If most of the Reformation’s repercussions for Jews were inadvertent and indirect, the Counter-Reformation’s shift in attitudes appears as something of a delayed reaction. The relaxed spirit of Renaissance papal policy toward Jews, permissive of Hebraist-rabbinic contacts and opposed, on both doctrinal and pragmatic grounds, to inquisitorial harassment of relapsed Iberian New Christian refugees in Italy, persisted through the 1540s. But Julius III (reigned 1550–1555), though continuing to tolerate the Judaizing New Christian merchants settled in the port of Ancona, could not withstand the mounting pressure to extend church censorship to Jewish as well as heretical Christian texts. In 1553, through the impetus of Cardinal Giovanni Pietro Caraffa (1476–1559), possession of the Talmud became prohibited and its volumes were incinerated in cities under papal domination.

The Counter-Reformation managed to resolve the church’s longstanding ambivalence toward the Talmud: on the one hand, as a blasphemous, anti-

Christian, and anthropomorphic abomination, and on the other, as a backhanded rabbinic attestation to Christian truth (and therefore a useful missionary tool). Even Hebraists like Pico and Reuchlin approved the Talmud less in its own right than as a repository of exegetical techniques deployed in cabala. But by mid-century the church had rendered its verdict: the Talmud was an obstacle—perhaps the main one—to Jewish conversion. When Caraffa succeeded to the throne of St. Peter as Paul IV (reigned 1555–1559), he determined to either convert the Jews or take decisive measures to prevent them from corrupting Christians (both the pope and Luther lived in dread of Jewish proselytizing). In fact, both of these ends would be pursued through the same policies. Thirteenth-century mandates such as the “Jewish badge” would now be restored and the Jews’ segregation from Christians fully enforced—excluding, of course, their obligatory attendance at Christian sermons. If this degree of separation proved too utopian to be realized in its entirety, it still extended well beyond the medieval precedents, many of which had been poorly enforced and none of which had entailed the creation of walled ghettos (the impossibly congested mandatory Jewish residential quarters, surrounded by a wall with gates locked at night). Despite momentary reversals by some of Paul IV’s successors, this Counter-Reformation papal Jewish policy of segregation and repression persisted through the late nineteenth century. Though it qualitatively increased the number of converts, like Luther’s Reformation it failed to win over the bulk of the Jewish population. Instead papal Jewish policy resolved itself into a stalemate (or war of attrition) with its erstwhile Jewish adversary, and through the perpetuation of the ghetto appeared to render Jewish-Christian relations frozen in time.

RAISON D’ÉTAT, MERCANTILISM, AND ABSOLUTISM

One might go further and assert that the institution of the ghetto facilitated the partial revival of Italian Jewry between the late sixteenth and the mid-seventeenth centuries. In a period when Sephardic Jews came to play an increasingly prominent role in Mediterranean and Atlantic trade, any device that made possible a Jewish presence in one locale had the potential to feed its expansion into another. Twenty-three ghettos were established in northern

Italy between 1555 and 1779, and with the economic shift of sixteenth-century Italian Jews from predominance in money lending to concentration in international trade, justifications could readily be found for employing new groups of Jews, even relapsed “New Christians,” to fertilize local exchange. As Counter-Reformation pressures mounted, Italian rulers rationalized their invitations to settle foreign Jews by emphasizing the contribution they would make to the commonweal. In 1593 Ferdinand I de’ Medici, the grand duke of Tuscany, advertised his “worthy motives” and “hope to benefit all Italy, Our subjects and especially the poor” when he accorded generous privileges to “Levantine” Jewish merchants who consented to populate his new port city of Livorno.

Economic benefit, whether rooted in trade, credit, tax farming, or estate management, had long functioned as a *sine qua non* for the Jews’ presence within various quarters of Christendom—witness the justification offered in 1086 by Bishop Rudiger, who, by attracting Jewish merchants to Speyer, intended “that the glory of our town would be augmented a thousand fold.” What proved unique to the circumstances of late sixteenth- and seventeenth-century western and central Europe, however, was that Jews had been absent from these territories for generations or sometimes centuries. This had the effect of weakening the estates’ resistance to the small-scale readmission of Jews, so long as this resettlement could be justified as fulfilling only certain limited and targeted economic duties that no other group could. Although exercised by the very fact of a renewed Jewish presence, guilds won assurances that Jews would traffic solely in commodities already excluded from regulation. It was no small irony, then, that such new goods in which the Jewish merchants specialized—including tobacco, sugar, and coffee from the New World—were among the era’s most profitable.

Still, this detailed specification within governmental privileges of the exact purview of Jewish settlement and the precise limits of their commerce marked the period when absolutist government came to impose itself as the ultimate arbiter of permissible Jewish activity. What could better express the seventeenth-century apotheosis (or distortion) of humanist *raison d’état* than the baroque manner in which absolutism translated limited resettlement

privileges into tortuous and seemingly arbitrary “Jews’ Regulations”? Frederick II’s 1750 Revised General Code (*Revidiertes Generalprivilegium und Reglement*), to cite a classic example, reveals the bind in which the absolutist state found itself. It was caught between, on the one hand, its impulse to incorporate Jews into ever more homogenous categories of subject status (a process likewise driven by the state’s increasing importation of Roman law), and on the other, its institutional loyalty to the functionalist and mercantilist rationales that had made a renewed Jewish presence possible in the first place. Although there were improvements in Jewish status in the second half of the eighteenth century (for example, the abolition of the onerous *Leibzoll*, ‘toll’), it took the cataclysm of the French Revolution to eventually cut this Gordian knot.

PHILO-SEMITISM

In Calvinist Holland and Puritan England, economic and Hebraist rationales for Jewish toleration combined to create an atmosphere that was distinctive from the claustrophobic regulatory regimes of Lutheran and imperial Germany or the ghettos of Catholic Italy. The Jewish community of Amsterdam had been founded by the immigration of Iberian New Christians, many of whom eventually openly reverted to Judaism. It was one of these former New Christians, Rabbi Manasseh ben Israel (1604–1657), who made a famous appeal to Oliver Cromwell, shrewdly combining mercantilist and messianic arguments on behalf of a Jewish restoration to England. Proclaiming that “the opinion of many Christians and mine doe concur herein” that Jews will be restored to their ancient homeland only after being first restored to England, Manasseh made Jewish readmission dependent upon English recognition of the spiritual and worldly benefits Albion would accrue from the presence of a skillful population of Jewish “merchandizers.”

Such arguments found a receptive audience within a segment of the Puritan and remonstrant communities of mid-seventeenth-century England and Holland. Calvinism, though at its inception an unlikely impetus to Jewish-Christian rapprochement, did exhibit at least one promising trait: a rejection—as the historian Salo Baron once put it—of “Pauline antinomianism in favor of Old Testament legalism.” Yet this relative fondness for bibli-

cal law was in itself no assurance of philo-Semitism. Also required was a type of millenarian conviction entirely lacking in the patristic heritage, namely, the expectation that the prophesied conversion of the Jews would occur only through their restoration to the Holy Land. This factor theoretically made feasible what had never before been even conceivable: the possibility that *two* chosen peoples could coexist—a national Protestant one and a resuscitated Jewish one. As the widow Johanna Cartwright and her nephew Ebenezer put it in their 1649 petition to the Puritan general Thomas Lord Fairfax, “this Nation of England, with the inhabitants of the Netherland, shall be the first and readiest to transport Izraells Sons and Daughters in their Ships to the Land promised to their fore-Fathers, Abraham, Isaac, and Jacob, for an everlasting Inheritance.” Truly, this was as close to a revival of Reuchlin’s grand vision as any latter-day and millenarian version of Hebraism was likely to come.

CONCLUSION

But philo-Semitism is a relative term; there were, in fact, few “unconditional” philo-Semites in early modern Europe. A prejudice in favor of the Jews necessarily came with certain strings attached to it, whether it was the wealth that would be generated by the Jews’ commerce or the millennium that would be inaugurated by their conversion. Philo-Semitism of this variety flowered in mid-seventeenth-century Holland and England but remained dormant through much of the eighteenth century. In this period weariness with Puritanism and all forms of “enthusiasm”—including not just Quakers but Jewish followers of the apostate messiah, Shabbetai Tzevi (also Sabbatai Sevi) (1626–1676), as well—went hand in hand with the ascent of a more “polite and commercial” Britain. Similarly, Holland’s loss of successive wars and overseas markets to England augured economic hard times, a fact that could not help but dull the mercantile sheen of Amsterdam Jewry. Even so, and without minimizing the widespread enmity manifested toward Catholicism or the occasional flare-ups of anti-Semitic invective, Augustan England justly earned the sort of reputation for religious toleration in the eighteenth century that the Dutch had enjoyed in the seventeenth.

This nondoctrinal adherence to toleration, hard fought for but comfortably worn, was one of the features that Voltaire, ensconced in London between 1726 and 1729, found most attractive about English life. Yet despite their embrace of toleration and condemnations of anti-Jewish violence, Voltaire and other philosophes, like most of the deists before them, evinced a deep hostility to Judaism itself, one that reflected the spirit of the criticism they leveled at, or perhaps to diverted to, the Old Testament. This had important repercussions for eighteenth-century Jews. In premodern Europe, Jews were essentially defined by their religion. Converts might be cruelly reminded of the “Jewish malice still in their hearts,” but the specimen of the secular Jew was still unknown. Humanism, short of actually converting the Jew, was not interested in abstracting him from his Judaism. Enlightenment ideology changed that. The philosophes held that the Jew was redeemable only to the extent that he distanced himself from Talmudic Judaism, without at the same time necessarily succumbing to Christianity. “As you are a Jew remain so, but be a philosopher!” Voltaire counseled the Sephardic Jew, Isaac de Pinto. Christian Wilhelm von Dohm (1751–1820), in his influential *Über die bürgerliche Verbesserung der Juden* (On the civic improvement of the Jews), put it somewhat differently: the Jew is capable of enjoying civic equality, Dohm insisted, but only to the extent that he regards himself as “more man than Jew.”

In eighteenth-century Enlightenment circles, the termination of religious hatred of Jews was therefore thought to require not just Christian toleration of the practice of Judaism, but paradoxically, the Jews’ own partial detachment from a faith widely regarded as a primary source of religious intolerance. The Jew’s vices, his materialism, chauvinism, and greed—though in themselves universally acknowledged—were seen not as biologically determined traits but rather as by-products of the narrowness of the Jewish creed. While not at all synonymous with popular anti-Semitism, this secularist antipathy to Judaism would prove readily compatible with it. For when the Jews’ behavioral characteristics refused to fade with the reform or even abandonment of the ancestral faith, the mystery of how Jews could exist without Judaism seemed to demand a solution. Modern anti-

Semitism, a product of the nineteenth century, arose to fill precisely that need.

The Iberian kingdoms were neither the first nor the last to expel their Jewish populations: England expelled its Jews in 1290, France expelled its Jews in 1306, and periodic expulsions of the Jews took place across Europe throughout the early modern period. But the expulsion of the Jews from Spain in 1492, from Portugal in 1497, and from Navarre in 1498 has long been seen as a critical turning point in the history of Iberia and in the history of Sephardic or Spanish Jewry.

CAUSES

Historians continue to debate the causes of the expulsions in Iberia. Ferdinand and Isabella's actions in Spain regarding the Jews served as the catalyst for expulsions in the rest of Iberia, and so all the Iberian expulsions must be seen in the broader context of the reforms of their reign. Isabella fought a civil war with her niece to gain the crown of Castile after her half-brother, Henry (Enrique) IV, died in 1474. Isabella's husband, Ferdinand, inherited the crown of Aragon in 1479. Through their marriage they united their two kingdoms in what became known as Spain, but civil unrest continued for years. Only in the 1480s did Isabella and Ferdinand begin to exert authority over their dominions and to institute new methods of legal, bureaucratic, and institutional control. Furthermore, by 1482, Ferdinand and Isabella had begun a fierce war against the Muslims of Granada. In Castile, Isabella also engaged in an extensive propaganda war, justifying the legitimacy of her own reign at the expense of her half-brother's.

Jews and *judeoconversos* (Jews who converted to Christianity and their descendants; also known as New Christians) came to occupy an important place in Isabella and Ferdinand's program of reform. Not only were there many Jews and *conversos* in Ferdinand and Isabella's court, but anxiety about the place of Jews and *conversos* in society was growing in the second half of the fifteenth century. Isabella and Ferdinand received permission from the pope to found their own Inquisition in 1478 precisely to punish and reform those New Christians who were believed to observe Jewish rites in secret. Many so-called "Old Christians" feared—rightly or wrongly—that *conversos* were not genuine Chris-

tians and could not be trusted in religious or political terms. Some Old Christians at the time laid the blame for this at the feet of the Jews who might encourage New Christians to Judaize as well as serve as a source of information on the details of Jewish observance. At the same time, Isabella in particular was convinced that the Apocalypse was nearing, an event that would involve mass conversion of the Jews. Most scholars, therefore, have explained the motivation for the expulsion in the context of anxiety about Jews and *conversos*. Many scholars affirm that the true motive was not expulsion per se, but rather to encourage conversion of the remaining Jews in Iberia. Others hypothesize that the expulsion was a measure designed to help New Christians avoid the temptation to revert to Judaism. Once there were no Jews to encourage *conversos* to practice Judaism, New Christians might assimilate more fully to Christianity. Still other scholars have posited that *converso* officials encouraged the expulsion of Jews to protect their own position in society, but this could not be the sole explanation of the expulsion.

THE EXPULSION IN SPAIN

The decree ordering the expulsion of the Jews from Spain was issued 31 March 1492, though it was not officially announced in many cities until several weeks later. Jews were given six months to leave. The decree met with immediate protest in some quarters by those who thought that the kingdoms should not have expelled such “industrious” people. Indeed, some of Ferdinand and Isabella’s most important advisers, such as Don Isaac Abravanel, emigrated. Others worried that the decree might provoke anti-Jewish violence, which was against the statutes of the church. Many Spaniards, though, applauded the decree of expulsion and leapt at the opportunity to take advantage of it. Jews were required to sell their property and could not even take jewels or coins with them; as a result, unscrupulous Old Christians bought the property of desperate Jews for a fraction of its true value. Once on the road toward the border towns and ports that would be their last stopping place in Spain, the Jews’ troubles continued. One contemporary chronicler, Andrés Bernáldez, described the sad families walking in slow procession to the border, lamenting their fate.

Despite the number of Jews who fled before the edict of expulsion, it is not clear that Ferdinand and Isabella expected or wanted the Jews to leave. In fact, it appears that many, if not most, Jews converted to Christianity to stay in the country. Perhaps the most notable convert was the chief rabbi of Castile, Don Abraham Seneor, who was baptized at the shrine of the Virgin of Guadalupe in Extremadura, with Isabella and Ferdinand standing as godparents. Exact numbers of those who stayed and those who left are difficult to ascertain, but Henry Kamen estimates that there were no more than 70,000 Jews in Castile (about 1.6 percent of the population) and no more than 10,000 Jews in Aragon (about 1.2 percent of the population). Of those, the best evidence suggests that most converted rather than emigrated. Over ten thousand Jews left via the Mediterranean coast in 1492–1493 (including Aragonese and Castilian Jews), and possibly as many as forty to fifty thousand left overall, traveling west to Portugal and north to Navarre, as well as south to Africa, east to Italy and—over time—to Ottoman territory in the eastern Mediterranean. Yet even the figure of fifty thousand may well be high, since many of those who left in 1492 had returned and converted by 1499. Isabella and Ferdinand encouraged conversion and return, promising in a decree that houses, property, and goods would be returned to their former owners for the price for which they were sold. Enforcement of this decree was inconsistent, but, nonetheless, evidence from many sources suggests that many exiles returned, particularly after Portugal and Navarre expelled or converted their Jewish populations, too.

THE EXPULSIONS IN PORTUGAL AND NAVARRE

Portugal received the clear majority of Spain’s exiled Jews. Its proximity, cultural similarity, and economic ties made it an ideal destination for the unwilling exiles. Yet Portugal would not prove to be a permanent haven. When King Manuel wished to marry the daughter of Ferdinand and Isabella, the Spanish monarchs demanded that Portugal expel its Jews. Manuel agreed, and five days after the marriage agreement was signed, on 5 December 1496, he issued a decree giving Portugal’s Jews eleven months to leave the country. Again, the long delay between publication of the edict and the date in which it took effect suggests a lack of enthusiasm for

the project, and Manuel's actions emphasize that his primary concern was conversion. Initially, he instructed the Jews to leave from one of three ports, but soon he restricted them to leaving from Lisbon only. When October 1497 arrived, the thousands of Jews assembled there were forcibly converted. Portugal's mass forced baptisms precipitated another exodus, this time of Spanish Jews returning home.

Tiny Navarre, in the north of the Iberian Peninsula, also suffered dual pressure, first from trying to assimilate Spanish Jewish exiles, and later from the Spanish government to expel or convert its Jewish population. Benjamin Gampel estimated that in the mid-1490s Navarre had approximately 3,550 Jews (about 3.5 percent of the population). That relatively high percentage, compared to the percentages in Castile and Aragon, was certainly due to the presence of Spanish exiles in Navarre. Even more so than with Portugal, Ferdinand and Isabella exerted much pressure on the small neighboring kingdom, and the threat of Spanish annexation was constant. The decree, which has not survived, was public knowledge by the beginning of 1498 and required that Navarrese Jewry convert or leave by sometime in March 1498.

CONSEQUENCES

The economic costs to Spain of the expulsion, once thought to be significant, now seem to have been relatively minor. The number of exiles was less than previously imagined, and the Jewish communities of Spain, already reduced in size by a century of conversions, did not command the wealth of previous generations. The social costs, both in terms of the loss of individual talents and in terms of the loss of a more pluralistic society, were much greater. Contemporaries may not have acknowledged the latter; but critics of the decree lamented the expulsion of so many industrious, esteemed Spaniards. But most traumatic was the terrible cost to Jewish individuals and families, who were faced with the horrific choice of giving up their faith or their home and whose families were often painfully divided in the upheaval that followed.

JEW S AND JUDAISM. The term *early modern* applies differently to Jewish than to general European history. Jews experienced no Reformation or Counter-Reformation of their own, nor for that matter were all Jews geographically "European" (between the sixteenth and eighteenth centuries approximately 30 to 40 percent lived outside of Europe proper). Perhaps for these reasons, nineteenth-century Jewish historians tended to view the modern era of Jewish history as proceeding immediately from a long Middle Ages (akin to the period Marxists traditionally ascribed to European "feudalism," roughly from the Christianization of the Roman Empire until the French Revolution). Modernity thus marked a sharp and sudden break with the past, a Reformation, Renaissance, and Revolution rolled into one. Meanwhile, the period between the expulsion of Jews from Spain and the era of the Enlightenment was cast in dark hues, a nadir in both mundane and spiritual terms, marked by intensive persecution and religious stagnation.

This depiction changed in the mid-twentieth century with a growing scholarly interest in the history of Jewish mystical and messianic movements, spurred by the writings of Gershom Scholem (1897–1982). Yet while Scholem's focus on the mystical cabala (kabbalah) and the great messianic pretender Shabbetai Tzevi (also Sabbatai Sevi) (1626–1676) gave the Jewish early modern period

a distinctive cast, it also reinforced the earlier emphasis on external persecution and internal crisis. Indeed, in this new rendering, the expulsion of Jews from Spain in 1492 came to be seen as the root cause of virtually all changes in Jewish life in subsequent centuries.

In the last several decades—building on the earlier research of figures like Salo W. Baron, H. H. Ben-Sasson, Cecil Roth, Jacob Katz, and Selma Stern—Jewish historians have complicated this picture considerably. Among other things, they have offered a multifarious portrait of Jewish culture in early modern Italy and a more coherent picture of the key role played by mercantilist policies in shaping Jewish demography, economic activities, and political fortunes. The spiritual plight, economic importance, and cultural contribution of Iberian *conversos* (forced converts to Christianity in the period 1391 to 1497, many of whom secretly practiced Judaism) have also received renewed scholarly attention. These advances have tended to underscore the utility of the designation “early modern,” albeit only when appropriately adjusted to fit the Jews’ distinctive geographic and cultural-religious experiences.

DEMOGRAPHY AND GEOGRAPHY

The Jewish early modern period is marked by dramatic demographic shifts. The Iberian expulsions of the late fifteenth century left only small pockets of Sephardic Jews within Christendom and spurred new Jewish settlement in North Africa, Greece, Turkey, and Palestine. The Ashkenazic Jews of Germany likewise declined through expulsions and migrations between the late fourteenth and mid-sixteenth centuries, a factor that contributed to the explosive expansion of Polish Jewry from the mid-sixteenth century on. Moreover, from the late sixteenth to the early eighteenth century, small numbers of Jews were readmitted to France, Holland, Germany, and England. Part of this latter process involved a segment of the Portuguese *converso*, or “New Christian,” population, a number of whom had retained familial and commercial ties with the expelled Jews. Some of these—the so-called Marranos, who continued secretly to practice Judaism in Iberia—migrated to Spanish or Portuguese colonies in the New World, or fled to towns along the European Atlantic seaboard, where they were often even-

tually able to revert openly to Judaism. The consequence of these population movements, as historian Jonathan Israel has remarked, was to ensure the distribution of Jews and New Christians to many of the key nodes of Western trade (Iberia, Italy, the Balkans, Poland, central Europe, the Atlantic seaboard, and the New World). This, in turn, made it possible for Jews to become a leading commercial force from the middle of the sixteenth to the end of the seventeenth century.

Expulsions and migrations. Expulsions from Spain (Castile and Aragon in 1492) and neighboring regions (Navarre in 1498, Provence in 1500, Sicily in 1492, and the Kingdom of Naples in 1541), as well as the forced conversion of the entire Jewish population of Portugal (including tens of thousands of Spanish refugees) in 1497, shifted the Jewish center of gravity, demographically and culturally, into the eastern zones of both the Mediterranean (North Africa, Palestine, Turkey, Bulgaria, and Greece) and Europe (Poland). The Ottoman conquest of the Balkans, Bulgaria, and large portions of Hungary complemented this eastward (or southeasterly) movement by opening avenues of migration into the Turkish hinterlands (and, to a lesser extent, facilitating the movement of Sephardic Jews to Buda and other Ottoman-controlled Hungarian locales). At the same time, due to the lack of state centralization, Jewish expulsions in sixteenth-century Germany and Italy resulted in a significant degree of “internal migration.” In the German and central European case, this meant dispersion into the countryside and villages; in the Italian, it entailed an increased concentration within the provinces of Mantua and Tuscany, in Ferrara, and in the cities of Venice and Livorno, in many cases within walled ghettos.

It is important to keep in mind that not all Jewish population movements resulted from expulsions. Voluntary migration had accounted for the Jews’ original presence in many parts of Europe and recurred throughout the Middle Ages. The most notable case during the sixteenth century was Poland. With the 1569 Union of Lublin formally uniting Poland and Lithuania (confirming a dynastic union of 1386), the nobility dangled extensive privileges to lure Jews to the frontier regions of the east. Large numbers of Jews shifted from more urbanized western and central Poland to the regions

of Lithuania, Little Russia, and western Ukraine (“borderlands”). It is estimated that between 1568 and 1648 the Jewish population of eastern Poland increased twelvefold. Moreover, beginning in the second half of the seventeenth century, a reverse trend of sorts came into effect, with Polish Jews trickling back to the West, a phenomenon that increased with the exponential growth of the eastern European Jewish population, and that reached its climax in the late nineteenth century.

It should also be noted that an account of Jewish expulsions, migrations, and resettlements does not readily fit into a single schematic sequence. Although the most sustained wave of expulsions extended from 1470 to 1570, local ones persisted through the seventeenth and eighteenth centuries, including the notorious cases of Vienna (1670) and Prague (1745). Even the period’s general eastward trend was counteracted by a tendency, already apparent by the middle of the sixteenth century, to draw so-called “Levantine” Jewish merchants back from Turkey and the Balkans into Italy and to lure Iberian “New Christians” into southwestern France (Bordeaux and Bayonne), an increasingly attractive prospect with the intensification of the Portuguese Inquisition in 1579. A year later, Portugal’s union with Spain intensified the exodus of Jews from Iberia to Livorno, Venice, Brazil, and Antwerp. A community of *converso* Jews had remained in Antwerp throughout the first half of the century, growing steadily in numbers and prosperity until the mid-1580s, while after the 1595 Dutch blockade against Spanish shipping, *conversos* sought refuge elsewhere, establishing new trading centers in Amsterdam, Rouen, and (though as yet only as New Christians) in London. Even the Hanseatic port city of Hamburg, long prohibited to Jews, permitted a *converso* settlement at this time. The Hamburg city council insisted upon the *conversos*’ commercial value despite a public clamor to expel them for crypto-Judaizing activities. At the same time, the new Sephardic presence encouraged Ashkenazic Jews to trickle into the Netherlands, as well as Altona and eventually Hamburg itself.

International trade. As a consequence of these population shifts, Jews became positioned as key players in the burgeoning international trade of the late sixteenth and early seventeenth centuries. Commerce linked the far-flung Jewish diaspora from the

Jewish communities in the Ottoman lands and Poland in the East to the New Christian merchants in Iberia and South America and their Jewish Marrano cousins in southwest France, Amsterdam, and Hamburg. (Sincere “New Christians” often continued to do business with crypto-Judaizers or returned Jews, even when bitterly at odds religiously.) Between 1550 and 1630 Jews dominated the important overland commerce through the Balkans and played an important role in the Vistula lumber, grain, and fur trade. They likewise had a hand in overseas commodity trades, including tobacco, sugar, Brazil wood, alcohol, and slaves, as well as brokerage and the refinement of imported raw materials, such as diamond cutting and tobacco processing in Amsterdam and coral polishing in Livorno. By the seventeenth century the mere appearance of Jewish commercial prominence in so wide a range of locales often functioned to persuade rulers to open their territories to Jews, who operated not just as merchants but also increasingly as lenders and financial agents to crowns.

Court Jews. These developments helped make possible the rise of the court Jews (*Hoffjuden*) in western and central Europe, a phenomenon that reached its acme in the period 1650–1750. The political aftermath of the Peace of Westphalia (1648), with its fractured sovereignties and attendant proliferation of state bureaucracies and armies, created a crushing need for cash on the part of states both large and small. Jewish financiers not only paid troops but also mastered the art of supplying armies in the field. The Hanover court factor, Leffmann Behrens, for instance, started as a financial intermediary between Louis XIV (ruled 1643–1715) and his ally Duke John Frederick (1625–1679), then served as a military supplier and financier to John’s brother Ernest Augustus (1629–1698) (along the way helping him raise the colossal funding needed to purchase a position as the ninth elector of the imperial college), and then, in a final incarnation, became an unofficial finance minister for George Louis (1660–1727), later George I of Great Britain (ruled 1714–1727).

Jews like Behrens formed the top echelon of an elaborate network of money, credit, and supplies, linked by religion, skills, and marriage. Yet the court Jews’ demise was often as remarkable as their rise. Samuel Oppenheimer (1630–1703) brilliantly

served Emperor Leopold I (ruled 1658–1705) as banker and military supplier through the War of the League of Augsburg (1688–1697) before his master (never an admirer of the Jews) abandoned him to the angry Viennese mobs. A similar fate befell the still more flamboyant and reviled Joseph Süss (“Jew Süß”) Oppenheimer (1698–1738) who, much to the chagrin of his Protestant subjects, became the virtual viceroy to the Catholic Duke Karl Alexander of Württemberg. With the duke’s death, Jew Süß was summarily tried and executed, his remains left on public display in an iron cage. In earning extensive privileges for themselves by strengthening royal centralization against the jealous local estates (quasi-feudal corporate groups), the court Jews rendered their own circumstances intensely vulnerable. Still, no matter how precarious their individual fortunes, the entitlement to settle their Jewish entourages usually endured, such settlements becoming beachheads for many a fledgling Jewish community in the seventeenth century, scattered through Germany, Austria, Holland, Denmark, and Hungary.

Eastern Europe. In Poland, where by the 1600s a majority of European Jews lived, the court Jew phenomenon found its counterpart in the institution of the *arendator*, a lessee of economic privileges on noble estates in Poland, Lithuania, and Ukraine. The opening up of latifundia during the fifteenth and sixteenth centuries—making possible a Baltic grain trade whose vast expansion facilitated the enserfment of the Ukrainian peasantry—drew Jews into the towns and villages of Lithuania and western Ukraine to assist the nobility’s economic exploitation of the eastern territories. In return for their services to the magnates, Jews won increasing religious, residential, and occupational freedoms, including protections against collective punishments and ritual murder accusations, limited rights to own real estate, and freedom to engage in a widening array of professions. With an expanding population, the Jewish economy became increasingly complex, diversifying well beyond the Jews’ traditional banking and tax farming activities into crafts, transport, and estate administration. The price for all this, however (in addition to mounting taxes), was the Jews’ insinuation into the dangerous and oppressive *arenda* regime.

The 1648 peasant backlash against the exploitative system, aggravated by religious tensions

among Greek Orthodox, Catholics, and Jews, and inflamed by Ukrainian Cossacks’ resentment against their misuse by the Polish crown, led to a ferocious rebellion under the generalship of Ukrainian hetman Bohdan Khmelnytsky (1595–1657). The Cossack phase of the conflict lasted until 1655 and exacted a devastating toll on Jewish population centers throughout Podolia, Volhynia, southwestern Lithuania, and even part of Galicia and central Poland. While contemporary chronicles exaggerated the extent of the loss, as many as 40,000 people—a quarter of Polish Jewry—may have perished. The Khmelnytsky uprising became the largest Jewish massacre before the twentieth century. But while the devastation created a drastic refugee crisis (the Cossack rebellion was followed by invasions from Sweden and Muscovy lasting through 1667) and accelerated Jewish migration to the West, it did not stem the tide of overall Jewish economic and demographic expansion in eastern Europe. On the contrary, within a century of the uprising the Jewish population reached one half million, with Jews becoming a key commercial force in an eighteenth-century Poland beset by economic woes.

Economic decline. In contrast to the early sixteenth century, Jews in the eighteenth century found themselves residing throughout the Continent, though in small numbers in western Europe. Yet now the mechanisms that had allowed for their restoration and distribution—the overland Balkan trade; Dutch overseas commerce with the New World, North Africa, and India; war and state building in the petty sovereignties of central Europe—had diminished in importance or were no longer operative. Jews were ill placed to take advantage of the new commercial centers and dynamic forces fueling a changing European economy, such as British colonial trade, early industrialization, and regional, intrastate as opposed to trans-European or intercontinental trade. Even the growing importance of Jews in Poland seemed to go hand in hand with that land’s political and economic decline, or so many anti-Semites believed. Polish Jewry’s demographic growth fed emigration and itinerancy, thus aggravating the existing poverty of sister communities in central and western Europe. By the end of the early modern period a widespread perception emerged in the European press of an internal Jewish social crisis, leading to demands for Jewish political

and occupational reform at the dawn of the modern age.

JEWISH SELF-GOVERNMENT

The autonomous community. In the wake of the Khmelnytsky massacres, Rabbi Nathan Hanover (d. 1693), himself a Polish refugee living in Livorno, concluded his chronicle of the devastation with an extensive elegy for the golden era of Polish Jewry, which he believed had now come to an end. In this idealized portrait, Hanover praised the features of Polish Jewry that made it so exemplary: its devotion to religious learning and scholarship, its highly developed and meritocratic system of religious education, its generous charitable institutions, and, finally, its extensive network of religious and civil courts and local, regional, and national administration. According to Hanover's depiction, Jews lived in a self-enclosed world, sealed off from all corrupting non-Jewish influences. "Never was a dispute among Jews brought before a Gentile judge or before a nobleman, or before the King . . . and if a Jew took his case before a Gentile court he was punished and chastised severely."

Despite Hanover's exaggerated claims (in seventeenth-century Poland, powerful Jewish interests—merchants, tax farmers, *arendators*—rarely hesitated to enlist non-Jewish authorities on their own behalf), Polish Jewry did enjoy a degree of autonomy almost unprecedented in the history of the diaspora, with self-governing institutions that extended from the municipal to the federal level. In earlier centuries the Polish crown had appointed chief rabbis for the entire Jewish community; such efforts died out by the middle of the sixteenth century when Jews won the right to administrative autonomy, even at the "national" level. Indeed, the crown benefited fiscally and the Jews administratively from the establishment of the Council of the Four Lands (first documented in 1581) and the Council of the Land of Lithuania (1623). Both were annual or biannual synods composed of delegates from regional Jewish councils who were entrusted with formulating general policies and recommendations for the Jewish population as a whole. Indeed, these councils exerted an influence well beyond their own lands, intervening on occasion in the internal disputes of other Ashkenazic communities (for example, Frankfurt, 1615–1628,

and Amsterdam, 1660–1673), a development that underscored Polish Jewry's newfound preeminence in the early modern period numerically, institutionally, and intellectually.

The autonomous Jewish community had derived its historic legitimacy from two sources: the consensus of its constituent members, made sacred through oaths and rights of excommunication (*herem*) and the independent, quasi-corporate standing conferred upon it in governmental charters, such as that granted by Casimir the Great in 1364 and renewed periodically by his successors. Membership rights in the community (*kehillah*) were the prerogative of the Jewish municipal government (*kahal*), rooted in local custom and conditioned by changing economic circumstances. Such membership, though normally heritable, did not automatically transfer to a new spouse; on the contrary, despite the premium placed on marriage in Judaism, communities exercised strict control over marriage and settlement. The medieval formula, according to which one acquired town citizenship by residence for "a year and a day," did not apply to the Jewish community of this period, which imposed waiting periods of between six and twenty-five years on prospective members, again depending on economic circumstances. On the other hand, visitors remaining for longer than several weeks were subject to special taxes—the city of Kassel, for example, required outsiders lingering more than a month to pay all of the taxes normally imposed on residents, in addition to the tolls to which travelers and merchants were otherwise subject. Itinerants might receive initial assistance with food and shelter, but they would be sent packing after a few days. Especially in northern and eastern Europe, by the second half of the seventeenth century, when population growth, war, and increased regional economic integration vastly multiplied the number of Jewish beggars, communities felt forced to impose strict rules against sheltering wanderers. In 1623 the Council of the Land of Lithuania insisted that "no beggar whatsoever shall be given anything except transportation to send him away; neither shall he be kept in one's house for more than twenty-four hours." The Jewish community was responsible for its own poor (if no kin were able) and could not support outsiders too, a factor that further aggra-

vated the problems of homelessness and mendicancy.

Oligarchy. As social divisions widened, particularly in the larger communities, a trend toward oligarchic rule emerged. In theory, ultimate authority resided in the consensus or majority rule of the entire community, meaning, essentially, all married male taxpayers. Yet by the sixteenth century, Jewish communities throughout Europe entrusted the election of municipal officers to “the majority of wealth.” Indirect election became the rule, with taxpayers of sufficient property choosing an initial assembly that in turn elected—depending on the community’s size—two or three tiers of officers (in Poland: *tovim*, ‘good men’; *zekenim*, ‘elders’; and *parnasim*, ‘pillars’) for an annual term. The position of community executive was usually rotated on a monthly basis. Stiff regulations against reappointment and nepotism were enacted, though increasingly observed in the breach. Indeed, private money was an essential ingredient of community government. At times offices might be directly purchased—though this abuse was vigorously condemned in community record books (*pinkasim*) and rabbinic preachments. But even short of such extreme cases, serving as an officer was a privilege of wealth, indeed, one that might carry numerous costs. The privilege of self-government came at a price, since every appointment of new officers had to be ratified by the ruler or his agent, entailing the payment of a sizable fee on each occasion. Rulers generally made officers personally responsible for unpaid community debts and taxes, imprisoning them to extort the fine if necessary. For this reason, communities felt justified in imposing penalties on wealthy individuals who declined to serve.

Institutions. The religious prerequisites for the existence of a Jewish community were a prayer quorum (*minyan*) of ten adult males, a cemetery, a kosher slaughterer (*shochet*), and a ritual bath (*mikvah*). If a community’s small size made any of these prohibitive, it would seek to affiliate with its nearest neighbor. A rabbi was not strictly necessary so long as a lay member possessed a respectable mastery of Jewish law. If no man was able, knowledgeable women would also sometimes serve as unofficial guides to the law and (in early modern Italy, at least) ritual slaughterers. The rabbinate became professionalized throughout Europe in the

late Middle Ages, but financial arrangements for hiring rabbis differed according to region; in Poland, for instance, the rabbi received a salary as well as specified tax exemptions and monopoly rights; in Italy, on the other hand, he earned merely a nominal fee, which he had to supplement through teaching, preaching, writing, or business. Still, any community that could afford to have a rabbi did so, for he epitomized its highest values and embodied its authority. He was both teacher and judge—even if in reality his personal power was often subordinate to that of the lay communal leadership.

Once the framework of local government was in place, its chief functions were to collect taxes (for its own administration and on behalf of the government); to maintain good relations with the authorities (often entailing a special functionary, the *shadlan*, as “lobbyist,” and always requiring the allocation in the budget of special funds for “gifts”); to ensure internal order and observance of the law (civil and religious); to appoint clerical officials (a rabbi and religious teachers) and lay judges to oversee local courts; to provide essential services, such as health facilities and teachers for the children of the poor; to appoint and supervise special officers, such as those responsible for tax assessment or truancy enforcement; and to oversee committees (*hevrahs*) engaged in specific activities (both ritual and civic), such as the burial society (*hevrah kadisha*) or artisan fraternities, as well as those engaged in poor relief and other charitable pursuits (for example, providing dowries to enable poor girls to marry). With the expansion of the size and complexity of Jewish communities and the intrusion of class polarities, such *hevrahs* proliferated. They allowed for participation by the middling ranks in community bodies otherwise inaccessible to them. In fact, though most *hevrahs* were restricted to males, a minority also offered a rare channel for women to participate in self-governing organizations. *Hevrahs* were mutual aid societies in life and death, providing charitable funds to help the family of a deceased member, as well as intercessory prayers on behalf of their souls. They were vehicles for the expression of new forms of spiritual creativity, even quasi-autonomous loci for an emergent Jewish civic society. But whatever their specific functions, it is important to keep in mind that such *hevrahs* were

viewed as religious institutions and not political ones.

Education. Public education at the elementary level, to the extent that it existed, was for the children of the poor alone. Poor but promising scholars were objects of private charity; it was considered a great religious virtue (*mitzvah*) to feed and house a penurious Talmudist. While valued as an end in its own right, scholarship also provided an avenue of social mobility and could secure a marriage into a wealthy family. Such meritocratic virtues served to elevate scholars and denigrate the illiterate. Promising children were urged to advance through the curriculum as rapidly as possible. Pedagogical theory held that the earlier something was learned, the longer it would be retained, and for this reason, ambitious parents sought to teach their sons to read Hebrew from as early as the age of two. As a proud father recorded in sixteenth-century Italy, at three his son began his religious studies, at four he chanted from Scripture, at five he learned to write, at eight he studied the legal codes, and at twelve he learned ritual slaughtering and led the morning service in synagogue. A childhood so attenuated—the process completed, as the historian Roberto Bonfil notes, even prior to any bar mitzvah rite of passage—expressed the premium placed by Jewish society on boys’ achieving early intellectual maturity. Maturity for girls, on the other hand, meant early marriage (from twelve or thirteen up). The community placed no value on a girl’s religious education (and only a wealthy family might train a girl in some secular arts), except that pertaining to the dietary rules and laws of ritual purity. Schools for girls, such as the one established in Rome in 1475, were rare. Nevertheless, learned women, self-taught or instructed by a parent, appear repeatedly in the early modern sources. Women’s spirituality—exclusive of their domestic roles—found expression in special Yiddish prayers (*tekhines*) and moralistic stories, and through the communal experience of the *hevrahs* and their charitable and devotional activities.

Finances and taxes. The Jewish community was as much an economic institution as a social and religious one. What this meant in practice was that the *kahal*, in its corporate status, frequently engaged in business transactions, loans (as both lender and borrower), and the leasing of franchises. (A Jewish com-

munity in early modern Poland-Lithuania might be a general *arendator*, subletting specific functions to individual community members.) In late medieval Germany, entire communities, ostensibly the “property” of the crown, were pawned to princes, nobles, or municipalities to generate cash. Jewish communities frequently found themselves deeply in debt—to individual members of their own communities or to Christians (in Poland-Lithuania, monasteries in particular thrived on loans to Jewish communities for periods often lasting generations). The trend toward oligarchic rule tended to dampen the fortunes of the *kahal*, since corruption, tax exemptions for the wealthy, the growing burden of poor relief, and mounting interest on community debts placed communal financial burdens increasingly on the backs of the middle stratum of “householders” (*ba’ale batim*).

Paying for communal services and privileges entailed a wide array of taxes. The Jewish community received assessments from state and local governments based on its ascribed population size and then apportioned the fiscal responsibility of its individual members. This created considerable overlap between “external” and “internal” taxation, with the former generally taking the form of capitation and property taxes and the latter sales taxes on commodities and fees on services. The *kahal*’s ingenuity was continuously tested by increased demands from above. Taxes on kosher meat and candles for the Sabbath and holidays proved particularly onerous, since these items were religiously obligatory. These taxes began as community imposts but were eventually seized upon by governments as their own. Ritual items like citrons (for the autumnal “Festival of Booths” [Sukkoth]) as well as “luxury” items like tobacco were likewise taxed. The community imposed sales taxes not just on types of commodities but on the types of professions that produced them. For instance, eighteenth-century Cracow taxed all transactions by peddlers, jewelers, bakers, and tailors, among others, at fixed rates, regardless of their character or size. Indeed, marriage, death, and taxes went hand in hand since dowries and burials were often taxed as well.

Eighteenth-century developments. The imposition of tax upon tax mandated by indebtedness and state demands, interference in the *kehillah*’s internal affairs by overweening magnates, increased oligar-

chic manipulation of the instruments of Jewish self-government, growing economic and social differentiation within the Jewish community, jurisdictional disputes between large Jewish communities and their numerous suburban satellites, and the eventual emergence of a strong Jewish artisan class jealous of its fraternal ties all conspired to transform if not destroy the traditional autonomous Jewish community in eastern Europe by the eighteenth century. In 1764, in an effort to extract more funds from the Jewish population, the Polish *sejmiki* dissolved the Council of Four Lands, thus ending one of the more remarkable experiments in the history of Jewish diaspora autonomy. With the Polish partitions of 1772, 1793, and 1795, the bulk of Polish Jewry fell under the administration of Prussia, Austria, and Russia, each with different policies affecting the future of the self-governing Jewish community.

Central, southern, and western Europe. Since medieval times the Jews of Germany and central Europe had made periodic use of rabbinic synods to deal with pressing political, economic, or religious problems. As absolutism became the order of the day, these interregional synods waned and were eventually replaced by regional councils or *Landjudenschaften*, backed, or sometimes even created, by the princes. Indeed, court Jews—acting as both agents of the crown and community lobbyists—would frequently play decisive roles in these bodies, at times even occupying the position of “state rabbi” (*Landesrabbiner*). Crown interference in the internal mechanism of the *Landjudenschaften*, a phenomenon that intensified in the eighteenth century, was not the only curb on their power and prestige, however. Perhaps more significant was the fact that a number of the major Jewish communities of central Europe—Vienna, Berlin, Prague—lay outside their jurisdiction. The increased independence of large urban communities in central Europe offered greater opportunities toward the end of the eighteenth century for institutional experimentation and religious reform.

A similar situation presented itself in Italy, where regional and peninsula-wide synods were held in the fifteenth century (Bologna, 1415; Florence, 1428; Ravenna, 1442–1443), but where localization was becoming the norm in the seventeenth. In Italian cities, as in Amsterdam, Hamburg,

and Paris (not to mention throughout the Balkans and the Ottoman lands), Jewish community life was also fragmented by other centrifugal forces, such as linguistic and cultural divisions between Castilian, Aragonese, Portuguese, German (*tedesco*), Romanian (Greek-speaking Jews), and other ethnic enclaves. In these settings communal solidarity transcending country of origin would have been unlikely, to say the least. Different rites and customs and endogamous marriages usually went together with different synagogues, cemeteries, and communal administrations. While each communal leadership demanded absolute obedience from its constituency, such institutional multiplicity and functional overlap tended in the long term to undermine the authority and prestige of autonomous Jewish institutions.

If these factors—state interference in the functioning of the super-communities, major urban communities that increasingly went their own way, and internal ethnic divisions—weakened Jewish self-government throughout Europe, they did not in themselves destroy it. On the contrary, in the “backward” societies of eastern Europe, unaffected by the French Revolution or liberal capitalism, the Jewish community persisted well into the nineteenth century, despite social divisions and frequent attacks on its legal basis and moral character.

RELIGIOUS AND INTELLECTUAL DEVELOPMENTS

Jewish law (halakhah). In the early modern as in the medieval period, Jews assumed that the proper and necessary expression of Jewish life was through the observance of Jewish law (*halakhah*). This was true even of the Marranos or crypto-Jews: their “Jewishness” expressed itself, inter alia, as the unfulfilled aspiration to observe the commandments of the Torah. For this reason, meaningful discussion of the inner life of the Jews of the early modern period must begin with the *halakhah*.

The *halakhah* was a highly elaborated system of study and praxis, based on the Mosaic law, alongside the “oral law” that, according to ancient custom, had been passed down from generation to generation as part of the original revelation at Mount Sinai. Scriptural and oral law were reintegrated, so to speak, both as a literary corpus and as a practical system of observance by scholars (*rabbis*)

active between the second and sixth centuries in Palestine and Babylonia. The laconic Mishnah (c. 200 C.E.) and the vast “sea” of the Babylonian Talmud (c. 500 C.E.)—the latter a compendium of scriptural and Mishnaic commentary, lore, and rabbinic hagiography—defined much of rabbinic Judaism and constituted the broad ideological and practical foundation for Jewish existence. Mastery of the Talmud—meaning not just its numerous tractates but also the successive layers of commentary and analysis that had evolved over generations—was also the prerequisite for entrance into the rabbinic class. Talmudic principles had to be applied and adapted to the specific circumstances of daily life as they emerged in different historical settings. Thus, a great deal of rabbinic literature is a literature of legal analysis, including commentaries on one or another aspect of the Talmudic corpus, codes of Jewish law, *hiddushim* (collections of legal *novellae* inferred from Talmudic literature and precedent), and *responsa* (answers by leading scholars to queries sent by letter from local rabbis regarding specific practical *halakhic* problems).

Responsa literature and legal codes. Because of the upheavals caused by wars, expulsions, migrations, and resettlements, the sixteenth and seventeenth centuries abounded in *responsa* literature. Much of it concerned banal or not particularly topical issues, for instance, the use of embroidered images on a synagogue curtain, the legality of employing non-Jewish musicians at weddings or of divorcing a wife for her refusal to relocate to the land of Israel. But a considerable number of *responsa* from this period reflect larger historical changes: disputes over jurisdiction and custom that arose when new settlements of exiles developed side by side with older established communities, for example, or uncertainty over the status of marriages, divorces, and inheritances when one or several members of a family had converted to Christianity—as was not infrequently the case with Jews leaving Iberia. In Poland, topical problems such as population growth, the rise of the *arenda*, the subsequent spread of novel economic relationships, and, later, as a consequence of the Khmelnytsky massacres, the proliferation of widows ineligible for remarriage (because Jewish witnesses could not attest to the deaths of their husbands, as required by

halakhah) prompted penetrating investigation into the legal sources.

Despite the urgency surrounding the content of much of this literature, the stylistic convention of rabbinic *responsa* became increasingly intricate and scholastic (one is tempted to say, baroque) in character by the sixteenth century. Far more *responsa* have endured from this period than from the preceding era. Yet despite their great quantity and weighty contents, they abound in deferential pieties that insist upon the superior understanding of the juristic giants who came before. Indeed, it is from the sixteenth century that *halakhic* scholars begin referring to themselves as *aharonim* (“later authorities”) and their predecessors as *rishonim* (“primary authorities”).

Such terminology attests to an emergent consciousness among Jewish legal scholars in the sixteenth century of a temporal divide between their own and the preceding era. This was not conceived of in terms of “ancients and moderns.” Rather, a wide array of sources attests to a growing sense within Jewish life that the providential plan had taken a decisive turn. In *halakhah* its clearest evidence emerges from the compulsion felt simultaneously by scholars in widely different places to devise a new and definitive code of Jewish law that would offer practical guidance to a people afflicted by seemingly continuous upheaval. The *Shulhan Arukh* (1564–1565; The prepared table) authored by Joseph Karo (1488–1575), a Spanish exile who lived first in Turkey and then in northern Palestine (Safed), appeared to answer that need. Its success derived from its pithy and accessible quality, no doubt. But backing this up was the unimpeachable authority of Karo’s lengthier and far more academic legal code, the Bet Yosef. Still more decisive was the fact that the *Shulhan Arukh* was soon supplemented by the *Mapah* (Tablecloth) of the Polish rabbi Moses ben Israel Isserles (1525 or 1530–1572), who glossed the Sephardic Karo in the light of Ashkenazic jurisprudence and custom.

Initially, Karo’s compendium had provoked strong opposition in eastern Europe, on the grounds that a legal code so devoid of argumentation would attenuate direct study of the Talmudic sources, diminishing the stature of the rabbis and undermining local and regional usage (*minhag*).

Why then did Polish rabbis eventually reconcile themselves to Karo's enterprise? The answer lies in the character of the problems generated by the mode of Ashkenazic legal studies in the early modern period. Polish Jewry had become perhaps the outstanding locus of *halakhic* scholarship by the sixteenth century. Its chief innovation was *hiluk* (both a form of pedagogy and a method of textual analysis), characterized by the continuous comparison of disparate Talmudic texts to uncover their underlying conceptual principles. While often denigrated as "casuistic," this dialectical approach made possible increased legal flexibility, a great virtue in the face of the many conundrums confronting early modern Jewish communities. At any rate, though the method of *hiluk* was antithetical to the spirit of codification, many Polish scholars came to realize that the vast amount of legal commentary and custom that had accumulated in recent generations necessitated a new and systematic organization of the law. (Note that similar controversies surrounding codification efforts were taking place among non-Jews in sixteenth-century Europe.) Broadly speaking, then, and despite the original controversy that surrounded it, the *Shulhan Arukh* triumphed because it addressed a range of pressing needs through its unique combination of practicality, scholarship, and universality.

Cabala (Kabbalah). Karo was no pedantic legalist, but a mystic and a visionary, the recipient, in fact, of nightly visitations from a heavenly messenger (*maggid*) who revealed divine secrets to him through the mechanism of automatic speech. His *maggid* aside, as a devotee of the cabala or kabbalah (a body of Jewish mystical thought and practice dating from twelfth-century Provence and Spain), Karo was hardly unusual—even among *halakhic* scholars. By the sixteenth century, cabala had become widely disseminated in almost every diaspora locale, due in part to the dispersion of Judeo-Spanish refugees throughout the Mediterranean and beyond. With roots in gnostic and Neoplatonic thought, and a core conception of divine ontology as corresponding to and interacting with human activity, cabala helped to invest Jewish ritual with fresh meaning and magical potency. Although cabalistic theosophy achieved its classical expression in the thirteenth-century *Zohar* (a pseudepigraphic work traditionally attributed to the second-century sage

Rabbi Simeon bar Yochai), the sixteenth-century Safed cabalists Moses Cordovero (1522–1570) and Isaac Luria (1534–1572) lent it greater systematization and a new set of topical emphases. Cordovero's mystical fraternity produced instructional guides to moral behavior (*hanhagah*) that reified mystical abstractions into concrete practices and lifestyles accessible to such fraternities (*hevrahs*) throughout the diaspora. Luria, according to the formulation of the historian Gershom Scholem, took over the gnostic myth of an originary crisis existing within the godhead and highlighted its correspondence to the specific condition of Jewish exile, thereby focusing attention on the cosmic process of messianic redemption within Jewish collective consciousness.

Abetted by the new print revolution, the cabalistic currents emanating from Safed and elsewhere fused with the existing pietistic temperament of sixteenth-century Poland, the latter a legacy of that community's origins in medieval Ashkenaz and of its own syncretistic folk culture. Asceticism, strict penances, self-flagellation, and elaborate demonologies, though hardly alien to diaspora Jewish life elsewhere at this time, became especially pronounced in early modern Poland. Both pietistic and eschatological interests found expression in cabalistically inspired Bible commentaries that reveled in numerological interpretations of scriptural terms and calculations of the anticipated date of messianic redemption. In addition, *musar* literature, a genre dating to the early Middle Ages that aimed at guiding the reader to a life of mental and spiritual perfection through the adoption of an ascetic behavioral regimen, now came to function as an apt vehicle for transmitting cabala to a wider readership. *Musar* works took on a strongly cabalistic flavor, infusing prayer, Sabbath observance, study, and sexuality (or the strict avoidance of sexual sin, particularly masturbation)—indeed, nearly all areas of life—with a core of mystical symbolism. But cabala could also be disseminated orally through preaching, sermons, and homilies; through group study and recitation, as conducted by *hevrahs*; or simply through the complex if unconscious processes by which new customs, such as midnight vigils, alterations in the order of prayer recitation, prohibitions on sons attending their father's funerals, and countless other *tikkunim* ('corrections' of the cosmos),

become sanctioned and sanctified. There can be little doubt that the explosion of such practices signaled a heightened sensitivity to the new spiritual possibilities engendered by the contemporary moment.

Renaissance trends. In early modern Italy, however, cabala seemed to take an altogether different turn. There it became linked to Renaissance trends, of both a Neoplatonic and a hermetic variety. In contrast to Isaac Luria's mythical and intensely anti-Gentile formulations, the Florentine Johanan ben Isaac Allemanno (c. 1435–c. 1504) constructed an enduring synthesis of cabala and Neoplatonism, reflective of and conducive to a Jewish-Christian dialogue. Allemanno exerted an important influence on Giovanni Pico della Mirandola (1463–1494) and on the development of Christian cabala more generally. Indeed, in Italy—despite the proselytizing aims of its Christian practitioners—Christian and Jewish cabala shared many features, reflecting a common philosophical vocabulary and devotion to the ancient wisdom lying beneath the surface meaning of the scriptural text.

Italian cabala functioned as one component of a Jewish Renaissance humanism that embraced the aesthetic values of the general environment. Italian Jews were active in every sphere of Renaissance literary production—biographical, linguistic, poetic, and philosophic. Strikingly, the Aristotelianism that since the time of Maimonides (1135–1204) had created deep fissures in the Jewish world was now deployed in a failed rearguard action against the rising forces of cabala and Neoplatonism. The latter—with Jewish roots in eleventh- and twelfth-century Spain—achieved its highest Italian-Jewish expression in the *Dialoghi di Amore* of León Hebreo (also Judah León Abrabanel, c. 1460–after 1523).

Sixteenth-century Italy (though the phenomenon extended beyond the peninsula) also experienced a brief efflorescence of Jewish historical writing, a genre that possessed rather shallow roots in post-biblical Jewish culture. Some of these works exhibited a decidedly apocalyptic character—again, suggesting a widespread sense of approaching cosmic crisis—but others, like the *Me'or Enayim* (The light of the eyes) of Azariah ben Moses dei Rossi (c. 1511–c. 1578), were produced with an unmis-

takably humanist orientation. Indeed, Jewish humanists viewed the pagan arts then being revived in Italy as derivative of their own ancient creed. As the geographer Abraham Farissol (1451–c. 1525) explained, “at the foot of Mt. Sinai God crowned us with the Torah in its entirety: it contained all the sciences, natural sciences, logic, theology, law, politics, and it was here that the whole World slaked its thirst.” Such one-upmanship served Jews well. In a milieu where acculturation offered opportunities and enticements, the claim of Judaic priority in the humanistic curriculum enabled Jews to act as their own cultural gatekeepers.

“CRISIS” OR “INCIPIENT MODERNITY”?

Italian ghettos. Though the broad humanist curriculum was the province of a relative handful of Jews, the adoption of Italian names, folkways, melodies, delicacies, and pastimes permeated the Italian Jewish community as a whole, even when secluded behind ghetto walls. Indeed, the impact of Italian ghettoization—few Jewish communities outside of Italy lived in ghettos proper—did not necessarily mandate inwardness or insularity. The famous Venetian rabbi Leone Modena (1571–1648), although admittedly an exceptional case, records that during the December festival of Hanukkah, the friar whom he called “Satan,” “duped me into playing games of chance . . . by the following [May holiday of] *Shavuot*, I lost more than three hundred ducats.” At the same time, while ghettos did not seal Jews hermetically from the outside world, they did offer protection from physical attack (though not plague and wrenching poverty), and a defined if circumscribed and degraded place within Christian society. That for many historians “the ghetto” became a catchall for the premodern Jewish experience in Europe as a whole is unfortunate, since it violates the actual ghetto's historical specificity as well as misconstrues its paradoxical value to those Jews who experienced it.

This paradoxical nature of ghetto life manifested itself in a psychological need to define the moral and conceptual boundaries of Judaism within a Christian society. Indeed, ghetto existence appears to have given rise to a number of apologetic works that defended Judaism and advertised the purported benefits of maintaining a Jewish presence to Christian state and society. In a work by the

aforementioned Leone Modena, written in Hebrew but readily accessible to a host of contemporary Christian Hebraist scholars, the author brought forth a penetrating analysis of the New Testament, depicting Jesus as a Pharisee whose later epigones had distorted his original Jewish message. In 1638 Modena's younger Venetian colleague, Simone Luzzatto (d. 1663), offered Christians a quite different message, unabashedly insisting that Jews act to enrich the gentile polity with their unmatched commercial skills. Luzzatto's argument on behalf of "mercantilist philosemitism" influenced debates on Jewish readmission to England in 1654–1655 and continued to have an impact well into the eighteenth century.

Marranism and messianism. The ghetto was not the only stimulus to such literature, however. The return of many Iberian New Christians to Judaism prompted a number of them to produce treatises, addressed not just to Christians but to wavering fellow Marranos as well, that attested to what the former New Christian Isaac Cardoso (1603 or 1604–1683) called "the excellences of the Hebrews." Such former New Christians constituted a volatile addition to the Jewish communities of Italy, Amsterdam, Hamburg, and London during the seventeenth century. Unlike their sixteenth-century predecessors, a number of whom retained a living memory of open Jewish practice in Iberia, many of these Marranos possessed only the most rudimentary knowledge of rabbinic Judaism, its observances, doctrines, and mentalities. Their subjection to the discipline of the Sephardic *kahal* government (the *Mahamad*), its alien customs, and *halakhic* regimen sometimes evoked in the minds of these "returnees" comparisons with the very tyranny they had fled. Even an insincerely felt Christianity might leave an enduring impression on the soul. When combined with a sense of disappointment with their recovered faith, this could lead in the most varied directions. The roughly contemporaneous Uriel Acosta (1585–1640) and Abraham Miguel Cardoso (c. 1630–1706)—brother of the above-mentioned Isaac—demonstrate the polar range of alternatives. Acosta fled the Portuguese Inquisition in 1615, but was later excommunicated by the Amsterdam Jewish community for his increasingly radical criticisms of the oral law. His case dramatically illustrates how the abandonment of Christianity

could feed a religious skepticism irreconcilable with an equally powerful need for membership within a Jewish community. Abraham Cardoso, however, seemingly presented the opposite phenomenon. His intense hostility to his former Christian faith manifested itself in a dogged adherence to the cause of the messianic pretender Shabbetai Tzevi, even justifying on cabalistic grounds the latter's conversion to Islam. The fact that these cases are extreme ones should not obscure the intimate and complex connections between Marranism and messianism in the Jewish history of the seventeenth century. Messianic pretenders had not been lacking during the previous century. But figures like Asher Lemlein and Solomon Molcho (c. 1500–1532), however great the fascination they engendered, secured relatively few actual followers, whereas the messianic fervor surrounding Shabbetai Tzevi appears at its height to have seized the hearts of close to a majority of Jews worldwide. The messiah's appeal cannot be attributed to any single historical cause; neither the expulsion of 1492, nor the dissemination of Lurianic cabala, nor the rough phenomenological equivalents that appeared simultaneously within Christendom are sufficient to account for a movement that swept from Adrianople to Amsterdam—sweeping up all types and classes of Jews along its path.

Less speculative are the reasons why the modest achievements and erratic and sometimes psychotic behavior of the pretender himself did not induce a greater skepticism. The momentous announcement in the summer of 1665 of the messiah's advent, emanating from the holy land and in the guise of a solemn appeal from his "prophet," Nathan of Gaza (1643/1644–1680), for mass repentance, appears to have successfully undercut competing reports of Shabbetai Tzevi's bizarre sexual behavior and evidence of the physical thuggery that his followers unleashed upon "infidel" dissenters. Concerns raised by reports of his February 1666 arrest at the hands of the sultan were likewise dampened by word that the messiah's prison was actually a palace where the "king" hosted emissaries from throughout the exile. Only the profound shock of Shabbetai's apostasy on 15 September 1666, once absorbed, transformed joy into disappointment, and elation into rage or despair. Cooler heads among the community leaders now emerged to supervise a

systematic effort to cover up the extent of official collusion with the movement and to root out lingering pockets of belief.

If in most cases the status quo ante was restored relatively quickly, two minority tendencies also made themselves felt: conversion from Judaism, on the one hand, and participation in the heretical Shabbetean movement, on the other. In the first instance, Christian missionaries proved adept at capitalizing on the disillusionment Shabbetai had inspired in many Jews. As for the case of Jewish heresy, Shabbetai's propagandists (including Abraham Cardoso and Nathan of Gaza) succeeded in formulating doctrines to demonstrate that the apostasy actually "proved" Shabbetai's messianic or (in extreme versions) divine nature. It seems that such claims may have found a particular resonance among former Marranos. For them, after all, the outward conversion and crypto-Judaizing that Shabbetai and some of his followers now engaged in constituted the very crux of their own past religious experience.

Shabbeteanism would cast a shadow over the next century of Jewish intellectual and religious life in Europe. This did not occur because the heresy was itself so widespread. Admittedly, respected community leaders such as the Sephardic chief rabbi of Amsterdam, Solomon ben Jacob Ayllon (1655–1728), and even a revered Talmudist, Jonathan Eybeschuetz (1690–1754), were secret though moderate Shabbeteans, while at the other end of the spectrum, the shocking heretical messianism of Jacob Frank (1726–1791) seems to have taken the form of a perverse experiment to see if the original shabbetean debacle could be outdone. Yet while these instances should not be overlooked, more significant still was the degree to which self-appointed heresy hunters in the decades following Shabbetai Tzevi's demise claimed to see incarnations of Shabbeteanism extremism almost everywhere they looked—in the pietistic conventicle of the brilliant Italian mystic Moses Hayyim Luzzatto (1707–1747), in the acrobatic "enthusiasm" of the fledgling Hasidic movement, and even in some of the mild pedagogic reforms advocated by the early Jewish Enlightenment. The Shabbetean scare, in short, seems to have produced a form of reductionism within some orthodox circles, which in itself helped to determine the dynamic interplay of

"tradition and crisis" in the Judaism of the eighteenth century.

Conclusion. If heresy calls forth inquisition, skepticism dogma and laxity enforcement, then it is plain why some historians have depicted early modern era Judaism as engendering a crisis. The crisis they describe pits the irresistible force of acculturation, antinomianism, and apostasy against the immovable object of cultures and communal institutions turned inward and rigid. According to this view, by the middle of the eighteenth century, such tensions proved too powerful to contain, leaving the fabric of traditional Judaism exposed and vulnerable to the simultaneous eruption of Enlightenment in the West and Hasidism in the East. However, more recently, an alternative narrative has vied for dominance, one that emphasizes a comparatively seamless transition to modernity. According to this view, an "incipient modernity" was engineered, more or less unconsciously, by representatives of a moderate tradition within Judaism—philosophical in medieval Spain, humanistic in the Renaissance, and scientific in the Enlightenment—who were at home in both the world of Jewish observance and that of commerce and culture. However, if both scenarios possess merit, they likewise equally exaggerate, particularly with regard to the degree of autonomy they accord to European Jewish history. Modernity did not "arrive" at all Jewish communities simultaneously. Rather, as was the case with most minorities within Europe—as well as most populations outside of it—modernity imposed itself as an alien but ineluctable force that left no choice but to react, resist, or adapt.

JOANNA I, "THE MAD" (SPAIN) (1479–1555), third child and second daughter of Isabella of Castile and Ferdinand of Aragón, and mother of the Emperor Charles V. The marriage agreement of Isabella and Ferdinand had stipulated that Ferdinand could not inherit the crown of Castile if Isabella died before him. It would pass instead to their legitimate heirs, who could include their daughters since in Castile women were allowed to exercise sovereign power. Intelligent and well educated, Joanna also showed signs of rebelliousness and mental instability that troubled her parents. Nonetheless, in 1502 Isabella and Ferdinand secured the cooperation of the Castilian Cortes in recognizing Joanna as proprietary heiress of Castile (her older siblings Isabel and Juan had both already died) and her husband, the Habsburg Philip the Handsome, as her legitimate consort.

When Isabella died in 1504, Joanna and Philip were not in Castile. This allowed Ferdinand to engage in political machinations that portrayed Joanna as mentally unsound and convinced the Cortes to appoint him in her place. A power struggle emerged between Ferdinand and Philip. Philip died in 1496, plunging Joanna into a period of profound mourning (which only exacerbated her tendency toward mental instability). By 1509 Ferdinand had "exiled" his daughter to Tordesillas, where she lived until her death in 1555.

Some recent scholarship has attempted to separate Joanna's image from the unfortunate appellation of "the Mad," seeking to demonstrate that she was the victim of the political ambitions of both her father and husband. Despite her exclusion from power, Joanna remained the queen of Castile, reigning jointly after 1516 with her son Charles I (Charles V of the Holy Roman Empire).

ELIZABETH A. LEHFELDT

JOHNSON, SAMUEL (1709–1784), English writer, lexicographer, and critic. Known as "Dr. Johnson," Samuel Johnson was one of the most complex and important figures of eighteenth-century culture. Renowned particularly for his personality, his contribution to eighteenth-century writing is important both for his scholarly knowledge and for his insight into humanity in its moral and social complexity.

EARLY LIFE AND EDUCATION

The son of Michael Johnson, a bookseller with intellectual ambitions in Lichfield, Staffordshire, Samuel Johnson was born in 1709. When he was three, he was taken to London to be touched by Queen Anne to cure his scrofula, which, along with smallpox, caused lasting disfiguration. Johnson was educated at Lichworth Grammar School and read prodigiously, enjoying Latin authors and Renaissance literature. While at school, he wrote several English and Latin poems and essays, and a distant cousin, the Reverend Cornelius Ford, whom he visited in Worcestershire, encouraged his interests in poetry and classical culture. As a student at Pembroke College, Oxford, Johnson translated Alexander Pope's "Messiah" into Latin verse, and the poem was published in 1731.

Due to the family's increasing poverty, Johnson completed only one year toward his degree at Oxford, a prevailing source of unhappiness throughout his life. Faced with unemployment, Johnson grudgingly helped in his father's bookshop for two years. The drudgery was compensated for by his friendship with the Reverend Gilbert Walmesley of Lichfield, who encouraged Johnson's literary ambitions.

Johnson taught briefly at Market Bosworth Grammar School in Leicestershire but quarreled with his employer and moved to Birmingham in 1733. He lived with a former school friend, Edmund Hector, and earned money writing for the *Birmingham Journal*. He translated the Portuguese Jesuit Jeronymo Lobo's *Voyage to Abyssinia* in 1735. In the same year he married Elizabeth Porter, a widow twenty-five years his senior, and opened a boarding school in Edial, near Lichfield; the school failed, perhaps as a result of the combination of Johnson's indifference to teaching and his physical deformity.

LONDON, JOURNALISM, AND BIOGRAPHY

In 1737 Johnson traveled with David Garrick (a former pupil who was to become the most famous actor of his time) to London, where Johnson was to spend the rest of his life. He found employment as a journalist with the printer Edward Cave, the founder of *The Gentleman's Magazine*, and later commented, "No one but a blockhead wrote except for money." Johnson almost certainly influenced the journal's development as an authoritative source of information. He contributed book reviews on

several subjects and wrote reports of parliamentary debates (a forbidden practice) under the title of *Debates of the Senate of Magna Lilliputia*, which was a blend of both fact and Johnson's own views presented in his own words. After writing satirical pamphlets that were critical of Prime Minister Robert Walpole, Johnson went into hiding in Lambeth under a false name because his arrest had been ordered.

Johnson secured literary success with *London*, a satirically exuberant poem on the excesses and corruption of London life. Between 1738 and 1744 he also wrote short biographies of historical and naval figures. He helped to catalogue the Harleian library, a collection of books by the first earl of Oxford, writing an influential preface on cataloguing as essential in helping scholarly investigation. Johnson collated *The Harleian Miscellany*, a series of pamphlets on the political controversies in sixteenth- and seventeenth-century Britain, and wrote a preface to his collation. In 1744 he wrote an extended biography, *A Life of Richard Savage*, a passionately written defense of his friend, a struggling poet who had died in poverty in 1743.

LEXICOGRAPHER, LITERARY CRITIC, AND POET

Johnson's ambition to be an authority on language and literature is realized in his most important work. In 1747, he produced a plan for *A Dictionary of the English Language* addressed to statesman Philip Dormer Stanhope (Lord Chesterfield), who ignored Johnson and sent him £10. Johnson wished to provide a work of reference "for the use of such as aspire to exactness of criticism, or elegance of style" (Preface, 1756). His intention was to stabilize the language, for example in usage and pronunciation, but not to impose rigid rules like the dictionaries of the continental academies. Johnson's dictionary elucidates the different meanings of words through close examination of the use of quotations from celebrated and authoritative authors. The dictionary's diversity reflects Johnson's wide reading to find illustrative quotations, which were transcribed with the help of six amanuenses. In a famous letter to Lord Chesterfield, Johnson refused his offer of patronage after the dictionary was published to high critical acclaim in 1755 and an abridgment published in 1756. The abridged version be-

came the standard dictionary until the publication of Noah Webster's in 1828.

The Vanity of Human Wishes, an imitation of the Latin poet Juvenal's tenth satire, was published in 1749; the tone and vision of the poem has been debated by critics as reflecting either pessimism at human vanity or hope for humanity's redemption. Although Johnson was disillusioned with the judgment of theater producers about its value as a tragedy, his play *Irene* was produced by David Garrick in 1749. It earned Johnson £300. Johnson also established a twice-weekly periodical, *The Rambler* (1750–1752), writing critical essays on many topics such as the English novel. Between 1758 and 1760, he produced for the *Universal Chronicle, or Weekly Gazette* a series of essays called *The Idler* that were lighter in tone. He also edited and wrote reviews for *The Literary Magazine*. Opposed to the Seven Years' War, Johnson wrote sporadic pieces attacking the war. To pay the expenses of his mother's illness, Johnson rapidly wrote *Rasselas, Prince of Abyssinia*, (1759) a philosophical "Oriental" novella. Because of his scholarly successes, Johnson was awarded an honorary M.A. by Oxford University in 1755 and an LL.D. by Dublin University in 1765. The need to support himself by writing was relieved in 1762, when he (controversially) accepted an annual pension of £300 from Lord Bute's ministry.

JAMES BOSWELL AND LATER YEARS

In 1763, Johnson became acquainted with a young Scot named James Boswell, who became his friend and his biographer. Johnson's expanding social life saved him from the bouts of melancholia and depression he suffered. Acquainted with almost all the leading political and literary figures of the time, in 1764 he formed the Literary Club, whose members included Joseph Banks, Edmund Burke, David Garrick, Edward Gibbon, Richard Brinsley Sheridan, Adam Smith, and James Boswell, who recorded their conversations. Johnson befriended Robert Chambers, a lawyer, who asked his help in composing a course of lectures on common law to deliver to Oxford undergraduates. The degree to which Johnson helped write the fifty-six lectures remains undetermined. In the same year he met the Welsh writer Hester Lynch Thrale (later Piozzi), with whom he developed a close friendship, and traveled to Wales and to France with her family. Her *Anecdotes of*

Johnson (1786) and *Letters to and from Johnson* (1788), as well as her diaries, have provided rich material for Johnson's biographers. In 1765, Johnson finally published an edition of Shakespeare's plays, which is the first variorum edition, providing the notes of previous editors to aid or sometimes correct interpretation. His preface to the edition demonstrates Johnson's excellence at close critical reading.

In 1773, Johnson traveled with Boswell to the Hebrides, recorded in his *Journey to the Western Islands of Scotland* (1775) and in Boswell's *Journal of a Tour to the Hebrides* (1785). At the urging of a number of London booksellers, Johnson agreed in 1777 to write *Prefaces, Biographical and Critical to the Works of the English Poets* (later known as *The Lives of the Poets*), which was published 1779–1781. The monumental work discussed fifty-two of the most celebrated English writers and displayed Johnson's powers of literary criticism and insight.

Johnson died in December 1784 and was buried in poets' corner in Westminster Abbey. His fame followed him with the appearance of his letters and several biographies after his death, most notably James Boswell's *The Life of Samuel Johnson* (1791).

JONES, INIGO (1573–1652), English architect. Inigo Jones was important for introducing Italian design into a country that was only haphazardly acquainted with the forms of Renaissance architecture. He was also responsible, from 1605 to 1640, for staging over fifty masques and plays for the royal court, often in collaboration with Ben Jonson; many surviving drawings show how well acquainted he was with stage designs from Florence and the Medici court. Jones was born in London, the son of a Welsh clothworker. Nothing is known of his early life but he is first recorded in 1603 as a picture-maker, working for the 5th earl of Rutland, with whom he perhaps went on a diplomatic mission to Denmark. But it was also about this time that he first traveled to Italy, perhaps in the entourage of Frances Manners, the earl's brother.

Jones's first architectural designs date from about 1606 and show that by then he had already

acquired a knowledge of the work of architects like Andrea Palladio and Sebastiano Serlio. In 1610 he was appointed surveyor to Henry, Prince of Wales, and it was during this period that he may have worked on some internal alterations at St. James's Palace. In 1612, after the death of the prince, Jones came into contact with the duke of Arundel, an important patron and collector of art, in 1613–1614 accompanying him to Italy, to deepen further his knowledge of architecture. It was on this trip that Jones acquired his first drawings by Palladio. When, in 1615, he was appointed surveyor of the king's works, he was now ready to design works of his own. Through the generous patronage of King James I, he was able to design a small, but important, number of buildings: the Queen's House at Greenwich (1619–1635), the Queen's Chapel at St. James's Palace (1617–1618), and the Banqueting House, Whitehall (1619–1622). Nothing like these buildings, in their strict, spare Italianate

forms, had ever been seen in England, and their style was perhaps at first difficult for many to appreciate.

From about 1618 to 1640 Jones was also busy on two other major projects: the repair of St. Paul's Cathedral, London, and the square and houses that he built for the Earl of Bedford on property the earl owned at Covent Garden. The work Jones did at St. Paul's Cathedral was destroyed in the fire of 1666, but, especially in its vast Corinthian portico, it represented a new and grander Roman style of architecture, defining church architecture in ways that would be especially important for Christopher Wren when he also worked at St. Paul's and later designed other London churches. At Covent Garden, where Jones designed St. Paul's Church, the first classical church in England, his opportunities were limited. But in the plan, and in the design of the houses around the square, borrowed from what he had seen in Paris and Livorno, Jones defined a pattern of

urban architecture that would be used widely in England for the next two centuries.

Jones's grandest project was for a vast palace at Whitehall, modeled on both the Escorial in Spain and the Louvre in Paris. And if nothing came of his plans because of the financial and political difficulties of King Charles I, what Jones suggested, as documented in his preparatory drawings, affected all the later designs done on this important site. Jones was also involved with several projects for country houses, the most important being Wilton House, Wiltshire, where the south front, begun by Isaac de Caux about 1636, was much influenced by his ideas. In a series of designs from this time, none of which were executed, Jones defined a restrained, undecorated style that was used in many of the buildings of this kind designed in England after the Revolution of 1688–1689.

The political misfortunes of Charles I affected Jones very directly; in 1643 he was dismissed as surveyor of the king's works. He received no further commissions after this, but when he died, he was able to leave a considerable sum of money to John Webb, his pupil and assistant, who had married one of his relatives. It was also to Webb that Jones bequeathed his drawings, which were later acquired by Lord Burlington in the 1720s and then used to define the revival of Palladio in England in the eighteenth century. Over forty volumes from Jones's library, many with his annotations, now reside at Worcester College, Oxford, and have been used extensively by scholars; many of his drawings for masques and stage designs passed through Lord Burlington to the dukes of Devonshire and are presently preserved at Chatsworth.

DAVID CAST

JONSON, BEN (1572–1637), English playwright and poet. A highly influential dramatist of Jacobean London and the court of his day, Jonson was a colorful character of early theater history. His plays communicate much about the vicissitudes of life for those who shared the playwright's time and place. Jonson's father was a clergyman; his death a month before Jonson's birth was to affect the playwright's early life, for Jonson's mother soon married a master bricklayer, Robert Brett. Jonson was educated at Westminster School, where the antiquary William Camden, who was the master, became his intellectual inspiration. It is not certain, however, how long Jonson remained at school. According to the Scottish poet William Drummond of Hawthornden (1585–1649), friend and recorder of his conversations, Jonson was "taken" from Westminster and began an apprenticeship in bricklaying. He left London briefly to serve as a soldier in the Low Countries, but by 1594 he had returned. He married, and in 1595 he entered the Tylers and Bricklayers Company.

Soon after this he was writing and performing as an actor with the Earl of Pembroke's Men. In 1597 the company got into trouble for presenting *The Isle of Dogs* (now lost), a seditious play that Jonson finished for Thomas Nashe, and subsequently they had to disband. Jonson was constantly at odds with the authorities. In 1598, the same year that he produced his highly successful comedy, *Every Man in His Humour*, for Shakespeare's company, the Chamberlain's Men, he killed an actor called Gabriel Spencer in a duel. When arraigned for the offense, he successfully pleaded "benefit of clergy"—that is, he escaped a hanging due to his ability to read. While in prison for this offense, he became a Catholic, though he reverted to the Protestant faith twelve years later.

Jonson was frequently punished for the subject matter of his plays, which were often interpreted as being too satirically interested in national or court politics. In response to his tragedy *Sejanus His Fall*,

performed at the Globe in 1603 and published in 1605, he was suspected of portraying the political crimes of Robert Devereux, the earl of Essex. He was jailed in 1605 with George Chapman (1559–1634) and possibly John Marston (c. 1575–1634), collaborators with him on the London satire, *Eastward Ho!*, because it alluded to King James I's acceptance of payments for knighthoods. Despite these troubles, Jonson always seemed to emerge unharmed, and ultimately he excelled within the context of court entertainment. This is borne out by the success of his many masques, written for members of the court to perform. Some of these were produced in collaboration with the designer and architect Inigo Jones (1573–1652). In 1616 he was given a royal pension that was similar, in today's terms, to being granted the post of "poet laureate" in England. Thereafter he styled himself "the King's Poet."

His principal dramatic works, other than those already mentioned, include satirical pieces like *Cynthia's Revels* (1600) and *Poetaster* (1601)—both contributing to a perceived dialogue among the playwrights, or what has been called "the war of the theaters" played out between Jonson, Marston, and Thomas Dekker. Other satires include *Every Man Out of His Humour* (1599), *Epicene, or the Silent Woman* (1609), *The Devil Is an Ass* (1616), and the rumbustuously carnivalesque *Bartholomew Fair* (1614). The most famous of the playwright's works are undoubtedly *Volpone, or the Fox* (1606) and *The Alchemist* (1610), which are regularly produced on the stage to this day.

Jonson also wrote poetry including his *Epigrams* and a selection called *The Forrest*. These were published in his collected *Works* of 1616. Another selection of verse called *Underwoods* was published in a collection in 1640. This also included *Timber; or Discoveries made upon Men and Matter*, a prose work that comprised some personal musings on texts he had read. Jonson is best remembered for plays that, while showing his audience the world in which they lived, drew heavily on classical influences. These sources were often noted in the margins of Jonson's published works—nowhere more so than in the collection that he himself put together, the folio of 1616. Never before had there been such a publication, which included dramatic works written in English, and it was this endeavor

that probably inspired the production of Shakespeare's First Folio of plays in 1623. Jonson demonstrated perceptiveness and foresight concerning the universal nature of Shakespeare's work when he wrote in a prefatory poem to his dead friend's collection that Shakespeare's plays were "not of an age, but for all time!" Jonson's plays belonged to early modern London and to England's court, and therefore to his age.

In 1623, Jonson suffered the catastrophe of seeing many of his papers burned in a fire. Although he continued to write into the Caroline period, he never regained the favor he had once won at court. In 1628 this extraordinary personality suffered a paralytic stroke, and he died in 1637 plagued by ill health and financial insecurity. He is buried in Westminster Abbey under a tombstone bearing the inscription, "O rare Ben Jonson."

JOSEPH I (HOLY ROMAN EMPIRE)

(1678–1711; ruled 1705–1711), Habsburg emperor. Joseph I's reign was dominated by the War of the Spanish Succession (1701–1714), which pitted Bourbon France and Spain against the "Grand Alliance" led by Austria and the Maritime Powers. Born to Emperor Leopold I and Eleonore of the

Palatinate-Neuburg, Joseph's upbringing was notable for the absence of Jesuit influence and the resurgence of German patriotism during lengthy struggles against France and the Ottoman Empire. In 1699 he married Wilhemine Amalie of Brunswick-Lüneburg, who his parents hoped would tame his youthful excesses, which included wild parties and a string of indiscriminate sexual escapades. He was soon admitted to the privy council, where he became the center of a "young court" of reform-minded ministers eager to resolve the daunting financial and military crises that confronted the monarchy during the opening years of the war, which Leopold had entered to secure the far-flung Spanish inheritance for his second son, Archduke Charles (the future Holy Roman emperor Charles VI). Their first victory came in 1703, with the appointments of Prince Eugene of Savoy and Gundaker Starhemberg to head the war council (*Hofkriegsrat*) and treasury (*Hofkammer*). Shortly afterward, John Churchill, the duke of Marlborough, was induced to march a British army into southern Germany, where it combined with imperial troops in destroying a Franco-Bavarian force at Blenheim (August 1704).

Although the great victory saved the monarchy from imminent defeat, Joseph had to overcome a succession of new challenges after succeeding his father (5 May 1705), which included the need to wage war on multiple fronts in Germany, the Spanish Netherlands, Italy, the Low Countries, and Spain, while simultaneously suppressing a massive rebellion in Hungary led by Prince Ferenc II Rákóczi. Joseph's strong German identity informed vigorous initiatives within the empire, including reform of the Imperial Aulic Council (*Reichshofrat*) and the banning of several renegade German and Italian princes who had sided with the Bourbons. Yet he gave little assistance to the imperial army fighting along the Rhine frontier or to the Maritime Powers campaigning in the Low Countries. Instead, he focused his resources (together with considerable Anglo-Dutch loans) on Italy, which Prince Eugene delivered in a single stroke at the battle of Turin (1706), after which the French evacuated northern Italy, much as they had abandoned Germany after Blenheim. A small force expelled Spanish forces from Naples the following spring. Joseph's other principal concern was Hungary, where

Rákóczi had aroused widespread support against Leopold's regime of heavy taxation and religious persecution. Although Joseph dissociated himself from his father's policies and promised to respect Hungary's liberties, he refused Rákóczi's demand that he cede Transylvania as a guarantee against future Habsburg tyranny. As a result, the war dragged on for eight years, as Joseph committed roughly half of all Austrian forces to the difficult process of reconquering the country. Once victory was assured, relatively generous terms were granted the rebels at the peace of Szatmár (April 1711), signed just ten days after Joseph's death.

With Italy secured and the Hungarian rebellion under control, Joseph shifted his attention to the last and least pressing of his war aims—his brother's acquisition of the rest of Spain's European and American empire. Prince Eugene and a small force were sent to join Marlborough's Anglo-Dutch army in the Spanish Netherlands, most of which fell after their victory at Oudenarde (1708). Joseph also instigated a short war with Pope Clement XI at the end of 1709, forcing him to recognize Charles as king of Spain. By 1710, the first Austrian troops were fighting alongside their British, Dutch, and Portuguese allies in Spain itself. Nonetheless, a combination of logistical difficulties, timely French

reinforcements, and the Spanish people's dogged support for the Bourbon claimant, Philip V, doomed the allied effort. Unsuccessful peace negotiations at The Hague (1709) and Gertruydenberg (1710) failed to deliver what the allies could not win for themselves. Finally, a new British cabinet initiated secret peace talks with Louis XIV at the beginning of 1711, foreshadowing the Peace of Utrecht two years later.

Despite his untimely death from smallpox (17 April 1711), Joseph attained his two main objectives: securing an Italian glacis to the southwest and reconciling Hungary to Austrian domination, albeit with constitutional safeguards. Indeed, both achievements endured until 1866. Much of his success rested with a talent for choosing and managing able ministers to whom he could delegate much of the responsibility for realizing policy objectives. At the same time, Joseph jeopardized these gains through extramarital liaisons, which prevented his wife from bearing children after he gave her a venereal infection in 1704. Although he was survived by two daughters, the absence of a male heir foreshadowed the dynasty's extinction in 1740.

JOSEPH II (HOLY ROMAN EMPIRE) (1741–1790; ruled 1765–1790), the eldest son of Empress Maria Theresa (ruled 1740–1780) and Francis of Lorraine (ruled 1745–1765), succeeded his father on the imperial throne in 1765, after which he acted as co-regent with his mother in ruling the Habsburg domains. Although the imperial dignity meant little in the non-Habsburg lands of the Holy Roman Empire, it was of real impor-

tance within the Austrian domains. These were held together constitutionally only by the person of the emperor and the Pragmatic Sanction of 1713, in which Emperor Charles VI (ruled 1711–1740) had declared the Austrian lands to be indivisible and that the various titles and thrones would descend to his daughter Maria Theresa. To this minimal constitutional framework Maria Theresa added the Council of State (Staatsrat) in 1762, part of a continuing effort to strengthen the central administration of her lands. Her constant policy, which her son would accelerate, was to increase royal power at the expense of provincial autonomy.

The domains that Maria Theresa and Joseph II ruled were the most diverse in all of Europe. Belgium belonged to the Habsburgs, as did some Italian provinces, the Duchies of Austria, Styria, Carniola, Carinthia, the kingdom of Bohemia, Croatia, the kingdom of Hungary, and other assorted lands and duchies. All spoke different languages, had different histories, laws, and customs, and were accustomed to being ruled according to their own traditions. Maria Theresa and Joseph II made it their overriding political aim to bring together administratively provinces and kingdoms that were otherwise separate, and which defended local privileges and immunities with tenacity and vigor.

Maria Theresa and Joseph II had two aims in their efforts to strengthen the central monarchy at the expense of provincial autonomy. The first, and easier to obtain, was centralization, which involved transferring political decision-making power from local notables to the royal councils. The second, much more difficult aim was uniformity, which meant treating all provinces and all social and legal classes alike in matters of law and administration. These policies constituted the core of enlightened despotism, in which reforms and modernization were imposed from above upon often hostile and unappreciative subjects. As enlightened despots, Maria Theresa and Joseph II had good intentions. For Maria Theresa, the difficulties in achieving centralization and especially uniformity had made her cautious, but Joseph was impatient, and his enlightened rationalism was as absolute as his despotism.

In 1780, the courteous, modest, diligent, and likeable Joseph II became sole ruler of Austria at the

death of his mother, which enabled him to push his aims as hard and fast as he liked. He had several programs, which he instituted quickly throughout all of his diverse domains. Joseph disliked the independent power of the Roman Catholic Church. He began his reign with an edict of religious toleration (13 October 1781), fulfilling the Enlightenment ideal that religious persecution was squalid, loathsome, and beneath the moral dignity of a modern monarch. This followed the Edict on Idle Institutions (1780), which began the closure of monasteries—ultimately about seven hundred of them—with their property seized to support secular state schools and charitable institutions. Joseph believed in religious liberty for everyone. His general religious opinions may be discerned from his comment that service to God was the same as service to the state.

Joseph combined secularism with reform of the courts and law within the Austrian crownlands. Centralization and uniformity were the basic principles he used to bring order and coherence to the chaos of multiple legal inheritances. He abolished the law that made mixed marriages a crime against religion, and he closed a number of ecclesiastical courts. Beyond these particular changes, Joseph simply nationalized the judicial system. Manorial and municipal courts had their jurisdiction circumscribed, and they came under much closer governmental scrutiny. He established new appellate courts, which were uniform throughout all his lands. He engaged in a favorite project of enlightened rulers and philosophers: codification of the existing welter of medieval law into a modern and coherent code that would apply uniformly to all the realm. He continued the work begun by Maria Theresa, who in 1770 had issued a criminal code, the *Nemesis Theresiana*. Joseph reformed this further with the Penal Code of 1787 and the Code of Criminal Procedure in 1788. A notable feature of this code was a substantial reduction in the death penalty. He also reformed civil law, with a code of the law of persons and of property in 1786. Finally, he abolished the patrimonial courts in the kingdom of Hungary, establishing new courts of first instance and bringing Hungarian procedure in line with the rest of the Austrian crownlands. Such judicial reform is rarely easy. Joseph's reforms deeply angered

the Hungarian rural nobility, who complained about the loss of their ancestral privileges.

Joseph II departed most dramatically from his mother's pattern of cautious reform in the area of land and the abolition of serfdom. On 1 November 1781, he abolished some of the worst disabilities of serfdom in the lands of Bohemia and Austria, and he extended these reforms to Transylvania in 1783 and Hungary in 1785. In 1789 he abolished the remaining obligations of serfdom and changed the existing tax structure into a single tax on land. This was the culmination of his social reforms, which turned the serfs from patrimonial into royal subjects.

Joseph had tried to reform everything, never learning that politics is the art of the possible, not the perfect. He appears to have been convinced that imperial power was sufficient to change virtually every aspect of social and communal relationships in the crownlands. A flood of decrees would improve everything. In Joseph's world, however, inertia had greater power than command. He attempted to use

central power to create the state, whereas it was the state that must come first for the central power to be effective.

JOSEPHINISM. The meaning of the term, as well as the origins and nature of Josephinism, have been the objects of one of the most savage controversies in Central European historiography. Initially coined in the nineteenth century to describe the reform program implemented in the Habsburg Monarchy during the reign of Emperor Joseph II (co-regent 1765–1780, ruled 1780–1790), “Josephinism” came increasingly to apply specifically to the measures undertaken against the social, economic, political, and cultural position of the Catholic Church in the monarchy. Definitions have ranged across a broad spectrum, from seeing it as a general ideology of reform—a kind of Austrian variant of the Enlightenment—to interpreting it narrowly as state control over the ecclesiastical sphere. All interpretations have come to agree, however, that the roots of the reform momentum go back to the early eighteenth century, and that the reign of Empress Maria Theresa (ruled 1740–1780) was the critical era during which reform ideas crystallized.

In the seventeenth-century Counter-Reformation, Catholicism was in many ways the integrating ideology of the highly pluralistic patrimony of the Habsburgs. It involved not only a set of confessional dogmas, but broader patterns of thought and cul-

ture inextricably intertwined with a social and political infrastructure that had grown out of the economic and social upheavals of the era. When this polity proved unequal to the challenges it faced in the first half of the eighteenth century, the remedial measures undertaken identified confessional issues among the central problems to be addressed. Because of the degree of integration between political and confessional issues in the Counter-Reformation state, however, these reforms were not effected in discrete confessional spheres but had broad social, economic, and political consequences. Political economists argued that confessional policies were responsible for the relative economic underdevelopment of the Habsburg lands, while various ecclesiastical reform movements within the church became increasingly disenchanted with most ritualized form of baroque piety and advocated more internalized forms of worship. Secular, rational, and utilitarian values and a simpler, internalized religious ethos thus came to constitute the backbone of Josephinism.

By the time Joseph II became sole ruler of the Habsburg lands in 1780, all the main features of the “Josephinist” program were already in place. Both the pace and scope of reform accelerated, but even then its most prominent aspects remained those that touched on the religious sphere: the dissolution of about one-third of the monarchy’s monastic institutions with its concomitant confiscation of church property, the proclamations of confessional tolerance for Protestants and Jews, the effective establishment of a civil constitution for the Austrian clergy through state control of seminaries and the wide-ranging reorganization of parishes, and the promulgation of civil marriage and austere burial ordinances. Attitudes underlying these reforms remained alive well into the next century, despite the monarchy’s sharp turn to political conservatism during the Revolutionary and Napoleonic Wars and the subsequent Age of Metternich. Josephinism can thus be seen as one of the most important roots of nineteenth-century Austrian liberalism.

No study specifically devoted to Josephinism exists in the English language. The reform momentum of the eighteenth century with its central ecclesiastical dimension, which culminated in the reign of Joseph II, can best be approached through Ernst Wangermann, *The Austrian Achievement, 1700–1800* (London, 1973). More recent discussions can be followed in the relevant chapters of Derek Beales, *Joseph II, Vol. 1: In the Shadow of Maria Theresa, 1741–1780* (Cambridge, U.K., 1987) and Franz A. J. JOURNALISM, NEWSPAPERS, AND NEWS SHEETS.

The earliest printed periodical news publications appeared shortly after 1600. By the end of the seventeenth century, newspapers were being published in every major European country. Together, they constituted a phenomenon new in European history and unique in the world: a system of communication that made the most up-to-date information available, not just to members of government bureaucracies or wealthy elites, but to a socially diverse public that included even those of modest means. Printed periodicals tied Europe's "Republic of Letters" together, promoted the diffusion of knowledge and of new cultural models, and offered a source of income to the period's increasing number of writers. As a medium for advertising, periodicals helped promote the growth in consumption that was one of the striking phenomena of the eighteenth century. By 1804, the German journalist and scholar August Ludwig von Schlözer could write that the periodical press was "one of the great instruments of culture through which we Europeans have become what we are."

Broadsheets (French *canards*, German *Flugblätter* or *Neue Zeitungen*), the earliest printed news publications, began to appear in the sixteenth century, carrying news of unusual occurrences such as battles, royal deaths, and "wonders" such as two-headed calves. Printers produced them irregularly, as the flow of events dictated, and used illustrations and headlines set in oversized type to attract readers. Around the same time, manuscript newsletters, particularly common in Italy, began to offer subscribers

a regular flow of reports. Such handwritten newspapers continued to circulate in many parts of Europe until the period of the French Revolution, but soon after the beginning of the seventeenth century, the development of dependable postal systems encouraged the creation of the first printed publications issued on a regular periodical schedule. The earliest known printed newspapers were published in Germany in 1605. In the course of the seventeenth century, the press spread throughout the European continent. The first newspapers appeared in Holland in 1618, England in 1622, France in 1631, Spain in 1641, and Russia in 1702. Events such as the Thirty Years' War, the Puritan Revolution in England, and the wars of Louis XIV promoted the spread of newspaper publication, producing a flow of constantly changing reports and generating an audience with an intense interest in the latest developments.

Unlike the broadsheets, early modern news gazettes lacked pictures and headlines, and their content consisted largely of dry chronicles of events from the major courts, battlefronts, and trading cities. The earliest news publications appeared at relatively long intervals, sometimes only once a year, but it did not take long for weekly and twice-weekly gazettes to dominate the market. A daily newspaper appeared in Bremen as early as 1650, and although daily publication remained rare before the French Revolution, there was a general trend toward more frequent issues and a greater total volume of content. Publishers quickly learned to help their readers make sense of the news by numbering and dating each issue of the paper, and giving the date and place of origin of each news bulletin they printed. Readers often preserved their newspapers as a permanent chronicle of events, and publishers sometimes provided title pages and even indexes so that the annual collections could be bound as books.

Throughout the early modern period, newspapers continued to be produced on hand-operated wooden printing presses. This technology limited the number of copies that could be printed: a single press could produce at most 3,000 copies of a paper in a day, so that expanding the press run required paying compositors to set a second form of type. In contrast to the leisurely and irregular pace of work in most enterprises of the period, newspaper printers were subjected to strict time constraints and

Certain approved Medicines for the Plague, to be used when coughing, and to expect it after it be taken; as have been approved in Anno 1625, & also in this present Visitation, 1665.

A cheap Medicinal to keep from infection.

Take a pint of new Milk and cut two cloves of Garlick very small, putte in the mill, and drink it morning and evening, and it preserveth from infection.

Reader, what ever thou art, rich or poor, Rowie up thyself, for Death strikes at the door. If God says strike, he must will come in. For death we know is the reward of sin. His very breath is so infectious grown, He poysons every one he breathes upon; He is the Rich-man's terror, makes him flye, And bear away his baggage, as loath to die.

What shall the Poor do that behind do stay? Death makes them rich, by taking them away. But what shall Poor men do, that here do live, 'Tis surely fit the Rich should comfort give, And weekly Means unto them fill afford: Oh such Rich men shall be rich in the Lord! Death frights all, but more the guilt of sin, Which sinfull man long time hath lived in, Doth make them fearful of that punishment Due unto sin, for time that's evil spent.

Oh why was this not thought on long ago? When God expected our Repentance so? Seventeen years since, a little Plague God sent, He shoke his Rod to move us to repent: Not long before that time, a death of Gorn Was sent us to see if we would turn: And after that, there's none deny it can; The Beasts did suffer for the sin of man: Greas was so flout and small, that it was told, Hay for four pound a Load was daily sold. These Judgements God hath sent even to cite us Unto Repentance, and from sin to fright us. Oh Hubbard England! childish and unwise, So heavy laden with iniquities:

Return, return, unto thy loving Father, Return I say with speed, so much the rather, Be asure his Son thy Saviour pleads thy cause, Though thou hast broken all his holy Lawes: Say to thy self, My sins are cause of all Gods Judgements that upon this Land do fall, And sin's the cause that each one doth complain, They have too much, sometimes to little pain: Say to thy self, this Plague may be removed, If I repent, as plainly may be proved By **Abraham**, that City great and large, For God hath given unto his Angels Charge, To strike and to forbear as he fits fit; If it be so, then learn thou so much wit, To use thy best endeavour to prevent A plague, which thou mayst do if thou repent. Let all infected Houses be thy **Towr**, And make this **U/e**, that thine may be the next. The **Red Crosse** still is us'd, as it hath bin: To shew thy Christians are that are within: And **Lord have mercy** say on the doore, Putt this in mind, to pray for them therefore, The **Watchmen** that attend the house of sorrow, He may attend upon thy house to morrow, Oh where's the vows we to our God have made! When death & sickness came with axe & spade, And hur'd our Brethren up in heaps apace, Even forty thousand in a little space: The Plague among us is not yet removed, Because that fin of us is still beloved, Each spectacle of Death and Funerals, Putt thee and I in mind, We must die all.

A Postive Drinke to remove the Plague from the Heart.

A Ale Boquet Drinke with Pimpernel feathered in it, till it tastes strong of it, drunk often, removes the Infection, though it hath got to the very Heart.

An approved Remedy against the Plague.

Take a sprig of **Rosmalin**, herb of grace, and tread it, and put it in a Figger two, and eat it every morning fasting. it keeps the Body from Infection, and purifieth the blood.

had to “frequently work as if on a forced march,” as an eighteenth-century typographer put it: the papers had to be ready to be mailed at fixed times. Although the work was demanding, skilled workers could earn more than in ordinary printing shops, and even before the end of the eighteenth century, some publishers offered enticements such as pensions to keep a loyal work force. For the owners of printing shops, newspaper publishing was a way of ensuring a regular income, particularly since most periodicals were sold by subscription, and readers therefore had to pay in advance, in contrast to the purchasers of books. In small provincial towns, a newspaper might be just one of a local printer’s many ways of keeping his presses occupied. At the opposite extreme, the eighteenth century already saw the rise of the first great “press barons,” entrepreneurs who brought together a group of periodicals aimed at different market niches. In the 1770s and 1780s, the French publisher Charles-Joseph Panckoucke (1736–1798) managed to gain control of most of the French national press, including the venerable *Gazette de France* and the country’s leading literary journal, the *Mercure de France*, and to create a “stable” of writers dependent on his patronage.

The news carried in the gazettes attracted a large and varied audience: rulers and their courtiers, military officers, bankers and merchants, all of whom had professional reasons for wanting to know about wars, treaty negotiations, and unusual developments in foreign states, as well as general readers motivated by simple curiosity. Kaspar Stieler (1632–1707), whose *Zeitungs Lust und Nutz* (1695) was the first book about newspapers, claimed that they were read by many artisans and also discussed their influence on women. Newspapers were the most popular reading matter in the coffeehouses, cafés, and reading rooms that began to spring up in major European cities in the late seventeenth century and then spread across the continent. Numerous sources describe the animated discussions that resulted from this kind of public reading: newspapers were the essential fuel for the verbal interactions that produced the phenomenon of public opinion.

Early journalists, such as Théophraste Renaudot (1586–1653), creator of the *Gazette de France*, had recognized that the newspaper could also serve an important economic function by carrying adver-

tising. In addition, many newspapers regularly reported the prices of commodities and other economic information. In most continental countries, advertising was printed primarily in newspapers licensed specially for that purpose (French *affiches*, German *Intelligenzblätter*), but in eighteenth-century England, a tradition developed of newspapers combining commercial advertising and political news. These mixed publications had a stronger revenue base than most of their continental rivals and pointed toward the form that the newspaper would take throughout the world in the nineteenth and twentieth centuries.

Whereas gazettes dealt largely with political news, periodical magazines, of which the first was the French *Journal des Sçavans*, founded in 1665, showed that the periodical form could also be adapted to carry many kinds of cultural information. Whereas newspapers did not change greatly in form and function before the end of the eighteenth century, magazines became increasingly varied. Less tied to the immediate flow of events than newspapers, they appeared at less frequent intervals and were often aimed at more limited audiences. Book reviews, literary journals, periodicals aimed at particular professions and at audiences such as women and peasants all appeared in the course of the eighteenth century. Joseph Addison (1672–1719) and Richard Steele’s (1672–1729) *Spectator* (1711–1714), which offered witty commentary on middle-class urban life, served as a model for dozens of imitators throughout Europe.

The profession of journalist developed more slowly than the press itself. Early news gazettes were frequently compiled by entrepreneurs who also engaged in other activities, such as postmasters, who had privileged access to incoming news, or printers. By the eighteenth century, some writers were able to make a living from editorial work alone, but journalists were disparaged as mercenaries who prostituted their talents for pay, and they therefore had a strong incentive to present themselves as “men of letters” rather than identifying themselves with the periodical industry. Voltaire’s article in Diderot’s *Encyclopédie* urging that “a good gazetteer should be promptly informed, truthful, impartial, simple, and correct in his style” shows that the elements of what would later become journalism’s professional ethic were taking shape, but Voltaire

also complained that few journalists measured up to these standards. In spite of its low prestige, newspaper work provided an important source of income for many eighteenth-century writers, and positions such as the editorship of the *Gazette de France* were much-coveted patronage plums. Editing journals and magazines generally paid less well, but by the end of the seventeenth century it had become one way in which individuals could establish important positions in the “Republic of Letters.” Pierre Bayle’s *Nouvelles de la République des lettres*, founded in 1684, provided one of the first demonstrations of this possibility and inspired imitators throughout the eighteenth century.

Rulers took a strong interest in the press from the outset. Throughout most of Europe, publishers needed a license or privilege to create a periodical. They were usually required to submit to censorship and to pay an annual fee to publish, but in exchange they enjoyed a protected monopoly on publication in their native region. Although governments routinely censored the press to prevent the circulation of items that might cause unrest in the population or embarrassment at court, their interest in the press also had a positive side. At a time when the notion of the reporter was unknown, publishers often depended on their local government to furnish them with foreign news culled from diplomatic dispatches. Each major government sponsored its own official gazette to present the news in the fashion most favorable to its own interests. By the eighteenth century, most rulers saw that periodicals could serve useful functions by publicizing new laws and edicts and by circulating economic information; French *intendants* often played key roles in establishing provincial *affiches*. Through the fees they paid for their privileges and for postal delivery, periodicals were also a source of income for governments.

The development of the press in England differed from the pattern on the continent. In 1695, the Licensing Act that had restricted press freedom was allowed to lapse, making England the only country where publishers could establish periodicals without prior permission. As a result, England became the only country where the press took on a clear political coloration, with Whigs and Tories subsidizing editors to promote their points of view. The absence of restrictions also gave free reign to

entrepreneurial initiative in England. Many of the country’s provincial newspapers, for example, were established by local bookstore owners, who used them to advertise their wares. The British press was not completely unfettered: a stamp tax on printing paper kept prices high and discouraged the poor from subscribing, and frequent libel prosecutions had a deterrent effect on most journalists and publishers. Summaries of debates in Parliament were not permitted until the 1780s. Continental visitors were nevertheless struck by the outspokenness of British periodicals and their wide audience.

Although the absence of regulation made the English press unique, its influence on the Continent was limited. In international affairs, the most important newspapers of the eighteenth century were the so-called *gazettes d’Hollande*, journals published in French but produced in the Netherlands or in other parts of Europe where the censorship systems of the major powers did not reach. Although they depended on privileges granted by their city governments, publications such as the *Gazette d’Amsterdam* and the *Gazette de Leyde* were normally accorded considerable latitude in their coverage of events in other countries. Founded in many cases by members of the Huguenot diaspora during Louis XIV’s reign (1643–1715), they remained a major part of public life in Europe throughout the eighteenth century. Unable to prevent their circulation, rulers sought to influence them instead by courting their editors, offering them confidential information, and negotiating favorable postal rates. Since French was an international language, these gazettes found readers throughout the European world. Under the editorship of Étienne Luzac from 1738 to 1772 and his nephew Jean Luzac from 1772 to 1798, the *Gazette de Leyde* occupied the position of Europe’s “newspaper of record.” “By water and land it was sent to the most distant countries; it was read with the same intense interest at the gates of the Seraglio and on the banks of the Ganges, and copied from by almost all other newspaper editors . . .,” wrote one observer.

Censorship restrictions kept newspapers published in the Holy Roman Empire from reporting as comprehensively as the international French-language press, but more newspapers were published in the German-speaking world than in any other part of Europe: at least 93 in 1750, and 151 by

1785. The most successful of these, the *Hamburgische Unparteyische Correspondent*, may have reached a press run of 20,000 by the time of the French Revolution. The large number of newspapers in Germany, and the correspondingly impressive number of journals and magazines, reflected both the area's division into many political units and the relatively high level of literacy in the population. By the 1780s, some German publishers were even putting out newspapers aimed explicitly at the peasant population.

Under normal conditions, governments throughout Europe were able to control the periodical press more easily than certain other forms of printing, such as pamphlets, which could be circulated anonymously. Anxious not to jeopardize their privileges and dependent on postal systems to deliver their products, publishers had strong incentives not to antagonize the authorities. The century saw few genuine examples of underground or subversive periodicals. The outstanding example was the French *Nouvelles ecclésiastiques*, the voice of that country's Jansenist religious minority, which successfully defied the police from 1728 down to the Revolutionary era. This feat was only possible, however, because the paper spoke for a well-organized and strongly committed group that included many influential elite members.

When public authority broke down, however, the door was opened for "media revolutions" in which periodicals became instruments for political agitation. The poet John Milton (1608–1674) served as a newspaper editor during the English Civil Wars of the 1640s, and the impact of his contemporary Marchamont Needham's (1620–1678) journalism was still remembered by the journalists of the French Revolution. Periodicals played important roles in the "democratic revolutions" of the second half of the eighteenth century, particularly the revolt in Britain's North American colonies and the Dutch Patriot movement of the 1780s. The greatest example of the press's role in a crisis was the French Revolution of 1789. At the start of that year, there had been only four newspapers published in Paris, only one of them a daily; before the end of 1789, 140 new titles had been founded, and readers had a choice of several dozen dailies representing a wide spectrum of political views and writing styles. This journalistic explosion increased readership; newspa-

pers read aloud even reached illiterate sections of the population. Leading journalists commanded salaries that dwarfed what pre-Revolutionary writers had made from their books, and many of them, most notably Jean-Paul Marat (1743–1793), used their papers to launch political careers.

The French Revolution and the wars that resulted from it brought about fundamental changes in Europe's press. Although Napoleon restored censorship and licensing of newspapers, press freedom became a central part of liberal programs throughout the Continent. Public demand for news led publishers to experiment with new technologies that would allow larger press runs: in 1814, the London *Times* put the first steam-powered press into service. Such machines allowed periodicals to overcome the limitations on press runs that had characterized the "typographical old regime" of the early modern period and made the development of a true mass press possible. The growth of the press after 1800 was so striking that its early modern predecessors were largely forgotten. Modern scholarship has made it possible to appreciate the important roles that periodical publications played in the politics, culture, and economic life of the seventeenth and eighteenth centuries.

JOURNALS, LITERARY. Literary journals appeared in the seventeenth and eighteenth centuries to provide a growing readership with news and gossip about literary matters and a sampling of contemporary writings. Like novels, coffeehouses, and salons, literary journals appealed to an emerging public keen on fashioning its own cultural tastes and literary opinions.

Though the best-known literary journals, such as *The Tatler* and *The Spectator* in England, were independent publications launched by enterprising men of letters, others, especially early periodicals, originated from official sponsorship. The *Journal des savants*, for example, was created by Jean-Baptiste Colbert in 1665 and combined scientific and technical information with the most noteworthy news from “the Republic of Letters.” The *Mercurie galant*, founded in 1672, was also a quasi-official publication: its editor was provided lodgings in the Louvre and received a royal pension. It furnished readers with news of the court and Parisian society, as well as commentary on literary, theatrical, and scientific events. France was not the only nation to give rise to literary journals in the seventeenth century. In Italy the *Journal des savants* served as a model for several *Giornali dei letterati*, which began appearing in 1668.

It was in the eighteenth century that this type of periodical, like newspapers in general, began to appear throughout western Europe, becoming an important feature of urban culture and sociability. Germany had its *Litteratur-Zeitung*; Spain its *Espiritu de los mejores diarios*; Italy its *Giornale dei letterati d'Italia*, published in Venice starting in 1710. Many of these newspapers, especially those in Germany and Spain, had a very limited circulation of only several hundred readers. The *Mercurie galant*, however, was distributed in twenty-six provincial towns in 1748 and fifty-five by 1774.

By far the most successful and influential literary newspapers were *The Tatler* (1709–1711), edited by the playwright Richard Steele, and *The Spectator* (1711–1712), a joint venture of Steele and the poet Joseph Addison. Though in part literary in nature, they were “moral” in spirit, aimed at improving manners and fostering sociability in a society increasingly dominated by the competitive spirit of commercialism. The success of these periodicals was enormous: *The Spectator* went from a circulation of 4,000 to around 30,000 in a few months. They also inspired emulators on the Continent despite the fact that the conditions for publication, such as censorship and a limited reading public, were clearly less favorable. The French writer Pierre de Marivaux (1688–1763) took Addison’s journal as his model for the *Spectateur français* (1722). The first German weekly, the *Hamburg Vernunftler* (1713–1740), was also fashioned after the English newspapers. Justus van Effen (1684–1735) began publishing the journal *Le misantrope* in Holland and also published *De Hollandsche Spectator* (1731–1735).

Literary newspapers were integral to the culture of the Enlightenment. Indeed, well-known men of letters, such as Jean-François Marmontel, who edited the *Mercurie de France* in 1758–1760, helped transform these publications into organs of Enlightenment, offering fellow philosophes popular and convenient outlets for their ideas. They also served as agents of national integration, bringing the fashion, language, and news of the court and capital to the provinces. But these journals were not simply one-way instruments: they invited readers’ comments and printed their letters, thus fostering discussion and debate. Many of their readers were women. Nearly half of the articles appearing in Addison and Steele’s newspapers addressed female concerns. In France the *Journal des dames*, which specifically aimed at a female readership, was inaugurated in 1759.

Literary journals scrupulously avoided the contentious topics of politics and religion. It was in part because of this that they were able both to flourish and to create a public out of readers who might otherwise find themselves at odds.

JUAN DE AUSTRIA, DON (1547–1578), Spanish admiral and governor, known to Elizabethans as Don John. Born in Regensburg, Germany, to commoner Barbara Blomberg, Don Juan, the natural son of Emperor Charles V, was brought to Brussels, where his mother married. In 1550 Charles had the boy, called Jeromín, taken to Spain by a servant couple, and then, in 1554, transferred to the castle of his chief of household, Don Luis de Quijada, and his wife, Doña Magdalena de Ulloa, at Villagarcía de Campos. Before his death, Charles saw Jeromín but did not openly acknowledge his parentage. In 1559 Philip II embraced Jeromín as his brother and renamed him Juan de Austria. Philip did not accord him royal status, though he was ranked before the grandees, but in 1575 he yielded to Don Juan's being addressed as "Highness." Charles hoped Don Juan might enter the clergy, but during his education in statecraft alongside Prince Don Carlos and Alexander Farnese, future duke of Parma, he revealed his martial inclinations. When he reached twenty-one in 1568, Philip appointed him Captain General of the [Mediterranean] Sea.

Don Juan returned from his summer at sea to find the court mourning the deaths of the mentally unstable Don Carlos and the queen. Differing with Philip over his place at the queen's funeral, he withdrew to a monastery. When the Morisco revolt erupted in Granada, Don Juan volunteered to serve as supreme commander over feuding local grandees in March 1569 to suppress it. Quijada, assigned to guide him, was mortally wounded in a skirmish, and a musket ball grazed his own helmet. In subduing the rebellion, he became a skilled general. Blond and handsome, he also became a womanizer. He

sired two natural daughters, one in Spain, the other in Naples.

When Philip agreed to a Holy League with Venice and Pope Pius V against the Ottoman Turks in 1570, he sought supreme command for Don Juan. Philip hoped the league might recover Tunis and conquer Algiers, after saving Cyprus for Venice. Don Juan sailed from Barcelona in July 1571 and had the League armada assembled at Messina by September. Unknown to him, Cyprus had been lost. Despite arguments that the season was late, he took the league armada to sea. The 207 galleys of the distrustful allies he mixed in the center, two wings, and rearguard, so that none dared desert. On 7 October 1571 he won a heady victory over the Turks at Lepanto and became a hero to all Christendom.

He hoped to complete the destruction of Turkish sea power in 1572, but Philip II, nervous about developments in France and the Netherlands, kept him and his galleys in the western Mediterranean. Not until September did Don Juan join the Venetian and papal galleys off the Peloponnesus, where forts and cavalry prevented him from destroying the beached Turkish fleet.

Venice quit the league in March 1573, and Don Juan recovered Tunis in October. Advised to dismantle the fortress of La Goleta, which dominated Tunis's harbor, and level Tunis, Don Juan chose instead to hold La Goleta and erect a citadel in the city. (Critics claimed he hoped the pope would make him king of Tunis.) In summer 1574, while Don Juan was distracted by Genoese politics and French threats, a huge Turkish armada took Tunis and La Goleta. In 1575 Philip declared bankruptcy, limiting Don Juan to raids against Turkish Barbary.

In May 1576 he received orders to proceed directly to the rebellious Netherlands as governor-general and restore peace. In correspondence with his half-sister, Margaret of Parma, once regent there, he expressed fear of such assignment. Other than duty, the only lure, nurtured by the papacy, was the possibility of invading England to liberate Mary Stuart, queen of Scots, and join her on England's throne. Uncertain about funds and authority, he detoured to see Philip in Spain. Continuing through France in disguise, he reached Luxembourg in November to find that the sack of Antwerp

by mutineers had united the Estates-General (the Netherlands' parliament) against him. Only by dismissing Philip's army, (and, thus, the chance to free Mary Stuart), temporizing on religion, and trading on his personal charm did he win acceptance. In May 1577 he entered Brussels. As his instructions allowed no real concessions regarding religion, the Protestant provinces remained defiant. Fearing assassination, in July Don Juan seized Namur in the southern Netherlands and dispatched secretary Juan de Escobedo to Spain to beg the return of the army. Having just received fresh treasure from America, Philip reluctantly agreed.

In December 1577 the army returned with the prince of Parma. In January 1578 they routed the Estates-Generals' army at Gembloux. In Spain, the king's unscrupulous and ambitious secretary, Antonio Pérez, bred unjustified suspicions of Don Juan in Philip's mind, and in March had Escobedo murdered (probably with Philip's approval). Again, inadequately funded, Don Juan failed before Brussels in July. With success eluding him and unsure of Philip's trust, he regrouped outside Namur, where, health failing, he died on 1 October 1578. He had served Philip faithfully and, if he failed, it was due to their shared opposition to religious toleration.

JÜLICH-CLEVES-BERG. The duchy of Jülich-Cleves was a shifting agglomeration of principalities on the Lower Rhine, a location that, despite its lack of large cities, gave it strategic significance as the gateway from the Low Countries to central and southern Germany. During the late Middle Ages the county of Jülich was raised to the dignity of a duchy in 1356 and expanded by adding the county of Ravensberg in 1346 and the county of Berg in 1348. Meanwhile the county of Cleves was taken over by the county of Mark in 1368 and was then raised to the dignity of a duchy in 1417. In 1511 a strategic marriage joined the duchies of Jülich-Berg-Ravensberg in a personal union with Cleves Mark, creating a territory almost the size of the landgraviate of Hesse or Württemberg.

In an effort to consolidate and expand these holdings, Duke William V ("the Rich," ruled 1539–1592) took advantage of the death of Charles of Egmont (1467–1538), the last duke of Gelderland, in 1538 and took over lordship of this important province as well, a move that could have had major political and religious implications, creating as it did a direct link between Cleves (on the Netherlandish frontier) and Jülich (between Aachen and Cologne). Duke William also seemed to welcome Lutheran ideas in his lands. In preparation for a possible contest over this expansion, William had pursued a calculated dynastic policy by marrying Jeanne d'Albret of Navarre, the thirteen-year-old

niece of Francis I of France (ruled 1515–1547), while giving his sister Anne of Cleves (1515–1557) to Henry VIII of England (ruled 1509–1547) in 1540. An older sister, Sybilla, had married Elector John Frederick I of Saxony in 1526. However, Emperor Charles V (ruled 1519–1556) reacted energetically to counter such an expansion by exercising a claim that Gelderland belonged to his Burgundian inheritance. Diplomatically he secured the neutrality of France and England and crushed Duke William at Düren in 1543. William the Rich had to subject himself to the emperor, give up all claims to Gelderland, and give up his wife (the marriage with Jeanne d'Albret was annulled in 1545).

In 1546 William married Mary, a daughter of King Ferdinand I of Austria (ruled 1521–1564; emperor 1558–1564), and he learned to practice a more cautious religious policy over the next thirty years. It was long thought that his moderate rule along with the influence of his skeptical physician, Johann Weyer (Wier), protected the duchies from severe witchcraft trials. But research has shown that over a span of 240 years well over two hundred persons were executed as witches, including two as late as 1737–1738.

In 1592, with the death of the duke, the succession of Jülich-Cleves-Berg went to William's only surviving son, Johann Wilhelm I (ruled 1592–1609), who was already suffering from severe madness. Despite increasingly desperate measures, Johann Wilhelm's marriage to Jacobe of Baden remained childless, as did his subsequent marriage to Antoinette of Lorraine. It seemed obvious that there would be no direct male heir, and claimants began jockeying for position already in the 1590s. When Johann Wilhelm died in 1609, the two *Possidentes* (that is, the two claimants already in place at the ducal court in Düsseldorf) were Elector Johann Sigismund of Brandenburg (1572–1619) and Pfalzgraf Wolfgang Wilhelm of Pfalz-Neuburg, both of whom were Lutherans. Emperor Rudolf II (ruled 1576–1612) reacted to prevent an important portion of the empire from going Protestant, and in 1610 the War of the Jülich Succession broke out (with reinforcements on the Protestant side from England, the Netherlands, France, and the Protestant Union). With the assassination of Henry IV of France (ruled 1589–1610), the anti-Habsburg coalition collapsed, but the two Protestant claimants

prevailed. Soon enough their collaboration broke down, however, especially after Johann Sigismund converted to Calvinism (1613) and Wolfgang Wilhelm converted to Catholicism (1614).

In the Treaty of Xanten (1614, reconfirmed in 1666) it was agreed that the duchy should be divided, with Cleves, Mark, and Ravensberg going to Brandenburg and Jülich and Berg going to Pfalz-Neuburg. This division was fateful in many ways, for while it extinguished an independent power on the Lower Rhine, it also guaranteed the involvement of two major dynasties in that region: the Hohenzollern of Brandenburg Prussia and the Wittelsbach of the Palatinate and Bavaria. Their rivalry punctuated the history of this region to the end of the eighteenth century. On the death of Elector Maximilian III (Joseph of Bavaria; 1727–1777; elector 1745–1777) in 1777, the presumptive heir Charles Theodore (Karl Theodor) of Pfalz-Sulzbach (1724–1799) even made plans with Emperor Joseph II (ruled 1765–1790) in 1777–1778 to exchange Bavaria for the Austrian Netherlands, which, along with Jülich and Berg, would have once again created a major power on the Lower Rhine and a greatly expanded and consolidated Habsburg territory in the southeast. But Frederick the Great of Prussia (Frederick II, ruled 1740–1786) successfully opposed these plans in the War of the Bavarian Succession (1778–1779, also ridiculed as the “Potato War” because of its military maneuvers without battles). The Prussian-sponsored League of Princes (1785) guaranteed that the Wittelsbach dynasty would remain in possession of Bavaria and would not expand on the Lower Rhine. The Hohenzollern possessions in Cleves and Mark provided a western outpost and later an industrial powerhouse that balanced their overwhelmingly agrarian interests in the German Northeast.

JULIUS II (POPE) (Giuliano della Rovere; 1443–1513; reigned 1503–1513), Italian pope. Born at Albissola near Savona in 1443, Giuliano was a vigorous man, suited to a life of action, not contemplation, and destined for an ecclesiastical career under the aegis of his uncle, Francesco della Rovere, who became a cardinal in 1467. Like him, Giuliano was a Franciscan; he studied at a Franciscan friary in Perugia.

The election of his uncle to the papal throne as Sixtus IV (reigned 1471–1484) was swiftly followed in December 1471 by his own promotion to cardinal. Important benefices were bestowed on him, including the see of Avignon, as well as the major curial office of Grand Penitentiary. He welcomed the opportunities for action, including participation in military campaigns, offered by legations to Umbria in 1474 and to France in 1480–1482. His wealth, energy, increasing experience, and taste for politics made him one of the most powerful figures in the College of Cardinals; he was an influential adviser to Pope Innocent VIII (reigned 1484–1492) and a leader of the opposition to the Borgia pope, Alexander VI (reigned 1492–1503). Justifiably fearing arrest, he went into exile in France in 1494, and, after accompanying King Charles VIII of France (ruled 1483–1498) on his campaign to conquer the kingdom of Naples in 1494 to 1495, he did not return to Rome during Alexander's lifetime. He was elected pope on 31 October 1503, taking the title Julius II.

His choice of title has been seen as a desire to identify himself and the papacy with the imperial traditions of ancient Rome, an ambition that is often associated with his artistic commissions as pope. Although there is no direct evidence for this link, Julius II was undoubtedly one of the most important cultural patrons of Renaissance Italy. Among the major artists who worked for him were Michelangelo Buonarroti (1475–1564), from whom he commissioned the Sistine Chapel ceiling and his own tomb, Raphael Sanzio (1483–1520),

who decorated Julius's apartments in the Vatican and painted his portrait, and Donato Bramante (1444–1514), whose projects for the pope included the Vatican courtyard and the new St. Peter's, which replaced the crumbling old basilica.

His most consistent political aim as pope was to bring the Papal States more firmly under the control of the papacy; he took personal command of some of the military operations that these aims involved. His efforts to prevent the Venetians from extending their influence in the northern Papal States brought him to participate in the League of Cambrai of 1509, and the subsequent war against Venice in 1509–1510. Having achieved his aims, he made peace with Venice and turned his attention to reducing the power in Italy of his former ally, Louis XII of France (ruled 1498–1515); he was a member of the coalition that drove the French out of the duchy of Milan in 1512.

Julius's initiatives in Italian politics and his personal participation in military campaigns shaped his reputation, both among his contemporaries and posthumously. He has been criticized by some patriotic Italians for his part in the war against Venice and lauded by others for his reputed determination to expel the "barbarians" from Italy. In practice, he was prepared to ally himself with the "barbarians" of France, Spain, and Germany when it suited his purposes, but he did not want them to form independent links with his own subjects. His penchant for military life was seen as unfitting for a pope, although his resolution and physical courage were admired by some. The image of Julius leading an army to the gates of heaven to demand entrance and being turned away by St. Peter, in the c. 1513 satirical dialogue *Julius Exclusus* 'Julius Excluded from Heaven' attributed to Desiderius Erasmus (1466?–1536), has had an enduring influence.

Julius himself regarded the recovery of the territory of the church and the defense of the independence of the Papal States, by war if need be, as prime duties of the pope. Although his outbursts of rage and heavy drinking attracted ridicule, he was conscious of the dignity of his office and careful to fulfill his religious duties. Nevertheless, his behavior gave Louis XII and the Emperor Maximilian I (ruled 1493–1519) an opportunity to seek his deposition from the papacy. They used dissident cardinals to

call a general council of the church that opened in Pisa in 1511; this attracted little support. The summons by Julius of the Fifth Lateran Council may have been a riposte to this, but once it assembled in 1512, he insisted that it should give serious consideration to the reform of the church. Julius died during the night of 20 February 1513.

KALMAR, UNION OF. The Union of Kalmar, which combined the three crowns of Denmark, Norway, and Sweden under one sovereign, was founded in 1397 in the Swedish city of Kalmar and lasted, with some exceptions, until 1520. The union established internal peace under a strong union king, supported by the nobility. It became a reality at a time when other unions in Europe were founded, such as the union in 1386 between Poland and Lithuania. Earlier unions had also existed in Scandinavia. A union between Norway and Sweden was established in 1319, and Scania and Sweden had a common king from 1332 to 1360.

Denmark and Norway united in 1380 when the young Danish King Olof, son of Haakon VI of Norway and Queen Margaret of Denmark (1353–1412), succeeded to the throne of Norway on the death of his father. Margaret had served as regent of Denmark since 1376, and she now became regent of Norway for her son. Olof died in 1387, but Margaret continued to rule Denmark and Norway. At the same time a group of Swedish nobles who opposed the Swedish king, Albert of Mecklenburg, asked for Margaret's help and made her regent of Sweden. The power struggle ended in 1389 when Margaret's forces defeated and captured Albert at Falköping.

Eric of Pomerania, Margaret's fifteen-year-old grandnephew, had been recognized as heir to the Norwegian throne in 1388 and was elected king in Denmark and in Sweden in 1396, but Margaret continued to govern. In the summer of 1397 she

invited nobles from Denmark, Norway, and Sweden to Kalmar. The meeting resulted in the formation of the Kalmar Union with Eric as its king. The coronation document presented a strong royal political program (*regimen regale*), whereas the "Letter of the Union," the written record of the proceedings, expressed aristocratic constitutional interests (*regimen politicum*).

Queen Margaret and Eric of Pomerania governed the three Nordic states as a unity until her death in 1412. Denmark was the most prominent country in the union, and the Øresund (The Sound, the straits between Denmark and Scania) became an economic center. Danes and Germans were placed in several Swedish castles. Eric followed an active foreign policy toward the Teutonic Order and fought the dukes of Holstein for many years in order to secure the Duchy of Schleswig for Denmark. From 1426 the king was also at war with the Hanseatic cities. The centralized royal system created opposition in the church and among the peasants and the nobility in Sweden. Under the leadership of Engelbrekt Engelbrektsson, the Swedish peasants rioted in 1434 and were soon supported by the nobility and the church. At a meeting in Kalmar in 1436 Eric had to agree to govern with more respect for the constitution, but he soon tried to restore his old position and was removed from the throne in Denmark in 1439 and in Sweden in 1440, forcing Norway to follow in 1441. King Eric lived on the island of Gotland in the Baltic Sea until 1449.

The new elected union king was Christopher of Bavaria, son of King Eric's sister Katarina; he governed the three countries together with their Councils of State. After his death in 1448, the Swedes elected the nobleman Karl Knutsson (Bonde) as King Charles VIII, whereas the Danes elected Duke Christian I of Oldenburg as king. The two monarchs fought over Norway and Gotland, with the conflict ending in favor of Christian I, who was king of Denmark and Norway.

During the union wars beginning in 1452, portions of the Swedish nobility supported Christian I, and in 1457 the union was reinstated with Christian as king, but this lasted for only a few years. A noble faction rioted in 1464, and Karl Knutsson became the Swedish king 1464–1465 and again 1467–1470. After his death, his nephew Sten Sture the Elder took over as regent and defeated King Christian in a battle at Brunkeberg in 1471; the subsequent negotiations did not restore the union.

King Hans succeeded his father Christian I in 1481 as king of Denmark and Norway. In 1483 the Swedish Council of State supported a renewal of the union (Kalmar Recess). Sten Sture the Elder managed to stay in power, however, until King Hans allied with his opponents in 1497 and was recognized as king of Sweden. The union was restored, but in 1501 a faction of Swedish noblemen rioted, and Sten Sture took over his old position.

The following two decades were marked by negotiations and war. The confrontation sharpened when Christian II became king of Denmark and Norway in 1513. Finally, in 1520, Christian II invaded Sweden, won a decisive military victory, and became king of Sweden. In spite of having promised amnesty, in November 1520 he in the end ordered the execution of all the Swedish nobles who had opposed him, the so-called Stockholm Bloodbath. This act stiffened Swedish resistance to Christian and to the Kalmar Union, which came to a definitive end when Gustav Eriksson became king of Sweden as Gustav I Vasa in 1523.

KANT, IMMANUEL (1724–1804), German philosopher. Immanuel Kant was born 24 April 1724 in Königsberg (now Kaliningrad) in East Prussia. He attended a Pietist school and the University of Königsberg and in 1755, after six years as a private tutor, obtained a position at his university. Promoted to professor there in 1770, he taught and served in administrative posts until 1798 and died 12 February 1804.

CENTRAL IDEAS

Kant's predecessors had treated knowledge as beginning from data about the world that the mind passively receives from the senses or through immediate insight into eternal truths or ideas. Kant, by contrast, made the activity of the mind central both to the world as we live in it and to our knowledge of it.

Kant built his systematic theoretical philosophy around the idea that the world as we experience it does not exist independently of us. Our own minds, he argued, are responsible for its form and structure. This idea constituted his "Copernican revolution." Before Copernicus, astronomical data were explained by assuming that the sun revolves around the earth. Reversing this, Copernicus explained the data by taking the earth to revolve around the sun. Kant explained experience by denying that our knowledge conforms to objects, instead holding that objects in experience conform to our knowledge—to the way our mind necessarily works.

In moral philosophy Kant proposed an equally revolutionary idea. In morality, he held, we are not required to obey laws imposed by God or eternal moral principles or Platonic forms; instead we must understand morality as resting on a law that springs

from our own practical rationality. We are “autonomous” because we legislate the moral law we are to obey. The form of the moral world results from the mind’s activity.

These views were designed to protect scientific knowledge from skeptical attacks such as that of David Hume (1711–1776) and also to show how morality and responsibility could be preserved in a Newtonian deterministic universe. Kant’s theoretical philosophy laid the foundations for the whole enterprise.

THEORETICAL PHILOSOPHY

In the *Kritik der reinen Vernunft* (1781; Critique of pure reason) Kant criticized his predecessors for not seeing that there is a deep difference between perceptual experiences and abstract concepts. The mind accepts the “percepts” that things outside it cause in it, but the mind itself imposes a framework of both time and space even on such given data. Concepts are rules by which the mind organizes percepts, and they show the mind’s activity. The mind of any rational agent is equipped with several basic “categories,” which are fundamental ways of organizing the data accepted through the senses. Nothing can be part of our experience, therefore, unless it is temporal and spatial and is organized by categories like those of continuing physical object and cause and effect. Percepts and concepts together yield the world as we live in it. The mind’s structure explains how we can attain necessary truth in our knowledge of this world.

Kant allows that we can think of a thing as it is in itself (*Ding an sich*) outside experience—a noumenon—but insists that we can know only things as they are for us—as phenomena. Because percepts as well as concepts are necessary for knowledge, we cannot know anything at all about what goes beyond possible experience. Hence we cannot have answers, either positive or negative, to what were then the main questions of religion and metaphysics: Does God exist? Are we immortal? Are we free?

MORAL PHILOSOPHY

In the *Grundlegung zur Metaphysik der Sitten* (1785; Groundwork of the metaphysics of morals) and the *Kritik der praktischen Vernunft* (1788; Critique of practical reason) Kant claimed that, in

Immanuel Kant. Undated portrait. LIBRARY OF CONGRESS

the practical realm, our desires are the counterpart to given sensory data in theoretical knowledge. But we are not causally determined to accept desires as giving us reasons to act. We are free because our will enables us to affirm or reject the claim of any desire to be a reason. Only what the will accepts is a reason to act. And the will, which Kant defines as practical reason, imposes its own forms prior to allowing a desire to count as a reason.

The forms the will imposes on desires include the master form, which is the moral law. As it applies to us, the moral law is an imperative or directive that cannot reasonably be flouted: it is the “categorical imperative.” It tells us to act only on plans we could rationally allow everyone to act on. Hence morality, under the categorical imperative, would create a harmonious moral world out of desires that would naturally all too often lead us into conflict.

RELIGION

Because he denied that we could know anything that goes beyond experience, Kant seemed to his contemporaries to have eliminated all hope for a rational religion. But he said that he had destroyed knowledge to make room for faith. He tried to justify a religion safe from scientific criticism by

arguing that the categorical imperative gives us practical or moral reason to believe in the essential religious tenets: God, freedom, and immortality. If few philosophers have been convinced by his moral arguments for God and immortality, many think that his account of freedom still has great appeal.

SIGNIFICANCE

Kant aimed to limit naturalism—the view that a single system of causation explains all human activity as well as all other events. To do so, he made philosophy the master discipline that sets boundaries to the cognitive claims of all other thinking. Science is the judge of beliefs about experience, but it can say nothing about claims concerning morality or religion, or (as Kant also argued) about aesthetic taste. His remarkable theory that the mind helps construct the world in which we live opened the way for the radical idealisms of Friedrich Wilhelm Joseph von Schelling (1775–1854), Johann Gottlieb Fichte (1762–1814), and Georg Wilhelm Friedrich Hegel (1770–1831). Kant’s assertion of “the primacy of practical reason”—that practical reason can answer questions that theoretical reason cannot—was suggestive for the development of pragmatism. His moral philosophy has been and still is both widely used and hotly contested. Kant’s work has had an influence on Western thought unsurpassed by that of any other modern philosopher.

KAUFFMANN, ANGELICA (1741–1807), Swiss neoclassical painter. The Swiss-born painter was considered a child prodigy, achieving attention for her works as early as age eleven. She was trained by her father, Johann Josef Kauffmann, whose family accompanied him to Italy, where he executed decorative schemes for churches. The Kauffmann family lived in Como, Milan, Parma, Florence, and eventually Rome, where Angelica copied the works of famous Old Masters. These included her richly colored version of Domenichino’s *Cumaean Sibyl* (1763, National Museum of Women in the Arts, Washington, D.C.) that was probably purchased by the 4th duke of Gordon, one of her many aristocratic patrons. Others included Catherine the Great of Russia, Emperor Franz Joseph of Austria, and John Parker II, Lord Boringdon.

During her first stay in Rome (1765–1766), Kauffmann became an integral part of the circle of artists that gathered around the German theorist Johann Joachim Winckelmann, who served as librarian to Cardinal Albani. This group, which included Pompeo Girolamo Batoni, Anton Raphael Mengs, Benjamin West, Sir Nathaniel Dance, and Giambattista Piranesi, was instrumental in promoting a neoclassical stylistic approach in art that remained fashionable in both Europe and America well into the nineteenth century. Kauffmann, in fact, was one of the first artists to paint in a neoclassical style and one of few women to gain fame from historical paintings. Her classically inspired historical works include *Venus Directing Aeneas and Achates to Carthage* (1768, The National Trust, England, Saltram collection); *Venus Persuading Helen to Accept the Love of Paris* (1790, Hermitage Museum, St. Petersburg, Russia); *Zeuxis Selecting Models for His Picture of Helen of Troy* (1778, Brown University, Providence, R.I.); and *Sappho* (1775, John and Mabel Ringling Museum, Sarasota, Florida).

It is believed that Kauffmann used self-portraits in her representations of Helen and Sappho, as well as many more of her historical figures, since they often resemble her. This may be judged by comparing them to her identified self-portraits, such as the one she contributed to the famous de Medici self-portrait collection at the Uffizi (1787, Uffizi Gal-

lery, Florence). Looking much like a classical goddess, Kauffmann wears a white muslin dress, belted just below the bodice. It is secured by a cameo that, according to Louise Rice and Ruth Eisenberg, represents the battle between Minerva and Neptune for control of Athens—a battle significantly won by the female goddess. Kauffmann’s stylistic approach combines the linearity and order of neoclassicism with a pastel lushness characteristic of the English rococo. This is not surprising since Kauffmann spent from 1766 to 1782 in London, where she was named one of the founding members of the Royal Academy of Art (1768). She painted a portrait of the academy’s first director, Sir Joshua Reynolds, in 1767 (The National Trust, England, Saltram collection). Reynolds praised Kauffmann’s talent, but there were many who criticized her weak rendering of anatomy. It was difficult for a woman to gain skill in this area because she was generally barred from drawing nude models.

Kauffmann was skillful enough in her historical works to be invited to contribute to the decorative

scheme of Somerset House, a building designed by William Chambers to house the Royal Academy. Kauffmann’s contribution included four oval compositions entitled *Invention, Composition, Design,* and *Color* using iconographic references from Cesare Ripa’s *Iconologia or Moral Emblems* (1611). These works are now located at Burlington House, London. She was also asked to participate in a scheme to decorate the dome of St. Paul’s Cathedral, although this was never realized.

Kauffmann had many admirers in both her personal and professional life. Contemporaries praised her beauty, talent, intelligence, and wit. Not surprisingly, she attracted a number of suitors, which included Reynolds, Dance, and the early Romantic painter Henry Fuseli. She rejected the attention of these artists to marry a Swedish rogue named Brandt, who charaded as the Count de Horn. After his death (1767), she married the Italian artist Antonio Zucchi and returned with him to Rome in 1782. There she was an active member of the Academy of St. Luke and maintained a studio that was

often visited by fellow artists. These included Elisabeth Vigée-Lebrun, who visited Kauffmann while in exile after the French Revolution. Kauffmann died in Rome on 5 November 1807. After a magnificent funeral, she was buried in the church of Sant'Andrea delle Fratte. Three years after her death, her good friend Giovanni Gherardo de Rossi published his *Vita di Angelica Kauffmann* (Life of Angelica Kauffmann), which serves as a major source of information with regard to her life and career.

KATHLEEN RUSSO

ler's family was poised at the boundary between the aristocracy and the artisan class. His father and brother Heinrich both served as soldiers; his youngest brother worked as a tinsmith. Kepler was educated at religious schools supported by the duke of Württemberg, and at the University of Tübingen. Here he studied with theologians trained by Philipp Melanchthon (1497–1560), the great German religious and educational reformer, and began a lifelong friendship with his mathematics teacher, the Copernican astronomer Michael Mästlin (1550–1631).

Unable to follow a church career because his scruples prevented him from signing the Formula of Concord, Kepler began his professional life as a teacher in the Protestant gymnasium at Graz, in southern Austria. From here he rose to become an imperial courtier, and achieved lasting fame as an innovator in astronomy. Kepler married twice (1597 and 1613). He was a devoted father who suffered deeply at the early deaths of many of his children, and he seems to have used mathematical research as a solace. Kepler's publication of the *Mysterium Cosmographicum* (1596; The secret of the universe) began a meteoric rise. Compelled to leave Graz with other Protestants in 1598, he attached himself to the court of Emperor Rudolf II (ruled 1576–1612) in Prague, and succeeded Tycho Brahe as imperial mathematician in 1601. Thus, in only three years, Kepler ascended from the position of a provincial schoolteacher to become the astrological and astronomical adviser to the most powerful monarch in the Christian world, although the emperor proved unreliable as a source of financial support. Kepler immediately began to produce a series of major works, especially the *Optics* (*Astronomiae pars Optica*, 1604) and the *New Astronomy* (1609), which extended and refounded their subjects. Other works (1601, 1610) attempted to reform astrology. In 1612, after the forced abdication and death of Rudolf, Kepler left Prague, but retained his title of imperial mathematician under later emperors. From 1612 to 1626 he and his family made their home in Linz, in Upper Austria, although Kepler traveled widely. While in Linz he produced the *Epitome of Copernican Astronomy* (1618–1621) and the *Harmony of the World* (1619). The latter precipitated a violent exchange with the English theosophist Robert Fludd (1574–

KEPLER, JOHANNES (1571–1630), German astronomer and mathematician; discoverer of the laws of planetary motion. Born into the Protestant minority in the free city of Weil der Stadt, within the Lutheran duchy of Württemberg, Kep-

1637), but Kepler declined an invitation to visit England despite his long-standing admiration for King James I (ruled 1603–1625). During this period his mother was accused of witchcraft. Kepler directed the defense that led to her acquittal in 1620–1621. The work that had secured the favor of the imperial house for so long, the *Rudolfine Tables*, was completed in 1627.

With the increasing violence and disorder of the Thirty Years' War, Kepler again sought the protection of a powerful patron, and he became astrological adviser to A. W. E. von Wallenstein, the leading Catholic general, in 1628. His patron's fall from power immediately preceded his own death, at Regensburg, in 1630. In the *Mysterium Cosmographicum*, Kepler presented the most important defense of Sun-centered astronomy since the appearance of Nicolaus Copernicus's *De Revolutionibus Orbium Coelestium* in 1543. Uniting ideas from his education in mathematics and religion, Kepler proposed that God had employed each regular geometrical solid exactly once in the plan of the world. Nesting the solids within each other, the orbs defining the limits of the planets' motions could be inscribed between them. The five regular solids provided the spacing between six orbs, explaining both their relative distances and the number of planets (the Earth-Moon system forms one unit). On both counts Kepler's Sun-centered model could be argued to be superior to the Earth-centered Ptolemaic system. But Kepler's defense of Copernicus faced another rival: the newly proposed hybrid system of Tycho Brahe, in which Earth was central and stationary, the Moon and Sun went around the Earth, but all the other planets circled the Sun.

On arriving in Prague in 1600, Kepler was effectively subordinated to Brahe, who first set him to writing an attack on an earlier imperial mathematician (*A Defense of Tycho against Ursus*). Although not actually published during Kepler's lifetime, this work gives valuable insights into both the state of astronomy and Kepler's novel methodological ideas. Brahe had presented Kepler to Rudolf II as the man who would distill Brahe's decades of observations into new astronomical tables that would carry the emperor's name. When Brahe died unexpectedly in 1601, the importance of this project helped Kepler to succeed Brahe as imperial mathematician. Kepler used the superlatively accurate and

complete observations to show that Brahe's cosmic scheme was untenable, and to replace Copernicus's circle-based models with elliptical orbits.

In 1604 Kepler published an important work on optics, which treated the nature of light and vision, the phenomena of refraction, and the applications of optics in astronomy. During the same period he established that the path of Mars was an ellipse and introduced a new way of calculating the planet's position based on the novel concept of an orbit with the Sun at one focus (a principle now called the first law of planetary motion). He showed that his new approach was superior not only to the models of Ptolemy and Brahe, but also to the original form of Copernicus's system. Also improving on Copernicus, he was able to show that the planes of the planet's orbits intersected in the Sun. He also suggested that the Sun was the origin of a quasi-magnetic force responsible for the planets' motions. Based on these physical ideas, he argued for a connection between the speed of a planet along its path and the area swept out by the line connecting it to the Sun (now called the second, or area, law). He demonstrated this result first for a circular path, then for an ellipse. Although originally presented only for the case of Mars, the elliptical orbit and the mathematical principles governing its motion were intended to extend to all planets, based on universal physical principles. Kepler advertised the new connection between physics and astronomy in his book's title, *A New Astronomy, Based on Causes, or Celestial Physics*. It appeared in 1609 after a delay caused by Brahe's heirs.

In Prague, Kepler also produced two important works attempting to reform astrology, *On More Certain Foundations for Astrology* (1601) and *Tertius Interveniens* (1610; The intermediary third position [between two extremes]). He rejected the traditional astrological machinery of houses, but retained the idea that geometrical configurations of celestial objects influenced human judgment and caused terrestrial weather. Also in 1610 he gave enthusiastic support to Galileo Galilei (in *Conversation with the Sidereal Messenger*, 1610, and preface to the *Dioptrice*, 1611), and confirmed the latter's telescopic discovery of the moons of Jupiter.

During his time in Linz, Kepler's two most important productions were the *Harmony of the*

World (1619) and the *Epitome of Copernican Astronomy* (which appeared in several volumes, 1617–1621). The former attempted a grand synthesis of geometry, harmonics, astrology, and astronomy, and presented the music of the spheres, in the form of tones generated as planets vary in speed throughout their orbits. Here also Kepler stated the third law of planetary motion, connecting the square of the planetary year with the cube of its mean distance. The *Epitome of Copernican Astronomy* was a systematic presentation of Kepler's version of the Copernican system, intended as a textbook, and as a basis for understanding Kepler's approach in the *Rudolfine Tables*. Appearing in 1627, the tables successfully predicted that Mercury would pass across the face of the sun in November 1631, showing that Kepler had improved the accuracy of positional calculations by a factor of ten.

Kepler was an innovator where Copernicus was a renovator. Copernicus had re-centered the planetary system, but his calculations of planetary positions took as their geometrical center the mean sun, a constructed point, located elsewhere than the Sun itself. The Sun played no physical role in Copernicus's system and he retained celestial spheres to move the planets. Like Ptolemy, Copernicus continued to use circles carrying circles to predict the positions of planets against the background of fixed stars, and although distances were calculable in his system, they played no role in predicting positions. Kepler introduced the modern form of Copernicanism. His planets moved freely through the heavens, propelled by a force originating in the Sun, along orbits that intersected at the Sun. They obeyed mathematical laws that united physics and astronomy in a new way. Their path through space was an ellipse, not a circle, and their distances and velocities were linked in the second law.

Kepler's insights were not immediately accepted by contemporaries, but they were vindicated by Isaac Newton (1642–1727), who replaced Kepler's solar force with universal gravitation, and demonstrated that the three laws of planetary motion followed from his own more general laws of motion in the case of a planet moving around the Sun. Although the laws of planetary motion became central results of the later mechanical philosophy, Kepler himself was not a mechanical philosopher. Kepler's sun rotates because of an animating spirit; the

planet Earth has a spirit that perceives celestial alignments and creates weather; in the 1609 presentation of Kepler's theory, planets are capable of directing their own motion of approach to or recession from the Sun. In his last work, the *Somnium*, published posthumously in 1634, another kind of spirit narrates the appearance of the heavens as seen from the Moon. In Kepler's cosmos, mathematical regularities are evidence of controlling minds, and the structure of the universe, which Kepler spent his life uncovering, testifies to the architectonic mind of its Creator.

KHMELNYTSKY, BOHDAN (c. 1595–1657)

KHMELNYTSKY, BOHDAN (c. 1595–1657), hetman of the Zaporozhian Cossack Host (1648–1657) and founder of the Hetmanate (Cossack state). Born into a family of Orthodox petty gentry, Khmelnytsky received a Jesuit education. Khmelnytsky took part in the Battle of Cecora (1620) and was taken as a prisoner to Istanbul for two years. He enlisted in the Chyhyryn Cossack regiment near his family holding of Subotiv and emerged during the Cossack revolts of 1637–1638 as military chancellor of the Zaporozhian Host, signing the capitulation of 27 December 1637. It is possible that he served among Cossack mercenary troops in France in 1644. In 1646, as captain of the Chyhyryn regiment, he accompanied a Cossack delegation to King Władysław IV Vasa (ruled 1632–1648), who sought to win the Cossacks over to his secret plans for a war against the Ottomans.

Khmelnysky's life as an established Cossack took a radical turn in 1647 because of a personal and property dispute with a magnate's servitor. Khmelnytsky found no redress for the seizure of his estate and was arrested in November 1647. He escaped and fled to the traditional Cossack stronghold or *sich*, where he was proclaimed hetman in February 1648. He rallied the Cossacks, who smarted under the harsh Polish regime, to his cause and came to an agreement with the Crimean Khanate that ensured cavalry support for the Cossack infantry. In May, Khmelnytsky defeated the Polish armies sent after him. The death of the king in the same month threw the Polish-Lithuanian Commonwealth, an elective monarchy, into crisis.

Although some historians believe that from the first Khmelnytsky had sought to overthrow Polish rule, in the initial phase of the revolt his demands centered on Cossack rights. Throughout 1648, as social war reigned in much of Ukraine and the commonwealth's elite fell into factional struggles over the election, Khmelnytsky energetically organized a military force and an administration of the territory he controlled. Defeating what remained of the commonwealth's forces in September, Khmelnytsky forces reached the limit of Ukrainian ethnic territory and influenced the election of John II Casimir Vasa (Jan II Kazimierz; ruled 1648–1668) as a pro-peace candidate. At the end of the year Khmelnytsky marched east, entering the ancient Ukrainian capital of Kyiv to the acclamation of the clergy and the other inhabitants that he was a Moses and a liberator from the "Polish bondage." He announced his plans to liberate the Ruthenian (Ukrainian-Belarusian) nation and declared that God had raised him up to be the autocrat of Rus'. These declarations of intentions to be the ruler of a new state could only be resolved by military victory. The Battle of Zboriv (August 1649) proved inconclusive because of the desertion of the Crimean

khan, who was troubled by the rising power. Khmelnytsky was recognized as hetman with sweeping privileges, above all as the leader of a Cossack Host of forty thousand. But this fell far short of his earlier aspirations and endangered his position because the masses rejected the terms and the depredations of his Tatar allies.

From mid-1649 Khmelnytsky sought to keep the unwieldy coalition supporting him in Ukraine together as he searched for foreign allies and protectors against the commonwealth in a program to entrench his rule. Initially the Ottoman Empire seemed the most likely source, and the hetman sought to create a dynasty by marrying his son Tymish to the daughter of the Moldavian hospodar, an Ottoman vassal. Defeated by the Poles at Berestechko (June 1651), Khmelnytsky in turn defeated the Poles in June 1652 on an expedition to marry off his son. His Balkan policy ultimately ended in ruin and the death of his son (September 1653). Khmelnytsky then turned more seriously to

the Muscovite tsar, taking an oath of loyalty to him in January 1654 at Pereiaslav but failing to receive an oath from him. Retaining far greater power in Ukraine than the terms negotiated, Khmelnytsky came to be disillusioned with Muscovy, especially after the truce between Muscovy and the commonwealth in November 1656. He joined a coalition with Sweden and Transylvania against the commonwealth (and Muscovite desires), but news of the failure of a Transylvanian-Ukrainian invasion reached him on his deathbed.

Khmelnytsky's major problem in his final years was the question of succession because his remaining son Iurii was a weak figure. Iurii initially succeeded him, but the Host soon turned instead to his chancellor Ivan Vyhovsky.

In a ten-year period the hetman had managed to create an effective army and civil administration and to turn his capital Chyhyryn into a center of international diplomacy. Khmelnytsky had not, however, found a secure place for the Hetmanate in

the East European state system or a way to prevent foreign intervention in Cossack affairs. Contemporary and subsequent evaluations of him differed, with some seeing him as a brilliant state builder and diplomat, an equal of Oliver Cromwell (1599–1658) or Armand-Jean du Plessis, Cardinal Richelieu (1585–1642), while others saw him as chimerical, rash (above all in the terms he negotiated with Muscovy), given to bouts of drunkenness, and even a destructive despot similar to Tamerlane (Timur; 1336–1405) or Batu Khan (died 1255). Eighteenth-century Ukrainian historiography created a cult of Khmelnytsky as founder of the Hetmanate. Opinions varied in the nineteenth century, with the Ukrainian national poet Taras Shevchenko (1814–1861) chiding him for his agreement with the Russians. Soviet historiography beginning in the 1950s praised him for bringing about the “reunification” of Ukraine and Russia. In the Jewish tradition he is decried as responsible for massacres of Jews during the uprising. He figures prominently in Polish historical imagination as an enemy of the Polish state.

Lithuanian Commonwealth began in early 1648 under the leadership of Bohdan Khmelnytsky (c. 1595–1657), a Cossack officer proclaimed hetman. The secret negotiations of King Władysław IV Vasa (ruled 1632–1648) with the Cossacks to begin a war with the Ottomans against the will of the diet stirred them to action. Initiated because of injustices against Khmelnytsky and discontent among the Cossack stratum with their treatment by the Polish authorities, the revolt rapidly succeeded because it enlisted Crimean Tatar support. The rebels destroyed the Polish standing army, and the confusion and dissension following the death of the king in May 1648 gave them the advantage.

The Cossack revolt turned into a general uprising drawing upon peasant resistance to the imposition of serfdom and manorial duties, Eastern Orthodox anger at discrimination by the Catholic authorities, Ruthenian (Ukrainian-Belarusian) antagonism toward the Poles, and the Ukrainian frontier population's opposition to the magnates and their servitors and leaseholders. In the first months a bloody social war raged with attacks on landlords, Catholic clergy, and Jews. Where they had the means, the magnates took brutal reprisals. The disparate coalition assembled around the Cossack Host did not have a united social or political program, but the Cossack hetman professed to support the monarch against the willful high nobility. Yet negotiations failed with the new king, John II Casimir Vasa (Jan II Kazimierz; ruled 1648–1668), elected in November, and by early 1649 the rebels had greatly expanded their Cossack Estate demands to a broad political-national program that would have virtually overturned the old order in Ukraine. Certainly by this time the leadership envisaged a break with the commonwealth and entered into negotiations with foreign powers for support. A battle at Zboriv in August 1649 wrung major concessions from the government, but the betrayal of the Crimean khan deprived the rebels of a decisive victory.

By 1649 a new political structure, the Cossack Hetmanate, had emerged out of the Cossack Host in the central Ukrainian territories, but it could not come to an accommodation with the commonwealth's magnate elite, which would not accept sweeping changes in the economic and political order. Defeated at the Battle of Berestechko in 1651, the Cossack authorities, despite subsequent vic-

KHMELNYTSKY UPRISING. The uprising in the Ukrainian territories against the Polish-

tories, could not fully triumph over the commonwealth in battle, thus leading them to redouble their search for foreign protectors.

Although surrounding states feared the radical nature of the revolt and distrusted the Cossack parvenu elite, they soon sought to take advantage of the commonwealth's distress and the opportunities offered by the revolt. The Ottoman sultan accepted the new polity under his protection in 1650–1651, but tied down by the War of Candia, he did not provide essential military support. The Porte also found Cossack intervention among its Danubian vassals troublesome, though this Ukrainian policy ended in a fiasco in 1653, offering new opportunity for Polish revanche. The need for military support led the Cossack hetman to accept the sovereignty of the Muscovite tsar, a coreligionist, in January 1654, though from the first the political cultures of the autocratic Russian state and the Cossack Hetmanate, derived from the traditions of the Cossack Host and the Polish monarchical republic, clashed. The commonwealth continued to struggle to regain its control of Ukraine, even coming to an agreement with Muscovy in 1656. The Muscovite officials attempted to assert control in Ukraine, but Hetman Khmelnytsky continued to rule over the new order he had established up until his death in 1657. He sought to change the political position of the Hetmanate and to partition the commonwealth through alliances with Sweden, which had invaded the weakened commonwealth in 1655, and Transylvania.

There is no clear ending to the Khmelnytsky Uprising because the consequences of the rebellion unfolded over decades. Although the commonwealth eventually won back the Ukrainian territories to the west of the Dnieper (1667, confirmed in 1686), the political and social order established by the revolt endured to the end of the eighteenth century. The Khmelnytsky Uprising stands out among early modern revolts for its success in overturning the social order and in setting up a new polity, thereby motivating some to call it a revolution. It also had great impact in setting off conflicts among the neighboring states and remaking the international order, above all by weakening the commonwealth, transforming Muscovy into the Russian Empire, and inciting the Ottomans' last great thrust into central Europe. It has also served as

a focal point for modern Ukrainian identity and relations with Poles, Russians, and Jews.

KIEV (Ukrainian, Kyiv; Polish, Kijów). Capital of the Rus' principality (tenth to thirteenth centuries), Kiev arose on the Dnieper River at the intersection of the Varangian trade route connecting the north by river with Constantinople and overland routes connecting the Caucasus and the Crimea with Galicia and western Europe. This religious and trade

center of medieval eastern Europe was sacked in 1240 by the Mongol-Tatar army of Batu Khan. In 1362 Lithuanian Grand Duke Algirdas annexed Kiev, and in 1471 it became the capital of the Kiev palatinate of the Grand Duchy of Lithuania. A modest revival began in the early fifteenth century, culminating in the confirmation of the Magdeburg law for municipal self-government by Grand Duke Alexander in the years 1494–1497. By this time, however, the Crimean Khan Mengli Giray had again plundered Kiev (1482), and the “Upper City” lay in ruins for over a century.

With the Union of Lublin in 1569, the Kiev palatinate was transferred from the Grand Duchy of Lithuania to the direct rule of the Polish crown, opening the door more widely to Polish immigration and cultural influences. In the first half of the seventeenth century, Kiev again experienced renewal, and it eventually became the political, religious, and cultural capital of Rus'-Ukraine, overtaking existing centers of early modern Ruthenian culture that had arisen in Vilnius and Lviv. Cossack

hetman Petro Sahaidachnyi resided there (c. 1610–1622) and was a member of the Kiev Orthodox Brotherhood of the Epiphany (founded 1615). A printing house was established at the Kiev Monastery of the Caves by 1615. In 1620, Patriarch of Jerusalem Theophanes III, stopping off in Kiev on his way home from Moscow, restored an Orthodox Ruthenian hierarchy to sees occupied by Uniate bishops since the Union of Brest in 1596. The Orthodox metropolitan again took up residence in Kiev. The Moldavian nobleman Peter Mohyla (archimandrite of the Caves Monastery 1627–1632, metropolitan of Kiev 1633–1647) launched a wide-ranging renovation of the city's old monuments (including the St. Sophia Cathedral) and began new construction. The school he founded at the Caves Monastery in 1631 was joined in 1632 with the older Brotherhood school (established c. 1615) to form the Kiev College (renamed the Kievan Mohyla Academy in 1701). It was the premier center of higher learning for the Orthodox of the Polish-Lithuanian Commonwealth, and it would later

help propagate Western learning in the Russian empire.

The triumphant entry of Bohdan Khmelnytsky into Kiev in December 1648 confirmed the city's status as the spiritual capital of a new Cossack polity. With the 1654 Treaty of Pereiaslav, a Muscovite garrison was established in the town. The Muscovite-Polish Treaty of Andrusovo (1667) granted Kiev to Muscovy for two years only, but the city never returned to Polish rule, and the 1686 Eternal Peace acknowledged the status quo. Until the second partition of Poland in 1793, Kiev remained an autonomous border town, severed from its former hinterland in Polish right-bank Ukraine. The city experienced a brief reflowering under the hetmanacy of Ivan Mazepa (1687–1709), but the Russian tsars of the eighteenth century progressively curtailed Kiev's autonomies along with those of the Hetmanate, making Kiev more and more into a provincial Russian city. In 1797 it became the capital of the Kiev province of the Russian empire.

KIRCHER, ATHANASIVS (1602–1680), German Jesuit polymath and collector. Considered by many to be the greatest polymath in an encyclopedia age, Athanasius Kircher was a scholar who aspired to expertise in many different domains of knowledge and sought connections among them in a quest to recover ancient *pansophia* (universal wisdom). He corresponded with scholars, princes,

popes, and missionaries, and his books traveled to virtually every corner of the globe.

Born in the German town of Geisa, Kircher entered the Society of Jesus in 1616; he completed his novitiate in 1620 and was ordained in Würzburg in 1628. That same year he requested to be sent as a missionary to China (he would make the same request in 1637). The Superior General turned down his request because he felt that Kircher's unique talents would best serve the society closer to home. After teaching mathematics, philosophy, and Syrian at the Jesuit college in Würzburg for several years and developing a reputation as an inventor of sundials, Kircher found himself caught in the vicissitudes of the Thirty Years' War (1618–1648) and fled Germany. He spent almost two years in Avignon, teaching at the Jesuit college there and cultivating a relationship with the French savant and antiquarian Nicolas-Claude Fabri de Peiresc. During this period, he convinced Peiresc that he was the person most capable of deciphering Egyptian hieroglyphs through the study of Coptic. Peiresc urged his Roman acquaintances, principally the pope's nephew, Cardinal Francesco Barberini, to find a position for Kircher in the Eternal City in order to realize this project.

Kircher arrived in Rome in November 1633, only months after the condemnation of Galileo for his advocacy of heliocentrism. He succeeded Christoph Scheiner in the prestigious chair of mathematics at the Collegio Romano, the leading educational institution of the Society of Jesus. Save for a brief excursion to Malta and Sicily in 1637–1638 to accompany a recently converted German prince on his travels, Kircher remained in Rome for the rest of his life. During his long and productive career, he published over thirty encyclopedic works on virtually every imaginable subject, not including the works of disciples such as Kaspar Schott, Giuseffo Petrucci, Johann Kestler, and Francesco Lana Terzi, who published his ideas—and often his exact words—under their own names. By 1646 his intellectual work had become so valuable and his fame so great the Jesuits relieved him of his teaching duties at the Collegio Romano, allowing him to devote himself fully to his research.

Kircher began his intellectual career with two principal interests: physico-mathematics and an-

cient Eastern languages and cultures. His earliest publications concerned various mathematical instruments such as the sundial he created in the Jesuit college in Avignon and a multipurpose measuring, calculating, and observational device that he invented during his trip to Malta. By 1636 his first work on Egypt, the *Prodromus Coptus sive Aegyptiacus* (Coptic or Egyptian forerunner), appeared. During the next two decades, Kircher published a series of works on Egyptian language, philosophy, history, and religion, culminating in his massive *Oedipus Aegyptiacus* (Egyptian Oedipus) of 1652–1655. In such works, he demonstrated his mastery of hieroglyphs—based on his Neoplatonic understanding of Egyptian as a symbolic and divine language, which bore little resemblance to the early-nineteenth-century decipherment of the Rosetta Stone—and argued strongly that Egypt was a universal source of culture and civilization that had anticipated Christianity with its strong Trinitarian symbolism. Kircher parlayed his expertise into a series of famous interpretations of the principal obelisks of Rome, namely the obelisk erected at the center of the sculptor Gian Lorenzo Bernini’s famous fountain in Piazza Navona and the one atop Bernini’s elephant in front of Santa Maria sopra Minerva. Kircher assisted Bernini in devising the words beneath each obelisk and published his interpretations of them in 1650 and 1666 respectively.

In addition to his work on Egypt, Kircher was equally prolific and bold in his account of the natural world. In 1641, his popular *Magnes sive de Arte Magnetica* (The magnet or the magnetic art) appeared, one of several publications in which Kircher argued that magnetism was the principal force organizing and controlling nature. At the same time, he began to develop his ideas on optics, leading to his *Ars Magna Lucis et Umbrae* (Great art of light and shadow) of 1646—a work filled with numerous optical demonstrations such as Kircher’s famous magic lantern. Kircher complemented his work on optics with similarly intensive studies of acoustics in such works as his *Musurgia Universalis* (Universal music making) of 1650. The hydraulic organ in the Quirinale in Rome still today bears traces of his skills at designing ingenious musical machines that created sound without regular human intervention. Finally, Kircher spent over twenty years developing an explanation of earthquakes, after witnessing the

eruption of Mount Etna in his youth. His *Mundus Subterraneus* (Subterranean world) of 1664–1665 attempted a comprehensive portrait of all the natural forces that organized the earth, just as his controversial *Iter Ecstaticum* (Ecstatic journey) of 1656 sought to explain what the cosmos looked like in an imaginative dialogue between an angel and a philosopher who discussed its composition while traveling throughout the heavens.

Kircher’s reputation as a man who knew almost everything emanated not only from his publications but from his role as custodian of one of the most famous museums in Europe. Founded in 1651, the museum of the Collegio Romano flourished under his guidance. Kircher filled it with natural objects, machines, antiquities, paintings, and curiosities brought back by missionaries from all over the world. Visitors were enthralled by dancing demons, talking automata, sunflower clocks, Japanese scrolls, Chinese stone rubbings, Greco-Roman and Egyptian fragments, and a seemingly endless series of demonstrations of the powers of the magnet. Kircher parlayed his ability to gather objects and information into expertise on subjects about which he otherwise knew very little. His popular *China Illustrata* (China illustrated) of 1667, for example, was written without once traveling to Asia or knowing much about its languages, customs, and religions.

Kircher relied upon his ability to command the resources of the entire Jesuit order in the service of a universal account of the presence of Christianity in every corner of the world. His boundless curiosity and energy, a source of wonder in his own lifetime, made him a figure of fun in a later age when scholars such as Leibniz declared that Kircher had written much but known nothing about virtually every interesting subject of his age. He was one of the last great humanistic scholars of the seventeenth century, a man of faith whose vision of the world was as global as the missionary networks of his religious order.

KLOPSTOCK, FRIEDRICH GOTTLIEB (1724–1803), German poet. Friedrich Gottlieb Klopstock was the oldest of seventeen children born into an impoverished Pietist family of attorneys and pastors in Quedlinburg (Saxony-Anhalt). After receiving a humanistic education at the princely college in Schulpforta, he studied theology and philosophy at the universities of Jena and Leipzig, where he began writing the first songs of his monumental religious epic *Der Messias* (The Messiah; published in 4 volumes between 1748 and 1773, final version in 1799/1800). In 1751, he accepted an invitation from the Danish king, Frederick V, who sponsored the completion of the *Messias*. Shortly after his arrival in Denmark, Klopstock married Margarethe (Meta) Moller from Hamburg, the “Cidli” of his odes, who died four years later. After living in Denmark for almost twenty years, Klopstock resided in Hamburg for the rest of his life, married his first wife’s niece, the widow Johanne Elisabeth von Winthem, and published poems, plays, and theoretical writings on German literature, language, and culture.

Klopstock became one of the most celebrated poets of his time and revolutionized German poetic language and its function within the theoretical debate about the possibility of a German national

culture. Inspired by Johann Jakob Bodmer’s and Johann Jakob Breitinger’s literary theory of the poetic use of imagination, he rejected the dominant German aesthetic theory, the rationalist poetics of Johann Christoph Gottsched with its rigid literary conventions. Klopstock aspired to create a new poetry that could live up to the stylistic qualities of masterpieces such as Homer’s *Iliad* or John Milton’s *Paradise Lost*. His vision of the poet as “genius” or prophetic “creator” rather than “imitator” of nature led to the invention of a new lyrical language. Written in classical hexameters instead of the traditional German alternating verse forms, the first three cantos of the *Messias* signaled a departure from grammatical and syntactical rules and introduced an innovative, complex style. The pathetic use of inversions, repetitions, neologisms, comparisons, and metaphors infused enthusiasm, passion, and sentiment into the biblical story. In this way Klopstock transformed the culture of religious dogma into an inner world of sensitive experience. Although composed and perceived as a devotional work, the *Messias* evoked readers’ or listeners’ emotional responses and let them experience the religious sublime through the new aesthetic form. In his following poems, odes of enthusiasm, patriotic hymns, and elegies, Klopstock continued his formal experiments and was the first to introduce free verse into German poetry. His search for an emotional and yet sacred poetic language that manifested the experiences of the inner self combined expressive subjectivity with poetic autonomy and resulted in the interdependence of the secular and the spiritual. In this way, Klopstock instilled religious pathos into the poetic representation of friendship, nature, love, leisure, and the nation.

While Klopstock wrote spiritual songs (*Geistliche Lieder* [1757, 1769]), and religious and patriotic tragedies (*Der Tod Adams* [1757; The death of Adam] and *David* [1772]), his most influential work was probably the play *Hermanns Schlacht* (1769; The battle of Arminius). However, it did not receive the same attention as his poetic work—after all, Klopstock and the *Messias* had become synonyms. His collection of theoretical and fictional texts, *Die deutsche Gelehrtenrepublik* (1774; The German Republic of Letters) added a new dimension to his publications. This utopian historiography of a German national culture in the

making launched the idea that national identity could be generated through shared values and transmitted by cultural artifacts and institutions. Drawing on Greek ideals, Klopstock envisioned a German republic in which the humanist tradition would unite political and cultural and public and private spheres. While the esoteric montage of different text genres did not receive the same attention as the *Messias*, its form of dissemination was quite remarkable in the history of publishing. Being concerned to receive fair compensation as an author, Klopstock circumvented the established book trade through publishers and booksellers by advertising his work via subscription and successfully launched a new means of profitable distribution.

Klopstock's contemporaries celebrated him as Germany's national poet. His poetic focus on feeling and experience influenced the young poets of the Sturm und Drang (Storm and Stress) movement; Johann Wolfgang von Goethe, Johann Gottfried Herder, and Friedrich Hölderlin praised him as Germany's leading lyric poet, and the Romantics embraced his cultural patriotism. Klopstock's poetic legacy was soon surpassed by that of Goethe, who dominated Germany's cultural landscape throughout the nineteenth century, and it was not until the twentieth century that German poets and authors such as Rainer Maria Rilke, Arno Schmidt, and Peter Rühmkorf rediscovered the power of Klopstock's lyrical voice. Recent scholarship has established a continuing interest in Klopstock through the production of a historical-critical edition of his works.

KNOX, JOHN (c. 1513–1572), Scottish church reformer. Born in Haddington (Lothian), Knox studied at Glasgow University and probably also at St. Andrews. After his ordination to the priesthood in 1536, he became a notary apostolic (a church lawyer); as tutor to Lothian gentry, the Douglasses and Cockburns, he met the Scottish reformer George Wishart and was converted to evangelical views around 1545. When Wishart was burned at the stake in 1546, Knox took refuge with the Protestant garrison in St. Andrew's Castle and began his preaching career. Although he had not been involved in the garrison's murder of Cardinal David Beaton, when the French captured the castle in July 1547, he was taken to France and made a galley slave, which permanently undermined his health. After his release in 1549, he went to England, where he actively promoted official Protestant changes, first in the northeast; he inevitably came into conflict with the conservative bishop of Durham Cuthbert Tunstall, but also captivated an enthusiastic evangelical gentlewoman, Elizabeth Bowes. In autumn 1551 he was made a royal chaplain, and John Dudley, duke of Northumberland, brought him south, probably hoping to exploit his religious radicalism to strip the church of its wealth. However, their relations deteriorated, and Knox was among the leading clergy who in early 1553 denounced politicians' worldliness. He failed to persuade the Privy Council to modify the 1552 Book of Common Prayer to forbid kneeling at holy

communion, although his protests prompted Archbishop of Canterbury Thomas Cranmer to insert a last-minute instruction (the “black rubric”) explaining that kneeling did not signify adoration of the bread and wine.

Mary I’s accession in 1553 interrupted Knox’s preaching ministry in Buckinghamshire. He fled abroad, followed by Elizabeth Bowes (who abandoned her Catholic husband) and her daughter Marjorie, whom he soon married. Knox championed thoroughgoing Calvinist reform among English exiles at Frankfurt am Main, resulting in his expulsion in 1555; he returned to John Calvin’s Geneva, which he called “the most perfect school of Christ on earth since the days of the Apostles.” In 1555–1556 he made a clandestine preaching tour in Scotland; back in Geneva in 1556 he drew up a directory of worship for the English congregation, the basis of the Church of Scotland’s *Book of Common Order*. After Scottish bishops burned him in effigy in Edinburgh, he abandoned a planned return visit to Scotland in 1557. His attack on the two Catholic rulers Mary Tudor in England and Mary of Guise in Scotland, *The First Blast of the Trumpet against the Monstrous Regiment of Women* (1558), asserted that it was unnatural (“monstrous”) for women to hold political power (“regiment”). Unfortunately this soon also applied to the Protestant Elizabeth I. Furious, she ended Knox’s hopes of resuming his English career, refusing even to let him pass through England on his way back to Scotland. He was appointed minister of Edinburgh in 1559. He became the most prominent clerical leader of the Protestant and anti-French revolution and successfully pressed Elizabeth’s adviser, William Cecil, Lord Burghley, for English military support. In August 1560 he was one of a team of ministers (“the six Johns”) who drew up a Confession of Faith for the Kirk (the new Protestant Church of Scotland); they also prepared a scheme to reorganize the Kirk on Calvinist lines, the first *Book of Discipline*, which, because of political uncertainty and lack of resources, was not fully implemented. From 1561 he bitterly opposed Mary, Queen of Scots and preached violent sermons against her; after she was deposed in 1567, he preached at her son’s coronation as James VI. He also preached at the funeral of the murdered regent James Stewart, earl of Moray, in 1570, but Stewart’s death and the resulting civil

war lessened his influence. One of his last contributions to the Reformation cause was, in spite of having suffered a stroke, to preach one of his classic sermons on the St. Bartholomew’s Day massacre of French Protestants.

Knox’s *History of the Reformation of Religion within the Realm of Scotland* (published 1587, then in full in 1644) remains an essential witness to the Reformation although it carefully conceals much of his own early career. He is a potent symbol of a militant and uncompromisingly Presbyterian Scottish Reformation, yet with his English wife and live-in mother-in-law, he was more Anglophile and flexible than either his detractors or his Presbyterian near-idolators have recognized. The contemporary Roman Catholic controversialist Ninian Winzet sneered at Knox that he had forgotten “our auld plane Scottis quhilk your mother lerit you” because his language was so Anglicized: at the height of the Scottish political crisis in 1566, he spent six mysterious months in England of which we know nothing. Without the accidents of English politics, John Knox might well have become the first in a long troop of Scotsmen to end up a bishop of the Church of England.

DIARMAID MACCULLOCH

KOCHANOWSKI, JAN (1530–1584), Polish and Neo-Latin poet, humanist, royal secretary and courtier, arguably the outstanding literary figure of the Slavic world before the Romantic age. Kochanowski was born to a middling gentry family of Little Poland. He matriculated at the standard age of fourteen in the Cracow Academy in 1544, then spent 1551–1552 at the Lutheran university in

Königsberg, where he once returned (1555–1556), perhaps in search of a patron at Duke Albert Frederick's court. Over the years 1552–1559, Kochanowski spent three longer periods at the University of Padua, where he studied with one of Italy's leading humanist scholars, Francesco Robortello. He completed his study years with a tour of France (1558/1559), where he came into contact with the poet Pierre de Ronsard.

Upon his return to Poland in 1559, Kochanowski began a fifteen-year period of activities connected with politics and the royal court. We find him among the clients of Little Polish magnates, including the Calvinist palatine of Lublin, Jan Firlej, and crown vice-chancellor (later bishop of Cracow) Piotr Myszkowski, thanks to whose patronage he became one of King Sigismund II Augustus's secretaries and courtiers. Around 1571 Kochanowski's ties with court life began to loosen, and he retreated more and more to his country estate at Czarnolas in Little Poland, where he lived from 1575 until his death in 1584.

Kochanowski began as a Neo-Latin poet, but his place in literary history is secured by his pioneering work in Polish. This “father of Polish literature” attempted to establish Polish models for the entire canon of classical and humanistic genres. During his court period, Kochanowski focused on poetry in an epic tonality (*Susanna*, c. 1562; *Chess*, between 1562 and 1566) and occasional poetry, as well as political poetry (*Harmony*, 1564; *Satyr, or the Wild Man*, c. 1564). He gradually shifted toward what would be his strength, lyric poetry. A central work here was his *Songs* (published posthumously in 1585), composed over nearly twenty years and based on Horatian and Petrarchan models. Over the same years Kochanowski worked on his *Trifles*, a collection of mostly short poems, often of personal or topical content, ranging in style from epic to anacreontic. They continue to find imitators among Polish poets. Kochanowski was the author of Poland's first Renaissance tragedy, *The Dismissal of the Grecian Envoys* (written probably c. 1565 but first performed in 1578, before King Stephen Báthory, and published that year). From the last, rural period come his *Laments* (1580) on the death of his beloved daughter Urszula. Kochanowski began work on his masterpiece—a versified *Psalter*, based on the model of George Buchanan's

Latin version (among others)—while still at court, but he did the lion's share of the work at Czarnolas, publishing it only in 1579.

Kochanowski received recognition as the premier Polish poet during his lifetime, and traditions of reading and imitation of his work have continued uninterrupted. His *Psalter* was issued twenty-five times by the middle of the seventeenth century, and it influenced similar projects in Russian, Romanian, Lithuanian, German, Hungarian, Czech, Slovak, and Lusatian. Polish Catholics and Protestants sang his versions of the Psalms in their churches (often without realizing whose they were), and seventeenth-century Polish Catholics sought to make him into an orthodox post-Tridentine Catholic, evidently troubled by the tonalities of Horatian epicureanism, Senecan stoicism, and Erasmian irenicism in his life and work.

DAVID FRICK

KOŁŁATAJ, HUGO (1750–1812), Polish cleric, reformer of education, politician, promoter of Enlightenment thought, historian, and philosopher. Born in Dederkaly (Vollhynia), the youngest son of an impoverished gentry family, he soon chose the clerical path of material and social advancement. He began studies at the Cracow Academy in 1761 and continued in Vienna (1771–1772) and Italy, especially Rome (1772–1774); during these travels he studied French, canon law, and theology and made his first contacts with Enlightenment thought.

Upon his return to Cracow in 1775, Kołłątaj took priestly orders and soon joined in the work of the Commission of National Education. From 1775 to 1786 he directed the reform of the Cracow Academy, Poland's oldest university, serving as rector from 1783 to 1786. In the years immediately pre-

ceding the Second Partition of Poland (1786–1792), Kołłątaj resided in Warsaw, playing a leading role in attempts to reform Polish politics and society. He achieved high office (becoming Lithuanian spiritual referendary in 1787 and crown vice-chancellor in 1791) and led a movement to transform Poland's feudal, magnate-dominated society into a modern bourgeois nation led by propertied gentry and burghers, governed by a parliament in permanent session, and with a now hereditary but much weakened monarch. From "Kołłątaj's Smithy" (a term coined by his opponents) came a stream of reformist writings by various authors. Among his concerns was the status of burghers and Jews in a reformed state. Kołłątaj was a coauthor of the constitution of 3 May 1791.

In the face of the catastrophe of 1792, Kołłątaj took up a conciliatory stance, urging King Stanisław II August Poniatowski to find a *modus vivendi* with the Russian-sponsored Confederation of Targowica—although Kołłątaj himself was anathema to the Polish conservatives of the confederation. The Second Partition (1793) found him in Saxony, where he helped prepare the Kościuszko uprising of 1794. Contacts with revolutionary France radicalized some of his ideas. Kołłątaj returned to Warsaw in May 1794, where he became a focal point for supporters of the uprising, burghers, and Jacobins, although he was certainly not the "Polish Robespierre" that the king and others saw in him.

After the Russian conquest of Warsaw in early November 1794, Kołłątaj fled south and was arrested by the Austrians near Przemyśl. He remained incarcerated in Moravian Olomouc until November

1802. During this time he continued his scholarly work, gathering materials and sketching an outline for an ambitious historical and ethnographic project. Upon release, Kołłątaj settled in Russian Volhynia, where, under discreet police surveillance, he continued his scholarly projects and worked on the organization of a lyceum at Kremenets.

Summoned to Warsaw under Napoleon in 1806, Kołłątaj delayed. This delay, plus the emperor's distrust of former "Jacobins," increased his isolation. He was arrested by the Russians in 1807 and interned in Moscow until the next year, when he returned to Warsaw. He failed, however, in his attempts to play a role in the politics and culture of Napoleonic Poland. A late work, *Nil Desperandum* (1808), offered a vision of a modernized, liberal Poland restored to its old borders, in alliance with France, in a Europe divided into two empires, west (France) and east (Russia).

LA BRUYÈRE, JEAN DE (1645–1696), French moralist, social commentator, and satirist. Jean de La Bruyère was baptized in Paris. His parents were bourgeois. Other than these facts, little is known about his early years before he obtained a law degree from the University of Orléans in 1665. He did not practice, however, and led a life of leisure, made possible by a modest inheritance from an uncle in 1671. In 1684 he obtained a position as one of the tutors to Louis de Bourbon, grandson of the Grand Condé, Louis II de Bourbon (1621–1686), a royal prince. When the latter died three years later, the young Louis quit his studies, but La Bruyère remained attached to the household. The role of domestic servant did not suit his temperament, although it allowed him to observe closely the court and all of its foibles.

His wounded pride and the injustices he witnessed due to the disparity of social status are often considered crucial to the creation of his only literary work, a collection of sarcastic observations and caricatures entitled *Les caractères* (1688; The characters). The work was immediately and immensely successful, going through seven editions in four years, with each edition bringing additions to previous texts as well as new passages. He was received into the Académie française (French Academy) in 1693, and can be considered one of the last “Anciens” in the quarrel between ancients and moderns. He wrote a polemical tract, *Dialogues sur le Quiétisme* (1696; Dialogues on Quietism), against the contemporary vogue for religious mysti-

cism, assailing with vigor François Fénelon (1651–1715). He died suddenly at Versailles in May, 1696.

In *Les caractères*, (‘portraits’ or ‘caricatures’), La Bruyère established his work within the tradition of classical Greco-Roman literature. He presented first a French translation of the Greek text by Theophrastus (d. 278 B.C.E.) with some of his own *caractères* and satiric observations drawn from his own time and society. These were divided into sixteen different chapters, covering such diverse topics as literary criticism, life in town and country, the court, women, judgment, and taste. With each successive edition came an increase of entries in all categories, until La Bruyère’s text far surpassed that of Theophrastus. The opening passage to his own work, in which he switches from translator to author, begins with the often-cited phrase, “Everything has been said. . . .” a paradoxical beginning perhaps, but one that indicates the contemporary view of imitation. Novelty is to be sought less in substance than in style, in how a work is expressed.

His text is a compendium of brief forms—maxims, observations, thoughts, portraits—that often lack external connections or transitions. The coherence, or organic unity, of the whole is not apparent, although certain themes and perspectives, such as superficiality, vanity, and righteous indignation, reappear. Some critics have argued that the entire work should be read in light of the final chapter—a Christian defense—although others consider him more a pessimist or satirist than a Christian reformer. He does stress the virtues of retreat from society. Within a textual entry, ellipti-

cal, paratactical structures make for a rapid and vivid description, as nouns and verbs come shooting forth, separated by punctuation marks, a simple “and” or “but” rather than complex constructions joined by direct causal links (“because”). The age of King Louis XIV (1638–1715) prized an oral, theatrical style, and many of the *caractères* read like small scenes, presented without authorial comment. To this extent the reader plays a role in supplying the criticism or condemnation implicit within the text, such as that found in the chasm that separates Giton, who is rich, from Phédon, who is poor.

Following his literary model, La Bruyère used Greek pseudonyms for his portraits, and keys soon circulated that claimed to identify the real identities of Ménalque, the scatterbrain, Gnathon, the gourmand, Ornulphre, the religious hypocrite patterned after Molière’s *Tartuffe*, and dozens of other individuals. He was much imitated in the eighteenth century, although without much success. Due to their short form but richly dense material, many passages were anthologized in the nineteenth and twentieth centuries, for general audiences as well as classroom exercises. Gustave Flaubert (1821–1880), Marcel Proust (1871–1922), and André Gide (1869–1951) were influenced by his style, and recent literary criticism has found an affinity for the open, “readerly” nature of the texts. As for his content, his comments on women have brought him some approbation, but his indictment is primarily against the way society treats them and how they are obliged to behave. In addition, La Bruyère was one of the few writers of the seventeenth century even to allude to the plight of the poor and the peasants.

LA FAYETTE, MARIE-MADELEINE DE (Marie-Madeleine Pioche de la Vergne, countess of La Fayette; 1634–1693), French novelist. Born in Paris to a family of the lower nobility with close ties to the court of King Louis XIII (ruled 1610–1643), Marie-Madeleine Pioche de la Vergne became a lady-in-waiting at the age of fifteen to Anne of Austria, the French queen. She received a broad education in the classics and languages, was an enthusiastic reader of the popular new novels of her day, and, from an early age, was close to prominent figures including the moralist and philosopher François de la Rochefoucauld, the cardinal of Retz, and the writers Gilles Ménage and Madeleine de Scudéry. In 1655 she married Francis Motier, count of La Fayette, and moved with him to his property in the Auvergne. The first of her two sons was born in Poitou in 1658, but after three years in the provinces Marie-Madeleine moved back to Paris, leaving her husband behind to manage his country estates. She lived independently in Paris for the rest of her life in her home next to the Luxembourg palace, where she remained closely involved with the intellectual and political life of the court and the salons of the capital.

Literary history has traditionally designated Madame de La Fayette as the originator of the modern novel. She turned to writing fiction soon after her return to Paris, and in 1662 anonymously published a short historical fiction, *La princesse de Montpensier* (The princess of Montpensier) followed by two novels, *Zaïde* (1670) and *La princesse de Clèves* (1678; The princess of Clèves). La Fayette’s great innovation was her particular way of blending history, romance, and psychological analysis. In her fiction she incorporated some of the features of pastoral and epic narrative into a framework more closely resembling memoirs and historical documents. In her most important and influential novel, *La princesse de Clèves*, she designed a plot drawn from events at the French court of the sixteenth century. Into a group of characters including Catherine de Médecis, the duc of Guise, and the young Mary Stuart, she placed a central figure of her own invention, presenting the story of the psychological development of a young woman maturing in the oppressive atmosphere of courtly intrigue. Madame de La Fayette’s first readers recognized in her novel more a reflection of their own time than that of

history. The book precipitated a major literary quarrel, conducted in print via a popular gazette of the day, *Le Mercure galant* (The gallant Mercury). Readers argued passionately about the novel's realism, the plausibility of the heroine's behavior, and the moral implications of her story. The controversy extended to La Fayette's readers in England, where each of her novels was published in translation within a year of its appearance in France.

Themes central to *La princesse de Clèves* are examined in all of La Fayette's fiction: the difficulty of sincere communication, the fugitive quality of love, the tensions between religious principles and worldly demands, and the constraints of marriage. Retreat from the world is the solution that holds the strongest appeal for her female characters, but the difficulty of decisions such as these, and their slow maturation in the minds of the protagonists, are what most fascinate La Fayette: exemplary behavior is achieved at a great cost. In the darkest of La Fayette's scenarios, as in the posthumously published *La comtesse de Tende* (1724; The princess of Tende), the heroine's urge for escape is suicidal. In *La princesse de Clèves*, retreat is a solution that is closer to a form of religious devotion.

Also published posthumously were historical memoirs of the court of King Louis XIV, *Mémoires de la cour de France* (1731; Memoirs of the French court). La Fayette used the memoir genre to dramatize the inevitable confrontation with death in her more personal historical memoir, *Histoire de Madame Henriette d'Angleterre* (The Story of Madame Henrietta of England) begun as a biography at the request of her friend Henrietta of England and transformed by the princess's abrupt death in 1670.

In the last decade of her life Madame de La Fayette withdrew from Parisian society but continued to engage in social life through letter correspondence. Her closest friend, after the death of her companion La Rochefoucauld, was Madame de Sévigné, whose letters are an important source for our knowledge of La Fayette's life. Their correspondence also provides documentation of Madame de La Fayette's ambivalent attitude toward her own status as an author and her strategic use of the practice of anonymous publication. Sévigné's letters record the popularity of La Fayette's writings.

Madame de La Fayette has remained a canonical figure in French literary history. The innovative aspects of her fictional plots are increasingly explored in literary criticism, with particular interest in her invention of new models for describing women's psychological and social development.

ELIZABETH C. GOLDSMITH

LA FONTAINE, JEAN DE (1621–1695), French poet and fable writer. Jean de La Fontaine grew up in a bourgeois family in rural France, where his grandfather, father, and finally he himself held the local charge of master of waters and forests. In his youth he quit the study of theology to pursue and obtain a law degree. He married and had a son, but cared little for his family and soon lived separately, in Paris. The poems “Adonis” (1658) and “Elegie aux nymphes de Vaux” (1661; The dream of Vaux) impressed Nicolas Fouquet (1615–1680), Louis XIV's superintendent of finances and a patron of the arts, who granted the poet a pension in 1659. The disgrace and imprisonment of Fouquet (1662) disrupted La Fontaine's life and finances and caused the king to be suspicious of the poet for many years. He entered into the service of the king's widowed aunt, where he again had access, albeit limited, to the rich bourgeoisie and the aristocracy. He began to frequent literary salons and published *Contes et nouvelles en vers* (1665; Tales and stories in verse), which were shockingly indecorous to precious ladies and followers of classicism because of their bawdy

topics, and which were closer in subject and style to medieval fabliaux or the works of François Rabelais (c. 1483–1553).

In 1668 La Fontaine published the first of a collection of *Fables choisies mises en vers* (Selected fables set in verse; books 1–6), dedicated to the dauphin, which became extremely popular. Fables and other short poetic forms had been practiced in the literary salons for a while by a number of noted writers, but not with the style, wit, or power that La Fontaine displayed. As the guest and protégé of Mme Marguerite de la Sablière (c. 1640–1693) he enjoyed modest personal and financial comfort. He continued to write and publish new *Tales*, but with less success, and eventually incurred a police ban. He wrote the libretto for an opera (*Daphné*) by Jean-Baptiste Lully (1632–1687), but the two fought and parted. Although actively writing, he only found approbation with a second set of *Fables* (books 7–11) in 1678–1679. When he was elected to the French Academy in 1683, the king complicated matters for the former client of Fouquet and

withheld royal approval until after Nicolas Boileau-Despréaux (1636–1711) had been admitted several months later. Leading a libertine life well into his sixties, La Fontaine did not change his life or renounce his more scandalous works until after he fell gravely ill in 1693. The next year saw a final book of *Fables*, a year before his death in Paris.

La Fontaine had the nickname of the “butterfly of Parnassus,” as he was often considered to be flighty and disorganized. Anecdotes abound related to his naïveté, lack of seriousness, and inability to hold a decent conversation. But more recently this view has been challenged, and he has been seen as a capable courtier possessed of more skills than previously thought. Meanwhile, his superb mastery of poetic technique has never been doubted.

The two hundred and forty or so fables that he wrote can be considered as various overlapping scenes in the drama of human life. This is presented generally by a brief story of animal conflicts, making the poems allegorical. They need to be applied to human behavior (the wolf represents a certain kind of individual, or even a particular person) before instruction can be drawn. The morals, which are often (but not always) stated, can seem contradictory, or at least tied to a certain situation, when the entire body of fables are read, but the didactic purpose frequently lies in citing one fable for a unique real-life case. The fables are appealing to both children and adults and are linked to the seventeenth century by numerous specific details, but they attain universal pertinence by the general character traits and morals revealed.

The first set of *Fables* was inspired mainly by the Greek writer Aesop and the Roman Phaedrus, while later works were modeled after Bilpay and other non-Western sources. The conflicts between the grasshopper and the ant, the wolf and the lamb, and the tortoise and the hare, among many others, were part of both an oral tradition and a literary one. La Fontaine did not alter the basic stories or outcomes from these sources, but elaborated both the narrative and poetic aspects. A bit of conversation or some detail of clothing or place makes them more dramatic, picturesque, and plausible. As for poetic technique, at a time that valued the alexandrine couplet, La Fontaine displayed great irregularity, as he varied his line lengths and rhyme schemes within

each fable, making them less artificial and predictable.

Both Jean-Jacques Rousseau (1712–1778) and Alphonse Marie Louis de Prat de Lamartine (1790–1869) criticized the *Fables* as being too violent for children or even for adults, who also might mistakenly follow the vices, rather than the virtues, depicted. It is true that the poems often teach by negative example, but their charm has captivated most critics, teachers, and parents for more than three hundred years.

LA METTRIE, JULIEN OFFROY DE (1709–1751), French physician and philosopher. Julien Offroy de La Mettrie is best known for his work of materialist philosophy, *L'homme-machine* (1747). His philosophical works were written early in the French Enlightenment but are among some of the most radical works of that period.

La Mettrie was born in Saint-Malo in Brittany on 19 December 1751, the son of a textile merchant wealthy enough to give him a good education. He attended several provincial colleges, where he was influenced by Jansenism. In 1725 he enrolled in the College d'Harcourt, the first academic institution to make Cartesianism central to the curriculum. La Mettrie then spent five years at the University of

Paris studying medicine. To avoid graduation fees at Paris, he took his degree at the University of Reims. He found his education insufficient preparation for the actual practice of medicine and went to the University of Leiden to study with Hermann Boerhaave (1668–1738), a renowned teacher of physiology and chemistry and an innovative practitioner of clinical medicine. La Mettrie translated many of Boerhaave's most significant works, and in his commentaries on those works, he emphasized the materialistic strand he found in them that provided the foundation for his own medical philosophy. La Mettrie also wrote five medical treatises on specific diseases and public health. His medical experiences led him to lampoon the ignorance and venality of Parisian medical practitioners in thinly veiled medical satires. From these satirical counterexamples, La Mettrie developed his notion of the *médecin-philosophe* who incorporated the astute empirical observation of a surgeon, the thorough training in physiology of an idealistic physician, and the zeal of the reform-minded philosophe. The *médecin-philosophe* could be an agent for reform based on scientific knowledge.

The critical perspective of the *médecin-philosophe* was gleaned from an understanding of the human being based in medicine and physiology. La Mettrie's philosophical works all approached philosophical issues from this perspective. *L'histoire naturelle de l'âme* (1745), his first philosophical work, was a rather conventional discussion of the philosophical treatment of the vegetative and animal souls combined with a materialist view of the human, rational soul, using a materialist reading of John Locke's (1632–1704) *An Essay concerning Human Understanding* (1690) as its source. La Mettrie argued that the human soul could be completely identified with the physical functions of the body and that any claims about the existence of the soul must be substantiated by physiology. Consequently his books were banned, and he was exiled to Holland in 1745. In *L'homme-machine*, La Mettrie not only adopted the engaging style of Enlightenment philosophes, he also applied a thoroughgoing materialism to human beings. Using evidence drawn from anatomy, physiology, and psychology, he demonstrated the effects of the body on the soul and the comparability between humans and animals. His man-machine was active, organic, and

self-moving; his materialism did not distinguish between conscious, voluntary movement and unconscious, instinctive movement. This work was deemed so radical that the tolerant Dutch exiled La Mettrie. He sought refuge at the court of Frederick the Great (1712–1786) of Prussia, where he remained until his early death in 1751.

Several other philosophical works, including *L'homme plante* (1747) and *Le système d'épicure* (1751), compared humans to lower creatures and placed all creatures in the context of the unfolding of matter and motion in an evolutionary process. La Mettrie insisted that the physician's approach to questions, usually treated by theologians and metaphysicians, would be more productive, even on ethical issues. In *Le discours sur le bonheur* (1748) La Mettrie examined the implications of materialism for moral values. He questioned whether moral systems corresponded to human nature as corroborated by his physiological understanding of human beings. Vice and virtue, he concluded, were arbitrarily constructed by society to serve its interests, but those interests were often at odds with the physiological constitution of the individual. He hoped that, by recognizing the arbitrary nature of its moral notions, society would reward a greater array of human behaviors and so alleviate the sufferings of those who were ill disposed to seek happiness in what society deemed virtuous. La Mettrie was particularly critical of both stoicism and Christianity as moral systems, which, he claimed, were based on a distorted understanding of human nature.

La Mettrie saw the *médecin-philosophe* as an agent of rational analysis and social progress and identified with the goals of the early Enlightenment. The philosophes, however, found his materialism, moral relativism, hedonistic ethics, and atheism much too dangerous to espouse. Even other materialists, such as the Baron d'Holbach (1723–1789) and Denis Diderot (1713–1784), did not acknowledge their debt to such a radical thinker. La Mettrie's medical materialism, grounded in the scientific issues of his day, is his most significant contribution to the French Enlightenment and the history of philosophy.

LA RAMÉE, PIERRE DE. See **Ramus, Petrus.**

LA ROCHEFOUCAULD, FRANÇOIS, DUC DE (1613–1680), French writer. A peer of France who later became a leading moralist in the French classical age, La Rochefoucauld, the eldest son of a provincial nobleman and courtier from the Angoumois in western France, was groomed early to inherit the family name, title, and estate. His formative reading centered more upon popular romance than the classical canon, as he acquired his nickname from a character in the serialized novel *Astrée*. Married at fifteen when he was still the prince of Marcillac, he soon embarked upon a military career. Starting in the middle 1630s, he fell in with noble opposition to the ministries first of Cardinal Richelieu (1624–1642) and then of Cardinal Mazarin (1642–1660). During the civil upheavals known as the Fronde (1648–1652), he sided with the rebels against the regency government, and was wounded in battle 9 February 1649. At the unsuccessful conclusion of the Fronde, he made a wary peace with the government, receiving a pension in exchange for renouncing further political intrigue.

From the end of the Fronde until his death, La Rochefoucauld spent his time principally in the social world of Paris, where he was a frequent guest in the salons and where he developed his very considerable talents as a writing stylist. Among his friends and collaborators were the salon hostess the Marquise de Sablé, the novelist Mme de La Fayette, and the worldly Jansenist Jacques Esprit. La Rochefoucauld is known today as the author of three significant works. The *Réflexions diverses* (Diverse reflections), which was only discovered and published posthumously and has never been translated into

English, is a series of essays on taste, sociability, and moral psychology. His *Mémoires* (1662) offer one of the most important accounts of the political factionalism in noble circles in the period up to and including the Fronde. His subtle and nuanced attacks on the motives of some of the principal players of his time, including Cardinals Richelieu and Mazarin and Louis de Bourbon, the prince of Condé, made the work a scandal when it first appeared in the 1660s.

His most important work was the *Maximes*. Growing out of a collaborative salon pastime, this work went through considerable elaboration between its first appearance in 1665 and its most polished edition of 1678. In the *Maximes*, most of the traditional resources of self-control and moral responsibility are depicted as illusory. Fortune triumphs over fortitude, the humors and temperaments win out over character, the passions interfere with reason, and self-love rules all. Even in the least likely corners of the heart and soul, the author traces the effects of self-deception and hidden self-aggrandizement. Some of the maxims seem to debunk the possibility of noble virtues such as courage and perseverance. Others unravel the more private sentiments such as love and friendship. Still others erode the social affections such as gratitude and generosity. “Self-love is the greatest flatterer of them all” (Maxim 2) is a fair sample of the genre.

The sheer scale of the unmasking enterprise, and the prominent role of self-love in it, led contemporaries to a disagreement that has not abated since. Some observers associated La Rochefoucauld with Blaise Pascal (1623–1662), Pierre Nicole (1625–1695), and other Jansenists, that austere movement of religious and moral revival that adopted St. Augustine’s view that grace alone brought salvation, and that what appear to be human virtues are in reality merely variations on the hidden pride and self-interest that move fallen man. Other readers felt that La Rochefoucauld’s systemic, lynx-eyed suspicion covered sacred as well as secular, religious as well as worldly ideals, and that his moral psychology therefore is best seen as a form of reductionism, perhaps even nihilism.

In the eighteenth century, there was a tendency to accept the premise of La Rochefoucauld’s views on the pervasiveness of self-love while drawing more

hopeful conclusions from it. Writers from Bernard Mandeville (1670–1733) to Claude-Adrien Helvétius (1715–1771) saw in the *Maximes* support for an emerging liberal view of society in which the pursuit of private self-interest is conducive to the public good, a view that perhaps culminated in Adam Smith’s *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776). In the nineteenth century, La Rochefoucauld’s most noteworthy influence was exerted on German aphoristic philosophers such as Arthur Schopenhauer (1788–1860) and Friedrich Nietzsche (1844–1900). Nietzsche saw in La Rochefoucauld an admirable specimen of uncorrupted European aristocracy, as well as a method of psychological insight and moral honesty far preferable to the democratizing utilitarianism of his day.

LA ROCHELLE. The primary characteristic of La Rochelle was its isolation. Situated on the Bay of Biscay, the city was all but cut off from the interior by marshland. Yet this very isolation allowed La Rochelle to become one of France's most prosperous towns by the end of the Middle Ages. At the beginning of the twelfth century the port barely existed. It blossomed into prominence with the subsequent expansion of the export trade in wine and salt, a salt yielded in abundance by the encircling marshes. The city also profited from seigneurial rivalries and ambitions to secure an unusual degree of municipal autonomy. It barely paid any royal taxes, and the economic life of the commune was regulated by its one hundred-member council headed by the mayor.

The most dynamic elements of La Rochelle's population of twenty thousand consisted of merchants, shopkeepers, and artisans. Royal authority was nominally represented by the *senechal* (who had the honor of selecting the mayor from three names offered by the council) and from 1553 by a diminutive corps of legal officers. Despite the existence of a number of monastic houses, La Rochelle boasted only five parish churches, and the ecclesiastical hierarchy was weak compared with that of many other towns.

This social physiognomy helps explain the receptiveness of the Rochelais to the Reformed Church. Clerics, artisans, merchants, and municipal and royal officers all adopted the Protestant doctrines, and by 1570 the municipality was firmly attached to the Huguenot cause, providing a virtually impregnable retreat for the Huguenot grandees in times of difficulty. La Rochelle withstood a siege lasting six months in 1573 and emerged from the Wars of Religion with its privileges bolstered. The resulting sense of security almost certainly explains why, as in the southern Huguenot towns of Montauban and Nîmes, the Huguenots sustained their congregations, which embraced the overwhelming majority of the population.

By the 1620s, however, La Rochelle's privileges had become an intolerable barrier to the government's plans to enhance its fragile control of the Atlantic seaboard, an ambition that dovetailed with the renewal of war against the Huguenots. The two processes reached a spectacular climax with a four-

teen-month blockade that culminated in the entry of Louis XIII (ruled 1601–1643) into the city at the head of his troops on All Saints' Day 1628. Reduced by death and desertion to a mere five thousand survivors, La Rochelle emerged into a different world. La Rochelle's municipal institutions and autonomy were destroyed along with most of the city walls. The wealth of its merchants was subject to the soaring fiscal exigencies of the crown, a fact most strikingly brought home by the progressive abandonment of the heavily taxed salt marshes.

It is testimony to the power of the Atlantic economy that the decline in La Rochelle's fortunes was relative rather than catastrophic. By 1675 the population had returned to its former level, and expanding colonial trade together with the growth of the brandy trade compensated for the decline in the quality of the local wines. By 1720 brandy formed 37 percent of total exports, while the West Indian slave trade gave the merchant community a new lease on life.

Yet the effects of royal taxation on a modestly sized town with an inadequate harbor and no major river ultimately could not be avoided. As the populations of Nantes and Bordeaux soared in the decades after 1720, that of La Rochelle declined once more. Although the value of its trade had risen, its share of France's colonial trade declined from 20 percent in 1730 to 7 percent in the 1770s.

LABORERS. Overtime, output schedules, and standardized wares suggest both rapid and regular production. Steady, fast-paced toil also conjures up the factory and mechanized work—and workers. Craft shops and even many mills, with the languid splash of their waterwheels, evoke a more leisurely rhythm of labor, a human pace governed by the hand and readily disturbed by the seductions of the tavern or carnival. A vast divide supposedly separated these two worlds of work, one modern and the other traditional, one in which time is spent and the other in which time was passed (Thompson, p. 359). There is much to commend in this conventional depiction. But the intensification of labor did not await the machine, and in many trades and settings, time became money without Watt’s engine.

WORKSHOP ORDER AND CONTROL

Fashioning a saddle, a wig, or a pewter cup in early modern Europe was often frustrating. When markets turned inviting, petty craftsmen and substantial manufacturers frequently faced idle workbenches and inadequate inventories. Locating ample raw materials, since many were perishable, could be maddening. Papermakers, for instance, engaged in an endless search for white rags, the material base of their reams, but knew that most bales of discarded linen would be streaked with dirt or human filth. At the other end of the process, successful producers of sheets of paper or panes of glass relied on cumbersome, risky portage. Teamsters turned into thieves, or simply abandoned fragile wares in the rain and dropped them on muddy roads. Above all, when demand surged, securing a group of skilled hands or a single man with indispensable know-how was an art in itself. And, once hired, said the masters, these workers rarely toiled with a proper sense of urgency.

Apprentices in the skilled crafts learned their trades slowly, with formal indentures generally last-

ing from three to seven years. Since employment was fleeting, they also learned quickly to labor slowly, which stretched hours and spread work and wages around. After completing their terms, these youths entered restless, spot labor markets, in which bosses discharged printers and stonemasons as soon as they completed a press run or a building. Ever boastful, Benjamin Franklin surely failed to endear himself to his brother workers in a London printing house by sometimes “carr[ying] up and down Stairs a large Form of Types in each hand, when others carried but one in both Hands.” His “constant Attendance” and abstention from Saint Monday, usually observed by pressmen and compositors at an alehouse, “recommended [him] to the Master,” but never to his fellows. When he violated yet another of his comrades’ rules, the “Chapel Ghost,” the guardian of their properties, exacted revenge by “mixing [his] Sorts, transposing [his] Pages, breaking [his] Matter” (Franklin, p. 99–101). In every mechanical art, skilled men sweated mightily to keep their ranks thin, familial, and initiated. Ensuring the appropriate duration of their toil was a crucial element of this mastery. Moreover, the men who enjoyed it did not depend on a foreman’s watch. Legislation from fourteenth-century Verona reveals that the town bell sounded the time to leave for work, the start and conclusion of the noon meal break, the afternoon respite, and the close of the workday (Goldthwaite, p. 290). At the building site of Santo Spirito, a clock chimed every thirty minutes, thereby empowering the workers as much as their masters (King, p. 51).

In 1796, the English Parliament mandated that paperworkers should take thirty minutes to fashion each post of paper, the trade’s production measure, and fabricate twenty posts per day. This clause was never enforced; papermaking went on as it always had, until the pulp ran dry. Meanwhile, French paperworkers traditionally commenced their day’s work in the middle of the night, from midnight to three A.M., and labored into the early afternoon. To economize on candles and oil, the master papermakers of Thiers decided to shut their mills until just before daybreak. Incensed, the paperworkers stayed away from the shops, leaving their bosses surrounded by vatfuls of perishing pulp. The manufacturers turned to youngsters, women, and “workers foreign to the province,” but the scabs

decamped quickly, the masters dismissed the women, and the producers' pleas to innkeepers "to cut off credit to the rebels" failed to bring the strikers to their knees. Despite the state's edict that the journeymen's workdays were to be divided equally around noon, a local official, Mignot, intervened in vain, for the paperworkers bent "neither to threat nor to persuasion." After two months of trouble and idled vats, the Thiernois masters threw in the towel: the paperworkers continued to start their day at three A.M. (Gachet, p. 130). "This is probably not the right hour to pursue a rigorous policy" toward the journeymen paperworkers, Mignot concluded (*ibid.*). Yet skilled paperworkers toiled within a complex division of labor and had an active, stiff-necked association.

Of course, the distance between the skilled man and the unskilled, the *gagne-deniers*, 'penny earners', in France, was not always great and, especially in hard times, could close rapidly. Witness the

twin definitions in eighteenth-century Paris of the term *tonnelier*, at once a cooper and a longshoreman unloading casks of wine (Haim Burstin, "Unskilled Labor in Paris at the End of the Eighteenth Century" in Safley and Rosenband, p. 68). That said, the hod carrier and street sweeper inevitably lacked many of the rights and powers of the skilled guild member, and doubtless possessed less mastery over the time and hours of their work. Still, it was widely recognized that the Auvergnat immigrant to the capital often became a water carrier, the Lyonnais served as a porter, the Savoyard shined shoes and swept out chimneys, and the Norman broke stones. Equally, in 1786, Parisian penny-earners dared to rise against a new company destined to monopolize the delivery of packages in the city and hence displace "established" porters (Burstin in Safley and Rosenband, p. 71). Such men did not expect to labor regularly and likely would have been thrilled with two hundred days (even partial days) of work in a year. Quotas were certainly

distant from their orbit of toil, but they, too, evidently put a price on their labor and knew how to secure—and protect—these precious hours.

THE PACE OF LABOR

So the length of the average early modern European workday will continue to be hard to determine. Unstable employment, seasonal patterns of production, and complicated accounting of time at the bench mandate cautious, cross-trade comparisons. London tailors, after all, labeled their slow summers “cucumber time,” when they could afford little else on which to subsist (Rule, p. 51). In printing, papermaking, and leather breech making, a “day” represented a closely negotiated amount of work rather than a fixed set of hours. Just to assess the earnings of the shipwrights in the royal dockyards of England, John Rule observed, involves the deciphering of the meaning of “treble days, double days, day-and-a-half, two for one, task, job, common hours, nights and ‘tides.’” Worse yet, these words, and hence the toil they depict, often defied conventional definitions (Rule, p. 63). At the far edge of this terminological thicket, consider this vague, but eloquent, rendering of the hatter’s day: “a man goes early and works late” (Rule, p. 55). In fact, when work was available, journeymen on both shoulders of the Channel routinely put in twelve- and fourteen-hour days, and sometimes labored even longer. Parisian blacksmiths endured workdays of fourteen hours in the eighteenth century, while bookbinders sweated for sixteen (Sonenscher, p. 95). Still, in 1776, the willful Josiah Wedgwood admitted, “Our men have been at play 4 days this week, it being Burslem Wakes. I have rough’d & smoothed them over, & promised them a long Xmass, but I know it is all in vain, for Wakes must be observed though the World was to end with them” (Pollard, p. 182). Wedgwood was both angered and puzzled by a problem, from the masters’ perspective, that extended far beyond his pot-bank: why did the laboring poor, so often desperate for work and familiar with punishing hours of toil, respond so peculiarly to the carrots and sticks he proffered? The issue, known to economists as “leisure preference,” can be reduced to a paradox, at least to modern readers responsive to the lure of high pay and other incentives: early modern Europeans tended to cut back on hours and effort when work was plentiful, wages high, and grain prices low. Long ago, Max

Weber provided an explanation for this practice: the worker “did not ask: how much can I earn in a day if I do as much work as possible? but: how much must I work in order to earn the wage which I earned before and which takes care of my traditional needs?” (Rule, p. 52). Eighteenth-century observers were less charitable, instead condemning the dissolute ways of the working classes. Restif de la Bretonne explained that the “dearness of labor” actually threatened a populace that “if it can earn what it needs in three days, only works for three days and spends the other four in debauchery” (Michael Sonenscher, “Work and Wages in Paris in the Eighteenth Century,” in Berg et al., p. 150). An English clothier put it bluntly: elevated rewards had rendered his hands “scarce, saucy and bad” (Rule, p. 54).

High wages, however, had yet to become the order of the day. Put another way, relatively few among the laboring poor enjoyed the chance to respond to the carrot while all too many still felt the compulsion of the stick. This circumstance suited those “low-wage thinkers” who celebrated long hours at flinty pay as the surest means to combat indolence and intemperance. But enlightened thinkers like Adam Smith had reached a different conclusion: “That a little more plenty than ordinary may render some workmen idle, cannot well be doubted; but that it should have this effect on the greater part . . . seems not very probable.” Indeed, Smith added, “Where wages are high, accordingly, we shall always find the workmen more active, diligent, and expeditious” (Smith, pp. 81–83).

CONSUMER CULTURE AND THE “INDUSTRIOUS REVOLUTION”

For high pay to work its magic, however, the laboring poor had to sacrifice their leisure in favor of consumption. Even the butcher, baker, and candlestick maker, who lacked internal promptings to maximize and accumulate, took pleasure in finery or an extra dram. As the Old Regime progressed, the wants of the past—goods that journeymen and penny earners had once dreamed about—were becoming needs. In an era when appearance still remained the measure of a man (and a woman), bourgeois and nobleman alike grumbled about the pretensions of their inferiors. An anonymous memoir from Montpellier, penned in 1768, raged that “The most vile artisan behaves as the equal of the

most eminent artiste or anyone who practices a trade superior to his. They are indistinguishable by their expenditures, their clothes, and their houses” (Darnton, p. 134). Shopgirls now wore silk stockings, and, to the horror of their betters, might be mistaken for persons of quality.

Perhaps the blurring of certain social lines during the twilight of the Old Regime accounted for an exaggerated concern over the ostentation and “luxury” of the laboring poor. If the plight of the casual laborer Louis Bequet, who crowded into one Parisian bed with his wife and five children in 1779, was unusual, cradles and children’s beds remained rare among the common sorts. Nevertheless, cheap knockoffs of muffs, snuffboxes, umbrellas, and countless other items increasingly figured among the inheritances of eighteenth-century workers. As Daniel Roche commented, they were “learning to be consumers” (Roche, p. 127). Nothing symbolized this education more than the prevalence of mirrors in working-class quarters. Here was evidence of a newfound attention to appearance among the popular classes, and possibly a willingness to exchange leisure for adornments. This was fertile soil for the manufacture of time-discipline at the workbench, both inside the factory and outside its gates.

The penetration of this “consumer revolution” into the lower ranks of European society, however incomplete, poses a critical question: if real wages in the eighteenth century were stagnant at best, how shall we account for the widening array of wares present in the inventories of the laboring poor? Jan De Vries has worked out an ingenious solution to this conundrum, which he termed the “industrious revolution” (De Vries, p. 255). This approach rests on careful consideration of the early modern European household as a site of production and as a source of labor power, as well as a web of consumption and distribution. De Vries contends that laboring households in England, northwestern Europe, and colonial America made decisions that enhanced both the supply of commodities and muscle outside the home and the demand for goods purchased in the marketplace. Thus peasants intensified their production for the market, unemployed hands in agrarian regions were increasingly put to work at the loom and the spinning wheel, and women and children performed more waged labor.

BUREAUCRACY, EXPLOITATION, AND EFFICIENCY

While an internal impulse to consume blossomed, it is also likely that a measure of exploitation, especially of women and children, accompanied the secondhand tapestries hanging in ever more households. Wages, however, also may have granted some independence to these women. Perhaps this relatively free hand, plus a taste for what a few extra sous could buy, helped prepare them for their role in the mills and factories of the industrial revolution—a role that submitted them to wearying, regular workdays (when the machines did not break down) of twelve hours or more, six days a week.

To reduce theft and coordinate the sweat and skills of a large number of hands, substantial workshops had systems of labor discipline, including time management, well before the turn to mechanized production and steam power. Unlike lesser hand papermakers, the Montgolfiers, one of the largest producers in late-eighteenth-century France, installed a precisely bounded workday, with quotas for each of the sections of a proper day’s work (Rosenband, p. 108). Consider, too, the Venetian state shipyards, better known as the Arsenal. By 1600, a battalion of administrators supervised this enterprise. They included at least a score of clerks and bookkeepers, as well as nearly one hundred technical and disciplinary figures who oversaw every facet of production. (Of course, all this should not be construed to mean that skilled and unskilled hands alike gave up their dodges, pranks, and capacity to steal rope and timber.) As a result of its organization of production and the Republic’s resources, the Arsenal was renowned for its capacity to turn out considerable numbers of battle-ready warships in a matter of months or even weeks (Robert C. Davis, “Arsenal and Arsenalotti: Workplace and Community in Seventeenth-Century Venice” in Safley and Rosenband, p. 180). Yet much of the work in these yards revolved around traditional skills, with their conventional nomenclature and custom.

A very different project took shape in the English dockyards under Samuel Bentham. Appointed inspector-general of the naval works in 1795, he embraced the quantifying spirit of the Enlightenment, particularly as a tool for the creation of orderly shops. He approached the resources at his dis-

posal with an accountant's eye and sense of efficiency. He also intended to overthrow the journeymen's rule of thumb and settle scores with these overmighty hands. So, his proud widow explained, "He therefore began by classing the several operations requisite in the shaping and working up of materials of whatever kind, wholly disregarding the customary artificial arrangement according to trade." From there, Bentham developed machines "independently of the need for skill or manual dexterity in the workman" (Linebaugh, p. 397). He reorganized and sped up the refitting of ships, introduced a new method for joining wood, and adopted the steam-powered sawmill for the handling of rough timber. This last innovation helped put an end to "chips," the right of journeymen to the shavings and flakes from recently worked wood, which frequently justified the disappearance of much larger pieces from the yards. And he installed the principle of "INCESSANT WORK," as he scripted it—twenty-four-hour shiftwork (Linebaugh, p. 399). Lastly, like the Montgolfiers, who had locked out their veteran hands (and, they hoped, their custom) and trained a bevy of newcomers in the art, Bentham attempted to drown the old ways of the dockyards in a deepened pool of workers. "It is well known," he claimed, "that an increase of the number of workpeople in any business is the most effectual bar to combinations [trade unions]" (Linebaugh, p. 400).

In the Netherlands, guild regulations around 1500 required the observance of forty-seven feast days. With the Protestant reform of religion, this number fell to six (Jan De Vries, "Between Purchasing Power and the World of Goods," in Brewer and Porter, p. 110). Later, the Montgolfiers secured lengthy workyears that doubtless earned the envy of their competitors. Many entrepreneurs, however, remained slow to press for greater time discipline, attributing Bentham's or the Montgolfiers' success to state support, advanced technology, and unusually stable markets (Pollard, p. 192). Still, the pace of manufacture quickened and became more regular at once, despite incomplete shifts and wholesale retreats. As E. P. Thompson acknowledged, "the division of labour; the supervision of labour; fines; bells and clocks; money incentives; preachings and schoolings; the suppression of fairs and sports," gradually accomplished their work (Thompson,

p. 394). So did the new patterns of consumption and market behavior within the households of the laboring poor. After all, the heirs of those men and women saddled with twelve-hour workdays fought for half-Saturdays and the ten-hour day.

LACLOS, PIERRE AMBROISE CHODERLOS DE (1741–1803), French novelist. Little in the life of the military officer offers a clue that Choderlos de Laclos was destined to write one of the most controversial and influential French novels of the eighteenth century. Born in Amiens into the lower nobility, he chose an army career in the 1760s. France was at peace and barracks life was routinely dull. He wrote poetry, erotic tales, and a comic opera, *Ernestine*, which failed when it was produced (1777). In 1779, upon being upgraded to captain and sent to fortify the île d’Aix, he began to form the plan for his novel, *Les liaisons dangereuses*, composed while he was on leave in Paris, and published in 1782. It met with immediate success, and scandal. He quickly took a military assignment in La Rochelle to avoid the controversy, and there met Marie Soulange-Duperré, with whom he had a child before they were married in 1784.

His criticism of French fortifications (1786) made him equally controversial in the military, and he soon left for service as a secretary to Louis-Philippe, duke of Orléans (1725–1785). At this time he wrote several tracts on military and political topics. During the French Revolution he was protected by Georges-Jacques Danton (1759–1794)—a member of the Paris Commune and minister of justice in the new republic—imprisoned, nevertheless, during the Reign of Terror, liberated, and eventually made a brigadier general (1800) by Napoleon Bonaparte (1769–1821). Named to a post in Naples, he died in Italy of dysentery in 1803.

Laclos’s reputation rests on his single novel, *Les liaisons dangereuses*. The plot involves interconnecting attempts at seduction and betrayal within a closed, elite segment of society. The vicomte de Valmont is encouraged by his former mistress, the marquise de Merteuil, to seduce the naive and innocent Cécile Volanges, engaged to a young man, Danceny, upon whom Mme de Merteuil seeks revenge. At first Valmont refuses, preferring, instead, to court the virtuous wife of the President de Tourvel. She appears to be slowly yielding, as the two libertines (Valmont, Merteuil) bitterly ridicule each other. Mme de Merteuil sends Valmont a lengthy lesson in seduction (letter 81) and pretends to be seduced by Prevan. Meanwhile, Valmont, learning that Cécile’s mother warned the president’s wife of his designs on her, decides to accept Mme de Merteuil’s challenge and becomes Cécile’s lover. The president’s wife, still in love with Valmont, finally yields to him. Mme de Merteuil demands that Valmont sacrifice his love for the president’s wife if he hopes to win her back, and the vicomte complies. Rather than finding love, however, the two libertines are at war with each other, and divulge each other’s letters. A young man in love with Cécile is furious and kills Valmont in a duel, Cécile enters a convent, and Mme de Merteuil, disgraced and disfigured by smallpox, flees society, which she had called “that great theater.”

The epistolary novel is structured as a series of personal letters exchanged between the main characters. The lack of a narrator, and the conflicting, competing perspectives presented by the different letter writers creates an open, ambiguous moral tone that shocked many contemporary readers. The work can be seen as promoting seduction through

Choderlos de Laclos. Pastel portrait by Louis Leopold Boilly. THE ART ARCHIVE/MUSÉE DU CHÂTEAU DE VERSAILLES/DAGLI ORTI

Valmont's and Merteuil's presentation of detailed tactics and a rhetoric of temptation, or as condemning this debauchery by the libertines' eventual failure and defeat. The amorality of the seducers, and their victims, is portrayed directly, with a neutrality that made the novel itself appear amoral, if not, indeed, immoral.

The exclusive use of the characters' letters also indicates effectively the hypocrisy of polite society, because they often reveal great differences between public and private conduct. On the one hand is illusion, on the other the reality of Valmont and Merteuil, whom Charles Baudelaire (1821–1867) labeled “a Satanic Eve.” All the characters maintain a virtuous façade, although the tempters reveal their real intentions and devious machinations to each other. The more innocent women reveal by their letters their slow descent as they yield to Valmont. We learn that he seeks not only to corrupt them but to ruin their reputation, as he plans to use their love

letters as proof. When Valmont and Merteuil reveal each other's letters near the novel's end, however, these missives serve as proof of their duplicity and corruption, ruining them and leading to their demise.

Laclos considered himself a follower of Jean-Jacques Rousseau (1712–1778), and we see this not only in the epistolary form of the novel, as in the philosopher's *Julie, ou la nouvelle Héloïse* (1761; *Julie, or the new Eloise*), but also in its content. Rousseau saw society and writing as corrupting influences, opposed to a natural state of purity and oral language. In Laclos's novel, moral degradation and letter writing are inextricably linked. Modern film versions of the novel have considerably extended the work's popularity and influence.

LAGRANGE, JOSEPH-LOUIS (1736–1813), French mathematician. Lagrange, a leading mathematician of the Enlightenment, contributed to a wide range of fields and played a leading role in the establishment of the metric system. Born in Turin to a French family of high officials in the service of the dukes of Savoy, Lagrange was destined for a career in the law. While in his teens he was introduced to the study of advanced mathematics when he read a treatise on calculus by the English astronomer royal Edmond Halley (1656–1742). Lagrange's remarkable mathematical abilities were

quickly recognized, and in 1755, at the age of nineteen, he was appointed professor of mathematics at the artillery school of Turin. He spent the next eleven years in his native city and established his reputation as one of the leading mathematicians in Europe. In 1766 Lagrange left Turin to become the director of the mathematics section at the Berlin Academy, taking over from Leonhard Euler (1707–1783), who had recently returned to St. Petersburg. In 1787, following the death of his patron Frederick II of Prussia (ruled 1740–1786), Lagrange moved to Paris as “veteran” member of the Paris Academy of Sciences. He remained there until his death, and during the tumultuous years that followed, he managed to stay apart from the political fray that absorbed many of his colleagues.

By the age of twenty Lagrange had already made one of his most important contributions to mathematics, the calculus of variations, which he developed along with Euler. Unlike the ordinary calculus, which analyzes the point characteristics of specific functions, the calculus of variations deals with the extremum characteristics of functions as a whole. The work quickly attracted the attention of Pierre-Louis Moreau de Maupertuis (1698–1759), president of the Berlin Academy, who used it to support his “principle of least action” against numerous critics.

Lagrange successfully applied his calculus of variations to many scientific fields. In 1759 he sided with Euler against Jean Le Rond d’Alembert (1717–1783) in the controversy on the proper mathematical representation of vibrating strings. In the late 1760s and the early 1770s Lagrange took part in several prize competitions sponsored by the Paris Academy on questions in celestial mechanics. He won the grand prize several times with essays on the orbit and rotation of the Moon, the trajectories of comets, the orbital perturbations of the moons of Jupiter, and the three body problem in general. After publishing on these and other topics in solid and fluid mechanics throughout his career, he summarized his work in *Mécanique analytique* in 1788. There he proposed to establish mechanics as a series of general formulas whose development would yield the necessary equations for the solution of each specific problem. Lagrange also contributed substantially to debates on the foundations of calculus, promoting a purely algebraic understanding of the

subject as against the geometric views of colleagues such as d’Alembert.

In 1790 the French Constituent Assembly established the Committee on Weights and Measures and made Lagrange its chairman. In this position Lagrange was largely responsible for the adoption and diffusion of the decimal metric system. During the 1790s he taught at the newly established École Polytechnique, and in his later years he worked on revising and republishing his works. During the empire he came under the patronage of Napoléon I, who made Lagrange a count of the empire, a senator, and a grand officer of the Legion of Honor. On his death in 1813 Lagrange was entombed in the Pantheon.

LANDHOLDING. Land was not only the source of most wealth in early modern Europe, but also a fount of political power, social status, and broad legal rights. The concentration of land in the hands of the aristocracy, the gentry, and the church (who constituted roughly 5 percent of the population but collectively owned between 50 and 70 percent of the land in many regions), was the dominant social feature of the age. Landownership of seigneuries or manors (privileged properties) conferred an array of financial and judicial powers over tenants at the local level and was indispensable to maintaining a gentle or noble lifestyle. The enduring symbolic and political functions of landholding were in turn rooted in the central economic role played by land. Agricultural commodities not only

formed the mainstay of the European economy until the end of the eighteenth century, but also directly produced most of the raw materials used in manufactured goods. Within these broad outlines, however, there were significant changes in landholding patterns between 1450 and 1789. The decline of serfdom in western Europe by 1450, the rise of a new village elite of well-off peasant leaseholders by 1550, and new opportunities for investment outside of land during the eighteenth century gradually altered social relationships based on landholding.

PATTERNS OF LANDHOLDING

While the nobility seldom constituted more than 2 percent of the population in western Europe, it owned approximately 40 to 50 percent of the land in many regions. Most noble land was in fact concentrated in the hands of a small minority of that class. In Brittany, approximately 200 of the 2,000 noble families controlled 40 percent of the land. In England, the aristocracy was a tiny but immensely wealthy elite. By the late eighteenth century it comprised about 150 families, who owned 20 percent of the land. But the gentry were collectively the largest landowners in England. Gentry landownership expanded from 25 percent to roughly 50 percent of arable land between 1500 and 1700, at the expense of both church and crown. Landownership was essential for supporting the four main expenses of the gentry and the nobility: buying crown offices, marrying off children, prosecuting lawsuits, and enjoying (as well as displaying) a gentle lifestyle.

From the early sixteenth through the eighteenth centuries, the percentage of land in church hands declined in Europe as a whole. The Protestant Reformation led to the seizure and sale of many formerly Catholic properties in the Holy Roman Empire, Scandinavia, the Baltics, and the Low Countries. In England, the church had owned significantly more land than the crown in 1450, controlling between a fourth and a third of the arable. By the end of the English Reformation, only about 4 percent of the land was left in church hands; almost all properties had gone to private buyers in the gentry or merchant classes.

Despite the predominance of landless or leaseholding peasants in western Europe, there were important pockets of peasant freeholders. In Holland, cultivators enjoyed full ownership rights over exten-

sive lands they had reclaimed from peat bogs, as did some peasants in the central Rhineland. In France, approximately one-third to two-fifths of rural land was in the hands of the peasantry before the French Revolution. But that figure includes land occupied by peasant houses and their garden closes; recent scholarship indicates that their ownership of the arable or open fields was often no more than 10 percent.

RIGHTS ATTACHED TO LANDOWNERSHIP

Landownership conferred a constellation of legal, political, and financial rights on landlords. Kaleidoscopic in their variety, these rights tended to fall into several broad categories. On seigneuries, or manors, they included the right to collect rents, crop shares, and reliefs, or entry fees (on a tenant inheriting or taking possession of a new piece of land); *corvées*, or labor obligations (requiring tenants to farm the lord's domain and repair bridges and roads); and *banalités*, or monopoly fees (for using the lord's grain mill, ovens, or winepress). Noble land held of the crown usually required homage, wardship, and relief to the crown. Across western Europe, however, these obligations generally became less onerous in both monetary and symbolic terms from the sixteenth through the eighteenth centuries. Ground rent, and in some regions, crop shares, became the central relationship between landlords and tenants.

The most politically symbolic group of rights were those of justice. Most seigneuries carried rights of low or middling justice, which allowed the landlord to adjudicate rent disputes and minor delicts. The most powerful seigneuries carried the right of high justice, which allowed them to hear cases meriting the death penalty. In some regions manorial or seigneurial justice faded in importance during the seventeenth and eighteenth centuries, especially in northwestern Germany and in England, where jurisdiction was absorbed by local justices of the peace or by the state. In other regions, like Normandy, landowners' high justices remained an important complement to the state's judicial system.

PROPERTY LAW AND PROPERTY RIGHTS

Landownership was almost always subject to the rights and usages of multiple parties in early modern Europe. Most villages included common lands that provided timber, reeds, or grazing grounds for the rural community and that were essential to the sur-

vival of the poorest inhabitants. Disputes over ownership of the village common lands and wastelands, as well as over usage rights like hunting, fishing, pasturing, and gleaning, were a source of endless litigation and frequent popular protest. In England, twin enclosure movements in the sixteenth and eighteenth centuries dramatically changed multiple property rights. Two-thirds of English arable land had been enclosed by the beginning of the eighteenth century, and most of the remainder was enclosed between 1750 and 1790. The loss of the common lands sent thousands of destitute rural laborers into London and other cities for work.

The transition from multiple-use rights to private property rights in land was gradual at best. The British Parliament passed hundreds of private bills granting clear-cut property rights to landholders in the eighteenth century. In France and Spain, however, the crown was powerless to alter provincial property laws or to enforce enclosures of common lands. Early modern legal codes prevented landowners from freely disposing of their properties in other ways, too. Customary, royal, and Roman laws on land inheritance were all carefully designed to prevent the fragmentation of estates (and of political authority) among the landed classes throughout Europe. The law of entail in England (fee entail), like the customs of France (*preciput*), ensured that noble and gentry properties could not be willed away from the legal heir. Ultimately, laws guarding the integrity of land ensured the landowning classes' continuing political and social dominance through the eighteenth century.

ZOË A. SCHNEIDER

LAS CASAS, BARTOLOMÉ DE (1474–1566), Spanish historian and missionary. Bartolomé de Las Casas was a missionary, Dominican theologian, historian, and bishop of Chiapas. In 1493 he saw Christopher Columbus pass through Seville on his return from the first voyage across the Atlantic. That year Las Casas's father, Pedro de Las Casas, and his uncles sailed with Columbus on his second voyage. Las Casas first traveled to the Western Hemisphere in 1502 to manage the land Columbus gave his father. Like other colonists, Las Casas at first gave no thought to the *encomienda* system of royal land grants that included Indians to work the fields in exchange for educating them in Christianity.

Returning to Europe in 1507, Las Casas was ordained a priest in Rome. He returned to the West Indies and in 1513–1514 served as chaplain to the invaders during the conquest of Cuba. After that campaign he was awarded additional land. Upon listening to a sermon by a Dominican father denouncing the treatment of Indians, Las Casas relinquished his holdings to the governor.

Las Casas returned to Spain to plead the Indians' cause before King Ferdinand II (ruled 1479–1516). With the support of the archbishop of Toledo, Las Casas was named priest-procurator of the Indies in 1516. He returned to the Western Hemisphere as a member of a commission of investigation. During 1520 he developed an alternative to the *encomienda* system in Venezuela with a colony of farm communities. After the failure of this idealistic scheme to get Spanish farmers to work alongside free natives, Las Casas joined the Dominican order in Santo Domingo during 1522.

Over the following decades Las Casas ceaselessly promulgated an ideological position that Indians had the right to their land and that papal grants to Spain were for the conversion of souls, not the appropriation of resources. Developing into a politically astute lobbyist, he was often able to effect positive change, such as insuring a peaceful entry into Guatemala by Dominican friars. During 1544 he was named bishop of Chiapas in Guatemala to enforce the “New Laws” of Emperor Charles V (ruled 1519–1556), which prohibited slavery and limited ownership of Indians to a single generation. The settlers objected to any limits, and many clergy

would not follow the new bishop's lead. After the king rescinded the prohibition on inheritance, Las Casas resigned his office in 1547 and returned to Spain.

This tireless "Defender of the Indians" crossed the Atlantic ten times in all. After he published his *Brief Relation of the Destruction of the Indies* in Seville during 1552, a flood of hectoring books followed. In 1550 he came into conflict with Juan Ginés de Sepúlveda (1490?–1572 or 1573), a scholar who was attempting to gain the right to publish a book approving war against the Indians. Las Casas appeared at a debate before the Council of Valladolid, where he spoke for five days straight. He influenced the committee not to approve his opponent's book for publication.

Las Casas's massive *History of the Indies*, finished in manuscript during 1562 but unpublished until 1875, incorporates an invaluable abstract of Columbus's now lost first logbook. The book demonstrates a prophetic intent to reveal to Spain that the injustices of its colonial rule would lead to a terrible punishment at God's hand. His example influenced both Simon Bolívar (1783–1830) during the nineteenth-century revolt against colonial rule and Mexicans during their struggles for independence.

Spanish patriots condemned Las Casas for helping create with his tireless propaganda a "Black Legend" that Spaniards were exceptionally cruel. The English published a translation of the *Brief Relation* when they were about to seize Jamaica. Another edition was issued by the U.S. government during the Spanish-American War to justify taking Spain's island possessions.

Las Casas has been applauded by proponents of human rights. In all his actions and writings he operated, however, from an unexamined theoretical foundation that maintains that Catholic Christianity is God's chosen creed for all people, and thus the argument with his opponents was primarily over the means to that conversion. In this sense the Indians were treated by him as wards who were allowed no doctrinal choice. Enemies in his time and some later scholars have argued that Las Casas shaped the truth as he wished it to be, exaggerating statistics about the loss of life and sometimes writing about places he had never been. Some recent estimates of the population of the mainland and islands argue that

Bartolomé de Las Casas. LIBRARY OF CONGRESS

the loss of life was originally higher than even Las Casas believed, and so the decline was much steeper than he estimated. It has also been shown that some of his remarks about areas outside the scope of his observation were drawn from official reports. He and his writings continue to be controversial, but he remains a key figure in historical scholarship about human rights.

LASSO, ORLANDO DI (c. 1532–1594), Franco-Flemish composer. Born in Mons, in what is now southern Belgium, Lasso spent much of his youth in Italy. From about 1544 until 1549, he was in the service of Ferrante Gonzaga (1507–1557), generalissimo of Holy Roman Emperor Charles V in Italy, France, and Flanders, and traveled with him to Mantua, Palermo, and Milan, after which he worked in Naples and then Rome, where he was choirmaster at San Giovanni in Laterano in 1553–1554. According to his first biographer, Samuel Quickelberg, Lasso returned to the Low Countries in 1554 to see his ailing parents, but they had died before he reached Mons. He may have traveled to England and France with Giulio Cesare Brancaccio, a Neapolitan nobleman. By late 1554 he was in Antwerp, where he oversaw the publication in 1555 of his first music book, his so-called Opus 1, an anthology of madrigals, *villanesecas*, chansons, and motets; and that same year, Lasso's first book of five-voice madrigals was printed in Venice. Lasso had found support in Antwerp from the wealthy Genoese merchant community for publishing his Opus 1, and from the powerful ecclesiastic Antoine Perrenot de Granvelle for his next publication, a book of his five- and six-voice motets, issued in 1556. Thus began a long series of active collaborations between the composer and his various publishers, in which Lasso exercised strong entrepreneurial control over the dissemination of his music.

In 1556, he was invited, on the recommendation of Granvelle and of Augsburg banker Johann Jakob Fugger, to serve in Munich at the court of Albert V, duke of Bavaria, first as a singer and by 1563 as choirmaster. Lasso remained at the Munich court until his death in 1594. In 1558 he married the daughter of a Bavarian court official; their offspring included two sons, Ferdinand and Rudolph,

who became musicians. Lasso's duties at court included recruiting singers, training the choirboys, overseeing the duke's daily entertainment, and composing music for religious services and special occasions. Under Lasso's leadership, the chapel grew in size, the duke spending extravagantly on his musicians. The most celebrated event during Lasso's tenure was the 1568 marriage, after difficult negotiations, of Albert's son William V to Renée of Lorraine. Lasso wrote music and supervised performances for the festivities, and he himself played a role in a commedia dell'arte production, according to a description by chronicler Massimo Troiano. Correspondence between Lasso and his patron reveals the composer to be learned and witty, and on friendly terms with the duke. Lasso chose to stay on at the court after the death of Albert, despite a much reduced musical chapel; Albert had made provisions that Lasso would continue to receive his salary for the rest of his life. Two miniatures by court painter Hans Mielich (c. 1516–1573), included in a Munich Staatsbibliothek manuscript, provide valuable performance scenes of Lasso with his musicians.

Lasso was perhaps the most prolific and versatile composer of his era. His output of sacred music includes about sixty Masses—most modeled on motets, chansons, or madrigals—hymns, canticles (including more than one hundred Magnificats), Passions, Lamentations, and other polyphony for the Divine Offices, and more than five hundred motets that span religious works, humorous and ceremonial compositions, didactic pieces, and settings of classical or humanistic texts. Notable is his collection *Prophetiae Sibyllarum*, featuring highly chromatic settings of Latin humanistic texts preserved in a manuscript from about 1560 but published posthumously (1600), and *Dulces Exuviae* (1570), a setting of Dido's lament from Virgil. The large amount of polyphonic music written for the Divine Offices suggests that these were celebrated with great solemnity at the Munich court.

His secular works include approximately 175 Italian madrigals and lighter *villanesecas*, some 150 French chansons, and about 90 German lieder. He set Italian texts by Petrarch (1304–1374), Ludovico Ariosto (1474–1533), and Jacopo Sannazaro (1456/58–1530), among others, and French poems by Clement Marot, Pierre de Ronsard (1524–1585), Joachim du Bellay (c. 1522–1560),

and Jean-Antoine de Baïf (1532–1589). These pieces are highly varied in style, spanning most of his productive career.

Lasso's music was the most widely disseminated of any composer, his works having been reprinted frequently during and after his lifetime. He was honored just after his death with the monumental motet collection *Magnum Opus Musicum* (1604), assembled by his two sons. Lasso is noted for his close attention to expressing the meaning of words through chordal declamation, sometimes alternating with contrapuntal writing, clear harmonic progressions, and finely crafted thematic material. His influence was far-reaching: his works provided the basis for innumerable parodies, especially of his well-known spiritual chanson *Susanne un jour*. Lasso's rich use of text painting in sacred music served as a precedent for German Protestant composers during the early seventeenth century, and helped establish Germany as a mainstream compositional center. Venetian composers Andrea Gabrieli (c. 1532/33–1585) and Giovanni Gabrieli (c. 1554/57–1612) both studied in Munich under

Lasso, where they assimilated his style of polychoral writing.

KRISTINE K. FORNEY

LATE MIDDLE AGES. The fourteenth and fifteenth centuries were difficult ones in European history. The demographic growth and prosperity that had characterized the High Middle Ages gave way to plague, famine, social upheaval, and rampant warfare. The crises altered the structure of European society.

PLAGUE AND FAMINE

The signal event of the era was the Black Death, which struck Europe in 1347/1348, and returned periodically for much of the next hundred years. The contagion is believed to have originated in central Asia. It moved westward along the silk route and was pushed to the Black Sea by Mongol horsemen. Genoese traders encountered the disease at their colony of Caffa in the Crimea and transported it to western Europe, to the city of Messina in Sicily, in November 1347. It subsequently appeared in Pisa and Genoa, and then spread throughout the peninsula and the rest of Europe, traveling as far north as Iceland and moving back east through Islamic lands. It did not subside until the end of the fifteenth century.

There are few precise figures for the number of deaths. Contemporary chroniclers gave graphic descriptions of heaps of dead bodies piled in public areas but often exaggerated the losses. The standard agreement is that from one-third to one-half of Europe died of the plague and its recurrences. But the disease did not strike all towns and regions the same way. The city of Florence may have lost as much as three-quarters of its population. Milan, by contrast, probably lost no more than 10 to 15 percent. Bohemia also likely lost only 10 percent of its population.

The plague struck Europe at a time when it was already suffering the effects of a series of bad harvests. During the last decades of the thirteenth century, agricultural production in numerous areas had declined significantly. The boundaries of productive land reached their limits, and peasants worked marginal plots with diminished returns. Records from the estates of Winchester, an important grain-producing area in southern England, show that there were declines in yields of wheat, barley, and rye after 1250. Wheat yields were also down in German lands and in northern France. Evidence exists that the European climate changed on the eve of the fourteenth century. Winters and summers became colder and wetter. A series of crop failures occurred at the beginning of the century, followed by a widespread famine from 1315 through 1317. The effects of this famine were felt particularly in urban areas, which relied on outside imports of food. The commercial town of Bruges lost 5 percent of its population in six months; the cloth-producing town of Ypres lost 17 to 20 percent of its population. The mortality elsewhere in Europe may have reached as high as 10 to 25 percent, though such figures are disputed. Some scholars, chief among them the English economic historian M. M. Postan and his French counterpart Emmanuel Le Roy Ladurie, have cited the decreased yields and famines as evidence that Europe experienced a “subsistence” or “Malthusian” crisis, which preceded the plague and indeed paved the way for it. The interpretation remains at the core of a lively debate.

The dramatic loss of population affected the European economy. In general, the price of labor rose, while land values declined. The former helped the peasant class, which could now demand salaries for its labor; the latter hurt the nobility, whose

wealth was derived from the profits of its estates. Authorities moved to forestall the changes—which threatened the traditional structure of society—by instituting wage and price controls. King Edward III in England’s famous Statute of Laborers of 1351 ordered prices and wages frozen at pre-plague levels, forbade the movement of peasants from farms, and, to augment the labor force, required beggars to find work. Governments in France, Aragon, Castile, and elsewhere issued similar legislation. Economic historians tell of a “scissors effect,” particularly after 1375, in which the price of wheat fell with respect to manufactured goods. In addition, the overall volume of trade declined. Exports of wine from Bordeaux declined from 100,000 tons in the first decade of the fourteenth century to 13,000 to 14,000 tons at the end of the century. The port of Genoa, one of the most active throughout the Middle Ages, experienced dramatic declines across the board.

The European economy was also affected by two important, though less-studied, factors: a shortage of bullion and the disruption of trade routes to Asia resulting from the advance of the Ottoman Turks. By the last decades of the fourteenth century the rich silver mines of central Europe and Tyrol, the source of much of the coin that sustained the earlier economic expansion, had become exhausted. They revived only toward the end of the century, with the help of new technology, and soon became augmented by the flow of specie from the New World. The Ottomans supplanted the Mongols, the traditional middleman between Europe and the East. Despite a reputation for ferocity in war, the Mongols had long been friendly to Christian traders. The Ottomans were less so. The Turkish presence expanded steadily, and in 1453 they took the great port city of Constantinople.

Scholars have long debated the broader meaning of the demographic crises and shifts in trade. Did they bring economic “depression” or did they result in a “new equilibrium,” in which the standard of living, particularly among the wage-earning classes, improved? The disagreement has been particularly heated for Italy, the most commercially sophisticated part of Europe. Evidence exists on both sides. The city of Florence, for example, compensated for a decline in the overall production of wool cloth, its principal manufacture, by moving more

forcefully into higher-priced silks and luxury cloth. Florence's banking industry, the international leader, all but collapsed just prior to the plague, but restructured itself, and emerged more resilient. Florentine bankers introduced the idea of limited liability, thus protecting themselves from losing more than what they invested in their businesses, and sought new markets. They remained closely attached to the papacy, a continuous source of money even in the worst of times. On the other hand, the evidence for the city of Genoa suggests that the decline in the volume of goods passing through its ports exceeded the decline in population and was not compensated for by other business ventures.

WARFARE

Demographic crisis and economic change occurred against a backdrop of warfare. In Italy, where fighting among numerous autonomous states in close geographic proximity was already commonplace, the recourse to violence increased markedly. The city of Milan embarked on a series of aggressive campaigns that involved virtually all of the peninsula. This and other wars continued through the middle of the fifteenth century. In 1454, Italian states signed the Treaty of Lodi, bringing a temporary cessation of hostilities. But the truce was tenuous and at times ignored. The French under Charles VIII initiated a new round of warfare when they invaded Italy in 1494.

The most famous war of the era was the Hundred Years' War, which was fought between England and France in episodic fashion from 1337 until 1453. Much of the fighting took the form of destructive marches known as *chavauchées*, in which English armies rode through the French countryside burning houses and fields, inflicting heavy economic damage. The English scored impressive battlefield victories at Crécy (1346), Poitiers (1356), and Agincourt (1415). The victories resulted in large part from superior English tactics, which included taking the defensive posture, descending from horses to fight on foot, and use of the longbow. The longbow could be fired more quickly than the traditional crossbow, yet still had impressive striking power. English archers sent thick volleys of arrows, which blunted French cavalry charges. The French clung to old methods, which corresponded to established chivalric codes of behavior, and were

thus slow to respond to the English challenge. Their fortunes turned with the advent of Joan of Arc (c. 1412–1431), a young peasant girl who rallied local armies. By 1453, the French had expelled the English from all but Calais.

The Hundred Years' War was followed in short order by the Wars of the Roses in England (1455–1485) and the Burgundian wars in France (1470–1493). Both were essentially dynastic struggles arising from disputes within the ruling elite. In the Holy Roman Empire a series of bitter wars broke out between the emperor and religious dissenters, the Hussites. In Spain, attempts to retake land from the Muslims, the Reconquista, were ongoing; the kingdom of Aragon was involved in the Italian Wars through connections in southern Italy. Popes spearheaded crusades against the Muslim Ottomans. The crusade to Nicopolis in 1396 ended in a humiliating defeat for the Christians.

Some scholars have directly linked the increase in warfare and violence to the crises of plague and famine. In a study of eastern Normandy, Guy Bois argues that declines in feudal rents led lords to search for additional sources of revenue. They hired themselves out as soldiers and exerted pressure on their overlords to wage wars. The wars themselves helped accentuate the effects of the other crises. Armies burned crops, which exacerbated famine, and they moved from region to region, thus spreading plague. The need to keep armies in the field for prolonged periods of time hastened the end of the old feudal system of mutual obligation and accelerated the recourse to wages. English scholars speak of a "bastard feudalism" arising from the Hundred Years' War.

SOCIAL AND POLITICAL UPHEAVAL

Europe experienced at this time numerous revolts by the lower classes. The uprisings were stimulated not by abject misery, but by a general improvement in the lot of the poor, which inclined them to seek still more from the upper classes. One of the earliest rebellions occurred in the commercially advanced region of Flanders. Artisans and peasants refused to pay taxes. The revolt, aimed at the gentry class, was soon joined by weavers in Bruges and in Ypres. The weavers briefly took control in Bruges, but the insurrection was ultimately put down by a French royal army in 1328.

A revolt known as the Jacquerie broke out in Paris in 1358. Peasants, known derisively as “Jacques,” a generic name for commoners, rose up against their lords, who had been unable to protect them from the ravages of roaming bands of soldiers during the Hundred Years’ War. The bands had burnt local villages and exacerbated the already profound fiscal burdens brought on the peasantry by the war. In 1356 King John II (d. 1364) had been captured by the English in battle and the nobility, obliged to ransom him, attempted to shift some of the responsibility onto the peasantry. The peasants went on a rampage and, as in Flanders, were joined by artisans. But as in Flanders, the nobles ultimately crushed the rebellion.

Perhaps the most spectacular revolt occurred in England in 1381. It too grew out of tensions over taxation. The English government imposed a series of unpopular flat or “poll” taxes to help pay for the war. These fell disproportionately on the lower classes, and with the enactment of the poll tax of 1381, artisans and peasants rose up, stormed London and outlying villages, killed the archbishop of Canterbury, and nearly toppled the young King Richard II (ruled 1377–1399). The rebels expressed egalitarian ideas, some of the most radical of the period. Their famous slogan ran thus: “When Adam delved and Eve span, who then was the gentleman?” They demanded the abolition of serfdom, the commutation of services for rents, and the elimination of the poll tax. Like their predecessors, however, they were eventually crushed by the nobility.

The most successful uprising of the period happened in Florence in 1378. Members of the lower rung of the wool cloth business, the so-called *ciompi*, rose up against the town government. They called on authorities to set minimum production levels in the cloth industry, thus ensuring their employment. They also sought representation in government, the right to form their own guild, and the elimination of monetary speculation by the wealthy classes. The uprising succeeded, and the *ciompi* dominated Florentine government for three years until it was swept aside by what some scholars have called a “patrician regime.”

CHURCH CRISES

The church experienced some of the most profound crises of the era. The great institutional battle between kings and popes, with deep roots into the Middle Ages, took a dramatic turn at the beginning of the fourteenth century. The French King Philip IV (ruled 1285–1314) vied with Pope Boniface VIII (reigned 1294–1303) over the issue of taxation of the clergy. Philip sought money from the clergy to wage his wars; Boniface objected and issued the famous bull *Unam Sanctam*, stating in bald terms the primacy of papal authority over that of kings. Philip responded by repudiating the pope and sending men to intimidate the elderly pontiff. The exchange represented a low point in papal prestige. Boniface died shortly thereafter and Pope Clement V moved the papacy in 1309 to Avignon in France, initiating the so-called Babylonian Captivity. The papacy remained in Avignon for nearly seventy years. Pope Gregory XI returned to Rome in 1377, but died the next year. Under pressure from a Roman mob, the conclave chose an Italian, Urban VI. Alarmed French clerics, claiming they had been coerced, repudiated the choice and elected a Frenchman, who took the name Clement VII. There were now two popes. The English, at war with France, supported the Italian pope; the Scots, at odds with the English, supported the French claimant. A conciliar movement, rooted in the work of the Italian doctor and theorist Marsilius of Padua (c. 1280–c. 1343), sought to end the dispute by means of a church council. One such assembly met at Pisa in 1409. But the two popes refused to cede authority and for a brief time there were three popes. The schism was ended at the Council of Constance (1414–1418).

If the split in the papacy increased the cynicism of European Christians, so too did the plague, famines, and other disasters of the era. Some contemporary writers spoke of the coming of the four horsemen of the apocalypse. Giovanni Boccaccio (1313–1375) in the introduction to his *Decameron* described how some citizens in Florence let go all restraint, ate too much, drank too much, and lived for the day. Others responded in precisely the opposite way, seeking refuge in their faith. The great Dutch historian Johan Huizinga speaks of a “somber melancholy” that descended upon European society. Clerics were often the first line of

defense against the plague, comforting those who fell sick and burying those who died. Consequently they themselves died in large numbers, leaving a crisis in leadership and a dearth of qualified men.

Popular religious movements flourished. Flagellants appeared in German and Spanish lands. Men and women formed long processions, publicly whipping themselves in an effort to gain absolution from God. The groups often preached anti-Semitic doctrine, blaming Jews for the contagion. They acted without the consent of the established church and were ultimately condemned by the pope. In England and Bohemia respectively, John Wycliffe (c. 1320–1385) and Jan Hus (1372/1373–1415) preached clerical poverty, the subordination of church to state, and the primacy of scriptures in faith. Both were condemned; Hus was burned at the stake at the Council of Constance, despite royal assurances that he would not be harmed. But the doctrines of Wycliffe and Hus continued to attract followers after their deaths.

THE BALANCE

Amid all the crises and difficulties, there were positive developments. War necessitated taxes, and taxes brought complaints. But taxes also facilitated the emergence of more centralized nation states, enabling kings to consolidate their sources of revenue, expand royal bureaucracies, and strengthen court systems. France initiated a permanent army in 1422 and King Louis XI (ruled 1461–1483) set in place the first reliable system of royal taxation. Henry Tudor, the winner of the War of the Roses, became Henry VII and increased both his legal and fiscal authority. Meanwhile, the shortage of manpower resulting from the plague hastened technical labor-saving innovations, chief among them the invention of the printing press. The movements of the Ottomans and the difficulties trading with the East encouraged overseas explorations, which led to the discovery of the New World. The wars and dislocations in Italy coincided with an intellectual and cultural flowering, which produced writers such as Petrarch (1304–1374), Boccaccio, and Lorenzo Valla (1404–1457), and artists such as Masaccio (1401–1428), Donatello (1386?–1466), and Brunelleschi (1377–1446).

WILLIAM CAFERRO

LATIN. Latin continued to be taught, studied, and even spoken in the early modern period. Knowledge of Latin was a sign of social prestige. It was the international language used to conduct the day-to-day business of church and state. It was, above all, the language of the educated and governing classes. University courses were taught in Latin, scholars wrote in Latin, and most official correspondence was conducted in Latin.

Latin remained a living language throughout the Middle Ages and into the early modern period. Medieval Latin, however, differed considerably from the language spoken within the Roman Empire. New words had filtered their way into the language to meet the needs of political, ecclesiastical, and academic institutions, which were almost entirely medieval products. Words had changed

meaning over the centuries, some of the grammatical rules had been altered, vernacular words had crept in, and spelling and pronunciation were inconsistent. Efforts were made by humanist scholars to stress the importance of classical Roman authors, particularly Cicero, Virgil, and Horace, as models for their own writings. Medieval Latin was considered by many humanists to be barbarous in comparison with the elegance of classical Latin. Not all scholars agreed, however. Many expressed their concern that an emphasis on the beauty of pagan classical Latin would corrupt the church and its theology.

Lorenzo Valla's (1407–1457) ambitious *Elegantiae linguae latinae libri sex* (printed 1471; Six books of the elegances of the Latin language) was a widely circulated work that proposed such reforms. Valla, like Desiderius Erasmus (1466?–1536), never advocated a slavish imitation of the classical authors. Other humanists, however, were proponents of Ciceronianism, the view that Cicero, considered by many to be the best Latin author of the classical world, should be the model for contemporary Latin usage. This meant that Ciceronians would only use words and constructions found in Cicero's writings. This movement was especially popular in Rome since Ciceronian language lent the majesty and authority of imperial Rome to the ideology and theology of the Renaissance papacy.

New Latin grammars were written with the hope of replacing the popular medieval grammars, such as the *Doctrinale* (c. 1199) of Alexander de Villa Dei, but this did not achieve wide success until the second half of the sixteenth century. Likewise, medieval spellings of certain words continued to be used into the sixteenth century despite efforts to restore the classical spelling. Latin pronunciation, too, varied significantly from region to region, as speakers tended to follow the norms of their mother tongue. Therefore, when Englishmen, Germans, and Italians were in the same room, they spoke Latin to each other, but with such different pronunciations that they sometimes could not be understood. The Italian pronunciation was most widely accepted because many people studied Latin in Italy, where they acquired this pronunciation.

By the seventeenth century, however, the attempts by humanists to restore classical Latin became overshadowed by the rise of the vernacular

languages and the discoveries of the scientific revolution. Many European vernacular languages, such as French, English, and Italian, were highly developed and had become classical languages in their own right by this time. Each could boast of their own great writers, such as Dante (1265–1321) and Shakespeare (1564–1616). Furthermore, people still had to come up with new words to describe the new discoveries in science and technology that surpassed those of the Romans. Although scholars of the scientific revolution were trained in classical Latin, the number of academic works written in the vernacular began to increase rapidly. For example, Galileo Galilei (1564–1642) published some of his scientific results in Italian, Isaac Newton (1642–1727) in English, and Gottfried Wilhelm von Leibniz (1646–1716) in French. It took a long time before Latin was altogether replaced by the vernacular languages. In the early modern period, the choice of Latin still offered a writer several advantages. First, a work in Latin reached a broader audience since Latin was an international language. Second, Latin offered a more stable and standardized medium, while the vernacular languages were in a state of flux and changing rapidly. As society changed, the need for knowing Latin declined, and by the nineteenth century the vernacular languages had all but taken over.

MILTON KOOISTRA

LAUD, WILLIAM (1573–1645), English clergyman and archbishop of Canterbury. The only son of a master tailor in Reading, Laud was educated at St. John's College, Oxford, of which he became a fellow in 1593. He was ordained an Anglican priest in 1601 and rapidly became controversial, being criticized by the vice chancellor of Oxford, Henry Airay (d. 1616), in 1606 for preaching sermons that were regarded as containing popish opinions. He was strongly opposed to the prevailing Calvinist trend in the Church of England and hoped to restore some of the pre-Reformation liturgy. Laud was closely associated with the Arminian tendency within the Church of England. Arminianism, an anti-Calvinist doctrine that attacked the rigid Calvinist views on predestination, was prevalent both in the Church of England and among its Puritan critics in the 1610s, and gained even more influence in the 1620s when Richard Neile, bishop of Durham, became principal church adviser to James I (ruled 1603–1625). A protégé of Neile, whose chaplain he became in 1608, Laud advanced rapidly. He was elected president of St. John's College, Oxford, in 1611, and became dean of Gloucester in 1616 and bishop of St. David's in 1621. His influence grew under Charles I (ruled 1625–1649), and he was promoted to the bishopric of Bath and Wells in 1626 and to that of London in 1628. He also became dean of the Chapel Royal and, in 1629, chancellor of the University of Oxford. In 1633 he became archbishop of Canterbury.

Once he became archbishop, the preaching of Calvinist doctrine in England was limited, as Laud sought to enforce uniformity on a church that had been, in many respects, diverse for decades. In 1633, at Laud's prompting, Charles I wrote to the bishops instructing them to restrict ordination to those who intended to undertake the cure of souls, an action that resulted in the suppression of Puritan lecturers. He was unwilling to offer to Puritan clerics the possibility of only occasional compliance with the regulations, and he insisted that parish churches should match the more regulated practice of cathedrals.

This authoritarianism compounded what was regarded by the Puritans as the offensive nature of Laudian ceremonial and doctrine—not least its stress on the sacraments and church services that

emphasized the cleric, not the congregation, and made the altar rather than the pulpit the center of the service. As dean of Gloucester, Laud had moved the communion table to the east end of the choir, a measure seen as crypto-Catholic. He also bowed whenever the name of Jesus was pronounced and bowed toward the east on entering a church. Arminianism was seen as crypto-Catholic (and thus conducive to tyranny) by its Puritan critics. Although Laud rejected claims that he was a crypto-Catholic, he was widely referred to by Puritans as the “pope of Canterbury.”

Laud was an active opponent of Puritan views, opposing, for example, Puritan strictures on the staging of plays and on activities on Sundays. He responded harshly to Puritan criticisms and writings. Laud was also active in government and was added to the Commission of the Treasury and to the Committee of the Privy Council for Foreign Affairs in 1635. He supported the promotion of clerics in the government and was delighted in 1636 when his friend Bishop William Juxon of London was made Lord Treasurer. Laud's attitude toward the Scottish church played a major role in the breakdown of Charles I's position in Scotland, and thus in the eventual collapse of royal authority. Laud actively backed a new prayer book and new canons for the Scottish church, and, when opposition was voiced in 1637, he persisted in enforcing his reforms. In 1639–1640, he was also a supporter of war with Scotland, a war that was to prove disastrous.

Laud, who had introduced new canons proclaiming divine right kingship in 1640, was to be a victim of the reaction against Charles I. He was impeached by the Long Parliament in December 1640 and committed to the Tower of London the following March. His trial for treason did not begin until March 1644; members of the House of Lords were hesitant about the charge, which they felt had been forced on them by the Commons. As a result, proceedings were brought against Laud alleging that he had tried to subvert the fundamental laws, to alter religion as by law established, and to subvert the rights of Parliament. After his request that the harsh character of the execution for treason be commuted was finally accepted, Laud was beheaded on Tower Hill on 10 January 1645.

An obstinate and difficult man, Laud bore part of the responsibility for his own downfall; he failed to comprehend the growing trend toward Puritanism and the intense hostility aroused by his treatment of those who disagreed with him, both of which contributed to the crisis of trust that led to the outbreak of the Civil War. He became a martyr figure for the “high” tradition of the Church of England.

JEREMY BLACK

LAVOISIER, ANTOINE (Antoine-Laurant Lavoisier; 1743–1794), considered the father of modern French chemistry and the discoverer of oxygen. Born to a family of notaries and lawyers, Lavoisier was raised in the comfort of bourgeois Paris and attended the Collège Mazarin, where he studied literature, rhetoric, and the natural sciences. Intended for a legal career (he received his law degree in 1763 and several prizes for rhetoric), he early on moved first into mineralogy, traveling with Jean Étienne Guettard of the Academy of Sciences, and then into chemistry, following especially the public courses of the controversial Guillaume-François Rouelle at the Jardin du Roi. He was accepted at a very early on into the Academy of Sciences, of which he would be a lifelong and tireless member.

At a young age, Lavoisier felt that chemistry was a science filled with unclear names and confused theories, and he was committed to resolving it into a science as systematic as Newton’s physics. From 1763 to about 1770, he slowly elaborated his famous principle that “nothing is gained and nothing is lost” in chemical reactions, that is, that conservation of mass defines the conceptual closure of chemical experiments. He also demonstrated that water is

not an element by separating it into hydrogen and oxygen and then reversing the process. During the “crucial year,” 1772–1773, he identified oxygen (and hydrogen) as elements and set the stage for the chemical revolution that disproved the phlogiston, or fixed-fire, theory of chemistry. In 1787 he and his disciples sealed their success with the *Method of Chemical Nomenclature*, a controversial reform of the field of chemistry based on Condillac’s definition of a science as a perfect analytic language. Lavoisier’s *Elements of Chemistry* of 1789 united the reformed nomenclature with the principles of closure-determined experimental observation and his definition of the chemical element. From the early 1780s he also worked with Laplace (1749–1827), studying the chemistry of respiration and theorizing that metabolism is a form of combustion. In this way he prepared the way for much of nineteenth-century biochemistry.

Lavoisier’s life was not limited to chemistry, however. Although he had inherited a fortune sufficient for financial independence, he was a shy, serious young man, not given to public displays of brilliance or adept at social climbing. His marriage to the fourteen-year-old Marie Paulze, daughter of one of the members of the infamous General Farm, a quasi-governmental organization that collected the taxes from the French subjects for the crown, provided him with the social connections and the additional financial resources needed to join the oligarchy of Enlightenment meritocrats attempting to reform the French state under Louis XV (ruled 1715–1774) and Louis XVI (ruled 1774–1792). Lavoisier’s training as a lawyer served him well at the tax farm and as a collaborator with Turgot (1727–1781) on proposals to reform the French economy. Dupont de Nemours (1739–1817) introduced him to the Physiocrats, and Lavoisier applied his scientific and economic theories to real-world experiments in agriculture (using experimental farms in his tax region to test the utility of crop rotation), prison reforms, analyses of the quality of the water of Paris, proposals for lighting Paris, and comparisons of hot-air versus hydrogen balloons for military observations and scientific investigations.

During the French Revolution and until the 1793 abolition of the Academy of Sciences, Lavoisier turned the sciences to the service of the republic. He was tireless in establishing a Bureau of

Weights and Measures and the adoption of the metric system. He ran the in-town saltpeter factory that provided France (but only after his chemical improvements) with sufficient gunpowder to fight the counterrevolutionaries. With Condorcet (1743–1794) he proposed a structure for a secular public education, in part based on his experience of the reform of chemistry through its nomenclature: He believed that a French language freed from the confusion, superstition, and historical connotations of *ancien régime* ideology would create a new type of republican citizen and guarantee the economic security of the modern technological state.

He was, nonetheless, sent to the guillotine with the other *fermiers généraux* on 8 May 1794. His wife and chemical disciples had circulated letters and petitions to show how much the “father of French chemistry,” as he was called, had been useful to the Revolution. The answer given them is famous: “the Revolution has no need of scientists.” The Reign of Terror fell only three months later, and the posthumous rehabilitation of Lavoisier as the ideal citizen-scientist went hand-in-hand with the dismantling of Robespierre’s (1758–1794) terrorist state.

CANON LAW

The basic elements of canon law were the *Decretum* (c. 1140) and the *Decretales* (1234). The *Decretum* (The concordance of discordant canons), compiled by a monk named Gratian, brought together materials related to the law and the administration of the church from a wide variety of sources in a dialectic fashion, in order to create a uniform body of law for

the universal church. The *Decretales* (The Gregorian decretals) consisted of approximately two thousand decretal letters, judicial decisions, that various popes issued between the mid-twelfth and the early thirteenth century. Eventually several smaller collections were added as well: the *Liber sextus* (The sixth book of decretals; 1298); the *Constitutiones Clementinae* (The Clementine constitutions; 1317), and the *Extravagantes a Johanne Papa XXII* (Decretal letters of Pope John XXII; 1325). The last brief collection was the *Extravagantes communes* compiled at the end of the fifteenth century.

In addition to texts in the *Corpus iuris canonici*, canon law also contained commentaries based on glossing the texts. Initially brief marginal comments explaining unusual words and phrases and referring the reader to related materials elsewhere, the glosses grew longer and more detailed. By the mid-thirteenth century there existed a standard commentary, a *Glossa ordinaria*, on the *Decretum* and one on the *Decretales*. These provided a kind of basic textbook based on the writings of a number of early canonists. Subsequently, many canonists wrote longer commentaries, not simply defining obscure terms and citing related materials but writing at length on substantive issues raised in the texts. Some of these commentaries contained in effect brief legal treatises on points of law and even political theory. The most extensive of these commentaries was that of Johannes Andreae (c. 1270–1348).

The period 1140–1378 was the golden age of canon law, the period when the law was fully formed and produced its greatest thinkers. Scholars judge the post-1378 period in the history of canon law as sterile, an era when commentators repeated thoughts of their predecessors without adding significantly to the law. Part of the reason for this division was that after 1325, papal judgment letters, decretals, were replaced as the basis of the law by decisions of the other papal courts, especially that known as the Rota. Nevertheless, canonists continued to produce extensive commentaries on the *Decretales*, often running to several volumes, that have received little scholarly attention although there is evidence that they deserve more extensive analysis. John F. McGovern has argued that many early modern economic concepts that Max Weber and others associated with the Protestant Reformation had in

fact existed in the works of fifteenth-century Italian canonists.

During the sixteenth and seventeenth centuries, the Protestant Reformation and the Catholic response to it had a significant effect on the development of canon law. The major effect of the Reformation was that canon law was no longer the recognized law of Christian Europe. Now only Catholic countries recognized canon law, and even in those countries agreements between Catholic rulers and the papacy granted wide powers to the rulers in return for supporting the papacy, agreements that restricted the jurisdiction of the law. Such agreements, concordats, effectively limited the role of the papacy and therefore of the canon law within Catholic kingdoms. The agreements often required the papacy to seek royal permission before circulating statements on ecclesiastical law and doctrine. The climax of this development came with the Peace of Westphalia (1648), which ended the religious wars in Germany. The pope was not invited to send a representative to the negotiations that led to the peace, and Pope Innocent X (1644–1655) condemned the treaty but to no avail. This marked the end of the role of the pope and of canon law in the international relations of Europe.

Within the Catholic community, there were important developments regarding canon law. In response to calls for codifying the canon law to bring all of the disparate materials of the law into a coherent body of law, Pope Pius V (1566–1572), taking advantage of Renaissance humanist scholarship, created a commission composed of cardinals and scholars with a mandate to examine the various manuscript copies of the materials of canon law, to correct errors, and to excise materials that had been added to the original texts. The result was the *Corpus iuris canonici* (Body of canon law), the official law of the Roman Catholic Church until 1918.

Another source of development in canon law in the sixteenth century was the Council of Trent (1545–1563), which generated a series of canons designed to respond to issues that the Protestant reformers had raised. Overall, the canons and decrees of Trent reinforced the institutional structure of the church, the sacramental system, and the power of the papacy, seeing the reform of the existing church structure as central and rejecting the

Protestant argument that the entire ecclesiastical structure, including the canon law, had to be eliminated.

From the perspective of Christian daily life, the most important of the canons of Trent was Tametsi (1563) dealing with marriage law. This decree restated the Catholic position that marriage was a sacrament and subject to ecclesiastical regulation, in opposition to the Protestant view that marriage was fundamentally a civil matter. Tametsi required parental consent, witnesses, formal recording of the marriage, and a blessing by a priest. This ended the older practice of secret marriage entered into by two persons without witnesses, a situation that caused a great deal of confusion for the ecclesiastical courts. Finally, Tametsi forbade secular rulers from interfering in any way with the freedom of their subjects to marry as they wished, thus stressing the right of the individual to enter a marriage without compulsion, a right protected by the requirement that the marriage ceremony be celebrated publicly and in the presence of witnesses.

Martin Luther (1483–1546) famously illustrated the Protestant opinion about canon law when he publicly burned volumes of the law along with other materials that he saw as corrupting the Christian faith by stressing the letter rather than the spirit of Christianity. Protestants rejected the Catholic sacramental system and the entire clerical structure headed by the pope so that it was possible to reject canon law as well. Even those Protestant countries that did retain some elements of canon law rejected any papal role in its functioning.

It was not only the Protestant Reformation that affected the role of canon law in European society in the early modern era. As modern states began to emerge, secular governments also began to take responsibility for marriage and family law, for cases involving wills and probate, and other matters that had previously been within the jurisdiction of the church and canon law. The canon law connected with these activities became the basis of secular law in these areas even in Protestant countries. As a result, one of the most important areas of scholarly research in modern times has concerned the appropriation of canon law by secular lawyers and political theorists in the early modern world. This scholarship has focused attention on three aspects of the

development of canon law in the early modern era: the conciliar movement, canon law in the expansion of Europe overseas, and marriage law. In each of these areas, the work of the canonists contributed to the shaping of modern political and legal concepts.

The conciliar movement, a fifteenth-century movement to reform the institutional structure of the Catholic Church, played an important role in subsequent discussion of representative government, because the canonists had wrestled with problems associated with the governance of large communities, the relation of the ruler, that is, the pope, to a representative institution, the council, and the nature of representation within a political community, issues that in the seventeenth century lay at the heart of political debate throughout Europe. Careful analysis of early modern political and legal texts has uncovered not only concepts developed by the canon lawyers but the language of the canonists as well.

A related concept that developed from the debates of the canon lawyers was the notion of the ruler as sovereign and then the application of that concept to the emerging nation-state, making the state answerable to no outside authority. This had emerged in the canonistic tradition as the canonists discussed the powers of the pope and the emperor. The canonists had rejected imperial claims to jurisdiction over all other Christian rulers, arguing instead that Christian kings possessed within their own kingdoms the power identified with the imperial office. Subsequent writers, such as Jean Bodin (1529–1596), whose *Six Books of the Republic* is usually identified as the initial modern work on the concept of sovereignty, drew heavily on the canonistic tradition in his work.

Finally, in spite of Luther's burning of volumes of the canon law, Protestant churches also employed at least some elements of the canon law tradition. The Church of England was perhaps the most notable example of continued use of the canon law and church courts in a variety of matters, but as recent scholarship has indicated, Lutherans also used elements of canon law. Elements of the medieval canon law can also be found in the major works of John Calvin, whose *Institutes* and *Ecclesiastical Ordinances* reflect a highly legal conception of

church structure, a conception rooted in the writings of the thirteenth-century canonists.

COMMON LAW

The common law was generally defined as the unwritten law, or *lex non scripta*, of England. It derived its authority from immemorial usage and "universal reception throughout the kingdom," as phrased by Sir William Blackstone (1723–1780) in his *Commentaries on the Laws of England* (1765–1769). The common law was contrasted with written statutory laws enacted by Parliament. For some, like Sir John Davies (1569–1626), it was "nothing else but the Common Custome of the Realm" (preface to *Reports*, 1612). Indeed, the *De Laudibus Legum Angliae* (c. 1470; In Praise of the laws of

England) of Sir John Fortescue (c. 1395–c. 1477) declared that "the realm has been continuously ruled by the same customs as it is now." Most, however, found it more accurate to describe the system as customary in origin. As Sir Edward Coke (1552–1634) put it in the preface to the eighth volume of his *Reports* (1600–1615), it was "the grounds of our common laws" that were "beyond the memorie or register of any beginning." By the mid-seventeenth century, Sir Matthew Hale (1609–1676) made it clear that the "immemoriality" of the common law did not imply that it was unchanging, it only indicated that the precise origin of institutions (such as Parliament and the jury) and rules (notably of landed property) predating 1189 could not be traced. Their continued existence carried the presumption of both original and continued popular consent. As Hale wrote in his *History of the Common Law* (1713), the common law was "singularly accommodated" to the "Disposition of the English Nation" and "incorporated into their very Temperament," while also reflecting their experience.

As Coke pointed out in the first volume of his *Institutes of the Laws of England* (1628–1644), there were "divers laws within the realme of England," including the prerogative law of the crown, the canon law practiced in the ecclesiastical courts, and the maritime law administered in the Admiralty. However, as John Selden (1584–1654) put it, "There are no laws in England but are made laws either by custom or act of parliament" (*Commons Debates*, 1628). These "particular laws" were included in the definition of *lex non scripta*, because their authority in England derived, according to Hale, from "their being admitted and received by us" either through statute or "by immemorial Usage and Custom in some particular Cases and Courts." They were subject to the control of the common law, which sought to keep their jurisdiction within its accepted boundaries or even, as in the early seventeenth century, to restrict them. Besides these particular laws, the *lex non scripta* also encompassed local and particular customs. Local customs, which originated in local practice in derogation from the general rules of common law, were recognized and enforced in the common law courts, but only if they were immemorial, continuous in usage, certain, and reasonable. Particular customs such as

the custom of merchants (*lex mercatoria*) were also said to be part of the common law. In court, if any doubt arose about what the custom was, the evidence of merchants was received to inform the court.

In the first half of the seventeenth century common lawyers fearful of the ambitions of the Stuart monarchy challenged the idea that law derived from the commands of a king, whose authority came either from divine right or conquest. For them, the common law was a “fundamental law” derived from an ancient constitution, limiting the power of the crown and guaranteeing the freedoms and rights of the English, most particularly to their property. In the case of *Prohibitions del Roy* (1607) Coke declared that the law as administered by the judges was “the golden met-wand and measure to try the causes of [the] subjects,” while in the *Case of Proclamations* (1610) it was ruled that the king’s proclamations did not have the force of law. The legal debate over the existence of an “absolute” power in the king to act according to his idea of what the public good required in emergencies continued to be debated in a legally inconclusive way in a number of causes célèbres in the early seventeenth century. But the vision of the constitution espoused by common lawyers prevailed in the later seventeenth century and was secured by the Bill of Rights in 1689.

Such was Coke’s veneration of the common law that he stated in 1610 that it could even declare void a statute “against common right and reason” (*Dr. Bonham’s Case*). Before the outbreak of the English Civil War in 1642, lawyers sometimes described Parliament as a court, implying that statutes might be seen as judgments or declarations of the common law. More usually, however, lawyers from Coke to Blackstone described Parliament’s power as “transcendent and absolute” (Coke, *Institutes*) and not liable to judicial review. In doing so they did not expect (and did not see) an active, interventionist legislature. Legislation that was passed amended and modified the common law, rather than displacing it. Parliament was therefore seen as part of the common law’s world rather than as a threat to it. Just as the common law grew from the consent of the people as manifested in custom, so statute was seen to come from current consent. It was a fundamental rule of the constitution, constantly reiterated, that the crown could neither change the law

nor impose taxation without consent. It was this that made England (in Fortescue’s terms) “a government not only regal but also political.” As Hale put it, all legislation was a “tripartite indenture” between king, lords, and commons, rather than the mere will of the king or the people. The notion of the mixed constitution, founded on a presumed ancient original contract reconfirmed in 1689 and conferring unlimited power on the crown-in-Parliament, was generally accepted in mid-eighteenth-century England. However, when Parliament began in the 1760s to tax colonists who were not represented at Westminster, American lawyers invoked Coke’s rhetoric from *Bonham’s case*, arguing for the existence of a higher law to control the legislature. Where parliamentary sovereignty became the cornerstone of the British constitution, the American constitution of 1787 recast the old ideas of a fundamental law.

THE COMMON LAW IN THE COURTS

In a narrower sense, the common law was the body of law administered in Westminster Hall by the twelve judges of the three superior courts of law. These were the Common Pleas, whose position as the prime court for civil suits had been secured by the Magna Carta (1215) and which continued to attract most civil litigation until the early eighteenth century; the King’s Bench, which originally dealt with crown business (including criminal matters) and had jurisdiction to correct errors from other courts of record; and the Exchequer of Pleas, which originally dealt primarily with revenue matters. By the later Middle Ages, thanks to procedural changes designed to attract litigants, these courts had a largely concurrent jurisdiction, and the King’s Bench gradually became the most popular court. The common law administered in these three courts contrasted with “equity” as administered primarily in the Court of Chancery. The Chancery was originally a court of conscience, concerned with securing justice in individual cases rather than following strict rules. There were some complaints in the sixteenth and seventeenth centuries about the certainty of the common law being undermined by the interference of the lord chancellor. It was argued that one chancellor’s conscience might differ from his successor’s, just as the length of their feet did. In 1614–1616 an unsuccessful attempt was made by Coke to assert the supremacy of the common law courts over the

Court of Chancery. However, after the Restoration, when Heneage Finch, earl of Nottingham, was lord chancellor (1675–1682), the court began to develop a more fixed set of principles and rules, which were further developed by Philip Yorke, earl of Hardwicke (lord chancellor, 1737–1756). By the eighteenth century, the old antagonism between the systems had gone. With a distinct procedure and set of remedies, the Chancery was able to develop a jurisdiction over matters to which the common law remained blind, most notably trusts. It thereby made up for the shortcomings of the common law, but its rules and doctrines presumed the existence of the common law, which it modified in particular contexts.

While common lawyers saw their law as based on immemorial custom, they also described it in terms of reason. As Coke put it in the *Institutes*, “reason is the life of the Law, nay the common law itself is nothing else but reason.” By this he meant not the “natural reason” of every man but the “artificial reason” of lawyers, obtained by long study and experience. Knowledge of the law was a specialized enterprise, which had to be left to lawyers, and “if all the reason that is dispersed into so many several heads were united into one, yet he could not make such a law as the Law of England is.” This law was seen to be both developing and unchanging. On the one hand, its core principles were seen as timeless. On the other, its details had been, as Coke stated elsewhere, “refined and perfected by all the wisest men in former succession of ages and proved and approved by continuall experience to be good & profitable for the common wealth.”

Rather than directly reflecting the customary practices of the people, most of the law applied in the courts to the end of the eighteenth century had been created and developed in the judicial forum. The common law had originated in the reign of Henry II (ruled 1154–1189) not as a set of substantive rules, but as a set of institutions and procedures to enforce rights whose substance was defined by community custom. However, with the development both of a legal profession and of the jury in the thirteenth century, new legal norms emerged by which custom was rapidly turned into law, which then developed within the courtroom. Since the jury’s function was to decide questions of fact, mat-

ters of the law had to be settled by lawyers and judges. In the later Middle Ages, when the process of pleading was flexible, judges avoided making clear determinations of substantive law, preferring to get the parties in uncertain cases to reformulate their claims to reflect the common understanding of what the law was. In this era, the law was often seen in terms of the “common erudition” of the lawyers, as debated at the Inns of Court as well as in the courtroom. By the sixteenth century, however, when pleading had become more formal, judges began to be more confident about making clear statements of law. Law was now often settled, after the determination of facts by the jury, by motions debated on the bench at Westminster Hall after a trial had taken place at the assizes.

In elaborating the law, judges assumed that the common law already contained within itself the answers to any questions they might be asked. They saw their function as being to declare what the law already was, rather than to make new law. In order to maintain certainty, they were expected as far as possible to follow the reasoning of earlier cases. Since cases were seen to be evidence of the law rather than law itself, no doctrine of binding precedent emerged in this period. Nevertheless, from the sixteenth century onward, law reports were produced that clearly set out the substantive decisions, in a way not done in the medieval Year Books, and lawyers such as Edmund Plowden (1518–1585) and Coke now published reports that sought to illustrate the principles of the law. Until the mid-eighteenth century most published law reports were the unreliable results of speculating publishers, but manuscript reports circulated widely and were often quoted in court. Principles, or maxims, could thus be obtained by a process of induction from the *ratio decidendi*, or reason for the decision, of earlier cases. Besides applying the principles and maxims thus obtained, judges were also expected to extend the reason of one case to another by a process of analogy. However, judges did not only derive their law from precedent or analogy, for in novel cases they were free to resort to arguments drawn from natural law, public policy, or convenience.

COURTS

Early modern law courts were multifunctional institutions whose reach extended far beyond the judicial branch of government. Throughout Europe, they held a wide range of administrative, governing, and policing powers, frequently making them a main channel of state administration. In eastern Europe, the courts were closely fused to the state bureaucracy and operated as the secure tools of crown authority. In western Europe, courts enjoyed varying levels of independence from the sovereign, but they nevertheless were active in maintaining daily order in both villages and state. Given the complex nature of early modern society, the judiciary was a key mechanism for conflict resolution not only among individuals, but among classes, estates, and orders. Law courts also served as a central elevator for social mobility. Buying or acquiring offices in the royal courts was an important stepping-stone into the gentry or the nobility, conferring honor, influence, and sometimes titles on the officeholder. Finally, judges served as the protectors of common law, customary laws, and privileges on behalf of society, and often actively defended those traditions against the encroachments of increasingly powerful sovereigns. Judges and lawyers in the courts were thus at the epicenter of several early modern rebellions and revolutions, including the French Fronde (1648–1653), the English Civil War (1642–1649), and the French Revolution (1789).

The law courts proved to be one of the most flexible and useful tools of governance available in western Europe, and the use of both elaborate law codes and a widespread court system to govern is one of the key factors in the development of the early modern state. Local seigneurial and royal courts helped to make village communities and towns largely self-governing, while provincial and regional courts often helped oversee the administration of large territories. At the pinnacle of the state, sovereign courts negotiated the privileges and competing claims of nobles, officials, and corporations. Despite the intense interest in recent decades in early modern crime and punishment, the vast majority of European courts' business was the regulation of civil society through contracts, laws, and customs. Courts thus provided limited opportunities for ordinary people to resolve their most press-

ing problems, especially those of family, property, and community, in a civil forum.

ORGANIZATION OF COURTS

The organization of the law courts in continental Europe was byzantine, full of overlapping jurisdictions that reflected both the organic growth of courts over time and the reality of competing claims to judicial sovereignty. Almost all European states had three major independent court systems: ecclesiastical courts to judge the religious crimes of clerics and parishioners, seigniorial or manorial courts that delivered justice to tenants (including the right to impose the death penalty for landlords exercising high justice), and state courts, which gradually began to encroach on the jurisdictions of the other two. Church jurisdiction eroded significantly from the sixteenth through the eighteenth centuries in many countries, but sovereigns faced a steeper challenge in dismantling the private jurisdictions of landlords, for whom courts were considered part of their property and family honor.

Outside of these three major systems, however, most corporations like towns, guilds, and officers' corps had the right to regulate their own members through internal courts and statutes. An enormous volume of early modern litigation was also resolved through formal and informal adjudication outside of the court system, though often brokered by notaries, lawyers, or even judges from the law courts.

SOVEREIGN OR SUPERIOR COURTS

Well before 1450, superior or sovereign courts had emerged out of the medieval king's household (the *curia regis*) in many states. They developed into professionalized resident law courts that enjoyed relatively high degrees of independence on a day-to-day basis. In France, the sovereign Parlement of Paris was installed on the Île-de-la-Cité by 1300 and remained there even when the royal court was itinerant. Peers of France had the right to have their cases heard there in the first instance, and the court's judgments were unappealable (save to the king himself). The parlement's real strength, however, lay in the extent of its geographic and legal jurisdiction. The court could judge any civil or criminal case in its extensive domain (the lands originally held by the Capetian kings, about one-third of France) and heard appeals from the lower courts, making it one of the most inclusive jurisdictions in

Europe. The parlement also had the right to register royal edicts before enforcing them, which gave magistrates opportunities to delay legislation or to remonstrate with the king. Although the *parlementaires* could neither legislate nor veto royal laws, they did issue a wide variety of administrative *arrêts* ('decrees') that gave them broad authority over public order.

The system of parlements was gradually extended to new provinces as they were added to the realm. In many recently acquired provinces, like Burgundy (1477) and Normandy (1499), existing ducal courts were simply transformed into sovereign parlements. By the late eighteenth century, France had thirteen parlements, each sovereign within its own jurisdiction. The Parlement of Paris, however, remained the superior member of the court system, and was often looked to for legal precedents. France thus had an extraordinarily dense corps of sovereign magistrates; there were roughly 240 *parlementaires* in Paris in the eighteenth century, and another thousand in the other sovereign courts.

By 1400 the French crown had appointed five varieties of sovereign courts to deal with different types of cases. Apart from the parlements, there were three sovereign financial courts: the Court of Aids (*Cour des Aides*) for tax cases, the Chamber of Accounts (*Chambre de Comptes*) for royal accounting disputes, and the Court of Monies (*Cour de Monnaies*) for monetary cases like counterfeiting. (Provinces with parlements typically had one or more of these sovereign financial courts as well.) Finally, the Grand Council decided jurisdictional disputes among the other courts and heard special political cases. Outside of these formal courts, the king, in his role as God's judge, always retained the right to hear cases, render judgment, and grant pardons in exceptional circumstances. For the most part, however, early modern French sovereigns increasingly left judging to a trained corps of jurists and lawyers.

One of the most prominent features of the French sovereign courts was that judgeships were both venal (bought by the official, sometimes for princely sums) and hereditary. Repeated fiscal crises of the French crown had early on led kings to the expedient of selling offices in their own administration, a habit that proved impossible to break. In

Law: Courts. *A Judge and Three Advocates*, eighteenth-century painting by an artist of the Venetian School. GALLERIA DELL'ACCADEMIA, VENICE, ITALY/BRIDGEMAN ART LIBRARY

1604 Henry IV (ruled 1589–1610) allowed royal officers to pass offices on to their heirs or sell them in exchange for an annual fee (the *paulette*), equal to one-sixtieth of the office value. Because of the high status of judging, it became axiomatic that the highest judgeships should only be held by nobles. Judgeships in the sovereign courts (all *parlementaires* and Masters in the Chamber of Accounts, for example) endowed personal nobility on their holders and eventually hereditary nobility on their families. The result was the emergence of a powerful “nobility of the robe” (for the long robes they wore in office), which became an increasingly wealthy, educated, and sometimes politically fractious elite. Robe nobles from the sovereign courts played important roles in the revolt of the Fronde as well as in the French Revolution in 1789, but they were an essential part of the backbone of national and provincial order in less contentious times.

Other continental regions experimented with different forms of sovereign courts. In the Holy Roman Empire, the Diet of Worms (the imperial parliament) created an imperial supreme court in 1495, an appellate bench for both territorial and

urban jurisdictions. The magistrates also claimed original jurisdiction over a variety of civil and criminal cases, including cases involving corporations, cities, estates, and crimes against the state. In practice, however, the more powerful states of the empire continued to claim sovereign jurisdiction and did not recognize the imperial court’s authority. Below the supreme court were a series of weaker imperial courts that were often regional in jurisdiction, and whose cases were increasingly appealed to the supreme court. As in France, these multiple appellate layers provided litigants with numerous political and legal avenues for pursuing their cases, and with abundant opportunities to exploit rivalries between jurisdictions.

England’s law courts were far more successfully centralized than most continental courts. Three types of superior courts were based in and around London, each specializing in a different type of law: common law courts, equity courts, and royal prerogative courts. The three main royal courts sitting at London’s Westminster Hall, the King’s Bench, the Court of Common Pleas, and the Exchequer, primarily practiced common law. By 1500, Com-

mon Pleas was the busiest jurisdiction in England, hearing nearly fifty thousand cases a year at its peak. The court possessed jurisdiction over most civil cases, including property, rents, and debts. King's Bench originally enjoyed criminal jurisdiction, but its civil jurisdiction was expanded after the 1530s, allowing it also to hear the common pleas from most of England. By 1600 the two courts' civil jurisdiction was similar, although King's Bench still heard only one-third as many cases as Common Pleas. The Exchequer had its own small court for revenue cases or debt, but few litigants had the right to plead there until the late 1600s. Despite the centrality of the Westminster courts, there was a remarkably small group of judges on the bench: there were only about fifteen sovereign judges in England. Once points of law had been settled by the courts at Westminster, most cases returned to the counties to be tried by jury in the assize courts. All three superior common-law courts were united in the nineteenth century.

Apart from the central common-law courts, and developed partly in opposition to them, were the crown's prerogative courts. The infamous Court of Star Chamber, along with the Court of High Commission, allowed crown and church to investigate and prosecute powerful nobles or ecclesiastics outside of common law. (Most sixteenth-century cases tried in the prerogative courts actually involved powerful subjects prosecuting one another, but the courts were notoriously used by Archbishop Laud to prosecute nonconformists in the early seventeenth century.) Lastly, the Court of Chancery in London administered equity law to litigants and appellants. Equity (considered a branch of reason) gradually evolved into a formal set of legal principles by 1700 and was integrated into the common law by 1800.

During the legal revolution of the seventeenth century, England's superior court structure was radically streamlined. In 1641 Parliament abolished the prerogative courts, including Star Chamber, High Commission, and Requests, along with the royal court of wards and legal enclaves that had long been under the jurisdiction of the Councils of the North and of Wales. This streamlining of the law courts reflected an increasingly unified sovereignty under the leadership of Parliament in England, and it furthered an increasingly dominant common law.

In eastern Europe, law courts were more firmly integrated into the bureaucracy and had considerably less freedom of action than in most western states, but in the eighteenth century both Frederick II of Prussia (1748; ruled 1740–1786) and the Habsburgs in their own provinces (1749) gave the judiciary a more independent identity. Frederick II no longer allowed the bureaucracy to involve itself in judicial cases, and the Habsburgs set up a new ministry and supreme court, the Oberste Justizstelle, to distinguish justice from administration more clearly. In both states, however, there was a far less developed structure of rights, privileges, and laws outside the control of the crown or bureaucracy than in most western states. In Russia, the senate had evolved into a judicial body under Peter I (ruled 1682–1725), but in practice it heard only cases of the nobility. Moreover, Russian *ukazy* ('imperial decrees') and government ministry orders were neither codified nor published, making it difficult for any organized study of the law to develop. Repeated attempts to codify Russian law by Peter I, Elizabeth (ruled 1741–1762), and Catherine II (ruled 1762–1796) between 1700 and 1767 all came to naught. Local justice was dispensed to Russian serfs on their estates through land courts, and landowners were essentially a law unto themselves. Under such conditions, a relatively independent judiciary never developed into a key institution of civil society.

LOCAL COURTS

Law courts frequently became the main channel of local administration in western Europe during the sixteenth and seventeenth centuries. As the nobility deserted the countryside for the allure of royal courts or cities, the mantle of daily authority settled naturally on the shoulders of royal judges in many regions. In France, a pyramidal structure of local courts spread out beneath the sovereign courts (the parlement, Cour des Aides, and Chambre des Comptes) within each province. The main line of the judiciary ran from the provincial parlement to the lower appellate courts (the *présidiaux*, established under Henry II [ruled 1547–1559]) and from there to the bailiwick courts (*bailliages* in the north of France, *sénéchaussées* in the south and in Brittany). Bailiwicks were medieval jurisdictions that varied greatly in size, but they averaged roughly a hundred parishes by the later seventeenth century.

In many regions there was a final layer of petty royal courts (*vicomtés*, or ‘viscounts’, or *prévotés*, ‘provosts’) under the bailiwick courts.

Each of these local royal courts heard both civil and criminal cases and could judge customary, royal, and Roman laws. (There were some jurisdictional distinctions between them; civil cases involving large sums of money were heard first in the *présidial* or in the parlement, for example.) Each royal court was required to have a judge (*lieutenant général*) and a royal attorney (*procureur du roi*), but most attracted a full complement of assistant judges, councillors (*conseillers*), and royal lawyers (*avocats du roi*), all venal offices. This meant that France’s judiciary was perhaps the densest bureaucracy in early modern Europe, with provinces like Normandy or Brittany supporting several thousand officials and functionaries each.

Most royal judicial officials enjoyed considerable independence from the crown. While the state provided letters accepting candidates into office, in practice almost all local offices were passed between individual buyers, without the intervention of the crown. The king did set minimum educational requirements for judges and attorneys, but the corps accepting them was supposed to inquire into their qualifications, morals, and religious practices, allowing them to vet (and sometimes reject) candidates for a variety of reasons. Lower court offices tended to be significantly less expensive than judgeships in the sovereign courts, but they did not confer personal or hereditary nobility on their buyers. (Nevertheless, a significant number of bailiwick judges were already noble before buying a judgeship.) In theory, all lower court cases could be appealed up from the bailiwicks to the *présidial* or parlement, but in practice only infamous criminal cases and civil cases involving officers, nobles, or wealthy elites tended to be appealed there. The vast majority of litigation was settled within the bailiwick (jurisdiction of a lower-court judge).

The authority of local judges was considerable by the seventeenth century. In France, bailiwick judges and king’s prosecutors were often the only resident royal officers in the countryside. They became administrators par excellence, supervising matters as diverse as the upkeep of bridges, roads, and chimneys, tavern hours, bread riots, and public

order in general. They also policed markets, prices, and the guilds, performing essential economic regulation. In many regions they held minor military responsibilities, too, for raising the militia. Above the bailiwick judges, the magistrates in the provincial parlements (in tandem with the provincial Estates where they existed), also exercised a broad governing role in the countryside. But these magistrates only rarely intervened in local administration outside of the city where the parlement resided, and the bailiwick remained the central unit of local governance. Unlike in England, there was relatively little interaction between the sovereign courts of parlement and the lower courts that served the majority of the population. The professional and social gap between the two main levels of the judiciary widened after the middle of the seventeenth century, leaving local judges little role to play in national affairs.

Alongside the main royal courts in France, there were hundreds of specialized jurisdictions handling everything from tax cases (the *élections*), crimes on the high roads, and army deserters (the *maréchaussée*, or mounted constabulary courts) to woods and waters cases (*eaux et forêts*, or water and forest courts). In one district that covered a third of Normandy, there were more than seventy special royal jurisdictions outside the main (parliamentary) branch of the judiciary. These were further complicated by more than 228 seigneurial high justices and dozens of ecclesiastical courts, but the confusion was more apparent than real by the middle of the seventeenth century. Although the tax courts remained vigorous, cases from many specialized jurisdictions were gradually swallowed up by the bailiwick courts over the course of the seventeenth century, making the bailiwick courts an increasingly important center of gravity for local governance.

Although French and other continental courts have often been criticized as despotic institutions, run by venal officeholders and lacking juries or criminal defense lawyers, the reality was considerably more nuanced. Local courts were thoroughly embedded in local society through their officials, attorneys, and functionaries. Even a relatively modest bailiwick court might have between twenty and fifty minor functionaries and lawyers drawn from the ranks of farmers, cottagers, and even weavers. Notaries, solicitors, sergeants, ushers, jailers, keepers of

weights and measures—all anchored the courts in local society. Judges were typically drawn from owners of *sieuries* or *seigneuries*, the equivalent of the English gentry, and king's attorneys came from similar or slightly lower backgrounds. Criminal procedures and some civil procedures were deeply dependent on the willingness of witnesses in the community to come forward and give testimony. Finally, judges frequently used the flexible legal tools of equity (judicial reason, as opposed to statutory law), discretionary sentencing, and community reputation when deciding cases. French local courts rarely pronounced death sentences and even more rarely actually executed them, even for crimes in which capital punishment was allowed. In Spain, local judges who were also venal officials exercised considerable discretion in applying royal edicts (the *Recopilación de las Leyes de España*, or 'Compilation of Spanish Laws') and in executing a harsh penal code. Given that the primary function of these courts was to regulate property, family, and other civil cases according to customary laws, they often functioned reasonably well in stabilizing communities and families and in keeping public order.

In England, justices of the peace (JPs), like French bailiwick judges, had become the preeminent judicial and administrative officers in the counties by the late fourteenth century. Meeting four times a year in quarter sessions, usually in the county town, JPs initially heard felony indictments and judged misdemeanors. There were approximately five thousand of them in the counties. The English crown, seizing on the usefulness of these unpaid officials, passed over three hundred statutes by 1600 that expanded the justices' governing powers in every direction. They were responsible above all for keeping order in the countryside, including quelling riots, controlling vagabonds, punishing extortion, prosecuting poachers, and helping with the military muster when necessary. JPs regulated the local economy as well, setting wages and prices, licensing taverns, and regulating weights and measures. Social and religious regulation was an increasingly large part of their brief. Justices gradually became responsible for enforcing the poor laws, sumptuary legislation, and religious laws. Finally, they were essential to the financial machinery of the state, because tax collection in the counties was partly under their supervision.

During the sixteenth century, the growth of litigation and the increasing burden of their responsibilities led JPs to use petty sessions, often every six weeks, to transact business. The number of JPs also rose dramatically in the sixteenth century, to as many as eighty in some shires. Given their broad governing powers, JPs were almost universally drawn from the gentry and had to meet property qualifications in most cases. They were given their commissions annually by the crown (the Commission of the Peace), although they were usually chosen by the lord chancellor, and they could be dismissed for political reasons. By the seventeenth century, an important segment of the House of Commons was made up of local JPs, and those not serving in Parliament were still expected to play an important role during elections. Their ties to the national government, through the common law, the assize sessions, elections, and Parliament made them not only the backbone of local government, but the core of English national government.

Twice a year, judges and senior lawyers (sergeants-at-law) from the common-law courts in London held assize sessions in the counties, riding the six circuits of England. Spending one or two days in each county town, they heard both cases sent up by the local JPs and cases sent down by the common-law courts at Westminster for trial. By the sixteenth century they typically heard criminal felony cases (such as murder and treason) as well as civil lawsuits sent back for jury trial from the courts of Common Pleas and King's Bench. They asked grand juries to give presentments of any malefactors or suspects in the jurisdiction and sat with petty juries to pass judgment on civil and criminal cases. Trials were usually brief (sometimes lasting minutes), and criminal defendants were not allowed legal counsel. On the other hand, relatively few convicted criminals were actually hanged by the assizes for offenses that technically merited the death penalty. Executions in England declined dramatically after 1630.

One of the notable features of English justice was the use of petty and grand juries to establish the facts and decide on guilt or innocence in trials. Grand juries (or presentment juries) were called at each assize to present suspected criminals or crimes in the jurisdiction. Grand juries typically had twenty-three members, mostly drawn from the

lesser gentry. If the members determined that there was a “true bill,” or reasonable case to be heard, it was sent to the petty jury for judgment. Petty juries, comprised of twelve men (a number with religious overtones), were typically made up of yeoman farmers and occasionally husbandmen. They were impaneled by JPs at petty sessions and quarter sessions, as well as by circuit judges at the assizes. Common law required unanimity in verdicts by juries. Although possibly Norman in origin, juries were increasingly used after the church abolished trial by ordeal in 1215. The level of popular participation in the English law courts was further increased by the appointment of constables who were usually yeoman farmers and of lawyers who typically came from the small landowners or lesser gentry.

URBAN COURTS

Urban courts were often an offshoot of city councils. In cities as distinct as Amsterdam in the Dutch Republic, Venice in the Venetian Republic, and the free imperial city of Lübeck in the Holy Roman Empire, courts were run by the regents or town councillors. These were the same men who also made city laws and enforced them. Judicial, legislative, and executive functions were thus gathered into the hands of the same elites. In France, the main urban courts (the *bailliages* and *sénéchausées*, or bailiwick courts, in most cities) were instead integrated into the royal judicial system and filled with venal crown officers. Some French cities also had royal provosts who shared jurisdiction with the bailiwick courts. Many large commercial towns in Europe had merchants’ courts as well. The Dutch East India Company’s High Court of Justice, like French mercantile courts, allowed merchants to judge their peers. Urban guilds typically had their own internal courts to police their apprentices, journeymen, and even masters. Although these were informal courts, they were highly effective in policing the members of their crafts through a variety of fines and even banishment from the trade or from a region.

SEIGNEURIAL AND MANORIAL COURTS

During the chaos of the Middle Ages, tens of thousands of nobles across Europe won the hereditary privilege of holding law courts on their estates. These *seigneuries*, or ‘privileged properties’, typically were given rights of low, middle, or high justice. Low justice was considered to be inherent in

the seignury, and it allowed landlords to judge disputes over rents or other obligations with their tenants. Middle justice was hazily defined but typically included a broader civil and criminal jurisdiction over tenants. High justice endowed the seigneurial court with the right to judge almost all civil and criminal cases, including those warranting the penalty of death. They ranged dramatically in size as well as in power. Some courts held jurisdiction over only a part of one parish, while the jurisdiction of great nobles could extend over several hundred parishes and effectively function as lower-level state courts. In Brittany, an unusually dense region for seigneurial courts, there was roughly one seigneurial court per parish. Over France as a whole, there were somewhere between fifty and seventy thousand seigneurial courts. In England, these were known as manorial courts or courts leet, and their jurisdiction was largely eroded by state courts during the seventeenth century. In Spain, by contrast, landlords continued to exercise justice over their tenants well past the early modern period.

The crown always retained some residual powers over high justices. In France, a high justice could only be created by the king, and kings in fact continued to do so for the revenues (Louis XIV [ruled 1643–1715] created more than ninety high justices in Normandy alone). The crown also forbade seigneurs to judge in their own courts or to hold court in the manor house. Judges of French high justices were required to have a law degree and to be confirmed by the provincial parlement after 1680; in the 1770s Prussia also set minimum qualifications for seigneurial judges. Nevertheless, French seigneurial justice retained a high degree of independence in most regions. Despite a royal edict that required certain royal cases (*cas royaux*) like counterfeiting and treason to be heard in royal courts in the first instance, these were exceptionally rare crimes in rural areas and had very little effect on the seigneurial courts’ real jurisdiction.

Despite the apparent conflict between royal courts and landlords’ courts in early modern Europe, the theory that the state set out to deprive seigneurial courts of jurisdiction does not hold up on closer inspection. In France the crown was interested in regulating seigneurial justice and bringing it into line with professional standards used in the royal courts, precisely because it was so integral to

the functioning of justice. Seigneurial courts, whatever their defects, were relatively cheap, accessible, and run at the expense of the seigneur rather than the crown. They were also increasingly run by the same personnel as royal courts. Many seigneurial court judgeships were actually held by officials and attorneys in the royal courts who were moonlighting in multiple jurisdictions. Last but not least, private seigneurial courts were increasingly owned by noble royal officials, including almost all the judges of the parlements by the middle of the seventeenth century. In Austria, Joseph II (ruled 1760–1790) felt compelled to order landowners to continue providing justice on their estates in 1786, because landlords were increasingly uninterested in the trouble and expense.

While French low justices gradually lost many of their clients during the seventeenth century, high justices tended to remain vigorous jurisdictions, and the largest of them sometimes operated as the bailiwick court for their districts. English manor courts (courts leet), by contrast, gradually lost both criminal and civil jurisdiction to the quarter sessions and assizes in the seventeenth century. Misdemeanors and capital crimes both went to the royal courts by about 1600.

CHURCH COURTS

Catholic and Protestant churches alike maintained their own internal courts and laws that governed the clergy and the faithful. The Catholic Church had developed an elaborate canon law based on Roman law procedures. Popes were also energetic lawmakers, adding to church law through papal bulls or decretals (papal decrees on points of canon law). Canon laws were enforced through a system of ecclesiastical courts that ran throughout the entire church hierarchy but whose center of gravity was usually the diocese or archdiocese. For serious infractions, the church could punish misbehavior with excommunication (for individuals) and interdicts (for regions or groups of people), which barred the accused from receiving most sacraments. Well before 1450, however, the jurisdiction of church courts over morals cases and crimes was being pushed back in centralizing monarchies like France and England. Judgments in church courts could increasingly be appealed to royal courts, under procedures like the *appel comme d'abus* ('abuse sum-

mons') in France, which further undermined their powers.

The church's concern with heresy had led to the establishment of exceptional tribunals using inquisitorial procedures in the high Middle Ages (1231). The Roman inquisition (and later the Spanish Inquisition) were central tribunals staffed by inquisitors, usually drawn from the Dominican and, later, the Franciscan orders. Inquisitorial procedure allowed judges to seek cases out rather than to wait for cases to be brought to them. The procedure also allowed suspects to be tried secretly, without known witnesses or defense attorneys. The Inquisition was particularly notorious, however, for approving the use of torture to extract confessions if other forms of proof were not sufficient. (Indeed, the accused could not have found lawyers in any case because it was a crime to aid heretics). Fewer than two or three thousand individuals were probably executed in Europe throughout the Inquisition's existence, but enormous amounts of property were seized, especially in Spain, where the Inquisition was used to root out both Moorish and Jewish communities.

Protestant churches also policed morals through internal courts. The Dutch Reformed church's consistories, for example, regularly issued summonses for adultery, drunkenness, suspicious bankruptcies, and disruptive behavior (even summoning Rembrandt's mistress for adultery). The penalties included exclusion from the sacraments and loss of public reputation. Ecclesiastical courts in England (sometimes called "bawdy courts") policed sexual and moral behaviors through a combination of canon law, Roman law, and ecclesiastical common law, but these cases were increasingly being handled by justices of the peace. By the late eighteenth century, ecclesiastical courts no longer had jurisdiction over the laity.

LAW CODES

Legal systems in Europe had grown up organically out of the mixture of Roman, tribal, and church law systems imposed on the landscape. Like court jurisdictions, law codes accurately reflected the divided sovereignty of most regions, in which landlords, the church, and the state all exercised some public powers. Four main legal systems stood out, however, in the mosaic of codes in use across Europe. These were Roman law (drawn particularly from Justin-

ian's *Digests* and *Institutes*, c. 533 C.E.), customary law (derived from medieval tribal codes), positive law (created by sovereigns, parliaments, or cities), and canon law (ecclesiastical law). While Roman law tended to remain most vital in the regions of southern Europe occupied by the Roman Empire, especially Italy and the south of France, elements of Roman law seeped into numerous law codes across Europe. Most Habsburg hereditary territories as well as the Low Countries were under mixed Roman and Germanic customary laws. By corollary, Roman law in the south of France was recognized by many eighteenth-century jurists as having developed into the customary law of the south, because it had gradually been transformed through long usage.

These dominant varieties of law were typically combined with minor codes, creating distinctive legal patterns that sometimes varied from parish to parish. In England, the early-seventeenth-century jurist Sir Edward Coke identified fifteen distinct types of law practiced across the realm. Most prominent among these were the common law (the general customs of the realm), manorial and borough laws (local customs), parliamentary statutes, the law merchant, and canon law. Each of these types of law in fact corresponded closely to a separate set of English courts. The common law was thus the law administered by the main royal courts sitting at Westminster, as well by the county assizes and quarter sessions, making it the dominant legal code.

This relative legal uniformity in England was furthered by the centralization of legal training in London at the eight Inns of Chancery and four Inns of Court. The Inns of Court (Grey's, Lincoln's, Inner Temple, and Middle Temple) were residences for lawyers during the four annual sessions of the Westminster courts, but they also provided lectures and training for students. No lawyer could plead before the superior courts without being first called to the bar at one of the Inns of Court; and, by extension, no judges in the superior courts or assize circuits could practice without having trained there as well.

England's was a remarkably organized legal system by continental standards, however. The positive laws of the French crown numbered over 800,000 by 1715. Despite their impressive number, though,

they primarily gave the crown legal control over state administration and taxes. The vast majority of cases heard in the kingdom were, in fact, regulated by more than three hundred provincial and local customary codes and by thousands of seigneurial privileges or microcustoms that varied from one seigneurie to the next. Customary laws dominated provincial legal proceedings; in some local bailiwicks, no more than about 2 percent of all cases involved positive royal laws. Because they governed property, family, and inheritances in France, they were naturally the laws used by ordinary people engaged in litigation. Customary laws and usages were codified with the crown's permission in the late sixteenth century, but they were largely impervious to state intervention until the French Revolution.

One of the most innovative regions in Europe with respect to law was the Dutch Republic. After the seven provinces broke with Spain to form the Union of Utrecht in 1579, a new legal framework had to be established for the fledgling state. Universities with law faculties were founded in several provinces, beginning with Leiden in 1575. Roman law became the lodestone of Dutch legal practice, but it was pragmatically combined with Germanic customary law, natural law, and the new statutes of the state by jurists and scholars. The provinces each retained their traditional system of lower courts and High Courts, like the Hooge Raad (High Court) of Holland, and flexibly adapted the new legal system to existing provincial customs.

From 1450 to 1789 two main patterns emerged in European law. The first was the rising tide of positive laws issued by sovereigns and local governments, which attempted to more minutely control the political, economic, and even social behavior of their subjects. By the late seventeenth and eighteenth centuries, attempts to codify laws were under way in states as different as Prussia, Russia, Austria, and France. Prussia's was the most successful attempt, producing the *Preussisches Allgemeines Landrecht* (Prussian General Common Law) in 1794, but almost everywhere the attempt foundered on the strength of customary laws, the vested interests of prominent social groups, or the lack of police and judicial officers to enforce them. The codifiers and law commissions paved the way for Napoleon's Code Civil in 1804, however, and for

numerous European legal codes that were forged in its wake.

The second pattern was the dramatic increase in litigation across much of Europe, particularly in the sixteenth and seventeenth centuries. Suits in the English courts of Common Pleas and King's Bench increased tenfold between 1500 and 1600. Litigation peaked in England and France from the mid- to late seventeenth century, then saw falling caseloads in the eighteenth century. The increase in litigation probably had multiple causes: increasingly complex laws, the growing pace of commercial and property transactions, rising literacy, and the growth of trained lawyers and jurists to handle cases. The decline of litigation in the eighteenth century is still a mysterious and ill-understood phenomenon, but the overall trends toward sophisticated law codes and increasingly large and wealthy legal classes reflected societies that had become increasingly driven by the rule of law during the early modern period.

INTERNATIONAL LAW

Tradition has assigned the title “father of international law” to the Dutch scholar, lawyer, and diplomat Hugo Grotius (also known as Huig de Groot; 1583–1645), because his *De Iure Belli ac Pacis* (On the law of war and peace), which appeared in 1625, was the most extensive treatise on international law and relations yet written. Grotius himself recognized that there already existed a number of treatises dealing with aspects of international law and an extensive body of customary practices regulating relations between states, materials such as the law of the sea, treaties, rules of war, and treatises on the just war written by medieval scholars. These concerned relations among the states of Christian Europe, although there was some interest in the nature of relations between Christian and non-Christian, especially Muslim, societies.

A second source of writing on international law consisted of treatises, papal letters, and royal charters accompanying the European overseas expansion that began in the fifteenth century. Initially, these dealt with the legal basis for European posses-

sion of the Atlantic islands, Canaries, Azores, Cape Verde, and Madeira, as well as parts of the African mainland. Subsequently, Columbus's voyages generated even more literature about the legitimacy of European possession of the New World, beginning with three bulls that Pope Alexander VI (1492–1503) issued in 1493. These bulls drew a line of demarcation from pole to pole, dividing the New World between the Portuguese and the Spanish, assigning each monarch responsibility for sending missionaries to preach the Christian Gospel and awarding each ruler a monopoly of trade and contact with the region assigned to him.

The basis for Alexander VI's actions was the concept that all mankind formed a single community and that the pope was the judge of all mankind, judging Christians by canon (church) law, Jews by the Law of Moses, and all other people according to the natural law. The natural law consisted of that part of God's eternal law accessible to all mankind by the use of reason. While the specific terms of that law were rarely spelled out, one important element of it was the right to travel freely in peace. The refusal of an infidel society to allow Christian missionaries to enter and preach was therefore a violation of the natural law. The pope could authorize Christian rulers to protect missionaries where necessary, justifying the conquest of infidel societies. The papal conception of an international legal order was a hierarchical one with the pope serving as the ultimate judge in matters of international relations. The most extensive discussion of the Catholic conception of international order was that of the Spanish Dominican theologian Francisco de Vitoria (c. 1485–1546), whose *Relectio de Indiis* (published 1557; Concerning the American Indians) analyzed all of the arguments for and against the legitimacy of the conquest of the Americas. Vitoria was, however, only one of a number of Spanish authors who responded to the discovery of the New World with a treatise on the legal issues involved.

The Protestant Reformation changed the character of the discussion about international law because the Reformers rejected the papacy and canon law. Furthermore, Protestant scholars distinguished more clearly than did their Catholic counterparts between theological bases for international law and relations and legal ones based on human reason and experience alone. Early Protestant writers included

Alberico Gentili (1552–1608), an Italian scholar who eventually became a professor at Oxford, whose *De Iure Belli* (Concerning the law of war) was a major influence on Grotius's work.

One fundamental difference between Catholic and Protestant writers concerned access to the sea and therefore access to trade between Europe and the New World. The Catholic position was that the pope had the right to judge all mankind, to punish violators of the natural law, to assign jurisdiction over the seas to specific Christian rulers in order to ensure peace among Christian nations, and to support the church's spiritual mission to the newly encountered peoples. Grotius's first work, the anonymously published *Mare Liberum* (1609; The freedom of the sea), denied that the pope or anyone else had the right to limit access to the sea. In his opinion the sea was open to all who would sail there in peace. Grotius defended the interests of Dutch merchants whose wealth depended upon access to the markets of Asia and America, restricted by papal decision to the Spanish and Portuguese and those whom these nations chose to license, as well as the interests of Dutch fishermen who desired access to the fishing grounds in the waters adjacent to Britain.

Grotius's views drew responses from Portuguese and English lawyers, who defended closing the sea, although they differed about who could do this. The Portuguese scholar Seraphinus de Freitas (d. 1622) wrote the *De Justo Imperio Lusitanorum Asiatico* (1625; Concerning the legitimate Portuguese Empire in Asia) defending Portugal's claim to a monopoly of trade with Asia based on papal authorization. William Welwood (1578–1622) and John Selden (1584–1654) wrote to defend the right of James I of England (ruled 1603–1625) to ban Dutch fishermen from the waters around the British Isles without royal license. They argued that any ruler could limit access to the adjacent waters but denied that the pope could do so universally. Eventually, European governments agreed that states possessed jurisdiction only over a zone extending three miles from the shore, a line that Cornelius Bynkershoek (1673–1743) defined as the distance that a cannon could fire.

Grotius's major work, *On the Law of War and Peace*, followed the medieval tradition of seeing mankind as a single community governed by natural

law. Grotius did not base his discussion of natural law on theology or philosophy but on the actual practice of human societies as described in the historical record. Thus, while the overall principles of international law sprang from the *jus naturale* (natural law), there was also a body of specific practices and customs agreed upon by participating nations forming the *jus gentium*, the law of nations. These two laws formed the basis for a legal structure that would regulate relations among states.

Unlike his predecessors, who saw the papal court as the ultimate venue for settling international disputes, Grotius did not describe any institutions to enforce these laws. He saw each state as sovereign, that is, not subject to any external authority. He also argued, however, that it might be necessary for one state to punish the rulers of another sovereign state because they had violated the natural law. While this would seem to make Grotius a defender of expansion into the New World, in fact he showed little interest in that issue. His interest was in relations among European Christian states, not relations between the Christian and the non-Christian worlds.

The writers on international law who followed Grotius fall into two broad categories. The first continued to employ the term *natural law* but understood the term differently than Grotius. They argued that the natural law described the law that governed men when they lived in the state of nature, that is, before the formation of organized societies. They identified these societies with individuals living in a state of nature so that each human society was therefore a sovereign entity equal to all other societies, just as each man, regardless of age, strength, and intellect, was equal to every other man. There was then no basis for one society punishing another's violation of the law of nature. This school of thought included Samuel Pufendorf (1632–1694) and Emerich de Vattel (1714–1769).

The second school of international law thinkers was the positivists, who argued that international law was the product of custom and of treaties that states made with one another for the purpose of regulating their relations. This school of thought included Cornelius van Bynkershoek.

These discussions had a limited effect on the practice of European states. The flaw in such discus-

sions was the lack of any external mechanism to enforce the law. What these works did was provide a conceptual framework and a language for creating a legal order among states. Unlike Grotius and his medieval predecessors, however, later proponents of international order restricted it to the European Christian states and did not include non-European states.

These early discussions of international law had one other effect on European thought. The Catholic writers were concerned about the relations between Christian and non-Christian societies. Was the conquest of the New World legitimate? Did the inhabitants of the Americas possess a right to govern themselves and to own property? If so, Europeans had no obvious right to conquer them. Although European thinkers did produce arguments that justified the conquest, arguing that the Indians violated the natural law, for example, they also produced arguments that defended the rights of the Indians to autonomy as well. According to these arguments, Christians could not assert a claim to all infidel lands simply on the grounds that infidels had no right to them. This became one of the bases for subsequent discussions of human rights, that is, the rights possessed by all people by virtue of their humanity.

In the final analysis, the discussion of international law in the early modern world consisted of attempts to create a legal order that would regulate relations among the various states and societies of the world. The goal was to limit, not to abolish, war and to create a framework for peaceful relations among peoples.

LAWYERS

The activities of early modern lawyers had much in common with those of their modern counterparts. They practiced courtroom defense, acted as political and legal counsels to princely houses, municipalities, and religious houses, and held positions in the courts and royal administration. The general economic expansion since the late Middle Ages and the accompanying growth of social and institutional complexity created a growing demand for services that could be performed only by those who possessed technical and specialized legal skills. Just as modern states employ teams of lawyers, a variety of governmental and judicial institutions of early modern states needed legally educated personnel. The functions and organization of lawyers varied over time and space, but the early modern period saw the ever-increasing presence and influence of lawyers throughout Europe.

RISE OF LAWYERS

The legal profession was already vigorous in the Italian towns of the twelfth and thirteenth centuries, fostered in part by the revival of jurisprudence in the study of Roman law. The Florentine guild of lawyers and notaries (*Arte dei Giudici e Notai*) dates from the early thirteenth century. The rise of lawyers in northern Europe coincided with the establishment of the supremacy of the royal courts over seigneurial and ecclesiastical jurisdictions. In France, lawyers for secular courts appeared in the mid-thirteenth century around the same time as the emergence of the sovereign court, the parlement. Feudal procedure, with its reliance on a judicial duel and ordeal, had been gradually transformed in the king's courts into accusatory procedure, where the parties were required to substantiate their claims by calling upon witnesses and producing written proof. The complexity of adversarial procedure required the intervention of legally educated personnel capable of representing the parties involved. The crowns of England and France allowed litigants in royal

courts to appoint lawyers to represent them and oversee the convoluted process of trial. A legal world that became increasingly complicated thus gave rise to professional lawyers when a growing number of people depended on royal justice for vindication.

Unlike in Italy, where the legal profession was governed and regulated by the guild, lawyers in northern Europe were closely attached to the state. The French royal ordinance of 1345 set the conditions of admission to the legal profession and its duties. To become a lawyer, the candidate had to prove that he (women were excluded) had studied law at a university for years. After the judges examined candidates' learning and moral rectitude, successful candidates were sworn in and were inscribed on the official roll. Lawyers were expected to abide by certain principles of professional conduct. According to the 1345 French rule, lawyers were prohibited from assuming the defense of causes they knew to be unjust, obliged to expedite the causes they had undertaken as promptly as was possible, and prohibited from withholding evidence from the opposing parties. These injunctions, which have a familiar ring today, were apparently frequently breached. The seventeenth-century writer Bernard de La Roche Flavin deplored the fact that lawyers all too often used surprises and dirty tricks, holding the best evidence back so as to catch the opponents by surprise in front of the judge. Another rule, also repeated time and again, was to plead and write briefly. Irrepressible verbosity of lawyers—and the public's exasperation with it—goes back to the profession's formation.

DIVISION OF FUNCTIONS

The lawyers of early modern Europe were a diverse group, ranging from a small elite of learned jurists to obscure practitioners akin to legal artisans. From early on, notaries were considered to form a profession separate from lawyers. In the Italian guild of judge-lawyers and notaries, the two groups were clearly distinguished. Drawing up contracts, deeds, marriage agreements, and wills was for the most part the province of notaries. Within the practice of law a division of function developed, leading to different careers with varying qualifications and reputation. The most fundamental distinction involved the separation between those who handled the procedural

aspects of a suit and those who dealt with substantive legal issues. A royal proclamation of 1547 in England restricted the right to plead before the royal courts to students of the Inns of Court. By 1600 a rigid divide had emerged between *advocati* and *procuratores* (barristers and attorneys in England, *avocats* and *procureurs* in France, *abogados* and *procuradores* in Spain). Although the distinctions between the two groups were not as clear as in the modern English or French legal profession (barrister/solicitor in England and *avocat/avoué* in France until 1971), each group held an exclusive right on a specific activity. Only the *advocatus* (hereafter ‘barrister’), not *procurator* (hereafter ‘attorney’), had the right to plead before the court. In England solicitors (*solicitadores* in Spain) appeared as an identifiable branch of the legal profession during the sixteenth century.

A barrister was a man formally trained in jurisprudence. He offered legal advice to clients and presented oral or written arguments to the court. Barristers’ arguments touched only on questions of law supposedly requiring legal knowledge and reasoning while questions of fact were left to the attorneys. Few French *avocats*, in fact, spent much time pleading in open court, for the parlements judged most cases on the basis of written evidence. Also, French *avocats* handled only civil cases; criminal defendants were deprived of their right to counsel by the ordinance of Villers-Cotterets in 1539. The ordinance of Villers-Cotterets required the use of French in both pleadings and court rulings, but lengthy Latin quotations were not easily abandoned by the Renaissance lawyers who were all too proud of their knowledge of the classics. Less prestigious than a barrister was an attorney. His place in society was solid but lowlier. It was an attorney who was most often consulted by a client needing legal representation at the beginning of a suit. His function was to steer cases through the court and take care of the procedural details, filing motions, drawing up writs, assembling facts, and collecting evidence. The attorney handled the formalities of the lawsuits, gave clients advice, and represented their claims in court. Only when a lawsuit involved a question of law that required greater expertise would the services of a barrister be obtained. An attorney was denied the right of audience, which properly belonged to a barrister, a full-fledged jurist. In the

sixteenth century there was as yet no sign of the later rule prescribing that clients contact barristers only through attorneys, but usually attorneys procured clients in the marketplace and then chose barristers. Attorneys did not necessarily train at a university, instead learning their law through clerkship or apprenticeship to other practitioners.

In the early modern period French kings openly sold royal offices to the highest bidder. In the sixteenth and seventeenth centuries the kings had forced venality upon nearly all legal occupations, magistracies included. French *procureurs* needed to purchase a venal office, but *avocats* did not become venal officers. The reason for this is not clear, but it is possible that the *avocats*’ powerful clients, prominent nobles and prelates, opposed venality, lest it threaten their interests. At any rate, this exemption of *avocats* from venality conferred a certain degree of status on the bar, as admission to its ranks was perceived to emphasize learning, not money. The price of the *procureur*’s offices rose sharply during the sixteenth century when the volume of litigation increased rapidly. Established attorneys opposed creation of additional places, fearing that such expansion would decrease the value of their own offices.

BUSINESS OF LAW

The relative profitability of the legal profession and its respectable status attracted talented young men to legal careers. There are many examples of those who pursued legal studies, often pressured by their ambitious fathers, but eventually failed or abandoned them: Petrarch (1304–1374), Martin Luther (1483–1546), John Calvin (1509–1564), and Voltaire (1694–1778) were only a few. The best source of lucrative practices for barristers lay in becoming consultants to leading princely houses, ecclesiastical institutions, towns, and corporate bodies. Those who made fortunes depended heavily on the business of aristocrats, managing their vast real estate holdings and providing legal and political advice. Of those lawsuits handled by Florentine lawyers, disputes over dowries were among the most common, followed by cases dealing with the confiscation of private property due to some act of rebellion. Other cases involved litigations between religious houses or between individual clerics over benefices, dis-

putes between local administrations, or litigations between government offices and individuals.

Little is known about legal fees. There were significant differences of income within and between members of the branches of the legal profession. From early on, lawyers claimed that the fees they charged were the result of free agreement with the clients and thus outside any state interference. The kings often attempted to prohibit excessive fees, without much success. The French Ordinance of Blois of 1579 (Art. 161) stipulated that *avocats* reveal the amount of their fees at the bottom of deliberations and court documents. In 1602 the Parlement of Paris, backed by Henry IV, revived this rule, which had fallen out of observance. Livid over what they regarded as a blow to their honor, the *avocats* waged a successful two-week boycott of the courts in protest. Faced with the collective resignation of the *avocats*, the parlement had no choice but to withdraw the measure. In general, lawyers' vested interests in the existing system and its traditions dictated their outlook and attitudes. Lawyers of early modern Europe were a tight-knit corporate group. On the eve of the French Revolution, the king simply could not break the fundamental solidarity of the jurists blocking legal reforms.

Like their modern counterparts, early modern lawyers were targets of sustained hostility. They were criticized for overcharging, fraudulently keeping clients' monies, illegally negotiating contingent fees, maliciously pursuing delays, or lodging endless appeals. Tales of shyster lawyers seem timeless. Luther, never kind to lawyers, observed that a successful jurist was a woeful Christian.

LAWYERS AND CULTURE

Men with legal training were one of the most prominent groups in early modern culture. Renaissance humanism in Italy was largely a creation of lawyers and notaries, such as Coluccio Salutati (1331–1406), Poggio Bracciolini (1380–1459), and Lorenzo Valla (c. 1406–1457). The French Renaissance displayed the close relations between humanism and the law, as represented by Guillaume Budé (1467–1540), Jean Bodin (1530–1596), Antoine Loisel (1536–1617), and Étienne Pasquier (1529–1615). Thomas More (1478–1535), Francesco Guicciardini (1483–1540), Michel de Montaigne (1533–1592), Francis Bacon (1561–1626),

Giambattista Vico (1668–1744), and Montesquieu (1689–1755) were among the many lawyers who were the leading minds of their time. Equipped with humanistic education and style, and endowed with judicial dignity and political influence, lawyers were often at the forefront of intellectual inquiry and challenge in early modern Europe.

SOCIAL BACKGROUND AND CAREERS

There existed a vast social gulf within the legal profession. Historians have confirmed the overall social heterogeneity of early modern European lawyers. The commonplace observation that the law was a quick and assured means of achieving upward social mobility appears exaggerated. Social mobility was indeed possible in the legal profession, but it occurred only at a slow pace over several generations. The great majority of lawyers in Europe came from families that had acquired wealth a few generations before there was a lawyer in the household. One obvious reason that the notion of rags to riches was no more than a myth in a legal career was that education at one of the great law schools was a very expensive affair. Historians have shown that a university education in the fifteenth and sixteenth centuries was much costlier than in modern times. A doctorate in canon law normally required six years of university and in civil law seven or eight years. A large number of lawyers had doctorates in both civil and canon law, spending a minimum of ten years in study. In most cases an aspiring lawyer either had some direct contact with the profession or had grown up with material means sufficient to set off to a university in order to pursue a dignified legal career.

Recruitment from within the legal professions was common and often involved a step upward. A son of a court clerk or a notary, for example, would become an attorney, and occasionally a shopkeeper's child would enter the career of attorney. The attorney, having made his moderate fortune, was likely to send his own child to law school and to the bar. Many lawyers in the *Reichskammergericht* (imperial court of justice) in Speyer in the early sixteenth century had been *Prokuratoren* (attorneys). It was rare for a barrister's or a magistrate's son to become an attorney, moving downward in social hierarchy. Many barristers came from families already established in the law. The bar also attracted

the sons of well-off merchants or urban *rentiers*. Sons of barristers used their law degrees to move even further up the hierarchy of law. In France, positions as magistrates in the inferior courts were readily open to them, and there was a chance, providing they had the money, to purchase an ennobling office in a sovereign court.

From the mid-sixteenth century the legal profession in most European countries tended to become more exclusive. Within the legal field each group was increasingly conscious of its status and took steps to protect it. Separation of attorneys from barristers was not merely a matter of the evolution of distinct procedural functions but of the differentiation of lawyers organized on the lines of education, prestige, self-perception, and family links. A doctorate required of *avocats* as well as of magistrates in the sovereign courts was one of the means to regulate entry into the higher ranks of the legal profession. Both magistrates and barristers had the strong desire to perpetuate their profession in their families, and there existed a high degree of continuity of career among families involved in the practice of law. The law faculties in early modern Europe increasingly became the preserve of students whose fathers were, in one capacity or another, men of law. Any French magistrate who wished to guard his investment in office and pass it on intact in inheritance saw to it that at least one of his sons attended a faculty of law.

In England, the gentry entered the world of justice in great numbers. In the years 1590–1640 more than half the barristers were gentry. France witnessed in the sixteenth century the emergence of noble judicial families, a *noblesse de robe*. The proportion of aristocrats among those attending law faculties in the Holy Roman Empire quadrupled at the beginning of the seventeenth century. Throughout Europe, access to higher-ranking legal offices and occupations was firmly in the possession of tightly interwoven families of lawyers, many of which formed great legal dynasties. It became rarer to rise from the ranks of attorney to barrister. Barristers from outside the close-knit network had difficulty procuring legal business and complained that certain families jealously maintained a virtual monopoly on legal practice.

AN INDEPENDENT PROFESSION

Before 1600 the French *avocats* did not have a formal bar association. The discipline of the practicing *avocats* and the protection of their collective interests were largely left to the magistrates of the parlements. Many magistrates, presidents of the parlements, and chancellors were selected from *avocats*. However, this relationship of the traditional cordiality and mutual respect between the *avocats* and magistrates began to deteriorate seriously because of venality of offices. By the early seventeenth century, high judicial offices had been made inheritable, practically becoming personal property. *Avocats* no longer had special access to magistracies; they had to purchase judgeships like others. As prices of offices increased, the prospect of becoming a judge became slim. In terms of training and social profile, barristers did not differ much from magistrates. However, the sale of offices now drew a clear line between the magistrates and *avocats*, between those who came from families of prominence and inherited wealth and who now enjoyed the title of nobility by virtue of their offices and those who saw themselves relegated into second-class citizens in the world of the law. Charles Dumoulin (1500–1566), the great French jurist of customary law, blamed his struggling career as an *avocat* at the Parlement of Paris on venality. He bitterly claimed that he, a brilliant scholar, was being ignored in his own country simply because he did not choose (rather, could not afford) to purchase a judicial office. The kings recruited the members of royal councils and administration in large part from the parlements, and the proportion of lawyers acceding to the highest public offices declined after the mid-sixteenth century. Furthermore, the *avocats* faced added competition from officeholders who, often in debt after acquiring their position, actively sought business from princely houses as counselors.

The social and moral crisis suffered by the *avocats* eventually brought about a significant redefinition and redirection of the profession. The emergence of the independent Order of Barristers in France in the 1660s represented a step toward professionalization of the lawyers. The order set down standards of conduct and disciplined its members. Aspiring *avocats* now needed to complete a two-year internship to obtain practical skills before gaining formal acceptance by the order. Lawyers, re-

sponding to a crisis in their profession, embraced a modern sense of professionalism, a concern for high ethical standards and occupational competence.

LITIGATION AND LAWYERS

The changing culture of litigation in early modern Europe overall contributed to the emergence of professional consciousness among lawyers. The favorable economic and demographic climate of the sixteenth century resulted in a marked increase in litigation and an almost explosive rise in the number of lawyers. England saw an enormous increase in central court litigation between 1560 and 1640. Business in King's Bench increased fourfold between 1560 and 1580, and more than doubled between 1580 and 1640. Historians have noted a sharp rise in litigation in Castile beginning in the late fifteenth century and continuing almost uninterrupted until the second quarter of the seventeenth century. In England the years between 1558 and 1640 witnessed a steady increase in the number of admissions to the four Inns of Court, from around fifty per year in the early sixteenth century to about three hundred in the later years of the reign of James I. Matriculations in the law faculties soared during the sixteenth century throughout Europe, more than doubling the number of graduates in less than fifty years. Between five thousand and six thousand students were enrolled each year in the law faculties of Salamanca and Valladolid; in 1617 there were five thousand law students in Naples. In France during the reigns of Louis XIII and Louis XIV, the influx of students into the faculties of law was so copious that many reformers, including Jean-Baptiste Colbert, were concerned that it would hamper the development of a commercial class.

This century-long expansion of lawyers began to recede from the mid-seventeenth century. Recent studies have linked loss of population, a stagnant economy, and rising court costs to contraction in litigation and a corresponding decrease in the number of lawyers in the late seventeenth century. The shrinking number of suits was reflected in the decline of the universities' once prosperous law faculties. From Spain and England to the provinces of the Netherlands and the Holy Roman Empire, the stream of students in law faculties fell steadily during the eighteenth century.

The downturn in legal business brought about a significant change in the legal profession. A negative economic climate and business retrenchment meant that lawyers, in order to carve out a living from the law, needed to reconfigure their activities and recast their relations with society as a whole. Faced with professional uncertainty, shrinking sources of income, and growing competition, lawyers developed a new professional model, one based on occupational competence, competitiveness, self-regulation, a heightened sense of identity, and claims to special knowledge and expertise. The study of law had attracted not only students interested in a professional legal career but also sons of the gentry and the nobility for whom legal training represented a broad preparation for life. In England, fewer than 10 percent of those attending the Inns of Court at the beginning of the seventeenth century truly aimed at practice as a barrister. In the seventeenth and eighteenth centuries fewer than half of the lawyers in the Netherlands were active in their profession. In France thousands of men held the title of *avocat* in the seventeenth century, but only a small percentage of them practiced law, many holding the title for purely decorative reasons. In the eighteenth century, however, legal study became a relentlessly practical training of vocational nature. Being a law graduate and becoming a lawyer now meant a profession, not a mere status or ornament.

The legal profession in early modern Europe underwent long-term evolution. By the end of the eighteenth century, lawyers possessed most of the criteria associated with a modern career. The increasing professionalization of this old occupation played an essential role in the development of the law itself and the differentiation of the legal systems of modern Europe.

ROMAN LAW

Roman law consists of the law of the Roman Republic and Empire, from the *Twelve Tables* (c. 451–450 B.C.E.) to the *Corpus Juris Civilis* (Body of the Civil Law) of the sixth century C.E. Within the context of Roman law, the term *civil law* is usually used specifically to refer to the *Corpus Juris Civilis*, the compilation that was ordered by Emperor Justinian I

(ruled 527–565 C.E.) and directed by the jurist Tribonian.

SOURCES AND ORGANIZATION

Roman law grew amorphously from several sources over a thousand years. These sources were divided into unwritten law (*ius non scriptum*) and written law (*ius scriptum*). Unwritten law referred to custom in Roman times, although by the early modern period in Europe, customs were accepted as written law in many places. Written law for the Romans was divided into six categories: acts (*leges*), resolutions or plebeian statutes (*plebiscita*), senate resolutions (*senatus consulta*), imperial laws or constitutions (*constitutiones principum*), magistrates' edicts (*edicta*), and jurists' responses or interpretations (*responsa prudentium*). Contradictions in the laws occurred because these numerous sources were neither coordinated nor routinely collected.

The early attempts to organize Roman law included the *Institutes of Gaius* in the second century C.E. and the *Theodosian Code* under Emperor Theodosius II in 438 C.E., but these were incomplete. The final compilation of the *Corpus Juris Civilis* under Justinian in the sixth century was issued in four parts: the *Digest* (529), the collection of judicial interpretations of the laws; the *Code* (529), the imperial laws and rescripts Tribonian's committee chose to keep; the *Institutes* (529), a condensed version to be used by first-year law students; and the *Novels* (until 565), new imperial laws.

MEDIEVAL ROMAN LAW

Roman law continued to influence European law after the fall of the Western Roman Empire to Germanic tribal rule, but it did so not as territorial law but as merely the personal law of the section of the population claiming to be Roman rather than Germanic. Among the Germanic kingdoms of western Europe, rulers such as the Visigothic kings of Spain used vulgarized forms of Roman law for their Roman subjects. The basis for these laws was usually the *Theodosian Code* rather than Justinian's, since the former was disseminated before the collapse of the Western Roman Empire. Justinian's corpus was not compiled until after Roman power was largely lost in the West. Roman law also influenced western Europe, because it was used as the basis of canon (church) law in the *Corpus Juris Canonici* (Body of Canon Law), and Roman civil and canon law also

became the basis of the *ius commune*, a set of legal principles generally accepted throughout Europe. Within each developing state of the late Middle Ages and the early modern period, Roman law had varying impact on local and royal laws, depending on the geographical proximity to the old Roman imperial areas and individual developments within the separate states.

Although it was taught continuously in the East, it was not until the late eleventh century that the West rediscovered the *Corpus Juris Civilis* of Justinian, and the text was then studied and taught at the medieval universities throughout western Europe beginning in the twelfth century. This new study of the *Corpus Juris Civilis* began in Bologna, Italy, at the university's law school, and it became popular for a number of reasons. The Roman Empire of Justinian and the medieval Holy Roman Empire were conflated in the minds of many. Justinian was seen as a Holy Roman Emperor and his laws as imperial legislation. In addition, twelfth-century jurists recognized that Roman law represented a high development of legal thought, and they saw Roman law as "written reason" and hence superior to other law.

University scholars not only studied the *Corpus Juris Civilis*, they also added their own explanations and interpretations, which often became as important as the original text. The earliest of these scholars were known as the glossators, who wrote marginal or interlinear comments called glosses on the entire text of Justinian. In this process they discovered some inconsistencies and contradictions that Tribonian's hurried committee had not managed to eliminate. Glossators tried to resolve such discrepancies by interpretation. Between 1220 and 1250 the glossator Franciscus Accursius compiled a collection of selected glosses, which became known as the *Glossa ordinaria* (or *Magna glossa*).

Following the glossators were the commentators (or postglossators). They did not merely continue the glossators' work but also contributed their own legal knowledge by writing original commentaries on the *Corpus Juris Civilis* and the *Glossa ordinaria*. They also applied the law to their own time by writing legal opinions in response to questions concerning real cases. Two of the most significant of the early commentators were Bartolus of

Saxoferrato and Baldus of Ubaldis. The commentators were most active in the fourteenth and fifteenth centuries, and, like the glossators, most were Italian.

RENAISSANCE HUMANISM AND ROMAN LAW

New approaches to Roman law developed with Renaissance humanism in the fifteenth and sixteenth centuries. Humanists applied philological techniques to the study of the Roman law to determine what it had been meant to say, and they also studied the laws and their meaning in the original context of Rome. Although begun in Italy with the work of Andrea Alciato, this movement reached its height in the French historical school of law in the sixteenth century. Because of their humanist approach, these scholars were able to see the *Corpus Juris Civilis* in historical context, as a product of its own time and place. They saw it as useful but not infallible, and their work identified many problems in the law itself and in the medieval studies of it. Guillaume Budé, Jacques Cujas, Hugues Doneau, and François Hotman, among others, contributed to this movement in France, as did Ulrich Zasius in Germany. Hotman's *Anti-Tribonian* (1567) was particularly critical of Justinian's compilation and elevated French law in its place. These scholars established the historicity of Roman law and removed its claim to authority over contemporary societies, even though it could still be seen to a certain extent as "written reason."

ROMAN LAW IN FRANCE, GERMANY, AND GREAT BRITAIN

France. Italy and southern France were the areas most continuously influenced by Roman law because they had been governed by the Romans themselves and by Germanic versions of Roman law codes. These were also areas where universities developed early, as did Renaissance humanism. Southern France had adopted Roman law and was known as the land of the written law (*pays de droit écrit*), while the northern two-thirds of France was subject to diverse local customary laws (*pays de droit coutumier*). This caused some tension, and French legal humanists tried to resolve some of the problems by carefully applying Roman law. French kings continually tried to increase the uniformity of the country's laws in the sixteenth through eighteenth centuries. Roman law sometimes provided the

source of these common laws, but so did the Custom of Paris, which was often seen as a more appropriate source for France. Partly under influence of the “written reason” of the *Corpus Juris Civilis*, the French tried to codify their customs, frequently using the organization of Roman law as a model for the structure, if not for the laws themselves. This is particularly notable in Antoine Loisel’s *Institutes Coutumières* (1607) and Étienne Pasquier’s *L’interprétation des institutes de Justinian* (1609).

Germany. In Germany, the reception of Roman law began around 1500, when the *ius commune* was given precedence over local customs in the imperial supreme court. Use of Roman law in this form was particularly attractive in the Holy Roman Empire, because there were over three hundred independent local jurisdictions, some quite backward administratively. Roman law provided a model for them and also created some form of unity in the fragmented empire.

Great Britain. Scotland had introduced Roman law indirectly in the form of *ius commune*, because it was distinct from English common law, and the Scots wished to establish their independence from English control. English common law developed independently from Roman law, but some courts in England, the Equity and Admiralty Courts, for example, were influenced by Roman law, at least in the form of the *ius commune* or through canon law, which church courts continued to use in England even after the Reformation.

THE WIDER INFLUENCE OF ROMAN LAW

The growth of the influence of Roman law was a gradual and continuous historical process; the law was adapted to territories well beyond those its Roman originators could have imagined and to uses of which they had not conceived. The Spanish acceptance of Roman law meant that it spread beyond western Europe and came to the Spanish territories of the New World.

Roman law was used to support various, even opposing, ideas. For instance, its maxims could support both absolutism and popular government: while the maxim “What pleases the prince has the force of law” (*Quod principi placuit legis habet vigorem*) was used as an argument for royal absolutism in various countries, on the other hand, “What tou-

ches all must be decided by all” (*Quod omnes tangit, ab omnibus approbetur*) was used to justify representative government and even rebellion against oppressive regimes. Roman law’s influence persisted beyond the end of the early modern period, as it served as the main model for Napoleon Bonaparte’s Civil Code (1804).

RUSSIAN LAW

During the early modern period, Russian law was modernized, that is, it became more predictable, rational, and ascertainable. There was considerable codification and ever increasing proliferation and sophistication of judicial officials. As of 1450 Russia had largely completed its transition from an archaic or dyadic legal system, characterized by no judicial

officials, composition (blood-wite, or penalty for bloodshed), and irrational modes of proof, to a triadic legal system, characterized by judges, criminal law, and rational modes of proof. The judicial officials, however, were not specialists and there were no real standing courts. Judges for particular cases were appointed on an ad hoc basis from the ranks of the service class and probably decided civil cases based on their own sense of rough justice or fairness. Perhaps the most advanced aspect of Russian law at the time was that detailed records of trials, judgments, and land transactions were maintained. Most of the early trial records involve trials over the ownership of land. Written deeds were also used and maintained to record transfers of land.

Existing alongside the grand prince's courts were ecclesiastical courts. Each of approximately thirteen bishops had his own court. The church courts had jurisdiction over the clergy in all matters and over laymen in such matters as marriage, family, inheritance, sexual crimes, heresy, and witchcraft. Monasteries also exercised judicial power over those who resided on their vast landholdings.

In 1497 Ivan III of Moscow promulgated Russia's first national law code, consisting of sixty-eight articles. It was primarily a procedural guide, with numerous provisions regulating the fees that judicial officials could charge. It provided penalties for only a few crimes, such as murder. The code also provided for central courts with judges from the two highest ranks of the service class and with judicial records, to be maintained by clerks. Starting in the sixteenth century, certain permanent chancelleries, staffed primarily by clerks, became the standing central law courts. They also performed administrative functions. The chancelleries proliferated, so that by the end of the seventeenth century there were as many as 150. The jurisdiction of the chancellery courts was therefore highly fragmented. The clerks began to develop judicial expertise and kept detailed records. They also developed internal procedure manuals for judicial business. One of the chancelleries also became the repository for deeds to land.

A somewhat more comprehensive codification of civil law was issued in 1550, but this codification, like the 1497 code, was largely procedural. The 1550 code also contained further specifications of

crimes and criminal penalties. But while civil trials were adversarial in nature (the two competing parties presented their evidence to a judge), criminal trials were inquisitorial; in other words, the same official was the judge and prosecutor. Criminal procedure would remain inquisitorial through the remainder of the early modern period. The clerical courts became more sophisticated as well, and in 1551 a vast codification of canon law was compiled, the so-called Hundred Chapters. As the tsar's power and bureaucracy increased, however, the independent power of the church courts was gradually circumscribed.

Legal modernization stagnated in the late sixteenth and early seventeenth centuries as the result of political turmoil, dynastic instability, and civil war. After the installation of the Romanov dynasty in 1613, the legal system and bureaucracy of the late sixteenth century was restored. The legal system, however, became the target of popular suspicion. It was perceived as subject to favoritism and corruption, particularly with respect to lawsuits over escaped serfs. In 1648 demands that the chancellery rulebooks be published became the focus of widespread civil disturbances, which culminated in the calling of an assembly to codify the laws. A vast codification was soon produced, based mainly on the chancellery rule books. The law code of 1649 was one of the most advanced codifications of its time. Its 967 articles fill over two hundred pages in a modern printed edition. For the first time the substantive law relating to landed property, serfs, slaves, and numerous other subjects was codified, along with lengthy codes of civil procedure and criminal procedure. Everyone, even slaves, had access to the courts, and legal rules were published to regulate most important relationships. The code proclaimed that it was to be applied in all cases, and it was indeed extensively cited in subsequent judgments and trial records. Among the most important, but dubious, achievements of the law code was the completion of the enserfment of the peasantry. The 1649 code was to remain Russia's basic law throughout the remainder of the early modern period.

It is important to note that this legal modernization was accomplished without lawyers or law schools and without any Western models or influences. The clerks in the chancelleries developed

considerable practical expertise, but the Russian legal system and Russian law as a whole lacked the theoretical consistency of Western legal systems developed by professional lawyers.

Peter I the Great (ruled 1682–1725) substantially reformed the machinery of justice, replacing the chancelleries with nine colleges, which, like the chancelleries, performed both judicial and administrative functions. He also created the Senate, which among its other functions, served as a supreme court. These institutions remained in place throughout the remainder of the century. Peter also used law as an instrument of reform: his reforms of the civil service, armed forces, and central bureaucracy were accomplished by means of lengthy decrees and regulations. Under Peter the church courts largely lost their independence. Peter also unsuccessfully attempted to transform the law of inheritance by requiring primogeniture.

Under the influence of the Enlightenment, the idea of legal rights, particularly for the nobility, began to gain ground in the eighteenth century, culminating in the Charter to the Nobility in 1785. Throughout the early modern period, law played an important role in controlling crime and protecting the property and status of the service class. Although there were few legal rights, Russia became a state governed by elaborate published laws.

LAW'S SYSTEM. A prophet of a modern credit-based economy, operating free of ties to metal currency, John Law (1671–1729) was born into a commercial family in Edinburgh, Scotland. After a rakish sojourn in London, where he narrowly escaped the hangman's noose, Law succeeded in Europe as a professional gambler, thanks to his grasp of probability theory. He also studied economics and argued in learned treatises that paper instruments should replace gold and silver as money. Only an economy free to expand its currency and fueled by credit could develop significantly. In Paris he befriended Philippe, duke of Orléans (1674–1723), himself a gambler as well as the nephew of King Louis XIV (ruled 1643–1715). When Philippe became regent of France, he turned to Law for help with the financial effects of twenty-six years of war, an empty treasury, and mountainous state debt.

Law perceived that these problems could be solved in association with each other. He planned to turn the debt into equity or shares of stock and to make the shares into paper currency, demonetizing gold and silver coin while simultaneously expanding credit. An economy thus oriented to growth would, in his view, lift itself free of debt.

Between 1716 and 1719, he created France's first national bank, the Royal Bank, and a powerful conglomerate, the Company of the West, or Mississippi Company, merging them in 1720. The former, based in Paris, established branches throughout the realm, taking in tax revenues as deposits and issuing negotiable banknotes. The latter sold shares of stock, also negotiable. It controlled tax revenues, the royal mint, and commerce with Africa, Asia, and the Americas. It assumed the state debt, turning creditors into shareholders and liabilities into assets. To encourage the public to buy company shares, some of which paid dividends of 12 percent, Law dropped interest rates to 2 percent, from 5.55 percent, a blow to fixed annuities. These elements, along with sharp restrictions on the monetary use of gold and silver, became his system.

After initial hesitations, the investing public reacted favorably. In January 1720, a share of company stock, having long since climbed nicely from its initial price of 550 livres, peaked at 10,100 livres, a real stock-market boom. Euphoric buyers, em-

boldened by easy credit, anticipated a share price of 20,500. Some of them became, if only briefly, “millionaires,” a word coined at the time. The system took on the aspects of a Europe-wide miracle. But when Law, deeming shares overvalued, acted to reduce their price, investors turned against him in fury, and the shares tumbled in value, compromising the bank and the company. A rueful John Law left France in December 1720 and died in Venice in 1729.

Amid the ruins of the system, the state emerged as a net gainer, having lightened its debt load: urban workers, victimized by inflation, were the primary losers. The experience turned France against paper money for almost two centuries and gave historians a low opinion of the system, until recently. In the twentieth century, however, the global economy developed in the growth-oriented ways that Law anticipated, with regard to a credit base, the importance of the quantity of money, and its freedom at long last from specie.

JOHN J. HURT

LE BRUN, CHARLES (1619–1690), French court painter and academician. After working briefly with François Perrier, Le Brun became a pupil of Simon Vouet (1590–1649). His earliest known works, such as the dynamic *Hercules and the Horses of Diomedes* of 1641 (Nottingham Castle, Nottinghamshire) reveal their influence and display a talent precocious enough to win the rare praise of Nicolas Poussin, whom Le Brun joined in 1642 on the elder artist’s return to Rome. Le Brun’s stay in

Italy was supported for three years by the powerful Pierre Séguier, duke of Villemor and chancellor of France.

On his return to Paris, Le Brun became one of Louis XIV’s painters and was one of the founders of the Académie royale de peinture et de sculpture in 1648. Not surprisingly, his patron, Séguier, was designated as the protector of the fledgling organization. Le Brun executed canvases and decorative commissions for large Parisian townhouses and religious organizations throughout the 1650s. The deaths of Perrier, Vouet, and Eustache Le Sueur by the middle of the decade—combined with the success of Le Brun’s ceiling in the Galerie d’Hercule of the Hôtel Lambert—made him the unrivaled French painter of his day. A royal order of 1656 forbidding the reproduction of his works without permission provides a measure of his growing reputation.

In 1658, Le Brun began the decorations at the château of Vaux-le-Vicomte for Nicolas Fouquet, the minister of finance. His responsibilities grew to include the direction of the embellishment of the country palace. Three years later, when Louis XIV imprisoned Fouquet for embezzlement of state funds (soon after viewing the results of Le Brun’s lavish efforts), the artist and most of his collaborators were quickly employed by the king in the royal household, especially at Versailles (beginning in 1669), where Le Brun would produce his most celebrated works in the Hall of Mirrors, the Ambassador’s Staircase, and the Royal Chapel. Le Brun’s part in the transformation of this former hunting lodge into the premier palace of Europe included supervising and supplying designs to an enormous team of painters, sculptors, gardeners, architects, and decorative artists, as well as executing vast stretches of painted surfaces glorifying his royal patron (*modello* for *The Second Conquest of Franche-Comté*, early 1680s, Musée National de Versailles). His commissions soon expanded to the Louvre and other royal residences.

Le Brun’s brilliant success as both artist and administrator may be a reflection of his absorption of the effective studio organization he witnessed at first hand during his years as a student in Vouet’s busy atelier. His perfect blend of talents led to his ennoblement in 1662, his appointment as director

Charles Le Brun. *Chancellor Séguier*. THE ART ARCHIVE/MUSÉE DU LOUVRE PARIS/DAGLI ORTI

of the Gobelins manufactory in 1663 (the division of the royal household that supplied most of the luxurious furniture and decorative arts for the royal residences), and his posts as first painter to the king, curator of the royal collections, and chancellor for life of the Académie in 1664.

Le Brun's role at the Académie was critical for the development of French painting and sculpture during the next two centuries. For him, drawing was the basis of the visual arts and therefore the most fundamental skill necessary for a young artist, especially one who aspired to be a painter of the historical, mythological, and religious works that Le Brun codified as the most noble type (or genre) of painting. His belief in the primary importance of drawing followed a long-established Italian tradi-

tion undoubtedly inherited from Vouet. It is also revealed in the many thousands of his own very accomplished extant sheets (*Triton*, c. 1680, Musée du Louvre). To ensure that the Académie's students attained the desired level of proficiency as draftsmen, Le Brun established and systematized a routine of study involving several years of well-defined, graduated stages of figure drawing—one that began with copies of prints or plaster casts and ended with drawings after the live model—that became the standard for academies across Europe. He also oversaw the founding of the French Academy in Rome in 1666 so that the best French students could travel for extended study in what was then the center of the European art world. And finally, beginning in 1667, he initiated his series of

lectures, or *conférences*, at the Académie in Paris—including the pivotal lecture on expression (1668) that was illustrated with his own drawings (*Terror*, c. 1668, Musée du Louvre)—that quickly became obligatory reading for young French artists. During his tenure, the Académie also became the center of heated debates over issues such as perspective and, most importantly, the merits of color versus design, or Rubens versus Poussin. Without forgetting the merits of Rubens, Le Brun's opinion was made clear: the greatest historical example was Raphael, whose genius was taken to even greater heights by Poussin. As he certainly realized, his view proclaimed the primacy of the French school.

Le Brun ended his career with a remarkably detailed inventory of the paintings in the royal collection in 1683. He also produced a number of successful cabinet pictures. Between his numerous posts in the royal household, his multitude of prestigious commissions, and his pivotal role at the Académie, he trained an entire generation of students and collaborators that included Louis and Bon de Boulogne, Louis Chéron, Antoine Coypel, Charles de Lafosse, René Houasse, Jean Jouvenet, and both Michel II and Jean-Baptiste Corneille, influencing them with the richly colored, heavy (but energetic), declarative, and classicizing baroque blend of Poussin and Rubens that had earned him such success.

LEAGUE OF AUGSBURG, WAR OF THE (1688–1697). This war is also known as the War of the Grand Alliance, the Nine Years' War, and King William's War.

FRENCH POLICY IN THE 1680S AND THE COMING OF WAR

French success at the Peace of Nijmegen (1678), which concluded the Dutch War (1672–1678), was followed a decade later by a diplomatic fiasco in which Louis XIV (ruled 1643–1715) began a war in which he had no allies and was opposed by a coalition comprising almost all the European powers. Indisputable characteristics of the years following Nijmegen were overconfidence in France's capacity to pursue political aims through military force and a dangerous contempt for international opinion. The "Chambers of Reunion" active between 1679 and 1682 may initially have presented spurious justifications for absorbing substantial territories lying across France's eastern frontier, but by the time French troops occupied Strasbourg and most of the duchy of Luxembourg, it was evident that Louis and his ministers were indulging the opportunism of the powerful. The lack of effective resistance owed much to the preoccupation of Emperor Leopold I (ruled 1658–1705) with the Ottoman threat, which climaxed in the 1683 siege of Vienna. The spectacular collapse of Ottoman power following the breaking of the siege caused concern at Versailles, but no modification of policy: Spain responded to France's "reunions" by a declaration of war in 1683, and in retaliation Louis sanctioned the seizure of the city of Luxembourg and the naval bombardment of Spain's ally Genoa. Although the Spanish, vainly expecting imperial leadership of an anti-French coalition, were forced to accept a truce at Regensburg in 1684, hostility and fear about French intentions were now widespread.

In this fragile situation French actions grew more provocative. The revocation of the Edict of Nantes in 1685 completed the alienation of Protestant Europe: after 1685 no Protestant power would again make an alliance with Louis XIV. Intrigues over the archbishopric of Cologne and a ham-handed attempt to exploit the succession to the Palatine Electorate antagonized and frightened the German princes. Meanwhile the success of imperial forces in the Balkans, which culminated in the 1688

capture of Belgrade, freed Emperor Leopold to play an active role in an anti-French coalition in the West. In 1686 a number of German princes, Charles II (ruled 1665–1700) of Spain, and Leopold I signed the League of Augsburg (later known as the Grand Alliance) to coordinate resistance to France. Preoccupied by his attempt to bully Pope Innocent XI and the German princes into accepting a French client as archbishop-elect of Cologne, and convinced that a protracted civil war in England would be the most likely—and desirable—consequence of an armed challenge to James II (ruled 1685–1688), Louis and his ministers did nothing to block the invasion of England by William, the stadtholder of the Dutch Republic. Landing at Torbay in November 1688, William's forces rapidly undermined any resistance on behalf of James, and by December, William and his wife, Mary, the daughter of James II, were in London. Louis's most implacable enemy was now established at the head of both the great maritime powers.

A house of cards consisting of facile and inflexible assumptions about the international situation was collapsing; belatedly, Louis and his ministers sought to halt the momentum toward war, but a characteristic reliance on threats and violence simply compounded the crisis. Though demanding that the emperor and the German princes should convert the 1684 truce of Regensburg into a permanent peace, a simultaneous attack by French forces on the Rhineland fortress of Philippsburg ensured that the French ultimatum was ignored. Louis's response was the devastation of the Palatine cities and countryside, not by any means the only instance of such exemplary destructiveness in the period, but one that could hardly have been worse timed in the face of a hostile coalition of all the major western European powers.

THE COURSE OF THE WAR

There had been little attempt during the 1680s to prepare France for another long war, and even in 1689 Louis still hoped that it might be won quickly. The pattern of conflict had much in common with the preceding Dutch War. In the field the French armies proved superior to their opponents, and a group of capable and enterprising commanders were able to maintain the initiative during successive campaigns. French forces in the first few years of

the war gained the military advantage in the Spanish Netherlands at Fleurus (July 1690), Steenkerque (August 1692), and Neerwinden (July 1693), while their victory at Staffarda (August 1690) in Piedmont threatened the collapse of allied power in northern Italy. But sustaining the war effort placed immense pressure upon France; the army was increased to at least 300,000 troops by the early 1690s. The allies could sustain heavy losses on campaign and still reinforce their army corps before the French could exploit a tactical advantage; French victories in the field and successful sieges did not, as Louis and his ministers hoped, bring the allies to the negotiating table. The French financial system and military administration were both under unprecedented strain. In 1693–1694 France suffered twin harvest failures accompanied by famine and disease, which killed upwards of 10 percent of the population. Tax revenues collapsed, much of the army went unpaid and unfed, and lingering hopes that Louis might be able to gain decisive victory evaporated. The French navy had acquitted itself impressively in 1690 with the victory over the combined Anglo-Dutch fleets at Béziers, and had continued to demonstrate tactical effectiveness in subsequent engagements. Yet in response to domestic crisis the navy was decommissioned (1695); some of the warships were contracted out to privateers, who continued a *guerre de course* (raiding campaign) against the allies, while the rest rotted in the dockyards.

By 1694–1695 the French government was desperate either to end the continental war outright or to reduce the scale of its military commitments; the allied capture of Namur (September 1695) provided alarming evidence that the military balance might be tipping against the French. Initiatives to divide the allies failed, and only in 1696 did Louis achieve a costly diplomatic breakthrough by a treaty (Turin) with Victor Amadeus II of Savoy (1666–1732), through which France gained the neutralization of the northern Italian theater at the price of abandoning the key French fortifications south of the Alps. Awareness that even with this scaling down of commitments in the south French forces on the northern and eastern frontiers would be heavily outnumbered during the 1696 campaign encouraged the first serious initiatives toward a general settlement.

Initial allied demands involved the restoration of all French acquisitions since Nijmegen, and negotiations foundered on Louis's refusal to return Strasbourg or to renounce any Bourbon claims in a future settlement of the Spanish succession. French negotiators finally settled with the Dutch and English representatives, recognizing William III as king of England, and conceding Dutch rights to garrison a fortress barrier in the Spanish Netherlands. The preliminary French settlement with the Dutch and English at Ryswick early in 1697 left the Austrians and the Spanish exposed diplomatically and militarily: the negotiations made major concessions to allied demands, returning most of France's conquests since 1678. Jeopardizing settlement over the refusal to surrender Strasbourg seemed disproportionate. Moreover, without the Maritime Powers' soldiers and warships, continuing the struggle against France looked less attractive. Indeed, deprived of the Anglo-Dutch navy, the Spanish were unable to prevent the French capture of Barcelona in August 1697. This provided a decisive inducement to accept the peace, signed at Ryswick by all the major combatants in September and October 1697. Although the emperor resented the abandonment of Strasbourg, and a party within Spain had wanted French concessions over earlier conquests in Flanders, Ryswick showed that France had been pushed to the limits of her resources by nine years of war.

LEDOUX, CLAUDE-NICOLAS (1736–1806), French architect. Ledoux was among the most prominent architects of the final decades of the *ancien régime*. Although few of his buildings are extant, engravings of them and of his unrealized projects continue to draw the attention of architects and theorists interested in their inventive forms, symbolic expression, and social vision.

Ledoux's career exemplifies the increased social and professional mobility of architects in the second half of the eighteenth century. Born into a merchant family of modest means in a provincial town, Dormans (Marne), Ledoux received a classical education in Paris as a scholarship student at the

Collège de Dormans-Beauvais from 1749 to 1753. He subsequently apprenticed as an engraver and studied architecture at the private *École des Arts*, directed by the eminent architectural educator, Jacques-François Blondel (1705–1774). He reportedly completed his professional training in the atelier of Louis-François Trouard (1729–1794). Ledoux deftly established his career through contacts among alumni of the *collège*, the architects and amateurs affiliated with Blondel's school, and a circle of musicians and artists at Versailles that opened to him in 1764 when he married Marie Bureau, the daughter of an oboist in the court orchestra. From the 1760s, these overlapping networks led to a wide range of challenging and profitable private and public commissions as well as his appointment to the royal academy of architecture in 1773. His royalist associations, however, led to his professional ruin and imprisonment (1793–1795) during the French Revolution.

Ledoux began his practice as neoclassicism was emerging as the preferred style among trend-setting designers and clients, and he made a place for himself among them. In 1771–1773, he achieved fame with two commissions, a pavilion at Louveciennes for Madame du Barry (1743–1793), who had recently become Louis XV's mistress, and a house and private theater in Paris for Marie-Madeleine Guimard (1743–1816), a prominent dancer at the Opéra. Both women sought to use patronage of architecture and art to legitimize their place in society, and Ledoux responded to their ambition with buildings attesting to their (and his) discriminating and adventuresome taste. He shared the interest in Greco-Roman architecture that constitutes a defining attribute of neoclassicism, but his formal sources and theoretical intentions went beyond the revival of antiquity. His teacher, Blondel, instilled an enduring appreciation for the grandeur and compositional logic in the buildings of François Mansart

(1598–1666) and a conviction that architects must infuse their designs with an expressive character appropriate to their purpose. Ledoux pursued this attitude by exploring typology and the ways by which architecture can convey meaning. His investigations into the fundamental characteristics of building types paralleled the classificatory efforts of scientists, such as Georges-Louis Leclerc, comte de Buffon (1707–1788). His study of meaning engaged him with contemporary theories of perception, including Edmund Burke's (1729–1797) writings on the sublime. Ledoux's formal language was informed by a lifelong interest in three-dimensional geometry and also by the compositional vocabulary of Andrea Palladio (1508–1580), which he learned through study of Palladio's *Four Books on Architecture* (1570) and English neo-Palladian architecture.

Public commissions were an important part of Ledoux's practice from the beginning of his career. In 1764, he obtained a position in the royal department of water and forests (Département des Eaux et Forêts) for which he designed churches, fountains, and bridges. This experience sparked an interest in the economics, social organization, and architecture of rural life and brought him into contact with physiocratic reformers. In 1771, his patron, Madame du Barry, facilitated his appointment as architect-engineer for the saltworks (*salines*) in eastern France administered by the corporation of tax farmers (Fermiers Généraux). From 1775 to 1780, Ledoux realized a new saltworks, the Saline de Chaux, at Arc-et-Senans (Doubs). His master plan and architectural designs systematically addressed the technical, social, and symbolic dimensions of this important industry. Subsequently, he expanded the project into a visionary scheme for urban and rural development, which he presented in his treatise, published in 1804. Ledoux's work for the Fermiers Généraux included projects in Paris; notably, one of the first commissions for a large office building (begun 1783, never completed) and the master plan and buildings for a wall around the city (begun 1784) intended to regulate the collection of customs duties. Four of his toll stations (*barrières*) remain today. Among his commissions for public buildings outside Paris were the municipal theater in Besançon (1771–1784), an unrealized project for the city hall of Neuchâtel, Switzerland (1783),

and the Palais de Justice and prisons for Aix-en-Provence (designed 1779–1786), begun in 1787 but completed to the designs of others.

RICHARD CLEARY

LEEUVENHOEK, ANTONI VAN

(1632–1723), Dutch microscopist. Born the son of a basket maker on 24 October 1632 in Delft, Leeuwenhoek had little formal education. He moved when he was sixteen to Amsterdam, where he was trained and employed by a draper. In 1654 he returned to Delft, married his first wife, Barbara, and established his own drapery business. One child from this first marriage survived, his daughter Maria, who became her father's lifelong companion.

Leeuwenhoek entered civic life in 1660, when he became chamberlain to the sheriffs of Delft. In 1669 he passed the exam to become a city surveyor, and in 1679 he became official wine gauger to the city of Delft. His first wife died in 1666; Leeuwenhoek married his second wife, Cornelia, in 1671, and she died in 1695.

Leeuwenhoek's career as a tradesman and civic figure took a sharp turn in 1673, when he was introduced to the Royal Society of London by a letter from Reinier de Graaf (1641–1673), a prominent anatomist of Delft. De Graaf said that Leeuwenhoek had devised microscopes that were far superior to any then known, and he included a paper by Leeuwenhoek that offered observations of bits of mold, the eye and sting of a bee, and a louse. The secretary of the Society, Henry Oldenburg, was interested and encouraged further correspondence. Over the next fifty years, Leeuwenhoek wrote more than three hundred letters to the Royal Society. He read and wrote only Dutch, so these letters had to be translated into Latin for publication. The extracts printed in the Society's *Philosophical Transactions* constitute the bulk of Leeuwenhoek's published scientific work.

We do not know how Leeuwenhoek became interested in either microscopy or lens making. It has been suggested that his use of the draper's glass to examine woven cloth might have been a stimulus, but probably his acquaintance with de Graaf and Cornelius's Gravesande, another Delft anatomist, was more important. Whatever the stimulus, by 1671 Leeuwenhoek was making his own microscopes, and they had a unique design. Whereas the microscopes made by Robert Hooke (1635–1703) and other contemporaries were compound instruments, with both an objective lens and an eyepiece, Leeuwenhoek built simple microscopes, with a single beadlike lens mounted between two small thin metal sheets, usually brass. The object to be viewed was mounted on a pin on one side of the lens, and the eye was placed, almost touching the lens, on the other. The microscopes were successful because the tiny spherical lenses were exquisitely ground, or, in a few cases, blown. The measure of their success is what Leeuwenhoek was able to see through them.

In 1674 Leeuwenhoek examined cloudy water from a nearby lake and discovered it was teeming with tiny "animalcules," which we recognize as protozoa. Two years later, while continuing to study his tiny animals, he discovered in an infusion of pepper water some creatures that were much smaller, so small that, in his words, a million would not occupy the space of a grain of sand. Leeuwenhoek had discovered bacteria (although he never recognized them as a radically different form of life

from protozoa). The Royal Society was quite excited by Leeuwenhoek's discovery of microscopic life, which he announced in his famous letters of 7 September 1674 and 9 October 1676, and other microscopists scurried to see for themselves. This was not easy, as no one had microscopes with the resolution of Leeuwenhoek's, but eventually his claims were confirmed.

Leeuwenhoek's other most notable achievement was the discovery of spermatozoa, which he announced in a letter of November 1677. He observed these first in humans, then in dogs, and eventually in more than thirty different species. After persistent study, he came to argue that each sperm was the seed of an individual creature and would give rise to the next generation if properly nourished in the womb. Since most contemporaries argued that the female provided the seed and the male merely some sort of fertilizing power, this was a radically new theory of generation. Leeuwenhoek believed that every element of an adult form was contained in a single sperm. However, he did not, as is sometimes stated, ever claim to see the form of a human within a human sperm.

Leeuwenhoek made other notable discoveries and observations. He was one of the pioneers of plant anatomy, taking a special interest in wood structure. He made a series of detailed studies of blood, observing the red blood cells, and was actually able to see single cells circulating through the capillaries in the tail of an eel, which he announced in a letter of 7 September 1688.

Leeuwenhoek became quite a famous figure in Delft (which, except for two early excursions, he never left). He entertained visitors willingly, although this proved quite time consuming in later life. The future James II of England (ruled 1685–1688) and Tsar Peter I of Russia (ruled 1682–1725) were among those who journeyed to Delft to see Leeuwenhoek and his wonders. When Leeuwenhoek had mastered a particular specimen, he would set up a permanent stand in his house, with a microscope devoted to that specimen, so that a visitor could go from station to station and observe swamp water, blood, insect parts, and other exotica without wasting time. This required a great number of microscopes, and it is estimated that Leeuwenhoek built over five hundred in his lifetime. Twenty-

six, made of silver, were presented to the Royal Society after his death, with specimens attached; sadly, these have disappeared. But nine of his microscopes have survived and are the treasures of museums in Utrecht, Leiden, Rotterdam, Antwerp, and Munich.

One rather odd feature of Leeuwenhoek's life is that he was executor, in 1676, for the estate of the artist Jan Vermeer (1632–1675). Although other interaction between the two figures cannot be documented, it has been suggested that Vermeer learned optics from Leeuwenhoek, or perhaps vice versa, and it has been further suggested that Leeuwenhoek was the sitting subject for two of Vermeer's famous paintings, *The Astronomer* (1668) and *The Geographer* (1668–1669).

Although the *Philosophical Transactions* of the Royal Society was the primary forum for Leeuwenhoek's discoveries throughout his life, he did supervise the separate publication of several collections of those letters, in both Dutch and Latin, beginning in 1684 and continuing to 1722. However, he never wrote any kind of a synthesis of his work. Leeuwenhoek died in his home, at the age of ninety, on 26 August 1723, shortly after dictating a last letter to the Royal Society.

WILLIAM B. ASHWORTH, JR.

LEIBNIZ, GOTTFRIED WILHELM (1646–1716), German philosopher, mathematician, physicist, historian, and diplomat. Gottfried Wilhelm Freiherr von Leibniz was born at the end of the Thirty Years' War in Leipzig, a Protestant university town in Germany, where his father was a professor. His father died when Leibniz was only six, but he inherited his library and his respect for intellectual pursuits and from an early age read widely in the Latin classics, history, Christian theology, and logic. His precocious eclecticism foreshadowed the course of his later life. The sixty thousand handwritten pages that he left behind at his death (now mostly housed in the Leibniz Archives in Hanover, Germany) cover an awesome range of topics, his mastery of each one of which is stamped by the erudition of a scholar and the originality of genius. His legacy includes the invention of the infinitesimal calculus and its application to mechanics via the study of differential equations and transcendental curves; a metaphysics that reconciles mechanistic science with the inviolable integrity of human awareness; a theory of knowledge based on analysis as a search for conditions of intelligibility and guided by a prescient appreciation of formal languages; a moral theory born of his experience as a diplomat that underwrites religious and cultural tolerance and decries tyranny; and a history of the House of Hanover, exemplary in its scholarly procedures, that deepens our understanding of the Middle Ages.

After an early academic post at the University of Altdorf, Leibniz decided in favor of the practical life as an advisor to princes: in 1667 he was called to the Catholic court of the Bishop Elector in Mainz, which led to his four wonderful years in Paris, 1672–1676; thereafter he served the dukes (then electors) of Hanover until his death, service punctuated by frequent voyages in Europe, the longest of which was a sojourn in Italy from 1687 to 1690. The sojourn in Paris changed his life, for there he met the Dutch physicist Christiaan Huygens (1629–1695), who introduced him to Descartes's geometry and the new algebra, and also made the acquaintance of Nicolas de Malebranche (1638–1715) and Antoine Arnauld (1612–1694). It is fair to say that between 1672 and 1676, Leibniz recapitulated the history of Western mathematics, for he came to Paris knowing only Euclid and left with the

invention of the infinitesimal calculus, including the essential notational innovations of dx for the differential and \int for the integral, to his credit. The inaugural publication of his differential and integral calculus appeared in the journal *Acta Eruditorum*: “Nova Methodus pro Maximis et Minimis” (A new method for maxima and minima) in October 1684, and “De Geometria Recondita et Analysis Indivisibilium atque Infinitorum” (On a deeply hidden geometry and the analysis of indivisibles and infinites) in June 1686. Leibniz’s discovery of the calculus in the 1670s occurred independently of Isaac Newton’s (1642–1727) activity, though his later application of the theory of differential equations to planetary motion seems to have been directly inspired by Newton’s *Principia* (1687). Johann (1667–1748) and Jakob (1654–1705) Bernoulli used Leibniz’s ideas and notation to work out important problems in analysis and mechanics, which led in turn to the work of Leonhard Euler (1707–1783), Jean Le Rond d’Alembert (1717–1783), and Joseph-Louis Lagrange (1736–1813) in the eighteenth century.

In the same year, 1686, Leibniz composed his *Discours de métaphysique* (Discourse on metaphysics) and began his correspondence with the French Jansenist philosopher Antoine Arnauld, two works that display the metaphysical position of his middle years with special clarity. The *Discourse on Metaphysics* argues that we should make God’s creation of the world our model in the employment of an *ars inveniendi*, though since we are finite, we must rest content with employing highly reductive formal languages (“characteristics”) to investigate intelligible but infinite or infinitesimal things. Its scientific reflections are developed in the unpublished *Dynamica* (Dynamics) of 1689–1691, and “Specimen dynamicum” (A specimen of dynamics) published in 1695. The jurisprudential and political works written during Leibniz’s maturity also urge that we take God’s rational and charitable freedom as the model for our moral decisions, legal system, and the comportment of princes and parliaments. Voltaire could never have satirized Leibniz’s philosophical views as naïve in his novel *Candide* (1759) if he had read and taken to heart the essay “Mars Christianissimus” (1683; Most Christian war god), where Leibniz attacks the aggression and autocracy of Louis XIV, then king of France, with the eloquent fury of a seasoned diplomat whose dearest wish was to see Europe reunited as a pacific confederacy. Leibniz was also one of a handful of seventeenth-century European intellectuals to entertain seriously the learning of China and to argue that Europe might profit from cultural exchange with the great Eastern empire. His later metaphysics, oriented more toward theology than science or politics, is summarized in short unpublished works written in 1714, “Principes de la nature et de la grâce, fondés en raison” (Principles of nature and grace, founded on reason) and “Monadologia” (Monadology), as well as the explicitly theological work of 1710, *Essais de Théodicée* (Essays on theodicy). Leibniz died quietly in Hanover in 1716, but his thought has enjoyed an animated afterlife ever since.

LEIPZIG. Leipzig was a center of trade, religious organization and innovation, music, printing, and education in the Holy Roman Empire. The population of the town grew from about 9,000 in 1500 to about 30,000 in 1800. Contemporaries often contrasted Leipzig's commercial atmosphere to the court-dominated atmosphere of Dresden, the other main Saxon urban center. From 1485, when the territory of Saxony was divided into electoral and ducal portions, until 1547, Leipzig was located in ducal Saxony. When Duke Maurice was awarded the electoral title in 1547, Leipzig became part of electoral Saxony.

Leipzig was influenced by the course of Saxon politics in many ways. The city's economic and cultural boom from the late seventeenth to the mid-eighteenth century was in part the result of Saxony's political prominence under the rule of Frederick Augustus I (ruled 1694–1733) and Frederick Augustus II (ruled 1733–1763). Similarly, the timing and degree of the city's involvement in the Schmalkaldic War (1546–1547), the Thirty Years' War (1618–1648), the Seven Years' War (1756–1763), and the Napoleonic Wars (1796–1815) were conditioned by territorial politics. The electoral court also influenced local politics, although historians have recently emphasized the power of local elites. The Leipzig city council was divided into three rotating groups, each typically made up of twelve councillors and one mayor, who served a one-year term as the governing or "sitting" council. About half of the councillors were merchants, and half were lawyers. Election was by co-optation (new members were chosen by the existing members). Eligibility to serve

on the council was not formally restricted, but most councillors were members of well-established local merchant and professional families.

Artisanal production, the university, and the printing industry were all important sectors of the local economy. About seventy trades were represented in the city; the university's thousand-plus students helped support the entertainment, luxury, and printing trades. Also key were Leipzig's trade fairs, held three times a year. The fairs achieved dominance in Saxony and Thuringia by 1500, and from the 1680s onward, they were the largest in central Europe. Leipzig became one of the main German distribution centers for colonial goods.

Leipzig had become a cultural center by the fifteenth century. A university that became one of the most prominent in Germany was founded there in 1409. By the eve of the Reformation, the city housed numerous monasteries, and the two main churches, St. Nicholas and St. Thomas, were the object of endowments by the city council, guilds, and individuals. Some burghers were early adherents of the Lutheran doctrine preached in nearby electoral Saxony. However, the Reformation was officially introduced into the city only in 1539, when Duke Heinrich succeeded his brother George, who had remained Catholic. Leipzig's clerics soon became well-known and influential in the Lutheran world. The next major religious dispute erupted in 1689, when a group of reformist students and burghers known as Pietists challenged mainstream orthodox clerics. High baroque culture thrived in Leipzig from the 1680s onward, with a boom in public and private architecture, fashion, entertainment, and secular and sacred music, most notably represented by Johann Sebastian Bach, who served as town cantor from 1723 to 1750. Leipzig was also a center of Enlightenment printing and debate.

TANYA KEVORKIAN

LEO X (POPE) (1475–1521; reigned 1513–1521). Second son of Lorenzo “the Magnificent” de’ Medici and Clarice Orsini, Giovanni Romolo de’ Medici was trained in the humanities and received a doctorate in canon law from the University

of Pisa in 1492. He was appointed cardinal in 1489, and held various legations culminating in that to the Holy League, which reinstalled his family to power in Florence in 1512.

Elected pope by the younger cardinals in 1513, Leo X quietly continued the imperial and Spanish alliance against France pursued by his predecessor Julius II (reigned 1503–1513), but he made peace with the French king Francis I following the latter’s military victory in 1515 and negotiated a concordat with him at Bologna, to replace the Pragmatic Sanction of Bourges (1438). He tried to create a French alliance by Medici marriages to relatives of Francis I: His brother Giuliano (1479–1516) was married to the royal aunt Philiberte de Savoy, and his nephew Lorenzo di Piero (1492–1519), to Madeleine de La Tour d’Auvergne (d. 1519), probably a royal cousin, whose orphaned daughter, Catherine (1519–1589), later became queen of France. With their deaths and the election of Charles V as Holy Roman emperor in 1519, which he opposed, Leo returned clearly to the Habsburg alliance and regained Parma and Piacenza for the Papal States once the French were defeated in 1521.

As head of the Roman Catholic Church, Leo took his responsibilities seriously. At religious ceremonies he presided with dignity and devotion. He brought to a successful conclusion the Fifth Lateran Council (1512–1517), which healed the Pisan schism, approved the abrogation of the Pragmatic Sanction, and confirmed the Concordat of Bologna; regulated relations between bishops and exempt clerics; condemned Averroistic views on the soul; ordered prepublication censorship of books; legislated various moral and curial reforms; and ordered a crusade that, given Christian rivalries, could never be launched. He tried to promote a reunion of the churches by sending a legate to the Hussites and establishing good relations with the Maronites and Ethiopians. To promote the evangelization of non-Christians, he approved in 1518 the training of non-European clergy and the episcopal consecration of Enrique (c. 1494–1531), son of the king of the Congo. To preserve orthodoxy he threatened Martin Luther (1483–1546) with penalties should he fail to recant forty-one propositions (*Exsurge Domine*, 1520); he then excommunicated the recalcitrant friar (*Decet Romanum Pontificem*, 1521). To Henry VIII he assigned in 1521 the title “Defender of the Faith” for writing against Luther. While he actively supported the observant movement in religious orders, he failed to effect a serious reform of the Roman Curia, because it would have reduced his revenues.

Leo was a lavish patron of arts and letters. He employed Michelangelo Buonarroti (1475–1564) to carve the Medici tombs in Florence, and in Rome he commissioned Raphael Sanzio (1483–1520) to work on the frescoes in the papal apartments and loggia, design the Sistine tapestries, paint his papal portrait, and supervise the construction of the new St. Peter’s Basilica and excavations of Roman archaeological sites. As domestic secretaries he hired the humanists Pietro Bembo (1470–1547) and Jacopo Sadoleto (1477–1547). He endowed professorships at the University of Rome and founded there a Greek college and press. Leo was on good terms with leading humanists such as Desiderius Erasmus (1466?–1536), who dedicated to him the *Novum Instrumentum* (New Testament) of 1516. He commissioned Marco Girolamo Vida (c. 1490–1566) to compose the epic poem *Christiad* (1535), begun in 1518, and in 1521 he urged Jacopo Sannazaro

Pope Leo X. Pope Leo X with cardinals Giulio de’ Medici (later Pope Clement VII) and Luigi de Rosai. Portrait by Raphael, 1518, Uffizi Gallery, Florence.

(1458–1530) to complete his *De Partu Virginis* (1526; “On the virgin birth”), begun in 1506.

Leo promoted numerous relatives and clients to church office, most notably in the 1517 mass creation of thirty-one cardinals following a plot to poison him, which had been provoked by his interference in Siense political affairs. His first cousin Giulio de’ Medici (1478–1534), whom he appointed archbishop of Florence, cardinal, and vice-chancellor of the church, was his closest adviser and would eventually succeed him as Clement VII (reigned 1523–1534). By his lavish expenditures on culture and warfare, and despite his efforts to raise new revenues by the sale of venal offices, dispensations, and indulgences, Leo X left the papacy deeply in debt at the time of his sudden death from pneumonia. He was eventually buried in the church of S. Maria sopra Minerva.

NELSON H. MINNICH

LEONARDO DA VINCI (1452–1519), Italian painter, sculptor, architect, and inventor. The illegitimate son of a young notary and a farm girl, both of whom married other people of their own social station shortly after his birth, Leonardo was adopted into his father's household when his stepmother remained childless. Unlike his father, Ser Pietro, who had learned Latin in connection with his profession, Leonardo, for all his evident intelligence, proved a poor and distracted student; he received the arithmetical training known as "abacus school" (*scuola di abbaco*) and then seems to have quit his formal schooling to be apprenticed to the famous Florentine sculptor Andrea del Verrocchio (1435–1488).

Leonardo's first biographer, Giorgio Vasari (1511–1574), tells how the young apprentice painted so ethereal an angel for Verrocchio's *Baptism of Christ* that the master threw up his hands and admitted defeat. But Verrocchio also helped to create Leonardo's famous sfumato or "smudged" shading technique, and encouraged his reliance on drawing as the chief medium for artistic composition, whether in painting, sculpture, architecture, or mechanics. Leonardo's first independent commission, an altarpiece for the Chapel of Saint Bernard in Palazzo della Signoria, contracted in 1478, was never completed, and this unfinished business set a pattern for the rest of his life. When his father procured for him the assignment of an altarpiece with the *Adoration of the Magi* for the Augustinian Canons Regular at San Donato in 1481, he put in several months of hard work on the ambitious painting, then abruptly left Florence for Milan in September, where he joined the court of Ludovico Sforza (duke of Milan 1481–1499).

This move represented more than a change of place; it also brought on a change in Leonardo's

whole way of life. Florence, despite the heavy hand of the Medici clan in every government office and public commission, was nominally a republic, a large city-state with an elaborate set of public institutions. Ludovico, on the other hand, was a professional soldier who had seized Milan by force and aimed to keep control of the city by maintaining an efficient system of government and an active cultural life.

Leonardo seems to have applied to Ludovico Sforza with an offer to serve as a military architect. He spent much of his time with Donato Bramante (1444–1514) and the mathematician Luca Pacioli, providing the illustrations for Pacioli's popular book *On Divine Proportion* (1509), some of them originally pillaged from Piero della Francesca

Sometime between 1493 and 1495, Leonardo obtained the commission to decorate the refectory of the Dominican convent of Santa Maria delle Grazie with a *Last Supper*. The fresco was widely influential despite the failure of Leonardo's experimental formula for its paint, which began to deteriorate almost immediately.

In 1494, Charles VIII, the king of France, invaded Italy. By 1499, Milan had fallen to French troops, who imprisoned Ludovico. Leonardo, in the company of Luca Pacioli, returned to Florence, but not before he had seen the huge clay model for his never-completed statue of Francesco Sforza used for target practice by Gascon bowmen.

In 1502 Leonardo worked briefly as a military engineer in central Italy for Cesare Borgia. When Borgia's military campaigns began to be reined in by his father, Rodrigo (later Pope Alexander VI; reigned 1492–1503), Leonardo again returned to the Florentine republic, where an extensive remodeling of the great city hall, the Palazzo della Signoria, was under way. Here, in a monumental room designed to hold the republic's new representative council, Leonardo was asked to paint scenes from the battle of Anghiari, a skirmish in which Florence had gotten the best of her inveterate rival (and sometime port) Pisa. On the opposite wall, the city council had engaged Michelangelo Buonarroti, whose newly completed *David* still provides the most eloquent testimony to the indomitable spirit of this early-sixteenth-century Florentine republic.

Leonardo worked up at least part of his design for the *Battle of Anghiari* (begun 1503) to full size and transferred it to the wall of the council hall, but he decided to paint it in a medium that would lend the chalky plaster surface of the fresco something of the sheen of oil paint. The experiment failed miserably, and Leonardo never finished the work. It was finally covered by another fresco executed by Giorgio Vasari. Also in Florence, Leonardo became preoccupied with water and its motions. Another side of nature shows forth in Leonardo's sketches for his lost painting of *Leda and the Swan*.

From 1506 to 1513, Leonardo moved between Milan and Florence, evading the irate city councilmen who clamored for the rest of their *Battle of Anghiari* and also evading the violent skirmishes that plagued the area around Milan. He filled a series of notebooks with his writings, sketches, and anatomical studies. In 1512, the Florentine republic fell to a restored Medici dynasty; in 1513, Medici

rule was reinforced by the election in Rome of a Medici pope, Leo X (reigned 1513–1521), son of Lorenzo the Magnificent. When the pope invested his brother, Giuliano de' Medici, with honorary Roman citizenship, Leonardo traveled with Giuliano's entourage and continued to study and write from his own special apartment in the Vatican Palace. In a city dominated by the imposing influence of Raphael, who had transformed himself from a painter to a designer (*disegnatore*) of international fame, Leonardo began to compile his own notes on painting, which would eventually be gathered together by his pupil Francesco Melzi and published in 1651 as *Treatise on Painting*.

In 1516, the aging artist accepted an invitation to become *peintre du roi* by Francis I of France and moved north with Melzi and his servant Salai. He died there in 1519 at the age of sixty-seven.

LEOPOLD I (HOLY ROMAN EMPIRE) (1640–1705; king of Hungary and of Bohemia from 1655; Holy Roman emperor from 1658). The second surviving son of Emperor Ferdinand III (ruled 1637–1657), Archduke Leopold was destined by dynastic tradition to enter the church, where he could use the wealth and influence of high ecclesiastical office to further Habsburg dynastic interests in Europe. His older brother, the heir apparent, died in 1654, however, and Leopold, at age fourteen, had to take his brother's place and abandon clerical vows in order to become the dynastic

patriarch. The young archduke's education was overseen by tutors and aristocratic mentors who molded him for an ecclesiastical career. Leopold early adopted the intense Catholic piety expected of him and the gentle manners appropriate to a merely supporting role. He grew to manhood without the military ambition that characterized most of his fellow monarchs. From the beginning, his reign was defensive and profoundly conservative.

His first crisis concerned the Habsburg dynastic succession in the future, for in seven years death had reduced the living male Habsburgs to only two: Leopold and his sickly cousin Charles II of Spain. In 1666 Leopold married the younger daughter of Philip IV of Spain, the infanta Margareta (1651–1673); of their four children, only one, Maria Antonia (1669–1692) lived beyond the first year. A second marriage in 1673 to Claudia Felicitas of the Tyrol (1653–1676) brought two more daughters, both of whom died in their first year. In 1676 his third marriage to Eleanora Magdalena of Neuburg (1655–1720) finally produced a male heir in Joseph I (ruled 1705–1711) and then another son, Charles VI (ruled 1711–1740).

Two decades of dynastic crisis encouraged Leopold's neighbors to contemplate the Habsburg lands should Leopold fail to provide a male heir. France coveted the Spanish territories along the Rhenish frontier; in the east the Turks seized control of Transylvania in 1663 and invaded Hungary the next year. A coalition of imperial and Hungarian forces defeated the invaders at St. Gotthard in 1664. Leopold then surprised and disgusted his generals by concluding a hasty treaty at Vasvár accepting Turkish occupation of most of what they held and paying a large tribute to the Sublime Porte, the Ottoman government in Turkey. Leopold defended the treaty by pointing to French threats against the Low Countries. The immediate consequence, however, was the emergence of a conspiracy among Hungarian magnates who accused Leopold of wasting their blood. Leaders formed armed bands that moved about Hungary attacking both imperial and Turkish units, leading to renewed Turkish incursions. When the plot developed into a plan to murder Leopold, the court struck back, rounded up all the leaders, and executed them. Characteristically, Leopold himself favored clemency for the

plotters, several of whom had been childhood friends, but sterner voices prevailed in his councils.

The imperial court at Vienna was a multilingual assembly of some two thousand persons, only about a hundred of whom participated in decision making through the judicial, financial, and military councils. Around them were small swarms of secretaries, copyists, investigators, bodyguards, lawyers, and others who were gradually coalescing into a primitive bureaucracy. Beyond them was a larger swarm of laborers, janitors, kitchen help, grooms, stable hands, laundresses, and court purveyors. All of these enjoyed the privilege of being subject to a special judiciary under the court marshal.

The aristocratic elite that dominated the governing councils generally split into two distinct factions: "westerners," who followed Leopold's own preference for appeasing the Turks in order to concentrate on the French threat, and on the other side the "easterners," who insisted that the Turks were the greater threat. That group included most of the military leaders, courtiers with great properties in Hungary or Croatia, and above all the church hierarchy, which followed the papacy's lead in the crusade against militant Islam.

It was clear that Leopold's territories could not provide the resources to allow major military campaigns in both Hungary and the Low Countries. Unrest in the east and French invasions into the Netherlands forced Leopold to enter into an alliance with the Calvinist Dutch Republic. This move unsettled his conscience for years, but the commercial wealth of the Protestant sea powers combined with the human and material resources of central Europe formed the basis on which subsequent Habsburgs built their Danubian empire. The war with France, which began in 1673, lasted beyond the end of his reign with only two brief periods of armed peace.

To deal with the eastern problems, Leopold was advised to resort to a policy of repression, revoking the privileges and freedoms guaranteed by Hungary's constitution and occupying the country with German troops, who would be paid by the local counties and the magnates. Spontaneous uprisings produced a general revolt. Vienna responded with a program of violent repression, setting up special courts that prosecuted Protestant preachers, an-

gering popular opinion in Protestant states. The repression lasted until 1676, when Leopold had to remove the imperial garrisons from Hungary to fight against France. Hungary again fell into civil war between Catholic magnates loyal to the emperor and Protestant nobles defending their freedom of religion as guaranteed in their constitution. Restoration of traditional liberties in 1681 merely intensified the rebellion.

A deadly plague spreading up the Danube hit the Austrian provinces in 1679, forcing the court to move to Prague. Vienna lost about a fifth of its population. That disaster alongside the diversion of war with France led the Turkish vizier Kara Mustafa to undertake a massive onslaught against the west. In 1683, moving unexpectedly quickly, a Turkish army of nearly a hundred thousand surrounded Vienna on 16 July. Leopold fled with his councils to Passau, where the government began organizing the city's relief. A relieving force gathered above Vienna attacked the besieging forces on 12 September. With the help of King John Sobieski III of Poland, the long battle ended with the Turks in full retreat down the Danube.

The triumph of 1683 turned Leopold's attention to the east. The shift of power in Hungary came slowly. Remaining rebel forces gradually accepted Leopold's offered amnesty. By 1686 Buda fell, the next year imperial forces occupied Transylvania, and in 1688 the great fortress of Belgrade fell. Vienna had just begun celebrating when France invaded the Palatinate. This forced Leopold once again to choose between allowing France to ravage the empire and concentrating on the east, or taking the great risk of fighting a two-front war. Leopold agreed to a greater war, which is known as the War of the League of Augsburg. For nearly a decade neither front produced clear results. In 1691 the Turks retook Belgrade. In 1697, with Prince Eugene of Savoy in command, imperial forces defeated the main Turkish army at Zenta. Two years later the Treaty of Karlowitz fixed the eastern boundary of the Habsburg empire where it remained largely unchanged until the twentieth century.

The treaty of Ryswick temporarily interrupted hostilities with France, but upon the death of Charles II in 1700, war broke out again over the

Spanish succession. Leopold sent his forces into northern Italy to occupy what they could of Spanish possessions there. The war soon became global, involving struggles in Germany, Flanders, Italy, Spain, Canada, New England, and the West and East Indies. Leopold died in 1705 at the peak of its intensity. He left a monarchy strengthened by military success, but in much need of institutional reform. Leopold was not a forceful personality. He believed sincerely that his conscientious piety would be sustained by divine providence, which would produce the necessary miracles for survival. He was a master at the art of representing his sovereignty on an elaborate baroque stage, staging complex allegorical productions, performing in them, and composing oratorios and incidental music for them. Vienna's premier role in the development of western music owes much to this modest emperor's cultivation of the one art form that could bridge the many languages spoken by his subjects.

LEPANTO, BATTLE OF. The Battle of Lepanto took place on 6–7 October 1571 between

the Catholic Holy League fleet led by Don Juan of Austria, a bastard son of Habsburg emperor Charles V, and an Ottoman fleet under Müezzinzade Ali Pasha. It occurred at the mouth of the Gulf of Patras, near where the Peloponnesian peninsula joins the mainland (now in modern Greece). An Ottoman debacle, Lepanto was the last great galley battle in the Mediterranean. The Ottomans sent about 280 ships there, and the Holy League had about the same number. The battle featured the use by the Holy League of a new naval weapon: galleasses. These were Venetian merchant ships outfitted with high cannon superstructures sent in front of the armada to pound the Ottoman fleet as it tried to sweep around them. Debate has persisted about whether it was these new ships with their improved firepower or the Ottoman failure to outflank the Christian force that caused the latter's victory. The battle resulted in about two hundred Ottoman ships being sunk or captured and thirty thousand Ottoman sailors and soldiers killed or captured with only minimal casualties on the Christian side.

A CELEBRATED BUT QUESTIONABLE MILESTONE

This defeat occurred only one month after the shattering Ottoman defeat of Venetian forces defending Cyprus, which the Ottomans then conquered and controlled for the next three centuries. Lepanto was soon celebrated in Europe as a reversal of this defeat and as the end of many years of naval defeats that the Ottomans had inflicted on the Christians. The battle came to be seen as the beginning of subsequent naval decline of the Ottoman Empire. Some modern historians have discounted this view by pointing out that the Ottoman Empire rebuilt virtually the entire fleet that it had lost at Lepanto within a year. Others have pointed out that although the Ottomans did restore their fleet, they suffered a crippling loss of manpower that was particularly harmful for galley warfare. The battle provided a psychological boost for the Catholic world then locked in numerous conflicts across Europe. It was commemorated in Europe through paintings and drawings that depicted it as evidence of a renewed crusading spirit. Miguel de Cervantes, a soldier for

Habsburg Spain, was so severely wounded in the hand at Lepanto that he became a writer. G. K. Chesterton memorialized the battle in a poem.

Lepanto proved the last great Christian-Muslim naval battle in the Mediterranean since privateers and corsairs increasingly dominated naval warfare there. Large-scale Christian-Muslim galley warfare ended in the Mediterranean, perhaps because this battle revealed to both sides the difficulties of permanently controlling this sea. The change may simply reflect, however, that the arena of naval combat had shifted to include the Atlantic and more distant oceans and seas. Ottoman, Habsburg, and Venetian acceptance of the inability of any one power to control the whole Mediterranean after Lepanto led to both a rise in piracy and more commercial activity between traditional partners like Genoa, Venice, and the Ottoman Empire, as well as newcomers like the British, the Dutch and the French.

LERMA, FRANCISCO GÓMEZ DE SANDOVAL Y ROJAS, 1ST DUKE OF (1552/1553–1625), favorite of Philip III of Spain and a member of a Valencian family with a long tradition as courtiers. Lerma, about whom few historians ever have said anything kind, was the first of the seventeenth-century *validos*, or Spanish favorites, whose greatest exemplar was the Count-Duke of Olivares (1587–1645).

Philip III (ruled 1598–1621) was an unworthy successor to his grandfather, Charles V (ruled as

Holy Roman emperor 1519–1556; as Charles I, king of Spain, 1516–1556), and father, Philip II (ruled 1556–1598). Lerma dominated the young monarch immediately upon his accession and for the next twenty years. Until his fall in 1618, Lerma amassed enormous wealth, elevated friends and relatives whose incompetence was matched only by their greed, oversaw economic ruin, including the sale of offices and debasement of currency, encouraged a lavish court that was a stark contrast to the austerity practiced in the sixteenth century, and engineered the costly and useless transfer of the capital to Valladolid. But he also advocated a series of peace treaties that enabled Spain (and its enemies) to spend around fifteen years in relative peace and recover from decades of warfare.

Scholars traditionally have said that Philip III, under the sway of Lerma, essentially abdicated. Lerma’s contemporaries, angry that he kept the king in virtual isolation and beyond their reach, certainly thought so, but recent scholarship disagrees. Evidence is scanty, but what is clear is that Philip III’s reign was the occasion for important political developments. The crisis of authority during the early seventeenth century provided theorists with ammunition for new ideas about the relationship between monarch and advisor; the economic crisis propelled the representative Cortes (parliament) and the cities into a more active political role; and even the opulent tastes of the aristocracy and the court spurred artistic production. Lerma can be blamed for these developments; he can also be credited for them. Moreover, peace allowed the government to undertake serious naval rebuilding.

Lerma owned one of the largest art collections of the period and was a patron of dramatists and architects. Peter Paul Rubens (1577–1640) painted his portrait in 1603, seating him like a king on horseback amid glorious, light-infused battle scenes. Juan Pantoja de la Cruz painted portraits of Lerma and Philip III in 1602 and 1606 that are practically identical; the implications were surely not lost on contemporaries.

By 1612, Lerma was the sole intermediary between the king and all government institutions, so much so that the king ordered the Council of State to obey the duke in all matters. His signature had the same weight as that of the king. He had skillfully

institutionalized and legitimized this position of unprecedented power, which he capped in 1618, on the eve of his fall, by being appointed a cardinal of the Roman Catholic Church, apparently the culmination of years of indecision about joining a religious order and withdrawing from the world.

Lerma was probably the richest man in Spain, as well as the most powerful. His enemies were legion, not surprisingly, and they included most of the aristocracy and the female members of the king's family: his wife, Margaret of Austria; his grandmother, Empress Maria of Austria; and his aunt, Margaret of the Cross, a nun. Indeed, it was partly to escape their influence that Lerma moved the king to Valladolid.

Lerma's power began to wane with the Twelve Years' Truce in 1609, seen by some as capitulation to the Dutch rebels. His enemies alleged that others of his noninterventionist decisions, such as avoiding the 1612 Savoy crisis, also were defeatist. One of his closest allies, Rodrigo Calderón, was forced to leave the country in 1611, an important step along the way to dislodging Lerma. As the Twelve Years' Truce neared its end and conflict in Bohemia appeared inevitable, his chief rivals, among them Cristóbal de Sandoval y Rojas, duke of Uceda (and Lerma's own son), and Baltasar de Zúñiga, a former ambassador who was already aiming to advise the future Philip IV, rose in prominence. In September 1618, Lerma asked permission to retire, which the king granted.

As courtiers and rivals fought to divide his wealth and influence and the new regime punished his allies (Calderón was eventually executed), Lerma spent his last years in the seat of his estates, the beautiful town of Lerma, just south of Burgos. The walled town, rebuilt on the orders of the duke in 1606, is among the most outstanding examples of seventeenth-century urban design, both a ducal court and a conventional town. He died 17 May 1625 in Valladolid.

LESSING, GOTTHOLD EPHRAIM (1729–1781), German dramatist, critic, theologian, and most prominent proponent of the German Enlightenment. A son of the city's chief Lutheran pastor, Lessing was born in Kamenz in the Electorate of Saxony on 22 January 1729. After attending the local Latin school and the famous ducal school of St. Afra in Meissen, Lessing entered the University of Leipzig in 1746 in order to study theology. Having discovered his love for the theater, he left the university without a degree and, to the dismay of his father, started to make a living as a freelance writer and critic, moving back and forth between the cities of Leipzig, Berlin, Wittenberg, and Breslau.

Scholars emphasize Lessing's role in the development of German theater and drama and his aesthetic theory. His earliest tragedy, *Miss Sara Sampson* (1755), which foreshadowed his rise to literary prominence, constituted a shift from the prevalent French classicist models to an advocacy of Shakespeare and the English theater. *Miss Sara Sampson* can be called an early example of bourgeois tragedy. Lessing argued that the essence of tragedy—pity—depended on the depiction of human suffering and not on the social milieu of the protagonists. It was important, however, to create situations and characters with which the audience could identify.

This new concept is best exemplified in his last tragedy, *Emilia Galotti* (1772). The play is an indictment of an immoral prince who ruthlessly pur-

sues his love interest, the virtuous bourgeois girl Emilia. Seeing no other way of defending his daughter, her father kills her in order to preserve her morality. The play shifts the focus from the court milieu of the heroic play into the private realm of the middle-class family. Later writers such as Johann Wolfgang von Goethe (1749–1832) and Johann Gottfried Herder (1744–1803) equally acknowledged the play's success in depicting an emancipated bourgeoisie of the Enlightenment rebelling against the corruption of court society.

Lessing outlined his thoughts on theater and drama in his *Hamburgische Dramaturgie* (1767–1769; Hamburg dramaturgy), which he wrote while serving as a theater critic at the German National Theater in Hamburg from 1767 to 1769. Despite the fact that the *Hamburgische Dramaturgie* is not a systematic work, it provides many insights into Lessing's thought. Its main concern is the critique of French classical drama and the reinterpretation of Aristotle's work on tragedy.

Lessing's interest in the classics reveals itself in his work on aesthetics. In his *Laokoon: oder über die Grenzen der Malerei und Poesie* (1766; Laocoon: or the limits of painting and poetry), Lessing emphasized the differences between the visual arts and literature. According to Lessing, literature focuses on action, whereas the visual arts focus on static objects. Lessing concluded that literature is superior to painting or sculpture because it can represent the full spectrum of human emotions.

With Lessing's acceptance of the post of ducal librarian at Wolfenbüttel in 1769, theological and religious themes emerged as the overriding concerns of his writings.

During his stay in Hamburg, Lessing had become a close friend of the children of Hermann Samuel Reimarus (1694–1768), a renowned Lutheran theologian and professor of Oriental languages at the academic gymnasium in Hamburg. Influenced by English deism, Reimarus had secretly written an attack on the veracity of revealed religion. After their father's death, Reimarus's children entrusted Lessing with the manuscript, from which Lessing published several parts under the title *Fragmente eines Ungenannten* (1774–1778; Fragments from an unnamed author). Most of the fragments criticized different parts of the Old and New Testa-

ment on moral as well as historical grounds. The publication created a stir in religious circles so that Lessing's employer, the duke of Brunswick, withdrew Lessing's censorship privileges. Forced to silence, Lessing wrote his most famous play, the epic poem *Nathan der Weise* (1779; Nathan the wise). Modern scholarship views the play essentially as a call for religious tolerance. By taking characters from the three major religious denominations, Lessing stressed his conviction that religious differences obscure the fact that all belief systems share a set of moral values. Lessing's last work, his *Erziehung des Menschengeschlechts* (1780; The education of the human race) has often been viewed as his literary testament. The work addressed the theological issues raised during the *Fragmente* controversy and in *Nathan der Weise*, namely the problem of the relationship between reason and revelation. According to Lessing, religion is part of the process of the spiritual growth of mankind. Whereas ancient religions needed textual codification in order to provide human beings with guidance in their lives, eventually reason would free humankind of this necessity.

Lessing is justifiably regarded as one of the most distinguished representatives of the Enlightenment. His advocacy of basic humanitarian values such as tolerance illustrates that some proponents of the High Enlightenment not only debated their ideas and values behind the closed doors of the reading societies and salons, but also defended unpopular positions and values in public.

LETTRE DE CACHET. The term “lettre de cachet” refers to arrest warrants that were signed by the king and delivered at the request of royal officials or family members. These letters, whose wax seal or cachet had to be broken in order to be read, allowed individuals to be incarcerated indefinitely and without legal recourse. Although it is difficult to date their first appearance, the use of lettres de cachet accelerated in the seventeenth century with the growth of royal authority. During the mid-century rebellion known as the Fronde, the crown used lettres de cachet to arrest prominent opponents. Once the crisis had subsided, the crown extended the practice to the realm of family discipline, where it acquired its greatest influence and notoriety. The recourse to lettres de cachet, which developed in response to gaps in Old Regime justice, rested on a consensus among the king and his

subjects privileging public order over personal freedom. New ideas about human nature and government that took root during the Enlightenment undermined this consensus and the institutional practices that it had sustained.

A parent or spouse submitted a request for a lettre de cachet to the king via his chief police officer, the lieutenant general. The most frequent complaints included debauchery, mental alienation, physical abuse, and financial dissipation. Individuals at all levels of French society could resort to a lettre de cachet when other options failed to resolve the problem. If the family was wealthy and willing to pay expenses, the accused was detained in a convent or a monastery. More humble subjects ended up in Old Regime prisons like the Bastille or asylums like Charenton. The procedure was extrajudicial since the accused had no access to a lawyer and never appeared before a judge. Detention time varied from several months to a lifetime, although the majority of victims were released in less than a year.

The lettre de cachet demonstrates the complicity between royal officials and subjects in the policing apparatus of the Old Regime. While police commissioners executed the arrest, they rarely initiated the request. The people turned to the police to reinforce their disciplinary capacities over an unruly individual. The monarchy complied with most requests because it viewed the family as a school of obedience and loyalty and thus as a model of political order in the kingdom. The supplicant always emphasized the socially disruptive nature of the behavior that threatened family honor while setting a bad example for others to follow. These arguments and their success in swaying the authorities reflected the value of honor in a traditional society based on hierarchy and privilege. The lettre de cachet allowed families to defend their honor without risking the damaging publicity of a trial.

During the Enlightenment intellectuals like Voltaire (1694–1778) and Simon-Nicolas-Henri Linguet (1736–1794) condemned the lettre de cachet in their campaigns for criminal law reform. The libertine writer and future revolutionary leader Mirabeau (Honoré-Gabriel Riqueti; 1749–1791) published a best-selling polemic in 1782 denouncing the lettres de cachet after his release from the Bastille. This book, along with juridical treatises,

consolidated the image of the *lettre de cachet* as a tool of abusive authority. By 1789 popular hostility toward the practice was unanimous and targeted the Bastille as the prison most closely identified with it. The revolutionary government abolished the *lettres de cachet* in March 1790.

LEVANT. The Levant covers the eastern Mediterranean, its islands, including Crete, Cyprus, Rhodes, Chios, and Lesbos, and the lands it borders: modern-day Turkey, Syria, Lebanon, Israel, Palestine, and Egypt. Around 1300, the region was under the control of a variety of different rulers, the Turco-Circassian Mamluk dynasty in Egypt and Syria, various Turkish states in western Anatolia,

and the Byzantines. The Genoese controlled Chios and Lesbos and had established themselves on the Anatolian mainland and in Constantinople, while Venice controlled Crete, Negroponte, Naxos, Andros, Mykonos, Karpathos, and Santorini. The Hospitallers ruled Rhodes and, at the beginning of the fourteenth century, built a castle on the Anatolian coast at Bodrum.

From about the mid-fifteenth century, the Ottomans became increasingly dominant. They defeated the Venetians in war from 1463 to 1479 and, in the following century, destroyed the Mamluks, capturing Syria (1516) and Egypt (1517), took Rhodes from the Hospitallers (1522), and conquered Cyprus (1571). While Ottoman control of the Levant weakened thereafter, such weakness was relative, for in 1669 the Ottomans took Crete from the Venetians. As Genoese and Venetian importance declined in the area, that of France, Britain, and Holland increased. Later, Russia also became increasingly active in the region. In 1770 the Russian navy wiped out the Ottoman fleet at Cesme.

TRADE

In the fourteenth and fifteenth centuries, Western traders, in particular those from Genoa and Venice, imported goods such as textiles, soap, cloth, wine, and war materials into the Levant and exported commodities such as slaves, grain, alum, cotton, and spices. Apart from being a producer of commodities itself, the Levant was also a central point for the transit trade in luxury items from the East.

With the Portuguese activities in the Red Sea and the opening up of the sea route to the East, the Levant suffered some decline, particularly as a region for the transit trade in luxury items such as spices, which had formed an important part of Egypt's trade. However, the area continued to be of major commercial importance into the eighteenth century and beyond.

From the late sixteenth century, the English became increasingly important in the commerce of the Levant. English trade, consisting largely of the import of woolen cloth, was to a great extent under the control of the English Levant Company in London, which was granted its first charter in 1581. Dominant through the seventeenth century, English trade went into a temporary decline in the eighteenth century, when the Marseilles merchants

became the dominant European traders. The French had established close diplomatic relations with the Ottomans from the early sixteenth century. From 1661, their trade was subject to very firm royal control. The Dutch also came to play a commercial role in the Levant. The interests of these western merchants were represented by their various consuls and ambassadors, and these countries conducted much of their trade through Ottoman middlemen, who liased among the western merchants, the Ottoman authorities, and the local producers. Such middlemen tended often to be Greeks, Armenians, or Jews.

RELIGION

Throughout this period the Levant represented a world of religious plurality in which Christianity (including Greek Orthodox, Maronite, Suryani, Armenian, Catholic, and Protestant), Judaism, and Islam coexisted, and in which Muslims, Jews, and Christians very much shared a common cultural heritage. From the beginning of the seventeenth century, Catholic missionaries began to proselytize among the various eastern-rite churches. Such efforts were often successful and there were many conversions, particularly among the Suryani. The eastern churches were much concerned by the threat such missionary activity posed to their communities, and Christian authorities in Aleppo, for example, appealed to the Ottoman sultan to protect them against this religious encroachment. The Ottoman government responded, backing the local religious establishment against the interloper, less in the interests of religion than from a desire for internal stability, and they issued decrees forbidding the Christian population from changing sects.

In the eighteenth century, religion came to be used as a political lever by the great powers, each seeking to protect the interests of a particular religious community within the Ottoman Empire in an attempt to gain influence over internal Ottoman political affairs. Russia claimed to represent the interests of the Orthodox community, using a clause in the Treaty of Kucuk Kaynarca, concluded between Catherine the Great (ruled 1762–1796) and the Ottoman Empire in 1774, to justify their right to intervene in favor of the Orthodox subjects of the sultan. The French claimed to represent the Catho-

lics, and the British concerned themselves with the Protestants.

From early on, the Holy Land attracted a growing number of pilgrims, both Christian and Muslim, visiting Jerusalem, Mecca, and Medina. Protection of the pilgrimage routes and of the Holy Cities formed an important part of the Ottoman sultan's image. While the sheer number of pilgrims could create problems for the authorities, temporarily swelling the population and placing additional strain on the resources of the cities, they also brought additional revenue. For example, in Jerusalem, the Christian pilgrims paid a tax to enter the Church of the Holy Sepulchre. Relations between the Christian pilgrims were not always harmonious, reflecting the bitter hostility between the Greek and Latin churches for control of the holy places. In 1755 the Franciscans were driven out of the Holy Sepulchre by the Greek Orthodox. Despite energetic protests from France, the Ottoman authorities supported the Greek Orthodox in this dispute.

This religious plurality was also reflected in the great ethnic mix of the Levant, which was made up of a great assortment of ethnicities. While the islands had populations of Greeks and Latins, as well as Ottoman Muslims, the great trading cities such as Aleppo were populated by a variety of different ethnic groups, for example, Greeks, Armenians, Turks, Latins, Arabs, and Kurds.

The Levant was thus a mixed world, religiously, ethnically, and linguistically, which gave rise to a vibrant cosmopolitan commercial Levantine culture. Although there were trade wars and political upheavals, and divisions between different groups and religions, the overriding feature of this world was one of fluidity and accommodation, not hard-and-fast divisions and impermeable boundaries.

LEYDEN, JAN VAN (Jan Beuckelson, John of Leiden; 1509–1536), Dutch religious leader. Jan van Leyden was a prophet who became notorious as “the king of New Jerusalem” in Münster, Westphalia. Very little is known about him, except for the few years in which he rocketed to world fame. His father was a deputy sheriff; his mother hailed from the vicinity of Münster. The city of Leiden in Holland was known for its cloth. When Jan became a tailor’s apprentice, his future looked bright. However, by the time he could make a start, the Netherlands was hit by an economic depression that lasted for more than a decade. Leyden fled Leiden and lived in London for a while, then wandered along the coast of Europe.

In the meantime, the Reformation had begun to spread. Yet it was neither Lutheranism nor Zwinglianism, established by Swiss religious reformer Huldrych Zwingli (1484–1531) in Zürich, that would set the Netherlands ablaze, but Anabaptism. Anabaptism originated in middle Europe and was a refuge for people who had become disenchanting with aspects of the Protestant Reformation. The Anabaptists believed that the End of Time was approaching and that they were to be admitted to God’s chosen few by means of adult, not infant, baptism. It was Melchior Hofmann (c. 1495–1543/44), a German prophet, who in 1532 brought the new faith to the Dutch border. The Last Judgment, he prophesied, was to be held in Strasbourg, the city which God had chosen for his New Jerusalem (Revelations, 21:9). The Dutch responded enthusiastically and embraced Hofmann as their own prophet. The authorities, however, considered Anabaptism a dangerous heresy and sought to root it out.

Up to this time Leyden was not an Anabaptist. He had settled down after his journeys and opened a tavern in Leiden called The Three Herrings. There he performed in his own plays and satirized monks and priests. He had also been to Münster to hear a famous preacher, and even preached himself, but once back in Leiden he returned to his cheery plays. This all changed suddenly when Jan Matthijsz, the new prophet of the Dutch Anabaptists, knocked at his door. Leyden was rebaptized on 13 January 1534 and was sent by Matthijsz to baptize and organize believers in the new Israel at Münster.

The idea of going to Münster was probably Leyden’s. None of the Dutch followers had ever seen Strasbourg, and after Hofman’s first prediction about the date of Christ’s Second Coming (end of 1533) did not materialize, they felt that since Hofman was wrong about the time, he probably was wrong about the location, too. However, there was no doubt about the reality of the approaching End of Time, so the Dutch followers began to look for cities themselves. Leyden was the first to arrive at Münster to prepare the ground for Christ’s Second Coming. At this task he was very successful; in a matter of weeks he built up a huge following.

Soon it was known to Anabaptists everywhere, and especially in Holland, that “God’s own people” were in Münster. On a snowy morning in February 1534 the Anabaptists, led by Matthijsz, drove out many of the Münsterites in order to make room for the thousands of newcomers. Ownership of private property and money were abolished and churches and monasteries destroyed. The Anabaptists were in a hurry to sanctify themselves because Jan Matthijsz had predicted the Apocalypse would occur at Easter. On that day he left the city unarmed, expecting the opposing forces to be crushed by the sword of the Lord. Instead, he was butchered before the eyes of his believers by the soldiers of the bishop of Münster, Franz von Waldeck. Leyden was Matthijsz’s designated successor.

Leyden was now faced with a very difficult task. He had to try to restore the loss of faith among the people as well as fight Waldeck’s soldiers. It was a race against the clock. The bishop grew stronger every day, but Leyden hoped his people would grow in holiness even more quickly, so that Christ would call the Last Judgment before the soldiers could

conquer the city. To help achieve this, he invented all kinds of new measures, for one of which he became notorious: the “new marriage,” or polygamy, for which Leyden has been derided as a disciple of lust ever since. But although he did not by any means eschew the pleasures of the flesh, his new institution of polygamy had a holy end: Of the 8,000 inhabitants of the New Jerusalem, 6,000 were female, and most people were without partners, many of them for more than six months by then. If he could not make monks out of his Israelites, he would make them polygamists, just like many of the Hebrew patriarchs of the Old Testament.

Jan had many wives. As a “second David,” after becoming king, he took more. Several times a week he preached in the marketplace and administered justice. During the course of his reign, after keeping order became more difficult, death penalties became more frequent. But even under these circumstances, it was with his leadership that the city beat off two of Waldeck’s attacks. When famine came, Leyden tried to mobilize support from Anabaptists in the Netherlands, but to no avail. On 12 June, 1535, the city fell by the act of a traitor. Leyden had to wait for half a year for his death, which came after prolonged torture. He and two of his companions were put in iron cages and hung high in the tower of the Lambertus Church of Münster. The cages still hang there.

LUC PANHUYSEN

L'HÔPITAL, MICHEL DE (1507–1573), French lawyer and statesman. Michel de L'Hôpital, the future chancellor of France and architect of religious toleration, was the son of a physician who

served the dukes of Bourbon. L'Hôpital was destined for a legal career, but in addition to studying law he had a humanist education at a number of Italian and French universities. His religious orthodoxy in his early life is attested by his marriage in 1537 to Marie Morin, daughter of Jean Morin, a Parisian royal official and fierce opponent of heresy. Councillor at the Parlement of Paris in 1544, president of the *Chambre des Comptes*, and councillor of the *Grand Conseil*, his career was greatly aided by aristocratic patronage. His father had ended his days in the service of Renée de Bourbon, wife of the duke of Lorraine, and it was through this route that Michel moved into the orbit of the Guise, the most powerful princely family in France, and became the most famous product of the irenic intellectual circle that revolved around Charles of Guise, cardinal of Lorraine. Lorraine procured for his client the office of *maître des requêtes* in 1553 and served as godparent to L'Hôpital's first grandson in 1558.

L'Hôpital's Christian humanist pacifism did not prevent him from becoming an apologist for the Guise war policy in the 1550s. When Henry II died in July 1559 he was succeeded by his sickly fifteen-year-old son, Francis II, who was dominated by his wife Mary Stuart and his Guise uncles. The new regime continued the policy of religious persecution, but the weakness of royal authority and the opposition of the princes of the blood gave encouragement to Calvinism, which was expanding rapidly. The regime was badly shaken by a bloody failed Protestant coup at Amboise in March 1560, following which the cardinal of Lorraine began to rethink the policy of repression. Catherine de Médicis, the queen mother, now began to play a greater role in the shaping of policy. When Olivier, the chancellor of France, died on 28 March 1560, the cardinal procured the appointment of his protégé L'Hôpital.

The new policy formulated by Lorraine, Catherine, and L'Hôpital aimed to promote civil peace by disentangling religious discord from sedition, making a distinction between heresy, which was to be treated more leniently, and rebellion. At the opening of the Estates-General at Orléans in December 1560 L'Hôpital spoke forcefully in favor of religious concord. Following the death of Francis II, the disgrace of the Guise, and the establishment of a regency under Catherine, L'Hôpital's intellectual authority grew, and the policy of compromise it

represented was pursued more systematically. Until the end of 1561 neither L'Hôpital nor Catherine believed that toleration and the existence of two religions in a state was possible. The Colloquy of Poissy, which met in August 1561, enshrined their belief that peace could only be achieved by reaching doctrinal concord between Catholics and Protestants. L'Hôpital's move toward toleration was a realistic response to the failure of Poissy and the divisive political and religious situation facing the monarchy. The Edict of Toleration of January 1562 and the Peace of Amboise of March 1563, which followed the First War of Religion, were novel legal attempts to solve the crisis of religious schism by establishing limited rights of worship for Protestant communities.

By the end of 1563 L'Hôpital and his moderate allies had come to dominate the royal council. He combated religious conservatives in the parlements who opposed his religious policy, and he clashed openly in the council with his former patron, Lorraine, who returned from the Council of Trent opposed to his former policies. Between 1563 and 1567 L'Hôpital was concerned with the reform of the royal judiciary and administration, which had suffered from the growth of venal office-holding and the collapse of royal authority. His reforms were enacted in the Ordonnance of Moulins (1566). Catherine de Médicis had been adopting a more intransigent position toward the Protestants for a number of years, and the outbreak of the brief second civil war in 1568 and the breakdown of L'Hôpital's relations with Lorraine led to his removal from the council in June 1568. At the outbreak of the third civil war in September he was forced to give up the seals, and he retired to his residence at Vignay, dying in 1573. Accused by his opponents of being a secret heretic, L'Hôpital was above all a faithful servant of the crown. Realizing that doctrinal reconciliation was impossible, he saw that toleration was the only means to achieve peace and was prescient in seeing Ultra-Catholicism as the main threat to monarchical power.

STUART CARROLL

LIBERALISM, ECONOMIC. *Economic liberalism* is an anachronistic but useful term to describe theories propounded in the seventeenth and eighteenth centuries. The term was coined by nineteenth-century thinkers to describe their own theories; rather than "economics," seventeenth- and eighteenth-century thinkers considered their inquiries "political economy," and those who defended the rights and freedoms of individuals over and against the state would not bear the appellation of liberals until the 1820s. Nevertheless, "economic liberalism" usefully describes theories of the seventeenth and eighteenth centuries that defended the individual liberty to buy, sell, work, employ, and trade without restriction or governmental interference. The general tenor of economic liberalism is succinctly captured in the French phrase of the era, *laissez-faire*, or 'leave people alone'. This theory maintained that people should be left alone because their self-interested activities in the market were self-regulating, guided by natural economic laws that were far more conducive to social well-being than the directives of state authorities. Thus, economic liberalism was the doctrine typified by seventeenth-century English, French, and Dutch pamphleteers who were critical of state restraints on trade and regulation of interests rates; by the treatises of eighteenth-century French *économistes* (retrospectively designated Physiocrats); and best ex-

emplified by Adam Smith's 1776 *Inquiry into the Nature and Causes of the Wealth of Nations*.

MERCANTILISM BACKGROUND

Economic liberalism can be seen as a response to the wide-ranging policies of European governments from the sixteenth century onward to shape economic activity for state purposes. Such state policies are designated by historians as mercantilism. Economic liberalism manifested itself in systematic criticism of such state interference for violating natural economic laws to the detriment of society. Economic liberalism arose after a wide variety of authors who had spent decades speculating about economic processes articulated natural economic laws that produced an automatic self-regulation of economic activity most conducive to social well-being.

The enormous fiscal demands of state-building in the modern era led various European crowns in relentless efforts for new revenues. Taxation was increased and expanded, and the sale of exclusive monopolies for the production of goods and trade, domestic and foreign, also brought new revenues. Thus, in France, the seventeenth-century minister Jean-Baptiste Colbert (1619–1683) transformed the medieval system of producers' guilds into state-licensed monopolies in goods ranging from salt to lace. In England, trade monopolies were granted for trade with Russia (the Muscovy Company, 1558), the Middle East (the Levant Company, 1592), and India and southeast Asia (the East India Company, 1600). By the seventeenth century in Europe, almost any foreign goods people used were likely imported by a trade monopoly; any domestic goods, by someone operating under a monopoly patent.

European crowns also engaged in currency debasement, that is, adulterating the silver coinage with a base metal and pocketing the difference between the original silver content of the coinage and its nominal value. This had significant consequences in terms of domestic price increases and distortions of rents and real wages. It also disrupted foreign exchange rates, interest rates, and international flows of gold and silver (specie). To ameliorate such consequences, governments undertook the regulation of wages, the prices of primary consumer goods, and interest rates. Since currency debasement created incentives for holders of specie to send it out of the country (to markets where purchasing

power was determined by specie value, rather than nominal values), governments were also greatly concerned about the loss of specie within their borders. The power of any state depended on its possession of specie, which allowed it to purchase mercenary troops and supplies abroad for the military struggles of European power politics. Although colonial mines served as the key source of specie for Spain, most other European powers could only obtain specie through international trade. It became an article of faith that state power was maximized by policies that produced a favorable balance of trade, that is, an influx of foreign specie in payment for domestic exports that was greater than the specie outflows to pay for foreign imports. To restrict outflows of specie, heavy import taxes restrained purchases of foreign goods and also produced revenue. To facilitate exports, and therefore specie inflows, government policy promoted the production of high-value domestic manufactures, protected by high tariffs or even prohibitions on imports of foreign manufactures.

The above mercantilist state-building objectives introduced new perspectives on economic activity. Because national power was promoted by influx of specie, international trade was seen in a new, positive light. Medieval views of merchants as exploitative were supplanted by a view of traders as national assets. From this perspective, domestic trade only transferred wealth from one group to another, but foreign trade brought in new treasure from abroad. Nevertheless, many believed that the selfish interests of merchants might run contrary to the interests of the state, and for that reason, trade needed strict regulation and the guiding hand of authorities.

MERCANTILISM AND THE DEVELOPMENT OF POLITICAL ECONOMY

By the seventeenth century, the growing role of government in control of the economy prompted extensive commentary on public affairs and public policies related to usury, prices, and the state of international trade. Such commentators, now designated mercantilists, were not mere spokesmen for the system of the same name. They frequently wrote to get the government to pursue some policy that would benefit them (for example, reduction of interest rates or prohibition of imports by competitors), but there was a wide variety of views and motives in their work, and many criticisms of gov-

ernment policy. Over time, the proliferation of such works resulted in a general understanding of “the economy” as a linkage of prices, money flows, interest rates, and international trade, which could be subjected to and explained by analytical theories. The analytical tools and theories developed by these writers were not terribly sophisticated, nor universally accepted or applied in anything like a systematic manner. Yet from such efforts to comprehend the intricate network of exchanges, prices, and behavior of human beings as producers and consumers, a new science emerged called political economy. Most authors now described as mercantilists showed a clear understanding, for example, of sophisticated ideas such as international trade representing a sort of barter mediated by money, and that there can be no export customers if nations do not also purchase imports from those to whom they hope to sell. Even though most recognized the need for regulated trade, virtually none proposed economic self-sufficiency. Similarly, most understood that the merchants could not simply set prices for exports; rather, prices were determined by the actions of all involved “in the common market of the world.”

A pamphlet dispute in the 1620s between two early English political economists, Gerald de Maylnes (1586–1641), an official of the Royal Mint, and Edward Misselden (1608–1654), a merchant, reveals the general level of analysis. Maylnes was alarmed at specie outflows from England, and he accused merchants involved in the exchange of foreign currency of being the cause of the kingdom’s loss of bullion. Since the merchants’ selfish desire for gain, amounting to usury, resulted in specie outflow, Maylnes proposed government-run currency exchange at “fair rates” to keep specie in the country. Misselden, on the other hand, denied Maylnes’s simplistic attribution of the problem of specie outflows to the malevolence of merchants. Specie flows, he explained, followed general levels of trade; if there was more specie flowing out of the country, it was because the balance of trade was not in England’s favor. Since England imported more than it exported, specie was lost to the nation. The true solution to the problem, Misselden urged, was to restore a favorable balance of trade.

Misselden’s use of the balance of trade concept illustrates a central feature of mercantilist economic

theory. A favorable balance of trade provided specie for national strength, but it was also desired because plenty of money at home would stimulate domestic trade and employment. Further, since interest rates were determined by the supply of money, plenty of money would reduce interest rates and stimulate investment. Thus, the English merchant Thomas Mun’s tract (written 1623; published 1664) ridiculed the idea that an exchange board could simply decree that specie stay in the country, as exchange rates were determined by supply and demand. He even expressed suspicion about any policy’s capacity to maintain plenty of specie in the country: since prices were determined by the quantity of money, more specie would invariably raise prices, and thereby diminish exports. Still, Mun argued that policies restricting shipping to English carriers, sumptuary laws to limit luxury imports, and state support of exports (such as herring), would promote, as his title declared, *England’s Treasure by Forraigne Trade, or the Balance of Our Forraigne Trade Is the Rule of Our Treasure*.

POLITICAL ECONOMY AND THE IDEA OF ECONOMIC LAW

The seventeenth century was a period of great intellectual ferment in which the techniques of the new natural sciences, exemplified by Galileo Galilei (1564–1642) and Isaac Newton (1642–1727), gripped the imaginations of thinkers such as Francis Bacon (1561–1626) and René Descartes (1596–1650), who boldly proclaimed that the new techniques of scientific analysis would transform the whole of human thought. Such aspirations fed the ambitions of those who sought to place human action within the descriptive bounds of similar natural laws. The notion of economic law developed out of a century’s observation of the regularity of markets, of rising prices producing increased supplies, and of gluts in the market producing falling prices. Many writers believed that the cause of such regularities was economic actors responding to opportunities for personal gain. Thus, the seventeenth century saw a new regard for self-interest. On the one hand, self-interest came to be seen as a more rational, less dangerous motivation for human behavior than the passions. On the other hand, because self-interest involved rational calculation, some believed that acts of self-interest demonstrated the same kinds of regularity in human nature as was found in

other scientific laws in the natural realm. The whole of human activity in buying, growing, selling, spending, and the satisfaction of human wants, without anyone's directing or even intending the result, could be explained as people pursuing their interests.

In his *Discourse of Trade* (1690) English physician Nicholas Barbon asserted that, as with all things necessary to life, everything that produced delight and pleasure, along with peace and economic development, was the product of trade, the consequence of people acting in the market for their own benefit. Such actions resulted in the nation being "well fed, clothed, and lodged" while "the richer sort are furnished with all things to promote the ease, pleasure, & pomp of life."

SEVENTEENTH-CENTURY ENGLISH ECONOMIC LIBERALS

The idea of natural economic law lay at the heart of the economic liberal critique of mercantilism. Perhaps no name is more closely associated with the concept of natural law than that of John Locke (1632–1704), the English philosopher widely accorded status as a founder of political liberalism. Although Locke's writings are concerned with both political and economic liberalism, proponents of these two fields were often at odds with one another. Locke's economic writings chiefly dealt with money and interest rates, and in both cases he utilized natural economic law to criticize government interference. In 1692, Locke published *Some Considerations of the Consequences of the Lowering of Interest and Raising the Value of Money* to oppose a legislative reduction of interest from 6 percent to 4 percent along with a scheme to reduce the silver content of England's coinage. In the case of interest rate reductions, Locke insisted that there was a "natural rate" that was the product of "the present state of trade, money, and debts," in other words, by the supply and demand for funds that could be loaned. Locke denied that interest rates could be regulated by law. The law would be flouted, as "it will be impossible by any contrivance of the law, to hinder men . . . to purchase money to be lent to them what rate soever their occasions shall make it necessary for them to have it." But all legal lending would also be reduced, since the interest reduction would reduce the supply of funds for loans, and guarantee that only the safest loans would be made.

Thus, rather than making loans more available, artificial reductions of the rate of interest decreased the supply of credit. The idea of legislating interest rates, Locke says, is as absurd as legislating rents: in both cases "things must be left to find their own price." In the case of the recoinage, Locke argued that the value of a coin was determined by its silver content, and "the opinion of men consenting to it," rather than the denomination stamped on it by the mint. Since contracts and rents had been entered into based upon coins having a given silver content, to change the silver content of the coins would amount to fraud. The proponents of the scheme may call debased coins shillings, but "one may as rationally hope to lengthen a foot by dividing it into fifteen parts instead of twelve and calling them inches."

Sir Dudley North (1641–1691) was a zealous partisan of Charles II (ruled 1660–1685) and James II (ruled 1685–1688) who led the legal persecution of liberal Whigs for the crown, but he was also an economic liberal. His *Discourses upon Trade* (1692), edited and published posthumously by his brother Roger, was suffused with the "principles of the new philosophy," the "mechanical" science that alone provides "clear and evident truths." Principles derived from scientific reasoning proved that "to force men to deal in any prescribed manner, may profit such as happen to serve them; but the publick gains not, because it is taking from one subject to give to another." North, too, contested the proposal to legislate a lower rate of interest, and, like Locke, argued that the natural rate of interest was determined by the supply and demand for loans. Indeed, North observed, the reason interest rates were lower in the Netherlands—which had no interest regulations—was that the trading wealth of the Dutch meant that more money was available for loans. North argued that artificial reductions of the rate of interest would reduce the sums available for loans since "it probably will keep some money from coming abroad into trade; whereas on the contrary, high interest certainly brings it out." Nor was there any need for the government to increase the money supply by means of the recoinage that Locke had contested; in North's view, money, like any commodity, was subject to the automatic equilibrating processes of the market. As North explained, the "ebbing and flowing of money, supplies and accom-

modates itself, without any aids from politicians . . . when money is scarce, bullion is coined, when bullion is scarce, money is melted.” People looked in vain to the government to produce prosperity, North averred, “for no people ever yet grew rich by policies; but it is peace, industry, and freedom that brings trade and wealth, and nothing else.”

Another self-conscious crafter of a new human science was the physician-politician Sir William Petty (1623–1687) who, taking a cue from Francis Bacon, sought to understand human society as a form of anatomy. (Petty also served as secretary to Thomas Hobbes, another great social anatomist.) Instead of the dissection of nerves and tissues, the scientific investigator of human society had to master quantitative data on population, tax revenues, trade and production, and all manner of social statistics. Petty called his program “political arithmetic,” and, while his general view of economic policy followed predictable mercantilist lines in viewing national wealth as contingent on its share of the (fixed) world trade, he also argued that government policy had limited capacity to directly control economic events because of the immutable operation of natural economic laws. Thus he attacked legislative reduction of the rate of interest as one example of “the variety and fruitlessness of making Civil Positive Laws against the Laws of Nature.”

Although Petty’s contributions to social statistics and economics are today judged negligible, he had followers who pursued his program of attempting to discern and articulate economic laws. One disciple, the politician and civil servant Charles Davenant (1656–1714), illustrates how economic law came to undermine the old sureties of beneficent government direction of the economy. In the 1690s, the English East India Company began to import large quantities of cheap printed Indian cotton goods. This produced a storm of protest from writers who attacked the company for undermining the domestic production of English woolens and silks. Davenant’s defense of the company (he was at this time an employee), called *Essay on the East India Trade* (1696), argued that economic regulation for the protection of a single industry ignored the systemic nature of economic life, in which all trades were linked, and injurious policies could spread their effects far beyond their intended purpose. Although he conceded that Indian imports

injured English woolen manufactures, Davenant merely took this as evidence that they were akin to hothouse flowers, unable to survive without artificial aids. To force trade in this manner brought no “natural profit” and was ultimately injurious to the public. Woolen manufactures were injured only because the public benefited more from cheap Indian cottons than from woolen garments dependent upon protection for a market. “Trade is in its nature free, finds its own channel,” he wrote, “and best directs its own course; and all laws to give it rules and directions, and to limit and circumscribe it, may serve the particular ends of private men, but are seldom advantageous to the public.”

Five years later, Henry Martyn’s *Considerations upon the East India Trade* (1701) took up the same matter and attacked the very idea of the legal monopoly of the East India Company. Cheap Indian cloth, Martyn wrote, was just one of many benefits, including from spices, silks, and wine, which foreign trade produced. While the public benefited from Indian imports, it would benefit still more, Martyn argued, if the trade were open to all, as competition between merchants would force prices and transportation costs to the minimum. Martyn also reasoned that if Indian goods could be purchased more cheaply than those produced at home, English cloth manufactures simply wasted labor. But if competition were unleashed, it might stimulate inventiveness of skill and machinery to reduce the costs of English cloth below India’s. Martyn’s central contention was that free competition of self-interested actors in the marketplace benefits the public by producing more at less cost.

DUTCH REPUBLICANISM AND ECONOMIC LIBERALISM

Pieter de la Court (1618–1685), polemicist for the republicans fighting the establishment of a Dutch monarchy by the House of Orange, published a very liberal tract that fused political and economic liberalism. *Political Maxims of the State of Holland* (*Aanwysing der heilsame politieke Gronden en Maximen van de Republike van Holland en West-Vriesland*, 1662) attacked monarchical principles and linked the cause of crowns with standing armies, clerical mystification, and the destruction of urban commercial society. Commerce, he wrote, by “common interest wonderfully linked together” all the people of the Netherlands “from the least to the

greatest” in “excellent and laudable harmony.” He pleaded for religious toleration to promote Dutch economic growth since “those that deal in manufactures, fishing, traffic [and] shipping” would not come to live in a “country where they are not permitted to serve and worship God outwardly, after such a manner as they see fit.” Domestic markets were integral to the prosperity of Dutch trade and shipping, he argued, and therefore he defended occupational freedom, “the liberty of gaining a livelihood without any dear-bought city freedom,” since no immigrants would come to the Netherlands “if they should have no freedom of chusing and practicing such honest means of livelihood as they think best for their subsistence.” Immigrants would not depress wages of native inhabitants; on the contrary, they would “lay out their skill and estate in devising new fisheries, manufactures, traffick and navigation.” Immigrants were essential in a commercial society to take up those enterprises—“in Amsterdam alone there are yearly three hundred abandoned”—whose native proprietors “finding the gain uncertain, and the charge great, are apt to relinquish it.” De la Court attacked monopolies and guild restrictions for violating people’s “natural liberty of seeking their livelihoods.” Trade should be open to “the industrious and ingenious,” for monopolies—“dull, slow, unactive, and less inquisitive”—were unable to exploit even opportunities guaranteed them by law. The whaling monopoly, for example, proved unprofitable; but under competition, “everyone equips their vessel at the cheapest rate, follow[s] their fishing diligently, and manage all carefully” and whaling became profitable with fifteen times more ships involved in the industry. Monopoly did nothing more than cause the Dutch to be “bereft of the freedom of buying their necessaries at the cheapest rate they can.”

ECONOMIC LIBERALISM IN FRANCE

In late seventeenth-century France, a civil servant, Pierre la Pesant, sieur de Boisguillebert (1646–1714) argued for economic *laissez-faire* with a sophistication that earned the respect of the great twentieth-century economist Joseph Schumpeter. In his chief work, *A Detailed Account of France (Le detail de la France, 1695)*, Boisguillebert dismissed the mercantilist equation of money with wealth, contending that wealth lay in goods, rather than coin. Social harmony and well-being were the prod-

ucts of individuals acting in their self-interested pursuit of happiness. The transactions of self-interested actors in a market created order and peace, for “the pure desire of profit will be the soul of every market for buyer and seller alike; and it is with the aid of that equilibrium or balance that each partner to the transaction is equally required to listen to reason, and submit to it.” The natural order produced by *laissez-faire*, however, could be disturbed: “nature alone can introduce that order and maintain the peace. Any other authority spoils everything by trying to interfere, no matter how well intentioned it may be.” Boisguillebert claimed that good intentions gone awry were behind the French crown’s efforts to diminish hunger by controlling grain prices, since price controls merely diminished cultivation of grain and exacerbated shortages. If the government would merely lift its controls on prices and grain imports, he argued, food would soon be abundant.

Boisguillebert’s concern with food supplies highlights one chief difference between French and English political economy in the seventeenth and eighteenth centuries: the French focus on agriculture, rather than international trade. Liberal critics saw the persistence of a feudal land tenure system in France as responsible for backwardness in agriculture, especially in comparison with her neighbors, England and the Netherlands. Chief among these critics was the circle gathered around the physician Francois Quesnay (1694–1774). Quesnay’s allies, such as Mercier de la Riviere (1720–1793) and Pierre Samuel Du Pont de Nemours (1739–1817), called themselves *les economistes*, but are now designated Physiocrats. The Physiocrats popularized the slogan, “*laissez-faire, laissez passer*,” as the essence of economic wisdom. At the heart of physiocratic doctrine was the conviction that agriculture alone was the source of all wealth, since only it provided surplus, or net product. Therefore, all restrictions on agriculture, such as price controls and barriers to internal and foreign trade, undermined national wealth. Quesnay’s famous *Tableau economique* (1759) drew upon insights developed by an Irish banker living in Paris, Richard Cantillon (d. 1734) in his *Essai sur la nature du commerce*, which explained the circular flow of income produced by markets. Quesnay’s intricate chart purported to demonstrate the circulation of net product

throughout the entire society, which was as perpetual and self-regulating as the circulation of blood. In the eyes of the Physiocrats, the countless restrictions on free commerce imposed by the government were as socially beneficial as blood clots in human circulation.

One of Quesnay's associates, Vincent de Gournay (1712–1759) a wealthy merchant and royal administrator, spent years in the Netherlands and admired de la Courts's *Maxims*. He also commended Cantillon's work to Quesnay, and although he never wrote economic tracts, he had a profound influence as tutor and advisor to Finance Minister Anne-Robert-Jacques Turgot (1727–1781). Turgot, in a eulogy to Gournay, praised him for grasping the fundamental principle of economic policy, which was that every individual knew his or her own interest best, and that with individuals left free to pursue their interests, "it would be impossible for the aggregate individual interests not to concur with the general interest." Competition in the market, which was the consequence of the pursuit of interest, produced innovation in manufacturing, and the lowest prices for consumers. Rather than the plethora of regulations covering every aspect of economic life, or monopoly privileges, Gournay favored the "natural liberty" to buy and sell as the guarantor of production, and of consumers obtaining goods at the best price. Short of providing justice, and bestowing honors on inventors and artists, government best served the economy by removing obstacles it had erected.

Turgot's turbulent years as finance minister to Louis XVI (ruled 1774–1792) saw an effort to create the system of freedom articulated by French liberals over previous decades. His chief objective was to remove all barriers to agricultural and international trade. The farmer was "the only one who suffers from monopoly as buyer and at the same time as seller. There is only he who cannot buy freely from foreigners the things which he has need; there is only he who cannot sell to foreigners the commodity he produces." Domestic and international laissez-faire, a "general liberty of buying as selling is . . . the only means to insure on one side to the seller a price sufficient to encourage production; on the other side to the consumer the best merchandise at the lowest price." Turgot's management of the economy amounted to not interfering with nat-

ural economic law, because "in order to direct it without deranging it, and without injuring ourselves, it would be necessary for us to be able to follow all the changes in the needs, the interests, and the industry of mankind . . . Even if we had in all these particulars that mass of knowledge impossible to be gathered, the result would only be to let things go precisely as they would have gone of themselves, by a simple action of men's interests, influenced by the balance of a free competition."

ADAM SMITH'S *WEALTH OF NATIONS*

Adam Smith (1723–1791), professor of moral philosophy at the University of Glasgow, published his great contribution to economic liberalism, *Inquiry into the Nature and Causes of the Wealth of Nations* in 1776, a significant date in the history of political liberalism. Deeply affected by the example of Isaac Newton's scientific system, which explained the orbits of the planets from the operation of basic laws of motion and mass, Smith sought to explicate how basic economic laws produced the regular operation of markets he called "the system of natural liberty." As the title of the book intimates, Smith's central concern was with economic development and growth, the means to secure "universal opulence which extends itself to the lowest ranks of the people." Opulence was a matter of the material well-being of the people, which consisted of cheap and plentiful goods. The key was productivity, the secret of which Smith identified as the "division of labor." Since the degree of specialization was determined by the extent of the market, the more extensive the market, the more productive human activity would be and the wealthier people would become. Smith was scornful of all the policies that were designed over centuries to secure a favorable balance of trade. Trade itself reflects the fact that different regions, different countries, have certain "natural advantages" in producing goods; and so if "a foreign country can supply us with a commodity cheaper than we ourselves can make it, better buy it of them."

Just as Newton described the motion of the heavens in terms of simple concepts of mass, motion, and the force of gravity, Smith's "simple system" operated from little more than self-interest, competition, and enforcement of basic rules of justice. Smith's previous book, *The Theory of Moral*

Sentiments (1759), explained how people's desire to be loved led them to conform to moral rules, but this principle, so effective at the level of family, friends, and neighbors, was too weak to account for relations between strangers. Rather, the extensive transactions that characterized markets were based on mutual gains from trade. "It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard to their own interest." Because the public interest is for people to live in opulence, individuals led by self-interest to employ their labor and capital to make the society more productive, and satisfy human wants, are "led by an invisible hand to promote an end which was no part of [their] intention." Smith was acutely aware of the dangers presented by self-interest, however: "People of the same trade seldom meet together, even for merriment and diversion, but the conversation ends in a conspiracy against the public, or in some contrivance to raise prices." It was for this reason that the force of competition was vital to the operation of his system. Contrivances to replace "the natural price, or the price of free competition" ranging from outright monopoly privileges, to bounties, to restrictive tariffs, to restrictions on free movement of labor—there were myriad ways governments could protect some person or group against competition, and thus allow private interest to take precedence over the public good. The elimination of all schemes to insulate people against competition was vital. "All systems either of preference or restraint, therefore, being completely taken away, the obvious and simple system of natural liberty establishes itself of its own accord. Every man, as long as he does not violate the laws of justice, is left perfectly free to pursue his own interest his own way, and to bring both his industry and capital into competition with any other man, or order of men."

Economic liberalism as an influence on seventeenth- and eighteenth-century policy was limited at best. Turgot's reforms were abandoned, and Smith's myriad recommendations for overhauling Britain's policies, while admired by prime ministers, were too radical to be undertaken in an age of war and revolution. In the nineteenth century economic liberalism acquired not only its name, but the status of scientific orthodoxy, with the establishment of professorships in the new academic discipline of po-

litical economy in universities throughout Europe. The nineteenth century also saw the implementation of such iconic economic liberal policies as free trade in Britain.

LIBERTY. While it possessed important connotations in philosophical and theological discourses, the term *liberty* (and its frequent cognate, *freedom*) conveyed primarily social and political overtones in early modern Europe. Liberty formed a central organizing principle around which myriad transformations of communal life occurred, culminating in the program of the French Revolutionaries, who placed the demand for civil and legal freedom at the forefront of their movement.

Early modern Europe inherited several different ideas of liberty that were revised, refined, and sometimes rejected entirely. The ancient republicans of Rome prized liberty as a collective good, which betokened both freedom from foreign domination and the absence of internal oppression in the form of a king. Liberty was thus connected with civic self-

rule of a populist (if not quite popular) character. This republican ideal was widely disseminated among, and often endorsed by, early modern thinkers.

Christianity contributed the doctrines of freedom of the will and evangelical liberty that added a personal dimension to human freedom. Created in God's image, humanity possessed a capacity to choose between good and evil and hence to accept or to turn away from the divine will. Of course, the objects between which one chooses are not of equal worth. Rejecting God by preferring one's own desires yields dissatisfaction and unhappiness in one's earthly life as well as the misery of eternal damnation. By contrast, submitting to God properly expresses one's divinely granted freedom; it is the correct use of the will with which human beings have been endowed. At the same time, the possibility of freely renouncing self-will in favor of embracing God's law—in sum, a conversional experience—remains always open up to the very moment of one's death.

Finally, medieval Europe added a legal dimension to liberty that, in a sense, synthesized the public and the private meanings conveyed by republicanism and Christianity respectively. Under the terms of feudal law, the person designated to hold a prerogative or privilege (such as the ability to exercise forms of justice or to collect certain types of revenues) was said to possess "a liberty." Feudal liberty, in this sense, was an exclusive, independent, and nonusurpable right to the application of power over people and property, granted under fixed conditions from a superior who was deemed to be its ultimate source and guarantor. In short, liberty reflected a sphere of authority within which no one could directly intercede or interfere with the exercise of specified rights. Yet it was not wholly private. The possessor of a liberty could protect it from erosion by appeal for assistance to the lord who granted it. Someone who claimed a liberty could also be charged with its misapplication by those subjected to it, and could even be challenged to demonstrate the warrant on the basis of which it was exercised.

RELIGION

Although these inherited concepts of liberty continued to circulate in early modern Europe, the lan-

guage of freedom proliferated and diversified in the context of the vast cultural changes that marked the period. Crucial to this development was religion. The Reformation brought not only a challenge in practice to the unity of the Christian Church, but also transformation of important theological categories. Martin Luther (1483–1546) insisted upon the unique presence of God alone in the conscience of believers, with the implication that the faithful Christian is responsible directly and immediately to God. The consequence of this teaching—while perhaps recognized only fleetingly by Luther and his followers—was that salvation did not depend upon submission to the authority of the priesthood or the church. Nor did it fall to the secular power, to whom pertained the control of bodies and behavior, to discipline the souls of subjects. Thus, whether intentionally or not, Luther opened the door to claims of public respect for “liberty of conscience,” and eventually freedom of worship.

In the generation after Luther, inferences about freedom of religion were drawn out by reforming thinkers. Sébastien Castellion (1515–1563) published pseudonymously a treatise entitled *De Haereticis, an sint Persequendi* (1554), in response to John Calvin’s (1509–1564) organization of the burning of a fellow Christian theologian for heresy at Geneva. Castellion argued that coercion is an inappropriate tool for effecting a change of religious views since Christian belief must be held with sincere conviction. Hence, clerics and magistrates must refrain from persecution of convinced Christians who cling to doctrines that do not coincide with official teachings. While Castellion does not go so far as to license broad dissemination of heterodox theology, he maintains that a Christian’s duties extend to forbearance of the free and honest faith of his fellows even in the face of disagreements of understanding and interpretation.

In the seventeenth century, the theme of religious liberty became more pronounced. For instance, the Levellers in England during the 1640s made freedom to dissent from the established religion a central plank of their political program. Major figures in European philosophy weighed in on the side of freedom of religion. Baruch Spinoza (1632–1677) claimed a broad application for a right to liberty of thought and belief without inference from a sovereign power’s (or a church’s) deter-

mination of the truth or falsity of one’s ideas. Pierre Bayle (1647–1706) boldly asserted that all forms of persecution (innocuous as well as harsh) of religious diversity encouraged hypocrisy and eroded social order. An erring conscience, if it be held in good faith, deserves as much protection as a correct one—a principle that Bayle extended even to atheists. John Locke (1632–1704) was unwilling to include atheism and other religious attitudes that he deemed dangerous to social trust and political obedience, but he, too, proposed liberty of conscience as justified in the case of most Christian (and perhaps some non-Christian) rites. The role of the magistrate, according to Locke, should be confined to the maintenance of public tranquillity and the defense of individual rights, rather than the care of the soul.

Pragmatic as well as principled considerations led to the acceptance of some measure of freedom of religion throughout much of Europe over the course of the early modern period. Wars of religion undermined peace and sapped public enthusiasm for persecution. The free practice of differing confessions (usually limited to Christianity, and sometimes only to reformed Christianity) became an enshrined feature of many European states by the late eighteenth century. Where this did not occur (with certain exceptions, such as in Spain and parts of the Italian peninsula), it posed a continuing source of conflict into later times, as Johannes Althusius (1557–1638) predicted it would in his *Politica Methodice Digesta* (1603; 3rd ed., 1614). Thus, freedom of religion constituted one of the main changes sought in France during the Revolution, as expressed in the “Declaration of the Rights of Man and of the Citizen.”

REPUBLICANISM AND LIBERALISM

The evolving acceptance of liberty of confession paralleled changes in other European cultural, social, and political practices and attitudes. The invention of the printing press and movable type immeasurably enhanced the ability of individuals to disseminate their ideas and for a larger public to have access to the written word. Demands were heard for freedom of the press (literally and figuratively) from censorship by clerical and secular authorities alike.

Of course, the tradition of republican liberty, inspired by the Romans, had not disappeared from the intellectual landscape. From Niccolò Machiavelli (1469–1527) and the more conventional humanists of Renaissance Italy through the thinkers and practitioners of Dutch republicanism like Hugo Grotius (1583–1645) to advocates of republican rule in England such as James Harrington (1611–1677) and Algernon Sidney (1623–1683), the praise of liberty as a distinctive feature of republican government was voiced. In the cities of Italy and of Holland, commercial vitality and strong civic loyalty, not to mention considerations of scale, rendered collective self-government a feasible option. Political practice could approach, even if never quite attain, the heights of theory.

In larger territorial states, such communally based republican liberty resonated less clearly. Indeed, republicans who spoke of their version of liberty too loudly found themselves at odds with authorities, hence Sidney's execution in England for espousal of and action upon his republican proclivities. Political liberty in more geographically extensive regimes with monarchic institutions tended to be conceived in terms of individual freedom rather than civic populism. Hence, it is at this time and place that we locate the origins of the doctrines that came to be labeled liberalism.

Thomas Hobbes (1588–1679) is generally identified as the most important direct antecedent of the modern individualist theory of liberty. In his *Leviathan* (1651), Hobbes ascribes to all human beings natural liberty (as well as equality) on the basis of which they are licensed to undertake whatever actions are necessary in order to preserve themselves from their fellow creatures. Hobbes believed that the exercise of such natural liberty logically leads to unceasing conflict and unremitting fear, so long as no single sovereign ruler exists to maintain peace. The exchange of chaotic natural freedom for government-imposed order requires renunciation of all freedoms that humans possess by nature (except, of course, for the sake of self-preservation itself) and voluntary submission to any dictate imposed by the sovereign. Yet, even under the terms of Hobbes's absolute sovereignty, the subject is deemed to remain at liberty to choose for himself concerning any and all matters about which the ruler has not explicitly legislated.

Locke begins his mature political theory in the *Second Treatise of Government* (1690) with the postulation of the divinely granted liberty of all individuals, understood in terms of the absolute right to preserve one's life and to claim the goods one requires for survival. Arguing against the patriarchal doctrine of Sir Robert Filmer (1588–1653), Locke insists that no natural basis—neither paternity nor descent—justifies the submission of one man to another. In contrast with Hobbes, Locke maintains that the condition of liberty does not represent a state of war, but instead can be maintained tranquilly because human beings are deemed sufficiently rational that they can and do generally constrain their free action under the terms of the laws of nature. Hence, should people choose to enter into formal bonds of civil society and to authorize a government in order to avoid the “inconveniences” and inefficiency of the precivil world, the only rulership worthy of consent is that which strictly upholds and protects the liberty possessed by nature. According to Locke, any government that systematically denies to its subjects the exercise of their God-given liberty (as Hobbes's sovereign would do) is tyrannical and cannot expect obedience.

While Hobbesian and Lockean lines of thought persisted into the eighteenth century alongside republican doctrines, occasional attempts were made to transcend, or at any rate to synthesize, the lessons of republicanism and nascent liberalism concerning liberty. The writings of Jean-Jacques Rousseau (1712–1778) afford an illustration of this. On the one hand, Rousseau held that Hobbes and Locke each captured an important facet of human liberty. Hobbes realized that the only way to create a truly sovereign authority—one capable of commanding the obedience of those subject to it—was the renunciation of all the liberty that one enjoyed by nature. Locke recognized that the sole reason any free person would consent to enter into a formalized social arrangement would be to protect his liberty. Hence, Rousseau concludes, the surrender of one's natural liberty must be matched by the return to each person of an amount of civil liberty (which he terms “moral liberty”) that is greater than what has been given up. In other words, in a properly organized political system, every citizen enjoys more freedom than if he had remained in a precivil condition with his natural liberty intact.

From this marriage of Hobbesian and Lockean conceptions of liberty issues a set of republican conclusions. For Rousseau, sovereignty cannot be exercised by any authority external to the body of citizens whose liberty is at stake. Hence, no matter what constitutional form of government is appointed—and he contends that kingship, aristocracy, and democracy may each be appropriate, depending on the scale of the territory to be governed—it remains only the executive of the general will of the community. Freedom reposes strictly and exclusively in the communal order in which the moral liberty of each person assumes the equal moral liberty of every person, guaranteed under the terms of the law and protected by the magistrates. Hence, Rousseau's free state is guided by the collective determinations of the people about how they wish to live—a clear statement of a system of popular sovereignty.

NATURAL LIBERTY

The concept of natural liberty is also one that came to the fore in the economic doctrines of the eighteenth century. Adam Smith (1723–1790) founded his principal doctrines upon the notion of natural liberty, by which he meant simply that if every person acts freely as he sees fit in his own interests, then the welfare of the whole society will be served best. For Smith, the system of natural liberty constitutes a sort of automatic or homeostatic mechanism of self-adjustment (which he sometimes calls the “invisible hand”), so that any attempt (on the part of government or some other agent) to interfere in its operation will lead to greater inefficiency and hence less total welfare. The sources for Smith's insight about maximized individual liberty, unconstrained by coercive externalities, have been debated. Certainly, the French economic theorists known collectively as the Physiocrats may have played a role in the formulation of this idea, as may have the political theorists whose views have already been surveyed. Smith applied this discovery, however, not only to the operation of the marketplace but to all aspects of society, including its educational, religious, and judicial institutions. He narrowly confines the role of government to those functions consistent with natural liberty: foreign defense, regulation of criminal activity, and provision of “public goods” too expensive for any single segment of the private economy to undertake.

By the end of the eighteenth century, the concept of liberty had pervaded the religious, social, political, cultural, and economic dimensions of European life. Yet it remained a controversial idea for (and against) which people would continue to fight and die. Moreover, the application of principles of freedom remained in many ways incomplete. Slavery had been by no means entirely eradicated from the regions over which European nations exercised control, even if it was largely passé within Europe itself. Women occupied almost exactly the same social, political, and economic position in 1789 as in 1450, and the extent of their personal and group liberty was largely determined by their class status. Despite occasional agitation for universal manhood suffrage, such as occurred during the earliest stages of the English Civil War, the unpropertied also experienced little improvement in their effective freedom between the fifteenth and the eighteenth centuries. Finally, the diffusion of ideas and practices of religious liberty was limited almost entirely to Christian sects, although deists and advocates of natural religion seem generally to have been left alone; freedom to worship occupied a far more precarious position for Jews and members of other non-Christian confessions (for example, Turks) who made their way to Europe.

LIBRARIES. The period 1450–1789 witnessed an unprecedented expansion in the publication, circulation, and readership of books. Such dramatic changes in patterns of literacy and book use are amply reflected in the history of libraries in the period.

MEDIEVAL INHERITANCE

By the late thirteenth century the scriptoria and companion book collections of the early medieval period had been eclipsed in importance by the rise of college libraries, particularly in Paris and Oxford. The most famous of these was the Sorbonne library in Paris, founded in 1287. Its 1290 catalogue lists over 1,000 manuscripts, and the library would expand to more than 2,500 volumes by the end of the fifteenth century. Equally important were the libraries of the *studia* (study houses) of the monastic orders. Over time, a body of regulations governing college and conventual libraries evolved. Many of these libraries employed sophisticated cataloguing and classification systems. While there was no single model of classification, most conformed to a recognizably Scholastic pattern, descending from theology, through philosophy and the other two university faculties of law and medicine, to logic, rhetoric, and grammar, with appropriate subdivisions where warranted by the quantity of books.

The expansion of private libraries in the late medieval period was closely related to the institu-

tional libraries of the university colleges and study houses. Members of the three professions—churchmen, lawyers, and physicians—responded to changing patterns of literacy and professionalization that demanded increased textual expertise with ever-expanding collections of professional textual materials.

RENAISSANCE AND REFORMATION

This milieu fostered the bibliophilia of the first major humanist book collector, Francesco Petrarch (1304–1374). Petrarch's library was not only large for the age (some two hundred volumes), but unusual in that it contained not the canonical texts and core manuals of the professions, but the works of classical authors and the church fathers. In early-fourteenth-century Florence, Coluccio Salutati (1331–1406) and Niccolò de'Niccoli (c. 1346–1437), key figures of Florentine humanism, built up collections of around eight hundred volumes. Niccoli was one of the first systematic collectors of older manuscripts, which he knew to be more accurate than later copies. Both before and after the fall of Constantinople, Greek émigrés such as Manuel Chrysoloras (c. 1353–1415) in Florence introduced many important Greek texts previously unknown to Western libraries. The library of Cardinal Bessarion (1403–1472) was the most important such collection for the transmission of Greek texts to the West. Bessarion's library contained over 1,000 volumes and was bequeathed to the Venetian republic after his death. From Venice, they were copied and recopied to furnish Western libraries with Greek manuscript texts. Important institutional Renaissance libraries were established in Florence, with the 1444 San Marco library, and in Rome, with the Vatican library first of Nicholas V (c. 1450) and, subsequently and more permanently, Sixtus IV (1471–1484).

The religious conflicts of the sixteenth century had a major impact upon libraries, both positive and negative, in Protestant and Catholic Europe. Most dramatic was the dissolution of the monasteries in England in the 1540s and the dispersal and loss of thousands of medieval manuscripts. The college libraries of Oxford and Cambridge suffered similar, if less systematic, loss. In Germany the holdings of many monastic libraries were absorbed by existing town and court libraries. century the French Wars of Religion resulted in the destruction of many important ecclesiastical libraries. It is no coincidence that this period witnessed the first postmedieval renaissance of systematic bibliography, with the efforts of Conrad Gessner (*Bibliotheca Universalis*, 1545) in the Swiss confederation, John Bale (*Illustrium Maioris Britanniae Scriptorum*, 1548) in England, and Flacius Illyricus (*Catalogus Testium Veritatis Basle*, 1556) in Germany.

The upheaval of the first half of the sixteenth century was countered by a considerable consolidation of library collections in the second half. This period witnessed the consolidation and foundation of important collections across Catholic Europe: the Escorial in Spain (1575), the Imperial Library in

Vienna (reorganized in 1576), the new Vatican library of Sixtus V (1589), the Hofbibliothek in Munich (1558), and the Ambrosiana in Milan (1609). This chain of Catholic libraries presented a wall of orthodoxy across Europe, a self-conscious effort at intellectual containment of Protestant gains. In Protestant Europe a number of important collections emerged: the ducal library at Wolfenbüttel (1572) and the Bodleian Library at Oxford (1602) were the most important. These libraries marked a watershed in establishing permanent institutional locations for the medieval manuscript heritage and in amassing unprecedented quantities of printed books. The Ambrosiana, for example, amassed a collection of some 15,000 manuscripts and 30,000 printed books in the decades after its foundation. By 1666, the ducal library at Wolfenbüttel held over

55,000 printed books. Most had established, if highly restricted, hours of opening. Access was equally restricted to members of established circles of scholars. Private collections also grew in size, frequently providing the nucleus of both local and far-flung networks of learning. Such was the case with the libraries of Claude Dupuy (1545–1594) in Paris and Gian Vincenzo Pinelli (1535–1601) in Padua. Pinelli, whose library and collections housed the young Galileo while he was composing his Padua lectures, could boast of over 6,000 printed books and 700 manuscripts, making it one of the largest private libraries of the period.

SEVENTEENTH AND EIGHTEENTH CENTURIES

This period saw continued consolidation and expansion of major collections and witnessed a growth in the political importance of libraries. Quasi-public libraries such as those of the de Thou family in Paris or Sir Robert Cotton (1571–1631) in London constituted loci of parliamentary intellectual activity and housed documents of great legal and historical importance. Their libraries were mirrored in the collections of legal and political élites across Europe. Conversely, Cardinal Mazarin's (1602–1661) formidable library in Paris (1643) became a powerful emblem of ministerial and royal authority: it was dispersed— forbidden to be sold intact to a single buyer— during the Fronde of 1651. The reorganization of the French Royal Library (1661) under Jean-Baptiste Colbert (1619–1683) transformed that library into a formidable political symbol of the French monarchy and, through Colbert's patronage, into a unique locus of learning in Europe.

As a result of the new cultural importance of libraries in the late sixteenth and seventeenth centuries and in response to the growing pressures of the print revolution, a recognizable discipline of library organization and classification developed. Gabriel Naudé (1600–1653) in his 1627 *Advis pour dresser une bibliothèque* (Advice for establishing a library) sought to establish universal principles for library organization and cataloguing sensitive to both the enormous growth of print and the intellectual needs of members of the republic of letters. The real home of library science during the Enlightenment would be Germany, where the subject of library organization was taught in the universities and where both professorial and university libraries were organized

on a loose arrangement much indebted to both Naudé and Francis Bacon (1561–1626). This development reached its culmination in 1734, with the library at the University of Göttingen, the first modern university “research” library.

The major development of the eighteenth century was the expansion of vernacular book collections. These libraries favored romances and novels in addition to the traditional vernacular genres of religion and history. The new genres provided the backbone of the lending libraries and popular reading rooms, important new features on the European library scene in the eighteenth century. More books were increasingly available to more people, and levels of personal ownership of books increased across the social spectrum. Many of the older institutional libraries rushed to embrace the new ideal of the public library (though many had long functioned as quasi-public institutions): for example, the French Royal Library in 1720 and the Imperial Library in Vienna in 1726 both opened their doors as public libraries. In 1753, Britain finally had an institution to match its continental rivals with the establishment of the British Library. But it was the nationalization of the French Royal Library at the Revolution and its confiscation of former monastic holdings that would set the standard for the large national continental libraries of the nineteenth century.

LIMA. Lima, the capital city of the Viceroyalty of Peru in early modern times, lies on the southern bank of the Rímac River, west of the Andes Mountains, and eight miles inland from the western coast of South America. Conquistador Francisco Pizarro founded the city on 18 January 1535 following the Spanish defeat of the native Incan empire. Possibly to account for Lima's title as "The City of the Kings," some scholars claim that the founding date was 6 January 1535, the Catholic celebration of Epiphany, when the Magi are believed to have visited the Christ child. Pizarro chose Lima, a Spanish

misunderstanding for the native word *Rímac*, over the Incan capital of Cuzco, which was further inland and nestled in the Andean highlands, because Lima had a milder climate and was better located in terms of ocean access and defense.

Symbolic of Spanish dominance and bureaucratic opulence, the city quickly became the crown's administrative, ecclesiastical, and economic hub in South America. The crown-appointed viceroy, whose short tenure was designed to preserve Spanish control from across the ocean, sat atop a highly structured and hierarchical regional government. Like other Spanish American cities, Lima was laid out in a grid design of east-west and north-south streets organized around a central plaza, a form later codified in the Laws of the Indies. As the capital city of Spanish holdings in South America, Lima was the first American city in which the Inquisition was established and the region's principal treasury office. Lima was also the conduit, via the nearby port city of Callao, for all incoming and outgoing trade with Europe. Most important were the precious metals that were mined and produced by Spanish-controlled Indian labor in the viceroyalty—most notably the silver mines at Potosí. Peru's silver mines were central to the European economy until the ore became depleted and a fiscal crisis seized Europe and Spanish America in the late seventeenth century. Lima did not recover from this decline until the eighteenth century, when Spain's new Bourbon rulers sought to streamline government and improve the colony's and the crown's economic positions. Despite Bourbon reforms, Lima's importance outside of Peru waned after this period.

The city's population increased only slowly, restrained in part by frequent and recurring earthquakes (most notably those in 1687 and 1746). Whereas in 1613 there were a little over 25,000 inhabitants, it took almost two centuries for that to double to almost 53,000 people (1796). As with other Spanish colonies, Lima's population at the time of the conquest was composed of a few Spaniards and numerous natives. Over time the populace became increasingly mixed as more Spaniards and other Europeans arrived, the indigenous population declined, and slaves were brought in from Africa. At least in theory, Lima's social structure was as ordered as the city's administration, with legal and geographical divisions among classes and eth-

nicities. Nevertheless, cultural and sexual exchange among the city's residents, the steady influx of exotic goods, and the continual influence of people and ideas arriving on visiting ships ensured that Lima would become a culturally diverse center for the viceroyalty.

JAMIE STEPHENSON

LINNAEUS, CARL (Carl von Linné; 1707–1778; ennobled 1761), Swedish naturalist and explorer. Linnaeus was born on 23 May 1707. His father was a curator in Råshult, a small parish in Småland (southern Sweden). After attending school in nearby Växjö, he studied medicine at the universities of Lund (1727) and Uppsala (1728–1732). Coming from a low-income family, he could only afford to attend a few lectures, but patronage from Olaus Rudbeck, Jr. (1660–1740) and Olof Celsius (1670–1756) at Uppsala University, and subsidies he received from teaching botany (1730–1732), allowed him to study natural history on his own. In 1732 the Uppsala Academy of Sciences sent Linnaeus to Lapland to do research. After his return, he gave private lectures in mineral assaying, and made another research trip to Dalecarlia (a region in central Sweden) in 1734. At this early stage, the foundation for all of his later work was laid down in

manuscripts. Occasion for their publication would come when Linnaeus went to Holland in 1735 to acquire a medical degree. This journey was financed by the governor of Dalecarlia, the father of Sara Elisabeth Moraea, who was promised to Linnaeus.

Skillfully seeking the patronage of leading Dutch naturalists like Jan Fredrik Gronovius (1690–1762), senator of Leiden, and Herman Boerhaave (1668–1738), only a few months after his arrival Linnaeus successfully published his first work, the *Systema Naturae* (The system of nature), a folio volume of only eleven pages that presented a classification of the three kingdoms of nature. Success was immediate, and there followed a whole series of further publications, among them the *Fundamenta Botanica* (The foundations of botany, 1735) and the *Genera Plantarum* (Genera of plants, 1737). Linnaeus extended his stay in Holland until 1738 to catalog the extensive botanical collections of George Clifford, former director of the Dutch East India Company, who also paid him for two short trips to Paris and Oxford. On his return to Sweden in 1738, he married Sara Elisabeth and settled in Stockholm as a physician. He was among those who founded the Royal Academy of Sciences in 1739.

In 1741 Linnaeus accepted the chair of medicine and botany at Uppsala University. His career was characterized by two different aspects: On the one hand, he used the contacts he had made while in Holland to establish an international network of correspondents, including such leading naturalists as Albrecht von Haller (1708–1777) and Antoine-Laurent de Jussieu (1748–1836), that would supply him with seeds and specimens from all over the world. Incorporating this material into the botanical garden at Uppsala, Linnaeus created a continuously growing empirical basis for revised and enlarged editions of his major taxonomic works. There were twelve authorized editions of the *Systema Naturae*, as well as numerous pirated editions, translations, and popular versions that appeared in Europe.

On the other hand, Linnaeus actively supported the cameralist theory that a nation's welfare depended on science-based administration. He promoted the creation of chairs in economics at Swedish universities, organized public botanical

excursions around Uppsala, undertook research travels within Sweden to identify domestic products that could replace imports, and sent some twenty students on travels around the globe to find exotic plants for acclimatization in Sweden. The results of these “patriotic” projects were published in the *Flora Suecica* (Swedish plants, 1745), the *Fauna Suecica* (Swedish animals, 1746), and four volumes of reports on journeys made to various provinces of Sweden (*Öländska and Gotländska Resa*, [Travel to Öland and Gotland], 1741, *Västgötha Resa* [Travel to Western Gothia], 1747, and *Skånska Resa* [Travel to Scania], 1751).

Linnaeus and his wife Sara Elisabeth, who managed the three farm estates of the family, had five children. His only son, Carolus, Jr., succeeded him at the University of Uppsala after his death in 1778, but died only a few years later.

The significance of Linnaeus’s scientific achievements in natural history is twofold. His major taxonomic works, but especially the *Species Plantarum* (1753), a catalog of all plant species known at the time, provided systematic access to earlier literature in natural history, while the *Philosophia Botanica* (Philosophy of botany, 1751) laid down rules for classifying and naming organisms that would inform all future taxonomic practice. His main innovation in this respect was the introduction of binomial nomenclature, proposed for the first time in the *Philosophia Botanica* and for the first time consistently applied in the *Species Plantarum*. The latter work and zoological part of the tenth edition of the *Systema Naturae* (1756) form the basis of all subsequent botanical and zoological nomenclature, in conjunction with Linnaeus’s extensive collections of botanical and zoological specimens, today preserved by the Linnaean Society in London.

Other fields in which Linnaeus is of historical importance include plant sexuality (*Sponsalia Plantarum* [The sex of plants], 1746), ecology (*Oeconomia Naturae* [The economy of nature], 1749), and the classification of diseases (*Genera Morborum* [Genera of diseases], 1763).

STAFFAN MÜLLER-WILLE

LIPSIUS, JUSTUS (Joest Lips; 1547–1606), Dutch humanist and philosopher. Justus Lipsius was the most widely published humanist of the end of the sixteenth century. With Joseph Scaliger (1540–1609) and Isaac Casaubon (1559–1614) he formed the famous triumvirate of learning that dominated the late Renaissance. The father of the Tacitist political tradition, he also led the Neostoic movement based on the works of Seneca, which Wilhelm Dilthey (1833–1911) regarded as one of the origins of modern individualism. Lipsius’s work illustrates how a pragmatic politics, ethics, and religion grew out of the convergence of classical humanism and the wars that wracked Europe during the Counter-Reformation.

Born to a well-to-do family in Overyssche near Brussels, Lipsius began his studies as a novice in the Jesuit College of Cologne, where he was recognized as a prodigy due to his extraordinary memory and voracious intellectual appetite. He first achieved renown at the age of nineteen for *Varie Lectiones*, a work of Ciceronian Latin prose commentaries on the ancients, which he dedicated to Cardinal Antoine Perrenot de Granvelle (1517–1586), who was a minister of Philip II of Spain. Although in later life Lipsius repudiated this work for its flowery style, it caught the eye of Granvelle, who invited Lipsius to Rome as his Latin secretary. It was in Italy, between

1568 and 1570, that Lipsius blossomed as a scholar, visiting great libraries and working with famous humanists such as Paolo Manuzio (1512–1574) and Girolamo Mercuriale (1530–1606).

Lipsius's meeting with the French poet and humanist Marc-Antoine Muret (1526–1585), however, led to a defining intellectual epiphany. Lecturing in Rome, Muret was a pioneering scholar who was working on a set of commentaries on Tacitus's works. Lipsius now repudiated Ciceronian Latin eloquence and advocated Tacitus's concise, sententious style, effectively creating a second humanist rhetorical movement. In 1572 Lipsius accepted a chair at the Lutheran University of Jena in Germany, where he began his famed critical edition of the works of Tacitus, which was published in 1674. This work stands as one of the greatest monuments of Latin humanism. Mixing his own brilliant emendations with those of other scholars, Lipsius used his considerable philological skills to clear Tacitus's text of its medieval inaccuracies, differentiating the *Annals* from the *Histories*, and restoring the work closer to its original state. In 1581 he added historical and political commentaries and highlighted maxims with the aim of making Tacitus's work useful for practical life. Scaliger considered this his most important work and indeed, it became an international bestseller, elevating Tacitus to the status of a secular saint of practical politics and an acceptable stand-in for Machiavelli.

Of his many works, Lipsius considered *De Constantia* (1584; On constancy) and the *Politicorum Libri Sex* (1589; Six books of politics) to be his most important achievements. *De Constantia* explained the basic tenets of his Stoic philosophy that sought to transform contemplation and study into the basis for worldly action. Traumatized by the Spanish atrocities during the Dutch Wars and by the St. Bartholomew's Day Massacre (24 August 1572), Lipsius formulated a philosophy of personal discipline, ethics, and rational judgment in response to the chaos that engulfed Counter-Reformation Europe. The following work, *Politicorum Libri Sex*, was an exercise in Stoic practicality. Harnessing maxims from the ancients, in particular from Tacitus, he hoped to create a collection, or *cento*, of political maxims to be used as a tool by monarchs to control and stabilize their kingdoms. His theory of "mixed prudence" was an attempt to translate Ma-

chiavellian practical prudence into an acceptable tool of politics regulated by the ethics of public utility. This theory later formed the basis of Liberine political philosophy and was central to the works of Pierre Charron (1541–1603) and Gabriel Naudé (1600–1653).

Lipsius lived his life according to the Stoic principle of accommodation and rejected the religious fanaticism of his day. He was a member of the secretive, proto-Deist Family of Love movement that stressed peace and unity above denominational loyalty. A true accommodator, he went from Lutheran Jena to Calvinist Leiden in 1572, and in 1591 he returned to Louvain, where he again embraced Jesuit Catholicism and lived out the rest of his days. He supported the interests of Protestant provinces, but he also counseled the emperor on the way to a peaceful settlement of the religious strife that wracked Holland. His numerous works also include a manual of letter-writing, *Epistolica Institutio* (1580); a history of classical libraries, *De Amphiteatro Liber* (1584); *De Militia Romana* (1595), which inspired many of the military reforms of his day; and finally his masterwork of Senecan Stoicism, *Manuductionis ad Stoicam Philosophiam* (1604). His works remained popular into the seventeenth century.

JACOB SOLL

LISBON. Portugal's capital stood as the key city for exploration of the south Atlantic and Indian

Oceans as well as one of Europe's most important ports. Lisbon was also the center of Portugal's domestic economy. During the rise of Portugal's maritime empire, its large and strategic harbor became a major entrepôt for slaves, ivory, spices, silk, sugar, salt, and other commodities. By 1550 its population had risen to 100,000, making Lisbon one of Europe's largest cities. Thereafter, the decline in Portugal's Asian empire, together with the union with Spain, slowed Lisbon's demographic and economic growth. After 1705, Brazilian gold and diamonds revitalized the city's economic and political importance, and by 1750, Lisbon held at least 250,000 people, or approximately one tenth of Portugal's total population. All growth stopped, however, with the 1755 earthquake and its subsequent fire, which destroyed much of the city. Rebuilding slowed with the end of the Brazilian gold rush, and Lisbon never regained its former prominence. By 1800, its population stood at less than 170,000.

The early sixteenth century saw the creation of a particularly Portuguese architectural style called Manueline, whose motifs reflected Portugal's overseas successes and whose monuments are prominent in Lisbon. The building activity brought about by the empire's wealth substantially diminished during Portugal's union with Spain (1580–1640), which coincided with economic difficulties that affected much of Europe. Vernacular architecture particularly declined as the court and much of Portugal's social and economic elite moved to Madrid. That decline continued after independence in the late seventeenth century. Both the crown and the nobility had become too impoverished to construct palaces or large public buildings. Building activities renewed during John V's reign (João, 1706–1750), when wealth from the Brazilian gold rush created an economic boom that led to the construction of new palaces, an opera house, and the Lisbon aqueduct.

Lisbon retained its medieval and Renaissance character throughout the early modern era. Its major commercial, religious, and political structures remained inside city walls. Towering over the skyline rose the castelo São Jorge, the Carmo monastery, and the Royal Hospital of All Saints, while the Royal Palace (Paço de Ribeira), the dockyards with its customhouses, and the two great squares—the Rossio and Terreiro do Paço—dominated its foreground. On Lisbon's nearly 370 streets stood

twenty thousand houses and over two thousand stores, interspersed with over a hundred churches, monasteries, and convents.

From a distance, travelers in the early eighteenth century described Lisbon as one of the world's most beautiful cities. The city stood on a series of hills within what appeared to be a naturally formed amphitheater. Such impressions changed on arrival, however. John V placed absolutism above economic and urban development. Thus, despite the wealth from Brazil, Lisbon's infrastructure and its commercial facilities had badly deteriorated by the mid-eighteenth century. Poor-quality mortar caused old building walls to collapse on unwary pedestrians. Steep, ill-maintained streets were too narrow for coaches and created health hazards from waste flowing downward toward the city's center. Lisbon was also one of Europe's most dangerous cities. Astonishingly, despite the importance of commerce, the city had neither a permanent bourse nor a separate structure for its municipal council. Instead, merchants, brokers, and contractors conducted their dealings around Businessmen's Square, while the municipal council usually met in Saint Anthony's Church.

The November 1755 earthquake caused catastrophic mortality (it is estimated that from ten to thirty thousand lives were lost), and unprecedented destruction. The earthquake and the subsequent fire and tidal wave destroyed approximately seventeen thousand houses, the city center and docks, and countless cultural treasures. The appalling scale of the destruction initiated an international debate over the concepts of optimism and evil. Politically, the disaster precipitated the marquis de Pombal's rise to power as Portugal's strongman for the next two decades.

Pombal (1699–1782) sought to rebuild Lisbon symbolically as well as physically. He envisioned an imperial capital reflecting a reformed and commercially centered Portugal. Because lack of funds and resources prohibited rebuilding the entire city, construction efforts focused on the lower section. Central Lisbon was reestablished on a grid pattern of wide streets and avenues featuring two large squares. Pombal mandated that all new structures conform to certain rules regarding size and architectural style. The enormous Praça do Comércio,

Lisbon. Aerial view of Lisbon, 1756, with a depiction of the fire that consumed much of the city in 1755. THE ART ARCHIVE/BRITISH LIBRARY

which occupied the area where the royal palace and its surrounding ground had stood, most visibly represented Pombal's commercial focus. Colonial taxes largely underwrote the enormous cost of construction.

After 1760 the rapid decline in Brazilian gold production impeded rebuilding, and travelers still spoke of ruined structures in the early nineteenth century. The French 1807 invasion, followed by Brazilian independence, heavily damaged Portugal's entire economy. Whereas Lisbon remained one of Europe's most important port cities, it never again approached its previous economic prominence.

LITERACY AND READING. In the Renaissance, Europe experienced the beginnings of a profound transformation from restricted to mass literacy. In 1500 very few people could read and write, but by 1800 a majority of adults in northwestern Europe were literate. This entry outlines the special nature of early modern literacy; it charts the changing social and geographical distribution of literacy in early modern Europe; and it offers explanations and an assessment of the importance of this complex development.

THE SKILLS OF LITERACY

Early modern literacy was made up of several skills, which are best seen as bands in a spectrum of communication rather than discrete categories. Reading of print or writing was possible at two levels. Some people could decipher texts, read them aloud, and memorize them in a mechanical or ritual way—although their personal understanding may have been questionable. We should not exaggerate the understanding and facility of those who possessed this intermediate or semiliteracy. Those with better education and a deeper immersion in printed and written culture could comprehend the text with greater precision, reading and thinking silently to themselves. They could understand new texts as well as familiar ones. However, “reading” was not restricted to written or printed words alone. People could gather information and ideas from looking: interpreting pictures and prints in broadsheets and “chapbooks” (pamphlets) or watching and participating in plays and processions. Gesture remained a subtle and important form of nonverbal communication.

If they wanted to transmit their own thoughts other than through speech, people had to learn to write, or rather compose—an advanced skill that required considerable training and practice and that effectively marked “full” literacy for most people. The other, more common, level of writing was in fact copying: writing without necessarily understanding. It was at this stage that people learned to sign their names on documents, and this ability is commonly used as an indicator that someone could read and understand printed and written texts in the vernacular, the language of everyday life. In other words, he or she was well along the road to “full” literacy. A small minority of men and a handful of

women could also copy or compose in Latin, the international language of learning throughout the Middle Ages, the Renaissance, and the early modern period, or in another pan-European language like French. Even those who had none of these skills were not culturally isolated, for they could listen—hear a priest’s sermons or a friend reading aloud, participate actively or passively in discussions with their peers. The way to understand literacy in early modern Europe is to assess the access that people had to the different bands in the spectrum and the ways they used them.

The ability to read and write was a function of access to schooling, demand for basic learning, and prevailing social and cultural attitudes to literacy. Commercial, religious, administrative, and intellectual “revolutions” of the fifteenth century onward enhanced the supply of education and fueled a growing demand for instruction. The chances of being educated and of acquiring literacy depended on a wide variety of factors in historic Europe. Wealth, sex, inheritance laws, projected job opportunities, employment for children, even the language a person spoke in everyday life—all played their part. Thus literacy grew because of “push” and “pull” factors. For example, there was the push of religiously inspired educational campaigns (Lutheran, Calvinist, and Catholic). There was the pull of personal religious needs and economic incentives such as a desire for social or geographical mobility. Book production also grew dramatically. Perhaps 150 to 200 million copies were turned out during the sixteenth century, and 1,500 million copies were printed in the eighteenth century. This outpouring fed on and was nourished by growing literacy. More schools were provided and more were demanded. Schools were important to learning, but nowhere were they compulsory and, because of costs, many children received only a very brief and basic education. In Sweden, mass reading ability was achieved almost entirely by learning at home.

THE IMPACT OF RELIGION

The Swedish literacy campaign that began in the late seventeenth century was designed to consolidate the Lutheran Reformation there, and many of the advances in reading and writing stemmed from the religious battles of the early modern period. It is commonly asserted that Protestantism is the

“religion of the Book.” Indeed, Protestant countries tended to be more literate than Catholic, and where the faiths coexisted, as in France, Ireland, and the Low Countries, Calvinists tended to be more accomplished than Catholics. However, on closer inspection the picture is less clear-cut. Dynamic Counter-Reformation Catholicism could produce results comparable with the Lutheran heartland. Just 40 percent of accused adults examined by Spanish inquisitions knew the Ten Commandments well in the 1560s and 1570s, compared with 80 percent by the 1590s, while the proportions felt to be crassly ignorant fell from 50 percent to under 10 percent. Importantly, this was pure memorization rather than reading. Indeed, the distinction between the faiths was often more subtle than crude literacy rates—but no less important. Qualitative differences in the uses and importance of literacy distinguished Protestants from Catholics. Reading Scriptures was central to the Reformed faith. Religious books were probably read more frequently among Protestants, and the very status of reading was special. Protestants tended to own more books on a wider variety of religious topics than their Catholic neighbors and to use them differently. Protestants accepted the overwhelming authority of what they knew or thought was in a religious book.

As well as successes in inculcating religious knowledge in (“Christianizing”) their peoples, Catholic countries could boast some excellent educational facilities. At the elementary level there were, for example, Italian Schools of Christian Doctrine, which from the mid-sixteenth century taught religion and basic reading and writing to urban children. At the postelementary level there were the famous schools of the Jesuits and other religious orders. Nor should we ignore the contribution of second- and third-generation Reformations, Protestant and Catholic alike. In Denmark and Prussia it was not the Lutheran Reformation of the sixteenth century that brought about widespread literacy, but the early-eighteenth-century campaign waged by the Pietists with the help of the new “absolutist” rulers. In France female religious orders provided the impetus behind the rapid advance in women’s literacy after c. 1740.

LITERACY AMONG MEN AND WOMEN

Outcomes (the social and geographical distribution of literacy) are relatively easy to demonstrate using the universal, standard, and direct measure of ability to sign one’s name in full on a document such as a court deposition, a contract, or a marriage certificate. Male achievements were superior to female, those of the rich to those of the poor; urban dwellers were almost invariably better able to write than were peasants. In the east, south, and far north of Europe, the ability to write was less than in the heartland of the continent, but reading may have been as widespread (maybe more so) in Scandinavia. For all the apparent simplicity of these patterns, they become more complex and nuanced on closer investigation—and more so still when we move away from the quantitative measures to a qualitative analysis of meanings and uses.

Around 1500 even basic literacy was restricted to less than 10 percent of men. Judged by the rather advanced skill of signing, the most pronounced early expansion occurred among the middling and upper classes, among men, and in towns. In northern England the illiteracy of the gentry fell from about 30 percent in 1530 to almost nil in 1600, but that of day laborers stayed well above 90 percent throughout the period. Male achievements were almost always superior to female. For example, one bridegroom in three could not sign Amsterdam’s marriage register in 1630, compared with two-thirds of brides. Until the eighteenth century the rate of improvement for men generally exceeded that for women. The literacy of townspeople also grew more quickly than that of rural dwellers. By the mid-eighteenth century London and Paris had literacy levels not achieved nationally until the late nineteenth century. In eastern Europe almost the only literate people were townspeople.

PATTERNS OF CHANGE

Change was halting and irregular. Different groups reached “ceilings” or “plateaus” at different times, from which it might take decades to move. For men at least, Castile in the sixteenth century was on a par with France and England until the second quarter of the seventeenth century. Between c. 1620 and c. 1740 it failed to develop at the same rate. The literacy of Castilian women crept up only marginally from 1500 to 1740. The second half of the eighteenth century was better for women everywhere in

western Europe. Female literacy grew much more rapidly than male in northern France in the two generations before the Revolution. In parts of northwestern Germany girls began to receive instruction in arithmetic for the first time. However, the current of change ebbed as well as flowed. For centuries the leaders in raising literacy, some early industrial towns of Britain and the southern Low Countries in the late eighteenth century saw falling levels as population growth swamped the social infrastructure and child employment created a disincentive for education.

The extent of divisions between social groups varied over both space and time. In the sixteenth century, when literacy was limited, virtually all those who could read and write came from the landlord, mercantile, or professional classes. Beneath them lay a yawning chasm of illiteracy. This stark differentiation was tempered over time as more members of the middling and lower orders—artisans and farmers, for example—picked up the skills of the book and the pen. In England, lowland Scotland, the Netherlands, northern Germany, and northeastern France, an expansion of literacy for the middling ranks had occurred by the end of the seventeenth century. Southern Italy and Poland (and, to an even greater extent, Russia) had very limited literacy deep into the nineteenth century.

READING

Much research into literacy has focused on the ability to write. However, there are many reasons to believe that reading was a more widespread skill. Children of the lower social classes, who made up 50 to 90 percent of European people, generally received no more than three to four years of education, meaning they learned only to read. For adults, reading had more religious and recreational value than writing, which was by no means essential to everyday life. Indeed, it may be that in countries like Italy and France two or three women could read for every one who could write during the eighteenth century. The campaign to promote religious literacy in Scandinavia produced remarkable results. As late as the mid-seventeenth century a third of adults were able to pass the church's tests of reading, but a century later more than four out of five men and women could read.

Tacitly or overtly, studies showing apparently extensive reading suggest that the breadth of cultural access was much broader than the figures for signing imply. Yet reading might actually mean memorization, and without practice, the reading skills of many ordinary people ill equipped them for exploring the new literature of the Renaissance and Enlightenment. As late as 1750 critical reading ability in the German lands was confined to just 10 percent of the population, a figure that applies equally well to the rest of northwestern Europe. Print and writing may therefore have had a limited impact on ordinary people who were ostensibly "readers." Nevertheless, we must be alert to the possibility that reading was more widespread than writing, especially among poorer men and among women as a whole. After all, women of the *haute bourgeoisie* or the landed classes (and especially unmarried ones, it seems) read periodicals and novels. They used circulating libraries, joined reading societies, attended the theater and concerts, collected prints, and bought paintings. Women seem to have been a crucial component of the anticipated audience for Enlightenment literature.

Yet such women were not typical. The existence of social forms, which provided visual, spoken, and sung communication (such as the French *veillée* or evening gathering and the German *Spinnstube* or spinning circle) and which were dominated by ordinary women, suggests that their cultural lives continued to be cast in an oral/aural and visual framework. Males were educated to participate in the public sphere, women in the private or domestic one. This usually meant that girls gained religious knowledge, learned to read, and were given practical instruction in gendered skills like "housewifery." In the Mediterranean lands where gender roles were most firmly delineated, it was long held to be unnecessary to train girls in more than the rudiments of religious morality. In the deep south of Italy and in parts of eastern Europe such as Hungary, reading and writing were uncommon for either sex. The people of these regions actively preferred oral forms.

LATIN AND THE VERNACULAR

The spread of literacy across western Europe made communication easier. What people did with their ability to communicate using letters depended on

what tongue(s) they knew. Until the second half of the seventeenth century, the majority of printed books were in Latin. Those with Latin (perhaps 1 or 2 per cent of the population) were part of a pan-European culture in the age of the Renaissance, but theirs was a circle from which were excluded the *illiterati*—the medieval term for those unable to speak, read, and write Latin. Latin remained important as a core subject in postelementary education throughout the early modern period. During the eighteenth century, speaking, reading, and writing French came to replace Latin for cultural and intellectual purposes—at least for the elites of Catholic and perhaps Orthodox Europe. French became the new Latin. Throughout the early modern period Church Slavonic was the language of learning and literacy in Russia, but it was alien to everyday speech and was taught to a tiny number.

Indeed Latin versus vernacular was only one of many linguistic oppositions in early modern Europe. The vernacular was increasingly used in education, print, government, and administration—but which vernacular? For even within small countries many tongues could be spoken, with important implications for literacy. Seven out of ten of the inhabitants of Wales knew no English and could speak only Welsh in 1800. France was a linguistic Tower of Babel. In 1790 French (*langue d'oïl*) was the dominant language in just fifteen of eighty-nine *départements*; six million French could not understand French at all; a further six million could understand it but spoke it only imperfectly; thirty patois were spoken, plus foreign languages like Flemish or German or Basque; only three million could speak French “properly.” The linguistic map of Europe resembles that of literacy: in areas where the language of everyday life was not that of education, contact with outside authority, or printed literature, literacy tended to remain low.

For all the obstacles, dead ends, and inconsistencies in the development of reading and writing, literacy certainly expanded between 1500 and 1800. What, in conclusion, can be said about its uses? Reading tastes changed, notably from the practical to the recreational. New value was placed on originality and novelty in writing. The real growth area in reading material was not the staple texts, which people perused closely, but the more varied, ephemeral, and entertaining fare that was

becoming available. Readers ranged more extensively among literary forms, where previously they had focused on a few texts. Between 1700 and 1789 there were published 1,200 French-language periodicals of at least one year’s duration. History and travel books became more popular. While literacy was, by all measures, on the rise in the eighteenth century, it may be that for reasons of cost and availability, or because of limited education, not everyone could enjoy its products. The fully literate indulged themselves in its novelties; the semiliterate remained within their traditional mental world. In his autobiography, Johann Wolfgang von Goethe (1749–1832) recounted childhood memories of enjoying a chapbook literature of magic, chivalry, and saints, which had changed little for centuries. Europe was well on the way to mass basic literacy by 1800, but there were still pronounced divisions in access to and uses of literacy’s products.

LITHUANIA, GRAND DUCHY OF, TO 1569. The dates 1385 and 1569 mark important turning points in Polish historiography concerning the Grand Duchy of Lithuania and the Polish-Lithuanian Commonwealth, a governing myth of which is that of state creation by marriages and free unions. In 1385 the Act of Union signed in Kręva (Krewo) marked the beginning of a federation between the Grand Duchy and the Polish crown that was to last until the third partition of Poland-Lithuania in 1795. Grand Duke Jogaila (Polish, Jagiełło; after baptism, Władysław Jagiełło) agreed to marry the twelve-year-old queen of Poland, Jadwiga of Anjou. The ceremony occurred 14 February 1386 in Cracow.

Interpretation of the Act of Union hinges on the term *applicare* used in the document: Did Jagiełło agree to an incorporation of the Grand Duchy into the Polish state (as Polish historiography once argued), or did he envisage a federation of

two more or less equal states (as Lithuanian historians have insisted)? Polish historiography sees the union as a foundational moment and emphasizes the importance, for the history of early modern Lithuania, of Jogaila's acceptance of Western Christianity and his baptism of Lithuania (Aukštaitija, the eastern "highlands" around Vilnius, in 1387; Samogitia, or Žemaitija, the western central "lowlands," in 1417). It also highlights the increasingly strong ties with Poland. Lithuanian scholarship sees the long reign of Jogaila's still pagan grandfather Gediminas (ruled 1316–1341) as the foundational moment and focuses on attempts to strengthen Lithuanian autonomies after 1385, especially during the reign of Jogaila's cousin Vytautas (Polish, Witold; ruled 1401–1430) as grand duke of Lithuania. In short, the period 1385–1569, as viewed from the Polish side, was a direct progression from the personal union, through a period of strengthening ties between the two states (during which time a single member of the Jagiellonian house most often ruled both), to the writing into law of a Commonwealth of the Two Nations at the Union of Lublin in 1569. The view from the Lithuanian side is one of lost opportunities for state formation; it focuses on moments of Lithuanian separateness and sees the union as the eventual forced marriage of two very unequal partners.

A mutual enemy helped bring the two states together. The Order of the Teutonic Knights had posed a threat to both Christian Poland and pagan Lithuania since its arrival in Mazovia and on the Baltic in 1226. A decisive victory of Lithuanian and Polish forces over the Order at Grunwald at Tannenberg in 1410 prepared the way for an ultimate subordination of what would become Ducal Prussia to the Polish crown. Lithuanian historiography views the fifteenth century as a missed opportunity, as the decline of a Gediminian concept of Lithuanian statehood and identity after the death of Vytautas in 1430 and its supplanting with a Polish-oriented Jagiellonian dynasty of Lithuanian origin. Polish historiography has emphasized a willing adoption of Polish political and cultural norms. In 1413 at a renewal of the union at Horodło, forty-seven Lithuanian noble families were "adopted" by, and took on the coats of arms of, forty-seven Polish lines. This marked the beginning of a gradual Polonization of the Lithuanian elites that reached

Lithuania's burghers by the early seventeenth century.

The Lithuanian state was multiethnic from the preconversion period. Large territories of Kievan Rus' (destroyed by the Mongolian Tatar invasion of 1240) gradually came under Lithuanian rule, and the Ruthenian element contributed to Lithuanian identity in later periods. Some individual conversions among the Lithuanian elite were to Orthodoxy, and many underwent a Ruthenianization before submitting to Polonization. Ruthenian became the language of the Lithuanian chancery. Lack of full legal rights for Orthodox Ruthenian nobles (fully granted only in 1563) helped speed the Polonization of Lithuanian (and Ruthenian) society.

The period immediately following the conversion of Lithuania witnessed the first settlements of Tatars and Karaim (around Vilnius and Trakai, among other settlements), to which continuing immigrations were later added those of Poles and Jews. Grand Duke Alexander (ruled 1492–1506; king of Poland from 1501) banished the Jews from the Grand Duchy in 1495 but allowed them to return in 1503. In the fifteenth and sixteenth centuries, Jews were most numerous in Brest, Hrodna (Grodno), and Pinsk, which first comprised the Vaad or Council of the Chief Lithuanian Jewish

Communities. (Vilnius joined only in 1652.) German merchants, engaged in Baltic trade and with contacts to Riga, Königsberg, and Gdańsk, were present in Vilnius before 1386, and their numbers and significance increased here and in other cities of ethnic Lithuania, such as Kaunas, throughout the early modern period. One estimate sees a Grand Duchy of the mid-sixteenth century with a population of about 3 million, of which one-third was Lithuanian and one-half Ruthenian.

The move to formalize the personal union between Poland and Lithuania that culminated in the Union of Lublin on 1 July 1569 gathered momentum as it became clear that the last Jagiellonian king, Sigismund II Augustus (ruled 1548–1572), would indeed die without a male heir. It was again a mutual enemy—now an ascending Muscovy—that helped facilitate the marriage. The middling Lithuanian gentry was now in favor of the union and saw it as a defense of the state against Muscovy. They also saw in the union and the extension of Polish views on the legal equality of the entire *szlachta* (‘gentry,’ or ‘nobles’) a strengthening of their own position vis-à-vis the Lithuanian magnates. The latter, a group of unusually wealthy and powerful families, led in this instance by the Calvinist Mikołaj Radziwiłł the Red, then palatine of Vilnius and chancellor of the Grand Duchy, attempted to block the union. In response to Lithuanian recalcitrance, Sigismund II removed the palatinates of Volhynia, Podlachia, Podolia, Bratslav, and Kiev from the Grand Duchy and subordinated them directly to the Polish crown.

Consequently a much smaller and weaker Grand Duchy of Lithuania entered into the Commonwealth of the Two Nations, forming a federation of two quite unequal partners, with one common, elected ruler, one parliament, and one foreign policy. The Grand Duchy would retain a limited sovereignty with a separate administration, army, treasury, judiciary, and legal system (based on the Third Lithuanian Statute of 1588). Other elements of Lithuanian difference—such as the use of chancery Ruthenian, which was abandoned only in 1697—remained a part of Lithuanian identity for the increasingly Polonized elite after the union. The union would bring Lithuanian causes more directly into the center of Polish politics, especially eastern questions, such as the struggles with the Tatars, the

Ottoman Empire, and Muscovy. Population in the Grand Duchy declined sharply in the wars of 1648–1667 (by 46 percent according to one estimate). The growth that began in the 1730s brought numbers back to their prewar peak only by 1790. The Grand Duchy disappeared with the third partition of Poland in 1795.

DAVID FRICK

LITHUANIAN LITERATURE AND LANGUAGE.

In the early modern period large portions of the societies of the Grand Duchy of Lithuania underwent Polonization. Polish began to function as a language of culture, politics, commerce, and some daily conversation (even if with a regional accent) for magnates, gentry, and burghers, and there was likely a growing bilingualism among all but rural speakers of the other represented languages. These included above all Lithuanian and Ruthenian (*ruskii*), an East Slavic language that would eventually be claimed as the progenitor of modern Belarusian and Ukrainian. Both Lithuanian and Ruthenian were used for certain cultural purposes in this period, and this entry will focus on them.

Speakers of other languages were also present. Lithuanian Jews spoke Yiddish and wrote in Hebrew, Aramaic, and Yiddish. The first Hebrew presses in the Grand Duchy were established at Shklov (1783) and Hrodna (1788). German-speaking merchants were present in cities like Vilnius and

Kaunas. Lithuanian Tatars originally spoke a Kipchak Turkic language, but numbers of them quickly assimilated linguistically and used forms of Belarusian or Polish in their *kitabs* (manuscript books of religious stories, legends, fairy tales, and prayers), which they wrote down in the Arabic alphabet. Courland and Livonia were incorporated into the Commonwealth in 1561, and the first book in Latvian, a Catholic catechism, was printed in Vilnius in 1585.

LITHUANIAN

Lithuanian elites of the Grand Duchy quickly became Ruthenianized and Polonized, so that the Lithuanian language came to have a highly circumscribed area of use, and monolingual speakers in the later part of the period were peasants. By the early seventeenth century, gentry and burghers of all ethnicities and confessions spoke Polish. The chancery language of the Grand Duchy of Lithuania was Ruthenian until 1697, when it was supplanted by Polish and Latin.

The situation was quite different in Lithuania Minor. After the Peace of Toruń of 1466, a defeated Order of Teutonic Knights established a new capital at Königsberg. Lithuanian speakers were the largest non-German ethnic group in a much diminished Ducal Prussia. With the secularization of the order in 1525 and the introduction of Lutheranism as the state religion, Königsberg became a center for Protestant learning and propaganda, drawing students and professors from neighboring states, including Poland and Lithuania. Lithuanian had higher status in the public life of Ducal Prussia than in the Grand Duchy, finding use in a broader range of institutions (some schools and a large Lithuanian parish in Königsberg).

The oldest printed book in Lithuanian, the Lutheran catechism of Martynas Mažvydas, was printed at Königsberg in 1547. Mažvydas (c. 1520–1563) also produced two volumes of hymns (1566 and 1570). In 1579 Baltramiejus Vilentas (1525–1587) published in one volume Luther's small catechism (*Enchiridion*) and a translation of the Gospels and Epistles. The Lutheran clergyman Jonas Bretkunas (1536–1602) published a hymnal and a prayer book (1589) and a two-volume collection of sermons (1591), and he worked on an unpublished Bible translation.

The union with Brandenburg in 1618 and the decline of Ducal Prussia from the 1620s led to a lowering of the status of Lithuanian in Prussian society. Nonetheless, these early works of Lutheran church literature provided a basis for the development of written Lithuanian in the Grand Duchy and an impetus for Catholic authorities to respond in kind. In the Grand Duchy, two competing forms of written Lithuanian emerged, a variant based on the central dialects of Samogitia and a second that favored the eastern variant of historic Lithuania with its seat around Vilnius. The canon of the episcopal college of the Samogitia diocese Mikalojus Daukša (d. 1613) produced the first Lithuanian book printed in the Grand Duchy; it was a translation of the Spanish Jesuit Diego de Ledesma's Catholic catechism (1595). In 1599 he produced a translation of the Polish Jesuit Jakub Wujek's monumental postil, which he prefaced with a Polish-language defense of the Lithuanian language. These two works quickly drew a Calvinist response. Merkelis Petkevičius, a clerk at the Vilnius court and supreme tribunal, published a catechism and small hymnal in 1598, and Jokūbas Morkūnas published a translation of the Calvinist Mikołaj Rej's Polish postil in 1600. These were all works in the central dialects that would play a leading role in the nineteenth-century revival.

The eastern dialect was employed in a second translation of Ledesma's Catholic catechism (1605) and by the Jesuit Konstantinas Širvydas (Szyrwid) in his Latin-Polish-Lithuanian dictionary (*Dictionarium Trium Linguarum*, before 1620, 1631, 1642, 1677, 1713, and 1718) and in his bilingual (Polish and Lithuanian) collection of sermons published in Vilnius (vol. 1, 1629; vol. 2, 1644). Public use of Lithuanian declined dramatically in the second half of the seventeenth and throughout the eighteenth centuries, a result of the increasing Polonization of all but peasant societies in the Grand Duchy.

RUTHENIAN

Historians of Belarusian language and literature lay claim to a portion of early modern Ruthenian (*ruskii*). This was a language at only the earliest stages of normalization, spoken and written by the Orthodox and Uniates of the Polish-Lithuanian Commonwealth and, by the mid-seventeenth century, showing the beginnings of differentiation

from Ukrainian variants. In this genetic schema, the language is sometimes called “Middle Belarusian.” Texts manifesting Ukrainian and Belarusian features were all labeled Ruthenian. They circulated and were read throughout the Ruthenian lands; moreover, some writers from Ukrainian lands, whose texts contained Ukrainian features, were active and printed their works in centers more closely connected with Belarus (e.g., Vilnius).

Ruthenian chronicles brought the history of Rus’ into the period of its incorporation into the Grand Duchy of Lithuania, telling of the events of the fifteenth to the seventeenth centuries (the *Chronicle of the Grand Dukes of Lithuania*, the *First*, *Second*, and *Third Belarusian Chronicles*). The pioneer printer Frantsishak Skaryna employed a version of the language in the forty-nine exegetical prefaces to the books of his Church Slavonic Bible (1517–1525). The Protestant minister Szymon Budny published a Ruthenian catechism at Niasvizh in 1562, and the Antitrinitarian Vasil’ Cjapinski published fragments of a Ruthenian New Testament in the 1570s. Ruthenian served as a medium for testaments and much state, diplomatic, and private correspondence, as well as all chancery and legal functions in the Grand Duchy of Lithuania until the Union of Lublin (1569), which ushered in an accelerating Polonization. Lithuanian elites, who had first Ruthenianized, now—along with Ruthenian elites—made increasingly broad use of Polish. Ruthenian nonetheless remained the chancery language of the Grand Duchy until 1697, when it was officially replaced by the Polish that had been making steady gains in practical employment throughout the seventeenth century. In addition to the use of Ruthenian in the record books of the Grand Duchy’s courts and chancery, we may note the three versions of the Lithuanian Statute, which were printed in Ruthenian in 1529, 1566, and 1588. We also have memoirs (Fiodar Ieūlasheŭski, 1546–1604; Afanasii Filipovich, c. 1597–1648) and a few sermons (Laontsii Karpovich, c. 1580–1620) and polemical works from the period immediately following the Union of Brest (1596). Simeon Polotskii (1629–1680) was the leading practitioner of syllabic verse (based on Polish models) in Belarusian. This variant of Ruthenian declined in public use and social status with the shift of Ruthenian cultural centers to Ukrainian cities (Lviv, then Kiev) and

with the increasing Polonization of Belarusian elites.

LIVONIAN WAR (1558–1583). In 1558 Tsar Ivan IV the Terrible began over twenty years of war for a Baltic foothold by invading eastern Estonia, an area made vulnerable by factional divisions within the Livonian Order (the Order of the Brothers of the Sword) and political conflict among the order, the archbishopric of Riga, and the increasingly Protestant population of the towns. Moscow’s potential rivals—Sweden and Poland—were preoccupied with other concerns; Muscovy therefore enjoyed early success. By 1560 Narva and Dorpat and most of the Livonian interior as far as Courland was under Muscovite occupation. But this provoked the Danes, Sweden, and Poland into entering the war.

The second phase of the Livonian War (1563–1571) saw Muscovite armies invade Lithuania; Polotsk, Ozerishche, and other towns along the Western Dvina quickly fell to them. The tsar planned to install Duke Magnus, brother of Denmark’s King Frederick II, as vassal king of Livonia to secure a Danish alliance to drive the Swedes out of Riga and Pernau (Pärnu), which they had seized in 1560. Muscovite occupation of northeastern Lithuania finally convinced the Lithuanian nobility to accept closer administrative union with Poland in a

Commonwealth (in the Union of Lublin, 1569), which considerably increased the military resources available to the Polish crown. Frederick II not only withheld the support Duke Magnus needed to expel the Swedes but signed a treaty with the Swedes at Stettin in 1570. The deposition of King Erik XIV brought to the Swedish throne John III Vasa (ruled 1568–1592), who was the son-in-law of King Sigismund II Augustus of Poland and was inclined to view Muscovy as a greater threat than Poland to Swedish interests in Livonia. The military stalemate in Lithuania and Livonia had meanwhile left Muscovy's southern frontier undermanned, with the result that Khan Devlet Girei took a large Crimean Tatar army deep into central Muscovy, sacking and burning Moscow itself in 1571.

In the third phase of the war (1572–1577) Ivan IV exploited the interregnum following the death of Sigismund II to mount another major offensive in Livonia. But the Muscovites were still unable to capture Reval (Tallinn) or Riga. Meanwhile the Commonwealth's newly elected king Stephen Báthory (ruled 1576–1586) was able to achieve rapprochement with the Ottomans and Crimeans, to convince the Sejm to raise taxes for a much larger army of 56,000 men, and to negotiate an alliance with the Swedes. By contrast Ivan IV was finding it harder to maintain large Muscovite forces in the field, for years of heavy taxation and manpower mobilization from the western Muscovite provinces (particularly Novgorod and Pskov) had left these districts devastated.

In 1578 Polish and Swedish armies combined to deal the Muscovites a crushing defeat at Wenden (Cēsis). This marked the war's final phase, which was catastrophic for the Muscovites. Over the next three years they were pushed out of Livonia altogether. Stephen Báthory recaptured Polotsk and the other towns of the Western Dvina region in 1579–1580 and carried the war into western Muscovy, placing Pskov under protracted siege in 1581. By the end of 1581 the Muscovite garrisons at Narva, Ivangorod, Yama (Kingisepp), and Kopor'e had fallen to the Swedish general Pontus De la Gardie. Ivan IV was compelled to sign a ten years' armistice with the Commonwealth at Iam Zapol'skii in January 1582 and a three years' armistice with Sweden at Pliuss in 1583. The tsar thereby forfeited all the lands his armies had occupied along the Baltic coast.

Central and southwestern Livonia came under Commonwealth control; the Swedes took Estonia and the territory along the Gulf of Finland.

LOCKE, JOHN (1632–1704), English philosopher, political and educational theorist, political economist, scholar, statesman, and sometime physician. John Locke, one of the leading figures in the history of English letters, was born on 29 August 1632 in the village of Wrington, Somerset, and was immediately surrounded by the political and religious controversies that were always to be at the center of his life. His parents were Puritans, and his father later fought on the Parliamentary side in the Civil War. Locke attended Westminster School from 1646 to 1652, when he was elected to a studentship at Christ Church, Oxford, from which he graduated in 1656. During this period, he wrote but did not publish a pair of essays criticizing the extensive conceptions of religious indifference and toleration advocated by Edward Bagshawe's *The Great Question concerning Things Indifferent in Religious Worship* (1660), and he delivered a series of lectures on natural law.

Royal Society, to which Locke himself was elected in 1668. Rather than take religious orders, he changed his studies to medicine and was trained and influenced by the physician Thomas Sydenham. On a diplomatic mission to Cleves in Brandenburg in 1665, Locke experienced an unanticipated degree of toleration, which seems to have had a major impact on his philosophical and political thinking. In 1666 he had met Anthony Ashley Cooper, subsequently the Earl of Shaftesbury, into whose household he moved in 1667 as the earl's personal physician and advisor, political aide, and author of political documents.

Shaftesbury, who fell into and out of grace with the king, was at the center of Restoration politics, and Locke was invariably at his side. For Shaftesbury Locke wrote a tract defending toleration in 1667, a draft constitution for the Carolina colony of which Shaftesbury was a proprietor, a defense of the king's prerogative power to issue a declaration of religious toleration in 1669, and—most important—the *Two Treatises of Government*. It was also while he was a member of the Shaftesbury household that Locke's

interest in philosophy deepened, and he completed various drafts of his *Essay concerning Human Understanding*.

Locke returned to Oxford in 1675, but like Shaftesbury he later went into political exile in the Netherlands, where he remained until 1689. There he enjoyed the friendship and support of Jean Leclerc, to whose *Bibliothèque universelle et historique* (1686–1693) he made several contributions, and Phillip Limborch, to whom he would dedicate the *Epistola de tolerantia*, published anonymously in the Netherlands in 1689 and translated into English (also anonymously) the next year as the *Letter concerning Toleration*. During his exile, Locke completed much of the final version of the *Essay*, an abstract of which was published by Leclerc in 1688.

While in the Netherlands, Locke presumably was involved in Monmouth's Rebellion in 1685 and in the politics of the Glorious Revolution of 1688, which brought the Dutch sovereign William of Orange and his wife Mary, daughter of James II, to the English throne. Locke himself returned to England in 1689 and began his public literary career, publishing the works that would establish his status in the pantheon of western philosophy and political theory. The *Essay concerning Human Understanding* appeared in December 1689 (dated 1690), and the *Two Treatises* were published anonymously in 1690.

The *Essay* is regarded as one of the foundational works of modern empirical, or rather “experiential,” philosophy. It opens with an extensive attack on the notion that some ideas are “innate,” arguing, on the contrary, that the human mind at birth is a “blank slate” (*tabula rasa*) but has the capacity to perceive and reason. Locke went on to claim that all ideas and knowledge are acquired from experience, which can be either sensationalist or rational, and that they bear direct relationships to a real, external world. The *Essay* also deals with language, its relationship to ideas, and its imperfections and abuses, and with reason and its role in the acquisition and assessment of knowledge. This “rationalism,” albeit less extreme than that of René Descartes (1596–1650), is sometimes seen as conflicting with the rest of the *Essay*, but the apparent contradiction between the two positions can be

found throughout the work. In a move that would be anathema to modern empiricists, Locke occasionally sidestepped difficult philosophical issues by referring to their resolution in the ultimately unknowable mind of God, for faith, as the acceptance of revelation, was one of the cardinal supports of Locke's entire system.

The *Two Treatises* are equally foundational for subsequent political philosophy as is the *Essay* for empirical philosophy, and their reliance upon divine will is even more overt. Written in the early 1680s as part of Shaftesbury's exclusion campaign, the work was not published until 1690, when it was issued as a theoretical support of the successful Glorious Revolution. The *Two Treatises* were directed against the patriarchal theory of Sir Robert Filmer (c. 1588–1653); the *First Treatise*, in particular, was a detailed and sometimes page-by-page attack on patriarchalism. In the *Second Treatise* Locke developed his own political theory, which was also an implicit assault on Thomas Hobbes (1588–1679), whom Locke never identified. Locke replaced Filmer's divine right sovereignty, derived from the paternity of Adam, with a conception of government and politics based on vaguely articulated notions of natural law and natural rights. He posited a pre-political state of nature characterized by human equality and freedom, the ownership of the world in common by God's grant, and legitimacy based on consent. Personal property was acquired by the mixing of one's labor with that which was common.

The most important part of Locke's criticism of Filmer was his insistence that fatherhood and political government are distinct forms of authority. Filmer had asserted their identity. Locke, however, was at pains to argue that while political or civil society had emerged historically and anthropologically from the household, paternal and political dominion were altogether distinct. The act of consent transformed fatherhood into government and undergirded all subsequent legitimacy.

The *Two Treatises* are perhaps best known for their theories of property and revolution. Government, according to Locke, is a human contrivance made necessary by the growing complexities of the state of nature and especially by the increasing insecurity of personal property. Locke had two conceptions of "property." In the state of nature

(through chapter V of the *Second Treatise*), "property" meant land and goods, including money; in civil society, however, it almost always meant "life, liberty, and estate," which was the more widely accepted meaning in seventeenth-century England. Locke's initial reliance upon the former definition—and the subsequent importance of the *Two Treatises*—undoubtedly played a large role in popularizing that narrower understanding among modern English speakers, but his shift back to the more conventional and broader meaning was the source of some ambiguities in his political theory.

The purpose of government according to Locke is to protect property, and it is in return for that protection that people agree to transfer to the government their individual rights to interpret and enforce the law of nature. When the government no longer provides that protection, or if it becomes an enemy to property, the duty to obey is superseded by a right of revolution, whereby the power and authority conveyed to the government revert to the people (or their representatives) who may then establish a new government.

The *Letter concerning Toleration* is a specific application of the principles of the *Two Treatises*. What was innovative and radical about the *Letter* was the argument that religious imposition went so far beyond the legitimate competence of the magistrate as to be a ground for resistance. Locke drew a firm distinction between the secular ends of magistracy and the religious ends of churches. In doing so, he made a bolder move toward genuine religious liberty than had any of his contemporaries. But Locke excluded Roman Catholics from this toleration, alleging, like many of his contemporaries, that they owed their primary political loyalty to the pope rather than to civil rulers. He was confident, however, that Protestant Christians could live at peace within one civil society despite their diverse religious beliefs.

Locke spent the rest of life in public service and writing. He was a member of the Board of Trade and published revisions of the *Essay*, replies to criticisms of the *Letter concerning Toleration*, and tracts on education, religion, and money, some of which were published after his death. Locke died on 28 October 1704 at Oates, Essex, at the home of Sir Francis and Lady Masham (the daughter of the

Cambridge Platonist Ralph Cudworth), where he had been living since 1691. He is buried in High Laver Church in Essex. Much of his massive collection of personal manuscripts—including journals, diaries, letters he received, and copies of those he sent—and a substantial part of his library have survived and are now in the Bodleian Library at Oxford.

LOGIC. Recent research on the seemingly staid subject of logic has revealed not only that certain topics in logic explained how inductive reasoning came about, but also that logic itself learned to create its own history in which logic arose from simple beginnings, but over time developed ever better ways of thinking, eventually becoming a progressive force in the history of thought. Furthermore, by the eighteenth century, the history of logic served as the structure for the history of philosophy, as well as an encyclopedia of knowledge known as *historia literaria*.

Although the importance of inductive reasoning to natural philosophy has been acknowl-

edged, other research has shown that the tradition of inductive logic, which historians of the scientific revolution have identified as new, was actually developed by Aristotelian philosophers. The best known of these is the Paduan philosopher Jacobo Zabarella. His logic developed in part as a criticism of Florentine Neoplatonism and the medieval Scotist philosophy. This tradition of logic was taught not only in Italy but also in England, where logic texts by Zabarella have been found to have been used as school texts. Further, in Germany there remain today ninety-seven copies of Zabarella's *Opera Logicae*. This logic was then adopted by Bartholomew Keckerman for more elementary teaching and finally adopted again during the second half of the seventeenth century in Finland and Scandinavia after the Ramus vogue had run its course. Finally, at Jena, texts by Zabarella and the Coimbra commentators from Portugal were seen to be the beginning of a tradition of logic that led to the philosophy of John Locke (1632–1704) and Robert Boyle (1627–1691).

The best way to explain the difference between the Neoplatonic and Scotist approaches to knowledge and logic is to follow the debate around what is now considered a guiding logical and philosophical question between 1500 and 1750: What was the first thing thought? Was it the pure concept of an object or idea as defined by the Neoplatonists and some Scotists, that is, an idea conceived in the mind without recourse to the unreliable senses? Was it being, or *ens*, as Thomas Aquinas wrote? Or was it a fuzzy notion of a whole object or concept that needed to be examined, carefully defined and refined, and finally, when more was known about it, completely reexamined?

The great innovators of logic in the seventeenth century—Francis Bacon (1561–1626), Pierre Gassendi (1592–1655), Robert Boyle, and John Locke—continued and transformed this anti-Platonic, anti-Scotist tradition. These anti-Platonic philosophers held that there were two types of knowledge, divine and human, each with its own method. Divine knowledge was accessed through inspiration; human knowledge, or artificial knowledge, had to be learned through the senses. The anti-Platonists often quoted Aristotle as saying, “There is nothing in the mind that is not in the senses.”

Many philosophers did work on inductive reasoning, beginning with the sixteenth-century Aristotelians Benedito Pereira in Rome and Zabarella in Padua. Their work was drawn upon and transformed by Bacon, Boyle, and Locke in England, Gassendi and his followers in France, and members of a new German school of philosophy known as eclecticism. The eclectics, like their counterparts in England and France, were both anti-Platonic and anti-Cartesian. They gave their tradition a historical dimension, writing that since no human being could know everything, philosophers should examine the reasoning of past philosophers, criticize or accept the methods they had used to reach their conclusions, and finally judge the validity of the original concepts. Using improved logic, each philosopher would then add new information to explain his findings. Eclecticism also referred to a Neoplatonic philosophy that tried to unify all knowledge under one idea by such early church fathers as Clement of Alexandria. Although it had the same name, this was very different from German eclecticism.

How is it possible to classify Gassendi, Bacon, and Locke together? Here one can realize the pitfalls of assigning one name to logical schools. For example, Gassendi did write a treatise attacking scholastic logic, *Adversus Aristoteleos* as he called it. This treatise was really attacking the self-referential syllogistic reasoning of dialectic, and often criticizes the Scotist philosopher Eustachius St. Paul, teacher of Descartes, and quotes Benedito Pereira, the anti-Platonic and anti-Scotist Aristotelian at the Collegio Romano. Gassendi dismissed Eustachius as Scholastic or Aristotelian, while he was developing his own version of the anti-Platonic logic of the sixteenth century that he reworked with his own recreation of Epicurean logic.

A further discussion of logic can be reduced to five points: 1) the use of rhetoric as a tool of persuasion by logicians; 2) the transformation of logic by anti-Platonic Aristotelian philosophers and their development of the question, *De primo cognito?*, ‘What was the first thing thought?’; 3) this orientation of logic leads to the very specific criticism of the Neoplatonic myth of the *prisca philosophiae*, the ‘first philosophers’; 4) the development of a technical vocabulary for natural philosophy that was a direct result of inductive logic: as myth and meta-

phor were rejected for biblical commentary, so Platonic myth and metaphor was to be shunned for inductive reasoning; 5) the hermeneutic of language for logic, which was then applied to the writings of logicians in the past and provided a tool for judging past thought. Thus the history of philosophy was born, and its midwife was logic.

RHETORIC AND LOGICAL REASONING

The scholarship of Letizia Panizza and Heikki Micheli has made it quite clear that, as Micheli writes, “there is no justification for separating rhetoric from logic.” The model of the correct logical proof changed dramatically when techniques of rhetoric were used. As Panizza explains, medieval philosophers “who learned their dialectic mainly from Boethius commentaries on Cicero and manuals of logic did not pay attention to Aristotle and Cicero on the close rapport of dialectic and rhetoric” (Cicero’s *De Oratore*, a work only known after 1421). Panizza also explains that by the end of the fifteenth century, “Aristotle is held up as a model for an orator who wants to unite not only eloquence with philosophy in general, but rhetoric with dialectic.”

She goes on to explain that logic was the instrument for philosophical thought, while rhetoric was the technique used to convince the reader. The philosophers adopted the persona of the orator, which was about the only technique used by Renaissance historians. By the time Zabarella (1532–1589) published *De Methodis* in 1578, rhetoric was being used to convince the reader of his method. Zabarella began each book of his treatises with a summary statement of method in which he declared his objectivity about his topic and his modesty towards knowledge, just as historians before him had done. After declaring his objectivity, he stated why his method of logic was superior to all others.

But the philosopher’s use of the first person, in imitation of the speech of an orator, really developed in France with René Descartes’s (1596–1650) *Discourse on Method* and Gassendi’s persuasive voice in the *Syntagma*. In his work, Descartes declared the originality of his thoughts. He tended to assert the truth of his logical statements with rhetorically styled sincerity rather than engage in argument. Regius, a fellow philosopher, was so annoyed at the Cartesian use of persuasion rather than logic for proof that he wrote to Descartes, “any mad man can

claim he is right.” Descartes declared, “I think therefore I am.” On the contrary, the first thing thought by Gassendi was not an a priori judgment; to him, thought had a history. He studied what past philosophers had thought, and he judged and critically examined the logic of the position. This led him to write a history of logic, the first comprehensive history up to that time.

ANTI-PLATONIC PHILOSOPHERS

Charles Schmitt wrote that Zabarella’s logic set the stage for the logic used in the seventeenth century. Logic texts quoted Zabarella’s attack on a priori reasoning and praised his logical method of setting out information not only in the seventeenth century but into the eighteenth. Johann Syrbius of Jena began his 1715 logic text with a critical history of the attack against a priori reasoning. He begins with a short historical discourse on the proposition that species originated in the mind, beginning with a quote from a commentary on Aristotle’s *De anima* by the Portuguese Coimbra philosopher and Zabarella and ending by having linked the earlier traditions with the contemporary philosophy of John Locke and Robert Boyle. He also criticized Descartes, who believed that the species originated in the mind.

NEOPLATONISM

Not only was a priori reasoning rejected by specific philosophers, but the same anti-Platonic argument was used against the nonhistorical view that the *prisci philosophiae* or *prisci sapientes* could have known all of human knowledge without having learned it. For the Neoplatonists there was one truth that could be found in different forms in different religions around the world. This universal truth was proposed in the fifteenth century by Marsilio Ficino and was still of interest in the seventeenth to the Jesuit polymath Athanasius Kircher. Kircher’s magnificently illustrated book of Noah’s Ark, in which all of the knowledge known intuitively by early man is set out among the rooms, is a delightful visualization of universal knowledge.

There was an encyclopedia based on the other view. Zabarella said that as unlearned men, the *prisci* only knew what was in their nature. As the first thing thought was only hazily understood and had to be observed, identified, and then named, human civilization followed the same pattern. Initially hu-

mans knew nothing and had to understand the world through trial and error. A clever person appeared and made improvements, then others asked to become apprentices so that they could learn the logic of that person’s way of working. Finally, all of this knowledge was written down. Adam, Moses, and Hermes Trimegistus are not part of this world: they all had only natural knowledge.

Just as there was not only one universal truth, there was not only one logical method for all disciplines. The greatest and most comprehensive history of disciplines was set out in 1708 in the *Polyhistor* by Georg Morhof (1639–1691). He articulated the difference between the disciplines as a logician articulates the difference between different sense impressions in inductive reasoning. Once the field of learning was identified, then the early and unclear beginnings of thought could be described and its history told as the history of the progress of the logic of that field of knowledge.

THE VOCABULARY OF NATURAL PHILOSOPHY

If logic could control the organization of knowledge, it also dictated correct vocabulary. Research has shown that this hermeneutics of language was used as a weapon against Platonic philosophers. Perhaps no one was criticized for his vocabulary more than Paracelsus (c. 1493–1541), the innovative medical philosopher who developed a vocabulary for spells to use in medicinal cures. Medical doctors like the Swiss Thomas Erastus (1524–1583) attacked the Paracelsian language of spells for its attempt to be universal. Erastus said that no word is universal, but is particular to the civilization in which it is found. Spells and magic tried to unite heaven and earth into a chain of being that did not exist, Erastus complained. He asserted that there was a separation between the realms.

If natural philosophy and medical science were to improve, logic had to be used. Logic must order sense perceptions in such a way that what is known is recorded and what is unknown discovered. To do this, a precise vocabulary had to be devised. There was such interest in identifying the correct type of vocabulary for inductive reasoning and identifying Platonic or Scotist definitions that at the turn of the seventeenth century Goclenius’s *Lexicon* was pub-

lished, which set out the different types of words for different types of logic.

APPLICATION OF LOGIC TO THE PHILOSOPHY OF THE PAST

Not long after Zabarella's attack on the logic of *prisci sapientes*, the various types of logic of the various philosophers came under scrutiny. Anthony Grafton pointed out that Isaac Casaubon discovered that the Neoplatonic texts by Hermes Trismegistus were third-century forgeries. This discovery paved the way for a reassessment of Egyptian civilization. When the logic of earlier philosophers was identified, examined, and judged, an important change occurred: the critical characterization of the logic of past philosophers, the identification of philosophers not chronologically but by the success of their logic, changed the way people viewed past philosophy.

Pierre Gassendi wrote the first history of logic. His little-known work *De Logicae Origine et Varietate*, published in 1648 as a preface to the *Syntagma*, took the reader on an intellectual trip from the logic of Adam to the logic of Descartes. Adam, wrote Gassendi, did not have logic when he argued with the snake: "He was merely quibbling." He also argued that none of the patriarchs in the Bible were capable of logic either. Logic began with the Greeks and Zeno. Gassendi then criticized Plato's logic because it depended on a priori thinking and "was too much like theology." Although he admitted there was much to admire in Aristotle's logic, Gassendi wrote that it had been spoiled by his followers.

Gassendi admired the logic of the ancient philosopher Epicurus, based on inductive reasoning. Gassendi constructed a believable Epicurean logic in this text that appeared in student logic texts until the mid-eighteenth century. Jean le Clerc, friend of both Robert Boyle and John Locke, wrote perhaps the most widely used of these logic texts. From Epicurus, Gassendi passed over the Middle Ages, cramming one thousand years into two paragraphs, then began in the early modern period with Francis Bacon and the establishment of inductive reasoning. Bacon, wrote Gassendi, went the "heroic way." Gassendi made Bacon as the hero of contemporary thought. There is a great deal of rhetoric in this history of logic.

Finally, the complete triumph of logic as the history of logic came with the work of the German historian of philosophy Jacob Brucker (1696–1770). At Jena, Brucker was a student of Johan Jacob Syrbius, who had linked contemporary English inductive reasoning with the earlier logic of the Coimbra commentaries and Zabarella's *De Methodis*. In 1723, Brucker wrote a history of logic called *Historia Philosophiae Doctrinae de Ideis*. In this work he attacked the *prisca philosophiae* in the person of Zoroaster. Following Gassendi, whose history of logic he knew, Brucker judged each philosopher by whether he used inductive reasoning. He praised Epicurus among the ancient philosophers and dismissed Renaissance philosophers like Valla and Vives, while praising John Locke and Robert Boyle.

Although the early modern period saw many breaks with past tradition, it did not usher in a new logic all at once. Rather, it was a period in conversation with past philosophy: sometimes it agreed, sometimes it disagreed, and sometimes the philosopher transformed his sources beyond recognition. As the *De primo cognito?* question was reworked by the anti-Platonic philosophers, the concept of intellectual (as opposed to chronological) progress developed in the sixteenth and seventeenth centuries. Nowhere can the concept of progress be seen more clearly than in the history of logic.

CONSTANCE BLACKWELL

LONDON. The most salient feature of London's experience in the early modern period was the enormous growth of its population. From approximately 70,000 inhabitants in 1500, it grew to 200,000 by 1600, to 400,000 by 1650, to 575,000 by 1700, and had reached 900,000 by 1800. Its position in the tables of European urban centers rose from sixth place in 1500 to third in 1600 (after Naples and Paris), and it outstripped Paris to reach the top position soon after 1650. Whereas it con-

tained about 2 percent of the English population in 1500, by 1700 it had reached around 10 percent, and this level was sustained through the eighteenth century. Mortality levels were extremely high in London: indeed they deteriorated after the disappearance of plague in the later seventeenth century because the capital acted as a reservoir of infections. For much of the eighteenth century tuberculosis, typhus, and smallpox were major killers. It was only from the 1760s that mortality conditions began to improve. This meant that the city's growth could only be sustained by a constant flow of migrants who came from every corner of England and Wales (and increasingly from Scotland and Ireland and the European mainland, too). By 1700 London needed probably about 8,000 newcomers a year. Only something between 20 and 30 percent of Londoners had been born in the city. And because London acted as a revolving door, not only receiving people, but sending them back to the provinces, as many as one in six of the national population had experience of London life by 1700.

ECONOMIC CHANGE

The cities that grew most rapidly in early modern Europe were capitals or ports. London was both. In the early sixteenth century London already accounted for 75 percent of the country's international trade, but it was dangerously dependent on the export of the key staple of woolen cloth to the Antwerp entrepôt in return for luxury goods. By 1600 the pattern of trade was already diversifying, as the disruptions to trade with the Low Countries encouraged London merchants to seek direct access to goods they had previously obtained there. The merchants of London returned to the Mediterranean in the 1570s, began voyaging to the East Indies in 1600, and began to develop trade with the Americas in the early seventeenth century. London entered a new phase of import-led growth, and re-exports, particularly of colonial products like tobacco, became increasingly important. By 1700 London handled 80 percent of the nation's imports, 65 percent of its exports, and 85 percent of its re-exports.

As a capital city London benefited from the increasing centralization of government. As the royal court became more sedentary and also asserted its monopoly of patronage, the landed elites came to

see a London residence as essential to the maintenance of their power and influence, contributing to the beginning of the London winter season from 1600 onward. Likewise, the huge increase in the volume of litigation in the central law courts brought more people to the capital on legal business. This in turn contributed to the concentration of the professions in the capital: by 1730 London contained at least a quarter of the country's solicitors and attorneys. The development of the fiscal military state from the 1690s onward brought about both an increase in the size of the government apparatus (as well as annual Parliaments) and a huge expansion in the financial services sector as London acquired the key banking and insurance institutions.

London's role as capital city and port contributed to its role as center of manufacturing and shopping. The residence of the elites brought an immense demand for luxury goods in its wake, while the import trades spawned spin-off industries like sugar refining and silk weaving. Whereas in 1500 the economy had been dangerously dependent on the state of the cloth trade, the broadening

of the manufacturing base contributed to the long-term resilience of the city economy. London's manufactures became increasingly heavily capitalized, entailing a diminution in the role of the self-employed artisan and a growth in larger enterprises. London was not, however, to be the cradle of the industrial revolution, and in the later eighteenth century the proving ground of industrial innovation lay in the provinces. The high labor costs associated with the capital meant that London came to concentrate on the finishing of industrial goods and on the luxury trades, but it remained the largest manufacturing center in Europe at the end of the eighteenth century. Likewise, the enormous demand represented by the concentration of people in London encouraged the precocious development of specialist retailing facilities. Already in the 1490s foreign travelers marveled at the wealth of the goldsmiths' shops in Cheapside; in the early sixteenth century moralists bemoaned the proliferation of haberdashers' shops selling fripperies; in 1568 London acquired its first shopping mall in the galleried arcades of Sir Thomas Gresham's Royal Exchange, a model for other purpose-built retailing emporia in the West End in the seventeenth century.

London. Based on older maps, this small sketch plan depicts London circa 1563, at a time when the population of the city was rapidly expanding. London was gradually extending west toward the City of Westminster, which was taking shape around the court. The less-developed area of Southwark, south of the Thames across London Bridge, served as an entertainment district with its theatres and bull and bear-baiting rings. The concentration of the social elites in the capital for the London season contributed to the proliferation of entertainments and the increasing commercialization of leisure. One of the earliest manifestations of this was the amphitheater playhouses (three were built in 1576–1577) with capacities of upwards of 1,500. Although subject to the constant strictures of the moralists and the fitful regulation of a nervous government, the theaters became an established feature of the London social scene. Commercial concerts began in the 1670s; although aristocratic patronage was critical in attracting high-class composers and vocal and instrumental performers, there was enormous public interest in the performances, the rehearsal for Handel's *Music for the Royal Fireworks* (1749) having an audience of twelve thousand. Citizens had long found recreation in the fields about the city, but physical expansion meant that it was necessary to create designated recreational promenades, beginning with Moorfields in 1608, but soon supplemented by the more fashionable Lincoln's Inn Fields and St. James' Park. By the eighteenth cen-

ture the metropolitan area was studded with a variety of pleasure gardens, their differential pricing ensuring that the classes would not have to mingle too much. Much cultural and social exchange, of course, continued to take place in the city's drinking establishments: by the 1730s London boasted at least 200 inns, 500 taverns, 6,000 alehouses, and 550 coffeehouses.

SOCIETY AND GOVERNMENT

The two foci of court and port affected the social geography of the city. The City proper, the area under the jurisdiction of the Lord Mayor and aldermen covering what is now known as the "square mile," was, although not socially uniform in character, increasingly dominated by the commercial elites. This process was reinforced after the Great Fire of 1666, which destroyed 87 parish churches, 13,200 houses, and many public buildings. Although it proved impossible to realize the ambitions for a comprehensive redesign of the city's layout, the post-Fire rebuilding changed its face, as brick replaced timber and lath, and many overcrowded

tenements were not rebuilt. Meanwhile the landed elites, many of whom had maintained residences in the City in the later Middle Ages, migrated westward toward Westminster, which constituted a separate focus for growth. The West End was characterized by a large number of speculative housing developments, usually regular terrace rows in wide streets and squares, many of them sponsored by the aristocracy themselves. By contrast, the eastern suburbs were dominated by the port, the miles of dockyards generating a huge demand for casual (and often seasonally unemployed) labor, and a variety of industrial activity, including shipbuilding, as well as the processing of imported raw materials. The northern and eastern suburbs were markedly poorer (with large numbers of subdivided properties and a high level of multiple occupancy) than the City and the West End, though it would be wrong to draw the distinctions too strongly. The presence of the elites in the West End generated an enormous de-

mand for services and manufactures, meaning that within a few yards of the fashionable squares dominated by the aristocracy and gentry were alleys teeming with the poor. In the City the commercial core was centered on the key shopping thoroughfares like Cheapside and places of mercantile association like the Royal Exchange, but there were areas of marked poverty, particularly in the insalubrious riverside parishes.

The scale of growth meant that the traditional City was soon engulfed by the expanding suburbs. By the later seventeenth century three-quarters of the capital's population resided in areas beyond the control of the Lord Mayor and aldermen. Unlike Paris, where there was a much stronger match between topographical and administrative boundaries, there was no attempt to integrate the suburbs with the governmental structures of the City. The suburbs, all of which experienced in various degrees the social problems of poverty and petty crime atten-

dant on population growth, were governed by overlapping manorial and parochial authorities. Nevertheless the breakdown in order was by no means as great as one might think. London was a relatively well policed capital. From Recorder William Fleetwood in the Elizabethan period to Henry Fielding in the 1750s, chosen magistrates worked closely with the central government to coordinate suburban policing. Parish vestries, particularly in the western suburbs, elaborated the poor law into a bureaucratic mechanism for controlling the poor. Local communities increasingly turned to Parliament for the powers they needed to address local problems. From 1700 there was a proliferation of improvement commissions responsible for street improvement, lighting, and sewerage. A host of voluntary organizations supplemented the work of parish vestries in the relief and schooling of the poor.

Throughout the period London evoked contrasting responses from contemporaries. Protestants

might celebrate it as a model godly commonwealth when contrasting the piety of its citizens with the state of rural religion, but they would alternately condemn it as a model of Babylonian depravity when considering its social problems and the greed of its leading citizens. Economic commentators might marvel at the wealth of the City and its increasing dominance over its Continental rivals, but they might also claim that it was strangling the provincial centers. The reality, however, seems to have been that London handled the problems of urban growth more successfully than comparable centers and developed a positive economic and cultural relationship with its hinterland.

LORRAINE, DUCHY OF. Nestled between France and the Holy Roman Empire, the Duchy of Lorraine experienced a turbulent existence during the early modern period. Lorraine was an irrational patchwork of different sovereignties and jurisdictions. The duke's two largest territories were the Duchies of Bar and Lorraine; however, in the heart of ducal lands lay three sovereign bishoprics: Metz, Toul, and Verdun. Like other small states, Lorraine was vulnerable to outside forces and thus could not escape involvement in international

affairs. Trade was a positive aspect of this involvement. Straddling the Meuse and Moselle rivers, and stretching from the Vosges Mountains to Luxembourg, Lorraine sat astride two major trading axes, east to west and north to south, and thus goods, people, and ideas constantly flowed through the duchy. However, Lorraine lacked the power to keep larger rivals out of its affairs and its territories. This weakness led to Lorraine's loss of independence.

The duchy's approximately 800,000 inhabitants in 1600 occupied an overwhelmingly rural territory. Lorraine's population was dominated by its natural environment, which ranged from mountains toward the southeast to rolling plains in the west. Dense forests blanketed the region. The largest urban center of the area, the sovereign bishopric of Metz, boasted a population of around 19,000. In contrast, at the beginning of the seventeenth century, the most important city under ducal control, the capital Nancy, only had about 8,000 residents. Agriculture formed the foundation of the duchy's economy, with the majority of peasants engaged in the growing of various cereal crops. A crucial aspect of Lorraine's economy was its industrial production, especially glass manufacturing and salt mining. These products as well as agricultural surpluses were sold throughout Europe and helped the duchy prosper in the sixteenth century. Although the ducal economy was devastated by mid-seventeenth-century crises, the eighteenth century witnessed gradual economic recovery.

At the beginning of the 1500s, Lorraine held the political status of an imperial fief. This situation changed in the mid-sixteenth century with two events that would define the parameters of Lorraine's geopolitical situation until the 1730s. In August 1542, Duke Antoine (ruled 1508–1544) and Emperor Charles V (ruled 1519–1556) approved the Treaty of Nuremberg, which recognized Lorraine's independence in exchange for the duke's continuing liability for certain imperial taxes. Ten years later, French King Henry II (ruled 1547–1559), as part of his dynastic wars with the Habsburgs, occupied the three bishoprics. Henry placed them under French "protection" until 1648, when the Holy Roman Empire ceded complete sovereignty over the cities. From the 1550s onward, France enjoyed a physical presence in the middle of

duc lands, and exerted increasing pressure upon the dukes.

Despite the arrival of the French, the next seventy-five years saw relative peace and prosperity for Lorraine. Lorraine's larger neighbors left the duchy alone because of their own internal crises. Close personal connections to France marked the reigns of Dukes Charles III (ruled 1545–1608) and his son Henry II (ruled 1608–1624). Lorraine elites, such as the Guise family, moved easily into positions of power within France. The period witnessed an artistic flowering, producing artists like Jacques Callot and Georges de la Tour. Because of its brilliance in comparison with what followed, the period has been called "Lorraine's renaissance."

Rebirth turned into chaos with the ascension of Charles IV (ruled 1624–1675) to the ducal throne. A strident Catholic like many of his countrymen, and more a warrior than a statesman, Charles actively opposed Cardinal Richelieu's pro-Protestant policies during the Thirty Years' War (1618–1648). This stance resulted in French occupation of Lorraine and ducal exile. Excepting the 1660s, French occupation lasted from 1634 until 1697. The dukes became imperial generals, fighting the French and the Ottoman Turks. Their greatest moment came in 1683, when Charles V (ruled 1675–1690) successfully defended Vienna against the Ottomans. Lorraine itself suffered terribly during these years. In addition to the horrors of military occupation, there was an epidemic of plague in 1635. As a consequence of these disasters, Lorraine lost nearly half of its prewar population.

In 1697, Louis XIV of France (1643–1715) restored Lorraine to its ruling dynasty. Upon his return, Duke Leopold I (ruled 1690–1729) found that although his lands were devastated, his personal power had been increased. Traditional limitations on ducal power had been eliminated; war and occupation had decimated Lorraine's elites, and the French had destroyed institutions that previously limited sovereign power. Although Leopold's predecessors had aspired to absolutism, he was able to institute it to a great extent and used his power to forward a program of internal reconstruction. Externally, he attempted to maintain good relations with both France and the Holy Roman Empire,

attaining recognition of Lorraine's neutrality in the 1720s.

However, less than a decade after Leopold's death in 1729, the duchy lost its independence. In 1731 Duke Francis III (ruled 1729–1737) married Maria Theresa of Austria, the heiress to the Holy Roman Empire. The French viewed this marriage as a threat because of the potential reunion of Lorraine with the empire. After lengthy negotiations, Francis agreed in 1737 to give Lorraine to Louis XV's father-in-law Stanislaus Leszczyński, the deposed king of Poland, effectively ending Lorraine's independence. Francis attained the imperial crown in 1745. Stanislaus ruled until his death in 1766, after which the duchy was incorporated into France. Interested more in Enlightenment culture than politics, he let a French chancellor run Lorraine and concentrated upon patronizing the arts and sciences and the founding of charitable institutions. In the process, Stanislaus became extremely popular and effectively prepared Lorraine for the transition from independent state to French province.

LOTTERY. Although lotteries had been utilized as a means of redistributing goods and wealth since Roman times, they began to develop on a large scale in fifteenth-century Europe, where they were used by governments as a means of raising revenue. The first recorded lottery was held in 1420 in Burgundy, with the proceeds going toward the fortification of the town. The state of Germany established a national lottery in 1521; between 1520 and 1539, the French *loterie*, created by Francis I, enriched some individuals as well as the nation; and Florence's *La Lotto de Firenze* was the first public lottery to pay money for prizes in 1528. In Britain, Queen Elizabeth I chartered a general lot-

tery in 1569 to raise money for the building of harbors and other good works, and in 1612, its role was extended when the money it raised enabled the Virginia Company to establish the New World colony of Jamestown. Such funds were a lifeline to the struggling company and accounted for half its annual income by 1621. The utility of lotteries to emergent nation-states, most of which struggled to have sufficient revenues, was immense, and from the fifteenth century on, lotteries were enthusiastically exploited by the monarchs and politicians of Europe. These institutions played a crucial role in the creation of young states' domestic and foreign policy, raising funds for public projects as well as financing their imperial adventures abroad.

Lotteries were also hugely popular throughout the population, although motivation to participate varied according to social position. While the poor were attracted by the chance of huge prizes for relatively small stakes, the wealthy regarded lotteries as a means of demonstrating patriotism and supporting the national cause by purchasing tickets.

However, like other forms of gambling, the position of lotteries became increasingly tenuous throughout the seventeenth century. Although attractive as a way of generating revenue, they were also regarded with suspicion by those who thought them antithetical to the Protestant work ethic. At the same time, practical problems involved in the running of lotteries began to emerge. Private operators intervened in drawings, buying tickets in bulk for excessive markups, and also offering side bets, or "insurance," on the main lottery—practices that the state did not derive revenue from. Allegations of fraud and dishonesty were rife, and criticism that lotteries encouraged mass gambling, idleness, and greed in the populace increased.

On top of this, by the late seventeenth century, with the increasing development of their economic infrastructures and tax bases, the economic utility of lotteries to governments began to decline. Accordingly, legislation was drafted that began to limit participation in lotteries—at least for the poor. In 1710, ticket prices in Britain were increased to an expensive £10, and, in 1721, private lotteries, which had been popular because of their smaller stakes, were banned. Although many continued to operate illegally, such moves effectively outlawed the lottery

for all but the wealthiest in society, destroying their popular base and ultimately demonstrating the patrician nature of legislation that had from the start been driven by political and economic expediency.

LOUIS XII (FRANCE) (born 1462–1515; ruled 1498–1515), king of France. The only son of Charles of Orléans and Mary of Cleves, Louis was the great-grandson of Charles VI (ruled 1380–1422). As a youth, Louis did not expect to gain the throne since he was several degrees of blood distant from the ruling family. Louis XI (ruled 1461–1483) coerced him into marrying his deformed daughter Jeanne, who was probably incapable of bearing children. He spent his early adulthood seeking an annulment for the marriage. When Louis XI's son became Charles VIII in 1483, Louis competed with Charles's older sister Anne of Beaujeu to become regent for the underage king. His purpose was largely to gain a position of authority from which to secure an annulment. When the Estates-General of 1484 refused him the office, he led the "Fools' War" against the monarchy. Defeated at the Battle of St-Aubin in Brittany in 1488, he was imprisoned for three years. He was released in time to join Charles in the first French invasion of Italy (1494), to make good the French claim to the kingdom of Naples.

Because Charles's only child died at age three, Louis gained the throne when Charles died in April 1498. Those who had opposed him in the Fools' War were fearful that he would exact revenge on them now that he was king, but Louis soothed them with his famous remark: "It is not honorable for the king of France to avenge the quarrels of a duke of Orléans." After loading Pope Alexander VI's (reigned 1492–1503) son Cesare Borgia with

French titles and gold, he received an annulment from Jeanne of France and married Charles's widow, Anne of Brittany, in January 1499. With her he had two daughters, Claude and Renée. Theologians of the University of Paris bitterly criticized the annulment, and when it led to unrest among the students, Louis cracked down on the university in 1499 and severely reduced its autonomy.

Louis had a claim to the duchy of Milan through his grandmother Valentina Visconti, and he sought to make good his Italian rights in the second French invasion of Italy (1499). Concentrating on winning Milan, which he achieved in 1500, he agreed to divide Naples with Ferdinand of Aragon (ruled 1468–1516), but Ferdinand expelled the French from the entire realm in 1503. For the next several years France was largely at peace. Louis dramatically reduced taxes, which, along with the era's broad prosperity, prompted the Estates-General to name him "Father of the People" in 1506. Louis's most prominent advisor was Cardinal Georges d'Amboise, whose influence and place in government were so vast that the saying "Let George do it!" is said to have referred to d'Amboise.

Although his tastes still were largely those of the Middle Ages, Louis took an interest in Renaissance culture, which he saw on several trips to Italy. He patronized the Italian humanists Lescaris and Aleandro, who taught Greek in France, and supported the classicist advocate and humanist Guillaume Budé at the beginning of his career. In 1499 Louis brought Italian architects and artists to France to rebuild the château of Blois, although the principal architect was probably the French mason Colin de Briart. The rebuilt château introduced the concept that a king need not live in a gloomy, fortified stronghold but in a beautiful place with open spaces and pleasant gardens for gracious living.

Louis allowed Pope Julius II (reigned 1503–1513) to persuade him to join an anti-Venetian league, bringing him back into the thick of Italian politics. After defeating the Venetians at Agnadello in May 1509, he found that Julius had organized a league to drive him out of Italy. Louis attempted to counter Julius by convoking the schismatic Council of Pisa in 1511, but it drew only four cardinals and a

few French bishops. After Louis's nephew Gaston de Foix defeated the papal-Spanish army at Ravenna in March 1512, the cardinals at Pisa declared Julius deposed and convoked the college of cardinals to elect a successor. De Foix's death prevented the French army from marching on Rome to effect Julius's deposition. The pope excommunicated Louis and promised parts of France to the Swiss, Aragón, England, and the Holy Roman Empire, which had joined his alliance. Ferdinand of Aragón seized southern Navarre, and Henry VIII invaded northern France. The French army retreated back to France, leaving Milan to the Swiss. The death of Julius in 1513 allowed Louis to make peace with the new pope, the Medici Leo X (reigned 1513–1521). When Anne died in January 1514, he secured peace with Henry VIII by marrying his sister Mary. The excitement of the wedding and his young bride probably hastened his death on 1 January 1515. His first cousin, Francis of Angoulême, who had married his daughter Claude in 1514, succeeded him as Francis I.

LOUIS XIII (FRANCE) (1601–1643; ruled 1610–1643), king of France. The historical reputation of Louis XIII has been overshadowed by two figures close to him—his chief minister, Cardinal Richelieu (1585–1642), and his son and successor, Louis XIV (ruled 1643–1715). Cardinal Richelieu stands as the personification of seventeenth-century statecraft, and his steely brilliance is generally credited for bringing France from its sorry state following the Wars of Religion to the verge of greatness. And history has enshrined Louis XIV as the

French king par excellence, the very embodiment of royalty in all its grandeur and power. In comparison, the stammering Louis XIII—sickly, dependent on a series of favorites, beleaguered by a quarrelsome family and a factious court—seems a ruler of diminished stature indeed. This second of the Bourbon kings, however, deserves a more exalted place in history, if only because his reign witnessed the decisive consolidation of monarchical power and France's rise to European prominence.

RISE TO POWER

Louis's reign formally began upon the assassination of his father Henry IV (ruled 1589–1610) in 1610, but the government remained in the hands of his mother, Marie de Médicis (1573–1642), who ruled as regent until 1617. The regency was a turbulent time, marred by noble conspiracies and revolts, the ascendancy of Concino Concini, Marie's Italian favorite, over the court, and the calling of the Estates-General in 1614. In 1617 Louis took power in a veritable coup d'état that ended with the ignominious execution of Concini and his wife. Historians looking to credit Louis with more initiative and political savvy than he is usually accorded have pointed to this decisive act by a fifteen-year-old. And in general it should be noted that Louis faced a series of daunting challenges, both at home and abroad, including near-permanent opposition, often rebellion, from his mother and brother and the growing crisis of the Thirty Years' War (1618–1648), while still a teenager and a young man in his twenties.

LOUIS AND RICHELIEU

The coup d'état of 1617 was the first in a series of acts that served as turning points in Louis's reign, demonstrating his deep and precocious appreciation of the craft of kingship. In fact, despite his sometime obsessive predilection for the hunt, Louis was, like his son, a dutiful ruler, fully cognizant of the demands of his position. His initiative was next displayed in 1624, when he appointed Richelieu to the royal council. This was a move fraught with potential difficulties, for Richelieu was his mother's man, a figure of formidable and widely recognized talents yet still identified with the *dévot* ('devout') position that saw alliance with the Habsburgs as France's proper course. The choice, however, turned out to be a brilliant stroke of talent spotting. Richelieu

brought discipline, intellectual rigor, and an enormous capacity for work to the royal cabinet. He also made himself a student of Louis's personality, taking pains to learn how to balance the delicate task of both coaxing and respecting his king's will. Together they managed to concentrate royal power in a partnership that many great noblemen and especially the queen mother and the king's brother Gaston (duc d'Orléans; 1608–1660) deeply resented. But it was a partnership that soon bore fruit in the successful siege of the Huguenot stronghold La Rochelle in 1627–1628, which not only demonstrated the royal resolve in the face of a Calvinist threat but also freed France to pursue an anti-Habsburg policy in Europe.

Despite the success of La Rochelle, the partnership of Louis and Richelieu and the foreign policy course they had set upon nearly foundered the following year. The so-called Day of Dupes was another crisis that illustrated Louis's ability to act on his own. On the night of 10–11 November 1630 the queen mother demanded that Louis dismiss his minister, a move that would have altered both the king's authority and France's European alignments. To everyone's surprise, including Marie's, the king

chose to keep Richelieu as his chief minister. Soon Marie de Médicis was in exile in Brussels, not to return to the realm for the rest of her life. Louis and Richelieu were free to pursue their anti-Habsburg foreign policy. In 1635 France formally entered the Thirty Years' War.

Even before that, Louis was preoccupied with martial matters. He had to face down a series of revolts, rebellions, and conspiracies—from his mother, brother, great noblemen like Henry II de Montmorency, Huguenots, peasants, and even court favorites. Backed by Richelieu, he responded in most cases with what many considered as shocking severity: his reign was the most costly in terms of noble heads lost to the executioner's axe. The notorious duelist François-Henri de Montmorency-Bouteville ended up on the block in 1627, as did his rebellious cousin Henri II de Montmorency in 1632, despite their family's long history of royal service, their personal popularity and charm, and the pleas for clemency from the highest ranks of society. Louis's last favorite, Henri Coeffier-Ruzé d'Effiat, marquis de Cinq-Mars, along with his supposed coconspirator François-Auguste de Thou, also died on the scaffold in 1642 for plotting with the Spanish. In war Louis displayed the same resolve. Well before France's formal entry into the Thirty Years' War, he engaged the Spanish and Habsburgs on several fronts, especially in northern Italy. He saw himself as a warrior-king, frequently exposing himself to great danger by personally leading his armies into battle.

Louis's martial bent contrasted with other aspects of his personality. He was constantly ill and several times at death's door. He abhorred ceremony and indeed cut a poor figure in public. He suffered from neglect, even abuse, as a child and received a poor education at court. (His childhood and youth were documented in extraordinary detail in a journal kept by his personal physician Jean Héroard, providing a remarkable, unequaled view of the upbringing of an early modern ruler.) Unlike his mother and Richelieu, Louis displayed little interest in the arts outside of the dance. He was a sincere Catholic, modeling himself on his saintly predecessor Louis IX (ruled 1226–1270), and in 1638 he placed himself under the personal protection of the Virgin. His marriage to Anne of Austria in 1615 took four years to consummate, and their

married life was marked by long periods of estrangement. Louis, however, seems to have remained faithful to his wife, despite a series of attachments to male and female courtiers alike. The birth of the dauphin in 1638, after years of inactivity in the marriage bed, was considered a minor miracle. Only five years later—and a year after the death of his cardinal-minister—Louis died at the age of forty-two. His legacy was a mixed one: on the one hand, a stronger France and a refurbished monarchy; on the other, deepening involvement in a costly European war that only fueled discontent at home.

LOUIS XIV (FRANCE) (1638–1715; ruled 1643–1715), king of France. Hailed as *le Dieu-donné*, ‘the God-given’, Louis XIV was the first child of Louis XIII (1601–1643) and Anne of Austria (1601–1661), born twenty-three years into their marriage.

THE EARLY YEARS (1638–1661)

Ascending the throne at the age of four, Louis XIV was educated under the tutelage of his godfather and chief minister, Jules Cardinal Mazarin (1602–1661), and under the day-to-day watch of his governor, Nicolas de Neufville, first marshal-duke de Villeroy (1644–1730). The young king received not a scholarly education in the classics, but a practical education in history, diplomacy, war, and the arts, while his preceptor Hardouin de Péréfixe guided his spiritual development under the direction of the Queen Mother Anne, imbuing in Louis a distaste for heterodoxy, and associated disorder, of any kind. His formative experiences came during the Fronde (1648–1653), when he was directly awakened to the potential instability lurking in the

kingdom as other forces sought to share in the crown's sovereign powers and remove Mazarin from the government and the kingdom. The events of these years, and Louis's exposure to the wider social and economic problems of France during his military progresses, taught him to mistrust the ambitions of peers and of senior princes of the blood and bred an awareness in him of the need for far tighter regulation of the leading institutions of the kingdom. The declaration of the young king's majority, two days after his thirteenth birthday on 7 September 1651, produced some rallying of support for the crown. But it was not until 1654, the year of the coronation (7 June), that the government reestablished military control over France. For the rest of the 1650s Mazarin led the government, while Henri de La Tour d'Auvergne, marshal-vicomte de Turenne (1611–1675), trained the king in the art of war. In these years Mazarin did not involve Louis in the details of administration but did seek to keep him informed of developments, particularly on diplomatic and strategic issues, while encouraging him to establish his chivalric leadership of the kingdom.

THE REFORM OF GOVERNMENT AND FINANCES

By the time of Mazarin's death on 9 March 1661, Louis XIV had already shown himself to be an astute military commander, a skill that he would retain all the way up to his last personal campaign in 1693. He was also regarded as an excellent horseman, a noted conversationalist with an extraordinary memory for people, and, in the cultural sphere, a good musician and one of the very best dancers at court. Furthermore, he had been married to the Infanta Marie-Thérèse of Spain since June 1660 as part of the peace settlement of the Pyrenees, and she was now one month pregnant with the future dauphin (1661–1711). But Louis had little experience of governing, and it was expected that Mazarin would be succeeded as minister-favorite, most probably by Michel Le Tellier (1603–1685). What nobody anticipated was Louis's decision to assume control of the reins of government himself and his determination to maintain a grip on affairs (albeit a fluctuating grip) for the rest of his reign. Between March and September 1661 there was a minor revolution in French government during which the person of the king assumed center stage: the inner council (*conseil d'en haut*) was reduced in size to include only a handful of senior ministers whose advice was given candidly and accepted with almost perennial good grace. After the fall of Nicolas Fouquet (1615–1680), the *surintendant* of finances, there was greater transparency in financial transactions, with the king reserving to himself the right to approve every financial decision of the central government, even if successive controllers general of finance continued to dominate financial business.

Louis XIV did not favor major overhauls of the system of government that would unsettle the kingdom, but he was willing to entertain considerable administrative reforms insofar as they diminished disorder, encouraged stability, and enhanced his own regal power. Indeed, it is fair to say that some very dramatic changes occurred during his reign not through any increase in state bureaucracy but through changes in regulations and financial arrangements. Using the provincial intendants as a tool for preventing abuses and malpractice by the venal officeholders, Jean-Baptiste Colbert (1619–1683), as senior intendant of finances from September 1661 and then controller general from 1665 until his death in 1683, managed to bring the cha-

otic fiscal system of taxation and borrowing to its optimum efficacy. However, when the demands of war grew in the 1690s and 1700s and net revenue as a proportion of gross revenue declined once again to the dismal levels of the 1640s, two major reforms had to be introduced that did challenge the social basis of the country, undermining the entire system of lay privileged exemption from direct taxation. In 1695–1698 the capitation imposed a graduated poll tax upon all French subjects from the dauphin down, and this was reintroduced permanently in 1701. And then in 1710 the *dixième*, a tax of one-tenth of personal income regardless of status, was brought in, lasting until 1721.

THE ARMED FORCES

In spite of setbacks in the 1700s, the reforms of finance in an era of economic stagnation enabled the crown to sustain stronger and larger armed forces than ever before during Louis XIV's "personal rule." France had almost no navy to speak of in 1661 (ten warships and twelve frigates), but Colbert was immediately given the task of working with the grand master of navigation, the duke de Beaufort, to increase the number of vessels; and by the end of 1663 he had brought the galley fleet in the Mediterranean within his own orbit. The great leap forward in the size of the fleet and in administrative and port infrastructure came in the years 1669 to 1673, and in spite of the belief that Louis XIV lacked personal interest in the navy, he gave considerable support both to Colbert and then his son Seignelay in their efforts to create and maintain by 1689 the largest battle fleet in Europe. Only during the final years of the War of the League of Augsburg (1688–1697) after 1695, and during the War of the Spanish Succession (1701–1714) after 1705, did it prove impossible to sustain such a navy. The crown was consequently forced to rely much more on privateering at sea.

Louis took a far stronger interest in the reforms of the army. With the king's close involvement, Michel Le Tellier and particularly his son, the marquis de Louvois, gradually overhauled a highly complex system of regulations and financial structures to equip France with an army that, by 1693, stood at around 330,000 men. Their sheer attention to detail prevented on occasion what would otherwise have been a series of logistical breakdowns. That the

extreme difficulties of the War of the Spanish Succession did not produce a military collapse can be attributed to the earlier structural and administrative reforms that had transformed the ramshackle forces of Louis's minority into, for all its defects, the most admired and feared army on the Continent.

FOREIGN POLICY

The developing army and navy of France were there essentially to enhance the interests of the Bourbon dynasty internationally, and French foreign policy was very much the king's own, albeit based on advice from his inner ministers. Throughout his reign Louis XIV aimed at securing for himself the most senior status among European princes in an age when the concept of an equality of sovereign states did not exist, and when most rulers pushed claims that others found outrageous at one time or another. In the first part of the "personal rule," between 1661 and 1674, Louis pursued a foreign policy of single-minded vainglory in a determined effort to facilitate further dismemberment of the Spanish Habsburg empire and, after 1668, reduce the United Provinces of the Netherlands to humble submission. But the failure to conquer the United Provinces, the entry of Emperor Leopold I (ruled 1658–1705) into the Dutch War in August 1673, a difficult winter in the Rhineland, and the subsequent French retreat into the southern Netherlands seems to have been a sobering experience for Louis, who after 1673–1674 sought to consolidate and strengthen his hold in and around Alsace while rebuilding and constructing anew a chain of fortifications on his northern and northeastern frontiers to defend against invasion. Such apparently defensive concerns were, however, not satisfied by the Treaty of Nijmegen in 1678, precipitating Louis over the following six years into highly aggressive seizures of strategically vital territory based on dubious legal title—the *réunions*—that antagonized German princes and drove them to seek support against France from the imperial Habsburg court in Vienna.

The growing influence of the Austrian Habsburgs within the Holy Roman Empire, both in Germany and northern Italy, in turn compelled Louis to engage from the early 1680s in heavy-handed political manipulation at smaller European courts to secure Bourbon influence and indirectly to protect the

gains he had made and the status he now enjoyed as head of Europe's leading dynasty. Failing to entrench his territorial gains in the brief War of the Réunions (1683–1684), Louis, encouraged by Louvois, became increasingly anxious about growing Habsburg strength. In a desperate attempt to secure greater security for Alsace, in September 1688 Louis seized the key Rhine fortress of Philippsburg in the hope that this would force the empire to negotiate a definitive settlement of Rhineland territorial issues. Instead it precipitated the greatest conflict of the reign thus far. Having subsequently forced the Dutch Republic, Spain, and Great Britain also to declare war upon him between November 1688 and May 1689, Louis's insensitive attack on the interests of the duke of Savoy, Victor Amadeus II, a year later earned him another theater of operations he could ill afford. The pressure of the war by June 1693 forced Louis, under the influence of increasingly moderate and chastened advisors, to abandon his excessive demands and to consider returning most of the *réunion* territories to their owners; to negotiate with William III about his succession in Great Britain after the Glorious Revolution; and to make huge concessions to Savoy in order to neutralize Italy. Even so, over three more years of demanding and exhausting war were required, in the context of a catastrophic famine that pushed the French population down by perhaps 10 percent, before Savoy could be bought off in the Treaty of Turin (June 1696) and a general peace signed with France's other enemies at Ryswick (September and October 1697).

All this left France ill equipped to deal with the looming issue of the Spanish succession, as the ailing Charles II moved toward his death in November 1700. To try to avert war, Louis XIV and William III signed two successive partition treaties for the Spanish empire in October 1698 and March 1700, but Charles II himself wanted instead to maintain the unity of his territories, so the dying Spanish king willed them all to the one power that might be able to hold them together: France, in the person of Philippe, duke d'Anjou, second grandson of Louis XIV. A conflict with the Austrian Habsburgs was inevitable, but the decisions to seize fortresses in the Spanish Netherlands and exclude the British from the lucrative Spanish slave trade in the early spring of 1701 ensured that any war would once again

include Britain and the United Provinces among the anti-French belligerents. France was pushed out of southern Germany and lost her Bavarian ally in 1704, and Philip V of Spain faced allied campaigning on the Iberian mainland from that year on. The Bourbons were expelled from northern Italy and Naples in 1706–1707 and from the southern Netherlands in 1708, while in 1709–1710 another somewhat less disastrous but still severe famine struck France. But the tide turned in 1710–1711 with Bourbon successes in Spain, and with changes of regime in Britain and Austria that affected the geostrategic considerations of the various powers. The War of the Spanish Succession consequently ended in 1713–1714 with France securing Spain itself and her overseas colonies for Philip V, while the Austrians received most of the rest of the Spanish European possessions, and Savoy was temporarily awarded Sicily.

Territorially, France emerged considerably larger and more secure from Louis XIV's reign, acquiring most notably Roussillon (1659), Franche-Comté (1674), and Alsace (1648 and 1678), as well as establishing serious colonies and trading posts in the Americas and western Africa. It is true that Louis XIV's foreign policies had brought hundreds of thousands of deaths, but this cannot be put down to a callous disregard for the fate of his own or foreign subjects. In fact, Louis was genuinely anxious to minimize casualties in warfare. But he was the most assertive and best-resourced individual in an international and cultural system that had an inbuilt tendency to resolve differences through arms, and in which its sovereign players could not afford to show too much understanding for the legitimate economic or dynastic interests of their rivals.

THE REGULATION OF A STATUS-BASED SOCIETY

A similar problem afflicted domestic state management during the mid- to late-seventeenth century. The rivalries of families and the personal ambitions of individuals, articulated in social and legal terms at all levels of the propertied hierarchy, militated against an easy resolution of disputes. Colbert's determined campaign in the 1660s to emphasize that all privileges and rights stemmed from the will of the king (and could be just as easily revoked) certainly helped to encourage a sense of strong royal author-

ity in the legal sphere. This was aided by the 1665 *Grands Jours* investigations into lawless nobles and bandits in the Auvergne in tandem with the Parlement of Paris, and it was carried forward after 1679 by repeated edicts against dueling and in favor of litigation before royal officials to settle disputes. But Louis XIV had come to realize full well by 1661 that the instability of France was rooted primarily in her political culture. The Fronde was not the last gasp of a feudal noble class but a struggle for political and military precedence within the upper noble elites who, in the context of a breakdown in state finances during a royal minority, had no other choice but to assert their own status claims—backed up, if necessary, by military force.

Removing the exposed figure of a chief minister after 1661 was but a partial solution to the difficulties. Louis remained well aware that his ministers had their own private interests to further, and this was as much the case with court appointments, or military commands, as it was with architectural projects, so the active balancing of ministers and great nobility required considerable effort that this king was prepared to make. Far more likely to entrench political quiescence in the long run was a remodeling of the system of patronage and clientage and a concerted effort to break the automatic link between service and expectation of reward. Even if he still relied on other people's recommendations, by 1672 Louis insisted that virtually all military, naval, and ecclesiastical commissions come from his own person. Furthermore, by maintaining multiple channels of access to his person at court for different groups, families, and individuals, he ensured that no one faction or person (including ministers) could dominate his decisions over patronage. On top of this, he expanded the amount of largesse, both monetary and honorific, disbursed by the crown, while widening the pool of potential recipients. All this contributed to a serious dilution of the patronage power of individual grandees. With the partial exception of his own brother Orléans, for the most part the dukes, peers, and senior military officers now became patronage brokers for the crown rather than direct providers of opportunities for the lesser nobility. Always concerned for the future of the monarchy, Louis allied this policy of supervising patronage distribution with closely managing the upbringing of his offspring and descendants to an

extreme extent in controlling their households. And if he made extensive military use of illegitimate princes (of his own body and those of his ancestors), he was loath to trust the erstwhile Frondeur branches of the Bourbon, the Condé and Conti, whose interests he encouraged only so far as was commensurate with the interests of the wider Bourbon dynasty. The aim in all this was to prevent another Fronde from ever happening again. Only at the very end of the reign, in 1714, when he had lost his son, two of his three grandsons (the dukes of Burgundy and Berry), and one of his great-grandsons to smallpox, did Louis XIV depart from the established dynastic rules when he wrote the bastard lines of the House of France into the succession. Although there was some sense in trying to avoid future succession wars by laying down an order of precedence in the event of the disappearance of all the legitimate Bourbon branches, this was bitterly resented by the great nobility and was overturned by the regent Philippe II, duc d'Orléans, in 1717.

HIGH CULTURE AND THE ARTS

The royal urge to preserve and impose order in the political field was also manifested in the arena of high culture. The growing presence of royal patronage in the arts and sciences after 1661 is better attributed to Colbert than the king himself, with the most notable advances being the foundation of the Academy of Inscriptions and Belle-Lettres in 1663 and the reform of the Academy of Painting and Sculpture the same year, followed by the foundation of the Academy of Sciences in 1666, and three years later that of the Royal Academy of Music. Moreover, between 1667 and 1672 Colbert oversaw the building of the Paris Observatory. Yet, if Colbert was the driving instrument who encouraged intellectuals and artists to view the crown as the foremost patron, it was Louis who set the tone and the taste and was the leading collector of objets d'art of his age. The king also took a very close interest in architectural projects, in particular the transformation of Versailles after 1669 from a relatively small hunting retreat to the largest palace complex in Europe by the mid-1680s. By and large Louis favored the classical over the baroque, in sculpture, architecture, and garden design, and in spite of the growing vogue for portraits of all manner of people, the king himself set great store by religious art.

RELIGION AND PUBLIC MORALITY

Louis XIV's preference for religious art was hardly surprising, for he was a devout Catholic, in spite of his several mistresses (most notably Louise de La Vallière [1644–1710] and Françoise, marquise de Montespan [1641–1707]) and the numerous bastards he fathered before 1680. Louis was sincere about protecting his subjects' souls and throughout his reign encouraged charitable giving. In 1693–1694, at the height of the famine, Pontchartrain, the controller general of finance, was ordered to organize grain imports from abroad and facilitate food transport within the country on a scale never previously attempted by France. But Louis was not just a charitable Christian prince. He was also instinctively hostile to anything that smacked of the heterodox, in particular Jansenism, which, under strong Jesuit influence, he equated with rebellion. By the early 1680s the king's increasingly devout attitude to personal morality and worship, encouraged by his second wife, Françoise d'Aubigné, marquise de Maintenon (1635–1719), whom he married in 1683, had become allied to his fear of religious disorder as manifested by Jansenism and the Huguenots. This combination of attitudes flowed together with a desire to live up to his title of "Eldest Son of the Church" at a time when Emperor Leopold I was pushing the Turks back in the Balkans and when relations between France and the papacy were in tatters over the *régale* dispute (when Louis extended the royal right to gather the revenues of vacant episcopal sees to areas of the kingdom that had previously been immune). Despite attempts by Colbert and Louvois to restrain persecution of Protestants by some intendants, Louis became increasingly convinced that forced conversions were effectual, an approach that culminated in the Edict of Fontainebleau in September 1685, which revoked all rights for Huguenots. Even when it became clear to ministers and generals by 1689 that this revocation had created a potentially dangerous fifth column inside France (which erupted in the vicious revolt of the Camisards in 1702–1705), the king's religious conscience would not allow him to restore Huguenot rights. Thus far, Louis XIV's religious policies were coherently Catholic and Gallican, zealous in defense of the temporal independence of the French church from Rome. But the repair of relations with the papacy in the 1690s, plus the resurfacing of the Jansenist controversy after

1703, pushed him into accepting ultramontane, pro-papal positions held by the Sorbonne. Eventually he solicited and accepted the 1713 papal bull *Unigenitus*, which condemned Jansenism but simultaneously mounted a full-scale attack on Gallican liberties, a move that did immense long-term damage to the Bourbon monarchy's image as the defender of France and French interests.

If order could be consciously pursued through state policies, Louis XIV was nevertheless also the beneficiary of changing attitudes to social and political life in the mid-seventeenth century, and in particular a growing distaste for personal violence. The need to display *honnête* behavior was not merely restricted to domestic social situations, but applied equally to public social behavior. The need for restraint, politeness, and self-discipline in deportment as well as language was emerging as the cornerstone of an ethical order to which one simply had to subscribe if one wished to remain a sociable being. What is more, the disorderly and chaotic Fronde, erupting just as such ideals were entering French cultural life, had the effect of reinforcing enthusiasm for obedience and decorum in both the social and the political fields. Louis XIV personally encouraged stronger discipline and self-control at court, in his armies and fleets, and in the church, so that such nostrums percolated through noble society and contributed to growing domestic stability in this period.

CONCLUSION

Throughout his reign, Louis XIV had placed the Bourbon dynasty, the Catholic faith, and the royal court at the center of his existence, and he had been highly mindful of the interests and outlooks of his propertied subjects. Nevertheless, compromise and cooperation had its limits, and it would be a misleading oversimplification to see this as a monarchy engaged in the revivification of feudalism in conjunction with a landed noble "class." In the first instance, the French nobility was in no sense a coherent class, and society as a whole was pervaded by myriad corporate and familial loyalties and interests. Moreover, for all the king's skill in trying to harmonize his own interests with those of his propertied subjects, Louis's reign was marked with a highly authoritarian stamp that pressed the imposition of firmer discipline in the armed forces, the curtailment of judicial inde-

pendence and privileges, and a demand for religious conformity and subordination that aroused hostility across Europe. On his death, on 1 September 1715, Louis XIV left a kingdom in an unprecedented state of domestic tranquillity that was to last throughout the regency for his five-year-old great-grandson, Louis XV; this can in large part be attributed to firm royal control of the military, more sophisticated poor relief strategies, and a general ethos of political obedience. But the destabilization of the credit markets wrought by the previous thirty years of unprecedented military mobilization, the unresolved issue of tax privileges, the example of baroque kingship that Louis XIV brought to its apogee as a model for rule, and the legacy of Jansenism were to bedevil his successors' governments for the rest of the eighteenth century.

GUY ROWLANDS

LOUIS XV (FRANCE) (1710–1774; ruled 1715–1774), king of France. Louis, duc d'Anjou, was the second surviving son of Louis, duke of Burgundy, and Marie-Adélaïde, daughter of Duke Victor-Amadeus II of Savoy, and great-grandson of Louis XIV (ruled 1643–1715). When Louis XIV's eldest son Louis (the Grand Dauphin) died in 1711, the little duc d'Anjou's father became heir to the throne. But less than a year later his father, mother, and elder brother were killed by smallpox, leaving him the sole direct descendant and heir to the old

Sun King. During Louis's boyhood, France was ruled in practice by his distant cousin the regent, Philippe, duke of Orléans, even after the boy came officially of age in 1723. When Orléans died unexpectedly later that year, the unpopular duke of Bourbon took over as principal minister, to be succeeded by Louis's tutor, Cardinal André Hercule de Fleury, in 1726. Louis can hardly be said to have been in command during the turbulent first decade of his reign, which was marked by two bankruptcies and the dizzying stock-market and currency bubble of John Law, but his strong loyalty and affection for his tutor were the reasons the cardinal got power and kept it for so long. Louis only began to take a significant independent role in the early 1740s, when he was already in his thirties, at which time he became known as *le bien-aimé*, 'the well-beloved'.

Fleury had taken over as tutor when Louis was six years old, and he supervised the king's education by a splendid team of instructors, including some of the most learned men of letters, scientists, and mathematicians of the day. The king developed a special interest in geography, the natural sciences, and medicine, which he kept all his life. For hobbies, he enjoyed learning to operate a printing press and a lathe. Hunting was his first obsession; women came later. From the age of ten, Louis sat on the Regency council, as his great-grandfather had prescribed in his will, and he seems to have taken an active interest in proceedings; Orléans and the successive prime ministers tutored him in the political issues of the day. But, deprived of parents from an early age, Louis was secretive and often incommunicative. These traits remained with him through his life. He could play the royal part, but he did not revel in public life like the Sun King, and he lacked his great-grandfather's self-confidence.

Overtaking an ephemeral engagement to the four-year-old daughter of Philip V of Spain, the duc de Bourbon persuaded Louis to marry Marie, the 22-year-old daughter of Stanislas Leszcynski, the ousted king of Poland. By 1737 the queen had borne Louis an heir, the Old Dauphin (father of Louis XVI), a second son who died in childhood, and eight daughters. Marie's social limitations and colorless personality eventually took their toll. In 1733, Louis began a series of affairs with the three aristocratic Nesle sisters, Madame de Mailly, Madame de Vintimille, and Madame de la Tournelle,

countess of Châteauroux. Then, around 1743, he began a more lasting liaison with Madame de Pompadour, the wife of a tax-farmer; the physical relationship ended by 1750, but she remained the official mistress until her death in 1764. Louis prized her because she understood him and could put him at ease. His more basic needs were taken care of by several dispensable young women whom she provided for the purpose, and then, after the death of the queen (1768), by a permanent relationship with Jeanne Bécu. Bécu, who became the comtesse du Barry (1743–1793), was said to be the most beautiful woman of the eighteenth century, but she had a dubious background. Madame de Pompadour is the only woman who played a significant political role in Louis's life, principally as dispenser of royal largesse and jobs, a task in which, unfortunately, she seldom excelled.

In foreign policy, Louis was successful until the Peace of Aix-la-Chapelle (1748), when his diplomats were unable to parlay military wins in the Low Countries into territorial gains. France played a reactive rather than active role in the Diplomatic Revolution of 1756, when she lost her Prussian ally and aligned with Austria, and in the start of the Seven Years' War on the Continent. There was little choice here, but the decision to commit further to the Austrian cause in 1757, when the effort should have been concentrated on the maritime war against Britain, was a choice—a bad one. France's disastrous losses at the Treaty of Paris of 1763 (Canada, most of India, etc.) are well known. Louis did not make the same mistake again in 1770, when he restrained his bellicose foreign secretary, Étienne François, the duke of Choiseul (1719–1785) from taking an unprepared country to war with Britain to defend Spanish rights in the Falkland Islands.

Domestic policy was to a large extent conditioned by these outcomes: the end of each war in this period caused a domestic crisis because the state had to raise new revenue or carry over some wartime taxes into peacetime, in order to retire unpaid war debts. In 1748–1749, controller general Jean-Baptiste de Machault d'Arnouville (1701–1794) attempted this with a vast reform program, including a new peacetime income tax, the *vingtième*, a package of laissez-faire economic reforms, the expansion of the money market, and attempts to limit "unproductive" church acquisition of land. This

program touched off violent conflicts with privileged groups, notably the church and the remaining provincial estates; the church and the parlements seized on the perceived weakness of the crown to fight their own wars over Jansenism and clerical control of lay society and crown control over taxation. As French rulers commonly did, Louis sought an equilibrium between the contending groups in society and within his own ministry, but through the 1740s and 1750s he came down on balance against the conservative forces to which Fleury had previously appealed—the church hierarchy, which was firmly anti-Jansenist, and the landed elites, who hated land taxes—and he tried hard to mollify the parlements, the Jansenists, and the men of letters. These tensions formed the background to a failed assassination attempt on the king in 1757 by Damiens, a domestic servant obsessed by the current religious quarrels. Louis stuck with his policy, however, going so far as to permit the suppression of the Jesuit order in 1764 and to appoint several leading members of the Parlement of Paris to ministries in order to neutralize the powerful court. After the defeat of 1763, the controllers general, Henri Léonard Jean-Baptiste Bertin (1720–1792) and Clément Charles François de Laverdy de Nizeret (1724–1793), resorted to a version of the 1749 program to solve the post-war financial crisis, but they did so in dire financial straits, without the confidence that a diplomatic victory would have inspired in the investing classes. The result was seven years of bankruptcy on the installment plan. Choiseul's position had been weakened by the death of his ally Madame de Pompadour in 1764 and his failure to quell the notorious Brittany Affair, an interminable quarrel between the Parlement of Brittany and the duc d'Aiguillon, the military commander in that province. So, in late 1770, when Choiseul pushed recklessly for war with Britain in defense of Spain's claim to the Falkland Islands, Louis dismissed him and allowed his chancellor, René Nicolas de Maupeou, to virtually destroy the parlements' powers of remonstrance and to restructure the judicial system, and his controller-general, Abbé Terray, to complete the partial bankruptcy that had begun in 1759. It was a total political reversal of the policy and personnel of the previous period. The reforms of 1770–1774 gave the monarchy a new lease on life but also created much antagonism; if Louis had lived longer, perhaps he would

have ridden out the storm, but he was suddenly carried off by smallpox on 10 May 1774. Louis XV was a ruler with considerable natural gifts who had to rule in difficult times; his choices in 1749 and again in 1770 showed the lucidity and the necessary ruthlessness that are the marks of a leader, but his belated start in personally ruling the country, his indolence, and the introversion he inherited from his lonely childhood prevented him from developing into a first-rate politician.

LOUIS XVI (FRANCE) (1754–1793; ruled 1774–1792), king of France. Louis-Auguste, duc de Berry was the second surviving son of the heir to the throne (dauphin) Louis-Ferdinand and his second wife, Marie-Thérèse-Antoinette-Raphaëlle, daughter of Augustus III, elector of Saxony and king of Poland. Louis's elder brother, the duc de Bourgogne, died in 1761, so when their father died in 1765, he became eldest male heir to his grandfather, Louis XV. Once thought a dull child, recent research has shown that he was a well-taught, reflective, and intelligent student, particularly interested in the sciences (mathematics, physics, geography) and history. He was raised and remained a convinced, but intellectually curious, Catholic; he had a taste for empirical facts, and brevity in expressing them, which, together with natural taciturnity and the secretiveness he inherited from his grandfather, often made him frustrating to work with. His political principles, which became settled in his adolescence, combined the moral politics of François de Salignac de La Mothe Fénelon with a firm belief in his traditional rights as an absolute king. In 1770, he married Marie-Antoinette, youngest daughter of Maria Theresa, the ruler of Austria, but it was not until 1776 that the marriage was consummated; Derek Beales has conclusively demonstrated that the delay was caused not by a physical impediment but rather by sexual ignorance, finally rectified by advice from the queen's brother, Emperor Jo-

seph II, who subsequently received heartfelt written thanks from the royal pair.

Louis's marriage had been designed to cement the alliance with Austria that had been concluded in 1756 and was supported by the dominant party at Louis XV's court, led by the duke of Choiseul and Madame de Pompadour. The young dauphin approved Louis XV's decision to drop Choiseul, as well as his reassertion of royal authority against the parlements in 1771, so when the old king died in 1774, it was thought that the new ruler would continue on this course. But, worried by his own youth and inexperience, he chose as close advisor and informal prime minister Jean Frédéric Phélypeaux, count of Maurepas, a veteran minister who had been disgraced in 1749 but was close to the royal family. Maurepas wanted to rebuild confidence in the monarchy, whose image had suffered from the coup of 1770–1771. He persuaded Louis to recall the old parlements, impose restrictions on their rights of judicial review of legislation through remonstrance, and choose a ministry that included the fashionable liberals Chrétien de Malesherbes and Anne Robert Jacques Turgot. The new ministry proved politically inept (for example, in their insistence on bringing back free trade in foodstuffs during the crisis year 1774–1775). Maurepas and Louis replaced them with a team that included, by late 1776, the Genevan banker and reputed financial wizard Jacques Necker as financial counsellor and the veteran diplomat Charles Gravier, the count of Vergennes, as foreign secretary.

Louis XVI, along with a large body of public opinion, enthusiastically supported France's alliance with the rebellious American colonists against Britain; he and Vergennes managed to keep the other European powers out of the conflict and avoid engagement on Austria's side in Joseph II's various adventures. The outcome in 1783 was diplomatic and military success: freedom of the seas and the restoration of France's position in Europe, although trade with the new republic did not develop as quickly as expected. Necker had hoped to finance the war on life-annuity loans serviced by economies and recovered revenue as earlier state loans were amortised, but the war went on too long, taxes had to be increased, and the usual flood of postwar claims on the government created a potential crisis. In the meantime, the political scene had changed.

During the reign, two principal factions fought for control within the ministry—the remains of Choiseul’s friends, grouped around Queen Marie-Antoinette and the Austrian alliance, and the so-called “king’s party,” which hankered after the methods of 1770–1774 and distrusted Austria. Maurepas successfully played them off against each other, but he died in 1781. Necker himself resigned that year.

Henceforward, Louis was more directly involved in politics, generally coming down on the side of the “king’s party,” represented in the ministry by Vergennes and Charles Alexandre de Calonne. Louis agreed with these two on the need for root-and-branch reform of the tax system to eliminate privilege and establish fiscal uniformity; with them he arranged to call an Assembly of Notables in 1787, to create a tide of public opinion to force these and other reforms through the Parlement of Paris. But Vergennes died just before the Notables met, leaving Louis and Calonne alone. They did not manage the assembly well, and

Calonne, whose reforms threatened them and their like through the country, got caught in a stock-market scandal, and had to be dismissed; he was replaced by Étienne Charles Loménie de Brienne, a partisan of Necker. John Hardman has argued that this constituted a turning point in Louis’s life, leading to prolonged bouts of depression, cynicism, and dependency that dogged his behavior thereafter. Brienne attempted to ram reforms somewhat similar to Calonne’s through the notables and, when that failed, through the Parlement of Paris; finally he tried to rule without them. But Louis was forced by a credit crisis to drop Brienne and bring back Necker in 1788, and, in 1789, to call the Estates-General.

Though willing to admit constitutional reform, Louis and Necker proved indecisive over the method of representation in the Estates, thus setting the stage for the successful refusal by the deputies of the Third Estate, when they met in Versailles in May 1789, to meet except as a National Assembly with one vote for each deputy. Louis’s instincts told him to go along with the Third Estate in the ensuing crisis, but, pressured by his advisors, he tried to slow or reverse the process of change. He put his wide-ranging reform plans, too late, to the *Séance Royale* (Royal Session) on 23 June as if nothing had happened. He consented to bring up troops to maintain order in Paris, but dismissed Necker, thus provoking the Parisian revolt in which the Bastille was stormed on 14 July; and he refused to withdraw from Versailles before the Parisian women and the national guard captured the royal family and forced them to return to Paris. Confined to the Tuileries, the king became in effect a prisoner and politically little more than a figurehead; he now secretly sent a message to his cousin Charles IV of Spain, disavowing any future actions he might take as being under duress. When matters settled down, however, he appears to have been willing to make an accommodation with the Revolution as long as the monarchy could play an active role in initiating legislation; Louis rightly refused to be a martyr to the diehard policies of the reactionary nobility, Marie-Antoinette, and his émigré brothers, the counts of Provence and Artois. That was the nub of his program in the Royal Session, and also of the manifesto he left behind when he fled eastward and was captured at Varennes with his family on 20–25

June 1791. The king seems to have viewed his flight not as a plan to invade France with the help of foreign troops, but as a demonstration of force to make the Constituent Assembly renegotiate his place in the monarchy. Forced to return, Louis made a deal with the assembly, who were frightened to dismiss him, fearing to open the way to a democratic republic. Basically, Louis intended to bide his time until the contradictions inherent in the new regime brought about its downfall, a policy of passive resistance well-suited to his character. He sanctioned the declaration of war against Austria and Prussia in April 1792, the better to demonstrate these contradictions. This strategy was clever—there was much royalist support in the country and even in Paris—but he never thought through how to translate it into constitutional change. In the meantime, popular militants in Paris and radical volunteers from the provincial National Guards stormed the Tuileries palace in a coup d'état on 10 August 1792, driving the royal family to take refuge in the Legislative Assembly. As in the crises of 1789, Louis once again drew back from using his troops in a way that would cause major bloodshed. The rump of the assembly, from which the moderate deputies had fled, convoked a new Constitutional Convention; the Convention proclaimed a democratic Republic on 22 September, put the king on trial, and found him guilty of “conspiracy against public freedom and attacks on general state security.” Louis died bravely on 21 January 1793.

LOUVOIS, FRANÇOIS LE TELLIER, MARQUIS DE (1641–1691), secretary of state for war under Louis XIV of France. Louvois was the third and eldest surviving son of Michel Le Tellier, who was intendant of the French army of Italy at the time of Louvois's birth, and subsequently became secretary of state for war between 1643 and 1677, and then chancellor of France until his death in 1685. Louvois was educated at the Jesuit-run Collège de Clermont in Paris, and was brought into the War Ministry by his father in 1658 to prepare him for eventual management of the king's armies. Louvois had already been guaranteed the succession to his father as secretary of state for war back in 1655, but had to wait until 1664 for his father to secure for him joint control of the War Ministry. He assumed sole control of its direction in 1677. In addition, Louvois picked up a number of other offices that he also held until his death, most notably superintendent general of the Post from 1668, and superintendent of Arts, Buildings, and Manufactures from 1683, on the death of Jean-Baptiste Colbert. These and other posts brought an

accumulation of responsibilities never to be exceeded by another secretary of state during the *ancien régime*. Indeed, by virtue of this set of responsibilities and through his allies, between 1683 and 1689 Louvois dominated government, though Louis XIV never allowed him to exercise a monopoly of patronage or to control access to his person.

Louvois's reputation rests upon his work as secretary of state for war, where he presided over a massive expansion of the peacetime standing army from around 55,000 men to 150,000, while even larger increases in the forces were generated during wartime. By the time of his death, the French army stood at around 300,000 men (allowing for inaccurate figures, fraud, and desertion). From the surviving documentation it is difficult to apportion credit accurately for the many improvements not only in the size of the army but also in its quality, as Louvois surrounded himself with a highly efficient group of administrators whom he had largely inherited from his father. But under Louvois's stewardship, complex financial and disciplinary rules evolved that made it far more worthwhile for the French nobility to enlist as army officers. By the 1680s the officers could sustain themselves in service for far longer than in the pre-1659 era, and collapses in morale and logistical support in the armies had become far less likely. Indeed, one of Louvois's greatest achievements was to establish more closely integrated systems for paying and feeding the expanding armies. Furthermore, he gave considerable support to the engineer Sébastien Le Prestre de Vauban's (1633–1707) fortification program to defend the frontiers, and many such fortresses became central to Louvois's logistical system.

In large part Louvois's success in equipping France with such a well-ordered army by contemporary standards can be attributed to his extraordinary grasp of the minutiae of military administration and to his remarkable stamina for business. In particular he paid unusual attention to the labyrinthine accounts of treasurers and entrepreneurs who supplied the logistical needs of the armies. He was also a strict disciplinarian who imprisoned two of his own sons, who were serving in the army, for insubordination, and he had a firm belief in the need to encourage godly behavior by officers. Louvois's power, however, also rested upon the support of the monarch. Louis XIV appreciated the need to inte-

grate the Le Tellier family into the court and the upper reaches of French society if they were to be able to deal successfully with the great nobility and the high command. Through promoting a succession of prestigious marriages from 1660, and by endowing Louvois's cousins and sons with offices in the royal household, Louis XIV gave the family social respectability. By the time of his death on 16 July 1691 from a heart attack, Louvois had succeeded in entrenching his family at the apex of French society, and for another ten years they also held on to the War Ministry: he was succeeded as secretary of state for war by his twenty-three-year-old third son, Louis-François-Marie, marquis de Barbezieux, whom he had been preparing for the role since November 1685.

Louvois was possibly the most divisive figure of Louis XIV's reign and still remains controversial, not least for presiding over the persecution of Protestants and the 1689 devastation of the Palatinate. He was highly partisan, driving good officers out of

service on grounds of divergent personal interests, and depriving people of the full exercise of their offices. His reputation for ill-mannered brusqueness, and even occasional insolence to the king, was well established. He also encouraged Louis XIV in the pursuit of an aggressive foreign policy and, fatally for the king, he personally found it difficult to appreciate the interests of other powers, especially German princes and the duke of Savoy. Moreover, Louvois had a relatively weak grasp of grand strategy, and his operational directions to commanders were sometimes sufficiently out of touch as to provoke open protests to the king from the generals in the field. In 1691 he was even sidelined by the king from operational discussions during the siege of Mons. Yet, for all this, Louvois was fiercely loyal to the ideal of a strong monarchy, and he was immensely efficient at transacting state business. Just as important, Louvois was highly successful in the one thing that united all ministers and nobles of this era—securing the elevation of his dynasty.

LÜBECK. With a population of 25,000 at the end of the Middle Ages, Lübeck was one of the great cities of northern Germany, located at the crossroads between the Baltic and the North Sea. It lived from international trade, and its central position had brought it leadership of the Hanseatic League. By the end of the eighteenth century, its

population was still at the same level, its international trade was dwarfed by foreign competition, and its regional position was overshadowed by Hamburg. Lübeck's decline was comparatively gentle. At times, its merchants reached the Mediterranean, the Iberian Peninsula, and the eastern Baltic, particularly in the later sixteenth and seventeenth centuries. Lübeck's decline was accompanied by the slow dissolution of the Hansa itself as contrasting commercial interests drove a wedge between its members, and the once favorable trading conditions offered to Hanseatic merchants by foreign rulers were withdrawn. Meetings of the Hansetag still took place frequently in the city, and its burghers occupied many of the organization's most senior posts.

The Reformation came comparatively late to the city, in 1531. From then on, Lübeck was strictly Lutheran. Religious change was accompanied by political upheaval in the early 1530s, when a reform group, led by Jürgen Wullenwever, responded to Lübeck's growing political and economic weakness by unsuccessfully making war on Denmark in order to restore the city's former position.

The importance of long-distance trade throughout the period was reflected in the strong presence of seagoing merchants among the city's elite. Sharing power first with a small group of landowners and later with lawyers and other professionals, they ran the city's affairs, occupied the central quarter around the Rathaus (Town Hall), St. Mary's Church, and the marketplace, and maintained a close-knit network of relatives and business associates around the shores of the Baltic. Among the most famous of mercantile aristocrats was Thomas Fredenhagen (1627–1709), whose ships sailed into the Mediterranean and the West Indies. Commercial decline in the sixteenth century was accompanied by artistic decline. Lübeck's earlier reputation as a printing center was sustained during the Reformation but faded as Low German became less popular. A strong tradition of painting and wood carving (especially of altarpieces) made famous by Berndt Notke (1435–1509) also lost its wider importance. There was little continuing patronage of foreign artists. Only the organ music of Dieterich Buxtehude (1637–1707) and Franz Tunder (1614–1667) reached a wider audience.

Lübeck retained its medieval street plan. There was little rebuilding of town houses and public buildings until the eighteenth century, with the noted exception of the Rathaus, which was given a new Renaissance facade incorporating an impressive outside staircase during the sixteenth century. Instead, the appearance of the city was transformed from the outside. New and more extensive fortifications were constructed during the sixteenth and seventeenth centuries in response to the increase in military threats. These included the renewal and redecoration of Lübeck's main gates. While financial constraints prevented a complete overhaul of the city's fortifications, they proved to be a major deterrent to passing armies. Lübeck paid a high price for its neutrality during the Thirty Years' War, however. Gustavus II Adolphus levied a large sum of money as his price for leaving the city alone.

The ideas of the Enlightenment were first brought to eighteenth-century Lübeck from the universities of Jena and Göttingen. The literary society established in 1788 went on to develop into an organization for reform, bringing together men of many different interests and backgrounds.

LUBLIN, UNION OF (1569). Poland's union with the Grand Duchy of Lithuania, signed in Lublin on 1 July 1569, was the final stage of the process begun at Krewo on 14 August 1385, by which the grand duke of Lithuania, Jogaila (who became King Władysław II Jagiełło of Poland), pledged to associate (*applicare* in Latin) the territories of Lithuania and Ruthenia with the Polish Kingdom in a permanent union. Until the Union of Lublin, two conflicting conceptions of the union existed: the Polish side strove for a full incorporation of the Grand Duchy, while the Lithuanians wanted to retain their statehood in a looser union. The act of union was renewed and amended several

times, the most important being the treaty signed at Horodło on 2 October 1413, which preserved the position of grand duke in Lithuania, envisaged joint Polish-Lithuanian congresses, and gave Lithuanian Catholics the same rights to land ownership as the Polish nobility. The forty-seven most important Lithuanian clans were also allowed to use the coats of arms of the Polish noble families.

Stormy debates over the union began in Lublin in January 1569; the Polish side tried to force through the incorporation of Lithuania into Poland, while the Lithuanians sought a federation in which Lithuania would retain separate central authorities and a separate parliament. As no agreement was reached, the Lithuanian negotiators left Lublin, and the Polish side, taking advantage of their absence, announced the incorporation of Lithuania's Ruthenian territories (Podlasia, Volhynia, the Kiev region, and the eastern part of Podolia) into Poland. Under pressure from the Lithuanian nobility, the Lithuanian magnates returned to Lublin, and a compromise act of union was signed on 1 July 1569.

Lithuania retained her political identity within the Commonwealth. The king and the grand duke would always be jointly elected, and parliament was to be held jointly. Lithuanian dignitaries holding posts that entitled their Polish counterparts to sit in the Senate became senators for life. The Chamber of Deputies was to include Lithuanians elected at twenty-four district diets (*sejmiki*). The Grand Duchy retained its own armed forces, currency, treasury, and laws. The Union guaranteed freedom of settlement and land ownership throughout the Commonwealth. It created a federation of the two states, called the Commonwealth of Both Nations. A far-reaching cultural Polonization of the nobility of the Grand Duchy followed, but the Lithuanian noblemen preserved a consciousness of distinct political identity and retained their laws and traditions, as expressed in the Third Lithuanian Statute (1588; in force until 1840). A supplement to the Constitution of 3 May, adopted on 20 October 1791, stressed the federal character of the Commonwealth and the Grand Duchy's equal status with the Polish kingdom.

LULLY, JEAN-BAPTISTE (1632–1687), French composer and founder of the French operatic tradition. Lully was born Giovanni Battista Lulli in Florence, the son of a miller. Despite his humble origins, he was selected at the age of thirteen to teach Italian in Paris to Louis XIV's cousin Anne-Marie-Louise d'Orléans, known as the "Grande Mademoiselle," and he completed his education while serving in her household, mastering harpsichord, violin, and dancing. Lully became familiar with the ballet style of the royal court and by 1652 had so risen in musical status that he com-

posed some of the music for a ballet that was given in the Grande Mademoiselle's palace. She became a partisan of the Fronde (a rebellion against the authority of the monarchy) later in the same year and was banished from Paris, freeing Lully to accept a post in 1653 as composer of instrumental music at the court of Louis XIV, functioning at first as both dancer and composer. The king, six years younger than Lully, befriended the composer, and the stage was set for Lully's extraordinary rise to musical power in France. By 1656 he had his own royal orchestra (the "*petits violons*") and began to compose all of the music for ballets, rather than collaborating with other composers. In the early 1660s he was understood to be the principal composer of ballets at court.

At this time, opera was understood to be exclusively an Italian phenomenon, and the considerable Italian presence at the court of Louis XIV (his first minister, Cardinal Jules Mazarin, was Italian) resulted in the importation of much opera. In 1664, Lully began to move in the direction of dramatic music in French, first by collaborating with Molière (1622–1673) in *comédies-ballets* (plays with much dance music). Louis XIV was in the process of ex-

tending his power in all aspects of French life, and in 1669 he added an Académie Royale de Musique to the “academies” he had established to control the artistic and intellectual life of the country; the new academy’s stated purpose was to promote operas in French. Lully soon saw his opportunity and became its director in 1672, a position he held and aggrandized until his death, at the age of fifty-four. According to one contemporary source (Jean-Laurant Le Cerf de La Viéville), he died of gangrene after banging his foot while conducting with a cane.

Lully and librettist Philippe Quinault (1635–1688) created a noble new genre that signaled the beginning of a French style of opera. It was first termed simply *tragédie*, then *tragédie en musique*; later, the genre was labeled *tragédie lyrique*. Lully completed thirteen of these, approximately one a year, eleven to librettos by Quinault and two to librettos by Pierre Corneille (1606–1684): *Cadmus et Hermione* (1673), *Alceste* (1674), *Thésée* (1675), *Atys* (1676), *Isis* (1677), *Psyché* (1678, libretto by Corneille), *Bellérophon* (1679, Corneille), *Prosperpine* (1680), *Persée* (1682), *Phaëton* (1683), *Amadis* (1684), *Roland* (1685), and *Armide* (1686). Because Lully held royal privileges that gave him a complete monopoly on musical stage works, his operas dominated the musical life of the court and of Paris, and they held the stage well into the eighteenth century. Stylistically, they eschewed the rapid speechlike declamation typical of Italian recitatives. Rather, Lully created a fluid and expressive style of melodic line based on the declamation used in spoken French drama. Airs are usually dance-songs, and there are many dances interspersed with the vocal music, including full-fledged divertissements (entertainments that interrupt the plot). The five-act structure of the *tragédie en musique* was adopted from the spoken dramas of Corneille, and the prologue that either directly or allegorically praises Louis XIV came from the ballet tradition. Lully established a form for his overtures that was widely imitated elsewhere in Europe, and came to be known as the “French overture,” consisting of a stately chordal section characterized by dotted-note rhythms, followed by a lively contrapuntal section.

Lully also composed a small but influential body of church music, particularly *grands motets* and *petits motets*. While he did not compose much independent instrumental music, the large amount of

Jean-Baptiste Lully. GETTY IMAGES

dance music in his stage works circulated separately, was gathered into suites, and was transcribed for other instruments. There is, for example, more harpsichord music derived from Lully’s operatic dances than original music by any seventeenth-century French harpsichordist. Outside France, his influence was particularly strong in the Netherlands and Germany, and also in England. After the middle of the eighteenth century, his music was regarded for the most part as historical artifact until a revival of *Atys* in 1987 generated a new wave of appreciation for his operas.

BRUCE GUSTAFSON

LUTHER, MARTIN (1483–1546), German theologian and author. Martin Luther came to be easily the most well-known public figure—and the most published author—of his time. He was born on 10 November 1483 to Hans and Margarethe Luther in the town of Eisleben and went to school in Mansfeld and Magdeburg and then in Eisenach. His father was in the copper mining business, and wanted Martin to become a lawyer. He entered the University of Erfurt in 1501 and completed the studies necessary for a master's degree four years later. By that time, however, he was suffering from doubts about the meaning of his life and from fears of death, and in the summer of 1505, against his father's wishes, he became a friar of the Observant Augustinians at Erfurt; he took monastic vows in 1506 and was ordained a priest in 1507. On a trip to Rome for the order in 1510–1511, he was disturbed by the corruption he found there, typified by the sale of indulgences to raise money for the rebuilding of St. Peter's. He returned to Saxony, earned his doctorate in 1512, and became professor of biblical exegesis at the University of Wittenberg, a post he held until 1546; he was also the preacher at the church in Wittenberg.

In his lectures on the Psalms and on Paul's Epistles, Luther began to preach the doctrine of salvation by faith rather than by works. Meanwhile, the popular Dominican preacher and papal fundraiser Johann Tetzel appeared in the area to proclaim that the pope had authorized the sale of St. Peter's indulgences; Luther was infuriated to the point of composing a letter of protest to the archbishop of Mainz and posting his *Ninety-Five Theses on the Sale of Indulgences* on the church door at Wittenberg on 31 October 1517. By the end of the year, the theses had been printed and, a short while later, translated into German and spread throughout the Holy Roman Empire. The archbishop sent the theses to Pope Leo X, who summoned Luther to Rome to answer charges of heresy in 1518. Frederick III (Frederick the Wise; ruled 1486–1525) of

Saxony intervened and arranged for Luther to have a formal hearing at Augsburg before the papal legate Cajetan rather than being sent to Rome. Luther refused to retract the views expressed in his theses, maintaining that there was no biblical justification for indulgences, and appealed to a papal council. There followed in 1519 a widely publicized debate at Leipzig between Luther and Johann Eck, a professor from Ingolstadt, on the subject of church authority. Luther's publication of three treatises in 1520 that called for revolutionary changes in late medieval German political, social, and religious life led to a papal bull excommunicating him in 1521; Luther publicly burnt the bull along with a copy of canon law and was called to the Diet of Worms for the purpose of recanting his teachings. He refused and was placed under the ban of the empire, which designated him an "outlaw" whom anyone could kill without legally committing murder.

His protector Frederick III of Saxony sent his soldiers to take Luther to the castle at Wartburg, where he spent a year writing pamphlets, preparing sermons on the Epistles and the Gospels, and translating the New Testament from Greek into German. He returned to Wittenberg in 1522 and resumed teaching and preaching. He urged the establishment of schools for all children (including girls), opposed the German Peasants' War, began the organization of the Saxon church, wrote hymns, a Small Catechism, and a Large Catechism, as well as numerous commentaries and treatises.

In 1525 Luther married Katharina von Bora, a former Cistercian nun who had fled her convent two years earlier under the influence of the Reformation. The couple moved into the former Augustinian monastery where Luther had lived as a monk; they had six children, three boys and three girls, and they also took in the six children of Luther's sister after her death; visitors reported that their home was always filled with students, guests, and boarders. Luther died at Eisleben on 18 February 1546 and was buried in the castle church at Wittenberg. In his funeral oration to faculty and students at Wittenberg, his long-time colleague and friend Philipp Melancthon observed that in Luther "God gave this last age a sharp physician on account of its great sickness."

Luther was in his own time and remains now an object of passionate approval and disapproval, whom even supposedly scholarly accounts praised (and praise) for whatever their authors find praiseworthy in their own time while condemning him for all that they might judge as repugnant in their worlds. On the other hand, praising and condemning the reformer for all the “right” reasons and in just the “right” measures according to one’s own time and culture amounts to thin porridge. The truest story is far more profound: Luther was at the same time quintessentially medieval and the single person who did most to put in motion the events that moved the clock of Western civilization into early modern times.

The notion that Luther was “medieval” refers to his motivating concerns rather than to any religious views that are no longer fashionable in polite circles, such as taking the figure of Satan or the Antichrist literally. Instead, Luther’s life displays a consistent, driven search for assurance that he and

those he taught and to whom he preached should be assured of their salvation both in the here and now and in the world to come. His fundamental concern was for the “care of souls,” first his own and then the souls of those he served. In and of itself, this single-minded focus marks him as a pre-modern religious figure.

By the same token, the essential consequences of Luther’s life and career are that, willy-nilly, the content of his personal spiritual quest, and the one he taught his students, changed dramatically. This change was so fundamental that, in combination with the circumstances of the early sixteenth century, it affected both the internal and public lives of many others. They too, unintentionally and perhaps even unconsciously, found themselves leaving the Middle Ages and moving into the early modern period.

The special indulgence sale of 1517, to which Luther objected in the *Theses*, has generally made indulgences the best known of the religious practices of the time. In fact, for the average believer, the sacrament of confession and penance was a far more common encounter with the medieval confrontation of sin, death, guilt, and wounded consciences. Above all, ever since the Fourth Lateran Council (1215) the faithful were obligated to go to confession at least annually, and most commonly during Lent or in preparation for partaking of Holy Communion at Easter. By contrast, going on a pilgrimage, venerating relics, and the like were all further and optional ways of strengthening and demonstrating one’s faith.

For his part, Luther confessed his sins to another person and frequently on a more than daily basis. It remains impossible, of course, to learn exactly what happened within the confines of the confessional. The late medieval manuals suggest a certain rigor. Frequently enough, for example, someone would come and be unable to think of any particular sin that he or she had committed. At this point, the confessor had recourse to a printed list of questions that might be asked, such as, “Have you ever had sexual relations with your spouse for reasons other than procreation?” “Did you or your spouse enjoy the encounter?” Answering yes to either of both questions produced two sins for which penance must be done. Being first a novice and then

a friar of the Observant Augustinians in Erfurt, the questions that Luther was asked and was taught to ask himself naturally turned to the internal status of his soul and in particular to the strength and commitment of his personal faith. From the posting of the theses forward, he never ceased in fact to inveigh against this practice of “inquiring about secret sins.”

In the preface to the Latin works, which he completed in 1545, one year before his death, Luther eloquently and accurately described the changes that overcame his thinking, indeed his personal faith. There, he detailed rejecting the theology he had been taught, that the righteousness of God was a divine quality with which God judged humanity, and how he realized that it was rather the gift that God bestowed for Christ’s sake on unrighteous people, and to which they cleaved in this life by faith alone. The basics of his more developed position appeared publicly in the Theses for the Heidelberg Disputation (spring 1518), in his lecture hall at the University of Wittenberg (1515–1519), and definitively in *Von der Freiheit eines Christenmenschen* (1520; On the freedom of a Christian). They lay beneath his insistence at Leipzig (1519) that “a simple layman armed with the Scriptures is mightier than pope and councils without them.” Their consequences for Christianity and for Christendom became undeniable in *An den christlichen Adel deutscher Nation* (Address to the Christian nobility) and *De captivitate Babylonica ecclesiae praeludium* (On the Babylonian captivity of the church), both of 1520.

Each struck fundamental and telling blows against the medieval ideal of Latin Christendom. Each had politically, institutionally, and religiously revolutionary consequences. Many at the time regarded the *Address* as a call to arms against everything Roman, a call that—to the likes of Ulrich von Hutten, for example—included the political arrangements of the Holy Roman Empire. Luther cast his treatise as an appeal to the “*Christian nobility*” (or “ruling class” as some prefer to translate), the *Christlichen Adel*, to proceed with the reforms that the papacy refused to consider. The problem he faced was that common opinion held overwhelmingly that actually reforming the church was far beyond the competence of secular rulers, no matter how very Christian and upstanding they might be.

Only those who had been ordained as priests, at a minimum, had the right to intervene in the affairs of the church in favor of or against any of its practices. There were many places in which local practice decreed that, if there were a property dispute between a clerical and a civil foundation, the case would be heard in an ecclesiastical court, and its outcome would be in little doubt.

This public and sanctioned conviction Luther called “the first wall” behind which papal prerogative protected itself. It was also the first one that he attacked. He did it with his famous teaching on the “priesthood of all believers,” which grew directly from the proclamation that all Christians lived by the same grace through faith in the same Christ without distinctions between them. The only differences turned on the principal office or calling that a particular person had, regardless of whether he or she served in the temporal or spiritual spheres. Any baptized Christian was eligible to be called by the believers to preach, to baptize, and to administer the sacrament of the Lord’s Supper on either a short- or long-term basis. With one stroke, Luther at least theoretically destroyed the very social class that helped constitute the social and political—as well as religious—reality of late medieval Christendom.

Luther’s treatise *The Babylonian Captivity of the Church* performed much the same function with respect to specifically religious activities. Erasmus thought this the most radical of his treatises, for in a few pages, published initially in Latin, Luther attacked the medieval sacramental system at its core, reducing the number of sacraments from seven to first three and then (on the final pages) two. Two consequences followed. In the first place, if one accepted Luther’s argument, then the Church of Rome no longer had anything to offer the laity that was essential to salvation. As then constituted, its *raison d’être* had ceased to exist. From pope to priest, they were all useless.

But there was an even more important aspect to what Luther had wrought. As he was working his way through one sacrament after another, he developed a consistent standard for what constituted a sacrament. It required biblical evidence that Christ had founded the practice and that it consisted of a promise added to a physical object.

Thus, the central sacrament—confession and penance—disappeared and with it went any semblance of religious authority that the clergy might hold over the laity as a matter of principle.

Yet, Luther should not be called a “reformer” without qualification. He made no effort to replace what he tore down with a “better” edifice. Instead, he and his colleagues proceeded to construct a new institution chiefly through ad hoc measures such as visitations that had the sole objective of securing the preaching of the Word of forgiveness through Christ and in the sacraments of baptism and the Lord’s Supper. All else they relegated to the world in which Christians carried out their vocations. Thus, to understand Luther requires grasping the contradictory theses with which he began *On the Freedom of a Christian*, published in 1520: “A Christian is a perfectly free lord of all, subject to none. A Christian is a perfectly dutiful servant of all, subject to all.” As time passed and the cause fell to less perceptive figures, this distinction metamorphosed into what became the dichotomy between church and state. In this regard and with these changes, the transition from the medieval world of Latin Christendom into early modern Europe was complete, whereas by contrast the old tensions, polarities, and rivalries persisted in France, Italy, Spain, and Catholic portions of the Holy Roman Empire until the French Revolution.

LUTHERANISM. Among all the major individual varieties of Latin Christianity to emerge from the Reformation, Lutheranism stands alone for two reasons. In the first place, it bears the name of an individual. Secondly, its hallmark, more vital even than the reference to Martin Luther (1483–1546), consists of its formal, agreed-upon confessions of faith, in particular the Unaltered Augsburg Confession (1530), but also (save in Scandinavia) the Formula of Concord (1577) and the other documents contained in the Book of Concord (1580), which claim faithfulness to both the Scriptures and Luther’s teachings. To answer the question, “What is Lutheranism?” therefore requires, at least in principle, no more than a careful reading of these theological sources with the understanding that conduct flowed from conviction. It can be no surprise, then, that Lutherans have traditionally relegated all other religious matters—liturgy, polity, hymnody, spirituality, and the like—to the realm of *adiaphora* or “things indifferent.” The teachings were at the time of the Reformation, and remain now, the heartbeat of Lutheranism.

By contrast, even the finest of Lutheran scholarship has little to say about its distinctive characteristics, if any, with respect to its political, social, intellectual, artistic, and cultural preferences over time. Thus, even its hymnody and its vibrant traditions in choral music were put in service to its teachings. For the unengaged student, Lutheranism presents the unavoidable impression that all matters which make

it a distinct variety of Christianity have rightly had a theological, as well as musical, standard applied to them. To the uninitiated and the veteran alike, it may well appear that once one has gotten the teachings of the Lutherans correct and arranged them in their proper relationships to one another, one has grasped all that is essential when it comes to understanding Lutheranism in almost any place and time. One is reminded of nothing so much as the words on the back of a coin struck in Württemberg on the fiftieth anniversary of the posting of the Ninety-Five Theses: “God’s Word and Luther’s Teachings are Never to be Forgotten!”

Luther had been in his grave for more than twenty years when this medal was struck. The Formula of Concord, to say nothing of the period of Lutheran Orthodoxy, did not yet exist. But the conviction that true doctrine was the equivalent of true religion did. Indeed, this very characteristic is not a caricature and, no matter how obvious it is, it must be underlined whenever one seeks to penetrate to the core of Lutheranism. Luther himself reportedly declared, “Others before me have contested practice, but to contest doctrine, that is to grab the goose by the neck!”

Even when one rightly approaches the core of Lutheranism by way of its teachings, there remain more and less enlightening ways to do so. One can, as noted above, and rather in the manner of Lutheran Orthodoxy in the seventeenth and eighteenth centuries, turn the exercise into an utterly misleading game of theological pick-up sticks. If, however, the objective is to render an image of Lutheranism that encompasses its whole as well as its many parts, one further and rather subtler characteristic must be given its due. Luther was indeed a theologian, and Lutheranism does indeed remain a highly theological version of even Latin Christianity. But, both Luther and the movement that sprang from him had almost no inclinations to systematic theology in a manner that might be recognized by, for example, Thomas Aquinas.

Neither Luther nor Lutherans in general have sought to create a *Summa Theologica* in which everything from the creation *ex nihilo* to human procreation has its own perfectly consistent theological understanding. This is not to say that Lutheran religious thought consisted merely of random in-

sights on one unrelated topic after another in the manner of some types of mysticism. Instead, the consistency or univocality of Lutheran theology derived from its genesis over time from a single, unitary point of departure. Thus it began, by Luther’s own testimony, with his personal search for a gracious God. He had been taught that the righteousness of God was a quality of God against which this divine judge measured all humans and found them wanting. On the bases of his lectures and writings from late 1518 through mid-1519, it is now a matter of nearly absolute certainty that he consciously rejected what he had been taught and then gradually came to understand God’s righteousness as a gift that God bestowed on humanity and by which he reconciled mankind to himself. Thus, the famous passage, “The righteous (*iustus*, ‘made righteous’) shall live by faith” applied directly not only to the theology he taught as a professor at Wittenberg but also to his personal religious life. “Faith” itself was no longer an attribute that played a role in moving the sinner toward salvation but the central, unwilling response to having been made righteous by the benefits of Christ. By comparison with *sola gratia*, Luther did not even use the terms *sola fide* and *sola scriptura* with much frequency. They did not do more than indicate the principal source for and the manner by which the Christian received and held grace.

The theology that marked Lutheranism was therefore intensely practical and rarely, before Kant, speculative or philosophical in the least. Two examples will illustrate the point. The first concerns the subject of predestination, which came under dispute during the 1560s in a few places that were, for the most part, south of the Main River and along the Rhine—most notably in Strasbourg. Those who introduced the issue were commonly Italian converts to Calvinism such as Girolamo Zanchi (1516–1590) and Peter Martyr Vermigli (1500–1562). The issue, certainly related theologically to Luther’s position in *De servo arbitrio* (1525; On the bondage of the will), nonetheless never caught fire among the German Lutherans. In its eleventh article, the Formula of Concord observed that the subject had not been an issue “among the theologians of the Augsburg Confession” and then addressed it anyway. Taking the approach and even borrowing some of the language that was used at Strasbourg in

1561–1563, the formulators declared that there were good biblical grounds in support of both the doctrine of election and the assertion that Christ came for all. But, because God’s predestining belonged to his hidden will and Christ’s coming for all to his revealed will, Lutherans would henceforth ignore predestination and preach only what God had revealed to all. For the most part, Lutherans to this day have carefully observed this self-denying ordinance. They were single-minded about the original insight regarding justification and remained tenaciously within it.

A second illustration from Luther himself may also be revealing. It concerns the subject of “hiddenness” and a similar, related principle of self-denial in general. Luther observed, for example, that everyone of sound mind could know that God existed, that he created all things, that he was omnipotent, and so forth. What humans could not know were God’s intentions toward them because God had hidden and continued to hide this knowledge in the folly of Christ. Moreover, this keen awareness of what God has revealed and what he has hidden guided even Luther’s exegetical practices. Consequently, his biblical lectures often contained the declaration regarding a particular passage, “It is too dark there. I cannot go there because all is hidden.” Indeed, his first reaction to Johann Agricola of Eisleben’s (c. 1494–1566) insistence that the Law should not be preached to the saved (the fundamental issue at stake in Lutheranism’s first Antinomian Controversy, which involved the notion that a saved Christian was free from the dictates of the Law) was not to press on to the truth of the matter but—in part because he was one of Luther’s favorite students—that Agricola should stop talking about the matter.

Nonetheless, little more than a generation had passed before Luther’s followers had fallen into so many internecine theological quarrels that Jakob Andreae of Württemberg (1528–1590) and others took up the work that led to the Formula of Concord. In addition to predestination, Andreae and his colleagues addressed ten such controversies that threatened to undo the unity implied in the name “theologians of the Augsburg Confession.” To modern ears, some of these issues were truly frivolous and may have derived more from some individuals’ vanity than serious theological considerations.

Georg Major’s (1469–1550) tactic of expressing Luther’s views of the place of works in the economy of salvation may be a case in point. Somehow, his declaration that “Good works are dangerous to salvation” seems intended more to enrage than to enlighten. It is easy to understand Philipp Melancthon’s (1497–1560) giving thanks at the point of death for at last being released from the *rabies theologorum* (“the madness of the theologians”).

With this much granted to the merely human, the emphasis should fall here on two related practical, political realities that forced theological reflection. The first was Emperor Charles V’s (ruled 1519–1556) victory over the Schmalkaldic League in 1547–1548 and his determination to establish religious peace within the empire by force if necessary. Thus, the Augsburg Interim required of the Lutheran rulers that they reinstitute the Mass in their territories, provide for an unmarried clergy, and cease secularizing religious foundations, among other, more local, arrangements. In addition, by putting the free imperial city of Constance under siege, the emperor demonstrated that he was more than willing to employ force during this interim before the calling of a general council. Consequently, in order to meet these terms, Strasbourg found itself compelled to negotiate a treaty with its long-time non-resident bishop, while Magdeburg to the northeast resisted imperial pressure successfully by holding firm behind its outlying marshes to defend its choice of resistance. At the same time, Maurice, called on account of his political behavior the “Judas of Meissen,” now enjoying the title elector of Saxony (1547–1553), found so much resistance to the new order in his territories that he felt compelled to negotiate a somewhat milder version, called the Leipzig Interim, whose intent was to defend Lutheran doctrine, albeit without much regard for contrary practices, in the face of these temporary practical concessions.

A genuine theological problem lay at what became an internecine pamphlet war among the theologians of the Augsburg Confession. Mathias Flaccius Illyricus (1520–1575) led the defenders of Magdeburg’s policy on the grounds that the Leipzig Interim violated the spirit, if not the letter, of true Lutheranism. In this instance, there was no authoritative text to which the parties could turn, if only because the Augsburg Confession’s seventh

article was silent with respect to any of the specifics regarding what actions (or lack thereof) fell under the umbrella of “things indifferent.” According to the Magdeburgers with Matthias Flaccius Illyricus, the “Genesio” or Original Lutherans (as they were now called) insisted that while some practices, such as the celebration of the Mass, might be indifferent in themselves, they were intolerable in a Lutheran territory, because they in fact promoted a false gospel. The outrage was so great that there are present-day Lutherans who still call themselves Genesios. During the late 1570s, its simple existence forced the inclusion of Section X in the Formula of Concord, which basically endorsed the Genesios’ position.

The decade from the mid-1540s to the mid-1550s also called for greater theological precision in imperial politics. The Religious Peace of Augsburg (1555) inserted the Augsburg Confession (1530) into the imperial constitution by declaring that adherents to it would be guaranteed a modicum of religious freedom, depending on the confession of the town or principality that was their home. This is the famous provision that is summarized with the anachronistic term *cuius regio eius religio*, according to which the ruler’s confession determined the religion of the town or principality. Some try incorrectly to draw from this provision the beginnings of state-dominated religion. Instead, this provision merely stated that the prevailing religion in any territory or city was to be the one that existed there before the Schmalkaldic War.

There was a problem, however, lurking beneath the easy reference to the Augsburg Confession as the imperial confessional standard. Which Augsburg Confession? In 1540 Melanchthon had been given the task of revising the version that was submitted at Augsburg in 1530 in light of the Wittenberg Concord of 1536. Specifically, he had used the language, approved expressly by Luther, *cum pane et vino* (“with bread and wine”) rather than *in pane et vino* (“in bread and wine”) as a way to describe just how the consecrated elements in the Lord’s Supper were presented as the body and blood of Christ. One change of preposition provided certain Reformed theologians, notably those active at the court of the elector palatine, just enough room to assert that their understanding of the spiritual presence of the body and the blood came under the

umbrella of “the Augsburg Confession” and therefore of the Peace of Augsburg.

At last an assembly of evangelical princes, meeting at the request of the elector palatine at Naumburg in January 1561, declared that the standard was the *invariata* (the version of 1530), but that the *variata* (Melanchthon’s version of 1540) might be used to explain its teaching on contentious issues. No sooner had they returned home than they were confronted with a round-robin inquiry from Emperor Ferdinand I (ruled 1558–1564), in which he asked whether the elector palatine was or was not in harmony with the Unaltered Augsburg Confession of 1530. They replied that, while perhaps technically he was not, the emperor should not presume to take any actions against him.

These festering disagreements and Reformed aggressiveness in northern Germany go much of the way to explaining why, about seventy-five years later, in the aftermath of the Battle of White Mountain, the Lutheran princes decided to sit on their hands when General Albrecht Wenzel Eusebius von Wallenstein attacked the Electoral Palatinate, deposed the elector, reduced parts of Heidelberg to ashes, shipped the contents of the university library, the Palatinum, off to the pope as a gift, and inaugurated the Thirty Years’ War (1618–1648). Certain developments within Lutheranism contributed to this decision not to intervene in defense of a generous interpretation of the Peace of Augsburg. Perhaps it was the price the Reformed were called upon to pay for their aggressive attempts over the past seventy years to convert Lutheran princes. In the event, it was Germany, and in particular northern, Lutheran Germany that paid the price by becoming the playground for armies from all over Europe, while the south had the burden of paying for it all.

The reference above to “certain developments within Lutheranism” points to the two paths between which Lutherans chose beginning in the early seventeenth century and continuing on through the mid-eighteenth century. They persist to this day under the terms “Pietism” and “Lutheran Orthodoxy.” Both had deep roots. As should be evident, Orthodoxy can claim parentage in the heavily doctrinal character of Lutheranism from the outset, through the Genesio Lutherans, the Formula of Concord, Martin Chemnitz with his monumental

Examination of the Council of Trent (1565–1573), and into the professorial life of seventeenth-century Lutheran theological faculties. Pietism, on the other hand, can claim its origins with Martin Bucer (1491–1551) of Strasbourg and a tradition that produced such luminaries in the movement toward a more “heartfelt” religion, as evident in two later products of Strasbourg, Johannes Arndt (1555–1621) and his *Vier Bücher vom wahren Christentum* (1606; Four books on true Christianity), and Philipp Jakob Spener (1635–1705), the *collegia pietatis*, and his *Pia Desideria* (1675), which is still read and cherished by many. That the two parties did not think well of one another is evident from the story about Johann Sebastian Bach (1685–1750), who was frustrated by a powerful Pietist preacher at the Church of St. Thomas in Leipzig. It was said that whenever he encountered the preacher on the street, Bach would “compose and throw another fugue” at him.

One may legitimately wonder whether Voltaire’s Dr. Pangloss, despite the evident reference to followers of Gottfried Wilhelm von Leibniz, was a parody of Lutheran theologians he had met. Research has only begun on these theologians, but two matters are presently apparent. In the first place, they were indeed extremely learned men who brought to their tasks Aristotle, both of the *Metaphysics* and the *Posterior Analytics*, the ancient authority whose very dominance of Wittenberg’s theological faculty Luther once celebrated. Secondly, it was the Orthodox who turned the substance of Lutheranism into a laundry list of virtually self-standing doctrines that the theologian needed only to memorize. While so doing, they no longer studied Luther himself nor did they cite him in their general histories of doctrine or their works on specific theological topics. Finally, their influence lasted long past the eighteenth century and can be said to have peaked in the nineteenth century. This is not to say that no one read Luther any longer. The Finnish “Luther Readers” both in Finland and in the Upper Peninsula of Michigan read him regularly, but more for the sake of spiritual enrichment than of theological learning. It was left to the Swedish Luther Renaissance of the late nineteenth and twentieth centuries to return to a genuinely theological-critical study of Luther himself.

Save in a few synodical groupings and a handful of individuals, notably in North America, Lutheran Orthodoxy is no longer particularly influential. Pietism in both vibrant and decadent forms is a different matter. Beginning with Bucer, who was truthfully more a religious thinker and churchman than a theologian, those with Pietist proclivities have downplayed the theological character of Lutheranism as a distortion that drew the believer’s attention away from the inclination of the heart, moral behavior, and the amendment of life that must follow the hearing of the Gospel.

To take but two examples, one at the beginning and the other near the end of the story, in the mid-1530s Bucer wrote a book called *The True Care of Souls*. In it (among other concerns) he listed Christians by type according to the extent to which they approximated the ideal and then prescribed different forms of pastoral care that would help them advance on the classification table. He did bow toward the central teaching from Luther that a Christian remained *simul iustus et peccator* (‘at the same time righteous and a sinner’). But this was for him merely a background principle to the main task of creating more genuine believers and moral members of the church on earth. Still, Bucer’s list of exercises remained some distance from Luther’s insistence that true pastoral care occurred in the preaching of God’s Word, which did all that could be done to create true people of God.

Spener differed from Bucer first in that he openly criticized the theologians and churchmen of his day for their self-serving lack of attention to improving the tenor of Christian life. Secondly, he favored the establishment where possible of *collegia pietatis* (‘colleges of piety’) in which the truly repentant and committed would withdraw to increase their search for true piety and their willingness to perform good works. Bucer, too, had engaged himself in similar work, known as the *Christliche Gemeinschaften* or *ecclesiolae in ecclesia* (‘little churches within the church’), shortly before being forced as a condition of the Interim to leave Strasbourg for England while under a storm of criticism from both the government and many of his fellow pastors for the tendencies of these small fellowships to split the existing parishes and churches. It should be noted that these efforts were not strictly anti-dogmatic but simply did not evidence much interest

in public teachings. The Pietist movement reached its apogee in August Hermann Francke (1663–1727) with his school and later university at Halle, institutions that came to specialize in the training of servants for the Prussian bureaucracy.

Lutheranism in the main experienced the same fate as most other branches of Christianity during the early modern period. By the end of the eighteenth century, true religion had retreated from the public sphere into the private. Whereas the “two kingdoms” through which God ruled his creation—the world of daily affairs in politics, society, and business, and the world of faith—had once served one another, by the end of early modern times, the kingdom of the world had come to dominate. Lutheranism in both its Orthodox and Pietist forms thus abandoned the public sphere to a heretofore-unknown realm of religious indeterminacy, and it did so well before the First Amendment to the United States Constitution. By their own doing, Lutherans turned true religion into a private matter that was by and large excluded from the “real world” of politics, business, and society. Christendom had died. Europe was born.

LVIV (Polish, Lwów; German, Lemberg; Russian, Lvov; Latin, Leopoldis). First mentioned in 1256, Lviv arose at the intersection of important trade routes linking the Baltic with the Black Sea and Cracow with Kiev. It was named for Leo, son of Daniel, prince of Galician-Volhynian Rus’, who founded the city in the mid-thirteenth century. In 1349 the principality was incorporated into the Polish crown under Casimir III the Great. Lviv became the capital of the Ruthenian palatinate in 1434.

Casimir granted the city the Magdeburg law for municipal self-government in 1356, opening the door to considerable immigration, especially from German-speaking lands. Lviv was thus highly mixed from the beginnings of the Polish period. In addition to the autochthonous Ruthenians (ancestors of Ukrainians) there were numbers of Polish, German, Armenian, and Jewish immigrants. A Roman Catholic archbishopric was established in 1412, an Orthodox bishopric in 1539 (it received the Union of Brest with Rome in 1700), and an Armenian bishopric from 1626. The burghers were largely German until the beginning of the sixteenth century, from which point they and the Armenians underwent Polonization. Rights of citizenship in Lviv under the Magdeburg law applied only to Catholics. The Orthodox Ruthenian commonality found itself in social and confessional conflicts with the Polish or Polonized nobility, patriciate, and burghers.

Lviv was a cultural center. It was home to Catholic poets working in neo-Latin and Polish—Szymon Szymonowic (Simon Simonides, 1558–1629, son of the city councillor Szymon of

Brzeziny) and the brothers Zimorowic, Szymon (c. 1609–1629) and Józef Bartłomiej (1597–1677), who served several times as Lviv’s burgo-master—all of whom reflected local Ruthenian realia in their works. The Lviv Orthodox Dormition Brotherhood was an important Orthodox cultural center (its right of stauropegion, whereby it was placed directly under the patriarch’s control and made independent of the local bishop, was granted by the patriarch of Antioch, Joachim V, in 1586). It established a school (1585) and printing house (first printing 1591), and it played an important role in the lives of local Ruthenians, serving also, with Vilnius, as an early center for a broader Orthodox revival in the late fifteenth and early sixteenth centuries before yielding that role to Kiev in the 1630s. The city’s first printing house was that of the Belarusian printer Ivan Fedorov, recently expelled from Moscow, who issued Lviv’s first Church Slavonic book in 1574. Latin and Polish printings began to appear in 1581.

By the early seventeenth century, over five hundred craftsmen worked in some thirty guilds, among which producers of metalware, jewelry, and weapons enjoyed respect abroad. Lviv’s artisans and architects joined western and eastern styles. Armenian artisans produced belts, caparisons, weapons, jewelry, and embroidery. Lviv’s Jews and Armenians played important roles in trade between western Europe and the Orient and offered competition to the rest of Lviv’s merchants and artisans.

The first Jews may have arrived from Byzantium, but the greatest immigration came after 1349 from Germany and Bohemia. The newcomers established two Ashkenazic settlements, an older, extramural congregation (in 1550, 559 Jews lived in 52 houses) and a newer, intramural congregation (352 Jews in 29 houses), with separate synagogues, *mikva’ot*, and charitable institutions, but one common cemetery.

Lviv declined together with the Polish-Lithuanian Commonwealth, beginning in the middle of the seventeenth century. It was under frequent attack: by Bohdan Khmelnytsky’s Cossack armies in 1648 and 1655 and by Turkish and Tatar forces in 1672, 1675, 1691, and 1695. The greatest depredations came at the hands of the Swedes in 1704 during the Great Northern War. Incorporated by

the Habsburgs after the first partition of Poland in 1772, Lviv became the administrative capital of the Austrian Kingdom of Galicia and Lodomeria.

LYON. Founded by the Romans as a provincial capital, Lyon maintained its prominence during the medieval period as the seat of a bishopric and an important law court (the *Sénéchaussée*). Its location at the confluence of two important rivers (the Rhône and the Saône) made it a commercial center as well, allowing it to act as a transportation and financial hub between the Renaissance Italian cities to the south and the French and Flemish cities to the north. From the sixteenth century, silk and other textile production combined with banking to propel the city’s economy, and its four annual trade fairs emerged as among the most important in Europe. Merchant dynasties (both French and Italian) came to dominate the city’s governing council, or consulate, and continued to rule the city up to the Revolution.

The Reformation came to Lyon from nearby Geneva in the sixteenth century, and religious conflict temporarily damaged the city’s economic dominance. Largely an elite phenomenon, Protestantism faded during the seventeenth century although economic and family contacts with Geneva continued. Prompted in part by Genevan and Italian models, Lyonnais merchants developed several new forms of poor relief during this period, including a publicly owned general hospital that took in foundlings and orphans, training them for work in the textile trades and supplying dowries to young women. The city’s governing elite also created pub-

lic institutions to supply food during grain shortages, including an urban administration to purchase grain at city expense, public ovens to bake bread, and an organized rationing system. Lyon thus served as a model in France for poor relief and administrative innovation in times of famine.

While textile production (especially silks) continued to expand through the seventeenth and eighteenth centuries, the four fairs became principally important as financial markets. Their regularity, and the supervision over them by a powerful judicial court (the *Conservation des foires*) made them attractive to merchants from Italy, Switzerland, and France who wished to make, pay, and exchange loans while minimizing the dangerous transfer of coin. During the latter years of the reign of Louis XIV, royal bankers such as Samuel Bernard manipulated these markets, burdening them with the royal debt and nearly bankrupting them. Though the fairs contracted and became less internationally important as a result, they survived and continued to

function on a smaller scale for the remainder of the eighteenth century. Unlike other cities, Lyon maintained a remarkable degree of independence from other royal exactions because the merchants of Lyon successfully manipulated royal patronage and the system of venal offices to preserve a degree of autonomy. As France's "second" city, Lyon enjoyed a tradition of independence and resistance to central authority that continued through the Revolution and into the modern era.

Thomas Gainsborough. *Cornard Wood*, c. 1746–1747. Although he made his living as a portrait painter, Gainsborough was devoted to the landscape genre. Of this early masterpiece, he wrote: “It is in some respects a little in the schoolboy stile — but I do not reflect on this without a secret gratification; for as an early instance how strong my inclination stood for Landskip.”

RIGHT: Artemisia Gentileschi. *Saint Catherine.* Taught by her father, Orazio, Gentileschi absorbed the naturalistic tenets of Caravaggism and became renowned for her large-scale paintings on biblical themes. She is widely praised for her sensitive presentation of female protagonists, both in the dramatic biblical paintings and in later, more personal scenes. ©SCALA/ART RESOURCE, N.Y.

OPPOSITE PAGE: Frans Hals. *Portrait of a Woman*, c. 1640. Of Hals, the historian Theodorus Schrevelius wrote in 1648, "His paintings are imbued with such force and vitality that he seems to surpass nature herself with his brush. USING THE ENCYCLOPEDIA

Tables of contents. Each volume contains a table of contents for the entire *Encyclopedia*. Volume 1 has a single listing of all volumes' contents. Volumes 2 through 6 contain "Contents of This Volume" followed by "Contents of Other Volumes."

Maps of Europe. The front of each volume contains a set of maps showing Europe's political divisions at six important stages from 1453 to 1795.

Alphabetical arrangement. Entries are arranged in alphabetical order. Biographical articles are generally listed by the subject's last name (with some exceptions, e.g., Leonardo da Vinci).

Royalty and foreign names. In most cases, the names of rulers of French, German, and Spanish rulers have been anglicized. Thus, Francis, not François; Charles, not Carlos. Monarchs of the same name are listed first by their country, and then numerically. Thus, Henry VII and Henry VIII of England precede Henry II of France.

Measurements appear in the English system according to United States usage, though they are often followed by metric equivalents in parentheses. Following are approximate metric equivalents for the most common units:

| | |
|-----------------|-----------------------|
| 1 foot = | 30 centimeters |
| 1 mile = | 1.6 kilometers |
| 1 acre = | 0.4 hectares |
| 1 square mile = | 2.6 square kilometers |
| 1 pound = | 0.45 kilograms |
| 1 gallon = | 3.8 liters |

Cross-references. At the end of each article is a list of related articles for further study. Readers may also consult the table of contents and the index for titles and keywords of interest.

Bibliography. Each article contains a list of sources for further reading, usually divided into Primary Sources and Secondary Sources.

Systematic outline of contents. After the last article in volume 6 is an outline that provides a general overview of the conceptual scheme of the *Encyclopedia*, listing the title of each entry.

Directory of contributors. Following the systematic outline of contents is a listing, in alphabetical order, of all contributors to the *Encyclopedia*, with affiliation and the titles of his or her article(s).

Index. Volume 6 concludes with a comprehensive, alphabetically arranged index covering all articles, as well as prominent figures, geographical names, events, institutions, publications, works of art, and all major concepts that are discussed in volumes 1 through 6.

MAPS OF EUROPE, 1453 TO 1795

The maps on the pages that follow show political boundaries within Europe at six important stages in the roughly three hundred and fifty years covered by this *Encyclopedia*: 1453, 1520, 1648, 1715, 1763, and 1795.

1453. In the years around 1450, Europe settled into relative political stability, following the crises of the late Middle Ages. France and England concluded the Hundred Years' War in 1453; the Ottoman Turks conquered Constantinople in the same year and established it as the capital of their empire; and in 1454 the Treaty of Lodi normalized relations among the principal Italian states, establishing a peaceful balance of power among Venice, Florence, the duchy of Milan, the Papal States, and the Kingdom of Naples.

1520. In 1520, the Habsburg prince Charles V was elected Holy Roman emperor, uniting in his person lordship over central Europe, Spain, the Low Countries, parts of Italy, and the newly conquered Spanish territories in the Americas. For the next century, this overwhelming accumulation of territories in the hands of a single dynasty would remain the most important fact in European international politics. But in 1520 Habsburg power already faced one of its most troublesome challenges: Martin Luther's Reformation, first attracting widespread notice in 1517, would repeatedly disrupt Habsburg efforts to unify their territories.

1648. The 1648 Peace of Westphalia ended the Thirty Years' War, one of the most destructive wars in European history. The peace treaty formally acknowledged the independence of the Dutch Republic and the Swiss Confederation, and it established the practical autonomy of the German principalities—including the right to establish their own religious policies. Conversely, the Holy Roman Empire lost much of its direct power; although its institutions continued to play some role in German affairs through the eighteenth century, the emperors' power now rested overwhelmingly on the Habsburg domain lands in Austria, Bohemia, and eastern Europe.

1715. The Peace of Utrecht (1713) ended the War of the Spanish Succession, the last and most destructive of the wars of the French king Louis XIV. The treaty ended Spain's control over present-day Belgium and over parts of Italy, and it marked the end of French hegemony within Europe. In the eighteenth century, France would be only one of five leading powers.

1763. The 1763 Treaty of Paris ended the Seven Years' War, a war that involved all the major European powers and included significant campaigns in North America and southern Asia, as well as in Europe. The war made clear the arrival of Prussia as a great power, at least the equal of Austria in central and eastern Europe.

1795. By 1795, French armies had repelled an attempted invasion by Prussia, Austria, and England, and France had begun annexing territories in Belgium and western Germany. These military successes ensured the continuation of the French Revolution, but they also meant that European warfare would continue until 1815, when the modern borders of France were largely established. Warfare with France did not prevent the other European powers from conducting business as usual elsewhere: with agreements in 1793 and 1795, Prussia, Austria, and Russia completed their absorption of Poland.

1450 TO 1789

ENCYCLOPEDIA OF THE EARLY MODERN WORLD

MACAU. Macau (Macao), the “City of the Name of God” in China, was the second largest in Portuguese Asia. Founded in the mid-sixteenth century on an isolated peninsula at the western edge of the mouth of the Pearl River, Macau prospered, since such a commercial center was in the mutual interests of both the Portuguese and the Chinese. Macau was the focus of a trade nexus extending throughout the South China Sea to Malacca (Melaka), south to Macassar (now Ujung Pandang, Indonesia), and north to Nagasaki (in Japan). The most famous and lucrative example of these trade routes was Chinese silk traded for Japanese silver. A state-awarded annual monopoly conducted the trade with very high annual profits. Mexican silver also entered this system via Manila in the Spanish Philippines.

Macau was governed by its senate (municipal council). Officials were selected to serve on this board from the local elites. Given the tremendous distance from the Portuguese viceroy in Goa, a state in India controlled by the Portuguese until 1961, the council had a great deal of independence and power.

Macau grew slowly from its origins as a cluster of fishing villages. The Portuguese were always a small percentage of the total population, which was largely Chinese. In 1583, there were a reported 900 Portuguese present in Macau. By 1640, in a population of 26,000, of which 20,000 were Chinese, only 1,200 were Portuguese.

Perhaps the best indicator of Macau’s wealth and importance were the unsuccessful efforts by the Dutch to capture the city in the period 1604–1627. Economics alone did not drive the city, however. It was also a base for Jesuit missions to China and Japan and had a number of impressive churches, monasteries, and convents.

TIMOTHY J. COATES

MACHIAVELLI, NICCOLÒ (1469–1527), political theorist. Niccolò Machiavelli was born on 3 May 1469, the son of a lawyer of modest means from an old Florentine family. He received an excellent humanistic education in the classics, but nothing else is known about his early life until he was appointed head of the foreign policy chancery of the Florentine government in June and July 1498. He spent much of the next fourteen years

traveling, negotiating agreements, and reporting to his government. This gave him the opportunity to visit Italian and foreign states and to observe rulers, statecraft, and military actions. He also organized and trained a militia that helped Florence reconquer the neighboring city of Pisa in 1509.

In 1512 the republican government that employed Machiavelli fell, and the Medici family came to power. Machiavelli was dismissed, and he moved to his small farm outside of Florence. Out of office, he wrote in the next fifteen years all the works that made him famous.

Machiavelli gradually worked his way into favor with the Medici by undertaking small tasks and commissions. In 1525 he became friends with the Florentine Francesco Guicciardini (1483–1540), a statesman and the most important historian of the

Italian Renaissance. In 1526, as war neared Florence, the Medici rulers of Florence employed Machiavelli to help defend the city. But in the spring of 1527 the Florentines threw out the Medici and re-established a republican regime. Machiavelli asked for a position in government but was turned down because of his association with the Medici. He died on 21 June 1527.

THE PRINCE

Machiavelli wrote *Il principe* (The prince) in the second half of 1513, but it was not published until 1532. It is probably the best-known work in political theory of all time. Machiavelli employed the advice-to-princes genre, which usually advised a prince act honorably and to work for the good of his people and state. *The Prince* is a manual on how a ruler should gain and hold power. It is based on what Machiavelli had witnessed of politics and war plus reading in ancient history. He wanted to understand politics, what succeeded and what failed, what actions and principles produced a successful ruler.

Several themes dominate the work. Machiavelli believed that politics could be understood through observation, study of the past, and the application of reason to uncover rules. He endorsed the use of force against internal and external foreign enemies to achieve desired ends. He emphasized the importance of the ruler's personal ability or *virtù*, a combination of manipulation, boldness, and stealth that brought success. He insisted that the prince must base his actions not on what people ought to do but what they were likely to do in the pursuit of self-interest and without concern for what was morally right. He viewed the bulk of the inhabitants of the state as fickle, selfish, and easily duped. But Machiavelli also recognized that rulers were not completely masters of their own destinies, but were at the mercy of necessity and fortune. Necessity was the accumulation of adverse circumstances so great that no ruler or state could withstand it. Fortune was luck, chance, even opportunity, the unpredictable in politics. Machiavelli offered numerous examples drawn from contemporary politics and the ancient world in support of his views.

A great part of Machiavelli's appeal and influence came from his brilliant and memorable language. Numerous phrases (here paraphrased) leap

Niccolò Machiavelli. Portrait by Santi di Tito. ©ARCHIVO ICONOGRAFICO S.A./CORBIS

from the pages to drive home his points. “It is better to be feared than to be loved.” “A good man will come to ruin among so many who are not good.” “The prince must learn how not to be good.” “Fortune is a woman who yields to the young and the bold.” “A man will sooner forget the loss of a father than the loss of his fortune.”

THE DISCOURSES

The *Discorsi sopra la prima deca di Tito Livio* (Discourses on the first ten books of Livy) was probably written between 1515 and 1517, although some scholars believe Machiavelli began it in 1513, dropped it to write *The Prince*, then returned to it. He used the first part of the famous history of the Roman Republic from its foundation in 753 B.C.E. to 194 B.C.E. written by Titus Livy (59 B.C.E.–17 C.E.) as the starting point. Machiavelli offered analyses of the principles and institutions of successful, enduring republics, that is, states in which the people have greater or lesser participation in government.

In the *Discourses*, Machiavelli paid less attention to individuals but focused on groups, such as the nobles and the people, and especially the political, religious, and military institutions and laws needed for a successful republic. Using even more examples from the ancient world, especially Rome, and current events than he used in *The Prince*, he argued that a successful republic must have good laws that the people respect. Indeed governments should engender respect by severely punishing transgressors. He endorsed civil religion with the argument that ancient Roman religion strengthened the state by encouraging its inhabitants to fight for the state. By contrast, Christianity, with its ideals of humility and peace, weakened the state. Machiavelli also criticized the papacy for dividing Italy through its politics and wars.

OTHER WORKS

Machiavelli also wrote *Dell'arte della guerra* (1519–1520; *The art of war*), which discussed military organization and tactics. Machiavelli believed strongly that states should develop citizen militias, which would be much more reliable than the untrustworthy and fickle mercenary soldiers. His *Istorie fiorentine* (1520–1524; *Florentine histories*) used episodes from Florentine history to illustrate political principles and to criticize Florentine factionalism. But he carefully avoided either praising or criticizing the Medici. His play *La mandragola* (c. 1517; *The mandrake root*) is a thoroughly amoral and hilarious masterpiece. The best comedy to come from Renaissance Italy, it is still performed in the twenty-first century. He also wrote another comedy, *Clizia* (c. 1525), the short story *Belfagor* (written between 1515 and 1520), poetry, shorter historical works, numerous personal letters, plus diplomatic reports during his active political career.

INFLUENCE

Machiavelli's works had enormous influence from the moment of the printing of most of his works in 1532 through the eighteenth century. Although the Index of Prohibited Books forbade the publication, holding, or reading of all of Machiavelli's works, numerous printings and translations, some of them under fictitious names, appeared in the sixteenth century and the following centuries. And writers responded to Machiavelli because he posed the basic political question, can political success and the

moral law be reconciled? The view that they could not was expressed in terms of "reason of state" (an expression Machiavelli did not use), the argument that for the good of the state a ruler or government may commit evil actions, such as killing innocent family members of political rivals, an action Machiavelli endorsed in *The Prince*.

The French Huguenot Innocent Gentillet (c. 1532–1588) in his *Discours contre Machiavel* (1576; *Discourse against Machiavelli*) was the first to condemn Machiavelli for separating politics from morality, although some of his political recommendations were equivocal. The term *Machiavellian*, meaning the use of immoral means to achieve political power, soon came into use. The English playwrights Christopher Marlowe (1564–1593) and William Shakespeare (1564–1616) several times used such expressions as "murderous Machiavel." King Richard III of England (ruled 1483–1485), who lived before Machiavelli wrote, was seen as Machiavellian, because it was believed that he murdered several people in his ruthless ascent to power.

Political theorists tried to come to terms with the issues Machiavelli raised. Giovanni Botero (1544–1617) in his *Della ragion di stato* (1589; *Reason of state*), which saw many reprints and translations, argued that rulers could reconcile political ends and Christian morality, especially if the state's actions benefited religion. When in doubt, the ruler should consult his confessor. Some seventeenth-century English Puritan casuists also endorsed the principle that the state's actions in defense of true religion were morally defensible. Frederick II the Great (ruled 1740–1786), king of Prussia, did not completely condemn Machiavelli in his *Anti-Machiavel* (1767). Machiavelli's republican theories also influenced such English political theorists as James Harrington (1611–1677), Henry Neville (1620–1694), and Algernon Sidney (1623–1683), and perhaps the founders of the American Republic in the late eighteenth century.

MADNESS AND MELANCHOLY.

When we think of madness and melancholy in the Middle Ages and early modern period, a number of prejudices often obscure our vision. It has been common, for example, to assume that in the age before the European Enlightenment, Christian faith so completely dominated that all mentally ill people were regarded as demonically possessed or that the mentally ill were frequently persecuted as witches. It has also been easy to conclude that the mad were basically neglected until they were confined in a massive roundup starting in the seventeenth century. Other scholars, looking for the origins of modern problems, have emphasized major gender differences, arguing that women were regarded as mentally more unstable than men or that women's cold nature was thought to preclude exalted states and genius. These and other images are either

wrong or misleading, but quite common. They survive in part because we moderns often prefer to regard earlier periods as simpler and less sophisticated than ours.

THE COMPLEXITY OF MADNESS

A better approach to the history of mental troubles begins with the recognition that during the early modern centuries (as in our own time), men and women had complex ideas that did not always harmonize easily with each other or foreshadow our concerns. Professional men, for example, usually tried to bring together the medical theories of the ancient world with the teachings of the Bible and the Christian tradition. Ordinary villagers, too, often tried to combine traditional folk wisdom with whatever their priest or pastor might tell them. When these sets of ideas clashed, as they necessarily did, professionals and villagers alike often tried to specify where and when one should think of madness as a medical problem and when as a religious disorder. Or else, they might try to smooth over the discordant features of both pagan and Christian notions so that they might mesh more seamlessly.

GALENIC IDEAS OF MADNESS AND MELANCHOLY

The legacy of Galen, the greatest late-ancient physician (c. 129–199 C.E.), survived in this way into early modern times. Revived first by Arab physicians (from the ninth to the twelfth centuries) and then in the West (from the twelfth to the fourteenth centuries), Galen became the core of the medieval medical curriculum. Renaissance physicians edited, published, and studied his numerous works along with the major Arab and Latin commentaries on him, making Galen even better known in the sixteenth century than he had been earlier. His medical theories were philosophical efforts to reconcile the competing claims of Plato, Aristotle, Hippocrates, and a host of lesser thinkers, but he was also an avid empirical investigator with a great interest in psychological and neurological disorders. For Galen, mental disturbances were sometimes due to accidents (such as a blow to the head), sometimes to brain fevers (“phrenitis”), and sometimes to hereditary flaws (which might produce retardation). In other instances, madness was the product of disturbances of the four basic bodily juices or humors: phlegm, bile, blood, and black bile (which was called melan-

choly, using the term in Greek). Renaissance physicians revived Galen's thought about melancholy ailments because they presented the opportunity for attractive theorizing about the place of temperament (natural or morbid) in the context of the four elements (water, fire, air, and earth), the four seasons, the four ages of human life, and four of the planets (the moon, Mars, Venus or Jupiter, and Saturn). Good health meant keeping one's humors in balance through diet and daily regimen (sleep, play, exercise, human company, sexual activity, and intellection). Too much heat or cold, too much smoke or moisture, too much study or worry, the wrong foods, too much drink, or the wrong music could all untune one's temperament and disorder one's juices, making one "unbalanced," overly fearful or sad, foolishly confident or belligerent, apathetic, raging, sanguine, phlegmatic, choleric, or melancholy, the last terms revealing even today their historic ties to the humoral system. Early modern philosophers also drew on a pseudo-Aristotelian work called *Problems* to conclude that the melancholy humor often prompted poetic or philosophical genius and religious prophecy. Writers as diverse as Desiderius Erasmus, Miguel de Cervantes, and William Shakespeare deployed melancholy disorders to evoke wisdom and folly. Albrecht Dürer used the image of melancholy as a figure for genius.

More commonly, however, bad habits and a bad diet were thought to produce an artificial black bile (*melancholia adusta*) that in turn caused deep depressions, optical and aural hallucinations, visions, sudden outbursts of wrath, weeping, and general madness. So melancholy meant much more than just sadness or depression; it was a physical condition that could include digestive disorders and flatulence, but it regularly led to illusions, delusions, the inability to test reality, and to insanity. The longer these conditions lasted, the harder they were to cure by means of changing the diet, the air, the regimen of sleep, sex, friendship, and music. One might need to add the therapy of vomits, sweats, and bleeding—indeed, many Galenists advocated bleeding with each change of the seasons so that one's physical and psychic system would be reset for each season's conditions.

THE MEDICAL EXCLUSION OF DEMONS

It is worth emphasizing that the strictly medical literature of medieval and early modern universities regularly excluded demonic and magical interpretations of madness. This exclusion of demons was part of what it meant to have a separate faculty of medicine, and straight through the Renaissance, physicians usually cultivated a "know-nothing" or even a skeptical approach to spirits. Medieval and early modern university life depended upon tacit (or sometimes explicit) rules of engagement so that medical thinking could be insulated against ideas and even words whose religious or folk origins might contaminate what was conceived of as a thoroughly natural pursuit. After all, physicians were those who studied and understood *physis*, or nature. Physicians were naturalists.

An example of this sort of thought is provided by André du Laurens (1560?–1609), who wrote a much-cited work on "Melancholike Diseases" (1599). As the chief court physician to King Henry IV of France, he was eager to affirm his royal master's charismatic power to heal the scrofulous, using the traditional English and French practice of "touching for the king's evil," a power that might look magical or miraculous. In the hands of Du Laurens, however, melancholy was a great naturalizer. All sorts of strange, wondrous, or even miraculous conditions might be unmasked as the workings of black bile:

The melancholike man, properly so called (I meane him which hath the disease in the braine) is ordinarilie out of heart, alwaies fearefull and trembling, in such sort as that he is afraid of every thing, yea and maketh himselfe a terrour unto himselfe, as the beast which looketh himselfe in a glasse. . . . To conclude, hee is become a savadge creature, haunting the shadowed places, suspicious, solitarie,emie to the Sunne, and one whom nothing can please, but onely discontentment, which forgeth unto it selfe a thousand false and vaine imaginations.

Drawing on the Arabs and the ancients, Du Laurens described several well-known melancholy delusions, such as the man who feared he had become a rooster or the man who feared that if he urinated, he might flood the world. Another famous melancholy madman thought himself made of glass, and yet others thought they had swallowed a serpent or a frog. Interestingly, the standard cure for such ailments often required the physician to play along with the

fantasy rather than trying to argue with the patient. In this therapeutic drama, a sick fantastic might come to recognize the absurd contradictions in his or her mind.

In rare instances, Du Laurens claimed that the cold and dry humor (black bile) might grow hot, causing “a kinde of divine ravishment, commonly called Enthousiasma, which stirreth men up to plaie the Philosfers, Poets, and also to prophesie: in such manner, as that it may seeme to containe in it some divine parts.” With a suggestion like this, Du Laurens showed how dangerous it was to mix medical and religious ideas, for if the humor of melancholy could explain the pretense of having direct access to God, more radical interpreters might move on to argue that all revelation, all prophecy, was the product of a sick mind. During the seventeenth century, this line of argument became a polemical weapon to debunk “fanatics” and “enthusiasts”—religious writers or leaders who based their essentially personal, mystical, or charismatic authority upon some supposed special access to God. During the eighteenth-century Enlightenment, this strategy was sometimes employed even against the supposed irrationalities of revealed religion.

Usually, medical thinkers avoided speculating about religious matters, but by 1600, a few medical writers were developing theories of magic, spirits, demons, or preternatural forces as a way of updating their understanding of illness, and especially of madness. Physicians began to write treatises on demonic pathologies; students now defended theses such as the 1650 Leipzig dissertation entitled “Diseases Arising in Spells and Witchcraft.” Even when they accepted the role of demons and their power to cause all manner of illness, however, physicians strove to understand demons as part of nature, applying Aristotelian categories to their theories of what spirits could actually do. Most often in these discussions, the devil was thought to act through nature, disordering the humors, stirring up the natural passions, disturbing the sense of vision or of hearing so that while the illness or madness might originate in witchcraft or in demonic possession, these disorders remained natural in the important sense that they were caused immediately by the familiar disorders of humors and vital spirits that were entirely physical and natural.

PARACELSUS

Perhaps the only physician to coordinate demonic theories with a whole system of thought was Theophrastus of Hohenheim, better known as Paracelsus (1493–1541). He developed an astrological and religiously infused medical theory that paid close attention to the parallels and connections between sin and madness. He was such a medical heretic, however, that he lost his teaching position at the University of Basel and spent the rest of his life as an itinerant preacher and healer. In his view, demons were as real as humors, and one’s physical and mental health mirrored one’s spiritual condition. Orthodox university medicine could not easily integrate Paracelsus’s strangely religious and experiential doctrines, but most sixteenth-century academic physicians were usually ready to admit that demons could indeed infest a person.

THE SOCIAL HISTORY OF MADNESS

Michael MacDonald has explored these overlapping areas of theory and expertise by studying the life and work of a seventeenth-century Anglican priest and medical practitioner, Richard Napier. Napier deployed a full range of Neoplatonist therapies—judicial astrology, alchemy, amulets, and even angelic consultations—to help him treat his far-flung clientele. Even among the orthodox, remedies for madness usually included purges, sweats, vomits, and bleeding as well as herbal concoctions, changes in diet, hot or cold baths, travel to different climates, music, alcohol in moderation, and sometimes prescribed doses of sex. University-trained physicians did not usually prescribe verbal therapies, talk sessions, amulets, magic, pilgrimages, or prayer.

On the other hand, when their methods failed, patients tried a host of nonmedical and unorthodox therapies. In the case of the last duke of Jülich-Cleves, Johann Wilhelm (1562–1609), for example, orthodox Galenic physicians first tried to heal him of his madness, but after several years of fruitless efforts, his councillors authorized a series of highly irregular cures: a regimen of astrology, magic, holy water, consecrated salt, Latin prayers, and exorcisms, herbs soaked in beer, and amulets sewn into his waistcoat and the soles of his shoes. Two women provided folk remedies and homemade potions, to no effect. An English “wonder doctor” managed to establish rapport with the prince, but the underlying melancholy remained, and so the

university-trained doctors turned to concoctions of alkermes (ground insects), bezoar stone (a calculus from the stomachs of goats or other ruminants), and theriac (a mixture of seventy drugs used to combat poison). Finally, they concluded that their duke was either bewitched or possessed; therefore, priests began to deploy elaborate exorcisms, including some that Rome might well have condemned. For example, they engraved a devil on a lead plate and beat it with rods; they fitted out Johann Wilhelm's mattress with blessings and crosses and fumigated his chambers with incense. By late 1605, however, the exorcists were also giving up.

This example shows how difficult it can be to speak of early modern medical imperialism, the process in which overconfident physicians claim competence over disorders that are moral or legal. Around 1600, orthodox physicians agreed that they could hope to heal only natural illnesses and that if natural remedies weren't working, it might be worth trying spiritual cures. But when exorcisms failed, Catholic confessors and priests concluded that their failure was due not to the weakness of spiritual remedies in general but to the fact that the mad duke was really insane, and thus beyond their ministrations.

MICHEL FOUCAULT AND THE CARE OF THE MAD

It is also difficult to generalize about the care provided for the poor. Most families, however impoverished, were expected to take care of afflicted or disabled family members, but increasingly from the sixteenth century onwards, they could send suffering or incompetent relatives to newly founded hospitals. There they might receive room and board or even certain modest kinds of therapy. Forty years ago, Michel Foucault argued that a "Great Confinement," beginning in the seventeenth century, incarcerated the mad along with other "unproductive" or "immoral" segments of society, but it has become clear that in many countries, hospitals, private asylums, and small urban work-houses remained the favored receptacle for those of troubled mind. A large-scale confinement of the insane really began in the nineteenth century under circumstances rather different from those sketched by Foucault. Rab Houston and Roy Porter have also shown that in Scotland and England religious motives and explanations remained important well into

the eighteenth century, that "madness" was hardly a mere label attached to the undesirable, and that healing the mad remained the goal of physicians throughout the early modern period. The so-called Age of Reason did not produce a novel intolerance of "unreason," and did not treat the mad as brute animals. Foucault's work has stimulated a great deal of fresh research, but many of his conclusions have been sharply revised.

GENDER

Despite the fact that early modern society enforced a wide range of gender distinctions and often placed women under the control of men, there is little evidence that madness was seriously "gendered." Most mental disturbances were suffered as commonly by men as by women; men were as likely to be incarcerated or mistreated as a result of their madness; and even hysteria (which because of its supposed origins in the womb pertained only to women) was balanced by other madneses that were thought to afflict men more often. A close analysis of these comparisons reveals, however, that they rely too often upon a hopelessly inadequate statistical base. We rarely have good evidence of the numbers of persons of either gender diagnosed as mentally disordered; and so, at this time, many ingenious comparisons are little better than guesses.

ROBERT BURTON AND MELANCHOLY

Probably the best introduction to early modern attitudes toward madness is Robert Burton's *The Anatomy of Melancholy* (1621). This Oxford Anglican was a solitary, often depressed, academic, whose great book is a treasure of the English language but also a massive monument to the richness of melancholy as a diagnosis and as a metaphor for life. Despite his familiarity with the vast medical literature, Burton was also steeped in the Platonic tradition, in which melancholy could be the source of genius, prophecy, and poetry. Thus, Burton was careful to maintain a difficult balance between the biomedical Galenic model of madness as a physical illness and the mental or spiritual model of madness as sin but also the source of exalted mental states. From this balanced perspective, Burton was well equipped to criticize what he thought were the two scourges of his day: infatuated love and religious enthusiasm. His lengthy sections on love madness were perhaps a response to the growing value placed

by some on love as the one true good required for happiness. Burton's critique of religious enthusiasm stemmed from his conservative sense that Scripture and church would not long survive if mystics, prophets, and other inspired spokesmen made good their claim to have direct links with the divine. Burton's critique of love and religious enthusiasm surely did not curb infatuated lovers or God-besotted fanatics, but his treatise robbed these figures of some of their self-proclaimed license, their claim to special authority and unique insight. As Michael Heyd has shown, this style of analysis became a common means during the Enlightenment of debunking the special claims to religious insight of Pietists, mystics, and even the advocates of traditional religion.

Madness has always been entwined with the social and philosophical problems of its age. As the most malleable early modern source of madness, melancholy, the black humor, found itself deployed to explain genius as well as folly and was used to justify a wide range of medical and social responses. Even though anatomists and physicians from the mid-seventeenth century onwards had increasing trouble locating black bile in the human body, melancholy remained a powerful concept down to the nineteenth century.

MADRID. Since 1561, Madrid has been the capital city and administrative center of Spain. At an elevation of 2,100 feet (640 meters), the city is located in the interior, near the Guadarrama and Gredos mountain ranges in an area of sparse rainfall (17 inches, or 460 mm, per year) and of hot summers and cold winters by Mediterranean standards.

Prior to the reign of Philip II, Madrid had no particular significance as a city. Muslim rulers constructed a fortress, or *alcazar*, at the site, and a system of underground wells supplied water. Under Christian rule, Madrid developed to the east of the alcazar. It was among the places visited regularly by the rulers of Castile, who had no fixed capital city. Chronicles report that Queen Isabella I (ruled 1474–1504) held public audiences and dispensed justice in Madrid's alcazar, and the first Habsburg ruler of Spain, Charles I (1516–1556; also ruled as Emperor Charles V of the Holy Roman Empire, 1519–1556), imprisoned Francis I of France in Madrid after his capture at the Battle of Pavia in Italy. East of Madrid, overlooking the fields, the Monastery of San Jeronimo stood, supported in part by royal donations.

By 1560, Madrid had grown to about 2,500 homes, or about 12,000 to 14,000 inhabitants. In 1561, Philip II (ruled 1556–1598) abandoned the

tradition of a traveling court and settled in Madrid in the refurbished alcazar. He built the Escorial, at once a summer residence, monastery, and mausoleum, at a higher elevation northwest of the city to escape Madrid's summer heat. The complex, restrained in design, was the work of Juan de Herrera, and Philip II personally supervised its construction. Madrid itself was crowded with courtiers and administrators, and the people of Madrid were initially required to house them on the upper floors of their own residences. By the 1580s, the early theater works of Lope de Vega and Cervantes were being performed in Madrid; theater grew in popularity under the rule of Philip III (ruled 1598–1621), who briefly relocated the capital of Spain to Valladolid (1601–1606).

Although nobles were ordered to leave an increasingly crowded Madrid in 1611, the population had grown to over 100,000 by 1621. Madrid had no medieval city walls to limit its size, and it continued to expand. The San Jeronimo monastery was the eastern boundary of the city until Philip IV (ruled 1621–1665) constructed his own new palace, the Buen Retiro, outside the city proper and to the east of San Jeronimo. Philip IV departed from the more severe style of his grandfather Philip II; the elaborate grounds housed gardens, a lake, a theatre and a zoo. The first Bourbon ruler of Spain, Philip V (ruled 1700–1746), attempted to remodel the Buen Retiro in the French style. Later rulers settled in the Royal Palace, constructed at the site of the alcazar, which was destroyed by fire. Charles III (ruled 1759–1788) was the first to occupy the Royal Palace. An Enlightenment-era ruler, he opened the grounds of the Buen Retiro to the public and created an observatory, a botanical garden, and a Museum of Natural Science within the city.

Madrid played an important role in the development of Spain's economy from the sixteenth to the nineteenth century. The heart of the Spanish empire, Madrid was nonetheless remote from the coastal cities that provided for and profited from imperial trade. Madrid, in fact, had to be supplied overland, having no navigable rivers nearby. Transportation costs thus made Madrid's own production of any goods other than merino wool too expensive to be profitable. It was said that Madrid manufactured only reputations.

From 1561 forward, Madrid's consumption of both subsistence and limited luxury goods also affected the economic development of other cities of the interior, notably Toledo. This effect was not immediate; as late as 1615, when Part II of Cervantes's *Don Quixote* was published, Sancho Panza's wife could request a hoop skirt from either Madrid or Toledo. But Madrid's population grew significantly during the reign of Philip III. By the 1630s, the city reportedly held more than 200,000 inhabitants and was the only interior city of this size in Spain. Madrid's demand for foodstuffs caused shortages and high prices in Toledo and elsewhere, driving migration to the capital. Madrid became a consumer of both goods and people, yet its demand for goods was not sufficiently deep or varied to encourage the economic growth of the interior. In the seventeenth century, even within Madrid, 75 percent of the population lived at subsistence level.

Madrid was first and foremost a political city, a capital deliberately chosen to be an administrative center, and if it acted as an economic link between coastal and interior Spain, it also undermined the economic development of the interior. Madrid can thus be considered a contributor to Spain's economic decline in the seventeenth century, rather than an engine of growth.

MARY HOYT HALAVAIS

MAGELLAN, FERDINAND (Fernão Magalhães; c. 1480–1521), Portuguese navigator. Magellan was born into a Portuguese noble family of French origin, possibly at Ponte da Barca in

Ferdinand Magellan.

northern Portugal. In 1492, he became a page in the queen's court. In March 1505 Magellan and his brother enlisted in the fleet of Francisco de Almeida, bound for India down the Atlantic coast of Africa to the Cape Verde Islands and around the Cape of Good Hope. Almeida sailed in East African waters for more than two years, sacked Mombassa, and established a string of Portuguese forts to serve as trading centers and to guard the sea lanes to India, where Magellan arrived from Mozambique in October 1507.

By the time of his arrival he had served first on a brigantine, then on a caravel in combat in the Arabian Sea. Under the command of Nuno Vaz Pereira on the caravel *Santo Espirito*, he participated in the Portuguese defeat, at the hands of a huge Egyptian Mamluk fleet fortified by Venetian gunships, which broke the Portuguese blockade of the Red Sea. Soon afterward he was dispatched, under Pereira's command, to the Maldiv Islands, but made instead for the port city of Colombo, having been blown by a storm to the coast of Ceylon (present-day Sri

Lanka). Magellan participated in the great sea battle of 2 February 1509, in which Almeida's fleet defeated the Mamluk-Venetian coalition at Diu (which became a Portuguese colony), a battle in which Pereira was killed and Magellan seriously wounded. Magellan was involved in intelligence on the Malabar coast, along with his cousin Francisco Serrão, to assess both the strength of local navies and the organization of local trade, which they found to be in the control of Arab merchants. Each of them was given the command of a caravel and promoted to the rank of captain. Magellan was again wounded in the botched attempt, under the command of Affonso de Albuquerque, architect of Portugal's Asian empire, to take Calicut.

Magellan was present at the capture of Malacca in August 1511. Serrão subsequently became director of the Portuguese factory at Ternate, a small town on the island of the same name that the Portuguese fortified and held 1522–1574, and which was used most importantly as a base for the clove trade, and invited Magellan to join him there. Instead, Magellan is thought to have made an illicit voyage, most likely northeast from Malacca to Amboyna, possibly coasting the Philippines. He was relieved of his command and, after eight years in the East, returned to Portugal. He served in a Moroccan campaign under the duke of Braganza in 1514, as a result of which he became embroiled in a corruption scandal which landed him in the bad graces of King Manuel I (ruled 1495–1521).

Like Columbus before him, Magellan thought he might have better success in Spain. He arrived in Seville in October 1517 and, working through the merchant community, eventually secured royal approval for a voyage westward to the Indies. He thought the Moluccas (Spice Islands) were close to South America and thus within the Spanish sphere of influence. His idea was to follow up on Amerigo Vespucci's (1454–1512) third voyage and seek a passage to the Indies around the tip of South America. Magellan had interviewed survivors of Juan de Solis's ill-fated voyage to the Río de la Plata in 1515 and deduced that the continental tip of South America lay within the area assigned to Spain.

The primary motive for the voyage was economic. Spain wanted to trade in the East Indies, but Charles V did not know (as Magellan surely did)

that the Moluccas were already in Portuguese hands. Perhaps Magellan thought there were other islands as potentially lucrative but as yet unclaimed. His fleet skirted Brazil to avoid any clash with the Portuguese and, at the mouth of the strait now called by his name, two of his five ships were lost, one by shipwreck, the other by mutiny. The remaining ships navigated the straits in thirty-eight days. Magellan reached Sebu in the Philippines in April 1521, where he became involved in a local war and was killed, along with forty of his men. He was succeeded by his second-in-command, the Spaniard Juan Sebastián del Cano (or Juan de Elcano), who continued on to the Moluccas and became the first captain to have sailed around the world.

The geographical impact of the circumnavigation was enormous, not only because of the new geographical data that it produced, but also because it demonstrated irrefutable proof of the sphericity of the Earth as well as the preponderance of water over continental masses on the Earth's surface, in contrast to what many geographers and explorers of Columbus's generation had believed.

MAGIC. Modern historians have reclaimed the term *magic* from anthropologists and social scientists who question its utility as a category and its existence as a phenomenon. Although an admittedly ambiguous and elastic term, *magic* was used by early modern Europeans to describe a complex of thought and practice involving the apparently disparate fields of religion, science, and language. Many

of the most sophisticated intellectuals and theologians of the early modern period include magic in their discussions about the nature of physical reality, the causes of suffering and misfortune, the rationale of history, the foundations of political authority, the institutions of the church, and the basis of morality and ethics. Consequently, magic is a legitimate and important field of study, and understanding such pivotal events as the Protestant Reformation, the Catholic Counter-Reformation, the scientific revolution, the Enlightenment, and Romanticism will remain incomplete until historians investigate the complex and varied attitudes toward magic that emerged between the fifteenth and eighteenth centuries.

CHARACTERISTICS OF MAGIC

Magic is best defined as a form of esotericism based on a view of the world as an integral whole composed of interacting spiritual and material forces that human beings can understand and manipulate for good or evil purposes. It encompassed a wide range of activities, such as astrology, alchemy, medicine, divination, necromancy, and conjuring. While this definition holds true for magic over the millennia, only during the early modern period was "black" magic equated with demonic witchcraft and made into a serious criminal offense. At the same time there was a growing interest in and respect for "natural," or "spiritual," magic that began in the twelfth century, reaching its apogee during the Renaissance and early modern period. Scholars agree that this type of elite magic contributed to developments in science, although they disagree about the nature and extent of these contributions. The traditional idea that magic disappeared with the triumph of science overlooks the fact that the decline in witchcraft prosecutions occurred in the mid-to-late seventeenth century, before Enlightenment thinkers embraced the new science and while a magical worldview was still valid for most people. Magistrates and judges, not philosophers and scientists, were the first to doubt the reality of demonic magic and to put a stop to witch prosecutions. While it is true that demonic magic lost its credibility among most European intellectuals and professionals, ordinary Europeans continued to explain misfortune in terms of the evil acts (*maleficia*) of evil individuals. Furthermore, alchemy and astrology appealed to many intellectuals throughout

the eighteenth century, and new forms of occult and esoteric thought (mesmerism, phrenology, physiognomy) emerged to answer questions mechanical and atomic scientific theories could not.

Much of early modern magic represented a continuation of traditions and practices that developed in the medieval period from a synthesis of classical, Jewish, Islamic, and Christian concepts of magic with indigenous Celtic, Germanic, Scandinavian, and Slavic traditions as these groups were converted to Christianity. It is difficult—though in some cases possible—to separate these various strands because they were so thoroughly mixed with Christian elements. Although some scholars continue to distinguish magic from religion on the grounds that magic attempts to manipulate supernatural forces, while religion is directed at divine entities who can be supplicated but not controlled, this distinction is untenable. Saints' prayers often have coercive force, while magical charms and rituals have a supplicatory element. Furthermore, Christianity shared many assumptions that were basic to a magical worldview. Foremost among these was that of a vitalistic universe divided into three levels, the super-celestial, celestial, and terrestrial, each of which was intimately linked to the others through a series of correspondences, sympathies, and antipathies that might be hidden (occult) but that were regular, rational, and discoverable. Christianity and magic also agreed on the existence of invisible, spiritual entities (angels, demons, devils), who interacted with humans in many ways, including sexually. Christianity and magic both emphasized the power and efficacy of words, a belief that was intensified by the Christian reliance on the spoken and written word and by the notion of Christ as the incarnate word of God. Many magical prayers and formulas were simply adaptations of Christian formulations. A further link between Christianity and magic was the belief that hidden powers and virtues existed in natural objects (amulets, talismans, relics, holy water, the sign of the cross, the Eucharist, church bells), which could be tapped for human use. Given these similarities, one can conclude that “[a]cross Europe, throughout the centuries . . . magic often seems indistinguishable from religion” (Clark, p. 110).

VARIETIES OF MAGIC

On a popular level, magic was practiced extensively to deal with problematic events or situations from childbirth and childcare to animal husbandry, sickness, misfortune, lost or stolen objects, divination, business affairs, traveling, falling in or out of love, counteracting witchcraft, and even such mundane activities as shutting windows at night. Magical remedies, rituals, and formulas can be found in necromancer manuals, medical textbooks, scientific texts, the lives of saints, and courtly romances. Since magical practices were so varied, one way of categorizing them is by their intended results: healing, protection, divination, obtaining a desired object, the acquisition of occult knowledge, or simply entertainment. While astrology was a recognized part of academic medicine, magical healing was reserved primarily for diseases that were considered “unnatural” (madness, possession, nightmares) or whose causes were unknown (sudden strokes, heart attacks, seizures) and consequently attributed to the evil machinations of sorcerers, witches, demons, elves, or dwarfs. In these cases, magicians and healers patterned their actions after those of Jesus and the saints and conjured spiritual forces by ritual actions, prayers, blessings, exorcisms, and the use of amulets, talismans, relics, the sign of the cross, holy water, and nostrums made variously from herbs, animal parts, stones, or gems. Next to healing, the most popular form of magic was divination, a practice emphatically rejected by Christian authorities. Charts and manuals existed for reading signs about the future in the sky or in animals, plants, parts of the human body, and dreams. Love magic was used both to seduce and to cause impotency, a common theme in both courtly romances and inquisitor's manuals.

Like popular magic, “spiritual” and “natural” magic were concerned with issues of healing, protection, and divination, but there was a greater emphasis on the acquisition of occult knowledge as a prerequisite to successful magical practices. Broadly, one can say that “spiritual” magic was a form of religiosity whose goal was to attract beneficial divine and spiritual forces into the soul of the operator. Marsilio Ficino (1433–1499) was the most famous Renaissance practitioner of this kind of magic. Language was an important element in Ficino's magic because he believed words had intrinsic powers. A

similar emphasis on the power of words appears in the work of Jewish Cabbalists like Abraham Abulafia (1240–after 1291) and Joseph Gikatilla (1248–after 1305) and their Christian counterparts, Pico della Mirandola (1463–1494) and Johannes Reuchlin (1455–1522), who believed that Hebrew was a repository of secret wisdom. In his *De Verbo Mirifico* (1494), Reuchlin claimed that Jesus’ name in Hebrew had the power to revive the dead, cure the sick, exorcise demons, turn rivers into wine, feed the hungry, repulse pirates, and tame camels. A similar kind of magical power was attributed to Egyptian hieroglyphs by Athanasius Kircher (1601–1680). It is not always easy to distinguish between “spiritual” and “natural” magic, nor between “spiritual” and “demonic” magic, for all three were concerned with the spiritual state of the practitioner and were thought to have transitive effects. Necromancy and black magic were an established part of medieval magic and continued throughout the early modern period. The *Picatrix*, derived from an Arabic source, mixed spiritual and demonic magic with astrology and was widely influential. This kind of synthesis comes out clearly in the work of Cornelius Agrippa (1486–1535), whose *De Occulta Philosophia* (enlarged edition 1533) discusses astrology, mathematics, mechanical marvels, numerology, universal harmony, the power of music and incantations, images for talismans, and the occult virtues in natural things. Agrippa claims that whoever wishes to be proficient in magic must study natural philosophy, mathematics, astrology, and theology. Only when he has mastered these disciplines will he attain the highest level of understanding through an act of mystical illumination and become a true magus. A characteristic feature of this kind of magic is its “intense religiosity and sense of piety” (Clark, p. 150). Giambattista Della Porta’s *Magia Naturalis* (1588) was another popular work on natural magic that described procedures for such diverse things as transmuting metals; producing exotic plants and animals through grafting and cross-breeding; cutting, conserving, and cooking meat; staving off baldness; eliminating wrinkles; and engendering beautiful children.

CHANGING ATTITUDES

Around 1400 there was a radical change in attitudes toward magic on the part of religious and secular authorities. No longer seen as a body of supersti-

tious and largely illusory practices that could be eradicated through a combination of missionary activity and the counter-use of Christian ritual—a view characteristic of the Middle Ages—magic and magicians came to be viewed as a demonic fifth column threatening the very existence of Christian civilization. This negative view of magic was reinforced by the Protestant attack on Catholic sacraments, rituals, and miracles as demonic. For the most part, however, Catholic and Protestant authorities distinguished between “popular” magic, whose practitioners were prosecuted as witches and sorcerers in league with the devil, and “learned” or “spiritual” magic, which was generally tolerated and widely practiced at European courts because of its promise of wealth and prestige and its sheer entertainment value. But even when tolerated, magicians inspired ambivalent attitudes, for beneficent “white” magic might easily be perverted into “black” magic. For this reason, two of the foremost demonologists of the sixteenth century, Jean Bodin (1530–1596) and Martin Del Rio (1551–1608), condemned all magic as demonic.

The increased concern with demonology and witchcraft in the early modern period has been attributed to the religious conflicts stirred up by the Reformation and Counter-Reformation. Recent research has shown, however, that it was not religious conflict per se that encouraged witch hunts but the new age of “confessionalism” that accompanied reform movements, heightening religious fervor and the concern with eradicating religious deviance. In more general terms, the increased fear of magic and sorcery was a response to increasing political and religious insecurity and social unrest. The Black Death, the Great Schism, the proliferation of heretical movements in the high Middle Ages, the discovery and dissemination of new texts, printing, trade, travel, and the discovery of the New World all undermined established truths and called into question the idea of divine providence and God’s omniscience and benevolence. Misfortune, uncertainty, and insecurity called for a new theodicy, and this was supplied by demonologists and witch theorists. Neither irrational nor unscientific, they deployed all the resources available from natural philosophy and theology to vindicate the goodness of God and the truth of the Bible. Witchcraft theory was a kind of “theological damage control” (Steph-

ens, p. 366) that let God off the hook for seeming injustice by attributing evil and misfortune to the activities of men and women in league with the devil.

The fact that the fear of sorcerers and witches was most intense during the period of the so-called scientific revolution (1570 to 1680) undermines the idea proposed by Enlightenment thinkers (Comte, Condorcet) and nineteenth- and twentieth-century social anthropologists (Edward Tylor, James Frazer, Bronislaw Malinowski) that magic represented an early stage of human development superseded first by religion and finally by science. Modern scholars reject this progressive view in favor of a conceptual history of magic that emphasizes it as an inextricable element in the religious, political, and scientific discourse of various time periods. In the early modern period, attitudes toward magic and witchcraft have been shown to correlate with political and religious views. For example, those committed to the divine right of kings and Tridentine Catholicism had a greater tendency to support the persecution of magicians and witches than humanists, libertines, and skeptics, who took the Machiavellian position that the magic and witchcraft were delusions manipulated for the benefit of those in power.

SKEPTICISM ABOUT MAGIC

There was also a correlation between magic and science. The argument that magic was a substitute for real science and technology is simply wrong. The widespread practice of magic suggests that it was considered effective, and the lively debate about the efficacy of magic is now recognized as a contributing factor to the development of science. Lynn Thorndike described magicians as the first experimental scientists. Frances Yates emphasized the role played by “occult” philosophy in stimulating science. Although her claims have been modified, it is clear that the natural magic tradition influenced important scientific figures such as Paracelsus (1493–1541), Daniel Sennert, Jean Baptiste van Helmont (1579–1644), Girolamo Cardano (1501–1576), Francis Bacon (1561–1626), John Dee (1527–1608), and members of England’s Royal Society. The paradox was that as demonologists debated with their critics about whether the effects of witchcraft, sorcery, and magic were natural or diabolical,

they promoted the very skepticism they were at pains to allay. Among the skeptics were Pietro Pomponazzi (1462–1525), who offered naturalistic explanations for the power of incantations; Johann Weyer (1515–1588), who turned to medicine, arguing that witches were simply insane old women; and Reginald Scot (1538–1599), who denied that incorporeal spirits could have contact with humans. Even more damaging were those like John Wagstaffe (1633–1677), who concluded that witchcraft was simply a politically useful tool, an idea that led Francis Hutchinson to conclude in 1718 that beliefs about witches and sorcerers were products of their historical contexts. Witch-hunting was therefore not an anomaly in the age of the so-called scientific revolution but a constituent part of it. Underlying the debate over magic and witchcraft were fundamental issues concerning the authority and credibility of the Christian revelation; the physical constitution of the created world; the nature of causality; and the basis of politics, ethics, and morality. Every one of these involved the more general problem of what constitutes valid evidence and how knowledge may be obtained. But however beneficial this kind of scientific questioning and skepticism was in the long term, it was not immediately responsible for the decline of witch-hunting. That fell to the judicial skepticism—created largely by the excesses of witch-hunting—which led those in charge of witch trials to demand more restraint in the use of torture and stricter standards of evidence. As a result of changes in judicial procedures, mass panics ended, more of the accused were acquitted, and courts became increasingly reluctant to initiate prosecutions. This did not happen because judges, magistrates, and inquisitors denied the reality or possibility of witchcraft but because they increasingly came to believe that witchcraft was not a crime that could be proven by law.

MALPIGHI, MARCELLO (1628–1694), Italian physician and anatomist. Malpighi was born in Crevalcore, near Bologna, on 10 March 1628. He graduated in medicine and philosophy at the University of Bologna in 1653, and he taught logic at the same university until 1656, when he was called to the chair of theoretical medicine at the University of Pisa. Three years later he returned to Bologna, lecturing in theoretical and practical medicine. From 1662 to 1666 he held the chair of primary professor of medicine at the University of Messina. He then returned once more to Bologna, where he taught practical medicine until 1691, the year in which he moved to Rome in the capacity of chief physician to Pope Innocent XII. He died in Rome on 30 November 1694. These institutional settings are of a special importance in understanding his development as an anatomist, physician, and natural philosopher. Although he was trained at Bo-

logna in the traditional course of scholastic disciplines, he also attended with other select students the private dissections and vivisections conducted by the university professor Bartolomeo Massari. In his time at Pisa he met Giovanni Alfonso Borelli (1608–1679), professor of mathematics there, and their ensuing collaboration was crucial in bringing Malpighi closer to corpuscularianism (the idea that the visible properties of matter derive from the interactions of minute particles of matter), to mechanical philosophy (the view that every natural phenomenon can be explained through matter and motion), and to Galileo's natural philosophy. In Messina he found a congenial environment for his investigations on marine animals and the sensory organs. Finally, from 1667, correspondence with Henry Oldenburg and the relationships that he established with the Royal Society brought Malpighi into closer contact with English experimental physiology.

Malpighi's works display a wide range of interests. In *De Pulmonibus* (On the lungs; Bologna, 1661), composed in the form of two letters addressed to Borelli, he announced his discovery of capillary circulation and gave a detailed account of the vesicular structure of the human lung. In *Epistolae Anatomicae de Cerebro ac Lingua* (Anatomical letters on the brain and the tongue; Bologna, 1665) and in *De Externo Tactus Organo* (The external organ of touch; Naples, 1665), he made his discovery of the sensory receptors of the tongue and cutaneous papillae part of a far-reaching project in neuroanatomical research. *De Viscerum Structura* (The structure of the internal organs; Bologna, 1666) and *De Structura Glandularum Conglobatarum* (The structure of the conglomerate glands; London, 1689) present Malpighi's main theoretical view of the gland as the building block of the body's mechanical structure. In *De Bombyce* (On the silkworm; London, 1669) he investigated the anatomy of insects, and he gave an accurate description of the development of the chick in *De Formatione Pulli in Ovo* (The development of the chick in the egg; London, 1673), adding new evidence in support to the preformationist hypothesis, that is, the idea that the organism is already present and fully developed in the seed or egg. In *Anatomes Plantarum* (Anatomy of plants; London, 1679), Malpighi made use of the microscope and its related techniques in the

study of animal and vegetable anatomy with great dexterity and profit. In *De Polypo Cordis* (On the polyp of the heart; 1666), he argued that the examination of pathological states, natural anomalies, and monstrosities could shed light on the normal functioning of organs and on the general processes of nature, thus laying the foundations for a research program centered on localizing the anatomical seats of disease.

From an anatomical point of view, Malpighi's work is a clear example of experimental investigation conducted in the wake of William Harvey's discovery of the circulation of the blood. Philosophically speaking, the main influence comes from Galileo's redefinition of matter, motion, and nature. Distancing himself from Descartes's extreme views on the mechanization of the body and the thorough identification of natural productivity with mechanical agency, Malpighi did not rule out the animate and sentient character of the body, and he emphasized the unattainability of perfection in the natural mechanics of living beings. Being both a theoretical anatomist and a physician—his *Consultationes Medicinales* (Medical consultations; Padua, 1713; Venice, 1747) are evidence of his clinical expertise—Malpighi represents the intriguing case of an early modern practitioner confronted with the need to harmonize theory (a new image of the body) and practice (the continuing success of traditional therapy) in the context of the new medical discourse.

GUIDO GIGLIONI

MANDEVILLE, BERNARD (1670–1733), satirical writer and medical doctor. A specialist in nervous disorders, Bernard Mandeville was a Dutchman whose family had included physicians for generations. He received a classical education at the Erasmian school in Rotterdam. At the University of Leiden he studied medicine but also wrote a philosophical treatise on the ancient question of whether or not animals had souls. His cosmopolitan background led to a close knowledge of French skeptical literature and particularly the writings of Pierre Bayle (1647–1706), which influenced him considerably. Mandeville emigrated to London around 1691, possibly because of his involvement in local political disturbances, known as the Costerman Tax Riots, in Rotterdam in 1690. He settled down to a successful medical practice and married an Englishwoman, Ruth Elizabeth Laurence. Mandeville counted among his friends the eminent physician Sir Hans Sloane (1660–1753).

Mandeville's literary career began with the publication of a Hudibrastic poem entitled *The Grumbling Hive; or, Knaves Turned Honest* (1705), in which he began a satirical attack on Puritan asceticism that lasted his whole life. With the addition of prose essays, the poem grew into the first part of *The Fable of the Bees* (1714). A second part appeared in 1729. One of the appended essays dealt with the subject of charity schools, which, Mandeville controversially argued, would create discontent among the poor by overqualifying them for the (menial) tasks that they needed to do to make a living and that society needed them to do for its survival. The polemical subtitle, *Private Vices, Publick Benefits*, pithily encapsulated what later became known as the Mandevillean paradox, a questioning of the effects of adhering to an ascetic morality in a materialistic society.

The addition of the essay on charity schools to *The Fable of the Bees* led to a sometimes bitter public controversy engaging clerics and theologians like William Law (1686–1761), Joseph Butler (1692–1752), and Bishop George Berkeley (1685–1753), who all attacked Mandeville's work as morally corrupting. The Grand Jury of Middlesex condemned *The Fable of the Bees* to be burned by the public hangman, which added to Mandeville's notoriety and reputation as a freethinker. But the Mandevil-

lean paradox became a focal discussion of the Enlightenment in the eighteenth century. Adam Ferguson (1723–1816), David Hume (1711–1776), and Adam Smith (1723–1790) in Britain and Voltaire (1694–1778) and Jean-Jacques Rousseau (1712–1778) on the Continent felt the need to examine Mandeville’s assertion that luxury, far from being harmful, was the foundation of a flourishing, commercial society.

Mandeville wrote a number of other works, including one on nervous disorders and several on the subject of religion and its effects upon war. He also wrote pamphlets on important and topical social subjects, such as prostitution (*A Modest Defence of Publick Stews*; 1724) and hanging (*An Enquiry into the Causes of the Frequent Executions at Tyburn*; 1725). On these social questions his views, expressed journalistically, could be radical, in the English context, suggesting, for example, that prostitution should be regulated by the state. But his lasting fame and the critical attention he has received is primarily based on the ideas expounded in his *Fable of the Bees*.

MANILA. Spaniards founded the distinguished and ever-loyal city of Manila in 1571, after early settlements in the central Philippines proved economically weak. In 1565 Miguel López de Legazpi (c. 1510–1572) sailed from Mexico and settled in Cebu. Manila, however, was a better location for the Spaniards because of its magnificently protected bay on the southwest coast of Luzon, closer to the wealth of China. Upon arrival, they destroyed a

Muslim settlement under a Rajah Sulayman. The Spaniards resided within a fortress, known as Intramuros, on the banks of the Pasig River, while the Tagalog and Pampango natives lived in villages with a marketplace and a Catholic church. The Spanish governors, known as “the City and Commerce,” hoped that trade would flourish with riches from American silver and Chinese goods. The trade with China usually gave Manila prosperity and stability. Merchants with silks, porcelain, and manufactured items came to the entrepôt to trade for American silver brought by galleons from Acapulco. An average of 128 tons of silver a year crossed the Pacific Ocean between 1565 and 1815, when the last galleon put into Manila Harbor.

The forty-two thousand people of the city embodied many different histories. There were significant numbers of Japanese Christian refugees, possibly fifteen thousand *sangleys* (Chinese), seven thousand Spaniards, and a majority of twenty thousand *indios* (natives) from Tagalog, Pampango, and Visayan groups. Manila faced constant threats from Muslim raids, Chinese piracy, and Dutch attacks. The British captured the city in 1762 but returned it to Spain in the 1763 Treaty of Paris.

MANNERISM. The definition of the style of mannerism was the subject of scholarly debate in the mid-twentieth century, but no consensus was

reached. The term is most helpful when used to identify one style of art in central Italy between the High Renaissance and the baroque, c. 1520–1600. It has been used more loosely, and less effectively, both in art history and other disciplines, such as cultural history, music, and literature.

SIXTEENTH- AND SEVENTEENTH-CENTURY USAGE

The word *maniera* was used in the sixteenth century by the historian Giorgio Vasari and others to mean simply “style.” Although it usually has positive connotations, it can be used negatively to mean routine, as in Vasari’s reference to the late works of Perugino (born Pietro di Cristoforo), where monotony resulted from his excessive reliance on *maniera*. Giovanni Pietro Bellori associated *maniera* with a lack of proper invention and dependence upon habit or convention. For him, the interval between the High Renaissance and the renewal of art brought about by Annibale Carracci was a deviation in which artists departed from the model of nature and followed their imaginations instead, straying into fantasy. When Bellori says that artists vitiated art with *la maniera*, depending on *pratica*, ‘routine’, it calls to mind Vasari’s condemnation of Perugino.

MODERN INTERPRETATIONS

In its departure from the norm, *maniera* acquired a positive value in the climate of the early twentieth century, when the dismantling of the academy and of the authority of classicism was being celebrated. Walter Friedländer undertook a reexamination of mannerism in his influential essay on the anticlassical style (1925), interpreting the paintings of Jacopo da Pontormo, Rosso Fiorentino, Parmigianino (born Girolamo Mazzola), and (selectively) Michelangelo Buonarroti as expressing a rejection of classicism and a rebellion against it. In its conscious rejection of the norm and search for a new ideal of beauty, the mannerist painters stretched the proportions of limbs, elongated the body, narrowed the depth of space, and pressed figures against the picture plane. Together with his contemporary Max Dvorak, Friedländer found in mannerism relationships to the spiritual expressionism of their own time, especially German expressionism. Dvorak defined mannerism as an artistic means to express spirituality. He identified the deformations of Jacopo

Tintoretto and El Greco with mannerism; their styles are better explained, however, as Counter-Reformation responses to the call of the post-Tridentine church for affective sacred images.

Friedländer’s essay was not translated until 1957, but well before then the “anticlassical style” had established a firm foothold in Anglo-Saxon scholarship. He had focused on the Florentines of the 1520s, but Frederick Hartt applied his analysis to Giulio Romano (born Giulio Pippi de’Gianuzzi) and the other artists of Rome, and extended Heinrich Wölfflin’s exclusion of the last half-decade of Raphael’s career from the canon of classicism (see Wölfflin’s *Classic Art*). Hartt found evidence of anticlassicism in Raphael’s late workshop projects, where the overextended master had to rely heavily on his assistants, led by Romano, beginning in the Stanza dell’Incendio. Some scholars were skeptical of Hartt’s conclusions, and S. J. Freedberg, in particular, restored to Raphael and classicism much of what Hartt and Wölfflin had taken away.

By the 1950s scholars had recognized that anticlassicism could not explain the works of the second generation of artists, like Francesco Salviati, Il Bronzino, and Vasari. As a result of a proposal by Luisa Beccherucci calling for refinement of the definition of the style, a distinction was made between mannerism, which was applied to the first generation, and *maniera*, the second generation. A session of the International Congress of the History of Art in 1961 produced two seminal papers by Craig Hugh Smyth and John Shearman. Smyth deduced from a study of the period’s works “conventions of the figure” that were frequently repeated and constituted a set of rules for the *maniera* method of constructing images. Marcia Hall further developed Smyth’s brilliant insight that these conventions were derived from late antique relief sculpture, and she found the precedent and model for this “relieflike style” in the late work of Raphael (particularly, the *Battle of the Milvian Bridge*, 1520–1524, Stanza di Constantino, Vatican).

John Shearman’s paper was later developed into a book (1967). He undertook to redefine the style by uncovering the sixteenth-century meaning of *maniera* and restricting its definition. His examination of texts from that time determined that *maniera* could always be translated as ‘style’, so his defi-

nition excluded the expressive and the anticlassical, in fact the whole first generation of mannerism. It focused on style itself as an end, and *maniera* became “the stylish style” characterized by refinement, grace, sophistication, elegance, and artificiality. This has proved the most durable of the definitions offered in the twentieth century, although objections have been raised by Henri Zerner and Jeroen Stumpel. Zerner found fault with Shearman’s exclusion of all meaning. He credited Freedberg’s analysis of *maniera* (1965), which pointed to an “underlying anxiety” apparent, although masked, also in Vasari. Freedberg saw the stylization of *maniera* as a mask for a generation that recognized that “there was no longer any virtue in a simple statement.” Layered complexity of meaning was suggested by layered artistic reference, and quotations from earlier art were intended to be recognized and appreciated by a cultured audience. Stumpel (1988), insisting that mannerism is an invention of the twentieth century, held that no definition can be reconstructed from sixteenth-century usage.

Recently, Philip Sohm has successfully argued that conceiving and naming mannerism as a period style was a sixteenth-century invention. Vasari’s definition of *maniera* includes five terms indicating three kinds of qualities: technique or procedural routine (*modi*, ‘methods’, and *tratti*, ‘brushstrokes’); the intellectual, imaginative, or psychological generation of style (*arie* ‘expressions’ and *fantasie* ‘imaginings’); and *maniera* that refers to transcendent, aestheticizing beauty.

The mannerist style has had the greatest appeal during periods of social unrest because of its association with anticlassicism and, therefore, rebellion against the establishment. Today, the “anti” character of mannerism is largely discredited; efforts to interpret it as continuous with High Renaissance classicism receive more attention. In sum, there is little agreement in basic texts on the definition of mannerism.

MANSART, FRANÇOIS (1598–1666), French architect. The brilliant François Mansart, though praised as the “God of architecture” by the professor and theorist Jacques-François Blondel (*Architecture française*, 1752–1756), attained the international reputation he deserved only in the mid-twentieth century, thanks to Anthony Blunt. Mansart’s buildings synthesized the French and Italian classical heritage in an original and subtle play of volumes and sculpted surfaces. The numerous sketches and alternatives for his projects testify to his irrepressibly fertile imagination. Yet his design process also made him costly and difficult to work with. He was willing to tear down portions of his buildings two and three times during construction. He therefore rarely saw his designs completed, and his surviving buildings are often in fragments or have been greatly altered. The greatest monument to his art consists of approximately forty manuscript drawings that have been preserved.

Mansart’s commissions from the royal circle were thwarted or curtailed. His hopes of completely rebuilding the château (residential castle) of Blois for the presumed royal successor Gaston d’Orleans (1608–1660; brother to Louis XIII) were defeated with the birth of Louis XIV (ruled 1643–1715) in 1638. Only one wing was completed (1635–1638). In 1645–1646 he managed to build only the foundations and the facade, up to the first order (columns and entablatures), for the church of the Val-de-Grâce, when the exasperated Anne of Austria (1601–1666; wife of Louis XIII) replaced him with Pierre Le Muet (1591–1669). In 1664, Jean-Baptiste Colbert, the *surintendant des bâtiments* (royal superintendent of buildings) solicited Mansart’s designs for the expansion of the Louvre and, c. 1664–1665, for a mausoleum for the Bourbon dynasty at the abbey of St.-Denis. But Colbert soon abandoned Mansart because the latter was unable to settle on one of his multiple proposals.

Most of Mansart’s completed buildings are in the area of residential architecture, often built for the new socially ambitious class of financiers and royal officers. These include the châteaux of Balleroy (Normandy, from 1631); Berny (Val-de-Marne, 1623–1627); Maisons, built for René de Longueuil (Île de France, 1641–1660); Fresnes-sur-Marne (rebuilt by Mansart with the addition of a chapel

1644–1666); and a series of Parisian *hôtels* (noble town houses), the Hôtel de la Vrillière (1635–1650), Hôtel de Jars (1648), Hôtel Guénégaud du Plessis, (expanded 1648–c. 1660), and Hôtel Guénégaud-des-Brosses (1651–1653).

As was typical of architects of his time, Mansart came from a family involved in various building crafts. His father Absalon, who died when François was twelve, was carpenter to the king. François was trained by his brother-in-law Germain Gaultier, an architect and sculptor (and nephew of one of the greatest sculptors of the French Renaissance, Germain Pilon, c. 1525–1590), and by his uncle Marcel Le Roy, a master mason and civil engineer. Mansart did not travel to Italy, yet his collection of books attests to keen study of ancient monuments and French and Italian architects of the sixteenth and seventeenth centuries. Born the same year as Gian Lorenzo Bernini (1598–1680) and considered his equal by his French contemporaries, he also shared with his Italian colleague dual sensibilities in both sculpture and architecture.

Mansart’s buildings are often formed in overall pyramid-shaped masses, as exemplified by the Parisian churches of the Val-de-Grâce and the Minimes (1657–1665) or the châteaux of Balleroy and Maisons. Although some compositions did not employ orders (for example, Balleroy or the church of the Visitation, 1632–1634), Mansart typically used classical orders or ornament, down to the smallest molding, to create a tectonic system, which evoked its support structure and volumes. For example, on the Val-de-Grâce facade, the orders are superimposed vertically, while advancing and receding from pilasters to engaged columns and exquisitely articulating its volumes.

Although he did not invent the mansard roof, it is aptly named after him. Mansart used it to good effect, and it became widespread in his time. The roof’s truss system spanned wider building units than would otherwise have been possible. Thus Mansart’s Hôtel de Jars (1648) and Louis Le Vau’s Hôtel Tambonneau (1642–1646) were the first to have double-depth *corps de logis* (main residential areas of a hôtel), allowing for more complex floor plan, variety in size and function of rooms, and even diagonal axes (as in the Louvre). Mansart designed staircases with particular virtuosity, suspending

them from walls with an open well in the center, lit by a ceiling dome.

On a large scale, Mansart was sensitive to the placement of his buildings in their urban context; he proposed forecourts and designed his facades and

domes with urban vistas in mind. The low entry wall and elegant classical entrance of the Hôtel de la Vrillière emphasized its placement, unique for its day, on an axis from the street behind it (the rue des Fossées). Mansart's designs of châteaux such as Blois

and Maisons influenced the garden designer André Le Nôtre (1613–1700) by aligning the garden, the château, and the road approaching it in one long axis stretching out to the horizon. Mansart anticipated the collective work of architects and garden designers (for example, at Versailles) in his harmonious integration of building and landscape.

MANTUA. Surrounded on three sides by lakes formed by the Mincio River, the city of Mantua was almost impregnable militarily. The duchy of Mantua spread across the fertile Lombard plain. The prosperity of the city came from textile manufacturing, that of the countryside from agriculture. The city, which had a vibrant Jewish community, had about 40,000 people in 1550, which declined to 31,000 in 1600. Plague and siege between 1627 and 1630 devastated the city, whose population only recovered to 14,000 in 1650, then rose to between 21,000 and 24,000 in the eighteenth century. The duchy as a whole had some 300,000 people in 1600, but fewer after 1630.

The Gonzaga family, rulers of Mantua from 1328 to 1707, intermarried with other princely families of Italy. They also produced several cardinals and one saint, the Jesuit Aloysius Gonzaga (1568–1591). In the 1530s the Gonzaga acquired through marriage the marquisate of Montferrat in Piedmont, not contiguous with the duchy of Mantua. This included the town and fortress of Casale Monferrato, a coveted military position some 120 miles west of the city of Mantua. The Gonzaga family supported the Habsburgs in the dynastic struggles of sixteenth-century Europe, and individ-

ual Gonzagas served them as military commanders and administrators.

Mantua had one of the most splendid courts of Italy and Europe in the fifteenth, sixteenth, and early seventeenth centuries. As many as eight hundred persons—writers, artists, musicians, and even a troop of commedia dell'arte actors—enjoyed Gonzaga patronage in the early seventeenth century. Peter Paul Rubens (1577–1640) came to paint. Mantua also played a key role in the development of opera; Claudio Monteverdi (1567–1643) lived there from about 1590 to 1612, and his *Orfeo* (1607) and other works were first presented there. In 1625 Duke Ferdinando (1589–1626; ruled 1613–1626) founded the University of Mantua, where Jesuits taught humanities and philosophy, while laymen taught law and medicine. In order to pay for their splendid court, Gonzaga dukes sold assets. In 1627 Duke Vincenzo II (1594–1627; ruled 1626–1627) sold the family collection of Renaissance paintings (works of Titian, Andrea Mantegna, Correggio, Raphael, and others) to Charles I of England.

Gonzaga dukes seldom lived long, and they produced few heirs. On the death of Vincenzo II on 26 December 1627 without an heir, rival claimants to the duchy appeared. Carlo I Gonzaga-Nevers (1580–1637; ruled 1628–1637) of the French branch, with strong support from the French crown, slipped into Mantua to claim the title ahead of the leader of a branch of Italian Gonzagas, who accepted the traditional alliance with the Habsburgs. The French held the fortress towns of Mantua and Casale Monferrato, key military positions threatening Habsburg control of northern Italy. The Habsburgs sent an army to take back Mantua, and the War of the Mantuan and Montferrat Succession (1628–1631), an episode of the Thirty Years' War (1618–1648), began.

Unfortunately, the foreigners—most likely the imperial army—brought the bubonic plague with them. Because bad harvests had already weakened the duchy's population, the plague of 1629–1631 killed one quarter to one third. The historical novel *I promessi sposi* (1825–1827; *The Betrothed*) of Alessandro Manzoni (1785–1873) described the devastation and social dislocation in northern Italy as well as any historian could. The Habsburg army

overwhelmed the duchy in October 1629 and blockaded the city of Mantua. After a long siege, the army sacked and looted the city on 18–20 July 1630. At least two-thirds of the city's inhabitants died as a result of plague, lack of food, and violence. The university closed, and the city and duchy never recovered their former glory. Carlo I and his heirs retained the duchy, now shorn of Casale Monferato, as minor Habsburg clients.

In 1707 the Habsburgs exiled Ferdinando Carlo (1652–1708; ruled 1665–1708), the last Gonzaga duke, for helping the French in the War of the Spanish Succession (1701–1714) and incorporated duchy and city into the Austrian Empire. The Austrian government of Empress Maria Theresa

(1717–1780; ruled 1740–1780) instituted governmental reforms and supported Mantuan learning and the arts to some extent. After the Austrians were driven out of northern Italy, the duchy of Mantua joined the kingdom of Italy in 1866.

MANTUAN SUCCESSION, WAR OF THE (1627–1631).

The death in 1627 of Duke Vincenzo II without immediate heirs plunged the Gonzaga duchies of Mantua and Monferrato into crisis. Vincenzo's closest relative was Charles, duke of Nevers, from a branch of the Gonzaga who had established themselves at the French court. Despite his earlier involvement in revolt against the crown, contemporaries assumed that Nevers's succession would increase French influence in northern Italy. However Nevers's title was challenged by Charles Emmanuel I, duke of Savoy, whose family had long sought the second Gonzaga duchy of Monferrato. In Mantua itself, Nevers was opposed by another Gonzaga cadet, Ferrante, duke of Guastalla. Charles Emmanuel appealed to Spain and agreed to a partition treaty with the Spanish governor of Milan for the occupation of Monferrato, which would place the key fortress of Casale in Spanish hands. In Vienna, Guastalla raised doubts about the legitimacy of Nevers's inheritance, and in March 1628 the Gonzaga territories, as imperial fiefs, were sequestered pending the emperor's adjudication. Although committed to suppressing Protestant revolt at home, France provided military support for Nevers, and in early 1629 French forces broke a Spanish siege of Casale. In 1630 the war swung in favor of Spain and the emperor, with the siege and sack of the city of Mantua, but the Swedish invasion of Germany weakened imperial commitment to Italy, and in late 1630 the Spanish were obliged to concede terms. The Treaty of Cherasco (April 1631) ratified Nevers's inheritance, though providing territorial compensation for both Savoy and Guastalla. French success, and Spanish resentment at the outcome, paved the way for the resumption of open war between the two powers in 1635.

MARBURG, COLLOQUY OF. The Colloquy of Marburg (1 October to 5 October 1529) was a series of meetings designed to end the religious quarrel between the Lutheran and Zwinglian theologians and to make a political agreement between their Protestant states possible. The Hessian landgrave, or prince, Philipp the Magnanimous (1504–1567), organized the colloquy, which was ended prematurely by the threatening epidemic known as the English sweats (possibly chronic fatigue syndrome). After establishing many areas of agreement, the religious discussions focused on the nature of the Lord's Supper, the main item of disagreement between the feuding theologians. Martin Luther (1483–1547) and Philipp Melancthon (1487–1560), both from Wittenberg in Electoral Saxony, were the main speakers for the Lutheran cause, while Huldrych Zwingli (1484–1531) from Zurich and John Oecolampadius (1482–1531) from Basel represented the Zwinglian side. There were also delegates from Nuremberg, Augsburg, and Schwäbisch-Hall.

Landgrave Philipp's strategy of using small group meetings as well as the large disputation format did produce a compromise agreement called the fifteen articles of faith, also known as the Marburg Articles. The theologians all agreed to articles on original sin, the Word of God, grace, baptism, infant baptism, and confession, and Luther was willing to compromise on his wording concerning the Real Presence of Christ in the Sacrament of the Altar. Zwingli, however, could not accept any understanding of the Presence other than a symbolic one. Zwingli held that Christ's words, "this is my body," mean 'this signifies my body'. Hence, on the fifteenth article, concerning the Lord's Supper, they stated their differences, but agreed not to continue to attack one another.

While the religious discussions continued, some of the politicians began separate political discussions in order to create a defensive Protestant alliance against possible hostile actions by their Roman Catholic opponents. From the start, the political desire for a defensive alliance had driven demands for a colloquy and religious agreement because Luther insisted that a defensive alliance of Protestants must hold the same religious views. The Lutheran princes of Electoral Saxony and Brandenburg-Ansbach, however, who were opposed to a defensive Protestant alliance with the Lower German and German-speaking Swiss cities, schemed to sabotage the Marburg Colloquy. Elector John sent Eberhard von der Tann to Marburg with instructions to prevent an agreement. Hence, failing to create an all-Protestant alliance, Hesse, Strasbourg, Zurich, and Basel drew up the Marburg Sketch of an Alliance to serve as the basis for one in the future.

Significantly, the religious discussions proved that Lutheran and Reformed theologians could compromise and reach agreement under favorable circumstances. Thus, the colloquy remains a subject of more than historical interest to this day. Landgrave Philipp's contention that the religious dispute was only over words—that the theologians simply misunderstood one another—was accepted by some of the theologians. Hence, it led to broader theological agreements, for example, the Wittenberg Concord of 1536, which included the Upper German towns (considered Zwinglian by the Lutheran party in 1529) in common communion with the Lutheran principalities. The Marburg Sketch of

an Alliance materialized in the Schmalkaldic League (1531), which defended the German Protestant states until Luther's death.

MARGUERITE DE NAVARRE (Marguerite d'Angoulême, Marguerite de Valois; 1492–1549), French author, humanist, and religious reformer. The sister of the French King Francis I (ruled 1515–1547), Marguerite became duchess of Alençon through her first marriage and queen of Navarre by her second, to Henry d'Albret in

1527. Marguerite was also a peer of the realm, duchess of Berri, countess of Perche, Armagnac, and Roddez, and held several smaller territories within France. Educated by some of the leading humanists of the late fifteenth and early sixteenth centuries, Marguerite was an intellectual who corresponded with many European humanists during her lifetime. Like many French humanists, Marguerite was a devout Catholic interested in religious reform who supported translating the Scriptures into the vernacular and believed in a doctrine known as French Evangelism. Unlike the Protestants, French Evangelicals were interested in reforming the church from within. The French Evangelical agenda focused on specific clerical abuses, such as pluralism and absenteeism, and reforming convents and monasteries.

Marguerite, who attempted to interest the king in church reform, supported the most important group of French Evangelicals, led by Guillaume Briçonnet, bishop of Meaux. For a short period in the early 1520s, when the French king and the pope were at odds, it looked as if Marguerite might convince her brother to support French Evangelism. However, when Pope Adrian VI died and was succeeded by Pope Clement VII, French-papal relations were restored, and the French king turned his attention to his claims to territories in Italy. The moment to gain royal support for Evangelical reform of the Catholic Church in France had passed.

Although Marguerite no longer pushed her brother to reform the French church after 1524, she did maintain a lifelong interest in religious reform, which led her not only to insist on the reform of corrupt convents and monasteries in her own far-reaching territories but also to support reformers inside France who were suspected of heresy. As a powerful patron, she defended many well-known French Evangelicals such as Gérard Roussel and Michael d'Arande from heresy charges, and she protected others by sending them to her court in Navarre, where they were no longer under French jurisdiction. The most famous of the reformers who fled France with Marguerite's help was John Calvin, who left in 1534. Marguerite continued to assist a number of other reformers both inside and outside of France throughout the 1530s and 1540s. In part because of her defense of such reformers, Marguerite was seen by many as a heretic and a woman who

meddled in matters that should be left to men, and until the mid-twentieth century, scholars debated whether or not she remained a Catholic.

At the same time that she was bringing French Evangelism to the attention of the king in the early 1520s, Marguerite was also embarking on a writing career that would gain her an international reputation. Her earliest works were mystical poetry, such as “Le miroir de l’âme pécheresse” (“The mirror of the sinful soul”), which espoused Evangelical ideas and combined them with a mysticism that portrayed Marguerite’s relationship with God in familial as well as spiritual terms. By the 1530s, Marguerite had begun a collection of short stories that would be published after her death as the *Heptaméron*, many of them composed in her litter as Marguerite made her frequent journeys across France. Patterned on Boccaccio’s *Decameron* in structure, Marguerite’s work rejected his misogynist view. Rather than portraying women’s weakness and sinfulness, Marguerite’s stories depicted women’s strength and

piety, and many of them condemned men for behavior that led to the ruin of women. In her later years, Marguerite wrote a number of short “closet” plays, meant to be read by her immediate circle but not to be staged and produced. These works also reflected her spiritual ideas.

Marguerite was more than a devout Christian humanist and author, however. Devoted to her brother, Marguerite often acted as a political representative for the king. The first instance of this was in 1525, when she negotiated with Emperor Charles V for the king’s release after the Battle of Pavia. Over the next two decades, Marguerite advised her brother on political and military matters, served on the king’s Grand Council, and entered into negotiations with the English for a peace treaty with France. While at times her influence with her brother waned, she always retained the king’s favor, and exercised a great deal of political authority within her own territories and those of her husbands.

MARIA THERESA (HOLY ROMAN EMPIRE) (Maria Theresa; 1717–1780; ruled 1740–1780), empress of Austria. Many historians regard the eighteenth century as a time when monarchical government represented the most progressive force in economics, politics, and society. Maria Theresa was one of the greatest of these eighteenth-century monarchs, but no one would have anticipated her success when she came to the throne. The Habsburg Monarchy was not a single

entity, but a conglomeration of provinces stretching from Belgium in the west to Transylvania in the east and Silesia—now in Poland—in the north to Tuscany in the south with many spaces in between. Many historians agree that, when she ended her reign, these disparate lands had achieved a unity they had never known before.

In the early eighteenth century, many of these provinces had no provision for a female ruler. As it became increasingly apparent that the Habsburg family might be running out of males, in 1713 Maria Theresa’s father, Charles VI (ruled 1711–1740), made public an internal family document called the Pragmatic Sanction, which guaranteed the right of succession to female family members. After 1720 Charles worked hard to persuade first his crownlands and then the other European powers to recognize the Pragmatic Sanction so that his elder daughter, Maria Theresa, could inherit the Habsburg patrimony. By the time Charles died in 1740, he seemed to have succeeded.

Within two months of his death, Charles’s carefully crafted diplomatic effort to assure his daughter’s succession fell apart. In December 1740 the new king of Prussia, Frederick II (later known as “Frederick the Great”), invaded the Austrian province of Silesia, claiming it for his crown. Maria Theresa’s advisers, including her husband, Francis Stephen of Lorraine, recommended that she seek an accommodation with Frederick because Austria was in no condition, militarily or financially, to resist.

Maria Theresa rejected that advice preemptorily. She vowed to fight to preserve her inheritance and to use every resource to do so. She rallied support from all parts of her realm, inspired her soldiers and officers with stirring words, and set out to crush Frederick, whom she would later refer to as the “monster.” Thus began the War of the Austrian Succession (1740–1748), which became a European-wide affair with Prussia, Bavaria, and France fighting on one side against Austria and Britain on the other. It took many twists and turns, finally ending in 1748 with the Treaty of Aix-la-Chapelle (Aachen) between Austria and France. The Austro-Prussian war had ended in 1745 with Maria Theresa ceding Silesia to Frederick II.

The Prussian seizure of Silesia was the driving force in Maria Theresa’s reign. From the outset, she

was determined to right this terrible wrong that Frederick had inflicted upon her, and her reform efforts for the rest of her reign always had that leitmotif running through them. Maria Theresa was not a theorist; she had no compelling vision of what she imagined her possessions should become. Rather, she was practical, authorizing reforms she believed were needed and adjusting their impact to the expected and unexpected results they invariably generated.

The reforms began at the end of the War of the Austrian Succession to answer the fundamental question: how does one raise an army that can defeat the Prussians and provide it with the financial support necessary to do so? To deal with this issue, she adopted the plan of a noble but impoverished refugee from Silesia, Count Friedrich Wilhelm Haugwitz, which called for ending the annual negotiations with the monarchy's estates for human and financial resources and replacing them with negotiations every ten years. The estates would grant the

central government an annual revenue for a ten-year period, along with the authority to collect it. With these funds and by combining many functions of government under the authority of a new central General Directory, Maria Theresa was able to raise a peacetime army of 110,000 men to prepare for war with Frederick II.

The opportunity to begin that war came in 1756. In that year Frederick concluded an accord with Britain, thereby pulling this old ally from its association with Austria. Instead of bemoaning the loss, Maria Theresa's master of foreign policy and brilliant adviser for many years to come, Wenzel Anton Kaunitz, arranged an alliance between Austria and its age-old enemy, France, in what has come down in history as the Reversal of Alliances (or the Diplomatic Revolution). The adherence of Russia to the alliance seemed to give it overwhelming power in relation to Prussia. In August Frederick launched a preemptive strike against Saxony, and thus began the Seven Years' War (1756–1763), called at times in central Europe the Third Silesian War.

Maria Theresa fought this war with all her heart. This was the war that she hoped would rectify the harm that Frederick had inflicted upon her in 1740. But Austria just could not pull off the necessary victories. Haugwitz's reforms had substantially improved the financial condition of the monarchy and the army, but they had been designed for peacetime, not for war. The monarchy had to resort to a number of financial gimmicks to keep the war going, and a number of favorite economic projects had to be abandoned. Austria's allies, France and Russia, were not at their peak in terms of military efficiency, while France especially was sidetracked by its war against Britain in Europe, America, and India. And Frederick was a formidable enemy. A master of the use of interior lines, Frederick kept his many enemies at bay until the war finally came to an end in 1762 when Russia dropped out of the coalition.

The Seven Years' War was the last true conflict Maria Theresa fought against Prussia or any other state. In 1778–1779 the War of the Bavarian Succession, encouraged primarily by her son and co-ruler, Joseph II (ruled 1765–1790), seemed about to become another war for Silesia, but she intervened personally to stop it. Her reforms did not

stop, however, nor did their intent to strengthen the Habsburg state. In the post-war period, Maria Theresa's reforms reflected the prevailing idea of Enlightened Absolutism, namely that the strength of a state did not rest in the size of its army or the amount of land it controlled but in the health and well-being of its people and the wealth they generated.

This second period of reform caused Maria Theresa some spiritual angst. She was a devout and conservative Roman Catholic who deeply opposed religious pluralism as a threat to the souls of her subjects. She also bore a number of prejudices that came out every now and then, one notable example being her expulsion of the Jews from the city of Prague in 1745 and another her forced emigration of crypto-Protestants either to Transylvania or out of the monarchy altogether. But, in keeping with her reforms, she wanted her church to be of practical benefit to her people and instituted a number of policies to make it that way. She insisted that the church reduce the number of monks, allow taxation of the clergy, create more parishes, and strengthen existing parishes. When the pope abolished the Jesuit Order in 1773, she secured papal permission to convert its property in the monarchy to use by the state in order to establish a system of public education. These policies reflected Maria Theresa's pragmatic desire to improve the lot of her subjects and her pious wish to strengthen the role of the church at the parish level. They also hinted at Josephinism, her son and co-ruler's more thorough endeavor to use the church's resources for the good of the state.

Other reforms included her efforts to improve the lot of the peasantry. In response to peasant unrest, she alleviated the condition of the serfs on crownlands and imposed restrictions on lords' treatment of their peasants. She advocated the conversion of work dues to rent in order to encourage the peasants to be more productive, which in turn would bring in more revenue to the state and offer a higher quality recruit for the army. Maria Theresa likewise determined to revise the civil and criminal codes of the monarchy. She abolished the use of torture in 1776, but wide-scale reforms were delayed in part because Joseph II and some of her ministers regarded what she wanted as not liberal and far-reaching enough.

Maria Theresa was famous not only for her successful reforms and her vigorous foreign policy but also as a wife and mother. Reflecting on the lack of Habsburg males as a reason for triggering the Prussian invasion of Silesia, she determined from the outset that the Habsburg family would never again be short of offspring. She was the mother of sixteen children, five boys and eleven girls. She wrote to one of her daughters, "I can never have enough children; in this I am insatiable." She deeply loved her husband, Francis Stephen. An effective ruler in his own province of Tuscany and bearing the title of Holy Roman emperor from 1745, in Vienna his primary political role was to offer advice. When he died in 1765, she went into deep mourning, even pondering giving all her authority to her eldest son, Joseph.

Joseph succeeded to the title of Holy Roman emperor in 1765 and became co-ruler with his mother until her death in 1780. Their relationship was a turbulent one, with Joseph advocating much more extensive reform than Maria Theresa was willing to allow. Their voluminous correspondence is full of references to Maria Theresa's resisting her son's advice and demands, and of Joseph's heading off on inspection trips around the monarchy to work off the tension and stress his mother's resistance caused him.

Maria Theresa's death in 1780 caused considerable grief throughout the monarchy. A tribute came from her lifelong foe, Frederick the Great of Prussia, who wrote when he heard of her passing, "I accepted the death of the empress-queen. She did honor to her throne and to her sex; I fought wars with her, but never was I her enemy." The Pragmatic Sanction created a legal basis for the unity of the Habsburg Monarchy; Maria Theresa established it in fact.

KARL A. ROIDER

MARIANA, JUAN DE (?1535/1536–1624), Spanish Jesuit (Alcalá de Henares, 1554), historian and economic and political theorist. Born in Talavera de la Reina (Toledo), Mariana was among the most important Spanish scholars of his time, and taught at Rome, Sicily, Paris, and Toledo.

Mariana published his history of Spain, *De Rebus Hispaniae*, in 1592, and revised and translated it into Spanish in 1601 as *Historia general de España*. His Castilian-centric vision of Iberian history, full of rousing speeches and moral lessons, was typical of the historiography of the period, in the tradition of Livy. Written in the wake of the Armada's defeat (1588) and reissued after Philip II's (ruled 1556–1598) death, a time when Spain's glory was beginning to fade, it was both pessimistic and romantic. It was also the first general history of Spain, and became an important source for later readers, particularly in the history-crazed late eighteenth century.

In 1599, Mariana published his great political treatise, *De Rege et Regis Institutione*, written as a guide for the young Philip III. In it, Mariana set out his vision of the best form of government: a hereditary monarchy in which the king is advised by a council and limited by an elected assembly. Thus, Mariana is justly thought to have originated the idea of constitutional monarchy. In *De Rege*, he praised the Cortes (parliament) of Aragón, the representative assembly of eastern Spain, which had retained more rights than the Cortes of Castile. During the reign of Philip III (ruled 1598–1621), the Cortes, whose members represented Castile's major cities, became the arena for an ongoing struggle between the monarchy, in desperate need of money, and the cities, increasingly prone to place conditions on their grants. Behind the struggle over taxation lay a deeper conflict over the true location of authority.

Mariana advocated equality under the law: “If the king requires obedience of his subjects, he must also show obedience to the laws, because the king must be subject to those laws sanctioned by the Republic, whose authority is greater than his” (*De Rege*, I.9). He was neither a democrat nor a revolutionary, and he was not alone in believing that sovereignty originated in the kingdom, not the king (Jean Bodin had published *La république* in 1577), but his words were more adamant than those of his contemporaries. For Mariana, government was partly the result of nature but also of human will; if people made government, they could also unmake it and were justified in doing so if rulers violated their contract. If monarchs ignored the words and wishes of their subjects, and if the Cortes were unable, because of a monarch's attitude, to continue meeting, then “any citizen, in the name of the people, has the right to kill the tyrant” (*De Rege*, I.6). His analysis was taken by some to be a justification for the 1589 murder of Henry III of France (ruled 1574–1589). When Henry IV of France (ruled 1589–1610) was assassinated in 1610, *De Rege* was publicly burned in French bonfires and listed on the Inquisition's Index, which, ironically, Mariana had collaborated on a decade earlier.

In 1605 Mariana turned his attention to economics, writing seven economic treatises, the most influential of which, *De Monetae Mutatione*, dealt with currency. The work proved as controversial as *De Rege*. Mariana was one of a chorus of economists who saw in debased coinage the ultimate explanation for Spain's decline, and his criticisms of copper coinage, which he regarded as taxation because it increased the money supply, causing inflation, drew the attention of the powerful duke of Lerma, Philip III's favorite. Lerma persuaded the king to seek papal approval for Mariana's arrest in 1610. On trial in Madrid, he defended himself by pointing out that his writings had aimed only to defend the king; nonetheless, the charge of lèse-majesté was proved. Philip, who had not prosecuted Mariana for *De Rege*, left punishment to Rome, which dropped the matter. Mariana was released in 1611. He continued living in Toledo until his death in 1624.

A work published after his death, written around 1605, *Discurso de los grandes defectos que hay en la forma del gobierno de los Jesuitas*, was a criticism of his own order. It was aimed particularly at

the government of Claudius Aquaviva, the general of the Society of Jesus, who in Mariana's opinion was excessively bureaucratic and dictatorial. Seen as a plea for greater democracy, it was immediately condemned by the order.

RUTH MACKAY

MARIE ANTOINETTE (1755–1793), queen of France. Joséphe-Jeanne-Marie Antoinette (Maria Antonia, archduchess of Austria) married Louis-Auguste, dauphin of France, on 16 May 1770. Louis XVI (ruled 1774–1792) and Marie Antoinette ascended the throne in 1774. The youngest daughter of the sixteen children of Maria Theresa (1717–1780), archduchess of Austria and queen of Bohemia and Hungary, and Francis I (ruled 1745–1765), Holy Roman emperor, Marie Antoinette wed at age fifteen to secure a tenuous Franco-Austrian alliance. A French tutor educated the archduchess in religion, history, the classics, and the arts. Not an adept learner, though enthusiastic, Marie Antoinette excelled in artistic pursuits. Her parents married for love, shared the same bed, and took joy in parenthood, unusual for the eighteenth century. Marie Antoinette's days were divided between courtly etiquette and the unceremonious family quarters. Maria Theresa's moral code permeated the court and influenced her children. Marie Antoinette venerated her loving, albeit highly principled mother, but she was especially attached to her father. His death at the age of fifty-six devastated

the ten-year-old Marie Antoinette, and sorrow attended her throughout her life. This burden typified her complex personality, which was often eclipsed by her public image as a pitiless and spendthrift queen.

The duc de Choiseul, foreign minister to Louis XV, and Maria Theresa orchestrated the political match between Marie Antoinette and Louis XVI, an excruciatingly shy adolescent of sixteen years whose chief delights were hunting and puttering in his locksmith shop. The marriage was politically disastrous and personally fragile for Marie Antoinette and Louis XVI. The enmity France bore for this Austrian queen was almost pathological. The hostility toward Marie Antoinette from both the educated elite and the populace forever impugned her character. She suffered rumors of infidelity and infertility in the seven years before she gave birth to a daughter and finally the dauphin, born in 1781. Marie Antoinette was comforted by Louis XVI, who ultimately came to love his charismatic bride and to whom he paid unfettered affection in public.

By 1774 the queen endured unspeakable venom at court and in Paris from those outraged at the monarchy for an unjust social order. Scandals proliferated, assuming a life of their own; “Madame Déficit” became the favorite political scapegoat. Marie Antoinette incensed her enemies with her disdain for etiquette and her expenditures, and she was condemned for trafficking with unsavory friends. Her untamed and extravagant conduct incited the authors of a libelous underground street discourse, already active by the time she came to France, and these authors exposed the decline of the monarchy. By the 1780s clandestine pamphlets targeting Marie Antoinette circulated widely, most notably in *Essais historiques sur la vie de Marie Antoinette d’Autriche* (c. 1789). Scurrilous works of this nature circulated in places like the Palais-Royal in Paris, a forum for public discontent, as well as at Versailles. The writers actively fed into public perceptions of Marie Antoinette as immoral and dissolute. Their fantastic charges of lesbian affairs, incestuous debauchery, and a demasculinization of men undermined the legitimacy of the monarchy.

The public refused to see Marie Antoinette as a loving and dutiful mother. This contemptuous response to the queen continued in the Diamond

Necklace Affair of 1785–1786. Marie Antoinette was proclaimed guilty in the court of public opinion for this infamous case of stolen goods devised by the adventuress Jeanne de La Motte and a gullible dupe, Cardinal de Rohan, both jockeying for position at Versailles. Events spun out of control in 1789. Hungry market women from Paris stormed Versailles, forcing the king and queen's exile and house arrest in the Tuileries palace in Paris, followed by the monarchs' failed escape to Saint-Cloud on Easter in 1791. The escalating political turmoil of 1792 led to their trials and incarceration in the Conciergerie, the jail on the Seine in Paris.

While Marie Antoinette's critics have denigrated her, modern scholarship dispels distortions that blur her import. From her early days at court, Marie Antoinette was high-spirited, mischievous, and witty; she once masqueraded as a Sister of Charity before Louis XVI, and they howled together over his naïveté. She supported the arts and sought to relax the stiff decorum of the court while cultivating her keen need for privacy. Her loyal friendships defined her, none more so than that of the

king, who sustained her in the anguish of relentless character defamation. Following the king's execution on 21 January 1793, Marie Antoinette on 16 October 1793 rode bravely erect in the tumbrel to her execution at the Place de la Révolution, a proud queen, devoted mother, and faithful wife.

MARIE DE L'INCARNATION (1599–1672), French mystic and missionary. Marie Guyart of the Incarnation was a leading figure of the Catholic mission to the Amerindians of New France; she was also a theologian (she was called “the Saint Teresa of the New World”), a spiritual adviser, mystic, businesswoman, and founder of the Ursuline convent in Quebec (Canada). Her extensive correspondence reveals a profound spirituality combined with a remarkable sense of organization and outstanding linguistic skills. As the first female missionary outside Europe, she exemplified female religious patronage and activism, which led to the development of social welfare in early modern Catholic Europe and its colonies. In New France, she was a star; it was almost compulsory for every newcomer to the colony to visit her, for she could provide information not only on the natives' languages and customs, but also on the settlers' living conditions.

Marie Guyart was born in Tours (France) to parents who operated a bakery. Nothing is known of her education or how she developed such a talent as a writer. Married to the silk manufacturer Claude Martin in 1617, but widowed two years later, she

raised her only son Claude by herself while running her brother-in-law's shipping business for more than six years until she decided to retire from society. In 1631 she entered Tours' Ursuline convent, leaving her son in her sister's care, and pronounced her vows after two years of probation as a novice. By then she had decided on the great project of converting souls. She succeeded in going to New France in 1639 with the help of a large network of supporters that extended from her close relatives to Anne of Austria, queen of France (1601–1666). Two Ursulines, Marie de Savonnières de La Troche (1616–1652) and Cécile Richer (1609–1687), accompanied her and helped her found, the same year, the first teaching convent in North America.

After a long life of ecstatic visions, letter writing (more than 10,000 in all), and down-to-earth missionary work, Marie Guyart died in Quebec in 1672. By merging contemplation and action, she typified the mystics of the early seventeenth century. On the one hand, she was an expert in speculative theology, which she taught to her fellow nuns. Considered a sensible spiritual adviser, she was frequently chosen as the mistress in charge of the probationers of her convent. Over the years she also became the thoughtful director of conscience of many of her correspondents. She was more reserved about her mystical ecstasies, which she confided only to select people such as her son. On the other hand, she was also a devoted missionary, teaching and assisting Amerindian girls and women and raising funds for her mission. All things considered, however, regard for her missionary work was poor. Her Amerindian pupils were always few in number and often died early. Their numbers fell drastically at the end of the century because of epidemics and wars.

Marie Guyart's task did not end with her mission to the Amerindians but extended to the rest of the colony. She not only converted Amerindian girls, she educated the French girls with the aim of raising them as good and pious housewives. Her other, numerous skills ranged from translation of dictionaries in various Amerindian languages to architecture and crafting such as embroidery and gilding, which she introduced into the colony.

DOMINIQUE DESLANDRES

MARIE DE MÉDICIS (1573–1642), queen of France (1600–1610) and regent (1610–1617) for her son, Louis XIII. Marie de Médicis, the daughter of the Grand Duke of Tuscany and the Archduchess of Austria, was born in Florence.

Though her upbringing was marred by the early death of her mother and her father's neglect, she received an excellent education, which, in keeping with family tradition, gave her a sound foundation in the fine arts. In 1600 she was married to Henry IV of France (ruled 1589–1610) and took up residence in the Louvre the following year. She bore five children; a daughter, Henrietta-Maria, married Charles I of England; a son succeeded his father to the throne as Louis XIII. She is remembered in part as one of the most troublesome queen mothers in history—a lightning rod for discontent with her son's reign and especially with his chief minister, Cardinal Richelieu. But she also should be noted for her considerable patronage of the arts and her extensive building projects that still grace Paris.

After the assassination of her husband in 1610, Marie was made regent by the Parlement of Paris. Though politically inexperienced, she was not lacking in ambition: she was after all a Medici and confidently seized control of royal authority. Seeking peace to ensure tranquillity at home, she reversed Henry's anti-Habsburg policy, withdrew France's armies from Europe, and struck up an alliance with Spain that was sealed with the marriage of the fifteen-year-old Louis XIII to the Spanish Infanta, Anne of Austria. Her regency, however, was marked by instability. The weakness of royal authority invited a resurgence of aristocratic expectations of power sharing, and ultimately led to the calling of the Estates-General in 1614. The distribution of pensions and other spoils to great noblemen drained the treasury but did not prevent their mounting discontent. Several princes of the realm abandoned the court and threatened open revolt, the Huguenots grew restive at the prospect of royal wavering from the guarantees of the Edict of Nantes, and the prince of Condé was eventually arrested for challenging the queen's authority. Some of this discontent was really disguised opportunism in the face of a weakened royal authority under the regency. But some can be blamed on Marie's own poor judgment, in particular the promotion of her favorite, Concino Concini, to the point where this Italian outsider dominated both the court and the royal council. Indignation against Concini was compounded by the dubious reputation of his wife, Leonora Galigai, Marie's childhood friend.

The reign of the favorite and Marie's regency came dramatically to an end with the intervention of her son. In 1617 the fifteen-year-old Louis XIII instigated a veritable coup d'état against the favorite, which ended with the arrest of Marie and the deaths of the Concinis. Thus began nearly fifteen years of *contretemps* between Marie and her son, adding to the instability of Louis XIII's early reign. With the aid of her younger son, Gaston d'Orléans, Marie managed to escape from her captivity in 1619 and raised her standard against the king. Beaten in battle, she was reconciled with Louis through the good graces of Bishop Richelieu of Luçon, who soon entered the royal council. Though initially allied to Marie, Richelieu became the king's loyal servant and was instrumental in once again setting France on a course of opposition to Habsburg domination of Europe. Aided by Gaston, Marie actively conspired against Richelieu, hoping to depose him as chief minister. On the night of 10–11 November 1630, the so-called Day of Dupes, she nearly got her way. The king led her to believe that he was acceding to her demand to have Richelieu dismissed, but then in a dramatic turnaround backed his chief minister, arrested Marie, and subsequently

put on trial those ministers most closely associated with her. Once again Marie managed to escape from her imprisonment in Compiègne and sought refuge in the Low Countries.

Marie's exile lasted until her death in Cologne in 1642. Though her political power was certainly diminished, she continued to exert influence as a rallying point for Richelieu's opponents. Mathieu de Morgues, a writer formerly in service to Richelieu, joined her entourage in Brussels and launched a barrage of pamphlets that attacked both the cardinal-minister's "tyranny" and France's anti-Habsburg policies and defended Marie de Médicis.

Beyond her political legacy, Marie played a role as a major patron of the arts. Shortly after Henry IV's assassination, she engaged Salomon de Brosse to begin work on a new palace, one that would prove more suitable than the dour, somewhat medieval Louvre as the residence of a queen. Completed in 1623, the Luxembourg Palace combined French tastes with Italian splendor. Its interior, the "Medici Gallery," was graced with a series of enormous paintings (now in the Louvre in Paris) executed by Peter Paul Rubens depicting "The Life of Marie de' Medici" from her birth to her reconciliation with the king in 1619.

ROBERT A. SCHNEIDER

MARILLAC, MICHEL DE (1560–1632), French political and religious figure. Scion of an old noble family from the Auvergne with a long history of service to the ducs de Bourbon and then the French monarchy, Marillac was born in Paris on the eve of the Wars of Religion. His father, superintendent of the royal finances in 1569, died in 1573, and Marillac was raised by an uncle. He married Nicola

(Marguerite) Barbe de la Fortune in 1587 and had six children with her; after her death in 1600, he married Marie de Saint-Germain in 1601.

Law studies and practice as a barrister prepared Marillac for an office as councillor in the Paris parlement in 1586. His active participation in the Catholic League for several years after 1589 might have destroyed his career, but some deft footwork in 1593 enabled him to draw a discreet veil over it. With the consent of the new king, Henry IV (ruled 1589–1610), Marillac became a master of requests in 1595. In this capacity he worked mainly as an agent of the royal council, embarking on numerous missions to the provinces and carrying out judicial and financial commissions, especially under Chancellor Nicolas Brûlart de Sillery (1607–1624), an experience that enduringly shaped his view of government. When Marillac resigned as master of requests in 1612, Sillery made him councillor of state, a post in which he specialized in financial affairs. This advancement was supported by Marie de Médicis (1573–1642), the queen regent during the minority of Louis XIII (ruled 1601–1643), to whom the Marillac extended family was already attached by ties of marriage and household service.

These personal and political connections dovetailed with the religious ones that were central to the so-called Dévot movement that emerged after the religious wars. Marillac was an emblematic figure of the movement. He apparently wished at various moments to abandon his career for the religious life. After 1602 he was closely associated with the influential Acarie circle, dedicated to pursuing spiritual renewal and reform. Some of the most significant religious developments of the time, such as the introduction into France of the Spanish reformed Carmelites (1604) and the foundation by Pierre de Bérulle (1575–1629) of the French Oratory (1611), were spearheaded by the circle. Marillac used his professional position to enable these and numerous other religious foundations to negotiate the legal and financial obstacles to their development. His personal combination of scholarship and religion led him to publish his own translations of the *Imitation of Christ* (1621) and the *Psalms and Canticles* (1625).

Marillac's career exemplified the myriad links between religion and politics under Louis XIII, and

they propelled him toward higher office in royal service, especially once Marie de Médicis recovered her political influence during the early 1620s. She and Cardinal Richelieu (1585–1642) enabled Marillac to serve as finance minister from August 1624 until June 1626, when he moved sideways to the more congenial post of keeper of the seals, whose responsibilities far transcended judicial affairs. His activity as keeper was the culmination of his long career as a magistrate, which had made him acutely aware of the need to overhaul and improve internal government, as the Estates-General (1614) and successive Assemblies of Notables (1617, 1626) had demanded. This led him to envisage reform from above via comprehensive royal ordinances. With its 461 articles, the vast Code Michau of 1629 (nicknamed for Mirallac) was largely but not exclusively his doing. It codified numerous existing laws and focused mainly on religious, judicial, and financial reforms. Simultaneously Marillac's ministerial responsibilities convinced him of the corruption of government. His efforts at reform, which involved curbing the powers of the parlements and provincial Estates, earned him a reputation as being even more authoritarian than Richelieu. However, the real differences between them were in temperament and emphasis.

The political consensus that brought Richelieu and Marillac into office broke down once the Protestant revolts ended in 1629. Marillac emerged as the principal Dévot critic of Richelieu's anti-Habsburg strategy. Apart from rejecting Protestant alliances, Marillac feared that war, by perpetuating disorder and preventing badly needed reforms, would weaken France further. Marie de Médicis rallied to this position in 1630 and agreed to demand Richelieu's removal from office. Instead, Marillac lost out in the prolonged infighting that erupted in the Day of the Dupes (10–11 November 1630). Disgraced and arrested, Marillac was kept in detention in Châteaudun, where he died in August 1632. He was luckier than his half brother, who was executed after a show trial on trumped-up charges. Much remains mysterious about the wellsprings of the career of a man whose only biographer, his admiring disciple Lefebvre de Lezeau, reduced his life to an instantiation of religious virtue and high-minded self-denial, a man who was seemingly devoid of all

ambition yet who might well have replaced Richelieu as chief minister to Louis XIII.

JOSEPH BERGIN

MARLOWE, CHRISTOPHER (1564–1593), English dramatist and poet. Marlowe lived an exciting, if short, life—part writer of renown and part—it is claimed—government agent. The son of a Canterbury shoemaker named John Marlowe, he obtained a scholarship to the King's School in Canterbury; from 1580 he attended Corpus Christi College, Cambridge, receiving his B.A. in 1584. Although he remained at Cambridge, completing his M.A. in 1587, documents show that his attendance became sporadic, and there is much speculation concerning his activities from 1584 to 1587, the year he left. A Privy Council letter written to the college and dated 29 June 1587 indicates that prior to that date he had been engaged in government business, possibly as an agent spying on the Roman Catholic seminary at Rheims.

What is most discussed about the writer's life is to what extent he was a spy, an atheist, and a homosexual. In 1593, the year of his death, another government agent called Richard Baines reported that Marlowe had uttered heresies against the teachings of the church. He quoted Marlowe as saying that "Moyses was but a jugler," and that religion only evolved in order to control nations. According to Baines's testimony, Marlowe had said: "all they that love not Tobacco & Boies were foolles."

Marlowe arrived in London soon after he left Cambridge, but not much is known about this time. His first play, *Dido, Queen of Carthage*, was written in collaboration with his Cambridge associate

Thomas Nashe (1567–1601), and may have been completed c. 1586, though it was not published until 1594. It was first performed by the Children of the Queen’s Chapel. However, the Admiral’s Men, an adult company under the management of Philip Henslowe, certainly performed his famous work for the stage—the highly successful *Tamburlaine the Great*, about a pagan leader, which appeared in 1587 and was published in 1590. This play along with its sequel, *The Second Part of Tamburlaine*, has been cited as marking “the beginning of modern drama” (Wiggins and Lindsey). The Admiral’s Men went on producing Marlowe’s plays into the late 1580s and early 1590s, with Edward Alleyn, the actor-manager of the company, taking the main role in all productions. These included *The Tragical History of Dr. Faustus* (published in 1604), *The Jew of Malta* (1633), *The Massacre at Paris* (1594?), and *Edward II* (1594).

Marlowe’s poetry, in particular his *Hero and Leander*, is also defined as distinctively groundbreaking work of the English Renaissance. All his verse, including *Hero and Leander*, “The Passionate Shepherd to His Love,” and his translations of Ovid and Lucan, were reputedly written during his Cambridge years, although there is no real evidence of this. It was all published during the period 1598 to 1600, with two endings penned by other writers for the unfinished *Hero and Leander* of 1598.

The traces we have of Marlowe’s life indicate a personality of violent temperament. In 1589 he was arrested after a duel with one William Bradley, and he was put into Newgate Prison in London. In 1592, having been sent back from the Lowlands by Sir Robert Sidney, the governor of Flushing, he was bound over to keep the peace after fighting with two city constables, and in September of the same year he was accused of assaulting a Canterbury tailor. He is known to have shared a lodging with another dramatist of the age, Thomas Kyd, who was to say of Marlowe (in 1593) that he was “intemperate and of a cruel heart,” possessing “monstrous opinions” and given to “attempting sudden privy injuries to men.” However, Kyd was himself arrested at the time, and doubt may be thrown onto his motives for this description. Marlowe’s death makes a bloody end to a colorfully interpreted life. He was killed by Ingram Friser in a brawl that ostensibly concerned a “reckoning” or

bill; however, because of the shady people involved, including Friser, who was employed by Thomas Walsingham, the nephew of Sir Francis Walsingham, Queen Elizabeth’s secretary of state, the doubt has persisted that Marlowe—an early, eloquent, and powerful user of the English language—was assassinated on the orders of a high-ranking official.

MARRIAGE. Marriage lay at the heart of early modern society. It created the basic social unit, the household: the site of childrearing, economic production, and mutual care and affection. Marriage tied families together in economic and social networks and, at higher social levels, cemented political alliances and even royal dynasties. It was also a major means of transmitting wealth through dowries, the resources that a woman brought to a marriage. Moreover in contemporary eyes marriage had the moral functions of channeling sexuality, creating new Christians, and supporting the divinely ordained patriarchal, or male-dominated, order.

Such a complex institution interested many beyond the individual bride and groom. Parents tried to use children’s marriages to improve their family’s economic or social situation, sometimes clashing with their children over choices of spouses. The inhabitants of a couple’s neighborhood or village also sought to enforce community norms regarding the suitability of a couple. Religious and secular legisla-

tion regulated different aspects of marriage, and in the sixteenth century church and state revised marriage laws to gain more control over their subjects. Some historians believe that marriage practices did not change during the early modern period, but many think that during the seventeenth and eighteenth centuries legal developments along with economic and cultural shifts contributed to a more explicit valuation of love, a diminution of parental control, and a simplification of weddings.

FINDING A PARTNER

As a rule a person married someone who came from roughly the same social class. The aristocracy in particular, especially in France and Italy, deplored the misalliance. But people also recognized that marriage was an important means of social mobility, as when a wealthy but common father married his generously dowered daughter to an impoverished but noble groom. Common people tended to take marriage partners from geographically nearby and from within their own or their families' occupations. A servant marrying a servant or an apprentice marrying his master's daughter were typical patterns. Aristocrats had to range farther geographically to find socially appropriate spouses. Both nobles and peasants favored cousin marriages to consolidate property. Catholic canon law placed limitations called "impediments" on marriages between close kin. But people frequently obtained dispensations from these rules, and the Protestant Reformation significantly reduced them.

Age at first marriage depended on economic circumstances and varied according to social status and geographic location. Canon law set the minimum marriage age at twelve for girls and fourteen for boys, although betrothals could be arranged earlier. Aristocratic women were married quite young by modern standards, generally in their midteens to men in their late twenties or thirties, although this difference lessened in the eighteenth century. Commoner spouses tended to be close in age, marrying in their mid- to late twenties after each had worked for several years, the woman for her dowry and the man to obtain the resources and skills necessary to establish himself in an occupation. Urban dwellers, who relied on wage labor, generally married younger than rural inhabitants, who often had to wait for the deaths of their fathers to inherit

land. As proto-industrialization in the mid-eighteenth century turned more people into wage laborers, marriage age fell slightly among common people.

While marriage was considered the natural state for adults and most people got married, a noticeable number never married, ranging from 5 percent in some times and places to 25 percent in others. Economic circumstances and family strategies usually kept a person single. Because marriage was an economic partnership, among the common people a woman's lack of a dowry or a man's inability to establish himself in a trade or on a piece of land frequently prevented them from marrying. Some places formalized these controls, like German cities that forbade men to marry until they had become masters in a trade, or towns that barred poor couples from marrying, fearing that such families would become an economic burden. At the same time, however, some institutions and individuals, especially in Italy, gave dowries to poor women to prevent them from becoming prostitutes. Unmarried people usually remained in positions of dependence as servants in the houses of others or as laborers on the farms of their married siblings. Some, however, supported themselves with wage labor in cities, sometimes forming households with other single people.

In the seventeenth century a rapid rise in dowries coupled with a rigid sense of family honor triggered a decline in the numbers of European aristocrats who married because many fathers could not afford noble marriages for all their children. In eighteenth-century Spain dowries could exceed twelve times the bride's family's annual income. In mid-seventeenth-century Milan three-quarters of female aristocrats never married. Especially in Italy and Spain, spinsters frequently entered convents; in Protestant regions they often lived with kin. This trend was less notable in England, where fathers were more willing to marry their daughters with smaller dowries to social inferiors. Unmarried sons often entered the church or the military. Though single, these men might still establish families by having children with concubines.

Peasant and artisan youths had many opportunities to find marriage partners in their daily lives, laboring in the fields, attending festivals, running

errands, or working in occupations employing both sexes, like hat making or household service. A young man might court a woman at her house, bringing along a male friend and talking at the door or window. At this social level the amount of parental control over children's marriage choices varied widely. Because young people frequently left home to work in their early teens, some seldom or never saw their parents, leaving them a great deal of freedom of choice. But some parents, even quite poor ones, arranged their children's marriages, sometimes at a young age and occasionally using force or threats, in order to create social alliances or enlarge landholdings. While some historians argue that marriages in this period were expected to be loveless, most scholars agree that early modern people expected that two people who loved each other would want to get married, although they subordinated emotions to practical concerns. In most cases parents and children probably tried to agree on a match balancing love with material concerns.

Aristocratic courtship usually only followed family arrangement of a match. Wealthy and especially aristocratic parents tightly controlled their children's, particularly their daughters', contact with members of the opposite sex and also consistently chose their children's spouses to further family strategies. Many wealthy parents distrusted passionate love, believing it formed an insecure base for such an important union. Some, however, tried to ensure that their children agreed with their choices and even that they felt some affection for their intendeds. A few children sought to evade their parents' control to marry partners of their own choosing.

In the eighteenth century the balance between love and material concerns appears to have shifted. Influenced by the Reformation's and especially the Enlightenment's positive evaluation of love, some members of the upper middle class and aristocracy began to consider love the primary goal of marriage and perhaps also to act on this idea. In the same period the rise of proto-industry, cottage production of goods for the market, and wage labor, freed many people from the constraints that land considerations imposed and allowed love to play a larger role in how they chose their spouses.

GETTING MARRIED

The Catholic canon law that governed marriage formation from the twelfth century through the mid-sixteenth century rested on the consensual definition of marriage that held that a valid marriage required only the freely given consent of the bride and groom. If the words used were in the present tense, no further action was needed; if they were in the future tense (a marriage promise), then sexual consummation completed the union. Such minimal legal requirements allowed local marriage practices to vary widely, shaped by a combination of communal norms, local law, and diocesan regulations. Everywhere, however, throughout the sixteenth century and much of the seventeenth century marrying was not a moment but a series of steps that created new property arrangements, changed the couple into man and wife, and made the union publicly known. Because of the length of the process, it was not always clear at what point a marriage became irrevocable.

Marriage negotiations centered on property settlement: the bride's dowry and any money the groom granted the bride, sometimes known as the morning gift. The details were often finalized in a written contract. As the wife's contribution to the new household, a dowry generally consisted of items such as a bed, linens, cooking implements, and clothing but sometimes also trade or farming implements. Elite dowries contained more opulent household and personal items as well as money and sometimes real estate. Local dowry laws and practices varied, but generally a husband managed the dowry and any revenue it produced during a marriage. A wife gained control of it and the morning gift only if her husband died, when she would need it to support herself or to make a new marriage.

Many couples promised to marry each other in private but also celebrated a formal betrothal. In this ritual the men of the two families—the bride's father, the groom, and other male kin—declared their agreement to the union before witnesses, shaking hands, usually publicly in a church, the town square, or even a tavern but sometimes in a house or before a notary. If the bride was present, she and the groom would also clasp hands. In most places a meal and the couple's exchange of gifts followed: a small token like a handkerchief from the bride and a more substantial gift like jewelry from the groom.

Especially in northern Europe, the parish priest then published the banns, or announced the betrothal, at mass on several consecutive Sundays in order to discover legal impediments to the union. Ecclesiastical and popular opinion considered betrothals strongly binding. Most communities permitted commoners to begin sexual relations even when their betrothal had been arranged in private, which, although discouraged by the church, transformed it into a valid marriage under canon law. Highborn brides were expected to be virgins until after the wedding.

Weddings usually followed several weeks or months after the betrothal. The heart of the ceremony was the couple's words of consent sealed by the ring and kiss. To ensure public knowledge of the union, in northern Europe rowdy village processions accompanied the couple to the church door for the exchange of consent, with music and revelry invoking fertility and highlighting gender roles. Churchmen fearful of remnants of paganism tried to control them. In Italy, where the bride's house was the normal place for the wedding, a procession marked the bride's progress to her new home. In some localities a notary guided the couple through the exchange of vows; in other places the bride's father, a priest, a neighbor, or even the couple themselves played this role. The celebration that followed, as lavish as the couple could afford, ranged from meals at taverns, where the guests paid, to huge feasts with dozens of dishes attended by the whole neighborhood and guests from other cities. Local statutes often limited—with little success—the number of guests and dishes.

CLANDESTINE MARRIAGE AND MARRIAGE REFORM

While most people married publicly, the lack of formal requirements meant that a marriage or betrothal contracted without witnesses, or clandestinely, could still be valid though difficult to prove. Churchmen urged couples to obtain their parents' consent and to celebrate publicly, but ecclesiastical courts also enforced unions that violated these injunctions. Because private betrothals were common and popularly held to permit sexual activity, some women were seduced under false promises of marriage and abandoned. Disputes also arose when one party decided to break a private engagement and marry another—particularly if the repudiated fi-

ancée was pregnant. Some people exchanged marriage vows in secret, usually to escape parental opposition, like Romeo and Juliet. Rates of clandestine marriage and betrothal are impossible to determine, but it is clear that ecclesiastical courts everywhere in Europe were full of suits in which couples disputed whether or not they were married.

In the fifteenth and sixteenth centuries many people—especially fathers and secular authorities but also some churchmen—began to find clandestinity particularly troubling, arguing that it caused confusion and dispute while undermining authority, especially of fathers. Secular legal penalties against clandestine marriage, notably in northern Europe, became harsher in this period, ranging from heavy fines to the loss of the bride's dowry to disinheritance. Despite some important differences, Catholics and Protestants responded similarly to the problem, reforming marriage laws to try to turn a sometimes indefinite social process into a definite legal moment overseen by authorities.

Placing new importance on marriage, Protestant reformers abolished celibacy of the clergy and legitimated divorce. Rejecting the consensual definition of marriage, most territories also made parental consent and the presence of witnesses and a minister at the wedding conditions for validity, and placed marriage under secular jurisdiction. England, however, retained the old canon law of marriage until 1753. Catholics responded with new decrees on marriage at the Council of Trent in 1563, rejecting the necessity of parental consent and reaffirming marital indissolubility, ecclesiastical jurisdiction, clerical celibacy, and the principle that free consent created a marriage. However, like Protestants, post-Tridentine Catholics had to exchange consent before a priest and witnesses for the marriage to be valid, and parish priests began keeping written records of marriages.

Despite these formal changes, through the seventeenth century popular practice continued to treat marriage as a process, grafting new requirements, like the priest's presence, onto the existing steps. People also continued to find ways to marry in secret. Catholic couples could dash in and exchange words of consent in front of an unwitting priest, as Alessandro Manzoni described in *The Betrothed* (1825–1827), though a more common route for

both confessions was the secret betrothal, which continued to function essentially as clandestine marriage had because courts continued to enforce betrothals. When increasingly secularized marriage courts ceased doing this in the eighteenth century, betrothal lost its importance. This, combined with a loosening of community ties associated with proto-industrialization, and the growth of reliable record-keeping that diminished the need for publicizing rituals, contributed to the transformation of marriage from a lengthy process into the moment of the couple's exchange of vows.

HUSBANDS AND WIVES

In the fifteenth and sixteenth centuries everyone agreed that duty defined the relationship of husband and wife. Churchmen of both confessions held the purpose of marriage to be preserving people from sin by channeling sexuality into procreation. Husbands and wives owed each other the "conjugal debt" of regular (though not passionate) sexual relations, and adultery was a serious crime justifying separation or divorce and even meriting death in some lands. Moralists taught that marriage was a hierarchy that upheld the patriarchal social and political order. The husband, by virtue of his superior masculine reason, ruled the family. Law gave him broad powers to control family property and dependents' behavior, including that of his wife, using moderate physical force if necessary; but it also held him to support his wife adequately and especially manage her dowry responsibly. The duty of the wife—who had few legal or financial abilities—was to help and to obey.

Popular views shaped by daily experience somewhat moderated the rigidity of the learned notions, emphasizing spouses' interrelated fortunes and reciprocal obligations. Husbands and wives were expected to protect each other's person, property, and honor by caring for each other when ill, being frugal and hardworking, treating each other with respect, and refraining from scandalous behavior. Communities used such practices as *charivaris* to enforce these standards; spouses sometimes went to court seeking separations when they were breached.

Marriage formed an economic unit in which the labor of both spouses was usually essential. Economic interdependence made it difficult for unhappy couples to separate or divorce but probably

also brought spouses together with a sense of shared purpose. Commoner spouses performed different but complementary tasks: an artisan wife sold her husband's products; a farmwife oversaw the farmyard and house and at harvest might join her husband in the fields. At higher social levels, tasks were usually less directly cooperative. While merchants' wives might oversee business matters when their husbands traveled, aristocratic spouses more often occupied two distinct spheres. A wife's duties running a large household involved significant responsibilities, but her main economic contribution, her dowry, was completely under her husband's control. Highborn spouses' common disparity in ages probably reinforced this separation. Still, some elite husbands spoke of their wives as companions and in their wills granted widows great responsibilities overseeing children and property.

Evidence exists of deep love between some spouses from all social levels, nurtured by the cooperation in their daily lives and perhaps by raising their children. While desirable, people did not hold love to be an essential aspect of the relationship. Sex was an important part of marriage, recognized even by disapproving churchmen, who tried to limit it to the passionless business of procreation. The practice of birth control (mainly male withdrawal) and abortion—though forbidden—and the existence of infertile couples point to the fact that sex enhanced married life in more ways than simply the production of children.

Historians disagree on the degree and chronology of change, but most believe that in the seventeenth century and especially the eighteenth century many people began to see marriage in a different way, as a companionate relationship emphasizing love rather than duty whose goal was happiness. Many point to the Protestant Reformation's more positive evaluation of marriage and particularly to the Enlightenment's emphasis on freedom of choice, affection, and equality in marriage as causes of this change. The secularization of control of marriage reinforced this by increasing the influence of laymen imbued with Enlightenment values. Others argue, however, that for most people the freedom from traditional constraints brought by proto-industrialization enabled them to focus on affective rather than practical aspects of marriage.

REMARRIAGE

High mortality rates from disease and childbirth meant that a marriage lasted on average less than twenty years. As many as a quarter to a third of marriages were not first marriages but remarriages following the death of a spouse or, much less frequently and only in Protestant regions, divorce. Dissolving a marriage also dissolved an economic unit. A widower almost always remarried quickly, needing someone to run his household, help in his occupation, and raise his children. The advanced age of the groom frequently angered young unmarried men, who banded into groups to harass the prospective spouses in *charivaris*. Widows, especially those with small children, often had trouble remarrying unless they had property. Without a man's income, widows and their children made up a significant portion of the urban poor.

MARSEILLE. Overlooking the Mediterranean, and located not far from the mouth of the Rhône River, the port city of Marseille linked the economy of France to Italy, Spain, the Ottoman Empire, and North Africa. A city conscious of, indeed proud of, its Greek origins and its ancient lineage, Marseille entered the realm of France in 1481 when control of Provence passed by inheritance from the Angevin counts to the kings of France. Despite Marseille's recent incorporation, it rapidly became one of the crown's *bonne villes* ('good cities'), a city that enjoyed a special relationship with the monarchy based on its strategic position and its resolute Catholicity.

The population and economy of Marseille grew substantially over the early modern period. In 1524, approximately 15,000 people lived in the city; by 1698, inhabitants numbered about 65,000; and, during the French Revolution, Marseille's population fluctuated between 93,000 and 110,000. Earlier, its economy was based on its position as a regional commercial center, and later as a Mediterranean entrepôt (warehouse). In the late sixteenth century, Marseille succeeded in dominating Europe's trade with the Levant and the Barbary Coast, but, until 1660, this trading nexus experienced spurts of growth tempered by periods of contraction. Under King Louis XIV (ruled 1643–1715) and Jean Baptiste Colbert (1619–1683), the king's finance minister, royal policies ensured more sustained growth for the city and its ties to the Levant. In 1669, the crown created tariffs that discouraged any trade with the Levant that did not occur under the auspices of Marseille merchants and their enterprises. Henceforth, most of the wheat, sugar, coffee, and cotton textiles that entered France from the Levant would pass through Marseille, the *bonne ville*.

The families that prospered by this privileged trading position had long dominated urban society and municipal politics. In a number of cases, their elite status was reinforced by claims to nobility,

Marseille. *Le port de Marseilles*, by Claude Vernet, 1754. THE ART ARCHIVE/MUSÉE DU LOUVRE PARIS/DAGLI ORTI

since it was possible in Marseille to engage in commerce and to call oneself noble or *écuyer* (literally, ‘horseman’ or ‘squire’). This merchant aristocracy was organized into factions by marriage connections and ties of patronage, and it was through such factions that aristocrats controlled the municipal council and acted as major players in provincial politics (though the seat of provincial and royal government was in nearby Aix-en-Provence). In the process, they competed to manipulate the masses of fishermen and laborers who made up the majority of Marseille’s population.

Factional struggle characterized, and explains, much of the political narrative of early modern Marseille. Even during the period of the Wars of Religion (1562–1598), politics and factionalism constituted far greater sources of instability than Protestantism because Marseille always remained a staunchly Catholic city. Indeed, reformed Catholicism became deeply associated with the communal values of the city, and Marseille’s numerous confraternities (all-male lay religious organizations) provided a vehicle for a new style of religious life. This

local revival of Catholicism began in the early sixteenth century, long before the era of religious conflict in France, and the fact that Protestantism and religious violence were notably absent in Marseille suggests the extent to which Catholic reform succeeded. Like the city itself, reform and the confraternities fell under the control of the merchant aristocracy.

But reform, albeit Catholic, was not entirely without conflict. In the 1580s the reform movement in Marseille developed connections to the Catholic League throughout France, whose political goal was to maintain a limited monarchy in which power was shared by the king and the nobility. In 1591 Charles de Casaulx (1547–1596), with a good deal of popular support, seized control of Marseille’s government and initiated a more radical agenda that served the goal of France’s Catholic League. His dictatorship and Leaguer program set the city in opposition to Henry IV, thereby jeopardizing its status as one of the monarchy’s *bonnes villes*. After Henry’s conversion to Catholicism, Casaulx sought an alliance with Philip II of Spain.

By refusing to accept France's first Bourbon monarch, Casaulx and supporters discredited the city and this phase of its Catholic mission. As a result, Casaulx was assassinated in 1596 by an elite conspiracy, and his demise opened the way for control by elites more willing to comply with the absolutist vision of Henry IV. In this way, Marseille, ever the *bonne ville*, became a cornerstone of Bourbon policies in Provence.

DONNA BOHANON

MARTYRS AND MARTYROLOGY.

The politico-religious struggles of the Protestant and Catholic Reformations produced a revival of the creation of martyrs and martyrologies. The conflicts between Catholics and Protestants, most notably in northern Europe, caused numerous casualties, many of whom voluntarily sacrificed their lives in the name of their religious beliefs. Those who "correctly" testified for their particular faith were recognized as martyrs; those who did not were categorized as antimartyrs or simply heretics. The martyrs' stories were then collected by various editors in significant volumes, which were published and used as literary weapons in the struggle against persecution providing inspiration, education, edification, and the defense of their particular causes.

MARTYRS

The term "martyr" is taken from the Greek *martus* meaning 'witness' or 'testifier'. Hence, those who witnessed their faith with their blood could posthumously be recognized as such. From the beginning, Protestantism had been identified as a threat to both Catholic states and the Roman Church, and its adherents were then perceived as not only heretics but

also traitors. On the Continent the persecution of Protestants began in the 1520s. Most of the first generation of martyrs emerged from the clergy and monastic orders. As Protestantism spread and expanded during the 1540s, the second generation, which included women, peasants, artisans, and those of the professional class, experienced heightened persecution especially in France, as heresy was defined under the Edict of Fontainebleau (1540) as treason against God and king.

The level and type of persecution, however, varied from region to region and fluctuated depending on the power of the religious minority (Catholic or Protestant) or the religious confession of the monarch. For example, in England both Protestants and Catholics were persecuted depending on the politico-religious views of the monarch, creating Protestant martyrs during the reign of Mary Tudor and Catholic martyrs during the reign of Elizabeth I. And in the German territories the Religious Peace of Augsburg of 1555 decreased the overall number of martyrs when it became the right of individual princes to choose the religion of their territory. Anabaptists, however, were persecuted throughout northern Europe and experienced no toleration.

Normally, a heretic would be arrested, interrogated, and given the opportunity to recant. Those who did would be penalized with a fine or public penance or both; those who did not would then suffer capital punishment at the hands of the state. Their "criminal" confession would later be transformed by their supporters into a "religious" confession, which was considered to be a "mark" of a martyr. The executions of heretics/martyrs were for the most part public events held in town or city squares, intended to discourage others and to demonstrate state authority, though displays of constancy by martyrs often served as vehicles for conversion for some observers. Forms of capital punishment included immolation, interment alive, hanging, beheading, and drowning. Mob violence also created martyrs as tensions between religious factions led to communal retaliation for perceived religious offenses or slights.

Faced with persecution, religious noncompliant (Catholic or Protestant) had three options: to remain in place and practice their faiths, risking the legal penalties of losing not only land, home,

offices, and wealth, but also their lives, which is to say, to risk martyrdom; second, to go into exile and still lose many if not all of their goods and lands, leaving behind family in many instances; or third, to dissimulate as Nicodemites (to appear Catholic while hiding Protestant beliefs).

MARTYROLOGY

The martyr was not simply an individual: once recognized with the title, he became a representation and embodiment of the movement to which he belonged. He would then become a symbol in the struggle against persecution. This transformation is evident in martyrdom's literary companion, the martyrology, a compilation of the accounts of the martyrs' lives and deaths. During the mid-sixteenth century no fewer than seven major Protestant martyrologies were produced, many of which were issued in multiple editions and languages: Ludwig Rabe, *Der heiligen aus erwählten Gottes Zeugen Bekennen und Martyren* (1552; The history of god's chosen witnesses, confessors, and martyrs); John Foxe, *Acts and Monuments* (1563); Jean Crespin, *Le livre des martyrs* (1554; The book of martyrs); Matthias Flacius Illyricus, *Catalogus testium veritatis* (1556; Catalogue of witnesses to the truth); Adriaan Cornelis van Haemstede, *De Gheschiedenisse ende den doot der vromer Martelaren* (1559; History and deaths of the devout martyrs); Heinrich Pantaleone, *Martyrum historia* (1563; History of martyrs); and Antoine de la Roche Chandieu, *L'histoire des persecutions, et martyrs de l'église de Paris* (1563; The history of the persecutions and martyrs of the church of Paris). Many of these editors/authors drew upon each others' works or corresponded, universalizing the plight of those suffering persecution.

The editors/authors of these martyrologies modeled their texts on the historical and hagiographical works of Eusebius of Caesarea (the fourth-century *Ecclesiastical History*) and Jacobus de Voragine (the thirteenth-century *Golden Legend*). The association with the early Christian tradition of martyrdom and genre of martyrology demonstrated a continuum between the two groups, attempting to prove the Protestants direct heirs to the first Christians. This connection also legitimated the disobedience of the Protestants toward the Catholic hierarchy in continuing a tradition of sacri-

fice sanctioned and even demanded by God. By drawing upon the martyrological tradition, the Protestant movements could claim the legitimating notion that "persecution marks the true church of God," a phrase Jean Crespin employed in the preface to his first edition.

In light of the multiplicity of claims to the name "Christian," a primary goal of the martyrologists was to define correct belief against those who espoused heresy. They identified their martyrs as those who testified "correctly" and who died confessing their particular movement's doctrine. Hence, the martyr's verbal or written confession of faith, sometimes as a letter to the faithful or a family member or as the "criminal" confession obtained during interrogation, was the focal point of the accounts. In the midst of the expanding number of martyrologies representing numerous religious movements, Calvinist and Lutheran works clearly protested and attacked Catholic "idolatry," "superstition," and "innovation" through their martyrs' testimonies and experiences. Catholic polemicists responded to this proliferation of Protestant martyrologies by creating their own "antimartyrologies," which then challenged the title of "martyr" assigned to those they considered heretics and criminals. Anabaptist martyrs, while recognized as "dying well," were decried as antimartyrs dying for the wrong confession by both Catholics and mainstream Protestants.

Due to their production during times of persecution, the martyrologies contain a prominent element of propaganda. The individual accounts of martyrs were placed in highly political, polemical, and historical contexts. The accounts themselves were constructed using eyewitness accounts, trial records, and personal and epistolary letters that were then woven together with commentaries (including previously published pamphlets) on the events, nature, and origins of the persecution to create a larger history of their movements. Most importantly, the martyrologies embodied the polemical stance of the faiths they represented.

The target audience for these martyrologies was their faithful coreligionists. The martyrs' stories and context offered consolation and encouragement to the reader, while also providing models for comportment and correct doctrine. These works and the

individuals whose stories they tell were significant weapons in the struggle against persecution.

MARVELS AND WONDERS. Early modern European writers used the terms *marvel* or *wonder* to refer to a well-defined body of unusual phenomena that included things such as comets, volcanoes, conjoined twins, magnets, rains of stone, and petrifying springs. These phenomena, a grouping inherited from medieval sources, lay between the commonplace and the absolutely miraculous. Unlike commonplace objects, they were rare and often exotic, and some had remarkable properties, such as the attractive powers of the magnet or the ability of the unicorn horn to neutralize poison. Unlike miracles, they were understood to be the product of natural causes, although the nature of those causes and their precise combination was difficult to comprehend. What such phenomena had in common was their ability to produce wonder in their observers, a kind of amazement that shaded into pleasure or fear.

The years around 1500 saw an explosion of interest in wonders among people at every level of European society. This new fascination took various forms. Certain kinds of marvels—notably monstrous births, such as conjoined twins, and celestial apparitions, such as comets—were taken to be prodigies or omens that were intimations of divine displeasure at particular moral behaviors or political and religious positions. Viewed in this light, marvels became a salient feature of the confessional polemics

unleashed by the Reformation and Counter-Reformation. At the same time, however, wonders could have strong positive associations, and the sixteenth and early seventeenth centuries saw the appearance of a widespread appreciation of marvels as sources of pleasure and delight. While parasitic twins, armless calligraphers, and two-headed pigs displayed themselves, or were displayed, in taverns, fairs, and markets, as well in the courts of Europe, the wealthy and the learned surrounded themselves with natural wonders, such as the dried bodies of mermaids or birds of paradise, and marvels of human ingenuity, such as a cherrystone carved with hundreds of tiny faces. Although only princes could afford the most precious of wonders, such as jeweled automata or nautilus shells mounted in gold, some of the earliest and most enthusiastic collectors of natural wonders were apothecaries and medical men, who hoped to explore and exploit their healing powers.

In addition to being evocative and powerful objects, wonders were also good to think with, and they played an important role in the early modern project to produce a reformed science of nature. Sixteenth- and early-seventeenth-century philosophers sought to offer new rational explanations for natural marvels, attributing these to, among other things, planetary influences, subtle vapors, and the power of the human imagination to shape the material world. Increasingly, however, it became clear that attempts of this sort were doomed to failure and that more dramatic reform was called for—reform in which wonders nonetheless had an important part to play. As the English philosopher Francis Bacon argued, marvelous phenomena served both a critical and a constructive role; defying existing explanatory categories, they underscored the total inadequacy of the old science, while they pointed toward something new. Buoyed by this vision, members of the newly founded scientific societies of the mid- to later seventeenth century, the French Royal Academy of Sciences and, especially, the Royal Society of London, collected observations of extraordinary phenomena, from two-headed calves to meteorite showers.

In the end, however, wonders gradually lost their aesthetic appeal and their intellectual cachet, at least in the minds of the cultivated. In part, this was because it proved impractical to construct a new science on the basis of the unique and the bizarre.

Philosophers found themselves increasingly attracted to a vision of the natural order as bound tightly to its divine creator and characterized by simplicity and economy, and by uniform and unbreakable natural laws; such a vision rendered extraordinary phenomena misleading or irrelevant. Finally, the learned and the powerful began to connect the fascination with wonders, which had gripped all levels of European society, with a range of undesirable cultural movements associated with the vulgar: political disorder, religious enthusiasm, and tasteless naïveté. Eighteenth-century politicians, divines, and philosophers rejected wonders as violations of the principles of order, regularity, and decorum that underpinned Enlightenment ideals.

Until recently, these enlightened values and the view of the natural order they reflected so permeated Western intellectual culture that well into the later twentieth century wonders were seen as peripheral—even opposed to—rational attempts to understand the natural order. The marvels that figured so prominently in early modern art and literature were tactfully ignored by historians or interpreted as “medieval” holdovers. In the last twenty-five years, however, scholars have begun to focus their attention on the wonders that so preoccupied the entire population of early modern Europe, revealing a complex and differentiated culture of the marvelous that reflected some of the deepest values of that world.

KATHARINE PARK

Mary's early life was dominated by her dynastic importance as daughter of Henry VIII (ruled 1509–1547) and heir to England's crown, involving negotiations for betrothal first to the French dauphin and then to her Habsburg cousin Charles V (ruled 1519–1556). Although Charles chose another prospective bride, her relationship with him remained one of the most important factors in her life. In 1525 she was created Princess of Wales, but from 1527 the estrangement of Henry VIII from her mother Catherine of Aragon (1485–1536) undermined her position. Prevented from seeing Catherine after 1531, she was bastardized when the Aragon marriage was annulled (1533) and reduced to a lady-in-waiting to the new heir presumptive, Elizabeth (ruled 1558–1603). The death of Anne Boleyn (1507?–1536) brought further humiliation. After spirited resistance, in 1536 Mary was forced to acknowledge herself a bastard.

Mary's position improved after Henry's final marriage to Catherine Parr (1512–1548) in 1543 and an act of Parliament in 1544 recognized her as second in line to the throne. During the reign of her half-brother Edward VI (1547–1553), she faced fresh troubles by stubbornly maintaining the Catholic liturgy. In 1550 unsuccessful efforts were made to arrange her escape to Habsburg territories. Edward's privy council tried to bypass her in making Lady Jane Grey (1537–1554) queen in 1553, but aided by Catholic advisers, Mary drew on popular provincial outrage at this insult to Henry VIII's bloodline and staged a brilliantly effective coup d'état based in East Anglia. She moved swiftly to restore not only traditional worship but also obedience to the pope (a much less popular cause), although legal problems delayed England's reconciliation with Rome until November 1554. She also insisted on keeping the title of “kingdom” for the island of Ireland, which her father had unilaterally adopted in place of the former papal grant to English monarchs of “lordship” of Ireland. She brushed aside objections to marriage with her cousin Charles V's son King Philip II (ruled 1556–1598) of Spain, which crystallized in Sir Thomas Wyatt's Rebellion (January 1554). Amidst general panic in London at the rebels' approach, Mary displayed firm courage and rallied support in a major speech at Guildhall. To her joy, Philip arrived to marry her at Winchester Cathedral on 25 July 1554.

MARY I (ENGLAND) (1516–1558; ruled 1553–1558), queen of England and Ireland.

Once the old heresy laws were restored (1555), persecution included almost three hundred burnings of Protestants. This was more intense than any previous English antiheresy campaign and uncomfortably reminiscent of recent Habsburg persecution in the Netherlands. Protestant sufferings handed a propaganda asset to her opponents, but Mary obstinately persisted in encouraging the burnings. Her hopes for Catholicism were complicated in 1555, when Cardinal Gian Pietro Carafa was elected Pope Paul IV (reigned 1555–1559). He was bitterly anti-Spanish and an old enemy of the papal legate in England, Mary’s close ally and cousin Cardinal Reginald Pole (1500–1558). Mary, who wished to be the papacy’s most loyal daughter, defied the pope when he revoked Pole’s legatine powers and tried to summon him to Rome on heresy charges. Meanwhile her marriage did not produce an heir to secure a Catholic future. Mary’s belief that she was pregnant caused national embarrassment and ridicule when the truth became plain in summer 1555. Philip’s good nature was strained by the English lack of enthusiasm for his presence. He returned in 1557 only to secure England’s help for Spain in war against France (and the papacy). After initial success, the French capture of Calais, England’s last mainland European territory, in January 1558 was a bitter blow, and Mary’s illness that summer was not her longed-for child but stomach cancer. She knew in her terminal illness that her half-sister Elizabeth would destroy everything she had worked for. Pole died of influenza within hours of Mary on 17 November.

Mary’s brief reign provokes differing assessments. Traditionally mainstream English historiography saw reaction, an unimaginative return to the pre-1529 past. A. G. Dickens stressed Protestant vigor that rendered her task a losing battle, and both A. F. Pollard and G. R. Elton were drawn to the metaphor of sterility in describing the reign. Eamon Duffy has led reassessments of Mary’s religious program, stressing elements anticipating Roman Catholic Church reforms after the Council of Trent (1545–1563), for instance, Pole’s proposals for clergy training colleges (seminaries) attached to cathedrals and the provision of instructional literature, some of which drew on initiatives of the early Reformation in England. In secular government, administrative and financial reorganization begun by Ed-

ward’s government officials continued. Major restructurings of customs revenue and of provisions for national defense were not greatly modified for more than half a century. Philip also encouraged naval expansion, which ironically chiefly benefited Elizabeth and her later wars against him. However the reign is judged, Mary’s blighted personal history can only attract sympathy.

MATHEMATICS. In his “Mathematical Praeface” to the *Elements of Euclid* of 1570, Elizabethan polymath John Dee (1527–1608) expounded on the importance and utility of mathematics to all fields of human endeavor. Field after field, he argued, from those we would find obvious (like navigation) to those we would find arcane (astrology) or outlandish (*thaumaturgike*), would benefit from the systematic application of mathematics. Although Dee was promoting a role for mathematics that was just taking shape during his lifetime, his vision did indeed prove prophetic. Undoubtedly, one of the most striking features of intellectual life in the early modern period is the startling expansion in the scholarly and practical domains covered by mathematics.

MATHEMATICS AND ITS CRITICS

Prior to the sixteenth century, mathematics in the West was a well-defined and circumscribed field consisting of two main branches: arithmetic, which had obvious practical applications in commerce and banking, and Euclidean geometry, which had few practical uses apart from astrology and, occasionally, optics. While mathematics was generally admired for the certainty and universality of its claims, the world as a whole, in keeping with Aristotelian tradition, was distinctly unmathematical, being governed by qualitative rather than quantitative rules. By the eighteenth century this view had been turned on its head: not only was an ever increasing number of fields being subjected to mathematical analysis, but the world itself had come to be understood as fundamentally mathematical in nature.

These developments were by no means a foregone conclusion in the sixteenth century; if anything, they seemed highly unlikely. For mathematics, far from being universally acknowledged as central to the intellectual and technological life of the age, was at the time being challenged as never before from various quarters.

Conservative critics, defending the established order of knowledge, challenged the truth claims of mathematics as incompatible with prevailing Aristotelian standards. Prominent among them were Italian philosopher Alessandro Piccolomini (1508–1578) and the Jesuit Benito Pereira (c. 1535–1610), who challenged the explanatory value of mathematical proofs. Proper scientific explanations, they argued with perfect Aristotelian orthodoxy, were causal arguments, proceeding from the true essence of objects to their properties. Mathematics, however, had no proper subject matter at all, and it could say nothing about the essential nature of physical objects. All mathematics could do was point to logical relations between hypothetical propositions, and thus it was a fundamentally inferior type of knowledge.

Mathematics did not fare much better among the new generation of reformers, who sought to uproot the Aristotelian framework and replace it with new conceptions of knowledge. In breaking the hold of Aristotelian standards on contemporary natural philosophy, many reformers found little use for mathematics. Its rigid procedures and unchanging truths seemed an unpromising basis for a

radical reform of knowledge. The study of nature, many argued, should proceed through unmediated experience and systematic trial and error. The rigorous deductive reasoning characteristic of mathematics could only lead to predetermined and unvarying results. The maverick Italian philosopher Giordano Bruno (1548–1600), for example, argued that mathematics could only describe the external appearance of phenomena, but never penetrate their hidden secrets. Similarly, in England, Francis Bacon (1561–1626) in the *Novum Organum* insisted that mathematics “should only give limits to natural philosophy, not generate or beget it.”

Mathematics did, of course, have many prominent defenders, ranging from the Jesuit Christopher Clavius (1537–1612) to Galileo Galilei (1564–1642) and René Descartes (1596–1650), each insisting in his way on the essential role of mathematics in any meaningful scheme of knowledge. But the very range of suggestions these and other natural philosophers offered for the role of mathematics in the general scheme of knowledge makes it clear that the fundamental questions raised by the challenges to mathematics did not go away. The critiques raised the fundamental questions that would guide the development of mathematics throughout the early modern period: what is mathematics, and how is it related to the natural world? The history of mathematics in this period is the story of the various answers that were given to these questions.

THE WORLD AS MIRROR OF MATHEMATICS

The fundamental answer to the critiques of mathematics was given by Galileo in his *Assayer* of 1623, when he wrote that the universe “is written in the language of mathematics.” Galileo was expressing the widely held notion among practitioners that mathematics, far from being devoid of all subject matter as claimed by its critics, had the entire natural world as its object. But while most agreed that mathematics was closely integrated with the physical world, the precise nature of their relationship remained a matter of intense dispute.

One leading approach accepted the classical view of mathematics as a rigorous deductive science of number and magnitude. The universal laws of mathematics, in this view, were the fundamental laws that governed material reality. Thus when one is investigating mathematical and geometrical rela-

tionships, one is in fact investigating the basic structure of matter.

The chief promoter of this approach was René Descartes, who viewed mathematics as a fundamental rational law laid down by God for his creation. Once God, the divine architect, had set in motion his perfectly rational universe, it would henceforth operate forever in accordance with mathematical principles. Mathematical investigations are accordingly studies of the divine plan for the natural world, and the world is the direct expression of abstract mathematical principles.

Descartes's scientific work directly reflects this fundamental understanding. In his *Meditations* and the *Discourse on Method*, Descartes insisted that by following strict rational rules one could, in principle, follow God and "create" the world step by step. Rigorous rational deduction was therefore the key to knowledge of the natural world, and Descartes proceeded to demonstrate the effectiveness of this principle in short treatises on optics and the colors of the rainbow, which were attached to the early editions of the *Discourse*.

Descartes's most important contribution to mathematics was also a reflection of his religious and philosophical views. The *Geometry* was the founding text of analytic geometry and, like Descartes's other scientific treatises, was published as an appendix to the *Discourse*. In essence, the new field demonstrated the fundamentally mathematical nature of the physical world. Abstract algebraic relationships (that is, $y = 3Dax + b$) were shown to have actual physical manifestations (in this case, a straight line). In pointing out these hidden relationships Descartes was unveiling the divine mathematical laws that governed the world. Mathematics, in this view, was a perfectly rational and logical web of relationships that determined the nature of physical reality.

MATHEMATICS AS THE MIRROR OF THE WORLD

While Descartes was honing his analytical geometry, a very different mathematical approach, based on a very different understanding of the relationship of mathematics to the world, was being developed elsewhere in Europe. The use of infinitesimals, or "indivisibles" as they were most commonly called, in calculating lengths, areas, and volumes of geometrical figures was the most dramatic and impor-

tant development in seventeenth-century mathematics. Fundamentally, the procedure involved reducing geometrical objects into an infinite number of their component parts: lines were viewed as an infinite collection of points, surfaces as made up of an infinite number of lines, and solids of surfaces. The length, area, or volume of the figure as a whole would then be calculated as the infinite sum of its elementary components.

The fundamental assumptions underlying this procedure were highly questionable and seemed to fly in the face of paradoxes that had been well known since antiquity. Descartes, who was much concerned with the perfect rational structure of mathematics, rejected infinitesimals and excluded them from the bounds of mathematics. Nevertheless, the effectiveness of this approach in reaching correct and previously unknown results was undeniable, and it was embraced enthusiastically by mathematicians across Europe. Thomas Hariot (1560–1621) and John Wallis (1616–1703) in England, Galileo and his disciples Bonaventura Cavalieri (c. 1598–1647) and Evangelista Torricelli (1608–1647) in Italy, Johannes Kepler (1571–1630) in Germany, and Blaise Pascal (1623–1662) in France were but a few of the most prominent practitioners of the new methods.

The infinitesimalist mathematicians' view of the relationship between mathematics and the world was, in many ways, the reverse of Descartes's approach. Whereas Descartes assumed that pure mathematical relationships governed the structure of matter, the infinitesimalists modeled mathematics on an intuition of the physical world. Geometrical bodies could be broken down into their indivisible components because, by analogy, physical bodies could be divided in the same way. As Cavalieri, whose *Geometria Indivisibilibus* was the most influential book about the theory and practice of indivisibles, wrote in his introduction, "plane figures should be conceived by us in the same manner as cloths are made up of parallel threads, and solids are in fact like books, composed of parallel pages."

The infinitesimalists' approach to mathematics drew much of its inspiration from the empiricist experimental philosophy that was gaining ground throughout Europe at this time. Much as the experimentalists sought to penetrate through external

appearances and bring to light the inner structure of the material world, the new mathematicians sought to uncover the “inner structure” of geometrical figures, which in their view was the true cause of all geometrical relationships. Both groups, furthermore, adopted the imagery of geographical exploration as their guiding metaphor, presenting themselves as adventurous explorers on the hazardous seas of mathematics and natural philosophy.

Like their experimentalist colleagues, the infinitesimalists made the discovery of new and correct results the true test of their success, and like them they often adopted a methodology of trial and error in searching for the correct answers. This “experimental” approach to mathematics accounts for the infinitesimalists’ relative disregard for the niceties of mathematical rigor and consistency. In their view, if a method produces true results, it must be fundamentally correct, and there was no point in spending too much time on clarifying the finer logical points. The most outspoken and unapologetic proponent of this approach was probably John Wallis, who advocated applying the experimentalists’ “method of induction” to mathematics, in preference to traditional rigorous mathematical deduction.

While the new infinitesimalist approaches were in wide use in the seventeenth century, they were also seriously challenged in certain influential quarters. The issues at stake were not purely mathematical in nature, but involved wide-ranging philosophical, religious, and even political considerations. For one thing, the new approaches carried the taint of atomism—the ancient view that all material objects could be reduced to indivisible particles called “atoms” (from the Greek *atomos*, ‘uncuttable’). Indeed there was no denying that the fundamental insights of the new mathematics and even its name strongly hinted that infinitesimalist mathematics was nothing but an expansion of atomism into mathematics.

This in turn led to a deeper difficulty: the suspicion that the new mathematics was based not just on atomism, but on materialism, which is the notion that the world was composed of nothing but matter, leaving no room for a providential spiritual realm. Geometry, after all, was often taken to be the very model of pure and abstract reasoning that gov-

erns the natural world. The notion that geometry itself, far from governing physical reality, is in fact a generalization of it, seemed to turn the proper hierarchy of mind and matter on its head, and challenge those who insisted that the world was ruled by a higher intelligence.

Finally, there was the question of the certainty of knowledge. Infinitesimalist mathematics seemed to be based on nothing more than a loose analogy with the physical world, trial and error, and a willful disregard for logical paradox. If even mathematics, that paragon of certain and unchanging knowledge, turned out to be so unsound, what hope could other, less rigorous fields have of attaining true knowledge?

In an age that still considered science, philosophy, and theology to be part of a single unified worldview, these criticisms cut deep. Descartes, concerned about the rational certainty of his method, excluded infinitesimal methods from proper mathematics. Even more significant was the reaction of the Society of Jesus, the most prominent religious order in Europe and the guardian of Catholic orthodoxy. Despite having among their members some of the most important and creative mathematicians in Europe, the Jesuits banned the teaching of infinitesimals from their educational institutions.

THE CALCULUS AND BEYOND

The invention of the calculus by Isaac Newton (1642–1727) and Gottfried Wilhelm Leibniz (1646–1716) in the late seventeenth century was the most important development of early modern mathematics, and it quickly transformed the landscape of the field. The calculus took as its starting point the many practical techniques and results achieved by the infinitesimalist mathematicians, both in the determination of surfaces and volumes of geometrical figures, and in the calculation of tangents of curves. The fundamental insight of the calculus was that these two operations, calculating tangents (differentiation) and calculating surfaces and volumes (integration), are in fact the inverse of one another.

The importance of this discovery becomes clear when curves and geometrical figures are presented not as independent geometrical figures, but as expressions of algebraic formulations in the manner of analytic geometry. When presented in this manner,

differentiation no longer deals with geometrical properties of particular geometrical objects, but becomes an abstract and general relationship between algebraic expressions. For example, one can say that the parabola expressed as $y = 3Dx^2$ describes the area under the line $y = 3D2x$, and that $y = 3D2x$ expresses the tangent of the parabola $y = 3Dx^2$ at any point. But the relationship between the two algebraic expressions is no longer dependent on their particular geometrical representation: $y = 3D2x$ is simply the *differential* of $y = 3Dx^2$ and $y = 3Dx^2$ is the *integral* of $y = 3D2x$. The inverse relationship is a fundamental relationship between abstract algebraic expressions (or *functions*, as they came to be called later in the eighteenth century) independent of any particular geometric representation. Both Newton and Leibniz were quick to reduce the transformations back and forth between *differentials* and *integrals* (or “fluents” and “fluxions” as Newton called them) into systematic and reliable algorithms.

In the calculus, the two competing traditions of seventeenth-century mathematics were brought together. Although it clearly grew out of the techniques developed by infinitesimalist mathematicians, the calculus was equally dependent on the algebraic formulations of analytic geometry. Furthermore, the calculus detached the infinitesimalist methods from their dependence on an intuition of physical reality. If the older approaches could be viewed as growing out of an atomistic intuition of material reality, the calculus restored the primacy of abstract logical relationship to mathematics. Particular geometric figures could be seen as examples of these abstract algebraic relations, but these relations themselves were no longer dependent on any particular physical or geometrical instances.

MATHEMATICS IN THE ENLIGHTENMENT

The calculus, which positioned mathematics as both an abstract system of algebraic relationships and as intimately connected to the physical world, set the tone for eighteenth-century views of the field. The most eloquent formulation of attitudes toward mathematics in the Enlightenment was given by Jean Le Rond d’Alembert (1717–1783), in his “Preliminary Discourse” to the *Encyclopédie*, published in 1751. Whereas seventeenth-century practitioners viewed mathematics as either a generalization of material intuitions or as a universal law

governing nature, for d’Alembert mathematics was necessarily both. On the one hand, he insisted, mathematics is clearly an abstraction from nature: it is nothing but the fundamental relationships among natural objects that are arrived at when the material features such as texture and color are stripped away. On the other hand, d’Alembert argued, the laws of nature are simply elaborations of mathematical relationships, arrived at by restoring matter’s physical attributes to abstract disembodied mathematics. The world, then, according to d’Alembert, is fundamentally mathematical: mathematics is derived from the physical world, while the physical world is an extension of mathematical principles.

This view of an essentially mathematical universe manifested itself in the inclusion of an ever-growing number of scholarly fields that were brought under the sway of mathematics in this period. Years before, Galileo had already introduced mathematics into the study of falling bodies and statics, and he and his followers extended his work to the field of ballistics. Cartographic work was thoroughly mathematized in the seventeenth century, and Kepler and Newton transformed the ancient science of astronomy by extending the reach of mathematics from merely describing the motions of the heavens into the realms of celestial mechanics. In optics, Descartes’s ingenious application of his “method” enabled him to explain such phenomena such as the formation of the rainbow with mathematical precision.

In the eighteenth century, a new generation of mathematicians, including the Bernoullis, Leonhard Euler (1707–1783), d’Alembert, Joseph-Louis Lagrange (1736–1813), and Pierre-Simon Laplace (1749–1827), among others, added increasingly precise theories of mechanics and argued famously about proper mathematical representations of abstract concepts such as *vis viva*, and concrete problems like the vibrations of strings and hydromechanics. Other fields that were seemingly less malleable for quantitative analysis, like doctrines of chance, or probability, and also the “moral” sciences, known today as social sciences, were also brought under the sway of mathematics, particularly in the work of the marquis de Condorcet (1743–1794). Institutionally, the eighteenth century saw mathematics gain a quickly growing foothold in newly established engineering and military colleges.

EPILOGUE

Unfortunately for d'Alembert and other promoters of the mathematical universe, rigorous mathematical analysis could not be easily derived from physical reality. Inconsistencies and paradoxes seemed to crop up repeatedly when mathematics was modeled on perceptions of the physical world, as critics of infinitesimal methods and the calculus, such as George Berkeley, were quick to point out. At the same time, the physical world proved to be far more varied and surprising than could ever be derived from bare mathematical principles.

Early in the nineteenth century the interdependence of mathematics and the physical world, so eloquently presented by d'Alembert, came to an end. In their work on the foundations of the calculus, mathematicians Bernhard Bolzano (1781–1848) and Augustin-Louis Cauchy (1789–1857) reformulated mathematical analysis as rigorous and logically self-consistent, a goal that had eluded their Enlightenment predecessors. They did so, however, at a price that would have seemed too heavy for d'Alembert and his colleagues: pure mathematics, in their scheme, was finally divorced from physical reality, existing in its self-enclosed Platonic realm.

The course and development of mathematics in the early modern period had come full circle. Criticized in the sixteenth century for being irrelevant to the developing sciences, mathematicians at the time had responded by forming a closer bond than ever before between their field and the physical world. Two and a half centuries later, in an attempt to save the identity and coherence of their field, mathematicians chose to sever those same conceptual ties, and establish mathematics in its own separate and insular domain.

MATTER, THEORIES OF. Philosophical ideas about the nature and constitution of bodies saw dramatic change in the early modern period, and new thinking about matter became a major factor in the so-called scientific revolution, contributing every bit as much to the new worldview of the early modern period as the changes in cosmology following from Copernicus's attempt to reform astronomy. Like the reforms in cosmology, changes in theories of matter were not simply recondite transformations within specialist natural philosophy, but were seen to have significant implications in other important aspects of intellectual life, most notably in theology.

THE ARISTOTELIAN BACKGROUND AND ALCHEMICAL INNOVATION

Even in the Middle Ages the dominant Aristotelian theory was subject to criticism and refinement. Aristotelian theory was based on a metaphysics known as hylomorphism, in which bodies were characterized as an inseparable combination of matter and form, and a physics in which all bodies were held to consist of a particular combination of the four elements: fire, air, water, earth. These ideas could hold sway in university natural philosophy curricula, but they proved inadequate as far as practitioners of alchemy were concerned. Driven chiefly by a concern to understand phenomena that became apparent in what we would call chemical reactions, alchemists developed a belief in *minima naturalia*, or natural minimum-sized particles of reagents. These ideas, first developed among Arab alchemists, were influentially expounded in the *Summa perfectionis*, attributed to Geber (Jabir ibn Hayyan, fl. 8th century C.E.), but written by a Christian alchemist of the late thirteenth century.

Although the idea of *minima naturalia* was justified in terms of Aristotelian hylomorphic theory (on the assumption that, in any characteristic combination of matter and form, the form must require a specific minimal amount of matter to work on), it

is easy to see the similarity between natural minima and atoms. So, although Aristotle himself had been critical and dismissive of atomism, the rediscovery in the fifteenth century of two major sources of ancient atomism (by Epicurus, c. 341–270 B.C.E., and Titus Lucretius Carus, c. 99–55 B.C.E., respectively) aroused great interest among the more eclectic of Renaissance thinkers. Accordingly, Aristotelian alchemy and atomism could be used together to understand natural processes. The combination of these two traditions, which looks so unlikely on the face of it, became highly influential as a result of other Renaissance developments.

Alchemy, once thought of as distinctly inferior to the supreme Aristotelian enterprise of natural philosophy, began to earn new intellectual respect in the Renaissance. The discovery of the corpus of philosophical and theological works attributed to Hermes Trismegistus led to a reevaluation of the supposedly Hermetic alchemical writings, and indeed to magical worldviews in general. The Renaissance rediscoverers of this literature believed that its author, Hermes, identified with the Greek god of that name, must have been a great pre-Christian sage. Generally assumed to be contemporary with Moses, the Hermetic writings were regarded as one of the oldest sources of ancient wisdom, to rank alongside the Pentateuch. The alchemical writings attributed to Hermes now also won new respect, as did the pursuit of alchemy in general.

Alchemy also attracted new attention because it seemed an obvious way to understand the so-called occult qualities of matter. The Aristotelian doctrine that all bodies were composed of the four elements led to the assumption that the qualities of all bodies must derive from the manifest qualities of the four elements (heat, cold, dryness, wetness). In both alchemy and pharmacology (and therefore in medical theory more widely) it became increasingly apparent that there were other qualities that could not be reduced to the four manifest qualities—these were declared to be occult or hidden, and could only be known by their effects. Interest in alchemy in the Renaissance, from Paracelsus (1493–1541) to Francis Bacon (1561–1626) and even Isaac Newton (1642–1727), was more often motivated by a concern to understand the occult qualities assumed to reside in the smallest particles of matter, than by a desire to transmute base metal into gold.

There can be no doubt that the new admiration for alchemy and its links to theories of matter that were essentially particulate, deriving either from the *minima naturalia* tradition or its eclectic combination with atomism, was a major factor in the development of new theories of matter that were to play such a major role in the scientific revolution. It was by no means the only factor, however.

THE REVIVAL OF ANCIENT ATOMISM

The revival of ancient atomism after the discovery of Lucretius's *De rerum natura* in 1473 gradually attracted the attention not just of alchemists but also of those working in the domain of physics. Galileo Galilei (1564–1642), for example, took up atomism as a way of accounting for the strength and coherence of materials, and differences between liquid and solid states. Galileo's attempts to use atomistic explanations were ultimately unsuccessful, but atomism continued to attract attention from reforming natural philosophers dissatisfied with scholastic Aristotelianism. Among the earliest of these were Pierre Gassendi (1592–1655), who devoted himself to a comprehensive scholarly exposition of ancient Epicurean atomism, and René Descartes (1596–1650).

Descartes, a mathematician at the forefront of contemporary attempts to develop a mathematical physics, was the first to see a way to predict and explain the behavior of moving bodies by assuming precisely defined laws of motion and rules of impact. By applying these same laws to invisibly small particles that were supposed to constitute all things, Descartes effectively developed a mathematized version of ancient atomism (except that Descartes did not believe the constituent particles were indivisible, and so his philosophy is more correctly called corpuscularist). This was not just a restatement of atomism, therefore, but something entirely new. It was the first presentation of what is known as the mechanical philosophy.

THE MECHANICAL PHILOSOPHY

Descartes's version of the mechanical philosophy made a huge impact on philosophical consciousness, but although it won many adherents there were many other natural philosophers who could not accept it in its Cartesian form. The principal problem was Descartes's theory of matter. According to Descartes's strict version of the mechanical

philosophy, matter was completely passive and inert. His vision of the physical universe and all its phenomena was one in which God, at the Creation, sets matter in motion and imposes the laws of nature upon it. Matter is so inert that, once set in motion, it cannot stop, but must continue to move until something else stops it. In the Cartesian universe inert particles of matter collide with one another and rebound after an exchange of motions, and all the phenomena we observe in the world are the outcome of collisions and combinations of invisibly small particles. In this system Descartes can only explain the continued coherence of an object, for example, by assuming that its particles are shaped in such a way that they can be entangled with one another, or by assuming that the constituent particles are all moving together with the same speed and direction. For many natural philosophers, this was just too implausible. What was required, such opponents of Descartes assumed, were principles of activity within the particles of matter that could account for coherence and other aspects of the behavior of matter.

It is surely significant that Descartes never showed any interest in or much knowledge of (al)chemical phenomena (even his account of biological systems depends upon what we would recognize as hydraulic and thermodynamic mechanisms, rather than supposed chemical interactions between fluids). It was those thinkers who were more aware of the complexities of alchemical and vitalistic phenomena, particularly those attributed to occult qualities, who developed alternative versions of the mechanical philosophy in which the supposed invisibly small particles of matter had their own principles of activity. This was true even of Pierre Gassendi, who saw himself simply as reviving the ancient atomism of Epicurus. There was no Epicurean precedent for Gassendi's talk of atoms with "natural impulses," "internal faculties," and "seminal powers." Robert Boyle (1627–1691), the leading natural philosopher in England in his day, promoted what he called the "corpuscular philosophy," which although owing much to the mechanical philosophy incorporated many doctrines from the tradition of alchemical corpuscularism.

The trend toward a mechanical philosophy in which matter was not completely inert but endowed with active principles achieved its culmination in the

natural philosophy of Isaac Newton. In the Preface to his *Principia Mathematica* (1687) Newton expressed his conviction that all phenomena could be explained in terms of attractive and repulsive forces operating between the particles of bodies, and yet he referred to these as "mechanical principles." Descartes would never have entertained the possibility of such forces (for him gravitational fall was not due to attraction but to streams of invisible particles pushing things down toward the center of the earth), but Newton, unlike Descartes, had spent many years of his life studying the principles of alchemy.

MECHANISM VS. VITALISM

If detailed experimental knowledge in alchemy contributed to new conceptions of the nature of matter, so did developments in medical knowledge. In part this was the direct result of alchemical ideas being used to reform medicine by thinkers like Paracelsus and Jean Baptiste van Helmont (1577–1644), but there were older medical traditions involved. Medical writers had always been concerned to understand the differences between life and death, between the living and nonliving. Although Aristotle noticed the link between heat and life, he denied that life was maintained by fire. Instead he attributed animal heat to the "element of the stars," since the stars were self-moving, and so, according to Aristotle, must be alive. Descartes simply insisted that the heat of the living body was nothing more than the result of a fire burning in the animal heart. William Harvey (1578–1657), discoverer of the circulation of the blood, by contrast, located animal heat in the blood, and asserted that blood corresponded to the element of the stars, having its own principle of life within it. Among the succeeding generation of medical writers in England were those, like Thomas Willis (1621–1675) and John Mayow (1641–1679), who tried to explain living systems in terms of the (al)chemically tempered (non-Cartesian) mechanical philosophy; and those like Francis Glisson (1597–1677), who was led by his discovery of tissue contractility and irritability (even in the absence of nerves) to conclude that all matter was endowed with perception, appetite, self-motility, and therefore life.

Descartes had tried to reduce all living processes to mechanistic interactions, and although he ini-

tially had some influence here, it seems safe to say that, for most thinkers, animal development and especially animal generation seemed to defeat Descartes's mechanistic ingenuity. By the eighteenth century only radically atheistic thinkers like Julien Offray de la Mettrie (1709–1751) and Baron d'Holbach (1723–1789) took the strict mechanistic line. Glisson's physiology, if not his theory of matter, was taken up by Albrecht von Haller (1708–1777), while post-Harveian medical research came together with the Newtonian version of the mechanical philosophy to consolidate a vitalistic theory of life that went hand in hand with a theory of matter that allowed for certain principles of activity within matter. One important ingredient in the mix emerged as a result of experimental investigations firstly of static electricity, and subsequently of current electricity. In the final paragraph of the second edition of the *Principia* (1713) Newton referred influentially to an electrical spirit, which he seemed to believe was not only responsible for attractions and repulsions between particles but also played a physiological role in animals.

THEOLOGY AND MATTER THEORY

Epicurean atomism was usually regarded as an atheistic philosophy and those natural philosophers who were associated with its revival, or indeed with any corpuscular matter theory which might be construed as atomistic, took pains to correct this view. Gassendi used all his scholarly and philosophical resources to “baptize” Epicurus and show that his philosophy was compatible with Christian doctrine. Corpuscular philosophers in England, such as Kenelm Digby (1603–1665), Walter Charleton (1620–1707), and Robert Boyle effectively began the tradition known as “natural theology” by showing how their natural philosophy could be used to prove the existence of God. Even so, the materialism of the strict versions of the mechanical philosophy—which included the system developed by Thomas Hobbes (1588–1679) as well as Cartesianism—led many to distrust these new philosophies.

Nicolas Malebranche (1638–1715) and other followers of Descartes tried to assert the necessary theism of Cartesianism by suggesting that matter was so inert that it was incapable of any causal activity. A hurled brick has no power of its own to break

a window, they would have suggested, and only does so because God, ensuring the perpetuation of the laws of nature, causes the glass to break on the occasion that the brick hits it. This religiously motivated “occasionalism,” as it is called, was regarded as unacceptable by many orthodox believers, however, because it seemed to make God directly responsible for everything in the world, including all the most debasing and the most wicked acts of mankind.

Assumptions about the activity of matter, on the other hand, seemed to many to support the theistic cause while allowing for the transcendence of God. If matter could be shown, by experiment, to have principles of activity within it, this raised the question of how these active principles came to be there. Clearly, they could only have been put there by a supreme Creator. This argument depended upon the standard assumption that matter was, by its nature, completely passive and inert, and therefore active principles must be extraneous additions.

Unfortunately, atheists found it easy to suggest that matter was not inherently passive. Indeed, they could use Newtonian and other claims to demonstrate that it was not. Nevertheless, the most common strategy among the orthodox was to strike a balance, making matter not passive but not too active, either. Matter that was too active was also regarded as subversive to sound religion. Glisson's living matter was regarded by some leading churchmen as highly pernicious, as was John Locke's (1632–1704) argument that God's omnipotence allowed him to make matter capable of thinking. For such churchmen, traditional religious dualism between passive matter and active spirit had to be upheld in order to leave a significant role for immaterial spirit. Consequently, living or thinking matter had to be declared to be logical impossibilities, which not even an omnipotent God could bring about.

In Roman Catholic countries atomism confronted its own special problem. Aristotelian hylomorphism could easily account for the seemingly paradoxical fact that the bread and wine used for the Eucharist continued to look and taste like bread and wine (even though it was supposed to be actually the blood and flesh of Christ). Atomist or corpuscularist theories could not, however. As a

result, Descartes's works were included on the Inquisition's Index of Prohibited Books after 1663, and from 1671 his theories could not be taught in French universities.

MATTER THEORY AND RECENT HISTORIOGRAPHY

The mechanical philosophy and its theory of passive and inert matter, interacting only by physical collision and entanglement, has been used by recent historians to make a number of bold claims about the nature of Western civilization. Feminist historians, for example, have seen it as the embodiment of a philosophy of domination and exploitation, insensitive to organicist and ecological concerns, which has led to the current lamentable excesses of capitalistic and technological culture. Unfortunately, most of this work characterizes the mechanical philosophy as monolithically Cartesian in its nature. In these same feminist accounts, alchemy and magical worldviews are seen as being holistic and organicist, and completely antithetical to the mechanical philosophy. A more sensitive reading of the historical development of matter theory and the mechanical philosophy, showing the crucial role of alchemical and other occult ideas, suggests that the story is more complex than feminist historiography has so far acknowledged.

As the complexities of early modern matter theory have been uncovered, another once influential historiographical claim has fallen out of favor. Some historians claimed to be able to see parallels between matter theory and political belief systems in early modern England. In these accounts orthodoxy was represented in natural philosophy by the mechanical philosophy, and in politics by monarchism and episcopalianism. Radical political thinkers, republicans and those with democratic tendencies, and presbyterians or independents in religion, by contrast, were held to favor theories of active matter. There were supposed to be clear parallels between the idea of passive matter, moved from outside by an omnipotent God, and an obedient populace ruled from above by an absolute monarch. Similarly, those with more democratic political tendencies were supposed to believe that particles of matter should have their own principles of movement within them. According to this view, only those of quite extreme radical politics believed in active matter. Looking back to the recent heyday of this historiographical trend,

the only thing to be said in its favor was that it stimulated historians to look more closely at the actual details of early modern matter theory. As should be apparent from the foregoing, it was not long before historians realized that the assumptions about matter theory in this historiographical tradition were hopelessly crude, if not downright wrong.

Part of the problem with both these historiographical trends is that they are based upon glib presuppositions about the nature of early modern science—in particular assumptions that the mechanical philosophy was always and everywhere indistinguishable from Cartesianism. This in itself could be seen to stem from the fact that until comparatively recently historians of science had a tendency to concentrate on those aspects of the history of science that were presupposed on presentist grounds to contribute to modern science. Accordingly, alchemy and other occult ideas were ignored as irrelevant. Feminist historians can perhaps be forgiven, therefore, for taking such recent historical reconstructions for granted, and using them in their own accounts. The inadequacies of this approach to the history of science have now been thoroughly recognized, however, and the current trend is to try to understand natural philosophy and past science in its own terms, not in relation to modern scientific beliefs.

JOHN HENRY

MATTHIAS (HOLY ROMAN EMPIRE) (1557–1619; ruled 1612–1619). The younger son of Maximilian II, Matthias served as governor-general of the Spanish Netherlands, 1578–1581, governor of Upper and Lower Austria (1593), king of Hungary (1608), and king of Bohemia (1611). He married Anna of Tyrol (1585–1618) in 1611.

In 1872, a play by the Austrian playwright Franz Grillparzer, *Ein Bruderzwist in Habsburg*, premiered in Vienna. This play immortalized the conflict between the Holy Roman emperor Rudolf II and his younger brother, Matthias, and in some ways marks the high point of the received significance of Matthias, who in 1612 followed Rudolf on the imperial throne.

Matthias was the seventh child of the archduke Maximilian and his wife, the Spanish infanta María. (Nine children followed.) Matthias's father Maximilian was elected emperor in 1564, and this imperial heritage seems to have marked Matthias as he grew up. Matthias's father had bequeathed all of his holdings to his eldest son, Rudolf, who reigned as emperor Rudolf II. This meant that the remaining male heirs had to be satisfied with modest cash settlements tied to residences in the Habsburgs' hereditary lands. Matthias was not satisfied with this legacy.

At twenty-one, Matthias was persuaded to participate in a scheme to replace the direct rule in the Netherlands of the Habsburg prince in Castile, King Philip II. This development was tied to the Habsburgs' attempts to reorganize the rule of their troublesome Burgundian inheritance. The constitutional position of these provinces, where armed rebellion began in earnest around 1568, was ambigu-

ously situated between the unclear boundaries of the Holy Roman Empire and the dynastic claims of the Habsburgs and their local supporters.

The experiment of rule by Matthias in the Netherlands did not last long, for it had not been sanctioned by either his uncle, Phillip II, or his brother, Emperor Rudolf II. The political and religious conflicts in the Low Countries were beyond the means or abilities of the young archduke. In 1581 Matthias returned, disappointed as well as discredited, to central Europe and was awarded the Habsburg city of Linz and given its imposing castle as his residence. He vegetated there for quite some time, and was not given significant ruling responsibilities again for over a decade and a half.

In 1595, the older and now wiser Archduke Matthias was assigned responsibilities over Habsburg holdings along the Danube River. Two years previously, the sporadic violence on the Hungarian frontier with the troops of the Ottoman sultan had broken into open warfare, prompting Emperor Rudolf to name his younger brother Matthias to the command of the Habsburg and imperial forces parrying the Ottomans' forays in the Hungarian arena.

In the meantime, the emperor became increasingly withdrawn. The Habsburg family's male representatives met in 1606 and designated not Rudolf but Matthias as head of the family. Soon the conflicts erupted into armed confrontations between the supporters of Rudolf and Matthias, and Matthias was able to engineer his election as King of Hungary in 1608.

The events of the next few years were both confused and confusing. (Grillparzer recognized the dramatic possibilities.) Matthias married his cousin, the archduchess Anna, the daughter of his uncle, Archduke Ferdinand of Tyrol and Ferdinand's second wife, Anna Catherine, from the house of Gonzaga. After Matthias's brother Rudolf died in Prague, Matthias and Anna ascended the imperial thrones in 1612. Matthias is often forgotten in the stories of this period, which rush to a description of the crises marked by disagreements over who should succeed him in the various lands over which he reigned. These disagreements are often given substantial influence in narratives about

the origins of the Thirty Years' War, which would soon convulse the Holy Roman Empire.

Because Matthias and Anna were childless, the issue of the imperial succession—as well as the succession to the various other Habsburg hereditary lands in central Europe—remained a burning question. Matthias's younger brother Albert, who had left central Europe in 1570 with Matthias's older sister Anna when she became the bride of his uncle, Philip II of Spain, was still alive, and a possible heir. Albert, however, had tied his star to the brothers' mother's Iberian branch of the family, serving as viceroy of Portugal, for example, among other offices, and was now (jointly with his wife, Philip II's daughter Isabel [also Isabella] Clara Eugenia) ruling the Netherlands as Matthias had once hoped to do.

In a controversial and significant move, the Habsburg Dynasty's central European representatives decided to throw their support to the young archduke from Styria, Ferdinand, son of Matthias's other uncle, Charles. Matthias tried to organize his various holdings through a general assembly in Linz in 1614, but the disagreements among the various representatives led to no memorable outcome. Emperor Matthias is often tied to the activities of his adviser, the energetic counter-reformer Cardinal Khlesl, but because of the cataclysm to come, these efforts remain underresearched and underappreciated. In the end, Matthias and Anna seem destined to be best remembered for their role in creating the preferred burial site for succeeding generations of Habsburgs: the Capuchin friary on the new market in Vienna.

Originally interred in the church of the Poor Clares (the Queen's Cloister) founded by his older sister Elizabeth in Vienna in the 1580s, Matthias's and Anna's remains were transferred in the 1630s to the now famous imperial crypt at the Capuchin friary, which they had endowed in their wills. It is there where they and so many of their Habsburg relatives now repose, much to the fascination of endless busloads of tourists.

JOSEPH F. PATROUCH

MAULBERTSCH, FRANZ ANTON (1724–1796), Austrian painter, decorator, and graphic artist. Maulbertsch was an Austrian painter, etcher, and decorator active in the second half of the eighteenth century. Though a major figure comparable in scope to Giovanni Battista Tiepolo (1692–1770) and working in the same monumental forms, he is little known outside the central European sphere of his activity. This is symptomatic of the scant scholarly attention given to areas outside the mainstream, notwithstanding the cultural permeability of Europe at the time and the particular vitality of the region itself. With the Reformation contained, if not suppressed, following the Thirty Years' War, and new land recovered from the Ottoman Turks, Central Europe saw explosive growth in church and state during the eighteenth century. Palaces, churches, and monasteries were built and repaired, rebuilt and redecorated in accordance with doctrinal and ceremonial demands that favored grand decorative schemes. Like many other artists of the time, beginning with the Italians, Maulbertsch, who lived in Vienna, traveled from abbey to palace in what is now Austria, Hungary, the Czech Republic, and Slovakia as opportunity arose. Many of his paintings are still in their original locations.

Born in Langenargen on Lake Constance, Maulbertsch, after receiving initial training from his father, Anton, went to Vienna, where he studied at the Academy of Artists, which was then equal to any academy in Europe. An active participant in academic culture throughout his life, he won a first prize in painting there in 1750 and was elected as a member in 1759. He also became a member of the newly formed Print Academy (Kupferstecherakademie) in 1770 and the Berlin Academy of Artists in 1788. cenzo Carlone (1686–1775), as well as that of Daniel Gran (1694–1767) and Paul Troger (1698–1762), who had traveled extensively in Italy (principally to Venice and Naples, but also to Rome and Bologna), helped to prepare Maulbertsch for his large-scale decorative commissions. These began with the Piarists' church in Vienna in 1752–1753 and continued nearly annually thereafter. In the decade of the 1750s, for example, he painted frescoes for the Jesuit Church in Vienna in 1753–1754; for the Schloss Suttner, Ebenfurth (Lower Austria), in 1754; for Heiligenkreuz-Gutenbrunn (Austria) and Sümeg (Hungary) in 1757 and 1758; for Mikulov/Nikolsburg and Kroměříž/Kremsier (both now in the Czech Republic) in 1759; and so forth. The intensity of his activity diminished only in the decade before his death in 1796. He executed works for parish churches and religious orders (the Servites, Augustinians, Barnabites, Jesuits, Premonstratensians, Carmelites, and Cistercians), for prelates and archbishops, and from 1765 for the imperial family.

In the course of covering the walls, ceilings, and vaults of churches, cathedrals, chapels, libraries, dining halls, refectories, reception halls, council chambers and other spaces, Maulbertsch developed an expressive pictorial language compounded of light and color for vast illusionistic schemes with and without fictive architecture. The same virtuosic technique of often dazzling brilliance appears in the large altarpieces and easel paintings he executed throughout his career. Although from the late 1760s on he adapted his style to the prevailing classical taste and emerging Enlightenment ideals through a new evenness of light and clarity of form and structure, his later commissions came mainly from the more provincial reaches of the empire. At the end of his life, he made etchings of popular themes that were aimed at new audiences and tastes.

To prepare his works, even the etchings, he regularly employed small preparatory sketches in oil, then a well-established technique but one that he brought to new levels of accomplishment. The sketches range from fully developed models—made for his own or assistants' use and the approval of patrons—to lively composition, figure, and part studies, freely executed in monochrome shades and full colors on paper or small canvases, using the same fluid and spontaneous brushwork that he

would employ in the actual work. When they were studies for mural paintings—including the variant typically practiced in Central Europe, which permitted a more varied application of paint and hue than true fresco—they were often made in the winter months when the weather otherwise made it difficult to work. But, having developed out of standard preparatory practice, these oil sketches, which sometimes seem to have been made for their own sake, transcended their origins and came to stand for the newly emerging aesthetic values of creativity that were being formulated by Enlightenment and Romantic writers from Diderot to Goethe. Rapidly laid down with a fully charged brush, such sketches seemed to promise more pleasure to the imagination and, as an apparently transparent means of communication, seemed nearer than the finished painting to the act of creation itself. Thus, if in his monumental decorative schemes and altarpieces Maulbertsch represented the *ancien régime* that was drawing to a close, in the spirited impasto and evocative forms of his oil sketches, he continued to be a vital force anticipating the values of the century ahead.

LINDA F. BAUER

MAXIMILIAN I (HOLY ROMAN EMPIRE) (1459–1519; ruled 1493–1519), Holy Roman emperor. Maximilian I was a member of the Habsburg Dynasty. Elected king of Romans in 1486, he declared himself elected Holy Roman emperor in 1508. In 1477 Maximilian married Mary, Duchess of Burgundy (1457–1482). In 1490 he married Anne, Duchess of Brittany (1477–1514), by proxy, but that marriage was annulled in 1491. In 1494 he married Bianca Maria Sforza

(1472–1510). He had three legitimate children, including Philip the Fair (1478–1506), duke of Burgundy and king of Castile (ruled 1506), and Margaret (1480–1530), regent of the Netherlands. Maximilian also had at least eleven acknowledged illegitimate children.

Possibly named after the third-century martyr Saint Maximilian of Celeia, Maximilian was the son of Holy Roman emperor Frederick III (ruled 1440–1493) of the House of Habsburg and Empress Eleonor (1436–1467) of the Portuguese royal house of Avis, who were married in Rome in 1452 by Pope Nicholas V (reigned 1447–1455). Maximilian was born on 22 March 1459 in his parents' residence city of Wiener Neustadt in Lower Austria, and he and his mother are buried there. His life was tied to building the power and reputation of his family through shrewd marriage alliances for himself, his children, and his grandchildren and through various artistic projects and sponsorships, including an important relationship with the artist Albrecht Dürer (1471–1528). When Maximilian died on 12 January 1519 in the archducal castle located along the walls of the Upper Austrian city of Wels, his family had claims over territories stretching across Europe and overseas into the Americas.

Maximilian is often referred to as “the Last Knight” and has been seen as a transitional figure on the cusp of early modern history. His constant lack of money did not deter him from imagining magnificent schemes, many relating to projecting an image of himself and his rule to posterity. The most famous examples of these undertakings are the elaborate funerary monuments he planned for himself in the court chapel at Innsbruck. These monuments reveal a combination of imagined ties among his dynasty, medieval antecedents, and classical Rome (inspired by humanist interests in antiquity). His court has been seen as an important mediator for the spread of Italianate forms and ideas across the Alps into the rest of the Holy Roman Empire, particularly after his marriage in 1494 to one of the richest heiresses of his day, Bianca Maria Sforza, from Milan.

In the history of the Habsburg Dynasty, Maximilian built on his father's acquisition of the imperial crown, which remained in Habsburg hands with one brief exception until they declared the end of

the empire in 1806. Maximilian's marriage to the heiress of the great late-medieval Burgundian inheritance, Mary, brought those rich lands under the control of the Habsburgs. While he was unsuccessful in his campaigns against the Swiss towns and cantons that wrested control of parts of the Habsburg patrimony from the dynasty, Maximilian is credited with engineering the marriage in 1496 of his son Philip to the Spanish heiress Joan I (queen of Castile 1504–1555; queen of Aragón 1516–1555). This marriage more than made up for the Swiss losses through the gain of the Iberian kingdoms of Castile and Aragon together with their overseas possessions in Italy, the western Mediterranean, and the Americas.

After the death in 1490 of Matthias I Corvinus (ruled 1458–1490), king of Hungary, who had taken the city of Vienna and made it his residence, Maximilian turned his attentions back from the west of Europe to the Habsburgs' hereditary Danubian holdings and the enticing kingdoms of Bohemia and Hungary. He captured Vienna and again employed marriage negotiations, this time with representatives of the important ruling dynasty of those kingdoms, the Jagiellonians (who also controlled Poland). Through a double marriage of Jagiellonians and Habsburgs negotiated in Vienna in 1515, Maximilian set up the situation in which his grandson Ferdinand I (ruled 1558–1564) claimed the Bohemian and Hungarian thrones after the death of the Jagiellonian king Louis II (ruled 1516–1526) on the battlefield at Mohács, fighting the Ottoman army, in 1526.

In the constitutional history of the Holy Roman Empire, Maximilian is known for the role he played in the reorganization of institutions beginning in the 1490s. This reorganization has been interpreted variously by historians of the empire, but it established a more active imperial judiciary and regional governing mechanisms, among other modifications.

When Maximilian died in the castle at Wels, he left to his Burgundian-raised grandson (who as Emperor Charles V ruled 1519–1556), an array of claims, titles, challenges, and opportunities vastly different from those he had inherited. The Habsburgs were well on their way to world significance.

MAXIMILIAN II (HOLY ROMAN EMPIRE) (1527–1576; ruled 1564–1576), Holy Roman emperor. Maximilian II, who was born on 31 July 1527 in Vienna and died on 12 October 1576 in Regensburg, was king of Bohemia (ruled 1562–1576), king of the Romans (1562), and king of Hungary (ruled 1563–1576). He became Holy Roman emperor in 1564. In 1548 he married María of Habsburg (1528–1603), coregent of Spain (1548–1550). Maximilian is buried in Saint Vitus Cathedral in Prague.

Son of the new king and queen of Bohemia and Hungary, Ferdinand I (ruled 1558–1564) of Habsburg and Anna of Jagiellon (died 1547), Maximilian grew up as a rival to his cousin Philip of Spain, the

future King Philip II (ruled 1556–1598). Ultimately Maximilian gained the imperial title and fathered two Holy Roman emperors, Rudolf II (ruled 1576–1612) and Matthias (ruled 1612–1619). Philip gained the Iberian lands, the Low Countries, parts of Italy, and the Habsburg overseas empire in the Americas, Africa, and Asia.

Maximilian is often portrayed as having had—much to the dismay of his more orthodox father—a lively curiosity when it came to religious matters. This curiosity led many of his time (and later) to speculate that he may have believed some of the theological points presented by the followers of Martin Luther (1483–1546). Some scholars believe that, to restrain the young archduke, some of his inheritance was given away to his brothers Ferdinand and Charles, and Maximilian was sent to Spain to act as coregent with his bride María, the sister of the later Spanish king Philip II.

Nonetheless Maximilian's father eventually entrusted the newly acquired kingdoms of Bohemia and Hungary, together with some of the Habsburg hereditary lands, to Maximilian and María. At the death of Ferdinand in 1564, Maximilian assumed the title of elected emperor and proceeded to organize the defense of Christendom against new Hungarian campaigns undertaken by the Ottomans in the 1560s. The defense, however, was less than spectacular. Maximilian, apparently shaken by the experience, retreated to a more intellectual and legally circumscribed sphere of cultural pursuits and limited political engagement.

Keeping an eye on the possibilities in Iberia (his cousin Philip was having difficulties producing a viable heir), Maximilian and María produced numerous children, including Anna, the future wife of Philip. A second daughter, Elizabeth, became Queen of France as the wife of King Charles IX (ruled 1560–1574).

Intelligent and open-minded, Maximilian supported research on historical and botanical subjects, and he continued to import styles and ideas from Italy, a process his father had actively supported. Outside of his residence city of Vienna, Maximilian oversaw the building of an impressive garden residence known simply as the “New Construction” (*Neugebäude*). Situated on a rise overlooking the Danube River, this construction provided an or-

derly alternative to an oft-chaotic political landscape over which the emperor had little clear control.

Maximilian lost influence in imperial Italy over such matters as what title was to be granted to the Medici in Florence. Nevertheless he transferred the crowns of Bohemia and Hungary as well as the imperial title to his son Rudolf, partly by allowing an ill-defined amount of religious toleration to the important nobles in various of his lands.

In lands distant from the Ottoman front in Hungary, Maximilian's policies were marked by a clear respect for the provisions of the religious peace set at Augsburg in 1555 by his father. Maximilian staked much on the support of the Saxon electors newly tied to the imperial constitution. He also reached out to the usually inimical Valois in France, as representatives of that dynasty struggled with religious and civil chaos in their kingdom. Maximilian even entertained cordial relations with the Tudor queen of England, Elizabeth I (ruled 1558–1603). His wife María and Elizabeth of England shared godparental responsibilities for Maximilian and María's granddaughter Marie-Isabelle, the daughter of Charles IX and Elizabeth.

Maximilian II was plagued with health problems. His heart and constitution failed him, and he died at the age of forty-nine. Various stories of his deathbed behavior circulated around Europe, and all tried to divine what his demeanor meant for the cloudy future of the (Christian) religious settlement of 1555. His sons Rudolf and Matthias took the imperial office, but their successive reigns did not continue their father's conciliatory project.

MAZARIN, JULES (Giulio Mazarini; 1602–1661), diplomat, cardinal, and first minister during the regency of King Louis XIV of France. Born near Pescara outside Rome on 14 July 1602, Mazarin was the eldest son of six children. He received an early Jesuit education in Rome and then pursued further studies in Spain. With the patronage and support of the Colonna family, who had ties to the court of Pope Urban VIII (reigned 1623–1644), he initially entered into the papal army in 1624, but by the late 1620s instead took the initial vows of a cleric and became a papal diplomat.

In 1630, while serving as an envoy for the papal court in the negotiations that sought an end to the war between Spain and France over the disputed succession of the crown of Mantua, Mazarin traveled to France to meet with Cardinal Richelieu, King Louis XIII's first minister. Mazarin's deft negotiating skills endeared him to the powerful French royal minister and helped to secure temporary peace between Spain and France.

Thanks to his success in the Mantua affair, the pope sent Mazarin to Paris in 1634 as his ambassador (nuncio) to the French court with the goal of realizing a lasting peace settlement between Spain and France. While in Paris, Richelieu and Mazarin began a mutually beneficial political relationship. In 1635, however, Richelieu adopted a policy of continued war with Spain in the context of the Thirty Years' War; Mazarin had failed in his mission to bring peace, and the pope recalled him. Once back at the papal court, Mazarin maintained his political ties to France and actively represented French interests there.

promote Mazarin to cardinal; he received the cardinal's hat 16 December 1641. As his nomination for cardinal was in the making, Louis XIII and Richelieu invited Mazarin to France to enter into the service of the French king. Mazarin left Rome, never to return, and arrived in Paris in January 1640.

In the service of the French crown, Mazarin's diplomatic goals remained the same: to secure peace between Spain and France. His initial years in France, however, proved to be ones of domestic political instability and crisis with the death of Richelieu in December 1642 closely followed by that of Louis XIII in May 1643. The succession of the five-year-old Louis XIV to the throne in 1643 ushered in a regency government with the acting regent, the Spanish Queen Anne of Austria, holding the political authority of the king in trusteeship until he reached the age of majority when he could assume the full powers of the crown. As Richelieu's protégé and Louis XIV's godfather, Mazarin became the first minister; together, he and the queen worked as close political partners trying to stabilize

the weak and vulnerable regency government. Although contemporaries and scholars alike have speculated that an even more intimate bond developed between the first minister and queen, there is no conclusive evidence as to the exact nature of their relationship.

With Mazarin and Anne of Austria at the helm of the government, a complex series of domestic revolts, collectively called the Fronde, developed in France, beginning in 1648 and lasting until 1653. The revolts began with the judges of the parlement or law court in Paris, spread to gain backing among some key nobles and princes, and then found popular support in Paris as well as the provinces. Although the causes of the revolts were rooted in varied and complex issues involving royal authority, including the levying of new taxes, the perceived abuse of royal authority in dealings with the parlement, and the crown's reliance on royal commissioned officers (*intendants*) in the outlying provinces, the revolts of the Fronde did specifically target Mazarin and Anne of Austria, seeking to remove these "foreigners" from power. During the crisis, pamphlets called "Mazarinades" circulated throughout France. These often-satirical pamphlets fueled the revolts as they contained scathing criticisms of Mazarin, Anne of Austria, and the regency government. The revolts of the Fronde forced Anne of Austria and Louis XIV, along with Mazarin, to flee Paris in 1649. Mazarin remained in exile from France during much of the Fronde, but continued to work with Anne of Austria and other noble factions loyal to their cause to bring an end to the revolts in 1653. The coronation of sixteen-year-old Louis XIV at Rheims Cathedral in June 1654 and Mazarin's return to Paris marked the end of the crisis and the full restoration of the first minister.

Even in the midst of the Fronde, Mazarin continued to direct France's foreign policy. He played an important part in the negotiations for the Peace of Westphalia at the end of the Thirty Years' War in 1648. Despite this treaty, which brought peace to much of warring Europe, the war between France and Spain continued. Mazarin pursued a policy of allying with German princes and England against the Habsburgs in an effort to force peace with Spain. Under the terms of the Peace of the Pyrenees in 1659, Mazarin finally secured his long-term goal of peace between France and Spain. The marriage of

Louis XIV to the Spanish princess Marie-Thérèse in 1660 sealed the peace.

As both a father figure and political mentor, Mazarin prepared Louis XIV to govern France by tutoring him in the craft of kingship and by providing the king with loyal advisors and able ministers, such as Michel Le Tellier and Jean-Baptiste Colbert, who would serve the crown after Mazarin's death. Mazarin died 9 March 1661 in the palace of Vincennes on the outskirts of Paris, leaving a legacy of a stronger, more stable France in domestic and international politics. Upon the death of his beloved first minister, godfather, and tutor, Louis XIV announced that he would name no other first minister, marking the clear advent of his personal rule as king.

MAZEPA, IVAN (c. 1639–1709; ruled 1687–1709), hetman of Ukraine. Born in the Kiev region into a noble Ukrainian family, Mazepa was educated at the Kievan Mohyla Academy and the Jesuit College in Warsaw, and he also studied military affairs in the Netherlands. His father's pro-Polish attitude allowed the young Mazepa to become a diplomat in the service of the Polish king, John II Casimir Vasa. While at the king's court,

Mazepa was alleged to have had amorous misadventures that were subsequently immortalized by nineteenth-century romantic writers and composers. In 1669 Mazepa left the royal court and entered the service of the pro-Polish Right-Bank hetman Petro Doroshenko. Doroshenko was not willing to accept the Truce of Andrusovo (1667), which in effect partitioned the Hetmanate between Poland and Russia; defying both powers, he made an alliance with the Ottoman Empire (1668). While on a diplomatic mission to the Crimean Tatars, Mazepa was captured by pro-Russian Cossacks, who delivered him to Moscow (1674). Mazepa's capture proved fortuitous, for Doroshenko not only failed to unite the Hetmanate but plunged it into a series of wars that depopulated and destroyed the Right-Bank Hetmanate. Meanwhile, Mazepa's imprisonment was brief, as the Russians decided that he would be more useful to the pro-Russian Left-Bank hetman, Ivan Samoilovych. Mazepa rose quickly in the camp of his former enemy, becoming Samoilovych's general aide-de-camp in 1682. After the failure of a joint Muscovite-Ukrainian campaign (first Crimean campaign, 1687), Samoilovych was deposed and exiled to Siberia, and with Russian backing Mazepa was elected hetman of Ukraine (1687).

Mazepa's primary internal focus was on the stabilization of Ukrainian society. He based his rule on consolidating an aristocratic elite (Cossack officers and nobles), granting them estates and new privileges. Other decrees attempted to regulate the Cossacks (1691), burghers, and peasants (1701). Mazepa allied himself closely with the clergy, confirming their privileges and granting property to monasteries. No hetman was a greater patron of the Orthodox church, education, or culture. He financed many church construction projects, some from his private funds, and donated many precious liturgical books, bells, and other church goods. He obtained the status of an academy for the Kievan Mohyla Collegium (1701). Mazepa was also a patron of literature and wrote a number of poems himself.

Politically, Mazepa relied on Muscovy and developed a close relationship with Peter I. He hoped to utilize Russian power to bolster his rule and recover Right-Bank Ukraine (which he occupied in 1704 on Peter's instructions). However, this alliance proved costly, for Peter ordered Cossack forces

into foreign wars and construction projects. Moreover, Peter's drive toward a regulated empire was increasingly violating Ukrainian rights and liberties, pushing Mazepa to break with Russia and seek the protection of Sweden—a disastrous move, as the Swedish-Ukrainian forces were defeated by Peter at Poltava (1709). Mazepa retreated with the Swedish king to Ottoman-controlled territory and soon died in Bendery (now in Moldova). In the Russian empire, Mazepa was viewed as a heinous traitor, and “Mazepism” remained a code word for Ukrainian separatism. Ukrainian national historians regarded Mazepa as a hero in the struggle for Ukrainian independence.

MECHANISM. Historians have picked out many characteristics by which to define the profound alteration of natural philosophy from Galileo's adoption of Copernicanism in the late 1590s to the publication of Newton's *Principia* in 1687. Some historians note that many authors prominently put forward an ideal of mathematical demonstration, an ideal that in mechanics and astronomy was effectively realized in the period; others emphasize the insistence that theory be submitted to the test of observation and experiment; according to still others, the defining character of the new philosophy is that intervention and control came to supplant contemplation as the primary motive and goal in the study of nature. By now it is evident both that no one trait suffices, even with respect to what we

now call the physical sciences, and that the historian must distinguish what was claimed for the new philosophy by its proponents from the more modest, piecemeal, and gradual changes that actually occurred.

TENETS OF MECHANISM

Ideologically if not always in practice, mechanism—the “mechanical philosophy,” as physicist Robert Boyle (1627–1691) called it—became the character by which the new science in all its branches distinguished itself from its Aristotelian predecessor. The tenets of mechanism can be summarized as follows:

(1) The sensible world, or the system of objects of outward experience, consists of bodies possessing just a few, chiefly geometrical, properties. This was in opposition to the Aristotelian profusion of forms and qualities and to the sympathies, antipathies, and other “occult powers” attributed to things by alchemists and natural magicians. René Descartes (1596–1650), in the wake of Galileo's dictum that the book of nature is written in the language of mathematics, allowed to the body only those properties determinable from its essence as extension. What we call an individual body is nothing more than a region of space delimited from other such regions by its instantaneous motion.

Figure, size, and motion: Descartes's list proved rather quickly to be insufficient. Henry More argued, and many agreed, that impenetrability could not be demonstrated from extension and must be an original property of matter. Leibniz insisted that force could not be reduced to motion. Newton added universal gravitation (though he did not rule out an eventual mechanistic account). In the eighteenth century, electrical, magnetic, and chemical properties were added to the list, as were those vital powers of organisms that proved incapable of explanation on Cartesian terms.

(2) The preferred mode of explaining the sensible qualities of gross matter was reduction. From hypotheses concerning the underlying structure of a substance—the shape and size of the “corpuscles” of which it consisted—the phenomena of that substance were supposed to be derived using the laws of motion. The corpuscles being too small to affect the senses except en masse, hypotheses about their configuration could be verified only indirectly, typically

by showing that they could explain a great many phenomena at once. Often, mechanical hypotheses were adaptations of hypotheses made earlier by Aristotelian philosophers: that transparency had something to do with pores through which particles of light could pass, for example.

The point was not novelty for its own sake but the elimination from natural philosophy of unwanted entities: Descartes's vortex theory of planetary motion, for example, eliminated the force of attraction that Kepler had found it necessary to propose; the planets stay in their orbits by virtue of being in dynamic equilibrium with the particles revolving around the Sun at their distance. In the science of life, sensation and action in animals were to be explained by reference not to the faculties of a mysterious soul but by invoking hypotheses about the shapes of the sense organs and the motions imposed by them on the "animal spirits" (a fluid consisting of very small, fast-moving particles) coursing through the nerves. Having no fluid dynamics worth the name, Descartes had no hope of actually deriving the phenomena from his hypotheses on the basis of the laws of motion. Instead, he tried to make them plausible by analogies with pulleys and pipe organs, whose manner of motion would be familiar to the educated reader.

That machines could perform even the functions of living things became more credible in view of the increasingly complex capacities of machines projected or built by late sixteenth-century and early seventeenth-century engineers, among them Salomon de Caus (d. 1626), Agostino Ramelli (1531–1608), and Vittorio Zonca. In the eighteenth century, the famous automata of Jacques de Vaucanson (1709–1782), which included a flute player and a duck with an apparently fully functioning digestive system, were adduced as evidence that the operations of living things could be simulated mechanically. Given that in the new physics, scale was irrelevant, nature in the large could be seen as a gigantic clock, and living things as (in Leibniz's words) machines whose parts were likewise machines—an infinite embedding of divinely engineered devices.

(3) With the advance of mechanism, two new skills became requisite for a natural philosopher. The first was that of deriving conclusions mathe-

matically from laws (treated as axioms) and initial conditions concerning the locations, shapes, and motions of bodies. The development of calculus by Leibniz and Newton in the late seventeenth century greatly increased the reach of mathematical physics. Newton and Christiaan Huygens (1629–1695) were among the seventeenth-century virtuosi of mathematical physics. In the eighteenth century, noted names included the Bernoulli family (Johann [also known as Jean], Jakob [also known as Jacques], and Daniel), Jean Le Rond d'Alembert, Leonhard Euler, Joseph-Louis Lagrange, and Pierre Simon Laplace, whose *Mécanique céleste* (Celestial mechanics, 1798–1825) was the capstone of the edifice begun by Newton.

The other requisite skill was the ability to generate experimental setups (or observational situations) capable of putting to the test conclusions drawn from theory. The now familiar dynamic by which the theorist is required to derive new testable claims, hence providing motive for new experiments, some of which generate new phenomena to be explained, was largely absent from Scholastic natural philosophy. One of the weaknesses of Cartesianism was likewise its inability, in the hands of its foremost proponents, to incorporate this dynamic. The more modest style of Marin Mersenne (1588–1648), Descartes's colleague and correspondent, was to prove the more enduring. The examples of Cartesianism and Gassendism (the atomist philosophy of Pierre Gassendi and his followers, including Walter Charlton and François Bernier) show that mechanism and the "experimental dynamic" were not inseparable. Nevertheless, the association of the two is not mere coincidence: mechanism emerged as the setting of natural philosophy was shifting from the schools to the competitive world of gentlemanly amateurs like Boyle and freelance teachers like the Cartesians Jacques Rohault and Pierre Sylvain Régis.

SUCCESS AND LIMITATIONS OF MECHANISM

Mechanism as an ideology for the pursuit of knowledge was enormously successful. It claimed for itself a clarity and explanatory prowess that Aristotelianism, despite the efforts of Honoré Fabri (1607–1688), who accepted the experimental method but not the ontology of mechanism, could not match. The examples of Nicolas Malebranche (1638–

1715), Pierre Varignon (1659–1722), and Louis Carré—all described by Bernard le Bouvier de Fontenelle (1657–1757), the “perpetual secretary” of the Académie Royale des Sciences in Paris, as finding a new light, even a new universe, in the philosophy of Descartes—show how persuasive the new philosophy could be to those educated in the old.

Nevertheless, there was no universal agreement that mechanism of the strict Cartesian sort was adequate to explaining the whole of nature. There were unreformed Aristotelians like Fabri who, while advancing hypotheses not unlike those of the mechanists (for example, concerning elasticity), nevertheless retained the Aristotelian distinction of form and matter and the system of four elements (earth, water, air, fire) defined by the very sorts of qualities Descartes had thought to banish. Other seventeenth-century dissenters, like Henry More, Ralph Cudworth, and Anne Conway, insisted on the necessity of attributing active powers to bodies—contrary to the Cartesian definition of matter as extension, which precluded any active powers. Leibniz argued that the “mutual rest” Descartes held to be the glue holding bodies together was quite inept to explain cohesion; this required instead an internal principle of unity. Newtonian gravity was a serious blow, as was Newton’s demolition of the vortex theory. By the end of the seventeenth century, moreover, the promise of Cartesian mechanism in explaining the phenomena of life had diminished to the point that Georg Ernst Stahl and other physiologists were ready to revive the animal and plant souls Descartes had extinguished. In particular, Stahl believed that the filtering of fluids in the digestive system could not be explained as the passage of particles through successive sieves; some selective power of attraction was instead required. In the first decades of the eighteenth century, the practice of hypothesizing configurations of subvisible particles had become “old hat.” Such hypotheses could be, if urged on the basis of analogy alone, no less question-begging than hypotheses about forms or occult qualities (Gabbey).

Mechanism could not quite deliver on its promises in the seventeenth century. Its ontology proved too sparse. In particular the science of life resisted “mechanization.” Nevertheless, the reduction of all of nature to the interaction of a few basic entities

and forces, whose phenomena were to be derived mathematically from first principles, has not only been enormously successful in fundamental physics but has also provided a model to all the natural sciences.

MEDICI FAMILY. The dominant family in early modern Florence, the Medici produced several popes and cardinals, married into Europe's Catholic royal houses, and either dominated or ruled Florence from the early fifteenth century until 1737.

In 1434 the banker Cosimo de' Medici the Elder (1389–1464), outwardly respecting the republican constitution, became the power behind the scenes in Florence. Following unsuccessful coups against them in the 1460s, the Medici strengthened their position through the *balie* (small extraordinary councils). The perception that the Medici were in fact, if not in law, lords of Florence lay behind an unsuccessful 1478 conspiracy by members of the Pazzi and Salviati families. Following its failure, Lorenzo the Magnificent (1449–1492) pushed through constitutional changes, vesting more power in *balie* and hunting down his enemies with a vengeance that the historian Francesco Guicciardini would call uncivilized.

THE MEDICI AND FLORENCE

Two years after Lorenzo's death, Florentine republicans and followers of the Dominican Girolamo Savonarola (1452–1498) forced Piero di Lorenzo (1471–1503) and his brothers into exile. Upon Piero's death, leadership of the house passed to his brother Cardinal Giovanni (1475–1521; reigned as Pope Leo X 1513–1521), who reinstalled his family in Florence in 1512. The Florentine patriciate, disillusioned with broad-based government, acquiesced reluctantly in Medici domination under Lorenzo, duke of Urbino (1492–1519), and Giuliano, duke of Nemours (1479–1516).

The sack of Rome during the pontificate of Clement VII (1523–1534) (Giulio de' Medici, 1478–1534) gave impetus to rebellion against the Medici. In May 1527 the family suffered exile again.

But Clement made his peace with the emperor and, in 1530, after a brutal siege, installed Alessandro (1511–1537) as capo (head) and, soon, as duke of Florence.

Following Alessandro's assassination in 1537, Florence's influential patricians, or *Ottimati*, faced the problem of the succession, for Alessandro had left no legitimate male heir. Looking to the progeny of Cosimo the Elder's brother, they discovered Cosimo, son of Giovanni delle Bande Nere ('of the Black Bands') de' Medici and Maria Salviati. The teenaged Cosimo lacked an independent political, territorial, or financial base, the family bank having collapsed in 1494. He appeared, therefore, to be the perfect candidate, subject to direction by the *Ottimati*. That he proved to be one of the most independent rulers in Florentine history came as a surprise. By the mid-1540s, he freed himself from domination by both the patriciate and his Spanish allies. He conquered Siena and, in 1569, won from the pope the coveted hereditary title grand duke of Tuscany. His reign elevated the house of Medici to parity with the great Catholic houses of Europe. In 1564 he handed over governance to his son Francesco (1541–1587) in what may have been the smoothest transfer of power in the history of Florence. The family remained grand dukes until the death of the last male, Gian Gastone, in 1737.

THE MEDICI AND THE CHURCH

Guicciardini wrote that, to dominate Florence, the Medici needed popes. They obtained what they needed; between 1513 and 1521, and again from 1523 to 1534, Medici ruled in Rome. Virtually every generation of the Medici in the early modern period produced at least one cardinal.

After Giovanni's departure for Rome, Lorenzo sent him a letter urging him to piety, but adding that, in serving the church, Giovanni would surely find occasion to serve the house of Medici as well. With this advice, Lorenzo implied that the state's interests had become identical to the Medici's interests. Some contemporaries alleged a change in Medici behavior with Giovanni's election, claiming that the Medici, upon return from exile in 1512, lived like other citizens; once Giovanni became Pope Leo X in 1513, however, they ignored the constitution and went about, like lords, with armed retainers.

MEDICI MARRIAGES AND PROPERTY

The Palazzo Medici (constructed 1444–1464) was designed by Michelozzo for Cosimo the Elder. As dukes, the Medici lived first in the Palazzo Vecchio and, as of about 1550, in the Palazzo Pitti. They also owned substantial property outside Florence.

For most of the fifteenth century, the Medici followed a pattern common among their peers: making astute *parentadi* (marriage alliances) with other Florentine patrician families. Lorenzo the Magnificent signaled expanded family ambitions with his marriage into the Orsini, powerful Roman magnates. He arranged *parentadi* for two offspring with the Orsini and the house of Savoy. Alessandro wed Margaret of Austria, illegitimate daughter of the Holy Roman emperor Charles V, and, later, duchess of Parma and stadtholder of the Netherlands. Cosimo I's marriage to Eleonora of Toledo, daughter of the viceroy of Naples, brought both wealth and a Spanish connection. The destinies of some of his fourteen children included marriage into the Orsini and the houses of Toledo, Este, Habsburg (this time to a legitimate daughter of the emperor), and Lorraine (to which the succession would fall in 1737). Catherine, a great-granddaughter of Lorenzo the Magnificent, wed Henry II, king of France, and exercised great power as queen mother; she was blamed for the St. Bartholomew's Day Massacre of 1572. Maria, the daughter of Francesco I, brought a dowry of 600,000 florins to Henry IV, king of France. Cosimo III married Margu rite Louise, daughter of the duke of Orl ans and granddaughter of Henry IV.

THE MEDICI AND CULTURE

Cosimo the Elder and his successors were patrons of the Neoplatonist movement. Lorenzo the Magnificent studied Greek and Latin under the foremost humanists, including Cristoforo Landino and Marsilio Ficino. Both Lorenzo and his mother, Lucrezia, were poets. Giovanni, the future Leo X, received an outstanding humanist education and studied canon law at Pisa. Cosimo I established the Accademia Fiorentina (Florentine Academy) and subsidized printing. Eleonora purchased and restored the Pitti palace and gardens. Francesco, Ferdinando I, and Cosimo II showed interest in literature, science, and mathematics. Francesco founded the Accademia della Crusca (*crusca* refers to wheat grain) to purify and promote the Tuscan language.

The young Galileo Galilei served as chief mathematician and philosopher to Cosimo II.

Among the painters, goldsmiths, sculptors, and architects who worked for the Medici were Filippo Brunelleschi, Filippo Lippi, Domenico Ghirlandaio, the della Robbias, Andrea del Verrocchio, Sandro Botticelli, Michelangelo Buonarroti, Giorgio Vasari, Bartolomeo Ammanati, Baccio Bandinelli, Jacopo Pontormo, Buontalenti, Guiliano and Francesco da Sangallo, Agnolo Bronzino, Benvenuto Cellini, and Giambologna. Catherine de M dicis brought Italian style to France, built the Tuileries gardens and a new wing of the Louvre, and collected a great classical library. Vittoria della Rovere, wife of Ferdinando II, transported to Florence important paintings, including works by Raphael and Titian. Justus Sustermans (1597–1681) brought Flemish baroque portraiture to Florence in his numerous depictions of members of the family and court. Anna Maria Ludovica, the last descendant in the line of Cosimo I, left the family's fabulous art collection to Florence as a public trust.

MEDICINE. Medicine in the early modern era was characterized by several distinctive features. First, the understanding of illness and its treatment was based on assumptions that were inherited from antiquity and differed conspicuously from our own ideas. Second, physicians comprised but one group among a host of healers who routinely competed with each other for access to patients. Thus, in contrast to medicine today, physicians neither dominated nor directed the care of most of the sick. Third, the delivery of health care was not centered in hospitals or specialized clinics. Hospitals certainly were a feature of early modern medicine, but their role in the delivery of health care was minor. Last, and perhaps most important, people in early modern Europe inhabited a social, cultural, and demographic environment in which death intruded itself far more frequently in the everyday lives of Europeans than it does for people living in the developed world today.

PATTERNS OF DISEASE

Death was a common occurrence in the early modern period, a fact that colored nearly every aspect of social and cultural life. Nor was it just the elderly who expected to die; infants and children died at such high rates that someone could be counted fortunate just to reach the age of twenty-one, not to mention sixty or seventy. This depressing fact was not lost on contemporaries. “Of each 1,000 people born,” wrote a German physician in 1797, “24 die during birth itself; the business of teething disposes of another 50; in the first two years, convulsions and other illnesses remove another 277; smallpox . . . carries off 80 or 90, and measles 10 more.” Of every 1,000 people born, he concluded, “one can expect that only 78 will die of old age or in old age.” Although we cannot verify the accuracy of these numbers, there is no disputing the appallingly high mortality rates they indicate. Available records of baptisms and burials from local churches suggest that in countries such as France and Denmark,

deaths of infants (that is, children under the age of two) from all causes could climb as high as two hundred or more deaths per thousand births.

A variety of factors contributed to these high mortality rates, including the prevalence of malnutrition and intestinal parasites. Although these may have only rarely caused death directly, they undoubtedly weakened the body’s defenses against disease. More directly responsible were infectious diseases like smallpox and measles, mentioned in the quotation above, along with other serious childhood diseases like diphtheria, whooping cough, and dysentery.

The most dangerous disease of all was the plague, which first struck various parts of Europe between 1347 and 1351 and returned to afflict almost every generation until the very end of the seventeenth century. The disease is believed to have begun in China and then spread along trade routes in Central Asia in the early 1340s. By 1346 it had reached the Crimean city of Caffa, and from there it was brought to Sicily and southern Italy. Once established there, plague spread, again along trade routes, to other parts of Europe. Skepticism has grown in recent years over whether the plague (caused by the bacterium *Yersinia pestis*) was exclusively *bubonic* plague, induced in its victims by the bite of a flea, or whether it was mixed with a more dangerous airborne form known as *pneumonic* plague. It is possible too that one or more other diseases were also part of the mix. Whatever its precise cause, there can be no question that plague hit many parts of Europe hard. Over the entirety of Europe, it is estimated that the first onset of plague killed approximately 25 percent of the population, although actual mortality varied considerably from place to place. Even as late as the seventeenth century, outbreaks of plague continued to hit with devastating impact. In 1656–1657, the Italian city of Genoa lost 60 percent of its population of 75,000 to plague—a horrific, although unusually high, mortality rate—while between 1609 and 1611 about 42 percent of the residents of the Swiss city of Basel (population 15,000) caught the plague and 62 percent of those victims died.

A second serious disease, syphilis, appeared for the first time in Europe at the very end of the fifteenth century. While having nowhere near the de-

mographic impact of plague in terms of deaths caused by it, syphilis was serious enough, especially in the virulent form in which it first appeared. The disease was first reported during the French army's campaigns in Italy during 1494–1495 (hence the common name given it, the “French Pox”), and from there it spread rapidly throughout Europe. Sufferers from syphilis, reported the German scholar Ulrich von Hutten in the early sixteenth century, “had boils that stood out like acorns, from which issued such filthy stinking matter, that whosoever came within the scent believed himself infected.” The stinking stain described by von Hutten could have been more than just physical, for it was soon determined that syphilis was sexually transmitted, thus giving the disease extra significance as an apparent punishment for sinful promiscuity.

THE ORIGINS OF PUBLIC HEALTH

Historians once commonly believed that plague was a primary cause of the breakdown of medieval society and the transition to the modern era. Although this is no longer widely accepted, there is no denying that plague did have a powerful impact. Arguably the most significant of its effects was the stimulus it provided to the development of public health, and, more speculatively perhaps, to the more general idea that the purpose of government was to formulate policy, not just maintain order. The idea that the government could exercise a regulatory and policy-making function was certainly not unprecedented in the late fourteenth and early fifteenth centuries, but the horrific consequences of repeated plague outbreaks made matters of health a particular focal point of concern and regulation.

As early as 1348, the town council of Venice appointed three of its members as a special commission to devise measures against the plague that had broken out there, and, in general, highly developed Italian cities like Florence, Milan, and Genoa were among the earliest to formulate measures against the plague. Many European cities and principalities north of the Alps followed suit during the next 150 years. The measures taken by these boards included the institution of quarantine, a practice whereby plague victims were shut up in their houses, together with their families and servants, if they had any. Quarantine could also be placed on entire towns and cities, and because such bans could last

for weeks or even months, a declaration of quarantine had serious consequences for trade and economic well-being. Plague ordinances further specified how those who had died of plague should be buried and what should be done with their personal possessions—clothing and bedding could be burned, for example. More controversially, they also prohibited public gatherings of different kinds, including church processions. Since such public gatherings were a major component of medieval Catholic spirituality, their prohibition by secular authorities was a recurrent source of conflict with the church.

Throughout the fifteenth century, most of the health commissions charged with dealing with plague remained temporary institutions, dissolving as soon as the threat posed by the current epidemic had subsided. But during the sixteenth century, more permanent health magistracies began appearing in northern Italian cities. The responsibilities given these boards gradually evolved to cover not only times of emergency but also the more routine supervision of public health. Justified by a desire to forestall future outbreaks of plague and building on prior medieval attempts to enforce sanitary standards in larger cities (in some cases dating much further back than the 1340s), these health boards began formulating more comprehensive sanitary measures to control such things as the cleaning of streets and dumping of wastes. Beggars and Jews, who were suspected of being transmitters of disease, were often singled out for unwelcome attention.

A somewhat different system evolved in German-speaking central Europe during the sixteenth and seventeenth centuries. There, towns and principalities began appointing a local physician or surgeon to the partially salaried post of *physicus*. Their primary responsibility normally involved providing medical care for the poor, but *physici* were also charged with enforcing sanitary regulations, instructing and supervising other practitioners, and conducting medical-forensic inquiries, among other functions. In effect, these practitioners served as the instruments for the enforcement of public health ordinances, while at the same time gathering information about local health conditions that could be transmitted back to the political authorities.

THE INSTITUTIONS OF CARE

To the extent that early modern medical care was centered in institutions of any kind and did not simply take place at the patient's bedside or in the practitioner's shop, hospitals provided that institutional setting. But this statement must be immediately qualified by noting that hospitals served almost exclusively the needs of the poor. Not until the early twentieth century, in fact, would people who were not poor begin using hospitals in any considerable numbers. Moreover, hospitals in the early modern era were not devoted exclusively to medical care, offering instead a spectrum of charitable support for the poor.

The roots of hospitals as integrated charitable/medical institutions go back many centuries, on the one hand to the social welfare needs of large urban centers of late antiquity and the early Middle Ages, such as Constantinople (modern-day Istanbul) and Baghdad, and on the other hand to the hospices established for travelers and the poor by early Christian communities. As monastic communities spread across the Christian world during the Middle Ages, many of them, especially those located on important trade routes or destinations for pilgrimages, established small infirmaries for sick members of their communities and travelers who had no other support during times of illness. Eventually, hospitals of varying sizes became an established feature of the urban landscape, funded by the charitable endowments of individual patrons or local religious organizations, such as confraternities.

By the sixteenth century, and especially in the wake of the Reformation, hospitals were confronted by significant new challenges. First, conversion to Protestantism often involved confiscation by the ruler of church properties, which deprived hospitals both of the assets that supported their operation and sometimes of the personnel who ran them. In England, Henry VIII's break with the Roman Church in the 1530s led to wholesale seizure of church properties, including those supporting the three London hospitals of St. Thomas, St. Bartholomew, and Bethlehem. This immediately threw the city's charitable services into chaos, and the city's leaders implored the crown to restore the funds necessary to operate the hospitals. This the crown did over the course of the next twenty years, yielding for London a total of five major hospitals: St.

Thomas's and St. Bartholomew's for the sick poor; Christ's for orphans; Bridewell for the shiftless poor, and finally, Bethlehem (known later as "Bedlam") for the mentally ill.

The functional "specialization" displayed by different London hospitals was by no means the standard in the period, and many hospitals, such as the huge Allgemeines Krankenhaus in Vienna or the Julius-Spital in Würzburg, folded various charitable services into one institution. What they did share with the London hospitals was the specific range of charitable activities. Just as importantly, the hospitals of the sixteenth and seventeenth centuries displayed a new attitude about the poor. This attitude was reflected in a separation made between the "virtuous" poor, such as the aged, widows, and children, and the "shiftless" or "lazy" poor, a separation that still resonates in welfare today. In a period when the poor were increasingly viewed as a possible threat to social order, hospitals became places for housing the poor and removing them and their supposed threat from the streets. By 1700, this thinking had led in France to the founding of more than one hundred so-called *hospitaux-généraux* (general hospitals), institutions in which the deserving and undeserving poor were rounded up together, with the former supposedly receiving benevolent shelter in their time of need and the latter corrected and improved by a combination of enforced labor and religious discipline.

All of these institutions, even those resembling prisons and workhouses, offered treatment for the sick. By the eighteenth century, the curing of patients and their return to useful roles in society became more clearly the focal point of the hospital's identity. Although they remained charitable institutions, supported largely by private philanthropy or government subventions instead of patient fees, hospitals discouraged the admission of the chronically sick or aged, pregnant women and children—in short, the traditional clientele who had populated hospitals in previous eras. Instead, they focused on curing and releasing what came to be known later as the "laboring poor," those who held regular jobs and had fallen ill.

MEDICAL PRACTITIONERS

Today, the treatment of illness is usually given by a physician, that is, someone with a university medical

education in possession of an M.D. Although other people, such as nurses or pharmacists may be involved in this process, physicians direct it. In the early modern era, that was decidedly not the case. Physicians formed but one small group among a variety of healers, any of whom could be consulted in time of sickness.

Among the other healers who competed for access to patients, surgeons were probably the most prominent. Like physicians, surgeons were a recognized occupation, often organized in larger towns into guilds that supervised professional standards and trained apprentices in the craft. In both the popular imagination and in their own professional identities, physicians and surgeons were separated by their domains of practice: physicians treated internal ailments, while surgeons handled external maladies, including wounds. Physicians were not trained to cut patients most of the time, while surgeons made liberal use of the knife, even if they also administered medications. Their use of the knife is a principal reason why surgeons often were grouped together occupationally with lower-status barbers, who not only cut hair but also performed routine medical procedures such as bloodletting.

However, because the boundary between “internal” and “external” is by no means obvious in every case, many diseases, such as cancerous tumors and syphilis, were often treated by surgeons. Therefore, rather than seeing physicians and surgeons as having clearly demarcated areas of competence, it would be more accurate to understand them as having overlapping spheres of practice, where the choice of healer more often depended on factors such as personal acquaintance, reputation, and availability, and not on a calculation of which healer was most appropriate for any particular illness. Part of the distinction between physicians and surgeons can be explained in terms of social hierarchy. Because physicians were university educated and participated in the literate, Latinate culture of the urban and courtly elites, they tended to enjoy higher social status than surgeons. But neither the status of healers nor the choice of healer by patients was determined along a gradient of social hierarchy. Kings and bishops were just as likely as a common artisan to consult a surgeon when the need arose—although not, of course, necessarily the same surgeon.

The same point could be made for other established healing occupations, midwives and apothecaries. Midwives were women who attended births and cared for the mother and newborn child during the first days after birth. In principle, they were not supposed to treat patients outside the context of birthing or to administer drugs, apart from those useful during or immediately after labor. But, in fact, midwives were consulted more widely, especially by women, whose trust in the midwife would have been cemented by her assistance during their children’s births. Apothecaries were dealers in herbal medications, grocers who knew how to extract the healing virtues from natural products. Physicians expected apothecaries to dispense medications to patients only on the orders of a physician. But here too, the prescribed division of labor was easily breached by apothecaries who believed that they could just as well (or better) determine the appropriate medicines to give people suffering from particular ailments. From the patient’s point of view, the decision to consult an apothecary or midwife might depend on the same considerations as those mentioned above—personal acquaintance, local reputation and accessibility—as well as cost. In most cases, it cost considerably less to bring a midwife or apothecary in than a physician.

During the later seventeenth and eighteenth centuries, governments in various parts of Europe began paying a great deal of attention to how practitioners were trained and to keeping practitioners from infringing on others’ domain of work. Surgeons, whose training had always swung between guild apprenticeships and university-based anatomy theaters (although surgeons did not routinely hold M.D. degrees), increasingly saw their training based in the newer hospitals or specially instituted surgical academies. The training and qualifications of midwives and apothecaries likewise came under closer scrutiny, and in a number of places they were required to submit to licensing examinations. The establishment of a separate licensing examination for physicians after awarding the M.D. also came into much wider use, when, for example, in 1651 the electorate of Bavaria created a *collegium medicum* that was authorized to examine every physician who wished to practice in its territory.

ern society. These other healers are represented, in part, by folk healers, who deployed a wide range of traditional therapies. The use of magical or religious invocations in treating illness, of course, was probably not a rare occurrence at this time. In addition, the early modern period was populated by a host of itinerant drug peddlers, stonecutters, and sundry charlatans who sold special talents or products in the medical marketplace. By the mid-eighteenth century, and as a result of the dramatic expansion of the press, medical products and services participated in a booming advertising market.

IDEAS OF HEALTH AND ILLNESS

The dominant medical thinking of the early modern period saw health as dependent on a particular bal-

ance in the body’s four humors, known conventionally as blood, phlegm, black bile, and yellow bile. Each individual humor, in turn, manifested a distinctive combination of qualities from the pairs wet/dry and cold/hot. Thus, blood was believed to be hot and wet, yellow bile, hot and dry, and so on. The balance of humors required to maintain health was highly individual, depending on someone’s age, sex, local environment, diet, work, lifestyle—in principle, almost anything could influence health. Excessive exercise, for example, could cause the body to heat up, resulting in an excess of blood or yellow bile. Scholars, on the other hand, were thought to suffer from particular diseases resulting from their having too little exercise and too much brainwork. The prevention of illness and its cure

depended in principle on the same idea, whereby the practitioner sought to maintain or restore the proper humoral balance. The application of many treatments, such as the use of bloodletting or emetics (agents that cause vomiting), can be understood as working in this way.

Over against these doctrines concerning pathology and therapeutics must be set a partially separate set of ideas concerning what we now call *physiology*, the functions of the living body. The body's functions were thought to be governed by three principal organs: the liver, which converted nutritive juices produced by digestion into blood, which was then sent via the venous system to all parts of the body and nourished it; the heart, which mixed air taken in by the lungs with some blood, producing vital spirit, which was distributed throughout the body by the arteries and governed vital processes such as motion, breathing, and digestion; and the brain, which produced animal spirits, responsible for the higher functions of sensation and consciousness, and which traveled throughout the body via the nerves. Although not entirely divorced from the humoral doctrines that molded thinking about health and illness, the theories governing physiology were formulated to answer a distinctive and separate set of questions, such as what breathing does or how the movement of muscles occurs.

The source of many of these ideas was a collection of writings attributed to the ancient Greek physician Hippocrates (c. 460 B.C.E.–375 B.C.E.), especially as interpreted by the later Greek physician Galen (129–199? C.E.). Very few of Hippocrates' and Galen's writings were available in Latin translation during the early Middle Ages, but a far richer view of Hippocratic and Galenic medicine started appearing in Latin-speaking Europe at the end of the eleventh century, when translations of Arabic medical writings were made in southern Italy and Spain. These encyclopedic compendia of ancient medicine became the basis for medical teaching in the universities that began appearing at the end of the twelfth century.

By the early sixteenth century, medicine was a widely accepted part of the university curriculum, with the teaching of theory and practice based largely on Hippocratic and Galenic precepts, as interpreted and synthesized by medieval Muslim

scholars. A second wave of translations, beginning in the late fourteenth century and inspired by the humanist cultural program for the restoration of classical antiquity, produced a wave of Latin translations from ancient Greek manuscripts, bypassing the mediation and (so the humanists claimed) the barbarism of earlier Muslim translators and commentators. The output from all this effort is astonishing: between 1500 and 1600, there are said to have been approximately 590 different editions of Galen's writings. To a surprising extent, these new translations from Greek sources did little to change the curriculum or the dominant medical theories. Yet in one important area, anatomy, the recovery of Galen's writings, especially his *On Anatomical Procedures* (first published in 1531), a guide to dissection, did lead to dramatic changes in medical thinking.

The conduct of dissections as part of the teaching of anatomy was a well-established, if also a sporadic, part of the medical curriculum. Well before 1500, medical scholars had used dissection as a means of engaging in critical dialogue with their ancient and medieval Muslim predecessors, to the extent that these sources were available to them. The appearance of *On Anatomical Procedures* in Latin translation, however, gave to humanistically inclined physicians an impeccably ancient source of authority for the practice of dissection, as well as practical tips for doing so. Consequently, anatomy and the practice of dissection acquired a status far exceeding what it had enjoyed before, and knowledge of human anatomical structure became a focal point of research interest. This burst of activity culminated with the publication of *De Humani Corporis Fabrica* (1543; *On the structure of the human body*), by Andreas Vesalius, the most renowned anatomist of the era. Vesalius's richly illustrated text presented itself as an extended critique of Galen's claims about anatomy, offering its readers a far more visually concrete picture of the body than anything previously available.

The critique of Galen's anatomical ideas, however, did not translate immediately into a broader abandonment of his physiology, in part because his theories about the body's functions made a great deal of sense in the context of physicians' experiences with the bodies of their patients. Only in the greatly changed circumstances of the seventeenth

century, when a new generation of scholars deployed a new “mechanical” philosophy based on experiment to overthrow the entire edifice of ancient natural philosophy and the kinds of explanations it offered, did physicians shift from engaging in their centuries-long critical dialogue with their ancient sources to thinking about the body’s functions in ways that departed significantly from ancient models. The most important among these later physicians was William Harvey (1578–1657), a highly skilled anatomist and experimentalist whose carefully designed investigations into the function of the heartbeat, published in 1628 as *Exercitatio Anatomica de Motu Cordis et Sanguinis in Animalibus* (An anatomical essay on the motion of the heart and blood in animals), directly attacked the physiological role assigned to the heart by Galen, suggesting instead that the heart acts as a pump, distributing blood to the body through the arteries and receiving it back again from the veins.

THOMAS H. BROMAN

MEDINA SIDONIA, ALONSO PÉREZ DE GUZMÁN, 7TH DUKE OF (1549–1615), Spanish grandee, admiral, and councillor of state. Succeeding his grandfather to the dukedom in 1558, with a palace at Sanlúcar de Barrameda, he acquired an interest in the sea and shipping. Sanlúcar's customs house, the tuna fishery (*almadraba*) of his coastal estates, and revenues from the county of Niebla made him the richest grandee in Spain, with an income that by 1600 approached 170,000 ducats annually. Some 55,000 souls lived under his jurisdiction. He married Ana de Mendoza y Silva (1561–1610), daughter of the prince of Éboli, and had eight surviving children, with heir Juan Manuel born in 1579.

From the 1570s he assisted in the annual sailing of the Indies fleets. A patron of books on chivalry, he also sought in 1574 to serve Philip II by contracting the Spanish galley squadron. Deemed too young, he got his chance to serve in 1578, with the succession crisis in Portugal. He assisted the marquis of Santa Cruz, despite strained relations, to prepare an armada, and used family connections with Portuguese nobles to promote Philip II's claims. In summer 1580, he led the Andalusian militia to the peaceful conquest of the Algarve, and then organized a dragnet that forced Dom António, Philip's chief rival for the Portuguese crown, to flee.

Philip awarded him the Golden Fleece and appointed him governor-general of Milan. He did not assume the office, for personal concerns and perhaps expectation of better. One concern was Philip's imprisonment of the princess of Éboli, which Medina Sidonia eventually succeeded in changing to confinement to her palace. He contin-

ued to work with the Indies fleets and was appointed in 1582 to head an expedition to occupy Larache, which the sharif of Morocco offered to Philip in return for aid against the Turks. When the Turkish threat abated, the sharif reneged on his offer.

War with England drove Philip in 1586 to build the Invincible Armada, with which Medina Sidonia was early involved. When Francis Drake attacked Cádiz Bay in April 1587, the duke rallied the local militias to defend Cádiz. He promoted a plan to overtake Drake with naval forces from Cádiz and Lisbon, but Drake left Spanish waters before it could be executed. Given his achievements and the traditions of his forebears, he requested explicit authority for regional defense, which Philip granted on 8 January 1588 with appointment as captain general of the Coast of Andalusia. In February, when Santa Cruz died, Philip shocked Medina Sidonia with appointment as captain general of the Ocean Sea and command of the Armada waiting in Lisbon. Medina Sidonia tried to turn down the appointment, and recommended galley chief Martín de Padilla (c. 1535–1602), Adelantado of Castile. Philip persisted and the duke headed for Lisbon, where he found all in confusion. His diligence had the Armada to sea by 30 May, but a storm forced it into La Coruña and neighboring ports. Believing it a sign from God, and pessimistic about chances for success, he urged Philip to use the Armada's mere presence to pressure Queen Elizabeth to withdraw from the Low Countries. Philip refused and on 22 July the Armada sailed. In the campaign, Medina Sidonia hewed to Philip's orders to proceed directly to join the duke of Parma and his army for the invasion of England, rejected proposals to assault Plymouth, and abandoned two ships disabled by accident. But as the English fleet hounded him, he vainly attempted to force a boarding action. His communications with Parma proved inadequate and he reached Calais to discover Parma not ready. Forced from Calais, he chose to return the Armada safely to Spain by sailing around Ireland. Storm battered the Armada and scarcely half the ships reached Spain.

Disgraced in the public eye, if not in Philip's, he retired to his estates. He continued to advise on the Armada, Indies fleets, and Morocco, and complained of the weakness of home defense, which the

Anglo-Dutch sack of Cádiz in 1596 proved inadequate. His hurried response limited enemy gains, but his authority was transferred to professionals.

His heir in 1598 married the daughter of the duke of Lerma, Philip III's favorite, while he became a councillor of state and had many of his debts canceled. A humane man, he disapproved of black slavery, and suggested that Moriscos expelled from Spain be resettled in Cuba. To the public he remained a scapegoat. He was blamed when a powerful Dutch fleet in 1607 destroyed the smaller Armada of the Strait at Gibraltar. His only role was to send its commander warning and advice. In the last years before his death he largely withdrew from public life. The defeat of the Armada has forever marred his reputation.

MEDITERRANEAN BASIN. The advent of the early modern era in the Mediterranean Basin is easy to identify, thanks to two quite spectacular events. In 1453 the Turkish Ottomans conquered the great city of Constantinople and put an end to the Byzantine Empire. Although help for the Byzantines had been fitful and reluctant, Christian Europe was shocked nevertheless.

At the other end of the inland sea the Catholic monarchs Ferdinand II and Isabella I (ruled 1474–1504) completed the centuries-long reconquest, as they called it, of the Iberian Peninsula in 1492, when they defeated the last Muslim kingdom, Granada. In that same momentous year they expelled the Jews from their domains, and Columbus landed on the shores of American islands.

The Spanish and Ottoman achievements put an end to the political fragmentation and unstable alliances that had been so characteristic of the medieval period. In the east, the central fact had been the quickening pace of Byzantine collapse. Although the Byzantines had managed to take Constantinople back from the Latins in 1260, this did not halt the steady dwindling of Byzantine power, especially on the sea. An assortment of political entities—both Muslim and Christian—fought for control of the eastern Mediterranean during the fourteenth century. The Ottomans managed to emerge triumphant, besting both Muslim and Christian rivals. Once again the eastern Mediterranean was ruled from Constantinople, now Istanbul, by an imperial power.

Prior to their conquest of the capital city, the Ottomans had established their control over western Anatolia and much of the Balkans. After 1453 they consolidated their rule in both places, reproducing and extending the borders of the now vanquished Byzantine Empire.

From the Muslim point of view, the stunning feat of the conquest of what they called Istanbul suggested that a preeminent Muslim power might be emerging. As in the Mediterranean, the medieval Islamic world had also been characterized by the proliferation of small states following the Mongol destruction of the Abbasid Caliphate at Baghdad in 1258. Ottoman supremacy was confirmed in the early sixteenth century, when Sultan Selim I (ruled 1512–1520) defeated the Mamluks in Syria and Egypt. By so doing he also became master of the holy cities of Mecca and Medina, a fact of the utmost symbolic power in the Islamic world. Ottoman primacy also meant a historic shift westward in terms of the political and cultural center of the Islamic world. Not since the Umayyads made Damascus the capital of their dynasty in the seventh century had the Mediterranean figured so prominently in the Muslim world.

The unification of Spain took a giant leap forward in 1469, just sixteen years after the Ottomans took Istanbul. In that year Ferdinand II of Aragón married Isabella I of Castile. When Ferdinand succeeded to the crown of Aragón in 1479, the two formerly independent kingdoms (which together make up most of modern Spain) became one. Ferdi-

nand and Isabella were determined to extinguish Muslim power on the Iberian Peninsula, and in 1492, with the defeat of Muslim Granada, they achieved their aspirations. The reconquest was complete, and a united, although admittedly fractious, Spain had emerged to take the place of the patchwork of kingdoms and emirates of the medieval period.

Control over Mecca and Medina had catapulted the Ottomans to leadership (albeit contested) of the Islamic world. Similarly the actions of Isabella and Ferdinand led them to see themselves, and to be seen by others, as the leaders of Christian Europe. In 1494 Pope Alexander VI bestowed upon them the designation of Catholic kings (*Reyes Católicos*) in recognition of their many services to Christianity, namely the conquest of Granada, the discovery of the New World, the expulsion of the Jews, and their leadership of the Spanish Inquisition. Both states then derived a good deal of their legitimacy from their militant offensive against the religious “other,” and both states were now the preeminent powers in their respective halves of the Mediterranean. Combining these two facts, it is not surprising that in the sixteenth century the Ottomans and the Spaniards now turned to face each other. The Spanish-Ottoman rivalry meant that in the early modern era the Mediterranean was a prime site for the enduring conflict between Christianity and Islam.

But this was not all. In the sixteenth century the Mediterranean Basin became an extension of the intense rivalries of European politics, a contest in which the Ottomans were full participants. These rivalries often ignored the religious divide that was so fundamental in Spanish-Ottoman hostilities. Two levels of conflict then, one old and one new, wove their way through the tumultuous history of the sea in the early modern period.

SPANISH-OTTOMAN RIVALRY

The first phase of the Ottoman-Spanish confrontation took place in North Africa and was directly related to the Spanish reconquest of the Iberian Peninsula. Even before the fall of Granada, privateers from the eastern Mediterranean had made their way to the western half of the sea, exploring the opportunities for holy war and enrichment. Some settled in the various port cities of North Africa, and over time the local populations came to

view them as a source of help against the Spaniards. The North Africans had good reason to fear Spain. The enormous consequences of the Spanish and Portuguese discoveries in the New World have led historians to neglect the continuing salience of a crusade against Islam for Spanish elites after 1492. An important segment of the Spanish nobility wanted the monarchy to direct its energies toward a conquest of Muslim North Africa rather than commercial exploration of the West African coast.

The Ottoman sultans at this time—Bayezit II (ruled 1481–1512) and Selim the Grim (Selim I, ruled 1512–1520)—were unwilling to engage in warfare with the Spaniards. They contented themselves with the trouble the corsairs caused for Spain and the intelligence they brought back to Istanbul from time to time. Thus hostilities early in the sixteenth century took the form of low-level raiding between North Africa and Spain. Full-scale conflict between the two empires did not commence until the 1530s, and at that point (Spain was now part of a much wider empire in Europe) it reflected Ottoman-Habsburg rivalry on the Continent as much as it did the contest between Christianity and Islam in the Mediterranean.

In 1532 Emperor Charles V (ruled 1519–1556) attacked the Ottoman city of Coron in southern Greece. The move was intended to divert the Ottoman armies from their campaign in the Balkans, which was putting pressure on Charles’s Austrian territories. The move did succeed to the extent that Sultan Suleiman (ruled 1520–1566) had to call off the Balkan expedition, but it also had the effect of galvanizing him into action in the Mediterranean. The Turkish corsair Hayreddin Barbarossa (Khayr ad-Dīn) was summoned from Algiers and put in charge of the Ottoman fleet. In 1534 he sailed to Tunis, where the Hafsid dynasty had been allowed to continue a semi-independent existence. In short order Barbarossa occupied the city and put down the meager resistance offered by the reigning sultan. The Ottomans now controlled one side of the Sicilian channel. This victory was short-lived, however. Just one year later Charles launched four hundred ships carrying over twenty-six thousand men and retook the city. For the next forty years the central Mediterranean was a major battleground between the two empires.

A string of Ottoman victories followed the Spanish recapture of Tunis. In 1541 the Spanish tried to take Algiers, but the attempt turned into a debacle. They had to withdraw with a major loss of men and matériel. The city of Tripoli fell to the Ottoman armada in 1551, and the Muslim threat grew apace. In the summer of 1558 the Ottomans wiped out an entire contingent of Spanish troops stationed on the Algerian coast and raided the island of Minorca. Truly alarmed, Philip II (ruled 1556–1598) sent his galleys once again to the central Mediterranean, where they met a spectacular defeat at the island of Gerba in 1560. Ghislain de Busbecq, the ambassador of the Holy Roman emperor in Istanbul, was there for the triumphant return of the Ottoman fleet. He watched as columns of Christian prisoners were paraded through the streets. The Ottomans were now firmly in control of the central Mediterranean, and the Christian world waited with dread as the spring of 1561 turned to summer; they fully expected the Ottoman armada to reappear and to attack some portion of the Italian or Spanish coastline. In the event, however, the armada never came and in fact did not reappear for four summers. The long-expected assault did not come until 1565, when Suleiman finally launched an attack on Malta. Incredibly the Knights were able to hold the attackers off long enough for disease, heat, and food shortages to do their work. When Spanish reinforcements arrived in early September, the Ottomans decided to abandon the siege; by 12 September “the last Turkish sail had disappeared over the horizon” (Braudel, p. 1019).

The defeat at Malta returned the initiative to the Spanish. Now instead of worrying about where and when the sultan would strike, observers wondered whether the Spanish—who had vast, even global, commitments—would choose to press their advantage in the Mediterranean. Initially they did not. The ongoing difficulties in the Netherlands turned into full-scale war in 1567, and Philip could not fight in both arenas simultaneously. It would take the Ottoman conquest of Cyprus (summer of 1570) to bring the Spanish back into the Mediterranean in force. Philip’s decision to go to the aid of Venice led directly to the justly famous 1571 battle at Lepanto (Návpaktos), where the allied Christian forces scored a tremendous victory over their Muslim foes.

It has often been remarked that, for such a renowned event, Lepanto was strangely inconsequential. Venice surrendered Cyprus anyway, and the Spanish did not press their advantage any farther east. Within a year the Ottomans had rebuilt their fleet, yet they too did not launch a single-minded pursuit of the enemy (although they did take Tunis back for the last time in 1574.) Lepanto was followed not by an accelerating spiral of warfare but by a gradual disengagement that proved permanent over time. This perhaps unexpected result reflects the fact that the Battle of Lepanto, for all the rejoicing it caused in Europe, was the last spasm of a system that was slowly grinding to a halt, collapsing under its own weight. Throughout the sixteenth century the cost of galley warfare steadily escalated. Loaded with more and more guns, the galleys had to be bigger and stronger. Thus governments had to search out even more manpower, the perennial Mediterranean problem, and this meant more provisions at a time when prices were rising. In 1520 ship biscuits accounted for just under 25 percent of the total cost of operating a galley. By 1590 that figure was between 30 and 50 percent (Guilmartin, p. 222). The final conquest of Tunis was probably the most expensive Ottoman campaign of the sixteenth century.

In the last quarter of the sixteenth century, then, both the Ottomans and the Spaniards retreated into their separate corners of the Mediterranean, unwilling to pay a higher and higher price for increasingly marginal gains. Thus the age of “great wars” drew to a close, and each side gave up the dream of hegemony over the Mediterranean in its entirety.

THE OTTOMANS AND EUROPEAN POLITICS

The Ottomans, of course, were not the only foes or even the principal foes of the Spanish Habsburgs in the sixteenth century. The wars of religion and the ambitions of other monarchs, the French crown in particular, ensured that Spain was resented, even hated, across much of the European continent. With its vast resources and proven ability to confront Spanish power both on the Continent and in the Mediterranean, the Ottoman Empire was thus a potential ally for many on the European political scene.

The French king Francis I (ruled 1515–1547) made his intentions clear as early as 1533. Meeting with Pope Clement VII at Marseille, he declared, “Not only will I not oppose the invasion of Christendom by the Turk, but I will favor him as much as I can the more easily to recover that which plainly belongs to me and my children, and has been usurped by the Emperor” (Knecht, p. 301). The following summer an envoy from Hayreddin Barbarossa met with Francis just one month before the former captured Tunis and expelled the Tunisian king, who was a Habsburg ally. In 1535 Francis sent Jean de La Forêt to Istanbul with a view to gaining the sultan’s help in a future war with the Habsburg emperor. On the way La Forêt stopped in North Africa and offered Barbarossa ships and supplies in return for help against Genoa. The French mission to Istanbul and rumors of a signed agreement scandalized Christian Europe, but more was to come. In the early 1540s France and the Habsburgs were at war again, and Suleiman informed Francis that he was placing Barbarossa’s fleet at his disposal. The fleet duly set sail from Istanbul with the French ambassador onboard; on its way to Marseille it raided the coasts of Sicily and Italy. After a combined Ottoman-French bombardment of the Habsburg-occupied town of Nice, the Ottoman fleet wintered at Toulon.

The Habsburg-Ottoman confrontation in the Mediterranean in the sixteenth century then cannot be disentangled from the rivalries on the Continent. But once the two old foes disengaged (a truce was signed in 1580), conflict in the Mediterranean changed both in nature and in significance. The Ottomans were no longer useful as an ally for those who wished to confront Spain. Ottoman struggles therefore became decoupled from European rivalries, and Ottoman activity in the Mediterranean had only a local significance. Indeed once the two superpowers departed from the stage, the age of “little wars,” as Fernand Braudel (1976) put it, commenced. Pirates and corsairs reclaimed the sea both east and west and worked for their own interests through a skillful combination of trade and piracy.

THE SEVENTEENTH CENTURY

The English presence in North Africa provides a good example of this new phase in Mediterranean

history. English privateers originally entered the Mediterranean as combatants in England’s war against Spain. Having engaged the Spanish in the Atlantic as early as the 1560s, the English by the turn of the century had taken up residence in the ports of North Africa, particularly Algiers. From there the entire southern coastline of Spain lay open to their assaults. Ottoman sailors and soldiers were happy to join the English in their raiding activity, but they were not directed by Istanbul and were not pursuing any larger Ottoman agenda on Spain. The English Queen Elizabeth I (ruled 1558–1603) may have asked, in negotiations with the sultan at the end of the 1570s, that the Ottoman fleet be sent out to confront Spain, but the Ottomans did not respond.

Hostilities between England and Spain came to an end in 1604, but the “Barbary pirates” (the term originally referred to the English in North Africa, not to the Muslim population) did not go home. If they had initially come to confront Spain, now they stayed on to enjoy the life of a corsair in the Mediterranean. Over time the Barbary States (as they came to be known) evolved into formidable corsair capitals with an international population that operated on its own account, independent of both Europe and the Ottoman Empire. The North African corsairs were adept practitioners of the “little wars” that characterized the Mediterranean in the seventeenth century, but they were not the only ones. The distinguished historian of Marseille, Robert Paris, has described much of the seventeenth century as an “interregnum.” In using this term he draws attention to the lull that attended between the decline of the Spanish and Portuguese navies and the rise of the northern powers of England, France, and Holland in the Mediterranean. This was the age of the great Mediterranean entrepôts of Algiers and Tripoli (on the Muslim side) and Valletta and Livorno/Leghorn (on the Christian side), which grew wealthy through a skillful combination of trade and piracy. The brisk trade in captured goods linked markets on either side of the religious divide. A Venetian commentator wrote the following early in the seventeenth century: “Livornese, Corsican, Genoese, French, Flemish, English, Jewish, Venetian and other merchants are settled in Algeria and Tunisia. They buy up all the stolen merchandise and send it to the free port of Livorno and

from there it is distributed all over Italy” (Balbi de Caro et al., p. 37). The Greek archipelago was another center of pirate activity in this chaotic century. Although it was nominally under Ottoman control, the actual Ottoman presence on these rocky islands was minimal, and it became even more so during the long Ottoman-Venetian wars of the second half of the seventeenth century.

To a certain extent the corsairs were operating on their own initiatives and were motivated by economic self-interest. But they were also part of a larger story. A historic shift in the Mediterranean balance of power was being worked out in the seventeenth century. It was in this period that the Dutch, the English, and to a lesser extent the French put an end to Italian commercial supremacy in the Mediterranean, and piracy was a vital instrument in this assault.

The English pirate, for example, was not confined to North Africa. Pirates slowly worked their way east, where they became hated and feared figures, particularly for the Venetians. A Venetian administrator in Crete in 1604 vented his frustration at the English pirates who hampered the island’s provisioning: “These damn bertonis which sail in these waters to their heart’s content, stealing from and plundering everyone, and not permitting even one caramousal, loaded with grain, to approach, as they used to” (Spanakes, pp. 523–524).

Piracy was only one prong in a many-sided northern assault on the commercial status quo in the Mediterranean. The English and the Dutch undercut Italian, particularly Venetian, power by circulating cheap imitations of Italian goods throughout the Mediterranean. At the same time, under the controlling eye of mercantilist governments, northern manufacturing began to produce a wide range of new goods, particularly textiles, that were both cheap and popular in Mediterranean markets. Commercial companies, such as the English Levant Company, which received its charter from Queen Elizabeth I in 1581, imposed a discipline on merchants that further strengthened the power of English and Dutch trade. All of these factors are in the bitter comments of the Venetian ambassador at Constantinople in 1636:

Among the bales of cloth I noticed some which [the English] call “anti-Venetian” which means in imitation and for the destruction of ours, a preju-

dice which is increased by many other advantages which the English have in trading in these parts, both from the Capitulations which they have with the Porte and because their trading is done by means of a company. . . . They are not only exempt from half the duties which may be remitted to them, but they have a thousand chances of smuggling, which assuredly they do not miss. (Rapp, p. 511)

These remarks made in Constantinople underscore how attractive and important the vast Ottoman market was for both older commercial powers, such as the Italians, and northern newcomers. The classic view of European exploration and expansion in the early modern period emphasizes the extent to which the Spanish and the Portuguese wanted to cut out the Muslim middleman, who stood between them and the luxury goods of the Far East, someone who was both a commercial rival and a religious enemy. This view is not incorrect, but it is not the entire story. Northern maritime powers, that is, the English and the Dutch, did of course continue the encirclement of the Mediterranean that was begun by the Iberians. Ottoman customs inspectors on the border with Iran notified the government that the volume of Iranian silk coming into the Ottoman Empire was diminishing and asked what should be done about it. (The Iranians of course were selling the silk to the English agents of the East India Company.) But at the same time northern merchants were interested in buying up whatever they could in Ottoman markets and selling northern goods as well. Beginning in the seventeenth century then, and with ever increasing speed in the eighteenth, the trade in staples and foodstuffs between the Ottoman Empire and western and central Europe began to grow. It replaced in importance the old luxury trade, in which the eastern Mediterranean had functioned as a transit point for luxury goods coming from the Far East.

The older cities associated with the overland luxury trade—places like Bursa and especially Aleppo—declined, or at least failed to grow, over the course of the seventeenth and eighteenth centuries. At the same time formerly modest towns along the coast began their slow but steady transformation into the cosmopolitan entrepôts that would reach their full flower in the nineteenth century. The free-wheeling, multiethnic, multilingual cities of the eastern Mediterranean that so captured the imagi-

nations of Western travelers and writers—cities like Alexandria, celebrated by Lawrence Durrell in his four-volume *The Alexandria Quartet* (1957–1960)—got their start in the seventeenth century.

Izmir, or Smyrna as Europeans called it, on the western coast of Anatolia, was one of the first examples of this new type of Ottoman urban development. Throughout most of the sixteenth century Izmir was just one of many small port towns along the Anatolian coast. Whatever modest amount of agricultural surplus might become available was sent along to the imperial capital. Istanbul encouraged this relationship; the sultan was anxious to ensure the provisioning of the city and did not want the empire's foodstuffs diverted to Western merchants. Toward the end of the century this quiet situation began to change. There had always been some Western merchants operating in the area, and low-level smuggling, made easier by the jagged coastline with its many inlets, was an enduring fact of life. With the repeated grain crises of the 1590s, the number of Western merchants—first Venetians, then Dutch, English, and French merchants—began to grow, as did the amount of smuggling. Izmir was at the center of this trade. Attracted initially by grain, the Westerners soon discovered that the fertile valleys of western Anatolia produced many other products as well: honey, fruit, nuts, cotton, wool, and tobacco, to name just a few. Later in the seventeenth century Izmir became famous as the Mediterranean outlet for silk coming from the east. Fueled by a combination of Western demand, low prices, and Ottoman willingness to trade, Izmir began to grow rapidly. In 1600 fewer than five thousand people inhabited the town; by 1650 that number had risen to thirty or forty thousand as both Europeans and Ottoman subjects moved in. Whereas no European consuls were resident in Izmir in 1600, the Dutch, the English, the French, and the Venetians all had representation by 1620. Travelers had rarely mentioned or visited the town prior to this period, but after 1620 no tour of the Levant was complete without a mention of the bustling port. Izmir's intimate relationship with the world of Mediterranean and Atlantic trade was clear even in the geography of its settlement; western Europeans installed themselves along the road that ran beside the city's quay. It came to be known as the Street of the Franks, and the taverns, coffee-

houses, and even churches that graced the cities of western Europe proliferated along this street as well.

Although it had not planned or even anticipated Izmir's development, the Ottoman government was not long in recognizing the potential benefits of the new commercial patterns that were turning the city into an international emporium. By the second half of the seventeenth century favorable tax policies, implemented by the powerful vizier Köprülü Mehmed Pasha (served 1656–1661), encouraged the city's trade and sent more of the surplus back to Istanbul. The Köprülü family viziers also initiated an extended public construction campaign, and the khans, covered markets, and baths that characteristically graced important Ottoman cities were erected in Izmir as well. Perhaps most significantly, a castle, Sancakburnu Kalesi, was built at the entrance to the city's harbor. Completed in the late 1650s, the castle vastly increased the state's ability to protect the harbor from attack and to collect customs duties from seaborne commerce. The Ottoman traveler Evliya Çelebi noted this with satisfaction some years later: "The vessels of the community of misbelievers used to carry freight and donate whatever customs they wished, or, drawing anchor and fleeing, nothing at all." However, "with the completion of this castle, no ship of the misbelievers could avoid paying customs" (Eldem et al., p. 108).

TOWARD THE EIGHTEENTH CENTURY

Earlier in the century the Ottoman government had resisted Izmir's new role and had railed in vain against the smugglers and pirates and their collaborators within Ottoman society. Gradually the state came to terms with the commercialized agriculture that was increasingly common along the Aegean coastline. This flexibility was one of the reasons (a return of security to the Anatolian countryside was another) they were able to regain control, at least relatively speaking, over the Mediterranean coastline and over seaborne commerce more generally. Not only the Ottomans reasserted their control over the Mediterranean as the century drew to a close. The actions of other states too signaled that the age of the corsair and the pirate was coming to an end (a similar phenomenon can be observed in the Caribbean). In the last quarter of the seventeenth century the French government, which dominated Mediterranean commerce in the eighteenth century, turned

resolutely toward the sea and began a systematic expansion of French commerce. An important part of this project was the reining in of the piracy, both Christian and Muslim, that had flourished throughout the century. In 1679, for example, Louis XIV (ruled 1643–1715) issued an order forbidding French subjects from serving on Maltese corsair ships on cruises in the Levant. More generally the king exerted heavy pressure on the Knights of Malta to halt all their activities, which included the harassment of French trade, in the eastern Mediterranean. Closer to home the French tried to regularize their relationships with the North African states through a series of treaties. By the middle of the eighteenth century corsair activity across the Mediterranean was sharply down.

The end of the age of piracy, however, did not usher in an age of normalized trading relations allowing merchants and ships to move freely from port to port. In fact the eighteenth-century Mediterranean was more and more the domain of western Europeans and to a certain extent local Christians. These Ottoman Christians, mostly but not exclusively Greek, sometimes collaborated with Western merchants and sometimes competed against them, but in any event benefited from the protection extended to them by European governments for a variety of reasons. Muslim merchants, while still extremely active in the internal trade of the empire (which continued to dwarf external trade), found that the sea was not so friendly, particularly outside the eastern Mediterranean basin.

The port of Marseille, which was the port for France's Mediterranean trade, was a different place than Venice had been in its prime. Muslims had been a familiar if still exotic presence in the city of the lagoons. Documentation from the sixteenth century demonstrates that Ottoman Muslim merchants were able to make complaints over ill treatment; it also shows that the Venetian authorities repeatedly tried to find suitable space to lodge all the merchants, including Muslims, coming from the Ottoman Empire. In the same century too the town of Ancona sought to provide lodging and warehousing facilities for Muslim merchants.

No such hospitality was extended by the Chamber of Commerce of Marseille to North Africans, who were the principal Muslim communities inter-

ested in trading with Marseille. If they managed to reach the port, they found there was no storage space for their goods, no translators for them, or no small craft available to take their merchandise into the harbor. Sometimes they were forbidden to sail into the harbor on the grounds that they must be pirates and not peaceful merchants bent on commerce. North Africans in Marseille were on uncertain territory, no matter the formal state of relations between the government in Paris and the regencies of Tripoli, Tunis, and Algiers. In 1674, for example, eight Algerians managed to flee the Spanish galleys where they were enslaved and sought refuge in a small French port, given that France and Algeria were then at peace. But the unfortunate runaways were seized and sent to the galleys of Marseille. Following protests from the ruler of Algiers, the French minister Jean-Baptiste Colbert ordered their release, but his instructions were not followed.

Just a little over a century earlier, of course, the Ottoman fleet wintered at Toulon, to the east of Marseille, after collaborating with the French in bombing Habsburg-held Nice. Now the Ottoman sultan reacted not at all to the ill treatment of individuals who were, nominally at least, Ottoman subjects, and the governor of Algiers found that his protest was ineffectual. The contrast suggests the extent to which, over the course of the early modern period, the Mediterranean Basin became an extension of European and particularly northern European power. Although much of the vast interior of the Ottoman Empire was never colonized by Europe, by the nineteenth century many of the empire's port cities were under European control, either through direct colonization (as in Algiers) or through the more indirect machinations of international finance and diplomacy.

MOLLY GREENE

MEHMED II (OTTOMAN EMPIRE) (1432–1481; ruled 1444–1446 and 1451–1481), seventh ruler of the Ottoman dynasty. In 1444 the Ottoman sultan Murad II (ruled 1421–1444, 1446–1451), having concluded one treaty with Hungary and Serbia and another with the central Anatolian state of Karaman, abdicated, leaving the throne to Mehmed, his twelve-year-old son born to

a slave woman in Edirne. Mehmed II's short initial reign began, and largely continued, badly. Seeing Murad's abdication as an opportunity not to be missed, John Hunyadi, the voyvoda of Transylvania, and King Vladislav I of Hungary promptly attacked. Murad, recalled to lead the army, defeated them at the battle of Varna (1444), and withdrew once more to a life of contemplation.

Mehmed was faced not merely with outside enemies but also with those from within. The janissary revolt of 1446, probably caused by arrears in pay, brought his first reign to an end. The grand vizier (the chief minister of the sultan), Çandarlı Halil, from the influential Turkish Çandarlı family who had dominated the position of grand vizier under Murad II, was apparently involved in ensuring Murad's return to the throne and Mehmed's departure to Manisa, the town in southwest Anatolia where he was to spend the next few years.

THE SECOND REIGN, 1451–1481

When Murad II died in February 1451, Mehmed came to the throne for the second time. He immediately turned his sights to the conquest of Constantinople, the capital of the crumbling Byzantine Empire. His advisers were divided over the plan. The grand vizier Çandarlı Halil, who was described by both the contemporary Greek historian Ducas and the Ottoman chronicler of the period Aşıkpaşazade as a friend of the Byzantines, was opposed to any attack on the city. However, Zaganos Pasha, a Greek convert to Islam who had been Mehmed's tutor while in Manisa, urged conquest.

On 29 May Constantinople fell, and with it the Genoese colony of Galata, whose leaders signed an agreement with Mehmed, now known as Fatih, the Conqueror, under which they retained various trading privileges. The Ottoman conquest of the Byzantine capital was seen by Western contemporaries as an unprecedented disaster. Piccolomini, later Pope Pius II, referred to the loss as that of one of the two eyes of the church. Contemporary Latin accounts spoke of the death of a center of learning, the destruction of the holy relics, and the desecration of the great churches. There was a general terror that within a short space of time, Mehmed, this new Caligula, as one Latin contemporary described him, would ride his horse through the streets of Rome with the very survival of Christendom hanging in

the balance. While the fall of the city was thus seen by Western contemporaries as an event of great significance, its importance was more symbolic than actual, for the Ottomans had already absorbed most Byzantine territory, reducing the once great empire to a small strip of land around the city.

Although the Ottoman conquest is sometimes taken as signaling the beginning of a decline in Latin trade in Turkish territory, this was by no means the case, and there is no evidence to suggest that Ottoman policy under Mehmed II was designed to discourage or destroy Latin trading relations. On the contrary, his economic policy shows both continuity with that of his predecessors and the importance he attached to his relations with the Latin trading states. The Genoese, too, continued to have close relations with the Ottoman ruler and, while in the immediate aftermath of the conquest there was some interruption of trade as merchants removed themselves prudently to the Aegean islands to watch developments, they were soon back, and trade continued unabated.

REPUTATION AS RULER

Mehmed had in fact a considerable interest in encouraging commercial activity and went to great lengths to rebuild Constantinople and recreate it as a thriving commercial center. He set out to repopulate the city, forcefully moving populations in from various parts of his empire, and embarked on an impressive building program, which included the Fatih Cami, the Mosque of the Conqueror, begun in 1463. He was also, according to contemporary accounts, a man of letters, who had various learned scholars at his court. A Latin contemporary, Giacomo Languschi, commented on his interest in ancient history and reported that Ciriaco of Ancona, who had resided also at the court of Murad II, read to him daily from the works of Herodotus and Livy.

A great statesman, Mehmed was much interested in the administration of his empire and in tightening control over the running of the state. He was described by Nicola Sagundino, a native of Negroponte who wrote a report on the Ottoman ruler for Alfonso V, the king of Aragon, in 1454, as having examined with great care the administrative system of his state on coming to power, and as having instituted the necessary improvements. His aim was to centralize power in his own hands, and for this he

chose for high office those tied to him personally as slaves, not those from the old established families, such as that of the Çandarlı. The former grand vizier, Halil Çandarlı, was arrested after the capture of Constantinople and later put to death. Such a drive for control aroused opposition, and Mehmed's policies of confiscating land, issuing new coinage, and increasing taxation proved unpopular.

He was also a military leader of considerable acumen, and during his reign the territory of the state continued to increase both in the European and the Asian sections of his empire. In Europe he took Athens (1458), Serbia (1459), the Morea (1460), and Bosnia (1464). During the war with Venice (1463–1479) he conquered Negroponte (1470). In Anatolia, Trabzon fell in 1461. In the east, he defeated the Aq-Qoyunlu ruler Uzun Hasan in 1473 and Karaman in 1468. Crossing the Black Sea he captured the Genoese trading colony of Caffa (1475) and reduced the Crimea to vassal status. In 1480 the Ottomans besieged Rhodes, and Ottoman forces landed at Otranto, withdrawing a year later. In May 1481 Mehmed II died and was succeeded by his son Bayezid II (ruled 1481–1512).

Mehmed II's reign represents the firm establishment of a major Islamic empire with the flourishing city of Constantinople, later to become the most populous city in Europe, as its imperial capital. The Ottoman Empire was to be a dominant political and commercial presence in the Mediterranean world for many years to come.

MELANCHTHON, PHILIPP (Philipp Schwarzerdt; 1497–1560), Lutheran reformer. Raised in Palatinate court circles, the son of an accomplished armorer, Melanchthon was later mentored by a distant relative, the humanist Johannes Reuchlin. He absorbed elements of the rival medieval philosophical approaches called the *via antiqua* and the *via moderna* during studies at Heidelberg and Tübingen, but the primary influence in his early development came from Erasmian humanism. Hailed by Erasmus and others as a wunderkind, he accepted a position as professor of Greek at the new University of Wittenberg in 1518. There he and Martin Luther formed a close working relationship at the heart of a team that propagated Luther's reform program. The two influenced each other's thought profoundly. Luther appropriated Melanchthon's philological insights into his translation of Scripture and his theology. Melanchthon in turn expressed Luther's thought in his *Loci Communes Rerum Theologicarum* (1521; Common topics in theology), an introduction to the study of theology, based on Paul's Epistle to the Romans. Completely revamped later editions (1535, 1543) presented a survey of all theological topics.

Although he held a second professorship in theology after 1526, Melanchthon was foremost an instructor in the arts, particularly rhetoric and dialectic. His innovative blend of the two, based on principles of Cicero, Quintilian, Aristotle, and recent humanists, became standard for European learning. Especially important was his concept of organizing learning by "commonplaces" (*loci communes*, 'topics'). He lectured and wrote on Aristotle's physics, politics, and ethics as well as history, astronomy, and ancient Greek literature. His encouragement and support of educational reform led to the establishment of many secondary schools and the universities at Königsberg, Jena, and Marburg.

Not only did Melanchthon lay the groundwork for subsequent Lutheran dogmatic instruction; his biblical commentaries employed humanist exegesis and provided sermonic and teaching helps for pastors. He led in producing a series of New Testament expositions (early 1520s), the "Wittenberg Commentary" with his own works on the Gospels of Matthew and John, followed by commentaries on

Paul's Epistles to the Romans and the Colossians, as well as other biblical books.

At Luther's side Melanchthon helped spread the Reformation, for example in his organization of the Saxon visitation (1527/1528) and the composition of defining documents for Lutheran teaching, the *Augsburg Confession* (1530), its *Apology* (1531), and the *Treatise on the Power and Primacy of the Pope* (1537), later authoring the *Saxon Confession* (1551). As chief ecclesiastical diplomat of electoral Saxony and other Lutheran governments, he attempted to forge plans for reform based on the Augsburg Confession for the French and English kings. Through correspondence and memoranda on ecclesiastical problems, often composed for his Wittenberg colleagues, he exercised widespread influence. He led Evangelical representatives at the Augsburg Diet of 1530 and in colloquies with Roman Catholics at Hagenau/Worms/Regensburg (1540/1541) and again at Worms in 1557.

After the defeat of the Evangelical Schmalkaldic League by Emperor Charles V in 1547, Melanchthon strove to preserve the integrity of Wittenberg University and to stave off imperial occupation of Saxony. Under his new prince, Elector Maurice, he sought to placate Charles's demands by forging a religious policy, the so-called Leipzig Interim, that reinstated some medieval practices while seeking to retain Luther's teaching. Melanchthon considered such rites neutral or *adiaphora*, but some of his best students considered these concessions to the papacy a betrayal of the Reformation. Melanchthon in turn felt betrayed by these students; their criticism embittered him. His former student and colleague, Matthias Flacius, and his "Gnesio-Lutheran" associates, who claimed to be adhering to Luther's teachings, also accused him of synergism and a focus on the law in the Christian life that turned believers back to reliance on good works. His writings show, however, that throughout his life he continued to center his theology on God's justification of sinners on the basis of his gracious favor alone, which created trust in the promise of forgiveness of sin and life through Christ. The hermeneutical guide to his teaching lay in the distinction of God's law (God's expectation for human creatures that condemns them when they sin) from God's gospel (the message of forgiveness in Christ that liberates people from evil for service to God).

His functional interpretation of the presence of Christ in the Lord's Supper also elicited the critique of former students.

Forced by Luther's death into a position of leadership for which he was not completely suited, Melanchthon suffered distress in the decade before his death (19 April 1560) because of these controversies, increasing Roman Catholic persecution of Evangelicals, and the deaths of a married daughter (one of his four children) and of his wife, Katharina Krapp, the daughter of a leading Wittenberg burgher. As the "Preceptor of Germany" his contributions to the intellectual life of Europe continued to determine elements of learning for more than two centuries, and his theology remains influential into the twenty-first century.

ROBERT KOLB

MENDELSSOHN, MOSES (Moshe ben Mendel mi-Dessau; 1729–1786), philosopher of the German and Jewish Enlightenments, leading literary critic in Prussia, biblical scholar, and Jewish communal leader and advocate. Mendelssohn was born to a poor Jewish family in Dessau. His father, Mendel Heymann, was a Jewish religious teacher

and scribe. His mother, Bela Rachel Sarah, was descended from an illustrious line of rabbis. As a child, he received a traditional Jewish education, studying the Bible with its commentaries, the Mishna and Talmud, and Jewish legal codes. At age ten, he became a student of the famous Talmudist David Fränkel, and in 1743 followed Fränkel to Berlin when the rabbi received a post there.

In Berlin, Mendelssohn met the Jewish philosophers Israel Samoscz and Aaron Salomon Gumpertz. Under their guidance he studied Latin, Greek, English, and French and read the works of the Enlightenment philosophers Gottfried Wilhelm Leibniz, Christian Wolff, and John Locke. These thinkers formed Mendelssohn's philosophical orientation, from which he never departed. He espoused "moderate Enlightenment"—a belief in rational or "natural" theology.

In 1754, Gumpertz introduced Mendelssohn to the young Gotthold Ephraim Lessing, with whom Mendelssohn developed a lifelong friendship. Lessing encouraged the young Mendelssohn to develop his ideas about metaphysics and aesthetics, as well as to write pieces of literary criticism. In 1763, Mendelssohn won a prize competition held by the Berlin Academy of Sciences on the question whether metaphysical truths allowed of the same certainty as mathematical truths. His essay defeated an entry by Immanuel Kant.

In 1767, Mendelssohn published his *Phädon* (Phaedo), a reworking of Plato's famous dialogue of the same name. This work used Leibnizian-Wolffian arguments to prove the immortality of the soul. The work was a sensation, running into four editions, and was translated in Mendelssohn's own lifetime into Italian, French, Danish, and Russian. Mendelssohn became recognized as a leading philosopher of the German Enlightenment and was dubbed by his contemporaries "the German Socrates."

While as a youth he had published a few pieces in Hebrew seeking to promote enlightenment among his coreligionists, initially Jewish apologetic concerns were not in the foreground. This changed in 1769 when the Pietist Swiss theologian and preacher Johann Caspar Lavater challenged him to either refute Christianity or convert. Mendelssohn defended himself by contrasting the religious tolerance in Judaism with Christianity's theological in-

tolerance, but the “Lavater affair” shook his faith in the ability of Jews to be accepted in Prussian society.

Throughout the 1770s, the German Enlightenment came under increasing attack from the counter-Enlightenment Sturm und Drang (‘storm and stress’) movement as well as from English empiricism, idealism, and skepticism. Despite being plagued by a nervous debility from the 1770s to the end of his life, Mendelssohn worked tirelessly on three projects: improving the civil status of the Jews, defending Jewish particularity, and defending the German Enlightenment.

In 1779, Lessing wrote his most famous play, *Nathan der Weise* (Nathan the wise), an apology for religious tolerance. The hero, the Jewish merchant Nathan, was widely seen as having been modeled on Mendelssohn. In 1781, Mendelssohn sought to actualize the tolerant ideals espoused by Nathan by commissioning the Christian German ministerial councillor Christian Wilhelm Dohm to write a book advocating Jewish civil improvement. In 1781 Dohm’s *Über die bürgerliche Verbesserung der Juden* (On the civil improvement of the Jews) appeared and was widely debated.

In 1783, Mendelssohn wrote his philosophical masterpiece *Jerusalem oder über religiöse Macht und Judentum* (Jerusalem or on religious power and Judaism). The book comprised two parts. In the first part Mendelssohn argued that religious institutions had no right to exercise political power. In the second part he offered a philosophical defense of Judaism showing that the applicability of Jewish ceremonial law did not depend on religious coercion. Through the 1770s and 1780s Mendelssohn multiplied his Hebrew literary work, most notably producing a highly regarded translation and commentary on the Pentateuch known as the *Biur* (Elucidation). In 1783, Friedrich Heinrich Jacobi disclosed to Mendelssohn that Lessing, who had died in 1781, had been a Spinozist at the end of his life. Spinozism was then widely equated with atheism, and Mendelssohn understood Jacobi’s disclosure as an attempt to undermine the rational theology of the German Enlightenment. This sparked the so-called Pantheism Controversy. In Mendelssohn’s contributions to the controversy, the *Morgenstunden* (Morning hours) and *An die Freunde Lessing* (To Lessing’s friends), he attacked

Moses Mendelssohn. LIBRARY OF CONGRESS

Spinozism and revised his metaphysics and epistemology.

At the end of his career, Mendelssohn aimed to achieve a synthesis of rationalism and empiricism and thereby save the German Enlightenment. In this respect, his project was quite similar to that of his friend and fellow *Aufklärer* Immanuel Kant, though Kant’s critical synthesis was far more philosophically sophisticated and influential.

Mendelssohn is widely considered the father of modern Jewish philosophy. His was the first attempt to articulate a conception of Judaism using modern philosophical concepts. Furthermore, he is seen as the spiritual ancestor of two of the main forms of nineteenth-century German Judaism—Neo-Orthodoxy and Reform. His defense of Jewish ceremonial law as “living symbols” of theological truth prefigures Samson Raphael Hirsch’s Neo-Orthodoxy, while his defense of the rational, universal foundation of Jewish belief prefigures Reform Judaism. His attempt to develop a German-Jewish symbiosis likewise set the agenda for later German-Jewish thought, and his work on behalf of Jewish

civil improvement anticipated later attempts to achieve Jewish emancipation in Europe.

Despite his importance as a philosopher, Judaic thinker, and mediator of German and Jewish culture, Mendelssohn's reputation shrank after his death. His metaphysics and epistemology were thought to have been overshadowed by Kant. His Jewish philosophy was seen to have been an unacceptable compromise between obedience to particularistic Jewish law and espousal of universal religious ideas. His interpretation of Judaism was accused of being inattentive to Judaism's historical development.

Recent scholars have debated the relationship between Mendelssohn's philosophical positions and his Jewish commitments. Some have subordinated his Jewish commitments to his philosophical concerns, and others have done the opposite. Of late, Mendelssohn's defense of religious pluralism on the basis of profound Jewish learning and subtle philosophical thought, along with his espousal of political liberalism, have made him appear a particularly prescient thinker.

MICHAH GOTTLIEB

MENGS, ANTON RAPHAEL (1728–1779), German painter. The son of Ismael Israel Mengs, court painter to King Frederick Augustus II of Saxony, Anton Raphael was born at Aussig in Bohemia in 1728. His strict father was determined that his children would become artists, including his daughters Theresia Concordia (1725–1808?) and Juliane Charlotte (1728–after 1789). The former married Mengs's student, Anton von Maron, and became a member of the Accademia di San Luca, the papal arts academy in Rome in which Mengs was later to assume a position of great influence.

Mengs's early works are pastel portraits and drawings after antique sculptures and Old Master paintings made during a trip to Rome in 1740–1744. In 1745, after his return to the electoral court at Dresden, Frederick Augustus commissioned him to paint portraits of himself and his family. It was during this residence in Dresden that Mengs switched from pastel to oils. After a second sojourn in Rome in 1746–1749, he returned to Saxony and received commissions for three altarpieces for the Catholic court church, including the impressive scene of the Ascension executed for the high altar. This important commission and his appointment as court painter enabled him to return to Rome in 1751 for further study, and he never saw Dresden again.

For the next decade Mengs worked successfully in Rome and Naples. His growing reputation earned him a professorship at the Accademia del Nudo and a free studio for the study of the male nude established by Pope Benedict XIV (reigned 1740–1758). He was also elected to the Accademia

di San Luca and enjoyed a steady stream of commissions for altarpieces, cabinet pictures, and portraits. These include the ceiling fresco *Saint Eusebius in Glory* for the church of San Eusebio in 1757; the world-famous *Parnassus*, executed for Cardinal Alessandro Albani's villa on the Via Salaria; and historical paintings such as *Cleopatra Kneeling before Octavian* (1760–1761), commissioned by Richard Colt Hoare, and *Perseus and Andromeda* (1771), executed for Sir Watkin Williams-Wynn. In addition, he painted portraits of British travelers on a grand tour to augment his income after his pension from Dresden was discontinued in 1756.

In 1761 Mengs became court artist to King Charles III of Spain. While in Madrid, he executed ceiling frescoes in the Palacio Real, including the *Triumph of Aurora* (1762–1764) and the *Apotheosis of Hercules* (1762–1769). He also painted altarpieces and portraits of members of the royal family. Due to Mengs's ill health, in 1769 Charles granted him permission to go to Rome, and he returned to Spain only in 1774–1776 to complete frescoes in the Royal Palace, including the *Apotheosis of Trajan*. His most important late Roman commission, the *Allegory of History*, was painted for the

ceiling of the Sala dei Papiri in the Vatican Library as part of the ambitious expansion of the papal collections that eventually became the Pio-Clementino Museum.

Although he was long derided as an uninventive eclectic, his style was in fact progressive, drawing inspiration from canonical artists such as Raphael, Correggio, Titian, Carracci, and Poussin while integrating these classicizing models with the mania for the antique that had swept Europe in the wake of the excavations at Pompeii and Herculaneum. Mengs was deeply interested in the pedagogy of art based on advanced academic principles, and he was a prominent reformer in both the Accademia di San Luca and the Academia di San Fernando in Madrid. The Villa Albani Parnassus is arguably the first truly neoclassical painting, given the dramatic reduction in the standard illusionistic devices of shading and foreshortening and its emphasis on strong local color. Nothing so visually radical was to appear until the 1790s.

Mengs was one of the most famous artists in Europe in the eighteenth century, but it is as an aesthetic critic and art historian that he is best remembered today. His friendship with the celebrated

German scholar Johann Joachim Winckelmann, Cardinal Albani's librarian, helped steer Mengs's taste in the direction of more stringent classicizing currents. His *Gedanken über die Schönheit and über den Geschmack in der Malerey* (Zurich, 1762; Thoughts concerning Beauty and Taste in Painting) and *Ragionamento su l'Accademia delle Belle Arti di Madrid* (Madrid, 1766; Argument concerning the Academy of Fine Arts in Madrid) reveal a reverence toward the classicizing art of the Renaissance and baroque eras combined with a strong sense of the social utility of the arts in an enlightened society. His complete literary works were published in 1780 and helped promote a more austere form of international neoclassicism. It is also significant that Mengs was among the first to suggest that canonical ancient masterpieces, such as the *Apollo Belvedere*, (Pio-Clementino Museum, the Vatican; fourth century B.C.E.) were in fact Roman copies of lost Greek originals, a controversial claim that gained general acceptance only at the end of the eighteenth century.

Struggling with poor health in the last years of his life, Mengs died in Rome on 29 June 1779. Awarded many honors and titles, Mengs enjoyed a level of international prestige enjoyed by no German artist since Albrecht Dürer.

CHRISTOPHER M. S. JOHNS

ized by the blind adherence to a single, precisely defined economic theorem. Rather, its adherents embraced, in various degrees, parts of a set of commonly held theoretical beliefs or tendencies that were best suited to the needs of a particular time and state. The underlying principles of mercantilism included (1) the belief that the amount of wealth in the world was relatively static; (2) the belief that a country's wealth could best be judged by the amount of precious metals or bullion it possessed; (3) the need to encourage exports over imports as a means for obtaining a favorable balance of foreign trade that would yield such metals; (4) the value of a large population as a key to self-sufficiency and state power; and (5) the belief that the crown or state should exercise a dominant role in assisting and directing the national and international economies to these ends. As such, mercantilism developed logically from the changes inherent in the decline of feudalism, the rise of strong national states, and the development of a world market economy.

The shift from payments in kind, characteristic of the feudal period, to a money economy was one key development in this process. By the late fifteenth century, as regional, national, and international trade continued to blossom, European currencies expanded as well; circulation was more common, widespread, and vital. The early mercantilists recognized the seminal fact of this period. Money was wealth *sui generis*; it gave its holder the power to obtain other commodities and services. Precious metals, especially gold, were in universal demand as the surest means to obtain other goods and services. At the same time the rise of more powerful European states with burgeoning bureaucracies, frequent dynastic wars that required larger and more expensive armies, and more lavish court expenditures exacerbated this fundamental need for money in the form of precious metals. Foreign trade, not domestic trade, was viewed as the preferred method for obtaining bullion, while manufacturing, which provided the goods for such trade, was favored over agriculture. Finally, the discovery of the New World by Columbus in 1492 and the discovery of the sea route to India by Vasco da Gama in 1497–1499 also provided fertile ground for obtaining such wealth while creating an ever greater need for wealth to conquer and protect these colonies and their imperial trade. All of these

factors ensured that the rising late medieval and early modern states embraced mercantilism as an economic theory that allowed them to adapt to and seek to exploit these shifting structures.

Since mercantilism at base postulated increased royal control over both the internal and external economic policies of the state, it found easy acceptance among the “new” monarchies of the late fifteenth century and the sixteenth century. In Portugal, Manuel I (ruled 1495–1521) and his successors embraced its tenets regarding bullion and colonies to help exploit their burgeoning Asian empire. In Spain both Charles I (ruled 1516–1556) and Philip II (ruled 1556–1598), given the boon of New World precious metals, also found comfort in bullionism as well as the tenets calling for the exploitation of colonies for the benefit of the mother country. In England, Henry VIII (ruled 1509–1547) and Elizabeth I (ruled 1558–1603) adhered to some mercantilist principles in an effort that was, at least in part, designed to combat the threat of universal Habsburg Monarchy and Iberian dominance in the developing world market economy.

PROPONENTS OF MERCANTILISM

During the seventeenth century, adherents of absolutism also found much to embrace in mercantilism. During the age of Stuart absolutism James I (ruled 1603–1625) and Charles I (ruled 1625–1649) found it logical to accept the premise that the monarch should not only control the political and social hierarchy but should enjoy control over the economy as well. Oliver Cromwell (1599–1658), after destroying Stuart pretensions in the Civil War, embraced both mercantilist warfare and the Navigation Acts in his commercial struggle with the Dutch. It was in France, however, that mercantilism found perhaps its greatest supporter in Jean-Baptiste Colbert (1619–1683). Colbert’s career was as much a product of the sociopolitical dynamics of the absolutist state as the result of the unrivaled bureaucratic energies he displayed in the service of his early patrons and eventually the crown. His family rose through the social hierarchy based on the time-honored expedients of wealth and venality of office. Utilizing family connections, Colbert entered the service of Michel Le Tellier in 1643, soon after the latter became secretary of state in charge of military affairs. This promising foundation was solidified

during Colbert’s “apprenticeship” under Jules Cardinal Mazarin, a mutually advantageous relationship that began in 1651 and lasted until Mazarin’s death in 1661. By the end of this decade of opportunity, Colbert had become baron de Seignelay, secretary of the orders of the queen, intendant general of the affairs of Mazarin, counselor of the king in all of his councils—not to mention a very wealthy man. Just as importantly, he had begun to create an apparatus for the implementation of his later policies by further enriching his family and arranging influential positions for a bevy of his brothers and cousins.

In this rapid ascent through the labyrinth of French political life, Colbert honed the ideas and theories that shaped his policies after 1661, the year Louis XIV (ruled 1643–1715) began his personal reign and Nicolas Fouquet was imprisoned, thus ensuring Colbert’s ascent to ministerial preeminence. The basic theoretical tenets of mercantilism predated Louis XIV’s reign, in some cases by half a dozen generations. Colbert was exposed to such ideas in the Paris of his youth, when the economic traditions of the first Bourbon king of France, Henry IV (ruled 1589–1610), and the theories of his able *contrôleur général du commerce* (comptroller general of finance), Barthélemy de Laffemas, were still relatively strong. Armand-Jean Du Plessis, Cardinal Richelieu (1585–1642) was still alive at that time, and Issac de Laffemas, the cardinal’s creature, was in the midst of perpetuating his father’s intellectual legacy. Although Colbert never referred to the writings of Antoine de Montchrestien (c. 1575–1621) and Jean Bodin (1530–1596), he was probably familiar with their works. Mercantilism reached its apogee under Colbert not because he was a theorist but rather because he was a man of action who judged its tenets to be the only natural and logical way to achieve his most cherished goal: a powerful and wealthy France united under a glorious monarch. The primary obstacle to France’s economic greatness was the overweening economic power of the Dutch. If the mercantile power of the burghers of Amsterdam could be broken in both Europe and the lucrative Asian trade, France could prosper.

Colbert’s anti-Dutch strategy evolved logically from his beliefs on political economy. Foremost among his particular tenets on mercantilism was the conviction that the volume of world trade was es-

essentially static and that, to increase its share, France would have to win part of that controlled by its rivals. In one of his most quoted *mémoires* (*Lettres* VI: 260–270) Colbert wrote, “The commerce of all Europe is carried on by ships of every size to the number of 20,000, and it is perfectly clear that this number cannot be increased.” Commerce caused “perpetual combat in peace and war among the nations of Europe, as to who shall win most of it.” His exaggerated estimate on the maritime strength of the major European trading nations competing in this “war” was fifteen thousand to sixteen thousand Dutch ships, three thousand to four thousand English ships, and five hundred to six hundred French ships. Just as importantly neither the French nor the English could “improve their commerce save by increasing this number, save from the 20,000 . . . and consequently by making inroads on the 15,000 to 16,000 of the Dutch.” (*Lettres* VI: 260–270). The bellicism inherent in such beliefs would in part culminate in the Dutch War of 1672, a war Colbert supported. Unfortunately, despite his most careful calculations regarding this struggle in both Europe and the Indian Ocean, Louis XIV’s armies and fleets suffered increasing difficulties in the war from 1672 to 1679. These setbacks forced Colbert to undo many of his initial reforms from 1661 that had doubled the king’s revenues, forged a powerful navy, and set France on a course for apparent dominance in Europe. By the time of his death in 1683, the kingdom was instead on the road to bankruptcy and revolt, and Louis XIV’s penchant for continued warfare in the decades down to 1715 only exacerbated this decline.

OPPONENTS OF MERCANTILISM

During the eighteenth century the limits of mercantilism became increasingly obvious, and intellectual and political critics of its basic tenets gradually emerged. First, Louis XIV’s spectacular failures in the kingdom viewed as the apogee of both absolutism and mercantilism certainly revealed the limitations of allowing the state to direct the economy for its own frequently selfish, if not self-destructive, purposes. At the same time, in parts of England, Holland, and northwestern France the initial adherence to mercantilist principles created the very conditions that fostered antimercantilist sentiments. These developments would ultimately cause the destruction of merchant capitalism. In short, mer-

chant capitalism reached a level within the mercantilist system where state intervention and direction of the economy was threatening and even preventing further expansion. The critical spirit toward existing Old Regime structures embodied in the intellectual revolution of the Enlightenment found its antimercantilist champions in the Physiocrats. In part adapting “natural law” doctrines to the economy, this influential group of economic theorists, including François Quesnay (1694–1774), Jean-Claude-Marie-Vincent de Gournay (1712–1759), and Pierre-Samuel du Pont de Nemours (1739–1817), instead argued for laissez-faire. This theory argued that the economy functioned best when its own “natural laws” were allowed to function without government intervention. Complementing the work of the French *économistes*, the Scottish philosopher David Hume (1711–1776) sought to identify the natural advantages that various nations enjoyed in the flow of commerce and provided a new theory on international trade. In his *Political Discourses* (1752) and *Essays and Treatises on Several Subjects* (1753), Hume also sought to refute some of the principal tenets of mercantilism, including confounding money with wealth and the blind acceptance of bullionism. Yet by far the most important work criticizing mercantilist thought was Adam Smith’s (1723–1790) *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), the first systematic economic analysis of the world market economy created during the preceding age of mercantilism. Smith’s strong advocacy of free trade and his belief that world wealth was not static, as Colbert and others had held, did much to undermine mercantilism. At the same time his theories and those of other Physiocrats also encouraged colonies like British North America to reject the traditional dependence on their mother countries as defined by the mercantilist model while furnishing intellectual fuel for the industrial revolution then taking place in Great Britain. In France, however, only the French Revolution and Napoléon I (1769–1821) would facilitate the destruction of the economic remnants of both the late medieval and mercantilist periods.

MERCENARIES. Mercenaries were paid soldiers who were bound to their employers by profit motive rather than loyalty. They existed in European armies from antiquity and fought in large numbers in the early modern period.

MERCENARIES IN FOURTEENTH- AND FIFTEENTH-CENTURY ITALY

Fourteenth- and fifteenth-century Italian states took the lead in using mercenaries. The accumulation of wealth by towns in the northern and central part of the peninsula created the means to spend, while incessant wars and weak feudal structures provided the need to hire military power. In the fourteenth century, the Italian military scene was dominated by foreign adventurers. These were mostly Germans, French, and Hungarians who fought in local armies. They coalesced into “free” companies: private armies led by captains elected by their troops, available for hire to the highest bidder. In the absence of pay, these armies roamed the countryside plundering and extorting money. There were several German “Great Companies,” but the most famous of the bands was the English “White Company,” which descended into Italy in 1361 during a truce in the Hundred Years’ War (1337–1453). Sir John de Hawkwood, a captain of the White Company, became the most successful soldier of the era. When he died in 1394, his last employer, the government of Florence, buried him with high honors in the cathedral.

John Hawkwood’s emergence apart from his band was part of a larger process whereby individual mercenary commanders became valuable commodities. This development resulted from the late-fourteenth-/early-fifteenth-century economic and political consolidation on the peninsula that reduced

the number of states that could hire mercenaries. This consolidation also strengthened a fortunate few mercenaries, who now sought lasting arrangements with men of assured reputations. Powerful states like Milan and Venice took the lead in granting long-term mercenary contracts and establishing more permanent armies. The new generation of mercenary captains was almost exclusively Italian, and prolonged service had the unfortunate consequence of mercenaries sometimes seizing political power in the states they served. An example is Francesco Sforza (1401–1466) from the Romagna town of Cotignola, who took control of Milan in 1450.

Mercenaries were hired in Italy by means of a *condotta*, ‘contract’. The term *condottiere*, ‘contractor’, Italian for mercenary captain, derives from *condotta*. A *condotta* typically spelled out the number of troops, the conditions of service, and the amount of pay. Most *condotte* involved horsemen, the most valued troops, but they could also include infantry. In fifteenth-century Italy mercenary cavalry comprised units known as lances, which consisted of three men and three horses. Employers usually retained the right to inspect the brigade; the mercenaries claimed a share of the booty and ransoms. Different kinds of men fought as mercenaries. Some, like Niccolò Piccinino (1380–1445), came from humble backgrounds; others, like Federigo da Montefeltro (1422–1482), were learned men from noble families. Niccolò Machiavelli criticized mercenaries as cowardly in battle, “thirsty for power, undisciplined and disloyal,” but many were in fact reliable and competent fighters. Musio Attendoli Sforza (1369–1424) and Braccio da Montone (1328–1424) were two of the most skilled tacticians of the fifteenth century. Musio exhibited considerable expertise maneuvering large armies and making effective use of his infantry. Braccio distinguished himself for his audacity in battle and his penchant for dividing his army into small units and committing them piecemeal into battle. Many of the captains of the fifteenth century fought under either Musio or Braccio and adopted their methods.

MERCENARIES IN OTHER PARTS OF EUROPE

Mercenaries were used in significant numbers elsewhere in Europe, particularly in wars in France and

the Holy Roman Empire. The Swiss emerged in the fifteenth century as a frightening fighting force. Unlike the *condottieri* in Italy, the Swiss formed infantry units, which were phalanxes of men armed with swords and halberds (a type of battle axe on a pike) for fighting in close order. Their weapons protected them from cavalry charges and gave them considerable counteroffensive striking power. Whereas capture and ransom were a fundamental part of Italian warfare, the Swiss did not take prisoners and often skewered their opponents with their sharp weapons. In the service of the French monarch, the Swiss scored impressive victories against the armies of Charles the Bold of Burgundy in 1476–1477.

In Germany, Emperor Maximilian I (ruled 1493–1519) created his own infantry, the Landsknechts, to rival the Swiss. Predominantly drawn from southern Germany, this infantry trained in the Swiss manner and were armed with pikes. They distinguished themselves by wearing loud, colorful clothing, and they incorporated handguns into their units as these weapons became more common on European battlefields. Their battles with the Swiss, whom they hated, were some of the bloodiest of the era.

The sixteenth century saw the rise of what the historian Fritz Redlich has called the “German military enterpriser.” This breed of mercenary bore a certain resemblance to the Italian *condottiere* but operated on a larger scale, raising whole armies, extending credit to large cadres of soldiers and, generally, treating war as a business enterprise. The phenomenon reached its peak in the seventeenth century during the Thirty Years’ War (1618–1648). At one point during the war, more than 400 military enterprisers were active. The most famous was Albrecht von Wallenstein (1583–1634), a petty nobleman of Protestant background from Bohemia. He fought for the Catholic Habsburgs, raised armies in excess of 100,000 men, and acquired states stretching from Bohemia to the Baltic. He organized arms production on his lands, recruited men, and retained the right to promote officers. His was a highly paradoxical personality: A convert to Catholicism, he remained intensely superstitious. He supposedly disliked noise so much that upon arrival in a town he ordered all the dogs and cats put to death.

The Thirty Years’ War notwithstanding, the seventeenth-century European military trend was toward more centrally organized professional state armies. But governments did not hesitate to employ mercenaries when the need arose. Prussia recruited men from outside its frontier, often from lesser German states. The army of the Prussian ruler Frederick William I (ruled 1713–1740) was only two-thirds native. One of the most well-known suppliers of mercenaries at the time was Hessen-Kassel, a relatively poor state. Hessian mercenaries served opposing sides the War of Austrian Succession (1740–1748) and were used by the English in the American Revolution (1776).

MERIAN, MARIA SIBYLLA (1647–1717), German artist and naturalist. Maria Sibylla Merian was born in Frankfurt into a family with a distinguished history in the visual arts, particularly with respect to the study and exploration of the natural world. Her father, Matthäus Merian the Elder, inherited a prosperous publishing house from Jean Théodore de Bry, whose *America* (Frankfurt, 1590) presented some of the earliest images of the peoples, plants, and animals of North America to

European audiences. Maria Sibylla's half-brothers Matthäus Merian the Younger and Kaspar Merian took over the family business after the death of their father and continued to publish illustrated works of natural history and other subjects. In 1651 Maria Sibylla's mother married Jacob Marrel, an artist who had studied with several prominent German and Dutch still-life painters.

Merian combined her interest in studying the processes of nature with the creation of visual images and from an early age showed an avid interest in insects. She received her artistic training in the workshop of her stepfather Jacob Marrel and in 1665 married Johann Andreas Graff, a painter who had apprenticed in her stepfather's workshop. The couple lived in Nuremberg between 1665 and 1670, where Merian taught painting and embroidery to young women, and where she published the first of her three major works, the *Neues Blumenbuch* (Nuremberg, 1675–1680), a series of copperplate engravings of flowers for use as models for embroidery and needlework. Merian began publication of her second major work in 1679, when the first volume of her *Raupenbuch* series appeared, which focused on the life cycles of European caterpillars and butterflies.

In 1686 Merian, her two daughters, and her mother joined a religious community in northern Germany known as the Labadists. It has been suggested that Merian joined the group in part to escape the marital difficulties she had been experiencing with Graff, from whom she was divorced several years later. Merian and her daughters moved to Amsterdam in 1691 and began planning a voyage to the Dutch colony of Surinam; in June 1699 Merian and her grown daughter Dorothea Maria set sail for South America. Merian is best known for the illustrated publication that resulted from this voyage, the *Metamorphosis Insectorum Surinamensium* (Amsterdam, 1705). Merian's compositions presented startling scenes of insects and plants previously unknown to Europeans and highlighted both the life cycles of individual insects and the struggles for survival between insects, plants, and other animals. The brightly colored forms and striking features of Merian's insects provided a disturbing yet fascinating vision of the New World for European readers. Merian's focus on the relationships between insects and plants and their environment had

a strong influence on natural history illustration during the eighteenth century, as can be seen in the illustrations for *The Natural History of Carolina, Florida, and the Bahama Islands* (London, 1731–1743) published by the English artist and naturalist Mark Catesby.

MERSENNE, MARIN (1588–1648), French mathematician, scientist, and theologian. Mersenne was born in the hamlet of La Soultière in the parish of Oizé, the son of Julien Mersenne, a farmer of modest means, and his wife, Jeanne Moulière. When a new Jesuit school at La Flèche opened in 1604, strongly supported by King Henry IV, Mersenne immediately transferred there, graduating in 1608. He continued his studies at the Sorbonne for two years, leaving to join the Order of Minims, a mendicant order founded in the fifteenth century by St. Francis of Paola, and in 1614 was sent to teach at their convent in Nevers.

There he began writing letters to ask the advice of others, primarily about scientific matters. In 1619

he moved to the Minim convent in Paris and continued writing to an ever-expanding group of scientists. As a result, he knew or corresponded with most of the leading scientists of his day. He often sent them a list of questions and then communicated their replies to others to encourage further work on the responses he received. His correspondence, published in the twentieth century, contains a wealth of information about many of the scientific ideas of the period. The letters Mersenne exchanged with René Descartes, for example, are an important source for studying the development of Descartes's ideas.

In 1635 Mersenne further encouraged the exchange of ideas by establishing a group called the *Academia Parisiensis*, which met on Thursdays and was attended by the outstanding scientists and mathematicians of his day. It was continued by others after his death and was an important forerunner of the *Académie des Sciences*.

Mersenne published over twenty books during his lifetime, and a treatise on optics appeared after his death. He began with the stated objective of examining the latest ideas in natural philosophy to see what their impact on Catholic theology might be and to show that, if properly understood, they did not threaten religion. As he continued to write and publish, he put more emphasis on science itself, but never forgot his purpose in studying it.

His first work, *Quaestiones Celeberrimae in Genesim* (1623; Well-known questions on Genesis), was written as a commentary on the book of Genesis in which he interspersed the text with an examination of a number of current ideas troubling religion. He dealt with atheism by providing thirty-five "proofs" of the existence of God. He also defended religious miracles against an attack by the Renaissance naturalist Julius Caesar Vanini, who had been executed as an atheist in Toulouse in 1619, by underscoring the limitations of scientific explanations. In the third part of the work, given the separate title *Observationes*, he pointed out flaws in Hermetic and magical accounts of natural phenomena. In the middle section, he addressed scientific questions such as whether the earth moves, or whether the heavenly spheres are solid, and gave a description of magnetism, drawing on the *De Magnete* (On

the magnet) of the English physician William Gilbert (1544–1603).

His next work, *L'impiété des déistes . . .* (1624; The impiety of deists), developed some of these criticisms further. He then turned to a consideration of the nature of scientific theories in *La vérité des sciences . . .* (1625; The truth of the sciences), concluding that we cannot know their truth and that we must settle for "mitigated skepticism" or a science of probabilities.

In the 1630s Mersenne published several works in which he advocated treating nature quantitatively and analyzing it mathematically. In these works he reported on the latest developments in science. He also demonstrated his admiration for the work of Galileo by publishing in 1634 a French paraphrase of an early manuscript of Galileo's on mechanics. In *Questions théologiques, physiques, morales et mathématiques* (Theological, physical, moral, and mathematical questions), he summarized Galileo's arguments for the motion of the earth from *The Two Chief World Systems*, the work that resulted in Galileo's condemnation by the Inquisition, although he was careful to remove the arguments from a copy he gave a friend to carry to Rome. He did include the Inquisition's sentence against Galileo. He also published a French version of Galileo's *Two New Sciences*, his major contribution to physics.

One of the sciences that interested Mersenne was music. Medieval scholars had considered it a form of mathematics, and Mersenne accepted that designation. He discussed music in several of his publications, but especially in his *Harmonie universelle . . .* (1635–1636), in which he described the musical instruments of his day and how they were played, analyzing musical theory and harmony, and developing his own musical philosophy.

In the 1640s he concentrated more directly on the physical sciences, such as ballistics, hydraulics, pneumatics, mechanics, and the recent work on air pressure.

Satisfied that he had helped to remove obstacles to further research, Mersenne believed that science was progressing along a path that would not clash with religion.

MESMER, FRANZ ANTON (1734–1815), German physician. Mesmer was born in the village of Iznang in Swabia (a region in southwest Germany) to Catholic parents. His father worked for the archbishop of Constance and his mother was a locksmith's daughter. As a youth Mesmer attended a local monastic school. He later studied at the Jesuit University of Dillengen in Bavaria and the University of Ingolstadt before entering the University of Vienna in 1759. He was awarded the M.D. degree in 1766, with a doctoral thesis entitled *Dissertatio Physico-medica de Planetarium Influxu* (Physical-medical dissertation on the influence of the planets). Influenced by the English physician Richard Mead (1673–1754), Mesmer asserted the existence of “animal magnetism,” a subtle fluid that permeated the cosmos and whose balance or imbalance in the human body was a primary determinant of health or disease. Using magnets and other means, he thought he could manipulate the flow of animal magnetism and relieve the “obstructions” he believed responsible for diverse ills.

In 1768 Mesmer married a wealthy widow, Maria Anna von Posch, whose financial support enabled him to establish a successful medical practice in Vienna. A music lover, he entertained leading musicians, including Wolfgang Amadeus Mozart (1756–1791) and Franz Joseph Haydn (1732–1809). (Mozart included mesmerist elements in his opera *Così fan tutte*.) Named a member of the Academy of Sciences in Munich in 1775, he aroused the antipathy of his fellow physicians in Vienna with his elaborately staged and publicized cures.

In 1778 Mesmer left Vienna for Paris, where his commanding personality and unorthodox therapeutic practices earned him notoriety. His therapy came to focus on assembling patients around a tub filled with magnetic fluid that was transmitted to their bodies through movable iron rods and their own interlaced thumbs and fingers. Dressed in a lilac robe or similar extravagant attire, Mesmer himself facilitated the flow of fluid with motions of his eyes and hands or by playing a glass harmonica, an instrument said to be of his invention. Cures were complete when a “crisis,” often accompanied by convulsions, restored the harmony of the body with cosmic influences. With these techniques he gained special acclaim for curing the nervous disorder known as the “vapors.”

Although lionized by the public, Mesmer ran afoul of medical and scientific authority. In 1784 a royal commission of eminent scientists judged his claim to have discovered a new physical fluid unfounded. He then left France and traveled widely before settling in Switzerland and withdrawing from public life. He died in Meersburg, Swabia, in 1815.

To spread Mesmer's ideas and practices, his disciples founded the Society of Universal Harmony in Paris with affiliates throughout the country. Especially notable were the activities of a wealthy aristocrat, A. M. J. de Chastenot de Puységur, who developed the healing technique known as “magnetic sleep” or “mesmeric somnambulism,” later termed “hypnosis.” Animal magnetism and somnambulism were the subjects of a voluminous literature well into the nineteenth century.

Sometimes dismissed as a charlatan, Mesmer has also been credited with anticipating the insights of depth psychology and exerting long-term influence on the development of dynamic psychiatry.

MESSIANISM, JEWISH. The hope for national redemption from exile and the ultimate reinstatement of Jewish self-government under a messianic (from the Hebrew for ‘anointed’) king descended from the House of David was an integral and unquestioned element of early modern Judaism. The Messiah was read into biblical texts like Jeremiah 36, referred to often in the Talmud, and rehearsed daily in the liturgy.

HISTORICAL CONTEXT FROM THE LATE FIFTEENTH CENTURY

Events encouraged speculation about an imminent end of days and moved dreams of redemption to the forefront of Jewish thought. Great wars in Europe, the breakdown of Christian unity with the Reformation, and even the discovery of the New World were all seen as part of a final apocalypse. The relentless Ottoman expansion against Christendom, and especially the fall of Constantinople to the Turks in 1453, were understood as the realization of the biblically predicted wars of Gog and Magog (Ezekiel 38, 39). When the Turks conquered the land of Israel in 1516, and Jews found it possible to travel to, and settle in, their ancient homeland once again, God’s imminent redemption seemed clear.

Messianic predictions also provided a form of theodicy: contemporary tragedies like the massive expulsion from Spain in 1492 were the necessary preparation for imminent redemption. Even mainstream figures engaged in these predictions. Despite strong Talmudic condemnation of those who calculated the time of the redemption, the Spanish-Portuguese financier, diplomat, and scholar, Don Isaac Abravanel, wrote no fewer than three tracts devoted to this subject (1496–1498). He rejected the warning that his predictions, if they proved wrong, could lead to even greater despair. At a time of great suffering he was offering solace. “God will not abandon His people,” he declared in the introduction to his *Wellsprings of Salvation*. “The day of the Lord who chooses Jerusalem is close at hand.”

APOCALYPTIC, PIETIST, MAGICAL, AND MYSTICAL MESSIANISMS

Indicative of the spirit of the time was the popularity of the seventh-century *Book of Zerubavel* with its apocalyptic visions of great wars over Jerusalem, a preliminary Messiah from the tribe of Ephraim son of Joseph, and another, ultimately victorious Messiah from the House of David. Often recopied in manuscript, the book was among the earliest Hebrew works to be printed (Constantinople, 1519).

Messianic preachers also struck a powerful chord. From 1500 to 1502, for example, Asher Lemlein raised great enthusiasm throughout north-eastern Italy and Germany when he predicted the Messiah’s imminent arrival and called for repentance and acts of self-flagellation.

Several decades earlier, kabbalistically (mystically) oriented messianic enthusiasts in Spain responded to mounting religious pressures by seeking to use magic to tame the forces of evil (including oppressive Christianity) and turn them to good. This kabbalistic circle is known for its major literary expression, *Sefer ha-Meshiv* (a book of divine “responses” and eschatological revelations). Its vision of an ultimate struggle against evil was popularized in tales about Rabbi Joseph della Reina, who was said to have brought down Satan but tragically failed to control the monster and thus delayed redemption.

The Spanish cabalist Abraham ben Eliezer ha-Levi may have been part of this circle. After the 1492 expulsion and especially after the Ottoman conquest of the land of Israel, he was a leading figure in a group of messianists in Jerusalem. Because they believed that the Messiah’s coming was imminent, they began instituting special prayers and vigils to alleviate the “birth pangs” of the Messiah.

THE LOST TRIBES

Travelers’ reports of isolated Jewish tribes also served to raise messianic expectations. These were assumed to be members of the ten Israelite tribes exiled in 722 B.C.E. and preserved ever since beyond a raging river, the Sambatyon. Possibly influenced by Christian tales about the secret kingdom of Prester John, Jews imagined these brave and fierce warriors now about to come to the rescue of their oppressed brethren.

Possibly himself an Ethiopian Falasha, David Reuveni (died c. 1538) gradually made his way from Egypt and the land of Israel to western Europe, where he met with Pope Clement VII in Rome (1524) and with King John III of Portugal (1525–1527). Claiming to be the brother and messenger of the king of the tribe of Reuben (hence his name), Reuveni pressed for treaties with European rulers and supplies of arms for a common war against the Turk. Reuveni's reception among Jews was mixed: some accepted his self-presentation at face value and tried to aid him; others considered him a dangerous charlatan and strove to discredit him.

CONVERSOS

Reuveni had an especially powerful effect on the Portuguese *conversos* (Christians of Jewish descent, many of whom secretly practiced Jewish rites even after their forced conversion to Christianity in 1497). The young Diogo Pires, secretary to the Portuguese royal council, was inspired by his tales, circumcised himself, and openly reverted to the Judaism of his ancestors, adopting the name Solomon Molcho. Forced to flee Portugal, Molcho traveled through Italy and the Ottoman Empire, studying cabala, preaching about the redemption, and eventually declaring himself the Messiah. After gaining considerable support from leading rabbinic thinkers of the time, Molcho was eventually reunited with Reuveni in Italy. Arrested by Emperor Charles V, Molcho was burned at the stake as a heretic in Mantua (1532); Reuveni probably suffered a similar fate in Spain a few years later.

Messianic hopes remained powerful among *conversos*, who understood their suffering at the hands of the Inquisition as part of a redemptive plan and incorporated certain Christian notions of the Messiah into their own, increasingly syncretistic, religious beliefs. This would be especially important in the later seventeenth century when former *conversos* would provide much of the theological background for the Sabbatean movement that began in 1665, the most important messianic movement since classical times.

SCHOLARLY TRENDS

Historians see Jewish messianism in the early modern period as more than a response to national suffering. It was a central motif in Jewish religious thought, open to substantially different interpreta-

tions by each writer. Scholars now focus on the religious, and especially mystical, dimensions of messianism.

Gershom Scholem accepted the link between the Sephardic (Iberian Jewish) experience and early modern messianism, though he argued that the sense of overwhelming catastrophe engendered by the expulsions was transmuted into a new form of cabalistic thinking linked especially to Isaac Luria (1534–1572) and the brilliant constellation of thinkers who gathered in Safed. According to Scholem, Lurianic Cabala, which assigned to the Messiah the task of redeeming not just exiled Israel but the world itself, became the basis of a new, mystical theology that influenced Jewish thinkers everywhere and eventually led to Sabbateanism.

More recent scholars have emended Scholem's once-dominant thesis, pointing to possible influence from contemporary Christian eschatological rhetoric (Ruderman), questioning the necessary link between historical crisis and theology, and suggesting that Lurianic thought was far less pervasive than had been claimed (Idel). The distinction made by Gerson Cohen between activist and quietistic forms of messianism (the former associated with Sephardic, and the latter with Ashkenazic, or central European, Jews) has been replaced by more nuanced categories that can no longer be associated with specific ethnic subgroups.

METHODISM. Methodism began as a movement in eighteenth-century England, part of the larger Protestant evangelical revival that endeavored to bring spiritual renewal to the nation and the Church of England and to increase the effectiveness of the church's ministry, especially to the poor. The term "Methodist" was applied about 1729 to a small group of students at Oxford University who devoted themselves to a strict method of study and religious practice. While the members of this group referred to themselves as the Holy Club, other university students and leaders reproachfully labeled them Methodists. The three principal figures in the origin and development of Methodism were members of the Holy Club, John Wesley (1703–1791), an Anglican clergyman who became its leader; his younger brother Charles Wesley (1707–1788); and George Whitefield (1714–1770).

Charles Wesley and Whitefield also became ordained clergymen in the Church of England. The Wesleys and Whitefield not only accepted the tradition and doctrines of Anglicanism, they also advocated an evangelical experience of conversion, notably in their preaching. Rather than settling into parish assignments, they engaged in an itinerant ministry, preaching in various churches when permitted but also speaking in private homes and in the open air at marketplaces, mines, and in fields.

BELIEFS AND PRACTICES

The Methodism of the Wesleys differed theologically from that of Whitefield at one main point. Whitefield advocated a form of Calvinism that held that, due to the blight of original sin, humans have no free will. Salvation is limited to those predestined or unconditionally elected by God to receive divine

favor. The Wesleys, who identified with the teachings of the Dutch theologian Jacob Harmensen (Jacobus Arminius, 1560–1609), claimed that God's grace is universal. It is available to all people, freeing them to respond to God's offer of forgiveness and reconciliation. Whitefield's brand of Methodism was particularly popular in Wales and gained substantial support from the preaching of Howell Harris (1714–1773) and the financial assistance of Selina Hastings (1707–1791), the countess of Huntingdon. The emphasis of the Wesleys on the universalism of divine grace had a wide appeal and resulted in larger numbers for their brand of Methodism.

The main doctrinal emphases of Wesleyan Methodism included the seriousness of human sin and its dire consequences; preventing (or prevenient) grace, which frees the human will; justification of the sinner by faith in God's grace; the experience of divine pardon in spiritual new birth; personal assurance of being in God's favor; and sanctification or holy living. The Wesleys believed that holy living is both personal and social. In addition the goal of the Christian life is loving God with all that one is and has and loving one's neighbor as oneself. These emphases are delineated in John Wesley's sermons and other writings as well as in the approximately nine thousand hymns written by his brother Charles.

Worship and the sacraments were important to Methodism from its beginning. Both of the Wesleys appreciated the formal liturgical worship of the Anglican Book of Common Prayer. However, they also encouraged less-formal worship in Methodist meetings. The Sacraments of baptism and Holy Communion were accepted as means by which God's grace is conveyed to the recipient. Wesleyan Methodism also stressed Bible reading, prayer, and fasting. From the Moravians they adapted a love feast for special occasions, at which the members served each other bread and water as a sign of Christian affection and fellowship.

ORGANIZATION AND TACTICS

Unlike Whitefield, the Wesleys effectively organized their followers. John Wesley, a skillful organizer, arranged the Methodist people into societies that met regularly for worship and Christian fellowship. Since Methodism was intended to revitalize the Anglican Church, not to supercede it, Methodists were

expected to attend society meetings as well as the services of their local Anglican parish churches. Each society was divided into subgroups of about twelve people, called classes, that met weekly for spiritual encouragement under the direction of class leaders. Society and class membership was guided by a set of General Rules for moral living devised by Wesley.

As Methodism grew across England, Scotland, and Ireland, John Wesley engaged laypeople to meet with the societies, preach in their meetings, provide pastoral care, and administer the General Rules. Since the lay preachers were not ordained, they were not permitted to administer the Sacraments. Lay leadership facilitated the movement's growth. In June 1744 the Wesleys met in London with four Anglican clergy sympathetic to the Methodist movement and four lay preachers, a gathering that evolved into an annual conference of the movement's leaders. At these important annual meetings the preachers discussed theological issues, deliberated business, mapped strategy, and received preaching assignments for the ensuing year. During John Wesley's lifetime the annual conference advised him but did not override his authority in governing the movement.

Methodists acquired buildings for their gatherings as membership increased. In 1739 John Wesley purchased an abandoned cannon factory in London that he renovated for worship and called the Foundery. Other chapels and meeting places, including the celebrated New Room constructed in Bristol in 1739, were purchased or built for Methodist gatherings. In 1768 Wesley formulated a Model Deed designed to govern the use of Methodist chapels and buildings and to protect them from what he considered erroneous doctrine.

The Wesleys and their followers encountered verbal abuse and physical persecution. Their opponents, both laypeople and Anglican clergy, complained about their insistence on an evangelical conversion; their criticism of some forms of public entertainment; "irregular" practices, such as allowing laypeople to preach; and holding worship in the open air. Persecution was especially severe in the 1740s but declined significantly in the decades that followed.

When John Wesley's overtures to Anglican bishops to ordain some of his lay preachers for work in America were refused, he ordained two of them in 1784, dispatched them to the United States, and authorized them to form a Methodist church. During Wesley's lifetime this was the only Methodist church he sanctioned. In the decades following his death, other Methodist churches were formed by his followers in Great Britain.

John Wesley and the Methodists adopted forceful positions on many social questions. They opposed slavery, offered assistance to the poor, ministered in prisons, promoted medical treatment and healthy living, fostered education, and criticized violence and war. Although some historians claimed that Methodism kept Britain from sliding into a form of revolution that engulfed Europe, this thesis is widely disputed. Nevertheless, Methodism was quite influential in British life in the eighteenth century and beyond.

MEXICO CITY. Mexico City was in many ways the quintessential city of the early modern period. While many cities in the Valley of Mexico had existed for several centuries prior to the arrival of the Spaniards in 1519, Mexico City was relatively young, having been founded in 1325. It was originally a swampy safe haven for the Mexica people,

popularly known as the Aztecs. Locating in the middle of the lake that filled the Valley of Mexico, the Mexica used land-reclamation techniques to convert this swampy area into a city of nearly a quarter million inhabitants by the time of the conquest. They called their city Tenochtitlán. Over the course of time a twin city, Tlatelolco, developed to the north and was home of the merchants who served as the commercial “glue” of the Mexica empire.

Mexico City fell to the Spanish on 13 August 1521. Hernán Cortés (1485–1547) ordered the site abandoned and built his capital several miles south in the town of Coyoacán. Nevertheless, the old site continued to attract both native peoples and Spaniards, and construction of a city began there. Finally, in 1524, Cortés recognized the old city as

the new capital, giving it the name Mexico-Tenochtitlán.

Mexico City then entered into a period of development as a hybrid city. The city took on a grid pattern of streets radiating off of a large central plaza. The cathedral, royal palace, and offices of the municipal government surrounded the central plaza, which was eventually called the *Zócalo*. The Spanish district of the city radiated out some ten blocks from the plaza. This part of the city came to be known as the *traza*. Beyond the *traza* was the Indian city. Spanish colonial law mandated a separate but equal political organization for the native peoples. They were largely self-governing but were subject to Spanish royal law. They were physically segregated, living in their own neighborhoods outside of the *traza*. The native peoples were required

to provide labor service to the Spanish colonists, yet they also engaged in their own activities, including farming, craft production, and transport of goods.

Mexico City was the first significant place where peoples from four continents created a single city. The Spanish conquerors brought Africans, both slave and free, along with them. It has been estimated that as much as half of the city's population consisted of African slaves. The sixteenth century saw the arrival of Asians to the city, initially from the Spanish colony of the Philippines, but eventually from China, Japan, and Korea. Like the Africans, Asians tended to provide household service to the Spanish, but they also found a niche in the ceramic and textile industries.

The city had been founded on a lake. Its symbiotic relationship with the lake formed much of the city's early identity. As more of the lakeshore was reclaimed, the threat of flooding became continual. By the end of the sixteenth century seasonal flooding inundated the city. In the early seventeenth century the royal government constructed a massive drainage canal to remove the water from the lake and drain it into a nearby river system.

Mexico City was the cultural, religious, political, and cultural capital of New Spain, which was Spain's name for the colony. Within the *traza*, wealthy Spaniards jockeyed for preeminence in building their palaces. Religious orders staked out sumptuous and imposing buildings, thereby claiming their presence in the city. The Inquisition, the Pontifical and Royal University, and many other civil organizations built equally impressive edifices. The *traza* could no longer hold the Spanish population, and it began to spill out along the well-established causeways and avenues that radiated off of the central plaza. In the early seventeenth century the viceroy decreed the creation of a large public garden, known as the Alameda.

During the eighteenth century, Mexico City saw dramatic changes. The city grew rapidly, building principally to the south and west, as vast areas of dry lakebed were reclaimed. Wealth resulting from increased mining activity and commerce poured into the city, prompting a building boom. Rich miners, merchants, and newly titled nobles built palatial mansions. The religious orders also constructed opulent churches and convents. The city

more completely eclipsed all the regional capitals as the leading metropolis of the colony. By the end of the century, Mexico City was unquestionably the largest and most opulent city of the region, if not the hemisphere.

JOHN F. SCHWALLER

MICHAEL ROMANOV (RUSSIA) (1596–1645; ruled 1613–1645), tsar of Russia. Michael Fedorovich Romanov came to the throne in 1613 as the solution to the dynastic crisis of the Time of Troubles. The son of the important boyar Fedor Nikitich Romanov, whom Boris Godunov exiled in 1600, Michael was only sixteen when the Assembly of the Land chose him as tsar on 21 February 1613. Michael, as grandson of the brother of Ivan the Terrible's first wife, had a tenuous link to the older dynasty, but he was primarily the choice of the boyar clans still in Moscow, the church, the Cossacks, and the townspeople. His father, tonsured in 1601 with the monastic name Filaret, was in prison in Poland in the early years of the reign, so the dominant force at court was at first his mother, the nun Marfa (born Kseniia Shestova, tonsured in 1600), who relied on the boyars B. M. and M. M. Saltykov as well as others. In those years the new regime secured peace with Sweden (Stolbovo, 1617) and Poland (Deulino, 1618), losing some border territory but reestablishing control over the remainder.

In 1619 the return of Filaret and his selection as patriarch of Moscow brought a powerful figure to the court. Filaret dominated his son and was the main advocate of a war of revenge against Poland. The result was the Smolensk war of 1632–1634, in part the result of Swedish prompting, as Gustavus II Adolphus hoped to secure his rear in Poland while he intervened in the Thirty Years' War. The Russian army, including many European mercenary regi-

ments, laid siege to Smolensk but were unable to take the city and had to surrender to the Polish army of relief under King Władysław IV. Filaret's death (October 1633) hastened the end. The Russian commander M. B. Shein was executed as a scapegoat, and the two sides made peace in 1634. Russia gained only insignificant border points and Władysław's renunciation of the Russian throne.

The last decade of the reign saw a fundamental change in Russian policy. The primary effort went toward a rapprochement with Poland, and as a corollary, a similar approach was taken toward Denmark. Long negotiations with Christian IV over the marriage of Michael's eldest daughter Irina to Prince Valdemar of Denmark came to an impasse over the insistence of the Russian church that he convert to Orthodoxy. The issue was unresolved at Michael's death and then abandoned. The main purpose of friendship with Poland was to allow Russia to concentrate its resources against the Ottomans and their Crimean vassals. Michael inaugurated a vast program of construction of defensive works on the southern frontier, including blockhouses, forts, Cossack settlements, and other obstacles to prevent Tatar raids. He did not, however, want to engage the Ottomans themselves, and so ordered the Don Cossacks in 1642 to return the recently captured fortress of Azov at the mouth of the Don to the Turks.

Much less is known about the politics behind Michael's internal policies. His government restored the institutions and societal structures shattered during the Time of Troubles. The boyar clans dominant before that time returned to power, and the newfound influence of the Cossacks and other lower orders gradually dissipated. Filaret took seriously his duties as patriarch and managed to rebuild the shattered institutions of the church. His attitudes toward religious culture were contradictory, for he pursued a policy of restricting contacts with the Orthodox of Poland, while simultaneously encouraging the importation of most Ukrainian religious texts into Russia. In the meantime, discontent with traditional devotional and liturgical practices grew among the clergy, a development that would lead to major conflict after Michael's death.

In these years Russia tried to recover its trade links with the Dutch and English, while trying to

avoid giving them too extensive commercial privileges. Commercial relations with Sweden flourished, and merchants from Novgorod and Pskov even began to visit Stockholm. These years also saw the beginning of a long demographic boom that lasted into the twentieth century. In the short run it was crucial to the restoration of agriculture.

Michael was married twice, briefly to princess Maria Vladimirovna Dolgorukaia (1624) and then to Evdokiia Luk'ianovna Streshneva (1626), who bore his heir, Tsar Alexis I Mikhailovich, and eight other children. A devout and apparently traditional Russian noblewoman, her political role seems to have been minor. Michael founded the Romanov dynasty that ruled Russia until 1917. Unfortunately, his reign is one of the least studied periods of Russian history.

PAUL BUSHKOVITCH

MICHELANGELO BUONARROTI (born Michelangelo di Lodovico Buonarroti Simoni, 1475–1564), Italian sculptor, painter, architect, and poet. Michelangelo achieved such renown in his lifetime that he was celebrated as *Il Divino*, the 'Divine One'. In five hundred years, his fame has scarcely diminished. Michelangelo is universally recognized as one of the greatest artists of all time. He established new and still unsurpassed standards of excellence in all fields of visual creativity—sculpture, painting, architecture—and was, in addition, an accomplished poet. Along with Dante and Shakespeare, Mozart, and Beethoven, he stands as one of the giants of Western civilization.

Michelangelo's career spanned from the final years of Lorenzo de' Medici's Florence to the first

stirrings of the Counter-Reformation. He outlived thirteen popes and worked for nine of them. Although his art occasionally was criticized (he was accused of impropriety in the *Last Judgment*), Michelangelo's influence and reputation have always been acknowledged. Many of his works—including the *Pietà*, *David*, *Moses*, and the Sistine Chapel ceiling—are ubiquitous cultural icons. Despite the familiarity of Michelangelo's art, the large quantity of primary documentation (more than any previous artist), and a voluminous secondary literature, many aspects of Michelangelo's art and life remain open to interpretation.

In contrast to the romantic conception of the artist as lone genius, contemporary scholars tend to view Michelangelo in a broad historical and social context. In Italy and throughout European civilization, the family was fundamental to self-definition; a family's status established an individual's status. Michelangelo was one of just a handful of Renaissance artists, including Filippo Brunelleschi, Donatello, and Leon Battista Alberti, who were born into patrician families. It was not unreasonable, therefore, that Michelangelo's father resisted his son's artistic inclinations; the boy should have aspired to a more elevated profession, to political office, and to a socially advantageous marriage. The tension between his patrician birth and his fundamentally manual profession occasionally caused Michelangelo to experience doubt about his art (best expressed in his poetry), and to encounter conflict with his patrons.

Michelangelo's father was a distant cousin and contemporary of the great Renaissance Maecenas Lorenzo de' Medici (1449–1492). It was probably thanks to this familial relation that Michelangelo spent approximately two years in the Medici household, where he received the beginnings of a humanistic education alongside two of his future Medici patrons, Giovanni (Pope Leo X, reigned 1513–1521) and Giulio (Pope Clement VII, reigned 1523–1534). The Medici were especially important to Michelangelo's early career, providing him with commissions, opportunities, and letters of introduction that permitted the young man to pursue an untraditional course independent of the guild system and the highly competitive artisan profession. Rather, he lived on the basis of comparatively few commissions, obtained by means of skillfully navi-

gating in a dense web of family, friendship, and patronage ties.

Appropriately for a family with social pretensions, Michelangelo was tutored by a grammarian and learned a modicum of Latin, a good hand, and how to write a proper letter. His penmanship was neat and regular, his orthography and grammar more self-consciously correct than that of many of his contemporaries. The sheer volume of Michelangelo's correspondence—more than 1,400 letters to and from the artist—distinguishes him from most artists of the early modern period. He took care in composing letters, often writing multiple drafts, and the very fact that he preserved his correspondence was characteristic of a member of the literate patrician class.

Even more important are Michelangelo's considerable labors as a poet. In the entire history of art, only William Blake has made a comparable contribution to both the poetic and visual arts. Michelangelo's poetry ranks among the greatest literary creations of the Renaissance, distinguishing him from most artists and many fellow patricians.

Michelangelo proudly declared that his family had paid taxes in Florence for three hundred years, thereby placing them among an elite group of "good families." The Buonarroti traced their citizenship back to the priorate of 1343, and in 1508 they had six members eligible for election to the Florentine government. But even more than the prestige of public office, wealth was the most certain measure of status, and property was the principal measure of wealth. Shortly after his commission to design the tomb of Pope Julius II (1505), Michelangelo began purchasing property in and around Florence. In addition to rental income, these various farm properties provided Michelangelo and his family with most of their basic needs, including grain, oil, wine, eggs, and firewood. By his death at the age of eighty-nine, Michelangelo was a millionaire; however, despite his affluence, he lived modestly, for he was, like his contemporaries, perpetually wary of gossip.

Wealth opened the door to a good marriage, which was an important means of securing long-lasting social status. Of course, Michelangelo never married, but his brother Buonarroto married into the patrician Della Casa family. The children of this

union also made good matches: Lionardo married into the Ridolfi family, and in 1537 Michelangelo's niece, Francesca, married Michele Guicciardini, scion of one of the oldest and most illustrious Florentine families. Michelangelo was preoccupied with the prestige and propagation of his family, which survived until the mid-nineteenth century.

Central to Michelangelo's self-perception and lifelong ambition was his firm belief that he was from a noble family who traced an ancient lineage from the famous counts of Canossa. It is scarcely important that we now doubt Michelangelo's claim; it was firmly believed by the artist and his contemporaries. His proud ancestry was affirmed in the opening lines of the biography written by his friend and pupil Ascanio Condivi: "Michelangelo Buonarroti . . . traced his origin from the counts of Canossa, noble and illustrious family of the territory of Reggio. . . ." After 1526 he stopped signing his name as "Michelangelo sculptore" and instead in-

sisted on using his full family name, the "nome della casa."

From early in his career, Michelangelo's art was a privileged commodity made for a few select persons. Michelangelo's relations with his patrons were, for the most part, extensions of a well-established network of social bonds founded on favor, friendship, and family relations. Therefore, he was particularly sensitive about being treated like an artisan, and he adamantly denied ever running a traditional workshop (*bottega*): "I was never a painter or sculptor like those who run workshops," he wrote to his nephew Lionardo in 1548. Reminding Lionardo of the family's illustrious history, Michelangelo advised his young nephew that he did not provide the products and services typical of such establishments. Rather, his career is marked by a series of unique objects that are never repeated and scarcely imitable: *Bacchus* (1496), *Pietà* (1497–1499), *David* (1501–1504), the Sistine Chapel ceiling (1508–1512), *Last Judgment* (1534–1541), the tomb of Julius II (1505–1545), and St. Peter's (1546–).

Like Leonardo da Vinci before him, Michelangelo attempted to maintain a life as a sort of artist-courtier where mutually beneficial and reciprocal relations blurred the distinction between artist and patron, between professional and personal obligations. In his final years, Michelangelo considered it unseemly to be paid a daily wage for his work at St. Peter's. Instead, he accepted remuneration as a favor from the pope, mostly in the form of lucrative prebends.

Michelangelo's concerns with family and lineage coincided with a pan-European preoccupation with the true nature of nobility. His desire for wealth, landed security, and social status place Michelangelo squarely in a contemporary milieu, sharing the most cherished values of his fellow citizens. At the same time, these concerns distinguish him from most of his fellow artists, few of whom could claim noble birth, a coat of arms, or even a proper family name.

Michelangelo's claim to noble birth—about which he was most adamant—is precisely the part of his biography that we treat as a fantastic delusion or myth, whereas we willingly subscribe to the literary fiction about the artist's early life and predestined

rise to fame. The tale of Michelangelo's genius is a convenient means of explaining his accomplishments. Otherwise, we are left trying to understand how and why this aristocrat became an artist, and how he created his greatest works. Indeed, it is the very magnitude of those accomplishments that tends to cast his aristocratic persona in the shade. More than any previous artist, Michelangelo's success as both an artisan and aristocrat was instrumental in advancing the social status of his profession, from craftsman to genius, from artisan to gentleman. In the words of his admiring contemporary Pietro Aretino: "The world has many kings and only one Michelangelo."

MIDWIVES. Almost every baby born in early modern Europe was delivered by a midwife. Childbirth was a female ritual into which men entered only in emergencies. An expectant mother invited female friends, relatives, and neighbors to attend her in childbirth. During the long hours of labor, these "gossips" supported the mother emotionally and physically, propping her up as directed by the midwife. They prayed and prepared special foods, kept the fire stoked, and performed all other necessary tasks. Historians have pointed out, however, that single or poor women may have experienced the attendance of gossips as discipline rather than encouragement. In the eighteenth century some well-to-do women began to choose male midwives, but such remained a minute fraction of all births.

Midwives ranged greatly in training, styles of practice, and expertise. Some women delivered a few babies based upon their experiences as gossips, never considering midwifery as their primary roles. Others were very skilled. Sarah Stone (c. 1730), for example, a midwife who practiced in the west of England in the early eighteenth century, functioned as a consultant midwife. She was called into a number of births when a midwife was having trouble, and her complaints about the ignorance of country midwives sound much like those of some of her male surgical colleagues.

The regulation of midwifery varied considerably across Europe. Informally all midwives were regulated by local reputation. Louise Bourgeois (1564–1636), midwife to the queen of France in the early seventeenth century, counseled her midwife daughter never to permit women to deliver in her home lest people think she was encouraging vice by allowing unwed mothers to give birth clandestinely. In England, where midwifery practice was only lightly regulated, a midwife might choose to take out a bishop's license. To obtain such she needed testimony from local respectable matrons about her skills and moral worth. Midwives' religious practices were closely policed. If a baby were born who might not survive, the midwife was often empowered to perform an emergency baptism. Many men feared the magical connotations of reproduction and childbirth, and midwives were sometimes thought to provide abortifacients and to practice magic, another reason for governing midwives' orthodoxy.

MIDDLE AGES, LATE. *See* Late Middle Ages.

Civic authorities were also keen to regulate midwives, since midwives provided evidence in cases of rape or suspicious pregnancy and asked unwed mothers in labor about the identities of the fathers. In 1452 the German city of Regensburg set up the first system of municipal regulation of midwives. These women had to satisfy the authorities about their religious orthodoxy and pass an exam set by a panel of physicians, surgeons, and midwives. It was assumed by the authorities that these women were literate and skilled.

The history of midwifery has echoed other concerns. Early histories of midwifery, often written by obstetricians, discussed the bad old days before the advent of the modern specialty and portrayed midwives as ignorant and superstitious. Women's historians have begun to consider a more balanced view of midwives, outlining their variety and integrating their practices into larger frameworks of gender relations and women's work.

MILAN. Milan and the rich agricultural district around it have constituted an important economic pole of Europe since the late Roman Empire. The rich agricultural plain in which Milan sits is irrigated

by summer rains, and glacial runoff from the Alps feeds rivers that are complemented by a network of navigable canals. Wealthy Milan instigated resistance against the Holy Roman emperors in the Middle Ages. Early in the fourteenth century, Milan's institutions were seized by the noble house of Visconti. Giangaleazzo Visconti (c. 1351–1402) added most of northern Italy to his dominions by 1400. With his death, the duchy shrank to include modern-day Lombardy, the Italian-speaking valleys in the Alps to the north, and the districts of Parma and Piacenza. The duchy passed to a Visconti son-in-law, Francesco Sforza, in 1447. Like those of his forebears, the duke's citadels kept subject cities in check, but his grip weakened nevertheless. A French royal marriage contracted to give legitimacy to the Visconti dynasty had the unintended consequence of providing King Louis XII (ruled 1498–1515) with a claim to the territory. Annexing the region to his kingdom in 1515, King Francis I (ruled 1515–1547) erected French-style institutions, such as the senate of sixty members invested with legislative and judicial powers, that operated with little royal interference. The imperial conquest of Milan in 1523 marked the onset of a new phase. Emperor Charles V (ruled 1519–1556) awarded Milan to his son Philip (and thereby to Spain) in 1540 but retained the ultimate authority over it as the Holy Roman emperor. Great projects of fortification around each of the cities and the permanent provision of Spanish garrisons removed the threat of new French invasions.

Politically, the territory was composed of nine city-states—Milan, Pavia, Lodi, Cremona, Como, Novara, Tortona, Alessandria, and Vigevano—each with its own autonomy and tax base. Considerable power was vested in both a landed aristocracy and a judicial and professional nobility living and practicing in the large cities. They were joined by new families residing in Milan, purchasing fiefs from the Spanish crown. Important political decisions were taken by the king in Spain, through his Council of Italy, and were dispatched to his representative, the governor of Milan. This Spanish governor ruled with a cluster of important officials in a secret council, dealing with justice, taxation, and provisioning; the commander of the citadel, the commanders of cavalry and artillery, and a handful of royal appointees were also members. Milanese and Lombards

comprised almost half of this personnel. From Milan, the Spanish governor could forestall any menacing activity by France or by Italian princes in northern Italy. The governors of Milan were often asked to arbitrate border disputes between states, to better reinforce Spanish influence. The governor enjoyed great leeway to prepare for war or cultivate alliances in the peninsula. Milan was the terminus of several strategic routes protecting the Spanish empire; one avenue led from Spain via water to Finale Liguria and Genoa; another coastal route connected Naples and Sicily with northern Italy. Finally, Milan was the staging area for troops destined for the Spanish Netherlands, who marched north through Savoy or Swiss Alpine valleys to Alsace and the Rhine Valley.

Wealth and population bolstered the strategic interest of the duchy. Milan's population reached 120,000 inhabitants in 1600, with about a million people in the duchy overall. Milan produced silks, fine woolens, weapons and armor, and myriad other products besides. Cremona was a producer of cotton fabrics, while Como, Pavia, and Lodi had textile industries of their own, exporting their products beyond Italy. The rural plain of Lombardy was one of the most advanced agricultural districts anywhere in Europe. Milan was also an important center of religious direction. No single individual had as great an impact on the Catholic Reformation as Carlo Borromeo (1538–1584), the nephew of Pope Pius IV and cardinal and archbishop of Milan. King Philip II (ruled 1556–1598) nominated loyal notables to religious benefices, but he did not have access to the church money in Milan that he had in Spain. Madrid initially tried to stop the flow of ecclesiastical revenues toward Rome but was challenged by Borromeo. The Milanese rejected the importation of the Spanish Inquisition in 1563, but they embraced the papal version of the same tribunal. Several governors clashed with the church's representatives, but the Milanese clergy would not give way, and the Spanish government instructed its officials to respect papal exemptions. The multiplication of religious schools made the city one of the most literate in Europe, and it vied with Venice, Florence, and Rome for cultural primacy.

SEVENTEENTH-CENTURY CRISIS

As everywhere in Italy, the onset of the Thirty Years' War in 1618 abruptly ended the economic and political stability of Milan, which was strategic in shifting Spanish resources of men and money to the Austrian Habsburgs. Milan was threatened, however, by the Mantuan fortresses of Casale Monferrato and Mantua. When a French branch of the Gonzaga dynasty, which had ruled Mantua and its environs for centuries until 1627, inherited the duchy of Mantua, Spain mobilized to eject them from it in 1628–1630, with mixed success. War inflicted lasting damage on the manufacturing economy. Lucrative markets in Germany and France became inaccessible. Many urban workshops moved their low-skilled operations to the countryside. The more resistant silk industry found it difficult to compete with new international competitors, such as Lyon in France. Much of the raw silk produced by Lombard peasants and transformed into thread in local mills was sent to France to be worked there. The Lombard economy was already in trouble when the bubonic plague of 1630 struck the region. It killed half the population of the city and roughly a quarter of the population of northern Italy. The sudden decline in population took the buoyancy out of the rural economy. The Lombard agricultural economy recovered earlier than most others, thanks to rich resources for livestock and the fertility of the soil. Nevertheless, prices and living standards declined throughout the seventeenth century and beyond. Over several generations, the number of noble families in Milan and other towns was sharply reduced.

New French invasions after 1635 had remarkably little impact on Spanish domination, partly because Cardinals Richelieu and Mazarin treated Italy as a sideshow. Lombard city and peasant militias performed valuable services, as in the siege of Pavia in 1655. Spain enjoyed the ongoing support of Milanese elites and held on until the peace of 1659 with only a few thousand troops sent from home. Under Louis XIV (ruled 1643–1715), Italy receded from French policy objectives. Piedmont shielded Milan from a French attack in the War of Devolution (1667–1668) and the Dutch War (1672–1678). In the War of the League of Augsburg (1688–1697), which united Europe against the French king, Piedmont constituted the battle-

field in Italy, while Spanish Milan contributed troops to the common effort.

AUSTRIAN LOMBARDY

Between 1649 and 1659, imperial (Austrian Habsburg) troops sent to help Spain resist France began to take control of imperial fiefs in Lombardy. In 1690 an imperial army sent to fight France imposed Austrian claims on northern Italy. During the War of the Spanish Succession (1701–1713), the Austrian cause triumphed at the battle of Turin in 1706, and Austria replaced Spain as the ruling power in Lombardy. In 1707, in 1734, and again in 1748 substantial slices of the rich plain and the Alps were shifted to Piedmontese control as the duchy shrank to a wedge of central Lombardy. Initially, Vienna ruled the duchy through the same institutions as before, a viceregal governor and a special council for Italian territories. However, renewed Spanish efforts to recover the duchy almost succeeded twice, in the Wars of the Polish Succession (1733–1738) and of the Austrian Succession (1740–1748). To Empress Maria Theresa (1717–1780) it underscored the need to make Lombardy contribute more to the central government.

The Austrian solution was to create new administrative bodies that paid no attention to the concerns of local aristocrats. Vienna compiled an innovative land register on which to assess taxes, giving state officials instead of private businessmen the task of raising the money. Landowners' assemblies in the countryside reduced the jurisdiction of city nobles. By the 1780s Emperor Joseph II (ruled 1765–1790) abolished many of the former magistracies and guilds, replacing them with departments of Austrian ministries. Religious institutions managed by Lombard aristocrats were also closed down as the state asserted its control over charity and education. These measures were in large part prompted or applauded by Italian intellectuals gathered around Pietro Verri (1728–1797) and Cesare Beccaria (1738–1794) with their journal *Il Caffè*. With Venice, the city was the most active center of the Italian Enlightenment.

Milan never recovered the manufacturing rank in Europe that it had held before the Thirty Years' War and the outbreak of bubonic plague. Austrian manufacturing subsidies helped plant some new textile industries on the English model in the city,

but the vast rural industry springing up in the hinterland, across the modern provinces of Milan, Varese, and Como was more important to the future. The region's agriculture kept pace with the rising population—a massive conversion to maize and rice cultivation provided new staples—but autonomous peasants and sharecroppers were reduced to the status of landless day laborers. In 1796 Milan and its state still figured as a rich prize to French armies under Napoleon and was the logical place to create the capital of a new kingdom of Italy.

ARMIES: RECRUITMENT, ORGANIZATION, AND SOCIAL COMPOSITION

Military life in the period from 1450 to 1750 underwent, it has been argued, a process of “proletarianization.” If medieval conflict was the preserve of specialist warriors, drawn heavily from the upper ranks of society, the sixteenth and seventeenth centuries were, according to this argument, marked by war based on quantity rather than quality of soldiers. In practice, medieval armies drew on a more diverse range of troops than exclusive focus on the highly trained, mounted knight would imply, and they could count substantial forces of semi- or unskilled soldiers in their ranks. This greater diversity in medieval armies notwithstanding, it is nonetheless assumed that the composition of armies changed greatly from the later fifteenth century.

WHO WERE EARLY MODERN SOLDIERS?

What the Swiss pikemen and German *Landsknechte* who dominated the battlefields of the later fifteenth and early sixteenth centuries offered was a combination of group identity and cohesion, together with brute force deployed within a solid phalanx, thousands strong. A subsequent move toward infantry armed with handguns did not restore military specialism but encouraged still greater reliance upon unskilled recruits. In contrast to crossbows or longbows, an infantry arquebus or musket required no great skill, training, or physical strength to load or fire. As soldiers’ expertise was of minimal importance in putting a force into the field, it is assumed that contracts for mercenaries, a feature of the entire early modern period, were the obvious mechanism for recruitment. Early modern warfare was a seasonal affair, most campaigning taking place between April and October, while few wars before 1618 lasted longer than two or three consecutive campaigns. Hiring and firing mercenary forces thus appeared to make military and financial sense. Why

create an elaborate military infrastructure if the raw material of warfare was rapidly recruited, minimally trained, and destined for short service?

But handing over the recruitment of soldiers to profiteering officers operating under mercenary contracts rendered military service unattractive to all but desperate or marginal elements of society. Enlistment brought danger, poor working conditions, and irregular pay and supply—as much through the machinations of the officers as because of the inadequacy of state revenues. From this comes the pervasive myth that the early modern army was populated with the refuse of society. Recruitment was based on an unholy alliance between rapacious officers and local elites, who saw military service as a device to clear jails and round up vagrants and other marginal elements. Any genuine volunteers were debtors, criminals, or beggars, the rootless with no stake in established society, and they signed up for the lure of a modest recruitment bonus and hoped to desert as soon as possible. The violence of military life in the sixteenth and seventeenth centuries, both among soldiers and between soldiers and civilians, reflects this lowest-common-denominator recruitment. Mass disbanding as soon as a campaign neared its conclusion—or simply because the officers failed to provide basic wages, food, and drink—ensured that soldiers, who were little more than a temporary association of vagrants and criminals held in service by brutal discipline, were regularly tipped back into civilian society, exacerbating problems of law enforcement, local violence, and vagrancy.

An image that fueled so much popular literature and was entrenched in the rhetoric of the ruling classes is unlikely to have been based on pure fiction. There were plenty of cases where recruits were acquired via jails or roundups of vagrants. There were certainly officer-proprietors down to the end of the eighteenth century who were none too rigorous about the quality of their recruits and their relations with the civilian population. Levels of desertion from early modern armies were extraordinarily high: rates of 50 percent or more over a few weeks’ campaigning were not unusual. Hans Jacob Grimelshausen’s contemporary account of soldiering in the Thirty Years’ War, *Abenteuerlicher Simplicissimus* (1669; *Simplicissimus the vagabond*), paints a picture of soldiers who were indeed petty criminals but were themselves victims of the exploitation and

corruption of their officers and administrators. Yet this is not the entire story of early modern soldiers, and it fails to explain how military effectiveness was achieved, where recruits in these centuries were really drawn from, and how they related to civilian society.

The assumption that early modern warfare was simply a matter of mass recruitment, minimal training, and rapid turnover needs qualification. It never applied for mounted soldiers, for instance. Training a cavalry trooper to a decent level of military proficiency and horsemanship or finding recruits already possessing equestrian skills could not be neglected, and cavalry remained a major element in all early modern armies. But even within the pike square or other infantry formations, it was important to distinguish between the ordinary, mid-file ranker, who may indeed have required little training, and an experienced core of soldiers. The importance of experienced troops became even more significant with the development of more effective infantry firearms. It was the veterans who set the pace of firing, maintained cohesion between musketeers and pikemen, and followed instructions rapidly and efficiently. Thus military effectiveness depended on soldiers who would remain in service, and inducements were needed to reward them. The pay structure of early modern armies reflected the different levels of skill and experience between ordinary and veteran soldiers. An elite French unit in the 1630s would contain three categories of veteran below any official noncommissioned officer rank, whose skills and service were recognized with between 20 and 50 percent higher wages than those of the ordinary recruits. One good reason for reliance on mercenary proprietors was not that they could produce bulk levies of easily disposable troops, but that the best-connected of the “military enterprisers” controlled or had access to units with a higher proportion of experienced veterans than the majority of local nobles or even government administrators could achieve in any recruitment exercise.

What other inducements existed to draw soldiers into long-term service? One possibility would be enforcement through conscription. In states with a relatively small population and substantial military commitments—seventeenth-century Sweden being a good example—conscription of a proportion of the peasantry offered a means to build up a core of

career soldiers. At the price of deep resentment from the Swedish peasants on whom the lottery of conscription fell very heavily, the system provided good-quality, long-serving troops during the Thirty Years’ War. But across most of west central Europe, conscription was regarded with suspicion by rulers and ministers convinced that it generated poor-quality and unsuitable recruits, aggravating already substantial problems of desertion. And for much of the early modern period, they could rely on voluntary enlistment. Demographic pressure leading to polarization of economic resources was squeezing the peasants and artisans in these states, eroding their earning power and economic independence. Recruiting officers were by no means dependent upon the most marginal and criminal elements in society. Indeed the vast majority of recruits whose backgrounds can be established were drawn from ordinary peasant households or were semiskilled artisans who would have enjoyed modest status, if not formal citizenship, in the towns.

THE MILITARY EXPERIENCE

In comparison with the worsening economic climate outside, military life could offer some advantages. Basic wages were comparable with those of an unskilled artisan, while the pay of more experienced soldiers and noncommissioned officers was significantly above this level. Volunteers who enlisted for a fixed period would be bribed by a substantial bonus to stay in service for another term of duty. The main disadvantage for soldiers was that military wages were almost always in arrears. Paying outstanding wages, even assuming money was available to distribute, would remove a good means of keeping men in service, and meeting wages in full would inevitably bring days of alcohol-induced incapacity. When soldiers, and especially veterans like those in the Spanish Army of Flanders, could squeeze their arrears out of the military paymasters, they could end up with accumulated lump sums of 1,000 ducats or more, enough to establish themselves as substantial property-owning peasants. Moreover, unlike those of civilian populations, the wages earned by soldiers were not subject to tithe, seigniorial dues, or ever-increasing taxes imposed by the central state. Difficult to quantify were informal sources of revenue: plunder and booty from captured towns, ransoms of captured prisoners, and the informal tide of local extortion, pillage, and

theft practiced by soldiers when opportunity permitted. These were probably diminishing in significance, but especially in the period before 1650 they should not be neglected as a potential attraction to military service.

Men drawn from the ranks of the respectable if hard-pressed peasantry or established artisan classes in the towns had traditionally enjoyed a modest status within the local community and some small personal autonomy, and they were governed by codes of honor and association that could provide both social solidarity and a degree of protection from outside interference. As these became more difficult to sustain in the face of worsening economic pressures in civilian society, the perception of distinctive status and the strong degree of group identity and cohesion associated with long-term military service became increasingly attractive.

Soldiers were emphatically not at the bottom of the social hierarchy in the two centuries down to the end of the Thirty Years' War. It was common for ordinary soldiers to have one or more servants, and while marriage might be discouraged in certain armies (notably the French), all forces were accompa-

nied by large numbers of women followers, serving as prostitutes, laundresses and seamstresses, cooks, nurses, and housekeepers. Two Bavarian regiments lodged at Schweinfurt in 1646 numbered 961 combatant soldiers, 310 servants, and 540 women and children, and maintained a baggage train that required 1,072 horses. Apart from a few elite regiments or units that were the property of a wealthy noble, soldiers did not wear uniforms before the mid-seventeenth century and could adopt styles of dress to flatter their vanity or signal group identification. With the notable exception of the Dutch army, whose mercenaries explicitly accepted this as a contractual obligation, soldiers did not expect to dig earthworks or engage in other manual labor; pioneers attached to the army or conscripted peasants would be employed to build or demolish siege-works or construct encampments. At the core of most long-serving units, whether informally accepted or formally recognized—as in the case of the Spanish system of *camarades*, for example—were groups of companions who lived and fought together and whose primary focus of loyalty, obligation, and identity was their small group.

Soldiering might involve extreme danger. Battles in both the sixteenth and seventeenth centuries could involve high casualties; defeated armies in flight could be all but annihilated. The opinion of contemporaries, moreover, was that the pitched battle was less dangerous than active siege warfare. That said, the majority of military losses came not from combat but from disease. It was probable that close-packed encampments of soldiers placed themselves at greater risk of infectious disease than civilians. Yet levels of mortality in cities and from epidemics like the plague, which spread across much of Europe in the 1590s, could easily equal levels of disease-related mortality among soldiers.

Much of a soldier's life was intermingled with that of civilian populations. The winter quarter, roughly from October to April, would see permanent troops garrisoned in frontier or other towns and cities, lodged with householders and subjected to limited military discipline. Many who had pursued previous occupations as artisans or craftsmen resumed these during the winter months as a supplementary or alternative source of income. Other soldiers who were formally laid off during the winter quarter would return home, possibly to re-enlist in the next campaign. Even during the campaign season, numbers of troops were not engaged in active fighting, but were in garrison, occupying territory or holding defensive positions. Again, in most such cases, military discipline was imposed lightly, and troops mixed with the civilian population and sought opportunities to supplement their wages. Soldiers frequently abused their relative freedom, presenting problems of drunkenness and disorder for the local authorities and provoking violent confrontations with the artisan or peasant communities, but they were not a marginalized underclass. Rhetoric about the violent, godless, and uncouth soldiery did not prevent them being seen by townspeople and peasants as a valuable source of cash income.

While the life of an early modern soldier was far from attractive to all recruits—the massive levels of desertion in armies throughout this period make that evident—it can nonetheless explain why for a significant minority long-term military service could seem an attractive alternative to a harshening economic climate and increasingly uncertain status in civilian society.

CHANGES IN MILITARY SERVICE, 1650–1780

A number of changes occurred in the nature of military service from the mid-seventeenth century, and these had a substantial impact on the character of recruitment and army life. Reliance on voluntary enlistment down to the later decades of the seventeenth century had been in part assisted by the worsening economic prospects for the great majority of the rural and urban poor. It had also been helped by the relatively small size of armies in proportion to the populations of the larger European states. Though, for example, a significant number of males may have had a brief experience of military service during four decades of French military activity from 1620 to 1660, at any one time an army of seventy to eighty thousand troops represented a low military participation rate for a state with a population of eighteen to nineteen million. From the 1670s to the 1680s this situation changed. While first-rank European powers with substantial human resources like France and Russia were maintaining military establishments by the early eighteenth century of 250,000 to 350,000 troops, even states like Britain, Holland, and Spain, whose resources would place them in the second division of European powers, were raising armies of over 100,000 men.

In some cases this demand for soldiers was considered too great to rely exclusively on voluntary enlistment. In France, conscript local militias were used from the 1680s in order to supply, none too effectively, the demand for regular soldiers. More successfully, in return for upholding and reinforcing the privileges of serfdom, the tsarist regime in Russia persuaded its local elites to accept the conscription of a proportion of peasants for permanent military service. A similar, slightly more humane mechanism based on part-time compulsory service (the cantonal system) allowed the second-rank Prussian state to maintain a peacetime army of 83,000 by 1740. Elsewhere conscription was still regarded with suspicion, but the only way that substantially larger forces could be raised on the basis of voluntary recruitment was to ensure that a higher proportion of the troops stayed in service for significant periods of time. Recruiters would quickly scrape the bottom of the barrel if several hundred thousand new troops needed to be found for short-term service each year.

The establishment of these permanent armies changed the life of the soldier. Wage rates for common soldiers did not improve, but into the eighteenth century and across much of Europe, the assumption that soldiers should receive no more than a recruitment bonus and some subsistence money was supplanted by regular payment made in accordance with formal accounts. Regular wages were part of an implicit contract; in return for pay, more rigorous standards of discipline could be demanded and soldiering could be turned from a part-time into a full-time occupation, whether outside of the campaign season or in peacetime. All of the operations concerned with recruitment, equipment, and details of service were formalized through military bureaucracies, which grew more elaborate and orderly in their record keeping. Uniforms were standardized, in part to discourage desertion, but more importantly to impose a disciplined culture that sought to eliminate individuality from military service.

Some aspects of this new ethos were perceived in negative terms. A determined attempt in many states to separate soldiers from civilian life was most evident in the construction of barracks. Soldiers were less likely to be billeted on civilians and were deliberately separated from the outside world, subject to pervasive military discipline backed by a heavy emphasis on drill and military duties. Administrators believed that sequestering soldiers in barracks reduced the incidence of disorder. It certainly created a deeper gulf between soldiers and civilians and contributed to the perception of the soldiery as a marginalized class, not apparent before the mid-seventeenth century. Penalties applied under military discipline were not necessarily harsher, but they were more systematic. Failure in the precise performance of drill, especially by experienced troops, was regularly punished in the armies of the eighteenth century, whereas such punishment had been haphazard before 1650.

A more positive consequence of permanent military establishments was a recognition that soldiers were more likely to continue to serve if they had some assurance of being supported in old age or disability. The *Hôtel des Invalides*, founded in 1670 on the outskirts of Paris, was the first of many hospitals for military veterans. The practice was not universally followed; Prussia was notoriously slow to acknowledge any obligation to old or wounded sol-

diers, but such a policy was increasingly out of step with other European powers by the mid-eighteenth century. There was also a readiness to try to appoint noncommissioned officers on the basis of deserving, lengthy service. Commanders or rulers like Frederick II of Prussia (ruled 1740–1786) resisted the automatic distribution of the posts of sergeant and below to clients of unit officers, seeking to build a promotional structure at this level that would reward merit. And while soldiers were more isolated from civilian society, the uniforms, rituals, and distinctive identities of units increased in importance. The great majority of regiments in the period before 1660 could never have acted as a focus for loyalty since they enjoyed only a short-term existence, three to five campaigns being a decent life expectancy. A permanent army created a mass of permanent units, whether recruited from specific localities or associated with a particular aristocratic family. The relationship of ordinary soldiers to their units is usually ambiguous: the regiment imposes burdensome duties and harsh discipline, but it is also the source of group identity, loyalty, and rivalry with other units. Although increasingly deracinated from civilian society, soldiers possessed a pride and strong sense of *esprit de corps* through the identity of their units that would earlier have been the possession of only a few elite formations.

THE EARLY MODERN OFFICER CORPS

The transformation from an army where the great majority of units were short-term creations into one dominated by permanent regiments also had an impact on the European officer corps. For many nobles and other wealthy individuals in the sixteenth or seventeenth centuries, military service involved paying to recruit a cavalry or infantry unit, assuming the command and filling the junior officerships with clients or relatives. Training or experience was irrelevant to this financial transaction. To a large extent, the experience was less a permanent step into military life than a rite of passage allowing a noble to validate social status through a campaign or two of military service, and a wealthy bourgeois or recently ennobled figure to engage in an appropriately “noble” activity. Some regimental proprietors saw the opportunities of warfare in more directly commercial terms and sought to create a unit of experienced soldiers with a high market value. But the majority of unit commanders were temporary offi-

cers, and the state made little attempt to retain them in service once their units lost military effectiveness through casualties, disease, or desertion. Insofar as the question of officer training was addressed in sixteenth- and early-seventeenth-century armies, it was assumed that the habits of command and authority possessed by a ruling elite would be sufficient to provide leadership. The most obvious role of the unit proprietor was to advance his own financial resources to meet shortfalls in supply and funding that would otherwise threaten the dissolution of the troops.

Developments in the character of weaponry and tactics, however, challenged the notion that the officer corps could successfully be based upon short-serving amateurs, filling the subordinate ranks of the company or regimental hierarchy with their clients. As more units gained a permanent status, it was possible to modify in certain respects the ethos of the officer corps. This in no sense excluded the nobleman or the wealthy, or the role of influence and birth in securing posts and promotion. Officerships in permanent units in most states were bought and sold, the system usually operating within the officer corps as a combination of entrance fee and pension provision. While the state and its military administrators might, sometimes grudgingly, accept the principle of purchase, now that far more units were permanent it was also feasible to expect rudimentary training for many of the officers, whether through service as cadets in a prestige unit or even through institutions such as the military colleges that were emerging in the eighteenth century. The efficacy of this training may be questioned; in practice the day-to-day business of running a regiment would be handled by longer-serving junior or noncommissioned officers. But as expectations of the length of officer service increased in the eighteenth century, so inevitably did the level of basic military education and experience at all ranks. Permanent military service was a feature of most nobilities in central and eastern Europe, but even in the west those nobles and wealthy commoners who became officers did so with the expectation that this was a career choice. To say that the officer corps became more professional, in all but specialized branches like the artillery and engineers, would be an exaggeration. It did, however, adapt itself to the demands and requirements of a perma-

nent military institution and contributed substantially to its distinctive identity.

BATTLE TACTICS AND CAMPAIGN STRATEGY

Accounts of military developments and events of the period 1450–1780 leave confusion about how these centuries should be interpreted. Was this a period of decisive or indecisive warfare? Was it shaped by pitched battles or by protracted maneuvers punctuated by interminable sieges? Were armies effective instruments of state power and ambition, or clumsy and unreliable consortia of private interests?

A crude model of military development views this period as characterized by the successive domination and decline of armored cavalry, massed infantry armed with pikes and cutting weapons, and infantry equipped with firearms and deployed in linear formations supported by more effective artillery. According to this interpretation, military decisiveness resulted from the mismatch between a fighting force making use of outmoded techniques and one employing newer tactics or weaponry. Thus

the annihilation of the Burgundian heavy cavalry at the battles of Grandson, Morat, and Nancy in 1476–1477 inaugurated the era of the pike square as a battle-winning tactic. But in turn the battles of the early sixteenth century in Italy indicated another mismatch, this time the result of improvements in firearms and their deployment. The success of infantry armed with harquebuses or muskets, supported by blocks of pikemen, consolidated the supremacy of the defensive. A period of military stagnation is then taken to follow, lasting through most of the sixteenth century. Although innovations linked to notions of a “military revolution,” particularly those identified with the Swedish army, seemed to combine enhanced firepower with successful assault tactics, this was no permanent solution, and commanders continued to avoid battles, with their likelihood of indecisive and costly outcomes. Instead, conflict was increasingly characterized by sieges, in which numerical superiority and grinding attrition could at least yield up a visible outcome in the form of a city or fortress captured. Thereafter, apart from the occasional meteoric figure combining generalship and tactical creativity—an Henri de La Tour d’Auvergne de Turenne (1611–1675); a John Churchill, duke of Marlborough (1650–1711); or a Prince Eugene of Savoy (1663–1736)—the pattern was set for the remainder of the period. The most significant military development of Louis XIV’s personal reign (1661–1715) was Marshal Sébastien Le Prestre de Vauban’s construction of the *pré carré*, the massive series of fortifications along France’s eastern frontier. Only commanders confident of greatly superior numbers or desperate in the face of territorial occupation (Frederick II of Prussia during the Seven Years’ War, 1756–1763, for example), or confronted by an imminent political-strategic crisis would be prepared to hazard battle.

Such an account simplifies a more complex reality. If the defeat of the Burgundian chivalry in 1476–1477 raised the prestige of the Swiss pike-square to unprecedented heights, it did not bring to an end the importance of heavy cavalry on the battlefield. A massed cavalry charge still represented a fearsome prospect to all but the most hardened of veteran infantry. Warfare in eastern Europe, which put far greater premiums on mobility and surprise, continued to be dominated by the use of massed cavalry in battle. Polish victories at Kirchholm

(1605) and Honigfelde (1629) against Swedish armies were a clear vindication of traditional cavalry tactics. More generally, the combination of cavalry and artillery was recognized as one of the few ways to break infantry formations. The cavalry's use of firearms, mostly flintlock pistols, has been treated as a tactical wrong turn, depriving them of their one real asset, mass and momentum. Yet pistoleer tactics transformed the most common form of cavalry combat, an engagement with other cavalry. The superiority of medium-weight cavalry armed with pistols against traditional heavily armored lancers had two important consequences. Expensive heavy cavalry was increasingly replaced by more numerous medium and light horsemen in armies of the later sixteenth century, while lighter cavalry troopers enjoyed improved range and maneuverability. When the infantry centers of two armies on the battlefield

fought each other to a standstill, a decisive opportunity went to the commander whose cavalry could break the opposing horse on the wings, regroup, and then advance against the flank or rear of the infantry center. Rocroi (1643) provided an example of this maneuver, triumphantly achieved by the French cavalry, turning the battle decisively against the Spanish.

Changing technology and organization led to a more complex interplay of different types of troops and forced commanders to be alert to ways of deploying and combining their forces. While infantry firepower could not be ignored, neither could emphasis on mass and cohesion. Far from leading to an immediate thinning out of infantry lines and a reduction in the size of units, wider use of firearms was followed by numerous experiments seeking ways to deploy more firepower without sacrificing

the weight and strength that came from large, independent units. The most successful trade-off in the seventeenth century was probably the Spanish *tercio*, an infantry unit that started at three thousand men but was progressively reduced to around half that size by the 1620s.

Commanders were aware of the potential of artillery, though the practical problems of its use for most of the period before 1660 were immense. The majority of cannon, interchangeable from siege use, fired shot weighing six pounds or above. Such guns, especially if made of cast iron, were heavy, often poorly mounted, and cumbersome. Ensuring supplies of munitions was a constant problem, as was maintaining adequate teams of draft animals. Reckless disregard for carefully prepared artillery positions, especially those that would allow cannon to enfilade the flanks of an infantry or cavalry advance, could prove costly. But most commanders would be reluctant to order their troops to assault such carefully prepared positions, just as they would seek to avoid storming a well-defended set of fortifications. The use of smaller, lighter cannon was attempted, notably by Gustavus II Adolphus of Sweden, who experimented with three-pounder guns in the 1620s. But the lighter shot sacrificed both accuracy and penetrative power. The Swedes sought to compensate by increasing the number of cannon; in 1639 a typical Swedish campaign army of eighteen thousand men included eighty guns. But other states proved reluctant to trade heavier, less maneuverable guns for this Swedish-style light artillery, and the post-1660 period vindicated the use of field artillery firing heavier shot. Even in the conduct of sieges artillery bombardment rarely proved to be the decisive factor in forcing a capitulation. If fortifications were taken by gunpowder, it was as likely to be the result of a successfully laid mine as of a bombardment. Much more often the besieged would capitulate with the walls intact because of shortage of supplies or recognition that relief would not arrive.

FACTORS IN MILITARY SUCCESS

This complex reality did not preclude the possibility of decisive success in battle. It would be hard to imagine a more conclusive encounter than Pavia in 1525, which led to the capture of the French king, Francis I, and destroyed his army. Reasons for suc-

cess are those common to most periods: numerical superiority at key points and moments on the field, tactical surprise, and the ability to persuade an enemy to assault forces in carefully prepared positions. The number and quality of experienced troops serving in a campaign force and their esprit de corps were significant factors. Commanders who could show leadership in the face of hardships and setbacks could be important, as were those, like the Spanish commanders Gonzalo Fernández de Córdoba (1453–1515) and Alessandro Farnese, duke of Parma (1545–1592), who possessed a sophisticated grasp of how best to combine the different troops and weaponry at their disposal.

A much greater problem was how to translate success in a specific battle, or even an entire campaign, into a favorable settlement to a war. The single greatest obstacle to capitalizing on tactical success throughout the early modern period was logistical. Systems for supplying early modern armies fell far short of the capacity to raise troops. Supply was almost entirely organized through private contractors down to and beyond 1650. These contractors agreed to provision armies in return for haphazard reimbursement from the state. Even if an early modern government proved able to meet its obligations to the contractors, the latter would almost inevitably fail to fulfill their side of the bargain. Supply contracts were rarely calculated with precision: grain prices were unstable; costings for adequate transport facilities, replacement draught animals, enough teamsters, bakers, and ancillary staff were never realistic. Roads were primitive or nonexistent; water was a better and cheaper transport option, but the movement of armies would be severely constrained if they had to be supplied from rivers or waterways. Transportation of bulk supplies was slow, lagging behind the main elements of the army, and the entire force would need to stop one day in four or five to allow the supply convoy to catch up and to give the attached millers and bakers the opportunity to turn grain into bread rations. This would not be sufficient in most circumstances to bring about either a decisive advance to the center of a state or threaten the possibility of occupation with overwhelming force. During the sixteenth century the most awe-inspiring aspect of the Ottoman armies was not their vast size or the training and commitment of their elite troops, but Ottoman

logistics, incomparably more advanced and more capable of supporting the rapid movement of the armies than anything in Christian Europe. Yet even at the height of its power, with the 1529 advance into the Habsburg lands, the Ottoman army only reached Vienna at the end of September, and it fell back in disorder during late October. What the Ottomans could not achieve was certainly beyond the capacity of other European forces.

Theorists examining logistical systems for the support of armies have consistently contrasted supply via magazines and convoys with the flexibility of “living off the land”—with rapidly moving forces, able to acquire the food and forage they needed by requisitioning or pillage. Here again, the early modern army was handicapped. Throughout most of Europe armies operated amid relatively low densities of population, sustained by primitive, low-yield agriculture. Armies could be self-sustaining, but only if they spread themselves out thinly over substantial territories. A concentrated advance into territory where supply potential was not assured or had been deliberately destroyed would be suicidal for military effectiveness.

Some wars were won rapidly in this period despite this apparently insuperable problem of supply. When the armies of Philip II invaded Portugal in support of his claim to the Portuguese throne in 1580, the resources of the great Spanish monarchy were thrown into a struggle with a small independent state, and one whose army had been destroyed two years before in the quixotic crusade that had also left the young King Sebastian dead on the Moroccan battlefield of El-Ksar-el-Kebir. In 1643 the Swedish war machine was turned against Denmark, whose army had been humiliated by imperial and Bavarian forces in the 1620s. In two campaigns the Swedes crushed Danish forces and imposed a harsh peace at Brömsebro (1645). In other cases, the military forces may have been more evenly matched, but one power was already in political disarray and military defeat served as a catalyst for disintegration. The collapse of the Bohemian rebellion against their Habsburg monarch followed the Battle of White Mountain in 1620. The forces engaged in the battle were more evenly matched than is frequently assumed, but the defeat of the Protestants provoked the collapse of a regime in which

political tensions and fault lines were everywhere apparent.

If some wars were won as the result of a decisive military encounter acting upon a state with a weakened political structure, others were finally resolved by attrition. One option, favored by belligerents in the Thirty Years' War, was simple territorial occupation. An army that could establish itself on enemy territory, even if it could not concentrate its resources for a knockout blow, could raise the stakes for continuing a war to an unacceptable level. Swedish forces devastated occupied Bavaria in 1646 and 1648 in successful bids to force Duke Maximilian I out of the Thirty Years' War. Another possibility for extracting a settlement was linked to siege warfare. The resistance of most besieged cities reflected garrisons' calculations about the chances of being relieved. A power that could combine sieges with a clear-cut military superiority in the field might provoke an avalanche of capitulations, leading an opponent to a rapid reevaluation of the struggle. The duke of Parma's advance into the Netherlands after 1578 produced waves of surrenders of cities and brought the Dutch rebels to the point of capitulation by the later 1580s, from which they were only saved by Spain's shift in military and political priorities.

CHANGES AND CONTINUITIES AFTER 1660

Lessons from the examples above indicate that small wars were more likely to produce decisive results than the extended, campaign-after-campaign struggles like the Italian Wars of the first half of the sixteenth century or the Thirty Years' War; predictably, wars that pitched territories with a significant disparity of military resources against each other were also likely to produce clear-cut outcomes. One of the problems of great power struggles down to 1650 was that the scale of military engagements was dwarfed by the available human and material resources of the states. The “cutting edge” of armies, the proportion of troops likely to be drawn into battle, was relatively small in comparison with the total military establishment and minuscule in proportion to the overall size of the population of the belligerent state. When a major campaign army totaled perhaps fifteen thousand men, then even the most annihilating defeat in battle would not strain the wider military resources of the state to the

breaking point. The loss of experienced veterans could be more serious, but even this does not appear to have impeded most major states from continuing a struggle.

From the later seventeenth century, overall military establishments increased exponentially, and the average size of individual campaign armies also doubled, tripled, or even quadrupled. Losing a battle had a much greater impact on the overall military establishment; and more importantly, because these establishments now represented a significant proportion of the adult male population of even a major state, the losses were far harder to make good. The

most telling example of this is provided by Brandenburg-Prussia in the wars of the mid-eighteenth century. A state with a population of perhaps 3.5 million was trying to sustain a permanent army of 80,000 troops, increased to 140,000 or more during the Seven Years' War, some 25 percent of all adult males. Heavy losses of dead, wounded, and prisoners were simply unsustainable by a state of this size engaged in military activity on this scale.

If armies were substantially larger in proportion to the populations, then losses were compounded by tactical and technological developments that were making battles and sieges considerably more

lethal. Changes in infantry firearms—to the flintlock musket with an attached ring bayonet—considerably increased the impact of firepower on the battlefield itself, as well as the casualties likely to be suffered by both attackers and defenders, victors and defeated. Developments in artillery added to this lethal transformation. Gun crews were better trained and the mobility of artillery steadily increased. Above all, there was a massive proliferation in the number of guns deployed on the battlefield; the Prussian and Austrian armies of the Seven Years' War were maintaining artillery trains of three to four hundred cannon.

The result of these developments in killing power became evident from early in the eighteenth century. At Malplaquet in 1709 the victorious allied army suffered losses of around twenty thousand from an army of eighty-five thousand, while a year earlier at the siege of the city and citadel of Lille, the besieging allies had suffered fourteen thousand casualties. When losses on this scale were sustained by a defeated power whose resources were overstretched, the results were catastrophic; the defeat of the Swedish army by the Russians of Peter the Great at Poltava (1709) was followed by Russian conquest of Sweden's gravely weakened eastern Baltic territories.

Yet even in this environment, it is noteworthy that the upward curve of military commitment and casualties still did not always produce the seemingly inevitable result for a state locked in struggle with a greater power or a more numerous coalition. If the "miracle of the House of Brandenburg" in the eighteenth century is the paradigm of survival against the odds, no less striking was the ability of France to hold out for a favorable peace in the War of the Spanish Succession after the allied victories down to 1709 had seemingly brought the monarchy to the breaking point. In part these outcomes reflected chance and circumstance; the obvious point about all military coalitions is the fragility of the interests that bind them together, and both France and Prussia were ultimately saved by divisions among their enemies. Yet behind the diplomatic rifts and divisions it is possible to detect the perennial problems of logistics, slow-moving troops, and short campaign seasons. A few eighteenth-century armies provide cases in which the normal constraints were overturned: Marlbor-

ough's march from the Spanish Netherlands down into Bavaria in 1704, keeping his army intact, well-supplied, and capable of winning a crushing victory over the Franco-Bavarian forces at Blenheim, provides a notable example of how efficient stockpiling and a commissariat with plenty of cash in hand to buy local provisions could overcome the risks of a long march into hostile territory. Two years later, Marlborough's victory at Ramillies, fought at the outset of the campaign, allowed him to drive the French out of the Spanish Netherlands before the end of 1706.

Yet for the most part slow-moving armies, commanded by generals who remained exceptionally—and probably correctly—nervous about supplying their men from requisitioning in the field, faced immense obstacles to gaining outright military success. Sophisticated fortifications proliferated throughout the century from 1660 to 1760, threatening supply lines and communications of armies attempting to bypass them. But a lengthy series of sieges was the surest way of slowing any military advance until the approaching end of the campaign offered the possibility of regrouping the defense. Any lengthy siege exacted a heavy cost on the besieging forces, destroying their capacity to return to effective campaigning in the field. Thus although wars exacted a heavy toll on armies from the 1690s onwards, it is far from clear that this resulted in more decisive resolutions to conflict, or that wars in general became a more effective method of resolving political competition.

EARLY MODERN MILITARY THEORY

A number of strategic, tactical and organizational issues preoccupied military theorists from the sixteenth to the late eighteenth centuries and had considerable impact on the way in which wars were fought and conflict envisaged within a political and social context.

CITIZENS VS. PROFESSIONALS

The debate over the use of citizen versus professional soldiers, which preoccupied theorists throughout the early modern period, was initially stimulated by consideration of republican government and focused on the merits of citizen militias against mercenaries. For Niccolò Machiavelli (1469–1527), councillor to the Florentine Republic after the expulsion of the Medici in 1494, an armed citizenry was desirable on both practical and

moral grounds. Machiavelli’s practical case rested on systematic denigration of the effectiveness of mercenary forces, creating a potent mythology that survives to this day. The moral argument rested on the conviction that participatory republicanism was the best means of transcending the human pursuit of self-interest, and that military service for all citizens would instill communal values and civic virtue. Despite challenges to these arguments—notably the rout of Machiavelli’s own Florentine militia in the face of Spanish mercenaries at Prato in 1512—the ideal of a citizen militia enjoyed wide currency. Almost all military writers of the sixteenth and early seventeenth centuries made reference to the potential advantages of raising, drilling, and deploying citizens, even as the major European states filled the ranks of their armies with mercenaries.

As mercenaries were in turn incorporated into professional standing armies in the later seventeenth century, the effectiveness of these forces was no longer denied, but critics argued that they underwrote governmental despotism and were a constant incitement to territorial aggression. In Britain the notion of standing armies was regarded as incompatible with representative government, better guaranteed by a county militia officered by the local elites. In other states and for different reasons, militias were being reinvigorated from the later seventeenth century as many rulers sought ways to enlarge the size of their armed forces without crippling the state with the burdens of a vast, professional military establishment. The obvious problem confronted by theorists was how to make such part-time soldiers into an effective force. Jacques de Guibert’s *Essai général de tactique* (1772; *Essay concerning tactics*) forcefully championed the potential of small, highly motivated citizen armies. The arguments, prefiguring the French “nation in arms” of the Revolutionary wars, were, in a sense, a return to the ideals of Machiavelli. Imbued not with republican virtue but with nationalist fervor, the aggressive élan of citizen soldiers would overcome the narrow professionalism of traditional armies.

For some theorists, especially in the sixteenth century, the debate about the benefits of civic militias was part of a larger attempt to locate military development and innovation within a context of Classical Roman military culture. If a citizen militia was fundamental to the greatness of Republican

Rome, then it was no less desirable to incorporate other aspects of Roman, even Greek, military thinking into current debates about strategy and tactics. The military treatises of Vegetius (fl. 4th century C.E.) and Aelianus (c. 170–235 C.E.) were regularly reprinted from the late fifteenth century on. Classical prescriptions might provide convenient justification for reforms and developments that were actually responses to a more pragmatic reality. Thus the reformer of the Dutch army in the 1590s, Prince Maurice of Orange-Nassau (1567–1625), could base his proposals for more rigorous drilling of his soldiers; smaller, linear formations; and sequential firing of his *harquebusiers* on prescriptions for the training and deployment of the Roman legionaries. Less plausible when transposed to an early modern context was the hostility of some Roman theorists to permanent fortifications; a disdain for weapons that detracted from direct, hand-to-hand combat; and a strong espousal of the offensive in almost all tactical circumstances.

Application of Roman models to military thinking by early modern Europeans should not be seen in isolation, but as part of an enthusiasm among a humanist-educated elite for almost all aspects of Roman politics, culture, and social organization. The reinvigoration of Stoic philosophy to underpin the military drill and justify the subordination of the individual, as pursued by the Netherlandish political philosopher Justus Lipsius (1547–1606), had a strong following in the early seventeenth century. The recourse to classical models remained commonplace among theorists into the eighteenth century. Jean-Charles de Folard (1669–1752) had no hesitation in using Polybius to justify his own arguments for the deployment of infantry in column rather than in line on the battlefield.

A MILITARY NOBILITY?

Changes in the character of early modern warfare increasingly defined the military role of the nobility as an officer class rather than as individual specialist warriors. But this evolution raised major questions about noble participation in a much more expensive military role. Poverty, according to many theorists from the late sixteenth century onward, was depriving the traditional nobility of their military birthright, while military specialization and technical expertise were consolidating this exclusion. Suc-

cessive works urged preferential treatment for the lesser nobility in military posts. For the French theorist Henri de Boulainvilliers (1658–1722), the old French nobles were racially distinct from the rest of the population, conquering Franks rather than indigenous Gauls. More prosaic theorists argued that the social background of nobles habituated them to command and responsibility and therefore made them an optimal, if not a genetic, officer corps. Thus when Frederick the Great (ruled 1740–1786) reduced the Prussian army in peacetime, he purged the officer corps of “common riff-raff,” arguing that the nobility’s innate sense of honor justified their preferment. But the notion of “reduction” exposes the gap between theory and reality. Few theorists before the 1790s would argue in favor of a non-noble officer corps, an elite of pure merit. Yet the military reality of the seventeenth and eighteenth centuries, compounded by the financial and administrative weaknesses of governments, was a market in officerships making wealth the prime determinant of appointment to a unit command and subsequent promotion. Frustration at an officer corps that appeared to exclude so many of the “natural leaders” was seized upon in the aftermath of military setbacks such as that of the Austrian army in the 1740 war against Prussia and the French defeat at Rossbach in 1757 to justify Prussian-style purges of non-nobles. Proposals for the better training and incorporation of lesser nobles into the armies had, in France, already been advanced by French theorists, most notably the chevalier d’Arc in his *Noblesse militaire* (1756; A military nobility), and this was anticipated in 1751 by the foundation of the *École Militaire*, primarily as a means to ensure that training and cadetships could be offered to nobles of modest background.

THEORISTS OF TACTICS AND STRATEGY

Military theorists concerned not with large conceptual issues but with the practical detail of winning wars were essentially a new phenomenon in the eighteenth century. Two centuries earlier there are a few examples of writers who combined memoirs and general observations with some military thinking: in France, François de La Noue’s *Discours politiques et militaires* (1587; Political and military discourses) is an obvious example, while Machiavelli’s *Arte della guerra* (1521; Art of war) offers much detail on deployment, tactics, and strategy, albeit

within a framework of Roman examples. Much of the writing of the later sixteenth and early seventeenth centuries, most notably the extensive works of Johann Jacobi von Wallhausen and Jacob de Gheyn, is concerned with the disposition and deployment of troops: elaborate guides to creating formations, marching order, and establishing fortified encampments. Indicative of priorities is the general concentration of prescriptive material on sieges rather than field campaigns: a French theorist such as La Valière devotes 15 pages of his *Pratique et maximes de la guerre* (1675) to deployment of armies on campaign, and 126 pages to the conduct of sieges. Raimondo Montecuccoli's *Sulle battaglie* (On battles; written between 1639 and 1642 and drawing on his experiences in the Thirty Years'

War), which discusses both battlefield tactics and campaigning based on maneuver, is unusual and looks forward to an epoch in which discussion of tactical theory and the conduct of war was commonplace.

The proliferation of such works in the eighteenth century is perhaps predictable; while there had been significant technological and organizational change in warfare from the late seventeenth century, this did nothing to reduce uncertainty about optimal approaches to battles and campaigning. Should infantry be massed in depth or deployed in line, especially given the growing number and effectiveness of artillery on the battlefield? Jean-Charles de Folard's arguments for the tactical superiority of the column was echoed by French theo-

rists throughout the century such as Baron François-Jean Mesnil-Durand and Paul-Gedeon Joly de Maizeroy, and a tactical theory stressing shock and the advantage of taking the offensive was not an innovation of the Revolutionary wars. More fundamental were attempts to assess whether improvements in communications, supply systems, and the mobility and training of armies rendered a war of maneuver more or less viable. If Antoine Manasses de Pas, marquis de Feuquières, was relentless in his emphasis on offensive, battle-seeking strategies in his *Mémoires sur la guerre* (1725; Memoirs concerning warfare), the *Les rêveries, ou mémoires sur la guerre* (written 1732, published 1756; Reveries on the art of war) of the successful commander Maurice de Saxe offer a more nuanced weighing up of the merits of battle and maneuver in a campaign. Much eighteenth-century theory would reinforce a disposition to avoid the hazard of battle in all but exceptional circumstances. The experience of war in central and eastern Europe and colonial warfare, as in America in the 1770s, generated a series of treatises exploring small-scale conflicts fought between light or irregular troops and emphasizing speed, surprise, and the initiative of relatively junior officers. Faced with the alternatives of massively costly set-piece battles and sieges and large-scale and probably indecisive campaigns of maneuver, theorists such as Lancelot Turpin de Crissé in his *Essai sur l'art de la guerre* (1754; Essay on the art of war) explored the techniques of partisan or local warfare as a possible means to gain the advantage over traditional, regular forces. This interest in the potential of irregular warfare also revived wider questions of the treatment of civilian and noncombatant populations, likely to change if armies found themselves engaged in warfare against irregulars and partisans. Most theorists were confident that eighteenth-century war had become more restrained and more respectful of the rights of noncombatants. They looked back to the early seventeenth century as a dark age of religious fanaticism and military brutality, while turning a blind eye to contemporary battlefield casualties, indifference to suffering, harsh exactions on civilian populations, and systematic destruction of the supply potential of territory, all of which arouse considerable skepticism about “enlightened warfare” among modern historians. There is plenty of evidence that the techniques and assumptions of Revolutionary and Na-

poleonic warfare had been anticipated in the writings and theorizing of the preceding decades.

HISTORIOGRAPHY

The historiography of early modern warfare has been shaped for the last fifty years by debate surrounding the concept of a “military revolution.” The attraction of such a thesis for many historians

stems, paradoxically, from the extent to which it transcends a purely military perspective and presents warfare as a transforming force, acting upon social and political institutions.

A MILITARY REVOLUTION IN EARLY MODERN EUROPE

The original argument for a “military revolution” in early modern Europe was presented by a historian of Sweden, Michael Roberts, who started from the proposition that between 1560 and 1660 initiatives in tactics and troop deployment sought to exploit gunpowder weaponry more effectively. Armies identified with these initiatives abandoned the mass and depth of traditional infantry formations. Instead musketeers were deployed in shallow, linear formations that maximized firepower, while interspersed groups of pikemen protected them from attack. Difficulties in controlling and coordinating infantry formations extended in shallow lines led the reformers to adopt smaller, more manageable units. The Dutch “battalion” or Swedish “squadron,” models for these reformed armies, typically contained 500–550 men compared to the traditional infantry formation of 1,500–2,000. The risk that smaller units would be swept aside in hand-to-hand engagement with traditional formations was counteracted—notably in the case of the Swedish army under its royal commander, Gustavus II Adolphus (ruled 1611–1632)—by associating them in coordinated and mutually supportive deep deployment, making use of multiple lines to contain enemy assaults and reinforce the units of the front rank. These deployments also permitted the infantry to aspire to that elusive goal of tacticians, combining massed firepower with offensive strength. Interlocking squadrons rendered the Swedish “push of pike” as formidable as traditional, massed infantry formations. If the central concern of the military reformers was with the infantry, cavalry and artillery were not neglected. It was Gustavus Adolphus again who recognized that the main value of cavalry lay in shock and mass, not in complex maneuvers allowing mounted troops to discharge pistols at enemy formations. More numerous, lighter artillery was also to be deployed on the battlefield in close coordination with the other arms, and it was to be used in a continuous supporting role.

These arguments about tactical change would not necessarily have excited wider historical interest.

The key to Roberts’s thesis is the claim that new tactics broke a previous stalemate of indecisive, limited warfare. Instead of standoffs and campaigns of maneuver, strategy was now influenced by the possibility of annihilating the enemy in battle and imposing peace from a position of outright military superiority. Strategies changed; rulers and commanders became more ambitious and less compromising in waging war. But these grander strategies could only be achieved by larger armies. If war was now more decisive and fought for higher stakes, it was essential to increase the number of troops in the campaign, whether to provide numerical superiority in battle, to ensure that successes could be followed up, or to contain defeats. In the aftermath of the victory at Breitenfeld (1631) Roberts describes a Swedish army swollen by recruitment to 175,000 men and undertaking a vast strategy to remodel the religious and political structures of the Holy Roman Empire. If these larger armies were to adopt the tactical innovations that provided overwhelming battlefield advantages, they needed more rigorous systems of drill and discipline. Soldiers were to be drilled in use of weapons and group maneuvers by constant practice at the hands of trained non-commissioned and subaltern officers. This could not be achieved by raw recruits overnight; a progressively higher proportion of armies had to serve permanently.

Larger and more permanent armies needed to be paid for, and they needed to be recruited, maintained, and controlled more effectively. European rulers had traditionally raised armies through ad hoc mechanisms that were partly feudal and partly contractual but respected the social and political structures of their states. Local elites contributed their organizational and financial resources to raising troops in return for the right to command and control them. But as the size of armies was ratcheted upwards, only a central administration could absorb the burden of mass recruitment, and only a centralized and more powerful financial administration could sustain the costs of warfare on this new scale. Once this more sophisticated administration was put in place—and backed by a considerably larger permanent army—the coercive potential of the state increased exponentially. If ordinary subjects resented paying ever higher taxes, and local elites objected to systems of centralized control that ex-

cluded them from power, the state now had the strength to sweep both aside.

A permanent army implied an increasingly professional officer corps. While some officerships would continue to be occupied by the traditional nobility, others, notably in the artillery or the bulk of the infantry, were open to the sons of new nobles or bourgeois, according to talent. Such officers acquired not just paid employment but social prestige in a society whose financial and administrative *raison d'être* became the maintenance of permanent armed forces. This process of militarization reached down into society as the struggle to maintain larger permanent forces could be resolved only through systems of conscription. The political, administrative, and social consequences of “military revolution” appeared momentous: changes in the character of warfare were to sweep away a traditional political culture dominated by the bonds of locality and social hierarchy, replacing them with the centralized modern state, existing for and underpinned by the military.

HISTORIOGRAPHICAL DIVERGENCES

Michael Roberts's skillful linking of changes on the battlefield with some of the most fundamental political and social transformations in European history has ensured that his thesis has enjoyed great influence. It has not, however, passed without criticism, and revisionism since the 1980s has taken issue with almost every aspect of the “military revolution.”

Chronological problems. It is questionable whether a “revolution” in military affairs spread over a full century has any real meaning. Other changes that fundamentally altered the nature of warfare—the breech-loading rifle, the machine gun, the ironclad warship—had a notably more rapid and specific impact than the tactical evolution described by Roberts. And precisely because of the indeterminacy of this evolution, historians have argued that even the century from 1560 to 1660 is a truncation of a more extensive process.

If the driving force behind military change is taken to be the emergence and development of more effective gunpowder weapons, then a starting date of 1560 appears arbitrary, indeed incomprehensible. If there was a “gunpowder revolution” in European warfare, it lay in the decades between

1450 and 1530. Technologically, the long period that follows is marked by little change in either artillery or infantry firearms. The development of better and much cheaper gunpowder had been a feature of the later fifteenth century, as had credible cast-iron artillery. Conversely, the crude technology, poor range, and inaccuracy of the matchlock infantry firearm remained little changed between the early sixteenth and late seventeenth centuries.

In the matter of infantry tactics, European commanders and theorists were wrestling with problems of combining infantry firearms and thrusting weapons throughout the sixteenth century, and here again, a number of historians have pointed out the fallacy of attributing dramatic success to a particular sequence of practitioners within a circumscribed chronology. Geoffrey Parker has emphasized that Spanish armies from the early sixteenth century onward were the most innovative in their experiments to try to combine infantry firearms, defensive capacity, and offensive mass in their infantry units.

If doubt has been cast upon a series of military changes claimed to start in 1560, historians have also questioned the end date of 1660. Indeed Jeremy Black has contrasted the stagnation of the century down to 1660 with the radical tactical and organizational changes occurring in the following century. The development of the ring bayonet finally permitted the phasing out of the pike in favor of infantry units entirely equipped with firearms and possessing their own defensive capability. The introduction of cartridges, which prepackaged shot and a charge of powder, and the mass production of a reliable flintlock musket, were equally important. The musket was no longer fired by means of a separate length of smoldering match, and infantry could be packed into a genuinely close order. All of these changes ensured that the killing power of infantry was dramatically increased, opening the way to a further reduction of the depth of formations, which by the 1740s–1750s were deployed in the three ranks that remained typical up to and beyond the Napoleonic Wars.

Whereas there is ambiguity about the growth in troop numbers during the century of the military revolution (see below), there is none for the period after 1660. By the 1690s France was maintaining around 340,000 troops in combat, and a battle such

as Steenkirk (1692) set 57,000 French troops against 70,000 allies. The scale of warfare after 1660 moves into a league that was entirely unprecedented and would remain relatively constant until the wars following 1792.

If the original chronology of 1560–1660 looks too extensive for claims to a “revolution” in warfare, subsequent historians have thus added to the problem. One response, proposed by a historian of Poland, Robert Frost, is to argue that there was no single military revolution, but a plethora of separate military revolutions, separated both chronologically and by the military needs and cultures of different European nations; what might be deemed obsolete on the battlefields of the Spanish Netherlands—the massed cavalry charge, for example—remained central to tactics in eastern Europe. Another approach, advanced by an historian of medieval warfare, Clifford Rogers, questions whether “revolution” is an appropriate concept for understanding a process such as military change. Rogers proposes an alternative model, derived from the theory of “punctuated equilibrium” in evolutionary biology, in which rapid technological and organizational changes in warfare may provide short-term advantages but are then either absorbed by all those involved in warfare or neutralized by specific counter-developments, after which the military system once again assumes a modified equilibrium.

Conceptual issues. An early and major challenge to Michael Roberts’s thesis was offered by Geoffrey Parker, who questioned whether the battlefield was the appropriate locus for the military transformation of early modern Europe. He suggested instead that the discussion had neglected the more fundamental role of siege warfare. Developments in artillery rendered obsolete traditional medieval fortifications based on tall curtain walls. Early experiences of this vulnerability stimulated experiments with systems of fortification, the so-called *trace italienne*, which relied upon low-lying, earth-packed walls, whose faces were defended by triangular, projecting bastions from which defending artillery and muskets could sweep the approaches. The result of this development was stalemate; it became almost impossible to take these fortifications by bombardment, and sieges became drawn-out blockades. Yet commanders, justifiably doubting the capacity of troops to make decisive progress in a field campaign, seized

upon the capture of fortresses or fortified cities as strategic targets. Such sieges required ever increasing numbers of troops, both to secure the blockade and to make good the losses from wounds, disease, and desertion. European warfare and all of its political and social consequences were determined by attritional sieges, not by tactical and strategic revolution.

Examination of warfare in the sixteenth and seventeenth centuries raises more questions about the “military revolution.” The significance of firearms in a period of matchlock muskets and unstandardized and cumbersome artillery can easily be overestimated. Commanders and theorists who continued to favor mass and cohesion in infantry tactics were not necessarily anachronistic. Historians have drawn attention to the persistence of debates about infantry deployment up to the end of the eighteenth century, indicating that claims to have achieved a tactical panacea in the early seventeenth century look premature. The Battle of Nördlingen (1634) has become a touchstone for skeptics. Not only was this one of the two or three most decisive battles of the Thirty Years’ War, but it saw the annihilation, at the hands of traditional Spanish and imperial forces, of the Swedish army that was heir to the tactical and strategic principles of Gustavus Adolphus. The frequency of military success by armies that were not identified as the originators or sponsors of military change gives cause for reflection. One conclusion from the experience of battle is that a key factor in success was the presence of veteran troops. Armies able to maintain significant numbers of long-serving troops, regardless of tactical deployment, were likely to gain the advantage, whether in battle or in protracted siege warfare. When forces with significant numbers of veterans in their ranks encountered each other, the outcome would tend to be bloody and indecisive, unless one force, as with the Swedes at Nördlingen, made a major tactical error.

The next stage of the argument, that tactical success could lead to a widening of strategic vision, has also been scrutinized. The missing factor here, critics have maintained, is logistics. Ambitious war-winning strategies may require the defeat of the enemy, but this will only be achieved if armies can be fed and supplied. It is clear that systems of supply, transportation, and distribution were inadequate

throughout the period down to 1660 to sustain large-scale strategies. By prioritizing supply over strategic goals, small armies might extract subsistence locally, but such forces were ill adapted to winning wars. A picture of massive armies destroying opposing forces through their tactical superiority and then rolling forward onto enemy territory simply ignores the insuperable contemporary problems of supply.

Other conceptual criticisms of the “military revolution” take issue with those features that non-military historians have always found most compelling. The increasing size of armies—for whatever reason—is assumed to be the catalyst for the developing fiscal and administrative mechanisms of the state. But here a number of historians have raised questions about the actual scale of military increase in the period up to 1660. Armies of twenty to thirty thousand were attained by states waging war before 1500. The total military establishments of the great powers moved up toward forty to fifty thousand by the 1540s–1550s, and this appears to have marked a plateau of military effort. Alone among the European states, the Spanish monarchy of Philip II (ruled 1556–1598) may have maintained seventy to eighty thousand men by the 1580s. No other power was capable of rivaling an establishment on this scale, and it was not until the Thirty Years’ War that some of the belligerents could claim that their total forces surpassed this. And if the imperial army under the generalship of Albrecht von Wallenstein (1583–1634) could claim to have over 100,000 men under arms, and Gustavus Adolphus was reported briefly to have had as many as 175,000 men, other military establishments—including the imperial and the Swedish for most of the war—remained well below 100,000 men. Despite traditional claims for an army of 150,000, the reality of the French war effort during the 1630s and 1640s is nearer half that number. Moreover a contrast between the total military establishments of the belligerents and the actual size of campaign armies is still more revealing. To all intents the maximum force that could operate in a campaign theater remained at thirty thousand until the latter decades of the seventeenth century. Most of the specific campaigns and battles of the Thirty Years’ War took place with far fewer troops on either side; engagements with more than twenty thousand combatants in each army were rare. This

was no larger than the battles of the Italian wars, a century earlier.

These less impressive increases in numbers raise obvious questions about a necessary transformation of the fiscal and administrative mechanisms of the state. The questions are reinforced by recognition that increases in the size of armies did not require a growth in centralizing state power. The disparity between overall military establishments and the modest “cutting edge” of the campaign armies in the Thirty Years’ War hints at a more fundamental issue. Military expansion from the 1520s was largely met by contracting out responsibility for the recruitment and maintenance of soldiers. By 1558 a French military establishment of around fifty thousand troops was composed of 70 percent foreign mercenaries.

Although large-scale mercenary contracts initially implied only administrative decentralization, from the later sixteenth century and the Thirty Years’ War they were also fueled by fiscal delegation. Mercenary contractors would reimburse themselves through “contributions,” war taxes extracted under direct threat of military force. Bigger armies did not mean more extensive central state structures; bigger armies in fact came into being to facilitate the extraction of contributions and other forms of plunder and extortion. Far from being synonymous with the growth of absolute monarchies and centralized administrations, war encouraged a retreat by the state from many of its essential functions. Even where states had retained some degree of control over government or fiscality, the tendency was not to tighten this, but to market it. Desperate for cash to maintain those parts of the war effort that still fell under their responsibility, governments such as that of France under Cardinals Richelieu (in power 1624–1642) and Mazarin (in power 1643–1661) launched into an orgy of short-term fiscal expedients, most resulting in the confirmation or multiplication of existing privileges and fiscal exemptions and a huge increase of proprietary office holding.

Such comprehensive skepticism about one of the central planks of the original military revolution thesis, the link between war and state formation, finds support in recent work on early modern absolutism. Traditionally, absolutism was portrayed as the triumph of centralized, bureaucratic structures

over societies made up of multiple layers of personal, provincial, and institutional privilege. Revisionist historians have questioned whether it was practical, or in any sense the intention of these regimes, to exclude traditional elites from government and its institutions. Indeed the efficacy of so-called absolutist states in the later seventeenth and eighteenth centuries stemmed, it is argued, not from exclusion of the elites, but from more self-conscious and deliberate collaboration with them. By maintaining or rebuilding close relations with the elites, based upon respect for their fiscal and juridical privileges, and by ensuring that they retained access and promotion within key institutions, notably the army, the European states of the later seventeenth century set the stage for massive military expansion. In both Brandenburg-Prussia and Russia state service, for the most part in the military, was a positive obligation upon the established nobility, though one that offered promotional prospects and status. Elsewhere political and social pressures ensured that the officer corps was dominated by traditional elites. The armies of the eighteenth century were a potent symbol of the power of the state, but this was a direct product of compromises with the privileged. If particular rulers—Peter the Great of Russia (ruled 1682–1725), Charles XII of Sweden (1697–1718), Frederick II of Prussia (1740–1786)—seemed able to obscure this compromise and to deploy their armies and their states' resources in pursuit of untrammelled dynastic ambition, the underlying reality of armies as virtual joint stock companies reasserted itself with regularity throughout the eighteenth century.

These different emphases in studying the relationship between rulers, states, and armies in early modern Europe have done much to strand an unmodified “military revolution” thesis in a historiographical backwater. A productive recent development has been more systematic study of the effects of European military technology and organization beyond the Continent. Historians have given much more attention to the impact of European armies and warfare in non-European contexts. Was there a “Western way of war”? How did the Europeans capitalize on their military advantages in a colonial context? Perhaps most interesting, to what extent did non-European states on their own initiative replicate some of the organizational and technical

changes associated with early modern European warfare? In other cases, how quickly and how effectively did non-European states adopt the characteristics of European warfare, and what impact did this have upon their own political and social organization?

MILTON, JOHN (1608–1674), English poet. England's epic poet and champion of civil and religious liberties was born in London on 9 December 1608, entered Christ's College, Cambridge, in 1625, and earned his M.A. in 1632. His conscience prevented him from becoming a clergyman in the Church of England under the repressive Archbishop William Laud, and his talent and his "great taskmaster" (Sonnet 7) led him to poetry, "the inspired gift of God . . . of power beside the office of a pulpit, to imbreed and cherish in a great people the seeds of vertu, and publick civility . . . and set the affections in right tune" (CPW 1:816–817). In 1638–1639 Milton traveled in Europe, met members of the Florentine Academies, visited Galileo Galilei, "a pris[o]ner to the Inquisition" (CPW 2:538), and shipped music books from Venice; but hearing that "my fellow-citizens at home were fighting for liberty" (CPW 4.1:619), he returned to

write on behalf of the religious and political reformation of England.

In 1649, after the parliamentary victory, Milton was appointed secretary for foreign tongues by the Council of State and asked to defend the execution of Charles I; he produced *Eikonoklastes* (The image-breaker), arguing that the king is not above the rule of law. In 1652 he became blind but continued his work for the Commonwealth government, with assistance from Andrew Marvell, who also helped obtain his release from imprisonment after the Restoration.

PROSE WORKS

Milton's major prose concerns religious, political, and domestic liberty. Five tracts promoting religious reformation appeared in 1641–1642. *Of Education* (1644) proposes a curriculum "to repair the ruins of our first parents" (CPW 2:366) through biblical and classical works in their original languages and the direct observation of nature and technology. *Areopagitica* (1644), credited with a part in the founding principles of the American republic, opposes prepublication licensing of books and urges that truth seeking requires the freedom of a well-instructed conscience. Four tracts on marriage and divorce (1643–1645) argue that God instituted marriage for mutual help and companionship in both spiritual and domestic life and that God's laws should be interpreted by the rule of charity. Whether these were motivated in part by the three-year sojourn of his young wife, Mary Powell, with her Royalist parents is disputed. After her return the union produced three daughters and a short-lived son. Four years after Mary's death following childbirth, Milton married Katherine Woodcock, who died three months after the birth of a daughter who also died, and later Elizabeth Minshull, who outlived him.

Numerous tracts against absolute monarchy and against any usurpation of conscience by civil or ecclesiastical powers appeared between 1649 and 1673. Other prose works include academic prolusions, letters, and state papers, a *Christian Doctrine* (authorship of parts disputed), a grammar textbook, *The History of Britain* (1670), and an *Art of Logic* (1672).

SHORTER POEMS

In 1645 Milton published his *Poems . . . Both English and Latin*: masques, odes, hymns, epigrams, elegies, epitaphs, sonnets often praising particular men and women, and metrical translations of Psalms 114 and 136, both songs of liberation. The *Poems* include a prophetic ode, “On the morning of Christ’s Nativity,” written in 1629; companion poems on the active and the contemplative life, “L’allegro” and “Il penseroso” (both 1632); and “At a Solemn Musick,” in praise of the power of words and music to raise the imagination to the “Song of pure concert” that “we on Earth . . . May rightly answer” as we did before sin “Broke the fair music that all creatures made”—a prelude to *Paradise Lost*. “Lycidas,” a pastoral elegy written in 1637, laments a drowned schoolmate as shepherd-poet and promising pastor and considers hard questions about God’s ways. *Arcades* (1633?) and *A Mask Presented at Ludlow Castle* (sometimes called “Comus”; written in 1634 and published in 1637) concern good government and the right use of nature. The young heroine of *A Mask* defends chastity against Comus’s lures and argues for the just and temperate use of nature’s gifts. The Latin poems include elegies and epigrams, two on the Gunpowder Plot of 1605; a revealing verse letter to his father; and a poignant epitaph for his friend Charles Diodati. *Milton’s Poems, &c. upon Several Occasions* (1673) adds others both personal and political. “On the Late Massacre in Piedmont” (1655) is a cry of outrage against violent persecution.

MAJOR POEMS

Paradise Lost was published in ten books in 1667 and twelve in 1674. Rather than a national epic with warrior heroes, Milton wrote an epic of all humanity and the claims of God and Satan, founded on Genesis and incorporating classical allusions, that redefines heroism and merit. Milton raises hard questions—for example, how can liberty be preserved in the face of evil?—and provokes complex responses. Because of its biblical sources, some readers associate the epic with interpretations of the Bible that postcolonial, gender-conscious, and ecologically aware readers reject. But Milton did not accept traditional readings that had been used to support dominion and conquest over nature, women, and peoples. He reorients the Genesis story—to what extent is a matter of debate—toward a more liberal

and complex understanding of human liberty and responsibility. His rejection of the separability of body and spirit and his interpretation of the Trinity, which portrays the Son not as coequal and coeternal with the Father but as having free will and being exalted by merit, are heretical according to the orthodoxy of his time and are still controversial. Recent scholarship shows that as a monist materialist he believed that all creatures are kindred, created from the same matter derived from God, and that the divine image in men and women, though tragically obscured by the Fall, is, for those who choose regeneration, more fully repairable on earth, as well as in heaven, than orthodox predestinarian and dualistic believers could imagine.

Milton’s other major poems came forth in 1671 as *Paradise Regain’d. A Poem. In IV Books. To which is added Samson Agonistes. Paradise Regained* expands the biblical temptations to power and glory (Luke 4:1–13 and Matthew 4:1–11) to include wealth and luxury. It represents the Son of God, fully human though divine, clarifying his understanding of his mission while Satan tests him to find

out who he is and whether he can be foiled. Jesus refuses easy answers, rejects war, power, riches, and philosophies inconsequential to his calling, and stands miraculously on the temple pinnacle by his own balance as well as God's will. *Samson Agonistes*, though not intended for the stage, is structured as a Greek tragedy, in which encounters with the disordered passions of others provoke Samson's recovery from despair. Some readers see in the blind and exiled Samson, whose story is told in the Book of Judges, correspondences with Milton's own situation. Current critics debate the problem of Samson's violence: Is he a terrorist, a divinely led liberator, or an imperfect type of divine justice that Christ will perfect? Further, does Milton attempt to control his readers or to provoke response and dialogue? His poems engage responsive reading with all the resources of language, including surprising syntax, alternative definitions and allusions, punning etymologies, rich imagery, many-layered metaphor, and prosody that mimes the actions of human and angelic characters and other living things. The music of his language is an inexhaustible delight. He teaches readers to hold complex relations in mind and to imagine polyphonically—as one must do to think responsibly and feel responsibly in a complex world. A reading community debating these choices and enjoying these pleasures will learn to perceive the interwovenness of experience and the misuse of power. Milton's epic and dramatic poems do not offer easy answers but help us think creatively and deliberately about the difficult issues of our own times.

MIRACLES. Miracles were a vital feature of Christianity in the early modern period. Issues surrounding the possibility and impossibility of miracles were enthusiastically discussed in many theological, devotional, and scientific works, even as most Europeans actively sought divine intervention when harsh circumstances threatened. In his theological and historical work, *The City of God*, the fifth-century theologian St. Augustine (354–430) had outlined many of the teachings concerning miracles that were to play an important role in Europe for centuries to come. Augustine had stressed that the greatest of all miracles was the daily re-creation of the earth, sustained and controlled by a benevolent God, who used nature as a mirror to display his power over every aspect of his Creation. In this view, seemingly inexplicable events that occurred in the natural order were not to be feared, but rather to elicit awe as signs of God’s dominion. At the same time, *The City of God* also enthusiastically recounted many wonders the saints had worked in recent years, using these as signs to confirm the truth of orthodox church teachings. These dimensions of Augustine’s theology of miracles—his emphasis on nature’s wonders and his insistence that the miracles of the saints confirmed the church’s truth—continued to exert a powerful influence on the religious piety of the early modern world.

Around 1500, though, it was the miracles of the saints that most often captivated the European imagination. The keeping of records of miracles worked by the saints was a common practice, one whose origins stretched back into late antiquity and found at least partial inspiration in the teachings of Augustine. A vast network of pilgrimage shrines sustained the practice, and the manuscript records that survive from these places reveal that an exchange mentality largely governed Europeans’ appeals to the saints. When life’s trials threatened, the faithful approached the saints with prayers and vows of pilgrimages and gifts. With their requests granted, pilgrims journeyed to the saint’s shrine, often describing their miracle to a scribe, who carefully recorded their testimony. These miracle records were often proclaimed to those who visited these places. By the later fifteenth century, such accounts were increasingly being committed to print and circulated among a broad readership. Church authorities and humanist critics sometimes condemned these

practices, seeing in them an indulgence in forms of magic and barter they believed bordered on idolatry. At the same time, the tens of thousands of miracle records that survive from the period point to the widespread popularity of the practice.

PROTESTANT ATTACKS

During the sixteenth century, Protestant reformers stepped up criticisms long voiced about the saints and their miracles, unleashing a war against pilgrimage and the cult of the saints in an attempt to rid the European countryside of these practices. In turning to oppose the long-standing popularity of the cult of the saints, Protestants faced several dilemmas. First, they needed to explain the seeming effectiveness of the saints to their sixteenth-century audience. In some cases the reformers accused the medieval clergy of having promoted fraudulent miracles. More often, however, they admitted that the miracles that had long been attributed to the saints were real, but that they had actually been worked by demonic, rather than divine, agency. A second issue involved the role that miracles had played in confirming not only a specific pilgrimage or saint but all church teachings. From the early days of the Reformation, reform-minded preachers and theologians responded that miracles were unnecessary to those who possessed faith, since faith was in and of itself its own self-confirming miracle. Even as they made such a claim, though, most sixteenth-century reformers were anxious to exploit wonders that seemed to confirm their own religious positions. Like Augustine before them, they turned to nature, where they found wonders that confirmed their teachings. The fashion for natural wonders in Protestantism emerged early, beginning even with Martin Luther, who in 1524 exploited a dramatic misbirth in print. Luther treated the appearance of a hideously deformed calf in Saxony, the so-called Monk Calf of Freiberg, as a divine pronouncement on the degenerate state of monasticism and the church. Numerous similar readings of natural miracles followed, and by the later sixteenth century hundreds of short broadsides and pamphlets filled with tales of recent celestial apparitions, earthquakes, floods, and deformed births poured from the presses of Europe. While accounts like these were consumed everywhere, the fascination with reading natural wonders as divine signs was far more pronounced in Protestant than in Catholic regions.

Here, natural wonders came to satisfy the appetites of readers for signs of God's continued intervention in the world, an appetite that early modern Catholics indulged, by contrast, through the miracles of the saints. Even in the generally restrained and often rationalistic climate of John Calvin's Geneva, natural wonders played a role in shaping piety. Although on occasion Calvin held out the possibility that miracles had long since ceased to occur, he endorsed the publication of Luther's treatment of the Monk Calf in Geneva, and in the dedication to his *Institutes of the Christian Religion* (1536) he insisted that a steady stream of wonders had long confirmed the Reformation message. Thus a curious paradox surrounded miracles in the Protestant tradition. On the one hand, most Protestant commentators insisted that miracles were not necessary to those who possessed a saving faith. On the other hand, wonders—if not full-fledged miracles—were enthusiastically tracked and commented upon and continued to shape piety in Protestant Europe during the seventeenth and eighteenth centuries.

POLEMIC AND GROWING DISENCHANTMENT

Miracles also entered into the heated religious rivalries of the time. The reformers' attacks of the early sixteenth century had sent pilgrimage and the recording of saintly miracles into a temporary decline in many parts of Europe, but in the late sixteenth and seventeenth centuries these practices experienced a dramatic resurgence. Catholic propagandists enthusiastically promoted the miracles recently worked by their saints or by the Blessed Virgin Mary as a vivid testimony to Roman Catholicism's truth. These renewed efforts sparked bitter confessional rivalries and polemic, prompting the Protestant charge that pilgrimage and the intercession of the saints was nothing more than a form of sorcery. In the overheated disputes of the later sixteenth and early seventeenth centuries, miracles of healing, successful exorcisms, and any seeming violation of the natural order might be used alternately by Protestants or Catholics to condemn their opponents. At the same time, the popular demand for miracles of healing persisted particularly in the Catholic countryside and inspired the foundation of numerous new pilgrimage shrines, many of which grew to heights of popularity far beyond any pre-Reformation precedent. While the saints did

not survive in Protestant territories except as vestigial models for piety, the fashion for visiting sites where great miracles had occurred was shared by Protestants and Catholics alike. At the end of the seventeenth century, for example, a spate of miracles involving images of Martin Luther inspired new pilgrimages among Lutherans to his one-time residences. As a result, the reformer's birthplace, Eisleben, was celebrated as Germany's "New Bethlehem" and was sought out by the pious well into the eighteenth century.

Even as the hunger for the wonders persisted, though, new forces were at work that questioned the possibility of God's supernatural intervention in the world. One important development in this regard was the appearance of the doctrine of the cessation of miracles, a teaching pioneered by Erasmus of Rotterdam (1466?–1536) and endorsed by seventeenth-century Calvinists, alleging that wonders had been necessary only for the foundation of the Christian religion in ancient times. Once Christianity had been successfully established, the Holy Spirit had ceased to work miracles. While this notion did not find general acceptance among most religious thinkers at the time of its appearance, the doctrine pointed to a new skepticism that would eventually result in the eighteenth-century Enlightenment's denials of miracles. The most famous of these appeared in the work of the Scottish empirical philosopher David Hume (1711–1776). In his *Enquiry Concerning Human Understanding* (1758), Hume argued that miracles were impossible because nature's laws operated according to ironclad regularity and inevitability and could not be violated. A similar debunking spirit pervaded Voltaire's *Philosophical Dictionary* (1752), in which he argued that miracles had functioned throughout Europe's history only to sustain fanaticism and intolerance. Even as these elite attacks on supernatural beliefs flourished, accounts of miracles remained vital to the religious life of the eighteenth century, particularly in the Catholic countryside where the cult of the saints and pilgrimage retained great popularity. At the same time, the attacks of elites were not without an eventual impact. By the later eighteenth century, Europe's Catholic princes often viewed the appetite for miracles as an archaism and many reform efforts focused on weaning people away from the long-standing

customs of pilgrimage and the veneration of the saints.

MISSIONS, PARISH. Parish missions, also called "internal missions," as opposed to foreign missions, were a temporary form of apostolate among Christians. The term refers to selective stays, lasting from a few days to three months, made by missionaries in a parish or a group of parishes with the aim of converting people or deepening their faith. This type of mission has its origins in Christian antiquity and has a long history of revivals.

For example, parish missions were revived in Europe during the evangelization campaigns of the fourteenth and fifteenth centuries and in the preachers' movement of the sixteenth century. It was during the 1570–1650 period, at the height of the confrontation between Protestants and Catholics, that these missions achieved their ultimate form of spiritual conquest. They were planned as military campaigns, with systematic logistics and thoughtful methodology, aimed at winning back Protestants and lukewarm Catholics to the Roman Catholic church. Though they declined at the end of the eighteenth century, these missions *ad fidele* or 'missions to the faithful' were still conducted in the 1960s in countries with a Catholic heritage, such as Italy, France, and Spain.

In the sixteenth century Catholic reformers realized that Roman Christianity had drastically declined in Europe. Not only had many people con-

verted to Protestantism, but many others had embraced superstitions and, in some cases, returned to paganism. Ignorance of the Christian faith was seen as the source of these evils. Internal missions were organized in order to fill these gaps. New missionary orders, such as the Capuchins and the Jesuits, launched missions all over early modern Europe and maintained them for two centuries. Individual churchmen, who worried about the poor state of local clergy and faithful, invited these orders to do missions in their country. At the end of the fifteenth and beginning of the sixteenth centuries in Spain, Cardinal Jimenez de Cisneros (1436–1517) had sought to restore a "pure" Catholicism that was free from heresy and, above all, from Jewish and Muslim influences. Many means were used to achieve this goal, including internal missions that reformers such as Juan de Avila (1499–1569) and Luis de Granada (1504–1588) promoted actively in the regions of Andalusia and Extremadura. After the Council of Trent (1545–1563), Saint Philip Neri (1515–1595) and Saint Charles Borromeo (1538–1584) introduced the Tridentine reforms to fight Protestantism and to reform Catholicism. They established an influential model of missions *ad fidele* that much inspired the missionary enterprises led in France by reformers such as Cesar de Bus (1544–1607), Saint François de Sales (1567–1622), and Saint Vincent de Paul (1576–1660).

Typically, parish missions were designed according to the structure of spiritual combat: missionaries were the soldiers battling against the forces of evil, assailing the fortresses of the Devil, and winning souls for Jesus Christ. Their missions consisted of a series of religious "exercises" that were crafted to fire the imagination and create the right climate for conversion. Discourses were carefully developed to achieve this aim. Preachers would focus on the sad condition of the sinner, on the Last Judgment, and on the pains of hell. After bringing the audience to an emotional climax through their discourse, they would abruptly change tone and invoke reassuring images of redemption and paradise. The decor and production of the whole mission were also neatly rendered with the following elements: solemn entry of the missionaries in the parish, pathetic sermons, catechisms using holy pictures, collective prayers and chants, religious plays, general confession, communion, processions, and

the erection of a cross at the end of the mission. All these exercises were conducted with great pomp and spectacle to attract people and stir them sufficiently to induce conversion.

Early modern parish missions were part of a much wider missionary movement used in sixteenth- and seventeenth-century colonialism. Countries attempted to conquer souls both at home and abroad through simultaneous internal and external missionary efforts. The same missionaries would work in both types of missions. They used the same methods of conversion and anticipated the same reactions from what they saw as the similar groups of people: lukewarm Catholics, superstitious peasants, heretics, pagans from Middle East and East Indies, Turks, and “savages” in America. Despite the apparent cultural diversity of the prospective converts, missionaries saw them as equal in their ignorance of the need for and the way to their salvation.

ASIA

The history of Christian missions in Asia is tied, for better or worse, to European expansion. When the Byzantine capital of Constantinople fell to the Ottoman Turks in 1453, Christian Europe was reduced to the status of a backwater area in world civilizations. Overshadowed and threatened by the ascendant Muslim empires, first by the Ottomans in the eastern Mediterranean and later by the Safavids (after 1502) in Persia and the Mughuls (after 1526) in India, Europeans were anxious about their future. Farther to the east, China was the colossus of the age and by almost any standard the greatest empire in the world. As Europe had receded, so had Christianity. Although missionaries since the time of Jesus had carried Christianity to Asia, churches there were now contracting and struggling to stay alive.

EUROPEAN EXPANSION

Shortly after 1450, Europe reached its nadir and began its ascent. In one of the ironies of history, the rapacious conquistador spirit of the Portuguese and Spanish trader-explorer-adventurers provided the ships that carried Christian missionaries to remote Asian lands. The committed missionaries who boarded these ships were inspired to do so by the fervor of the Counter-Reformation. (They were nearly all Catholic; Protestants did not send out missionaries until after 1789.) Hence, the love of Christ was spread in collusion with the lust for wealth, power, and adventure. It might therefore appear that the church was making a pact with the devil, but it is doubtful that these Europeans were aware of the contradiction. Furthermore, this intermingling of pure and selfish motives had a powerful effect not only in spreading the dominant religion of early modern Europeans to Asia, but also in shaping European culture. Europe's contact with Asia was a two-way process of mutual influence, and the expansionist Europe of the early modern period was much more open to Asian influences than the imperialistic Europe that followed.

The path of missionaries to Asia was opened by the success of two small and previously insignificant nations seeking trade routes to Asia. After years of Portuguese effort on the western coast of Africa, Vasco da Gama (c. 1460–1524) sailed east to India in 1498, six years after the Genoan explorer Chris-

topher Columbus (1451–1506) opened a trade route to the west for Spain in 1492. With papal assistance, Portugal and Spain had divided the world between them and established their mission monopolies (Portuguese *padroado* and Spanish *patronato*) with the Treaty of Tordesillas in 1494. Thereafter, most European missionaries bound for Asia would travel on Portuguese ships, although a smaller number took Spanish ships to Mexico and then crossed the Pacific Ocean to the Philippines. This sole Spanish base in Asia proved to be the most fertile mission field of all. The Augustinians were the first to arrive, in 1565, and within one century, the entire population of the Philippines was converted to Christianity.

JESUITS

Throughout Asia, the triumphalism and chauvinism of the Counter-Reformation Catholic Church were tempered by the accommodating spirit of a remarkable new religious order called the Society of Jesus. The Jesuits had emerged as the right arm of the pope in the Counter-Reformation struggle with the Protestants. Far more educated and sophisticated than most other missionaries, the Jesuits tended to missionize by cultivating the local elites. This led them to study the indigenous cultures with an aim toward accommodating Christianity with local cultural elements that were not in blatant conflict with Christianity. Many other missionaries accused the Jesuits of being too accommodating, and the early Jesuits manifested an arrogance that aroused a very unchristian hatred among their critics. Nevertheless, in retrospect, it is clear that the process of inculturation that the Jesuits sought for Christianity in Asia was a necessary foundation for the long-term viability of the faith there.

Jesuit accommodation did not dominate the missions in Asia but had to compete with the rivalry of other religious orders as well as nationalistic and Eurocentric forces. When the Portuguese first landed in India, they had encountered a group of approximately 100,000 Christians in the south, said to have been converted by the apostle Saint Thomas. These were Nestorian Christians of the Syrian church who were technically under the control of the patriarch in Babylon. The Portuguese, through their colonial base at Goa, forced the Saint Thomas Christians to submit to the authority of the

pope via the Portuguese representative of the archbishop of Goa. This fostered great resentment among the Saint Thomas Christians. When the Jesuits first arrived in India, they went to the court of the Mughul emperor Akbar (ruled 1556–1605) in the hope of converting the emperor, but they were disappointed to learn that Akbar was merely using their views to forge a new religion called the Divine Faith.

Hopes for the mission in India were renewed in 1605 when a brilliant young Italian Jesuit named Robert de Nobili (1577–1656) arrived; he spent the following half century developing a new and fruitful approach to inculturating Christianity into Tamil culture in south India. Nobili focused his efforts on the highest of the four castes of Hindu culture, the Brahmans, or priestly caste. He studied the languages of ancient India (Sanskrit and classical Tamil), adopted the indigenous ochre robe, and renounced attachments to the world—even cutting himself off from other Christians. Nevertheless, the conversions resulting from Nobili's work were limited until missionizing was extended to the lower castes.

The strong Buddhist beliefs of southeast Asia resisted the penetration of Christianity, with the notable exception of Vietnam. The remarkable success there can be traced to the work of the French Jesuit Alexandre de Rhodes (1591–1660), who arrived in Macau in 1623, hoping to go on to Japan. But with entry into Japan barred to missionaries, Rhodes was sent to Vietnam, whence he was expelled in 1625, 1630, and 1645. Nevertheless, he developed a remarkably effective missionary method by creating a Vietnamese group of catechists who were trained in basic medicine and who lived as a celibate brotherhood. They fostered thousands of conversions. Rhodes also developed a system for transliterating the Vietnam written language from Chinese characters to the Latin alphabet.

In Japan, missionaries met with striking initial success followed by harsh persecution. (This Japanese resistance to Christianity has been portrayed in the best-selling novel *Silence* [1969] by the Japanese Catholic author Shusaku Endo.) The first mission was led by the great Jesuit Francis Xavier, who arrived in 1549, when Japan was still in a period of warring feudal chaos without centralized leadership.

This chaos provided an opportunity for the missionaries, and within sixty-five years there were 300,000 Christians in a Japanese population of twenty million. However, most of these Christians were concentrated in the southern part of Japan where the allegiance of the daimyo (feudal lords) to the shogun was regarded with suspicion, a suspicion that was strengthened when several of these daimyo converted to Christianity. The shogun (who ruled in the name of the emperor) decided to preempt any possibility of subversive rebellion by expelling the missionaries in 1614. When the missionaries surreptitiously returned, the shogunal court resorted to harsh persecution, including the torture and execution of many Japanese Christians and several Portuguese priests. The Catholic Church records the death of 3,125 Christian martyrs in the years 1597–1660. Christianity was exterminated in Japan, except for a small group of faithful followers who continued to worship in secret in the area of Nagasaki throughout the Tokugawa period (1600–1867).

THE CHINA MISSION

Of all Asian lands, none received more attention from missionaries of early modern Europe than China. Its great distance from Europe and high level of civilization made it a tremendous challenge. The Jesuits in particular, who served “for the greater glory of God” (*ad majorem Dei gloriam*), sought to fulfill their motto by converting what was then the greatest nation in the world. Consequently, from 1552 until the Society of Jesus was temporarily abolished in 1773, nearly a thousand (the best source lists 920) Jesuits participated in the China mission, far more than any other religious order. In second place were the Franciscans (Order of Friars Minor) who sent approximately 130 of their members to China in the years 1450–1789. Smaller numbers were sent by the Dominicans (Order of Preachers), Augustinians, the Missions étrangères de Paris, and the Lazarists.

However, these missionaries were not entirely controlled by the superiors of their own orders. Even the Jesuits, who were notorious for their “corpse-like obedience” in obeying orders passed down in a militaristic chain of command from the Jesuit father general in Rome, were subject to the monarchs in whose territory they served. Particularly notable in this regard were the Portuguese,

who constituted the largest segment of the Jesuits in China (314 out of 920). The Portuguese court exploited their mission monopoly to dominate the office of vice-provincial, which directed the China mission. Through their control of the colonies on the trade routes between Europe and China (most notably Goa in India and Macau in southeast China) the Portuguese restricted the entry of missionaries of other nationalities, particularly their Spanish rivals. The latter were forced to enter China from the Philippines by way of the pirate-infested coast of Fujian Province. The French Jesuits tried to circumvent the Portuguese control of entry at Macau by landing a group of five French Jesuits at Ningbo in 1687.

Because Rome felt that these nationalistic rivalries were harming the missionary effort, not only in China but throughout the world, Rome in 1622 had created the Sacred Congregation for the Propagation of the Faith, commonly known by its Latin name Propaganda Fide (or simply Propaganda). While the Portuguese continued to control the appointment of ordinary bishops throughout Asia, Propaganda appointed a special sort of bishop called a “vicar apostolic” who was consecrated directly by Rome. Consequently, in China and elsewhere, missionaries under the control of Propaganda competed with missionaries controlled by Portugal or the Jesuit father general. The Portuguese king struggled with Propaganda over the administrative division of China and eventually nine dioceses were established, with a vicar apostolic appointed to head each of them. However, when one of the appointed vicars apostolic, Bishop Bernardino Della Chiesa, attempted to take control of his newly appointed office of bishop of the diocese of Beijing in 1700, he was forced by the Portuguese Jesuits to establish his base outside of Beijing in a neighboring province.

Because the Jesuits tended to make conversions from the top down, focusing first on the imperial court or socioeconomic elites, their efforts in China had been shaped by the drive to establish a base in the Chinese capital. The great Jesuit missionary Matteo Ricci achieved this goal in 1601 and the Jesuits thereafter became valued servants of the Chinese emperor. Their training enabled them to be useful in a number of capacities, particularly in overseeing the Bureau of Astronomy, which was responsible for compiling the annual calendar, and in

painting, architecture, cannon making, and even in serving as translators in diplomatic negotiations with the Russians in formulating the Treaty of Nerchinsk (1689).

However, the Jesuit strategy tied the fate of the mission to the whims of particular rulers. Other missionary orders in China attempted to ground Christianity in conversions among people in the provinces. The Jesuit strategy peaked in the years 1644–1661 when the Jesuit father Adam Schall developed a close relationship with the youthful Shunzhi emperor, who at one point was thought to be near converting. However, the mission later suffered persecution when the throne was occupied by a hostile ruler, such as the Yongzheng emperor (ruled 1723–1735). In terms of the overall development of Christianity in China, the Jesuits placed too much emphasis on cultivating the court but were wise in their emphasis on cultural accommodation. Ultimately, Christianity survived because of conversions effected by both Jesuit and non-Jesuit orders among the people in the provinces.

CULTURAL INTERMEDIARIES

The missionaries' contact with China influenced the development of early modern Europe in substantive ways. Missionaries (mainly Jesuits) returning from China wrote books about its remarkable culture that were avidly read by some of the most important European thinkers of the seventeenth and eighteenth centuries. Francis Bacon (1561–1626), a leading figure in the scientific revolution, saw in the Chinese written script elements of a universal language. The dates of biblical chronology developed by the Anglican archbishop James Ussher in 1650–1654 and printed in the margins of the King James version of the Bible were modified to avoid contradicting the Chinese chronology introduced to Europe by the Jesuit Martino Martini.

The great philosopher-mathematician Gottfried Wilhelm Leibniz (1646–1716), who corresponded with the French Jesuit Joachim Bouvet in Beijing, concluded that the most ancient Chinese classic, the *I Ching*, or *Book of Changes*, had anticipated his discovery of a binary system of arithmetic by several millennia. Leibniz also believed that the Chinese surpassed Europeans in “practical philosophy” or the adaptation of ethics and politics to contemporary life. Enlightenment thinkers like

Christian Wolff (1679–1754) and Voltaire (1694–1778) agreed; they extolled the philosophy of Confucius and sought to adapt Confucian teachings to Europe.

Whereas in seventeenth-century Europe China was the preoccupation of mainly learned savants, by the eighteenth century “sinomania” had become a popular preoccupation. Almost all the information about China was supplied by China missionaries. Louis XV of France in 1756 and Joseph II of Austria in 1769 imitated the Chinese emperor in performing the ritual plowing of the earth in spring. European artists were influenced by Chinese art to create a new hybrid and fanciful style called chinoiserie. English gardeners abandoned the geometrical forms of French gardens and imitated the Chinese in an attempt to reproduce the irregular and varied patterns of nature found in Chinese gardens. The Chinese economy provided inspiration for the French to help regain their lost status in the aftermath of their disastrous defeat in the Seven Years' War (1756–1763). François Quesnay advocated emulating the Chinese model in reorganizing the French economy around agriculture (with minimal government intervention) and gave birth to the economic philosophy of laissez-faire. Chinese porcelains were so technically and aesthetically superior to European stoneware that they shaped European tastes.

The Jesuits' accommodative approach was well-suited to the syncretic culture of the late Ming dynasty (1368–1644) and made a number of conversions of prominent literati. While Buddhism and Taoism were difficult to reconcile with Christian teachings, the moral philosophy of Confucianism was much more amenable. Chinese teachings typically were transmitted from master to pupil. The prominent scholar-official Xu Guangqi (1562–1633) was the founding teacher in a Confucian-Christian tradition. Xu developed the formula *bu Ru yi Fo* (‘supplement the Confucians and displace the Buddhists’), a four-character phrase of the sort favored by Chinese literati. Xu's formula was later developed further by other Christian literati, such as Shang Huqing (1619–after 1698) and Zhang Xingyao (1633–after 1715).

However, after the Manchu conquest of 1644 and the establishment of a new dynasty, the Qing,

and the emergence of a less experimental and more conservative culture, the intellectual quality and prominence of the converts deteriorated. The conversion of scholar-officials was made more difficult by a bitter interorder dispute called the Chinese Rites Controversy (1715). It produced Eurocentric rulings from Rome that opposed flexibility in dealing with converts' rites of reverence to their ancestors and to Confucius. Consequently, most of the conversions of the late seventeenth and eighteenth centuries were made by non-Jesuit missionaries working in the provincial cities and rural areas of China. As the missionaries lost the support of the court, magistrates became increasingly harsh in their treatment of Christians and anti-Christian persecutions grew in intensity. Nevertheless, many of the Catholic converts made in villages continued to practice Christianity with remarkable continuity, passing their practices in filial-pious style from generation to generation down to the present day.

SPANISH AMERICA

The missionary effort in the regions of the Americas controlled by Spain provided a pretext for converting peoples beyond the Mediterranean. The Catholic missionaries relied heavily on the efforts of Portuguese and other missionaries in the Old World as models for successfully “spreading the gospel.” Moreover, the reforms begun in the religious orders of Spain in the fifteenth and early sixteenth centuries had a profound effect on missionaries sent to the Americas.

The Spanish conquest and settlement of the Americas had an important religious component because the crown saw the conversion of the indigenous peoples as a way of justifying their occupation of the newly conquered lands. In a diplomatic effort of the highest order, Spain sought justification and legitimization of its claims in the Americas from its closest neighbor and rival in overseas domination, Portugal, and confirmation of the bilateral agreement from the pope. Conversion to Christianity was also one way of assimilating the native peoples into the European political sphere. Thus, the Spanish inextricably linked territorial conquest with converting those they considered “heathens” to Christianity.

Religious orders took the lead in converting the native peoples of the American continents: the first missionaries arrived on the island of Hispaniola only a few years after Columbus's initial voyage. The Dominican order initiated the early phases of the missionary movement in the Americas, establishing themselves in Santo Domingo, Columbus's capital on Hispaniola, and it was the Dominicans who first raised concerns about the Spanish treatment of the natives of the islands. Fr. Antonio de Montesinos launched the campaign for protection of the natives in a fiery speech in the cathedral of Santo Domingo, taking as his text the passage from Isaiah, “I am the voice of one crying in the wilderness.” This sermon, while it upset the Spanish residents of the town,

became a crucial factor in the intellectual development of a priest who would eventually lead the struggle for native rights, Fr. Bartolomé de las Casas (1474–1566).

Because priests and friars frequently accompanied expeditions, the missionary effort quickly moved to the mainland with the Spanish conquest of Mexico. The Cortés expedition included two clerics: Fr. Bartolomé de Olmedo, a Mercedarian, and the secular priest, Juan Díaz. Olmedo functioned as the official chaplain of the expedition and frequently took center stage in the conquest. Díaz was simply another member of the conquering band who happened to be a priest, though on a few occasions he actively functioned as a priest. Similarly, the Pizarro expedition to Peru had at least two priests: Fr. Vicente Valverde, also a Mercedarian, and Juan de Sosa, a secular priest. The efforts of these first missionaries bore little fruit. The true efforts of conversion to Catholicism began in the wake of the conquest, ushered in by small groups of friars sent out from Spain specifically for the purpose of converting the natives.

In the case of Mexico, called New Spain by the Spanish, the first missionaries were Franciscans. Two contingents reached Mexico immediately following the defeat of the Aztecs. The first consisted of three Franciscan lay brothers from Flanders, home of Charles I, the new king of Spain (who also became Holy Roman emperor Charles V). These three quickly set about converting the natives, establishing a base of operations in Texcoco, just east of the Aztec capital of Mexico, Tenochtitlán. Two of the friars achieved fame for their efforts. Fr. Peter of Ghent began the first European school in the Americas, created to train the sons of the native nobility in European ways. The other, Fr. Jacob of Tastera, created a method of explaining the principles of Christianity to the natives through the use of pictures, not unlike cartoons. These now carry the name of Testerman catechisms.

The first major missionary expedition, consisting of twelve Franciscans, arrived in 1524; a similar expedition of Dominicans followed four years later, and five years after these the first contingent of Augustinians arrived. The first religious orders essentially carved up the territory among themselves. The Franciscans dominated in the central area of

New Spain and in the Yucatán. The Dominicans predominated in the south, especially around Oaxaca, while the Augustinians concentrated on the area immediately north of Mexico City and in the west in the province of Michoacán.

A similar pattern emerged in Peru. While the religious orders that participated were largely the same, they appeared in a different sequence. The Dominicans and Mercedarians claimed preeminence in Peru, whereas the Franciscans and Augustinians arrived later. As in the case of Mexico, the religious orders spread out into the hinterlands, creating areas of dominance. In both North and South America, all the orders established important centers in the leading cities and towns.

The Jesuits were latecomers to the American missionary field because the order was not formally established until 1540. As the founder, Ignatius Loyola, was a Spaniard, the order manifested a strong interest in colonial missionary work. As early as 1566 the order sent a group of missionaries to the newly settled colony of Florida, and within five years they were establishing missions in Mexico and Peru. Despite its late arrival, the order would become the most powerful in the colonies.

While the early missionary efforts fell to the religious orders, the secular, or diocesan, clergy consolidated the missionary effort. Their internal organization allowed the religious orders the institutional structure to assist in missionary activity on the newly conquered frontier while the secular clergy enjoyed a structure better suited to the full incorporation of the faithful into the church militant. The crown appointed the first bishops to the Americas at approximately the same time as the first missionaries arrived, but it took several years for them to gain a modicum of control over the priests and friars in their diocese. Because so many of the clerics in the newly created dioceses were members of the regular clergy, gaining control over them was a difficult process.

The missionaries developed a wide range of techniques to address the various problems they encountered. Clearly, simple communication between the missionaries and native peoples was the major initial problem. Through methods such as the Testerman catechism the friars began the process of Christian indoctrination. At the same time they be-

gan to learn the native languages. The sixteenth century saw the publication of dozens of grammars, vocabularies, and other linguistic tools giving missionaries access to the indigenous languages. They then had to communicate the essence of Christian doctrine in the new language, an extremely complex process. The priests tried to avoid confusing the pre-Columbian religions with the newly imposed Christian religion, but as one scholar has noted, their efforts required a dialogue with the missionaries and the native peoples.

The missionaries also wanted to construct suitable places to celebrate their rituals. Frequently this meant destroying the native temples, locating the new church close to the old site, but not immediately on it, and often using rubble from the destroyed temple as building material for the invaders' church. Slightly later, the priests used the platforms of the old temples as bases for their churches, visually destroying the native peoples' religions and imposing the Christian religion on top of them. Nonetheless, local artisans had skills honed before the conquest and incorporated symbols from their native religions in some of the decorative motifs of the new churches.

Within the first century after contact, the American populations were nearly annihilated by warfare, by Old World diseases inadvertently imported by the invaders, and by the resulting social and economic disruption. With the decline of the native population, the missionaries and Spanish officials pressed for relocating the remnant native populations from their dispersed settlements into clustered villages. The process, called *reducción* ('reduction') or *congregación* ('bringing together'), made it easier to perform rituals, indoctrinate the people, and collect tribute from them, but it led to the further depopulation of large regions. Nevertheless, clustering dispersed native populations became a standard feature of missionary activity.

The conversion process focused initially on teaching the rudiments of Christianity to local peoples, but the missionaries' high expectations for rapid success were dashed by events in Mexico. Religious officials found that one of the first native leaders to have converted, Don Carlos Omtechtizin, lord of Texcoco, continued to practice his native religion for more than a decade after his

baptism. The local bishop, acting as inquisitor, tried him and ordered him burned at the stake as an apostate. This shocked Spanish sensibilities to the point that the crown removed the natives from the purview of the Inquisition. With setbacks such as this, most priests and friars then realized that the conversion process takes generations, not years.

Although the church establishment reduced its expectations regarding the conversion of the natives, by the early seventeenth century concerns rose again. In both Peru and Mexico religious authorities began to scrutinize native beliefs and practices more closely, and in Peru an effort known as the extirpation began. While the Inquisition had no authority over the natives, local bishops could act to root out remnants of the native peoples' religions, so the archbishops organized campaigns to extirpate all vestiges of them. While causing a great deal of disruption, the campaigns had little lasting effect. By the early eighteenth century a new philosophy, one that was willing to proceed with conversion at a slow, methodical pace, was evident. In Mexico efforts to root out pre-Columbian beliefs and practices were not so well organized but required considerable effort in the seventeenth century.

The nature of the conversion effort tended to create core areas, places characterized by early and successful conversions, and peripheries. Later, missionaries spread from the core areas to the peripheries. In general there was a greater concentration of priests and friars in Spanish cities, ports, and mining districts than in the hinterlands. In the northern reaches of Mexico and in Florida, a new type of conversion effort developed in the seventeenth century: military contingents accompanied missionaries and established bases—*presidios*—from which they "pacified" the frontier while the friars created missions where they delivered sermons. In some areas the missionaries pushed so deeply beyond the frontier that for all intents and purposes they were the only Europeans for miles around.

The two classic late colonial missionary fields were California and Paraguay. Starting in the early seventeenth century, the Jesuits established a network of missions, far from the supervision of Spanish authorities, among the Guarani Indians in Paraguay. These missions are a model of conversion through attraction. The Jesuits established them-

selves without military assistance and attracted the natives to settle on the mission, teaching them sedentary agriculture and European arts. Later authors have tended to idealize the Jesuit experiment in Paraguay, but it was noteworthy nonetheless.

The Franciscans managed the mission field of Upper California. They used some of the practices of the Jesuits, but the crown established military forts to assist in keeping the peace. While many natives came to the Franciscan missions through attraction, the friars also coerced others to settle down. Once natives had joined a mission, however, the friars prohibited them from returning to their former lives. Unfortunately, European diseases and the change of lifestyle killed many of the mission Indians.

The Jesuit order was successful in the Americas, both in terms of its missions and in economic terms. The order supported itself through the development of commercial enterprises, frequently agricultural estates. Using donations from the faithful, the order acquired ranches and farms, then managed the estates directly, producing goods for the local market. This system was very profitable and the proceeds supported the work of the order, both the missions and the development of schools in Spanish towns and cities. Jesuits were important participants in the universities of colonial Latin America.

By the mid-eighteenth century, the Jesuits had attracted both strong supporters and vocal opponents. In 1769 the Spanish crown formally expelled the order from the Americas, and reassigned the Jesuit missions to other orders and to the secular clergy. This action gave the Franciscans the missionary field of Upper California, originally a Jesuit territory. The crown confiscated the Jesuit estates and sold them at auction to generate cash for the always-strapped royal treasury. The crown had demonstrated its willingness to take extreme action against any order that defied the royal will: the expulsion of the Jesuits had a dramatic effect on the other religious orders, and the secularization of the parishes concluded with little or no opposition.

The church occupied an important role in colonial Latin America, not only because of its missionary role, but also because of its social and economic impact. It was the leading institution in the provision of hospitals and other institutions that assisted

the disadvantaged and ill, and played a crucial role in the economy of the colonies by providing capital on credit. The missionaries' efforts ensured the pervasive presence of Roman Catholicism throughout the Americas during the early modern period.

MOBILITY, GEOGRAPHIC. The early modern period was marked by considerable population movements. Yet, compared with the medieval centuries or with the nineteenth and twentieth centuries, it was a time of reduced mobility, particularly in France. Between the sixteenth and nineteenth centuries there was no need for further rural development, which had been very intensive between the tenth and the fourteenth centuries, producing a well-rooted peasantry that was shaken only by the rural exodus after 1840–1850. Thus, mobility was primarily a matter of micromobility, deriving mainly from matrimonial exchanges. Young peasant girls rarely moved more than ten kilometers from their place of birth when they married; their husbands for the most part traveled less than twenty kilometers from their place of birth, and the majority of them less than ten kilometers. This model was accompanied by regional and chronological nuances and

even exceptions. Nor did it exclude some major population movements.

RECRUITMENT AND MOTIVATION

In both town and country, there were in reality two types of behavior reflecting, as it were, two populations, one stable and rooted, the other highly mobile. In spite of micromobility related to matrimonial exchanges linked to boy-girl imbalances in families and the marrying of younger sons and daughters, rural areas saw family continuity and the maintenance of family patronyms within a zone rarely larger than, say, ten kilometers. This zone was roughly circular, but considerable geographical dissymmetry could be caused, for example, by bad relations with a neighboring parish or by geographical obstacles (a watercourse, mountain, etc.). In isolated mountain communities mobility was even more limited. Continuity of one part of the family over several generations was also common among urban middle and elite strata. This was much less frequently the case in working-class environments, partly because of very high mortality rates.

Cities, by contrast, show high mobility, both socially and geographically, for a variety of reasons. Except for small towns, cities in the early modern era were unable to renew their populations because of high mortality in urban environments. For cities to maintain their populations, there had to be very high immigration, and even higher if populations were to increase. Thus, the growth of London between the mid-seventeenth and the mid-eighteenth centuries absorbed half the surplus births for all of England (Wrigley). Given the considerable scale of urban growth in the sixteenth and eighteenth centuries, and the development of capitals and ports over the early modern era as a whole, there was necessarily a major movement toward cities, though its sources varied.

Recruitment was predominantly rural and reflected the size of the city. A considerable share, often a majority, of immigrants came from the nearby countryside, especially female immigrants, only a minority of whom came from farther afield. Larger cities drew immigrants not only from the smaller cities of the hinterland, but also from other major cities. The bigger the city, the more likely it was that immigration came from more remote areas.

This long-distance immigration was varied and sometimes minimal.

Motivation for migration was sometimes occupation-related—trading colonies from the middle of the Middle Ages are an important example of this. Another type of migration involved groups of seasonal and temporary migrants, which we shall discuss later on. Thus, some populations moved a lot, sometimes because they could not take root: Rouen is an example of a city that could function both as a pressure pump and a suction pump, repelling and attracting migrants at the same time. Some segments of populations, such as the sailor populations of Amsterdam or Dunkirk, were constantly on the move. By contrast, the majority of seasonal and temporary migrants were much less mobile, making only one journey each year, or even every two or three years, the goal being to bring back as much money as possible to their home town or village.

Overall, the mobility of rural and urban populations may be entirely due to circumstances. For example, social difficulties, particularly the high cost of bread, were particularly hard on the lower strata of urban populations. Heaped with debt and more or less dispersed, families—or the remaining members thereof—abandoned not only their accommodation but also their city of residence and took to the roads, often in search of other cities. The poor in general were very mobile, as revealed by poorhouse admission records. The mobility of poverty sometimes intersected with criminalized or criminogeneous mobility; criminal populations traveled a lot in search of better possibilities or simply as a means of escaping judicial and police authorities. In sixteenth-century England—particularly at the end of the century—this led to the development of laws directly relating to the poor. On the Continent, poorhouses, bridewells, workhouses, and prisons were established; the last three were reserved for populations that were considered dangerous, as victims of venereal disease, beggars, or hardened or petty criminals.

MASS MIGRATION

Clearly, local and state authorities were concerned about some of the migrants as well as about some of the sedentary population because of their potential to create disorder. But states themselves were often the cause of major population movements, either as

a result of wars, or deliberate expulsions, or because the political or religious decisions of governments sometimes induced segments of the population to emigrate. Wars caused populations to flee in search of shelter from the ravages of armies and armed rabbles in general. Although direct military mortality may not be very high, the same cannot be said for civilian losses, as witnessed by the devastation caused in part of Germany during the Thirty Years' War. Wars caused populations to retreat when their fields were ravaged, their livestock seized, and their very lives threatened. War forced them to seek refuge in nearby regions that had been spared by the conflict, or behind city walls. In those cities of refuge, the arrival of uprooted and undernourished people constituted a fertile soil for the development of formidable epidemics. After a war, agricultural and sometimes urban structures had to be renewed, and shattered landscapes reconstructed, all of which took time. Repopulation necessitated immigration staggered over several decades, as was the case for the plain of Hungary after the defeat and routing of the Turks in 1699 and again in 1718.

The greatest population movements resulted from political and religious decisions or contexts, which were intimately linked from the start of the Protestant Reformation. Population movements were not, however, limited to the conflict between Catholics and Protestants. They were preceded by important examples of forced migration based on state decisions. France and England expelled their Jewish populations in the late Middle Ages, and other expulsions occurred elsewhere in Europe during the early modern period. Perhaps the best known expulsion is that of 1492, when the Jews of Spain were given the choice of converting to Christianity or leaving the country. Portugal issued a similar ultimatum in 1496.

Although estimates once ran to several hundred thousand for the number of Jews who left Iberia rather than convert, the best estimates now place their numbers in the neighborhood of fifty thousand. In 1609–1611 Spain also expelled its large population of converted Muslims, branding them notoriously as bad Christians and as a political threat as well. The best estimates currently place the number forced into exile at about 300,000, though an unknown number reportedly returned to the country thereafter. The Jewish diaspora led to the cre-

ation of colonies that played a leading economic role in European cities such as Bordeaux, Amsterdam, and London, as well as in the Turkish empire. Like other affinity groups with dispersed membership, the Jewish exiles established a very effective commercial and social network over long distances.

Thousands of other individuals and communities were also displaced by the religious and political strife that marked the early modern period. Perhaps the best known from the late seventeenth century are the French Protestants known as Huguenots and the English and Scottish supporters of the ousted Stuart dynasty, known as the Jacobites. Protestants in Catholic France had been under pressure since the early sixteenth century, but they had gained important privileges in 1598 with the Edict of Nantes. Louis XIV (ruled 1643–1715) revoked the edict in 1685, propelling 130,000 to 160,000 into exile: 30,000 to Switzerland, 30,000 to the states of the German Empire, 50,000 to the United Provinces of the Netherlands, and 50,000 to England. In all, some 200,000 Huguenots left France between the first third of the sixteenth century and the beginning of the eighteenth, helping to develop agriculture and industry in the Protestant countries where they settled, especially England and the German states of Hesse and Prussia. The Jacobite migration was less numerous—about 50,000 people—but it was a continuous movement from the end of the seventeenth to the end of the eighteenth centuries and resulted in the creation of an extended business network, out of which important personalities emerged. In other cases, as in Russia and central European countries in the eighteenth century, governments focused essentially on attracting colonists. Frederick II (ruled 1740–1786) of Prussia established in his states 300,000 immigrants, coming mostly from southern Germany. In Russia, Catherine II the Great (ruled 1762–1796) planted more than 60,000 colonists from Lorraine and Germany, mostly in the region of the Volga, the Ukraine, and the Crimea, supplementing the Russian migrants already there. Other governments launched active relocation campaigns among their own residents. For example, after the Moriscos (Muslim converts to Catholicism) rebelled in Granada in 1568–1570, Spain dispersed them northward to Castile and provided incentives for Old Christians from the north to repopulate Granada.

And in the mid-seventeenth century, states in central Italy worked to attract new settlers to repopulate areas devastated by plague.

MOBILITY AND ECONOMIC DEVELOPMENT

The mobility of the European population within Europe was therefore an essential element in economic development during the early modern era, as it was during the medieval period, although the significance of migration varied from place to place. The importance of European migration overseas was even more varied. In the case of Asia and Africa the figures are quite low. The Portuguese were never very numerous in Africa or India. The English and the French were present only in limited numbers in Asia in the early modern period. Even the Dutch colonies in Java and the Sunda Islands did not amount to very significant numbers, and it is estimated that only about 15,000 Dutch settlers migrated to South Africa. Nonetheless, Jan Lucassen has calculated that about 30,000 to 40,000 men were required overseas yearly in order to maintain Dutch positions. He estimates that 973,000 soldiers and sailors were employed by the VOC (Dutch East India Company), of whom 48 percent were foreign immigrants, and that a little more than half of them perished far from Holland. Although French emigration to Canada was quite modest—some 70,000 migrants, only 15,000 of whom settled and had descendents—French emigration to the West Indies was considerable, between 250,000 and 300,000.

However, it is clear that overseas departures consisted mainly of Portuguese, Spanish, and English. Portugal and Spain began extensive European overseas migration with the colonization of the Atlantic islands (Madeira, the Azores, and the Canaries) in the fifteenth century. In spite of the large population difference between Spanish and Portuguese territories, the disparity was not so significant because Portuguese emigration increased greatly in the eighteenth century. In raw numbers, the evolution of Spanish emigration to America was as follows: 243,000 in the sixteenth century; nearly 200,000 in the first half of the seventeenth century, about 250,000 between 1650 and 1800. It is difficult to advance precise figures for the British Isles. Somewhere between 250,000 and 500,000 moved in the seventeenth century and between 250,000

and 300,000 in the eighteenth century, with more Scots and Irish than English in this latter century. In the course of the eighteenth century there was also a considerable German contingent: about 70,000, although German movements were essentially inside Europe. This largely ignored German mobility amounted to about 500,000 people in the course of the eighteenth century.

Movements inside the European continent were distinctly more numerous than overseas departures, which were long interpreted as the product of individual choices. In fact, networks played an essential role in an individual's decision to migrate, and many migrants were recruited by contract in Europe in order to clear or farm the land, or to respond to artisanal and domestic needs, which was also the case for slave trading. Between two-thirds and three-quarters of British Isles immigrants to the West Indies and North America were therefore contract workers or "indentured servants."

All this underlines the fact that, in spite of the historic and emotional importance attached to religious migration, European mobility in the early modern era stemmed first and foremost from social and economic causes corresponding to micromobility and partially to urban attraction. Displacements were most often work-related and can be explained mainly by the availability of work and by salary differences. This is certainly the case for seasonal and temporary migration. Seasonal migration involved short-term displacements—harvesters or vineyard laborers being the most obvious example. Such short-term displacements could last several months: many stonemasons from the French province of Limousin went to work—except for the winter months—in the building industry in Paris, Lyon, and Bordeaux, and returned annually. Temporary migrations involved longer stays: for example, the French migrant workers from the Pyrenees or the Massif Central who went to work in Spain returned only every three or four years. Temporary migrations might last for the whole of a person's working life, the return to the homeland only taking place, if at all, in retirement. This "lifelong" migration occurred often among French migrants in Spain. Lifelong migration also occurred in the West Indies, and the Americas in general, although a limited number of emigrants who found great success overseas might return sooner. The wealthy Spanish *in-*

dianos and *peruleros* of the sixteenth century and the even wealthier French planters in the West Indies in the eighteenth century are cases in point.

There were also considerable manpower movements in Europe during the early modern era. The most sizeable were located in Italy (more than 100,000 people per year) and in France (a similar figure). One of the most interesting is what Jan Lucassen has called the “North Sea system,” which from the seventeenth century onward involved some 30,000 migrants annually from the German states, mostly into the United Provinces. Other movements of migratory workers, such as harvesters in the east of England, also involved regular and regulated movements, as was also the case for peddlers, or migrants with a similar lifestyle, such as tinsmiths from the Auvergne region or sawyers from the Limousin and Forez regions of France. They followed the same traditional routes every year and often—as in the case of the tinsmiths—served as cultural intermediaries who transmitted news as they moved from place to place.

CONCLUSION

The population movements in the early modern era did not present a serious threat to an essentially rural rootedness characterized by strong regional attachments. For example, although there was high mobility of young adults in England, involving frequent changes of residence, the majority of movements were less than fifteen kilometers, the average being four to five kilometers. Most of all, once married, people hardly moved at all. And rarely did people move randomly. Instead, migrants followed veritable migration routes, either as part of highly organized departures, as was the case for indentured servants and seasonal or temporary migrants, or alternatively as part of traditional family or parish links (for example, apprenticeships or marriages), or the ongoing attraction of the nearest city. Sometimes they were led to move by information available locally or through occupational contacts, letters from earlier migrants, or kinship links. Even religious migrations show a migratory context that is similar to that of work-related movements. It is now well established that migrants maintained strong links to their homeland, thanks in particular to an active interchange of letters between migrants and family and friends back home.

Generally speaking, mobility was not chosen, although there was a minority of adventuresome spirits. People moved because they could no longer stay in their place of birth or because the living conditions there had become unacceptable (forced migration). People moved to find work or a better salary. But the idea of returning home was always very strong—and was even part of the system in the case of seasonal and temporary migration—and adaptation to other places and other societies was far from being always successful, particularly in places with a tropical climate, such as parts of Africa, Asia, and the Americas, which severely tested the health of European migrants. Migration and increased mortality often went hand in hand, and it took many overseas migrants to create successful colonies; many overseas migrants gave up and returned home, just as many urban migrants in Europe abandoned cities and returned home. Many died far from their families and homeland without ever managing to establish roots in their new country.

Migration involved some very real risks, sometimes because of insalubrious conditions in city tenements or overseas colonies, or alternatively because the life of sailors or soldiers was dangerous in itself. Soldiers did in fact constitute a part of European mobility, not only because regiments moved about but also because the armies of various European countries recruited mercenary soldiers; Switzerland, Scotland, and Ireland became famous as suppliers of mercenary soldiers. In the first half of the seventeenth century, there were 100,000 Scotsmen recruited as soldiers in other countries or who had become subject to military service after settling abroad. This type of mercenary, which always existed, took on new proportions from the middle of the thirteenth century. The Scots and the Swiss occupied a special place in this form of mobility, with the Irish also migrating in very large numbers in the seventeenth century and the first half of the eighteenth. The Swiss enjoyed a high reputation as mercenaries, but the Irish and Scots were scattered more widely all over Europe, including Spain, the Scandinavian states, and Russia. The Spanish monarchy alone moved some 500,000 soldiers for military reasons in the first half of the seventeenth century. An estimated one million Swiss served abroad during the early modern era—the equivalent of the entire Swiss population at the start of the seven-

teenth century. Somewhere between 10 and 31 percent of the Swiss male population over the age of sixteen were in foreign service in the seventeenth century and between 5 and 20 percent in the eighteenth century.

Finally, while seasonal and temporary migrants such as tinsmiths, and marginal types such as criminals, moved about a lot, this was also the case for students in the early modern centuries. And it has always been the case for gypsies, for whom migration—geographic mobility—was an important part of life.

JEAN-PIERRE POUSSOU

(TRANSLATED FROM THE FRENCH BY LIAM GAVIN)

MOBILITY, SOCIAL. Early modern European societies were by definition nonegalitarian. Social position or status was determined by an individual's place within the institutions of family and social hierarchy. Removed from these hierarchies, the isolated individual appeared marginal at best. The hereditary nature of position and status was supported by systems of family lineage, patron-client relations, and loyalty. Marriages usually joined one “house,” lineage, or family to another of equivalent social status. Thus, for the early modern period, social mobility, when it occurred, generally involved family and kinship groups and bore little resemblance to its modern counterpart. Nevertheless, there were opportunities for “upward mobility,” as in sixteenth-century France, when *réussite sociale* (social success) enabled so many of the bourgeoisie to become gentlemen, and their families with them.

Nearly everything in the structure and function of European societies was opposed to social mobility of any great consequence. These were ordered societies with nobility at the top of the hierarchy. Because it was hereditary, the nobility was difficult to join. Thus, short of massive ennoblement, ascension to the social elite was inherently a minor, even marginal phenomenon. Heredity was also important in the artisan classes throughout Europe, as the

sons of master craftsmen had privileged access to their fathers' skills. Indeed, social division was sometimes stricter among commoners than among the nobility. Finally, in a world where learning and literacy were not available to all of society, the fact of belonging to a noble or bourgeois elite, or even an artisan elite, conferred advantages that were as decisive as family wealth and constituted another obstacle to social ascension.

The fear of social backsliding—slipping down the social ladder—was a veritable obsession. When nobility was particularly institutionalized, as it was in France in the seventeenth and eighteenth centuries, loss of status and its accompanying privileges became a permanent worry. Even among commoner families, there was a constant fear of social backsliding. However, this should not be considered solely a question of wealth: in the Maine region of France, the fact of belonging to an old, well-established, and honorable family was sufficient to dispel many of the social differences linked purely to wealth. There were three main avenues leading to loss of status:

- Marrying beneath one's station. However, marriage was also a means of "enriching the stock," that is, bailing out the sons of impoverished noble families by marrying them to rich heiresses from the bourgeoisie, especially the daughters of financiers. Such exogamous marriages resulted in pulling women upward in social status.
- Shame, linked to loss of honor or due to misbehavior. This was a consequence much feared by good families. It gave rise to many *lettres de cachet*.
- Ruination, as a result of bad investments or careless spending.

Social backsliding could also be the result of bad luck, such as the premature death of the head of the family or of the only male heir. Also, a considerable number of families simply disappeared, either because a family produced no children at all or no male heir. Research based on patronyms can be misleading by exaggerating both geographic and social mobility of certain family names, because it was the women who ensured the continuity of the family. It is clear, however, that the lack of male offspring was a serious concern for strongly patriarchal families, especially among the social elites. It was the social

destiny of the males that was essential, not that of the females.

In many countries—and primarily for the nobility—there were legal mechanisms to protect male heirs while simultaneously ensuring the survival and integrity of estates. Obstacles to social mobility were also imposed in the name of religion. In Ireland during the late seventeenth and early eighteenth centuries, when Britain's Penal Laws prohibited the practice of Roman Catholicism, Catholics saw their lands confiscated and were prohibited from constituting or reconstituting their estates, forced instead to live as tenant farmers. The central and western Pyrenees also had laws preventing the unification of estates. For the smooth running of this society, in which only the eldest inherited the ancestral patrimony, it was considered essential not only to preserve farms but also to maintain their number. Thus, the eldest child in a family, regardless of its sex, was supposed to marry a younger child from another family, or vice versa, but marriage between an "heir" and an "heiress" was forbidden because it would cause one "house" to disappear and reduce the number of farms. The corollary of this extremely constraining system was that younger sons and daughters could either marry with uncertain prospects, or choose to emigrate because they could not look forward to inheriting the estate.

MIGRATION

A minority of migrants managed to improve their condition during the first generation, but many failed, and mortality was high among migrants, particularly when the migration was to a country with a tropical climate, which suited very few Europeans. Still, migration could enable some people to climb the social ladder. Stonemasons migrating from the Limousin region to Paris or Bordeaux were able to devote their earnings to enlarging the family holding. Migrants settling in Spain were able to use their earnings to become large rural landowners. And there can be no doubt that there were remarkable successes in the East and West Indies.

The agrarian colonization of North America, especially among the English, often resulted in a firmly rooted peasantry. Generally speaking, this was also the case for the soldier-colonists, including those that the French installed on the banks of the Saint Lawrence River, particularly after 1668, with

the officers and troops of the Carignan-Salières regiment that came to fight the Iroquois.

In the world of trade, some of the younger and less fortunate sons and cousins sent abroad to serve as commissioners or representatives for trading houses proved to be spectacularly successful. The success could be entirely individual, as in the case of Jacques Necker (1732–1804), the son of a poor Geneva family, who enjoyed unrivaled success as a banker and served as director general of finance for France in 1777. Success in the colonies could be accompanied by a reputation for knavery or could result in shocking *nouveau-riche* behavior, as in the case of the “nabobs”—the most famous being Robert Clive (1725–1774), who went to the East Indies poor and returned in 1767, having conquered a large part thereof and possessed of a considerable income of £40,000 sterling—or the West Indian planters, known in France as the “*Américains*,” many of whom enjoyed a high profile in eighteenth-century London. It is clear that upward social mobility was often the result of successful migration accompanied by chance and talent. This was true even in sixteenth-century Russia, where a small but important merchant bourgeoisie developed, consisting of men of varied status, based on their extremely heterogeneous origins.

UPWARD MOBILITY

In Russia, as in western Europe, social mobility most often affected the nobility. However, Russian nobility was unique in that, until Peter I the Great (ruled 1682–1725), the hereditary elite was based on service to the state, or “*chin*.” There were some very intense class struggles, but access to employment, therefore a higher “*chin*” level, depended on skills and personal success. Peter the Great restructured all that, particularly in 1721 and 1722. He created new titles, such as count or baron, which he borrowed from other realms. The nobility was divided into fourteen ranks, and while it was still possible to rise in the “*chin*” system, only the tsar could authorize such a rise. This resulted in a nobiliary social elite, as elsewhere, except that it was linked very directly to state functions and needs for service, which ensured real flexibility for the ruler, until Catherine II the Great (ruled 1762–1796) agreed in 1785 to emphasize the hereditary divisions among the nobility. Until then, social ascension

both into and within the Russian social elite was perfectly possible.

The opportunity for social ascension was much more widespread than is generally believed. A great many painters, sculptors, and artists of all kinds came from very common and even humble origins. Moreover, it was often the case that neither their family background nor their place of birth predisposed them in any way toward their future status. For example, the painter Hans Memling (c. 1430 or 1435–1494), who was so important in Bruges during the fifteenth century, was born into a peasant family in a village situated some twenty kilometers from Frankfurt am Main. The flowering of his talent and his enormous success will always remain a profound mystery. Similarly, nothing in Sir Richard Arkwright’s (1732–1792) origins offers any inkling of his future success. He may not have been scrupulously honest, but his invention, the water-powered spinning frame, was astonishing and led to his accession to the gentry.

The church also provides many examples of “self-made” men, with one significant difference: the benefits of a successful career in the church could not be passed on to one’s descendants (however, there was no shortage of nephews and nieces to favor). The career of Cardinal Jules Mazarin (1602–1661) provides a remarkable example. Born into a Roman family of very modest extraction, he entered the service of Cardinal Richelieu (Armand-Jean du Plessis; 1585–1642), chief minister to Louis XIII (ruled 1610–1643) of France, and later succeeded him as prime minister (1642–1661). Mazarin amassed a considerable fortune, from which his nieces benefited greatly. Although distinctly less impressive, the success of Robert Gaguin (c. 1433–1501) is no less exemplary: born near the boundary between Flanders and Artois, his family may have been common laborers. But this did not stop him from quickly becoming the leader of the Trinitarian Order, a major figure in the University of Paris, a central character for the history of humanism and the Renaissance in France, a great author, a diplomatic adviser, and a representative of the kings of France. These very well-known examples provide us with the key to upward social mobility: the power to make personal talents bear fruit through networks of allied families and kinship groups.

Although family lines and kinship groups preserve social structures, and slow, limit, or prevent social backsliding, they also foster social ascension. J. M. Moriceau's study of powerful peasant families in the Île-de-France region provides a good illustration of these different aspects. Beginning in the fifteenth century, the group studied constituted a veritable village aristocracy that practiced endogamy and maintained very effective networks; it even tended to develop into a caste. Only major crises, like the one that followed the Fronde (1648–1652), could shake it, by multiplying failures and social mobility. However, this did not ruin the families. The rest of the family line, collaterals if necessary, recovered the positions. In this very closed milieu—more closed than the nobility—families had considerable power. During the second half of the eighteenth century, this resulted in their becoming veritable gentlemen farmers and, later on, rural notables.

In the eighteenth century, widespread interest in science and technology increased the number of direct ascensions to fame and wealth, as in the case of Gaspard Monge (1746–1818), the great mathematician and physicist, born at Beaune (Burgundy) to a knife-grinder father and a mother whose father was a coachman. Literature offers similar examples: the French writers Denis Diderot (1713–1784) and Jean-Jacques Rousseau (1712–1778) came from very modest backgrounds.

While ability and talent were a means to rapid social ascension in science, literature, and the church, the same cannot really be said for the army because the officer level was only barely open to men rising from the ranks. Of course the army can provide some examples of swift ascension, but only when the position of the officer was not the absolute monopoly of the nobility, as in Russia. It was generally exceptional for a commoner to rise to the rank of officer. For example, the careers of British officers, who came largely from the lower branches of the gentry, were fixed in advance by their level of wealth. Whenever we find social ascension in the army, it relates primarily to members of the *petite noblesse*.

DEGREES OF CLOSURE

We therefore find multiple social groups—the term *class* is too precise and should be avoided: master

craftsmen, for example, did not constitute a class—seeking to preserve their positions and most of all to ensure their status through their progeny and by jealously maintaining their positions. Craft communities or corporations were very much attached to their privileges and monopolies: these monopolies were “the key to the decent level of living to which the corporation masters considered they had a right, and the basis of their economic independence” (M. Prak). At the high end of society, patriciates, like that of Venice, provide classic examples of the self-protective group. The ranks of the nobility were nowhere more restricted than in Venice, where they remained closed from 1297 onward. Their members were listed in a golden book or in noble genealogies, and members could not form alliances with outsiders. This patriciate held all power and authority in Venice.

In Geneva also, the “Geneva aristocracy” completely dominated social and political life, just as it dominated trade and banking. Unlike other patriciates, however, it was more than willing to open its ranks, even to immigrants, when they were at the head of a great fortune or had acquired a great reputation in religion or the sciences. The Geneva patriciate was therefore remarkable by virtue of its cosmopolitan aspect, which clearly distinguished it from that of Venice.

The tendency for groups to remain closed was nevertheless a much more general phenomenon. In pre-Revolutionary, rural French society, many of the notarial acts to which families had recourse were aimed specifically at excluding girls from the greater part of the inheritance, particularly land inheritance. Girls received a dowry, usually a sum of money and some items of furniture (trousseau, bed, etc.) but the future inheritance went to the male heirs. There was much greater diversity for boys, ranging from egalitarian inheritance to the choice of a single distinctly privileged heir. There was in fact no standard, uniform practice. For example, customs in the region of Paris and Orléans aimed solely at preserving the family bond, paying no particular attention to whether the presumptive heir was male or female, older or younger. In Normandy and Anjou, however, the customary system was egalitarian, and estates in that region were far more difficult to preserve.

Furthermore, the closed nature of nobilities and patriciates was much less extensive than is often thought. It varied from period to period and from country to country. The sixteenth century was undoubtedly a period of great upward mobility in Europe as a whole. The high mortality caused by difficult living conditions combined with the effect of the multiple wars that marked the century to form a social context that was far less rigid than it later became. The passage to nobility was, indeed, more difficult from the eighteenth century onward. However, even when openness and mobility clearly existed, they were accompanied by a strong resistance to change, the Neapolitan nobility being a good example. Victory in the “Spanish affair” certainly ushered in some immediate upheavals in the positions of families, as well as many downfalls. Yet, the composition of the Neapolitan nobility manifested “a remarkable continuity compared to the previous period” (M. A. Visceglia). This resistance was no doubt facilitated by a shared belief in common values and social rules. Having been provost of Parisian merchants from 1622 to 1627 and having also become president of the parlement in 1627, Nicolas de Bailleul decided in 1639 to have his family tree drawn up. He managed to root the pre-eminence of his family in the distant past in order to erase the obstacles to his rapid ascension and efface all traces of social mobility in a world where prestige, virtue, and success were not linked to meteoric social ascension but to the reality of family and lineage.

MOHYLA, PETER (Romanian, Petru Movilă; 1596–1646), archimandrite of the Kiev Monastery of the Caves and Orthodox metropolitan of Kiev. Mohyla was the son of Simeon, *hospodar* (lord) of Walachia and Moldavia. He and his mother, the Hungarian princess Margareta, sought the protection of magnate relatives in the western Ukrainian lands of the Polish-Lithuanian Commonwealth after his father’s murder in 1607. Mohyla may have studied at the school of the Orthodox Lviv Brotherhood and at the Zamość Academy; one source suggests that he studied in western Europe. In any event, he received a thorough education, mastering Greek, Latin, Polish, and Church Slavonic, as well as Catholic, Protestant, and Orthodox theology.

On 16 September 1627, with the support of the palatine of Kiev, Tomasz Zamoyski, Mohyla was named archimandrite of the Kievan Caves Monastery, replacing the recently deceased Zakhariia Kopystenskyi. During that year, Mohyla was drawn into a series of discussions about the reunification of the Ruthenian Church. He broke with Meletii Smotrytskyi’s plans for Union at the council held in Kiev

in 1628; Smotrytskyi alleged that Mohyla was motivated by fear of the Cossacks and the lesser clergy.

Mohyla remained at the center of interest on the Uniate side. In a memorial to Rome in the spring of 1629, the Uniate metropolitan of Kiev Josyf Veliamyn Rutsyki proposed the creation of a Ruthenian patriarchate and suggested Mohyla for the office. Such discussions would continue, always foundering on Mohyla's insistence on the relative autonomy of the Ruthenian church and the suspicions of Cossacks and lesser clergy that such plans were simply a ruse to bring the Orthodox into the Roman church.

Orthodox Metropolitan of Kiev Iov Boretskyi died on 12 March 1631. Mohyla had the support of King Sigismund III of Poland to succeed him, but, with the backing of the Cossacks, lower clergy, and middling Orthodox gentry, an implacable enemy of the Union, Isaiah Kopynskyi, was chosen instead. Mohyla turned his attention to education in the interim. He brought teachers from Lviv and opened a school in Kiev 1631, over objections of the Kiev Epiphany Brotherhood, who had established their own school c. 1615. In 1632 Mohyla went to Warsaw for the parliament that elected King Władysław IV. There he worked for the legalization of the Orthodox hierarchy and was confirmed by the king as Orthodox metropolitan.

In July 1633 Mohyla removed his competitor Kopynskyi by force and took the St. Sophia cathedral in Kiev away from the Uniates. Under Mohyla the Orthodox Church was consolidated and centralized, and Kiev overtook Vilnius and Lviv as the center of the Ruthenian renewal, regaining some of its ancient splendor through the metropolitan's projects of archaeology, renovation, and new building. On 18 March 1635 the king gave his permission to transform the united schools of the brotherhood and the monastery into an Orthodox Ruthenian college (soon known as the Kiev-Mohyla College) with rights to teach dialectics and logic in Greek and Latin.

In the years 1637–1646 Mohyla oversaw a number of projects (liturgical and devotional books) at the printing house of the Monastery of the Caves, over which he remained archimandrite. A synod met in Kiev in 1640 to discuss dogmatic questions, and in 1645 the first partial edition of

Mohyla's catechism of the Orthodox faith appeared in print. Plans and cautious negotiations to create a Ruthenian patriarchate in some sort of relationship with Rome continued to surface in the 1630s and 1640s. Mohyla died in January 1647.

DAVID FRICK

MOLIÈRE (Jean-Baptiste Poquelin; 1622–1673), French playwright, actor, and troupe director. Born into a successful merchant family, Jean-Baptiste Poquelin received an education from the Jesuits and was studying law when, at the age of twenty-one, he renounced his career to join a troupe of itinerant actors. In 1643 he signed a contract with the actress Madeleine Béjart and other members of her family to establish a troupe which they called the "Illustrious Theater," but they were soon unable to pay their bills and Poquelin, who had assumed the stage name Molière, was jailed for debt in 1645. Once released, he and his troupe departed to tour the provinces. From 1646 to 1658 they staged plays throughout the French countryside, with Molière gradually assuming a role as the troupe's leader, principal actor, and creator of scenarios for the farces that the group performed along with their centerpiece tragedies. In 1653 the prince de Conti, royal governor of Languedoc, engaged the actors as his personal troupe, granting them status and financial stability until Conti's abrupt "conversion" to a life of religious austerity led him to withdraw his patronage. In 1658 the Illustrious Theater returned to Paris and were granted another opportunity to please the more difficult audiences of city and court, where they played first at the Louvre

palace. The king's brother Philip, duke of Orleans, became their sponsor.

Beginning in 1659, Molière focused on performing his own plays, though he professed ambivalence about his new status of published author in the preface to his play *Les précieuses ridicules* (1660; *The affected young ladies*). His attention to performance and staging and to the improvisational traditions of the *commedia dell'arte* remained paramount in his comedies, even as he developed an increasingly sophisticated vision of the comic genre. His greatest achievement as an author was to have invented a “comedy of character” that introduced psychological depth to stock comic situations, in the process drawing on traditions from popular farce and more serious drama. Beginning with *L'école des femmes* (1662; *The school for wives*), he wrote five-act comedies in verse, as well as *comédies-ballets* combining music, dance, and poetry with the clownish elements of *commedia dell'arte*. His comic characters often have a single dominant trait or “mask,” suggested in many of the titles of his plays,

as in *L'étourdi* (1655, *The bungler*) and *L'avare* (1668, *The miser*). They also portray the social obsessions of Molière's elite audiences, as in his satirical portrait of educated women, *Les femmes savantes* (1672, *The learned ladies*) or in his penetrating portrayal of salon society, *Le misanthrope* (1666).

Having secured the favor of the young King Louis XIV, Molière undertook to fight, from the stage, the attacks on the theater being mounted by radical religious parties of the Catholic reform movement. A first version of his play *Tartuffe*, portraying a religious hypocrite who deceives his gullible and devout host and attempts to seduce his wife, was staged in 1664. It was immediately banned by the church's censors and attacked in print by Molière's former patron Conti, among others. Molière withdrew the play, but continued to press for its revival, at great personal risk, until a final version, which included a flattering panegyric to the king, was produced under royal protection in 1669. Meanwhile, in 1665, he composed and produced *Dom Juan*, a disquieting and innovative version of the story of the legendary seducer of women, who in Molière's version is a libertine and an atheist, a modern, educated nobleman who has lost his moral bearings.

Throughout the first decade of the reign of Louis XIV, Molière produced plays commissioned for court spectacles, many of them on short notice, in which he also played the principal role. His *L'impromptu de Versailles* (1663) gives us an amusing inside look at his own troupe at work attempting to rehearse a play that Molière has not had the time to finish. *George Dandin* (1668) was first performed at Versailles with ballet and musical *intermèdes* written by the composer Jean-Baptiste Lully, and *Monsieur de Pourceaugnac* was commissioned for a court spectacle at the château de Chambord in 1669. *Le bourgeois gentilhomme* (*The would-be gentleman*), a *comédie-ballet* also produced in collaboration with Lully, premiered at Chambord in 1670.

Molière died 17 February 1673, after collapsing during a production of his play *Le malade imaginaire* (*The imaginary invalid*), in which he was playing the title role. Denied burial on sacred ground because of his profession, he was finally interred, secretly and at night, in his parish cemetery by special permission of the king. The manner of his

death has become part of his legacy; students of the theater regard him as an iconic figure, devoted to the stage, whose work bridges the gap that so often divides the play as text and performance. The chair in which Molière was seated during his last production is preserved in the halls of the Comédie Française, an institution founded by several of the members of his troupe six years after his death, and today the world's oldest theater company.

MONARCHY. We know a great deal about the monarchs of early modern Europe, but we know much less about monarchy, that is, the institution of personal rulership. Until the French Revolution, monarchy was usually taken for granted by Europeans. Since it was endorsed by the Bible and Aristotle, the touchstones of written truth, few thought to analyze it further. Those who did, like Jean Bodin or Thomas Hobbes, were viewed with suspicion by more cautious minds. The adjectives that we employ today to describe types of monarchy, such as “absolutist,” “divine right,” or “constitutional,” were not used in a systematic way before the eighteenth century because they were not greatly needed. Other terms, like “thaumaturgic kingship,” “sacral kingship,” “the king’s two bodies,” or “enlightened absolutism,” were coined long after 1800. While they may be quite useful in understanding early modern monarchy, it would be a mistake to apply them too rigorously, as if monarchs adhered to them as underlying principles.

Institutions that everyone takes for granted tend to be conservative, and this was certainly the case with monarchy. It generally fostered a distrust of political change. Yet monarchs could sponsor the most daring innovations, which became more acceptable because of their support. Indeed, perhaps the most remarkable feature of early modern European monarchy was its recurring dynamism, its ability to create or adapt to new circumstances. Unlike its counterparts in many other parts of the world, European kingship between 1450 and 1800 was constantly changing in response to competition or crisis. By the eighteenth century, European monarchs possessed more effective means of communication and control than their rivals elsewhere, combined with better military technology. These advantages encouraged them to impose themselves

on other parts of the world. Their systems of governance may not have been superior, but their organization was, however haphazard it may seem to us today. Thus, the transformation of rulership in early modern Europe had global consequences.

INSTITUTIONAL DEFINITIONS

If called upon to define “monarchy,” we might say that it is rulership over a political entity by one person who inherits his or her position by hereditary succession, is crowned, reigns for life, and exercises authority by the will of God rather than by the choice of the people. While this may be a reasonable overall description, it does not fit most early modern European monarchies very precisely, because they were so diverse. To begin with, few of them were simple political entities. Most were composite states, amalgamations of regions, provinces, or even kingdoms, whose chief or only point of unity was the person of the monarch. Spain after 1516 was not a single administrative unit; rather, it was a collection of separate kingdoms united only by allegiance to a single ruler. The same was true of Great Britain between 1603 and 1707. Today, national states are held together by identities based on common values and impersonal institutions. It is hard for us to imagine a political body that would dissolve if a single office were vacant, but that was the case with most early modern monarchies.

This in turn complicated the meaning of rulership, which might relate to little more than the existence of a monarch at the head of a realm. The day-to-day direction of the polity might rest in the hands of the king only in an abstract sense. He was, to be sure, the ultimate source of authority in the kingdom. Yet nowhere did he make every political decision, either alone or in his council; and nowhere was his power unrestricted. Customs, privileges, traditions, laws, Estates, assemblies, and parliaments—all put boundaries on royal power, sometimes so severely that the king was able to do very little on his own. Besides, in the “age of the favorite,” kings were often happy to delegate power to a leading minister, such as Olivares in Spain, Richelieu in France, Buckingham in England, Oxenstierna in Sweden, and Griffenfeld in Denmark.

Personal rulership was in flux during the early modern period. It was traditionally understood to mean two things above all: leadership in war and the

administration of justice. Both roles had seriously decayed by the mid-1700s. Medieval kings regularly led troops into battle and were eager to intervene in strategic decisions during wartime. This began to change with the expansion of armies in the 1500s, and by 1750, generals and military experts were firmly in charge. Kings stopped regularly dispensing personal justice in the late Middle Ages and rarely exercised direct supervision of judicial systems, although they continued to use pardons as a means of exhibiting their final say over the law. The expanded mechanisms of war and impersonal justice were made possible by tax collection, which was carried out by officials acting in the king’s name. Taxation became the most important practical function of government. Those who resisted taxes in the sixteenth and seventeenth centuries liked to claim that the ruler was ignorant of the tyranny and corruption of his officers (“if the king only knew . . .”), but by the eighteenth century this polite fiction had worn thin. The rumor that Louis XVI (ruled 1774–1792) was involved in a *pacte de famine* against his own people was a crucial factor in the erosion of his rulership over France. In some eyes, the warrior leader and font of justice had become little more than a chief bureaucrat.

Was monarchy always strictly hereditary? Poland, Bohemia (to 1627), Hungary (to 1688) and the Holy Roman Empire were elected monarchies, and nobles in other countries, notably Muscovy, Denmark, and Sweden, could fall back on the elective principle in times of crisis. The only nation where hereditary right was fixed in law was France, which was why some observers, like Claude de Seyssel, thought the French monarchy was more stable than any other. Yet in spite of its supposed virtues, the Salic Law, invented to keep English claimants off the French throne by ruling out inheritance in the female line, was not imitated in the rest of Europe. The English determined their own succession by armed struggle in 1461, 1471, and 1485, by usurpation in 1483, by the novel principle of female inheritance in 1553 and 1558, and by parliamentary statute in 1689 and 1714. The Swedes, whose Vasa kings were viewed as mere usurpers by their former Danish overlords, thrice chose a king by legislative approval. The Spanish royal inheritance of 1702 was dictated by the testament of Charles II, not by lineage alone. The Ottoman succession was never

secure. In spite of Mehmed II's edict requiring a new sultan to execute his brothers, the empire suffered several usurpations and wars of succession before the "law of fratricide" fell into disuse in the seventeenth century.

Did a king rule for life? Not necessarily. Charles I of England was tried and executed in 1649; his son James II was deposed in 1688, although Parliament declared it an abdication. Queen Christina of Sweden really did abdicate in 1654 (she expected to be treated with royal dignity for the rest of her life). Philip V took the unprecedented step of first abdicating in 1724, then reclaiming the Spanish throne after the premature death of his son, Luis. Victor Amadeus of Savoy's abdication in 1730 was perceived as a devious ploy to regain the throne with more power (it failed when he was imprisoned). Ottoman sultans could not abdicate, but they were regularly murdered, particularly by rebellious Janissaries. The same grim fate was meted out to several Russian tsars, including the false Dmitry, Peter III, and Ivan VI.

Not all kings were crowned. The Ottoman Empire lacked a coronation ceremony, as did Castile; in both cases, the ruler was simply proclaimed, and banners unfurled. Elsewhere, the coronation ceremony was carefully observed, but the *ordines* or rules that governed the ritual were always subject to revision. The church had at first resisted the idea that coronation made the king into a holy figure, like a priest. By the early modern period, however, the clergy had given way to royal assertiveness. The coronation was now represented as an ordination, replete with holy oils and chrisms for anointing the king's body. It conferred an aura of sacredness on the royal person. Yet in hereditary monarchies, coronation did not initiate rulership, which began at the death of the preceding monarch. This contradiction was often noted, never resolved. In the eighteenth century, the legitimizing power of the coronation declined throughout Europe, and it became simply another occasion for display and panoply.

While coronation ceremonies usually retained some form of popular acclamation, they tended to reinforce the idea that early modern kings ruled by the will of God rather than that of the people. This was a consistent message, even in Poland, where the king was elected by the nobles and was frequently

bullied by them. In practice, however, the will of God could be narrowly interpreted, as the Providence that maintained the king on the throne and gave him victories. It might also extend to acts of the king that directly invoked the deity, like the miracle of the royal touch in England and France; but when the king laid hands on sufferers to cure scrofula, it was God, not he, who performed the healing. Divine sanction did not mean that the king was a saint (although Russian tsars, Louis XIII of France, and the martyred Charles I of England were represented in that way), or that specific acts of royal governance expressed the intentions of the Almighty. It was often the opponents of monarchs, from the French Catholic League to Belgian patriots of the 1780s, who were most strident in appropriating heavenly favor for their political actions. Kings were usually more wary; after all, they had to deal with the guardians of religion, who resented claims to God's approval that were made without their explicit support. Even the Ottoman sultan was circumspect in his use of the title "caliph" or heir to the prophet.

Monarchs gradually became bolder in asserting control over the clergy and religion. This did not make them more sacred, but it did make them controversial. Tsars Alexis Mikhaylovich and his son Peter I (Peter the Great) outraged traditionalists with their religious reforms; so did James II in England. The regalism of the Bourbons, especially Louis XIV in France and Charles III in Spain, created many critics among devout Catholics. The attack against Jansenism that was initiated by Louis XIV and continued by his successor created a political furor that lasted sixty years. The most daring offender against religious sensibilities may have been Emperor Joseph II, who dissolved monasteries, gave toleration to Jews, and aroused bitter clerical opposition. As a result, traditionalist church parties formed throughout Europe. What they had in common was disillusionment with monarchy, causing a distrust that could feed into revolutionary sympathies after 1789.

THEORIES OF RULERSHIP

If we turn from institutional definitions of monarchy to the theories of political writers, we may be surprised to find how little connection there was between them. Inspired by the ancients, political

philosophers usually wanted to write for the ages, not to address specific institutional questions. While they were deeply influenced by what was happening around them, they consciously sought to separate their writings from contemporary circumstances. The impact of their theories, however, was seldom what they had expected.

The main classical sources for European political theory were Roman law, Aristotle (often filtered through Cicero), and the Roman historian Tacitus. Roman law dealt directly with the question of *imperium*, which could be understood variously, as absolute sovereignty (the emperor was above the laws) or as some sort of limited rulership (the emperor was bound by the laws). The civil lawyers often regarded *imperium* as meaning both simultaneously: that is, the king normally had to observe the laws, but could in special circumstances dispense with them. This was the point of view of leading imperial jurists, like Dietrich Reinking. The breakdown of imperial power in the Thirty Years' War, however, led some legal writers, like Hermann Conring and Samuel Pufendorf, to deny that the Holy Roman Empire was descended from ancient Rome. As a result, sovereign authority was held by German territorial rulers, not the emperor. The empire survived, however, and by the eighteenth century, constitutional equilibrium rather than *imperium* was the main concern of its civil lawyers.

The impact of Aristotle was more pervasive and subtle. His emphasis on personal balance and self-restraint informed countless manuals on lordly behavior, or "Mirrors for Princes." They appeared in Muslim as well as Christian lands; in fact, one of the first and most important of them was written by the Islamic scholar al-Ghazālī, in the eleventh century. Desiderius Erasmus wrote one, as did Justus Lipsius and, in the eighteenth century, Frederick the Great of Prussia. The reading of Aristotle and Cicero inspired an abhorrence of despotism and a belief in the public good as the ultimate end of government. Aristotelians from Thomas Aquinas to Francisco de Vitoria to the great Spanish Jesuit writers (Pedro de Rivadeneira, Juan de Mariana, Francisco Suárez) held to the view that kings should rule for the benefit of the people. Since most of them were priests, they also stressed the supremacy of the church over any secular monarchy. Protestant Aristotelians like Martin Luther himself and Henning

Arnisaeus accepted the primacy of religion but were more willing to separate monarchy from popular approval.

The third classical strain in early modern European political thought was derived from the historian Tacitus, who excoriated the corruption and decrepitude of the Roman imperial state. His main follower in our period was Niccolò Machiavelli, whose books on princely amorality and republican virtue were formally despised, but rarely ignored, by other political writers. Admirers of Tacitus were not always critical of monarchy; like Henry St. John, Lord Bolingbroke, in the eighteenth century, they might believe that only a strong, heroic ruler could restore decayed virtue. Similarly, Tacitus's view that empires must continually grow or necessarily decay could supply arguments to both opponents and defenders of imperial expansion.

The classical tradition gave only limited sustenance to those political writers who wanted a more "absolute" monarchy. In fact, Aristotle and Cicero could be read as consistent with an interpretation of the Bible that saw kings as responsible to the people rather than directly to God. This was expressed by certain followers of John Calvin, called "monarchomachs," notably the German Johannes Althusius, the Scot George Buchanan, and the Frenchmen François Hotman, Philippe Duplessis-Mornay, and Hubert Languet. They vested ultimate authority in the magistrates, in legislatures, or in the people rather than the king. Buchanan, like Mariana, even allowed that open resistance to a tyrant might be legitimate.

Where could defenders of a stronger monarchy turn? To the Bible, of course, and to Roman history. For the French lawyer Jean Bodin, the sovereignty of a monarch could not be divided, shared, or legally resisted because it rested on the patriarchal power exercised by an all-powerful God as well as by ancient Roman fathers. The Englishman Robert Filmer carried Bodin a stage further by making patriarchal power "arbitrary," so that the father-ruler could do whatever he wanted, without any right of resistance. Most apologists for royal power, like Bishop Jacques-Bénigne Bossuet, did not go so far as either Bodin or Filmer; they simply maintained that the authority of the king was derived from God, to whom he was solely responsible. This did not

entirely rule out some sort of original agreement with the people; but as the Dutch jurist Hugo Grotius pointed out, once such an agreement was made, the people surrendered their sovereignty and had no right to reclaim it. Thomas Hobbes repeated the point in his *Leviathan* of 1651, which presented government as the convergence of individual wills in an “artificial man,” the state. Hobbes’s unorthodox religious and philosophical views ensured that few in England would acknowledge his contribution for the next century. On the other side, only the most radical political thinkers, like John Locke, continued to argue for a right to resistance to monarchs by the end of the seventeenth century, and Locke was not very clear about how it could be activated.

The Enlightenment added a new dimension to these debates, by introducing a critical, comparative method. It was best exemplified in Montesquieu’s *L’esprit des lois* (1748; *Spirit of the laws*), which sought to replace the ideal categories of classical

philosophy with observations of the ways in which peoples were actually governed. The aristocratic Montesquieu was often read as a proponent of a mixed constitution based on the post-1688 English model. Admiration for England was widely held, but it did not wholly sway every enlightened mind (Voltaire, for example, continued to praise Louis XIV’s powerful, activist monarchy). Foreign observers, moreover, tended to misinterpret the centralist English constitution.

By the late eighteenth century, many enlightened writers (Cesare Beccaria and Denis Diderot among them) had decided that the form of government was less important than what it accomplished in terms of the public good. Kings, it was hoped, would become reformers: “the first servants of the state,” in Frederick the Great’s memorable phrase. They would abolish torture, establish religious toleration, grant freedom of expression, and spread education among the masses. They might even transform the European empires into federations of sovereign states, a sentiment expressed by several prominent Spanish reformers.

The American Revolution complicated such aspirations because it associated reform with republicanism. At the same time, some proponents of economic change, like the Marquês de Pombal of Portugal, had proven themselves to be less than enlightened in other areas. A renewed threat to monarchy emerged in the writings of Jean-Jacques Rousseau, who scorned the “despotism” of kings and suggested that sovereignty rested not in them, but in an abstract conception of the “general will” determined by the whole people. Few read Rousseau’s *Du contrat social* (*Social contract*) when it first appeared in 1762, but it made a great impact on the subsequent generation. By the early 1790s, some enlightened thinkers throughout Europe held the view that, if kings were not willing to lead the nation and the people into a golden age of reform, they might not be necessary after all.

COURTS AND DISPLAY

The works of political philosophers shaped educated minds, but until the late 1700s, they made little difference to the conduct of royal courts. The court was the main arena of royal display and magnificence. In the absence of bureaucratic institutions, it was also the center of monarchical govern-

ment. Leading members of the king's councils usually held prominent positions at court. Local officials often had to go to court to transact important business. Aristocrats jockeyed at court for positions, titles, honors, and the prestige of personal proximity to the sovereign.

The courts of the fifteenth and sixteenth centuries were often peripatetic, moving between royal palaces and cities, or installing themselves temporarily in the houses of prominent nobles. By the late 1500s this had become too expensive and complicated, so courts became more or less fixed in a few big palaces, in or near administrative centers. They also grew. The salaried officials of the French court numbered around one thousand under Francis I; they swelled to eight to ten thousand under Louis XIV. The Spanish court remained at around fifteen to seventeen hundred persons during the same period, and the English court included about one thousand officers until the Civil Wars. The much smaller Austrian Habsburg court did not exceed six hundred persons from the late 1400s to the late 1600s, but by the second quarter of the eighteenth century it had reached twenty-five hundred. None of them, however, compared with the 95,000 employees and officers of the Ottoman court, among them 68,000 soldiers, 2,146 doorkeepers, 5,003 gardeners, and 1,372 cooks.

The main purpose of the court was to bring together the king's principal servants, both government officers and members of his household, in one place. This was particularly vital in composite monarchies, where high-ranking royal officials came from disparate regions and might even speak different languages. The king could not live in all his territories, so he had to call their leading men to him. A court where rewards were to be had was one to which they would flock; a feeble court would indicate a lack of cohesion in the kingdom. Thus, the court was above all a point of contact between the crown and the elite.

It was also a locale for royal and aristocratic display. Kings lived out much of their daily lives in public, and their every move, from rising in the morning to dining to walking in the palace gardens, could be accompanied by elaborate ceremony. Religious observances were particularly important occasions for ritual. The Russian court, for example, was

highly ritualized until the reign of Peter I, because the tsar was expected to perform endless religious duties. Every member of the high aristocracy (between 24 and 153 men) had a part in these ceremonies. For similar reasons, the Spanish court under the Habsburgs was obsessed with ritual, partly derived from the ordinances of the dukes of Burgundy. The king of Spain's cousins at the imperial court of Vienna, however, were much more relaxed—the emperor even dined privately, with his wife! The ritual of the French court waxed under Henry III and waned thereafter, until it was reestablished by Louis XIV at Versailles. English court ritual was never formalized to the same extent, with the exception of the annual Garter Ceremony, a favorite duty of Charles I.

Participation in the rituals of the court was determined by etiquette—not a list of behavioral rules, but a ranking of courtiers by precedence. Etiquette dictated who sat or stood near the king, who handed him his clothes or his towels or his food, who had a right to wear a hat in his presence. A courtier's position might be determined by office, by birth, or by some other distinction, such as the holding of a chivalric order. The king was the ultimate source of precedence, and he could manipulate the system of etiquette as he could the distribution of political positions. Few monarchs, however, made dramatic changes in etiquette or used it arbitrarily to control the aristocracy. They tended to reward those who already had influence, wealth, and social prestige. The court was not a self-enclosed social system; rather, its etiquette reflected the wider hierarchical society beyond it.

Artistic patronage was also based at court. Most kings enjoyed theatrical performances—plays, ballets, operas, masques—that were designed to edify the court nobility. They might call for the ruler to appear directly on stage, surrounded by obese courtiers. Some kings, like Philip IV of Spain or Charles I of England, assembled magnificent collections of paintings, both religious and secular. A few, like Louis XIV at Versailles or Frederick the Great at Potsdam, wanted to make their courts into artistic centers for the whole kingdom. In evaluating the impact of court art, however, we should remember how restricted the audience usually was. Monarchs spent far more on clothing than on paintings, and

no court dominated artistic life as completely as its royal patrons hoped.

By the eighteenth century, there were signs that the larger royal courts were in decline. The English court was reduced in size after 1660 and lost its centrality in art patronage after 1688. The king's old palaces were not updated, and in the end George III had to purchase a new one, Buckingham House, from a subject. Versailles remained magnificent, but under Louis XV its ceremonies became increasingly empty of significance, and it gained a reputation for luxury and corruption. Philip V's palace at La Granja and the new Habsburg palace of Schönbrunn near Vienna were designed for the private relaxation of the ruling family, an indication that royalty was no longer willing to live fully in the public glare. The Swedish court in the "Age of Liberty" was perceived as geriatric and moribund. There were exceptions: the Russian court, removed to St. Petersburg and stripped of much of its Orthodox ritual, presented a brilliant show, albeit one with limited relevance to the wider nation. It was still possible for a royal court to transform a city, architecturally and culturally, as the kings of Sardinia did at Turin after 1730.

Courts were never universally admired, even by those who frequented them. Throughout the early modern period, they were criticized for waste and vice. It is difficult to judge how effective they were in impressing a sense of royal grandeur on the minds of the people. Yet they were vital instruments of royal power, and it is impossible to imagine early modern monarchy without them.

MONARCHY BEYOND THE COURT

What did the people of Europe know about monarchy? Even in France or Russia, only a fraction of the nobility went to court. As for townspeople and peasants, they may not even have known where the court was. Yet they were exposed to various images of monarchy, and kings made a definite mark on their lives. Over time, the ruler's control over them appears to have increased.

Subjects who did not live near the court might see the monarch during a royal entry into a town or a progress through the countryside. These were more common in the sixteenth century when courts were peripatetic, but they continued into the eighteenth century. The events of a monarch's life, from

birth and baptism to accession, coronation, and eventual death, were marked by public celebrations or mourning. Royal funeral ceremonies involved lyings-in-state, processions, grand catafalques, and numerous religious ceremonies that affected large numbers of people. The churches took an active part in almost every public ceremony of monarchy, as well as in the dissemination of royal messages. In France, *Te Deum* services proliferated in the seventeenth century to commemorate occasions of importance to the crown. The Ottoman sultans were regularly blessed at Friday prayers in mosques throughout their empire, just as the English monarchs were on Sundays in Anglican churches. In return, the king took every opportunity to associate himself with religion. Marching behind the Host in the Corpus Christi procession was an important annual ritual for many Catholic monarchs.

Graphic images of kings became more available in the late sixteenth century through engravings and woodcuts. Queen Elizabeth of England tried in vain to prevent the sale of unauthorized pictures of herself. The market for prints was concentrated in towns, among the urban nobility and bourgeoisie. Peddlers, however, carried prints into the countryside, along with printed chapbooks that might contain idealized images or descriptions of rulers. By the late eighteenth century, newspapers had spread throughout western and central Europe, and the doings of courts were among their favorite topics. While they were often heavily censored, and could be prosecuted for seditious libel even in a relatively tolerant kingdom like Great Britain or Prussia, newspapers gave a regular insight into court life that had previously been available only to a select few. They complemented the often scandalous court memoirs that became popular reading material. It would be unwise to argue that the growing awareness of the doings of courts bred disillusionment with royal government, but it certainly encouraged critics, including those French pornographers who invented lurid (and wholly fictitious) accounts of the orgies presided over by Queen Marie Antoinette.

Ordinary people often looked to the king's law courts for justice against their aristocratic overlords. In Tudor England, the Court of Star Chamber meted out cheap justice to the poor; and in 1665–1666, Louis XIV's Assizes of Auvergne passed

eighty-seven sentences against gentlemen, “to rescue the people from the oppression of the powerful.” Even as the Holy Roman emperor’s power was declining after 1648, his Aulic Council continued to hear two to three thousand lawsuits every year. It made a big impression when Joseph I deposed a German prince after the council had investigated his execution of a peasant without a trial. Distrust of the nobility explains why ordinary people generally seem to have favored a stronger rather than a weaker monarchy. In Stockholm in 1743, for example, crowds eager for a Danish rather than a Russian successor to the throne called out, “One king and not many! No Russian puppet!” Unfortunately for them, they got almost thirty more years of aristocratic domination.

Subjects could prove more rebellious if the king tried to implement policies that were perceived to be despotic or impious, as the revolts of the mid-sixteenth and mid-seventeenth centuries demonstrated. After 1660, however, the privileged classes seem to have become less willing to support serious rebellions. This permitted monarchs to extend the state controls that had been building up for the previous two centuries. Their measures mainly involved military organization, conscription, and taxation; but state interference could spill over into new areas like social welfare, peasant labor services, comprehensive school systems, or even the structure of composite monarchy (for example, the union of England and Scotland, the dissolution of privileges in Aragón, or the annexation of the Ukraine). Reform did not always work; the French monarchs were amazingly ambitious in setting out plans for improving the economic conditions of their kingdom, but almost all of them ended in spectacular failure, due to the power of vested interests.

Did European monarchs lay the foundations of the modern state? In a fiscal and military sense, they certainly did; and they came up with the winning formula of controlling the individual by creating allegiance to a distant authority wearing a human face. Nevertheless, most rulers were resistant to the next, crucial step in state formation: the dissemination of national identities. A few, like George III of England and Gustav III of Sweden, were happy to be seen as patriot kings, although both made political havoc by overplaying the role. Frederick the

Great was hailed as a German patriot by his admirers, but did not take the idea seriously. Joseph II tried to force the German language on his recalcitrant Hungarian subjects not because he was a patriot, but because he thought it would be more efficient. Charles III of Spain failed to appreciate the patriotic opposition to his Italian advisers, until riots in 1766 forced him to dismiss them. Catherine the Great and Louis XVI wanted to have nothing to do with national sentiments. Catherine was lucky enough to rule over a country where they were embryonic. Louis XVI was not so fortunate; his people wanted a patriot king, and when it became evident that he was not prepared to be one, popular disillusionment contributed to revolutionary anger.

In the next century, of course, monarchs would willingly become national icons. Their initial hesitation to commit themselves to nationalism, however, was well considered. Identification with a particular nation meant the end of the composite state with which early modern monarchy was so closely associated. It also meant that the ruler was now beholden to a national community, that is, to the people; and if he failed them, as so many monarchs did at the end of World War I, he could not expect to retain their allegiance.

MONEY AND COINAGE

CENTRAL AND EASTERN EUROPE

During the second half of the fifteenth century, the late-medieval silver famine finally came to an end with the development of many new silver mines in the Alps, in the Erzgebirge, at Schwaz in Tyrol, at Schneeberg, Annaberg, and Buchholz in Saxony, and subsequently at Joachimstal in Bohemia. The so-called central European copper-silver mining boom was the result of two technological innovations: one in mechanical engineering, which permitted much more effective drainage of deeper mining shafts; and the other in chemical engineering, the Saiger process, which, for the first time, permitted silver and copper to be separated from each other in their ore bodies.

When this mining boom peaked in the 1530s, Europe's silver supply had expanded at least five-fold. The character of the silver coinages also changed with this mining boom. During the later Middle Ages, both fiscal exigencies and periodic scarcities of silver had encouraged many European

governments to engage in coinage debasements that often drastically reduced the silver contents of their coins. But from the later fifteenth century, many princes and city-states began striking much larger and much finer silver coins. The first to do so was the Habsburg Austrian Archduke Sigismund of Tyrol who, in 1486, used his silver mines at Schwaz to mint a new prototype, the *Guldiner*, weighing 31.9 grams, which was worth 1 golden florin (*Goldgulden*). These silver *Guldiner*, *Gulden Groschen*, or *Talers* were of the general size that the English later adopted for their silver crowns and, subsequently, the Americans for their silver dollars. When the Counts Schick, who controlled the Joachimstal silver mines in Bohemia, began striking *Joachimstaler* (28.7 grams) in 1519, these *Talers* became very popular in Europe.

After the central European mining boom began to wane, the production of *Talers* was sustained by the large influx of Spanish-American silver from the 1550s to the 1660s. The Italians, however, did not strike what Carlo Cipolla calls the “maxi-silver coins” until the mid-sixteenth century. In 1551, Milan, then under Spanish Habsburg domination, issued a silver *scudo*, later called a *ducatone* (about five times heavier than a *testone*), modeled on the Spanish Real of Eight (*real de a ocho*); Venice followed suit in 1563, in issuing the *piastre*, weighing 32.896 grams (with 31.19 g fine silver), worth 6 lire 4 *soldi*, that is, the full value of the silver-based ducat money of account (see “Money and Coinage: Western Europe”). In 1567, Genoa struck a silver *scudo*, weighing 37.265 grams (35.71 g fine silver), and the next year, in June 1568, Florence struck its own *scudo* or *piastra*, weighing 32.6 grams (31.2 g fine silver).

Despite the vast increases in silver supplies from central Europe and then the Spanish Americas, and also some increase in gold supplies from Portuguese-African imports, monetary stability had not yet been obtained. International trade and warfare consumed increasing quantities of coins; coins were also the object of speculation. Many mints counterfeited the popular *Taler*, issuing imitations of the same size but with reduced silver contents. In accordance with Gresham's law, the imitations drove the original, full-bodied *Talers* out of circulation, and many of them were exported as bullion to the

East. Warfare was also financed, to some degree, by coinage debasements.

If, as the companion essay shows, early modern western Europe experienced far less war-induced debasements than it had in the later Middle Ages, such was not the case in Germany and eastern Europe. The most notorious is Germany's inflationary debasement known as the *Kipper- und Wipperzeit*, which took place during the opening phases of the Thirty Years' War (1618–1648), when the emperor tried to mobilize new resources for financing his armies. To do so, he leased the imperial mints to a consortium formed by several entrepreneurs, including the Bohemian Stadtholder Liechtenstein and Colonel Albrecht von Wallenstein. The consortium debased the silver coinage by two-thirds, and reaped huge profits. When so many bad coins were received by the Imperial treasury, however, the government soon ended this experiment, imposed a recoinage, and, as in most other German territories, returned to stable money. Although the consequences of the *Kipper- und Wipperzeit* did not prevent later princes from engaging in debasements to finance their wars—for example, Louis XIV during the War of the Spanish Succession (1701–1714) and Frederick the Great during the Seven Years' War (1756–1763)—in the long run, monetary stability did come to prevail. In 1690, Brandenburg, Saxony, and Braunschweig-Lüneburg entered into a monetary union that created a homogenous *Taler* zone in territorially scattered Germany.

In the eighteenth century, new sources of gold from Brazil along with a revival in Mexican silver mining improved the metallic base of European coins. While Britain introduced the gold standard (from 1718; see “Money and Coinage: Western Europe”), France maintained a bimetallic system, and its *Louis d'or* (22 carats, with 6.189 g fine gold), first struck in 1640, became the model coin for central Europe. Moreover, banknotes and the expansion of the banking system made coins less and less required for internal European trade. The Asian trade, however, still required large shipments of precious metals, especially the Spanish *reales de a ocho* and Dutch *ducatoons*, during the seventeenth and early eighteenth centuries; later in the eighteenth century, they were replaced by silver bars minted in Asia.

MICHAEL NORTH

WESTERN EUROPE

The coinages of early modern Europe, which were basically a continuation of those created in the medieval era, were composed of the two precious metals—gold and silver—and the base metal copper. Most European countries and regions continued to employ a monometallic system based on silver, but supplemented by gold and copper. Silver provided the essential link between physical coins and the monetary systems in most principalities, in that the silver penny (with a few exceptions) always equalled the value of one penny in that principality's money of account: i.e., the *denarius*, *denaro*, *denier*, *Pfenning*. From Carolingian times (c. 795), the most widely used system in western Europe (except in Spain and parts of Germany) was based on the pound (*libra*, *lira*, *livre*, *Pfund*)—originally equal in value to the Carolingian pound weight of silver (489.51 g). For accounting purposes, it was subdivided into twenty shillings (*solidi*, *soldi*, *sous*, *Schillingen*), which in turn were subdivided into twelve pennies or pence, so that each money-of-account pound always consisted of 240 currently circulating pennies. For centuries, the only silver coins struck were the various regional pennies (and their subdivisions); and not until the later twelfth and thirteenth centuries did some Italian city-states, and then France, introduce heavier weight silver coins, known as *grossi* or *gros*. The Florentine *grosso* or *fiorino* was in fact first struck (in 1237) with a value of 12d (*denari*), as was the French *gros tournois* (12 *deniers*), from 1266; but England did not issue such a “shilling coin,” known as the *teston*, until 1504.

By that time, the English pound sterling (20s) contained, or was worth, only 186.621 grams sterling silver (92.5 percent fine) or 172.624 grams fine silver—just over half of the original Tower Pound mint weight of sterling silver, 349.914 grams, dating from shortly after the Norman Conquest; it was

1.430 times heavier than the French mint weight, the *marc de troyes* (244.753 g—which was one-half of the old Carolingian pound). The French *livre tournois* by 1504 contained a mere 4.36 percent of the original Carolingian weight, now the Paris *livre*, of silver *argent-le-roy* (95.833 percent fine). Over the ensuing centuries, the explanation for this break—often an extreme divergence—from that Carolingian monetary link was coinage debasement.

This development highlights the monetary importance of the base metal copper. Even the very finest coins were always alloyed with some copper, since a hardening agent was required for these soft and malleable precious metals. As indicated, English sterling silver had 7.5 percent copper, and the French *argent-le-roy* coins, 4.17 percent. For too many impecunious princes and city-state governments, the profits to be gained through substituting proportionately more and more of this base metal alloy—hence the term *debasement*—for less and less silver were too tempting to resist. A complementary technique for reducing a coin's precious metal contents was simply to decrease the weight of the coin itself; together, these techniques allowed the prince to mint more and more coins of the same nominal or “face” value from a pound or *marc* of fine silver or gold. A more precise definition of debasement is the reduction of the quantity of precious metal—silver or gold—represented in the principality's money-of-account system, that is, the pound, *livre*, or *lira*.

The profits derived from coinage debasement came from a seigniorage tax on the mint's coinage output, a tax borne by those who sold bullion to the mint, but ultimately by the public at large. The government's objective in undertaking aggressive debasements was to increase its mint outputs, and thus its seigniorage revenues, by forcing its subjects to remint their former good coins into a greater number of inferior ones having the same nominal or “face” value and also by luring bullion away from foreign mints by offering a higher mint price for gold or silver. Merchants who received the debased coins from the mint would profit by spending them quickly (at home or abroad) before the almost inevitable inflation ensued. Neighboring governments were in turn compelled to engage in defensive debasements to maintain their own coinage outputs and mint profits.

The success of so many debasements can be explained by the crudity of medieval and early modern mint techniques. In the production of so-called hammered coinage, employing an upper and lower die (hammer and anvil) to stamp the coins as well as shears to cut them, no two coins from the same batch were exactly identical; even money changers, equipped with accurate scales and touchstones, generally had great difficulty in detecting small changes in coinage alloy (fineness) and weight. Obviously, the general public was far more readily deceived by such debasements and thus had to accept the seigniorage tax.

England's kings had long been a significant European exception in undertaking debasements only rarely, chiefly for defensive reasons, and almost always only by reducing their coins' weight, while maintaining the traditional sterling fineness. For example, in 1526, Henry VIII altered the silver coinage for the first time in sixty-two years (since 1464) to match the current circulating standard, which had deteriorated through wear and tear, by reducing the penny's weight, and thus its silver content, by 11.13 percent (from 0.719 g to 0.639 g). From 1542 to 1551, however, he and his successor undertook the famous “Great Debasement,” which employed both mint-manipulating techniques. The long-traditional sterling silver standard (11 oz, 2 dwt silver) was debased to a mere three ounces of silver so that, with so much copper (9 oz), the coins “did blush with shame”; overall, the penny's silver content was reduced by 83.10 percent (to just 0.108 g silver). (Net profits from the “Great Debasement” of 1544–1551, from all mints, amounted to £1,270,864.10 sterling, an immense sum for that era.) In 1553, the government restored most of the fineness (to 11 oz) and some of the weight—and thus the penny's pure silver content to 0.475 g. That task was completed with Elizabeth I's general recoinage of 1560, which restored the sterling silver standard, increasing the pure silver content to 0.480 g. Subsequently (apart from a very minor debasement in 1578, reversed in 1583), the English silver coinage remained unimpaired for over forty years, until July 1601, when it underwent another minor weight reduction, reducing the silver contents by a mere 3.33 percent (to 0.464 g). Thereafter, the English sterling silver coinage remained completely unaltered for over two centuries,

undergoing its final weight reduction in 1817 (by 6.03 percent, with 0.436 g pure silver in the penny).

If the Henrician “Great Debasement” was therefore a striking anomaly in English monetary history, it was also not readily imitated elsewhere in early modern western Europe. It stood in sharp contrast to the monetary chaos that had afflicted the French, Flemish, Spanish, and most Italian silver coinages during the later Middle Ages. For example, fifteenth-century French coinage had become so impoverished in its silver content that the *denier tournois* was no longer a useful coin; and the standard or link coin became the *blanc couronne* or *douzain* (= 12d *tournois*; in effect, the shilling). Strengthened in 1488 to contain 1.023 grams of pure silver, it remained unaltered until 1519, when Francis I’s minor debasement (reducing slightly both fineness and weight) diminished its fine silver content by 11.72 percent (to 0.903 g). When this coin underwent its final alteration in 1572, it lost another 22.18 percent of its fine silver (with only 0.703 g)—if not a minimal loss, certainly not a drastic one compared to so many medieval debasements.

Thereafter, and throughout the seventeenth and eighteenth centuries, French monetary history is characterized by the issue of chiefly heavyweight, much finer, silver coins (see “Money and Coinage: Central and Eastern Europe”), and they generally had a fineness of full *argent-le-roy*. Their periodic “debasements” were not effected by physical changes but were implemented by yet a third technique: an increase in their face or money-of-account value. For example, in 1641, French mints issued the *écu blanc* with 26.062 grams fine silver and nominal value of 3 *livres tournois*; by 1693 this coin, physically unchanged, had increased in value to 3 *livres 12 sous tournois*. By 1791, when the final French silver coin of the medieval *tournois* genre was issued, as the post-Revolutionary *écu constitutionnelle*, nominally worth 6 *livres* (with 28.260 g pure silver), the *livre tournois* then contained just—and exactly—one percent of the fine silver in the Carolingian *libra* of about a thousand years earlier.

In early modern Italy, the various city-states and principalities (including the papacy) continued to strike their own individual coinages; but sufficient documentation is available only for Florence (to

1597). Having undergone considerable debasement for much of the medieval era, its silver coinage enjoyed relative, if not complete, stability for the one hundred years from 1371 to 1471, during which time the penny or *denaro picciolo* lost only 13.15 percent of its fine silver contents. But in 1472, it suffered a further and most dramatic loss of 71.13 of its fine silver (with just 2.08 percent fineness); and, when last issued in 1504 (with the same silver contents), its value was raised to 2d. The effective “link” money had become the *quattrino* (4d), which, in the same year, 1472, lost 30.85 percent of its fine silver contents; by 1560, it had lost a further 44.02 percent of its silver (with a reduction in fineness from the original 16.67 percent in 1332 to 8.33 percent in 1560).

More complex were debasements of the Florentine *grosso* (originally, the shilling coin). While nearly always retaining its *argent-le-roy* fineness (95.833 percent pure silver), its weight was periodically reduced, and its money-of-account value was increased, from 2s 0d in 1296 to 5s 6d in 1390, and finally to 7s 6d, with its final issue in 1531. During that period, its weight had been reduced by 34.03 percent, so that the pure silver content of the lira money of account, as reckoned in these *grossi*, had fallen by 56.02 percent. In the sixteenth century, Florentine silver coinage issues were also chiefly in the form of much heavier, higher-denomination coins, again all with *argent-le-roy* fineness: the *Barile* or *Giulio*, valued at 12s 6d (from 1504); the *Cosimo*, at one lira (that is, 20s, from 1539); the *Testone*, at two lire (40s, from 1540); and finally, the *Piastra*, at seven lire (140s, from 1568). During this century (1504 to 1597), the silver content of the lira, as reckoned in these coins, fell by only 17.24 percent (15.04 percent by 1552): from 5.386 grams to 4.4575 grams.

Even greater monetary stability was to be found in the silver coinages of sixteenth- and seventeenth-century Habsburg Spain. From 1497 to 1686, the Spanish crown consistently minted (with one exceptional minor deviation in 1642–1643) two silver coins at 93.06 percent fineness: the *Real*, with 3.195 grams pure silver (67 cut from an alloyed marc of 230.0465 g) and a nominal money-of-account value of 34 *maravedis* (375 to the ducat money of account); and the heavyweight *Real* known as the “piece of eight” (*real de a ocho*), with

just over eight times as much fine silver: 25.997 grams and a value of 272 *maravedís*. In 1686 it was subjected to a very minor weight reduction that lowered its fine silver content to 25.919 grams. The American dollar can trace its descent from this Spanish coin.

The more interesting Spanish monetary phenomenon was the issue of petty billon or *vellon* coinage, beginning with the *blanca* of 1583, with a fineness of just 1.39 percent (containing only 0.0146 g silver), and a nominal value 0.5 *maravedí*. That was followed in 1597 by the *maravedí* coin itself, with a fineness of only 0.35 percent (and a silver content of just 0.0063 g); in 1599 that became Spain's first purely copper coin (minted at 140 per copper *marc*, and from 1602 at 280 per *marc*). Certainly, some of the ensuing inflation in seventeenth-century Spain, with a widening gap between nominal and silver-based prices, ranging from 4.0 percent in 1620 to 104.2 percent in 1650, has to be explained by such issues of copper coinage. Large volumes of copper coinages were made possible first by the central European silver and copper mining boom (c. 1460–1535), but subsequently and more especially, by the enormous expansion in Swedish copper production, peaking in the 1660s. The first European principality to issue a copper coinage had been, however, the Habsburg Netherlands, in 1543 (France, only in 1607, and England, not until 1672).

The Spanish-dominated government in the Habsburg Netherlands (from 1506) managed to retain, until the Revolt of the Netherlands broke out in 1568, a remarkable monetary stability. (The previous Burgundian regime had managed to achieve some stability only toward its end, in the years 1496–1500, after almost a century of frequently severe debasements.) The one significant set of Habsburg monetary changes took place in 1521, under Emperor Charles V. The silver *stuiver* or double *groot* (2d) was debased very slightly, in fineness only, so that it lost a mere 3.26 percent of its silver content (from 0.977 g to 0.945 g); and the pound *groot* Flemish, in terms of 120 *stuivers* (240d), now contained 113.453 grams fine silver. The major objective of the monetary change was to issue a new, heavier-weight silver coin, the double *Carolus* or *Réal*, 93.40 percent fine, and thus similar to the Spanish *Real*, though containing just 2.858 grams

fine silver, and worth 6d *groot* (3 *stuivers*). These silver coinages remained unchanged until 1553, when the *stuiver* underwent a debasement of 4.80 percent, so that the pound *groot* Flemish now contained 108.00 grams fine silver. By 1567, on the eve of the Revolt of the Netherlands, the *stuiver* had lost another 10 percent of its fine silver; and during the revolt era (to 1648), the *stuiver* of the now Spanish Netherlands lost a further 37.04 percent of its fine silver, so that the pound *groot* Flemish now contained only 61.20 grams fine silver—less than half of the silver prescribed in Charles V's 1521 monetary ordinance.

The major consequence of the revolt was the secession of the seven northern provinces, which, by the Union of Utrecht, in 1579, became the Republic of the United Provinces, better known as the Dutch Republic. It gained its de facto independence from Spain in the Twelve Years' Truce in 1609. Its monetary and coinage system retained, however, some important links with the pre-revolt Habsburg system. Its basic silver coin was the same *stuiver*, which, however, formed the shilling in the Dutch money-of-account system. The reason for this seeming anomaly is simple. From the 1460s, when the market value of the Rhenish gold florin (Rhine-land Electors) had risen to 40d *groot* Flemish, many merchants in the then Burgundian Low Countries adopted this “florin” as an additional silver-based money of account whose value was fixed at 40d *groot*—one equal in value to the old *livre d'Artois* or *livre de quarante gros*. Thus, this florin money of account contained 20 *stuivers*, or “shillings.” The other common names for the old Rhenish florin were *gulden* and *guilder*, the term for the Dutch money of account (with the symbol *f*), which disappeared only with the arrival of the Euro in January 2002.

During the seventeenth century, the Dutch *stuiver* (as issued from 1619 to 1681) enjoyed a remarkable stability in fineness (33.333 percent fine) and weight (1.310 g) and thus in its fine silver contents, 0.436 g. The florin money of account, in terms of 20 *stuivers*, thus contained 8.725 grams fine silver (and the equivalent of the Flemish pound *groot*, as 120 *stuivers*, contained 52.348 g fine silver). In 1681, its silver contents were increased to 0.472 grams: by an improved fineness, to 58.30 percent, though with a reduction in weight, to

0.810 grams; and it retained that composition and unchanged value (9.445 g fine silver in the florin money of account) until it was last minted in 1791, on the eve of the French Revolutionary invasion of the Dutch Republic.

Throughout this long period, the Dutch Republic also issued various series of heavyweight silver coins, chiefly used in Dutch overseas commerce. The earliest, struck from 1606, were the *Rijksdaalder* ('state dollar'), a name derived from the Bohemian *Taler* (*Joachimsthaler*), 87.50 percent fine, with 25.264 grams fine silver, and a value of 47 *stuivers*; and the *Leeuwendaalder* ('lion dollar'), 74.30 percent fine, with 20.459 grams fine silver, and a value of 38 *stuivers*. Their official values were raised to 52 and 42 *stuivers*, respectively, in 1659, when two new heavyweight coins were issued (both struck until 1798): the *Rijder* ('knight'), 93.80 percent fine, with 30.388 grams fine silver, and a value of 63 *stuivers*; and the *Dukaat* (ducat), 86.80 percent fine, with 24.241 grams fine silver, and a value of 50 *stuivers*. Surprisingly, not until 1681, when the *stuiver's* silver contents were enhanced, was an actual coin named the *Gulden* finally issued, with a value of 20 *stuivers*: 91.10 percent fine, with 9.557 grams fine silver. It is also significant that during the seventeenth century, the Dutch *stuiver* and the English sterling penny, as issued from 1601, with 0.464 grams fine silver, were virtually identical in silver contents, so that each had the market exchange value of the other.

The gold coinages of early modern Europe, commanding lesser economic importance, thus deserve less attention. In medieval and early modern Europe, according to many historians, their use was reserved for international trade and finance, for a reason made obvious by this example: in the years 1521–1525, a single Venetian ducat or Florentine florin (both containing about 3.45 g fine gold) could be used to purchase, on average, 628 eggs or 243 herrings on the Antwerp market; an English gold "angel" noble (with 7.735 g fine gold) could be used to purchase, on average, 934 eggs or 362 herrings. Obviously, one would never spend gold coins for such transactions; instead, a silver *stuiver* would more likely have been used to purchase sixteen eggs or six herrings on the Antwerp market. Yet, in the seventeenth century, western European merchants chiefly employed heavyweight silver

coins, and gold only infrequently, in conducting their trade with the Baltic, Russia, the Levant (eastern Mediterranean), and Asia, for three reasons. First, the initially wide divergences in the bimetallic ratios—the ratio of the values of gold and silver, ounce per ounce, on the market—between East and West meant that silver had a much higher purchasing power in goods in these regions than it did in western Europe. The massive increases in European silver supplies, first from the central European mining boom, and then, by the 1560s, from the influx of Spanish American silver, reduced the relative value of silver, and thereby increased the bimetallic ratio in England from about 10:1 in the 1450s to 16:1, by the 1660s. But second, when the bimetallic ratios in India and London had then both achieved this level by the 1660s—thanks to the massive inflows of western silver into Asia—the Asian payments systems were still designed to accommodate the well-known European silver coins more easily than their gold coins. Third, since western merchants had little of value in merchandise to sell in these regions, and thus required precious metals to purchase about 70 percent of the value of their eastern goods (spices, silks, etc.), the ships that sailed to these regions left western ports so empty that the silver, with from twelve to sixteen times the weight of the equivalent value of gold, served as a useful ballast. For reasons that seem less obvious to the economist, these large heavyweight silver coins also predominated, from the 1550s, in the international commerce of the great European fairs.

Nevertheless, within western Europe itself, before the large, heavy silver coins achieved their predominance, gold coins had served as the more useful medium of international exchange, for two reasons. The first, as just suggested, was a superior value: weight ratio, so that merchants requiring precious metals for their commerce (rather than bills of exchange) found it more economical to transport gold, when transport costs had become so high in war-torn late-medieval Europe. Second, gold coinages were far less subject to physical coinage debasements than were silver coins, especially those of small denomination. In view of the far higher value of gold coins, affluent merchants, engaged in international trade, were far more likely to test such coins for proper weight and fineness than were petty merchants using silver coins in domestic trade. gold coins were given a money-of-account value in terms of the silver coinage, merchants could easily have discounted the value of a debased gold coin by reducing its exchange value proportionately. If the silver *stuiver* were debased by, say, 10 percent, merchants and the public would have found it impracticable to discount its value from 2d to 1.8d; instead, they would have raised prices for merchandise to compensate for the lost silver. The other reason that explains why gold coins were so infrequently subjected to physical debasements was their symbolic relationship with sovereignty. Few princes—or even city-state potentates, such as the doge of Venice—would have tolerated having their reputations tarnished abroad by allowing international circulation of their debased gold (or heavyweight silver) coins; as indicated earlier, debasements of small-denomination silver coins posed no such threats since most circulated only within the prince's or city-state's territory. But, as with heavyweight silver coins, a government could effect a technical “debasement” of its gold coins by raising their domestic value in the silver-based money of account, as indicated in the accompanying table; that action was often necessary to maintain a desired bimetallic mint ratio when engaging in a silver debasement (which thus made silver coins relatively cheaper).

In later medieval and early modern Europe, by far the two most famous gold coins were the Florentine florin, struck from 1252 to 1533, and the Venetian ducat, struck from March 1285 (not 1284, as commonly stated) until the French invasion of 1797. In theory, both of these so-called “dollars” of the Middle Ages contained about the same

amount of fine gold: 3.536 grams for the florin and 3.545 grams for the ducat; and, indeed, exchange-rate evidence for France, Flanders, and England for the fifteenth and sixteenth centuries reveals that they virtually always commanded identical values in each country's local currencies. In theory, both were supposedly pure gold of twenty-four carats, but in fact they usually contained about 23.875 carats (99.48 fine), the same as the English gold noble. But unlike the noble, which periodically (every fifty years or so) underwent weight reductions, the florin only infrequently varied in either weight or fineness, by any significant amount, according to the mint accounts. Such accounts are regrettably missing for the ducat, which has, perhaps for this reason, enjoyed a better reputation with monetary historians. As the accompanying table indicates, the fine gold content of the florin, during the years 1466 to 1531, varied from a high of 3.507 grams (1486) to a low of 3.423 grams (1524). The florin ceased to be issued in 1533, when its money-of-account value (originally twenty *soldi* or one lira of 240d, in 1252) had reached 7 lire 10 *soldi* in the Florentine *moneta di piccioli*; from that date it became a silver-based money of account with that fixed value. The florin had been superseded by another gold coin, known as the *scudo* (or *écu*, in French), valued at exactly 7.0 lire, inferior in both fineness and weight to the florin. It was first struck in June 1530, with only 22.5 carats (93.75 percent fine) and a weight of 3.412 grams, and thus a fine gold content of 3.119 grams. In 1533, its fineness was reduced to 22 carats (91.67 percent fine), which was retained thereafter, but by 1548 its

weight had fallen to 3.379 grams (3.097 g fine gold), while its official value has risen to 7 lire 12 *soldi*, increasing to 7 lire 12 *soldi* in 1556 (but remaining at that value for the rest of the century). As noted earlier, Florence also issued a series of heavyweight silver coins during this century.

In Venice, the ducat changed its name, though not its physical composition, in 1517 to become the *zecchino* (*sequin d'or*), a name derived from *ducato di zecca* (that is, ducat of the mint). The term *ducat* was then reserved for a silver-based money of account, with a fixed value of 6 lire 4 *soldi* Venetian (in current money). Subsequently (by or before 1563), the Venetians also issued a heavyweight silver coin, the *ducato d'argento*, more commonly called the *piastra*, containing 31.19 grams fine silver. All of these heavyweight silver coins—Spanish, Dutch, French, Italian, and Austrian—commanded continuous international respect, chiefly because they were not subjected to physical debasements for the same reasons that the major gold coins were spared this fate. According to Herman Van der Wee, the European predominance of the large silver coins lasted until 1718, when Great Britain issued its famous gold guinea (22 carats, with 7.689 g fine gold); in doing so—though more by accident than design, in overvaluing the coin at 21 shillings—the British inaugurated the modern era of the gold standard.

For monetary historians, as well as for numismatists, every gold and silver coin has its own interesting history. If a picture is worth a thousand words, perhaps the following table on European gold coinages from the later fifteenth to late eighteenth centuries, will suffice to reveal the varieties of gold coinages and their almost continuous “debasements” in terms of the fine gold content in each principality’s or city-state’s money of account.

MONOPOLY. Monopoly and competition are diametric terms used to describe complex relations among firms in a single industry. Simply put, monopoly is the exclusive control by one firm or group of firms of the means of producing or selling a commodity or service. As sole supplier, the monopolist can set any price, provided the sales generated are acceptable. Generally that price will be beyond production costs, and it will return profits in excess of normal return on investment.

When Adam Smith (1723–1791) wrote his sustained attack on monopolies in *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), he did not have single-firm monopolies in mind. These are relatively rare, except for those established by state policy or subject to state regulation. Rather, Smith directed his criticism toward multifirm industries with statutory protection, like medieval guilds.

MEDIEVAL COMPETITION

The medieval economy appears to have had a positive aversion to competition, which occurs in a free or atomistic form when the number of producers or sellers in a single industry is so large that each seller's share of the market is too small to affect the market share or income of any competitor. Thus, each seller must adjust output and price to reflect established market conditions. These conditions are affected, in turn, by the ease of entry into the industry, the concentration of sellers in the industry, and the degree of product differentiation in the industry. Given the widespread medieval presumption of fixed resources and limited growth, where pure competition would lead to failure and suffering, these conditions had to be regulated. So, medieval polities opted for monopolistic structures.

Monopoly constituted a form of political protection in most sectors of the medieval economy. Manorial agriculture relied on the guaranteed tenure of peasants on the land and the guaranteed rights of landlords, both of which were types of monopoly. Guilds strictly regulated access to markets and differentiation of products, thus establishing monopolies in most medieval industries. Shipping corporations exercised monopoly rights over transportation along certain routes, such as the Alpine passages. Merchant companies received extraction-and-purchase monopolies for metal ores from mines in certain regions, such as Tyrol or Saxony, in some instances expanding these to near domination of entire industries, as by the Fugger in copper or the Höchstetter in mercury. Nearly all corporations sought monopoly rights for themselves. In most cases, these were thought to guarantee the shared interests of all, producers and consumers alike.

EARLY MODERN OPPOSITION

Attitudes began to change as early as the fifteenth century. More accurately, attitudes began to be recorded, published, and preserved more consistently

at this time. Merchant companies came under suspicion of manipulating prices through monopoly. The 1425–1429 guild rising in the south German city of Constance demanded the dissolution of commercial firms, and the *Reformatio Sigismundi* (1438–1439) reflected this sentiment. (The *Reformatio Sigismundi*, a document attributed to the Emperor Sigismund [ruled 1433–1437], set forth a program of social and ecclesiastical reform within the Holy Roman Empire. Though not accepted in its day, many of its ideas resonated in the Protestant Reformation a century later.) Complaints multiplied against “monopolists,” who hoarded commodities to keep prices artificially high. By the sixteenth century, “monopoly” had become a clarion call of opposition not only to monopolies in the strict sense, but also to cartels, syndicates, hoarders, and usurers who did not deserve it, however questionable their dealings.

Matters came to a head in the Holy Roman Empire, where large mercantile companies, such as the Fugger, Rehlinger, and Höchstetter, engaged in interest-bearing credit and investment transactions as well as price-manipulating monopolies and cartels to increase their profits. Such activities inspired opposition from many strata of society, not only artisans and peasants but also merchants and princes, all of whom saw their expenses rise and incomes fall within the environment of the “price revolution” of the sixteenth century. They found a compelling spokesman in Martin Luther (1483–1546), who viewed such commercial enterprises with a “peasant’s mistrust.” He wrote and preached repeatedly against interest and usury. His 1524 pamphlet “Von Kaufshandlung und Wucher” lumped monopoly among these other abuses according to the rationale that any price beyond a just price constituted usury—a violation of divine law.

By this time the issue had already engaged the attention of the imperial government for more than a decade. At the urging of estates in the territories of the Hanseatic League and Franconia, centers of opposition to monopolistic practices, the Imperial Diet of 1512 first considered limiting the activities of the great mercantile houses. In 1523, the Reichsfiskal, an institution of the imperial government charged with overseeing taxation and expenditures, lodged a formal complaint against the monopolistic practices of six Augsburg firms, the

Fugger above all others. Only the refusal of Emperor Charles V (ruled 1519–1558) to support the measure—prompted by the personal influence of his banker, Jacob Fugger himself—prevented the measure from becoming law. Yet the antimonopoly forces were not ready to admit defeat. The Reichsfiskal renewed its complaint and brought the matter before the Imperial Diet of Augsburg in 1530. Its members moved to form a commission, which prepared a report for the “common good” on the monopolistic abuses of these great companies. It referred specifically to their trade in Oriental spices and metal ores, their use of interest-bearing instruments and transactions, and their manipulation of prices through speculation and hoarding. These techniques allowed the monopolists to alter market conditions in such a way as to unjustly inflate their profits from these enterprises, thus driving their more modest competitors out of business and the “common man” into the streets. The report also proposed that monopolistic practices be forbidden by law, that commercial firms be limited in size, that imported goods be subjected to price controls, that imperial subjects be forbidden to engage in overseas enterprise, and that foreign merchants in the empire be similarly regulated.

In the midst of such dangerous opposition, mercantile interests found a spokesman in Conrad Peutinger (1465–1547), merchant son, university-trained jurist, Augsburg councillor, and renowned humanist. In a 1530 legal opinion, he defended monopoly as essential to the economic well-being of the nation. Through their entrepreneurship and audacity the accused monopolists drew international trade to the empire and, he argued, created profit and advantage for princes and plebeians alike. Their firms traded in large volumes of goods, thus lowering prices. Their capacity to concentrate capital enabled them to undertake ventures that were too costly or risky for smaller competitors. He argued that risk and profit should be linked. Indeed, the pursuit of individual advantage in economic life was not opposed to the common good, rather contributed directly to it and, as such, was both economically and morally justified. Peutinger became one of the first advocates of a truly modern economic ethos. Whether his arguments had any immediate bearing cannot be determined. Emperor

Charles V saw fit to let the matter die an administrative death.

UBIQUITOUS MONOPOLIES

The resort to monopolies—as well as opposition to them—continued in the Holy Roman Empire and elsewhere. Inspired by mercantilist thought, which emphasized protectionist legislation to shield domestic industries from competition, German princes granted production monopolies as a privilege to German manufacturers. Indeed, the catalogue of princely prerogatives, referred to collectively as *Regalien*, included the granting of monopoly rights. Although denied to the Holy Roman emperor by the Treaty of Westphalia (1648), these prerogatives came into increasingly frequent use among territorial princes who were anxious to expand their power and increase their revenue. Nor were the Germans alone. State-sponsored monopolies were a common economic contrivance in Bourbon France and Tudor-Stuart England. Everywhere, trading monopolies played an essential role in commercial and colonial development. They involved the creation of charter trading companies to which the crown gave monopoly rights. The Company of Merchant Adventurers, the Levant Company, and the East India Company used political influence to exclude foreign competitors and limit export quotas in order to maintain market share and stabilize profits. Members paid a fee to trade under the aegis of company direction, a fact that led to bitter resentment among those excluded. An attack on trading companies was launched in Parliament in 1604, but their monopolies were not relaxed until late in the 1600s, when regulation of monopolies was no longer viewed as essential to commercial security. Monopolies were not limited to commerce. The reign of Elizabeth (ruled 1558–1603) witnessed the expansion of the patent system as a spur to English manufacturing, whereby patents were granted the sole right to produce a given product by a given process, in effect monopoly control of a certain manufacturing process. Reliance on monopolies did not yield to faith in competition until physiocratic thinking made its influence generally felt in the course of the eighteenth century.

The early modern economy relied to a surprising extent on monopoly and monopolistic practices. Their effects were not uniformly deleterious. Yet the

period initiated a passionate debate about commercial activities and a turn toward freer competition that continues to this day.

THOMAS MAX SAFLEY

MONTAIGNE, MICHEL DE (1533–1592), French essayist. Montaigne was born at his family's château, which is still in existence, near Bordeaux, on 28 February 1533. The château de Montaigne and the title had been bought in 1477 by his great-grandfather Ramon Eyquem, who had made his fortune trading in wine and salt fish. Pierre, Montaigne's father, was the first of his family to "live nobly," that is, give up commerce, and Montaigne himself was the first to follow the aristocratic practice of adopting the name of the estate as his own. Pierre had married, in 1528, Antoinette de

Louppes (Lopez), from a family of *converso* Spanish Jews, and Michel was the eldest of their surviving children.

Montaigne's father took a great interest in the new humanist learning, and thus had Michel raised in the company of a tutor who spoke only Latin to him, so that Latin, rather than French, was his first language. Montaigne spoke fondly of this part of his childhood, but less fondly of his years at the Collège de Guyenne, whose harsh discipline he detested, although he admitted to having had a few excellent teachers. He went on to study law, in preparation for a career of public service. By the late 1550s he was a member of the Parlement of Bordeaux, a position he retained until 1570. It was there, around 1558, that he met Étienne de la Boétie, who became his greatest friend, and whose premature death in 1563 was the defining moment in Montaigne's personal life. In 1565, Montaigne married Françoise de la Chassaigne; around this time, he also began to translate, at his father's request, the *Theologia naturalis* of Raymond Sebon (d. 1436), which described a path to faith through rigorous self-examination. He finished the translation in time to present it to his father before the latter's death in 1568, and it was printed in 1569.

In 1570, Montaigne sold his parliamentary office, and officially retired from public service, out of (he said) a desire to devote the remainder of his days to study, writing, and contemplation. His "retirement" was, however, not complete. Himself a moderate Catholic, he was trusted by both Catholics and Protestants, and often played an important role in negotiations between them in France's Wars of Religion, work for which he was honored by both sides. He was at the same time working on the *Essais*, whose first edition, in two books, was published in 1580. In the same year, he embarked on a leisurely trip through central Europe to Italy, visiting various spas in search of relief from the kidney stones that had begun to plague him two years earlier. This trip resulted in the *Journal de voyage*, not rediscovered and published until 1774. While still in Italy, Montaigne was informed that he had been elected mayor of Bordeaux. He was initially reluctant to accept the office, and it was only at King Henry III's insistence that he returned home in late 1581 to take up his none-too-onerous duties. Two years later he was elected to a second term as mayor,

which kept him busy dealing with the Catholic League and working to reconcile Henry III and the Protestant leader Henry of Navarre (later King Henry IV).

He continued work on the *Essais* during this time, revising and adding to the essays of the first two books while writing the thirteen essays of the third book. In 1588 he went to Paris on a diplomatic mission, also bringing the new three-book version of the *Essais* to the printer. On this trip he met an enthusiastic reader, Marie de Gournay, who would become his literary executor. Montaigne kept working on the *Essais* up to the time of his death (13 September 1592), making notes, revisions, and extensive additions in the margins of his own copy of the 1588 edition. This book, the *exemplaire de Bordeaux* (Bordeaux copy), became the basis of the posthumous 1595 edition, whose publication was overseen by Marie de Gournay, and of most subsequent editions as well.

Montaigne has been credited with inventing in the *Essais* both the essay form and the modern notion of the self. In fact, neither claim is strictly true. Montaigne's earliest essays are in fact closely modeled on (even, sometimes, translations of) the moral essays of classical authors like Cicero, Seneca, and Plutarch. Later essays, while ranging farther afield, always remain in dialogue with their classical models. Likewise, the notion of an approach to philosophical wisdom through autobiography has a long history in the Western tradition, from Augustine on. Montaigne's real innovation is to combine essay and self-examination into a genuinely unique result: the literary representation of the self as constantly evolving process. He intends, he tells us, to offer an entirely unvarnished self-portrait, including everything, no matter how trivial, and hiding nothing, no matter how embarrassing. Montaigne's self-deprecatory attitude is, of course, partly ironic, since the inclusiveness of his project allows him to claim for it an exemplarity on a par with, or surpassing, that of his classical predecessors. And it is indeed inclusive; the *Essais* cover an astounding range of topics, from the deepest theological and philosophical questions to codpieces, motion sickness, and the drinking habits of Germans. Some essays are miniatures, a paragraph or two of comment on some classical topic, while others, especially those of the third book, are extended and complex, weaving

together multiple themes (the *Apologie de Raymond Sebon*, a critique of Sebon running to nearly two hundred pages, is in a class by itself).

In the midst of such diversity, a few major themes, or rather sets of questions, unite the *Essais*. First, a radical skepticism, given its fullest expression in the *Apologie* but pervading the entire collection, through which Montaigne constantly calls into question his society's most fundamental assumptions. Second, a critical fascination with Stoic philosophy, influenced both by his readings in classical authors and his experiences in the Wars of Religion. Third, a kind of pragmatic Epicureanism, likewise conditioned by his readings (especially of Lucretius) and by his own experience of the limits of Stoicism. From all of these emerges, finally, a spirit of humility and tolerance, to which Montaigne is led by a thorough contemplation of human imperfection, including his own. Montaigne's style and language are as diverse as his subjects. Now discursively Latinate, now colloquial and blunt, his voice adapts constantly to his topic and mood. He is therefore a deceptively difficult author. The reader is sometimes lulled into complacency by the apparent ease and simplicity of Montaigne's style, only to find that the thought being expressed is far more complex than it had seemed. The *Essais* are Montaigne's running conversation with antiquity, with his own society, with the reader, and with himself; digressive, polyphonic, sometimes contradictory, often ironic, always generous and humane, they show us one of the finest minds of the Renaissance at work.

Montaigne's impact on his contemporaries was immediate and substantial, and he has occupied a central place in Western literature ever since. John Locke and the philosophes owed much to him, as did Shakespeare and Francis Bacon. Blaise Pascal rightly recognized in him a formidable opponent; the heart of the *Pensées* is therefore a critical dialogue with Montaigne. Many have applauded Montaigne's skeptical critique of both reason and religion, while others have found him a dangerous freethinker, but none have failed to recognize the necessity—and the pleasure—of conversing with this most engaging of authors. He has inspired some of the best literary criticism of the last half-century and continues to be a major presence in literature, as well as in political and moral philosophy.

DAVID M. POSNER

MONTESQUIEU, CHARLES-LOUIS DE SECONDAT DE (1689–1755), parliamentary judge, historian, and political philosopher. Montesquieu was born on 18 January 1689 at La Brède, near Bordeaux. His earliest education was with a local schoolmaster; in 1700 he was sent to an Oratorian institution near Paris emphasizing the

classics. Between 1705 and 1708 he studied law at the University of Bordeaux, receiving a license in law and becoming an advocate at the Parlement of Bordeaux. From 1709 until 1713 he resided in Paris, attending meetings of the Academy of Science and the Academy of Inscriptions, compiling notebooks on Roman law, and becoming acquainted with such luminaries as Bernard le Bovier de Fontenelle and Nicolas Fréret.

Following the death of his father in 1713, he returned to La Brède to take charge of the family estates. In 1715 he married Jeanne de Lartigue, a wealthy Huguenot from a nearby village who bore him a son and two daughters and ably managed his estates during his many trips to Paris. In 1716 he inherited from his uncle the office of *président à mortier* (deputy president) in the Parlement of Bordeaux. For ten years he served in the Chambre de la Tournelle, the criminal section of this regional court, prior to selling his office in 1726 to procure more time for his literary and philosophical pursuits.

EARLY WRITINGS AND TRAVELS

From an early age Montesquieu displayed the interests of a polymath. In addition to numerous youthful scientific papers, his early writings included essays on Cicero's politics and philosophy, on the problem of the French national debt, on political uses of religion in ancient Rome, on the obligations of citizenship and morality, on the decline of Spanish wealth, and on the respective roles of chance and determinism in the unfolding of history. His first published work, *Lettres persanes* (1721; Persian letters), was a brilliant excursion into comparative politics, juxtaposing the laws and customs of Islamic and Christian societies. Considered by many the point of origin of the French Enlightenment, this early work presented satirical portraits of French and Persian manners, customs, and religion amidst significant philosophical observations on such diverse subjects as justice, divorce, slavery, despotism, punishment, demography, English liberty, religious liberty, and principles of government.

In 1728 Montesquieu embarked on a lengthy tour of Europe and England. Prior to his departure, he had been favorably disposed toward republics. After reacting negatively to the aristocratic republics of Italy and Holland, however, and after observing English politics for eighteen months, he returned to

France in 1731 with renewed appreciation for the potential for achieving liberty in properly structured monarchies, whether based on a combination of monarchical and republican elements, as in the English system, or, as in France, constructed on feudal components and with intermediary and corporate bodies whose presence moderates absolutism.

ROMAN HISTORY

In 1734 Montesquieu published a philosophical account of the causes of Roman greatness and decline, replacing Jacques-Bénigne Bossuet's (1627–1704) providential explanation of an ordered concatenation of events with a secular philosophy of history stressing underlying general causes that produced predictable patterns. Montesquieu was critical of the Romans for employing a combination of force and fraud to achieve their goals, and his account of Rome can be read as an attack on Machiavellian tactics in both domestic and international contexts—thus setting the scene for his later pronouncement in Book XXI, chapter 20 of *De l'esprit des lois* (1748; *The spirit of the laws*) that Machiavellianism was waning, since bold strokes of political authority interfere with the economic interests on which power is based. Although he did not find Roman history on the whole an edifying spectacle, Montesquieu drew many lessons from it, including the importance of a balance of powers, the contributions of party conflict to political liberty, the benefits of strengthening patriotism with religious sentiment, and the connection between democracy and small republics that avoid imperial conquest.

THE SPIRIT OF THE LAWS

Montesquieu's reputation hinges most substantially on *The Spirit of the Laws*. As Émile Durkheim and Raymond Aron have emphasized, Montesquieu's viewpoint contributed to an emerging social science perspective exploring the interconnection between all of the complex variables that shape laws, customs, religion, manners, and mentalities. While he by no means discarded the natural law perspective, which stressed an ordered universe, subject to laws embodying transcendent standards of justice, Montesquieu nonetheless introduced sociological perspectives into the study of positive laws. His stress on the influence on human development of laws, customs, religion, education, maxims of government, and modes of subsistence, combined with his

interest in such physical influences as climate and topography, inaugurated a new epoch in the study of society from anthropological and climatological perspectives and influenced numerous later theorists.

The Spirit of the Laws also contributed to recurring disputes regarding France's ancient constitution. For centuries theorists had debated the historical lineage of the respective components of the French constitution, with the legitimacy of absolutism hanging in the balance. The key question was whether the early Frankish monarchy had been absolute—having peacefully inherited the Roman Empire—or whether, following an early Frankish conquest of Gaul, the Frankish kings beginning with Clovis had been elected by noblemen, who kept a close watch on the exercise of monarchical powers. François Hotman contended in his *Franco-gallia* (1573) that the French monarchy had always been elective and restrained by a powerful aristocracy. Numerous absolutist theorists of the same century, however, including Jean Ferrault, Charles Du Moulin, and Charles de Grassaille, contended that both the parlements and the Estates-General of France represented illegitimate constraints on an originally absolutist monarchy.

Montesquieu supported the Germanic nobiliary thesis rather than the Roman royalist thesis concerning the origins of the French monarchy. Unlike Hotman and other proponents of a revived Estates-General, however, he believed that the Parlement of Paris functioned as the key bridle on absolutism through its right to register the king's edicts before they became law. His arguments in *The Spirit of the Laws* provided support for the *parlementaires* during their numerous clashes with Louis XV (ruled 1715–1774) and Louis XVI (ruled 1774–1793) in the decades leading up to the French Revolution—until both the parlements and the crown were extinguished during a period of intense republican fervor.

MONTESQUIEU'S LEGACY

The Spirit of the Laws was the most authoritative political treatise of its day. Montesquieu altered the language of politics by replacing the ancient political classification distinguishing between governments of the one, the few, and the many with a new typology contrasting moderate and despotic forms

of government and identifying republics, monarchies, and despotisms as the main types. Moreover, his selection of political virtue (defined as self-sacrificing, patriotic attachment to the needs of one's country) as the principle of republican government reverberated through both American and French political developments of the late eighteenth century. In America "virtue" was extolled by nearly all the patriots opposing a monarchy they considered corrupt, whereas in France Maximilien Robespierre adopted Montesquieu's language of virtue only to debase it by linking patriotic self-sacrifice with terror, claiming that both are necessary when forging a republic during revolutionary times.

Montesquieu bestowed lavish attention on republics within his governmental typology, but he was no republican by conviction—and certainly no democrat. He had a low opinion of the political abilities of the masses. Moreover, he considered democracy suited only to the extremely small city-states of classical antiquity. Like James Madison in America, he formed a negative opinion of the unsta-

ble democratic states of Greek antiquity, whose tendency to produce unmanageable factional strife had often led to the rise of dictators who could quell disturbances. Only monarchical constitutions, Montesquieu concluded, were well suited for governance of the large states of the modern world.

The Spirit of the Laws contributed significantly to the humanitarian legacy of the Enlightenment since Montesquieu employed devastating satire to ridicule such evils as slavery, disproportionate punishments, religious intolerance, and despotism. Above all, Montesquieu is remembered as a defender of political and civil liberty. Central to that goal, he concluded, is the division of governmental powers between executive, legislative, and judicial authorities to ensure that no one individual or group monopolizes power. Also central to the achievement of liberty is the presence of an independent judiciary enforcing a criminal code that punishes only offenses that threaten actual harm to others.

Montesquieu remained a hero to advocates of constitutional monarchy during the early phases of the French Revolution, but he lost favor as radical elements turned to Jean-Jacques Rousseau for inspiration. The depiction of the English government in Book XI, chapter 6 of *The Spirit of the Laws* as a mixed constitution combining monarchical, aristocratic, and democratic elements became the classic view taken over by William Blackstone in his influential *Commentaries on the Laws of England* (1765–1769). In America the framers of the constitution were so enamored of Montesquieu's depiction of the need to separate executive, legislative, and judicial powers that they made him the most quoted author during the Constitutional Convention of 1787 and divided the American government into three separate branches, each one empowered to check the others. Following the collapse of Communism in the late twentieth century and the French reassessment of the terror phase of their Revolution during the bicentennial of 1989, Europeans have shown a renewed interest in the liberal constitutionalism of Montesquieu, whose work stands as a timeless contribution to our understanding of political and civil liberty.

DAVID W. CARRITHERS

MONTEVERDI, CLAUDIO (1567–1642), Italian composer of madrigals, operas, and sacred music; one of the most pivotal figures in the history of music. Claudio Monteverdi's music was a primary force in the change in style and aesthetics that marked the transition from the Renaissance to the baroque—the shift from the *stile antico* (old style) or *prima prattica* (first practice), as represented by Giovanni Perluigi da Palestrina (1525–

1594) and Orlando di Lasso (1530–1594), to the *stile moderno* (modern style) or *seconda prattica* (second practice). Under the influence of humanistic discoveries—in particular notions about Greek drama—Monteverdi’s contemporaries sought new ways to move the passions of the listener. The Renaissance ideal of complex vocal polyphony was abandoned in favor of a simple texture, often featuring one melodic line and a bass (monody) so that the music could respond spontaneously to the rhythms and meaning of the text. Rigid rules of counterpoint were discarded in favor of a freer treatment of dissonance and chromaticism. Monteverdi’s adventurous tonal style and his use of irregular rhythms, dance patterns, and frequent shifts of texture not only enriched the newly invented genre of opera but transformed genres that had developed during the preceding century, including the madrigal, motet, and mass.

Monteverdi was born in Cremona and baptized on 15 May 1567. The young musician’s genius was so precocious that his first collection of vocal compositions, the *Sacrae cantiunculae*, was published when he was fifteen, when he was still a student of

Marc’Antonio Ingegneri, the *maestro di capella* of Cremona Cathedral. While still in Cremona, he published his first book of madrigals in 1587 and a second on 1 January 1590. In 1590 or 1591, Monteverdi began a lengthy association with the city of Mantua and the Gonzaga family, entering the service of the Vincenzo I Gonzaga, duke of Mantua. His third book of madrigals, dedicated to the duke on 27 June 1592, featured texts by Tarquato Tasso (1544–1595) and Giambattista Guarini (1538–1612). Guarini’s poetry would do much to shape what Gary Tomlinson had referred to as the “epigrammatic” style that characterized the fourth book of madrigals (1603). Monteverdi was appointed *maestro della musica* in Mantua in 1601, and went on to dedicate his fifth book of madrigals (1605) to Vincenzo Gonzaga. During this period, Monteverdi’s unconventional style had attracted the attention of a conservative Bolognese theorist, Giovanni Artusi, who attacked Monteverdi (among others) for his rejection of tradition; the often vitriolic exchanges between the two—which include Monteverdi’s preface to the fifth book of madrigals and his brother Giulio Cesare’s addendum to the *Scherzi musicali* (1607; Musical jokes)—provide insight into this new aesthetic in which words might be understood as the mistress of the music.

Monteverdi’s duties at court included the composition of a variety of dramatic entertainments. His *Orfeo* (1607), described as a *favola in musica* (fable in music), has long been considered the first great opera. The libretto by Alessandro Striggio was certainly influenced by that of *Euridice* (1600) by Ottavio Rinuccini (c. 1562–1621), one of the early Florentine operatic experiments. But Monteverdi’s *Orfeo* was the first to truly transform the pastoral play with music into a compelling, through-composed entertainment. Expressive monody, juxtaposed with dancelike madrigals and brief arias, vividly depict Orpheus’s joy, subsequent despair, and musical virtuosity, as in the famous aria “Possente spirito” (Powerful spirit) addressed to Pluto; the highly dramatic use of a large instrumental ensemble (recorders, cornettos, trombones, and a basso continuo group of harps, harpsichords, and plucked instruments) captures the contrast between the pleasurable earthly existence and Pluto’s underworld. In 1608, Monteverdi provided wedding entertain-

ments for Prince Francesco Gonzaga and Margherita of Savoy, including the *Ballo delle ingrato* (Dance of the ingrates), and the opera *Arianna*, from which only the lament (which famously brought tears to the eyes of the court ladies) has survived.

In 1613, Monteverdi was appointed *maestro di cappella* of San Marco in Venice, a declining institution that he revitalized by hiring new musicians, expanding the music library, and raising the standards of performance. He was responsible for directing and composing music for all major church ceremonies and activities, such as masses, vesper services, feast days, and weddings. While maintaining his connections with Mantua and Florence, Monteverdi continued to publish madrigals: books 6 and 7 were published in 1614 and 1619 respectively, and his earlier madrigals were reprinted in both Venice and Antwerp around this time. The eighth book of madrigals (1638), known as the *Madrigali guerrieri, et amorosi* (Madrigals of love and war), is a compendium of works written earlier. Monteverdi's attention to poetic detail is apparent in this volume, which includes settings of poems not only by Guarini, Tasso, and the revered Petrarch (1304–1374), but also the infamous Giovanni Battista Marino (1569–1625), whose influence on Monteverdi's aesthetics has frequently been observed. In book 8, Monteverdi invents a number of novel musical strategies to illustrate the popular topoi of love and war. *Il Combattimento di Tancredi e Clorinda* (1624/5; The battle of Tancredi and Clorinda), drawn from Tasso's *Jerusalem Delivered*, is noteworthy for the use of the *stile concitato* (agitated style) as discussed in the preface to book 8, in particular the innovative string techniques used to represent the battle scenes, including the use of pizzicato (plucking the strings) and *col legno* (striking the strings with the wood of the bow). Love is well represented by the *Lamento della ninfa*, in which the hypnotic soprano's complaint, set over a repeated descending bass pattern, became the model for numerous such laments.

When he was in his seventies, Monteverdi published his most important collection of sacred music, *Selva morale e spirituale* (1640; Spiritual and moral forest), and also profoundly influenced Venice's emerging opera industry. His 1639–1640 revival of *Arianna* was followed by a trilogy of three-act operas in Venetian style: *Il ritorno di Ulisse in*

Patria (1639–1640; The return of Ulysses to his homeland); the lost *Le nozze di Enea con Lavinia* (1640–1641; The wedding of Aeneas and Lavinia); and *L'incoronazione di Poppea* (1642–1643; The coronation of Poppea), which some music historians believe was probably finished by Francesco Saccati and others. Unlike in *Orfeo*, much of the expressive power of these works is concentrated in the closed forms (arias and duets) rather than recitative, as would become the norm in baroque opera. All three were written to librettos by members of the Venetian Accademia degli Incogniti, a group of freethinking patricians involved in both opera and publishing whose staunch patriotism, interest in the erotic, and playful attitude toward the classics seem to have inspired the composer at the height of his creative powers. From the representation of chaste marital fidelity in the recasting of Homer (in *Il ritorno*) to the seemingly immoral endorsement of physical love in imperial Rome (in *Poppea*), the surviving Venetian operas provide an eloquent testimony to Monteverdi's understanding of complex human emotions and his incomparable genius.

MORAL PHILOSOPHY AND ETHICS. In early modern Europe "moral philosophy" often referred to the systematic study of the human world, as distinguished from "natural philosophy," the systematic study of the natural world. During the seventeenth and eighteenth centuries moral philosophy in this broad sense was gradually split up into separate disciplines: politics, economics, historical sociology, and moral philosophy more narrowly understood as the study of the ideas and the psychology involved in individual morality. It should be noted that moral philosophy was a part not only of Aristotelian philosophy but also, along with grammar, rhetoric, poetry, and history, of the humanities (*studia humanitatis*), and in this connection, the ethics of the Platonists, Stoics, and Epicureans also came under consideration.

NEW ISSUES

The philosophers who created modern moral philosophy were familiar with the thinkers of classical antiquity; some had also studied the medieval scholastics. But neither the ancient nor the medieval philosophers faced the conditions that increasingly confronted the whole of Europe from the Reformation onward. Early in this period political and religious authorities struggled for control over all significant human activity. After the Reformation, religion no longer spoke with the single voice it claimed in the Middle Ages, but ministers of every denomination demanded obedience to the God they preached. For Lutheran and Reformed thinkers as well as for Catholics, all philosophy had to be subservient to theology. Philosophers had to reach conclusions that theologians could certify as agreeing with Christian doctrine. Monarchs claimed to rule by divine right and worked with their national churches to enforce social hierarchies that shaped daily life even in its details, but established institutions, practices, and beliefs were increasingly being challenged and were eventually severely weakened

or destroyed. Political and religious authority and the hold of custom and tradition were eroding. New kinds of groups were developing in which individuals interacted without attending to rank or class. In these new forms of sociability people treated one another as equals, able to get along together pleasantly and profitably without control by external authority.

All these changes called for the rethinking of both individual and political norms. Advances in scientific and geographical knowledge contributed greatly to the widespread feeling that everything from the past was open to question. But even without the advances in knowledge, the turmoil of religious controversy and social change made evident the need for a new understanding of morality.

Ancient moral philosophers thought that their task was to determine what was required for human flourishing—the highest good—and to show what virtues were needed in order to attain it. Christian theologians made ultimate human flourishing dependent on a proper relation to God, who alone was man's highest good. Laws of morality, which God teaches everyone through conscience, would guide us to the good of sociable living in this world. Conformity to them, however, could not guarantee salvation, for which God's grace was needed.

MONTAIGNE'S CHALLENGE

Modern moral philosophy began as the effort to answer questions like those raised most effectively by Michel de Montaigne (1533–1592). In his widely read *Essays* (1588) he presented himself as earnestly trying all the available theories about how we should live, asking if any of them could be followed. Although Montaigne was a devout Catholic, he used neither dogma nor theology to test claims about the good life. His attempts led him to think that neither he nor anyone else—aside from a few exceptional figures—could steadily follow Christian or classical models.

Montaigne concluded that we must each determine for ourselves what the good life is. We each have a distinctive natural form that tells us what we need and what we cannot tolerate. For each person that must be the supreme guide. Montaigne could find no grounds, outside religion, for believing in moral laws known to all. We should obey the laws of our country, he held, not because they are just but

simply because they are the established local law. Our individual form gives guidance to each but not guidance for all.

In an age already deeply unsettled by interminable debates about religion, Montaigne was taken to be a skeptic about morality. His conservative acceptance of local law and his claim to a private inner voice did not offer enough to a world in which confessional and international conflict was pervasive. His denial that there is a common highest good seemed to make it impossible to find a basis for working toward principles that could cross all the lines dividing Europe. Modern moral philosophy had to create new resources to underpin a common morality.

NATURAL LAW AND INTUITIONISM

The two earliest lines of thought were started simultaneously. Hugo Grotius (1583–1645), a Dutch Calvinist lawyer, initiated a new understanding of natural law theory with his *Law of War and Peace* in 1625. As part of it he outlined the view that natural law should be understood as empirically based directions for enabling sociable but quarrelsome people to get along with one another, no matter how much they differed about God or the good. In his *On Truth* (1624) Edward, Lord Herbert of Cherbury (1582–1648) claimed that all humans have an intuitive grasp of certain basic moral truths that show us how to live. Though both thinkers believed in God, both wanted to minimize the extent to which God or his ministers had to be consulted about morality. Herbert also rejected the subordination of philosophy to theology, holding that religious claims in conflict with intuitively known moral principles must be false.

Grotius's themes were developed by the English philosophers Thomas Hobbes (1599–1679) and John Locke (1632–1704) and by the German lawyer Samuel Pufendorf (1632–1694). All saw humans as needing to live together but as so prone to selfishness that they found this difficult. Moral laws of nature were basic directions for solving the problem posed by our unsociably sociable nature. With Luther and Calvin these thinkers held that morality requires law, that law requires a lawgiver, and that God is the ultimate lawgiver. Morality is obedience to divine commands. Since no one can command God, he alone is self-governing. God has left it up to

us to discover the contents of morality. Ordinary experience provides us with all the facts we need to infer the divine commands. We need not appeal to revelation.

Critics of modern natural law theory all objected that an ethics of divine command made God an arbitrary and unlovable tyrant. One group followed Lord Herbert's lead in working out how to defeat this kind of theory. Two Anglican clergymen, Ralph Cudworth (1617–1688) and Samuel Clarke (1675–1729), held that eternally valid moral principles guide God. They are known by us because he has given us a power of intuition enabling us to grasp them. Moral knowledge thus makes us self-governing. Developed further by an Anglican bishop, Joseph Butler (1692–1752), and a dissenting minister, Richard Price (1723–1791), intuitionism received its classic form in the *Essays on the Active Powers of Man* (1788) by the Scottish professor Thomas Reid (1710–1796), who was a major influence on nineteenth-century British and French moral thought.

PERFECTIONISTS AND MORAL SENSE THEORISTS

Another group, the rationalist perfectionists, including Baruch Spinoza (1632–1677), Nicholas Malebranche (1638–1715), Gottfried Wilhelm Leibniz (1646–1716), and the Leibnizian Christian Wolff (1679–1754), held that ignorance, not quarrelsomeness, was the source of immorality. They argued that only increase of knowledge could improve our behavior and our happiness. The more we think as God does, the more perfect we become. God is guided not by an arbitrary will but by his knowledge of all facts and all values. We and our societies will become more perfect the more knowledge we have and the more we live according to it. People who know more than others are closer to governing themselves and are responsible for directing the lives of the rest.

Many eighteenth-century British thinkers shared the common reaction against divine command theory and its assumption that only punishments and rewards, here or in an afterlife, could make most of us act morally. We are not, they held, as selfish as Hobbes and Pufendorf said we are. We are benevolent as well as self-interested, and we feel moral sentiments of approval and disapproval, com-

ing from a moral sense that approves of what we do from benevolence. To be self-governing, we need no further guidance. Moral sense theorists like the Earl of Shaftesbury (1671–1713) and the Presbyterian minister Francis Hutcheson (1694–1746) were not atheists, but their views began to make God marginal for morality.

The Scottish philosopher David Hume (1711–1776) developed moral sense theory to its fullest and excluded God from morality altogether. Morality for Hume is just the feelings with which we respond to certain facts about people and their characters. We feel approval of people whose character leads them to be good company or useful to others and to themselves. People tend to feel benevolent toward those close to them. For dealing with strangers we invent rules, called laws of nature, governing property, contracts, and obedience to government; and we are moved to obey them because we can feel sympathy with those who benefit from them. Hume held that there can be no rules of obligation unless we naturally have or create sufficient motives to follow them. We need no divine threats or promises about an afterlife to make us virtuous. Even political authority springs from our sense of our own needs and how to meet them. We are wholly self-governing parts of nature, and nothing more.

EGOISTS AND UTILITARIANS

Philosophers who rejected the sanguine portrayal of human nature given by the moral sense theorists followed Hobbes in arguing that rational self-interest alone could give rise to morality and decent government. Some saw God's providential hand in this happy outcome of selfishness. Atheistic thinkers in France, like the government official Claude Adrien Helvetius (1715–1771) and the wealthy Baron D'Holbach (1723–1789), saw it as showing that morality was nothing but instruction about how individuals could attain for themselves the highest good, a life filled with pleasure.

Many religious thinkers believed that God wills the happiness of all rather than purely private happiness and that we should therefore try to bring about as much happiness as we can. For many years *The Principles of Moral and Political Philosophy* (1786) by the Anglican cleric William Paley (1743–1805) was the most widely read version of this doctrine,

but a secular counterpart had a much longer life. In his *Introduction to the Principles of Morals and Legislation* (1789) the legal reformer Jeremy Bentham (1748–1832) set out the view later known as utilitarianism. The good, for Bentham, was pleasure and the absence of pain. Pleasures and pains can be balanced against one another, like credits and debits. The basic principle of morality instructs us to bring about the greatest happiness we can for the greatest number of people. To the extent that individuals are not naturally inclined to act this way, society and government should set up inducements that would lead them to do so. Bentham was sure that England's laws were not aimed at maximizing happiness. He set out to change them and gathered an active group of disciples to help him. Partly as a result, secular utilitarianism eventually became the main systematic alternative to Reid's brand of intuitionism in nineteenth century Britain.

KANT

Secular theories basing morality on experience seemed always to rely on emotions and to take the highest good to be earthly happiness, no matter what its source, and whether for all or only for oneself. The British intuitionists fought against such views, as did the German Lutheran philosopher Christian August Crusius (1715–1775). But the most systematic opposition came from the philosopher Immanuel Kant (1724–1804). He rejected divine command ethics but thought that perfectionist and intuitionist theories led inevitably to a morally objectionable reliance on an educated elite to control everyone else. He had learned from the Genevan writer Jean-Jacques Rousseau (1712–1778) to honor the common man. But Rousseau's views rested finally on sentiment, and Kant held that sentiment could not ground the kind of absolutely universal and necessary principles that morality needed.

Kant based morality not on pure thought or on emotion but on the will, which is the ability to make decisions for reasons. Our desires propose reasons for action, but the will can accept or reject any such proposal. Only proposals that match the will's own demands can become reasons for action. Kant identifies the basic demand that the rational will imposes on desires as the moral law—the voice of reason in practice. It comes to us as the form of a directive or

imperative that cannot reasonably be avoided. Kant calls it the categorical imperative. We can moreover be moved to act as the categorical imperative requires simply out of respect for our will's dictates. Because we govern ourselves not by knowing external laws but by following a self-legislated law, Kant called our form of self-governance "autonomy."

The categorical imperative says that I ought to act in such a way that the plan of action proposed by my desire could be a universal law. If a desire gives me a reason for action, it must give the same reason to anyone who has the same desire. We can use this principle to test our plans. We ask whether it would still be rational to follow our plan if everyone were to act on it. If not, we must reject it.

The categorical imperative requires us to treat all autonomous agents including ourselves with respect. We may pursue happiness in any way that the categorical imperative allows, and we ought to help others carry out their own plans for happiness if the categorical imperative allows those plans. Happiness, or the satisfaction of desires, is thus a goal to be pursued, on condition that we act fairly toward everyone in pursuing it.

Among other goals that the categorical imperative requires us to pursue is the highest good: the distribution of happiness in proportion to virtue. We know we need assistance to bring this end about. Hence morality requires us to believe that there is a superhuman being who can help us. Kant thus tried to avoid the naturalism that earlier thinkers such as Hume had championed. For Kant morality does not come from God. Instead it leads us to him.

CONCLUSION

Natural law theories and perfectionism lost their hold by the end of the eighteenth century. Kantianism, utilitarianism, and intuitionism set the initial terms for future discussion. All three types of view grew from efforts to show how morality could be supported without reliance on tradition, authority, or revelation. To different degrees contemporary defenders of these still-living positions have argued that everyone can think through moral issues and be moved by themselves to do what they conclude is right. We can thus all be self-governing.

Modern moral philosophy developed while Europeans were increasingly treating people as equals who were capable of living sociably without external authority. Philosophy aided this movement by providing alternative ways to talk about how morality could structure an aspect of life that was not dependent on its religious and political aspects. In doing so modern moral philosophy created much of the vocabulary through which Europeans were enabled to envisage the kind of self-governing person needed to sustain modern liberal democratic societies.

MORAVIAN BRETHREN. The Moravian Brethren, also known as the Renewed Unity of the Brethren, developed out of the combined forces of Lutheranism, the German Pietist movement, and the drive to re-Catholicize the Habsburg holdings. The impact of the Moravian Brethren outstripped their numbers, largely due to their ecumenism, influential aristocratic members, and leadership in the Protestant missionary movement. Those influenced by their piety and social organization include the theologian and philosopher Friedrich Schleiermacher, the poet Novalis (Friedrich von Hardenberg), and the social reformer Benjamin Owen.

THE DEVELOPMENT AND GROWTH OF THE MOVEMENT: 1722–1736

The Brethren trace their heritage to the “Ancient” Unity of the Brethren (*Unitas Fratrum*), a Hussite group that went underground after the resounding Catholic victory at the Battle of White Mountain in 1620. A little over a century later, the last effort to unify religious practice in the hereditary Habsburg territories sent some groups of Protestants into exile just over the Czech border, where they sought refuge on the estate of the Pietist Count Nicholas Ludwig von Zinzendorf (1700–1760). These groups formed the nucleus of what became the Moravian Brethren.

Initially the Protestant exiles, including Christian David, David Nitschmann, and Johann and David Zeisberger, who later held leadership roles within the Brethren, settled among the tenants of the village of Berthelsdorf. Soon, however, tensions between the new arrivals and the villagers led to the founding of a separate settlement that was given the name Herrnhut. Zinzendorf had little to do with the settlement until 1727, when religious dissension among the ever-growing number of refugees attracted his attention. The diversity of religious

roots within the community, including some of a more radical bent, led to bitter disputes. Zinzendorf, as lord of the manor, crafted two sets of regulations, one dealing with basic economic and social matters, and one dealing with spiritual issues. At the insistence of members of the Nitschmann family, the latter was based on the traditions of the original Unity, most notably the right to refuse to take oaths and bear arms, and the right to impose spiritual discipline. An emotional religious awakening on 13 August 1727 set the spiritual flavor of the newly ordered community, in which devotion to Christ overrode doctrinal disputes.

Herrnhut provided the initial model for the unique communities, called *Ortsgemeinen*, ‘congregation places’, which the Brethren founded throughout Europe and North America in subsequent years. When Zinzendorf revised the regulations governing Herrnhut in 1728, he combined both spiritual and mundane matters in a single document. These regulations reflected a blending of particular Pietist interests, such as the regulation of moral conduct and provisions for economic, educational, and social welfare, with governmental structures common to European villages and towns. The expectation underlying all aspects of the community was that the inhabitants shared a common love of Christ and a desire to act for the good of the whole. The combination of Herrnhut’s continued growth as a center for religious refugees, and Zinzendorf’s alienation from the influential Pietist center at Halle, led to his banishment from Saxony in 1736 on suspicion of heresy. As a result, the count and a central group of the Brethren, defined as a *Pilgergemeinde*, ‘pilgrim congregation’, traveled across Europe and grew in numbers and influence.

THE FLOWERING OF THE MOVEMENT: 1736–1760

The period from 1736 to Zinzendorf’s death in 1760 saw the founding of several communities. In addition, during the 1730s and 1740s the practice of drawing lots to make decisions and the social/spiritual division of the congregations into “choirs” came into regular use. These years also saw the height of the Brethrens’ popularity along with a firestorm of criticism.

Zinzendorf’s banishment from Saxony caused him to move quickly to ensure that Protestant refu-

gees no longer allowed to settle in Herrnhut would have an alternative. This provided the initial impetus for the founding of other *Ortsgemeinen*, first in Wetteravia, then in America. Herrnhut's economic success led King Frederick II (the Great) of Prussia to invite the Brethren to set up communities in his territory in the early 1740s. The presence of noble members and patrons with ties to European courts opened more doors, and by 1770 congregation communities existed in several German states, as well as Denmark, the Netherlands, England, America, and Russia. In many cases, the founding of communities went hand in hand with support for their missionary endeavors, initially focused in the Caribbean and Greenland.

Despite (or perhaps because of) their ability to open doors at the courts of Europe, the Brethren faced hostility on both sides of the Atlantic. This hostility was largely generated by their popularity with people from all ranks and religious backgrounds, and by their clash with "orthodox" Pietism, which emphasized repentance and moral reform. The Brethren shared the Pietist concern with behavior but laced it with an often intensely emotional experience of connection with Christ. This found its most unusual expression in their designation of Christ as literal chief elder, whose will was revealed by the use of the lot. The records of the lot's use illustrate the mindset of the Brethren regarding their view of it as Christ's word; the decisions were always recorded as "The Savior approves" or "The Savior does not approve." During the height of its use, from the 1740s through the 1760s, the lot served as the final determiner of all decisions including business issues and marriage proposals.

The emotional bond between the individual member and Christ spilled over into a bond with fellow members. This bond was underscored by the official division of the membership into choirs, or groups defined by sex, age, and marital status. In most communities the Choirs of Single Brothers, Single Sisters, Widows, and Widowers each shared common housekeeping. Thus they formed a second type of family unit that rivaled the biological unit. The intense devotion to Christ and to community that characterized the Brethren reached extreme expression in the 1740s "Sifting Period." During this decade, and rippling beyond it, the devotional

language of the Brethren strongly resembled Catholic mysticism in its sexual overtones and close identity with the suffering and death of Christ.

THE "TAMING" OF THE BRETHREN: 1760–1800

After Zinzendorf's death in 1760, the leadership of the Brethren faced the consequences of their expansion and a decade of controversy in the form of a rather large debt and a tarnished reputation. As a result, with the exception of their missionary outreach, the last decades of the eighteenth century saw them turn inward in an ultimately successful effort to ensure their survival. In the process, they made the final transition from a movement to an established church. This transition manifested itself in several ways. As early as the 1750s, the primary leadership had begun to shift from charismatic individuals to a series of elected and appointed committees. After Zinzendorf's death in 1760, most of the more "unconventional" aspects of the Brethren's organization began to disappear, at least partially in response to outside criticism. The role of women became increasingly restricted, and more attention focused on the nuclear family unit. The role of the lot in decision making was gradually reduced, and unconventional imagery was removed from hymns and liturgies. Finally, the leadership directed much of their energy at educating, cultivating, and retaining those born within the circle of the church. By 1800, much of what had made the Brethren distinctive was disappearing from practice. The core of the vision survived, however, in the modern Moravian Church, the worldwide membership of which is largely non-Western and from a variety of traditions.

MORE, HENRY (1614–1687), English philosopher. Henry More was the most prolific of the group of seventeenth-century thinkers known as the Cambridge Platonists. Born in Grantham, Lincolnshire, he was educated at Eton College and Christ's College, Cambridge, where he was elected fellow in 1641. Despite living through one of the most turbulent periods in English history, More retained his fellowship at Christ's during the English Civil War, Interregnum (1648–1660), and Restoration, devoting himself to a life of scholarship and publishing many works of philosophy and theology.

In his day More came to be regarded as one of England's leading contemporary philosophers. One of the first proponents of Cartesianism, he attacked Thomas Hobbes and Baruch Spinoza and was an enthusiast for the new science of Galileo and the Royal Society. His own philosophy owes much to Plato and Plotinus and is largely dedicated to the defense of religious belief against the twin forces of skepticism and atheism. Central to it is his philosophy of spirit, which underpins his arguments for demonstrating the existence and providential nature of God. More accounted for the operations of nature through his hypothesis of the Spirit of Nature or *principium hylarchicum*, analogous to Plato's world soul (*anima mundi*). His Platonism, first evident in his earliest writings, his *Philosophical Poems* (1647), was developed more fully in his *Of the Immortality of the Soul* (1659) and *Enchiridion Metaphysicum* (1671; Manual of metaphysics), in which he propounds the idea for which he is probably best known today: his concept of infinite space.

After repudiating predestinarian Calvinism in his youth, More subscribed to a tolerant Christianity that influenced the latitudinarian movement, which took a tolerant stance on doctrinal matters within the Church of England. Although he conformed at the Restoration (1660), he was nevertheless regarded as heterodox in High Church circles, principally on account of his adherence to Origen's

doctrine of the preexistence of the soul. In his later years More was much preoccupied with the study of biblical prophecy and the Cabala, sharing this last interest with Franciscus Mercurius von Helmont (1579–1644) and the German scholar Christian Knorr von Rosenroth (1636–1689).

More's most famous pupil was Anne Conway (1631–1679), who owed her introduction to philosophy to him. Among those who came under his influence were the clergyman Joseph Glanvill (1636–1680), the philosopher John Norris (1657–1711), and the naturalist John Ray (1627–1705). He was also known to Isaac Newton and to Gottfried Wilhelm Leibniz.

MORE, THOMAS (1478–1535), English humanist scholar, author, and statesman. Thomas More was born in London on 7 February 1478 and executed there for high treason on 6 July 1535. His father, John More (died 1530), secured an appoint-

ment for his twelve-year-old son as page to John Morton, archbishop of Canterbury and Lord Chancellor under Henry VII (ruled 1485–1509). Grateful for the training in diplomacy, More paid tribute to Morton, a canonist who had helped to overthrow Richard III in favor of Henry VII, in both his *Utopia* (1515) and his *History of Richard III* (c. 1513, published 1543). Under Morton's influence More attended Canterbury College, Oxford, where he met such humanists as John Colet, William Grocyn, and Thomas Linacre. Under parental pressure, he left Oxford in 1494 for the study of law at New Inn, and later at Lincoln's Inn. While studying law he became deeply attached to the Carthusians of the Charterhouse and carefully discerned a religious vocation. But once he determined that he should seek God in the world rather than in ascetical retirement from it, he married Jane Colt, who bore him four children before her death in 1511. Six weeks later the widower married the widow Alice Middleton to provide his young children with a good stepmother.

The center of a group of humanists at London, More in 1499 first met Desiderius Erasmus, who honored his friend in the Latin title of his famous *Praise of Folly* (*Encomium Moriae*). More's earliest literary works date from this period, but legal work and a series of public offices increasingly consumed his time. He began to compose *Utopia* during a trade mission to the Low Countries in 1515, and in 1518 he formally entered the service of Henry VIII (ruled 1509–1547) as a royal counselor. Mindful of the vagaries of political life, More dramatized the arguments for and against royal service in the first book of *Utopia*. While the philosophical seafarer Raphael Hathloday (whose account of Utopia fills the second book) refuses even to consider advising a European prince, lest he be sullied by contact with unprincipled courtiers intent on money, territory, or power, the character More takes a guardedly optimistic tone by arguing that politics is the art of the possible and that one need not necessarily be seduced or compromised if one is clear on certain nonnegotiable moral principles. While the second book has been interpreted in ways as widely different as heralding an ideal Platonic polis and prophetically anticipating a Marxist paradise, it may well be an ironical humanistic exploration of what a society would look like if it systematically aban-

doned the principles of political philosophy associated with Augustine's *City of God*, on which More had lectured as early as 1504 and to which he frequently returned in later political writings and in his own practice.

From 1518 to 1529 More proved himself an able member of the king's council, especially as a liaison between Henry VIII and Cardinal Thomas Wolsey (1475?–1530), then Lord Chancellor, who was laboring to secure a general European peace. More was knighted in 1521 and chosen as the speaker of the House of Commons in 1523. By that year he had joined the campaign against the Lutheran literature then beginning to flood England and wrote controversial works, some on the king's behalf and others in his own name, against Luther and against William Tyndale, Simon Fish, and others. At this time also Henry began to consult More on his proposed divorce from Catherine of Aragón. When More informed the king that after long study he could not support his case, Henry chose other officials to pursue his "great matter" and sent More off to France for the negotiations that eventually resulted in the Treaty of Cambrai (1529).

When Wolsey had to resign from office after proving unable to dissolve Henry's marriage during the 1529 trial, Henry named More as the first non-clerical Lord Chancellor on 25 October 1529. While Henry's policies veered toward a breach with Rome over the question of the divorce, they showed little inclination to any doctrinal changes of the sort that More considered heretical and that he had long opposed both by the controlled use of civil law and by his writings. In the business of the chancery he garnered a reputation for impartiality and promptness in handling a vast docket of cases, but his direct influence with Henry VIII waned as it became increasingly obvious that the king was willing to break with Rome in order to marry Anne Boleyn. More resigned his office on 16 May 1532, the day after the bishops capitulated to the king on certain questions that More considered non-negotiable.

For over a year he lived modestly in retirement at Chelsea. His ongoing efforts to inform the king's conscience took the form of pseudonymous works such as *The Debellation of Salem and Bizance*, a story about the Turkish invasion of Christian Hun-

gary in which one need not look terribly deep to find applications for the controversies between Protestant and Catholic religion in England. More managed to evade the various efforts of Thomas Cromwell, Henry VIII's principal secretary and chief minister, to implicate him in treasonable activities, but he began to prepare himself for the inevitable by beginning to compose his *Treatise on the Passion*. He finished the work during his imprisonment for refusing to swear to the Oath of Supremacy when summoned to Lambeth Palace on 12 April 1534. Alert to various traps and ruses, he refused to reveal his conscience on the matter to anyone, even the much-loved members of his family. After confinement to the Tower of London for over a year, he was convicted of treason on 1 July 1535 on the basis of perjured evidence by Sir Richard Rich, one of Cromwell's lackeys. Only after the delivery of the verdict did he break his self-imposed silence about the reasons for his refusal to swear the oath when he delivered a great speech, claiming to have all the councils of Christendom in support of his conscience. After merrily joking with the executioner and insisting that he was "the king's good servant, but God's first," he died on the scaffold on 6 July 1535.

MORISCOS. First recorded in 1500, the term *Moriscos* denotes Muslims who converted to Christianity after the fall of Granada in 1492. In effect, *Morisco* constitutes a highly ambiguous religious-ethnic designator. From Muslims living near the Ebro River in Aragon to long-standing Castilian *Mudéjares* (Muslim subjects of the Christian monarchs) and from Valencian Muslims tied to local seigneurs to the conquered communities of Granada, this great variety of Muslim peoples converted to Christianity at various times and under different circumstances.

The conquest of Granada set in motion a process that would herald the conversion of Granadan and Castilian Muslims by 1502. Initially, the surrender capitulations granted extensive freedom of religion to Muslims. Their conversion to Christianity through preaching and patient persuasion—a proselytizing process always favored by the monarchy—began under Archbishop Hernando de Talavera. However, when Cardinal Francisco Jiménez de Cisneros arrived in the city in 1497, he forced the mass conversion of Granada's *elches*—descendants of Christians converted to Islam. This violation of the capitulations resulted in a violent revolt in 1499. Although the rebellion extended to the countryside, by 1501 the royal government's troops emerged victorious. In exchange for amnesty, Muslims throughout the kingdom converted to Christianity en masse. By 1504, approximately 150,000 Moriscos populated the Kingdom of Granada.

Castille's *Mudéjares*, numbering approximately 20,000, having lived in relative peace and tranquillity, now faced the repercussions of the Granadan insurrection. Instituting an explicitly militant policy, the royal government ordered their conversion in lieu of expulsion in 1502. Almost all converted to Christianity.

Muslims in the Kingdom of Aragon constituted, after those in Granada, the most important community in the Iberian peninsula. Valencia's *Mudéjares* may have numbered almost 100,000. Those in Aragon have been estimated at 50,000, while Catalanian Muslims numbered no more than 10,000. Protected by the local Christian nobility—especially in Valencia where Muslims constituted the cornerstone of the seignorial economy—these

communities were initially able to avoid the fate that befell their Castilian brethren. By 1522, however, widespread popular revolts in Valencia—the *germanías*—led to forced conversions of many Muslims. By 1525 the royal government ordered all remaining Aragonese Muslims to convert.

Thereafter, this large population of nominal Christians, still adhering to some degree to Islamic religious practices and Arab cultural norms, presented a host of problems. The royal government and the church hovered uneasily between patient evangelization and repressive assimilation. Until 1570, official attitudes towards Moriscos stressed tolerance and catechism. Morisco communities were sometimes spared investigation by the Spanish Inquisition, and some cultural manifestations such as traditional dress and dances were more or less tolerated. Even when inquisitors tried Moriscos for practicing Islam, the penalties applied were rather lenient. As it became evident, however, that Moriscos continued to resist attempts toward assimilation, attitudes increasingly hardened and Morisco religious and cultural practices were conflated and interpreted as signs of subversion.

In 1568 the widespread Morisco revolt of the Alpujarras in Granada against the increasing control placed upon their cultural and economic activities resulted in a bloody war that lasted until 1570. Drastic measures were taken in the revolt's aftermath. In four years, approximately 80,000 Granadan Moriscos were relocated to the Castilian interior and interspersed among Old Christians—Christians who apparently did not descend from converted Muslims or Jews. Moreover, the state adopted repressive policies against any kind of religious or cultural sign that denoted Islamic heritage. The Inquisition stepped up its prosecution of Moriscos. Assimilationist policies were curtailed, and Moriscos faced increasing hurdles in various cultural and professional pursuits.

Meanwhile, Morisco resistance to acculturation increased. Whereas some evidence points to increasing Christian influence in religious literature in the first half of the sixteenth century, by the 1580s Morisco communities and families had learned to defend their Islamic religious and cultural practices. Often with women safeguarding ancestral knowl-

edge, Moriscos successfully resisted pressures the state heaped upon them to assimilate.

In some ways, however, Moriscos and Old Christians continued to cooperate and enjoy cordial relations. Local studies have shown that Moriscos and their Old Christian neighbors often lived in relative harmony, continuing commercial transactions and economic cooperation. Some evidence even suggests that the efforts by church and state to highlight religious and cultural differences between Moriscos and Old Christians exacerbated social tensions that were mild beforehand.

By the early seventeenth century, the failure of Morisco assimilation, the fear of their contacts with the Ottomans, Barbary pirates, and Protestants, and the increasingly virulent polemics against them convinced the royal government to issue an edict of expulsion. Between 1609 and 1614 almost 300,000 Moriscos left Spain, mostly for North Africa and Constantinople, although, later, many secretly returned and effectively assimilated into the dominant culture. After 1614, traces of Moriscos both in Spain and in their new homes slowly disappear from archival records. Some Moriscos established a semi-independent pirate state in Salé, Morocco, and even entered unsuccessful negotiations with the royal government to return to Spain in 1631. Other Moriscos arrived in Tunis and established a strong cultural and commercial presence. (Chronicles referred to them until the middle of the eighteenth century.) Slowly, Moriscos became integrated into the dominant cultures of their new homelands, even as they left an imprint of their Spanish identity in various commercial and cultural pursuits that retained Spanish language and practices for decades.

The short-lived history of the Moriscos has had an appreciable impact on Spanish historiography. Their contribution to Spanish society, their level of assimilation or resistance, the attitudes of the state and the Old Christian majority, and the effects of their expulsion have consistently recurred as viable themes because they strike at the heart of Spanish political sensibilities and provide material for various historiographical traditions seeking to forge a particular view of a national past. Moreover, the vagaries of the place of Morisco communities within Christian society are particularly relevant for our understanding of various early modern phenom-

ena—the rise of the state, the increasing marginalization of minorities, and the delicate balance between central processes and everyday local structures—and these are reflected in the growing production of scholarship on Moriscos.

MORISCOS, EXPULSION OF (SPAIN). Between 1609 and 1614, approximately 300,000 Moriscos—new Christians converted from Islam—were expelled from Spain. This mass relocation of people was the end result of a drastic decision that was many years in the making.

First discussed in government circles in 1582, the possibility of expulsion slowly gained credence as desirable government policy and merited full consideration after Philip III's accession to the

throne in 1598. Three factors mainly determined the ultimate acceptance of the expulsion as a remedy for national ills. First, the utter failure of the assimilation of Moriscos into a normative religious and cultural mold underscored the seeming futility of previous governmental efforts. Throughout Spain, and especially in Valencia, where Moriscos were numerous and often lived in separate villages, Moriscos continued to cling to traditional religious and cultural practices. With women often serving as guardians of traditional knowledge, Morisco communities managed, despite great pressure, to maintain specific practices such as circumcision, the ritual slaughter of animals, traditional dress, prayer, and the production of *aljamiado* literature, which was written in Castilian with Arabic characters. A multitude of signs—no matter how equivocal—convinced the authorities that Moriscos could never be fully assimilated into Christian society.

The failure of assimilation partly engendered another factor favoring expulsion that was critical at the time: state security. Constituting a large and visibly different minority, Moriscos often aroused suspicions of collaboration with Spain's enemies. Some contacts between Morisco communities and the Ottomans, Barbary corsairs, and French Protestants had occurred and were known to authorities. Moreover, given the rather hard-fought Morisco revolt of 1568–1570 in Granada, the crown worried about the possibility of another rebellion coupled with foreign invasion. This constant threat of Moriscos as potential traitors who could threaten the very safety of the state also influenced the decision to expel them.

Finally, the actions of individuals proved crucial to the government's decision. During the reign of Phillip II, fears regarding Moriscos were already evident and perhaps more compelling, yet expulsion was hardly discussed. During the reign of his successor, however, two figures stand out as crucial to the edict of expulsion: Juan de Ribera, archbishop of Valencia, and the Duke of Lerma, favorite of Philip III. Ribera, in a tireless and persistent fashion, was perhaps the most vocal advocate for expulsion. As early as 1601, he urged the king to expel the Moriscos because of their obstinacy, heresy, and the danger they presented to state security. The Duke of Lerma's support for expulsion likewise seems to have been crucial. Until January 1608, the Council

of State had continued to discount expulsion as a viable alternative. In an amazing turnaround, however, the Council of State, with Lerma presiding, voted to expel the Moriscos on 30 January 1608. Some historians have speculated that the duke stood to profit greatly from the confiscation of the estates of Moriscos in Valencia.

Spawned by this mixture of long-term causes and individual animosities and opportunities, the expulsion was carried out between 1609 and 1614. Of all the Morisco communities, the ones in Valencia suffered the most as they accounted for approximately 120,000 of the 300,000 expelled. In some areas of that kingdom, moreover, force was necessary to remove the Moriscos. A few thousand irregular troops and their families briefly resisted in the mountainous regions close to Castile before being decimated by Spanish soldiers. Although perhaps more peaceful, the expulsion of Moriscos from other areas inevitably resulted in serious hardship. From Morisco children being kidnapped to save them from the infidel to the abuse heaped on Morisco families by local authorities and seigneurs and from the perils of a voyage at sea to deaths due to malnutrition or banditry once they reached North Africa, the expulsion witnessed many tribulations. At the same time, sympathetic neighbors and local authorities sometimes helped Moriscos remain in Spain or even return after the expulsion. For example, the Count of Oropesa managed to certify the appropriate Christian behavior of his Morisco tenants who remained in Spain. In Catalonia, the Bishop of Tortosa protected many Moriscos and even allowed numerous families to return to his diocese. Other Moriscos remained after taking their case to the courts, while less fortunate ones sold themselves into slavery as the price of staying on Spanish soil. Despite these isolated cases of Moriscos who remained in Spain, the expulsion of 1609 was, for the most part, complete. Historians have estimated that perhaps only a few thousand managed, through some means or other, to remain, though precise numbers may never be known.

Most Moriscos settled in North Africa, Constantinople (Istanbul), and other parts of the Ottoman Empire, although small colonies emigrated to France and Italy. Their fate varied. While those in Tunis managed to prosper and become a political force, many unfortunates who disembarked on the

Algerian coast were robbed and killed by marauding Berber bandits. Likewise, while those arriving in Constantinople settled in a specific neighborhood and were reputed to be an influential minority, those who traveled to Morocco were not well received and were insulted as Christians. Their trail as a distinct community within their new homes disappears in archival sources around the late eighteenth century as they became integrated into the dominant communities.

Whereas the expulsion largely curtailed the Moriscos' viability as a distinctive cultural group, the consequences for Spain have been debated mostly from an economic point of view. Mired in an economic depression fostered by debasement, rising prices, and faltering population levels, Spain in the early seventeenth century presumably suffered from the expulsion of such a large and productive group. Valencian historians in particular have castigated the expulsion as harmful to that kingdom's economic viability. Although recent studies have helped contextualize the magnitude of the economic impact and have placed the somber specter of Spanish decline in a more nuanced light, few question that the expulsion of the Moriscos exacerbated an already gloomy economic situation in early-seventeenth-century Spain.

MOROZOVA, BOIARYNIA (1632–1675). Feodosiia Prokof'evna Morozova, born

Sokovnina and known later as the nun Feodora, was one of Muscovy's leading aristocratic women associated with the Old Believers. After Morozova's death as a martyr in defense of the old forms of worship, she was venerated as the movement's principal female saint.

In 1662 Morozova obtained control over one of Muscovy's largest estates following the death of her husband, the Kremlin politician Gleb Ivanovich Morozov. Ruling in the name of her only son, she proved an effective administrator. However, she soon adopted an ascetic way of life and used her wealth for almsgiving. After the 1667 church council that condemned numerous male Old Believers to exile in the Russian north, Morozova's patronage became essential for the movement's long-term survival. Old Believers flocked to her Moscow palace in order to escape church persecution. She allowed priests to say mass according to the old rites in her palace chapel, and opened her doors to fugitive monks and nuns. One of these nuns, Sister Melaniia, became Morozova's mentor and convinced her to take the veil in late 1670. Morozova also protected persecuted Old Believer intellectuals such as the monk Avraamii. Her messengers maintained regular contact with exiled Old Believers and smuggled their writings to Moscow, where she had them copied by her scribes, thus promoting the dissemination of Old Believer literary culture.

Although Morozova's behavior greatly annoyed the Kremlin, she evaded arrest due to the tacit support of Tsaritsa Mariia Il'ichnina Miloslavskaiia, the first wife of Tsar Alexis Mikhailovich (ruled 1645–1676). After her death and the tsar's remarriage in 1671, Morozova was arrested by agents of the Secret Chancellery, put in chains, tortured, and threatened with execution. Staunchly refusing to betray her Old Believer loyalties, she was confined to a monastic dungeon, where she finally died of starvation in 1675.

Morozova's vita was compiled shortly after her death, probably on the initiative of her older brother. Revised at least twice by early-eighteenth-century authors, this enormously popular vita made Morozova a larger-than-life figure and inspired subsequent generations of Old Believer women. But while the story of Morozova's resistance against the Orthodox Church entered the Old Believer canon,

stories of other boyar women who engaged in similar resistance were not widely transmitted. Particularly noteworthy among the omissions is Morozova's sister, Evdokiia Urusova, whose correspondence with her children provides moving insights into the spiritual struggles that led her and other elite women to sacrifice their lives for their religious convictions. Another omission is Princess Elena Khrushcheva, who led the Moscow Old Believer community after Morozova's death and became so influential that the exiled archpriest Avvakum Petrovich considered her a major challenge to his spiritual authority. Other boyar women whose activities left substantial traces in church archival records include Anna Khilkova, Evdokiia Naryshkina, and Evdokiia Leont'eva. These and other largely forgotten elite women significantly contributed to the survival of the Old Believer movement during the late-seventeenth century.

MOSCOW (*Moskva*). The etymology of *Moskva* and the question of whether the name was applied first to the city or to the river on which it is located both remain in dispute. Moscow is located in approximately the center of the East European plain on the Moscow River, a tributary of the Oka River, which flows into the Volga. Among distinguishing reasons for Moscow's rise to power over its neighbors in the fourteenth to sixteenth centuries are the following. First, being centrally located among East Slavic principalities, its trade routes stretched far in all directions. Second, due to its central location, Moscow was protected to some extent by distance from hostile neighbors to the west (Poland, Lithuania, Baltic Germans) and to the south and southeast (Tatars). Third, its political system was relatively

Moscow. A map of Moscow first published in Braun & Hogenberg's collection of town plans *Civitates Orbis Terrarum*, published between 1572 and 1618. This somewhat fanciful view across the frozen Moskva River gives a sense of the many churches and wooden buildings within the walled center of the city. stable, thanks to long-lived rulers and to the adoption of primogeniture in the royal dynasty, which made princely succession more predictable than in rival principalities where succession was frequently a matter of rivalry among brothers and sons. And, fourth, Moscow princes frequently proved able, shrewd, and adept in acquiring neighboring principalities and in making strategic alliances with or against various Tatar khanates.

As Moscow grew, the original fortified settlement, or *gorod*, became the central citadel of a city that expanded outward in roughly concentric circles, with radial streets emanating from the citadel. By the sixteenth century, the citadel was being called the Kremlin (from *kremľ*, a word that apparently origi-

nally denoted an oaken stockade); its walls, faced with red brick, had been reconstructed by Italian engineers and encompassed the present territory of the Kremlin, some seventy acres. During the course of the sixteenth century, districts of the expanding city were encircled with their own protective walls: first Kitai Posad/Gorod, a commercial district east of the Kremlin and containing Red Square; then the Belyi (White) Gorod, the walls of which are marked by the current Ring Boulevard around the combined Kremlin and Kitai Gorod; and finally, the Zemlianoi Gorod, whose walls made a full circle around the city, crossing the Moscow River. The latter walls defined the official city limits until the eighteenth century and were located along the present Garden Ring Road.

During the fifteenth and sixteenth centuries, a protective semicircle of six fortified monasteries was built up outside the city walls along the southern perimeter, guarding against the frequent incursions of Tatar forces from that direction. Those monasteries, now well within city limits, are, from west to east: Novodevichii, Donskoi, Daniilovskii, Simonov, Novospasskii, and Andronikov. Something of a city planning and masonry construction office (*Prikaz kamennykh del*) was founded in 1584, the principal mission of which was to encourage masonry construction instead of wood and to plan firebreak areas where construction was forbidden. Despite such efforts, 72 percent of Moscow buildings were still wooden as of 1811.

Trustworthy population statistics for old Moscow are lacking. Frequently cited estimates number 30,000–40,000 residents in the fourteenth century,

100,000 in the sixteenth century, 200,000 in the mid-seventeenth century, although all those estimates may be too high. Moscow's first systematic census, in 1701, counted 16,358 households, from which an estimated population of 200,000 residents has been proposed. The first official census of individuals was in 1784, when the population count was 217,000, a figure reduced by substantial losses during the plague of 1771. The next detailed census was in 1811, when the population of Moscow was measured at 262,000 (another "official" document says 270,000).

With the shift of government to St. Petersburg and the buildup of that city beginning in the early eighteenth century, Moscow was reduced to second place politically. burg, the new capital representing Russia's turn to western European cultural norms, was well underway in the eighteenth century. Under Empresses Elizabeth (ruled 1741–1762) and Catherine II the Great (ruled 1762–1796), some western European baroque and classical architecture was introduced in Moscow—the beginnings of a partial “St. Petersburgization” of the former capital. Moscow was still honored ceremonially, in that emperors and empresses, up to and including Nicholas II, continued to travel to Moscow for a formal coronation in the Kremlin Dormition (Assumption) Cathedral. The relative neglect of Moscow, however, is exemplified by two grandiose projects in Moscow that Catherine started but then decided to abandon: a gigantic reconstruction of the Kremlin in Classical style, and a huge neo-Gothic palace at Tsaritsyno, on the outskirts of town.

MOTHERHOOD AND CHILDBEARING. Church, society, and their own expectations shaped the lives of early modern European women of childbearing age toward the goal of reproduction. Marriage was viewed not as the culmination of personal desire, whether sexual or economic, but as the gateway to a woman's proper destiny of motherhood and the perpetuation of the human race. For poor women, the birth of children could be viewed as insurance against the deprivations of old age. For wealthy women, the birth of an heir conferred status and frequently ensured both wealth and affection in an “arranged” marriage. In societies across Europe, children were essential for

the transmission of property, and women who failed to reproduce were looked upon as failures.

Women were most commonly in their mid-twenties when they married, and could expect the birth of their first child twelve to thirteen months later. Motherhood was considered the highest calling for a married woman, but the unmarried mother was subject to moral, economic, and social censure. Poor, unmarried mothers were on occasion driven to commit infanticide, but the harsh penalties for such a crime were not always invoked.

In a barren marriage, the woman was always believed to be at fault. Against the despair and shame of infertility, women balanced their anxieties and concerns surrounding childbirth itself. Complications of childbirth, when they occurred, were often fatal. Many mothers in Italy, France, Holland, Spain, and England could call upon the services of capable and experienced midwives when they faced the childbed experience, but for others giving birth could prove disastrous. Throughout the countries of western Europe, the midwife played a key role in the event of childbirth, and women were well served for centuries by the traditional midwife, whose expertise had been acquired by observation and first-hand participation, usually as an apprentice to a more experienced midwife.

THE MIDWIFE IN EARLY MODERN EUROPE

Historians have increasingly turned their attention to the person and role of the midwife in early modern Europe, and the result has been a revised view of their competence and importance. Midwives were generally mature women who had themselves borne children. Often they were trained by their mothers, grandmothers, aunts, and other relatives who were themselves practicing midwives.

Opportunities for training and licensing varied from country to country. In southern Germany midwives were solidly respectable women who answered to civic authorities and drew their salaries partly from municipal treasuries and partly from the women who were their clients. Farther north, in late-eighteenth-century Brunswick (Braunschweig), for example, the situation was more complex, with the board of health acting as examiners. The church in Italy exerted control over midwives, touching issues such as baptism and female sexuality, but by the end of the eighteenth century the

state had joined the church in attempting to regulate midwives. In eighteenth-century Holland midwives were generally regarded with respect, with the towns offering educational opportunities as well as paying their salaries and overseeing their work.

In France the French royal midwife Louise Bourgeois (c. 1563–1636) published a three-volume treatise based on her personal experiences as a midwife. Written between 1609 and 1626, this work, generally known as *Observations diverses*, was the first on the topic of childbirth by a female author. It was highly popular throughout the seventeenth century and a number of English translations appeared. Although facilities existed in Paris for teaching a relatively small number of midwives at the famous Hôtel Dieu, by 1759 the need for a training program, particularly for rural midwives, was so great that King Louis XV (ruled 1715–1774) appointed Angélique Marguerite du Coudray (1715–1794) as the national midwife. She traveled throughout France for the next thirty years not only instructing midwives in the practical techniques of delivery but also publishing a midwifery manual. In early modern Spain women traditionally called upon the services of midwives who shared knowledge among themselves and were relatively free from outside control. In the second half of the eighteenth century, however, this changed as the surgeons began to control midwifery, assisted by royal legislation that permitted them to prescribe and enforce a restrictive curriculum for midwives.

LONDON MIDWIVES

Of all the midwives, the English midwives, licensed by ecclesiastical authorities, have been the subject of the most intensive investigation. In particular the lives of seventeenth-century London midwives have been brought to light, and a wealth of information has been uncovered about their training, licensing, work, and in some cases their social and economic profiles.

London midwives trained in an unofficial apprenticeship system whereby less-experienced deputy midwives worked with highly experienced licensed midwives for periods varying from several years to several decades. A deputy midwife could become a licensed midwife by presenting proof, in the form of sworn “testimonials,” of her competence and character before a church court, where

she usually was accompanied by women whom she had successfully delivered as well as her midwife mentor. In addition the midwife paid a substantial fee to the ecclesiastical authorities for her license. Quakers, who rejected the tenets of the Church of England, were served in most cases by their own competent Quaker midwives, who also had non-Quaker clients.

The midwife drew her clientele from all levels of society, delivering both rich and poor women, as promised in her oath. In London a competent midwife could earn more from one delivery than a member of the working class earned in two weeks. As London inhabitants, a number of midwives were women of substance. All London midwives were either married or widowed, and their husbands were merchants, artisans, tradesmen, professionals, and gentlemen. Research on English midwives in the countryside supports this view of respectability and prosperity, and there is evidence emerging in studies from other European countries of midwives’ general responsibility and competence.

A prospective mother usually saw the midwife for the first time when labor had begun. Births took place in the home, frequently in a room crowded with female relatives, friends, and neighbors. Childbirth was viewed as a strictly female affair, and the presence of males was taboo. For this reason knowledge of normal birth processes was the exclusive preserve of the traditional midwife until well into the eighteenth century. In England by the seventeenth century most women were delivered in bed. Italian and Dutch midwives employed a “birthing chair,” which they carried with them to deliveries. Ninety-five percent of deliveries were uncomplicated. If a problem arose, such as a breech or other abnormal position, experienced midwives corrected the problem and successfully delivered the infant. Only in the worst situations would a surgeon be called, who then used his instruments to destroy the fetus in an attempt to save the mother’s life. Midwives, aware that the medical profession was helpless in the face of a life-threatening event, such as postpartum hemorrhage, endeavored to ensure that the placenta or afterbirth was delivered whole so the mother would not continue to bleed. Cesarean section was seldom attempted by a surgeon and usually resulted in the loss of a woman’s life.

After the baby was successfully delivered, the midwife cut the umbilical cord with her scissors or a knife. If it was a male, this action was carried out with considerable care, since conventional belief related the length of the penis to the length of the remaining cord. After tying off the stump of the cord, ensuring that the airways were clear, and checking for any deformities, the midwife or one of the female attendants swaddled (closely wrapped) the infant and placed him or her near the fireplace. According to Christian beliefs, each newborn must be christened or baptized. If the infant was in critical condition, baptism was performed immediately, in some instances by the midwife. Babies who were not in any danger were baptized in a more elaborate church ceremony before godparents and friends, usually a few days to several weeks after birth. Frequently the midwife who delivered the baby was in attendance, but the mother would not attend if the baptism took place during her lying-in period. In

England, toward the end of the seventeenth century, private baptism came increasingly to replace the public ceremony, especially among the upper classes. The ecclesiastical service in church was transformed into a domestic occasion for eating, drinking, and gift giving from which the new mother was not excluded.

LYING-IN

After delivery the midwife washed the new mother and helped her change into clean garments. The bed was freshly made, frequently with elaborate “child bed linen,” in order for the new mother to receive visitors and begin her four-week lying-in period. During this time she was relieved of many if not all of her normal household responsibilities. In addition husbands were expected to forego sexual relations with their wives for this period. In London parish officials engaged and paid for the assistance of a woman, who was usually herself the recipient of

poor relief, to assist other poor women during their lying-in periods. The complication most feared by postpartum women in Europe and by far the most common cause of maternal mortality was childbed fever or puerperal sepsis, a bacterial infection. In an era when bacteria were as yet not understood, it could strike down unsuspecting mothers within two or three days after delivery. The sudden onset of chills was an ominous sign of the dreaded infection and frequently heralded septicemia, the excruciating pains of peritonitis, and death. Women delivered at home by a competent midwife using acceptable standards of hygiene were not at high risk for succumbing to its deadly effects. But in London, with the opening of lying-in hospitals in the first half of the eighteenth century and deliveries increasingly carried out by male midwives, the death rates of women stricken by childbed fever soared.

Once their lying-in ended, English women, the majority of whom were communicants of the Church of England, went to be “churched.” This ceremony was performed with the new mother and her midwife appearing before the parish congregation and has been variously interpreted as a service of thanksgiving, celebration, or purification. By their participation, women affirmed their status as new mothers and their gratitude for surviving the perils of childbirth before parishioners and the whole community. The churching rite provided an occasion for happy celebration and partying. It was an important and positive ritual in the life of childbearing women. Once “churched,” the woman could partake fully of all rites of the church, including Communion. In France, Italy, Spain, and Portugal, traditionally Roman Catholic countries, mothers went to church for a blessing after a forty-day period of purification following the “impurity” of giving birth, as instructed by the Council of Trent.

FEEDING THE NEWBORN

Although Puritan writers of the period as well as occasional medical authors urged women to breast-feed, there is no evidence that their advice met with widespread acceptance. Until the middle of the eighteenth century mothers followed the counsel of most medical writers and looked with distrust on placing the baby at breast immediately following delivery. Instead, many gave the infant frequent

purges for one or two days. This was thought to aid in clearing the bowel of meconium. Others gave the newborn pap, a watery mixture of cereal and liquid. In the sixteenth century and well into the seventeenth century, women were often advised to wait for a month after delivery before attempting to breast-feed. The value of colostrum, the thin fluid that new mothers produce for several days before the breast milk is established, was not appreciated until the 1670s. Even so, the babies of wealthy women continued to be purged for several days and then sent to a wet nurse.

The practice of wet-nursing was a well-established social institution throughout western Europe by the sixteenth century. It began to decline in the eighteenth century, but until at least 1800 the institution flourished. Initially popular among the aristocracy and aspiring gentry in France and England, the practice of employing a wet nurse spread to the lower classes, where a woman’s situation (illness, type of employment) might discourage breast-feeding. Wet nurses were usually married and had children. They were of the lower ranks of rural society, although not poverty-stricken, and nursed the infants in their own homes. In the case of London parents, the wet nurse might live twenty or thirty miles away. The infant would seldom, if ever, receive parental visits. Not surprisingly there was a high mortality rate among “nurse children.” Deprived of the protective elements provided by their mother’s colostrum and milk and exposed to the new germs of their wet nurses’ homes, they succumbed by the score to gastroenteritis as well as a host of other illnesses of bacterial origin. Many foundlings, already in poor condition upon arrival at the wet nurse’s home, were particularly at risk and failed to survive the first six months of life.

Wet nurses were employed by the family, and in Florence, for example, the father of the infant hired the wet nurse and oversaw all arrangements regarding her duties and obligations. In some cases wet nurses were engaged by parishes or foundling hospitals to nurse abandoned infants. Earning more than the occupations of indoor servant or dry nurse, the occupation of wet nurse was seen as a profitable and respectable one for many women of the period. It was not until the middle of the eighteenth century that the benefits of putting the newborn to breast within twenty-four hours of delivery began to at-

tract attention. It was noted that neonatal feeding practices among poor women greatly reduced the incidence of milk fever, an affliction involving high fever, abscesses of the breast, and possible death. Not only was maternal mortality from milk fever decreased by putting the infant to breast soon after birth, infant mortality in the first twenty-eight days was lowered. The increased opportunity for bonding also resulted in a more positive attitude toward infants and their well-being. In mid-eighteenth-century Paris, however, fully 10 percent of infants were still sent out to wet nurses, and the aristocracy throughout Europe was slow to abandon the practice.

Because of high infant and child mortality rates from infections and communicable diseases, it was not uncommon for women who had experienced ten or twelve pregnancies to enter middle age with only one or two surviving children. Despite the expectation that many infants would not survive the early months of life, mothers were devastated by the loss of their little ones. Although women were well aware of the risks they faced in childbearing in an era when licensed physicians and qualified surgeons had nothing to offer by way of assistance in life-threatening situations, most of them chose to dwell on the celebratory aspects of childbirth. Well into the eighteenth century the majority of women continued to place their trust in God and the ministrations of their midwives.

DOREEN EVENDEN

MOZART, WOLFGANG AMADEUS

(1756–1791), Austrian composer, widely considered one of the most gifted figures in the history of Western music. Born in the archbishopric of Salzburg, a territory of the Holy Roman Empire, Mozart by the age of six had already acquired a reputation throughout Europe as a musical prodigy. According to his father, Wolfgang was already composing minuets at the age of four, and he was barely six when he performed on the harpsichord for the Habsburg imperial family in Vienna. Yet Mozart's astonishing precocity as a composer and performer should not obscure the role of his father, Leopold, in nurturing his genius. Leopold, the son of an Augsburg bookbinder, became a musician at the Salzburg court in 1739 and in 1763 secured an appointment as deputy kapellmeister. He was himself an accomplished musician and composer who in 1756, the year of Wolfgang's birth, published what would become a highly influential treatise on violin playing. He was therefore able to provide Wolfgang and his sister, Maria Anna ("Nannerl"; 1751–1829), with superb musical tutelage. Leopold could be a demanding and irascible father, proud of his son's talents but also possessive and manipulative, and the bitter conflicts that marked his relationship with Wolfgang in later years have made it easy for some biographers to portray Leopold in an unflattering light. But even those scholars inclined to highlight his shortcomings (see, for example, Maynard Solomon's brilliant but controversial biography) acknowledge Leopold's crucial role in fostering the talents and career of his son.

This role was evident above all in the series of European tours he arranged for Wolfgang between 1763 and 1772, when Leopold journeyed with his son to such major musical capitals as Vienna, Paris,

Wolfgang Amadeus Mozart. Contemporary portrait.

Naples, Milan, Mannheim, and London. These journeys were undertaken with the purpose of landing Wolfgang a position more suitable to his talents than what was then available in Salzburg. Mozart failed to secure a permanent appointment and for most of the period up to 1781 would remain formally in the service of the Salzburg court. But the grand tours of the 1760s and early 1770s did have the effect of exposing the young composer to an exceptionally broad array of musical influences and genres. In this respect the extensive travels of Wolfgang's youth certainly helped foster what would become a key element of his gifts as a composer, namely his universality. Mozart would not only master every musical genre of his day, but leave a lasting imprint on each—sacred music, keyboard and chamber music, concertos and symphonies, opera—and although a composer of his talents was certainly more than the sum of his musical influences, the range of styles and genres to which his father helped expose him fostered the conditions under which Wolfgang's genius could flourish.

But the young Mozart's travels also bred a growing dissatisfaction with his patrons at the

Salzburg court, where he spent most of the years from 1773 to 1780. Mozart's unhappiness came partly in response to the policies of the new archbishop, Hieronymus Colloredo (in office 1772–1803), whose reform-minded efforts to lower court expenditures and curtail the use of instrumental music in the Mass further reduced what to Mozart already seemed a dearth of musical opportunities. Growing tension between the two, heightened by the efforts of the Mozart family to find employment elsewhere, culminated in the composer's unceremonious dismissal (in Mozart's words, “with a kick on the ass”) by the archbishop's court chamberlain in 1781. Mozart's break with the archbishop later acquired legendary and dramatic force as the romantic embodiment of the clash between unrequited genius and mediocrity.

But the incident also pointed to the growing importance of Vienna, where Mozart now resolved to make his fortune, as a musical and cultural capital. The 1780s, which coincided with the reign of the reformist Joseph II (ruled 1765–1790), marked the high point of Enlightenment culture in the Habsburg capital. The city's expanding musical and theatrical venues help explain why Mozart could take a step so unusual for a composer of his day, namely that of embarking on a freelance musical career in lieu of one based on court patronage. Legends to the contrary, Mozart enjoyed considerable success in Vienna. The concerts he presented earned him noteworthy sums, due substantially to the popularity of his concertos, while the city's lively stage provided a vehicle for Mozart's operatic ambitions. The Viennese premier of his German Singspiel, *Die Entführung aus dem Serail* (1782; The abduction from the seraglio), was a major success, as was *Le nozze di Figaro* (1786; The marriage of Figaro), his first of three collaborative efforts with the Italian librettist Lorenzo da Ponte (1749–1838). The Viennese reception of *Don Giovanni* (1788) and *Così fan tutte* (1790), for which da Ponte also wrote librettos, was more muted, though the former had earlier premiered to an enthusiastic audience in Prague. *Die Zauberflöte* (1791; The magic flute) masterfully blended North German chorale, Viennese popular comedy, and Italianate coloratura, while its Masonic themes of brotherhood, reason, and justice (Mozart had become a Freemason in 1784) mark the opera as one of the highest expres-

sions of the Viennese Enlightenment. There Mozart's universality is once again evident, not only in the opera's synthesis of diverse musical traditions but also in the transcendence of its moral universe.

Although Mozart's annual income during most of his Viennese years was relatively comfortable and roughly approximated that of a merchant or higher government official, his failure to achieve financial security is legendary. Personal extravagance, aggravated by the need to maintain a style of living proper to his status as a composer, was partly responsible. Later scholars have sometimes blamed Mozart's financial insecurity on his wife Constanze (née Weber), the daughter of a Mannheim court musician, whom Mozart had married in 1782. But charges that Constanze, after "entrapping" Mozart in marriage, drove the pair to financial ruin through her spendthrift ways, appear to be groundless. Evidence suggests that she was a supportive wife and a competent if not shrewd household manager. At least in his later years, what was chiefly responsible for Mozart's precarious finances were deteriorating health, which reduced the income he would otherwise have earned through teaching, performing, and composing. The causes of his death in 1791 remain a subject of speculation, with rheumatic fever the most widely accepted explanation. Serious scholars have dismissed the sensationalist claim, first advanced in the 1820s and later revived in stage (1979) and film (1985) versions of Peter Shaffer's *Amadeus*, that Mozart died of poisoning at the hands of the composer Antonio Salieri (1750–1825).

MUNICH. Although settlement along the Isar River, south of the Danube, dates from Roman times, this city owes its German name München (meaning 'monks') to the brothers of the Benedictine abbey of Tegernsee, who first nurtured an agricultural outpost in the region in Carolingian times. In 1158, the Saxon duke Henry the Lion granted the town its first market charter, allowing the fledgling settlement to compete commercially against the rival trade and diocesan capital of Freising, about thirty miles north of the modern city center. Despite fits and starts, Munich's role as a commercial outpost developed from its control of an important bridgehead on the Isar and its strategic location on the trade route between Salzburg and the north. Its commerce in Bavarian salt, gold, and other commodities grew in the later Middle Ages, although its population lagged far behind the other great cities of the German south, including Augsburg (which by the sixteenth century had a population of around forty thousand), Nuremberg (with around twenty thousand), and Regensburg (fifteen thousand). The city's fourteenth-century defensive walls proved largely sufficient to hold Munich's population until the eighteenth century, and the town's inhabitants probably numbered around five thousand in 1500. Despite its modest size, Munich's prosperity is attested to by the surviving monuments of the late fifteenth century, including the imposing Frauenkirche (Church of Our Lady; 1468–1488) and the Altes Rathaus (Old Town Hall; 1470–1480). During the sixteenth century the city rose to prominence as a center of government, of Catholic reform, and of art. As a result of the brief Landshuter Erbfolgekrieg (Bavarian Succession War; 1503–1505), several previously separate Bavarian possessions in the region were joined into a single duchy, and in the course of the century that followed, the Wittelsbach dynasty increasingly identified Munich as their capital. In the city a lavish building program began in the 1560s with the expansion of the ducal palace, the Residenz. Its Antiquarium or library, completed between 1569 and 1571, was hailed in the early modern period as the "eighth wonder of the world." Other additions to the Residenz followed, including the rococo-era Cuvilliés Theater (constructed between 1746 and 1777). Although minorities of Protestant artisans were present in Munich during the mid-sixteenth century, the

building program also expressed the attachment of the Wittelsbachs and the city's burghers to Catholicism. These included the massive Michaelskirche (Church of St. Michael; completed 1597), the first structure in northern Europe to be modeled on the famous Roman church of the Jesuit order, Il Gesù; the seventeenth-century Theatinerkirche (Church of the Theatines), which was decorated for more than a century by a succession of Italian and French artists and architects; and the fantastically ornate Church of St. Johann Nepomuk (also known as the Asamkirche), designed by the brothers Cosmas and Aegidius Asam and built between 1733 and 1746. The role of architecture was considerable in establishing a Catholic confessional identity in early modern Munich. At the same time, the Wittelsbach dynasty pioneered governmental innovations that were mimicked elsewhere and were designed to rid the city and the surrounding territory of Protestant sympathizers and to foster a new purified culture of Catholic religious practice. In the late sixteenth century Munich became home to the duchy's Clerical Council, an institution of both clerical and secular officials that supervised the Catholic clergy and all aspects of religious practice in the duchy for more than two centuries. Music was yet a third prong of the Wittelsbach's counteroffensive against Protestants. In 1556 Duke Albrecht V recruited the Franco-Flemish musician Orlando di Lasso (1532–1594) to serve in his court chapel, elevating him to the status of musical director in 1562. During his more than thirty years in this position, Lasso reigned as the greatest composer of the Catholic Reformation in Europe, with hundreds of his compositions being printed in France, the Netherlands, and Italy. The alliance between the Wittelsbach dukes and artists deepened in the seventeenth century, although the city's fortunes fell into a decline for a time during the Thirty Years' War, especially during the years between 1632 and 1634, when occupation by the Protestant King Gustavus II Adolphus of Sweden and an outbreak of the plague decreased the town's population by as much as a third. Munich's staunchly Catholic allegiances softened somewhat during the eighteenth century, as the Wittelsbach dukes adopted an enlightened despotic stance similar to that of the Habsburgs in Austria or the Hohenzollern in Brandenburg-Prussia. The more worldly sensibilities of the age are displayed in the monuments of that time, including

the suburban pleasure palaces of Schloss Nymphenburg and the Amalienburg on Munich's outskirts, as well as the grand, but naturalistic Englischer Garten (English Garden) first laid out in the city in 1789. While the great monuments of the sixteenth to the eighteenth centuries show that Munich was an important early modern provincial capital, its rise to the status of a major international city occurred only in the nineteenth century as the town's population increased fivefold in the half century after 1850. During the early modern centuries Munich displayed traits typical of many German provincial capitals, including local autonomy, guild dominance, concerns for confessional purity, and grand dynastic pretensions.

MÜNSTER. The prince-bishopric of Münster was the largest and most populous Catholic ecclesiastical territory in the Holy Roman Empire. Founded in 805 C.E., it covered 4,571 square miles (12,100 square kilometers) in the Westphalian region (*Kreis*) of northwestern Germany and had 311,341 inhabitants in 1800. It was predominantly rural apart from Münster itself, which, with 14,000 inhabitants, was the largest Westphalian town. Grain and cattle were the main products, and most peasants remained bound by varying degrees of feudal servitude until the early 1800s. As in other German prince-bishoprics, the cathedral canons elected each bishop and dominated the administration together with the local nobility, who controlled the territorial Estates, or assembly. The spread of Lutheranism in the city of Münster heightened longstanding tension between its inhabitants and the bishop, particularly after the election of Franz von Waldeck (1491–1553) in 1532. Defense of civic autonomy became enmeshed with the expression of new religious ideas, notably Anabaptism, which attracted a large following around the Dutch immi-

grant Jan van Leyden. Leyden's followers seized control in 1534, initiating a radical social experiment that included polygamy. The bishop blocked the city with the assistance of other princes who regarded the Anabaptists as godless subversives. Many Lutheran citizens shared their opinion, and Leyden's regime collapsed amidst growing internal discontent and external military pressure in June 1535. Leyden was executed in 1536, but the city retained some autonomy, and Lutheranism spread to the surrounding countryside by the 1580s, while most of the nobles became Calvinists under Dutch influence.

The election of Ernst of Bavaria (1559–1612) as bishop in 1584 signaled an important change of direction. Ernst had secured control of the archbishopric-electorate of Cologne in a disputed election the previous year and was a representative of militant Catholicism. Münster remained linked to Cologne until 1650, as his successor, Ferdinand of Bavaria (1577–1650), was also elected there. The association with Cologne was continued by other dual elections in 1683–1688 and 1719–1802 and considerably increased Münster's political importance within the empire. It also complicated the territory's own politics, since the Estates generally resented initiatives from Cologne, where their ruler preferred to reside. Ferdinand joined the Catholic League and coordinated its policy in northwest Germany during the Thirty Years' War (1618–1648). The canons tried to curb external influence by choosing a local noble, Christoph Bernhard von Galen (1606–1678), as Ferdinand's successor. Galen proved to be Münster's most ruthless and significant bishop. Known as *Bommen Berend*, 'Bomber Bernhard', and the *Kanonienbischof*, 'Cannon Bishop', for his enthusiasm for the military, he was determined to reimpose Catholicism and secure his territory against the Protestant Dutch and Swedes. Skillfully exploiting the divisions between the canons, the Estates, and the city, he raised taxes for an army that sometimes numbered twenty thousand men. This was loaned to other powers, particularly the emperor, in return for subsidies and political support. The latter proved crucial in Galen's long struggle with the city, which endured four sieges before finally capitulating in 1661. Episcopal authority was firmly established, and Münster became solidly Catholic by the eighteenth century. Further

involvement in later European wars drained territorial resources, and Münster declined to only regional importance, despite the continued association with Cologne. Prussia gained influence in Münster after 1795 and annexed it in 1802.

PETER H. WILSON

MURATORI, LUDOVICO ANTONIO (1672–1750), Italian historian, reformer, and ecclesiastic. Probably the most important figure of the early Italian Enlightenment, Muratori at first pursued erudition and cultural reform as separate areas. Following his education in civil and canon law at the University of Modena, he became involved in the movement, sponsored by the Rome-based Accademia degli Arcadi, to redeem literature from the supposed decadence of the seventeenth century. Meanwhile, he learned Greek and Latin paleography from the Benedictine scholar Benedetto Bacchini (1651–1721), a disciple of the pioneer medievalist Jean Mabillon (1632–1707). Soon after the turn of the seventeenth century, he began to think that effective reform of civil life could only come from a reinforced Christianity and an accurate understanding of the emergence of modern institutions from those of the past—the ancient past—and even more pertinently, the medieval past in which they were really rooted. He thus repudiated the

Arcadi and began his own movement, whose major tenets he explained in *I Primi disegni della repubblica letteraria* (1703; First designs of a literary republic).

Following his appointment as librarian at the Ambrosiana in Milan, he became ducal librarian and archivist for the Este family in Modena. In this position, where he remained for the rest of his life, he published a remarkable body of works aimed at excavating the unknown medieval roots of the societies all over the Italian peninsula, culminating in the twenty-eight-volume *Rerum italicarum scriptores* (1723–1751), still a primary source on the Italian Middle Ages. Meanwhile, drawing upon this and other scholarly foundations, he published a series of influential polemics on contemporary civil society designed to provide guides for the enlightened monarch and for the enlightened citizen alike.

To the monarchs, he directed a searing attack on current legal systems (*Dei difetti delle giurisprudenza* [On the defects of jurisprudence], 1742), advocating simplification and codification of law and reform of procedure. He argued for better systems of public health, denounced economic differences, and called for more equitable systems of taxation (*Della pubblica felicità oggetto de' buoni principi* [On public happiness, the object of good princes], 1749). He called for removal of inheritance practices that prevented large quantities of land from being cultivated efficiently, advocated a reduction in the number of feast days so the poor would be able to earn more money working in the fields, and urged governments to sponsor agricultural improvements as well. To both the monarch and the citizen, he tried to show that Christianity properly understood—informed by sacred and profane learning, supportive of creativity, constructively encouraging the duties of all, responsive to human needs, and freed from distracting and irrelevant practices—could lead to both spiritual and material well-being (*Della regolata devozione de' Cristiani* [On the moderate devotion of Christians], 1747). In spite of disagreement with Muratori's respect for church traditions, more radical figures like Pietro Giannone built upon the solid foundation he provided. His last great project was a monumental history of Italy to his own time (*Annali d'Italia*, 12 vols., 1744–1749), reiterating many of the great themes of his life's work.

BRENDAN DOOLEY

MURILLO, BARTOLOMÉ ESTEBAN

(1617–1682), Spanish painter. Orphaned at the age of ten, Murillo was adopted by a sister, who arranged his apprenticeship with Juan de Castillo (1590–1657). By 1538, he was working in Seville. *Heavenly and Earthly Trinities* (Stockholm, Nationalmuseum, c. 1638/1640), one of his earliest known works, incorporates characteristic features of several prominent artists, including the elegant facial types of Alonso Cano (1601–1667), the sculptural draperies of Francisco de Zurbarán (1598–1664), and a celestial vision in the manner of Juan de Roelas (c. 1560–1624). Murillo's first major commission was a series of eleven pictures for San Francisco in Seville (1645–1648). Part of this series, the *Angels' Kitchen* (Paris, Louvre, 1646) helped establish his reputation as the leading artist of the city; this large painting depicts an unidentified Franciscan saint, floating in rapture, as elegant angels and putti prepare an elaborate repast.

In the 1650s Murillo received prestigious commissions for the Seville cathedral. In 1655, he painted *San Isidoro* and *San Leandro* for the sacristy; the glowing colors of the saints' garments set off their resolute facial expressions. The *Vision of Saint Anthony of Padua* for the cathedral baptistery (1656) imitates the dynamic baroque style that Francisco de Herrera the Younger (1622–1685) had recently introduced from Madrid.

Murillo spent most of 1658 in Madrid, where he studied paintings by a wide range of Spanish and foreign artists. With Herrera, he founded in 1660 the first art academy in Seville; until 1674 it offered classes in life drawing. In *Birth of the Virgin* (Paris, Louvre, 1660), Murillo achieved his definitive manner. Firm contours are dissolved through loose,

sketchy brushwork and soft, glowing light. This style perfectly corresponded with the tender piety predominating in Spanish religious life of the era.

His many commissions of the 1660s included a group of eighteen altarpieces for the Capuchin church in Seville (1665–1670). For the Hospital de la Caridad, a confraternity devoted to caring for the sick, he produced eight large pictures (1668–1670) depicting good works. Compassionate expressions, warm colors, and hazy atmospheric effects emphasize the theme of loving forgiveness in *Return of the Prodigal Son* (Washington, D.C., National Gallery of Art, 1667–1670). His altarpiece of the *Immaculate Conception* for the Hospicio de Venerable Sacerdotes, Seville (Madrid, Prado, 1678), determined the later iconography of the theme. This jubilant image eliminates almost all traditional attributes; the young, beautiful Virgin is surrounded by celebrating putti, who dissolve into soft clouds and golden light. As the Sevillian economy worsened during the 1670s, Murillo sought patronage in Cádiz, where he was working at the time of his death on altarpieces for the Capuchin church.

Murillo also produced many independent devotional paintings for private clients, some of whom collected his work in large numbers. His five paintings of the Old Testament story of Jacob (including *Jacob Setting the Peeled Rods before the Flocks of Laban*, Dallas, Meadows Museum, Southern Methodist University, c. 1660) incorporate extensive landscapes, based on northern prototypes. Especially popular were his charming images of the infancy of the Christ Child and of Saint John the Baptist. Typical of these, *The Infant Saint John the Baptist and the Lamb* (London, National Gallery, c. 1660–1665), shows the Baptist, smiling at the viewer, as he embraces a lamb.

Murillo produced approximately twenty genre paintings, such as *Children Playing Dice* (Munich, Bayerische Staatsgemäldesammlungen, c. 1665–1675). In most of these, two or three impoverished children are playing or eating in a pastoral landscape featuring a picturesque ruin. The strong sentimentality distinguishes these paintings from Dutch prototypes. Usually interpreted as a brothel scene, *Two Women at a Window* (Washington, D.C., National Gallery of Art, c. 1655–1660) may depict an innocent flirtation.

Murillo was esteemed as an elegant portraitist. *Don Antonio Hurtado de Salcedo* (Spain, private collection, c. 1662/1664) is one of the few hunting portraits by a seventeenth-century Spanish artist. The extensive landscape, the three dogs with their keeper, and numerous genre details emphasize the hunting theme. For his *Self-Portrait* (London, National Gallery, c. 1670–1673), Murillo utilized a Netherlandish formula, depicting himself in an elaborate oval frame, on which he rests his hand. The inscription and professional attributes suggest the status artists had attained in Spain.

Murillo's many followers included Francisco Meneses Osorio (c. 1640–1721), who finished his series for the Capuchin church in Cádiz. Murillo's work strongly influenced painting in Seville until the late eighteenth century. British collectors avidly sought his paintings throughout the eighteenth and nineteenth centuries. His paintings of children were imitated by Sir Joshua Reynolds (1723–1792) and Thomas Gainsborough (1727–1788). In the Victorian era, Murillo was regarded as one of the greatest artists of all times.

RICHARD MANN

MUSEUMS. Early modern museums were very different from the modern institutions that bear that name, so much so that some scholars suggest that museums per se did not exist before the eighteenth century. Many museologists believe that the true

history of museums begins with the creation of institutions like the British Museum (1753) and the Louvre (1793). What came before the eighteenth century was a chaotic phenomenon, unrelated to the careful, scientific classification and exhibition of the natural and human-crafted world witnessed in modern art galleries and museums of natural history, civilization, and science and technology, among others. It is true that earlier collections lacked some of the basic features of modern institutions. The earliest were privately owned elite institutions not open to the general public. As a group they lacked the orderliness common in collections today, and they were frequently idiosyncratic in composition, focusing on the unusual, shocking, and even disturbing. Even the name “museum” itself was uncommon: it is more correct to refer to cabinets of curiosity (*cabinet des curiosités*; *Kunst-kammer*) or wonders (*Wunderkammer*) well into the seventeenth century. But there are good reasons to discount the claims that such cabinets lack any place in the history of museum development.

Perhaps the most obvious reason to challenge the notion of an unbridgeable divide between the sixteenth- and seventeenth-century cabinets on one hand and the modern museum on the other is the sheer ubiquity of collecting in the early modern period. This period witnessed an unparalleled upsurge in collecting throughout Europe that continues right through the modern era. It is here that long-standing collections emerge in the Italian peninsula, the Habsburg Empire, Switzerland, France, England, the Netherlands, Denmark, and Russia, many of which are the foundations of later national museums. Though early modern cabinets were privately owned—often by a noble, a ruler, or an institution of learning—it became increasingly common for their owners to grant admission to worthy guests. These cabinets lured natural historians and philosophers of the age who were striving to understand the workings of nature, but visiting such collections also became part of the educational tour of worthy young men from all over Europe. The demand for access proved so widespread that printed catalogs detailing the contents were created for those who could not visit them in person. Their popularity was enhanced when individuals lower down the social scale began collections in imitation of their social superiors, as they did in increasing

numbers during the seventeenth century. It is in the sheer numbers of these collections and the constant traffic to them that some scholars now identify the first glimmers of the modern museum-going public.

The collectors and travelers were undoubtedly experiencing something very different from the modern museum visitor, however. Early collections could easily be described as chaotic because it was often the aim of the owner to encompass universal diversity in his cabinet, and the organization schemes would seem very confusing today. Though there were collectors who specialized in a single type of item, many simply included anything they deemed appealing, intriguing, rare, exotic, or valuable. Collectors might have particular interests, and their cabinets reflect those: the Habsburg Archduke Ferdinand II (1529–1595) had an especial interest in arms and armor and dedicated three rooms of his four-room collection to them; Peter the Great of Russia (1672–1725) was interested in woodcraft and archaeology, among other things, and kept an extensive collection of tools and archaeological finds from Siberia and the Caspian Sea; England’s Samuel Pepys (1633–1703) gathered printed matter. Other collectors specialized in coins, clocks, shells, biological or anatomical materials, books, or metal objects; the possibilities were as numerous as the collectors themselves.

Though most collections did not rigorously specialize, they did not necessarily lack any organizing impulse. Recent research and examination of individual collections suggests that there were organizational principles at work, though they are not methodologies at use in museums today: Pepys, for instance, organized his immense collection of books by size, not author. One particularly prevalent goal was the desire to create coherence from chaos. The collection of the Royal Society (founded in 1660) was meant, according to its first curator, Robert Hooke (1635–1703), to provide the opportunity for visitors and scholars to “peruse, and turn over, and spell, and read the Book of Nature.” Following Francis Bacon’s (1561–1626) proposed program of investigation, the mysteries of nature would be uncovered and explained through the careful examination of, in particular, her “miracles.” It was, therefore, incumbent upon collections to focus on the anomalies even to the exclusion of examples of the mundane and regular. Although we can see here an

emphasis that is different from modern museums, the explicit agenda certainly foreshadows the type of investigation that underpins modern museum exhibits.

Perhaps the failure to recognize the underlying structure of these collections stems in part from the fact that the cabinets might be very cramped; hundreds of items from various parts of the globe would necessarily be housed in very close proximity, creating a sense of astonishing and exuberant bounty. Whatever organizing principle was employed, the collector would be sure that it accentuated plenitude since the object was to awe (even overawe) the visitor, in the process increasing the collector's reputation and celebrity. In an era when ownership of physical things and consumerism was to become a basis for honor and prestige, the cabinet of rarities was very visible proof of an individual's status.

It is a consequence of the owner's desire for notoriety and eminence that the private cabinet became increasingly more public in the seventeenth century. Though a ruler might wish to defend the exclusivity of his or her personal collection, for the rising merchant, professional, or emergent scholarly group, publicity was desirable. The more visitors, the greater the potential for renown. (Of course, the opening of collections to the general public had the advantage of providing income as well.) Despite this apparently modernizing development, it was the "un-modern" character of the early modern collections that made them so popular; people traveled to see these collections precisely because they were filled with the singular, the anomalous, and the monstrous. When a collector chose to publish a catalog, he did so to highlight the breadth and the uniqueness of the collection; educating the audience, while often an important motivator, was usually ancillary to stunning and amazing it. Museologists argue that it is this reversal of priorities and the lack of "rational" categorization and specialization that make such collections primitive and inferior. And yet for the early modern collector and his audience, such collections were the means to encapsulating and understanding a fecund and ingenious nature; without such collections and the study they enabled, nature's constitution, methods, and limits would remain shrouded in mystery.

KATHRYN BRAMMALL

MUSIC. Just as artists, poets, and men of letters looked to antiquity for direction in the mid-fifteenth century, the musically minded in early modern Europe also spoke of ancient powers lost to modern times.

The composer Johannes Tinctoris in 1474 yearned for the former potency in melody "by whose virtue gods, ancestral spirits, unclean demons, animals without reason, and things insensate were said to be moved!" Humanists read in Polybius that music could enrage, elevate, or enfeeble; in the *Republic*, Plato schooled his guardian class in modes that hardened and conditioned them for civic duty and emboldened the weak and effeminate; and Aristotle, in the *Politics*, distinguished the vulgar use of music in public entertainments from its proper use to educate. The generation of composers who came of age around 1500 was responding in part to new calls for the recovery of music's forgotten force in the civic and moral life of the community. At issue for humanists was how to sharpen and enhance the effects of the text. Renaissance composers employed novel techniques to do this, including a system of emphatic syllabic declamation called *musique mesurée*, promoted by the French humanist Jean-Antoine de Baïf (1532–1589). In his letters patent approving Baïf's academy, Charles IX praised its aim "of improving the morals of its citizens and promoting the welfare of the city." Composers found a more fertile path in fashioning melodic phrases to mirror the poetic line

in length and emotional direction. Orlando di Lasso (1532–1594) used extreme chromaticism and elaborate polyphony in his twelve-motet cycle *Prophetiae sibyllarum* (c. 1555) to evoke the unnatural voices of ancient seers. “Polyphonic songs which you hear with a chromatic tenor,” he wrote, “these are they, in which our twice-six sibyls once sang with fearless mouth the secrets of salvation.”

The music from such composers as Pierre de La Rue (c. 1450–1518), Jacob Obrecht (c. 1450–1505), Heinrich Isaac (c. 1450–1517), and Josquin des Prez (c. 1440–1521) was self-consciously revolutionary, rejecting predecessors and forging a fresh style. They employed greater musical variety, added instruments to sacred songs to supplement what had been a cappella singing, and drew attention to emotional expression. Josquin was the boldest innovator of his time, moving away from plainsong and chant as his musical foundation to freely composed and self-generating phrases that he wove into interlocking parts. The composer of some 20 Masses, over 100 motets, and more than 75 secular works, Josquin achieved a pliancy and sumptuousness in his writing that stands in marked contrast to the more angular, Gothically inflected works that preceded him. Music in the Renaissance progressed from theory-laden books to concrete and practical applications. It also expanded into the vernacular and away from liturgical settings. Popular expressions were the French chanson and the Italian madrigal; varieties of the latter became the continuo song and cantata in the baroque age.

The Renaissance courts of northern Italy were centers of innovation and patronage. “Seek not to deprive our Courtier of music,” Castiglione advised in *The Book of the Courtier*, “which not only soothes men’s minds, but often tames wild beasts.” Ercole I d’Este schooled his children in music, and Lorenzo de’ Medici (1449–1492) sang. Competition among Renaissance princes for grandeur and power sparked bidding wars for professional talent and even cases of musical espionage. The rivalry was especially keen among Florence, Ferrara, Mantua, Urbino, Milan, and the Papal States. On the low end of the social scale were singers and poets on the peripheries of power: itinerant *improvisatore*, *cantimbanchi*, and *ciarlatini* moved from court to court to sing about King Arthur, Orlando, and Charlemagne. At the high end of the scale were highly sought after talents

like Claudio Monteverdi (1567–1643), whose sixteen-year association with the Gonzaga family of Mantua produced three books of madrigals, the operas *Orfeo* and *L’arianna*, and numerous other works for festive and commemorative occasions. Musicians allegorized and elevated the might of their patrons with lavish works for weddings, feasts, private celebrations, dances, theatrical displays, and liturgical services. Music was also a prominent feature in state ceremonials: in Venice, the announcement of victory at sea over the Turks at Lepanto in 1571 came with a flourish of drums and trumpets; choirs in St. Mark’s greeted a diplomatic delegation from Japan; and the annual marriage of Venice and the sea celebration on Ascension Day, when the doge announced his “true and perpetual domination” over the Adriatic, was consummated to music. Each artistic center proudly claimed priority in leading music out of its medieval darkness. The theorist and composer Gioseffo Zarlino (1517–1590) blamed the “ravages of time” and the “negligence of men” for bringing music to its degraded state and credited God for sending “one of the rarest intellects ever to have practiced music” to Venice, Adrian Willaert (c. 1490–1562). As *maestro di capello* at St. Mark’s and composer of Masses, motets, madrigals, and chansons, Willaert pioneered the use of split choirs situated throughout the basilica for stereophonic effect, a technique taken up by Giovanni Gabrieli (c. 1553–1612) and, much later, Hector Berlioz (1803–1869).

The printing press speeded the pace and broadened the diffusion of musical innovation. Its appearance helped to shape a new profile of the composer around 1500, as music masters moved away from church administration and toward uniquely musical pursuits. The first music printed with movable type came from southern Germany in the 1470s. The first published volume for multiple voices and intended for large-scale distribution was *Harmonice Musices Odhecaton A* (1501), which came from the Venetian house of Ottaviano de’ Petrucci; Petrucci later published volumes of single composers including Josquin, Pierre de La Rue, Obrecht, Agricola, and Isaac. The other major musical publishing centers were Rome, Milan, Ferrara, Florence, Naples, Antwerp, Nuremberg, and Augsburg. Publishers sought to establish a particular niche in the rapidly growing commercial market by affiliating them-

selves with a single composer, building more specialized lists in secular or sacred music, offering music across a range of levels and abilities, and providing simplified arrangements of well-known works for the amateur. The large firms sent scouts to Rome and other Italian cities to recruit young talent. Instruction books geared toward the nonaristocratic public fed a growing popular appetite for private music making, particularly in lute and keyboard works. By 1550, musical presses in Italy and the German states were publishing vocal part books by the tens of thousands. In England, by contrast, there were comparatively few works of music published in the sixteenth century, an early sign that English and Continental music were already on separate paths of development. A single published volume of polyphony from the first half of the sixteenth century anthologized the music of William Cornysh (c. 1465–1523), Robert Fayrfax (1464–1521), and John Taverner (c. 1495–1545).

MUSIC AND THE REFORMATION

The level of music making varied widely across early modern Europe, from the superb organists and choirmasters of cathedral towns to unlettered singers of rudimentary plainchant at parish churches. Most people experienced music through vernacular songs in the streets and inns. Towns employed municipal musicians for popular entertainment and to trumpet fanfares on special occasions. Folk songs encompassed a wide array of types, including narrative ballads, lovers' laments, parting songs, drinking songs, devotional songs, and saints' day songs. There were also more pointed songs, like this 1520 lyric urging the expulsion of Jews from the German city of Rothenburg:

*Ein Reichstat an der Tauben legt,
Ist Rottenburg genannt.
Da haben die Juden lange zeit,
Getrieben grossen Schand.
Mit Wucherei und schärfer List
Damit gar mancher Trümmer
Zu Grund verdorben ist.*

(A city on the Tauber lies,
Whose name is Rothenburg.
There, for many years, the Jews
Have spread their shame.
They saw waste and destruction
Through usury and other cunning tricks
In order to bring ruin.)

Vernacular songs furnished ready tunes for new texts, a practice that proved useful for religious instruction given the minuscule literacy rates. In France, the tune *Quand j'ai pensé en vous, ma bien aimée* ("When I think of you, my beloved") was kept but the words reworked to become *Quand j'ai pensé en vous, Bible sacrée* ("When I ponder you, O sacred Bible"). Such substitutions provided the vehicle and the message for the spread of the Reformation. Easy to memorize and quick to spread, Lutheran songs rapidly became a weapon more potent than the flood of anti-Catholic books and pamphlets. Hundreds of popular tunes, many of them originally Catholic, were rewritten with Lutheran texts. Posted at inns and passed by travelers from town to town, the songs were used to "sing down" priests as they spoke.

The uncertainty and dissent among Reformers about the proper use of music is testimony to the extent of innovation since 1500. In the minds of many Reformers, new musical styles revealed the dangers of the humanists' project. In *The Genevan Psalter* (1543), John Calvin warned of music's power to pervert the morals of its listeners and urged strict controls: "Just as wine is funneled into a barrel, so are venom and corruption distilled to the very depths of the heart by melody." The English Puritan Phillip Stubbes wrote in his *Anatomic of Abuses* (1583) that music "corrupteth good minds, maketh them womannish and inclined to all kinde of whordome and mischeef," while Erasmus censured the appearance of brass and stringed instruments in liturgical settings, which caused people "[to] flock to church as to a theater for aural delight." Calvin banned polyphony from services, though it was permitted in social gatherings; Huldrych Zwingli (1484–1531) banned all music in services. In England, Anglican reforms vastly simplified music in both style and text: statutes in Lincoln Cathedral specified that the choir was to sing no anthems to "our Lady or other Saints, but only to our Lord, and them not in Latin." Catholic reform undertaken by the Council of Trent went in the same direction, stopping just short of Calvin's move to ban all polyphony. The council censured music composed merely "to give empty pleasure to the ear" and urged composers to write in such a way as to make the words easily understood by all. Within fifteen years of his death, Giovanni Pierluigi

da Palestrina (c. 1525–1594) was hailed as having saved polyphony in the wake of the council's decrees by crafting an audition piece for the Vatican that convinced the authorities of its value through sheer beauty as well as its calculated propriety. The story is likely apocryphal, but it captures the tension between the direction of musical development and the liturgical needs of the Catholic Church in the sixteenth century. It also highlights Palestrina's own solution, which was to craft a style less ornately contrapuntal than that of Lasso by alternating chordal sections and free movement among independent lines. Palestrina was one of the most prolific of all composers, writing some 104 Masses, 250 motets, 68 offertories, 65 hymns, 35 Magnificat settings, and various lamentations and litanies.

In contrast to the other major religious reformers, Martin Luther (1483–1546) embraced the widest possible variety of musical expression. He called music “the mistress and governess” of human emotion, deserving highest praise “next to the word of God,” and yet more eloquent than the most powerful orator in its “infinite variety of forms and benefits.” Luther's musical ecumenicism, which helped to inspire the popular musical education that spread throughout the Lutheran lands on every level of society, had lasting consequences for music in Germany. The highest expression of this encompassing vision came in the music of Johann Sebastian Bach (1685–1750), whose 200 known sacred cantatas (about three-fifths of what he is thought to have composed) convey their texts with remarkable subtlety, variety, and precision. Here, as well as in his keyboard and orchestral works, Bach employed virtually every European style, high and low, sacred and profane, from the grand French overture to dances of the popular classes. Famously provincial in his aversion to travel, Bach nevertheless drew from all available printed sources to produce works of universal appeal and enduring mastery. Bach's six keyboard partitas, for example, transformed popular dance forms known throughout Europe into virtuoso solo pieces. These included the *corrente*, a zigzag, hop-stepped Italian dance; its more fluid French counterpart the *courante*; the noble German *allemande*, a grave dance involving couples in a line; and the Spanish *saraband*, a slow, dignified dance of great sweeping gestures. Living on the threshold of musical classicism, an aesthetic whose simplified

style he steadfastly resisted, Bach was doggedly anti-progressive. From within this conservative world Bach also surveyed and on occasion borrowed from more recent styles of such contemporaries as Johann Adolf Hasse (1699–1783) and Carl Heinrich Graun (1703–1759). Like Dante before him, Bach brought the elements of a passing age together in magnificent synthesis. Bach resisted any notion that he possessed special powers of genius; composers were instead to be craftsmen. He said: “I have had to work hard; anyone who works just as hard will get just as far.”

PRIVATE AND PUBLIC PERFORMANCE

Throughout the seventeenth century, and owing to the wide availability of printed scores, amateur music making was increasingly viewed as a pastime for the great and small. One source was the Protestant tradition of hymn singing. The 1561 Sternhold and Hopkins edition of the Psalms in English included a brief introduction on the “Science of Music” that urged readers to sing in common worship and “privately by themselves or at home in their houses.” There was much secular music, too. New wealth and a taste for luxury among the moneyed in late-sixteenth-century England supported a flourishing publishing industry, with some eighty collections of vocal music published from 1587 to 1630 intended primarily for the amateur market. The large number of dedications to gentry and noble patrons in England in lute and madrigal collections is one indication of their likely audience, but the presence of merchants and tradespeople among the dedicatees suggests that private performance was not limited to elites. Thomas Morley's *Canzonets to Five and Six Voices* (1597), a volume of five- and six-part madrigals with lute accompaniment, was dedicated to “Master Henrie Tapsfield, Citizen and Grocer of the Cittie of London,” and Thomas Weelkes's *Balletts and Madrigals* (1598) was dedicated to Edward Darcy, a groom in the royal household. Such examples notwithstanding, private music making throughout Europe was largely a pursuit of those with the time and money to devote to refining their skills and acquiring the music and instruments. The lute was the aristocratic instrument par excellence in much the same way the piano became a fixture in nineteenth-century middle-class interiors. There are glimpses of social mixing in private performance even at the highest levels.

Roger North (1653–1734), gentleman and brother to Baron Francis North, who was keeper of the Great Seal of England, described musical evenings of his childhood involving solo and ensemble performances by his sisters, the servants, the steward, and the clerk of the kitchen.

In England, public concerts were first offered in private houses, taverns, and other meeting halls. Old forms of patronage persisted into the eighteenth century—and in some places on a scale greater than ever—but the new public concerts fundamentally recast the relationship between composer and audience by granting immediate access to large numbers and creating a venue for the rise of popular individual performers. The first truly public musical recital in England, and probably in Europe, occurred in 1672 when the composer and violinist John Banister opened his home for regular 4:00 P.M. performances given, as the *London Gazette* promised, “by excellent masters.” Other series soon followed, with their success a part of the overall exuberance in public entertainments associated with the Restoration. Cromwell’s destruction of organ pipes with battle-axes at Chichester, Worcester, Norwich, Peterborough, Canterbury, and Winchester was only the most dramatic example of the so-called purification of music during the Protectorate. The appearance of public concerts also marked a shift from church-sponsored to more secular music, much of it tied to the court. Entrepreneurs such as Banister and Robert King, who obtained a license to offer concerts in 1689, also oversaw performances within the royal household.

This was the context for one of England’s most versatile and gifted composers, Henry Purcell (c. 1659–1695), who was appointed composer-in-ordinary for the king’s violins in 1677, just four years after his voice changed. Principal organist at Westminster Abbey from a young age and later at the Chapel Royal, Purcell also wrote for the stage. His output included anthems, overtures, “semi-operas,” entr’actes, dances, instrumental works for harpsichord, organ, and viol consort, and royal birthday odes and welcome songs. He was also famous for his catches, a popular form that in England displaced the madrigal and which, especially in Purcell’s hands, delighted in randy lyrics. His catch on the plot of Titus Oates includes a characteristic mix of politics, religion, and sport:

Now England’s great council’s assembled
To make laws for English-born freemen.
Since ’tis dang’rous to prate of matters of state
Let’s handle our wine and our women.

Let’s drink to the Senate’s best thoughts
For the good of the King and the nation.
May they dig on the spot as deep as the plot
As the Jesuits have laid the foundation.

A plague of all zealots and fools,
And each silly Protestant hater;
Better turn cat-in-pan and live like a man
Than be hanged and die like a traitor.

As court composer and keeper of the king’s instruments, Purcell wrote music for state occasions—including five welcome songs for Charles II, three for James II, and six birthday odes for Queen Mary—but neither he nor his contemporaries undertook the kinds of lavish productions deifying the monarchy that composers in absolutist France were perfecting at the time. There is a discreet reference to William and Mary in the prologue to Purcell’s best-known work, *Dido and Aeneas* (1689), an opera staged at the Josiah Priest Boarding School in Chelsea just after the Glorious Revolution. A Nereid announces the appearance of a “new divinity,” to which the chorus responds: “To Phoebus and Venus our homage we’ll pay, / Her charms bless the night, as his beams bless the day.”

In eighteenth-century France, private concerts in aristocratic salons were an important feature of upper-class sociability, though, as Mozart related to his father, the attention of the listeners was not always fixed on the musicians. “What vexed me most of all,” he wrote of a performance for the duchesse de Chabot’s circle, “was that Madame and all her gentlemen never interrupted their drawing for a moment, but went on intently, so that I had to play to the chairs, tables, and walls.” The first public concerts in France began in 1725 with the *Concert Spirituel*, a regular series of sacred music held in the Tuileries Palace. Among favored works, performed by an orchestra of forty players and a chorus of fifty-three singers, were motets by André Campra (1660–1744), Michel-Richard de Lalande (1657–1726), and Jean-Joseph de Mondonville (1711–1772) and chamber works by Guisepppe Tartini (1692–1770) and Antonio Vivaldi (1678–1741). Given the high ticket prices, concert audiences were necessarily the moneyed, and the atmosphere was uniquely aristocratic. There were other semipublic

concerts in France later in the century, most notably those sponsored by the celebrated musical patron Alexandre-Jean-Joseph Le Riche de La Popelinière, a wealthy tax farmer who invited the likes of Jean-Philippe Rameau (1683–1764) and Johann Stamitz (1717–1757) to conduct their own music with an orchestra whose members lived on the premises. Late in the century, subscription concerts, one of them sponsored by the Freemasons, attracted a broader public with programs that regularly featured the symphonies of Franz Joseph Haydn (1732–1809).

Until the second quarter of the nineteenth century, music making in Paris was dominated by the Opéra, whose state monopoly on virtually all staged productions dated from its 1669 establishment as the Académie Royale de Musique. France's most celebrated composer in the epoch of Louis XIV was Jean-Baptiste Lully (1632–1687), whose operas came to define the French style of the *grand siècle* with their characteristic mix of stately pomp, dazzling effects, and refined graciousness. Lully reworked and enlarged the elements of Italian courtly spectacles in the Renaissance to produce a musical formula that shaped the monarchy's public image, depicting and occasionally casting Louis XIV in productions that were transparent homages to the state in the dress of Olympians. "The Peace which Your Majesty has given as generously to his conquered enemies," Lully wrote of his work *Le temple de la paix* (1685), "is the subject of this ballet." While French operatic audiences retained their aristocratic complexion in the decades before the French Revolution, such royal allegories receded before the ambitious musical innovations of Rameau, whose dense textures and bold orchestral effects shocked some listeners, and the reforms of Christoph Willibald von Gluck (1714–1787), who simplified plotlines and concentrated musical expression to heighten the dramatic intensity of his operas.

THE COMPOSER AND HIS PUBLIC

The relationship of Haydn and Mozart to their publics, which grew in many ways from their differing professional status as composers, shaped the nature and style of their works. Haydn was among the last of the great classical composers to live on the premises of his patron; over a thirty-year period beginning when he was twenty-nine, Haydn existed as

a virtual ward of Prince Paul Anton Esterházy. He was required by contract to dress in uniform at all times and to provide music whenever requested; he was regularly denied visits to Vienna and forbidden to copy his music or compose for others without the prince's permission. Nevertheless, pirated editions of his symphonies flooded Europe, possibly with his clandestine assistance. The isolation and routine of Esterháza castle proved extraordinarily fertile for the composer, whose prodigious output revealed the expressive range of the classical form. Deft, witty, harmonically rich, and endlessly inventive, Haydn's string quartets are the essence of eighteenth-century grace and refinement. "A certain kind of humor takes possession of you, and cannot be restrained," Haydn remarked to a visitor. Haydn typically led over 100 concerts a year that featured newly composed orchestral, chamber, vocal, and keyboard repertoire. His oeuvre includes 107 symphonies, over 60 string quartets, 58 keyboard sonatas, 42 keyboard trios, and 24 operas.

Mozart, by contrast, was the first major composer to flourish without a permanent position or sustained patronage. His famous indignation over his treatment by his employer, Archbishop Colloredo of Salzburg ("When I see that someone despises me and treats me with contempt, I can be as proud as a peacock"), was a mark of his temperament, but it was also an indication of the changed relationship between the artist and his public. It was possible for Mozart to leave his position as *Konzertmeister* only because of new public opportunities in the Vienna of Emperor Joseph II (ruled 1765–1790). Vienna was home to two flourishing opera companies, the Italian-language *Hofoper* and the German *Singspiel*, both of which mounted his productions. Mozart also taught privately, encouraged commissions, and wrote numerous works, for his own performances and those of his students, with particular audiences in mind. His letters are explicit and even gleeful about his opportunities as a free agent. In a 1778 letter to his father he wrote: "I pray to God daily to give me grace to hold out with fortitude and to do such honor to myself and to the whole German nation as will redound to His greater honor and glory; and that He will enable me to prosper and make a great deal of money."

The rise in public musical performance encouraged the explosion of new forms in the eighteenth

century. Audiences in rapture over virtuoso performers fueled the composition of solo instrumental and vocal works. The fireworks of Mozart's Queen of the Night aria in *Die Zauberflöte* were an exuberant and gloriously exaggerated version of what attracted many to opera in the late 1700s, a lesson not lost on Rossini and the nineteenth-century school of bel canto. The eighteenth century witnessed the appearance of keyboard sonatas and solo concertos in unprecedented numbers, as well as the birth of the *symphonie concertante*, a concertolike genre involving multiple soloists and orchestral accompaniment. The development of the string quartet from the 1760s is among the century's most important musical achievements, with the quartets of Haydn and Mozart the best known among a field of composers that included the Chevalier de Saint-Georges (c. 1739–1799) and François Joseph Gossec (1734–1829) in Paris, Carl Friedrich Abel (1723–1787) in London, and the Italian Luigi Boccherini (1743–1805). Between 1760 and 1780 over five hundred quartets were printed in Paris alone. At the same time, the modern symphony found immense approval in public settings, with some twelve thousand composed in Europe from 1720 to 1810. Its centers were Vienna, Mannheim, Paris, and London.

In many ways, the musical public in European capitals on the eve of the French Revolution resembled modern audiences. Its tastes increasingly drove programming decisions and influenced compositional styles. The public could select from among competing theaters and concert halls. It was the key ingredient in an increasingly commercialized art. The French Revolution and its effects across Europe hastened these tendencies and introduced others that changed the nature of public performance by ending state theater monopolies and reducing aristocratic and church patronage. The new taste for “ancient music”—works generally over twenty years old—formed an emerging canon of classics to be performed, preserved, and repeated in ever-larger concert halls and opera houses.

JAMES JOHNSON

MUSIC CRITICISM. Diverse literary genres emerged in the early modern period that voiced opinion on works of music or their performance, and as such constituted the field of music criticism. The genres most commonly associated with such writing in the present day, the formal, critical review of a concert, opera, edition, or recording, were, however, only beginning. The main genre in music criticism as a whole was the essay, usually done in polemical terms.

It was unusual to write upon specific works or composers in any context prior to the middle of the eighteenth century. The study of music in philosophical and scientific theory by definition did not concern itself with music itself; the closest it normally got to musical practice was in the field of tuning. Treatises or handbooks on musical compo-

sition defined rules and practices; they only occasionally gave examples from particular works or discussed the style of any composer. (One exception might be noted: the commentaries of the Franco-Flemish theorist and composer Johannes Tinctoris upon the music of his contemporaries in *Liber de arte contrapuncti* of 1477.) Yet we know that a vigorous critical discourse took place among people involved in music. It can indeed be argued that the music review grew directly out of informal discourse in opera boxes, foyers, and salons.

The most important context within which publishing music criticism emerged at the turn of the eighteenth century was the “quarrel,” a highly contentious dispute between intellectual factions. Such disputes, and the polemical essays written in their regard, were related to the quarrel of the ancients and the moderns, the debate over the authority of ancient sources in France and England in the 1690s, but took particular directions within the musical world. The first *querelle* in Paris arose over an essay contending the virtues of Italian music by François Ragueneau in 1702 (*La parallèle des italiens et des français, en ce qui regarde la musique et les opéras*) and that of his critic Jean Laurent Le Cerf de la Viéville in 1704 (*La comparaison de la musique italienne et de la musique française*). Ragueneau argued in acid, polemical terms that French music was stuck in an outdated style; Le Cerf called him a traitor to French musical tradition. *Querelles* broke out periodically in Paris, over Jean-Baptiste Lully in the 1730s, over a visiting Italian company (the Bouffons) in 1752–1754, and over the rivalry of Christoph Willibald von Gluck and Niccolò Piccinni in the 1770s. A parallel series of quarrels over Italian opera took place in London, begun by John Dennis in his 1706 *Essay on the Operas after the Italian Manner* and revived by a variety of authors through the 1730s.

Religious discourse also spawned critical commentary that played an important role in the evolution of public musical performance. In England in 1711 the Reverend Arthur Bedford, a colleague of Jeremy Collier in the movement against the theaters, called for great music of the past to serve as models for the present, a very new idea, in his influential *Great Abuse of Musick*. In France both orthodox and Jansenist writers claimed that sacred music was being secularized and attacked the grow-

ing practice by which churches put on public concerts for paying audiences.

Music criticism first took root in theoretical treatises and in periodicals in Germany, chiefly in Berlin and Leipzig. The main figures tended to be at odds with court musical life; they shaped a polemical discourse that laid the groundwork for the German intellectual leadership of musical life in the nineteenth century. Johann Mattheson began the tradition in Hamburg, originally in *Das neu-eröffnete Orchestre* (1713) and the periodical *Critica Musica* (1722–1725). Johann Forkel, organist at the University of Göttingen at the end of the century, wrote the first biography of Johann Sebastian Bach, but in one of his short-lived periodicals attacked the master's son Johann Christian Bach for pandering to the nobility and writing superficial music.

The burgeoning of periodicals during the eighteenth century brought practical music into a far closer relationship with other areas of written discourse than ever before. In the course of the century, treatment of music evolved from simple reportage to critical commentary. Lists of newly published works gradually took on a critical dimension, especially in the many German periodicals. Reports on opera and concerts at first only gave the names of works and performers, as well as details of notables present, but by the end of the century often had an important critical element. In some periodicals, the *Mercure de France* most notably, the author reported opinions supposedly voiced variously by the public and connoisseurs. Neither the author nor the connoisseurs he cited yet had strongly based intellectual authority. By 1800 critical reviews had developed the most fully in Parisian daily newspapers and in German music magazines. One senses a fully empowered reviewer in reading pieces on new opera productions in the French capital and reports on concerts in the Leipzig-based *Allgemeine musikalische Zeitung*.

Another important new authority that began to develop in music criticism during the eighteenth century was the canon. Prior to around 1700 there existed few repertoires where old works were performed regularly in any sense as classics. That practice began first in England, in the performance of older works as “ancient music,” and then in France as *la musique ancienne*. The *querelle des bouffons* was in fact fought over the entirely unprecedented authority that stage works by Jean-Baptiste Lully had acquired in their regular revivals. In Berlin the operas of Karl Heinrich Graun and Johann Adolf Hasse stayed on stage in similar terms. By the same token, commentary on the many performances of music by George Frideric Handel bestowed upon him a respect no composer had ever received. Throughout Europe, a new kind of canonic language thus began to develop in music criticism, whose only precedent was the honoring of masters such as Giovanni Palestrina and Girolamo Frescobaldi as pedagogical models. Nevertheless, in France and Germany the works did not stay on stage after the late 1780s, and a new movement of canonic taste began as music by Franz Joseph Haydn, Wolfgang Amadeus Mozart, and Ludwig van Beethoven was established as “classical” internationally.

WILLIAM WEBER

NANTES, EDICT OF. As Catholics flocked to Henry IV's side after his 1593 conversion to Catholicism, the French Calvinists, or Huguenots, began to consider the once unthinkable possibility that they would have to go to war against the very man who had for so long championed their cause. One sign of their disaffection was the fact that few Huguenots lent their support to the king's war against Spain, declared in 1595. They greatly worried that their precarious freedom to worship might be taken away from them. Henry IV also dreaded the notion of fighting the Huguenots, even though Catholic pressure grew upon him to restrict their rights in order to prove his sincerity as a Catholic. The situation called for decisive action by the king lest a new religious war break out, especially as negotiations to end the war with Spain moved ahead, culminating in the Treaty of Vervins in May 1598.

In a bold move to avert this crisis, Henry IV reached a historic settlement with the Huguenots on 13 April 1598 in the Edict of Nantes. This famous accord has been seen as an important step forward for the idea of religious toleration as well as a victory for the notion that politics takes precedence over religion. Upon closer examination, however, neither of these interpretations can be sustained. The Edict of Nantes stated as its principal goal the eventual peaceful reunion of the king's subjects in one agreed-upon faith. In the meantime, the king wished to ensure religious coexistence of the two confessions so that this process of reunion

could go forward. The Edict of Nantes therefore affirmed the age-old French heritage of "one king, one faith, one law" rather than looking forward to modern ideas about toleration and secularism. It testified more to the growing authority of the crown than any willingness to accept religious differences on a permanent basis.

In the Edict of Nantes, Henry IV tried to solve the dilemma he faced of reassuring the Huguenots without alienating the Catholics. A closer look at the edict shows how he hoped to achieve these contrasting goals. Four separate documents actually made up the Edict of Nantes. The first one consisted of ninety-two general articles, while the second one had fifty-six "secret articles" that granted exemptions from the general articles to particular towns and persons. The last two documents were royal writs known as brevets. The reason for all this complexity in the edict stemmed from the political circumstances that Henry IV faced. The first two sets of articles had to be registered in the Parlement of Paris, which was the chief judicial court in France, in order to receive the force of law. Royal brevets, by contrast, did not need to be registered because they ended once the king who originally issued them had died. They were thus provisional in nature. Henry IV put the most controversial concessions to the Huguenots in the royal brevets because he knew that the Parlement of Paris, which was controlled by the Catholics, would never register them. In fact, it took nearly a year for the parlement to accept the first two sets of articles. How long the Edict of Nantes would last was therefore, from a legalistic

point of view, an open question right from the outset. Henry IV's declaration in the preamble that the edict was "perpetual and irrevocable" actually meant only until such time as another edict was issued and registered to replace it.

The provisions making up the Edict of Nantes did not break new ground but rather returned quite explicitly to earlier edicts of pacification, such as the Peace of Bergerac (1577) and Peace of Fleix (1580), sometimes word for word. First, the king consigned all events since 1585 to oblivion, making it a crime to stir up the memories of past grievances. The edict recognized the Huguenots' right to freedom of conscience and liberty to worship in all towns that they controlled as of August 1597. It also guaranteed the right of Huguenots to hold political office and established special new courts with both Huguenot and Catholic judges to enforce the provisions of the edict. At the same time, the Edict of Nantes also addressed Catholic concerns. It reaffirmed, for example, the Catholic character of both the crown and the kingdom. While Huguenots could only worship in specially designated areas, Catholics could practice their faith anywhere in France. In fact, the Edict of Nantes called for the reintroduction of Catholicism in places where Huguenots had long forbidden it, most notably Béarn. All of these general principles in the first set of articles became decidedly less firm when considering all the exceptions to them contained in the second set of "secret articles." The most significant concessions to the Huguenots came in the two royal brevets, the first of which provided generous royal funds to help subsidize the French Calvinist Church, while the second allowed the Huguenots to fortify and garrison towns under their control. These measures thus provided financial and military security to the Huguenots, but only while Henry IV was king.

The Edict of Nantes thus brought a temporary end to the Wars of Religion, which broke out once again after Henry IV's assassination in 1610 as the Huguenots tried to secure the substantial gains they had made in the royal brevets. They ultimately failed to do so when Henry IV's son, Louis XIII, finally defeated the Huguenots in 1628 after the siege of La Rochelle. Louis XIII stripped the Huguenots of their former military independence and subsidies in the Grace of Alais (1629), though he recognized their right to worship in places already established.

The provisions in the two sets of articles came to an end in 1685 when Henry IV's grandson, Louis XIV, revoked the remaining provisions of the Edict of Nantes in the Edict of Fontainebleau. He did so because he mistakenly believed that most of the Huguenots had returned to the Catholic Church. The resulting persecution forced the French Calvinist Church to go underground, while many Huguenots emigrated to Germany, England, and North America. French Calvinists only enjoyed the right to worship publicly later on, in 1787, just prior to the French Revolution.

NAPLES, ART IN. Although the second largest city in Europe, Naples was, until the second half of the seventeenth century, considered of little interest or import artistically. Giorgio Vasari asserted that until he worked in Naples (1544–1545), no one since Giotto had produced any painting of importance there. Even as, over the course of the seventeenth century, Naples became one of the most important artistic centers in Italy—perhaps the most important by the end of the century—the development of its art was greatly dependent on the presence of foreign artists and their works, although

the exact nature of that dependence is still much debated. The list of artists from outside Naples visiting or working in the city in the first half of the century is impressive; it includes Caravaggio (Michelangelo Merisi), Paul Brill, Goffredo Wals, François de Nomé, Guido Reni, Matthias Stomer, Diego Velázquez, Pietro Novelli (called *il Monrealese*), Artemisia Gentileschi, Domenichino (Domenico Zampieri), Johann Heinrich Schönfeld, Viviano Codazzi, Giovanni Lanfranco, Charles Mellin, and Giovanni Benedetto Castiglione. The Spaniard José (Jusepe) de Ribera constitutes a special case in that, after working briefly in Parma and Bologna and for several years in Rome, he relocated to Naples in 1616, where he spent the rest of his career, establishing himself as the leading painter of the first half of the century. Works by other artists came to Naples, and the artists themselves may have visited the city; among them were Louis Finson, Domenico Fiasella, Simon Vouet, and Nicolas Poussin.

Although many Neapolitan artists visited Rome, they had virtually no impact there, with the exception of Naples's most famous permanent expatriate, Salvator Rosa. Similarly, a few Neapolitan works found their way into collections outside of Naples, but there was no significant awareness of them, except in Spain. In the second half of the century, however, Neapolitan art gained international recognition, especially owing to the impact of the highly prolific Luca Giordano, who worked in Venice, Florence, Rome, and Madrid, as well as in his native city; and later Francesco Solimena, whose career lasted until the middle of the eighteenth century. For Bernardo De Dominici, whose three-volume *Lives of the Neapolitan Painters, Sculptors, and Architects* was published in 1742–1745, Solimena represented the acme of art and the proof of the international import of the Neapolitan school.

STYLE

Four significant shifts in style occurred in Neapolitan painting over the course of the seventeenth and early eighteenth centuries: first, the introduction, in the first decade of the century, of a strong tenebrism and trenchant naturalism; second, a lightening of the palette around 1630; third, a loosening of compositions and a use of a more full-bodied figure style from the 1650s on; and lastly, a withdrawal from

“baroque” illusionism to a less ostentatious classicism at the turn of the eighteenth century.

The prevailing mode in Neapolitan painting at the turn of the seventeenth century was a competent version of the “reformed” style developed elsewhere in Italy in the preceding decades. The most prominent practitioner of the style in Naples was Belisario Corenzio, who persisted in using it to the end of his career in the fourth decade of the century. The paintings executed by Caravaggio, including the *Seven Works of Mercy*, during his two brief sojourns in the city (1606–1607, 1609–1610) had a remarkable impact on the local school. As early as 1607, Giovanni Battista Caracciolo (Battistello) produced a strikingly Caravaggesque *Immaculate Conception with SS. Dominic and Francis of Paola*, a remarkable change from his earlier style developed under the aegis of Corenzio, and he maintained a stark tenebrism to the end of his career. The greatest exponent of Caravaggism in Naples was Ribera, who had already worked in this style in Rome. His rise to prominence in Naples further entrenched Caravaggism as the dominant mode there, although he developed in a direction not pursued by Caravaggio or his close adherents, namely toward bravura brushwork and use of what De Dominici called a “tremendous impasto.”

After his earliest works, Ribera had generally substituted for Caravaggio's plebeian figures and sometimes awkward compositions more elegant figures and coherently organized compositions. In these aspects, and in his continuing tenebrism, he shared stylistic concerns with his rival as leading Neapolitan painter, Massimo Stanzione, although the two are often seen in stark opposition. In the late 1620s, he moved further from Caravaggio's example, lightening his palette, often using outdoor settings, and increasing the painterliness of his brushwork, evident in his *Holy Trinity* of the early to mid-1630s. Ribera's stylistic shift was shared by many Neapolitan artists and paralleled developments in Rome. In both instances, the artists' attention to sixteenth-century Venetian painting, whether directly or indirectly, seems to lie at the root of the shift. Reinforcing this “neo-Venetianism” in Naples may have been the presence or work of Reni, Anthony Van Dyck (possibly through the Sicilian painter Novelli), Velázquez, or others, although the matter has been vigorously debated.

Although the great plague that decimated the population of Naples in 1656 took several painters, foremost among them Stanzione, Neapolitan art was already beginning a significant change before that date, in part because of the passing of a generation of artists, but also because of the arrival, in 1653, of another outside artist, Mattia Preti. The well-traveled Calabrian had developed his earlier tenebrist manner into a vigorous, dramatic style that worked well in large canvases and fresco projects. Perhaps because of Preti's presence, and from 1664 also that of Giovan Battista Beinaschi, Neapolitan artists finally began to assimilate the Roman "grand manner" frescoes that Giovanni Lanfranco had executed in Neapolitan churches—the Gesù Nuovo, S. Martino, SS. Apostoli, and the Cappella del Tesoro in the cathedral—during his sojourn in the city

(1634–1646). Although Preti left Naples in 1660, his work had a profound effect on the artistic development of the young Luca Giordano and was consciously evoked and refined years later by Solimena.

A less dramatic shift occurred around the turn of the eighteenth century within the art of Solimena, with important repercussions for his followers, especially Francesco de Mura and, in turn, de Mura's followers, who dominated the field in the second half of the eighteenth century. While some artists, namely Giacomo del Po and Domenico Antonio Vaccaro, continued to develop an exuberant, painterly style, Solimena began organizing his works with increased restraint and monumentality, in a style that has been termed "anti-baroque." In a different direction, Paolo de Matteis, who vied with Solimena for dominance in the early eighteenth century, pursued a classicizing version of Giordano's style. Giordano's brilliant, airy *Triumph of Judith* (1703–1704), decorating the vault of the treasury of the Certosa di S. Martino, which has been called "the source of the Italian rococo," had surprisingly few echoes in Naples itself.

PATRONAGE AND SUBJECT MATTER

Giorgio Vasari famously stated that Polidoro da Caravaggio, who worked in Naples in 1527–1528, nearly died of hunger because Neapolitan noblemen are so "little curious about the excellent things of painting" and "value more a horse that jumps than someone who can paint with his hands figures that appear alive." To be sure, the most important patronage in Naples through the eighteenth century was ecclesiastical. Most of the hundreds of churches in Naples were decorated in this period, many of them lavishly. The most important projects of the seventeenth century were the decoration of the Capella del Tesoro (or di S. Gennaro) of the cathedral (with frescoes and altarpieces by Domenichino, Lanfranco, and Ribera and sculptures by Giulio Finelli, Cosimo Fanzago, and others, largely executed in the 1630s–1640s) and the Certosa di San Martino, which is perhaps the most splendid artistic complex of the Italian seicento. Situated with a commanding view of the city and bay of Naples, the fourteenth-century monastery underwent massive rebuilding and decoration beginning in the late sixteenth century. From 1623, Fanzago was responsible for the architecture, also contributing sculp-

ture and elaborate marble revetments in the church. Frescoes and canvases in the church and throughout the charterhouse were provided by most of the leading painters in the city—Corenzio, Ribera, Stanzone, Caracciolo, Lanfranco, Domenico Gargiulo, and Paolo Finoglia, among others—and include as well Reni's monumental *Adoration of the Shepherds* (c. 1640). Further campaigns in the eighteenth century included work by Giordano, de Matteis, and de Mura, as well as lavish sculptural decoration by Vaccaro.

Some of the viceroys in Naples—first Spanish, then, in the eighteenth century, Austrian—were significant patrons and collectors, sometimes playing important roles in the traffic of objects and the dissemination of style between Naples and Spain, the rest of Italy, and Central Europe. Many of the seventeenth-century viceroys employed Neapolitan artists, sometimes on behalf of the king of Spain, and a few amassed substantial collections, most notably the Count of Monterrey (viceroy 1631–1637) and the Marquess del Carpio (viceroy 1683–1687). Of the Austrian viceroys, the most important collector was Count Alois Thomas Raimund Harrach (viceroy 1728–1733), who extended his already vast collection while in Naples, not only commissioning contemporary artists, especially Solimena, but acquiring seventeenth-century Neapolitan works as well.

Large-scale decoration of private palaces was rare in the seventeenth century, and nearly all the many such projects from the early eighteenth century, especially by de Matteis and del Po, have been destroyed. But over the course of the seventeenth century and into the eighteenth, private collecting became much more extensive, ultimately belying Vasari's severe (and biased) judgment. Foremost among the collectors of the seventeenth century was the fabulously wealthy Flemish merchant Gaspar Roomer, whose vast collection included Peter Paul Rubens's *Feast of Herod*.

Religious subject matter predominated, especially in the seventeenth century, for both ecclesiastical and private patrons, but significant works with other subjects were produced. Mythological subjects were somewhat unusual, as in Spain, but important examples were executed by Ribera, Stanzone, and others. Relatively few portraits were

produced in Naples in the seventeenth century, although the local painters—foremost among them Solimena and Giuseppe Bonito—caught up to international practice in the eighteenth century. Naples also did not have a highly developed tradition of genre painting until the eighteenth century, when it is best represented by Bonito and Gaspare Traversi. Seventeenth-century landscape painters, especially Gargiulo (who also showed himself a brilliant frescoist in his work at the Certosa di S. Martino), tended toward the dramatic, rather than the idyllic or classical. Fanciful architectural settings were common. In the eighteenth century, idealized views predominated, produced at their highest level by Angelo Maria Costa and his pupil, Leonardo Coccorante. Neapolitan painters of still lifes—with a penchant for foodstuffs and flowers—especially Luca Forte, Paolo Porpora, Giovanni Battista Ruoppolo, and members of the Recco family, were among the most important in Italy from second quarter of the seventeenth century.

JAMES CLIFTON

NAPLES, KINGDOM OF. The early modern kingdom of Naples, whose twelve provinces comprised the southern third of the Italian peninsula, was the military and fiscal cornerstone of Spain's Mediterranean empire from its conquest in December 1503. It provided significant resources of men and money in a subordinate political role as a

vicerealty in the sixteenth- and seventeenth-century Spanish imperial system. After the War of the Spanish Succession (1701–1714), the kingdom passed to the Austrian Habsburgs in 1713. During the War of the Polish Succession (1733–1738), a cadet branch of the Bourbons made Naples the capital of a new, independent Kingdom of the Two Sicilies in 1734. The capital vied with Paris as western Europe's largest city until the plague of 1656 halved its population with 150,000 deaths; yet Naples still remained western Europe's third largest city into the nineteenth century.

POLITICS AND SOCIETY

Spanish Naples (1504–1713) saw itself as the defender and legitimate successor of the formerly independent Aragonese kingdom destroyed by French invasions in 1494 and 1499. Gonzalo Fernández de Córdoba (1453–1515), the Great Captain, led an innovative military campaign that resolved more than two hundred years of Angevin-Aragonese rivalry in southern Italy. Charles V (king of Spain as Charles I, 1516–1556; Holy Roman Emperor, 1519–1556) confiscated pro-French nobles' titles, fiefdoms, and offices to forge an alliance between the absentee Spanish monarchy and the loyal local nobility, while Eleonora of Toledo, daughter of viceroy Pedro de Toledo (ruled 1532–1553), was married to Cosimo I Medici (ruled 1537–1574) of Florence as part of the Spanish pacification of Italy. This *pax hispanica* quelled factional feuding among the local nobility, put a stop to open warfare between the Italian states, and protected Italy from the Ottoman Turks. Philip II of Spain (ruled 1556–1598) encouraged powerful Genoese families as merchants and financiers in the kingdom and supported lawyer-administrators (*togati* or nobles of the robe) as middlemen between the baronial nobility and the monarchy. The city and countryside unsuccessfully revolted against Spain for nine months in 1647/1648. Spanish Habsburg rule ended with the death of Charles II (ruled 1665–1700) and the accession of the French Bourbon Philip V (king of Spain, 1700–1746), grandson of Louis XIV of France (ruled 1643–1715). The Austrian Habsburgs occupied Naples in 1707 during the War of the Spanish Succession.

Austrian Naples (1713–1734) became an Austrian vicerealty by the Treaty of Utrecht in 1713.

Administrative structures remained relatively unchanged under Austrian Habsburg rule, but international rivalries led Sicily to be reunited with Naples in 1720. The War of the Polish Succession displaced the Austrian Habsburgs, and Philip V's son, Charles of Bourbon (king of Naples, 1734–1759; king of Spain as Charles III, 1759–1788), conquered Naples in 1734 and reestablished an independent kingdom.

The Kingdom of the Two Sicilies (1734–1860) became a model of Enlightenment reform under Charles and his chief minister, Bernardo Tanucci (served 1755–1776). Charles III became king of Spain and left Naples to his third son, Ferdinand IV (king of Naples, 1759–1806; king of the Two Sicilies as Ferdinand I, 1816–1825). Ferdinand IV lost Naples briefly during the five-month Jacobin republic in 1799 and fled the Napoleonic conquest to exile in Sicily from 1806 to 1815 before his restoration.

A population density of 35 people per square kilometer in the mainland kingdom's 79,477 square kilometers counted a countryside population of about 1.5 million people in 1505, 2.5 million in 1595, 2.0 million in 1669, 3.0 million in 1700, 3.5 million in 1750 and 5.0 million in 1800. The capital numbered roughly 10 percent of the kingdom with an additional 100,000 inhabitants in 1500, 250,000 in 1600, 350,000 before the 1656 plague, 215,000 in 1707, 315,000 in 1742, and more than 400,000 by 1800. No other city in the kingdom had more than 20,000 inhabitants, and rural populations clustered around provincial capitals, coastal enclaves, or localized markets in Aquila, Foggia, Bari, Lecce, Taranto, Reggio di Calabria, and Salerno, whose regional economies were tied to Tuscan, Venetian, and Genoese trade. In 1520, export of agricultural raw materials created a trade imbalance of 10:1 in favor of exports. By 1771, however, imports had outpriced exports by a 6:5 margin, and the kingdom's agricultural riches could no longer offset higher-priced industrial imports.

The feudal nobility and foreign merchants controlled the agricultural economy through contracts and loans that kept an indebted rural population far removed from the wealth and power enjoyed by their regional lords. Provincials escaping feudal dues and jurisdiction swelled the teeming plebs in the

capital, and the feudal nobility too was drawn to Naples where they formed part of the ruling class with the old Neapolitan patriciate, foreign officials, merchants, and financiers; the new “robed” bureaucracy, professionals, and artisans made up a small middle-class *popolo*. Food-provisioning needs in the city were of primary concern, with shortages causing revolts in 1508, 1533, 1585, and 1647. The famine of the mid 1580s–1590s precipitated a

sharp economic downturn, but the disastrous famine of 1763–1764, which struck the kingdom with the resonance of the Lisbon earthquake, was especially severe with some 200,000 people—5 percent of the kingdom’s population—dying in 1764 alone. Only the two revolts against the introduction of the Spanish Inquisition in 1510 and 1547, the lone examples of coalition between nobles and *popolo*, succeeded.

POLITICS AND CULTURE

Renaissance Naples's local variant of "feudal humanism," which concerned itself with the problems and values of the ruling baronial elite, continued into the early sixteenth century as humanist natives of the city or kingdom sought to interpret its failures and conquest in the Italian Wars. Giovanni Pontano (1426–1503) continued to be read, and Jacopo Sannazaro (1458–1530) published his influential pastoral poem, *Arcadia*, in 1502. The university reopened in 1507 and was known for its faculties of philosophy, law, and medicine, but the humanist Neapolitan academy was suppressed in 1542. Spanish Naples hosted the Spanish mystic Juan de Valdés (1500–1541) and his circle, the anti-Aristotelian philosophy of Bernardino Telesio (1508–1588), numerous academies and salons including the suppressed Accademia dei Segreti and later the Accademia degli Oziosi, both led by the scientist and dramatist Giambattista della Porta (1535–1615), while Torquato Tasso (1544–1595), born in exile in Sorrento, was a favorite son among the Neapolitan literati. The university's seat in the monastery of San Domenico spawned two Dominican geniuses who ran afoul of the Inquisition, Giordano Bruno (1548–1600) and Tommaso Campanella (1568–1639).

Baroque Naples witnessed a cultural flowering in literature, music, art, and architecture. The poetry of Giambattista Marino (1569–1625) defined a century-long European aesthetic (marinism), which glorified the "marvelous" through wit, surprise, and artifice; while in Neapolitan dialect, Giambattista Basile (1575–1632) founded the new European genre of the literary fairy tale in the *Pentamerone* (1634–1636). Naples also became a Spanish literary topos of luxury and libertinism, as in the opening seduction scene in Tirso de Molina's *El Burlador de Sevilla y el convidado de piedra* (The seducer of Seville and the stone guest), the first literary appearance of Don Juan, in 1630. Musical culture flourished in church and court settings with early conservatories and composers. Alessandro Scarlatti (1660–1725) moved Neapolitan music to the world stage, and after 1700 Naples began to rival Venice in operatic production, to develop comic opera, and to boast the musical training of stars such as the poet and librettist Pietro Metastasio (1698–1782) and the castrato singer Farinelli (Carlo Broschi) (1705–1782). A distinctive Nea-

politan school of painting took off after Caravaggio's *Seven Acts of Mercy* altarpiece (1606–1607). Major artists such as Jusepe de Ribera (1591–1652), Massimo Stanzione (1585?–1656), Artemisia Gentileschi (1593–1652/53), Bernardo Cavallino (1616–1656), Salvatore Rosa (1615–1673), Luca Giordano (1634–1705), and Francesco Solimena (1657–1747) had prominent careers. A spectacular building boom began to revive the city, with more than 150 projects begun between 1600 and 1650 alone, and important architects such as Domenico Fontana (1543–1607), Cosimo Fanzago (1593–1678), and Luigi Vanvitelli (1700–1773) distinguished themselves in Naples.

Enlightenment Naples became a privileged venue on the early modern European grand tour as much for its great men as for its natural beauty and ancient ruins. Political thought about the end of Spanish rule matured with Paolo Mattia Doria (1662–1746), Pietro Giannone (1676–1748), and Giambattista Vico (1668–1744), whose *The New Science* (1725; 1730; 1744) is a philosophy of humanity and universal history. Ferdinando Galiani (1728–1787) published his pathbreaking book *On Money* in 1751 and enjoyed a reputation as one of the major figures in intellectual life in Paris, where he served as Neapolitan ambassador from 1759 to 1769. Antonio Genovesi (1712–1769), who published widely on political and economic reform, held the first European university chair in "Mechanical Arts and Commerce" (political economy) in 1754. Genovesi's school produced government reformers such as Francesco Longano (1728–1796), Giuseppe Maria Galanti (1743–1806), Domenico Grimaldi (1735–1805), Francesco Antonio Grimaldi (1741–1784), and Francesco Maria Pagano (1748–1799). Gaetano Filangieri's (1752–1788) *Science of Legislation* (1780–1785) proposed a radical model for society that influenced the American founding fathers. He joined a reform council of finance with Giuseppe Palmieri (1721–1793) that included Melchiorre Delfico (1744–1835) after Filangieri's death. When Goethe wrote in the diary entry of 12 March 1787 for his *Italienische Reise* (1816; Italian journey) that Naples was a paradise in which everyone—including himself—lived in "intoxicated self-forgetfulness," he was perpetuating the persistent myth of a carefree people in a land of plenty and the romantic

fantasy of finding one's true self in the liberating southern sun.

JOHN A. MARINO

NAPLES, REVOLT OF (1647). On 7 July 1647 a protest in Naples against a tax on fresh fruit by both the *popolo* (non-noble professionals and artisans) and plebs of the city spread to the rural provinces. The protest initiated a nine-month revolt against the heavy fiscal burdens that had been imposed on the city and kingdom as a result of the Thirty Years' War (1618–1648), the feudal and oligarchic government of the local elites, and the monarchical rule of Spain. In the first days of the revolt, the houses of financiers, tax collectors, and nobles

were burned. Armed neighborhood militias took control of the city under the charismatic leadership of a fishmonger named Masaniello (Tomaso Aniello d'Amalfi) and his intellectual ally, an eighty-year-old lawyer named Giulio Genoino, who had in 1619–1620 been unsuccessful in an attempt to lead a constitutional reform in Naples.

After Masaniello, on the order of the viceroy and with the complicity of Genoino, was murdered on 16 July, divisions emerged among rebels in the capital and between them and rebels in the provinces. Bombardment by a Spanish fleet in October failed to break the urban resistance, and Naples was declared a free republic under the French duke of Guise, Henry of Lorraine. The uprising foundered, however, when no consensus could be reached among rival political factions on whether to create a bourgeois democratic, oligarchic, federated, constitutional, or military republic, on Dutch, Swiss, Venetian, or new models. A negotiated settlement allowed the Spanish to retake Naples on 6 April 1648, with limited concessions granting some tax reductions and a nominally greater role for the *popolo* in fiscal and administrative affairs. The failed revolt strengthened the compact between the Spanish monarchy and the local nobility, increased the power of bureaucratic elites and privileged orders in the city, and further subjugated the countryside to the feudal nobility and the capital.

NASI FAMILY. The Hebrew word *nasi*, meaning ‘elevated one’ or ‘prince’, was used as a surname by a prominent Sephardic (Spanish-Jewish) family of the sixteenth century. Family members included some of the most powerful merchants and courtiers of the time, both in Christian Europe and the Ottoman Empire.

When all practicing Jews were expelled from Spain in 1492, members of the clan were among the six hundred wealthy families who managed to purchase sanctuary in Portugal. Five years later, however, they, along with all other Lusitanian Jews, were forced to convert to Christianity. Paradoxically, forced baptism opened up opportunities for these “New Christians,” or *conversos*, to participate fully in the rapidly expanding Portuguese spice trade with the Far East. The brothers Francisco and Diogo Benveniste, now known under the Christian name Mendes, were the leading members of a consortium that marketed the annual spice shipment and provided vital financial services to the Portuguese crown. At the same time, they were leaders in the unofficial *converso* community, working especially to keep the horrors of a Spanish-style Inquisition from being instituted in Portugal.

Despite their strenuous efforts and the expenditure of large sums both in Lisbon and in Rome, the *conversos* could not overcome the religious and social forces of the time. By 1531, the papacy had authorized an Inquisition in Portugal, and in July of 1532, Diogo Mendes, then representing the family firm in Antwerp, was arrested for Judaizing and other crimes. Substantial monetary payments as well as vigorous protests from the city’s merchant community, England’s King Henry VIII (ruled 1509–1547), and Portugal’s King John III (ruled 1521–1557) and Queen Catherine secured his release, but the family’s safety remained precarious. When Francisco died in Lisbon in January 1535, his young widow, Beatriz de Luna, soon departed for Antwerp with her daughter and the family’s wealth, narrowly escaping the inquisitorial fires that would begin burning the following year. In 1543, Diogo too

died, and Beatriz took over leadership of the family and its business interests and began looking for a safer home.

Cautiously, and over a lengthy period, the family transferred members and assets from Antwerp through Venice and Ferrara to Istanbul, where at last they could openly adopt Jewish identities under the common surname Nasi. At each step along the way they were tempting targets for official rapacity and personal greed. The years of transition were marked also by bitter family quarrels and scandal, by sensational court cases, and by political intrigue at an international level. Still, by 1553 Beatriz was triumphantly ensconced in a palatial home in Istanbul. There she promoted wide-ranging trading ties with both western and southeastern Europe. Known now as Doña Gracia or simply “La Señora,” she played an active role in the life of Ottoman Jewry through her generous support of charitable, religious, and cultural institutions. She also continued the family’s well-established practice of preserving wealth through endogamy: just as she and her sister had married their uncles, the brothers Mendes, she now married off her own daughter, Reina, and her niece, Gracia (la Chica), to her close cousins, the brothers João and Bernardo Micas. They, as open Jews, had adopted the names Joseph and Samuel Nasi.

Joseph (1524–1579), who had grown up close to court circles in Brussels, capitalized on his European experience and contacts and gained considerable influence at the Ottoman Sublime Porte. Named duke of Naxos in 1566, Joseph was generally content to rule his Greek island territories from Istanbul. There he could participate actively in palace politics, consistently advocating an anti-French and anti-Venetian line when it came to relations with Europe. He is reputed to have been a major instigator of the campaign that took Cyprus from Venice in 1570, and he expected to be made king of that island after the Turkish victory, though this was not to be.

Although exceptional in the degree of their wealth and power, the Nasis were representative of the influential Jewish merchant dynasties that operated across religious, national, and even imperial boundaries in the early modern period. The family left a lasting mark as patrons of Jewish culture, giv-

ing generously to Jewish religious institutions and supporting both *converso* and rabbinic writers. When, in 1556, Pope Paul IV arrested former *conversos* living in Ancona and had many of them executed as heretics, the Nasis organized Jewish merchants for a retaliatory boycott of that city. Though the effort eventually foundered, it does illustrate the increasing efforts by early modern Jews at coordinated political action. In a similar vein, the family secured control of Tiberias from the Sultans and invested heavily in rebuilding the city and its economy while helping Jewish refugees to settle there. The messianic overtones of Jewish settlement in the land of Israel under Jewish governance were celebrated by contemporary Jews and protested by their non-Jewish enemies. Doña Gracia may actually have lived there briefly before her death in 1569. Don Joseph died in Istanbul, politically marginalized but still wealthy, a decade later.

NATIONAL IDENTITY. The appearance, extent, and character of nationalism in European society has attracted much debate among historians and sociologists. Although there is little consensus regarding the forces responsible for its manifestation, most specialists on nationalism believe it to be an essentially modern phenomenon, appearing in the late eighteenth century in Europe and North America.

Three theorists stand out in the genealogical debate over nationalism. Eric J. Hobsbawm defined nationalism as the popular realization of political rights in a sovereign state. A populace linked itself to a limited national territory and was embodied through a centralized government, an event Hobsbawm believed first occurred during the French Revolution. If nationalism was a modern invention, so were nations: the nation-state was the result, rather than the origin, of nationalist discourse. Ernest Gellner adopted an economically reductionist approach, deeming nationalism a necessary function of industrialization. Because industry required skilled labor, a common vernacular, and high rates of literacy, he argued, the need developed for a national “high culture,” promoted by a state-run educational system. Simultaneously, the old agrarian order faded away and societal anonymity replaced provincial distinctness, facilitating the creation of a homogenous national culture. Like Hobsbawm, Gellner sought to dispel teleological notions of the nation as eternal; nationalism was a modern invention, created in response to the needs of a new economic system, even if it represented itself as a natural, historical phenomenon.

The theory of the nation as invention was taken further by Benedict Anderson, who saw nationalism as a process of “imagining communities.” The decline of universal religious paradigms and the rise in print capitalism allowed for this cultural construction to flourish in the eighteenth century. The mass consumption of newspapers and novels enforced a common vernacular, linked a populace to urban centers, and encouraged common participation in a shared (imagined) culture. Anderson implied that the Reformation and the printing press did more to encourage nationalism than did the advent of industrialization. Despite their differences, all three of these prominent theoreticians identified nationalism, and by association the nation-state, as a phenomenon of the last few centuries.

If nationalism is a modern novelty, then what came before? Certainly the terms *nation*, *patrie*, and *Vaterland* were used before the modern period. What did they mean? Faced with this question, modernists distinguish between nationalism as political ideology and nationalism as cultural identity. Most postulate that the former occurs only in modern society, starting with the French Revolution,

while the latter had early modern antecedents. The early modern variant is usually referred to as “national identity” or “proto-nationalism,” and it implies an awareness by the populace, at least in part, of a common national culture not yet manifest as a motivating political ideology. Cultural bonds could be found in common language, religion, and custom as well as in the common social condition of being dynastic subjects. Citing these bonds, some historians see modern nationalism making an appearance as early as the sixteenth century.

Conversely, the historian Eugen Weber has argued that if the modern definition requires that nationalism be popular in scope, then nationalism did not permeate the French countryside until the late nineteenth century, when public schools and railroad access exposed the rural population to cosmopolitan cultural norms and formalized instruction in the French language. These latter two interpretations call into question the importance of the French Revolution in the development of modern nationalism.

Time, then, is not the most useful tool for categorizing nationalism or national identity. Nationalism appears irregularly and is dependent on a variety of historical factors or “accidents” that escape structural categorization. And one cannot simply label national identity as embryonic nationalism: not all national identities function within nations, and not all nations have “proto-national” origins. Moreover, national identity should not be seen as something that replaces local attachments. Identities were conterminous, and awareness of national belonging was appended to local and provincial identities. The historian Peter Sahlin has described early modern identity as a series of “counter-identities,” in which local communities defined themselves through a multitude of attachments: village, county, province, nation—all of which were distinguishable from the “other,” that is, the foreigner.

Throughout the early modern period, the character and intensity of national identity varied widely from place to place. Spain is an excellent example of the potential ambivalence of early modern identity. Spanish subjects generally did not think of themselves as Spanish, but rather as Castilian, Valencian, or Catalan; the formation of a Spanish identity was further hindered by the presence of multiple king-

doms in Spain and the unwillingness of the Habsburg monarchs to promote their association with the Spanish state, particularly in their Castilian exclusivity. Identity was further complicated by the Jewish and Moorish populations on the peninsula, which added a racial character to Spanish identity construction. Nonetheless, Catholic beliefs were widely shared among the inhabitants of Spain.

In Italy, certain Renaissance writers encouraged national awareness through an appeal to an ancient Roman homeland and by evoking civic pride in the cultural accomplishments of the Renaissance. Certainly some contemporary writers idealized Italy: Francesco Guicciardini’s revealingly titled *Storia d’Italia* (History of Italy, written 1536–1540) describes the decline of independent Italian states during the early sixteenth century. The Italian Wars resulted in Spanish occupation of much of the peninsula, and local elites became Spanish clients. Additionally, the papal resurgence during the Counter-Reformation discouraged national consciousness, as the papacy claimed a universal jurisdiction that transcended national limits. Italy remained a geographical expression rather than a nation, and national identity only resonated in elite literary circles. The situation in Germany—conceived of as the homeland of the ancient Germanic tribes, the descendants of whom shared a common ethnicity (as members of a single *Volk*)—was similar. Germany was a patchwork of small principalities under the nominal authority of the Holy Roman Empire, but the empire was divided between Protestant and Catholic communities; it was not exclusively Germanic; and it lacked a strong central government. German identity was not political or territorial; rather, it was a cultural affinity consisting of linguistic, ethnic, and historical associations.

State centralization played an essential role in the development of national identity in France. The vicissitudes of the Hundred Years’ War (1337–1453) imbued the French monarchy with a national character that, though threatened during the Wars of Religion (1562–1598), was reinforced over the course of the seventeenth century. The crown was a powerful unifying factor in French society, and belonging to the French nation meant allegiance to the French king. Royal patronage of art, literature, and historical writing promoted French culture, and the international acceptance of the French language

and Parisian styles as the epitome of civilization at least among European elites, contributed to the sense of its distinctiveness and superiority. The monarchical association with the *patrie* faded only during the eighteenth century, as Enlightenment discourses posited the French people, rather than the king, as the legitimate repository of national sovereignty.

Before nationalism became central to French revolutionary discourses, the Netherlands and Great Britain—two relatively isolated North Atlantic Protestant states—seem to have developed strong national identities, the Dutch in the seventeenth century and the British in the eighteenth. They may thus meet the key criterion set out by modern definitions of nationalism—a widely held political ideology that identifies the nation-state as a distinct and sovereign representation of a particular people and as the embodiment or defender of its culture. In the cases of both the Dutch and the British, national identity was deeply entwined with religion, economic wealth, and political revolt. Protestantism was essential to the creation of both nationalisms. Protestant theologians' insistence on widespread vernacular literacy, combined with the rise of print capitalism, facilitated the creation of a national religious community. Urbanization and a rising middle class gave common people a vested interest in the political order, and as the historian Linda Colley has shown, patriotism and profit went hand in hand. Daniel Defoe's *The Complete English Tradesman* (1726) provides an excellent example of this growing national identity, as it explicitly links the social benefits of international trade to national pride in being English. Military crises—particularly the struggles against a Catholic “other”—augmented Britons' burgeoning national sentiment by juxtaposing religious and national sovereignty against the fear of foreign invasion.

Significantly, both the Dutch and the British endured severe political crises that resulted in the demise of monarchical regimes. The resulting insecurities over political legitimacy necessitated justifications for revolt, and contemporary writers constructed a new kind of legitimacy based on a pseudo-historical national ethos. Dutch and British writers used classical allegories as reflections of contemporary political conflicts and as means of constructing essentialized notions of national unique-

ness. Seventeenth-century coins, medals, and pamphlets associated the new Dutch Republic with the Batavians, ancient barbarians who fought Julius Caesar, or, more often, with the Israelites. The Dutch saw themselves as a chosen people threatened by subjugation, and they deployed such images to distinguish themselves from surrounding peoples and states. In the British case, even if the English, Scots, and Welsh had individual claims of separate identity, they all knew that they were fundamentally different from the Catholic French. Protestantism for them became synonymous with “Britishness,” hence the litany of characteristics the British believed themselves to exemplify: freedom, prosperity, and rationality, contrasted forcefully against the perceived superstition and impoverishment of the oppressed French.

The concept of national identity is complex, and its intensity, character, and origins vary with time and place. Some areas of Europe were completely ambivalent to national sentiment, while populations elsewhere could be considered exceedingly patriotic. Different classes and orders could display varying degrees of national identification, and there could be differences between urban and rural populations as well. While the development of national identity remains a difficult historical problem, several general conclusions may be offered. Although most early modern European societies did not develop national identities to the same degree as the British and the Dutch, they did readily contrast themselves with their neighbors. In the early modern mind, “nation” might primarily mean place of birth, yet it also carried cultural weight: one's nation connoted perhaps ethnicity, perhaps language, but almost certainly religion. Religious homogeneity played a vital role in the construction of national identity, not just for the cases cited above, but also for the Scandinavian states and for Russia and much of eastern Europe. One can state with fair certainty that most people saw themselves as part of a wider community, one that was occasionally national in scope, and that religion, language, and local political structures played prominent roles in determining that identity.

NATURAL HISTORY. Columbus’s first voyage to the Americas in 1492 transformed natural history perhaps more than any it did other early modern science. The ensuing development of European maritime empires of trade and commerce opened new routes for the acquisition of specimens, supplied museums of natural history with countless new species, and ultimately shaped natural history itself into a science intimately embedded within European systems of colonial governance over non-European peoples, floras, and faunas.

Natural history, as a discipline, had existed since classical times, and fifteenth-century Europeans were very familiar with Pliny the Elder’s *Historia Naturalis* (40–79 C.E.; Natural history). Throughout the early modern period, natural history continued to be acknowledged as the science that described the three kingdoms of the natural world: animals, plants, and minerals. Many other types of enquiry and interpretation would be undertaken under the umbrella term *natural history* between 1450 and 1789, but natural history as an enterprise of acquisition and description was mirrored in the sites in which it was practiced: collections. The early modern museum, cabinet, *Wunderkammer* (‘chamber of wonders’) or *studio* (‘study’) developed out of the medieval treasury and other settings—usually princely or ecclesiastical—in which rare, precious, and exotic items were amassed. During the sixteenth and early seventeenth centuries, collections continued to be largely the province of princely owners, making visible not only their personal wealth, but also their ability to gain access to unique objects from other parts of the world. Universality and comprehensiveness was the leading characteristic of these collections, which were designed as microcosms of the whole world, and in which natural rarities and works of artifice were not separated. Early modern collections were both showpieces that displayed power and repositories that preserved value.

HUMANIST NATURAL HISTORY

Sixteenth-century natural history was part of the humanist tradition of learning with its literary and artistic orientation, typified by the writings of the Dutch scholar and theologian Desiderius Erasmus (1466?–1536). The study of the natural world in the early modern period was first and foremost a philological pursuit. Authors of new publications plundered earlier manuscript and published works of natural history for descriptions, anecdotes, and proverbs concerning natural objects, including many that would today seem quite foreign to a scientific approach. The Milanese jurist Andrea Alciati’s *Emblemata* (1522) configured animals as literary puzzles, with an obscure image and motto that the reader could decode by means of an epigrammatic poem. Emblematic texts of natural history accumulated literary materials rather than observations: fables, emblems, proverbs, allegories,

sympathies. This emblematic tradition emphasized the symbolism of animals alongside their uses, rather than their anatomy or classification; it continued to dominate natural history until the very end of the sixteenth century, exemplified in the writings of naturalists such as the Lutheran Joachim Camerarius the Younger (1534–1598).

By the end of the sixteenth century, learned men across Europe collected natural history objects and advanced explanations for their nature, types, and transformations. Massive publication projects were often associated with collections like the famous studio of the “Bolognese Aristotle,” Ulisse Aldrovandi (1522–1605). The great collections of individuals like Aldrovandi, the Neapolitan apothecary Ferrante Imperato (1550–1631) or the Dane Olaus Worm (1588–1654) were famous throughout Europe, visited by princes and noblemen, and documented in printed descriptions and catalogs such as the *Museum Wormianum* of 1655 in Leiden. Collections continued to play a central part in princely and scholarly identity, as in natural historical practice, throughout the early modern period, although the principles of their construction varied over time. In his many writings, the English philosopher Francis Bacon (1561–1626) called for the ejection of philology from natural history and for greater attention to wonders and monsters, the exotic and the rare. By the 1660s, museums were theaters of marvels, where the scholarly observer was encouraged to contemplate the philosophical issues raised by the juxtaposition of neighboring objects, which might reveal contrasts or similarities, the variety or the uniformity of nature. The wondrous natural or artificial object served as a basis for philosophical analysis, natural theology, and reflection on the role of the human observer, both as part of the natural world and as the transformer of its materials by art. Such studies always had a theological purpose as well: museums of natural history were described as “books of nature,” which the scholar could read alongside the great book, the Bible, for pious purposes. This natural theological approach was typified by the writings of the Cambridge botanist John Ray (1627–1705).

ACCUMULATING AND CLASSIFYING

A number of important institutions of European science were founded during the Renaissance, sup-

ported by rulers, nobles, universities, and municipal authorities. Alongside observatories, laboratories, and anatomy theaters came the first botanical gardens: Padua (1546) and Pisa (1547). Andrea Cesalpino (1519–1603), professor of philosophy, medicine, and botany at Pisa (1555–1592) and director of the botanical garden (1554–1558), was also the creator of one of the first herbaria and the inventor of botanical systematics. Cesalpino’s classificatory system was an attempt to bring natural history within the purview of scholastic philosophy, with its logical categories and formulae. This exercise in conferring scholarly prestige upon an activity hitherto largely limited to medical herbalism enshrined botany within the universities and gave it the status of a science. Up until the end of the eighteenth century and beyond, natural historical classifications, such as that invented by Joseph Pitton de Tournefort (1656–1708), professor of botany at the Jardin du Roi in Paris (founded 1635; since 1793, the Muséum National d’Histoire Naturelle), continued to draw on Cesalpino’s work. Of all the subdisciplines of natural history, botany was the first to be formalized independently and to be practiced within institutions dedicated to its pursuit. Classification demanded not only the generation of logical categories based on a philosophical system, but also the material and practical enterprise of sorting, preserving, identifying, naming, distributing and, sometimes, propagating specimens from the three kingdoms of nature, animals, plants, and minerals. Botanical specimens far outstripped other natural history specimens such as animal carcasses or mineral samples in their portability and ease of preservation. By contrast, animal classification was contested, and reliable methods of preservation did not emerge until the very end of the seventeenth century at the hands of the Dutch anatomist Frederik Ruysch (1638–1731). Minerals, with the exception of gemstones and precious metals, were less amenable to transportation or exploitation, although they were well represented in collections devoted to local natural history.

Natural history as a cumulation of objects and observations provided both factual certainty and greater knowledge of God, but it also had economic outcomes. Europe’s botanical gardens were important centers for the acquisition, propagation, and distribution of new species derived from voyages of

discovery and conquest undertaken with increasing frequency towards the eighteenth century. The potential of replicating useful plants, including coffee, potatoes, pineapples, and nutmeg, was explored throughout the early modern period, but more systematically after the formation of the first colonial botanical gardens in the late seventeenth century. Scientific participation in the proceeds of imperialist enterprises increased substantially during the eighteenth century as naturalists presented the organized pursuit of useful plants, animals, and minerals to rulers and patrons as indispensable to national wealth. Curious natural history thus coexisted with a repertoire of activities and practices—cultivation, exchange, consumption—that would transform the flora, fauna, foods and other natural resources of western Europe forever. Such an approach to natural history as a science of resources, peaking in the eighteenth century, required extensive cooperation among naturalists as well as vast financial support. A resource-oriented approach to natural history also justified the publication of local natural histories itemizing the flora, fauna, and mineral wealth of one province or state, especially in England and the German lands.

COMMERCE AND THE PUBLIC SPHERE

The distinction between private and public collections, or between curious and useful, was rarely clear-cut in botanical gardens, academies, or princely collections. Even naturalists wholly lacking institutional affiliations depended for their collecting upon the growth of European commerce and exploration. Natural history specimens ranked alongside valuable works of art from porcelain to paintings in the households of wealthy collectors and fetched nearly as much in the marketplace. The Dutch Republic was a center for fashions in the collection of natural objects, from tulips in the 1630s to shells in the 1710s. Both depended on the wide global reach of Dutch trade and colonization to supply new specimens. From a private collector's viewpoint, there was no categorical distinction to be made between beautiful objects of nature and art; seventeenth-century collectors admired the artifice of nature in decorating flowers or butterflies in much the same way as they appreciated the artistry of antique coins or sculpture. Natural objects acquired value within the marketplace, and their meaning was often controlled by wealthy connois-

seurs of the fine arts and by the merchants who sold to them. This commercialization of natural history affected even rulers. As part of his attempt to westernize Russia by founding scientific institutions, Peter the Great of Russia (ruled 1682–1725), entered into negotiations with several naturalists to buy a collection worthy of his nation, finally succeeding in purchasing that formed by the Dutch apothecary Albert Seba (1665–1736). Although institution-based naturalists called for the separation of natural history objects from other types of collectables and the formation of collections dedicated exclusively to the natural world, such goals were not systematically pursued anywhere before 1789.

As were most sciences of the period, natural history was largely a male pursuit, with women collectors, such as the German artist Maria Sibylla Merian (1647–1717), greatly in the minority. Because imported specimens were rare and costly, early modern collectors were usually rich. The Dutch turn toward fashions in collecting was the start of a bigger Europe-wide transformation in natural history that paralleled the growth of a middling market for books and luxury items. By the eighteenth century, natural history publications, specimen sales, and public, pay-on-entry collections proliferated. Critiques of the pursuit of luxury among the middling sort accordingly hit hard at certain versions and practitioners of natural history. Private collectors were castigated for unscholarly amassing of natural objects as a means to display their personal wealth, and rulers were exhorted to support enterprises for a useful, rather than spectacular, natural history.

The lack of formal methods for accrediting scientific expertise meant that early modern naturalists in institutions were effectively on a par with unaffiliated private collectors. In early modern Europe there were no university degrees in natural history and no formal training programs or diplomas in the natural sciences. Individuals entered posts in princely or municipal institutions through personal patronage from social superiors. Often they acquired their knowledge and skills through a sort of informal apprenticeship under renowned naturalists, by participating in botanizing journeys or at the dissecting table. To acquire renown and scientific authority as a naturalist in the early modern period was thus no easy task, involving extensive social

interaction and material manipulation, much of which has left little historical trace. If any one category of individuals had a privileged relationship with the objects of natural history, it was licensed medical practitioners. Apothecaries routinely dealt with large masses of animal, plant, and mineral material, and physicians often had a working knowledge of botany and anatomy. Thus many prominent early modern naturalists were also physicians, from Ruysch in Amsterdam to Sir Hans Sloane (1660–1753) at the Royal Society in London. Right up to the mid-eighteenth century, this privileged relation between medicine and natural history persisted, and it is only from 1750 onwards that the beginnings of its unraveling can be seen in the filling of natural historical posts by non-medically trained individuals.

FROM EMBLEMS TO EXPERIMENTS

In combining an emphasis on the literary and stylistic description of nature with a concern for its experimental and instrumental investigation, early modern natural history challenges preconceptions about linear progress in the history of scientific activity in the West such as are frequently represented in histories of the “scientific revolution” and the Enlightenment. The history of natural history relates to the history of display, order, and power for the early modern period, as well as to the history of early modern commerce and consumption. It was characterized by a close relationship with language, philology, and art, but, like other disciplines, it was transformed by the emergence of specialized institutions across Europe and by the rise to prominence of experimentation and observation as principles of practice in the scientific study of nature from the mid-seventeenth century. It was a science typified by social practices—correspondence and exchange—as much as by texts, objects, and classifications. More than almost any other scientific activity, it was also shaped by the dependency of collections upon the gradual process of global scientific conquest. The transformation in natural history between 1450 and 1789 was dramatic. Emblems had vanished, fabulous beasts were vilified, and naturalists boasted less of their literary skills than of their powers of accurate observation. Whole groups of animals had disappeared from natural history, from the mermaid and unicorn to the hippogriff and basilisk, and others, such as the molecular animals

(microorganisms), had entered it, symbolizing a shift in attention from texts to instruments, experiments, and observation.

Thanks to the new forms of experimental natural philosophy characterizing seventeenth- and eighteenth-century scientific activity, natural history was gradually ceasing to be a science of words and objects alone. From the 1660s onwards, European naturalists investigated animal and plant physiology, opening up new domains of interpretation for natural beings, as for example the inquiries into plant sexuality pursued by Sébastien Vaillant (1669–1722) in Paris and the English botanist Nehemiah Grew (1641–1712). By the end of the eighteenth century, experiment had a prominent place in natural history, matched only by ambitious and labor-intensive networks of communication that gave naturalists access to specimens from around the world. Old and new traditions alike were evident in the activities of the Swedish naturalist Carl von Linné, better known as Carl, or Carolus Linnaeus (1707–1778), who drew upon Cesalpino’s scholastic logic to create his sexual system, a classification based entirely on the sexual parts of the plant. The system, first published in *Systema Naturae* (1735; System of nature) and propagated by a European network of proselytizing Linnaean students, would earn lasting renown for its author as the “Prince of Botanists.” Less well-known are Linnaeus’s extensive experiments on naturalizing animals and plants within Sweden, and his close connections to supporters of cameralist politics there. His natural history was both a classificatory and an economic enterprise, grounded in a concern to understand the workings of Providence in distributing resources for mankind across the globe.

On the face of it, nothing could have been more different than the radical classificatory skepticism advanced by Linnaeus’s archrival, Georges-Louis Leclerc de Buffon (1707–1788), the head of the Paris Jardin du Roi, in the famous *Histoire naturelle* (1749–1788, 1789; Natural history). Utterly different from Linnaeus’s dry, aphorismic style, Buffon’s poetic descriptions sketched cosmogonies and sweeping portraits of man’s past, present, and future place in nature. Yet he was as active as Linnaeus in supporting a global program of acquisition and acclimatization of natural productions at his institution. More secular and more radical than Linnaeus,

Buffon, the “French Pliny,” concerned himself primarily with animals, opening the way for his institution to become the leading European center of natural history by 1800, and for zoology to become the nineteenth century’s model of natural historical enquiry.

tents—no less than the word *nature* itself—most of which can be traced back to Saint Thomas Aquinas (1225–1274), Roman Stoicism, and ultimately, Aristotle (384–322 B.C.E.). Constant to all its meanings is that natural law is coherent, suprahuman, objective moral order that contains the standards of what is good and just; and that it contains the standards by which human or positive law is to be judged from the perspective of a harmonious and coherent universe and is inherent in the “nature” of the world. It was born of attempts by ancient philosophers and jurists to discover—or determine—what was common to all legal systems in order to eliminate what would today be seen as the problems of “relativism” and cultural and legal “diversity.” The presumption that there is a common core to all systems of morality and law that provides the standards by which they are to be evaluated leads to the issues of discovery, validation, and enforcement.

UNIVERSALITY AND PERMANENCE

Natural law, like justice, aims at universality and permanence. Operationally, like all law, it is duty-contradict, a series of moral prohibitions, permissions, and requirements. It proclaimed the union of morality and politics and emerged from an ancient worldview that saw a singular harmony in nature, manifested in the universal *jus* (or *ius*) *gentium* (international law). That universality was subsequently incorporated by Christianity into its conception of the divine ordering of all creation. Aquinas separated this classical understanding into the eternal, the divine, the natural, and the human (or positive) laws. The natural was still common to all humanity and was part of God’s will and was the direct source for human law. In keeping with its Stoic roots, the natural law as conceived by Aquinas was discoverable through the use of natural reason, with the difference that for Aquinas that reason had been planted in everyone by God. Justice was an irresistible, rational necessity of naturally sociable human beings.

In this Aristotelian-Thomist form, for the most part, natural law continued into the early modern period. Even Jean Bodin (1530–1596), famed for his conception of political sovereignty as the absolute power to make and enforce law, held in his *Six livres de la République* (1576; Six books of the com-

NATURAL LAW. Natural law is a contribution to the perennial discussion of the nature of justice and morality; it is an attempt to root them in something beyond human convention and creation. The notion has had various meanings and con-

monwealth) that the state in general was under the moral aegis of the overarching law of nature and limited sovereign absolutism to the positive law.

Protestant and secular natural-law theorists retained the understanding of humans as naturally sociable and rational and viewed the natural law as that which superintended human laws. The *Vindiciae, contra Tyrannos* (1579; Defense of liberty against tyrants; written by Philippe de Mornay, known as Duplessis-Mornay [1549–1623], but published anonymously) pointed to violations of the natural law as one of the signs of tyranny, and the sixteenth-century Anglican theologian Richard Hooker (1553 or 1554–1600) espoused a conception of natural law that was heavily indebted to Scholasticism in his *Laws of Ecclesiastical Polity* (1593, et seq.).

REASON AND NATURAL SOCIABILITY

The seventeenth century witnessed the beginnings of a series of remarkable changes in natural-law theory, starting with the Dutch thinker Hugo Grotius (1583–1645), who made reason and natural sociability, rather than divinity, central to the conception developed in his *De Iure Belli ac Pacis* (1625; On the law of war and peace). So strong was his reliance upon these two that he suggested that the natural law would obtain even without God. Grotius was certainly not an atheist, but that charge was hurled at Thomas Hobbes (1588–1679), the English philosopher whose understanding of natural law shared many features with that of Grotius.

Sociability, Grotius argued, drove humanity into society from its prepolitical, state-of-nature beginnings; people were capable of understanding the ruling law of nature through their natural reason. Aquinas and the early-seventeenth-century Jesuit natural-law philosopher Francisco Suárez (1548–1617) had seen rationality as a reflection of divinity that enabled humans to understand God's will. Grotius appeared to have minimized that relationship, treating reason as a semiautonomous—albeit divinely implanted—and extremely important aspect of human nature. In his hands and those of his successors, this radically secularized and rationalized natural law was potentially removed from the realm of experience in which it had previously been rooted. The inherent human capacity to reason and the use of “right reason” independent of actual

experience could lead to universal moral, social, and political principles by which human life was to be governed.

Perhaps the most important and influential proponent of this Grotian view of natural law was Samuel von Pufendorf (1632–1694), the first holder of a chair in natural law in a German university. In his *De Jure Naturae et Gentium* (1672; On natural and civil law), Pufendorf went even further and separated the natural, sociable world of human affairs and the natural law that governed it from the spiritual realm of theology. In this form, the new, secular natural law was adopted by many seventeenth- and eighteenth-century philosophers, especially Richard Cumberland (1631–1718), bishop of Peterborough (whose *De Legibus Naturae* [On natural laws] was published the same year as Pufendorf's work) and Jean Barbeyrac (1674–1744), the translator of Grotius and Pufendorf into French and historian of moral philosophy.

Cumberland had reached his conclusions independently of Pufendorf and was acknowledged in later editions of *De Jure Naturae*. Paradoxically, perhaps, Cumberland had developed some of his argument in opposition to the writings of Thomas Hobbes, who had denied natural sociability and ignored, if he did not actually deny, divinity. But Hobbes was subsequently to be ranked by Barbeyrac in the company of Grotius and Pufendorf as one of the great innovators in natural law theory.

STATE OF NATURE

Hobbes's theory, most notably in *Leviathan* (1651) and earlier in his *De Cive* (1642; On citizenship), began with an utterly undeveloped, fiercely competitive, and dangerously uncertain state of nature in which the natural law gave everyone the right to all things within their reach. People escaped this state of nature by voluntarily establishing a conventional absolutism in accord with the natural law requirement of self-preservation. Where traditional natural-law doctrine had provided a natural and rational basis for rights and liberties that persisted in some form in political society and had imposed varying limits on political authority, in Hobbes's hands, the inevitable destructiveness of natural freedom led only to a rationally established absolutism in which subjects had only as much freedom as their rulers permitted. It was the conceptual genius of Hobbes

to subvert the appeal to natural law by many of his contemporaries—especially the Levellers—to attack the rule of Charles I as antithetical to their natural rights.

This Hobbesian reworking of natural law created great difficulties for his successors—he was frequently attacked and his books were subsequently banned in England—especially John Locke (1632–1704), who sought to establish a notion of secular natural law as leading to limited government. Locke is better known for his doctrine of natural rights than for his theory of natural law. The state of nature described in his *Two Treatises of Government* (1690) was sociable and far more peaceful than that of Hobbes, precisely because it was governed by the God-given natural law that people recognized and generally obeyed. The establishment of political—or “civil,” as Locke often called it—society, accomplished by consent, was fully in accord with the law of nature and enabled people to achieve their natural ends by overcoming the uncertainties and insecurities of the state of nature. Locke’s political state was to be limited by the natural justice contained in the natural law, and prolonged violations of that justice legitimated—in some cases, even required—a resort to revolution.

THE PROBLEM OF DIVINE WILL

There is a paradox inherent in a natural law theory that depends on divine will. Grotius and those who followed him recognized this problem. If God is the author or legislator of the law of nature, and its validity is a consequence of his will, then things are right or wrong *because* God has so directed, which makes him into something of an arbitrary but benevolent ruler. If, on the other hand, there are principles according to which God has decreed the natural law, as Aquinas seemed to have implied, then God is not omnipotent. Consigning all this to the realm of divine mystery severely limits its applicability to human affairs. The role of reason is crucial, but reason that is God-dependent simply pushes the problem one step further away. Aquinas, following Aristotle, argued for the relationship between divine natural law, reason, and human experience. But an independent reason of the sort advocated by Pufendorf requires some standard of validation. Locke tacitly sidestepped the issue in his *Two Treatises*, but at an earlier period in his life, in a

series of lectures he delivered in 1664 but refused to publish (published from the manuscripts in 1954 as *Essays on the Law of Nature*), he had agonized over the source of natural law and how and whether it could be known.
