Strategic Alaska Looks Ahead

Our Vast Territory, Now Being More Closely Linked to Us by Road and Rail, Embodies the American Epic of Freedom, Adventure, and the Pioneer Spirit

BY ERNEST H. GRUENING

Governor of Alaska

WHEN I first visited Alaska in the spring of 1936, I had reached the age of 49 and had seen many interesting and beautiful places in Europe and the Americas. But no region ever gave me quite the profound thrill that did Alaska, then far away. No longer is it a far country, thanks to regular airplane service established two years ago.

Entering Alaska by boat up the Inside Passage, more than a thousand miles long, I could sense the joy of discovery that must have filled the early explorers. For virgin forest still vests the mountains as it did when Bering and Chirikof, Cook and Vancouver, La Pérouse and the Spaniards sailed through those uncharted waters.

The same rugged peaks, green-meadowed above the dark spruces and hemlocks, raise their jagged summits into the eternal snows. From them, from the high-hanging glaciers—numerous and nameless then as now—pluming cascades pour thousands of feet into the clear blue waters of the Pacific's myriad bays and inlets.

Between tremendously high, steep banks, fiords cut deep into the coast. The inlet which divides Alaska from British Columbia on the south is called *Portland Canal*, so long, so regular, so apparently purposeful are its parallel shores, its high lining cliffs.

Everywhere the wilderness rises sharply from the water's edge. The settlements to come in the explorers' wake were to find their location as precarious as an eagle's eyrie.

Later, to locate an airport site would be harder still. Wooded islands, thousands of them, hills forested to where altitude and latitude combine to shrivel and gnarl the evergreens—these form a tumultuous panorama.

Northward the mountain walls loom higher, the fiords steeper. From deep-cut recesses glaciers pour their luminous loads, tumbling immense blue-white crystals into the sparkling and placid waters. From the peaks thrust huge rock pinnacles—Devils Thumb, Kates Needle, the four-pronged Devils Paw—sentinels which mark the otherwise invisible Canadian-American boundary.

For over a thousand miles we sailed in sheltered seas from Puget Sound to Glacier Bay. The last big terminal fiord, Lynn Canal, cuts straight north and deep into the continent, the wild, jumbled Chilkats walling it in on the west (Plate VI and map, pages 286-7).

Shining Peaks Soar from the Sea

As the long Inside Passage finally led through Icy Strait, past Cape Spencer, into the North Pacific, a tableau more sensational than any yet seen beckoned to the great Alaska which lay beyond. Ahead, soaring far aloft, a mighty range glistening in the sunlight lifted in Gothic pinnacles and spires, tier on tier, to a central apex—Fairweather, 15,300 feet above the sea.

Here was the witness that we had indeed come to a cosmic country.

T. S. FORD, BUREAU

Up Comes a Load of Wriggling Salmon, Alaska's Silver from the Sea

The fishermen made their catch with a fish trap in Icy Strait, Tongass National Forest. President Theodore Roosevelt set aside the 16,000,000-acre Tongass reserve as public lands in 1907. Moored in background is the United States Fish and Wildlife boat *Widgeon*.

As our eyes lifted to the shining splendor and followed it along the coast, far to the west a still higher cone rocketed skyward—18,008-foot Mount St. Elias. Surrounding its southern base is Malaspina Glacier, one of the largest single icefields on the continent.

Just behind loomed the Brobdingnagian bulk of Logan, 19,850 feet, a massive truncated mountain mammoth.

Here, but for Mount McKinley, 400 miles farther northwest, are the highest peaks in North America.* Against these eternal escarpments the restless North Pacific dashes its 20-foot tides.

It was not merely the breath-taking scenic grandeur that exalted me, as almost invariably it does those who see this awesome

spectacle of Nature's prodigality for the first time. Here was a primeval country, a frontier land, in which by some strange atavism the newcomer feels himself the pioneer.

Peopled with Present-day Pioneers

First impressions are often truest and most enduring. I remember the thrill of sensing that somehow here in Alaska one was in effect reliving the great American epic. I felt as if I were stepping back into American history, seeing, let us say, the Oregon and Washington of the seventies and eighties.

First there was—there is—the emptiness of the land. One travels for miles, rounding capes, passing deep bays and forested islands, without seeing habitations. The last census showed Alaska had but one inhabitant to about eight square miles, compared to the United States' 44 per square mile.

Air and sea have a cleanness and freshness found only remote from industry and crowds.

* See, in the NATIONAL GEOGRAPHIC MAGAZINE, "Conquest of Mount Crillon (Alaska)," March, 1935; "Exploring Yukon's Glacial Stronghold," June, 1936; and "Over the Roof of Our Continent (Mount McKinley)," July, 1938, all by Bradford Washburn.

(Official Photograph U. S. Army)

Governor Gruening Pampers "Lena," Fort Richardson's Young Cow Moose Mascot

Brig. Gen. Jesse A. Ladd, commander of a fast-growing Alaska army base, offers genial advice. Moose attain enormous size in the Territory. Full-grown bulls sometimes are seven feet tall at the shoulders and have an antler spread of more than six feet.

Wildlife abounds. Eagles soar aloft and deer browse placidly on the beaches. Occasionally around a bend appears a totem pole or two.

The few towns and villages appear to be rough-hewn from the wilderness; their construction almost wholly of wood; even the streets are planked. In recent years some main thoroughfares have been paved and a handsome stone or concrete Federal building rises above the town.

More significant are Alaska's people. There is a friendliness and a forthrightness which the frontier breeds. Where all are new or recent comers, informality, mutual helpfulness, hospitality, are the instinctive reactions of a people not yet grown old with the land.

Frontiersmen have never been much interested in where you came from, in what you had been, in what wealth or position your family had. It is what you are, here, on the new ground, in the pioneer struggle to wrest a

stake from earth or sea; it is what you can do in these new surroundings that counts.

Here everybody works. And in a new country where mining and fishing are the dominant activities, physical labor is universal and not looked down upon.

More or less everybody knows everyone else. It is a long way from Ketchikan to Kotzebue. But persons and performance throughout the Territory are common knowledge.

Chiefly this is because Seattle has long been the funnel for all Alaska activity. Virtually all shipping to Alaska starts there, and one is in effect in Alaska when one steps on board in Seattle.

They Catch and Can at Ketchikan

Except for the Bering Sea traffic, steamers follow a coastwise port-to-port course.

Ketchikan, calling itself "the first city," is one of the world's chief salmon-canning

Bradford Washburn

Fairbanks Preserves Old Number One, the Alaska Railroad's First Locomotive

The old-timer with the blunderbuss smokestack originally chugged along a 39-mile narrow-gauge line between Fairbanks and Chatanika. Later the stretch became part of the Alaska Railroad. President Warren G. Harding drove a golden spike at Nenana on July 15, 1923, completing the 470-mile line.

towns (page 314). It hugs for four miles a narrow beach between Tongass Narrows and the steep forested hills of Revillagigedo Island.

Then come Wrangell and Petersburg, picturesque fishing towns. Most of the people of Petersburg, a shrimp center, are sturdy sons and daughters of Norway.

Unofficial greeter at Juneau, the capital (Plates I and XII), is the famous Alaska Juneau gold mine, whose shafts go *upward* into Roberts Mountain. The mine's brilliantly lighted mill, reflected at night in Gastineau Channel, is often mistaken by first-comers for a palatial hotel.

Across the channel lies Douglas, once, in the heyday of the now defunct Treadwell gold mine, bigger than Juneau. Though it has a foundry and cannery, Douglas survives chiefly as a residential suburb linked to the capital by a fine steel bridge, product of early P.W.A. construction. It now provides the late night life for the two towns.

Sitka, the old Russian capital, richly rewards a side trip toward the outer edge of the Alexander Archipelago. It lies on the west coast of Baranof Island, named after the city's founder and the greatest figure in the century and a quarter of Tsarist rule.

In an island-studded bay surrounded by steep saw-toothed peaks nestles this delightful town, in which the fragrance of the past still pleasantly lingers.

A century and a quarter ago Sitka was the busiest and gayest port on the west coast of North America. Here sovereignty was transferred from Russia to the United States in 1867, and the town remained the American capital of the Territory until 1906. It has one of the finest Russian cathedrals in the Western Hemisphere: the green cupola and graceful spire, surmounted by the characteristic cross, still dominate the old town.

Appropriately, the Pioneers' Home, that unique Alaskan institution where the Territory's old-timers spend their last years retelling the tales of prospectors' adventure, is here in Alaska's citadel of romance.

Now Sitka again teems with new life and faces a new adventure.

Skagway, indelibly associated with the days of '98 and with the Territory's most famous outlaw, "Soapy" Smith, is on some American steamer schedules and is the northern terminal port of all the Canadian vessels.

From Skagway and from the near-by ghost town of Dyea thousands of hopeful prospectors

Fish and Wildlife Service, U. S. Department of the Interior

Saved from Drowning, Two Columbia Blacktails Warm Up under a Tarpaulin

Exhausted while swimming in the Inside Passage, the deer were overhauled just in time by a United States Fish and Wildlife Service boat and pulled aboard. Alaska's blacktails, once greatly reduced in numbers, now are protected by game laws.

in gold-rush days started over the steep mountain passes to the headwaters of the Yukon and the Klondike. Today the journey is comfortably made on the White Pass and Yukon Railroad and continued in summer down Alaska's mightiest river, sung in verse by Robert W. Service.

The tang of that robust era persists in Skagway. Harriet Pullen, herself one of the pioneers, still stalwart in her eighties, preserves its unique mementoes in her museum and hotel, and revives those glamorous days in vivid reminiscence (page 290).

At near-by Haines three scant years ago stood the only military establishment in the Territory, Chilkoot Barracks, with an ancient harbor tug as its only transport. The town is the port of another famous route to the interior, over the Chilkoot Pass and the old Jack Dalton Trail.

Klukwan Clings to Its Totem Poles

A 42-mile road now leads to the British Columbia boundary, past the old Indian village of Klukwan, which has some of the finest totem poles in America. Its inhabitants have steadily refused the blandishments of collectors and museum scouts.

For these outstanding relics of Tlingit culture, Klukwan has been called a "Chichen Itzá of the North," since they rival in wood the architectural massiveness of the Maya temple carvings in stone in southern Mexico. Klukwan's people—fewer than a hundred today—deserve high praise for remaining firm in their unacquisitive faith.

The Inside Passage ended, the journey swings westward across the Gulf of Alaska. An occasional boat stops at Yakutat, Indian village, cannery site, and terminus of one of the shortest of the world's railroads, the Yakutat Southern, whose chief claim to distinction would seem to be the privilege of its officials to swap passes with longer railroad systems in the United States.

Scenic Yakutat Bay receives the icebergs from some of the continent's most active glaciers, those of the St. Elias Range (page 288).

The route now swings toward another great region of fiords, glaciers, and fisheries—Prince William Sound. Its principal port is Cordova, for thirty years—until four years ago—the ocean terminus of the sensational Copper River and Northwestern Railroad, which carried to the sea the rich copper ores from the famous and now defunct Kennecott mine. Cordova,

Alaska—Springboard for Attack on Japan and Key to Continental Defense

Its Aleutian Islands stretch westward to within 750 miles of the northernmost Japanese islands, the Kuriles. The great circle ship and air routes—shortest distance between Seattle and Tokyo—pass within a few miles of Dutch Harbor, United States naval base. Control of Alaska and the Aleutians, together with the Hawaiian Islands, Midway, and west coast bases, assures United States domination of a huge "strategic triangle" in the northeastern Pacific. Alaska's life line, the new highway through Canada, is omitted by direction of the censors.

For Nearly 100 Miles Hubbard Glacier Grinds Its Way through the Heart of the St. Elias Range

Named for Gardiner Greene Hubbard, first president of the National Geographic Society, the huge frozen river is Alaska's largest tidewater ice mass. It originates in an icefield almost on the summit of Mount Steele, in northwestern Canada. In background rises Mount Hubbard. In making this aerial photograph, the camera was aimed northeastward into the St. Elias Range from an altitude of 5,000 feet over ice-choked Disenchantment Bay, an arm of Yakutat Bay.

Fairbanks, Alaska

When the Sun Deserts the North Country—Fairbanks at Noon in December

Shop windows and street lights shine brightly, for midwinter days are almost entirely without sunlight. The moon, the aurora borealis, and starlight on the snow partly make up for Old Sol's absence. In midsummer he rides the sky without ceasing, and night disappears entirely. On June 21 every year Fairbanks stages a midnight baseball game (page 296). For two or three weeks at this season newspapers may be read outdoors at any hour of night.

Anson Hutz

Black-bearded "Soapy" Smith, in Effigy, Rides Martin Itjen's "Skaguay Street Car"

The sourdough proprietor stands beside the silk-shirted sombreroed image of the Alaska bad man who terrorized Skagway in gold-rush days (page 284). Soapy's favorite saying was: "The way of the transgressor is hard—to quit." At left is Mrs. Harriet Pullen, "Mother of the North." She came to Skagway when it was a city of tents and made a small fortune selling apple pies. Then she bought seven horses. With them she trucked supplies to the miners over perilous trails. Today she operates the Pullen House (background), a comfortable steam-heated hotel.

refusing to become a ghost town, survives stubbornly as a crab, clam, and salmon cannery port.

Next is Valdez, where the Richardson Highway starts toward the interior. It boasts—and justly—that it is our farthest-north, all-year-round ice-free port (Plate II).

Finally the journey ends at Seward, set deep in the fiord called Resurrection Bay, and the terminus for Alaska's principal land route, the 470-mile Alaska Railroad to Fairbanks.

From that "Golden Heart of the North" scatter the miners and traders, up and down the Yukon and its tributaries, into the vast, still partly unexplored and unmapped sections of Alaska, into the headwaters and placer creeks of the Kuskokwim, the Koyukuk, the Kobuk, the Noatak, the Porcupine.

News Travels by "Mukluk Wireless"

Here they work till the southing sun freezes the running waters which wash the golden "pay dirt" into the sluice boxes. Then the spring trek is reversed, and like sun and birds they begin the southward journey.

On their way "outside," miners, traders, cannerymen stop for a few hours in each port as the boat stops, or skip a sailing to visit their friends en route. Thus all Alaska is closely in touch with affairs in all other parts through constant personal contact and through that mysterious Alaskan network, the "mukluk wireless."*

This seasonal migration—based primarily on Alaska's latitude, which in turn makes its two great pursuits, placer gold mining and salmon fishing, summer occupations—is distinctive of the Territory. It affects its economy, social customs, and politics, distinguishing it from all other earlier American frontiers.

The West was not settled by folk who went back East every fall. Nor did they expect to go back East to spend their accumulated wealth and declining years. They loved the abundant country to which they had come and were prepared to found homes there for their children and their children's children. Alaska's history has been different.

It falls into three periods, and a fourth is about to unfold. First was the period of Rus-

Mostly Legs and Claws but Good to Eat Are Alaska's Giant King Crabs

Although the big fellow suspended by the crabber measures 48 inches from claw-tip to claw-tip and weighs 16 pounds, it is not exceptionally large. The United States Bureau of Fisheries is studying methods of profitably canning these crabs. Large quantities formerly were packed by Japanese canneries.

sian sovereignty following the explorations of Bering, who discovered St. Lawrence Island in 1728 and the Alaska mainland in 1741. The first permanent settlement established by Shelikof at Three Saints Bay, on the southeastern coast of Kodiak, did not come till 1784, so that the actual settlement of Alaska by Russia, which never penetrated far inland, lasted only 83 years.

The second period, from the purchase by Seward in 1867 to the gold discoveries of the late nineties, was an era of abandonment and governmental neglect. The Territory, chiefly inhabited by fishing, trapping, and hunting natives, lay empty, dormant. The American people were too busy opening up the West to concern themselves with their vast unknown northern empire.

History Told in Place Names

The Klondike gold strike, opening the third period, changed all that overnight. A rush of prospectors to the Territory doubled the population—and many of the newcomers were hardy pioneers. They were of the stuff that had crossed the uncharted Atlantic wastes and pushed the American frontier to the Pacific.

The chapter which they added, as indeed

the earlier history of Alaska, is graphically told in its place names.

The aboriginal names, Indian and Eskimo, such as Ketchikan and Nunivak; the names given by the Russian discoverers and settlers—St. Michael, Chichagof, Shishmaref, Golovin; by the British explorers—Dixon, Chatham, Salisbury, Hinchinbrook; by the Spanish—Chacon, Muzon, Bartolome, Valdez, Cordova—were outnumbered by myriads of simpler, homelier, ready-made tags which testify to the coming of the miner and fisherman.

They were men of action and few words. Their imagination expressed itself in deeds and scarcely in their choice of names, which reflected their new environment.

There are in Alaska five Bear Bays, one Bear Cove, two Bear Capes, eighteen Bear Creeks, two Bear Gulches, one Bear Harbor, two Bear Islands, one Bear Lake, three Bear Mountains, two Bear Rivers, one Bear Slough—a total of 38.

With its giant brown bears and other species, Alaska was and is the greatest bear country in the world (pages 312, 313). Four times I have seen bears on the Glacier Highway only a few miles out of Juneau.

Similarly, there are fourteen Moose Creeks

Schaller's Alaska map

Aided by Two Long Spirals, One a Complete Loop, the Alaska Railroad Twists and Turns Its Way Down the Kenai Mountains

Fifty miles north of Seward, on the line to Fairbanks, this spectacular engineering feat was accomplished. The circle of track crosses the Placer River. At one point a glacier comes within 300 yards of the roadbed. The 470-mile railroad serves gold mines, coal fields, and a rich farming area.

Fish and Wildlife Service, U. S. Department of the Interior

On Narrow Ledges of Pribilof Cliffs, Myriad Murres Lay Their Gaudy Eggs Each Year

Delicacies to the Eskimos are the many-colored eggs—no two alike—which may range from blue, green, and buff to pure white. When eggs are found on sheer cliffs, the hunter is lowered by ropes. With a long pole tipped by tonglike strips of cedar, he deftly removes eggs from the crude nests. Rivals of the Eskimos in egg hunting are nimble foxes, which also occasionally catch a young bird. Winged visitors to the Pribilofs include gulls, kittiwakes, puffins, and auklets.

Sealskin Coats on the Flipper! Countless Fur Seals Raise Their Young in Exclusive Rookeries on the Pribilofs

To these rocky Seal Islands in the Bering Sea the valuable animals come each spring to breed. The rest of the year they are at sea. These sleek aristocrats should not be confused with common sea lions and hair seals, useless for fur coats. The half-grown males are taken in July for their pelts.

Bradford Washburn

In Quest of Gold a Powerful Dredge Eats Its Way through This River Bed

The dredge (center) stands in a small artificial pond. With chain buckets it scoops up, disintegrates, and washes the gold-bearing sand and gravel. Coarse material is stacked at the other end of the dredge and the mass of fine residue is run over a gold-saving table. Here the heavy metal settles behind riffles while the waste material runs back into the pond. The long mounds of tailings mark the progress of the dredge in a large-scale placer mining operation near Fairbanks. Alaska's gold output averages about \$18,000,000 a year.

and thirteen Sheep Creeks (mountain sheep, mind you!). On May 23 of this year, traveling northward from the coast in a "speeder" on the Alaska Railroad with Lieut. Col. Hobart Murphy, the Provost Marshal of the Alaska Defense Command, I saw six moose and nine mountain sheep in the 30 miles between Seward and Moose Pass.

There are eight Grouse, seven Trout, and seven Goose Creeks. Of Beaver, Porcupine, Ptarmigan, and Salmon Creeks there are six each. The early comers could scarcely be expected to worry about the problems of later geographers!

Alaska's trees have contributed fifteen Willow, twelve Alder, six Spruce, four Birch Creeks.

Prospectors named nineteen Quartz Creeks, eleven Gold Creeks, eight Bonanza, and seven each of Eldorado and Eureka Creeks.

Liar Rock and Big Hurrah Creek

The hopes and disappointments of both mariner and miner are engraved imperishably on the future's maps: Disenchantment Bay, Deception Point, No Thorofare Bay, False Pass, Turnagain Arm, Lucky Cove, Goodnews Bay, Goodhope Bay, Liar Rock, Graveyard Cape, and Grubstake Gulch, Last Chance Creek (five of these!), Goodenough Creek, Lucky Creek, Lucky Gulch, Lucky Strike Creek, Big Hurrah Creek, Big Skookum Creek.

Ten creeks named Dewey indicate the year and its hero. Near one of them are also Sampson and Schley Creeks.

Of course these pioneers had no thought of staying in Alaska. It was an unknown wilderness to them, and they braved its hardships uncomplainingly in the hope of reward and the prospect of an easier life back home. This was Alaska's third period.

Many struck it rich and went "out." Others stayed, ever hopeful of a strike next year.

Modern methods of mining replaced the pan, rocker, and cradle. Mining became a bigger business. Methods of canning salmon improved correspondingly. Camps and canneries sprang up. Some were abandoned: ghost camps and ghost canneries are found everywhere in Alaska. But others sprouted, grew, and communities developed.

The earlier pioneers rarely brought their women, though they often named the creeks after the girl back home: Essie, Esther, Etta, Hazel, Helen—or maybe after the girl near by!

But later, having stayed on, they married—and a new generation of Alaska-born children is reaching maturity. They have no sentimental ties with the "outside." They know only Alaska, love it, and want to stay there.

A fourth period, the period of permanence, is in the making.

Perhaps the greatest single contribution to the permanence of Alaska is the Territory's excellent University, America's farthest-north institution of higher learning.

It owes its founding and growth chiefly to its president, Charles E. Bunnell. Coming to the Territory as a young man and serving successively as a school teacher and Federal judge, he realized that few of Alaska's youngsters would ever acquire a higher education unless the opportunity were offered them at home.

The first unit opened as the Alaska Agricultural and Mechanical College in 1922 with six students. The institution has grown steadily, attracting boys and girls from many States of the Union, chiefly because of the excellence of its mining curriculum.

The University's unpretentious but wholly practical whitewashed frame and concrete buildings cluster around the summit of a birch-covered hill overlooking the wide Tanana Valley, three miles west of Fairbanks.

The boys and girls, both white and Indian, come from modest surroundings and most of them either wholly or partly work their way through. In this effort they are assisted by Dr. Bunnell, who, by prodigious energy and untiring devotion, makes it possible for those who want to help themselves to do so.

No country-club college, this, but a unique institution where hard work and earnest effort are the watchwords. Here is the Territory's truest example of pioneering in a wilderness long haunted by skepticism and indifference.

Baseball by Light of Midnight Sun

My first visit to the Territory and the University was in May. I was keenly enjoying the absence of night. The long days merged into a brief twilight, and one lost count of hours. On June 21 every year Fairbanks stages a midnight baseball game, and for two or three weeks it is possible to read a newspaper out of doors all night.

Coming north from Anchorage to Fairbanks on Col. Otto F. Ohlson's "dodgemobile," a steering wheel-less auto adapted to the rails—pausing once to avoid bumping a moose cow and calf off the tracks—I witnessed the, to me unprecedented, spectacle of a sunrise and sunset displaying themselves simultaneously in the northern sky.

But the charm of unending day and its interesting impact on local habits raised a question or two.

"This is wonderful," I said, as, shortly before midnight, from the porch of President Bunnell's cottage I watched the sunset glow

Kodachrome by Anon Diaz

Not a Chesapeake Bay Vacation Camp, but a Summer Cottage on Glacier Highway

Near here is a magnificent bathing beach at Eagle River Delta, 29 miles from Juneau, Alaska. It is reached after a half-hour stroll through woods and meadows.

on Mounts Hayes and Deborah, 90 miles to the southeast, and on Mount McKinley, 160 miles southwest. "But how is living here in the winter? Don't the long, dark nights get on your nerves?"

"What long, dark nights?" Dr. Bunnell asked me in turn. "We have no dark nights," he continued. "Up here the stars are so clear and shine so on the snow-covered ground that there is no darkness even when there is no moon. And then two or three nights every week we have the aurora borealis."

I was slightly skeptical. The president, I thought, is painting too bright a picture. Yet after my first winter in Alaska I found he had spoken truly.

Splendor Caught by Laurence of Alaska

The winter days are short, the nights long, but in the interior, except when the skies are deeply overcast, there is no darkness. And the northern lights supply a brilliance and a mysterious beauty to which the written word can scarcely do justice.

They are, however, admirably interpreted in another medium by Alaska's great painter, Sydney Laurence, who died two years ago. His canvases hang in the home of many an Alaskan and are its most prized possession.

Laurence was an extraordinarily versatile and prolific painter. He did marine scenes as well as landscapes and depicted both the scenic background and the people—Indians, trappers, miners—in their daily pursuits.

His favorite subject was Mount McKinley (page 310), which he painted more than 250 times—with but one exception always from the south side, which he considered much more interesting. Apart from their power and beauty, Laurence's paintings of the "Monarch of the North" are important because they alone adequately convey, as no photograph has yet done, the height and depth of old Denali.

Alaska is a painter's paradise not merely because of its incredible beauty but because Sydney Laurence has made its people appreciative of painting.

The University has promoted important work in special fields. It is now engaged in physical research dealing with the ionosphere, of high importance to radio transmission and of particular usefulness in the present war—so important indeed that its details cannot be divulged.

For years the excellent Department of Anthropology has been engaging in archeological and paleontological excavations.

Not far from the college the Fairbanks Exploration Company, a subsidiary of the United States Smelting, Refining, and Mining

Company, is "hydraulicking"—washing down the accumulated muck of centuries to reach the gravel beds below, where the gold is to be dredged. High-pressure streams from big nozzles in the hands of skilled operators wear away the frozen earth cover often to a depth of fifty or sixty feet.

Long before the bottom is reached, this black muck yields a treasure more precious in the eyes of science than the glittering gold which has played so potent a part in Alaska's history. Imbedded in the muck, preserved by its icy sterility, is the biological history of Alaska for several hundred thousand years.

Out of it are extracted—fortunately uninjured by the use of pick or shovel—the bones of mammoth, of mastodon, of prehistoric bison, of the pygmy horse and the saber-toothed cat, which, long before the coming of man, roamed the now subarctic plains.

The University's scientists have made good use of this treasure, extracting it, classifying it, assembling it with care, and sharing the collections with the museums of the world.

Mammoth Molar Weighs 11 Pounds

In these diggings my son Peter and I spent a summer afternoon with Archeologist Otto William Geist, of the University. Peter found a mastodon's thighbone more than half as big as he was, and my treasure was a mammoth molar weighing 11 pounds.

Throughout Alaska, along the shores of Bering Sea and in adjacent islands, the University has engaged in valuable archeological and ethnological research. Five different vanished Eskimo cultures have been studied.

The transcendent discovery, however, was made not long ago by Dr. Froelich G. Rainey, the University's young Professor of Anthropology. Far in the north on Point Hope, a big sand bar thrust into the Arctic Ocean, he uncovered an older and far more advanced Arctic culture than any yet known. It is described in "Discovering Alaska's Oldest Arctic Town," by Dr. Rainey, on page 319 of this issue.

The Eskimos, who live along the Arctic Ocean, Bering Sea, and some of their tributary rivers, constitute an important part of Alaska's population. Nearly half of the natives—about 15,570—are Eskimos.

They are a hardy race and, except in a few of the larger towns, are little touched by the white man's civilization. At the same time, they are aided by it through the acquisition of reindeer and assistance in marketing their handiwork; ivory carvings and fur garments. Especially sought are the Eskimo-made parkas and the admirable high moccasins, or mukluks, which alone give adequate

Roof of the Continent—Mount McKinley, North America's Tallest Peak

Bradford Washburn made this aerial photograph while leading the National Geographic Society-Harvard University Mount McKinley Flight Expedition. The 20,500-foot Alaskan monarch is "the world's mightiest precipice—one stupendous cliff plunging to the plains 17,000 feet below." Not even Mount Everest in the Himalayas rises higher above the land at its base. The Indians called the mountain "Denali," meaning "the great one." A native Alaskan, Walter Harper, was the first man to reach the top (south peak at right). With three companions he made the ascent on July 7, 1913.

U.S. DEPARTMENT OF THE INTERIOR

Half a Century Ago There Were No Reindeer in Alaska—Now Thousands Range over the Tundra

In 1891 ten animals were imported from Siberia and later others arrived. Laplanders came to teach the Eskimos how to care for the herds. Today more than 200,000 reindeer flourish here, most of them over the coastal areas bordering the Bering Sea and the Arctic Ocean. Some 15,000 Eskimos depend on them as a chief source of food and clothing, killing about 37,000 animals each year (page 115).

D. S. FORTS SERVICE

"Once Upon a Time There Were Three (Alaska Brown) Bears"

Proudly a hunter exhibits pelts of the world's largest carnivorous land animal. This giant species roams the Alaska coast and near-by islands, from the head of Norton Sound south to Sitka. Some of the big fellows exceed 1,500 pounds, and pelts more than eight feet long have been taken. Although dangerous when wounded or surprised, the animals usually flee at the first sign of man.

foot protection against the bitter cold of Arctic winters.

Eskimos are a friendly and a jolly people. Last summer, when our amphibian stuck on a sand bar while taxiing across a lagoon back of the village of Kivalina, the entire male population turned out under the leadership of their devoted Office of Indian Affairs school teacher. Standing knee- and waist-deep in the icy water, they helped push, rock, and pull the plane loose.

"Strong Like Whale, But No Blubber"

They had never seen an amphibian before; indeed they had never had such intimate contact with any plane. When at last it took off with a roar and a rush, they were much impressed with its power.

"Strong like beluga! Strong like two belugas!" were the comments.

"Not so good," said a third. "Strong like

beluga, but no muktuk." (Muktuk is the savory Eskimo food staple, whale blubber!)

Hardy, cheerful, maintaining their own culture vigorously, our farthest-north citizens have already played a useful part in supplying our Army in Alaska with hand-made fur garments which could not have been procured without their skill and experience.

They will be further valuable in the protection of our west and northwest Alaska coast, to which they are thoroughly acclimated and where their endurance and adaptability to savage weather conditions on land and sea are far superior to the white man's. Accompany the Eskimos on a walrus or whale hunt in their skin boats, and you will forever be a willing witness to their hardiness and endurance! (See Dr. Rainey's article, p. 319.)

Hunting and fishing—the primeval means of getting a livelihood—still support half the population of Alaska. For the others, whether

ERNEST H. GRONING

From the soft hides they will make warm clothing. Here at Golovin, on the Seward Peninsula, the carcasses go into a cold-storage plant especially built for reindeer meat.

with gun or camera or rod and reel, they provide a royal sport.

America's Biggest Game Roams Here

Alaska is the greatest game preserve in the Western Hemisphere. Even the casual visitor seldom fails to see bears—black, grizzly, or brown. The great brown bear of the Alaska Peninsula and his cousin of Kodiak Island are the biggest carnivorous land animals in the world. The largest specimens weigh 1,500 pounds and when reared upright they stand about nine feet high (page 312).

Where else can one see the big herds of caribou in migration across the rolling grasslands, the mountain sheep along the lofty crags, the wild goat on heights near the sea, or the great moose, largest of his species?

So plentiful are moose that Colonel Ohlson, the efficient general manager of the Alaska Railroad, wagering with skeptical passengers that he will show them at least one moose

from the car window, almost always wins. (Invariably he refuses to collect.)

As for fishing, it is the fate of Alaskans, telling the truth about their catches, to be disbelieved unless they can show visible proof. But where can one hook as many salmon as on the Territory's Pacific coast, or land trout—rainbows, cutthroats, Dolly Vardens—that are considered small at twenty inches? Trout abound in rivers from the Kenai to the Kuskokwim and run to 36 inches.

I got my first strike—a 25-pound king salmon—fifteen minutes after fishing began, in Auke Bay, 12 miles out on the highway northwest from Juneau. I was not a fisherman; Alaska fishing is foolproof.

My son Peter and two others, with two lines for the three of them, fished for two and a half hours in the Naknek River at the head of Bristol Bay. Result: 38 rainbows, the shortest 22 inches long, the larger ones running up to 32 inches.

Anon. Ditzig

In a Ketchikan Cold-storage Plant, Frozen Salmon Await Shipment to "the States"

Other Alaska salmon are canned, pickled, smoked, salted, or sold fresh. A few yield oil and meal. The bulk—almost 90 percent—goes to the canneries, which produce millions of cases a year. The country's entire salmon pack has been turned over to the Government for allocation to military and civilian needs.

Maj. Gen. Simon Bolivar Buckner, Jr., the able commanding officer of the Alaska Defense Forces, himself an enthusiastic sportsman, once remarked to me that Alaskans were in one respect unique among Americans: "They never lie about their fishing. They don't need to; the truth is unbelievable!"

Alaska flora is no less abundant. For three years I have watched the wild flowers bloom each week in the meadows along the Mendenhall River, less than ten miles from Juneau, with the lofty glacier and the sharp peaks as a backdrop.

First comes the big, yellow, callalike bear cabbage—known as "skunk cabbage" in the United States—lining the rills and moist edges of the forest. Then, almost simultaneously, come the violets and the pink shooting star, or bird's bill, sufficient to tint wide patches of ground.

Most gorgeous is the light-blue lupine, which likewise gives its color to whole meadows. Along the shores of Kenai Lake, twenty miles north of Seward, I have seen the darker blue aconite, or monkshood, turn the fields into its glorious color.

The climax of the summer hues, however, comes with the common fireweed, which in

the United States sends a few stragglers off a back-lot dump but in Alaska becomes whole fields of massed pink, coloring meadows and mountainsides with its brilliance.

The blue forget-me-not, Alaska's official flower, grows luxuriantly along a hundred thousand creeks, and in the Arctic it forms, with its dwarfed stems, an enamel-like carpet on the tundra.

Alaska indeed is a land of blue, in its skies, inlets, bays, rivers, and lakes, in its glaciers; but above all in its eternal mountain vistas, where distance and sunlight turn them cobalt, purple, lavender, violet, and horizon blue.

Incidentally, we also swim in Alaska, believe it or not. The lakes, of course, warm up under the magic of eighteen to twenty hours of May, June, and July sunlight. Even the ocean is not so bad. I have seen youngsters dashing into the surf from the gold-bearing sand beach of Nome; Ketchikan and Douglas have popular bathing beaches.

My favorite spot is the Eagle River Delta, which has formed a magnificent beach on the shores of Lynn Canal, with the Chilkats to the west and the unnamed peaks back of the Eagle and Herbert Glaciers to the east. That idyllic spot lies a half-hour's walk through

Ernest H. Groning

Juneau Picnickers Acquire a Tropical Tan at Eagle River Beach

"There one basks in a burning sun," writes the author, "with the combined tang of primeval spruce forests, salt meadow, and ozone of sea and mountains in one's nostrils."

woods and meadows at the end of the Glacier Highway, 29 miles out of Juneau.

Glacier Bay swimming is a bit colder, but very bracing. Peter and I tried that, too, and liked it (Plate VII).

Boys from Back Home Come to Stay

Alaska is entering a new era, its fourth period. It is not merely that its Alaska-born are beginning to come of age. World events have brought defense on a grand scale to Alaska. They are bringing a highway from the United States; also a railroad. These will speed a transformation already beginning.

Within the Territory airports and highways, long dreamed of by the pioneer flyers and trail blazers, are under construction.*

Twenty-five years ago the dog team still remained the one method of transportation in interior Alaska when winter had paralyzed the rivers.

Then came the earlier aviators, who until a year or two ago flew without navigational aids, guessed at the weather, alighted on incredibly small clearings, on beaches, on river sand bars (I have landed on bars in the

Koyukuk and the Chitina). They alighted on lakes and coastal waters with pontoons, on frozen lakes with skis.

They have written a chapter in the winning of the air which will always be memorable in the history of intrepidity, daring, and skill.

Now war has brought men to Alaska: engineers, construction workers, and many more in the uniform of the armed forces of the United States—boys from back home.

"I have a girl back in Wisconsin. We were in high school together," an apple-checked, curly-blond youngster in a private's uniform informed me as I overtook him on one of the roads north of Fort Richardson at Anchorage.

"I like this country. After the war we're going to get married, and I'll bring her up here."

There are thousands like him. They have come to keep free the freest part of all America, to keep it free with the rest.

To Alaska, remnant of a world which fulfills the American dream and may play a still greater part in fulfilling our destiny, they have come. Many of them, their task completed, will stay. They will homestead. They will hew log cabins from the wilderness. And the love of adventure that is in the American's heart will hold them there.

Bizarre Battleground—the Lonely Aleutians

BY LONNELLE DAVISON

BEHIND a tantalizing, intermittent curtain of fog lies one of the strangest of the bizarre battlegrounds of the war—the Aleutian Islands (map, pages 286-7).

Darkly upthrust from the gray-blue waters of the North Pacific, this giant's causeway of half-drowned volcanic peaks extends for more than a thousand miles in a bewildering panorama of ice and fire, of dead and smoking volcanoes, of boiling springs and chilly streams, of disappearing islands, nameless waterfalls, green valleys, and stretches of barren desolation where grows not even a bush.

The Aleutians jut out so far toward Asia that Attu at the tip of the chain is actually farther west of San Francisco than that California city itself is west of Eastport, Maine!

Attu has been called "the uttermost point of America, an island on the edge of nothing." The nearest Japanese territory (the northern Chishima, or Kurile Islands) is but 750 miles from Attu, and Tokyo itself is only 2,000 air miles away.

At Attu and on the near-by islands of Agattu and Kiska the Japanese this summer established bases and listening posts—and that ear cocked in our direction was promptly and enthusiastically boxed by American bombers and submarines every time they could get a peek at it through the fog.

Williwaws Swoop from Mountain Heights

Fogs veil the Aleutians almost constantly, for here the moisture borne by the warm Japan Current condenses as it strikes the cold waters of Bering Sea. Many a storm that later hits the United States is brewed in this northern weather kitchen. The islands' climate is wet and raw rather than bitter cold.

Down the steep mountain slopes swoop sudden fierce gusts—the dreaded williwaw of mountainous coasts. Tricky currents deceive the mariner. Tides sweeping around headlands and through narrow channels collide with each other in dangerous tide rips, a maelstrom of heavy, choppy seas.

Against such a background Americans and Japanese are fighting a strange, unreal, hide-and-peek type of war, battling the elements as much as each other.

Between Dutch Harbor and the Japanese-occupied positions on Attu, Agattu, and Kiska Islands is a flying distance of between 680 and 840 miles, and such mileage must be doubled to give bomber round-trip figures. Below, occasional volcanic craters send up poisonous gases and treacherous air currents.

Atka and other islands in this forbidding no man's land hundreds of miles long are now virtually deserted, for the Navy has announced evacuation of noncombatants.

So sparsely inhabited are the Aleutians that a single good-sized ship could take on every soul who lives there. Total civilian population is about 900.

Most of the people whom enemy aggression has driven from their homes are Aleuts, patient, philosophical cousins of the Eskimos.

On their lonely islands the squat, swarthy Aleuts—now largely of mixed blood—fish, hunt, and raise foxes for furs.

Aleut women, with marvelous artistry, weave incredible watertight baskets of grasses interwoven with strands of silk. These command high prices but drive their makers nearly blind. A single basket may take a year to make. Grasses are split with the fingernails into threads which are often as fine as silk.

"A Wind Is Not a River . . ."

Living in a land of storms, the Aleuts have a saying, "Don't speak of the wind." If you do there may be a storm.

But these long-suffering folk, buffeted alike by the elements and the warring of men, console themselves with a more hopeful proverb.

"A wind is not a river," they say. "Some time it will stop."

Of the few permanent American residents when war came, some were traders; others had sheep ranches. On Umnak Island one rancher had 15,000 sheep. A whaling station flourished on Akutan Island.

The islands are largely treeless but grassy. On some graze imported reindeer.

If you could fly the length of the Aleutians, equipped with some magic device for clearing away all clouds, fog, and mist, you would see five main groups of islands among the countless dots and dashes of mere rock and sand. The very names of the groups stir curiosity—the Near Islands (farthest from the Alaska mainland but closest to Siberia, whence the Russian explorers sailed), the Rat, Andreanof, Four Mountains, and Fox Islands.

The Rat group is so called from the Russian word *kryty*, meaning rats and referring to the hordes of rodents once found there. The Fox Islands are named for the little fur bearers whose raising is a leading Aleutian industry.

It is in the Fox group, near the Alaska mainland, that the United States forces are entrenched. These islands are the largest and even in peacetime the most populous and im-

Peaceful Approaches to Dutch Harbor Hold No Hint of Its Striking Power

When Japanese carrier-based bombers and fighters attacked the Dutch Harbor naval base and the near-by Army station at Fort Mears, they found Americans ready. Antiaircraft guns crashed into action five minutes before the first bomb fell. Hitting back hard, U. S. submarines and planes began picking off Jap ships.

portant of the Aleutians. Together with nearby islands and islets, they include the three U's—Unimak, Unalaska, and Umnak—all derivations of early native names.

Unimak, separated from the Alaska Peninsula by the now virtually choked channel, False Pass, is the biggest of all the Aleutians. But next-door Unalaska, with Uncle Sam's adjacent base of Dutch Harbor, is the most familiar and significant.

Near Dutch Harbor sprawls the town of Unalaska, war-booming capital of the island and leading settlement of the Aleutians.

On Unimak Island is the highest point of the Aleutians, the active volcano of Mount Shishaldin, dubbed "Smoking Moses," 9,300 feet high. Sometimes it blows huge, wispy smoke rings hundreds of feet in diameter.

Japanese-occupied Attu, however, is perhaps the most generally mountainous of the chain. This irregularly shaped island, with an elevation of slightly over 3,000 feet, has several good harbors but little flat ground.

Kiska Island, formerly used to some extent by our Navy, has one of the best harbors in this part of the world. It also has more level ground than do most of the Aleutians, few of which present sites for landing fields.

Strangest island of all is Bogoslof, a volcano whose head is just above water. This jack-in-the-box island is sometimes one isle, sometimes two or three, as huge convulsions change its form. At last reports it had a good harbor—for any skipper willing to risk Nature's equivalent of a million-pound bomb.

Among vivid place names are Irishmans Hat, a square tower of rock, Kettle Cape, Scotch Cap, and Cape Cheerful, a bit of determined wishful thinking.

On a flat map the Aleutians may appear far to the north and well removed from Uncle Sam's major centers of life and work. Yet it is a geographic fact that the shortest traveling distance between Seattle and Tokyo is by way of these islands, as one can see by connecting the two points with a piece of string on a globe. Of such direct "great circle routes," the one from Seattle to Tokyo passes about forty miles north of Dutch Harbor.

Our ships and planes astride that route guard Alaska and the west coast and hold a commanding position for attack or defense. Similarly the Jap-seized bases guard approaches to Tokyo and cut us off from the Russians in Kamchatka. Throughout the Aleutians today all decks are cleared for action.

American Museum of Natural History

Twenty Centuries Stare at You with Jet-studded Ivory Eyes

Who was he? Where did his tribe come from? These questions, like his Mongoloid skull, are haunting. This much is known: he built his Alaskan home to face the Asia whence he apparently sprang. The walrus-ivory eyeballs are set with jet pupils. The nose plugs represent birds. The mouthpiece was designed—for what?

Discovering Alaska's Oldest Arctic Town

A Scientist Finds Ivory-eyed Skeletons of a Mysterious People and Joins Modern Eskimos in the Dangerous Spring Whale Hunt

BY FROELICH G. RAINEY

Professor of Anthropology, University of Alaska

AT POINT HOPE on the barren shore of the Arctic Ocean, 200 miles north of Bering Strait, recent excavations have revealed a buried town inhabited before the time of Christ by a people with a surprisingly high culture.

Its vast cemetery contains elaborate and mysterious ivory carvings unlike anything known among the Eskimos or other primitive people of the northern regions.

In strange log tombs we found skeletons whose skulls were equipped with big, staring, artificial eyeballs carved of ivory and inlaid with jet (opposite and page 325). There were ivory mouth covers and carved nose plugs, fantastic spiral carvings made from walrus tusks, and many delicate implements beautifully made and engraved (pp. 320, 321, 326).

These finds and the extensive ruins stand in such sharp contrast to the prehistoric Eskimo remains hitherto brought to light that we believe we have found evidence of ancient migrants to the Arctic coast from some center of culture in more temperate regions, probably in the Orient.

Larger Than Modern City of Fairbanks

Ruins of more than six hundred houses, and indications of probably 200 more now buried by beach sand, attest to a population larger than that of the modern city of Fairbanks, Alaska (3,455); yet the town flourished far north of the Arctic Circle (map, pages 286-7). We named it Ipiutak after the Eskimo term for a sandspit adjoining the site.

Excavations indicate that Ipiutak existed at least 2,000 years ago and possibly much earlier, making this the oldest as well as the most highly developed Arctic culture yet found.

Some of the Ipiutak designs resemble those produced in North China two or three thousand years ago.

Bones found in the ruins show that the inhabitants lived chiefly on seals and walruses, which must have existed in numbers far beyond anything known or dreamed of in later times to supply food for so numerous a population. Walrus tusks became the common raw material for implements and ornaments.

Inhabitants of the near-by modern Eskimo village of Tigara, who live by whaling and

seal and walrus hunting, were consulted as to the use and possible purpose of some of the implements found in the excavated houses and graves. These present-day Arctic coast dwellers had never seen their like before and could furnish no clues.

To save time and complete the excavating in the limited summer season between frosts, villagers were enrolled in a Civilian Conservation Corps camp and shown how to disinter the remains of their prehistoric predecessors.

Nature's Invisible Ink Reveals Ruins

Nature's hand, tracing a springtime pattern in contrasting colors, unexpectedly revealed to us the extent of the vanished town.

Ruins had been found in the summer of 1939 by a joint expedition of the American Museum of Natural History, the Danish National Museum, and the University of Alaska, comprising the Danish anthropologist Helge Larsen from Copenhagen, Louis Giddings from the University of Alaska, and the author.

But it was not until the spring of 1940, when I returned to the site with Mrs. Rainey and Mr. and Mrs. Magnus Marks, who had just graduated from the University of Alaska, that we discovered the extent of the settlement. We suddenly realized that we stood in the streets of a buried town like nothing we could imagine on the Arctic coast and different from anything hitherto described.

Reaching off toward the east were long rows of yellow squares, about fifteen feet on a side, marking what we knew to be the locations of houses abandoned many centuries ago. In the spring, grass and moss growing about the house sites had turned green while the slightly taller grass over the ruins retained the yellow cast of dead grass. It was as if the town had been drawn in invisible ink, swiftly and briefly made visible (page 322).

Two weeks later the yellow squares had disappeared, but not before we had mapped a plan of the town with its hundreds of houses.

There were no houses built over the ruins of earlier ones, and no large refuse deposits; hence we were led to conclude that the large majority of the houses were occupied at the same time.

The houses averaged about 15 feet square and each had a long covered entryway facing

American Museum of Natural History

A "Modernistic" Seal Carved in Ivory by an Ancient People

Bones found in their homes show that seals and walrus were the principal food of Ipiutak families. Only 160 miles from Asia, they lived beside the narrow Arctic-to-Pacific migration lane of sea mammals.

toward the west, a central hearth in which driftwood and blubber were burned in an open fire, flooring of driftwood poles and planks, and probably a log or pole framework with walls and roof of sod blocks.

We found hundreds of peculiar flint, antler, and ivory objects, few of which we could recognize. Some of the tools were like those used by the present Eskimos of Tigara, but the majority were not.

At first we could find no skeletons of the men who made these houses and tools. Such skeletons should be the deciding proof, one way or the other, and we felt sure there must have been a cemetery somewhere near the village. In July we began digging exploratory pits along the bar east of the Ipiutak houses in a blind search for graves.

Eskimos Suggest a Good Medicine Man

Eskimos, half serious and half joking, said that what we needed was a good medicine man. One young Eskimo announced that the reason we could not find skeletons of the people themselves was because they were so old they had already had resurrection!

But finally the council of village elders decided that the whole village should help us search. They had become as interested in

these strange people of the past as we were ourselves, and a reward of three dollars a grave formed a further stimulus.

On the morning set for the mass attack a terrific storm came howling out of the northeast, but nobody seemed to mind. More than forty people turned out, men, women, and children, some with old whalebone picks, some with pieces of reindeer antler, some with battered iron shovels, even one with a large soup spoon.

With patience and endurance the Eskimos worked through the storm for over ten hours, digging scores of pits. Then in the evening old Kuwana found a series of graves nearly a mile from the eastern end of the buried town. His shout called me and a score of diggers, and before nightfall we had located a large group of graves.

If the objects found in the houses were strange, those found in the graves were fantastic. The first intact burial I opened was a log tomb, the logs now reduced to a soft, brown, fibrous substance. In it was a large male skeleton which stared up at us with huge handmade eyes of yellowed ivory and jet.

Later we found two other ivory-eyed skeletons: also three with carved ivory covers over the teeth, one with carved bird figures plug-

American Museum of Natural History

Chain? Comb? What Are These Strange Tools?

The second ivory artifact from top is a part of a harpoon. But the others have no present-day use. The head on right of the three-link chain might be a polar bear's; the others are obscure.

ging the nostrils, and many with elaborate ivory carvings in weird twisted, looped, and spiral forms, the meaning and use of which we cannot even guess.

Skeletons May Help Solve Mystery

A clue to the age of the Ipiutak settlement is seen in the fact that many of the ivory implements bear engraved designs which resemble in part those on implements made by the Old Bering Sea Eskimos, ancient inhabitants of the Bering Strait region, whose culture has been tentatively dated as about the time of Christ.*

But the Old Bering Sea people possessed a culture not unlike that of Eskimos living at Point Hope in historic times, while that of the Ipiutak people, lacking such typical Eskimo implements as seal-oil lamps, slate tools, pottery, sleds, and certain types of hunting gear, is far different from Eskimo culture. Many implements found have no relation to known prehistoric or modern Eskimo forms.

These facts lead to the conclusion that the Ipiutak town was occupied at a remote time before the basic pattern of Eskimo culture was developed here in the Old Bering Sea period. Moreover, it seems probable that some art styles and certain types of imple-

ments were borrowed by the later Eskimos from these earlier settlers on the Arctic coast.

But the culture of the Ipiutak people is not the primitive, proto-Eskimo culture we have sought in the Arctic regions. It is, rather, that of a sophisticated people with a complex culture in many respects more advanced than that of historic Eskimos.

All these facts suggest that the Ipiutak people are immigrants from some ancient center of neolithic culture in eastern Asia.

Such centers in Manchuria and even in North China lie closer to the Bering Strait region than do the centers of high culture in America.

Some of the peculiar spirally carved objects found at Ipiutak (page 326) resemble relief carvings of the Ainu in northern Japan, the Goldi and Gilyak on the Amur River, and relief figures on early neolithic pottery from northern Japan. This art motif is not known in North America.

Furthermore, the exceptionally fine flint implements found at Ipiutak appear to be more closely related to flint implements made by early neolithic people of northeastern Asia

* See "Exploring Frozen Fragments of American History," by Henry B. Collins, NATIONAL GEOGRAPHIC MAGAZINE, May, 1939.

Friedrich Harmer

Grass Growing in the Streets Here Reveals the Mysterious City of Ipiutak

Alternating light and dark streaks of vegetation, as seen from an airplane, mark the mile-long "avenues" and the rows of house ruins. Black spots are the author's excavations. At right is the Episcopal mission. This ancient metropolis, on the barren shores of the Arctic Ocean, contained 800 homes and apparently sheltered 4,000 people, more than the present population of Fairbanks (page 319).

than to those made by people of northern North America.

The possible connection between what now appears to be an ancient and isolated culture at Point Hope and oriental cultures of eastern Asia cannot be proved until much more extensive excavations are made, particularly in northeastern Siberia, but the connection is very probable.

Are the Eskimos living at Point Hope today descendants of the people who lived at Ipiutak, and are these in turn descendants of orientals who migrated out of Asia to the Arctic coast two or three thousand years ago?

A study now being made of the skeletons from Ipiutak will go far to answer the first of these two questions, but no definite conclusions can be stated at present.

A more thorough knowledge of the living Eskimos is as necessary as continued archeological research, and many months of my work were devoted to a study of the present culture of the Tigara Eskimos.

This culture, which centers about the pursuit of huge bowhead whales,* still maintains

* See "Whales, Giants of the Sea," by Remington Kellogg, NATIONAL GEOGRAPHIC MAGAZINE, JANUARY, 1940.

much of its aboriginal character in the legends, beliefs, and customs of the people, in spite of long contact with white men.

In the spring, when the sun returns to glare down upon the wilderness of pack ice, the wives of the Tigara whaling captains begin preparations for that critical moment when their men will go out over the ice to hunt the largest of all living creatures.

"Drop a Whale into This Pot"

Up to about a generation ago the Eskimo women prayed to the moon for success.

They were not impressed by Sukunuk, the sun, regarded as female, but waited for the appearance of the male moon, Alignuk, on whose response depended the security of their families and the prestige of their kin.

In March, Alignuk would draw back the trap door in the floor of his house, and a faint silver crescent would appear in the night sky. Then each wife of a captain used to take her special little wooden bowl and fill it with clean, clear water from a certain lagoon.

After the chamber buckets of the village had been dumped and the dogs had quieted for the night, she stole out through the long entrance tunnel of her house and held her bowl up toward the moon man, calling: "Alignuk, drop a whale into this pot so that we can kill one this spring!"

If she had obeyed all the rules and if the water was clear, her voice and the glimmer of light in the bowl reached up to Alignuk, the moon. He would send a whale.

Now the daughters of those women who called to the moon pray to the Christian God who controls all creatures of the sea. When I asked old Qoqoq why he now prayed to Jehovah instead of calling to Alignuk as he had during much of his life, he said it was not until the missionaries came that he knew Jehovah controlled the whales.

Yet something of the old faith remains. At Easter in Tigara we watched an abbreviated performance of the old winter festival which must have been held there each year for many centuries before the Yankee whaling ships arrived.

Omen of Death

On the stage of the Episcopal church building a score of masked men sat with bowed heads, waiting for a signal from the singers. Then, as the song began in a deep, measured cadence, bodies moved in a slow, writhing motion.

Soon both song and drums burst forth into full power, and Kuwana stepped forward to begin a dance we recognized from old Agavek-

sinya's description. He carried a wooden top out of which rose goose feathers arranged like the leaves of a turnip.

When the song and the dance reached their climax, Kuwana stooped to hurl the top from its coiled sinew line to the planking. We knew that if it spun smoothly and the feathers sailed off into the air, the whale hunt soon to begin would be a success. If it did not, someone now sitting there would die before the next spring.

The top spun smoothly for a moment, then caught and slid along the planks, scattering its feather plume.

There was some laughter and joking when the moment of suspense was over, but I watched old Nashugruk's drawn face as she sat staring at the top. Three weeks later Poyuruk, the jovial dancer with the beaming smile, died with parts of an exploded whaling gun embedded in his intestines. Kunuknoruk was badly wounded from another explosion, and we had the meat from two whales in the storage pits.

To know and understand the Tigara Eskimos, one must hunt whales with them, joining in pursuit of the all-important great bow-head whale, Agavik.

In moments of tense and breath-taking excitement, after a commanding hiss from the captain warns the paddlers to cease all movement, when the fragile skin boat glides softly up onto the glistening hulk and the harpooner rises to strike—then and then only is it possible to understand in some measure all the elaborate preparations, all the tradition, and the real meaning of this performance.

Hunt Opens with Raw Meat Feast

I joined Umigluk's crew. At five o'clock one morning late in March he rapped on our window, calling out that the feast was ready. Whales had been sighted the day before. The town of Tigara began to bustle.

We found most of the village people in Umigluk's house, the men in one room, the women in the other, seated about a huge black, slimy lump—part of a whale killed by Umigluk's crew the year before. This had been thawed in front of the fire during the night, and the women had scraped away the yellow scum accumulated in the meat cache during the year. The room was permeated by a sweet, sickish odor which soon became overpowering.

We of Umigluk's crew were expected to cut this big chunk of black skin, yellow blubber, and red meat into portions for each man and woman. The nine captains of whaling crews in the village were served first, as befitted their

rank; then the crew men, and finally our wives.

All of our portions were, of course, raw and partly frozen. Old whale meat is eaten raw and in this state is extremely tough. The two of us who were then introduced to our first feast of whale meat did not share in the general joy caused by the odor and taste of this delicacy.

The simple feast, followed by a long and tedious prayer, initiated a period of intense activity in the village.

Sharp, Shiny Knives Please the Whale

All gear used in whaling must be clean and, if possible, new. Traditionally, the whale cannot easily see bright and shining gear, but, if he does, it pleases him. It promises sharp cutting knives and spades which will not hurt in the butchering.

You see, the whale does not die, he only "has his parka removed"—painlessly, if knives are sharp—and returns to the sea to report on his treatment by the Eskimos.

New skins of the bearded seal were sewn for our boat by old crones of the village who were paid in tobacco and meat. Umigluk's father supervised the refitting of the craft, a skin umiak some 20 feet in length—half that of the animals we were to attack in it.

The crew scraped clean all eight spruce-wood paddles, the harpoon shafts, the great cutting lance shafts, and the boat hooks. New sealskin floats were made and tested. New lines were made fast to the floats, and the darting guns were oiled, repaired, and plugged against the icy sea water. Bombs were refilled with fresh black powder, the fuses reset, and the caps tested.

This exciting preparation of materials was a man's bustling world, but the women's work was no less essential. They provided huge bowls of biscuits, *nukpori*, a kind of pretzel of flour paste fried in seal oil, which were passed among the crowds of children.

These youngsters shouted the Eskimo equivalent of "There she blows!" as they came forward to stuff themselves, a tradition upheld for centuries by the rising generations of whale hunters and their future wives.

One morning, not many days after the whale feast, Umigluk's wife, Dinah, made the rounds of the village, calling for each member of his crew. Dinah's mother, in the days before the mission, went through a complex ceremony to purify her husband's boat, leading it down to the ice and preparing it spiritually for the coming contest with supernatural and natural forces.

Few traces of this old-time ritual remain, except a feeling in the village of great solemnity and suppressed excitement.

But I knew from my crew mates, although he never told me himself, that Umigluk had retired alone the night before to sing his charm song, almost inaudibly, with a light tapping of his tiny whaling captain's drum. This song had been taught him by his grandfather, a great medicine man, and no one must hear it.

Tigara clings to the very tip of a long ribbon of sand that curves out into the Arctic Ocean for nearly twenty miles north of Cape Thompson. A strong sea current setting northward along the coast strikes this spit, which is known as Point Hope, and swings out toward the northwest. At certain times the current and the wind combine to force an opening, or lead, in the pack ice.

In April, May, and early June, bowhead whales migrate northward along the open lead, headed for Point Barrow and the Arctic Ocean to the north and east. The lead along Point Hope is generally opened by a north wind and closed by a south wind, and the old men watch the weather to decide when the boats shall be taken out across the ice to open water.

If the bitter male northeast wind blows, the lead will open, but great pans of shore ice may break off to be driven out to sea in the wide lead, carrying with them boats and crews. Often this is very dangerous because ice may be crushed into a seething mass over which a boat cannot be dragged and through which no boat can be driven.

But that spring the day of launching was beautiful, dazzlingly bright, with only a breath of air from the north. Each of the other eight crews had been called at the same time as ours by their captain's wife, since all crews must go down to the ice the same morning.

We lashed our boat on a low, flat boat sled and piled in extra fur clothing, guns, and all manner of gear to be used on the ice, since we would not return to shore until the lead closed, perhaps many days later.

Umigluk's team of nine dogs was hitched to a light sled and a line run from that to the boat sled. In addition, each member of our crew was harnessed to the boat sled, so that we moved off through the piles of ice and pressure ridges in a long procession, Dinah leading and Umigluk following us.

Inside our fur clothing perspiration trickled down into our high sealskin boots.

A Huge Black Living Submarine

Only a few minutes after we reached the open water, perhaps a mile and a half from the shore, someone shouted, "Agavik!" There, half a mile off, a great black submarine

A Stone-Age Man Sleeps in His Crumbling Log Tomb

The Ipiutak man, who carved ivory with flint, represents a higher culture than the slate-tool Eskimo, but he evidently did not know the Eskimo's seal-oil lamp, dog sled, or whaling technique. At burial this man's eyeballs apparently were gouged out to make room for the ivory set (pages 318, 319).

American Museum of Natural History.

Out of the Past Come These Ivory "Pretzels" to Baffle Archeologists

When the relics were unearthed, the Eskimos called them *nukpori*, their word for fried pretzels. No one has determined the objects' utility. Their double-spiral motif, unknown elsewhere in North America, has some parallels among carvings of Asia's Amur River tribes and Japan's hairy Ainu (p. 321).

emerged to blow a fine puff of steam from its bow.

Half an hour later we heard an explosion just beyond an ice pile to the east and suddenly a boat shot out from the ice, then lay still.

Kunuknoruk rose in the stern, held out his arms over the bowed heads of his crew, and prayed in a loud clear voice to Our Father, "Apapta" in Eskimo. In the old days his harpooner would have sung the *Avituksiun*, a prayer song to hold the harpoon fast in the flesh of the fleeing whale.

The prayer finished, we sprang into our boat and drove it off toward open water where

Umigluk thought the whale would rise to blow.

After a long, hard pull, one Uyarak shouted "Avituk!" and pointed off across the water toward the edge of the pack. Again we drove the boat forward, racing all eight other crews toward a small dark buoy which was the sealskin float (*avituk*) fastened by 14 fathoms of line to the harpoon iron, now embedded in the whale.

When the float appears it is a sign that the whale is rising, and you rush to a position from which he may be struck again before sounding a second time. Unfortunately, this time whale and float disappeared under the ice. We never saw either again.

During those first few days, scores of whales moved through a wide lead and lured us on to many wild and unsuccessful pursuits. Often all of us were so exhausted that we fell asleep in our places when the captain ordered "cease paddling."

When no whales were in sight we returned to the ice, drew out the

boat, and sat dozing on the boat sled while a young girl cook boiled meat and made tea.

At night it was bitter cold. The boat sled would not hold all of us, so those standing paced back and forth across the ice, stamping their feet and beating their arms.

In the old days no cooking was allowed on the ice, no damp boots could be changed, and no shelter of any kind could be used; all these were prohibited. Today, old men say, the young are soft. They have hot tea, hot meat, dry clothes, and a tiny windbreak made of ice blocks, but they are still not allowed a tent (except for the girl who cooks) or sleeping bags.

Hours of idleness and waiting were passed in storytelling or long discussions about religion, in making string figures, snaring sea gulls, or just in a numb, sleepy stupor.

Later in the spring big flocks of eider ducks whirred along the edge of the ice, flying low, close together, and very fast. The use of shotguns was frowned upon because it frightened the whales; consequently, we amused ourselves and replenished the cook pot by snaring the ducks with the famous Eskimo "bolas," sets of six bone weights connected by sinew lines which entangle a bird when they are hurled into a flying flock.

Boats Race Madly for the Whale

Early one morning, soon after the hunt began, Okpik shook me out of a cold, fitful sleep, shouting that another whale was struck. Far out across the water a single boat lay idle, its crew waiting and watching, but as we moved out from the ice seven more boats flanked us in a mad race toward the idle boat.

Each boat upon the scene of a kill gets a certain portion of the whale, but the part each boat receives depends upon the order of arrival. The second boat to strike gets a very large share; hence the race, which has every paddler exerting all his strength. After some two miles of this, most of us had the taste of blood in our mouths.

As our crew were all young men, we soon outdistanced the others and drew into the lead. Just as we approached the idle boat its float broke the surface a hundred yards off our bow.

We redoubled the speed of the stroke and our boat surged forward like a whale in full flight. Then beneath us we felt a huge boiling movement of the water; the boat rocked

An Arctic Jinx Was the White Man's Exploding Gun

Following an evil augury at pre-hunt ceremonies, four whaling guns exploded, killing one Eskimo and wounding another. Here a hunter is using the shoulder gun fired at whales close to the ice. Modern powder used in such obsolete weapons could account for the accidents (page 333).

crazily, and directly under the bow rose the great black bulk of the whale.

There was a deep and unforgettable blast, something like the exhaust of a steam engine as it stands in the station, but bigger, when the whale blew, his steam drifting back into our faces.

Aground on a Whale's Back

Paddling at the stern, Umigluk swung the boat about, and with one terrific stroke of our paddles we drove the boat up the glistening slope of the whale's back. Melik, the harpooner, rose, held the harpoon shaft high above his head, then drove it straight down through three feet of quivering skin, blubber, and flesh.

Down to the Sea in Umiaks. Go the Men of Tigara to Hunt Agavik, the Whale

In Greenland the umiak is the women's boat, but in Alaska it is paddled by men. To put the harpooner in range, the boat is steered right up to the whale and then "grounded" on its slimy back (page 327).

Prohibit-Bahary

Like Camouflaged Ski Troops, Walrus Hunters in Gossamer Raincoats Await Their Prey

The thin, waterproof parkas are made of seal membranes. A wounded walrus is a bellowing, ferocious ton of tusk and muscle.

A mighty shudder passed from the whale through our flexible skin boat to each one of us. A deep muffled thud followed as the harpoon bomb exploded in that mass of flesh; then came a convulsion that threw the boat off on its side.

A cry from Umigluk warned us to clear away the sealskin floats attached to the line, which now was running out with the whale's sounding (page 336). In a moment line and floats disappeared beneath the surface.

With all my heart-pounding excitement I yet remember the sweat-streaked, beaming faces of the crew, each shouting and laughing.

The nine boats now formed a wide circle. All of us watched the surface of the water in the enclosed area for the float which would rise some time before the whale. At last it bobbed up, dark and agitated like a female bearded seal when she rises far out of the water to wave her flippers to lead you away from her pup.

We closed in and the whale soon rose, spouting a thick mist of steam and clotted blood. Kunuknoruk's boat swung in, and young Stephen leaned over the bow, brandishing a ten-foot steel-headed lance.

As the boat slid up over the whale's flippers until only the stern remained in the water, Stephen thrust downward, then raised himself over the lance shaft, like a pole vaulter, forcing the lance down through probably six feet of flesh.

Bracing himself in the bow, he twisted and turned the shaft, searching for that vital spot which would disable the lashing flukes. But he lost his balance when the boat was thrown off to the side and for a moment we thought he would be left dangling from his lance shaft.

Two other boats rushed to the kill, and other lances searched for kidneys, heart, and lungs. In a few minutes it was finished. A black rubbery hulk floated quietly, with only an oil slick and swirls of bloody water to remind us of its titanic death struggle.

Not until that moment did I realize that it was snowing hard. The ice pack was no longer in sight, and the other boats seemed ghostly in the gray light.

"Joy Shout" Announces First Kill

Fred, the captain of the boat which made the first strike, drove a harpoon iron deep into the upper lip of the carcass, then bent around it the end of a long walrus-hide line. By tradition his boat took the lead and the others followed in the order of their arrival on the scene of the kill, making fast to the towline to begin the long, hard pull toward the edge of the shore ice.

When the carcass began to move, someone raised the "joy shout," a short repeated barking sound like the cry of a sea lion, and all the others soon joined him. The cooks on the edge of the ice would hear this, then carry word to the village that the first kill of the spring had been made.

I have often wondered whether that peculiarly American custom of "ragging" one's friends in a completely friendly manner was not adopted from the American natives. Certainly I felt entirely at home in the joyous ribbing that took place among that crowd of Eskimos as they strained against their paddles. None of us escaped the sharp banter, but few could return the wisecracks of Peter or Jimmy.

There was a pause in the joking and shouting when we reached the ice. Kuniq, a tall slender man with iron-gray hair, stepped out on the ice, raised his hand, and called for our attention, then in a long prayer thanked God for our safe arrival.

To me this was a strangely weird scene. Sixty fur-clad men were huddled together in a blinding snowstorm on the pack ice 200 miles north of Bering Strait, thanking the Father and the Son of Levantine people from the desert in Palestine for our success in killing a leviathan of the Arctic Ocean.

The flukes of the bowhead belong to the captain whose crew makes the first strike, but they must be given to the community at the time of the whaling feast (page 332). They are symbolic of the hunter's relation to supernatural forces, to the whole village, and to the spirit of the whale himself.

A Drink of Water for the Whale

As soon as the whale is brought to the ice, the flukes are cut away, then carried to the village at once. Formerly a piece was borne to the captain's wife on a staff as an announcement of success, and she then came out on the ice with her little ceremonial bowl to give the whale a drink of fresh water. All sea mammals are forever thirsty, the Eskimos say.

The butchering is a day of joy and feasting. Two slanting holes are cut down into the ice until they meet, leaving a sturdy ice-beam strong enough to hold the large pulleys attached to the whale carcass. Then, as all the men gather to draw the nose of the whale up onto the ice with the set of pulleys, the women light cooking fires and begin to boil strips of skin that have been cut away from the floating carcass (page 333).

Old men mark each boat crew's traditional share by cutting long gashes in the black skin. The last boat to arrive on the scene has a sort

Fraternity Brothers of the Far North Give a Jamboree under Three United States Flags

The champion of two whaling clubs entertains its defeated rival at a feast. The three flags indicate that the hosts have killed three whales. The 45-starred flag at the top, the model used from 1896 to 1908, dates from the admission of Utah to the Union (page 335). In the distance is the Eskimo village of Tigarta.

Like the Butchered Pig and His Wasted Grunt, All Parts of the Whale But One Are Utilized

Prosser Halsey

The skull, representing the spirit, goes back to the sea, but other parts feed men and dogs, provide drumheads, baskets, moccasins, and even bouncing balls for boys (page 332). Eskimos here are dividing the meat. Smoking behind an ice windbreak is a cook stove, a luxury which old-time whaling crews taboed.

Fowell's Eskimo

Victory over a Whale Is Celebrated with Pennons Cut from His Tail

"I celebrate a tail . . . its amazing strength . . . the graceful flexions of its motions." So wrote Herman Melville in praise of *Moby Dick*. The Eskimo shares his sentiment. Here a crew captain presents slabs of the flukes to his friends (page 329).

of "booby prize" in a strip the length of the captain's foot, cut completely around the whale just below the navel.

We worked all day and all night cutting up this first whale of the season. Many dog teams raced back and forth from pack-ice edge to storage pits on shore, hauling the many tons of meat.

The ice for yards around became slippery with blood and fat. A long, winding red trail marked the course of sleds across the ice to the shore. Our clothing was soaked and greasy (page 331).

Flocks of sea gulls screamed overhead or dived for titbits drifting out into open water.

Like the gulls, old people without relatives to care for them snatched choice bits and stuffed themselves until they fell asleep.

Heart, liver, lungs, intestines, everything was prized; only the bare skull went unclaimed, since that must be returned to the sea, no one knew or remembered why; some thought it represented the spirit of the whale, others that it was the share demanded by the crabs.

Kuwana eventually made drumheads from the skin of the liver and lungs, and from a white rubbery substance along the skull the boys made balls that bounced on the ice like any hard rubber ball. Net sinkers were made from the ribs, woven baskets from strips of the baleen, the vertebrae were fed to the dogs, and the jawbones were set up as monuments at the feasting ground.

Village Starts Drifting Out to Sea

Late in April a spell of bad luck struck the Tigara people and reminded many of us of the top which had

failed to spin properly during the Easter ceremonies.

Suddenly, and with almost no warning, the pack ice off Point Hope began to break up while we were cutting up the second whale killed during the hunt. Most of the meat was still on the ice, and a large part of the village, including women and children, was gathered there to assist in the butchering.

Three great cracks opened in the pack between the scene of the kill and the shore, and these grew wider so rapidly that few of the people were able to cross on foot. Then heavy slush ice began to move through these open leads in such a solid mass that boats could

be forced through only with the greatest difficulty.

It was the only time I had seen Eskimos really terrified. There were eight boats to convey more than one hundred people across three separate channels, and as one boatload followed another, mush ice became more and more congested, grinding and crashing like ice in a river during the spring breakup. To make matters worse, the solid pan beyond the original cracks began to break up and to move northward, carrying the remaining people far out from the point of land.

But after about an hour the feverish work of the boat crews was successful. All the Tigara people reached shore, glad to be alive but weary and very sad because tons of whale meat had been carried off in the pack, as well as some of their dogs and hunting gear.

Death Omen Fulfilled

The ice reformed later and remained solid about the point for weeks, but bad luck continued. Two days later Poyuruk, standing watch on the ice near Killigvuk's camp, saw a whale rise only a few yards away. In his eagerness to make the best of his opportunity, he attempted to kill the whale with a short bronze "shoulder gun" which discharges a small bomb set to explode ten seconds after it leaves the barrel (p. 327).

Something went wrong. The bomb exploded in the gun, the barrel was blown into bits, and Poyuruk was fatally wounded in the abdomen. He died the next day.

Then, with continued ill-fortune which would make even the least superstitious person pause to reflect on the mysteries of chance, three more whaling guns exploded during the

Polar Porterhouse—Rare and Fat

This slab of blubber is being dragged away as the choice of the successful crew. Other cuts will be stored in ice caches. The following year the black, rubbery skin, yellow blubber, and red meat will be served raw and of ripe vintage at the pre-whaling feast (page 323). A booby prize sliced below the navel goes to the crew last to arrive at the kill (page 329).

two days following Poyuruk's death. Kunuk-noruk was wounded in the thigh and his skin boat was riddled with holes. Miraculously, neither of the other explosions wounded any of the crew, though we found shrapnel-like bronze fragments a hundred yards away.

An unsuperstitious person might explain the gun explosions by the fact that they were weapons purchased from American whalers over fifty years ago.

Several weeks later, when the sun had begun to circle around the sky without setting, the ice became restless. Big cracks appeared everywhere in the shore ice, pools of water collected on the smooth pans where our boats

lay, and sometimes we could feel ourselves rising or settling as the ground ice prepared to move away to the north.

Bowheads disappeared and a few of the more dangerous gray whales came. The season was over. We had struck 13 bowheads, killed five, and cached the meat from four.

Snow had gone from the spit. Some days on the ice our faces blistered with sunburn, though in the night when the sun rolled along the horizon, sunburned faces were nipped by the frost. We came off the ice for good one day after we had seen a huge bumblebee flying off the pack toward the shore. Boats were dragged across the last of the ice to the bar where bumblebees already had found the first spring flowers.

Feasting Fraternities Go into Action

Nalukatuk is the time of feasting. It begins early in June, or the day after the boats have returned to the shore. The women sew new clothes for weeks in preparation, and in May it becomes the chief topic of conversation.

All people in the village of Tigara belong to one of two clubs or fraternities, known as *qalegi*, each of which has a special feasting place. The clubs are named Ungasiksikaq and Qagmaktoq. Since our boat captain was an Ungasiksikaq, my wife and I had been adopted by that group and were expected to feast at their feasting place.

Rivalry in the hunt, in preparation for the feast, and in the production of new clothing is very strong between the two groups, and each of us was expected to do his part in making Ungasiksikaq's celebration outshine that of Qagmaktoq. We were handicapped, since our rivals had killed three whales to our two.

The feasting continued for three days, appetites being encouraged by such delicacies as raw whale kidneys, tongue, hearts, skin, and "ice cream" made from beaten reindeer fat, bits of meat, and berries; flour soup made of flour boiled in seal oil; molasses, coffee, biscuits, and beans (page 330).

Dancing in the Air

To renew appetites there were many games of strength and endurance, dancing, singing, and drumming. But the climax of the feast is *Nalukatuk*, the performance which gives its name to the whole ceremony. This is a kind of glorified tossing-in-the-blanket, which delights and terrifies at the same time.

At each feasting place there are four tripods, made from small whale jaws, grouped in a circle. Ropes anchored in the ground are passed over these tripods to meet in a square framework at the center, and over this frame-

work is stretched a large walrus hide at a height of three or four feet above the ground.

Forty or fifty people grasp the skin at special rope handgrips about its margin and urge someone to climb up on the skin. This courageous person finds himself being shot into the air by the combined efforts of all the tossers, sometimes as much as 15 or 20 feet above the skin (opposite page).

The object is to remain upon one's feet when landing, and many are skilled enough to remain right side up for many minutes. The novice has a bad time. He lands just at the wrong moment, his knees buckle, he is soon on his back or face, and amid shouts of laughter he is sprawled in the air completely disorganized and at the mercy of the tossers.

Those who are really good "dance in the air," rhythmically moving arms, body, and legs to the music of the drummers and singers who accompany the performance.

If there is any significance in the *Nalukatuk*, it has been forgotten. Now it is just fun, enjoyed by men, women, and children of every age. Oddly enough, it is done only at the time of the whaling feast.

The bright new clothes, the dancing, singing, feasting, and, above all, the excitement of *Nalukatuk* combine to make this three-day festival the high spot of the year in the lives of all Tigara people.

People of Patience, Endurance, Humor

During the many weeks of the hunt, while we waited long days and nights at the edge of the ice, raced through vast fields of loose drifting ice pans in pursuit of whales, or sat very quietly in our boats far out in the lead while herds of white belugas broke the night silence with their puffing, the question of who these people were often occupied my thoughts.

The patience and endurance of my crew mates, their deep-rooted and entirely unconscious courtesy, their humor, and, above all, their formalized pattern of behavior, which seemed based upon endless generations of adjustment to the life they lead, suggested the Orient.

This formalized behavior and the complex traditions surrounding the ancient whale hunt, as well as the complicated equipment required to live on the Arctic coast, were startlingly different from the ways of interior Indians. I had never realized how much more knowledge, experience, and equipment are required to live on the barren coast than in the wooded interior.

The Eskimos have come to respect the white man's knowledge of certain things. When Poyuruk and, later, Kunuknoruk were wounded by the white man's exploding guns,

Ernest Hainer

This Daring Young Girl, Tossed in a Walrus "Blanket," Keeps Time to Eskimo Songs

A hide stretched between four whale-jaw tripods and tossed by 40 fun-lovers sends the lass dancing 20 feet into the air. Only the skilled can remain upright; others plunge sprawling on their faces. The ceremony, climax of the whaling feast, is known as *Nalukatuq* (opposite page).

FREDERICK BARNES

There She Sounds! A Harpooned Whale Dives at the Bite of the Bomb in the Iron

When the leviathan reappears, spouting mist and blood, the Eskimos will drive their boats upon its back and lancers will jab vital spots. The seal skin float in foreground is attached to the harpoon line. When the whale sounds deeply, the float submerges. It bobs up warningly just before the victim rises again.

they went to him for treatment, Poyuruk even trusting himself to an airplane en route to a hospital.

But they do not respect us in our attempt to settle the Arctic coast. We are helpless there without their clothing, their knowledge of the country, and without food shipped in from the "outside." We can live there with all the southern regions supplying us, but we cannot live there without this help unless we become Eskimos.

Light on an Ancient Mystery

Unlike Alaskan Indians, Arctic Eskimos do not stand in awe of Western civilization. Assurance, pride, and tradition reinforce their culture and leave them still masters of an environment nobody else has really mastered.

With a more intimate knowledge of Eskimo people, the discovery of an ancient and complex culture in the Eskimo region which may prove to be ancestral to that of the Eskimos and at the same time derived from an advanced oriental culture, is not surprising. It may explain the contrast between Arctic Indians and Eskimos.

The one race, primitive in behavior and equipment, has been unable to stand the shock

of intercourse with European civilization: the other, sophisticated in behavior, is equipped with ingenious gear adapted to an impossible environment and has that intangible self-assurance one might expect in a race with a long and powerful tradition.

Furthermore, it is easier for me to comprehend a movement into the Arctic wastes by a people with a complex culture than by a people with a simple and primitive culture like that of the northern Indians in America.

It now seems probable that my whale-hunting companions at Tigara are the descendants of a mysterious people who, some time before the beginning of the Christian Era, moved northward along the shore of the Pacific in eastern Asia, gradually adapted themselves to the hunting of sea mammals, then penetrated to the Arctic coast of North America.

The long history of their life in the Arctic regions can be known to us only in part from our present excavations, and there must be scores of such settlements as that at Ipiutak yet to be found. The exciting thing is not the collection of mysterious implements unearthed by the excavations, but the history of a sturdy group of whale hunters seen with a new perspective.

China Opens Her Wild West

In the Mountain-girt Heart of a Continent a New China Has Been Created During the Years of War

BY OWEN LATTIMORE

Political Advisor to Generalissimo Chiang Kai-shek; Director, Walter Hines Page School of International Relations, Johns Hopkins University

UNDER a sunny wall near the gate of an ancient temple sat an old Chinese countrywoman. In front of her she had put a big basket, which she had carried on her back. It contained cigarettes, matches, candy, spools of thread, needles, little mirrors, and other oddments which she hoped to sell to people going in and out of the temple.

In the meantime she and a neighbor, another old woman, were gossiping peacefully in the California-like sunshine that floods the far southwestern Province of Yunnan all through the winter.

It might have been almost any corner of China, on almost any day in the last hundred years, except for the wall behind the two old women.

On the wall was a propaganda picture, painted in bright colors (page 338). In the middle, in a sort of cloud to show that he was far away at the front, a soldier was charging with fixed bayonet. At the left, painted much larger to show that he was right here in this part of China, a peasant with trousers rolled above the knees was plowing a rice field with a water buffalo.

At the right, in big, plain characters easily read by peasants who have to puzzle out each word, was the slogan of the poster painting: "At the front, strive to kill the enemy and defend our land; in the rear, strive to plow and plant and build."

A smaller inscription declared that this patriotic picture was the work of the Provincial Middle School of the city of Tali (Color Plates I and IV).

Off to War in American Trucks

Only fifty yards away something was going on that gave grim reality to the brave picture and bold words painted by boys and girls of high-school age. A group of conscripted recruits for the army was being assembled by a sergeant and a corporal. Their uniforms were only a few days old, and they were more eager than skilled in forming ranks and executing orders.

When the roll had been called, they swarmed into a big, battered American truck. Some of them looked bright-eyed and laughing, excited by a sense of adventure; others were going

with sober, serious faces to meet the unknown.

For me there was one especially dramatic note in this little scene of the ancient tragedy of young men going off to a war forced on them by distant aggressors of whom they knew almost nothing. Probably not one of those boys had ever been more than 30 miles—a long day's walk—away from home.

They had grown up in the lovely valleys of this remote province, one of the least touched by foreign influences in the last hundred years of China's contact with the outside world.

Very likely not one of them had ever ridden in a motorcar. Until four or five years ago there was hardly a car in the whole province, except at Kunming, the capital.

Yet now that they were leaving home, perhaps to die, they were being taken off in an American truck; by the raw new gashes of the Burma Road or its successor they would swoop through their own homeland, across ranges where for centuries men had trudged by narrow trails, following their pack mules (map, pages 344-5).*

War Speeds China's Full Awakening

Taken together, the cause for which they were going and the way in which they were going symbolized what is happening in the China of our time: To defeat a military invasion, the Chinese are speeding up the development of their own country by every industrial, technological, modernizing agency of the 20th century.

Everywhere in Free China you can see this kind of contrast. It is typical of China that the change is both chaotic and constructive; and it is also typical of China that on the whole the forces of growth, of healing and construction, clearly have the upper hand over the forces of violence and destruction.

The Chinese are the heirs of the world's oldest living continuous culture. Their ancient history overlaps that of the Pharaohs. But the Pyramids of Egypt are monuments of a culture of the past; there have been big breaks in the history of Egypt.

* See "Burma Road, Back Door to China," by Frank Outram and G. E. Fane, NATIONAL GEOGRAPHIC MAGAZINE, November, 1940.

Owen Lattimore

"At the Front, Strive to Kill the Enemy and Defend Our Land; in the Rear, Strive to Plow and Plant and Build"

Beside the big, plain characters of this message painted on a Yunnan wall, a soldier is drawn in a cloud to represent him far away at the front. In contrast, the farmer at home is pictured large and prominent, plowing a rice field with a water buffalo. Under the wall an old Chinese woman sells cigarettes, candy, needles, and other oddments (page 337).

China has a prodigious vitality, but it is not a rigid, unyielding vitality. While accepting the new, she also preserves the best features of the old.

Excavations in North China that have laid bare the foundations of palaces of about 1300 B.C. show that certain principles of the Chinese architecture of today were well established more than 3,000 years ago. That is one kind of continuity.

Another kind is shown by the fact that in parts of North China the crops are reaped with iron-bladed sickles identical in shape and size with the stone sickles used at the end of the Stone Age, 3,500 to 4,000 years ago.

The men of the Stone Age had worked out a cutting blade of a good size and shape for

the work they wanted to do. When the men who came after them learned the use of metal, they adapted the new raw material to the work and to the way of doing the work which they had already proved to be practical.

It is this ability to change by adaptation, and not simply by throwing away one set of principles, one way of living, and adopting another, which is, I think, the true secret of China's long and vigorous history.

Better Scissors from Roadside Wrecks

I saw an example of the same kind of thing in a little town on the Burma Road. This town had long been famous for the making of scissors. The scissors are beautifully artistic, and they are still made today with the

Paul G. Guillemette

China Has Some Tanks, but Far Too Few for the Job

These six light tanks are lined up in embattled Hunan Province, ready for action. China's armored units are named after animals known for their ferocity, such as the tiger and the dragon. The animal's name is painted on the side of each tank.

skill which each generation of apprentices learns from the older generation of craftsmen; but today the scissors are better because the smiths have learned to use tough American alloy steel salvaged from the wrecks of trucks along the road. This is better than the steel they can forge for themselves by traditional methods (Plate II).

Other and newer skills are also at work in the China of today. Last November, at Chungking, I was present at the "blowing in" of a new 30-ton blast furnace.

It had been built by a company in which government capital and private capital were jointly interested. This is one of the policies favored by Dr. H. H. Kung, Minister of Finance. The government interest assures continuity and stability, while the private interest guarantees initiative.

Thirty tons of steel sounds like tragically little for a country defending itself against an enemy who relies more on tanks, artillery, and planes than on manpower. Thirty tons of steel a day, however, is about 900 tons a month. If China had to rely on getting it in over the Burma Road or some new mountain route from India, that would be 900 tons that she might get and might not; made here in Chungking, it is 900 tons right where it can be used.

The Making of a "Whatizzit"

There is a link between factories like this and supplies coming into China from abroad. In order not to give away any military details, let us imagine a weapon called a "whatizzit."

The Chinese armies would have very few

Runjean

Bomb-battered Chungking Has Learned to Roll with the Punches from the Sky

Four summers of Japanese air raids have almost destroyed the original buildings of the capital of Free China, yet daily life goes on much as usual. Heavy damage has resulted because of the city's flimsy and inflammable wood and mud construction. Thousands of residents now find shelter in enormous caves dug in the rocky hills.

Buttraces of rock between the arched entrances partly protect the wards from bomb blasts. This International Peace Hospital in northwestern China is largely supported by United China Relief. (page 361).

China's Mountain Fortress Stands Out Clearly in a Hand-modeled "Sculpture Map"

To create this graphic relief picture, The Society's cartographers modeled mountains and valleys in clay from accurate contour maps. The model then was photographed. The new India-China supply road, now under construction between Sadiya, in Assam, and Likiang, must surmount high mountains and cross the deep parallel gorges of the Salween and Mekong Rivers.

whatizzits if they all had to be brought in by truck. But with the machines and the materials that China already has, most of a whatizzit can be made right there. All that it is absolutely necessary to bring into China is, let us say, one of the mechanical parts and the raw material for another part.

Looked at in these terms, one ton of cargo brought into China by transport plane from India or over the Northwest Road from Russia may mean a hundred whatizzits instead of ten.

This kind of stepping-up of China's productive power is a good illustration of the true co-operation in America's Lend-Lease supplies

to China. What we supply multiplies what China is able to do for herself; what China does multiplies the value of what she receives from us.

Factories in Caves Turn Out Guns

Widely scattered to reduce the risk of bombing, and with their most delicate and valuable machinery hidden in caves wherever possible, the arsenals and factories of China also mean a number of things besides so many tons of steel or so many rifles or machine guns a month.

They mean, among other things, more

Japanese Have Infiltrated into Plains and Lowlands but Not China's Rugged Heart

Like meshes of a net, the invading armies have attempted to "put the squeeze" on China by following rivers, roads, and railroads. Territories now occupied by the enemy, indicated by white vertical lines, blockade the interior. Only access to the capital, Chungking, now that the Burma Road has been closed, is by airline from India. Russia is sending in some vital supplies by the long and difficult Northwest Road.

speed in the development and training of skilled labor than at any other time in China's history (pages 346-7).

Thanks to one of the Government's wisest policies, most of China's modern factories are not only centers of production but schools of technology.

Under the old guild system, an apprentice was a boy who learned most of his trade by standing around watching. He moved very slowly from the simple stages to the skilled processes of the trade he was learning. It might well take from five to seven years.

Today there is a system under which the

Government and the factory owner both contribute money and time to enable the apprentice to study instead of just watching and imitating. This reduces by at least half the time it takes to train a skilled workman.

As yet, however, there is a shortage of skilled labor in China, and this will continue for many years. There is even, in many parts of Free China, a shortage of unskilled labor.

This is an idea that will be strange to many Americans. We have always thought of China as a country swarming with surplus labor—an "overcrowded country." Yet in the Province of Yünnan last fall—the province of the

China Keeps the Home Fires Burning to Forge the Weapons of War

Workers are shoveling crushed limestone into an electric furnace to cleanse the molten scrap steel. The white-hot metal is about to be poured into ingots. This refining furnace is one of many heavy machines moved intact from industrial coastal China deep into the interior ahead of the Japanese invasion.

Burma Road—I saw scarcely a young man helping to get in the harvest, at the busiest season of the farmer's year.

Young men have been drafted away by the hundred thousand, not only for the Army but for making and keeping up the new truck roads that are opening up the deep hinterland of China as well as making possible the supply and transport of the sinews of war. This partly explains China's wartime shortage of labor.

Millions Help Open China's West

There is also another explanation.

Think, for instance, of the tremendous migration of people from the invaded provinces of China into the free west. This has been estimated at from forty to sixty million people. Even the greatest years of European migration to the Americas never saw anything like such numbers on the move.

These people came from the richest, most

thickly populated agricultural provinces. The Province of Szechwan, which is today the Chinese National Government's stronghold, is also a great food-producing area, with rich irrigated farmlands; but the rest of the west of China is comparatively thinly populated.

In the western provinces, however, are found the very raw materials which China needs to carry on her war of survival and to energize her future industrialization. China's major oil wells are in the far northwest. In both northwest and southwest are rich deposits of coal and iron.

New people are needed to develop these resources; and so the millions of refugees, instead of being a burden on an overcrowded country, provide instead a new population which the country needs.

Of course this does not mean that China's wartime development is painlessly easy. Far from it. There is a terrible margin of suffering during the time it takes for the refugees

to find the places where they are needed and to begin their work.

This is the gap that is partly being filled by America's contributions to China through United China Relief.

Perhaps even the people who contribute to these funds do not always fully realize how they are taking part in the making of history; for they are not simply helping to feed the hungry and tend the sick until things get better, but are actually helping the Chinese to transform their own country.

A dramatic illustration of this is the work for the "Warphans" under the War Orphans Committee, in which Madame Chiang Kai-shek takes an especially active interest (page 359).

Families Shattered by War

The Chinese family system, as it used to exist, could be called the greatest insurance syndicate in the world. The functions of life insurance, and of insurance against fire, accident, unemployment, and old age, were all taken care of under the system of mutual loyalty, mutual responsibility, and filial piety within the Chinese family.

The war has changed all that. Obviously, when forty to sixty million people are driven from their homes by invading armies, families cannot hold together as they migrate. One of the most terrible things about this vast forced migration is that it is made up of the innumerable fragments of hundreds of thousands of shattered families.

For this reason Madame Chiang's War Orphans Committee is more significant than it would be in a European country or a nation such as ours. It means that people are consciously assuming the burden of new responsibilities to take the place of the old family ties.

The children who are brought up in these orphanages are a new generation in the long history of China: children who are cared for by the public, not by their own families; children who grow up to be first and foremost citizens of a state, not just members of families.

The difference between China and other countries is that in other countries the industrial revolution itself has destroyed the old way of life before building a new one. In China it is an alien invader who is doing the destruction. The new industries are healing and creative; they are knitting together new families, creating new employment and new citizens.

You can see this illustrated in any number of ways in wartime China. In one large city

I saw a number of textile mills. The conditions in all of them were better than in the old mills of prewar treaty ports like Shanghai and Tientsin.

Most of the workers were girls in their teens. Most of them lived in dormitories at the mills, though a few came every day from their homes. The mills had their own kitchens, health centers, and schools.

Girls who a few years ago would have been doing housework at home were drawing wages that contributed to the family. They were getting more and better food than they would have had in the poor families from which most of them came. Many were getting an education that their families would not have been able to afford.

As a byproduct of their skilled labor they were becoming emancipated women and good citizens.

Nor is it only the city that is affected. The finest silk production of Old China was in Chekiang and the lower Yangtze Valley (page 362). At one time it had almost been ruined by Japanese trading tactics. To make sure of their own control of the world silk market, the Japanese would buy irregular quantities of silk on the Chinese market at high prices and then throw it back on the market at cut prices, thus creating a confusion which destroyed the Chinese industry.

Under the National Government, a strong effort was made to revive the Chinese industry, from the breeding and feeding of the silkworms to the production of the finished silk. For a few years the progress was amazingly rapid.

Then came the war, and the silk-producing regions were mercilessly devastated.

Even Silkworms Join the Migration

In one of China's western provinces I found that the silkworms, like the people, had been migrating from the invaded coastal regions.

I was traveling with a Chinese engineer who was in charge of building a strategic railway. Twenty years ago he learned English under my father and German under my uncle. After studying in America, he became one of the young, energetic revolutionaries who were close personal followers of Chiang Kai-shek, then himself one of the younger generals under Sun Yat-sen.

In due course, my friend served for a time as reconstruction commissioner in Chekiang, where he took an energetic interest in reviving and improving the production of silk.

While we were inspecting the line of the new railway which he was building, he told me he wanted to visit a village where a new

The men doing the heavier work have tethered their horse on a grass-grown dike separating the paddies. The Kunming plateau is exceedingly fertile, producing two or three crops a year.

silk center had been started. There we found that most of the younger technicians, both men and girls, were refugees from far Chekiang.

They recognized him, crowded round him, often with tears in their eyes, and proudly showed him the work they were doing. They had acclimatized their silkworms so well that they were getting more production and better quality than in their native province, from which most of them had traveled on foot for a thousand miles and more with incredible hardships and adventures.

This engineer was a superb example of the generation that is making China anew. Like many of the Generalissimo's picked men, he was about fifty but looked thirty.

China's Amazing Young Men of Fifty

Nothing is more amazing than these "young men" in their fifties. Every one of them is an active, driving man. Almost always he carries more than one high responsibility and has been working without rest for 15 or 20 years.

Yet the typical member of this group has a smooth, youthful complexion, not a gray hair, a quick laugh, and the zest and enthusiasm of a young man who is just beginning to make good.

The answer must be, I think, that for keeping young there is nothing like a job in which you are always making new things, and making them work.

My friend's new railway was a job typical of the New China. In organizing it he combined the most ancient methods with the most modern devices.

Most of the engineering had to be done by human labor, with the assistance of a little black powder. Dynamite was much too precious for "civilian" blasting.

Moreover, the line was being laid through stretches of wild country where food was scarce. He had therefore to organize work gangs of thousands of men and women, to buy food for them over a wide radius, and to transport the food to the work sections.

In addition, he had to keep in touch with his advance surveyors and section engineers and to keep a check on the rate of shipment of American Lend-Lease supplies from far-distant Burma.

Portable Radios Direct Human Caravans

He did all this largely by a skillful use of the radio. He had a number of small, portable radios, spotted at strategic points, and radio centers at his main headquarters and field headquarters. On sections where he

could travel by car, he even had a portable radio in his automobile.

In this way he could hold a regular radio roundup and conference every morning, which kept him in exact touch with routine work and sudden emergencies in the whole vast organizational complex he controlled.

It was strange to think of human caravans of men—and women—carrying rice on their backs over mountain trails that had never seen a wheeled vehicle, while their movements were being directed by this latest means of communication.

In some of the valleys lurked the dreaded cerebral malaria, which is feared like the plague—and one main section of the line was to run through a bad malarial district.

"The Germans showed that you can use blitzkrieg tactics," said my friend. "Then the Russians showed that you can use blitzkrieg against the Germans. Now I am going to show that the only way to break through a malaria front is by blitzkrieg."

His method was to leave that section alone until the season when malaria was least active, then to concentrate men, supplies, field hospitals, and everything he had and break through the whole bad section in one rush of frantic work lasting a few weeks.

He made no exemptions. Engineers and technicians had to take their chances with the unskilled labor, and this ensured a high morale.

Geography Fights on China's Side

Geography plays a dramatic part in the China of today. A skillful use of geography enabled the Generalissimo to carry out his policy of "trading space to get time" in the four and a half years in which China was fighting alone; and the same geographical factors will have much to do with shaping the China of the future.

Maps of the long fighting front which divides Free China in the west from invaded China in the east ought always to be drawn in such a way as to show the relation of mountain masses to open plains. An ordinary newspaper map reveals no particular reason why the front lines should be where they are and not somewhere else. A map which shows the relief reveals at once why the fighting lines are where they are (see "sculpture map," pages 344-5).

In the first rush of their attempted conquest, in 1937 and 1938, the Japanese, by the use of tanks and artillery and by their overwhelming superiority in planes, were able to overrun the wide and open valleys of the lower Yangtze and Yellow Rivers. Here the Chinese could only retreat, avoiding encirclement and an-

Manpower Still Does Most of China's Work

Railways and roads are slowly searching out long-bidden corners of China. Yet even where trucks move, coolies with carrying poles plod side by side with mules and horses, portaging bales of tea, wool, and hides, and now supplies for soldiers.

nihilation while inflicting considerable losses on the invaders.

Then the Chinese began to feel the mountains at their backs, and this enabled them to fight a kind of war that baffled the Japanese tanks and planes and artillery—a poor man's war.

Making use of hilly, broken country, the Chinese are now able to slow up and tear to pieces even heavy Japanese offensives with trench mortars and rifle and machine-gun fire.

This kind of defensive the Chinese can keep up more or less indefinitely; but they need heavier equipment, especially mobile artillery, antitank guns, and planes, if they are to move back in force into the open plains to recover territory from the Japanese.

It is worth understanding the essentials of the military front in China, because the military front roughly follows a great historical dividing line. The heart of Old China lay east of this line, in the vast sweep of country

between the lower Yangtze and the lower Yellow Rivers.

There the agricultural civilization of China reached its highest development, marked by the stately palaces of Peking (now Peiping), great engineering achievements like the Grand Canal, and the most sophisticated development of philosophy, art, and poetry.

Chinese Shunned the "Barbarous West"

Peking, at one end of the Grand Canal, was the center of the philosophy as well as the practice of the science of government and the art of war.

Hangchow, at the other end, was for centuries the dream city of silks and sophistication, the poetic Paris of beautiful women and bohemian living.

Westward of this dividing line there was less of the typical Chinese irrigated agriculture, because of the higher, more rugged land. Even such fertile regions as the Chengtu plain

His small playmate eyes the beverage enviously, though it is simply water from the barrel. The group is waiting patiently outside a dugout in Chungking in an interval between air raids. The lull came after departure of the first flight of Jap bombers and before arrival of the next.

of Szechwan were isolated by mountains from the main part of eastern China, and so reflected the main culture of China in a cruder, more provincial way.

Generally speaking, in the mountainous west the smaller scale of irrigation meant a more thinly scattered population. It was a backwoods area from which ambitious and successful men liked to move eastward, not an expanding frontier to which men looked with hope or enterprise.

"Go west, young man, go west," was not a romantic saying. Instead, Chinese poetry and history are full of the melancholy of exile and privation in the barbarous west.

In spite of this, the west, and especially the northwest, was also, centuries ago, the land through which ran China's main avenues of contact with foreign countries and people. Marco Polo came this way some two hundred years before the time of Columbus.

The Venetian, as we often forget, was not

a romantic adventurer or a visionary but a young merchant learning the family business and accompanying his father and uncle on a journey of a kind that had already shown a good profit.*

China Turns to Marco Polo Trails

In one way, what is happening in China today is a return to the days of Marco Polo. With most of her coast and her ports occupied or blockaded by Japan, China has turned once more to the ancient land routes that once were her most important links with the outside world.

The route through central Asia along which move supplies from Soviet Russia is one of the many variants of the ancient trade routes and routes of migration known by the peoples of the heart of Asia since the Stone Age.

Along this route—which is really a network

Let the Bombs Cr-r-umph Above! Quiet Reigns in an Underground Hospital

Tunnels connect the twenty cave-rooms of this subterranean hospital—complete with operating room, research laboratories, wards, and kitchen. It was blasted out of the solid rock hill upon which stands Chungking (page 343). Deep in the earth the "men in white" tend the sick and wounded. American medical equipment and drugs are supplied by the United China Relief.

of caravan trails—the silk of ancient China was carried as far as the markets of Imperial Rome. By the same routes the first grapes and watermelons, and such handicrafts as the making of glass, were introduced into China.

Not only Buddhist pilgrims but Nestorian Christian priests also traveled back and forth between China and central Asia and north-west India by these routes.

Thus the Poles, both on their first journey to China and on the second when they took young Marco along, were traveling by roads which, though dangerous, were the least dangerous and the best known to the serious business men of their day.

It is interesting that a Chinese general and statesman who ventured far into central Asia about 2,000 years ago and returned to report to his Emperor on the kingdoms of that region discovered that there must be a southwest road from China into India because he found

in central Asia Chinese products which had come this other way around.

At that time the Chinese had not yet conquered and civilized the wild tribes of the southwest, but somehow a small amount of Chinese trade was even then filtering through the warring tribes.

Trucks and Planes Instead of Elephants

Burma never became one of China's main frontiers, because of the wildness of the country and the deadly malaria in the deep jungle valleys; but veteran missionaries, even today, remember being told, many years ago, how elephants used to come up the trail that was grandly known as the Ambassadors' Road, bearing a token tribute to the Manchu court in Peking.

A new kind of history is today filling in the gap between those vanished elephants and the devil-may-care drivers of trucks on the moun-

Before the Fall of French Indo-China, the Yunnan Railway Was China's Major Life Line

Over this French-built narrow-gauge railway between Haiphong and Kunming (formerly Yunnanfu) Britain and the United States shipped supplies and munitions to hard-pressed China. Occupation of the French colony by the Japanese in 1940 cut the route, and China became dependent upon the Burma Road.

tain roads, the tough Chinese infantry who opened a new chapter in China's annals by coming to the aid of China's friends on Burma soil, and the gallant aviators of the American Volunteer Group who, operating from improvised "guerrilla airfields," have fought so brilliantly to keep the sky open between China and Burma and India (page 359).

Half a century ago there was talk of opening a railway approach to China from Burma. This talk was an echo, faintly heard along one of China's remotest frontiers, of the building of America's transcontinental railways.

Would these railways, linking up with newer and faster steamers across the Pacific, compete with Britain's sea route to China and Japan? Would it not be wise for Britain to open up her own land access from Burma to China?

However, nothing came of this talk except inconclusive boundary negotiations between Britain and China. Except for a narrow-gauge French railway from Indo-China, Yunnan Province continued to dream like a Sleeping Beauty, romantic and lovely but undisturbed.

The trade and cultural influences of the West kept to their established routes, en-

tering China at Canton and Shanghai and the other coastal ports, and people forgot that the "back doors" of China had ever been the front doors.

War Wakes China to Her Destiny

Then came the present war, and something new in history: China herself determined to open a new way of access to the outer world.

Thinking chiefly of the guns and goods the Chinese needed, few people realized how revolutionary was China's achievement in building the Burma Road. Yet it was nothing less than revolutionary. It meant that in opening up and developing the still backward parts of Asia, which had always been regarded as the mission of the powerful Western countries, the initiative had passed to China.

It is hardly possible yet even to estimate the consequences of this. French Indo-China, the Philippines, Thailand, Malaya, and the Netherlands Indies, as well as Burma, are occupied today by Japan; but America, Britain, the Netherlands, and Australia, as well as China, are determined that this usurpation shall not last.

It is true that the Japanese have now cut the Burma Road; or rather, they have oc-

cupied the approaches to the Burma Road. In Chinese territory, they have been able to set foot on only a very small stretch of the road, and the real significance of the great wedge which they now occupy in Burma is that they threaten India quite as much as they do China.

While it was the Chinese who built the original Burma Road, the task of establishing new communications by land between China and India is now a challenge to the United Nations as a whole.

The Chinese, on their side of the frontier, can build a new stretch of road to link the existing Yunnan Province section of the Burma Road with India; but this must be joined to the railhead in Assam on the British side of the frontier. There are two or three alternative lines of valleys and passes by which this can be done (map, pages 344-5).

When Japan has eventually been driven back, there will be portentous changes all over Asia. A key factor in those changes will be the Burma Road, for it is obvious that the use of the Burma Road will not lapse when peace returns. On the contrary, the route will certainly be supplemented by other truck roads leading into Assam and northeastern India.

There will also be air routes linking India, Burma, Malaya, Thailand, Indo-China, and China, and at least one main railway, with branches perhaps into both India and Burma. The almost incredible mineral resources of Yunnan, for the processing of which there is an immense reserve of water power, will find outlets to the sea at both Hanoi and Rangoon.

World's Greatest Mass of Mankind Linked

Only two events in the development of sea communications—the digging first of the Suez Canal and then of the Panama Canal—can be compared in importance with this new complex of land and air routes.

There are about 389 million people in India and about 450 million in China. If we add to these the millions of Burma, Thailand, and French Indo-China, whose land frontiers touch the rich but underdeveloped provinces of southwest China, it means that the greatest concentrated mass of living mankind will be closely linked together by interior land communications for the first time in history and energized by all the technical developments which those new communications will make possible.

Paul G. Guthrie

China Stands Behind Chiang Kai-shek

For five long years, with infinite courage and patience, the Generalissimo has led his people in the bitter, costly war with Japan. He calmly meets the tragic blows to his united nation, which he forged from China's many disunited provinces.

For centuries there has been a cultural traffic of religion, philosophy, and handicrafts among these peoples, but never before has there been the possibility of moving goods in quantity by direct, short, rapid methods. That means that to the ideas which all these peoples already have in common, new common ideas will be added.

The term "Asia" has always linked together, inclusively but loosely, vast regions which had quite as many characteristics distinguishing them from each other as they had in common.

From now on, it will mean something much more compact, and as huge as ever in bulk. And the lead in bringing all this about has been taken by an Asiatic people, the Chinese.

Increasingly in the long run, and already to a great extent today, this means much more to the hundreds of millions of people of Asia than Japan's version of Asia for the Asiatics, which means only a harsh imperialism under the most ruthlessly militaristic people in Asia.

This may help to explain why the China of today is the most fascinating country in the world. You have always about you the sense of expanding horizons—not the expansion of annexing territories and conquering peoples, but the expansion of ideas, the widening of access to new possibilities, a feeling of liberation, of room to move and opportunities to build and create.

Man of Serenity and Flame

If I were asked to describe in one word the character of Generalissimo Chiang Kai-shek, I should say that the best word would be "serenity," but even then one word would not be enough, because it is a special kind of serenity, steadily lighted by an intense flame.

One reason why he so unfailingly communicates, in any company, a feeling of sure poise, of complete command of the situation and himself, is that he never allows himself to be entirely overwhelmed by the problems that swarm around him and the urgent, quick decisions that he is called on to make.

Because of his unfailing power of detachment, he is always able to see in proportion both the details of today and the potentialities of tomorrow. Even in company he is a man of long silences, and he likes to withdraw to walk for half an hour under the trees on a mountain-

side, or to sit on a rock watching the subtle changes of water in a still pool.

Something of the same feeling of creative possibilities and expanding horizons is to be found among the men who work under him. Chungking is not only a city of bombings and suffering and uncomfortable living; it is also a city of tireless thinking.

In the long hours in the bomb shelters I have never once found a lack of people to talk to; and the talk always ranges over new possibilities, new developments, new combinations, new energies to be released. These are human resources that come right up from the roots of the people.

You are constantly being reminded in China that you are living in a culture that is ancient as well as vigorous. It has had thousands of

years to seep through the consciousness of the whole people.

A man may be illiterate, but he knows through folklore, legends, and songs something of the broad sweep of his nation's history, and something of the story of his own region and clan that ties in with the history.

Give that man the power to read and write; give him tools and machines, and the change is almost chemical. He becomes at once a man of the 20th century, but with a rich background of all the centuries that went before.

You can see that chemical change happening all around you in wartime China, and it gives you new strength now that our own country is at war, because it shows how the ability to create and build new things is dominant over the power to destroy.

Notice of change of address for your NATIONAL GEOGRAPHIC MAGAZINE should be received in the offices of the National Geographic Society by the first of the month to affect the following month's issue. For instance, if you desire the address changed for your November number, The Society should be notified of your new address not later than October first.

Danish Officials and Assorted Eskimos Welcomed the Americans to Greenland

Greenland Turns to America

BY JAMES K. PENFIELD

United States Consul at Godthaab, Greenland

UNTIL April, 1940, I had no more idea of going to Greenland than trying to fly to Mars.

After the fall of Denmark on April 9, 1940, Greenland suddenly turned to the United States for food and supplies for her 20,000 people. So it happened that Vice Consul George L. West and I boarded the Coast Guard cutter *Comanche* bound for Godthaab to open the first American consulate ever established on the world's largest island.

A year later, under an agreement signed by the Danish Minister at Washington, American soldiers and hardy workmen from our mid-northern States poured in to build commodious air bases complete with runways, hangars, and snug cabins. Airplanes, even speedy pursuit ships, now use these bases for short hops to European fronts, for geography makes Greenland an important way station on our busy warplane ferry routes to Iceland and Great Britain.

Even the captain's shower on the 165-foot *Comanche* was stuffed with our hastily bought skis, snowshoes, rubber boots, other supplies, and books as the little ship pitched and rolled its way northward.

After days of boisterous weather, we got our first view of the hymnal's "icy mountains," a few snow-capped peaks buttressed by lower ranges, all barren and forbidding in the cheerful sunshine.

As we steamed slowly up Arsuk Fjord, an Eskimo paddled out to meet us in his kayak, but even our Danish-speaking crewman could get no intelligible replies. Sailors shouted, "Hey, Joe, where's your penguins?" "Any night clubs in town, Butch?" and similar questions. But our friend only smiled and grunted pleasantly.

We rounded a point and before us lay Ivigtut, our first Greenland port. My first impression was not enchanting—just a big corrugated-iron building, a collection of cranes, and dozens of drab houses straggling up the barren mountainside.

As we drew closer and tied up to a buoy, at least a dozen Danish flags were run up, a siren sounded, and many people appeared. These sophisticated Greenlanders were fair-skinned and wore bright-hued polo shirts and other familiar clothes rather than sealskin pants and parkas.

As soon as the *Comanche's* boat was put over the side, we went ashore and were greeted

at the landing by the Danish Government Controller. Before he had time to say, "Welcome to Greenland," a swarm of camera enthusiasts surrounded us. Handshakes were as abundantly photographed as if we were arriving in New York.

On our way up to our host's house we passed a big pit, several hundred feet across and almost 200 deep.

"Is that the famous cryolite mine?" I asked a young engineer.

"That's right," he replied.

Stooping, he picked up a piece of rock which looked like quartz.

"And this is cryolite; we blast it down from the sides of the pit. Greenland, you know, is the only place in the world where this strange mineral is found in commercial quantities. It is used in making aluminum."

Inside our host's house on the highest hill, we could imagine ourselves in Copenhagen. Electricity, telephone, modern plumbing, all were there.

"Don't think all Greenland is so," my engineer friend warned in quaint English. "All the miners are Danes, and the one who gets less moneys has more wages than even the Governor of Greenland. The officials spend most of their lives in the colonies with very low wages and primitive living, only just to help the Greenlanders.

"But we in Ivigtut come out for usually only a few years to save up some moneys; we have electricity, central heating, plenty of beer and schnapps."

Huge Island Orphaned by War

The *Comanche* was the first vessel to call at Ivigtut since the last cryolite ship sailed the previous November. No news had come from Denmark since the German occupation. No word had been heard from the mine's supply ship which left Copenhagen six weeks before. For all the Ivigtuters knew, their badly needed supplies were at the bottom of the sea.

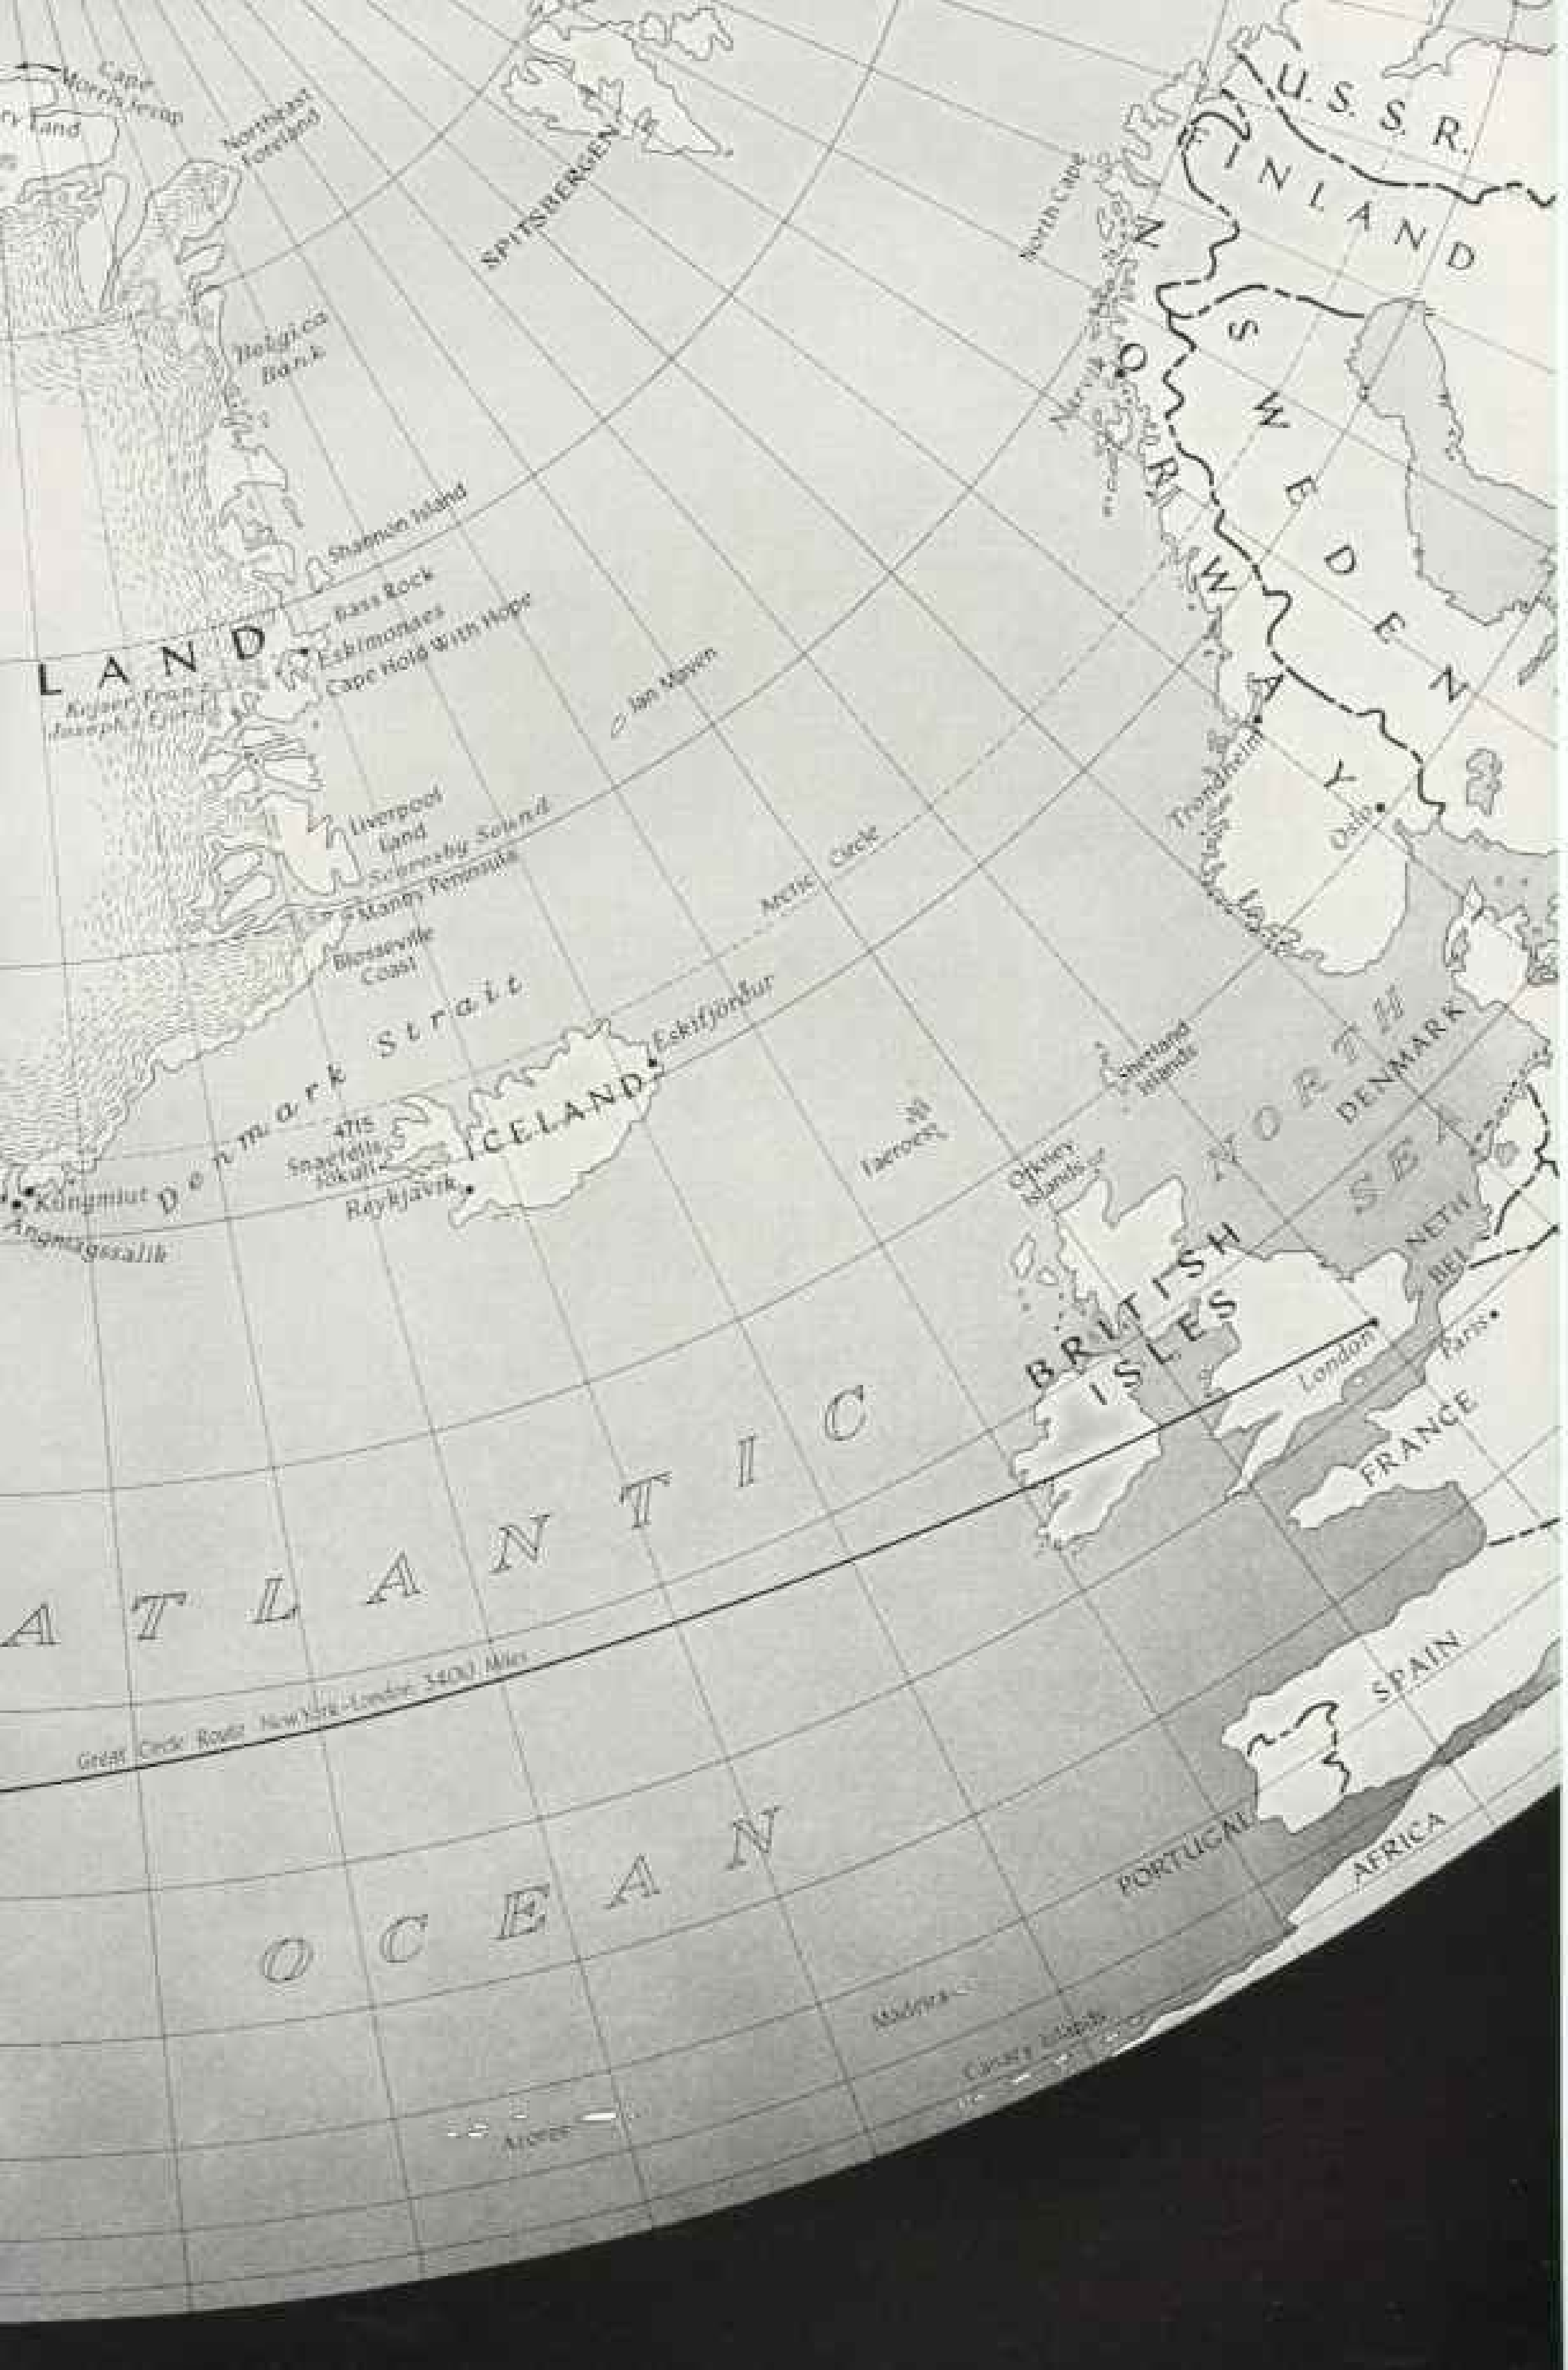

We were the first tangible evidence that Greenland had not been forgotten. The entire ship's company was royally entertained.

Early next morning we departed, and 36 hours later we dropped anchor in the inner harbor at Godthaab, in almost the same latitude as Reykjavik, Iceland, and Trondheim, Norway. At 8 o'clock, daylight-saving time (I could find no reason to save daylight at this time of year, when the sun sets for only a few

Icy Greenland, an Aerial Stepping Stone to Europe

In the accompanying article, James K. Penfield, the first American Consul to Greenland, describes two years of life on the world's largest island. He was sent to the orphaned Danish colony as the vanguard of American relief. Later he saw United States Army Air Forces build bases on its fertile fringe to serve warplanes flying to and from the British Isles.

hours each day), we embarked in the ship's boat for the 20-minute ride to the settlement.

A hundred or more excited Danes and Greenlanders lined the small landing. As I stepped ashore, three toy cannon boomed out a consul's salute. The Governor of Southern Greenland, Mr. Aksel Svane, resplendent in formal attire, pushed his way forward to give the usual cordial greeting: "Welcome to Greenland. Won't you come up to the house for coffee?"

The Governor's residence was only 200 yards from the landing, but the walk took us twenty minutes. Every few steps an official would be introduced, tip his hat, shake hands, smile cordially, and say "Welcome!"

No Hotels or Real-estate Agents

My first official problem was to find a place to live and work. There are no real-estate agents or hotels in Greenland. Every house in Godthaab large enough to do duty as a consulate belongs to the Administration. So I approached Governor Svane for help.

"Oh, yes," he said. "The doctor is a bachelor. He has kindly offered to move to the hospital, making his residence and office available to you."

A Greenland girl cooked, kept the house clean, and carried water for the equivalent of \$3 a month. We had communication troubles, of course, but sign language was adequate for routine requests. In crises we would all parade over to the house of an obliging English-speaking neighbor for interpretation.

At first Marie distrusted our American canned goods, but gradually she learned to identify the labels. One day she discovered the tinned fried onions, so that evening we had fish with fried onions. The next noon we had the same. The following night—fish and onions again. Finally it took a trip to the obliging neighbor to head off this run of cod.

Danish families have adopted many Greenland foods, so they import few canned goods. Fish is the staple. "Fish" mostly means cod, but includes capelin, halibut, flounder, haddock, and salmon trout. Then there are the various sea birds, but most of these taste a little fishy unless properly prepared. We found cooking them with a little bacon does wonders.

Parlor-grown Tomatoes—with Ribbons

During the summer we enjoyed particularly a land bird, the ptarmigan, or arctic grouse. In the fall comes lamb, raised in southern Greenland, and, during the two-month open season, reindeer venison.

Many housewives supplement these staples with a few vegetables grown in gardens behind

neat white picket fences, in glass-topped boxes, or even in plots in living-room windows. I know of one Danish woman who grows tomatoes in her parlor windows, carefully tying up the fruits with ribbons!

Our house was equipped with both a garden and boxes, but nursing radishes, lettuce, and spinach was too much of a chore for a pair of bachelors. So we stuck to our cans and an occasional welcome gift from our neighbors.

As the summer wore on, I picked up a few words of Danish and began to feel myself a part of Godthaab life. One or two evenings a week we dined in a Danish home on a typical sweet soup, seal liver and potatoes, salad with home-grown lettuce, and ice cream. Then we would play bridge, and about midnight return to the table to eat cakes and drink coffee before going home.

Tuesday evenings are movie nights. Most of the forty or fifty Danes, and as many of the 700-odd Greenlanders as can squeeze in, troop up to the Seminary gymnasium, Godthaab's movie emporium. A tired little projector reels off a film, usually European, of uncertain vintage.

I was startled when I first arrived to hear school children frequently singing "Home from Work We Go." Though the words were unintelligible, there was no doubt as to the tune. I thought it strange that sailors from the *Comanche* could teach Greenland children to sing American songs so quickly.

On Tuesday the phenomenon was explained; we saw the star number of the film library, "Snow White"—in Danish, if you please!

One sunny evening in August, we had a Danish couple and the captains of two U. S. Coast Guard cutters in for a dinner of tinned ptarmigan. I had noticed during the past few days increasing numbers of icebergs, many bigger than a living room, drifting into the harbor. I remarked to the Dane, a long-time Greenland resident, that summer seemed a funny time of year to get iced in.

"Yes, very strange it is," he replied. "Godthaab's fiord never freezes in winter because the average temperature for January and February is 14 degrees plus (Fahrenheit), and the current is so strong that the salt water cannot freeze at that temperature.

"This ice you see is *storis*—you call it pack ice, no?—which is carried by the current from east Greenland around Cape Farewell in late winter or early spring. It works gradually up the west coast, blocking harbors usually as far as Frederikshaab, the next colony south of here. Once, some years ago, the pack got this far north and even Godthaab was blocked."

Suddenly one captain exclaimed, "Why, it's

Godthaab's Wooden Church Traces Its History Back over Two Centuries to Valiant Hans Egede

Modern colonization of Greenland began with the arrival of the Norwegian pastor and his courageous wife on May 17, 1721. They hoped to find descendants of the early Northmen, who came to Greenland centuries before, but only Eskimos greeted the adventurous couple. Egede founded the settlement of Godthaab.

after twelve! What's happened to the boat I ordered sent in for us?"

We all went out to the front door to look at the landing just a few yards from the house and to our surprise found that the ship's boat was blocked by *storis* and couldn't make the landing. Those innocent cakes of ice made such an effective barrier that there was absolutely no way for the distraught captains to get back to their ships (page 381). After a couple of hours of futile worrying, they accepted makeshift beds in the consulate.

Next morning the captains were relieved to see their vessels still there and the ice apparently not so closely packed. They persuaded a Greenlander, Pavia, to take them out in his eight-foot rowboat.

For the next ten minutes we watched the two dignified gold-braided Coast Guard commanders trying to keep their balance in the tiny boat as it twisted through the pack ice.

When Pavia had delivered his passengers safely, I saw him gratefully accept two cigarettes in payment.

Later in the day, the cutters were able to get out of the harbor and make for the open sea. They were lucky, for the following day Godthaab was blocked by the pack ice and for the next few days nothing but an ice-breaker could have forced its way in or out.

The Governor and I planned an inspection trip to some of the other colonies on the four-masted sail and steam vessel *Gertrud Rask*, one of the two Greenland ships to escape Denmark before the occupation.

One evening, when we thought our ice blockade was breaking up, I rowed out to the *Grask* (as she is known locally), expecting to leave early next morning. But I awoke to find us still moored, unable to move because of the chunks of ice and a high wind. So we were forced to spend another night in harbor.

Next morning we found the ice pack had vanished—just as suddenly as it had appeared. That was the end of *storis* for another year.

The ship's larder was not too plentifully supplied, and we were so crowded that passengers were sleeping on all the benches in the little smoking room. But the *Grask* is a homey ship, and its heavily reinforced wooden hull is specially designed for navigating Greenland's ice-infested waters.

As we cruised northward, we began to see the mammoth icebergs which are calved by the glaciers of northern Greenland. These drift around to the north, then south along the Labrador coast, and finally, before they melt in the warm waters of the Gulf Stream, threaten steamers in the transatlantic lanes.

We followed the path of the icebergs north,

and as we steamed across Melville Bay the midnight sun shone on a vast armada of these beautiful monsters.

It was very clear the evening we sighted Cape York. Though we were miles away, we could see the tall shaft of the Peary Monument, which stands high on top of the cliff. Through peace and war, fair weather and bad, it stands as a permanent reminder of the work of that great American explorer, Admiral Robert E. Peary. Captain "Bob" Bartlett, who commanded Peary's ship, the *Roosevelt*, erected this monument ten years ago.*

Eskimos Revere Memory of "Great Peary"

When we arrived at Thule, I found Eskimos who still revere the memory of Peary. In fact, I saw there one of the men who accompanied Peary to the North Pole in 1909. He was sitting on a packing case watching the unloading, a dignified and strong-looking character. He still is treated with deference by his fellows because of his connection with Peary-ark-suah ("Great Peary"), as he is called.

Thule, a settlement of 100 or so Eskimos and two Danish families, is itself a monument to another great friend of the Eskimo, the late Knud Rasmussen. Here he founded a trading station in 1910, where the Eskimos can barter foxskins for the foreign tools and goods which Peary taught them to use (page 382).

While I was at Thule the Greenlander preacher got married, and in accordance with custom he held a "kafe-mik." Large caldrons of coffee and mountains of little cakes were set out in the sunshine beside his house and the whole settlement dropped by to sit or stand about, gossiping and sipping coffee.

Dressed up in their Sunday best, they made an unforgettable picture. The women wore the colorful costume shown in Plate IV. The men, too, were striking in snow-white, bushy polar bearskin pants and white *anoraks* (slip-over cloth parkas).

A Picnic on the Greenland Icecap

While here, I visited the great Greenland icecap which comes down to within a few miles of Thule. This immense sheet of ice, many thousands of feet thick, covers four-fifths of Greenland's 827,300-odd square miles.

From Greenlander friends we borrowed two sledges made of wood with iron runners and bound together with rawhide. Each was pulled by a dozen dogs spread out in a fan.

The dogs started off with a flourish, but the going soon got tough. There was not

Klinckschmidt from Black Star

"I Can Answer, Teacher!"—the Three R's in the Sub-Arctic

The native instructor at Julianhaab also teaches Danish and Greenlandic. The latter, derived from Eskimo, forms words of amazing length by additions to the root. Such words express whole sentences.

enough snow for good sledging. Frequently we had to help the dogs by walking or pushing the sledges over bare patches. In a few hours we reached the edge of the cap and walked up on the glistening, granular ice (page 380).

To protect us from the cold wind, we tipped the sledges on their sides, got a primus stove going, and brewed some coffee to drink with our sandwiches. Returning to the settlement thoroughly tired, we were able to say, "I've stood on the Greenland icecap!"

From Thule we sailed south, stopping at many settlements on the way. Upernavik marks the northern limit of the regular shipping service. We arrived on a gray day. The whole settlement seemed drab and rather dejected, as if already depressed by the thought of the eleven sunless winter weeks before it.

Proven, our next stop, was much more cheerful. This little settlement is one of the few places in Greenland where whales are still caught in any numbers. Small white whales (not the huge Moby Dick variety) seem to be attracted to its narrow passage, in which nets of the fishermen reap a rich harvest. Sometimes Greenlanders in boats encircle schools of the whales and drive them into shallow water. They make leather shoestrings from the skins and get oil from the blubber.

A Danish official who returned to his post on the *Grask* regaled us with tales of how fine a place it was. To prove his boast he invited us to his house for a feast. We went ashore in bright moonlight and climbed the hill to his residence perched on a cliff.

While we were enjoying the winking lights of the settlement and the *Grask* bathed in the moonlight below, our host came out and announced, "I have a surprise for you."

On the dinner table steamed a big platter heaped with some strange delicacy covered with rich brown gravy.

"What do you think of it?" he asked, after helping me to a generous portion.

"Why, it tastes good," I replied. "Not a very pronounced flavor, but nice and crisp and chewy. What is it?"

"It's *matak*, the outer skin of the whale. Unfortunately, this is only canned. You should try it raw, cut from a freshly killed whale."

Coal Mined on Disko Island

Sailing early next morning, we put in at Marmorilik, site of an old marble quarry. Before the Danish market was cut off, 400 Greenlanders worked modern machinery here. Now the place is desolate, with blocks of

Kitchener from Black Star

Far from Cold Is a Greenland Greeting—Broad Smiles Visa Your Passport

A nurse and cook at a hospital window in Jullanebaab show typical Greenlander good humor. Eskimo stock has absorbed much foreign blood. Some natives are blond and a few are red-haired and freckled.

marble waiting patiently on the docks for a ship which may never come. Many workers were transferred to the coal mine; the others were given new kayaks and sent back to the fishing and hunting life whence they came.

Later we visited the coal mine on Disko Island. Here Greenlanders produce a low-grade lignite which is mixed with imported coal and used for cooking and heating. Black coal veins scar the face of the mountain, which rises almost vertically from the shore.

We approached Umanak in a dense fog, but our captain brought us in as accurately as if the air were clear. No sooner was the anchor down than a little motorboat materialized from the mist to take our lines ashore, and we found ourselves safe in Umanak's tiny harbor. Navigation in Greenland seems strange and wonderful to me, but to our captain, who had sailed these inhospitable coasts for 20 years, ice, fog, snows, and inadequate charts are simply part of the day's work.

One of the Danish families I visited at Umanak was busy packing for a vacation in the United States.

"Oh, I'm so glad to see you," the lady of the house greeted me. "Tell me, do we need overcoats in Florida?"

"We cannot go to Denmark," explained the

husband, "so we shall vacation in Florida."

Umanak residents are proud of their new church which Danish masons built from Greenland stone quarried on the spot. A model hospital was shown me by the only woman district medical officer in Greenland.

Back in Godthaab, we found the settlement had become a boom town. Supply ships had arrived to swamp all storage space. Buildings were going up to house the influx of Danish officials. Even the new American Consulate, ordered from a mail-order catalogue, was nearly finished. Canadians were putting up an adaptation of an Arctic reindeer inspection station for their consulate.

One day, walking out to the back harbor, I saw islanders harvesting green barley growing in fields alongside the road. It was the first cultivated land I had seen in Greenland except for small garden plots. I asked the manager why the grain was being cut green.

"Barley," he replied, "won't ripen in our short summer; so we must harvest it green. It does nicely as winter fodder for the sheep."

This "road," by the way, was the only one in Greenland. The settlement's few bicycles and carts, pulled by diminutive Icelandic ponies, use its two-mile length. Greenland is not bothered by motor traffic!

James K. Pennington

Where Solid Ice Flows Like a Lazy River—the Frederikshaab Glacier, an Outlet for the Icecap

Covering four-fifths of Greenland is the Inland Ice, a frozen sea with a maximum measured depth of 8,850 feet. Here weather is born—storms howling at 100 miles an hour and temperatures sinking to -85° F. Nunataks (mountain tops) rise like islands above this waste, but, except along the edges, life is nowhere. Mirages and snow blindness harass the explorer. In winter, man's expelled breath crackles as it freezes. In summer, rivers of melted snow cascade into unflathornable crevasses. Here at its moraine, where it plows up the soil, the glacier is granular and almost black. Note tiny figure of a man perched on the ice in center.

James K. Pentecost

Godthaab, Meaning "Good Hope," Sees Its Name Come True as the War Boom Enlivens This Capital of South Greenland

Five ships, including a white Coast Guard cutter, rest in the fjord. A housing shortage has brought a rush of construction. American plumbing is a sensation.

Harbor-blocking. Ship-crushing Pack Ice Serves One Good Purpose: It Carries Seal Herds to West Greenland

Polar ice, drifting south past the east coast, swings north at Cape Farowell. Here, in August, 1940, it blocks Godthaab for the first time in many years (page 372).

James K. Probst

Even in Far-off Thule—Symbol of Remoteness and Isolation—Natives Feel the Effect of World Events

After Denmark fell, the task of ministering to the needs of Greenland's natives fell to America (page 369). At Thule, Knud Rasmussen founded the farthest-north trading station for the "Arctic Highlanders" in 1910. The ancients' *Ultima Thule* (most distant unknown land) inspired the name. Only tiny Etah, Admiral Peary's headquarters, is farther north in Greenland. The "lost tribe" of Thule Eskimos believed, until their discovery in 1818, that they were the world's only men. In background is table-topped Thule Mountain (page 377).

One day Marie had a pleasant surprise for us—a glass of fresh milk!

"Fru Sorensen sent us a litre," explained Marie. "She brought back a cow from Juli-anehaab." In that pastoral district near the southern tip of Greenland, Eskimos make their living by raising sheep, cows, horses, and chickens instead of hunting and fishing.

Toward the end of December the last ship left for home, and we buttoned up for the winter. Calm and isolation struck us suddenly, in contrast to the busy comings and goings, the shipping, and activities of summer.

Strangely, wind rather than cold is our chief winter enemy. Day after day it blows, cutting through the heaviest clothes and getting on everyone's nerves. A white blanket of snow may cover the countryside, but almost immediately the wind blasts it away, uncovering bare patches.

Daily Skiing at One's Front Door

Drift snow collects in the lee of some hills; so, regularly after lunch, I put on my skis at the front door and in ten minutes would be sliding down the Devil's Claw or Big Raven Hill. As many as ten or fifteen Danish skiing enthusiasts would gather.

Greenlanders, especially the children, also like to ski. They make their own skis. Ordinary boards with cloth loops to hold seal-skin-booted feet will do. Every nice winter day Devil's Claw swarms with kids shooting down the hill at breakneck speed. They soon develop an excellent sense of balance. I saw one tiny Greenlander lose a ski and continue to the bottom on the other without a tumble.

Frequent dinners and bridge tournaments help pass the evenings, but highlights are birthday parties. In Greenland a person's natal day is a big event and practically the whole settlement helps him celebrate.

On my birthday all my friends came to call and bring presents. Fortunately, I was prepared. Marie had ready quantities of hot chocolate (reserved exclusively for birthdays) and delicious Danish cakes and pastries. As everyone celebrates his birthdays thus, a week rarely passes when I do not rise from some friendly table and make my way home, vowing never again to stuff like that!

A Cargo of Colds

As winter wears on, days get longer and the snow less. By March a few of the forgotten fences poke their heads from under snow-banks. Finally, about the first of April, a ship arrives, bringing four months' mail.

Greenlanders say the first ship brings cold germs along with its more welcome cargo.

Anyway, most of us soon came down with the sniffles after going through a coughless winter.

Along with spring came realization that the world had not stood still while we were hibernating. The tide of war moved closer to Greenland when Secretary of State Hull and the Danish Minister at Washington, Mr. Henrik de Kauffmann, signed the agreement on April 9, 1941, whereby the United States accepted responsibility for the defense of Greenland. As a result, I spent a busy spring and summer helping to solve the problems of newly arriving American soldiers and sailors.

Our military bases are located away from the settlements, so Greenlanders rarely see Americans, except a few sailors on shore leave. On the way to visit one base I asked my Greenlander crew what they thought of the foreign visitors.

"They O.K.," one fellow volunteered. "Absolute O.K. We know Americaner protect us from Germans so we go back to Denmark. See all this chew gummy the soldiers give me for my child; such people is O.K."

Jeeps Brought by Airplane

When I arrived I found the Army had created a number of records. Greenland's first real highways (except for Godthaab's "road" to the harbor) had been laid, and the first automobiles were using them. I even saw "jeeps" darting around. Several were flown up in commercial planes.

Our Arctic soldiers live in model camps in a womanless world. This base reminded me of many others I had seen in the United States.

Nearly all barracks, comfortably insulated against the cold, have running water and toilet facilities. Like other American camps, this one boasts a motion-picture theater, barber shop, and an excellent library. I saw newsreels of last Saturday's football games almost as soon as I would have at home. The films had been flown up.

I asked one soldier what he thought of Arctic life.

"Everything is so different from what I expected," he replied. "Instead of snow and ice all the time, it is warm here in summer. We had to send a hurry call for our regulation uniforms to replace the heavy clothing we had brought! The biggest drawback when we first arrived was the mosquitoes; they were terrible. Nettings and screens now have fixed that."

Military details, of course, cannot be given. Suffice it to say that in Greenland and its icy waters today is unfolding an epic of air and sea, a saga of courage and accomplishment as thrilling as the deeds of the Vikings of old.

A Mighty Man Was the Sheik Falih es Sehud, Monarch of the Marshes

Resembling a Roman conqueror, this Marsh Arab chief had only to whisper his commands to be obeyed. Here he stands—all six feet four—in *abba* (robe) and headdress, with double-barreled shotgun and ebony cigarette holder (page 414). The British lost a friend when the sheik died in 1941.

Forty Years Among the Arabs

BY JOHN VAN ESS

ALLAH, be He praised, gave me a sense of humor. More than once I have sat in the middle of the desert, shivering with fever and weak from dysentery, and laughed till the tears rolled down into the sand.

The fun wasn't always as sidesplitting as that, for, like a baseball player or a ski jumper, you may be having lots of fun while your jaws are tightly clenched and your soul is filled with apprehension.

My interest in the Arabs began when I started to study their language at Princeton. It has all the dignity of Latin, the variety of English, the beauty of Italian, the sonorousness of German, the flexibility of Greek—and the bewilderment of Russian.

Exploring the Wonders of Arabic

Its underlying motif is the three-letter root which gives you the basic idea. This root, which you dig from an extensive root garden, you can modify, intensify, reciprocate, attenuate, dilute, step up, step down, and otherwise maul around, in any one of 15 so-called "measures." Each measure has its active, passive, indicative, subjunctive, and imperative, besides energetic and jussive forms, by which time you feel you have had some action.

But the noun then comes along to complicate the action, for the noun has no regular plural, and, indeed, may have more than one plural.

Add to all this the fact that there is really no tense but that an action is either complete or incomplete, and, further, that some of the sounds have been taken straight from the throat of the camel or the bulbul, and you are confronted with a project that will challenge your memory, ingenuity, patience, and even your religion.

But he who learns Arabic gets an amazing vehicle for his thoughts. He can say blitzkrieg, blackout, lease-lend, parachute troops, and all the rest, and not go into the red to any other language.

How that amazing tongue was developed by a primitive people living in a barren land, and was embodied in a rich and varied literature, is one of the enigmas of history.

With three years of Arabic grammar under my belt, with no binding family ties, and a fund of good health, I first reached Basra at the head of the Persian Gulf in the fall of 1902.*

About the first article I needed from my baggage was the aforementioned sense of

humor. The Turk was then in power in that part of the world, and the Turk of those days could provide you with more annoyance to the square inch than anyone else I have ever known. I got to know him better as time passed and had many close friends among the Turks. I learned that his apparent perverseness was only a cloak behind which he concealed subtle cleverness and protected himself against aliens.

It was in the days of Sultan Abdul Hamid II, Abdul the Damned, as the fuming European diplomats called him. There were spies everywhere, and every book and paper you carried was subject to censorship. The story goes that a chemistry book was confiscated for containing the formula H_2O , which was supposed to hint darkly that Hamid the Second was nothing.

Some years later I imported some English primers for the school where I was teaching. The censor had in the dim past learned a little English, and as he opened a primer for inspection he gasped with horror. On page one was a picture of a dog and under it the caption, "This is My Dog; His Name is *Turk*." I was summoned into the office of the pasha who sat within.

"A dog!" shrieked he. "Allah, what blasphemy!"

"But, Pasha," I cooed, "listen and I will explain. In my country a dog is much thought of. Women carry dogs in their arms and lead them by silver chains. So we give such a precious animal a precious name."

"Ah," said he. "Pardon, Monsieur, I was mistaken. Even I do not know everything. I thank you. Ahmed, bring Monsieur some sherbet."

It had been a hefty hurdle, and I breathed again.

The Hurdle of Jake and the Pasha

A short time after that I came up against a real hurdle.

Sultan Abdul Hamid, after a turbulent reign of 33 years, had been dethroned by the revolutionaries, and Mohammed Reshad had succeeded to the throne. The whole empire sighed with relief at the removal of that

* John Van Ess has spent forty years in Iraq and the surrounding region, and has lived through five regimes: the old Turk, the new Turk, World War I, the Mandate, and Independence. Most of the time he has spent as a missionary-educator and has enjoyed the confidence of both the British and the Arab Governments. He has written two standard Arabic grammars.

haunting terror. From the arsenal the batteries thundered the salute of a hundred and one guns to the new monarch.

In the spacious salon of the barracks sat General Shamil Pasha to receive the congratulations of visitors. My pointer dog, Jake, had followed me to the outer door and I warned the sentry to keep him out. Around the wall of the salon sat pashas, begs, sheiks, mullahs, and consuls.

As I entered, the pasha beckoned me to a chair near his right. Etiquette demanded that you keep your feet together on the floor and sit bolt upright. I had just had my coffee and sherbet and was puffing at my first cigarette when I heard an ominous tap-tap under my chair.

Glancing down, I saw Jake, immensely pleased to have found me and announcing his arrival with a vigorous thumping of his tail. He had stolen by the sentry and had crept behind the feet of the sitters till he reached

my chair. I frowned at him and he froze.

But the problem was to make my getaway, for I knew he would not return as he had come. When all but six or seven had left, I also arose and started to back away from the pasha.

In an instant Jake leaped out and started to cavort on the priceless carpet with glee and relief. This time the pasha froze.

"Allah, what is this?" he gasped.

"Excellency," I ventured, "even the dogs are glad that Abdul Hamid has been deposed."

"Bravo, Monsieur!" he chuckled. "Have another sherbet."

But it was a narrow squeak.

Policemen Club the Crowds to Show "All Honor" to the "Harmless Monk"

In those faraway days travelers in the Near East did not require passports except in Turkey. It leads one to speculate whether passports breed wars, or wars breed passports.

Part from *Three Lions*

Frans Hals' "Laughing Cavalier" Smiles Mockingly upon Iraqi Lottery Hopefuls

Strung to the left of the old master are tickets on lotteries authorized for state-approved charities. Prizes may run as high as \$2,500. The Baghdad men at left wear the *sidar*, the national cap created by the late King Feisal I.

Anyway, when you reached Turkey you handed in your American passport, which was then a sort of wallpaper parchment. They registered it and gave it back, and gave with it a document in Turkish which described you as you appeared to the Turk. I happened to be in Baghdad and asked for permission to visit the shrine cities of Karbala and An Najaf, then rarely visited by a Christian.

My *teskere*, as it was called, was very impressive. It was written in beautiful *divani* script, but I was rocked back on my heels when I discovered that in it I was described as a tall, harmless monk. Perhaps for that reason it commanded that I was to be allowed to travel anywhere and was to be shown the highest honor.

Toward sunset of a spring day I rode in to Karbala on my horse and took lodgings in a caravanserai. In a few minutes a policeman stormed in and asked what I, a foreigner and an Unbeliever, was doing in the holy city.

I sparred for time while I looked him over; but he began to threaten, so I handed in my *teskere* with my compliments to the governor.

In another quarter hour he came clattering up the stairs accompanied by a dozen *gendarmes*. They saluted and begged me to follow. Word of my arrival had spread through the city, and a mob had gathered to see the fair-haired stranger.

The policeman walked ahead, cracking heads with his club, the guard around me likewise swiping at all and sundry.

"Stop clubbing those poor Arabs," I protested. "They are only curious."

"The pasha has commanded me to show you all honor," he said.

A Pasha's Parable

The pasha, who was the local governor, was a Stambuli Turk, the only Sunni among thousands of Shiites. My coming was a god-send to him, he said. "We Europeans," he

Civilization's Birthplace, the Rich Near East, Is the Goal of Axis Armies

Based on Libya, German and Italian armored units have tried repeatedly to break through to the fertile Nile Valley, cut off the Suez Canal, and then seize the vital Iraq oil fields. In the north lies the oil-rich Caucasus, goal of the Nazis in their all-out drive against the Russian armies of the south. For 40 years the author lived among the people of Iraq, or Mesopotamia, as it used to be called, the "Land Between the Rivers," the Tigris and Euphrates. He studied the extensive irrigation system, which, impounding Euphrates floods, will turn arid regions into a Garden of Eden again and dry up and make fertile the Tigris marshlands.

WILL F. VANDER

A Dervish with His Begging Bowl

Just such a long-haired fakir wandered into the author's camp on the Euphrates and placed a curse upon him for refusing to give bakshesh. "You will choke to death," the dervish warned, but his prophecy proved false (opposite page).

went on, "must stand together against these savages!"

For a week he kept me as his guest while he rid his soul of his anti-Arab rancor, the accumulation of months of isolation.

When I asked him why he stayed there he replied, "But consider, Effendim, I paid the Minister of the Interior at Stambul 2,000 pounds for this post and I have made only 3,000 in these six months."

One day, after a full meal of chicken pilau, he seemed to boil over. He was in negligee, in his slippers, his long white tunic, and his skullcap—and he was disgusted. Suddenly he turned to me and said, "Allah," and then he paused while his hookah gurgled fiercely.

"Allah one day decided to visit the world He had made. He came to Frangistan and said, 'Did I make this land?'

"'Yes,' said Gabriel, 'but the Franks have unlocked the secrets which Thou didst put in mountain and valley, in river and stream, and have made the land what Thou didst intend it to be.'

"Then He came to America and said, 'Nor do I recognize this land.' 'Because,' said Gabriel, 'the Americans have worked and striven till this land is no more like its first estate than the flower is like the seed.'

"And so Allah passed through the earth, and everywhere He saw that things had grown and become beautiful, and men had become wise and strong.

"At last He came to Iraq. 'This,' exclaimed He, 'is Iraq. I know it—it is just as it left my hand; the Arabs have done nothing with the treasures I put there, nor used the secrets I cunningly laid there.'

"Wallah," said the pasha, "so is the Arab. Lest he presume to improve on the Almighty, he says 'As Allah pleases,' and goes to sleep."

I tried to remind him of the civilizations that had risen and flourished and gone again.

"But you only prove my point," said he. "The Arabs, the heirs of the ages—and today naked as a newborn babe." And he sucked his finger and drew it out with a smack.

Down the Euphrates on a Raft

How the Turkish Empire was held together in those days is a mystery to me still. But then, nothing lasts longer than a mud heap, and that is what Turkey was in those days. This, however, only accentuates the splendid achievement of Kemal Atatürk and his colleagues who created a modern state out of the wreckage of the Ottoman Empire.

Perhaps the chief reason for their success lies in the fact that the Turks, in one way and another, sloughed off the minorities and

Spoons go unnoticed as these town Arabs plunge into the big pan of rice and lamb. At right is a dish of lamb broth. For a Bedouin feast, see page 417.

became and have since remained a homogeneous state.

After months of trekking around, I reached Alep (Aleppo), weary and saddle-sore. So I determined to try a new method of travel back to Baghdad from Meskéné. I bought a raft, a hefty structure about 25 feet square.

I took on a dozen bales of soap as cargo and ballast and as protection against pot shots from the Arabs on the banks. I put a sweep on either side to keep the raft in midstream and started to float the 600 miles to Al Faluja, on the Euphrates.

Being myself captain, navigator, purser, and steward, I took passengers on condition that they man the sweeps when necessary.

In the stern I stowed a goat for milk, a dozen watermelons, a bag of rice and other supplies, and under the gunny-bag tent amidships I sat on my bedding while my passengers made coffee, cooked, and talked. For a bath and exercise I would jump overboard and swim alongside.

The twelfth day we reached the place where the rapids began. Here the Arabs had constructed stone intakes along the banks to increase the speed of the current and thus turn their huge water wheels for irrigation.

The river became swift and dangerous as the water rushed through the narrow openings, so I stopped at a village to have a long sweep fastened to the stern for a rudder.

The village Arabs were hospitable and spread out carpets and brought forth their coffeepots for a real visit.

Laughing Off a Dervish Curse

Just then a tall dervish, a religious mendicant, with long hair over his shoulders, strode up with his begging bowl and poniard. He stamped into the middle of our carpet and demanded baksbeesh. I protested against his rudeness and asked him to wait till we had finished our visit. But he became more impudent and vociferous, so I uncoiled my length, took him firmly by the rear, bum-rushed

him to the river, and threatened to throw him in.

The effect was not quite what I had anticipated, however. He straightened up, took a deep breath, and began to curse me, and when an Arab begins to curse he turns out a piece of verbal embroidery which is a real work of art. He climaxed his curses by saying, "I will constrict your throat, and this night, before the moon is down, you will choke to death."

I laughed at him and went back to my friends. After the supper of rice and fish which the Arabs had prepared, I tried to go to sleep. But my throat was beginning to feel tight and uncomfortable, so I prepared myself a gargle from my medicine chest, all the time keeping one eye on the declining moon. But the tightness seemed to increase, and I was getting a bit alarmed.

Then I stood up straight, took a deep breath, berated myself for a jittery fool, and sat down in the sand and began to laugh. I must have laughed myself to sleep, and kept on laughing, for when I opened my eyes the day was breaking, and the passengers were standing around me waiting.

"How strange are the Franks," said one. "Perhaps they see heaven when they sleep."

Floods in the Land of Eden

We shot rapids for the next seven days, while all hands clung to the sweep and shouted wildly, and then, spinning madly in the backwash, we would straighten out for the next one. At Al Falluja I sold my raft, delivered my cargo of soap, and found that, having fed my crew and paid all expenses, I had netted just over two pounds.

The next day I rode into Baghdad.

As in the old Greek plays, I must stop here while the chorus gives you a little background.

Iraq, the country where I spent most of my life, used to be called Mesopotamia, meaning the Land Between the Rivers, the Tigris and the Euphrates.

Most people think of Arab lands as consisting mostly of desert. This is true of the Arabian Peninsula, to be sure, and of the great Syrian Desert. But, paradoxically, the prime problem of Iraq is not drought but flood.

The Euphrates rises in the mountains of Armenia and the Tigris in the mountains of Kurdistan. When the snow melts on these mountains in the spring, great volumes of water rush down, and by June the whole southern area is one vast marsh. This whole region is alluvial and therefore almost dead level.

The Bible account of the Garden of Eden and the four rivers, as detailed in the second chapter of Genesis, indicates that the waters then were controlled from the Euphrates side. The Hiddekel (the Tigris) took off from the Euphrates at the place where the one river flowed out from Eden and became four heads.

The present Tigris was at that time a tributary, as has been demonstrated by surveys. But the channel of the old Tigris became blocked up and the two rivers became independent.

Now, the level of the Euphrates is there some 32 feet higher than that of the Tigris. The irrigation and drainage problem is to impound the Euphrates water until the Tigris floods have subsided, and then to release the Euphrates water, which, by free fall, can irrigate the whole land through transverse channels. This the Babylonians did, and you can still ride for hours through these old silted-up channels.

West of the Euphrates, at the present site of the Royal Air Force base at Dhibban, is a huge depression. A channel with barrages and regulators is being constructed to take off the surplus floods and store them (page 404).

Southeast of Lake Habbaniya is still another and much larger depression, called Abu Dibis, which can be used when the lake is full. When, in consequence, the Tigris and Euphrates floods are thus staggered, the marshes will soon dry up and millions of acres of fertile land will become available for agriculture.

Since the soil of Iraq contains lime, essential to bone-making, sheep can be raised in vast numbers. The country can be populated with Bedouin* who now depend on a precarious rainfall, and the result will be a second Australia.

The Medley of Iraq Peoples

I will let the chorus sing something of the people of Iraq.

The northern region, with Mosul at its center, is the ancient Assyria and is in large part mountainous. It is the habitat of the Kurds.

The Kurds are not Arabs and are not Semitic; their language is Aryan and contains many Persian words. They are a hardy crowd, organized in clans over each of which is a chief.

Most of them are Moslems, though among them you find Christians and Yezidis, devil worshipers (page 414). They have never

been enthusiastic about their inclusion in the Iraq State, though some of the best soldiers and some of the most capable officials come from among the Kurds.

The plainsmen in northern Iraq are tribal Arabs, mainly belonging to the great Shammar confederation. The ruins of Nineveh, the capital of ancient Assyria, can be plainly seen near Mosul, as can, indeed, part of the fish which regurgitated Jonah.

Coming southward, the rural people can be divided into Bedouin and Ma'dan.

The Bedouin are the tent dwellers. They raise sheep and camels and ride horses. The Ma'dan inhabit the marshes. They live in huts made of marsh reeds, they raise water buffaloes and cultivate rice, and go about in canoes. The fellahs, or farmers, originate from one of the two groups; generally, in the south, from the Ma'dan, for the Bedouin hold manual labor in low regard (pages 409-411).

The Bedouin despise the Ma'dan heartily, and will not intermarry with them nor even fight with them. The tribal system prevails along the two rivers, the chief Bedouin clans being mainly along the Euphrates and inland on both sides of the river, while, from below Baghdad, along the Tigris and into the marshes you find the Ma'dan.

The Mystery of the Ma'dan

Just who the Ma'dan are is a puzzling problem. Some guess that they are the descendants of the ancient Babylonians. This was the opinion of the late Professor Albert T. Clay, of Yale.*

Among the Arabs and especially among the Bedouin, the Ma'dan are lightly spoken of. You can expect any sort of treachery, crudeness, and stupidity from a Ma'idi, they say.

I have been in the depths of their marshes for long periods and completely at their mercy. Crude they were, and I was once in a camp where they had never seen matches or a candle such as I carried. Their only illumination at night was by rush fires. But I found them hospitable enough. I never met with any serious mishap nor was I ever robbed of anything by them.

Before the last war little was known about them. The Turks sedulously avoided clashes with them, knowing that they would retire into their impenetrable marshes.

Back in 1905 Sir William Willcocks, noted irrigation engineer of Egypt, asked me to undertake an exploratory tour to fill in the

blank space on the maps. My main hurdle was to evade the Turks, who were in a sense responsible for my safety, having given me a passport.

Good fortune played into my hands. The Turks were conducting a campaign against the tribes in the neighborhood of An Nasiriya on the Euphrates and were being persistently defeated. When I suggested the tactic of friendship and straight dealing, the commander challenged me to prove my theory by going across the great marsh unarmed and alone.

My Arab servant, Suleiman, however, flatly refused to leave me.

"They will not harm you except over my dead body," said he, and there was nothing for it except to let him come along.

A friendly Turkish officer pressed a service revolver and a belt of cartridges upon me, which, according to his code, I could not refuse. So I was not technically alone, but as for being unarmed, I knew that one revolver, even if I wanted to use it, which my profession as a missionary precluded, would be useless among a crowd every one of whom had a high-powered rifle.

Crossing the Great Marsh

Suleiman donned the belt and the revolver, and, before dawn one day in May, we started out. The floods were high and we soon reached the edge of the great marsh. The trip consisted of endless miles of marsh, with reeds 12 and 15 feet high, through which tortuous channels twisted and turned. How the paddler could find his way remains a mystery to me to this day.

Every so often we would come to a village built on reed islands, where buffaloes and men and women and children wallowed about. Sitting still in a tipsy canoe through hours and hours of pitiless sunshine and stinging insects while you try to make a compass survey is tedious business. The bird life was marvelous, though, and the talk of the Ma'idi paddler, weaving together folklore and tales of tribal fights and haunted islands, filled in the long days.

The nights we spent on some island in a village, for the guide would go only from island to island, where another would have to be engaged.

On the fifth evening we reached an island larger than the rest. As we beached the canoe, the headman, naked to the waist and with hair to his shoulders, came forward. As I stepped ashore, I said the magical word *dakhil*, which among the Bedouin implies you expect protection and which, in the desert, is never refused. But the tall Ma'idi looked

* See "Pushing Back History's Horizon," by Albert T. Clay, NATIONAL GEOGRAPHIC MAGAZINE, February, 1916.

Field Museum of Natural History

A Chaldean Christian Bride Wears Her Dowry of Coins

Fourteen years old, she lives in a small village north of Mosul. Note the cross and nose ring. Girls of this village are famous for their beauty. They marry young and bear children early.

at me quizzically and told me to follow him.

We entered a large reed hut and he bade me sit on a pile of rice straw. In a short time the hut was surrounded by a veritable mob of human water rats. Within, the chief, with a dozen of his men, gave me the third degree.

My Arab clothes could not hide my gray eyes and my tawny beard. He said, "You are a Turk and therefore an enemy. You have come to spy on us and your life is forfeit."

I protested, however, that I was not a Turk, and that, indeed, I was a *tabib*, short-cutting through the marshes to reach the Tigris. A *tabib* is technically a doctor, but to an Arab it may include many degrees of quacks, and so I qualified.

"A *tabib*?" said he. "Then I will test your skill. I will bring you a sick man. If you cure him, you are our honored guest. If you fail—pkhkhkh," and he drew his hand across his throat significantly.

"Bring along your sick man," I said as confidently as circumstances seemed to require. But inwardly I prayed, "Oh Allah, anything but a leper!"

"Bring Abu Farhan," said the chief, and in a few moments an old man was brought in groaning and writhing in pain. I diagnosed it as colic and gave him the biggest dose of morphine I think any mortal has ever swallowed and survived.

In a few minutes he was asleep and my skill had been vindicated. I did a thriving practice for the next hour, trusting rather to the harmlessness of my remedies than to their potency.

Ink pills, I had found through the years, were especially popular with Arabs. Their lurid colors and lethal taste seemed to foster confidence, and so the faith of the patient generally cooperated as the textbooks say it should. After a while the chief himself called a halt and drove out the patients with his huge fists and feet. We had supper together, he and I: grilled fish, rice, and buffalo milk.

After supper the young bucks of the tribe came and performed for my benefit. The precentor recited tales of their exploits, while the others chanted the chorus. Then he sang about me. I had eyes like a buffalo's. I was tall and supple like a marsh reed. My beard was like the setting sun on a mud flat, etc.

H. Eric Matson

A Symphony of Hammers Is the Coppersmiths' Shop at Baghdad.

"If you don't want to hear what your friend is saying, go to the coppersmiths' bazaar," say the Baghdadis. These smiths when working at their ancient calling pound the metal like mad. Regardless of the labor, their wares are sold by weight. New copper comes from Iran. Old pots and pans are salvaged and rebated. Seen here are water jars, bath basins, and a cluster of trays.

I slept that night next to the chief himself, on a bundle of loot which, the chief told me proudly, they had taken from a distant tribe.

A Wife the Fee for a Resident Physician

The next morning I asked him for a guide to see me on my way.

"I have been thinking during the night," said he. "I want to keep you here. We are always having ague and fever or getting shot up or bent with rheumatism. To induce you to stay I will give you my niece for a wife. It isn't often a skilled tabib like you comes this way."

"I suppose not," I said with a shade of condescension, "but there is one great difficulty. Last night I nearly finished my medicines. This," I said, picking out an empty bottle, "is for fever, and this for wounds, and this for rheumatism. I am not like Allah. I cannot create medicine from marsh reeds or

the hair of a buffalo. Let me go on and replenish my medicine chest and, if Allah wills, I shall return."

So he let me go, and Allah did not will my return.

At last one fair afternoon I reached the Turkish outpost on the other side. I think I was never gladder to see the Turkish flag than at that moment.

As I approached civilization, I secured a larger canoe in which embarked with me, among others, a woman carrying an infant. I was suffering from a touch of dysentery and ordered the canoe to tie up at the bank while Suleiman milked a cow which was grazing not far away.

While we were thus delayed, the woman got out of the canoe with her infant and started walking ahead. When she was about a hundred yards away I heard her scream. A band of Arabs had emerged from the tall grass and had kidnaped her child.

American Tractors Chug and Grunt to Make the Traditional Garden of Eden Bloom Again

An intricate irrigation system built by the ancient Babylonians turned to desert sand when the Mongols overran fertile Mesopotamia in 1258. These tractors, scrapers, and scrapers on the Habbaniya flood-control project near Baghdad are rushing to completion a reservoir to impound the torrents of the Euphrates (page 392).

A Human Plow Team Transplants Rice in the Great Marshes

The puller has the easier job; his "driver" must stop constantly to put in rice tufts. They are Abu Mohammed tribesmen of the Hor al Hawiza (page 411).

There was no use in pursuing them with my revolver and I was puzzled to know just what to do. I learned, though, that the band belonged to her own tribe and that they had taken the infant as security for a debt which her husband owed to one of them. She herself started in pursuit, and I imagine all were eventually satisfied.

British Disarmed Marsh Arabs

At length I reached 'Amara, the Turkish headquarters, and reported myself to Ibrahim Pasha, who was incredulous that I had come that way. When I showed him my map and described the country I had traversed, he was convinced.

A Turkish military doctor kindly offered to treat my dysentery, but when he measured out 35 drops of laudanum I feigned nausea and asked for the bottle itself so that I could save him the trouble later.

Eventually I went upriver again, sailed down the Hai River, and 40 days later reached An Nasiriya just at sunset. The commandant and his staff were sitting on the roof of the caravanserai. I saluted and sat down.

"Where have you been?" said he. "We had given you up for lost and telegrams have gone to Stambul about you."

"I have crossed the great marsh unarmed and alone," I said, "and if you don't believe me, ask Ibrahim Pasha at 'Amara."

I have flown many times over that marsh area in recent years, covering in minutes what took days. One of the benefits resulting from the British occupation has been the complete disarmament of the Marsh Arabs, save for such caches of rifles and ammunition as they have tucked away for some future emergency.

As scientific irrigation and flood control progress, extensive regions are being reclaimed and are being skirted or crossed by motor roads. The Iraq Government has established reed-but schools in the more accessible centers and the people are becoming civilized. Indeed, the grandson of one of the marsh chiefs is now a teacher in one of the Government schools, and he told me last year that he possesses a tuxedo.

The son of my proffered bride may be learning the rumba in Baghdad for all I know.

Tale of an Enchanted Island

Before leaving the marshes I wish to recount a puzzling phenomenon. In the course of my wanderings I had heard the Arabs speak of an enchanted island where the

Mir Said Beg, Head of the Yezidis, and His 13th Bride

The Yezidis have been persecuted for centuries because they propitiated Satan, not as the Evil One, but as the fallen angel restored by God to rule Earth. Visitors to the Mir's fortress-castle north of Mosul have described him as affable and humorous. In reply to a question by Dr. Henry Field about his corkscrew beard, Said Beg replied: "Young man, if you had had 13 wives, your beard would be twisted, too." The Mir's bride, Wansa, who was 15 when married, was educated at the American School for Girls in Beyrouth, Syria.

unwary visitor would see marvelous visions, of castles, and gardens, and maidens, and all the rest so dear to an Arab's heart. But a spell would fall on the visitor and he would starve to death.

I tried more than once to induce the Arabs to take me there, but no amount of bak-sheesh could turn the trick. I had taken cross bearings from many points and pricked it off on my map. Years later I mentioned the story to my friend Jack Howes of the Royal Air Force, and he volunteered to fly over it. He told me that as he approached

the spot he could detect nothing unusual. Suddenly, however, his compass began to swing and gyrate crazily, and then came to rest again.

Perhaps, at some prehistoric time, a meteorite had fallen there, and legends had gathered and grown. That is all I can offer by way of explanation.

I do not wish to leave the impression that all Marsh Arabs are definitely an inferior type. I think especially of Sheik Falih es Sehud whose territory embraced the lower reaches of the Tigris. I have rarely seen his equal as a magnificent physical specimen (page 384).

Standing six feet four in his sandals, and broad in proportion, he had the face of a Roman conqueror, and when he whispered his commands the farthest corner of his dominion heard and obeyed.

He had a rare sense of humor. I was visiting him once in his camp on a tributary of the Tigris. We were sitting in an enormous, cathedral-like hut in which big arches of reed pillars six feet thick disappeared into

the smoke-filled ceiling. Just then a dozen holy mendicants came in for their annual largess.

"Bring coffee," he said, and tossed off his three tiny cupfuls. Then he signaled the slave to pass it to me sitting by his side. As among all Arabs, I was entitled to three cups, but when I had drunk the first I rocked the cup as token that I wished no more.

My reason for doing so was that, being a Christian, I had defiled the cup, which would normally be laid aside and cleansed separately. But if I drank again, the steam from my cup, become thus defiled, would defile the

whole coffeepot and all who drank from it.

"Drink a second and a third," said Falih sternly, and as he said so I caught the shadow of a twinkle in his eye. When I had finished he commanded, "Give to them all." One by one the holy men drank and were duly defiled. I departed soon after, but the sheik told me later that all twelve had promptly repaired to the river and had forcibly undrunk their coffee and washed their clothes that they might pray again.

He was tremendously interested in men and affairs and when Babylon Lodge of the Masons was formed, he promptly joined. At the annual lodge dinner he always appeared in his tuxedo. With his gray pompadour and short-trimmed beard he looked like a prince among men.

I mentioned to him one day that one of my pupils had fainted from hunger in the classroom. He tossed me the equivalent of \$100 and said, "Don't let that happen again, not while the Falih lives."

I come now to the Bedouin. Although the name derives from *badiya*, which is the desert, not all of Arabia is desert. Only parts of it are yellow shifting sand. The desert is largely gravel or mud, and when the rains come pasturage springs up and reaches a respectable height.

A Thousand Words for "Camel"

It is on this herbage that the Bedouin camels and horses and sheep subsist, augmented by barley, dried dates, and straw. At certain periods of the year the horses are given camels' milk to drink, for the camel

Building a River-going "Bow" with No Bow or Stern

Unlike the unseaworthy bowl in the nursery rhyme, "Three Wise Men of Gotham," Iraqi *gufas* are strong and buoyant enough to resist the swiftest current. Lacking hard wood, Iraqis weave a hull of reeds, bind it with cross ribs, and calk the whole with pitch, just as their predecessors did 3,000 years ago. The *gufa* carries heavy loads, even horses. A man in the "bow" paddles and steers with uncanny skill.

can live on the dried camels'-thorn, which only that creature can chew and swallow.

There are more than a thousand words for "camel" in the Arabic language. No Arab knows them all or even a fraction of them, and many of these words were coined by the poets to fit their rhyme or meter scheme.

I have in my time heard and tried to learn the word for a camel that limps on his left hind leg, and for the one that closes his eyes when he drinks, and for the camel that does not like to have the crows pick the lice from his back, etc., etc.

A camel has no natural affection and is al-

Boring into the Heart of the World's Oldest Oil Field, They Hope to Strike a Gusher

Even before Daniel's day, Mesopotamians collected oil from seepages, glazed bricks in "fiery furnaces," and laid them in a mortar of asphalt. Today this Kurdish derrick crew, working under an American driller, is driving a steel shaft toward the petroleum pool some 3,000 feet below.

together a cynic. Allah has a hundred names, the Arabs say, the Koran contains ninety-nine of these, and only the camel knows the hundredth name and he won't tell. That's why he looks so supercilious (pages 393-400).

His bite is poisonous, he kicks forward, and he is so stupid that he cannot follow a path. In consequence, a caravan is always led by a mule or a donkey.

One day, on the great desert about two miles from my home in Basra I saw a string of twelve camels ambling along, tied head to tail. The last two camels became detached from the rest and started lumbering along on their own. The one was not quite behind the other, and as they approached a telegraph pole I watched to see what would happen.

It did happen. The one took one side of the pole and the second took the other, and they became so hopelessly entangled that the driver had to untangle them.

When a camel falls down—that is, does not

let himself down, one, two, three, four, so to speak—he cannot get up by himself. And when it has rained and the ground is slippery, he becomes panicky and lifts his head high toward Allah, like a terrified but unrepentant sinner.

For a consistent, long-distance traveler, give me a mule. A mule has principles and he abides by them.

Here is a question I ask American school-boys, and it is only the rarest boy, or teacher, for that matter, who knows the answer.

What is a dromedary?

Most people will say that it is a question of humps. As a matter of fact, all Arabian camels have only one hump. The two-humped camels are found in Central Asia (pages 393 and 399).

Well, a dromedary is a speed camel (page 395). The difference between a dromedary and an ordinary camel is that between your limousine and a truck.

A dromedary can lope six miles an hour for 24 hours and then you have to rest him. A camel can go two miles an hour or a little more and then *you* have to rest.

I was in Egypt years ago and saw a two-mile race between a dromedary and two purebred Arab horses. The condition of the race was that the winner should take the other two animals as a prize.

At the signal the dromedary leaped forward, the Bedawi on his back wildly shouting and waving his cloak. He streaked along like some gigantic nightmare insect, alternately coiling and uncoiling those spindly legs. He beat the horses by a third of the course.

Selling a Fraction of a Horse

When you talk of horses Bedouin eyes light up. I shall not attempt to enumerate the virtues of an Arab horse or to depict his fine points.

An Arab sheik will rarely sell a blooded mare of highest pedigree. Pretending one day to have more money than I had, I asked a sheik to sell me his mare.

"I will sell you," said he, "one eighth of one of her legs for five hundred rupees."

The process would be this: If the mare foaled, my eighth would become a quarter, and so on, through the mare herself and her offspring. The thirty-second would be mine, be it colt or filly. For this chance, five hundred rupees.

It is when you come to the Bedouin themselves that you meet really colorful people. First of all, they all speak beautiful Arabic, which appeals to my dotting heart. I have heard boys of twelve out in the desert turn flip-flops in the Arabic found only in the classics.

They are exceedingly race-conscious, or rather tribe-conscious. I asked one of three youngsters who his father was.

"Would you know my genealogy?" he asked. And he proceeded to name his ancestors. At the thirteenth he hesitated, and the other two, not of his lineage, at once filled in for him.

Perhaps the chief characteristic of the Bedouin is their hospitality. The stranger is always entitled to shelter, protection, and food.

Only after three days may he be questioned as to his name, his tribe, and his errand, though he may volunteer information before that time.

For guests of honor, if in any number, a camel is slaughtered, stuffed, perhaps with three sheep, and each sheep stuffed with five

chickens, and each chicken stuffed with ten eggs, all on top of a veritable mountain of rice.

The sheik and his guests and immediate menfolk of equal rank eat first, then those of lesser rank, then the slaves, beggars, and, ultimately, all and sundry who may have smelled the feast from afar.

Once a guest, you are entitled to safe conduct to the next tribe. Tribe A may, however, be at feud with Tribe B, and so A may take you to D, and D to B, and so on in zigzag fashion. But you are always safe, at least as safe as the tribe itself is under the circumstances.

Once I was caught in a town on the Euphrates where the Turks were being besieged by the Arabs. Not relishing the idea of a prolonged siege, I smuggled a letter through the lines to a sheik whom I knew, asking him for a guide. The next evening my messenger returned saying that a guide would be waiting for me on the third day in a certain irrigation ditch. So I stole away from the Turks and proceeded to the rendezvous.

A dozen Arabs rose from behind a hillock, surrounded me, and threatened to kill me for a Turk. Just then a lad not a day over 15 came running up, kissed my hand, pointed to me to ride on, while, with rifle leveled at the twelve, he stood them off till I was out of range. Then he caught up, mounted behind me, and brought me to his sheik's tent.

Once I rode for miles through hostile Arabs with a lad of six in front of me on the saddle.

"In whose face are you traveling?" they would ask.

"In the face of this lad of the Beni Khafaja," I would say.

"Pass on, in the name of Allah," they would answer.

Arriving at an encampment, you go to the largest tent, usually marked by a spear stuck in the ground. A slave takes your bridle and leads your horse away while you proceed into the tent.

At the head sits the sheik himself, leaning on a camel's saddle. A foreigner is always given the seat of honor at his left. Around the edge of the tent might be sitting as many as two hundred Arabs, each in his place according to his rank.

The Ritual of Coffee Making

The coffee making is an art, or, rather, a ritual in itself. The beans are first roasted, then pounded fine in a mortar to a delightful, rhythmic clanging. Water is added; the whole boils up three times, and then is served.

As you receive the cup, you twist it to make the coffee run round the lip. If it is well made,

Field Museum of Natural History

The Hand of Abbas Stretches Aloft as if for Water

Abbas, a relative of Mohammed, was slain and his hands were cut off while he was seeking water during the Battle of Karbala, A. D. 680. His hand became a sacred symbol to the Shi'ite sect. Here the hand surmounts an Iraqi fountain. On the plaque at right are pictured tombs of the Twelve (Shi'ite) Imams.

it will leave a brown ring around the edge. Then you drink it, or rather, aspirate it, with as much gusto as you can muster.

You are entitled to three cups; so, if you drink for formality's sake, you take one, and if you are thirsty you take three. There is no excuse for taking only two. Each cup, be it said, contains only a spoonful.

On a spring morning I was sitting in the large council tent of one of the Saadun sheiks. Suddenly a gaunt and ragged Bedawi walked in, greeted the sheik, and sat down among the lowest. Coffee was at once given him, but he took the cup, spat into it and tossed it over his shoulder.

"Speak, O Bedawi," said the sheik.

"Last night," said he, "I was sleeping in your territory and my camel was stolen, and, by Allah, I will not drink your coffee."

"Bring him one of my camels," commanded the sheik.

A camel was brought, the head rope passed through the tent flap and put into the Bedawi's hand, whereupon he was offered coffee and drank it.

Your real Bedawi is a true democrat. He will walk straight up to the paramount sheik, look him squarely in the eye, and say, "Peace be with you, Abdullah."

Bedouin hospitality is matched by their generosity. A cultivator owed old Sheik Nasir \$600. Not being able to pay, he fled to Iran. After a year he became homesick and decided to return and throw himself on the mercy of the sheik, but he brought with him twenty chickens as a "covering for the eyes."

On his journey he killed and ate two of the chickens and on arrival threw the eighteen at the sheik's feet, kissed his hand, and begged for mercy.

"I have won," said Nasir. "I will count each chicken for a hundred shamis."

Quick Justice in a Bedouin Court

Bedouin justice is swift and to the point. Court is held each morning, accusations and witnesses are heard, and punishment administered. There is no court calendar.

As I sat one day, a Bedawi was brought before Sheik Falih as Saadun, accused of theft, and convicted. He was tied to the tent pole, a pipe was brought to the sheik, and a slave held the lighted coal. As the sheik exhaled the first puff, the slaves began to beat the culprit, until the sheik beat out his pipe and justice was satisfied.

The tales of Bedouin skill in tracking are not exaggerated and to a Bedawi every track and every footprint is an open book which he reads as you read your newspaper.

Black Star

Parties to a Lawsuit See Their Lawyer in his Curbside Office

The medley of modes seen in the yard of the Court of Justice at Baghdad is typical of the Western influence invading the East. The petition writer in the center is preparing a form for a lawsuit over property.

The distinctness or faintness or number of footprints, human or animal, spell for him the size and destination and composition of the company that has passed. The nature, consistency, and freshness of the camel dung indicate whence they have come and when.

They will direct you by the stars, and a moment's reflection will remind you that many stars and constellations have Arabic names. I learned more astronomy from the Arabs than I ever learned in college, besides the delightful folklore which they treasure so highly.

Five-sixths of Iraq is tribal, such as I have been describing, and is rarely seen by the casual visitor. It is that part of the country, though, which must be known and understood if we are to have a worth-while postwar reconstruction. Most of the resources of men and material are there, and most of the problems.

Since Iraq is not an industrial country, the cities are only the centers of government and owe their existence chiefly to trade.

The Approach to Iraq

As the visitor comes up the Persian Gulf, the first thing he encounters is the bar. The bar, like most bars, has produced many a headache.

Some 77 miles from the Gulf the Tigris and Euphrates join and form a broad, deep river which carries with it the accumulated silt of the upper reaches. Twice in 24 hours the tide backs up this current, and in the resultant slack water the silt settles to the bottom and forms a mud bank about 20 miles across.

Left undisturbed, this bank would leave only about 12 or 15 feet of water at high tide. The result was that cargo ships of greater

draught were compelled to lighter across the bar, causing great expense and delay.

After World War I, the problem was taken in hand. Under the capable management of the Port Director, Col. Sir John Ward, and substantially financed by the Anglo-Iranian Oil Company, five suction dredges now work 24 hours a day to keep clear a channel which admits ships up to 32 feet draught at all times.

This channel is so well-lighted and buoyed that skippers refer to it as "Piccadilly."

At Fao, just across the bar on the land side, is the medical inspection and repair station. Thence the visitor's eyes pop with wonder at the marvelous scenery. Both banks are lined with millions of date trees, in a belt extending two miles inland. On the left bank, 31 miles above Fao, is the Abadan refinery operated by the Anglo-Iranian Oil Company.

Thirteen miles farther on is Khorramshahr, formerly known as Mohammerah, a largish town still on the Iranian side and situated on the Karun River, which comes down from the Persian hinterland to add its mud and water to the Shatt-al-Arab. Thence on past villages and date groves, you reach Margil at Basra, where are the docks and wharves.

The visitor will have noticed that at intervals of about a mile broad creeks flow into the main river. These are natural remnants of the time when the whole area was marsh, but, as the land has encroached, they have been widened and deepened to make possible the irrigation of the date gardens. The Arabs say that the date tree likes to have its feet in water and its head in hell; hence Basra.

At the mouth of a large creek, about four miles below Margil, is the town of Ashar, with a population of 30,000. Here most of the business is done, here the banks are located, and here, on the river bank, or near it, are the offices of the European firms.

Go two miles up Ashar Creek, along a well-paved road, and you reach Basra city, of about 50,000. If you go inland another eight miles you get to Az Zubair, and along the road you see the ruins of the ancient town where the shadow of Sindbad the Sailor still stalks. The whole area is connected by asphalt roads that challenge the skill, ignorance, or folly of the Arab taxi driver.

The port area is the showpiece of Basra and has been entirely built since World War I. Its only significance in Abdul Hamid's day was that it contained the European cemetery.

The avaricious old monarch had bagged about one-third of the empire as his private estate, but one particular part on the river was constantly threatened with being washed away. So the wily ruler gave this point to the

foreigners as a burial place, figuring that we would take the necessary precautions. We did. But the fact remains that in those days we visited Margil only when we were laying away one of our little community.

The only deep water alongside the bank is just there, and so British army engineers built wharves there during World War I of finest teak, which cost the tidy sum of four million dollars. Huge electric cranes make possible the expeditious handling of cargo.

The airport, a mile farther up, accommodates both sea and land planes, and boasts a hotel, the Shatt-al-Arab, where you can sit A. D. 1942 in air-conditioned rooms and look across the river into 1942 B. C.

That is not exactly accurate, however, for as late as 2000 B. C. the present site of Basra was a hundred miles down the Gulf and under forty feet of water.

At Margil, too, is the railway station where you embark for Baghdad and Europe. The railway runs along the Euphrates most of the way for 354 miles, and on the way you can salute Abraham at Ur of the Chaldees, Nebuchadnezzar at Babylon, and other worthies with whom your knowledge of the Bible or of history has made you familiar.

U. S. Army Engineers Busy in Iraq

Among the tasks of the American engineering corps under Brig. Gen. Raymond A. Wheeler is that of broadening the gauge of this railway to make it conform to the standard gauge prevailing on the main line north of Baghdad and in Europe; also the building of sidings, tunnels, roads, bridges, and increased port facilities.

Lots of fun remains to be had among the Arabs of Iraq for any American who looks beyond Main Street; fun with its generous, hospitable, warm-hearted people; fun with its young men, now wistfully looking toward America for sympathy and understanding; fun with its challenging problems of reconstruction; fun with its vast and almost untouched resources; fun with the shadows of its past lurking in buried cities, palaces, and temples; and fun with the shape of glorious things to come.

The majority of the photographs illustrating this article were taken for King Feisal by an Iraqi photographer under the direction of the late Mrs. A. L. Fisher, a wealthy American traveler interested in the Near East. This unique collection was entitled "Your Beautiful Iraq." Mrs. Fisher presented the negatives to Dr. Henry Field, who donated them to the Field Museum of Natural History.

ORGANIZED FOR "THE INCREASE AND DIFFUSION OF GEOGRAPHIC KNOWLEDGE"

To carry out the purposes for which it was founded fifty-four years ago, the National Geographic Society publishes this Magazine monthly. All receipts are invested in The Magazine itself or expended directly to promote geographic knowledge.

Articles and photographs are desired. For material The Magazine uses, generous remuneration is made.

In addition to the editorial and photographic surveys constantly being made, The Society has sponsored more than 100 scientific expeditions, some of which required years of field work to achieve their objectives.

The Society's notable expeditions have pushed back the historic horizons of the southwestern United States in a period nearly eight centuries before Columbus crossed the Atlantic. By dating the ruins of the vast communal dwellings in that region, The Society's researches solved secrets that had puzzled historians for three hundred years.

In Mexico, The Society and the Smithsonian Institution, January 10, 1899, discovered the oldest work of man in the Americas for which we have a date. This slab of stone is engraved in Mayan characters with a date which means November 4, 291 B. C. (Spinden Correlation). It antedates by 200 years anything heretofore dated in America, and reveals a great center of early American culture, previously unknown.

On November 11, 1935, in a flight sponsored jointly by the National Geographic Society and the U. S. Army Air Corps, the world's largest balloon, *Explorer II*, ascended to the world altitude record of 72,295 feet. Capt. Albert W. Stevens and Capt. Orvil A. Anderson took aloft in the gondola nearly a ton of scientific instruments, and obtained results of extraordinary value.

The National Geographic Society-U. S. Navy Expedition camped on desert Canton Island in mid-Pacific and successfully photographed and observed the solar eclipse of 1937. The Society has taken part in many projects to increase knowledge of the sun.

The Society cooperated with Dr. William Beebe in deep-sea explorations off Bermuda, during which a world record depth of 3,028 feet was attained.

The Society granted \$25,000, and in addition \$75,000 was given by individual members, to the Government when the congressional appropriation for the purpose was insufficient, and the finest of the giant sequoia trees in the Giant Forest of Sequoia National Park of California were thereby saved for the American people.

One of the world's largest icefields and glacial systems outside the polar regions was discovered in Alaska and Yukon by Bradford Washburn while exploring for The Society and the Harvard Institute of Exploration, 1938.

Here comes the Future!

The world of tomorrow... a world with infinite potentialities for human betterment... is in the making *today*. Science and industry... pooling their efforts and resources to make America self-sufficient... are making discoveries which will contribute to better living.

Among these discoveries is "synthetic rubber." In the search for a substitute for natural rubber, a whole series of remarkable rubber-like materials has been developed. Through the magic of synthetic organic chemistry, atoms are combined in ways that never occurred in nature, to yield materials that can be made to fit particular applications.

In many respects, these "substitutes" are superior to natural rubber. They are more resistant to oils, solvents, air, and water. Since their molecular structure can be *controlled*... and since the synthetic chemicals of which they are made are largely *interchangeable*... these materials can be produced in a great variety of novel and useful forms.

Developed by no one individual... no one organization... but by many minds working together... these amazing substances are a triumph of scientific and industrial co-operation. Today, they are being used for bullet-proof gas tanks, cable coatings, and other strategic defense purposes. Tomorrow, they will be used in clothing, house furnishings, and hundreds of other manufactured articles.

"Vinylite" plasticized resins—one type of synthetic rubber—and *Butadiene, Ethylene Oxide, Ethylene Dichloride, Dichloroethyl Ether and Dichloroethyl Formal*—basic chemicals used in tank car quantities for making other synthetic rubbers—are among the more than 160 synthetic organic chemicals produced commercially by Carbide and Carbon Chemicals Corporation.

The great strides made in the field of synthetic organic chemistry by Carbide and Carbon Chemicals Corporation have been facilitated tremendously by technical assistance in the use of special alloys and metals developed by Electro Metallurgical Company and Haynes Stellite Company; by the special carbon products of National Carbon Company, Inc., and by the application of many engineering and processing methods perfected by the Lindo Air Products Company — which companies also are Units of Union Carbide and Carbon Corporation.

PRODUCERS OF SYNTHETIC ORGANIC CHEMICALS

YOU DO
Two Good Turns

WHEN YOU TRAVEL ON
MID-WEEK DAYS...

1 - for war workers and men in uniform who often can travel only on week-ends

2 - for yourself... avoiding inconvenience and crowding

In time of war Greyhound suggests postponing all purely sightseeing trips. But many kinds of travel are *necessary*—to the war program, to livelihood, to health, to the morale of men in the armed services. To all who plan such trips we urge: go on Tuesday, Wednesday or Thursday, if at all possible.

And it's good to know, as you go Greyhound, that these buses use *only a fraction as much rubber*, per passenger, per mile, as the average private automobile—while doing a vitally important job carrying selectees, men in uniform, war workers and all who must travel to win Victory!

For trip information, write nearest of these Greyhound Information Offices:

New York City • Cleveland, Ohio • Philadelphia, Pa. • Chicago, Ill.
Fort Worth, Texas • Minneapolis, Minn. • San Francisco, California
Boston, Massachusetts • Washington, D. C. • Detroit, Michigan
St. Louis, Missouri • Lexington, Kentucky • Charleston, West Virginia
Cincinnati, Ohio • Memphis, Tennessee • New Orleans, Louisiana

Daily, Including Sunday

Lisbon, Balboa, New York, Natal, Honolulu, San Francisco . . . these are way stations on the aerial trade routes of the world.

Daily, including Sunday, in war and peace, giant Boeing flying boats shuttle to and fro across the world in the service of American and British airways. From the beginning, three years ago, of regular flight schedules between this country and Europe, the transatlantic service has been maintained almost entirely by airplanes designed and built by Boeing.

Today, when time itself is flying, men and materials are dis-

patched by Pan American Clipper to key points in the battle formation of the United Nations. Such important figures as Winston Churchill have recently crossed the Atlantic in Boeing planes.

The construction of a huge transoceanic Clipper, complete with galleys, berths, lavatories, baggage rooms, crew compartments, etc., requires aeronautical engineering of the highest calibre. . . . It also requires skill in radio, acoustical, chemical, mechanical, structural, electrical, heating, ventilating, seating, sanitary, civil and many other kinds of engineering.

Today the diversified Boeing engineering which produced the Boeing flying boat is concentrated on the designing of Flying Fortresses,* trainers, gliders and other military aircraft for our armed forces. When the work of these war planes is done, these same skills will be turned once more to peacetime tasks, creating products which serve you well.

Wide variety in engineering skills . . . integrity in engineering design . . . efficiency in production . . . long experience in research . . . these are qualities which are built into things built by Boeing.

Keep Posted With GEOGRAPHIC WAR MAPS

■ LARGE, TEN-COLOR MAPS featuring every region involved by war can be found in this comprehensive, up-to-date series of National Geographic Wall Maps—authoritative, accurate, highly legible for everyday reference. Time-saving Indexes are available for all Maps marked *.

The World: 41x22 inches; ideal to determine quickly the "lay of the land" wherever news happens.

***Theater of War in Europe, Africa, and Western Asia:** 26½x31 inches; features of three maps in one.

***Theater of War in the Pacific:** 26½x20½ inches; gives 861 air distances between strategic points.

***Pacific Ocean:** 38x31 inches; has 72 insets of islands, harbors; shows reef formations, time zones.

Indian Ocean: 32¾x25½ inches; includes eastern Africa and Australia; six timely insets.

Atlantic Ocean: 25x31¾ inches; includes large part of the four continents bordering the Atlantic.

***United States:** 41x26½ inches; shows military divisions, defense data, 8,838 place names.

***Europe and the Near East:** 39x34 inches; all Europe and large part of Russia; 9,052 place names.

***Central Europe and the Mediterranean:** 36½x26½ inches; on a large scale for easy reference.

***Africa:** 29x31½ inches; 7,162 place names; gives railway routes, highways, and other data.

***Mexico, Central America, West Indies:** 41x24 inches; shows Caribbean defense bases, Panama Canal.

***South America:** 26½x37½ inches; shows chief natural resources, railways, air lines, etc.

***North America:** 26½x33 inches; includes all adjacent areas related to hemisphere defense.

***Canada:** 40x27 inches; main highways, railroads, etc.

***Classical Lands of Mediterranean:** 35¼ x 26 inches.

British Isles: 29x35 inches; historic, decorative design.

***Asia:** 38¼x31 inches; includes Russia; 6,500 places.

***Bible Lands and the Cradle of Western Civilization:** 35x25 inches; modern developments, ancient sites.

HANDY MAP FILE: Bound like a book, 7¼ x 10¼ inches; 10 Manila pockets in indexed order accommodate 20 folded paper maps or 10 maps and Indexes; maroon library-buckram covers embossed in gold.

PRICES	Paper Maps	Linen Maps	*Indexes	Map File
	In U. S. & Poss.	50c each	\$1 each	25c each
Elsewhere	75c each	\$1.25 each	30c each	\$3.75

* Indexes available for Maps marked with asterisk *. All Maps come on either paper or linen. Remittances should be payable in U. S. funds. All items sent postpaid.

Miracle in the night

It is night at a hidden airfield.

A huge bomber rolls forth and roars down the dark runway. Hours later it returns and circles above the field. Not a light shows—yet its wheels unerringly find the runway its pilot never sees.

How can men fly like this? How can they take off in darkness, return to an unmarked field, land safely without lights? The answer, of course, is instruments—precise, delicate dials and indicators that are the eyes and ears of our fighting forces.

In the cockpit of every American bomber are more than 200 of these instruments. In ships, submarines, tanks, in every type of artillery, instruments perform a thousand essential tasks. America needs instruments by the millions.

Westinghouse is proud to be contributing to this vital war effort. In Westinghouse plants, delicate, precise, hand workmanship has been put on a mass-production basis—the job men used to say could never be done.

Westinghouse is doing this job 24 hours every day.

Again it's Westinghouse "know how"

On sea and land and in the air, wherever American troops go into action, Westinghouse "know how" is on the job.

What is this "know how"? It is the ability to get things done in the best possible way. It is a combination of pride of craftsmanship, untiring research, industrial ingenuity, and a world of experience.

Today, Westinghouse "know how" has a single aim: to provide the weapons that will keep freedom alive.

Westinghouse

Every Westinghouse plant is producing equipment for the Army, Navy, or Merchant Marine. Here are some examples:

Blackout Plant Air-Conditioning Equipment	Military Radio
Naval Ordnance	Marine Turbines and Gears
Field Hospital X-Ray Equipment	Fluorescent Lighting
Army Camp Refrigerators	Tank Equipment
Instruments for Battleships	Ship Searchlights
Aircraft Instruments	Water Coolers
Binoculars	Ignitron Rectifiers
Mercury Vapor Lamps	Motors and Controls
	Armor-Piercing Shot
	Electronic Tubes

“What he sees...he GETS!”

THERE'S a familiar ring in those words to thousands of home movie enthusiasts. For “*what you see, you get*” has long been a tradition with owners of fine FILMO personal movie equipment, built by Bell & Howell.

Traditional, too, is the craftsmanship which makes that slogan an honest one—and, in this war, one of far-reaching significance. For today, as never before, the motion picture is an indispensable aid to our fighting forces. Each battle, re-enacted on the screen, is the basis for building better weapons, the key to new tactics, and

the irrefutable scoreboard of achievement.

Pleasant in peace, but priceless in war is this assurance that “*what you see, you get*”—with the finest motion picture equipment that American skill and ingenuity can devise.

**UNCLE SAM WANTS
YOU TO SAVE
PEN REPAIR MATERIALS!**

*Fill today with
new Parker Quink
...the ink that keeps pens writing
...eliminates the cause of most pen
failures!*

The **ONLY** ink that **CONTAINS** **MAGIC SOLV-X**... protects your pen against corrosion and rubber rot... dissolves sediment and gummy deposits... actually cleans your pen as it writes!

● Rubber... copper... steel—these war materials are consumed in making pen repairs. That's why it's so important to safeguard your pen now against breakdown and needless waste of vital materials.

To meet this situation—to give your pen lasting protection—Parker has perfected an amazing new ink. It's Parker Quink, containing *solv-x*.

Quink dissolves sediment and gummy deposits formed in pens by neglect and dried-up ink—twin enemies of pens, responsible for most destructive corrosion and rubber rot. In fact, Quink actually cleans your pen as it writes. New pens are kept new—and even old crusty pens are often restored to good working order simply by flushing and filling with Quink.

Give your pen the cleansing protection of Quink with *solv-x* today. Smooth-flowing, full-

bodied, with a deep, lasting color. Dries far faster than ordinary inks! Quink is fine for steel pens, too. Get Parker Quink at any ink counter. The Parker Pen Company, Janesville, Wisconsin, U. S. A.

Especially these days . . . a man needs a good meal

IN PEACETIME, you owe it to yourself and your family to eat well-balanced, nourishing meals. In critical times like these, it's a patriotic duty.

The food you eat is the fuel which your body turns into energy—the energy needed for everything you do, physical and mental.

Your food supplies your body with the materials which build it and keep it in repair.

From your food, your body also gets the elements which help to protect it from disease and keep it running smoothly.

Everyone—desk worker, industrial worker, home worker—needs each day a varied selection of the right foods: milk, vegetables, fruits, eggs, meat or fish or poultry, cereals and breads, and fats. From these foods your body can obtain the nourishment it requires. Naturally, the amount of food you require varies with your activity. If your work is hard you can eat more of the foods high in energy value—bread, cereals, potatoes, fats, cheese and dried beans.

Almost as vital as the right kind of food is the way the food is divided among the meals of the day. It takes satisfying, well-balanced breakfasts and nourishing lunches to supply you with enough energy to last until the next meal. Hasty, sketchy meals may let you down and result in unnecessary fatigue and mental depression. In industrial plants, even your safety may depend on meals that maintain energy throughout working hours.

Nourishing meals not only help you feel better—they help you do better work and do it

more easily. Even your spirits improve and you get more fun from leisure hours. Better eating habits can also build up your resistance to the illnesses which may become more widespread in times of war.

Housewives can do much to see that the members of their families get the nourishing meals they need. Where workers are on night shifts, it is important to arrange meals so that both the workers and the family have nutritious, satisfying meals at the right times. Try to arrange at least one meal so that the whole family may eat together.

To help you select the right amounts of the right foods, Metropolitan will send you on request a free booklet, 92-N, "Your Food—How Does It Rate For Health?"

Metropolitan Life Insurance Company

(A MUTUAL COMPANY)

Frederick H. Ecker, CHAIRMAN OF THE BOARD

Levy A. Lincoln, PRESIDENT

1 MADISON AVENUE, NEW YORK, N. Y.

This advertisement is published in the interest of the National Nutrition Program of the Federal Security Administration.

Sentry Corvus

THE COMMON AMERICAN CROW, (genus *Corvus*), is an exceedingly wary bird.

He seems to sense the presence of firearms, and judge the range of a rifle to a nicety. Farmers and hunters wage unrelenting war upon the crow, yet his numbers continue to increase with amazing rapidity.

But the crow's ability to avoid the tragedies and accidents of life is not due solely to his uncanny perception. It is due in large measure to the fact that the crow never takes any chances.

This intelligent bird knows that the accidents and misfortunes peculiar to his way of life are hazards which can be seen or heard approaching. And so he adopts the obvious safeguard against such hazards.

For example, when a flock of crows is feeding in a corn field two or three of their number act as sentries. These birds, stationed on fence posts or in tall trees, keep watchful eyes open for the approach of danger. A cry of warning from one of the sentry birds will send the entire flock into the air, winging away to safety.

Military men long ago learned to imitate the wary crow in posting sentries to guard against sudden disaster. But the accidents and tragedies peculiar to the lives of most of us often cannot be seen or heard approaching.

Sometimes a man cannot see an accident coming, until it is too late to avoid it. He cannot foretell at what moment his house will catch fire, or when some other form of disaster will strike. But, even though he cannot guard against the occurrence of such things, he can greatly lessen their tragic results by providing himself with insurance.

Your Travelers agent or broker is experienced in providing insurance protection where it will do you the most good. It would be to your advantage to discuss your insurance needs with him. He will be glad to show you how insurance can be your sentry, always on duty, protecting you against insecurity, and guarding you against loss.

Moral: Insure in The Travelers. All forms of insurance. The Travelers Insurance Company, The Travelers Indemnity Company, The Travelers Fire Insurance Company, Hartford, Connecticut.

The job of Matson men *and ships*

TONIGHT, somewhere out in the Pacific, a MATSON ship
nears the end of her voyage. She's low in the water.
Great numbers of the Nation's fighting men crowd the
rail. Her hatches bulge with cargo.

On the bridge, her Captain sights a familiar landfall.
The port is just to starboard. Soon the throb of the
engines will end. The watch of invisible eyes, sweeping
the black reaches of sea and sky, will rest from its
vigil. Again a precious cargo will be safe. Again, in one
of the Nation's outposts, there will be *war* men, guns,
ammunition, and food out on our *front lines*... because
a MATSON ship arrived.

MATSON ships have sailed to HAWAII and the South
Pacific for 63 years. Their captains, officers, and crews
know its deeps, shallows, currents, and safe havens,
from California to the Antipodes. With what they
learned *in days of peace*, they now serve *in days of war*.

They serve on MATSON passenger liners, LUCIFER,
MARIPOSA, MONTEREY, and MATSONIA... ON MATSON'S
flotilla of swift freighters... bringing precious lives
and cargoes to the Nation's *front lines*.

This is "*the job of MATSON men and ships*" in the battle for
democracy. A job, we are qualified to take on, because we
have more than a half-century of sea-faring experience.

Matson Line

TO *Hawaii* NEW ZEALAND - AUSTRALIA VIA SAMOA - FIJI

WHY DON'T YOU WRITE?

Writing short stories, articles on education, homemaking, business, hobbies, travel, sports, human interest stories, etc., will enable you to earn extra money. In your own home, on your own time, the New York Copy Desk Method teaches you how to write—the way newspaper men learn, by writing. Our unique "Writing Aptitude Tests" tells whether you possess the fundamental qualities essential to successful writing. You'll enjoy this test. Write for it, without cost or obligation.

"Today I received a check for \$185 for a story. Another I sold for \$34. Not bad for a beginner! The other day I counted up just how much I have made. It amounted to \$1,520.00!"—Mrs. L. L. Gray, 379 E. McKays Ave., Stamford, Texas.

★ **Clear the Lines for the War** ★

★

★ Before you make a Long Distance telephone
★ call today, ask yourself these questions: ★

- ★ 1. Is it necessary? ★
- ★ 2. Will it interfere with war calls? ★

★ The weight of war on the telephone lines is
★ heavier every day. We can't build the new lines
★ to carry it because sufficient materials aren't
★ available. We've got to make the most of the
★ service we now have. ★

★ Please give a clear track to the war effort by
★ confining your Long Distance calls to those
★ that are really necessary. ★

★ ★ ★ ★ ★ ★ ★ ★

BELL TELEPHONE SYSTEM

Slugger

Summa: to fight...to fight harder and longer...slugging out cannon shells, slamming out bullets. Power to fly...to fly higher and faster...screaming down out of the sun, slugging it out up where there's room to fight.

- That's what's in the 'planes America builds. They're sluggers with speed, cannon-carrying, armed to the wing tips.

- That's what it takes to sweep the Axis from the skies; mighty fighter 'planes with a heavyweight's hitting power, the speed and shiftiness of a lightweight champ.

And Lockheed builds such a hard-hitting, cannon-carrying fighter...the P-38 Lightning interceptor pursuit. Planned for defense...to smash attackers...it now serves on the *offense* in the skies of America's fighting fronts. Lockheed Aircraft Corporation, Burbank, California.

**for protection today, and
progress tomorrow, look to**

Lockheed
