types of questions, as historians have realized the limitations of simply trying to fit women into historical developments largely derived from the male experience (an approach rather sarcastically described as “add women and stir”). Such questions often center on women's physical experiences—menstruation, pregnancy, motherhood—and the ways in which women gave meaning to these experiences, and on private or domestic mat-

ters, such as friendship networks, family devotional practices, or unpaid household labor. Because so little of this was documented in public sources during the early modern period, this research has required a great amount of archival digging and the use of literary and artistic sources.

To these older and newer lines of inquiry historians have also added questions about the symbolic role of gender, that is, how qualities judged masculine and feminine are differently valued and then used in discussions that do not explicitly relate to men and women, but that still reinforce women's secondary status. Investigations of the real and symbolic relations between gender and power have usually not been based on new types of sources, but have approached some of the most traditional types of historical sources—political treatises, public speeches by monarchs, state documents, religious tracts, and sermons—with new questions.

Taken together, these investigations have resulted in hundreds of books and thousands of articles on many aspects of the lives of early modern women. This is still far less, of course, than the number of books and articles on men, but it has created a much more complex—and interesting—picture than historians of women could have imagined thirty years ago and has changed the way we view many features of early modern life.

LAW AND LEGAL SYSTEMS

Traditional medieval law codes in Europe accorded women a secondary legal status, based generally on their inability to perform feudal military service; the oldest legal codes required every woman who was not married to have a male legal guardian who could undergo such procedures as trial by combat or trial by ordeal for her. This gender-based guardianship gradually died out in the later Middle Ages as court proceedings replaced physical trials, and unmarried women and widows generally gained the right to hold land on their own and to appear in court on their own behalf. In most parts of Europe, unmarried women and widows could make wills, serve as executors for the wills of others, and serve as witnesses in civil and criminal cases, though they could not serve as witnesses to a will.

Limitations on women's legal rights because of feudal obligations thus lessened in the late Middle Ages, but marriage provided another reason for

restricting women's legal role. Marriage was cited as the key reason for excluding women from public offices and duties, for their duty to obey their husbands prevented them from acting as independent persons; the fact that an unmarried woman or widow might possibly get married meant that they, too, were included in this exclusion. A married woman was legally subject to her husband in all things; she could not sue, make contracts, or go to court for any reason without his approval, and in many areas of Europe could not be sued or charged with any civil crime on her own. However, Russian law codes and Islamic law in the Ottoman Empire recognized women's right to sue and be sued as well as certain property and inheritance rights. In many parts of Europe, all goods or property that a wife brought into a marriage and all wages she earned during the marriage were considered the property of her husband, a situation that did not change legally until the nineteenth century.

The husband's control of his wife's property could be modified somewhat by a marriage contract that gave her legal ownership of the dowry she brought into the marriage, or, in some cities, by her declaring herself unmarried (*femme sole*) for legal purposes, such as borrowing and loaning money or making contracts. In the sixteenth century, wives were also gradually allowed to retain control over some family property if they could prove that their husbands were squandering everything through drink, gambling, or bad investments. In addition to these exceptions provided through law codes, it is clear from court records that women often actively managed their dowry property and carried out legal transactions without getting special approval. The proliferation of exceptions and the fact that women were often able to slip through the cracks of urban law codes began to bother jurists who were becoming educated in Roman law with its goals of comprehensiveness and uniformity. Roman law also gave them additional grounds for women's secondary legal status, for it based this not on feudal obligations or a wife's duty to obey her husband but on women's alleged physical and mental weaknesses, their "fragility, imbecility, irresponsibility, and ignorance," in the words of Justinian's sixth-century code. Along with peasants and the simple-minded, women were regarded as not legally responsible for all of their own actions and could not

be compelled to appear before a court; in all cases their testimony was regarded as less credible than a man's. These ideas led jurists in many parts of Europe to recommend, and in some cases implement, the reintroduction of gender-based guardianship; unmarried adult women and widows were again given male guardians and were prohibited from making any financial decisions, even donations to religious institutions, without their approval. In many parts of Europe, women lost the right of guardianship over their own children if they remarried.

Increasing restrictions on unmarried and married women continued throughout the early modern period. In 1731, for example, the Paris Parliament passed the *Ordonnance des donations*, which reemphasized the power of the husband over the wife; its provisions limiting women's legal rights later became part of the *Code Napoléon* of the early nineteenth century. The fact that court records show that fewer and fewer women appeared on their own behalf indicates that male guardianship was enforced. Governments generally became less willing to make exceptions in the case of women, as they felt any laxness might disrupt public order.

The spread of Roman law thus had a largely negative effect on women's civil legal status in the early modern period because of both the views of women that jurists chose to adopt from it and the stricter enforcement of existing laws to which it gave rise. Its impact on criminal law was less gender-specific, as was criminal law itself. In general, women throughout Europe were responsible for their own criminal actions and could be tortured and executed just like men. Women were often executed in a manner different from men, buried alive or drowned instead of being beheaded, largely because city executioners thought women would faint at the sight of the sword or ax and make their job more difficult. In Germany, a wife was often included in her husband's banishment for criminal actions—including banishment for adultery!—while the opposite was not the case. In Russia under Ivan the Terrible (ruled 1547–1584), the execution of a husband or father usually meant death for the victim's wife and children as well.

Along with concepts of feudal obligation, wifely obedience, and Roman law, one additional idea was

essential in shaping women's legal rights in early modern Europe—the notion of honor. Honor in this period was highly gender-specific, and for women, honor was largely a sexual matter. In most parts of Europe, women of all classes were allowed to bring defamation suits to court for insults to their honor, and it is clear from court records that they did this. Because of ideas of female sinfulness, irrationality, and weakness, however, women, particularly those in the middle and upper classes, were never regarded as able to defend their own honor completely without male assistance. Lower-class women might trade insults or physically fight one another, but middle- and upper-class women were expected to internalize notions of honor and shame and shape their behavior accordingly, depending on male relatives to carry out any public defense of their honor.

WORK

Though the actual work that men and women performed in the early modern economy was often very similar or the same, their relationships to work and their work identities were very different. Male work rhythms and a man's position in the economy were to a large degree determined by age, class, and training, with boys and men often moving as a group from one level of employment to the next. Female work rhythms were also determined by age and class, but even more so by individual biological and social events such as marriage, motherhood, and widowhood, all of which were experienced by women individually and over which they might have little control. Women often changed occupations several times during their lives or performed many different types of jobs at once, so that their identification with any one occupation was not strong.

Women rarely received formal training in a trade, and during the early modern period many occupations were professionalized, setting up required amounts of formal training and a licensing procedure before one could claim an occupational title. Thus in the Middle Ages both male and female practitioners of medicine were often called “physicians,” but by the sixteenth century, although women still healed people, only men who had attended university medical school could be called “physicians.” This professionalism trickled down to occupations that did not require university

training; women might brew herbal remedies, but only men could use the title “apothecary.” Professionalization did not simply affect titles, but also the fees people could charge for their services; a university-trained physician, for example, could easily make ten times the annual salary of a female medical practitioner.

During the early modern period, gender also became an important factor in separating what was considered skilled from what was considered unskilled work. Women were judged to be unfit for certain tasks, such as glass cutting, because they were too clumsy and “unskilled,” yet those same women made lace or silk thread, jobs that required an even higher level of dexterity than glass cutting. The gendered notion of work meant that women’s work was always valued less and generally paid less than men’s. All economies need both structure and flexibility, and during the early modern period these qualities became gender-identified: male labor provided the structure, so that it was regulated, tied to a training process, and lifelong; female labor provided the flexibility, so that it was discontinuous, alternately encouraged or suppressed, not linked to formal training, and generally badly paid. Women’s work was thus both marginal and irreplaceable.

Despite enormous economic changes during the early modern period, the vast majority of people in almost all parts of Europe continued to live in the countryside, producing agricultural products for their own use and for the use of their landlords. Agricultural tasks were highly, though not completely, gender-specific, though exactly which tasks were regarded as female and which as male varied widely throughout Europe. These gender divisions were partly the result of physical differences, with men generally doing tasks that required a great deal of upper-body strength, such as cutting grain with a scythe; they were partly the result of women’s greater responsibility for child care, so that women carried out tasks closer to the house that could be more easily interrupted for nursing or tending children; they were partly the result of cultural beliefs, so that women in parts of Norway, for example, sowed all grain because people felt this would ensure a bigger harvest. Whatever their source, gender divisions meant that the proper functioning of a rural household required at least one adult male and one adult female; remarriage after the death of a

spouse was much faster in the countryside than in the cities. Women’s labor changed as new types of crops and agricultural products were introduced and as agriculture became more specialized. Women in parts of Italy, for example, tended and harvested olive trees and grape vines, and carried out most of the tasks associated with the production of silk: gathering leaves from mulberry trees, raising the silk cocoons, and processing cocoons into raw silk by reeling and spinning. Women also worked as day laborers in agriculture; from wage regulations, we can see that female agricultural laborers were to be paid about half of what men were, and were also to be given less and poorer quality food.

Women also found work in rural areas in non-agricultural tasks, particularly in mining in central Europe and by the sixteenth century in domestic industry. In mining, women carried ore, wood, and salt, sorted and washed ore, and prepared charcoal briquets for use in smelting. In domestic industry, they produced wool, linen, and later cotton thread or cloth (or cloth that was a mixture of these), and were hired by capitalist investors, especially in parts of France, southern Germany, and northern Italy, as part of a household or as an individual. In areas of Europe where whole households were hired, domestic industry often broke down gender divisions, for men, women, and children who were old enough all worked at the same tasks; labor became a more important economic commodity than property, which led to earlier marriage, weaker parental control over children, and more power to women in family decision making. In parts of Europe where women were hired as individuals, men’s agricultural tasks were more highly paid, so men continued to make most of the decisions in the family, and there was little change in women’s status.

In the cities, domestic service was probably the largest employer of women throughout the period. Girls might begin service as young as seven or eight, traveling from their home village to a nearby town. Cities also offered other types of service employment on a daily or short-term basis. Many of these jobs were viewed as extensions of a woman’s functions and tasks in the home—cleaning, cooking, laundering, caring for children and old people, nursing the sick, preparing bodies for burial, mourning the dead. The hospitals, orphanages, and infirmaries run by the Catholic Church were largely

staffed by women, as were similar secular institutions that many cities set up beginning in the fifteenth century. In most parts of Europe, women continued to dominate midwifery, the one female occupation whose practitioners developed a sense of work identity nearly as strong as that of men.

The city marketplace, the economic as well as geographic center of most cities, was filled with women; along with rural women with their agricultural and animal products there were city women with sausage, pretzels, meat pies, cookies, candles, soap, and wooden implements they had made. Women sold fresh and salted fish that their husbands had caught or that they had purchased from fishermen, game and fowl they had bought from hunters, and imported food items such as oranges, and, in the eighteenth century, tea and coffee bought from international merchants. Women also ran small retail establishments throughout the city. They made beer, mead, and hard cider, and ran taverns and inns to dispense their beverages and provide sleeping quarters for those too poor to stay in the more established inns. Among Muslim populations in Ottoman urban centers, a number of women vendors, many of them Christians and Jews, catered to upper-class harem women.

Domestic industry provided employment for increasing numbers of urban as well as rural women, particularly in spinning. Early modern techniques of cloth production necessitated up to twenty carders and spinners per weaver, so that cloth centers like Florence, Augsburg, or Antwerp could keep many people employed. The identification of women and spinning became very strong in the early modern period, and by the seventeenth century unmarried women in England came to be called “spinsters.”

Women increasingly turned to spinning as other employment avenues were closed to them, particularly in craft guilds, which continued to dominate the production and distribution of most products throughout the early modern period. There were a few all-female guilds in cities with highly specialized economies such as Cologne, Paris, and Rouen, but in general the guilds were male organizations and followed the male life cycle. One became an apprentice at puberty, became a journeyman four to ten years later, traveled around learning from a number of masters, then settled down, married, opened

one’s own shop, and worked at the same craft full-time until one died or got too old to work any longer. Women fit into guilds much more informally, largely through their relationship to a master as his wife, daughter, or domestic servant. Masters’ widows ran shops after the death of their husbands, and were expected to pay all guild fees, though they could not participate in running the guild. As the result of economic decline, the competition of rural and urban proto-industrial development, the increasingly political nature of the guilds, and notions of guild honor, even this informal participation began to be restricted in the fifteenth century on the Continent, however, and women largely lost this relatively high-status work opportunity.

RELIGION

In Christianity, Judaism, and Islam, the early modern period was a time when the domestic nature of women’s acceptable religious activities was reinforced. The proper sphere for the expression of women’s religious ideas was a household, whether the secular household of a Jewish, Orthodox, Catholic, Protestant, or Muslim marriage, or the spiritual household of an enclosed Catholic or Orthodox convent. Times of emergency and instability, such as the expulsion of the Jews and Muslims from Spain, the first years of the Protestant Reformation, the English Civil War, or the Schism Crisis in Russia, offered women opportunities to play a public religious role, but these were clearly regarded as extraordinary by male religious thinkers and by many of the women who wrote or spoke publicly during these times. Women who were too assertive in expressing themselves during more stable times, or who were too individualistic in their ideas, risked being termed insane or being imprisoned by religious or secular courts.

Christianity, Judaism, and Islam all contain strong streaks of misogyny and were in the early modern period totally controlled by male hierarchies with the highest (or all) levels of the clergy reserved for men. In all three, God is thought of as male, the account of Creation appears to ascribe or ordain a secondary status for women, and women are instructed to be obedient and subservient; all three religious traditions were used by men as buttresses for male authority in all realms of life, not simply religion. Nevertheless, it was the language of

religious texts, and the examples of pious women who preceded them, that were used most often by women to subvert or directly oppose male directives.

Before the Reformation in western Europe and throughout the early modern period in eastern Europe, the most powerful and in many ways independent women in Christianity were the abbesses of certain convents, who controlled large amounts of property and often had jurisdiction over many subjects. Convents had widely varying levels of religious devotion and intellectual life; many were little more than dumping grounds for unmarriageable daughters, while others were important centers of piety and learning. In the fifteenth century many underwent a process of reform designed to enforce strict rules of conduct and higher standards of spirituality. These reforms put convents more closely under the control of a local male bishop, taking away some of the abbess's independent power, but also built up a strong sense of group cohesion among the nuns and gave them a greater sense of the spiritual worth of their lives. In addition to living in convents, a number of women in the late Middle Ages lived in less structured religious communities, supporting themselves by weaving, sewing, or caring for the sick.

Like Christianity itself, the Protestant Reformation both expanded and diminished women's opportunities. The period in which women were most active was the decade or so immediately following an area's decision to break with the Catholic Church, or while this decision was being made. In Germany and many other parts of Europe, that decision was made by a political leader—a prince, duke, king, or city council—who then had to create an alternative religious structure. During this period, many groups and individuals tried to shape the new religious institutions. Sometimes this popular pressure took the form of religious riots, in which women and men destroyed paintings, statues, stained-glass windows, or other objects that symbolized the old religion, or protected such objects from destruction at the hands of government officials; in 1536 at Exeter in England, for example, a group of women armed with shovels and pikes attacked workers who had been hired by the government to dismantle a monastery. Sometimes this popular pressure took the form of writing, when women and men who did not have formal theologi-

cal training took the notion of the "priesthood of all believers" literally and preached or published polemical religious literature explaining their own ideas.

Women's preaching or publishing religious material stood in direct opposition to the words ascribed to St. Paul (1 Timothy 2:11–15), which ordered women not to teach or preach, so that all women who published felt it necessary to justify their actions. Once Protestant churches were institutionalized, polemical writings by women (and untrained men) largely stopped. Women continued to write hymns and devotional literature, but these were often published posthumously or were designed for private use. Women's actions as well as their writings in the first years of the Reformation upset political and religious authorities. Many cities prohibited women from even getting together to discuss religious matters, and in 1543 an act of Parliament in England banned all women except those of the gentry and nobility from reading the Bible; upper-class women were also prohibited from reading the Bible aloud to others.

Once the Reformation was established, most women expressed their religious convictions in a domestic, rather than public, setting. They prayed and recited the catechism with children and servants, attended sermons, read the Bible or other devotional literature if they were literate, served meals that no longer followed Catholic fast prescriptions, and provided religious instruction for their children. Women's domestic religion frequently took them beyond the household, however, for they gave charitable donations to the needy and often assisted in caring for the ill and indigent. Such domestic and charitable activities were widely praised by Protestant reformers as long as husband and wife agreed in their religious opinions. If there was disagreement, however, most Protestants generally urged the wife to obey her husband rather than what she perceived as God's will.

The Protestant rejection of celibacy had a great impact on female religious, both cloistered nuns and women who lived in less formal religious communities. In most areas becoming Protestant, monasteries and convents were closed; nuns got very small pensions and were expected to return to their families. In parts of Germany where convents had

long been powerful, nuns became the most vocal and resolute opponents of the Protestant Reformation; the nuns' firmness combined with other religious and political factors to allow many convents to survive for centuries as Catholic establishments within Protestant territories or even as Lutheran institutions, redefined as educational centers for young women.

The response of the Catholic Church to the Protestant Reformation is often described as two interrelated movements, a Counter-Reformation that attempted to win territory and people back to loyalty to Rome and prevent further spread of Protestant ideas, and a reform of abuses and problems within the Catholic Church that had been recognized as problems by many long before the Protestant Reformation. Women were actively involved in both movements, but their actions were generally judged more acceptable when they were part of a reform drive; even more than the medieval crusades, the fight against Protestants, which was generally couched in very military language and could involve secret missions into "enemy" territory, was to be a masculine affair. Women who felt God had called them to oppose Protestants directly through missionary work, or to carry out the type of active service to the world in schools and hospitals that the Franciscans, Dominicans, and the new orders like the Jesuits were making increasingly popular with men, were largely opposed by the church hierarchy. The Council of Trent, the church council that met between 1545 and 1563 to define what Catholic positions would be on matters of doctrine and discipline, reaffirmed the necessity of cloister for all women religious, though enforcement of this decree came slowly. The only active apostolate left open to religious women was the instruction of girls, and that only within the convent. No nuns were sent to the foreign missions for any public duties, though once colonies were established in the New World and Asia cloistered convents quickly followed.

Some analysts see the period of the later seventeenth and early eighteenth centuries as a time when western European religion was feminized, as large numbers of people turned to groups that emphasized personal conversion, direct communication with God, and moral regeneration. Many of these groups were inspired by or even founded by

women, and had a disproportionate number of women among their followers. Women prophesied, published religious works, and even occasionally preached during the English Civil War, and also organized prayer meetings and conventicles in their houses. Quaker women preached throughout England and the English colonies in the New World, and were active as missionaries also in Ireland and Continental Europe well into the eighteenth century. Jansenism, a movement primarily within the French Catholic Church that emphasized personal holiness and spiritual renewal, attracted many women, and the convent of Port-Royal in Paris became the movement's spiritual center. In Germany, Pietism developed as a grass-roots movement of lay people who met in prayer circles and conventicles, among which were many women.

Judaism and Islam were minority religions in western Europe and Russia in the early modern period, and Jewish and Muslim women, along with men, were often the targets of persecution. Jewish women as well as men were questioned, tortured, physically punished, and in some cases executed by the Inquisition in Spain, leading Jews in other parts of Europe to make special efforts to help women of Jewish ancestry leave Spain and Portugal. Jewish women were excluded from public religious life, but they did have specific religious duties relating to the household and special prayers to say when they carried out these duties. Like Jewish women, Spanish Muslim women (termed "Moriscas") carried out religious rituals in their homes and taught them to their children. According to the records of the Inquisition, Moriscas observed the Muslim holy month of Ramadan, performed daily prayers, hid religious books and amulets written in Arabic in their clothing and furniture, taught Muslim ideas and practices to Christian women who married Muslim men, and organized funerals, weddings, and other ceremonies.

Women's lives involved much more than legal systems, work, and religious life, of course, but it is as impossible to cover all aspects of their lives in a relatively brief article as it would be those of men's lives. In fact, including a separate article on women—without a corresponding article on men—goes to some degree against recent research, which has emphasized the diversity more than the commonalities in women's experience across Eu-

rope. Even the experience of the relatively small group of women who held political power was diverse. Elizabeth I's situation was very different from that of queen mothers in France such as Marie de Médicis, female rulers of eastern Europe such as Maria Theresa, tsarinas such as Catherine the Great, or mothers of the sultans (known as the *valide-sultan*) in the Ottoman Empire. Thus perhaps the only generalization safe to make is that gender shaped the lives of all early modern Europeans in complex ways, and that every development of the period was shaped by, and in turn shaped, ideas about or structures of gender.

MERRY WIESNER-HANKS

WOMEN AND ART. Although women certainly produced art in previous centuries, it is in the sixteenth century that we first find strong biographical information on female artists. In the second edition of his *Lives of the Artists* (1568), Giorgio Vasari mentions a number of Flemish and Italian female artists, including the Bolognese sculptor Properzia De' Rossi (c. 1490–c. 1530), Sister Plautilla (1523–1588; prioress of the Florentine convent of Santa Caterina da Siena), a Madonna Lucrezia, wife of Count Clemente Pietra, and Sofonisba Anguissola (1527–1625). Nonetheless, the sixteenth and seventeenth centuries also witnessed a progressive exclusion of women from membership in guilds and the newly established art academies. The latter elevated painting, sculpture, and architecture above the status of craft by linking them to fields of knowledge—mathematics, geometry, human anatomy and study from living models, as well as a deep understanding of classical literary and visual sources—largely inaccessible to women.

FATHERS AND DAUGHTERS

Until the modern period women rarely achieved success in sculpture or architecture, although De' Rossi, who won a reputation for miniature curiosities comprising elaborate scenes carved on peach stones and later received public commissions in stone for the Church of San Petronio in Bologna, is a notable exception. Vasari emphasizes her accomplishment in household management and her physical beauty along with her artistry as a carver. According to Vasari, her relief of *The Temptation of Joseph by Potiphar's Wife* (c. 1526–1530), was “esteemed by all to be most beautiful,” emphasizing that “the wife of the Pharaoh's Chamberlain” is seen stripping Joseph's garment from him “with a womanly grace that defies description.”

Occasionally, educated aristocratic women achieved great success as courtiers and artists. The career of Sofonisba Anguissola is, in this regard, paradigmatic. She was the daughter of a noble family of Cremona. Her father, Amilcare Anguissola, educated all his seven children in music, painting, and Latin. He also sent Sofonisba, together with her sister Elena, to spend three years (1546–1549) in the household of the painter Bernardino Campi, and she subsequently studied with another Cremonese painter, Bernadino Gatti. Sofonisba, in turn, trained three of her sisters—Lucia, Europa, and Anna Maria—to paint. Anguissola was celebrated for her informal portraits and self-portraits, singled out by Vasari as “breathing likenesses.” An extraordinary painting depicting three of her sisters playing chess while a maid looks on (1555, *The Chess Game*) stands out for its striking attention to detail and for its natural rendition of physiognomy and gestural expression. While still in her twenties, Anguissola was invited to join the retinue of Philip II in Madrid, where she resided for over ten years (1559–1573), working as court painter and lady-in-waiting to Queen Isabel of Valois and subsequently Queen Anne of Austria.

Although some aristocratic women, like Anguissola, received an education that prepared them to pursue a career in the arts, more often than not the women who achieved success as artists benefited from a relative in the trade. Antwerp artist Catharina van Hemessen (1527/28–after 1566?), court painter to Mary of Hungary, came to be known for her small panels of religious subjects in the mode of

her father, the artist Jan van Hemessen. Levina Teerlinck (c. 1510–1576) followed the profession of her father, the miniaturist Simon Bining (or Bennick), and was called to the court of Henry VIII. Barbara Longhi (1552–1638), painter of small-scale devotional images, was trained by her father, Luca, in Ravenna; similarly, Venetian Marietta Robusti (1560–1590) was a vital member of the workshop of her father, Jacopo Robusti (called Tintoretto, c. 1518–1594). The Bolognese artists Lavinia Fontana (1552–1614) and Elisabetta Sirani (1638–1665) were also taught by their fathers, Prospero and Giovanni Andrea, respectively. Bologna, in fact, appears to have been an environment marked by progressive attitudes toward women in general (its university admitted female students already in the thirteenth century) and by its relative openness to female professional artists: no fewer than twenty-three female painters are recorded as active in Bologna during the sixteenth and seventeenth centuries. Sirani even opened a school for female artists in her native Bologna, allowing the possibility for women of non-artistic families to pursue a career in the arts.

SELF AND OTHERS

These forms of alternative education became more widespread in the following centuries. Yet with the powerful presence of the art academy in the seventeenth and eighteenth centuries and the limitations placed on female admissions, it was still very difficult for women to study art and therefore to become professional artists. Women could hardly aspire to produce the highest genre within the academic hierarchy, history painting, since they were barred from the life classes where the nude (and especially the male body) could be studied. This form of study was perceived as a prerequisite for the complex figurative compositions that history painting demanded. One way to circumvent this limitation was by copying from casts, statues, and skeletons, with which most studios were equipped. In a striking self-portrait of 1579, Lavinia Fontana shows herself seated with an air of intellectual seriousness at her desk, surrounded by a small nude figure and casts of body parts. Fontana, who in her lifetime amassed an impressive collection of antiques, gained success as a portraitist but also became known for her many ambitious religious and mythological scenes. Her marriage and eleven children did not hinder her

Women and Art. Properzia De' Rossi, *The Temptation of Joseph by Potiphar's Wife*, marble relief, Bologna, Museo di San Petronio. ©ART RESOURCE, N.Y.

career; she became official painter at the court of Clement VII and was elected to the Roman Academy. Her history paintings include a large-scale altarpiece of the *Consecration of the Virgin* (1599) and the full-length nude depiction of *Minerva Dress-*

ing Herself (1613) commissioned by the major Roman art collector Cardinal Scipione Borghese. This image of the goddess-warrior and patron of the arts is the first documented single-figure painting of a female nude by a female artist.

Another female artist who managed to produce a large body of work, including history paintings, was Artemisia Gentileschi (c. 1597–after 1651). Trained in the style of Caravaggio by her father, Orazio Gentileschi (c. 1562–c. 1647), and by Agostino Tassi, Gentileschi produced a great number of mythological and biblical scenes for patrons in Florence, Rome, Naples, and London. Products of one of the most powerful of female artists, Gentileschi's impressive heroines have been linked to her own biography, particularly with regard to the assault she suffered at the hands of her teacher Tassi. Her *Judith Decapitating Holofernes* (1615–1620; Pitti Palace, Florence) shows a dramatic nocturnal scene: the Old Testament heroine Judith has secretly entered the enemy camp and, with the help of her maid, cuts the throat of the Assyrian general. Although this iconography was painted by many of Gentileschi's contemporaries—including Caravaggio, Sirani, and her own father—no other artist achieved such a convincing rendition of sheer bodily force and psychological tension. We know from surviving letters that Gentileschi privately hired female models. The first extant studies of a male nude by a female artist are, however, a series of exquisite drawings by the Venetian painter Giulia Lama (1681–1747) and the roughly contemporary life studies by Susanna Maria von Sandrart (1658–1716), a graphic artist from Nuremberg.

Female artists often turned their attention to the mimetic genres of portraiture and still life painting, where academic training mattered less and which permitted women to work in the privacy of their own homes. In these fields, female artists were often highly innovative. Dutch artists such as Clara Peeters (1594–after 1657) and Rachel Ruysch (1664–1750) specialized in still life painting. Ruysch's marvelous, minutely rendered flower pictures were much sought after and fetched more than double the price of what Rembrandt could ask for his canvases. With her meticulous and painstakingly detailed renditions of insect specimens and plants in watercolor on vellum, the German-born Maria Sibylla Merian (1647–1717) contributed fundamentally to the fields of entomology and botany. Born in Frankfurt am Main and living much of her adult life in the Netherlands, Merian spent two years with her sister in the Dutch colony of Suriname in South America, where she catalogued indigenous

insects, plants, and animals. Other female baroque still life painters include the Italian Giovanna Garzoni (1600–1670), who became a member of the Academy of Saint Luke in Rome, Josefa de Obidos (1630–1684) in Portugal, and the Parisian child prodigy Louise Moillon (1615/16–after 1674), known for her imaginative combining of genre and still life scenes.

As a painter of intimate domestic genre scenes, Judith Leyster (1609–1660) deserves special mention. She presumably studied painting in the workshop of Frans Pietersz de Grebber, a renowned portrait painter in Haarlem, before becoming a member of the Haarlem Guild of St. Luke in 1633. The membership in the painters' guild enabled Leyster to establish her own studio, to which she also admitted a number of male students. Her paintings have often been confused with those of her contemporary Frans Hals. Leyster's successful career ended when she married an artist colleague and became a mother.

THE EIGHTEENTH CENTURY

The belief that women's ability to bear children paralleled their ability to reproduce nature mimetically bears upon the products of women artists throughout early modernity. From the sixteenth through the eighteenth centuries, female artists were particularly prized as portraitists. Mary Beale (1633–1699), England's first documented professional female artist, made a name for herself as a prolific painter of clerical portraits in the London of Charles II, competing with Peter Lely and Godfrey Kneller. A generation later, the Venetian Rosalba Carriera (1675–1757), who began her career illustrating snuff boxes, won international repute for her skillful portraits in pastels. Her light and effervescent manner not only helped raise pastel to a fine art, but—following her visit to Paris in 1720–1721 (on the invitation of the important patron Pierre Crozat)—her technique and style also had a decisive impact on the development of the rococo. Carriera captured her sitters in flattering portraits of brilliant luminous color and introduced a degree of informality that suited the taste of her international clientele and was quickly emulated by other artists throughout Europe. She became the first foreign woman to be elected to the French Academy of Fine Arts. Felicità Sartori, Carriera's best student, also

won international acclaim; she worked for August III, elector of Saxony and king of Poland, at his court in Dresden. In France, many female artists achieved success in and around the Bourbon court and in the Paris salons, including Anne Vallayer-Coster (1744–1818), Adélaïde Labille-Guiard (1749–1803), Marie Gabrielle Capet (1761–1818), the sculptor Marie-Anne Collot (student of M. E. Falconet), and the German painter Anna Dorothea Lisiewska-Therbusch (1721–1782).

But the most successful female French artist of the late eighteenth century was undoubtedly Elisabeth Vigée-Lebrun (1755–1842). One of the foremost painters of her time and court painter to Queen Marie Antoinette, she is remembered for her animated portraits and her equally lively autobiographical *Souvenirs* (1835–1837), which describe her coming of age in the *ancien régime*, her European travels, and her life in Napoleonic Paris. In this book, Vigée-Lebrun records her awareness of female artists both past and present: she notes studying works by Carriera in Venice and expresses pride at seeing the *Self-Portrait* of Angelica Kauffmann (1741–1807) in the Uffizi gallery. Indeed, during the second half of the eighteenth century Vigée-Lebrun's fame was matched only by the Swiss-born Kauffmann, who lived most of her life in Italy, but who spent a productive decade and a half in London. In 1768 Kauffmann became one of only two female founding members of the British Royal Academy, along with Mary Moser (1744–1819), a flower and subject painter. Kauffmann was enormously successful as a history painter of ambitious ancient and modern themes, while many of her smaller allegorical and mythological subjects were picked up by the print trade and reproduced on furniture, wall panels, and fabrics, causing one critic to exclaim that “the whole world is Angelicamad.” It was, however, through her portraits that Kauffmann, like Vigée-Lebrun and Carriera, secured an international clientele. Capitalizing on contemporary notions that promoted women's “sensibility,” Kauffmann's portraits came to be seen as particularly profound comments on the sitters' interior states.

Given that female artists had to negotiate their identities in a profession that for the most part shunned them, it is perhaps not surprising that as a group they produced such a large number of self-

portraits. One of the earliest known self-portraits by a female artist is that by a young Dutch woman, who emerges from a dark background holding a thin brush in her hand. The painting is inscribed “I, Catharina van Hemessen, painted myself in 1548 at the age of 20.” Sofonisba Anguissola's father sent out some of his daughter's many self-portraits to patrons as advertisements of her beauty and her talent, and Clara Peeters sometimes captured multiple self-reflections, holding brush and palette, in the surface of shiny objects in her meticulous still lifes. With the advent of the public art market and the unavoidable visibility of artists in the competitive annual academy exhibitions, self-portraiture had, by the eighteenth century, become a vital genre for female artists. It allowed them to craft public personae in a time when invisibility and private virtues (associated with modesty and domesticity) constituted ideal femininity. In the year that Vigée-Lebrun exhibited her monumental portrait of *Marie Antoinette and Her Children* (1787), an effort to counter the slander identifying the queen as a “bad mother,” the artist also showed her own *Self-Portrait with Daughter Julie*. Emulating a Madonna painting by Raphael, Vigée-Lebrun advertises her role as mother while simultaneously competing artistically with her celebrated male predecessor.

It also became a matter of pride—and self-advertisement—for professional women to show themselves with their female students, as in Carriera's *Self-Portrait* in which the artist works on a pastel portrait of her sister, whom Carriera had trained as her assistant. The accomplished painting by Marie-Victoire Lemoine (1754–1820), *Atelier of a Painter, Probably Mme Vigée Le Brun and Her Pupil* (1796), shows the artist as a student, learning to draw under the guidance of her celebrated teacher. After 1780, Vigée-Lebrun's chief female competitor and co-academician in Paris, Adélaïde Labille-Guiard, ran a private studio for women and in September 1790 approached the academy to raise the established quota of four female academicians. In her celebrated painting *Self-Portrait with Two Tulips*, Labille-Guiard depicts herself life-size in a dazzling dress at work on a monumental canvas, framed by attentive pupils Marie Gabrielle Capet (d. 1818) and Garreaux de Rosemond (d. 1788).

THE SALON: PATRONAGE AND PERSONALITIES

Since the appearance of Baldassare Castiglione's *The Courtier* (1528), the idea of art as a component of ideal feminine comportment had become widespread, reaching its greatest extent in the eighteenth century when the status of the amateur artist became broadly accepted as a norm. It was common practice for female artists to instruct aristocratic pupils, thereby cultivating a network of female patrons. Indeed, many female artists found particular success with powerful female patrons. This was certainly true for Vigée-Lebrun, Kauffmann, and Labille-Guiard, all of whom prospered from female protectors. There was, in fact, a long tradition of female aristocratic patronage, from the voracious collector and patron Isabella d'Este in sixteenth-century Ferrara to Rubens's great patron, Marie de Médicis, in seventeenth-century Paris. It was, however, in the eighteenth century that female patrons emerged as a powerful force in determining the development of art. For example, the extensive patronage of Catherine II the Great of Russia (ruled 1762–1796) helped transform St. Petersburg into a European city. In France, the sociable patronage of Jeanne Antoinette Poisson, Dame Le Normant d'Étioles, Marquise de Pompadour (1721–1764) deserves mention. The mistress of Louis XV, Pompadour shaped the cultural life of France between 1744 and her death in 1764. She collected art, commissioned paintings, and influenced the king's architectural patronage. By promoting certain artists, notably François Boucher, Pompadour supported the novel rococo forms, which defined the art of her age. Pompadour was also at the vanguard of what was to become the public expression of the new theory of aesthetics: the private salon. In line with contemporary notions privileging the cultivation of taste, salons were social gatherings staged for the polite cultured exchange that was increasingly thought to represent the foundation of civilized society. Women, long associated with the private sphere, played a major role in this development. Important salons were held by Marie de Rabutin-Chantal Marquise de Sévigné, Marie-Madeleine Marquise de La Fayette, Anne (called Ninon) de Lenclos, Claudine Alexandrine Guérin de Tencin, and Jeanne Françoise Julie Adélaïde Récamier. Germany lacked the cultural and social climate of France but similar attempts to institute salons were

made by Dorothea Caroline Albertine von Schelling (later Schlegel) and Henriette Julie Herz. These informal social gatherings also often provided the space for artistic expression by women; for example, Emma Hart (later Lady Hamilton) became famous throughout Europe for her performance of “attitudes,” a series of poses emulating different ancient works of art.

When the female body entered representation in the early modern era, it often negotiated a long tradition of accepted figural, social, and moral models. Given prevailing Christian conceptions of female virtue and vice in representation women were often seen to embody the virginal/maternal qualities of Mary or the seductive worldliness of Eve. Early modern portraits of female sitters—almost always patrician or aristocratic—shift between these two poles, with images of courtesans enticing assumed male spectators on the one hand, or, on the other, enacting the roles of “happy mothers” who appear to embrace a domestic ideal. This ambivalence runs through all genres and media. It is made more complex by the enduring fascination with Greco-Roman mythology. The reclining female nude, a staple of Renaissance, baroque, rococo, and neoclassical art, produced an alternate moral axis. For while the woman represented might be a courtesan elevated to the status of Venus, the mythological guise could also be donned by aristocratic women—but referring only to their beauty, not to their moral state. In fact, given the ease with which the female body could pass into abstraction, many representations of women in early modernity tend to fluctuate between fixed reference to a particular individual and/or character, and an embodiment of an abstract principle. This is perhaps most evident in the baroque art associated with the courts of Rome and Paris in the seventeenth century, but it also can be seen in contemporary Dutch paintings of domestic scenes. The women represented within the apparently unpretentious Netherlandish interiors are taken by some scholars as images of actual women, while other scholars insist that these women are types, operating within various moralizing tales.

Although often hindered by misogynistic opinions and obstacles, women in early modern Europe were active as artists and patrons, contributing decisively to the development of major artistic move-

ments. The work they produced is, in fact, intriguing in part on account of the manner in which these women responded to the complex restrictions they faced.

WREN, CHRISTOPHER (1632–1723), English architect. Sir Christopher Wren was an English scientist and architect, important for confirming, in what later was jokingly referred to as the “Wrenaissance,” a tradition of classical architecture in England in the seventeenth century that lasted for two centuries. His father was a distinguished cleric, and Wren was well educated, coming into contact while a student at Oxford with a group of scientists who were later, in 1661, to found the Royal Society. His interests at this time were science and astronomy; after receiving his degrees, he was elected a member of All Souls College and in 1661 he became the Savilian professor of astronomy at Oxford.

Gradually, however, Wren became interested in architecture, then considered a part of mathematics. When in 1663 his uncle, the bishop of Ely, asked him to design a chapel at Pembroke College, Cambridge, he was able to produce an adequate design, simple and classical in its forms. A year later he began the Sheldonian Theatre, Oxford, a complex structure, taken as to be expected from the design of

Christopher Wren. St. Paul's Cathedral, London, view from the northwest. ©DAVID REED/CORBIS

classical theaters, but roofed with a new truss system without columns, based on a floor plan devised by John Wallis, formerly professor of geometry at Oxford. It was in 1665 that Wren made his only visit abroad, to Paris, where he visited the new classical buildings and met, if briefly, the Italian architect Gian Lorenzo Bernini.

On his return to London, Wren began further restorations at St. Paul's Cathedral. But in 1666 came the Great Fire, and with it an opportunity for him not only to rebuild the fabric of the cathedral, but also to redesign the whole city of London on a regular and ordered plan. As one of the commissioners appointed to survey the areas destroyed, Wren was very much involved in the restoration of London; when in 1668 he was also appointed surveyor general of the king's works, he resigned from Oxford and turned all his attention to architecture. Of the project for London, which was taken from some of the new plans for Rome, little was realized, commerce and expediency requiring that everything

in the city be quickly rebuilt along the existing patterns of streets. Wren was also involved in rebuilding more than fifty local city churches. Their designs, varied and distinct as they were in their plans, established a new form for the Protestant church, with open galleries inside and bell towers outside, often set apart from the basic structure and effectively recalling, in all their classical details, the spires of the older medieval churches that had earlier been present at the same sites.

Wren's design for St. Paul's Cathedral was equally important. Its great dome, with the colonnade running around the drum, taken from a design by Donato Bramante for St. Peter's, was a model for many later buildings—such as the Capitol in Washington, D.C.—where a dome was to be used for purely secular buildings. Wren also worked on several projects for King Charles II. Although many of his designs for Winchester Palace, Whitehall, and Hampton Court were never realized, at the Royal Hospital, Chelsea (begun in 1682), and at the Royal

Hospital for Seamen, Greenwich (1696 onward), he defined an ideal of monumental architecture, deeply influential on architects of the next generation. In addition, Wren again worked for the universities, notably at the library of Trinity College, Cambridge (1676–1684) and at Tom Tower at Christ Church, Oxford (1681–1682), which, following what he called customary rather than natural beauty, was constructed in a Gothic style to complement its older architectural surroundings.

The last years of Wren's life were not happy. His supervision of the Office of Works became haphazard, and in 1718 he was dismissed, retaining only his surveyorship at St. Paul's and at Westminster Abbey. It was then that the Palladian group, led by Lord Burlington, took charge of this office, arguing for a new native style of architecture, based on the theories of Andrea Palladio and Inigo Jones, to replace the more pragmatic baroque style of Wren and his followers. But what Wren had done was of immense importance. And if his designs never reached the quality of those executed by Sir John Vanbrugh and Nicholas Hawksmoor, who had begun his career in Wren's office, his ideas about his work, carefully preserved by his son, served to demonstrate, in ways now compatible with the experimental approaches he learned as a scientist, how architecture and its history could be seriously thought about and seen as part of a design tradition that dated back to Italy and antiquity.

WÜRTTEMBERG, DUCHY OF. Early modern Württemberg had a flourishing agricultural economy, a highly developed administrative structure, and superb cultural achievements, yet its prime location in the southwest corner of the Holy Roman Empire also made it a target for imperial ambitions and invasions. For administrative and taxation purposes, the territory of almost 3,500 square miles (9,000 square kilometers) was divided up into districts (*Ämter* or *Vogteien*) that varied greatly in size and whose number rose from thirty-eight in 1442 to fifty-eight by 1600. Württemberg's total population during the sixteenth century was between three and four hundred thousand, with 70 percent of the populace living in the countryside and 30 percent in the towns. The capital was Stuttgart, the largest town by far with a population of about nine thousand inhabitants. Württemberg's economy rested primarily on wine, rye, barley, hay, and oats, although its merchants also traded in wood, wool, cloth, linen, glass, and metal. Small property ownership by landlords who charged their tenants rent (*Grundherrschaft*) remained the rule, rather than the large landed estates (*Gutsherrschaften*) common in other German territories.

A series of wars during the seventeenth century and the early eighteenth century had a devastating impact on the region's social, economic, and cultural life. While the duchy was at first little touched by the Thirty Years' War (1618–1648), large-scale invasions by imperial troops following the Battle of Nördlingen in 1634 led to a decline in the duchy's population from 415,000 to 97,000 by 1639. The wars of Louis XIV (ruled 1643–1715) continued to suppress population levels, and it was not until the Treaty of Utrecht of 1713 that an era of relative peace and prosperity ensued.

GOVERNMENT

Territorial administration existed on several levels. Rulers came from the House of Württemberg, which had governed the territory since the eleventh century. Count Eberhard im Bart ("the Bearded," 1445–1496) became a duke following the elevation of Württemberg to a duchy by Emperor Maximilian I (ruled 1493–1519) at the Diet of Worms in 1495. For advice on policy, subsequent dukes surrounded themselves with burgher and noble councillors,

many of whom were educated at Tübingen University, founded in 1477.

The majority of councillors came from the urban notables (*Ehrbarkeit*), a relatively diverse administrative group holding positions at the local and district levels. Most local positions, such as village mayor (*Schultheiss*), burgomaster, and town clerk, arose during the thirteenth century. At the district level the position of the commissioner (*Vogt*) split into two separate positions, junior commissioner and senior commissioner (*Untervogt* and *Obervogt*), by the late fifteenth century. The junior commissioner, typically a burgher, worked with the district court to maintain law and order and supervise taxation, whereas the senior commissioner, almost always a noble, had a military role, although this position became essentially honorary by the early seventeenth century.

The notables also dominated the Estates, which first met in 1457 and comprised the territory's representative body. With 75 percent of the representatives coming from the towns, the Estates comprised lesser nobles, burghers, and prelates and served as a counterbalance to the higher nobility, the knights (*Reichsritter*), who gradually exempted themselves from Württemberg's state control. While the ruler had to call the Estates to assembly, two committees, the Small and Large Committees, could convene on their own authority. The Estates claimed some early victories, such as the 1514 Treaty of Tübingen that affirmed citizens' privileges, but it rose to even greater heights during the seventeenth century, particularly following the Thirty Years' War, when the duke needed the Estates to raise more revenue. A combination of the diversity and power of the notables, the long-term presence of the Estates, and rigorous Lutheran reforms contributed to the relative unity of Württemberg's territories over time.

RELIGION AND CULTURE

After fifteen years of Austrian occupation, Württembergers witnessed two seminal events: the triumphant return in 1534 of Duke Ulrich (1487–1550) with the aid of Landgrave Philip of Hesse (1504–1567) and the Schmalkaldic League, and the ushering in of the Lutheran Reformation. A confiscation of church property ensued, which initially brought in over 100,000 gulden annually, although the monasteries were not dissolved. The

principal reformer, the humanist scholar and theologian Johannes Brenz (1499–1570), cofounded the visitation to instruct the faithful and enforce church discipline. The church council (*Kirchenrat*), created in 1553 under Duke Christoph (1515–1568), subsumed these and other duties, such as collecting rents from church lands, distributing loans or grants to the poor and to university students, and paying the salaries of court musicians.

The Pietist movement, based on the theology of Johann Valentin Andreae (1586–1654) and Philipp Jacob Spener (1635–1705), arose during the 1680s and 1690s, when the Württemberg court moved toward a hedonistic lifestyle patterned after Versailles and reveled in opera, dance, and Carnival. Pietism offered a “passive, antiabsolutist” stance and provided a corollary to English Puritanism but was less political in its manifestations. Pietists' disapproval of the court increased strongly while Württemberg had Catholic dukes from 1733 to 1797, beginning with Carl Alexander (1684–1737), who had converted in 1712 and established close ties with the Habsburgs. His son and successor Carl Eugen (1728–1793), who ruled for almost fifty years, seemed to personify the “petty absolutist” and was in continual conflict with the Estates. Court life inspired the territory's greatest Enlightenment figure, Friedrich Schiller (1759–1805), who attended the duke's military academy and rebelled openly against the pomposity and vainglory of the age through drama and verse.

Notable achievements in the fine arts included the establishment of a music ensemble (*Hofkapelle* or court chapel) in 1496 under Duke Eberhard II (1447–1504). Consisting at its peak of fifty-nine instrumentalists and a boys' choir, the music ensemble became renowned throughout Europe during the sixteenth and seventeenth centuries, and performed at both sacred and secular occasions. It attracted many foreign musicians, including the English lutenist John Price (d. 1641) and the Hungarian composer Samuel Capricornus (1628–1665), who served as music director (*kapellmeister*) from 1657 to 1665. The territory's most famous artist, Hans Baldung-Grien (c. 1484–1545), was an apprentice to Albrecht Dürer (1471–1528) before he moved to Strasbourg to become one of the leading figures of the northern Renaissance. In his paintings, stained glass, drawings, woodcuts, and engrav-

ings, Baldung depicted a broad array of subjects, from traditional Christian iconography and secular portraiture to witchcraft and death.

KENNETH H. MARCUS

YOUTH. The transitional phase of life between childhood and adulthood in early modern Europe is not easily fixed chronologically. Traditionally childhood ended around age seven, but since full adulthood was usually marked by marriage, “youth” (Latin *iuventus*) could last as little as ten years and as long as twenty-five or more years. Consequently, terms for male youths, such as lad or knave, *garçon* (French), or *Knabe* (German), could refer to someone as young as seven years old or as old as thirty-five. The same is true of the female maid or maiden, *jeune fille* (French) or *Jungfrau* (German), as well as the forms of address of Miss, Mademoiselle, and Fräulein. Early modern legal codes similarly varied widely on the age of majority, ranging from twelve in canon law to twenty-five in Roman law and its later imitators.

The onset of youth, on the other hand, enjoyed broader consensus in European societies and was reinforced by the ecclesiastical tradition established by Lateran IV (1215) of establishing seven as the age of discretion (Latin *anni discretionis*), when a child was intellectually and morally competent to receive the Eucharist. Puberty certainly fell within this life stage but was rarely a formalized marker within itself, not only because of its individual character but also because the average age of menarche was at least sixteen or seventeen, and many males continued to grow physically into their twenties. Occasionally, certain rituals marked the transition from childhood to youth, such as the bestowing of a knife or sword on a boy, or distinctive jewelry,

headwear, or a new hairstyle among girls. In general, though, early modern “youth” is best measured in chronologically flexible terms of an individual’s position in various groups, principally relating to his or her immediate family, employer, and peers.

WORK AND SCHOOL

Most boys and girls left their homes at some point before marriage for apprenticeships or domestic service positions with relatives or strangers. Few departed before the age of seven and some not until their late teens. By the time youths had reached their early twenties, though, at least two-thirds and sometimes three-quarters of them had left their parents’ homes. Ostensibly the main purpose of the arrangement, typically lasting three to seven years, was for a boy to learn certain marketable skills and for a girl to earn the money for her dowry. The sojourn away from home, however, also had the effect of reducing a household’s expenditures while the child was away. Some returned at the end of their contractual period, awaiting an inheritance (in the case of a son), a dowry and/or marriage prospect (in the case of a daughter), or a new position. The same expectations held for the large number of youths who had never left home in the first place (particularly in the countryside) and who in the meantime worked to contribute to the family’s income. Meanwhile, the remainder had married and usually set up their own households, a universally recognized sign of adulthood.

Education received a powerful boost from both the Renaissance and Catholic and Protestant Refor-

mations, but schooling remained a minority experience among European youths until at least the eighteenth century. The majority of those boys and girls who did attend school usually received no more than a few years of instruction from parish or private schools in basic vernacular literacy and some fundamental arithmetic. Well-to-do and intellectually gifted boys were able to attend Latin grammar schools, with many continuing their studies at a university. Often, pupils, like apprentices, moved into the homes of their masters. Among the wealthy, either tutors took up lodging with their students' families, instructing their charges in a variety of subjects, or teenagers attended exclusive boarding schools. In Catholic countries, the new religious orders of the Catholic Reformation, notably the Jesuits, Barnabites, Piarists, and others, offered free education in Latin schools found in every major city and many towns. Those boys who were able to continue their studies at a university were forbidden to marry before completing their degrees and were controlled in other ways by their masters, who acted in loco parentis and continued to set strict rules and discipline with the rod.

One of the initial benefits of the Reformation for girls was the opening of many mixed and single-sex schools that they might attend in Protestant lands. Among Catholics, new teaching orders such as the Ursulines undertook a similar mission to educate girls and young women. In addition, in Catholic countries many girls received educations as long-term boarders in convents or as novices (future nuns). The majority received limited vernacular reading and writing skills plus sewing and singing lessons. A few convent boarders and future nuns received good Latin educations. Unfortunately, both movements coincided with a greater restriction against and eventually prohibition of non-accredited "cranny schools," the more affordable and thus more common site of education for early modern girls. The reforms and advances among Protestants must also be weighed against the closure of all convent and other girls' schools run by nuns. Consequently, only a minority of girls enjoyed the fruits of the education boom of the early modern era and even those who did, with the exception of the privileged few, gained little more than the most fundamental of literary and mathematical skills.

GROUP ACTIVITIES

Rural fraternities or youth groups were known by a variety of names: *iunores* (Latin), *Bürschen* (German), *garçons de village* (France), *gioventù* (Italian). All were exclusively male, rarely accepted anyone younger than sixteen, and sometimes required experience as an apprentice or soldier. Their leaders might be known as "abbots" (in the case of France's *abbayes de la jeunesse*, or 'youth abbies'), "captains," "kings," and so forth. Initiation usually involved some sort of extended and humiliating hazing, after which new members swore their allegiance to the group and received their own secret nicknames. Some fraternities maintained their own written law as well as primitive courts for handing out fines and other punishments. As everywhere in early modern society, a strict hierarchy ruled, with older boys at the top charged with introducing younger males to the adult male culture. Drinking, gambling, and cursing constituted the main pastimes, but the principal focus of such groups was the regulation of sexual activities in the community. For the most part this meant finding eligible girls for one another and possibly organizing dances. However, such bands of rural youths also ritually harassed other members of the community who had transgressed local mores (such as widows who remarried too soon or shrewish wives), failed sexually (presumed impotence or sterility), or were beginning a sexual union (newlyweds). The youths' loud verbal abuse, lewd songs, and crudeness—known as *charivaris*, 'rough music', or *Katzenmusik* (German)—served an important communal function of expressing popular approval or disapproval of what modern people would consider private matters. Surviving modern customs, such as putting tin cans and signs on the groom's car, have largely lost such meaning in the contemporary world but continue to survive as obscure relics of communal approval of some sort.

In cities, male youths could join a number of groups. The best organized were probably the journeymen's associations (German *Gesellenverbände*; French *compagnonnages*), distinguished by craft. Like rural fraternities, these groups were characterized by prolonged hazing and other mischief as well as drinking and gambling. Because of their extensive European networks as well as growing association with assorted acts of violence, journeymen's associa-

tions were banned in France in the early sixteenth century and were prohibited in the Holy Roman Empire in 1730.

University fraternities were also a prominent part of urban life, with students originally divided into “nations” (based on common languages), but by the eighteenth century organized by a variety of purposes and identities, including religious groups such as the John Wesley’s Holy Club at Oxford, derided by other students as “Methodists.” In Britain the college constituted a central corporate identity for most students and continues in this role to a lesser degree today, albeit with an increasingly heterogeneous undergraduate population. Still another type of young male organization were the secular fool societies (French *sociétés joyeuses*), groups that played key roles in all secular pageantry (especially at Mardi Gras) and reveled in mocking their elders and playing pranks on them. The most famous of these was the Parisian *Enfants sans souci* (‘carefree children’), closely rivaled by the Kingdom of Basoche, composed of the clerks of the Parlement of Paris.

Male groups tended to gather at local inns as well as at private homes or barns. In addition to their *charivari* activity, they were especially visible during public holidays, when they would engage in various ball sports, archery, wrestling, boxing, card-playing, cock fighting, and dog tossing. Often competitions became quite heated and led to serious injuries and occasionally deaths. In England Guy Fawkes Day (5 November) was renowned as the prompter of many violent town versus gown riots in Oxford and Cambridge. Ritualistic raids on brothels were also common, though more so at the beginning and end of the early modern period.

Single-sex gatherings of young women, by contrast, were both less formalized and less publicly visible than those of their male counterparts. This reflected the typical public-private expectations in gender relations. Among Catholics, convent schools and cloisters themselves were the most obvious centers of exclusively female societies, in both instances removed from the public sphere. Some Protestant girls formed prayer groups, particularly during the later seventeenth and eighteenth centuries. Otherwise, spinning at home with female relatives or communally with other women provided opportunities for young women to become accul-

tured to their society’s expectations of them as adults. Such gatherings also provided important companionship and conversation with peers, without any of the prolonged rituals of initiation or formalized aggression of male groups. On the other hand, segregation of teenage boys and girls shared one important goal, the finding and securing of an acceptable mate, an objective that simultaneously reinforced and (if successful) undermined the coherency of single-sex groups.

RELATIONS BETWEEN THE SEXES

The numerous festivals and wedding feasts provided a host of opportunities for young men and women to meet and court. In addition to local village or town holidays, youths were especially prominent in the festivities of St. Valentine’s Day (England), Shrove Tuesday (Mardi Gras), May Day, Midsummer (June 24), and Christmas. According to the historian Michael Mitterauer, “These were social institutions which virtually forced adolescents into contact with the opposite sex.” Males were almost always expected to initiate contact with the opposite sex, though in a few cases girls were customarily allowed to organize dances and collect boys, such as the St. Catherine’s Day Ball in France (25 November) and the German *Jungferntanz* (‘maidens’ dance’). In rural Bulgaria, the feast of St. Lazarus, before Palm Sunday, marked the ritual transition of young girls (*lazarki*) into eligible young women, known as *lazarouvané*. Following a collective withdrawal of adolescent girls from the village, they would return to sing outside the house of every bachelor, donning new festive dresses that signified their right to take part in all of the village’s public festivities. More typically, teenage boys and girls met under more informal circumstances: through relatives, in the marketplace, or (especially in the case of domestic maids and males of the house) in the home. In fact this last pairing—including masters, their sons, and male servants—accounted for more of the illegitimate children born than any other type of relationship. Sometimes the sex was consensual; often it was coerced, either through threats of dismissal or outright rape. It rarely resulted in marriage and usually meant dismissal and disgrace for the pregnant young woman. As in cases of incest between stepfathers and stepdaughters, we have no reliable statistics on the actual frequency of

such situations since families usually shrouded themselves in conspiracies of silence.

After first contact, youths normally began a courting process, varying in formality by social status, whose ostensible final goal was marriage. Throughout Europe, we hear of the practice of youths visiting girlfriends in their bedrooms at night, a custom variously known as “night visiting” in the south of England and “sitting up” in the north, “nights of watching” in Wales, *Kiltgang* (‘dusking’) or *Fensterln* (climbing in through a window) in German lands, and *nattelöpere* (‘night-runners’) in Norway. Sometimes these visits involved kissing, petting, or even intercourse, but given the possibility of parental interruption, sex was not always involved. Parental attitudes toward this ubiquitous practice varied widely, with some mothers and fathers turning a blind eye if they thought the two youths well-matched for marriage, while others (particularly in Scotland) strongly condemning such meetings on moral and religious grounds. The same divergence characterized parental attitudes toward premarital sex in general, with most of Europe’s parents apparently tolerant even of premarital cohabitation as long as they were assured that a suitable formal union and public ceremony were forthcoming. If parental disapproval was known or feared, young people might meet at the homes of friends, secluded places, or the boisterous gatherings known as “spinning rooms” (German *Spinnstuben* or *Gunkeln*; French *veilles*; Russian *posidelki*), smoky rooms at private residences or inns where women of all ages gathered in the evening to spin cloth and gossip, visited by young men who drank, sang, and occasionally danced with their female counterparts. Often such encounters led to engagement and eventually marriage; other times they could result in unwanted pregnancy and rushed marriage, abortion, abandonment, or infanticide.

“MASTERLESS YOUNG PEOPLE”

Complaints about “youth these days” are as old as civilization itself. The early modern period was no exception, with unceasing laments from every region about a world “full of ill-advised and ill-nurtured youth” (Griffiths, p. 111). Some of these concerns may be tied to the attempted Protestant and Catholic reforms of morals through cate-

chization and other educational means. It is thus difficult to assess whether there truly were more problems with young people or simply higher expectations. Clearly, economic instability during the entire early modern period also contributed to the perceived laziness of youths at any given time. Changes in the common practice of tramping (German *Wanderjahre*; French *tour de France*), for instance, illustrate some of this transformation at work. Since the Middle Ages, most young journeymen spent their late teens and twenties traveling the countryside, sometimes staying at established houses of call for their profession (referred to in France as “mother houses”), but more often renting a small room or bed and getting by on whatever work was available. Ideally, those already trained in crafts would be accordingly employed, but by the late sixteenth century such temporary positions were increasingly difficult to find, and becoming a master was a near impossibility for someone without family connections. Instead, many youths turned to day labor or, what was more lucrative still, begging. Countless ordinances throughout Europe complained of a pandemic of “able-bodied beggars,” whose tactics were often quite physically aggressive and extortionate of passersby. References to what we might call “gangs” of youths had been common since at least the late Middle Ages, but during the early modern period scuffles increasingly went beyond turf battles. Violence could also be turned against property, yielding vandalism such as breaking or stealing street lanterns, damaging conduits, rolling timber onto the highways, and committing widespread graffiti. Some of these unemployed and “masterless” youths made the more serious turn to professional crime, principally burglary and robbery, but occasionally arson and murder.

In response, some parents succeeded in having their unruly children incarcerated in new “bridewells” and workhouses. During the seventeenth century, punishment of both juvenile delinquents and sturdy beggars grew in intensity, with magistrates increasingly relying on chain gangs, galley sentences, military impressments, and “transportation” to foreign colonies. Repeated petty thefts were also often treated as capital offenses. Despite such extreme measures, the number of “masterless” young people continued to grow in Europe, particularly in burgeoning cities. Philanthropic endeavors approached

the problem from a different perspective and had some successes but were no match for the enormity of the economic and social crisis underway.

CONCLUSION

While early modern youths throughout Europe shared many experiences, it would be misleading to speak of a uniform youth culture. Friends and other peers were merely one of several social groups to which a young person belonged, and their influence—admittedly strong during the teens and early twenties—was not the only shaper of individual identity and values. The transition from childhood to adulthood involved many biological, cultural, economic, and political changes that occurred at different ages for each youth. Some events, such as entering the world of work or school, proved more significant in the social development of some young people than others. Only marriage could be described as a universally recognized sign of adulthood, and even here an independent household might still be years away. Thus while clearly an important stage in every individual's life cycle, the phase known as youth often remained ambiguous as to both rights and responsibilities—a situation not completely unfamiliar in the modern West.

JOEL F. HARRINGTON

ZINZENDORF, NIKOLAUS LUDWIG VON (1700–1760), poet, preacher, theologian, and religious leader. Count Zinzendorf was a controversial figure within German Pietism in the first half of the eighteenth century. He advocated a nonrational approach to Christianity that he called “religion of the heart.” In addition to being a creative theologian and author, he was the founder of a dynamic religious community known as the Brüdergemeine (Community of Brethren, now commonly called the Moravian Church) that established communities on four continents.

Zinzendorf was the son of George Ludwig von Zinzendorf, a counsellor in the court of the king of Saxony, and Charlotte Justine von Gersdorf. Because of the early death of his father, Zinzendorf was raised primarily by his grandmother, Henrietta Catherine, Baroness von Gersdorf (1648–1726), who was closely connected to the leaders of the Pietist movement, Philipp Jacob Spener (1635–1705) and August Hermann Francke (1663–1727).

When he was ten, Zinzendorf was sent to Francke's school in Halle, where he developed a strong interest in the Pietist program. He was then sent to the University of Wittenberg for advanced education to broaden his perspective, but Zinzendorf devoted himself to theological and religious pursuits rather than to politics and law.

After his marriage to Erdmuth Dorothea von Reuss (1700–1756) in 1722, Zinzendorf became deeply involved with a group of Protestant refugees from neighboring Moravia who claimed to be a remnant of the Unitas Fratrum (Unity of Brethren), a pre-Reformation Protestant church with roots in the Hussite movement. In addition to offering the Moravians protection from persecution, Zinzendorf organized their village of Herrnhut as a unique religious community.

The Brotherly Agreement of 1727 subordinated secular activities to a religious mission. Women assumed leadership roles almost equal to those of men. Artisans held leadership posts alongside nobles. Several distinctive Moravian practices originated in Herrnhut, such as the Daily Texts drawn from the Bible, making or confirming decisions through the lot, the Easter dawn confession of faith, foot washing, and love feasts. Through schools, publications, and Herrnhut-style communities, the Moravians established a strong presence throughout Protestant Europe, especially in Germany, Switzerland, the Baltic, the Netherlands, and the British Isles.

In 1735 Zinzendorf was ordained as a Lutheran minister, although he never held an official position in the church. Also in 1735 he arranged for the ordination of one of his Moravian followers as a bishop of the nearly defunct *Unitas Fratrum*. In 1737 Zinzendorf was consecrated a Moravian bishop.

Inspired by Zinzendorf, the first Moravian missionaries left for Saint Thomas (Virgin Islands) in 1732. Soon mission work was established among the Inuit in Greenland and Labrador, the Khoi Khoi in South Africa, the Delaware in British North America, and many other tribal peoples in the Atlantic world. On his voyage to Georgia, John Wesley (1703–1791) met Moravian missionaries and became interested in Zinzendorf's theology. Zinzendorf's writings played an important role in the early development of the Methodist movement.

Controversy swirled around Zinzendorf throughout his career. In 1736 he was exiled from Saxony because he sheltered religious refugees from Habsburg lands. Subsequently Zinzendorf traveled extensively, including two trips to North America, where he preached to slaves and tribal people.

During the 1740s Zinzendorf developed some of his most creative and controversial ideas. Among them were the "choir system" that replaced traditional family structures in Moravian communities with groupings according to age and gender. He also promoted a positive attitude toward sexuality. For instance, he argued that the incarnation of Christ made both male and female genitalia holy since Christ was born of a woman and had male organs. He also taught married couples to view sex-

ual intercourse as a sacramental act symbolizing the mystical union of the soul with Christ. In addition, Zinzendorf encouraged his followers to worship the Holy Spirit as "Mother," and he maintained that all churches are expressions of the true, invisible church. Most controversial was his promotion of a Lutheran "theology of the cross" through a highly evocative worship of the wounds of Christ.

In 1747, Zinzendorf's banishment from Saxony was lifted and the following year, the Moravians received official recognition in Saxony because they had proven to be good subjects. In 1749 Zinzendorf persuaded the British Parliament to recognize the Moravian Church as "an ancient and apostolic church," paving the way for further mission work in the British colonies.

Also in 1749 Zinzendorf experienced the greatest blow to his work when Count Ernst Casimir of Ysenburg-Büdingen (ruled 1708–1749), the secular overlord of the Moravian community of Herrnhag in the Wetterau, died. His son and successor Gustav Friedrich Casimir (ruled 1749–1768) ordered the Moravians in his realm to swear their fealty to him and repudiate their allegiance to Zinzendorf. Reports of eroticism connected to the veneration of the wounds of Christ among the Single Brothers in the late 1740s (the so-called Sifting Time) may have contributed to this crisis. Over a thousand Moravians chose to relocate in 1750 rather than reject Zinzendorf. They were forced to abandon Herrnhag's expensive buildings, and the resulting financial crisis nearly destroyed the church.

In 1755 Zinzendorf returned to Herrnhut, where he edited and republished his works. Following the death of Erdmuth in 1756, he married his lifelong co-worker Anna Nitschmann in 1757. Zinzendorf's death in 1760 was a severe blow to the church. Under the leadership of August Gottlieb Spangenberg (1704–1792), the church became increasingly conservative in orientation.

Zinzendorf left a multifaceted legacy. He was a forerunner of the modern subjective theology exemplified in Friedrich Schleiermacher (1768–1834), and he was an early Romantic poet. Moreover, his unusual understanding of race, gender, sexuality, and society attracts attention and even admiration. He established important Moravian

communities in Bethlehem, Pa., and Salem, N.C., that continue to be centers of Moravian work in America. By the early twenty-first century the bulk of his followers were in eastern Africa, thanks to the Moravian mission effort.

CRAIG D. ATWOOD

for their symbolic or allegorical meaning. Medieval bestiaries, based on the *Natural History* of Pliny and the encyclopedic works of such early church fathers as Isidore of Seville, mingled naturalistic description, uses, and symbolic significance in their accounts of animals, and did not clearly demarcate real from mythological beasts. Conrad Gessner's *Historia Animalium* (Description of animals) of 1551, the era's most comprehensive text on animals, continued this mode of description, still evident fifty years later in Edward Topsell's revised translation, *A History of Four-Footed Beastes* (1607). Animals were classified in hierarchical terms centered on the notion of the great chain of being. However, the voyages of discovery and the intellectual changes associated with the scientific revolution began to strip away the layers of symbol and allegory from animals and made them objects of study in themselves.

Animals had been used as surrogates for humans in the training of physicians and surgeons since the twelfth century. Even after human dissection began to be practiced in the fourteenth century, medical schools continued to use animals, especially pigs, dogs, and cats, to teach human anatomy by means of both dissection and vivisection. The beginnings of comparative anatomy are usually dated to the appearance in 1551 of Pierre Belon's (1517–1564) work on the anatomy of cetaceans, soon followed by his comparison of a human skeleton to that of a bird (1555). Volker Coiter (1534–1576) established comparative anatomy as an autonomous field of study in the 1570s, and while animals continued to function as human proxies, numerous works appeared on animal anatomy and physiology as well.

Exotic animals were a form of diplomatic exchange dating back to Roman times. Medieval monarchs established menageries such as that at the Tower of London, which during the sixteenth century included lions, leopards, a tiger, a lynx, an eagle, and a porcupine. Animals in menageries were often used for sport in the form of animal combats or baiting. Louis XIV of France established a menagerie at his palace at Versailles; when the animals died, they were dissected before the Paris Academy of Sciences, and many of them were described in Claude Perrault's (1613–1688) *Mémoires pour servir à l'histoire naturelle des animaux* (1671–

ZOOLOGY. For much of the sixteenth century, as in earlier periods, animals were valued for use or

1676; *Memoirs for a natural history of animals*). After death, these animals graced natural history cabinets (among which Gessner's was famous), which also included plants, antiquities, minerals, and curiosities. These predecessors of the modern natural history museum attempted to make sense of a rapidly expanding world by means of analogies, etymologies, and seemingly odd juxtapositions and also served important social and cultural roles in an aristocratic society based on status and patronage.

The work of Perrault's team and others such as Edward Tyson (1651–1708) made great strides in comparative anatomy. However, the main use of animals in science from the end of the sixteenth century onward was to demonstrate aspects of human (and animal) anatomy and physiology, for instruction and especially for research. William Harvey (1578–1657) demonstrated the circulation of the blood, published in 1628, by means of hundreds of experiments on live animals ranging from fish to dogs. Experimenters in universities and academies all over Europe embraced Harvey's experimental techniques, which included injection and inflation as well as vivisection. Notable examples included the work of Marcello Malpighi (1628–1694) on the structure of the lungs and the capillary circulation, Robert Hooke (1635–1704) on the process of respiration, Regnier de Graaf (1641–1673) on the glands, and Nicolaus Steno (1638–1686) on the structure of the muscles. Hooke and Robert Boyle (1627–1691) placed small animals in a vacuum pump of their design and demonstrated the body's need for fresh air to sustain life. Antoni van Leeuwenhoek (1632–1723) revealed the possibilities of the microscope, also used successfully by Malpighi and Hooke.

Most seventeenth-century natural philosophers regarded animals as machines, although few went as far as René Descartes (1596–1650) in denying their mental capacity to experience pain. Vitalist philosophies revived in the eighteenth century, although the mechanical philosophy continued to influence views of animal function. The work of Stephen Hales (1671–1767) on blood pressure was mechanistic, but by mid-century, Albrecht von Haller (1708–1777) exemplified the new emphasis on vital function with his work on the sensibility and irritability of the nerves. At the beginning of his 1752 treatise on this topic, Haller also displayed a new

sensibility toward animals when he apologized for causing them pain.

By the end of the seventeenth century, concepts of classification had reached a crisis. The seemingly chaotic organization of cabinets and collections reflected a lack of consensus on classification schemes. The great influx of animals from the New World and other areas disrupted the old notion of a chain of being that was both full and complete, but there was little agreement about what might be a proper criterion for classification. Although Aristotle had attempted to establish a natural system of classification based on essential features and natural affinities, he also believed in a natural hierarchy. Various theories of plant classification multiplied, but the classification of animals lagged behind. At the end of the seventeenth century, John Ray (1627–1705) attempted a natural classification of animals, but its complexity did not bode well for future endeavors. In 1735, Carl Linnaeus (1707–1778) described a classification of plants based on sexual parts in his *Systema Naturae* (System of nature), which also presented a scheme for classifying animals, organizing them in six broad classes. In the 1779 edition of *Systema Naturae*, he described nearly six thousand species of animals. His system was artificial, aimed at establishing order rather than reproducing nature's plan, and its use of the binomial nomenclature was widely adopted.

Linnaeus's system of classification was challenged by Georges-Louis Leclerc, comte de Buffon (1707–1788), whose *Histoire naturelle* (1749–1788; *Natural history*) was the most comprehensive (and best-known) work on natural history in the eighteenth century. Buffon argued that any system of classification was by definition arbitrary and artificial, and that reality resided in individuals, not in species. While he modified his views over the course of his life, adopting many Linnaean categories, Buffon is especially important for introducing the concept of time into the discussion of taxonomy, finding variability of species over time but constancy of form at higher taxonomic levels.

By the end of the eighteenth century, animals had lost much of their earlier symbolic meaning. But in both laboratories and natural history museums they were, more than ever, objects of scientific scrutiny.

ANITA GUERRINI

ZURBARÁN, FRANCISCO DE (born Francisco de Zurbarán Márquez [or Salazar]; 1598–1664), Spanish painter. Francisco de Zurbarán was born in Fuentedecantos (Extremadura), an agricultural village. At considerable expense, his father, a shopkeeper, sent him in 1614 to Seville, where he was an apprentice to Pedro Díaz Villanueva, an obscure artist. In 1617 he established a workshop in Llerena, a large Extremaduran market town; no paintings before 1627 have been located. By 1630 he was living in Seville.

In 1626 Zurbarán contracted with the Dominican monastery of San Pablo el Real, Seville, to produce twenty-one paintings for the relatively modest sum of 4,000 reales. Displayed in an oratory chapel of this monastery, *Christ on the Cross* (1627, Art Institute of Chicago), his earliest dated painting, made him famous. Against the dark background, strong illumination accentuates the sculptural qualities of the naturalistically rendered figure. The exceptional stillness of the body indicates death, but dramatic tension is introduced by its leftward sag, which causes Christ's head to fall against his shoulder. Zurbarán probably developed

his distinctive style by studying the work of the Italian painter Caravaggio (born Michelangelo Merisi, 1573–1610) and the Spanish sculptor Juan Martínez Montañés (1568–1649).

From 1628 until approximately 1640, Zurbarán was regarded as the leading artist of Andalusia, and he received commissions from monasteries and convents throughout Spain. Apparently jealous of his success, officers of the painters' guild, led by Alonso Cano (1601–1667), ordered him on 23 May 1630 to take the examination for master painters in Seville. Zurbarán appealed to the city council, which denied the guild's authority on 8 June 1630.

Many of Zurbarán's major pictorial programs concern the lives of the most famous saints of the monastic orders that had commissioned them. Thus, for the Monastery of the Merced Calzada, Seville, he produced twenty-two paintings that illustrate the life of Saint Peter Nolasco, the founder of the order. *Saint Peter Nolasco's Vision of the Crucified Saint Peter the Apostle* (1628, Prado, Madrid) eloquently reveals his ability to make the supernatural seem believable. Zurbarán's eight paintings for the Sacristy of the Monastery of Saint Jerome, Guadalupe (1638–1639; still in situ), were unusual because they all depicted residents of that house, such as Bishop Gonzalo de Illescas. His commission for the Carthusian Monastery of Jerez de la Frontera included four large altarpieces depicting Christ's early life. In *Adoration of the Magi* (1639–1640, Musée du Peinture et de Sculpture, Grenoble), he created spectacular effects through the use of glowing colors and lavish still life details.

In 1634 Zurbarán went to Madrid in order to undertake a royal commission, which had been awarded to him through the intervention of Diego Rodriguez de Silva Velázquez (1599–1660). For the Hall of Realms in the Buen Retiro Palace, he painted ten pictures of the Labors of Hercules and a battle scene, *The Defense of Cádiz against the English* (all in the Prado, Madrid). In contrast to most seventeenth-century painters, Zurbarán did not base his images of Hercules on famous classical statues. Instead, he infused Hercules' Labors with an earthy vitality by depicting Hercules as a rugged, awkward man of exceptional strength.

Francisco de Zurbarán. *Christ on the Cross*. ©CHRISTIE'S IMAGES/CORBIS

In addition to large-scale programs, Zurbarán also produced many single paintings, including over forty images of Saint Francis of Assisi. As does *Saint Francis in Meditation* (c. 1635–1640, National Gallery, London, National Gallery), most prominently feature a skull, a symbol of penitence; upturned eyes and open mouth express the saint's mystical ecstasy. The “close-up” depiction of the isolated figure against a neutral background still makes a strong impact. In his few still life paintings, such as *Still Life with Lemons, Oranges, and a Rose* (1633, Norton Simon Foundation, Pasadena, Calif.), Zurbarán endowed humble objects with transcendent importance.

After 1640 Zurbarán's career underwent an irreversible decline. The collapse of the Spanish economy greatly limited the expenditures of Spanish monasteries and convents, his primary clients. Moreover, his austere style did not correspond with the increasing emphasis on tender piety in Spanish religious life. To compensate for the loss of clients in Spain, Zurbarán expanded his workshop's production of images for export to the Americas. Moreover, he responded to the changed spiritual mood by creating images such as *Christ Carrying the Cross* (1653, Cathedral at Orléans) that invokes the pity of its spectator. In 1658 Zurbarán moved to Madrid, where he imitated Velázquez's style in portraits such as *Doctor of Laws* (c. 1658–1660, Gardner Museum, Boston).

In 1838 the modern revival of interest in Zurbarán's work resulted from the display of eighty of his paintings in the Galerie Espagnole of the Louvre. His paintings were copied by Édouard Manet (1832–1883) and many other nineteenth-century artists.

RICHARD G. MANN

ZURICH. Although there is evidence of settlement around Zurich from the Bronze Age, the Romans were the first to fortify the site and named it Turicum. The legend of the city's foundation dates from the martyrdom of Felix and Regula, Roman Christians and the patron saints of Zurich, who fled to the city from the massacre of their legion in Valais in the third century C.E. They were martyred by decapitation for refusing to pray to Roman gods, whereupon they picked up their heads and carried them up the hill to the spot where they wished to be buried. The Wasserkirche in Zurich marks the spot where they are thought to have been executed. During the eleventh and twelfth centuries, Zurich's traders exploited the favorable location of the city between the Alpine passes and the Rhine to build the city's wealth from textiles, such as wool and silk. In 1336 the Bürgermeister Rudolf Brun led a revolt that shifted power from the patrician families into the hands of the thirteen guilds. Shortly thereafter, in 1351, still under Brunn's direction, Zurich joined the Swiss Confederation, though it remained an imperial city under the direct authority of the emperor. During the fifteenth century Zurich repeatedly attempted to centralize the Confederation under its control, and the result was civil wars such as the Old Zurich War (1439–1450).

Although it lay in the vast diocese of Constance, Zurich was fairly independent of the bishop and had three major ecclesiastical bodies: the Grossmünster, the Fraumünster, and St. Peterskirche. Huldrych Zwingli (1484–1531) arrived in Zurich in 1519 and gradually built a reform movement that gained minority, although influential, support from leading families and the guilds. In April 1525 the Reformation was formally adopted and the Reformed church established. It was an institution that remained under the control of the magistrates throughout the early modern period. Zurich developed provision for higher education, but not a university. It remained an important center of trade and a key member of the international Reformed church, but during the seventeenth and eighteenth centuries

Zurich was a provincial city with little influence beyond the Swiss Confederation.

BRUCE GORDON

ZWINGLI, HULDRYCH (1484–1531), Swiss reformer and church leader. Born into a peasant family in Toggenburg, an Alpine valley in the eastern part of modern-day Switzerland, Zwingli studied at the universities of Vienna and Basel (1498–1506), where he was exposed to the major currents that would shape his theology: late medieval Scholasticism and humanism. Research beginning in the late twentieth century has pointed to the particular importance of Desiderius Erasmus (1466?–1536) and John Duns Scotus (c. 1266–1308) to his theological formation. Zwingli was ordained to the priesthood and served first in Glarus, one of the smallest cantons of the Swiss Confederation, before going to the great Benedictine monastery of Einsiedeln (1516), whose rich library resources afforded the young priest the opportunity to deepen his knowledge of patristic and medieval writers. He preached at the yearly official pilgrimages made by the citizens of Zurich to the Black Madonna of Einsiedeln, and his sermons made him well known in the city. In 1519 he was called to the Grossmünster in Zurich as a stipendiary priest.

Zwingli's preaching, in which he denounced corruption and called on the people to purify themselves before God, created the mood for reform, but it was a small circle of like-minded priests, printers, and magistrates who pushed the movement forward. Events took shape around two disputations in 1523 for which Zwingli wrote his *Sixty-seven Theses*, his first major work. Zwingli sought to reform church and society, but he recognized that to do this he required the support of Zurich's magistrates, who in turn needed to be reassured that reform did not imply social revolution. His vision of Christian

government was drawn from the Old Testament, with the prophet (Zwingli) advising the ruler (the Zurich town council), who was responsible for enforcing the laws of the state.

Zwingli's position in Zurich was never wholly secure. The establishment of the new Reformed order in Zurich at Easter 1525 was largely due to the influence of a couple of key magistrates who backed Zwingli. At the center of Zwingli's vision was the reform of worship, and the Reformation commenced in Zurich with a celebration of the new liturgy of the Lord's Supper. His reforms, however, revealed a mixture of late medieval and Erasmian impulses; institutional changes, as well as moral legislation, were drawn from the reform councils of the fifteenth century, and, like Erasmus, Zwingli believed that education was the key to the creation of a Christian society.

Institutional reform under Zwingli was halting, largely because from 1525 until his death he was involved in a series of heated polemical exchanges. Zwingli faced opposition from Catholics, his former mentor Erasmus, the so-called Anabaptists, and most famously, from Martin Luther. Virtually all of Zwingli's theological writings were hastily compiled responses to particular crises or attacks. Thus his work cannot be treated as systematic theology. The three major events in Zwingli's career after 1525 were the Baden disputation (1526), which he refused to attend for fear of being arrested and executed, the Bern disputation (1528), which saw the Reformation adopted in major parts of the Swiss Confederation, and the Colloquy of Marburg (1529), where he and Luther came face to face. Zwingli's desire to bring the Reformation to the rest of the Swiss Confederation led to alliance building that made war with the Catholic states probable. This led to the disastrous First and Second Kappel Wars of 1529 and 1531. Zwingli was killed in a surprise attack on the night of 11 October 1531.

On account of their acrimonious falling out with respect to the celebration of the Lord's Supper, specifically the nature of Christ's presence in the Eucharist, the question of Luther's influence on Zwingli has remained, for confessional reasons, highly contentious. Certainly Zwingli keenly followed the "Luther affair" of 1517–1521, and read all the German reformer's works, which were being

printed in Basel. On key theological points, such as “faith alone” and “scripture alone,” they were in agreement, but Zwingli had an entirely different agenda, which led to a theology of a different character. Zwingli’s theology was shaped by two crucial aspects: first, his experience of serving in military campaigns (1513–1515) and observing with horror the effects of the mercenary trade on the Swiss; and second, the form of Christian humanism prevalent in southwestern Germany and the Swiss lands. The type of humanism that shaped Zwingli’s thought concentrated on the practical Christian life and reform of the church, emphasizing the role of the Old Testament. To this we can attribute most of the major themes in Zwingli’s thought: the utter sovereignty of God, the covenantal nature of God’s relationship with humanity, God’s demand that his people be “pure,” and the centrality of ethics and the life of the regenerated Christian.

Zwingli was not a national reformer; his cause was closely linked with the particular aspirations of Zurich. Nevertheless, the clarity of his thought carried his ideas across Europe, and there can be no doubt that he was the founder of the Reformed tradition.

See also Bullinger, Heinrich; Erasmus, Desiderius; Luther, Martin; Lutheranism; Marburg, Colloquy of; Reformation, Protestant; Zurich.

SYSTEMATIC OUTLINE OF CONTENTS

This outline provides a general overview of the conceptual scheme of the *Encyclopedia*, listing the titles of each entry and subentry. Because the section headings are not mutually exclusive, certain entries in the *Encyclopedia* are listed in more than one section. Monarchs of the same name are listed first by their country, and then numerically. Thus, for example, Henry VII and Henry VIII of England precede Henry II of France.

Giovanni Battista Tiepolo. Mercury, messenger of the gods, detail from ceiling fresco in the staircase of the Residenz, Würzburg. ©ERICH LESSING/ART RESOURCE, N.Y.

RIGHT: Titian. *Bacchus and Ariadne*, one of three “Bacchanals” created by Titian between 1518 and 1524, all of which portray the classical world as a place of sensual delight. ©ERICH LESSING/ART RESOURCE.

BELOW: Jacopo Tintoretto. *The Annunciation*, 1581-1582. This masterpiece of the artist’s maturity beautifully illustrates his use of naturalism to create realistic scenes that powerfully suggest the presence of the divine. ©CAMERAPHOTO/ART RESOURCE, N.Y.

LEFT: **Anthony Van Dyck.** Portrait of Countess Helena Grimaldi, 1623. During his lifetime, Van Dyck was the most influential portraitist in Europe. THE ART ARCHIVE/NATIONAL GALLERY OF ART WASHINGTON/ALBUM/JOSEPH MARTIN

BELOW: **Diego Velázquez.** *Mars*, c. 1639. Velázquez wittily depicts the ancient god of war contemplating his frustrations in love. THE ART ARCHIVE/MUSEO DEL PRADO MADRID/ALBUM/JOSEPH MARTIN

OPPOSITE PAGE: **Jan Vermeer.** *The Milkmaid* is typical of Vermeer's intimate interiors.

LEFT: **Art in Venice.** *Apotheosis of Venice*, 1585, by Veronese, painted on the ceiling of the Sala del Maggior Consiglio in the doge's palace, Venice. ©SCALA/ART RESOURCE, N.Y.

BELOW LEFT: **Veronese.** The coronation of Esther as Queen of Ahasuerus, ceiling decoration in the Church of San Sebastiano, Venice, painted c. 1556. ©CAMERAPHOTO/ART RESOURCE, N.Y.

BELOW RIGHT: **Elisabeth Vigée-Lebrun.** Portrait of Marie-Antoinette, 1788. Vigée-Lebrun was favored by the queen for her ability to lend an informal air to royal portraits; this is one of several portraits of the queen painted by Vigée-Lebrun between 1778 and 1793. ©GIRAUDON/ART RESOURCE

ABOVE RIGHT: **Simon Vouet.** *Allegory of Riches*, c. 1640. Vouet is considered the founder of the early modern school of French painting, combining naturalism with extravagant use of color, as in this painting. THE BRIDGEMAN ART LIBRARY

BELOW RIGHT: **Jean-Antoine Watteau.** *Gilles*, 1717. Although typical in style, this later depiction of a standard commedia dell'arte character reflects the artist's more mature vision in the contrast between the character's festive dress and melancholy expression. THE ART ARCHIVE/MUSÉE DU LOUVRE PARIS/DAGLI ORTI (A)

LEFT: Women and Art. Angelica Kauffmann, *Self-Portrait*, 1787. An enormously successful artist, Kauffmann was one of only two women among the founders of the British Royal Academy. ©ARTE & IMMAGINI SRL/CORBIS

BELOW LEFT: Women and Art. Clara Peeters, *Table with Pitcher and Dish of Dried Fruit*. THE ART ARCHIVE/MUSEO DEL PRADO MADRID

BELOW RIGHT: Women and Art. Adélaïde Labille-Guiard, portrait of Marie Adélaïde of France, 1787. A noted portraitist, Labille-Guiard ran a studio for women in Paris and at one point asked the French academy to raise the quota of four female academicians. THE ART ARCHIVE/MUSÉE DU CHÂTEAU DE VERSAILLES/DAGLI ORTI

Francisco de Zurbarán. *St. Peter Nolasco's Vision of the Crucified St. Peter*, 1628. Many of Zurbarán's paintings depict the lives of notable saints. Here he shows his ability to make the miraculous seem eminently real. ©ERICH LESSING/ART RESOURCE, N.Y.
