By 1905 Heinz had opened a factory in Great Britain, beginning what would become a global operation. In 1906, unlike many other American food manufacturers, he supported the Pure Food and Drug Act, which regulated the production of processed foods to make them safer to eat. By the time of Heinz's death in 1919, the H.J. Heinz Company employed 6,500 people and ran 25 branch factories. He was succeeded by his son, Howard, who remained president until his death in 1941. Heinz continued to produce its traditional condiment lines, though in 1931 it added a baby food division, which, along with canned soups, helped keep the company afloat during the Great Depression (1929–1939). By 1937 the company's business had doubled.

H.J. Heinz II, known as Jack, took over as president after his father's death, leading the company in once again doubling its sales over the next five years. Jack Heinz was active in food relief efforts during World War II (1939–1945); during this time, many more women took jobs in Heinz plants as men went to

war. Sales abroad increased substantially in the 1940s, ketchup and baked beans were particularly popular in England. Heinz went public after the war and continued to expand during the 1950s and 1960s, opening plants in the Netherlands, Venezuela, Japan, Italy, and Portugal. It also bought Reyumer & Bros., Inc., Hachmeister, Inc., StarKist Foods, and Ore-Ida Foods. Throughout the latter half of the twentieth century, Heinz weathered many changes in the food industry, as distributing and marketing systems adapted themselves to the new supermarket chains.

R. Burt Gookin succeeded Jack Heinz as CEO, and J.F. O'Reilly, president of the company's British subsidiary, took over as president of the parent company in 1973. He changed the company's emphasis by cutting back on traditional business while introducing new products. During O'Reilly's tenure Heinz acquired Weight Watchers International and several other companies, and ceased trying to compete in the soup market with the Campbell Soup Company. O'Reilly, who became CEO in 1979, also instituted a cost-cutting policy, downsizing some product packages and pressuring plants to be more productive. Although the Justice Department prohibited Heinz's bid to purchase Bumble Bee Seafoods in 1988, the company reorganized StarKist Foods and Heinz Pet Products in an effort to increase sales abroad.

Heinz began to expand into Third World countries and also reached into China, Korea, and Thailand. These new strategies succeeded, doubling Heinz's sales from \$2.9 billion in 1980 to \$6.1 billion in 1990. During these years Heinz was investing almost as much overseas as in the domestic economy. It controlled 29 percent of the worldwide infant food market, challenged only by the U.S. leader, Gerber Foods. Heinz also had begun investing in the Asia-Pacific market with the acquisition of Wattie's Limited in New Zealand. A recession in the early 1990s, however, combined with increased competition caused a slowdown which decreased the company's stock value. A number of divestments, staff reductions, and decreases in advertising outlays helped to minimize the losses in the domestic market.

Despite continuing market challenges O'Reilly insisted that Heinz would prosper if it remembered its dedication to niche markets—condiments, tuna, frozen potatoes, and weight-control products—and to what he called "constant rebirth." The company acquired the pet food division of Quaker Oats Company in 1995 and increased its market share of the tuna business to 46 percent by 1997. O'Reilly instituted a major restructuring plan called Project Millennia, which would eliminate 25 plants, cut 2,500 jobs (6 percent of the total

Helms-Burton Act

workforce of 43,000), and take a charge against earnings of \$650 million. O'Reilly said that the move would make Heinz, along with Campbell Soup Company and Sara Lee Corporation, one of the three most important food companies in the world. Indeed, the company came close to its 1997 goal of \$9.5 billion in sales, pulling in actual sales of \$9.3 billion. Although O'Reilly was criticized by some industry observers for raising product prices and reducing advertising support for some of the Heinz brands, he had helped the company to grow from \$1 billion in net worth in 1979 to nearly \$20 billion in 1998.

In 1997 Heinz divested itself of the Ore-Ida food service operations business and scaled down its Weight Watchers division. Under the leadership of William Johnson, the company president who succeeded O'Reilly as chairman, Heinz considerably enhanced its advertising and marketing efforts. After a drop in 1998 sales, in February 1999 the company announced another cost-cutting plan that would eliminate 4,000 jobs and close an additional 20 factories.

HELMS-BURTON ACT

Despite vigorous opposition from the main trading partners of the United States, including the European Union and Canada, the Helms-Burton Act was signed into law by Congress on March 12, 1996. The law

extended sanctions to all non-U.S. companies that did any business with Cuba, and allowed U.S. citizens (including naturalized Cuban exiles) to sue foreign companies for dealing in confiscated U.S. property in Cuba. The Helms-Burton Act (also known as the Cuban Liberty and Democratic Solidarity Act) was perhaps the most assertive move of the United States during the 1990s designed to further isolate Cuba, to strengthen the trade embargo against it, and to extend U.S. legislation to punish foreign companies investing simultaneously in the United States and Cuba.

Cuba, the island-Socialist republic, located 90 miles south of the tip of Florida, had made efforts in 1975 to soften its relations with the United States, but these efforts ceased in 1996, following an incident in February of that year in which two aircraft, piloted by Cuban exiles living in Miami, Florida, were shot down in the Caribbean Sea off the northern coast of Cuba, killing four men. The United States maintained that the planes had been shot down over international waters and reacted strongly to the incident. The reaction included the creation of the Helms-Burton Act of 1996, named after the bill's co-authors, Senators Jesse Helms of North Carolina, and Dan Burton of Indiana.

HEPBURN ACT

Passed by the United States Congress in June 1906, the Hepburn Act gave the Interstate Commerce Commission (ICC), established in 1887, the authority to compel railroads to abide by the regulatory agency's standards and rulings. Rail companies that chose to challenge the ICC in court continued to be subject to all ICC regulations while the legal proceedings were going forward; in other words, the fact that a trial was underway did not exempt any rail company from abiding by all ICC rules. The Hepburn Act gave the ICC the right to fix rail rates, investigate rail trusts, and expanded the agency's purview to include interstate transportation terminals, bridges, rail sleeping cars, express companies, and ferry services. The bill, also called the Railway Rate Regulation Act, was sponsored by representative William Peters Hepburn (1833–1916) of Iowa. The legislation was one of several congressional acts to broaden the jurisdiction and increased the power of the Interstate Commerce Commission, which originally gave the agency control over interstate rail rates and practices.

HERSHEY FOODS CORPORATION

Milton S. Hershey, the founder of Hershey Foods Corporation, was born in 1857 in central Pennsylvania. As a young boy Hershey was apprenticed to a Lancaster, Pennsylvania, candy-maker for four years. When he finished this apprenticeship in 1876, at age 19, Hershey went to Philadelphia to open his own candy shop. After six years, however, the shop failed, and Hershey moved to Denver, Colorado. There he went to work for a caramel manufacturer, where he discovered that caramel made with fresh milk was a decided improvement on the standard recipe. In 1883 Hershey left Denver for Chicago, Illinois, then New Orleans, Louisiana, and New York, New York, until in 1886 he finally returned to Lancaster. There he established the Lancaster Caramel Company to produce "Hershey's Crystal A" caramels that would "melt in your mouth." Hershey had a successful business at last.

In 1893 Hershey went to the Chicago International Exposition, where he was fascinated by some German chocolate-making machinery on display. He soon installed the chocolate equipment in Lancaster and in 1895 began to sell chocolate-covered caramels and other chocolate novelties. At that time Hershey also began to develop the chocolate bars and other cocoa products that were to make him famous.

In 1900 Hershey decided to concentrate on chocolate, which he felt sure would become a big business. That year he sold his caramel company for \$1 million, retaining the chocolate equipment and the rights to manufacture the chocolate products he had developed. He decided to locate his new company in Derry Church, the central Pennsylvania village where he was born, and where he would have a plentiful milk supply. In 1903 Hershey broke ground for the Hershey chocolate factory, which today is still the largest chocolate-manufacturing plant in the world.

Before this factory was completed in 1905 Hershey produced a variety of fancy chocolates. But with the new factory he decided to mass-produce a limited number of products, which he would sell at a low price. The famous Hershey's Milk Chocolate Bar was born, the first mass-produced chocolate product in the United States.

In 1906 the village of Derry Church was renamed Hershey. The town was not simply named after the man or the company: it was Milton Hershey's creation, the beneficiary of and heir to his energy and his fortune. At the same time he planned his factory, Hershey began planning a whole community that would

These are some of the miniature products manufactured by Hershey Corp.

fulfill all the needs of its inhabitants. A bank, school, recreational park, churches, trolley system, and even a zoo soon followed, and the town was firmly established by its tenth anniversary. One of Hershey's most enduring contributions was the Hershey Industrial School for orphans, which he established in 1909 with his wife Catherine. After Catherine's death in 1915 the childless Hershey gave the school Hershey stock, valued at about \$60 million. Today the school, which became the Milton Hershey School in 1951, still owns 31 percent of Hershey Foods Corporation's stock and controls 76 percent of the company's voting stock.

In 1907 Hershey's Kisses were first produced, and the next year the Hershey Chocolate Company was formally chartered. In 1911 it had sales of \$5 million, more than eight times what it had earned 10 years earlier. The Hershey company continued to prosper, producing its milk chocolate bars (with and without almonds), Kisses, cocoa, and baking chocolate. In 1921 sales reached \$20 million, and in 1925 Hershey introduced the Mr. Goodbar Chocolate Bar, a chocolate bar with peanuts. In 1927 the company listed its stock on the New York Stock Exchange.

By 1931, 30 years after the company was established, Hershey was selling \$30 million worth of chocolate a year. As the Great Depression (1929–1939) cast its shadow on the town of Hershey, Milton Hershey initiated a "grand building campaign" in the

1930s to provide employment in the area. Between 1933 and 1940 Hershey's projects included a 150-room resort hotel, a museum, a cultural center, a sports arena (where the Ice Capades was founded), a stadium, an exotic rose garden, and a modern, windowless, air-conditioned factory and office building. Hershey liked to boast that no one was laid off from the company during the Great Depression.

Though Hershey's intentions seem to have been wholly sincere there was always some suspicion about his "company town." Labor strife came to the company in 1937, when it suffered its first strike. Though bitter, the strike was soon settled, and by 1940 the chocolate plant was unionized.

In 1938 another famous chocolate product was introduced, the Krackel Chocolate Bar, a chocolate bar with crisped rice. The next year Hershey's Miniatures were introduced, bite-sized chocolate bars in several varieties.

During World War II (1939–1945), Hershey helped by creating the Field Ration D for soldiers, to sustain them when no other food was available—a four-ounce bar that provided 600 calories and would not melt easily. The chocolate factory was turned over to the war effort and produced 500,000 bars a day. Hershey received the Army-Navy E award from the quartermaster general at the end of the war. Hershey died soon after, on October 13, 1945.

After Milton Hershey's death, the chocolate company continued to prosper and maintain its strong position in the chocolate market. By the 1960s Hershey was recognized as the number one chocolate producer in the United States. In the middle of that decade the company began expanding beyond candy for the first time, acquiring two pasta manufacturers, San Giorgio Macaroni and Delmonico Foods Inc., in 1966. The company changed its name to Hershey Foods Corporation in 1968. An end of an era was marked in 1969 when the company raised the price of Hershey's candy bars to 10 cents. The bars had been priced at five cents for the past 48 years. Another key change came in 1970, when Hershey launched its first-ever national advertising campaign, having previously relied mainly on word of mouth advertising.

In 1977 Hershey bought Y&S Candies, Inc., the nation's leading manufacturer of licorice. Hershey acquired Peter Paul/Cadbury in 1988, thereby gaining such brands as Peter Paul Mounds, Almond Joy Candy Bars and York Peppermint Patties. Through the 1996 purchase of the North American operations of Leaf, Inc., Hershey gained the Good and Plenty and Jolly Rancher brands. By 1999 the company decided to

concentrate solely on chocolate and candies, and it sold its pasta business that year. At the end of the twentieth century Hershey Foods was the number one candy manufacturer in the United States.

HILL, JAMES JEROME

James J. Hill (1838–1916) rose above a childhood of poverty in Canada to become one of the great U.S. empire builders and one of the wealthiest men of the nineteenth century. Hill founded the Great Northern Railroad, which by 1893 connected St. Paul, Minnesota, to Washington's Puget Sound. Hill also acquired a reputation as a "robber baron," and the Supreme Court ruled in 1904 that his railroad system was an illegal monopoly.

Hill was born in 1838 and grew up in Ontario, Canada. His father, who had secured only occasional employment as a farmer, died when the boy was only 14. While his mother kept an inn, young Hill worked as an assistant to a grocer and studied with the Rev. William Wetherald, a schoolmaster who taught him algebra, geometry, literature, and grammar.

In 1856 Hill moved to St. Paul, Minnesota, and began work as a clerk for a firm of shipping agents who served a fleet of Mississippi steamboats. In addition to keeping the books, he handled freight and performed other manual tasks. Hill arrived in St. Paul around the same as the Old Northwest, including Minnesota and Wisconsin, was experiencing explosive growth. Over

**James Jerome Hill.**

the next several years Hill worked for a succession of shipping firms. The ambitious young man had exceptional energy and drive, and he developed a reputation for hard work and shrewd judgement.

In partnership with two associates, Hill formed the James J. Hill Company in 1866. He soon negotiated an exclusive arrangement as a forwarding agent for the St. Paul and Pacific Railroad, under which his firm would transfer produce from riverboats to the westward-oriented railroad. He built a large warehouse, and the business began to prosper. Simultaneously, Hill expanded his business to include fuel. With two other partners he formed Hill, Griggs and Co., which first concentrated on firewood but quickly shifted to coal. It was Hill's rise to the top of the local coal business that formed the cornerstone of his fortune.

By 1872 Hill, Griggs and Co. dominated the Twin Cities coal market, selling 5,000 tons of anthracite annually. Four years later, after organizing his company with its chief competitors in a market-sharing consortium, Hill left the independent coal business.

His attention began to focus on railroads. Together with three Canadian capitalists he purchased the financially troubled St. Paul and Pacific Railroad in 1878. The line was subsequently reorganized as the St. Paul, Minneapolis, and Manitoba Railway Company ("the Manitoba"). Hill became the railroad's president in 1882 and began to extend the line north to the Canadian border. After linking up with a Canadian railroad to

Winnipeg, Hill expanded the Manitoba westward, reaching Great Falls, Montana, in 1887, and Everett, Washington, in 1893. The rail system was renamed the Great Northern Railway Company in 1890.

Hill was not content to simply construct a railroad. He recruited thousands of homesteaders to settle and establish small towns in the Dakotas and Montana. To develop markets for goods to be carried on his railroad, Hill found buyers in the Far East for U.S. cotton, flour, and metals; the Great Northern also carried Pacific timber and minerals east to the Midwest and the Mississippi.

Together with financier J.P. Morgan (1837–1913) of the Northern Pacific Railway Company, Hill acquired control of the Chicago, Burlington and Quincy Railroad Company in 1901. Hill's railroads now had complete access to cotton and other commodities grown in the South, as well as to the natural and manufactured products of the Northwest, the Plains, and the Midwest. In that same year Hill formed and became president of the Northern Securities Company, a holding company that consolidated the Great Northern, the Northern Pacific and the Burlington lines. In 1902 Northern Securities was sued at the behest of President Theodore Roosevelt (1901–1909) as a violation of the federal Sherman Anti-Trust Act. The president's attack on the holding company won him popular acclaim as a "trustbuster." In 1904 the Supreme Court ordered that the company be dissolved. Nevertheless the three railroads involved remained under the control of the same group of investors.

According to biographer Michael P. Malone, Hill was "without peer, the preeminent builder of the frontier economy of the Northwest. By controlling the transportation structure of the region. . . he exercised more sweeping economic power than did any other industrialist, even the lumbermen and mining barons." James Hill died in 1916.

HILTON, WILLIAM BARRON

William Barron Hilton's (1927–) name has become nearly synonymous with the word "hotel." The son of Conrad Hilton (1887–1979), he was arguably one of the founders of the U.S. hotel tradition. Hilton struggled with tough competitors, like Marriott and Hyatt, but with the record and reputation of his own father. For several years Hilton was told that if business was good, it was because of the assets his father put together, and if business was bad, then it was William Hilton's own fault. However, Hilton's assumed control of the family-owned Hilton Corporation in 1979, after his father's death, and the company prospered to the point where, in the late 1990s, it ranked as one of the country's largest holders of real estate.

William Barron Hilton was born in Dallas, Texas, in 1927. His father, Conrad Hilton, was the legendary founder of the Hilton hotel chain. When William was eight, the Hilton family relocated to southern California in the midst of the hotel chain's enormous growth. Before growing into manhood the young Hilton watched his father go through two divorces.

As a young man Hilton showed little interest in taking up the family business. Instead, he joined the Navy and served as a naval photographer during World War II (1939–1945). After the war he started his own business selling orange juice products in California; he was soon the owner/operator of his own citrus distributorship. It wasn't for another five years that Hilton considered joining his father's business. When he did, in 1951, he started in the operations department of the Hilton Hotel Corporation, at the bottom of the corporate ladder. Hilton showed an early talent and initiative for the work in the hospitality business, and in 1954 he assumed the role of vice president of the corporation, with his father in the role of president.

Variety in business ventures seemed important to the younger Hilton. In 1960, while still vice president of the company, he turned his attention to establishing the Los Angeles Chargers football team, a team of the American Football League. The following year he

moved the team to San Diego, California, and served as its president until 1966.

That same year he took on the role of president and chief executive officer (CEO) for the Hilton Hotels. In 1970 he bought two Las Vegas hotels, beginning the company's involvement in the gaming industry. Gaming interests grew rapidly, and within 25 years they accounted for 46 percent of the firm's revenues.

With the death of his father in 1979, Hilton became chairman of the board of the company's operations. The will of the senior Hilton specified that the bulk of his estate go to the Conrad Hilton Foundation, a charity to aid Catholic nuns. William Hilton fought successfully to alter the terms of the will, and he obtained sufficient shares of Hilton Hotel stock to control 25 percent of the company.

Only after a long struggle did William Hilton come to be seen as the company's master strategist. During the 1970s, when other hotel chains plunged ahead with the development of luxury hotels and vacation resorts, Hilton sat back and watched his competitors' successes and failures before making any of his own moves. He was also cautious during the 1980s, when it seemed that everyone else in the business was either buying or selling.

Hilton made the move, finally, to sell off his less profitable hotels and retain choice properties like New York City's famed Waldorf-Astoria. He decided also to manage and franchise the rest of the hotels bearing the Hilton name. His cautious yet strategic maneuvers caused the company stock to rise while other hotel operations were seeing a downturn. William Hilton obtained the reputation of a cautious, prudent, and savvy strategist in real estate dealings.

During the 1990s, however, he became aggressive about the gaming industry and led the pack with construction of new casinos and proposals for gambling complexes. In 1996 Hilton began expanding internationally. His aim was to bring his total hotel room capacity to 100,000 by the year 2000—by 1997 he had already reached his goal. By the late 1990s the Hilton Corporation operated 16 casinos and 240 hotel properties, and in 1996 Hilton bought the Bally Entertainment Corporation for \$43 billion.

At the close of the twentieth century, as owner of more than 25 percent of the company's shares William Barron Hilton was president of a vast hospitality empire employing 62,000 people. His personal wealth was estimated to be over \$600 million, which made him a regular on *Forbes* magazine's list of the "400 Richest People in America" since 1982.

HIRES, CHARLES ELMER

Charles Elmer Hires (1851–1937) was the first soft drink entrepreneur. Before industry giants like Coca-Cola and Pepsi, there was Charles Hires and his “root beer,” which he created in 1875. An entrepreneur at 24, Hires went on to develop a second successful business in the manufacturing of condensed milk.

Charles Hires was born on August 19, 1851, in Roadstown, New Jersey, the son of a farming couple. At age 12, after a meager early education, Hires moved from his parents’ farm to begin a four year apprenticeship as a pharmacy clerk. He completed the apprenticeship at age 16 and moved to Philadelphia, where he worked for a pharmacist and attended evening classes at Jefferson Medical College and the Philadelphia College of Pharmacy.

At age 18, Hires opened his own pharmacy in Philadelphia. Oddly, his first successful business venture involved the purchase and resale of a kind of clay (fuller’s earth) that Hires recognized as having solvent properties. He renamed the common substance “Hires’ Potter’s Clay” and made several thousand dollars selling it to various wholesale drug houses, to whom he advertised it as a successful grease and spot remover.

Hires first tasted the drink that would bring him fame and fortune while staying at a New Jersey boarding house during his honeymoon. The drink, “root beer,” was served to him by the landlady. It was a beverage made from sassafras bark and herbs. Hires loved the taste and, so the story goes, wanted to produce it himself.

After conversations with chemist friends and his own experiments with sarsaparilla root and other ingredients, Hires finally created what came to be known as root beer. Originally, he intended to call the beverage a tea, hoping to sell it among Pennsylvania miners

as a substitute for an alcoholic drink. A friend told him bluntly that miners would never drink his concoction if it were called tea. His friend further instructed him to call it a beer, root beer, if he expected it to sell to men.

During the Philadelphia Centennial Exposition of 1876 Hires took the opportunity to sell his root beer to the millions of fair visitors. Their response was immediately favorable and it led Hires to begin marketing and packaging his root beer. He first sold it in bulk, dried, for 25 cents. It could be brewed at home by mixing it with water and a few other ingredients and it made about five gallons of the drink. In 1893 he began to produce root beer in liquid form, packaged in three ounce bottles.

Root beer began to sell extremely well at soda fountains which were popular during that era. The drink became popular among industrial workers as an alternative to water, tea, and alcohol, and it also became popular among the middle class as a universal beverage available to children, adolescents, and adults.

Hires advertised his product extensively in newspapers and national magazines. By 1890 he was able to organize all his business efforts into the Charles Elmer Hires Company. Starting with an original capital investment of \$300,000 Hires watched his company’s value rise to more than \$2 million by 1921.

In addition to root beer, Hires made considerable money from the manufacture and distribution of condensed milk. The venture began in 1899 and blossomed into a wholly separate business for Hires. He eventually sold this condensed milk company to the Nestle Company in 1918, after having built more than 20 milk plants in various regions of the United States and Canada.

Hires spent much of his leisure time supporting the work of the Society of Friends, a Quaker organization he joined during the last half of his life.

By the end of the nineteenth century Hires Root Beer was known as a favorite American soft drink. Hires’ success made U.S. business realize there was a large market for an alternative to tea, coffee, alcohol, and fruit drinks. It did not take long for Coca-Cola and other soft drink manufacturers to follow in Hires’ footsteps and create the enormous world market for bottled soft drinks. The founder of root beer died in 1937.

HOFFA, JAMES RIDDLE

During the mid-twentieth century James Riddle Hoffa (1913–1975) rose to become one of the most powerful figures in the U.S. labor movement. In 1932 Hoffa began his involvement in the unions. He organized for the Teamsters during the Great Depression and by 1935 was president of the local Detroit, Michigan, chapter of the International Brotherhood of Teamsters (IBT). During the ten years that followed he brought many smaller unions into the IBT through his organizing skills, "street smarts," and personal charisma. Hoffa was elected president of the IBT in 1959, becoming the head of the largest, richest, and most powerful labor union in the United States. At the time the IBT represented a membership of two million blue-collar truckers and transportation workers. While historians have disagreed about his contributions to the labor movement, none have questioned his legacy of power and influence, or his status as a legend.

Jimmy Hoffa was born in 1913 in the small town of Brazil, Indiana, one of four children. His father was a coal miner who labored long hours to support his family and died young of a lung disease associated with working conditions in the mines. Hoffa's mother was employed as a domestic worker and a cook, and took in washing to make ends meet. She moved the family to Detroit, Michigan, four years after the death of her husband.

Jimmy Hoffa attended school until the tenth grade, when he dropped out to help his family meet the severe economic conditions of the Great Depression. He took a full-time job as a stock boy at Kroger's, a Detroit grocery store chain. The low pay, poor working conditions, and the impact of the Great Depression all contributed to making the young Hoffa conscious of workers' problems.

Hoffa began to demonstrate his organizing skills as a young man. At age seventeen he led four of his co-workers in a successful strike against the Kroger Company. Hoffa's synchronized the strike with the delivery of a large trailer of fresh strawberries to the Kroger loading docks. Kroger's business managers knew it would not take long for the strawberries to spoil and they desperately needed the loading dockworkers to unload the shipment. Within one hour a new union contract was reached and within one year Jimmy Hoffa's "Strawberry Boys" joined Teamsters Local 674, which later merged with Truck Drivers Local 299. Hoffa transformed the local from a 40-member unit with \$400 in its coffers to a 5000 member unit with \$50,000 in the bank.

The early U.S. labor movement was volatile and Hoffa's involvement with the IBT during the late 1930s resulted in many threats to his life. Hoffa's car was bombed, his office was searched, and he was once arrested eighteen times in a single day. Hoffa once recalled, "When you went out on strike in those days, you got your head broken. The cops would beat your brains out if you even got caught talking about unions." Undeterred, at the age of twenty-eight Hoffa became vice president and chief negotiator for the IBT.

During the 1950s the federal government began promoting strong attacks against organized crime such as the Mafia. Hoffa had never made a secret of his relationship with the Mafia and the federal government's intense focus on organized crime, combined with the resistance of business to his unionizing, squeezed Hoffa at both ends. The government, for criminal reasons, and business, for labor reasons, both sought Hoffa's downfall.

During the 1960s, after numerous charges of corruption in the Teamsters, Hoffa faced several felony trials. He was convicted of jury tampering and fraud in two separate trials in 1964, and was sentenced to a 15-year prison term. President Richard Nixon (1969–1974) commuted Hoffa's sentence in 1971, but banned him from any union activity. Hoffa had remained president of the Teamsters Union throughout the five years he served in jail, but upon his release from prison he stepped down.

Hoffa appealed to the courts to regain his union presidency but the Supreme Court denied his motion. Hoffa continued to be unofficially involved with the Teamsters union, and with organized crime. On a July afternoon in 1975, Hoffa disappeared after a luncheon meeting. He was never seen again. His colorful life and mysterious disappearance have created an enduring historical legend about the man who served at the

James R. Hoffa.

forefront of the U.S. labor movement in the mid-twentieth century.

HOLLERITH, HERMAN

Herman Hollerith (1860–1929), an American engineer and inventor, made a major breakthrough that paved the way for the invention of the modern digital

computer. He invented a punch-card system in 1890, first used widely by the federal government, that was the beginning of all modern data processing in business. His invention of the punch-card tabulating system, still used in many voting machines in the United States, became the foundation of a company that evolved into the International Business Machines Company (IBM).

Hollerith was born in 1860, and raised in Buffalo, New York. In 1879 he graduated at the age of 19 from Columbia University with a degree in mining engineering. He then went to work for the United States Census Bureau's Division of Vital Statistics, compiling mountains of census information into readable data. At the time, information was processed by hand. It was costly, time consuming, and very slow.

In the late 1880s the Census Department determined that the upcoming 1890 census would include data from over 62 million Americans. The department's traditional census tabulating measures were so time consuming that it had little hope of compiling the information into any useful format until well after the 1900 census. By that time the data would be of little value. Working on a solution, Herman Hollerith designed a machine to tabulate the large amounts of census data in a shorter time period. His automatic

Home Front

machine was based on electrical impulses, which transmitted only when holes in punched cards passed over the electrical contacts. The signals were then fed into electrical-mechanical tabulators to be counted, like those in old-fashioned adding machines. Hollerith's tabulating machine quickened the Census Department's ability to compile data and, for the first time, allowed the census data to record new details, such as the number of doctors working in a particular state who were married with one child and owned their own home.

Hollerith patented later models of his machine, ones that could count, add, sort, and which used automated card-punching to make the right holes in the cards to provide the right electrical signals in the right places. He sold his first machine to the United States Army to help in their compilation of medical statistics. He then obtained a contract from the Census Bureau to provide machines to be used in the census count of 1890.

According to evaluations made of the value of his early tabulating machines, Hollerith's tabulators saved the Census Bureau \$5 million for the 1890 census and did in one year what would have taken eight years of hand-tabulation. Hollerith's invention was the beginning of modern data processing. His humble "press" machine, using paper cards with punched holes in them, became the beginning of an electronic way for all businesses to efficiently keep track of thousands of business transactions.

It did not take long for businesses and industries to find uses for Hollerith's tabulators. Business could keep track, easily and quickly, of the amount of stock they had in different departments and keep more adequate supplies on hand for consumers. The business tabulator was an important advancement in business, especially for large companies that dealt with mass markets where significant amounts of information needed to be processed quickly.

When Hollerith was 36 years old, he had enough demand for his tabulating machines to found the Tabulating Machine Company, where he continued to improve his machines. In 1911 Hollerith sold his share of this company, retiring in his mid-fifties. The company name changed, and by 1924 it merged with others to become the first giant in computer tabulating companies—IBM, the International Business Machine Corporation.

Herman Hollerith's modest punch-card press tabulator changed the face of American business by allowing for the creation of high-speed, efficient ways to keep track of all aspects of business transactions, enabling businesses to grow significantly without losing control

of daily information crucial to the maintenance of business.

Hollerith died in 1929 at the age of 70, having no idea he would later be regarded by many as the grandfather of the modern computer.

HOME FRONT

Home front is a term that describes domestic civilian activity during times of war. During World War II (1939–1945) the U.S. home front was marked by a national purpose that united Americans behind the efforts of the Allied Powers (United States, Great Britain, Russia, and China, among others) to defeat the Axis Powers (Germany, Italy, and Japan). Sacrifice and patriotism of average Americans combined with the dynamism and flexibility of private enterprise to galvanize domestic war production. More than 7 million of America's 8 million unemployed persons in 1940 returned to work by 1944. Nearly 3.5 million of the newly employed were women. The popular image of Rosie the Riveter working on planes, tanks, and ships embodied the contribution made to industrial war production by female laborers. Jobs were paying both sexes 25 percent more at the end of the war than they had at the beginning. However, inflation was spiraling upward so rapidly that the federal government placed a ceiling on prices, wages, and rents. Congress also established the nation's modern tax structure during the war, imposing a steeply graduated income tax that

Americans were patriotic during the war, and more united than ever before. To increase productivity factories stayed open for a second or third shift, and workers added long hours of overtime. Roosevelt's promise in 1940 to build 50,000 aircraft was received with amazement. In the end 300,000 were built. The gross national product doubled from \$101 billion in 1940 to \$214 billion in 1944. Egalitarianism was the rule in the war years, reinforced by rationing, shortages, price controls, and the universalism of the draft.

Oxford Companion to World War II, 1995

for the first time covered most middle-income and lower-income groups. As a result, the number of families paying income tax quadrupled, and the amount of tax they paid increased twenty-fold.

Governmental rationing of scarce and valuable commodities, such as gasoline, rubber, meat, sugar, and leather, also tested the resolve of civilians on the home front. But the ingenuity and entrepreneurial spirit behind America's capitalistic system helped civilians look past the daily inconveniences to see the bigger picture. For example, the Allies had to devise an efficient way to transport personnel, vehicles, and equipment across the oceans in order to invade Europe, Africa, and the South Pacific. Andrew Higgins, a Louisiana boat manufacturer, convinced reluctant Navy officials to turn production of transport vessels over to him. He integrated a workforce of 30,000 blacks, women, and men, and paid top wage without regard to sex or skin color. A huge sign hung over the assembly lines: "The Man Who Relaxes is Helping the Axis." Higgins' factory produced more than 20,000 transport vessels in four years. General Dwight D. Eisenhower (1890–1969) later credited Higgins and his workers with winning the war.

Hundreds of other American industries also converted civilian business to wartime manufacturing, churning out 44 billion rounds of ammunition, 20 million small arms, 2.5 million trucks, 300,000 planes, 100,000 tanks, and 90,000 ships. But single-minded zeal was not always an asset. To minimize domestic sabotage and espionage, President Franklin D. Roosevelt (1882–1945) issued an executive order in February 1942 authorizing the forcible removal of approximately 110,000 Americans of Japanese descent. There were transferred from strategic locations around the country

to inland relocation camps, where they were detained like prisoners without a hearing or trial. Despite their mistreatment many of the detained Japanese Americans maintained their patriotism, raising the Stars and Stripes every morning at camp and singing the national anthem. Some detainees contributed to the war effort, helping develop a synthetic rubber to augment the Allies dwindling supply of natural rubber. More than 17,000 Japanese Americans were released from detention to join the U.S. Army. During one campaign in Italy Japanese-American soldiers earned 3,000 Purple Hearts, 810 Bronze Stars, 342 Silver Stars, and 47 Distinguished Service Crosses in the field of battle. Although the U.S. Supreme Court upheld the constitutionality of the forcible relocation and detention, in 1988 the federal government issued an apology for the episode and offered to pay money damages to the victims and their families.

HOMESTEAD ACT (1862)

The Homestead Act, passed by the Republican-dominated Congress during the American Civil War (1861–1865), was intended to place public land in the hands of western settlers. It stated that any adult citizen (or a person who declared an intention to become a citizen) who was the head of a family could lay claim to 160 acres of public land. The only payment required was a small registration fee. The claimant was required to live on the land for a five-year period while improving it by building a house measuring at least 12 by 14 feet and farming at least ten acres. The period of residence was reduced to six months if the settler was willing to pay a price of \$1.25 an acre. Within three years of the act's passage, more than 15,000 claims on public lands had been registered with the federal government.

The passage of the Homestead Act represented the culmination of 30 years' work by Republicans and their Whig predecessors. When the United States purchased the Louisiana territory from France in 1803, it acquired a huge tract of federally administered land. President Thomas Jefferson (1801–1809) envisioned this territory divided into small farms, whose owners could follow his rural vision of American democracy. Over the next few decades, Congress was split on the question of what to do with this land. Southern legislators feared that homestead laws, which divided public lands into small farms rather than large plantations,

Homestead Act (1862)

Women working on an assembly line, mass producing planes on the home front during World War II.

would attract immigrants and others who were opposed to slavery. Some of their northern counterparts, especially from the industrialized northeast, feared that the lure of free land would drain cheap immigrant labor from the factories to the frontier. Others, such as Senator Thomas Hart Benton, supported free farms as a means of encouraging democratic growth.

I SOLD MY PENNSYLVANIA FARM WITH ITS STUMPS AND STONES AND STINGY SOIL THAT YIELDED SO GRUDGINGLY TO THE TOIL I HAD GIVEN IT. MY WIFE, SUSIE, AND I DECIDED TO GO TO KANSAS AND TAKE UP A GOVERNMENT CLAIM.

Warren P. Trimm, Kansas homesteader

The problem became especially acute after the Mexican War (1846–1848), when transportation of both people and produce became cheaper because of new canals and railroads. So important was the issue that one party, the Free-Soilers, made distribution of public lands the major plank in their campaign platform during the 1840s. Although bills offering public lands to settlers were passed by the House of Representatives in 1852, 1854, and 1859, they were all defeated by the southern-dominated Senate. When an

1860 homestead bill was finally passed by both houses of Congress, President James Buchanan (1857–1861) vetoed it.

Although the Homestead Act was intended to benefit the homeless immigrants of the east, those who gained the most from it were native-born Americans and land speculators. Immigrants were mostly too poor to afford the stake needed to move west and take up a claim. It was typically second- or third-generation Americans who sold their farms to head west with their families. Most of these farmers, however, were poorly prepared for farming on the Great Plains. The quality of land allotments open to farmers varied considerably, and good claims were quickly taken up. Accustomed to plenty of water and wood for cooking and heating, as well as plentiful grass for their livestock, many were unable to cope with the arid conditions of the West. Many original homesteaders were unable to live on their new land long enough to complete their claims. These farmers often sold their claims to land speculators, who resold them to latecomers at a profit. Some land speculators also bought abandoned land and hired claimants to file false claims.

Those homesteaders who remained on their claims found new opportunities, as well as challenges. Federally

funded railroads spanned the continent by 1869, opening isolated farms to markets and manufactured goods and bringing new settlers to the prairie. These pioneers built schools, churches, and towns, as well as homesteads. Within 40 years of the passage of the Homestead Act, most of the territories opened to settlement had either entered the Union as states or filed for statehood.

HOMESTEAD STEEL STRIKE

The industrialization of the United States in the second half of the nineteenth century involved a complex and unsettling social and economic transformation of U.S. society. The spread of factory towns, urban living, transportation networks, and new technologies were catalysts for the reorganization of American life. So, too, were the emergence of the American corporation, which concentrated industrial wealth and power in the hands of a new economic elite, and the mass labor union, which sought to protect the burgeoning ranks of factory workers. The Homestead Steel Strike of 1892, which pitted the industrialist Andrew Carnegie (1835–1919) against the Amalgamated Association of Iron and Steel Workers, was one of the most dramatic expressions of the sharpening conflict between the corporation and the union—between capital and labor—on the terrain of industrializing America.

Homestead, Pennsylvania, was the center of Andrew Carnegie’s enormous steel empire, the Carnegie Steel Corporation, which produced fully one-quarter of

the world’s steel by 1892. Its work force was concentrated in Homestead, a town of 12,000. Most of the steelworkers belonged to the Amalgamated Association of Iron and Steel Workers. With 24,000 members, the union was one of the most important members of the American Federation of Labor (AFL).

Carnegie himself, along with most other business leaders of the time, possessed a deep opposition to unions. He viewed the Amalgamated as a dangerous organization that not only weakened his ability to treat labor as a freely disposed commodity, but also resisted his attempts to introduce technological advances. Carnegie was also well aware that the threat of a strike, which was fully endorsed by the AFL, could cripple his steel empire if it was carried out effectively. For their part, the Homestead workers, reflecting the attitudes of other steelworkers of the time, believed Carnegie was generally insensitive to their needs. In particular, they were upset that he refused to share the profits of more efficient production techniques.

In July 1892, as his contract with the AFL was about to expire, Carnegie decided to crush the steel workers union. He instructed his general manager, Henry Clay Frick, to announce that the steel mill would now employ non-union workers and pay lower wages. This started a general strike by the Amalgamated, which set up committees to run the strike and prepare the town. Carnegie, who left on vacation for Europe, transferred operational control to Frick, whose hatred of unions was well known. Frick proceeded to employ 300 company guards hired through Pinkerton’s National Detective Agency to seize the millworks from the strikers. On July 5, the guards used river barges in an attempt to land near the factory under the cover of night. The strikers were waiting for them and a battle lasted for eight hours. When it was over, 35 men lay dead and 60 others were seriously wounded.

Even before the violent clash, public opinion was running against the strikers through no fault of their own. An agitator named Alexander Berkman had earlier attempted to assassinate Frick in his office. The failed attack brought much sympathy for Frick and significant discredit to the strikers. The news of the deadly confrontation between strikers and Pinkertons further turned opinion against the Amalgamated. Pennsylvania sent 4000 militiamen to occupy the factory, which was soon turned over to management. Nonunion workers were hired and the millwork resumed normal operations. Four months later, the Amalgamated voted to end the strike, but the organization was now crushed, effectively ending unionism in the steel industry. More important, the struggle crippled the AFL and weakened efforts to organize labor throughout the United States.

HOMESTEADERS

Homesteaders, sometimes credited with settling the West, were people who took advantage of the Homestead Act of 1862. The first family to do so was that of Daniel Freeman (1826–1908), who made a land claim on January 1, 1863, the day the law went into effect. Freeman settled near Beatrice, Nebraska.

The Homestead Act of 1862 and its later modifications were collectively known as the Homestead Laws. During the mid-1800s, a debate arose over what the federal government should do with its newly acquired lands in the West. Those supporting the free land movement, led by the Free Soil Party, believed the government should grant lands in the West to whoever settled them. Conservatives believed the government should sell the lands to raise revenue. Southerners opposed free-soil policy, which they felt did not benefit their interests: they not only viewed the spread of agriculture in the West as a threat to their economic prosperity, but they feared that territories settled under a free-soil policy would eventually oppose slavery. Northerners tended to support the free-soil initiative, because the region's growing industrial sector would need new domestic markets for finished goods produced by the (industrialized) North.

Free land legislation that would improve the allowances of the earlier Pre-Emption Act of 1841 were introduced in Congress in 1851, 1852, and 1854;

Southern Democrats succeeded in blocking passage each time. When the Republican Party was formed in 1854; in absorbing the Free Soil Party and its agenda, the Republicans proclaimed they would enact a "complete and satisfactory homestead measure." Soon after Republican presidential candidate Abraham Lincoln (1809–65) won the election in 1860. In response, the Southern states made good on their threat to secede from the Union if the Republican party put its candidate in the White House. With Southern lawmakers out of Congress (with the exception of Tennessee Senator Andrew Johnson (1808–75), who had long supported free-soil initiatives and did not join his fellow Southerners in the act of secession), the Homestead Act was introduced and passed in Congress.

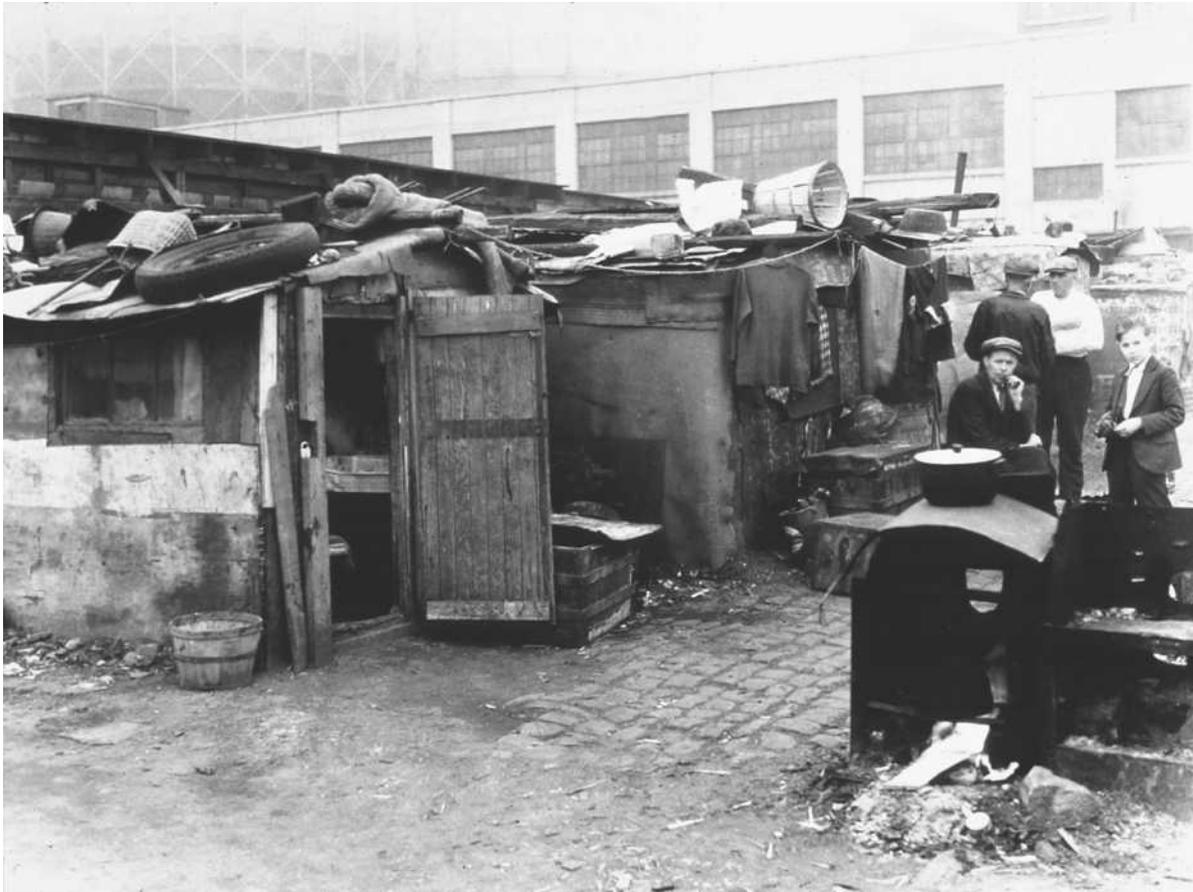

The legislation provided that anyone who was head of a family, or 21 years of age, or a veteran of just 14 days of active service in the U.S. armed forces, and who was a citizen or intended to become a citizen of the United States could receive up to 160 acres (64 hectares) of land. A homesteader was required to build on the land or cultivate it for a period of five years. Having only paid the initial, nominal filing fees, at the end of the five-year period the homesteader received a title to the land. In 1912, the required period of settlement was decreased to three years. Other modifications opened forest and grazing land for settlement and increased the maximum acreage to 640.

The Homestead Laws encouraged the rapid settlement of lands held in the public domain outside of the original 13 states (as well as Maine, Vermont, West Virginia, Kentucky, Tennessee, and Texas.) By 1932 more than one million homesteaders had developed more than 270 million acres (109 million hectares) of formerly public lands. In 1935 the remainder of public domain was withdrawn from homestead settlement. By 1962 all agricultural land that had been set aside for homesteading had been settled. Congress repealed the Homestead Laws in 1976 (except for laws pertaining to Alaska).

HOOVERVILLE

Hooverville was a derogatory term used to describe the ramshackle towns that were built and inhabited by millions of homeless and unemployed people in communities across the United States during the Great Depression. Named after Herbert Hoover (1874–1964),

Trash-laden shacks at a Hooverville, a temporary shantytown outside a factory during the Great Depression.

who was president from 1929–1933, when the Depression began, Hoovervilles typically consisted of makeshift homes made from cardboard, tin, crates, scrap lumber, and other discarded materials. Hoovervilles generally sprang up within the inner cities of the country’s most populated metropolitan areas. For daily subsistence residents depended on the charity of nearby bakeries and produce houses that would make periodic deliveries of stale bread or gristly meat. Soup kitchens were established in several Hooverville communities. Residents cooked their food in cans when they cooked it at all. Newspapers used to keep the residents warm were called “Hoover blankets.”

Health, fire, and law enforcement officials closely regulated many Hoovervilles, enacting requirements that tenements be above ground, have a certain number of windows, and be kept clear of debris and human waste. Some Hoovervilles assembled a rudimentary government of their own, electing a mayor, city council, and police chief. Hooverville tenements were bought and sold like other homes, though prices rarely exceeded \$30. By the onset of World War II (1939–1945) most Hoovervilles had disappeared, as the nation’s

unemployed and homeless began returning to an economy that was mobilizing for military production. A number of Hoovervilles, however, lingered through the early 1950s.

HOPKINS, HARRY LLOYD

Harry Hopkins (1890–1946) was one of the major architects and managers of the New Deal during the Great Depression (1929–1939) and he was a major U.S. policymaker during World War II (1939–1945). Brought to Washington, DC, by President Franklin D. Roosevelt (1933–1945) to administer public relief programs during the Depression, Hopkins went on to become one of Roosevelt’s closest advisors during World War II.

Harry Lloyd Hopkins was the younger of two children born to David and Anna Hopkins. He was born in Sioux City, Iowa, in 1890, and grew up largely in Grinnell, Iowa.

Hopkins, Harry Lloyd

His father was a moderately successful traveling salesman who apparently communicated to his son his competitive style, good nature, and early loyalty to the Democratic party. His mother, a deeply religious woman, impressed on Harry the values of strict honesty and moral principles. Hopkins was also exposed to his sister Adah's enthusiasm for social work.

In 1912 Hopkins graduated from Grinnell College, where he studied social work. He then left Iowa for New York City and a career in the same field, rising rapidly to the administrative ranks of his profession. From 1915 to 1930 he held a wide variety of difficult high-level positions in social work, always initiating new, creative, and useful programs.

Hopkins became active in social movements, especially those focused on political action to create pensions for widows with children and relief for the families of servicemen who had fought during World War I (1914–1918). Hopkins was one of the founders of the American Association of Social Workers, the first national professional organization for social workers.

Though Hopkins achieved much in social work, he would achieve a great deal more in the years ahead. His reputation as a fine administrator reached the ear of New York's governor Franklin Delano Roosevelt, who brought Hopkins into his administration. Hopkins' job was to help develop relief programs for New York state residents during the early years of the Great Depression.

After Roosevelt became the president of the United States, Hopkins was invited to join Roosevelt in Washington, DC. He was appointed head of the Federal Emergency Relief Administration (FERA), an agency which granted federal money to individual states for unemployment relief.

Hopkins was never able to resolve any of the large issues of the Great Depression, but he did create many useful programs that eased the pain and suffering of millions of Americans during that time. He demonstrated a consistent genius for creatively dealing with social emergencies.

In 1935 Hopkins began to build the Works Progress Administration (WPA), which became a major effort to combat unemployment during the Depression. Admittedly, it was a temporary "make work" government-supported program, but its focus on getting the average American back to work through socially useful jobs was enormously popular. It gave faith and hope to Americans looking for some relief from the devastation of the Depression.

The results of the WPA enriched U.S. society. Thousands of miles of roads were built during this time, as well as bridges, parks, playgrounds, schools, airports, post offices, and other public buildings. Though the WPA was a federal program Hopkins had the foresight to operate it in a decentralized fashion, with many decisions made at state and local levels. The WPA did not have the "feel" of a huge, faceless, federal bureaucratic program, largely because it was administered by local areas which defined their own needs, projects, and means by which to manage WPA monetary allotments.

Health problems caused Hopkins to resign from government service in 1940. Yet within a year he was back in service because Roosevelt's desperate need for someone with strong administrative and leadership skills during World War II. Despite his weakened health, Hopkins returned to work and supervised Roosevelt's controversial lend-lease program to the British. In this role Hopkins became a kind of unofficial roving ambassador for Roosevelt, providing him with impressions, observations, insights, and advice. Hopkins quickly familiarized himself with most aspects of the war effort and became a close working-partner with Winston Churchill (1874–1965), the Prime Minister of Great Britain. He also conferred with Russian leader and then-U.S. ally Joseph Stalin (1879–1953) and had a well-informed and motivated staff to assist him.

It has been said that as the United States entered the war in December of 1941, Harry Hopkins likely knew more about the details of U.S. war-making capacity than any other American. His actions in the administration of World War II, despite his ongoing poor health, marked the highpoint of Hopkins' career as a public servant.

Although Hopkins was officially behind the scenes in much of what happened during the war, he was praised worldwide by Allied Forces for his always creative and honest approach to the war effort. He also was known for his help in sustaining the confidence of Americans to overcome the crises of war and economic downturns.

His increasingly poor health and the death of his friend President Franklin Roosevelt, in 1945, did not deter Hopkins from playing an important role in winning congressional approval for the establishment of the United Nations, an international cooperative organization. For his service to the United States, President Harry Truman (1945–1953) awarded Hopkins the Distinguished Service Medal, the nation's highest civilian honor. Hopkins died months later, in January 1946, an American hero.

HORSES

The horse originated in the Western Hemisphere but it became extinct there at the end of the ice age (around 10,000 B.C.). Horses had migrated into Asia before this time, and there the species continued. From Asia horses spread both northward and westward, and they were domesticated by man by 4350 B.C.. Between A.D. 900 and 1000 horses came into widespread use throughout Europe. When Christopher Columbus (1451–1506) landed at Hispaniola (present-day Santo Domingo, Dominican Republic) in 1492, he brought with him horses and cattle. These were the first seen in the New World in 7,500 years; the Native Americans had no beasts of burden prior to the arrival of the Europeans. In 1540 Spanish explorer Hernando de Soto (1500?–42) landed on the Gulf coast of Florida with more than six hundred men and two hundred horses. Also in 1540, Spanish explorer Francisco Vasquez de Coronado (c. 1510–54), who was looking for the Seven Cities of Cibola (mythical cities thought to contain vast treasures), arrived in the American southwest and brought with him the first horses and livestock ever seen in the region.

The introduction of the horse had a profound effect on North and South America. The Spanish conquistadors rode on horseback in battle against the native inhabitants, and they could easily subdue them and claim their lands. (The Spaniards also had guns, which combined with the horse to give them the advantage over the Native American warriors.) The

American Indians that survived European incursion learned how to raise and use horses themselves. This knowledge enabled them to hunt game such as buffalo more effectively. The horse allowed the European settlers to expand westward via stagecoach and covered wagon and to convey messages cross country (by Pony Express).

Until the advent of the train (called the “iron horse”) in the mid-1800s, the horse was the primary means for overland travel in the United States. It also figured prominently in the nation’s military history, including the American Revolution (1775–83) and the American Civil War (1861–65). In 1811 construction began on the first federal road, the Cumberland Road (also called the National Road). Beginning in Cumberland, Maryland, the road continued west to St. Louis, Missouri. As a result, St. Louis received an influx of immigrants and became a vital trade center later that century.

HOWARD JOHNSON INTERNATIONAL, INC.

When 27-year-old Howard Johnson (1896–1972) bought a drugstore-newsstand outside of Boston in Wollaston, Massachusetts in 1924, he added more to his debt than to his assets. The \$28,000 obligation that the new acquisition brought added to Johnson’s already-existing debt of \$10,000, which was left over from a failed joint venture in cigars with his father. Two innovations, however, quickly made Johnson’s new business a success. First, he devised a home delivery service to peddle newsstand products in Wollaston and surrounding communities. His annual profits for the newsstand reached \$30,000 in a few years. Although this money helped Johnson get out of debt, it was his interest in ice cream that had the biggest impact on his business.

An ice cream fanatic, Johnson wanted to use the drugstore’s soda fountain to sell the best ice cream in town, which in his opinion was the ice cream being sold by a local pushcart vendor. Johnson paid the vendor \$300 for the recipe (which yielded an extremely rich ice cream because it called for twice the butterfat of other commercially produced ice creams). Eventually Johnson began to experiment with other flavors, adding each one he liked to the soda fountain’s menu. His 28 flavors were so popular that they became the Howard Johnson trademark.

These relatively small experiments began an early expansion and formed the basis for what would soon become a very big business. Howard Johnson was so pleased with the success of his ice cream that he decided to expand its sale outside of his drugstore. He put up small ice cream stands along the beaches of south Boston suburbs. The stands were a huge success; on one extremely hot August day alone, he sold 14,000 ice cream cones. In 1928 the profits from all Howard Johnson ice cream sales totaled \$240,000.

Emboldened, Howard Johnson decided to open a family restaurant in 1928. The restaurant, in Quincy, Massachusetts, enjoyed only a short-lived popularity and closed in 1929 at a loss of \$45,000 for Johnson. The Quincy restaurant, however, was not an entire loss. In 1929 a family friend, Reginald Sprague, wanted to open a restaurant on a nearby highway. Sprague knew that Howard Johnson's name and ice cream would boost the restaurant's visibility and popularity. The two men entered into an agreement that stipulated the following: Johnson would allow Sprague to use the Howard Johnson name. In return, Sprague agreed to pay Johnson a cash fee, to sell only Howard Johnson brand ice cream, and to allow Howard Johnson to set the standards for all foods served at the restaurant. It all made perfect sense for Johnson who, in light of his earlier debts and failed restaurant, could not obtain bank loans to start new restaurants himself.

This is generally viewed as the birth of the first U.S. franchise restaurant chain. Under this system, independent businessmen called licensees owned and operated the restaurants, not Howard Johnson or his company. The licensees had the right to use the Howard Johnson name, but they paid the start-up costs for their properties, including an initiation fee paid to the company. They also had to purchase their food and other products from the Howard Johnson company, which was the main method by which the Howard Johnson company made money on these ventures.

Johnson had no trouble finding other takers for his franchise system. By 1935 there were seven Howard Johnson restaurants in Massachusetts. In 1940 there were 135 restaurants that extended down along the East Coast as far as Florida. That same year Howard Johnson won a bid to put 24 restaurants along the Pennsylvania Turnpike, where he would maintain a restaurant monopoly until 1979. Howard Johnson favored well-traveled automobile routes for his restaurants, knowing that the increasing popularity of cars would draw people out of population centers onto the roads. He hired 27 architects to design new properties. The trademark buildings each had bright orange roof tiles (orange being the color most likely to be seen by

motorists) and a New England-style cupola in bright blue topped with a weathervane. Howard Johnson maintained high standards—he devoted two days a week to conducting unannounced inspections. He institutionalized novelties like the children's portion to attract families. The company provided the chain restaurants with elements of guaranteed success and it continued to grow.

World War II (1939–1945) brought gasoline rationing, and by 1944 only 12 out of about 200 restaurants were still open. Some restaurants were converted to cafeterias for workers in war plants. After the war Johnson decided to build smaller restaurants, leaving behind the grand roadside mansions of the pre-war years. In the summer of 1947, the company was building 200 of these new restaurants, which would extend into the southeast and Midwest. By 1954 there were 400 Howard Johnsons in 32 states, and the company was also adding a motel business. Some of these were franchises, others were owned directly by the Howard Johnson company.

In 1959 Howard Johnson Senior turned the company's presidency over to his 26-year-old son, Howard Johnson Jr. The company's headquarters remained in Wollaston, but executive offices were moved to Rockefeller Center in New York City. The company continued to expand and in 1961, when its stock went public, there were 605 restaurants, 10 Red Coach Grills, 88 motor lodges, 17 manufacturing and processing plants, net sales of \$95 million from 1960, and a net income of \$2.3 million. Between 1961 and 1967 Howard Johnson Sr., his son, and his daughter sold around two million shares of stock for \$1 billion. When Howard Johnson, Sr. retired as chief executive officer and executive treasurer in 1964, his company was the country's third largest food distributor, behind only the navy and the army.

Although the company continued to grow—becoming a coast-to-coast chain with properties in California in the mid 1960s and adding Ground Round restaurants in 1969, it was now facing new problems and competition. Holiday Inns, Ramada Inns, and Marriott hotels were becoming increasingly popular with people who once stayed at Howard Johnson's motor lodges. Howard Johnson restaurants were increasingly perceived to be out of date in terms of their looks and their frozen food, which compared poorly to McDonalds and Burger King fast food franchises. Management was accused of being too cheap to upgrade the company's image. The company responded by introducing 24 hour service in over 80 percent of company-owned (not licensees') restaurants. Also, soda fountains were replaced with cocktail lounges in

100 company-owned locations. Seating capacity was expanded; special menu promotions were added; and new properties were concentrated in population centers as opposed to major highways. Howard Johnson continued to have record high sales and share earnings.

In 1979 Imperial Group Ltd. of Great Britain bought Howard Johnson for \$630 million. It liberated the past controls over restaurants and motels, allowing them to buy food from a variety of sources and not just from the Howard Johnson company. Imperial also offered new food and lodging packages, entrees, and low cholesterol breakfasts. To attract business travelers, Imperial offered corporate discounts. Licensees were given the choice of refurbishing their existing properties by 1987, with low-interest loans from the company, or losing their franchises. Imperial also started a new Plaza Hotel chain in 1983. It was mid-priced and also geared toward business travelers, with restaurants and lounges, banquet and meeting rooms, and executive accommodations.

Despite its changes, Imperial was unsatisfied with Howard Johnson's performance and it sold the company to Marriott Corporation in 1985 for \$314 million. Marriott divided the company, selling the franchise system and company-owned lodgings to Prime Motor Inns Inc. for \$97 million. Prime assumed the company's \$138 million debt but also took the Howard Johnson trade name and trademark. Both purchasing companies wanted to get rid of the independently owned properties after their franchise agreements expired.

This opened an interesting chapter in the company's history. To protect their interests, the franchisees threatened a class-action lawsuit against Marriott and Prime. In 1986 Franchise Associates, Inc., a company formed by the franchisees, won a perpetual exclusive license to the Howard Johnson name for restaurants in the United States, Panama, and the Bahamas. Franchise Associates, Inc. also obtained exclusive rights to use the trade name for Howard Johnson Signature Food Products and the free use of Howard Johnson recipes. By 1991 Franchise Associates owned and operated 85 of the 110 Howard Johnson restaurants.

The story of the lodging branch of the company took a different turn. In 1990 Prime sold its Howard Johnson lodging properties to an affiliate of Blackstone Group for \$170 million. Blackstone renamed the Howard Johnson Franchise Systems subsidiary to Howard Johnson International Inc. in 1996. By the mid-1990s Howard Johnson lodging was expanding to worldwide locations under the leadership of president and chief

operating officer Eric Pfeffer. Its intent was to fill the gap in international lodging between high-priced hotels and youth hostels. The company was operating over 600 hotels worldwide, with international locations in Columbia, the United Arab Emirates, and India.

HOWE, SAMUEL GRIDLEY

Samuel Gridley Howe (1801–1876) was a key figure during the nineteenth century in helping disabled people lead productive, dignified lives. Howe was a physician by profession and worked primarily with people who were blind or otherwise disabled. His activism spread to broad segments of the population. Through his efforts he demonstrated that people with a variety of physical and emotional disorders could become economically and socially functional. The disabled, he claimed, did not need to be abandoned or shut away in institutions.

Samuel Howe was born in Boston in 1801 to middle class parents. In 1824 he obtained a medical degree from Harvard University at age twenty-three. He then went to Greece and became involved in that country's war against Turkey. He spent five years in Greece as a surgeon and likely developed his ideas about disabilities during this time.

When he returned to Massachusetts Howe opened a new school for the blind. He aggressively pursued a philosophy of "overcoming obstacles" when it came

Hughes, Howard Robard

to teaching the blind. This may have been based on his observations of how the disabled in Greece functioned during a time of war. He inspired educators of his time with the articles and reports he wrote about the disabled. His writing was filled with educational theories, positive principles of human psychology, and a good dose of hope.

Howe soon became the leading spokesperson for the needs of and the possibilities for the disabled in the United States during the nineteenth century. He increasingly asserted through his work and his writings that the disabled should be treated with confidence rather than pity. He developed a system of raised-print writing which was used by the blind to read until the simpler Braille method was invented by Louis Braille (1809–52).

OBSTACLES ARE THINGS TO BE OVERCOME.

Samuel Gridley Howe

Howe joined a variety of reform movements. He advocated better public schools, as well as enlightened treatment of the mentally ill and the developmentally disabled. He worked to reform prisons and end the institution of slavery.

Throughout his life Howe opened and organized schools designed to integrate disabled students into society. At the beginning of the twentieth century the trend in the United States was against isolating the blind and other disabled persons in institutions. A new social tendency arose to provide for the disabled a way to participate fully in everyday life.

At one point in his life Howe ran unsuccessfully for Congress as an antislavery candidate. He was among the most active of the New Englanders who worked to keep the state of Kansas from permitting slavery. He supported John Brown's (1800–1859) raid on Harper's Ferry in 1859. During both the American Civil War (1861–1865) and the Reconstruction era (1865–1877) Howe served on national commissions and agencies concerned with providing aid for freed slaves.

Howe died on January 9, 1876 at the age of seventy-five. His wife carried on his fight for the rights of slaves and the disabled. Julia Ward Howe also wrote the words for the famous "Battle Hymn of the Republic."

Howe is regarded as the father of the modern Disability Rights Movement (DRM). The movement

advocates that people with disabilities be treated with appropriate techniques and education, allowing them to become active in the routine work and business of their communities.

Howe helped create an understanding that the blind, the deaf, and others with disabilities were not mentally or otherwise inferior. Howe's vigorous reform efforts at first focused on the blind, and later expanded to include former convicts, African slaves, the emotionally impaired, and the developmentally disabled. All of his efforts eventually focused on the fundamental humanity of all people. Howe championed the right of all people to be treated equally as their abilities allowed, and not their disabilities. He was among the first to aggressively confront U.S. society with the motto: "Obstacles are things to be overcome."

HUGHES, HOWARD ROBARD

Howard Robard Hughes (1905–1976) was born into great family wealth, and despite his flamboyant lifestyle as a playboy, tycoon, and eccentric, he nevertheless enjoyed a remarkable business career that made him a billionaire. He was successful in many endeavors. He was a test pilot, the majority owner for years of TWA airlines, a movie producer, and a real estate developer. Oddly, Hughes is perhaps best remembered not for his successful business enterprises but for his bizarre and reclusive behavior. In his later years, his paranoid concern for privacy became legendary.

Howard Hughes stands on the flight deck of his enormous eight engine flying boat, the *Spruce Goose*, observing a pilot at the control panel.

Howard Hughes, Jr. was born in Houston, Texas, the only child of Howard and Alene Hughes. His parents had grown wealthy because of his father's invention of a drill bit used in most gas and oil drilling. This invention brought vast revenues to the family's Hughes Tool Company, which manufactured the drilling bit. Howard attended private schools in California and Massachusetts, and later, Rice Institute in Houston, and the California Institute of Technology.

His mother died when Hughes was sixteen. Two years later, his father also died. At age eighteen Hughes inherited an estate of \$871,000 and a patent for the revolutionary drill bit, which continued to bring large revenues to the Hughes Tool Company. Hughes left school to take control of the company after his father's death, using its profits to finance a variety of projects.

At the age of twenty, in 1925, he married and moved to Los Angeles. Two years later, Hughes put up the money for the first of several films he produced, a movie called "Hell's Angels," about World War I (1914–1918) fighter pilots. It was the most expensive movie ever made at that time, and it did very well at the

box office. He went on to produce other films, some of which are considered classics, including "Scarface" and "The Outlaw." He discovered the actors Jean Harlow and Paul Muni, and made Jane Russell a Hollywood star. Hughes became romantically linked with a number of Hollywood stars.

Hughes continued to produce movies while he pursued an interest in aviation. He seemed to be driven to prove his excellence in whatever field he entered. Becoming a pilot in 1928, Hughes went on in 1932 to found the Hughes Aircraft Company, and to design, build, and fly record-breaking planes. He set the world speed record in 1935, transcontinental speed records in 1936 and 1937, and a world flight record in 1938. He was named to the Aviation Hall of Fame in 1973. Hughes built the largest aircraft ever, made out of wood. It flew one time, piloted by Hughes, and was known as "The Spruce Goose."

Hughes became a well known public figure, popular for his aviation and movie heroics. He seemed to embody the traditional American qualities of individuality, daring, and ingenuity.

Human Capital

His aircraft company became a major defense contractor after World War II (1939–1945), and as the profits of his company increased, Hughes became obsessed with ways to avoid paying taxes on his huge profits. In 1953 he created a medical institute designed to be a tax-shelter, to which he transferred the assets of his aircraft company. For a time in the 1950s, his fame increased, as he openly confronted the federal government. In 1956 he loaned future President Richard Nixon's brother, Donald, \$205,000 in an apparently successful ploy to influence the Internal Revenue Service's rulings on the Howard Hughes Medical Institute. In the eyes of many, he was a lone hero fighting against the intrusion of federal bureaucracy and the Internal Revenue Service (IRS). In the eyes of the government, he was a tax-cheat.

Hughes continued investing with his tool company profits. He created Trans-World Airlines (TWA), one of the most famous mid-century world airlines. Because he failed to appear in court in a matter related to possibly illegal TWA operations, Hughes was forced to sell his TWA holdings in 1966. He invested all of the \$566 million from the sale of TWA into Las Vegas hotels, gambling casinos, golf courses, a television station, an airport, and land in Las Vegas. He again increased the size of his fortune.

In 1970 Hughes left the United States. He traveled secretly throughout the world, arriving unannounced in luxury hotels. To the paparazzi, he took on the aura of a romantic figure, but in reality he was a profoundly ill man. His last act of business, before going into total seclusion and paranoid decline, was to sell off his Hughes Tool Division, the basis of his great fortune, and put the money into a building company he named Summa Corporation, located in Las Vegas.

At that point, the Hughes fortune became muddled. His money and business interests seem to have often been used for secret activities; some allegedly involved in Central Intelligence Agency (CIA) operations aimed against the former Soviet Union. One such operation involved the Hughes conglomerate designing and constructing a naval vessel to raise a sunken Soviet submarine. The Hughes organization was reportedly linked, along with the CIA, to the Watergate affair. Details of the end of the Hughes empire are shrouded in mystery and controversy. Howard Hughes' mental illness was progressive and characterized by his obsessive concern to control every aspect of his environment. He died April 5, 1976, on an airline flight to a hospital in Houston, Texas. Hughes left no direct heir or will to his great fortune. The U.S. government was the big winner in the contest for the Hughes estate.

Sixty percent of his fortune was taken as estate tax by the IRS.

HUMAN CAPITAL

The quality of labor in a country's workforce can directly influence a nation's economic growth. Investment in vocational training and education, which improves the quality of labor, is called investment in human capital. As an individual becomes more skilled and educated, productivity or output of work may increase, along with income. The concept of human capital can provide justification for wage and salary differentials by age and occupation. Education and training in skill development can create human capital just as construction of a building creates physical capital.

Some economists assert that a society should allocate resources to educational and training services similar to the allocation of resources for physical capital. Costs would be incurred in expectation of future benefits. However, unlike physical capital, human capital is not a guarantee and cannot be repossessed in settlement of a debt. The key question has been whether or not benefits exceed expenditures by a sufficient amount.

Until the mid-nineteenth century, education expenditures were primarily generated by the private sector. By the 1850s all states had developed programs for funding public schools. As late as the early twentieth century, most people considered education that was beyond the primary grades to be a luxury—particularly

among low-income groups. However literacy rates continued to move upward and since 1940, education levels have consistently climbed. In 1940 24 percent of the U.S. population had high school diplomas and 4.6 percent earned college degrees. By 1996 almost 82 percent had completed four years of high school and almost 24 percent had completed four or more years of college. By attending college or vocational training

programs, individuals were able to invest in themselves. Firms invested in human capital with on-the-job training. Government invested in human capital by offering programs to improve health, quality free schooling, including vocational and on-the-job training, and by providing student loans.

IACOCCA, LIDO ANTHONY

Lee Iacocca (1924–) retired as the Chief Executive Officer (CEO) of the Chrysler Corporation in 1992. He had joined the corporation fourteen years earlier when Chrysler was on the edge of bankruptcy. The company was at the time one of the largest automobile manufacturers in the world, employing thousands of people. Upon entering the company Iacocca convinced everyone involved, including the United States government, to underwrite \$1.2 billion in loans to rebuild the company. To obtain this critical support, Iacocca used the legendary salesmanship and public relations skills he had honed while president of the Ford Motor Company. Seemingly by sheer willpower, Iacocca saved Chrysler and its employees from financial ruin.

Lido Anthony Iacocca was born in 1924 in Allentown, Pennsylvania. He was the son of Italian immigrants. Lee, as he preferred to be called, learned about business from his father, Nicola, who was a businessman with many interests. Nicola was a cobbler, the owner of a hot dog restaurant, a theater owner, and the owner of one of the first car rental agencies in the country. Iacocca credits his father with passing on to him a love for the automobile.

Iacocca earned his Bachelor's degree from Lehigh University. He later earned a Master's in mechanical engineering, with a specialty in industrial engineering, from Princeton University. He decided early on to become an auto company executive. After graduating from Princeton in 1946 he joined the Ford Motor Company as an engineering trainee. Within a year he realized that he was far better at selling automobiles than at making them. Iacocca entered the fast-track of sales. In 1960, at age thirty-six, he sped into the vice presidency and general management of the company's most important unit, the Ford division.

In 1964 Lee launched the Mustang automobile. Its attractive styling and successful marketing introduced a new wave of sports cars to the Ford operation. The

Mustang earned Iacocca instant fame as an industrial innovator. In 1964 his face was on the cover of both *Time* and *Newsweek* magazines. By 1967 he was the executive vice president of Ford Motor Company. In 1970 he became president of the company. His only superior was Henry Ford II (1917–1987), chairman of the board of Ford Motor Co. For reasons that were never made clear, Chairman Henry Ford II discharged Lee Iacocca in June 1978. It was a shock to many people who saw Iacocca as a natural heir at Ford.

Five months later Iacocca was named president of the rival Chrysler Corporation. He became chairman in 1979 and began turning around the failing corporation. At the time Chrysler was headed for bankruptcy. Iacocca took the number three automaker, deep in debt, and transformed it into a highly profitable enterprise. He began managing expenses by winning approval of over \$1 billion in federal loan guarantees. He then sold off profitable units like the tank manufacturing division and introduced new products to the marketplace. He also brought the president of the United Auto Workers onto the company's board of directors.

Within six years Chrysler paid off its debts and posted a profit of \$2.4 billion. In 1985 Chrysler bought the Gulfstream Aerospace Corporation for \$637 million and the E.F. Hutton Credit Corporation for \$125 million.

Under Iacocca's leadership the company put out innovative new vehicles and eventually bought out competitor American Motors Corporation. As Chrysler bounced back to life in the 1980s, Iacocca became an extraordinary business and corporate celebrity. Some of his detractors felt he was a self-obsessed egomaniac, but many analysts of his career regard him as an important U.S. industrial hero of the late twentieth century.

A key product to the resurgence of the Chrysler Corporation was Iacocca's promotion of the K-car "minivan." It was a vehicle loved by the young family

Lee Iacocca.

in need of room and efficiency. The mini-van largely helped revitalize Chrysler and its public image. It clearly set the trend for the enormous popularity of the sports utility vehicle that claimed much of the auto industry's market in the late twentieth century.

Iacocca continued to be the successful and charismatic CEO of the Chrysler Corporation until his controversial retirement in 1992, during a period when Japanese auto competition was once again hurting Chrysler's profits. He moved into retirement reluctantly after spending much of the previous thirty years of his life as an automobile industry corporate legend. Iacocca remained a major stockholder in Chrysler and in 1995 he became involved in a battle to gain control of the company. In the unsuccessful attempt for control, Iacocca sided with Las Vegas financier Kirk Kerkorian and was strongly criticized.

Iacocca's impact on the auto industry was controversial, but undeniable. He saved the Chrysler Corporation and turned it into a profitable business. In 1998, even in retirement, Iacocca was still involved in the

auto industry, investigating the market for electric cars in California.

IDAHO

One of the most sparsely populated states, Idaho remained undeveloped until gold and silver strikes began to attract eager prospectors. Like other areas of the Great Plains and the West, Idaho was at first just a place to cross during a westward journey, not a place to settle. As mining and agriculture began to take hold and the transcontinental railroad made settlement and commerce more feasible more people began to make Idaho their new home. Contemporary Idaho has a number of important industries and significant agricultural products, especially potatoes. Idaho's tourist industry is also strong, attracting thousands annually to the state's ski resorts and scenic areas.

During the first quarter of the nineteenth century Idaho was part of the vast territory known as the Oregon Country, claimed at various times by the United States, Great Britain, Spain, and Russia. Until 1805 no known white explorers had disturbed the Native American tribes who were the only residents of Idaho. When Meriwether Lewis and William Clark's expedition reached the region that year the Native Americans helped supply the explorers for their journey to the Columbia River and the Pacific. Fur trappers and missionaries soon followed. Although the Oregon Trail crossed Idaho and the area officially became United States land in 1846, no one thought the territory worthy of settlement until 1860. In that year, Mormons established the first permanent settlement at Franklin and a gold rush began in northern Idaho. The Idaho Territory was organized in 1863. According to historian F. Ross Peterson, "It is a sad fact of American history that while hundreds of thousands of uniformed Americans in Virginia, Tennessee, and Maryland were trying to kill each other [in the American Civil War (1861–1865)], thousands of Americans in the West were running from creek to brook to river trying to get rich quickly."

In the following two decades Idaho grew rapidly with Boise established as the capital in 1863. The Boise Basin became the most developed part of the state, reaching a population of 6,000 by 1864. Two years later \$24 million in gold was produced during the Boise Basin strike. By then more than \$50 million in gold had been taken from the Idaho mountains with little regard for possible damage to the environment.

As mining boom towns came and went agriculture was becoming more important in Idaho. Telegraph service and the transcontinental railway reached the state, and the population increased twofold between 1870 and 1880. The Utah and Northern Railroad,

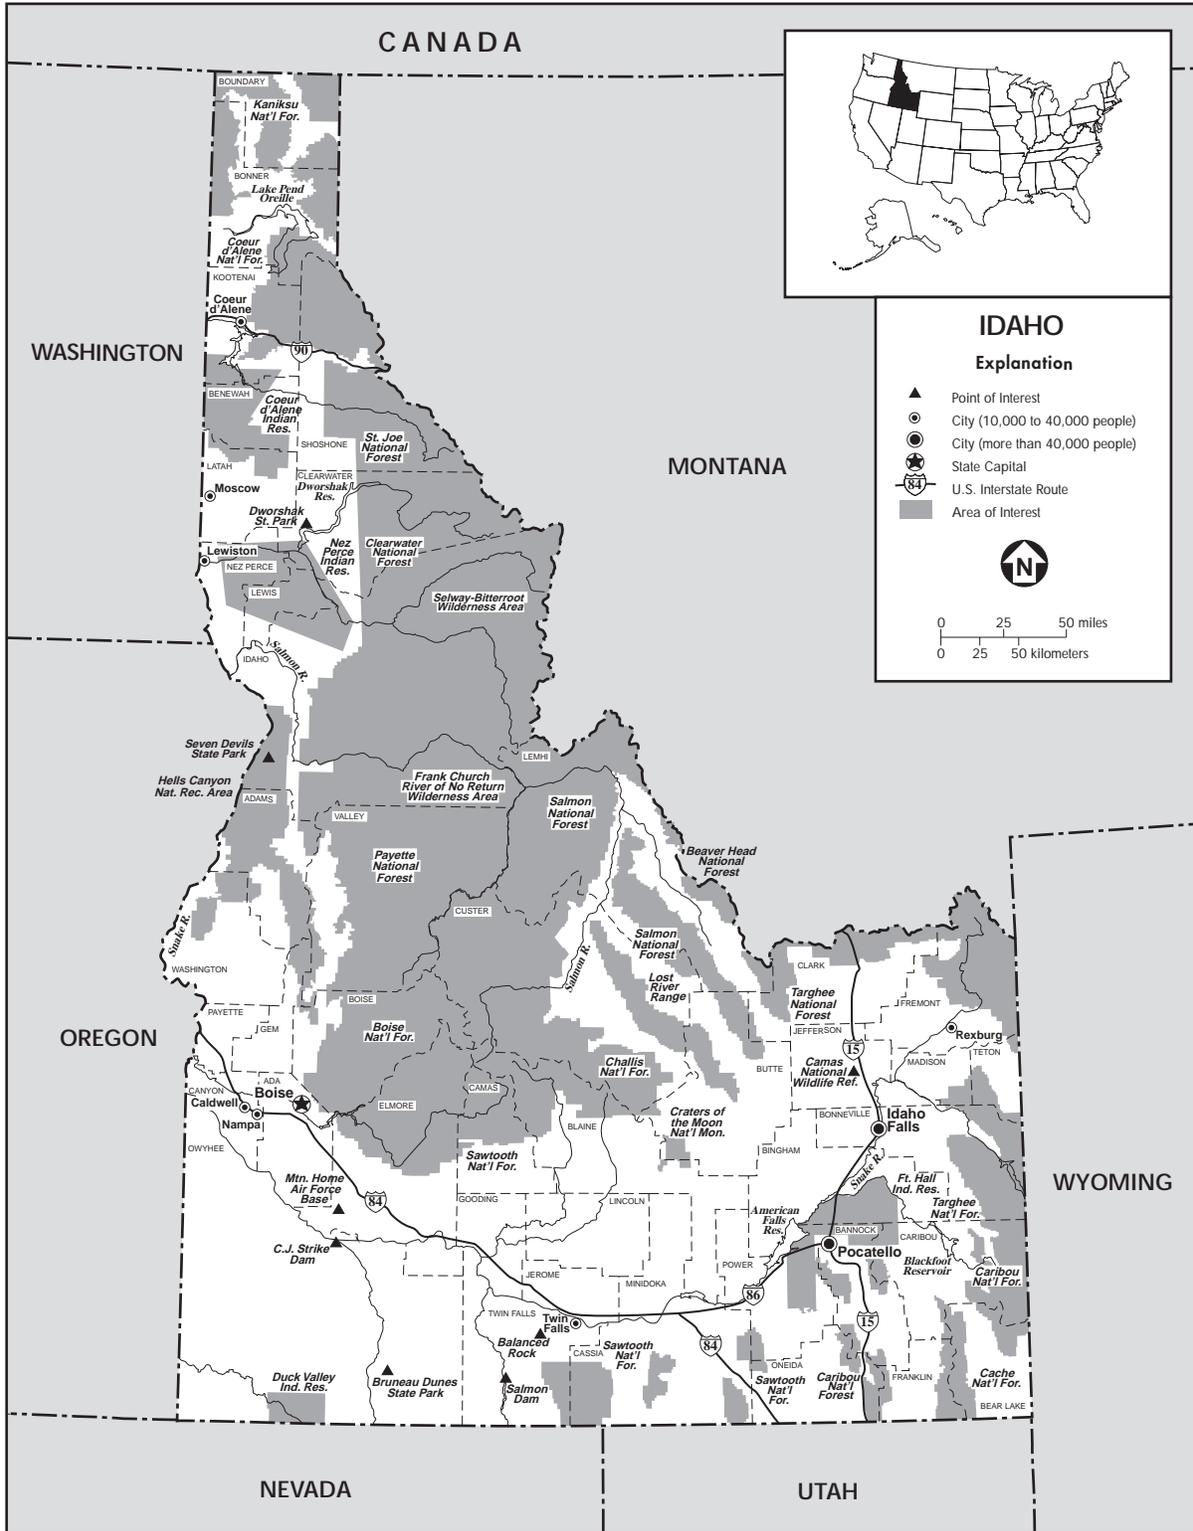

owned by mogul Jay Gould, was the first major railroad in the state which hastened the settlement of northern Idaho. Many Mormons, encouraged by their Utah church leaders, migrated to Idaho during this time to establish farms and communities such as Blackfoot and Victor. The Oregon Short Line was completed through Idaho in 1884 and a traveler could now reach Portland, Oregon, from Omaha, Nebraska, in five days—a trip that had taken Lewis and Clark 18 months to complete in 1805. The Northern Pacific and the Chicago, Milwaukee, Saint Paul, and Pacific railroads also made possible the development of lead-silver lode mining in the area of the Coeur d'Alene Mountains. During the late 1870s, as in all territories settled by whites, Native American residents were gradually pushed off their land by a series of wars. The most famous Idaho battle was the Nez Percé war, after which Chief Joseph surrendered and his people were pushed onto reservations.

Another rush of prospectors came to Idaho between 1880 and 1884 after silver and lead were discovered in south central Idaho and the panhandle region. Idaho became the 43rd state in 1890, having reached a population of more than 88,000 that same year. During the 1890s Idaho was plagued with violent labor disputes in the mining regions and political bickering among Mormons and non-Mormons.

Further economic growth was made possible in the early twentieth century by federal land and irrigation projects. A very large sawmill at Potlatch was an indication of an increasingly prosperous timber industry, and agriculture also began to grow in importance in the state. The development of the russet potato in the 1920s gave Idaho its signature agricultural product. A farm depression in the 1920s, however, lasted through the Great Depression of the 1930s and did not end until World War II (1939–1945). Both agriculture and industry were important after the war, especially the fertilizer and potato businesses. Development was encouraged even more after the construction of a nuclear reactor testing and power plant at Idaho Falls in 1951, the first such generating station in the country. Idaho's mountains and open spaces also created a thriving tourist business. Today, the Sun Valley ski resort and other scenic areas attract thousands of tourists each year.

Contemporary Idaho faces new problems as the population expands and environmentalists push for better land use planning. Controversies also arise over mineral development and over water supply and dam construction. A major economic and human disaster occurred in 1976 when the new Teton Dam in eastern Idaho collapsed, causing loss of lives and \$400 million in property damage.

Idaho

State of Idaho.

Idaho's economy in the 1990s was largely dependent on agriculture, mining, forest products, and food processing. Idaho is the nation's leader in potato production; most potatoes are grown in the Snake River plain, and about three-fourths of the crop is used for processed potato products such as french fries or instant mashed potatoes. Other important crops produced by Idaho include hay, wheat, barley, and sugar beets. This agricultural bounty is made possible because nearly 64 percent of all land used for farming in the state is under irrigation. Mining is only a small percentage of the state's annual gross product, but a variety of minerals, such as garnet, phosphate rock, construction sand and gravel, silver, lead, and pumice are produced. It is one of the few places that produces molybdenum, in a reopened mine at Thompson Creek.

Manufacturing in the state is concentrated in the resource industries—food processing, chemical manufacturing, and lumber production. In the late 1970s and early 1980s a number of northern California computer concerns, such as Hewlett Packard, opened or expanded plants in Idaho. The leading food producer is Ore-Ida Foods, and J.R. Simplot processes both food and fertilizers. Some of the wood products industries include Boise Cascade and Louisiana-Pacific.

The state survived a downturn during the recession of the early 1980s by restructuring its major industries. Although the number of workers employed in many industries in the state has shrunk, chemical manufacturing employment grew 36 percent during the 1980s, and paper industry employment rose by 30 percent. Between 1982 and 1991, tourism employment increased by 35 percent, and jobs in the high-technology industry increased by 50 percent between 1986 and 1990. In 1996 the average per capita income in the state was \$19,539, ranking 43rd in the nation. Although Idaho was a pioneer in establishing fair labor practices only 8.1 percent of all workers belong to unions, and the state is now a right-to-work state.

ILLEGAL DRUGS (ISSUE)

One of the most serious social problems in the United States since World War II (1939–1945) has been the trafficking in illegal drugs. These drugs—mostly derived from the opium poppy or from coca leaves—have powerful psychotropic (mind-altering) effects and are very addictive.

The U.S. government's attempt to deal with the drug problem has few defenders. The devastation that heroin and "crack" cocaine have imposed on the nation's already disorganized central cities and even on its affluent suburban high schools are widely acknowledged. There is less agreement on the root causes of this policy failure. Critics differ widely. Conservatives point to the weakening of family values. Liberals have no consolidated position on the drug problem. Some counsel a "get tough" policy of more vigorous enforcement of existing drug laws. Others go to the other extreme and favor the decriminalization of drugs. They point to the fact that the greatest growth in the U.S. prison population is from non-violent drug offenders. They argue that the result of the official U.S. policy banning drugs has been to turn addicts into criminals and to create a world-wide "black market" in illegal drugs.

As Adam Smith (1723–1790), the eighteenth century spokesman for free market economics, might have predicted, the constricted supply and growing demand of a banned substance inevitably increases the price and attracts entrepreneurs—in this case, organized crime. Or, as novelist William Burroughs once ironically remarked, the economic marvel of heroin is that the problem of slack demand never arises. Heroin is a very salable product: once introduced into the population, it needs no advertising; it not only sells itself, it drives the buyer to sell himself or herself.

As early as the second half of the nineteenth century, medical researchers recognized that opium and morphine combined beneficial pain-killing qualities with problems of addiction. In fact, when the German pharmaceutical company Bayer introduced heroin into the United States, it called the drug a non-addictive substitute for morphine. By the time government regulation arose during the Progressive period (1900–1920), the addictive qualities of these drugs

Illegal Drugs (Issue)

Policeman guarding 20 tons of cocaine in 1989, which at the time was the largest drug bust to date. The cocaine had a street value of \$6.7 billion.

were better understood and the government banned them in the Pure Food and Drug Act of 1906 (which prevented Coca-Cola Co. from adding its most potent ingredient). By World War II, a growing number of drugs were ruled illegal. Still, the use of illegal drugs before World War II was minuscule by late twentieth century standards and confined to the margins of society.

In the first few decades after World War II the worldwide black market in illegal drugs grew steadily and sustained the profit margins of organized crime. Not since the Eighteenth Amendment to the U.S. Constitution prohibited alcohol in 1918 (followed by the repeal of Prohibition in 1933) had organized crime been able to corner the market on such an attractive commodity. Still, in spite of a growing underground drug culture in the 1940s and 1950s, there was little panic concerning drugs in mainstream society.

This all changed suddenly in the 1960s and 1970s, as rampant drug use (both marijuana and hallucinogenic drugs) by the young and a “tidal wave” of heroin inundated the United States. In contrast to earlier heroin, which originated in the opium poppy fields of Afghanistan, most of this new wave of drugs came from the “golden triangle” area of Laos, Burma, and Thailand in southeast Asia.

This was made possible by a remarkable set of military and political alliances between the Central Intelligence Agency (CIA) and the warlords that it recruited to fight covert anti-communist campaigns in

Laos, Cambodia, Thailand, and Burma during the Vietnam War (1964–1975). At that time, Congress had granted authority to President Lyndon Johnson (1963–1969) to wage limited war in Vietnam, but nowhere else. In order to generate funds for covert anti-communist warfare, the CIA allowed the Meo tribesmen of northern Laos, among others, to cultivate opium and to sell large quantities of drugs. Beginning in 1965, “Air America,” a CIA-front operation, even participated in transporting drugs. A large portion of the drugs made their way into the United States, and through corruption among individual agents as well as South Vietnamese government officials, some went directly into the veins of U.S. soldiers in Southeast Asia. The Corsican Mafia (the “French Connection”) in Marseilles, France, also prospered from this glut of heroin.

In the late 1970s youth-culture drugs like LSD faded from the U.S. drug scene and the more addictive heroin once again became popular. The Sicilian Mafia, facing competition from the Corsican Mafia, stepped up its own drug operations, smuggling heroin from anti-communist guerrillas in Afghanistan. Thus, the connection between opium trafficking and Cold War anti-communist crusades clicked into place again as much of this new opium product was generated by the rebel Mujahadeen to fund their CIA-supported war against the communist government of Afghanistan. Anti-communist warlords needed money to fund their operations, and the CIA was willing to “look the other way” as they grew and sold prodigious quantities of

drugs. These banner crops needed outlets, and U.S. organized crime was there to service the market.

Late in the 1970s the U.S. heroin market seemed finally to have reached its saturation point. New organized crime rings in Latin America began to step up production and distribution of a different, but equally addictive and destructive drug, cocaine. By the mid-1980s new, more potent methods of ingestion (free-basing) and forms (crack) appeared. Whereas heroin never lost its association with a low socio-economic consumer profile, cocaine appealed to a more “upscale” public. Hollywood stars like Richard Gere were quite open in their acceptance of the drug. Because of the few short-term side effects associated with its use, cocaine became the “drug of choice” during the 1980s. Sex was reportedly more enjoyable on cocaine. Long-term side effects like heart problems and sexual impotence did not become apparent until later, when millions of Americans found themselves addicted.

On January 30, 1982, President Ronald Reagan (1981–1989) mobilized his forces and announced a war on drugs. The First Lady, Nancy Reagan, took a high-profile position and sternly advised America’s youth to “Just say no!” Vice President George Bush became the chief coordinator of drug policy. As former head of the Central Intelligence Agency, Bush was no doubt familiar with the problem. He targeted a prominent center of narcotics distribution, south Florida. Bush incorporated the U.S. Attorney’s Office, the Drug Enforcement Agency, the U.S. Customs Service, the Federal Bureau of Investigation, the Bureau of Alcohol, Tobacco and Firearms, the Internal Revenue Service, the U.S. Border Patrol, and the Army, Navy, and Coast Guard into the fight. These agencies pooled resources, shared information, and coordinated a strategic assault to rid the United States of what many believed was a drug plague that caused crime, social dislocation, and demoralization.

During the first year of the war, the U.S. Attorney’s Office reported a 64 percent increase in drug prosecutions. In 1983 six tons of cocaine were seized in south Florida; by 1985 such seizures snared twenty-five tons; in 1986, thirty tons. According to the DEA, this represented more cocaine than the drug cartels in Colombia had produced in 1980. While these arrests and seizures were touted as successes, many realized that more people were using cocaine, heroin, and other drugs than ever before. Even in south Florida, the primary theater of combat, illicit drugs were as easily available as over-the-counter varieties, and were often sold in the same places—openly and without fear of the law.

At the same time the new Latin American cocaine cartels were growing in power, the Reagan administration began to wage a covert war against the Cuban-supported Sandinista government of Nicaragua and to oppose all Marxist and communist influence in Latin America. In a post-Vietnam mood of disgust with waging wars against Third World countries, Congress forbid the use of public funds to overthrow the Sandinistas. The Reagan administration used covert methods, paid for with predominantly private funds. The resulting congressional Iran-Contra hearings investigated relations between the United States government, the Islamic fundamentalist regime in Iran, and the anti-Sandinista *Contra* forces in Nicaragua. Buried in this investigation was the question of whether drug sales helped fund the *Contras*.

Responding to public pressure, the Senate Foreign Relations Committee set up a special Subcommittee on Terrorism, Narcotics, and International Operations, chaired by Senator John Kerry, to conduct hearings into these matters. Its findings were clear: at the very least the CIA (and other U.S. agencies) had again looked the other way while the Colombian drug cartels provided millions of drug-generated dollars to arm the *Contras*.

The Kerry Committee also found instances of drug activities on the part of U.S. allies in the region, the most important of whom was General Manuel Noriega of Panama, known by U.S. drug enforcement agents since 1971 as a drug trafficker linked to the Colombian cartels. The Kerry Committee learned that the CIA had used Noriega to funnel secret arms to the *Contras*. As evidence uncovered by the Kerry Committee showed, Noriega had been on the payroll of the CIA since 1976, when he collected an annual fee of \$110,000. By 1985 he was collecting \$200,000 per year, all in secret cash deposits in the Bank of Credit and Commerce International (BCCI—which would figure prominently in new scandals in the early 1990s, including drug-money laundering). Ostensibly Noriega was “our man” in Central America serving in the war against communism. Yet in 1986, when the DEA proposed an undercover plan to unravel the mysteries of a multibillion-dollar drug money-laundering scam in Panamanian banks, it had to seek CIA approval. The go-ahead was given by the CIA, but with the stipulation that any information that exposed Panamanian government officials be dropped.

The DEA’s findings in this regard may have been ignored, but the Kerry Committee’s revelations were not. In 1988 the U.S. District Court in Miami issued an indictment against Noriega and a warrant for his arrest. Eventually Noriega was caught, tried, convicted, and

Illinois

imprisoned. During his trial, both the CIA and the National Security Council (NSC) refused to hand over files on Noriega, saying that to do so would compromise national security.

In late November 1997, under the administration of President William Clinton (1993–2001), the United States and Mexican governments entered into an agreement to help control the weapons smuggling from the United States into Mexico. Under the agreement, the U.S. Federal Bureau of Investigations (FBI) and the Office of Alcohol, Tobacco, and Firearms (ATF) were to coordinate efforts with Mexico's Procuraduria General de la Republica (PGR) to stop illegal trafficking of arms. A U.S.-based ATF office and U.S. Customs personnel at the American Embassy in Mexico City were called upon to oversee the effort. Experts from the two countries conducted investigations to determine whether weapons sold legally in the United States were diverted to the black market, where drug traffickers in Mexico acquired them. The new accord was part of a sophisticated joint strategy to combat drug trafficking, a strategy which included the creation of a hotline between the U.S. Pentagon and Mexico's Secretary of National Defense to coordinate efforts to intercept drug shipments moving into the United States.

The joint U.S.-Mexico effort to control illegal sales of firearms was part of an ongoing campaign embraced by the Organization of American States (OAS) to reduce gun smuggling and reduce violence both in the United States and in Central and South America. The campaign, which was first proposed by Mexico, sought to tighten controls on weapons trafficking across national borders and impose restrictions on weapons production. According to a report from Mexico's drug enforcement campaign, customs and other law enforcement authorities confiscated almost 23,000 illegally imported weapons and 1.2 million munitions during 1996 alone. The report said at least one-third of the weapons and almost one-fifth of the munitions were destined for drug traffickers in the black market.

Ironically, the joint U.S.-Mexico effort followed reports that the Clinton administration had requested a threefold increase in the budget for exports of weapons and military equipment to Mexico. According to the non-governmental Federation of American Scientists (FAS), the Clinton administration requested \$9 billion for sales of weapons, aircraft, radar units, and other military equipment to Mexico in the 1998 budget. The FAS, whose board of sponsors includes over 55 American Nobel Laureates, claimed that the United States domestic gun market was the principal source of weapons for the drug traffickers, and that both the Mexican

government and the drug traffickers were dependent upon the United States for guns. The FAS also warned that weapons originally exported to Mexico to combat drug trafficking would soon be diverted for other purposes.

Thus, as of the late 1990s, the ability of the U.S. government to control the black market in drugs and guns appeared to be limited by a set of strategies, reflexes, and relationships in place for generations.

ILLINOIS

Situated in the center of the Midwestern prairie, on the edge of Lake Michigan, the state of Illinois was always in a good position to benefit from its own natural resources. It is bounded on the west by the Mississippi River, while the Ohio runs along its southern border. Good land and water routes helped the state grow from an undeveloped territory into a powerhouse of agriculture and industry. Most notable of the land routes were the numerous railway lines running through the state. Illinois cities and farms, as well as its service industries continuously fostered a diverse economy. This eventually placed the state high in per capita income nationwide, with Chicago as its shining star.

The first white people to exploit the resources of Illinois were French fur traders who explored Illinois rivers in the seventeenth century. Although the British controlled the Illinois territory after the Treaty of Paris (1763), they made no attempt to establish permanent settlements. The state of Virginia claimed Illinois from 1778 to 1784 but gave up its claim to the area when Illinois became part of the new Northwest Territory. The Treaty of Greenville in 1795 gave the United

State of Illinois.

Illinois

States the tract at the mouth of the Chicago River, which later became the site of Chicago. The Illinois Territory was created in 1809, and after the British were defeated in the War of 1812 (1812–14), Illinois formally became the twenty-first state in 1818.

After the final defeat of the Indians in the Black Hawk War of 1832 the Illinois prairie became open to settlement, especially by people from Kentucky. The term “land office business” certainly applied to Illinois during this time, as settlers, who were lured by cheap land prices, flocked into the new state. Farmers and entrepreneurs from the East found possibilities in the state’s good soil and convenient water routes.

In the first part of the century, schemes to promote rapid economic development in the form of roads, canals, and railroads left the state in a debt so heavy that it would persist for 50 years. Yet, Illinois continued to grow rapidly, and northern and central Illinois were helped considerably when the short-lived Illinois and Michigan Canal opened in 1848. A network of railroads was built in the 1850s and allowed the state to prosper during the American Civil War (1861–65). It fostered continued growth after the war by providing easier routes to market for both farmers and manufacturers.

The early years of the industrial revolution helped both farm and city. The John Deere plow and McCormick reaper, both made in Illinois, revolutionized agriculture during the mid-nineteenth century and added to the increased prosperity of the state

The period after the American Civil War saw substantial economic growth, particularly in the city of Chicago. In the minds of its citizens, Illinois was soon divided into two parts: Chicago and “downstate.” Chicago became the central city of the Midwest; its development was spurred by its proximity to Lake Michigan and the Chicago River, and by the railroads, which brought farm products to the city. The great Chicago Fire of 1871 temporarily halted the city’s growth. But it was soon brought into even greater prominence by steel mills, banks, new buildings, and transportation networks. The crown jewel in the latter part of the nineteenth century was the building of the “White City”—the Columbian International Exposition of 1893. It showcased the technological achievements of a growing United States and highlighted the importance of the nation’s second largest city at the time.

Foreign immigrants, so vital to the growth of the entire state, came at first from northern Europe and after 1890 from southern and eastern Europe. They developed prairie farms, small towns, and cities and

eventually provided needed labor for Chicago industries. Chicago became a cradle of the labor movement; the Knights of Labor and the Chicago Federation of Labor, two of the earliest unions were originated in Chicago. The 1886 Haymarket riot and the 1894 Pullman Strike brought the labor problems of Illinois to national attention.

Most of Illinois prospered during the first 30 years of the twentieth century. The International Harvester Company became a major Chicago manufacturer of farm equipment. The Caterpillar Company, makers of earth-moving equipment, dominated Peoria. The Chicago steel industry, centered in Gary, Indiana, became second only to that of Pittsburgh. The state led the nation in food production, agricultural implement manufacture, and agricultural finance. World War I (1914–18) spurred economic growth in the state. War production demanded more the unskilled labor, which was again provided by European immigrants and also by African Americans coming from the South.

The pursuit of wealth preoccupied Illinois during the 1920s, highlighted by the violence and corruption surrounding the Prohibition era and the organized crime wave that accompanied it. The Great Depression affected Illinois as much as it did the rest of the nation. Farmers were the first to suffer; then industries began closing around 1930. Growth slowed drastically, and the Illinois coal industry suffered. The pro-business Republicans who had run the state since the 1850s suffered great losses in the 1932 election, as African Americans, white ethnic minorities, and factory workers responded to the economic hopes brought by Franklin D. Roosevelt’s New Deal. The 1933 Chicago World’s Fair (named “A Century of Progress”) brought attention to Chicago and optimism to its citizens, despite depressed economic conditions. During World War II (1939–45) Illinois began to recover, helped largely by military contracts.

Prosperity reigned in Illinois during the 1950s. At that time the economy began its gradual shift from a manufacturing to a service economy. The negative effects of heavy industrialization began to appear as well. By the 1960s the state faced severe problems with air and water pollution, and urban decay. The Chicago stockyards closed in 1972. The yards had been a symbol of Chicago’s preeminence in the meat-packing industry since 1865. A severe recession followed during the early 1980s, as industries like steel, machine tooling, and automobiles were facing increasing foreign competition and were forced to lay off workers. Many industries fled to the South, and by 1990 the unemployment rate in Illinois was 7.2 percent, in contrast to the national average of 5.2 percent. In 1992

the city of Chicago faced additional economic losses when water tunnels under the city ruptured. In 1993 flooding of the Mississippi and Illinois rivers caused 1.5 billion dollars of damage in western Illinois.

In the 1990s Illinois regained economic strength, ranking seventh in per capita income among all the states in 1996. It prospered in the service sector, the metals industry, and food processing, as well as in the manufacture of industrial and farm equipment, electric equipment, appliances, electronic components, and printing equipment. The 1989 Technology Advancement and Development Act aided companies that develop advanced technologies for commercial use. Labor unions in Illinois declined to little more than 20 percent of workers statewide, but continued to be strong in the Chicago area. Chicago remained the Great Lakes' busiest port and the leading wholesaling center of the Midwest, as well as Illinois's industrial center. The city was followed by Rockford, the East St. Louis area, Rock Island and Moline, and Peoria. The tourism industry also became an important economic boon to the state, with Chicago as a major tourist destination.

Led by the central and northern corn-belt counties, Illinois was one of the top five producers of agricultural products in the late 1990s. The total number of farms, however, declined significantly after World War II. Mining is also an important industry in the state. Illinois continued producing significant amounts of non-fuel minerals, including industrial sand and gravel, cement, and clays. The state was the only producer in the nation of fluorspar in 1995.

IMMIGRATION (ISSUE)

Immigration is the influx of people to a country or region which is different from their country of birth. In the United States, immigration has been a basic part of life at least since the settlement of Jamestown in 1607 and remains part of American life today. One of the truisms of U.S. history, then, would seem to be that all Americans are immigrants or the descendants of immigrants.

While the early white settlers of America were largely English, there were significant numbers from other areas including Ireland, Scotland, and Wales in the British Isles, various German states, French Huguenots, as well as Dutch and Swedes who were absorbed when their settlements became English colonies. With the exception of the Huguenots who settled in Massachusetts and South Carolina, most of the non-English settlers were in New York, Pennsylvania, and Delaware. Immigration can be voluntary or involuntary. Africans, too, represented a significant portion of the immigrant colonial population, especially in Virginia and South Carolina. However, immigration was not a clear concept in the colonial period when all of the colonies were being settled. In fact, prior to 1820, no statistics were kept on immigration and regulation was largely left to the states. In that year the Department of State began to keep statistics. Thus, in the sense that immigration is an observed and recorded phenomenon, it can be said to have begun in the United States around 1820.

Emigration (the outflow of people from the country of origin) was characterized by two factors—push and pull. Push is shorthand for the various reasons people might want or need to leave their home country; the pull consists of the attractions that the United States offered. Famine, religious persecution, failed revolutions, and war have been strong factors “pushing” emigrants toward the United States. Low-cost land in the late nineteenth century, religious and political freedom, and economic opportunity have been the major “pull” factors which helped immigrants (people of foreign heritage newly-landed in the United States) achieve the promise of success in their new country.

U.S. immigration can be divided into several distinct phases based on the origins of those entering the country. Immigrants from the British Isles, including Ireland, and Germany heavily dominated the “old” phase of immigration, prior to the 1890s. The “new” immigration phase, from the 1890s to 1920, saw large numbers of immigrants from southern and eastern

Shown are the changes in European immigration to the United States. Prior to 1896 immigrants were primarily from Northwestern and Central Europe. Between 1896 and 1915 the number immigrating from Eastern and Southern Europe greatly increased.

Europe. From 1920 to 1965 there were nationality quota limitations on the number of emigrants from a particular country entering the United States each year. The post-1965 period continued limitations on the numbers entering the country each year, but abandoned nationality quotas.

Between 1830 and 1880 some 9 million people entered the United States. Most were from western and northern Europe. Irish and Germans were the two most identifiable groups, although equally large numbers came from Great Britain and smaller but steadily increasing numbers from Scandinavia. Repeated failure of the potato crop in Ireland beginning in the mid-1840s and the failure of the 1848 revolutions in Europe were events that led to dramatic increases in migration.

Many immigrants entered the United States through Castle Garden, New York City's immigration depot. In 1864 Congress established the Bureau of Immigration, but it was primarily concerned with collecting statistics. In 1882 the first comprehensive, national immigration law was passed, but primary responsibility still

lay with the states. In 1891 Congress established immigration as a federal responsibility and established formal procedures and standards for admission to the U.S. Since most immigrants were entering the country through the port of New York a processing center was established at Ellis Island in 1892.

Between 1880 and the outbreak of World War I (1914–1918) 25 million people entered the United States. Beginning in the late 1880s increasing numbers of immigrants derived from eastern and southern Europe. They were Italians, Poles, Russian and other eastern European Jews. These “new” immigrants supplemented rather than replaced emigration from northern and western Europe, which continued as before. The new immigrants were overwhelmingly non-Protestant and few spoke English. The new immigrants triggered concerns about the future character of the United States and how such different groups could be assimilated. There was also concern about Asian immigrants that led to the Chinese Exclusion Act of 1882 and the Gentlemen's Agreement between the United States and Japan in 1907. These concerns first led to

demands for a literacy test for immigrants that was enacted over President Woodrow Wilson's (1913–1921) veto in 1917 and the establishment of quotas for various nationality groups based on the 1890 census, first enacted on a temporary basis in 1920.

The quota system was made permanent in 1924 and governed entry into the United States for forty years. Some countries rarely filled their quotas while others, in central eastern and southern Europe, often had long waiting lists. Latin American, Caribbean, African and Asian countries had minuscule quotas. The quota represented a significant reduction in the number of people allowed into the country. Between 1925 and 1929 the total quota was 164,667 people per year, a striking contrast to the 1.2 million immigrants in 1914, the last year before World War I. Some exceptions were made to the quotas for refugees from World War II through the Displaced Persons Act of 1948 and the McCarran-Walter Act (1952), but total immigration remained well below pre-quota levels.

In 1965 the Immigration and Nationality Act ended the national origin quota system and established new criteria for admission to the United States based on the need for certain skills in the workforce, refugee status, and the reunification of families. The changing nature of immigration is clear from the comparison between the origins of immigrants since 1820 and the origins of those arriving between 1981 and 1996. Seven out of the top ten nationalities represented in the emigration from 1820 to 1981 were European—Germany, Italy, the United Kingdom, Ireland, the former Soviet Union, Austria, and Hungary. The others are Mexico, Canada, and the Philippines. In contrast, no European nation appears in the list of most common nation of origin from 1981 to 1996. This group is dominated by Mexico, with nearly a quarter of all emigrants, along with Asian and Caribbean nations.

IMPERIALISM (POSSESSION OF COLONIES) ISSUE

Imperialism is a policy aimed at the extension of political, economic, and cultural control over areas beyond a nation's boundaries. It can be accomplished in one of four ways: by military conquest; by treaty; by lending money to a weak country and then taking over control when the recipient country is unable to repay the debt; by economic penetration followed by intervention when the settlers from the expansionist country demand it. During the late nineteenth and early twentieth centuries the United States engaged in all these activities.

Modern imperialism was triggered by the Industrial Revolution, which so increased the productive capacity of the major European states that they were forced to seek overseas markets and sources for raw materials. This process began around 1870. The United States joined the competition late because the country had been preoccupied with westward expansion across the North American continent.

Until the 1890s overseas expansion was not a matter of high priority, interest in the acquisition of Cuba peaked from time to time, especially during the 1850s. The United States purchased Alaska from Russia in 1867, and established a presence in Samoa during the 1870s. The importance of Hawaii was recognized early in the nineteenth century; by 1875 a treaty made Hawaii a virtual protectorate of the United States and gave the country control of Pearl Harbor.

American imperialism received new impetus during with the Spanish-American War (1898), when the press stimulated a spirit of nationalism. Between 1895 and 1898 the native Cubans were in revolt against an oppressive Spanish regime. Major American newspapers gave the rebellion extensive and sympathetic coverage, which fueled demands for action. The United States demanded a settlement and sent the battleship *Maine* to Cuba to protect American interests. When it blew up in Havana harbor on February 15, 1898, hostilities became a certainty. The war in the Caribbean began in April and lasted only until August 1898. The conflict included U.S. invasions of Cuba, Puerto

Rico, Guam, and the Philippines. In addition, during the height of wartime enthusiasm, Hawaii was annexed. Early in the war the United States, by means of a law known as the Teller Amendment, had denied any ambition to take over Cuba. However, the actual conquest of Cuba during the war naturally raised the question of the status of the island in relation to the United States.

The war was formally concluded by the Treaty of Paris of 1898 in which Spain ceded Guam and Puerto Rico and sold the Philippines to the United States for \$20 million. Spain also gave up her claim to Cuba which remained under American military occupation from 1898 to 1902.

During the war attitudes shifted among many groups in U.S. society and the desire for territorial expansion matured. It was especially well developed among business leaders, advocates of a large navy, and influential politicians like Theodore Roosevelt and John Hay. They came to be known collectively as the "Imperialists." They argued that territories won with U.S. blood should not be given up, that ownership of overseas territories would be good for business and trade, and that to be a great nation, the United States had to have a great navy (which, of course, required coaling stations and bases all around the globe).

Not everyone agreed with the Imperialists. The opponents of expansion, including former President Grover Cleveland, author Samuel Clemens, and Progressive Jane Addams, were given the name "Anti-Imperialists." They argued that conquest was incompatible with U.S. tradition, and that the economic advantages of overseas possessions would be offset by the dangers of potential conflict with other nations. The debate on Imperialism raged on until February 6, 1899, when the Treaty of Paris was narrowly ratified by two votes.

American expansion did not end with the conclusion of the war. In Cuba, a U.S. influence remained, although United States troops were withdrawn in 1902. Cuba was forced to accept the terms of the Platt Amendment, which permitted U.S. intervention and reduced Cuba to the status of an American protectorate. This relationship endured until 1934 and led to substantial U.S. economic penetration.

United States' expansion in the Caribbean continued. In 1903 the United States fomented a revolution in Panama, which separated the province from Columbia. The United States and the new Republic of Panama immediately concluded a treaty, which allowed the United States to build a canal in Panama on land leased

for 100 years. The Panama Canal was built over a period of 10 years from 1904 to 1914, and its very existence required a United States presence in the Caribbean. The importance of the region to the United States was also reflected in the so-called "Roosevelt Corollary" to the Monroe Doctrine. In 1904 President Theodore Roosevelt (1901–09) declared that the U.S. reserved the right to intervene in the affairs of smaller western hemisphere nations (whom the U.S. policy makers sometimes called "banana republics") should these smaller countries fail to meet their financial obligations to European creditors. The United States would reorganize the repayment schedule to prevent invasion by the European creditors. During the next few years this policy was applied in the Dominican Republic, Haiti, and Nicaragua.

The Dominican Republic went bankrupt in 1904. The following year the United States took over control of the country's customs houses and the administration of its finances. Marines were inserted in 1916 to maintain order and the Dominican Republic remained under American military government until 1924. Even after the marines were withdrawn, U.S. financial control continued until 1941. Meanwhile private U.S. interests gained control of the financial affairs of the country and 30 percent of the sugar industry.

In 1915, in order to prevent possible occupation by German creditors, the U.S. intervened in Haiti and remained there until 1934. The American presence was based upon a treaty that allowed for American control of Haiti's finances and defenses, but the intervention in Haiti was deeply resented by the Haitian people, even though it brought infrastructure repair and improved health standards.

During the early twentieth century U.S. Marines entered Nicaragua on several occasions, at the request of the government, to maintain order. Moreover, there was an extensive financial connection. By 1913 U.S. interests handled 30 percent of Nicaragua's imports and bought 56 percent of exports. During the next few years U.S. businesses assumed almost complete control of the nation's finances. President Calvin Coolidge sent the Marines back into the country in 1925 to help put down a revolution and to protect U.S. interests. The Marines did not leave again until 1933.

During the era of U.S. expansionist activities abroad there was also a vast increase in overseas investments, which rose by 500 percent between 1898 and 1914. Canada and Mexico were the leading targets for U.S. investments. In the former, where the major interests were manufactured goods, chemicals, and lumber, the increase was from \$189.7 million to \$867

million. In Mexico the increase was from \$49 million to \$336 million. There, investments were concentrated in extractive industries like mining and oil as well as in railroads. In Central and South America, U.S. investments totaled \$458 million by 1914. The main interests in those regions were fruit and mining. Investments in oil did not begin to expand until later.

Investments in Asia also increased, but not to the extent predicted by the Imperialists of 1898, who had argued that possession of the Philippines would open vast markets and sources of raw materials, especially in China. However despite major efforts on the part of the U.S. government to promote trade and investments in the Far East, trade did not flourish. From 1898 to 1914, U.S. exports to Asia increased from \$39.2 million to \$380.2 million. Although the latter figure may seem large, it represented only 6.05 percent of all U.S. trade. U.S. economic penetration in the Far East did not develop to the level that had been predicted because of the poverty in the region and the determined opposition of competitive nations, especially Japan.

Overall, U.S. imperial expansion was not as successful as many people had hoped. The interventions were expensive and often frustrating because they caused bitterness and resentment among the people of the affected countries. Moreover, as U.S. productivity rose, businesses sought to expand their markets in the Western Hemisphere rather than in the Far East. This required the promotion of good will, not tension. So the Age of Imperialism waned.

In 1934 Congress passed legislation providing for Philippine independence in 10 years; in Latin America a new “Good Neighbor” policy replaced the Roosevelt Corollary. Troops were removed from the Dominican Republic, Haiti, and Nicaragua, and treaties with Cuba (1934) and Panama (1939) ended their protectorate status. At an international conference in Montevideo, Uruguay, in 1933, the United States formally renounced intervention.

But, after the 1959 revolution in Cuba, the Cold War priorities of the U.S. dictated a new round of intervention by the Central Intelligence Agency (CIA) in Cuba, Honduras, Chile, Nicaragua, and a number of other countries.

IMPORTS

Imports are goods and services that are brought from the country in which they are produced into another country for use by its people. Examples of goods that have been imported into the United States include oil from the Middle East, cars from Japan, wine from France, and bananas and coffee from South America. There are thousands of other imported goods, ranging from raw materials to finished products like computers, clothing, and jet aircraft.

Imports play an important role in the economy of virtually all modern industrial nations. In many leading industrial nations, 20 percent or more of all money spent was used for buying something produced in another country. The United States is one of the world's leading importing countries, which enables citizens to buy a wide range of goods and services.

Imports give citizens a broader range of products to choose, but they can be a source of political anxiety as well. Laborers who rely on sales of domestic-made products for job protection may complain that their fellow citizens are spending money on foreign-made products when similar products may be produced domestically. The higher the amount of imports, the greater the number of jobs that may be lost to foreign workers. In the 1970s for example, U.S. auto and steelworkers were losing jobs while record levels of foreign-made cars and steel were being imported to the United States. This anxiety led to calls for protectionist legislation—laws that restricted the flow of goods into a nation. Another source of anxiety from imports is the

Inca

fear that one nation may develop too great a dependence on foreign goods. In the 1970s for example, Middle Eastern oil producers were able to create widespread shortages of gasoline and other energy products in the United States by temporarily halting oil shipments to the United States.

INCA

The Inca were an American Indian people of western South America who settled in the altiplanos (high plains) of the Andean mountain region. Between 1200 and 1400 they subjugated neighboring tribes to form a vast and wealthy empire. Inca territory covered parts of present-day Colombia, Ecuador, Peru, Bolivia, Chile, and Argentina. The capital was at Cusco (in Peru). The civilization reached its peak during the latter part of the 1400s and into the early 1500s. The Inca had a multi-layered government in which the central authority of the emperor was balanced against the regional authority of chiefs. However, the emperor required absolute obedience from local rulers. Inca ruins indicate that they were accomplished engineers: They not only built an extensive system of roads and bridges to connect the provinces, but they built irrigation systems, temples, citadels, and terraced gardens on a grand scale. Machu Pichu, high in the Andes of Peru, is believed to be the last great city of the Inca. The Inca were skilled craftspeople who worked with gold, silver, and textiles (cotton and wool). The government controlled trade. There was no system of money; cloth, which was highly valued, was sometimes used as a medium of exchange. The Inca used llamas to transport goods. Canoes, rafts, and other boats were used in coastal areas and along rivers. Like the Aztec of central Mexico, the Inca were pantheistic (worshiped many gods), and they, too, at first mistook the Spanish explorers for gods.

The last of the great Inca rulers, Huayna Capac, died in 1525, and his sons subsequently fought over the empire. When the Spaniards, led by Francisco Pizarro (c. 1475–1541), arrived in 1532, they encountered a somewhat weakened Inca society. Nevertheless the people resisted the European incursion, and in 1536 they rose up in rebellion. The Inca were conquered by the Spaniards in 1537, and their vast territory came under Spanish colonial control.

INCENTIVE

Companies offer incentive plans to encourage employees to work harder. Incentive pay is a reward for employees or employee groups whose extra effort on the job results in higher production levels. For instance, incentive pay might be given to a sales department that exceeds its monthly sales goals. In addition to helping motivate employees, many companies believe that incentives improve recruiting and retaining high-quality workers, boost morale, and send a positive message about management's performance expectations.

Incentive schemes can be found at all levels of a company, from the shop floor to the boardroom. To be effective, an incentive plan must be clearly defined and the terms for payment understood and agreed upon by the employer and employees. There are several types of incentive schemes, which provide different ways to determine if an employee should receive incentive pay. The type of program will also affect how an employee's job performance will be measured. For example, factory workers might have their job performance rated according to their contribution to a team or the quality of the product they produce. On the other hand an executive's job performance might be based on company profit or cash flow. The outcome of these performance measures will determine whether an employee qualifies for incentive pay.

Incentives may be monetary or nonmonetary and may include cash or vest an employee in a profit-sharing plan. In some ways incentive pay is similar to an employee bonus program because compensation in both plans is based on exceptional job performance and paid in addition to an employee's basic salary. Bonuses, however, are usually given to employees only once a year, while incentive payment is made immediately after an employee becomes eligible for it.

Incentive programs are an outgrowth of the piece-rate system. The piece-rate system bases payment on the number of units that workers produce. The system began in the sixteenth century with the disintegration of the craft guilds. At that time, merchants hired people to work from their homes; home-based workers were then paid based on piecework. This piecework system was replaced by the rise of the Industrial Revolution in the late 1700s, which took production out of the home and into the factory. The use of incentives for factory work did not come about until the end of the 1800s, when scientific management theorists said that financial rewards could improve worker performance.

INCOME

Income is an important concept in economics as well as accounting. Accountants prepare an income statement to measure a company's income for a given accounting period. Economists are concerned with measuring and defining such concepts as national income, personal income, disposable personal income, and money income versus real income. In each field the concept of income is defined in slightly different terms.

For accounting purposes, income is distinguished from revenues. A company's revenue is all of the money it takes in as a result of its operations. On the other hand, a company's net income or profit is determined by subtracting its expenses from its revenues. Thus, revenues are the opposite of expenses, and income equals revenues minus expenses. When looking at a company's income statement, it is easy to distinguish between revenues, which appear at the top of the statement, and net income, which appears at the bottom. In other contexts, however, it is easy to confuse the two through improper usage. It is misleading to refer to revenues as income, for a company with revenues of \$1 million is much different from a company with net income of \$1 million.

For personal income tax purposes, gross income is money received by an individual from all sources. Many of the items that the Internal Revenue Code defines as income and that are called income on tax form 1040 are actually revenues, such as dividend income, investment income, and interest income. The Internal Revenue Code also provides for exclusions and exemptions as well as for nontaxable types of income to arrive at the concept of taxable income.

While accountants measure a single company's income for a specific accounting period, economists are concerned with the aggregate income for an entire industry or country. In looking at an entity as a whole, economists define its gross income as the total value of all claims against its output. That is, when goods are produced and services are rendered by the entity, workers, investors, the government, and others have a claim against those goods and services. Workers are paid wages or salaries, investors receive interest payments for their investment, and the government collects taxes. The total value of these claims represents the entity's gross income and is equal to the total value added through activities that have contributed to the production of the entity's goods and services.

In looking at the economy as a whole, economists view gross national income as the total of all claims on the gross national product. These include employee

compensation, rental income, net interest, indirect business taxes, capital consumption allowances, incomes of proprietors and professionals, and corporate profits. National income includes all compensation paid to labor and for productive property that is involved in producing the gross national product. In addition, about 20 percent of national income includes such items as depreciation or capital consumption allowances, indirect business taxes, subsidies less surpluses of government enterprises (such as the U.S. Postal Service), and business transfer payments to employees not on the job.

Personal income includes all payments received by individuals, including wages, transfer payments such as sick pay or vacation pay, and the employer's contribution to Social Security. Personal income differs from national income in two important aspects: (1) some national income is received by entities other than individuals, and (2) some individuals receive personal income from social insurance programs that are not connected with producing the current gross national product.

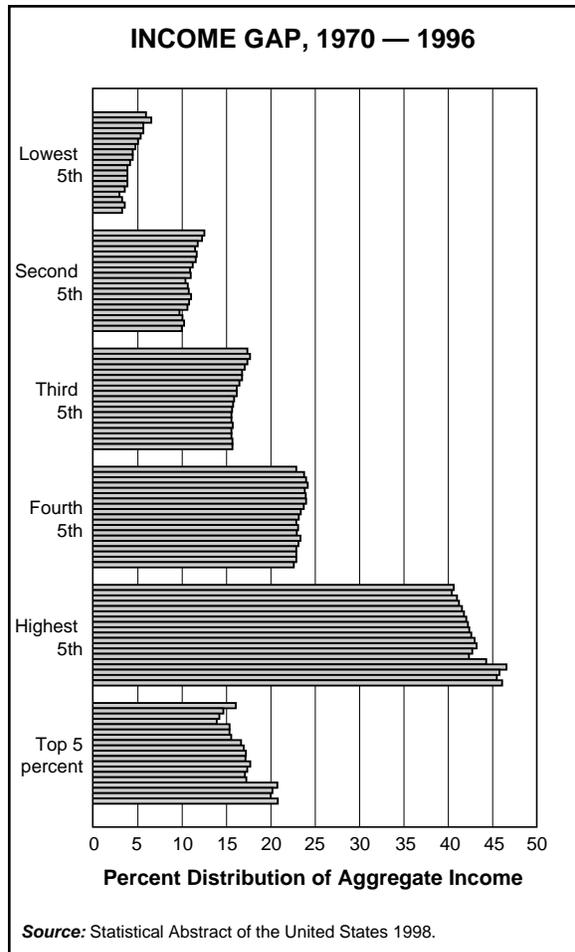

Disposable personal income is the amount of personal income that remains after an individual's taxes have been paid. It is estimated that approximately 70 percent of the gross national income ends up as disposable personal income. The remaining 30 percent includes such items as depreciation, retained corporate profits, and the government's net tax revenue.

Economists also distinguish between money income and real income. While money income is measured in terms of the number of dollars received, real income is measured by the purchasing power of those dollars. After all, what is important is not how much money you earn, but how much you can buy with that money. Economists use a deflator based on a price index for personal goods and services to calculate an individual's real income from his or her money income. Since rising prices reduce the dollar's purchasing power, real income provides a truer measure of buying power than does money income.

INCOME GAP

In the United States, as in every nation, an income gap exists between the rich and poor. Income levels predict the ability to purchase goods and services. Economists analyze the distribution of income by ranking all family income levels from highest to lowest, then dividing the levels into fifths, 20 percent of

This graph depicts the share of total income received by U.S. families divided into five equal income groups and the top five percent. The income gap remained relatively the same, though the bottom 80 percent decreased, and the top 20 percent increased their shares.

families in each of five groups. (The same numbers of households are in each fifth.) The range of income for each fifth is then determined. In 1998 the lowest fifth's income ranged from \$0 to \$15,102, and their total income represented 4.6 percent of the entire income of all households in the U.S. That same year the highest fifth's income range was \$55,907 and above. Their total income represented 44 percent of the entire income of all households.

In 1947 the lowest fifth received 5.1 percent of the entire income of all households and the highest fifth, 44.3 percent. Although the incomes of all families increased through the years, these figures illustrate that the income gap between the poorest and the richest, in percentage of all U.S. household income received, changed very little. Individuals at the lowest levels generally fall into the following categories: minorities, the elderly, young wage earners, households headed by

women, urban low-income-housing residents, and the rural poor.

Various factors, including education, inherited wealth, ability, experience level, and discrimination, contribute to the unequal distribution of income or the income gap. In addition, a self-perpetrating condition known as the cycle of poverty traps many individuals at the lowest income levels. People born into slums in large cities are likely to remain there the rest of their lives. High crime, poor living conditions, limited educational opportunities, and lack of adult role modeling all contribute to the perpetuation of the cycle. Wealthy families are more likely and able to send their children to expensive universities and thus help them obtain high-paying jobs.

INDENTURED SERVANTS

The arrival of indentured servants in the American colonies addressed a labor shortage that emerged in the early 1600s because of the success of a system of land distribution that was meant to encourage the establishment of farms. In 1618 the Virginia Company, a joint stock enterprise that wanted to settle and develop of Virginia, adopted a new charter based on the "headright system." Englishmen who could pay their own Atlantic crossing were granted fifty acres of land; each of their sons and servants were also granted an additional 50 acres. Other colonies were developed under the headright system in which the land amounts varied by colony. Soon there were more farms than there was labor to work the fields. The colonists solved this problem through the system of indentured servitude.

There were two kinds of indentured servants: voluntary and involuntary. Voluntary servants were people, often trained in a craft or skill, who could not afford passage to the colonies. In exchange for their passage, they agreed to work for a period of four to seven years for a colonial master. At the end of this period, the servant became a freeman and was usually granted land, tools, or money by the former master. Involuntary indentured servants were the impoverished, those in debt, or criminals whose sentence was a period of servitude. Most indentured servants in North America were voluntary. Their period of obligation to a colonial master was longer than that of a voluntary servant, usually seven to fourteen years. But, like their counterparts, the involuntary servants also received land, tools, or money at the end of their contract, called "freedom dues," and they also became freemen.

Certificate of Freedom for an indentured servant

Many indentured servants were drawn from England, Ireland, Scotland, and Germany. In European ports people contracted themselves or became involuntarily contracted to ship captains, who transported them to the colonies where their contracts were sold to the highest bidder. Roughly speaking, half of colonial immigrants were indentured servants. Colonial laws ensured servants would fulfill the term of their obligation; any servant who ran away was severely punished. Laws also protected the servants, whose masters were obligated to provide them with housing, food, medical care, and even religious training. The system was prevalent in the Middle Atlantic colonies, but it was also used in the South. When the economies of the Caribbean islands failed at the end of the century, plantation owners sold their slaves to the mainland. There the slaves worked primarily on southern plantations, replacing indentured servants by about 1700. In other colonies the headright system ended with the American Revolution (1775–1783).

INDEPENDENCE, ECONOMIC IMPACT OF (ISSUE)

Although the Treaty of Paris (1783) ended the American Revolution (1775–1783) and formally granted the newly formed state political independence from Great Britain, answers to the economic questions raised

by its new-found freedom were not as easy to find. The former colonies had been an integral part of the British Empire and its vast transatlantic economy for nearly 200 years. Before any decisions could be made concerning the economic direction that the United States would take, serious political questions had to be settled first. But even after the Constitution of the United States was adopted in 1789, after the Articles of Confederation proved insufficient, economic problems still loomed large in the minds of many Americans. In the end, Americans were posed with two rather idealistic options. Would the United States seek self-sufficiency in an agrarian economy with small, independent self-sufficient farms, as Thomas Jefferson (1743–1826) advocated. Or would it seek a continuation of the international specialization and exchange it had grown accustomed to during the colonial era, as Alexander Hamilton (1755–1804) proposed? Before they could choose either one of these however, Americans had to deal more directly with the problems caused by the Revolution and its newly found political independence.

For many Americans, independence didn't provide all the solutions it appeared to have promised. For some, it only made things worse. The British Navigation Acts, although no longer restricting trade outside the Empire, were now applied to Americans who wished to trade in the Empire. Moreover, the mercantilist regulations of other European countries were often times more stringent than British laws had been. War-born industries found it impossible to match British efficiency. Cheap British manufactured goods began reappearing on the American market and the protection that American industries had enjoyed due to trade disruptions during the war, disappeared. Trade came to a standstill, domestic prices fell (farm produce brought the lowest prices) and unemployment among common laborers rose sharply.

Specie (coined money) balances that had accumulated in the last years of the war flowed out, back to England as payment for imports. During the war, Congress and the several states had issued almost \$437 million in paper currency. Because of the magnitude of these issues as well as counterfeit currency, state monies had depreciated in varying degrees. Money issued by Congress (Continental currency) had become almost completely worthless and soon found its way into the hands of speculators. As money lost its value, business again, as it had during the colonial years, became dependent upon English, Spanish, French, and Portuguese coin. Currency became as scarce as it had ever been under British rule and the cry for paper money mounted, especially from the debtor class of farmers and common laborers. In many cases, the legal

collection of farmer/laborer debts could only be settled by imprisonment or by stripping the debtors of real estate, cattle, or furniture.

Under the Articles of Confederation, which had been adopted in 1777 during the war, Congress had little authority and was unable to exert any effective control over the economic activity of the individual states, either in their relations with foreign countries or with each other. It could not levy taxes, issue money, or enforce a uniform tariff on imports and exports and could only ask the states for funds with which to carry out its duties. Under the Articles, some states could receive a higher percentage of foreign trade that would more than compensate for any loss either in manufacturing or employment.

But things weren't all bad under the Articles of Confederation. The break-up of some of the large estates previously owned by Tories (Loyalists) did allow states to provide some minor improvements in access to land and to flexibility of its use (although some tracts passed intact into the hands of wealthy patriots). Quitrent payments to colonial proprietors were abolished and laws restricting entail (which allowed heirs only the use but not the right to sell estates) and primogeniture (a policy which granted the eldest son exclusive rights to inheritance) were established. The Land Ordinances of 1784 and 1785 and the Northwest Ordinance of 1787 provided a highly favorable climate for westward movement and unwittingly eased transition to government under the soon-to-be ratified Constitution. By dictating the terms by which land could be sold and administered politically, the Ordinances settled many potentially serious problems. Land could be sold only after accurate surveys had been done and townships systems had assured secure land titles. In addition, because the thirteen states ceded their claims to western lands to the central government, new states could enter the Union on equal political footing, not as colonies.

Even so, with the central government facing no more urgent problems than those stemming from its financial difficulties, what little progress the Articles did achieve proved insufficient to reestablish public confidence and order. Shays's Rebellion in 1786 convinced many Americans that a stronger federal government was necessary.

But when the framers of the Constitution assembled in the spring of 1787, their emotions were still mixed. While they were compelled by the sobering experiences of what independence had brought so far, they were also moved by the revolutionary zeal of more

liberty and less government. In the end, the Constitution they produced reflected these tensions. It gave the federal government the powers to tax, borrow, and coin money, regulate foreign and interstate commerce, establish a postal service, and issue patents and copyrights, but it imposed constraints on the government's ability to regulate trade. The federal government could not impose duties on exports, could not discriminate against the ports of any state in its commercial regulations, could not restrict a carrier's freedom to enter or leave a state without stopping in another, and finally, could not extend any trade barriers between the states themselves.

In his Report on Public Credit (January 1790), Alexander Hamilton, Secretary of the Treasury under President George Washington (1789–1797), recommended that the federal government assume full responsibility not only for the outstanding debts incurred by Congress during the war but also for the debts accumulated by the states since 1775. By doing so, he wanted to ensure that the holders of public securities, most of whom were wealthy merchants and speculators, would have a significant financial stake in the survival of the national government. The new Congress accepted Hamilton's proposal and assumed the debts of the central government under the Articles of Confederation as well as the debts of the thirteen states.

To further promote economic development, Hamilton also presented to Congress a report on manufacturing. The report recommended that the government embark on a protective tariff policy that would tax imports in order to nurture infant industries, foster new ones, and stimulate domestic production. As a strong advocate of mercantilism, Hamilton was dissatisfied with the narrow economic base of merchants and farmers. He believed that manufacturing had to be developed, with the aid of the federal government, as soon as possible. Finally, Hamilton proposed that the creation of a national bank would provide the federal government with funds necessary to discipline irresponsible state banks, some of whom he believed could debauch the monetary system by issuing paper money.

The response to Hamilton's proposals was quick and immediate, mostly among farmers. They resented monetary curbs and saw a national bank as a successor to the Bank of England, which they felt, was too inclined to make monied men rich and landed men poor. They found their most ardent spokesman in Thomas Jefferson. Jefferson envisioned a rural democracy with an agrarian economy and believed that the United States should remain a nation of farmers. He argued diligently against the shackles of tyranny, which

for him came in the form of a powerful central government. He spoke out against the “evils” of an urban economy and sought to uphold liberty at all costs. Hamilton, on the other hand, sought order and regulation and fought against political anarchy. He wanted to diversify economic life by encouraging shipping, manufacturing, and increased economic activity through the legislative powers of a strong federal government. While Americans remained skeptical about the extremes of both of these views, by the end of the nineteenth century, Hamilton’s vision had been decided through the fires of political maturity, civil war, victory abroad, national aggrandizement, economic prosperity, and western expansion.

INDIANA

The stereotypical picture of Indiana is one of rolling farm fields, open space, and small towns with picturesque courthouse squares. The state of Indiana is much more than this, however. It is as urban as it is rural, and has a highly diversified economy. The state’s economy has a high proportion of agriculture, but the state also houses a large heavy industrial and high technology sector. The urban-industrial lifestyle in some parts of Indiana coexists well with the rural small-town ways of life in other parts of the state.

Europeans first ventured into Indiana in the 1670s. It was the Frenchmen Father Jacques Marquette (1637–75) and Robert Cavelier (1643–87) who first explored the region. Another Frenchman named Jean Baptiste Bissot lived in a Native American village at the present site of Fort Wayne. The French erected Fort Miami in 1720. Vincennes’ son constructed another fort at the site of the town that later bore his name. The British vied with the French for control of the territory during this period, and the land was ceded to the British after the French and Indian War (1754–1763). During the American Revolution (1775–1783) George Rogers Clark (1752–1818) captured Fort Vincennes from a British garrison.

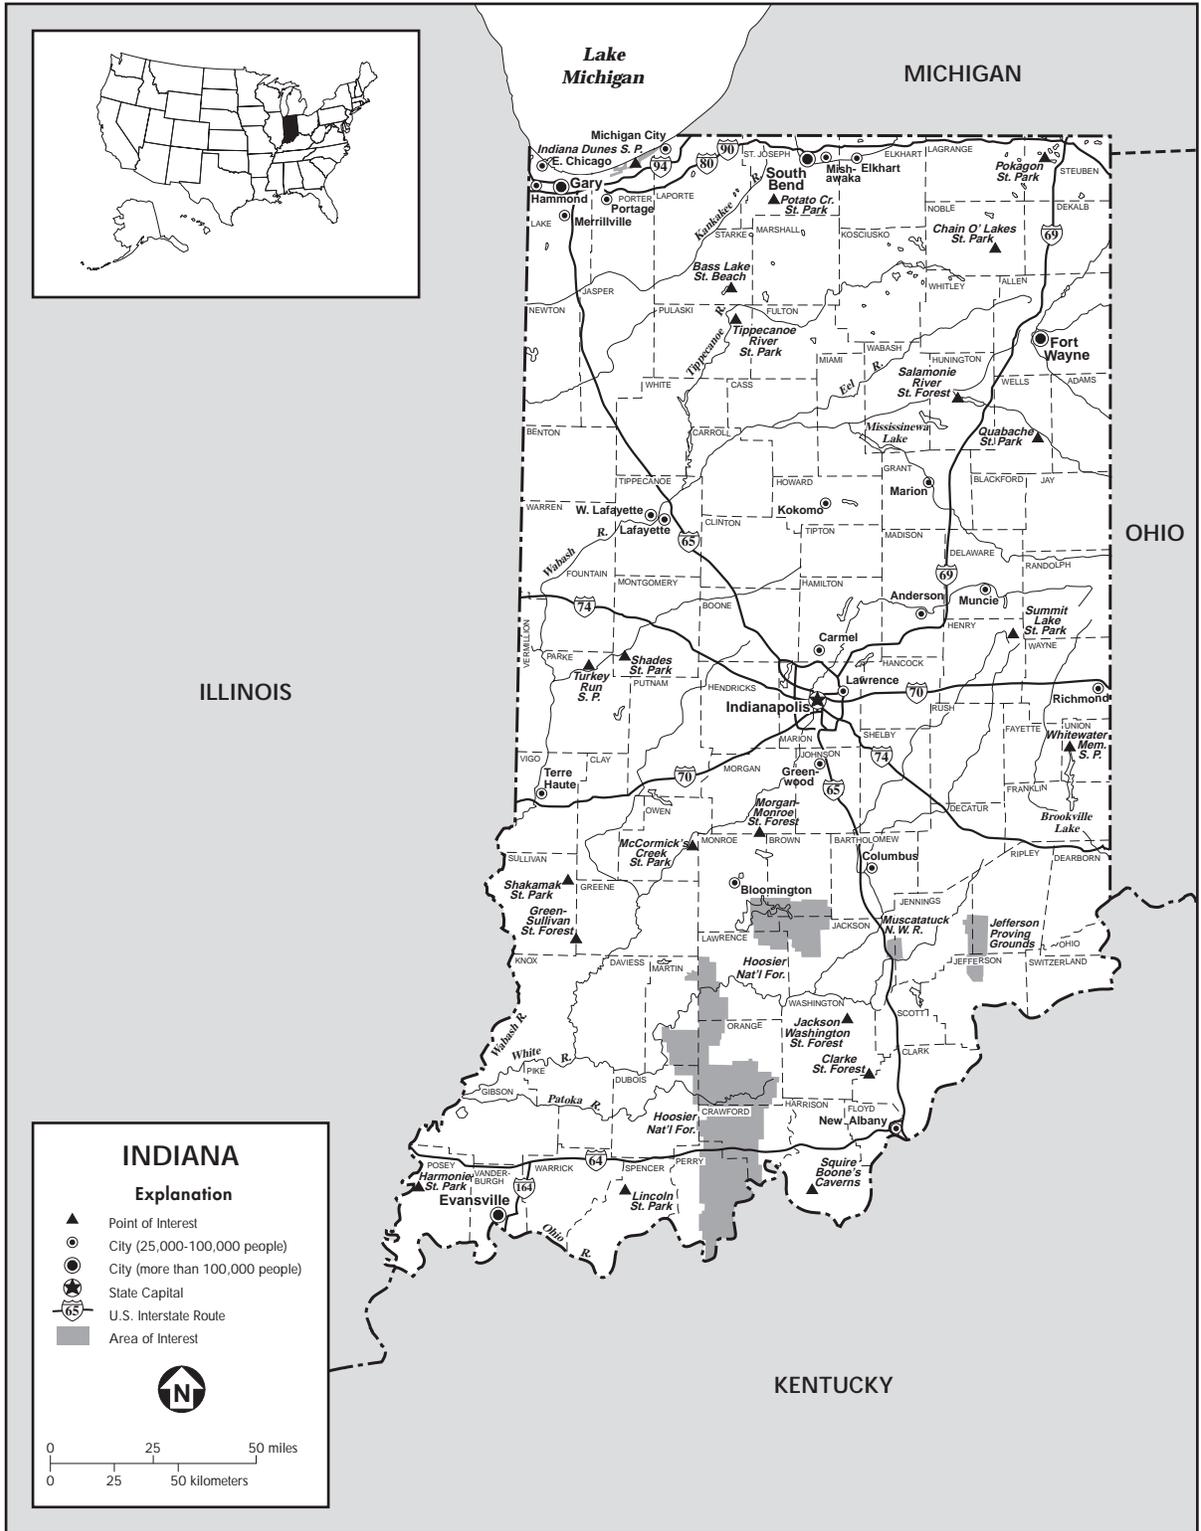

Future development in what would become Indiana was regulated by the Ordinance of 1785 and the Northwest Ordinance of 1787. The Northwest Territory was the area between eastern Pennsylvania and the Mississippi River. It was bounded on the south by the Ohio River and on the north by Canada. This region included the present-day states of Indiana, Ohio, Illinois, Michigan, Wisconsin, and parts of Minnesota. In 1794 General Anthony Wayne (1745–96) defeated the Native Americans in Ohio at the Battle of Fallen Timbers. The resulting Treaty of Greenville pushed many Native American tribes out of the territory. This encouraged the rapid settlement of the region by white Americans.

The first state to form out of the Northwest Territory was Ohio in 1803. By that time the rest of the Northwest Territory was called the Indiana Territory. The Michigan and Illinois territories soon separated from the Indiana Territory, and Indiana took on its present boundaries. In 1816 it became the nineteenth state of the union.

Indiana developed from south to north, largely because of the commerce made possible by the Ohio River. An increasing number of settlers established farms in the area as Native American tribes were driven out of the state. Trade in corn, hogs, whiskey, and timber flourished along the river. Indianapolis was a centrally located and planned city, being the capital of the state. It grew slowly, however. The major transportation arteries were located far away from it early on.

In the 1830s the state embarked on a massive internal improvements program that left it in severe debt. The Wabash Canal was built, largely using the labor of Irish immigrants. The National Road (now U.S. 40) reached Indiana in 1827, and the Michigan Road (now U.S. 421) was completed in the late 1830s. The first railroad in Indiana was completed in 1847. It ran from Madison to Indianapolis. Railroad building

Indiana

State of Indiana.

increased rapidly in the 1850s and continued to do so after the American Civil War (1861–1865).

Indiana was staunchly pro-Union during the Civil War. Primarily an agricultural economy when the war began, Indiana began to industrialize during the war. The industries included such enterprises as gristmills, sawmills, meat packing plants, breweries, furniture factories, and carriage makers. The Studebaker Company became well known for its wagon manufacture during the Civil War. The Van Camp Company was also important during the war for its canned pork and beans.

Industrialization and growth continued after the war. In 1867 the famous Eli Lilly drug company was established in Indianapolis. Glass factories proliferated in the 1880s in northeastern Indiana after the discovery of natural gas. New manufacturing towns like Terre Haute, Muncie, Fort Wayne, and South Bend began to grow. Steel manufacture became the lifeblood of Gary and an oil refining industry was centered in nearby Calumet. By the beginning of the twentieth century, Indiana had become a center for the developing automobile industry, with 375 manufacturers were turning out “horseless carriages.” The popularity of cars in the state made possible the construction of a speedway at Indianapolis; the first Indianapolis 500 race was held in 1911.

Indiana industries were benefited by the onset of World War I (1914–1918). But things changed once the war was over. By 1920 the number of automobile manufacturers had declined to around a dozen. The only one to compete successfully with the “big three” automakers in Detroit was Studebaker. It grew to around 23,000 employees during World War II (1939–1945). Studebaker ceased manufacturing in 1965, but auto parts remained a large segment of Indiana’s industrial base. By 1920 the urban population was beginning to outnumber the rural population.

World War II gave a strong boost to Indiana’s economy. Most factories converted to production of war materials, and unemployment virtually disappeared in the state. DuPont and Goodyear built large powder plants near Charlestown. That virtually made the sleepy small town of just under 900 “explode” overnight. According to historian John Bartlow Martin, 45,000 were employed in the plants’ operations and 15,000 managed to stay in Charlestown. Martin wrote: “The single liquor store reportedly earned more than one hundred thousand dollars net.” The town was again virtually deserted after the war: “[T]housands of war workers hadn’t even waited to be laid off; they just piled their mattresses, stepladders, and pots and pans

onto their cars and put the kids in the back seat and went back across the river to the hills to stay.”

The economy of Indiana remained strong even after wartime production ceased. The number of wage earners in Indiana nearly doubled between 1940 and 1950. Workers came in from other states. Labor unions grew despite Indiana’s reputation as an anti-union state. National corporations like General Motors and Inland Steel were absorbing smaller companies. In 1984 General Motors was the state’s largest employer, followed by Inland and U.S. Steel. The availability of natural resources such as coal, natural gas, and stone encouraged industrial development; good transportation networks also enabled industrial success. This was especially true in the northwestern part of the state.

The early 1980s were difficult economic times for Indiana. The state suffered a recession like many of the other “Rust Belt” states. In addition Indiana had been losing population since the 1960s as many workers migrated south. The state’s economy began to improve as high-technology industries were brought in and the service sector expanded. That brought a net gain in population between 1990 and 1996. In 1995 Indiana’s per capita income was over \$21,000, ranked 28th in the nation. In 1997 there were six Fortune 500 companies with headquarters in Indiana. The state continued to rank among the top ten states in agricultural production, with cash receipts for all crops and livestock reaching \$5 billion by 1995.

INDIGO

Indigo is a deep blue dye used to color cotton, wool, and other textiles. Today it is manufactured

synthetically, but in earlier times it was derived from the indigo plant, a member of the legume family. The plant was chiefly grown in India (hence its name). In the Caribbean indigo was cultivated by European colonists. During the 1600s it was a principle item of export from the region. In the United States the indigo plant was cultivated in the low country of South Carolina and Georgia beginning in 1741. It was introduced by Elizabeth Lucas Pinckney (1722–93), the daughter of a plantation owner whose family later figured prominently in American politics. Pinckney had brought the plant with her from the Caribbean island of Antigua, where she had lived. Since indigo is a labor-intensive crop, plantations required numerous slaves to cultivate the plant. Growers sold indigo overseas to be used in the European dyestuffs industry. By the 1760s indigo had become an important crop for the southern plantation owners—its export value was on a par with rice and wheat. It continued to be grown in the region until the American Civil War (1861–65). Synthetic indigo was produced in 1880, and it was first used commercially in 1897. This launched a synthetic dye industry that completely eliminated the need for the dye to be derived from plants.

INDUSTRIAL POLICY

Industrial policy refers to organized government involvement in guiding the economy by encouraging investment in targeted industries. Such policy serves to allocate capital across manufacturing industries by a system of taxes, subsidies, and investment incentives designed to move the economy along a specific pathway. Although an industrial policy was in place since the 1950s in many developed countries including Japan, Germany, France, and Sweden, it continued to be hotly debated in the United States toward the end of the twentieth century.

Japan's successful industrial policy drew a great deal of attention. In Japan the Ministry of International Trade and Industry (MITI) orchestrated directed development of selected industries and products which it deemed necessary for Japan to compete in the international market. MITI only assisted the private sector in targeted industries. It generally financed no more than 50 percent of a project, leaving the rest to the private sector and market influences. The MITI is not autonomous but is overseen by various government agencies. Japan's automobile industry served as a highly successful model where a specific industry was targeted to assume an expanded role in world markets.

Advocates for an industrial policy in the United States pointed to four major issues. First, since the law of supply and demand in world markets is greatly skewed by various measures employed by nations to help particular industries, the U.S. needed to do likewise to compete. Second, an industrial policy could help ease the social costs when industries lost their competitive advantage by assisting in retraining workers for new jobs. Third, industrial policy could ease "boom and bust" cycles by planning tax incentives to stabilize regions. Finally, the United States already protected certain industries and special interest groups but in a haphazard manner with no organized social goals; an organized program was believed to be more effective.

Opponents cited the market as the most efficient allocation of resources, insisting the government could not do a better job. Interfering in the market process was generally less accepted in the United States than in other countries.

INDUSTRIAL REVOLUTION

The advent of the Industrial Revolution towards the end of the nineteenth century raised numerous economic and political questions for the United States that neither the populace nor the government was prepared for. In the years following the American Civil War (1861–1865), the twin pillars of capitalism and industrialization catapulted the American economy to the forefront of world commerce. Oil, steel, rail, mining, and agricultural industries all enjoyed tremendous growth in the latter part of the nineteenth century as Americans exploited the riches of its natural resources, land, manufacturing technology, and a large labor pool from increased immigration. In cities across the United States, all of these elements came together to form the ingredients and the momentum behind the Industrial Revolution.

America's tremendous industrial and financial growth in the last decades of the nineteenth century were due in large part to the entrepreneurial boldness and business instincts of a number of industrial and financial tycoons who came to be known as the "robber barons." J.P. Morgan, John D. Rockefeller, Cornelius Vanderbilt, Andrew Carnegie, James J. Hill, Jay Gould, and others guided their diverse business interests to unprecedented levels of profitability. The monopolies of the robber barons enabled them to eliminate less powerful competitors, raise prices, and

subsequently realize huge profits that were pumped back into their businesses. The federal government gradually began to heed the voices of small business owners, who called for reform, and the cries of American workers, who had begun launching the country's first organized labor unions in the face of company-sponsored violence and public ridicule.

In 1890 the Sherman Anti-Trust Act was enacted in an effort to curb the power of the trusts, but the robber barons continued to maintain their privileged positions in the American system. Blessed with access to abundant natural resources, valuable technological advances, a growing labor force, and a congenial political environment, these men and the monopolies they held dominated the U.S. economy. So much so that, for a generation after the Civil War, political power of the presidency paled in comparison to the economic talent and power of the robber barons.

The railroad industry particularly transformed the business landscape of the United States. By the early 1850s several railroads had established lines that allowed them to transport freight back and forth between the Great Lakes region and the East Coast, and new railroad construction projects were generating across eastern America. This ever-growing network of rail lines, many of which spanned relatively short distances, came to be seen as a more timely, reliable, and inexpensive way to transport goods than other options previously available. The explosive growth of the railroad industry in the eastern states, coupled with the potential wealth contained in the country's western territories and the nation's accompanying desire to expand in that direction, convinced growing numbers of people that a transcontinental railroad stretching from coast to coast should be built. Begun in 1863, the effort was hampered by the Civil War and the daunting obstacles of western geography and weather, but on May 10, 1869, the rail lines of the Central Pacific and the Union Pacific railroads were finally joined in Utah. Celebrations of the epic achievement erupted across the nation as Americans hailed this giant step forward in the country's westward expansion.

Farmers benefited from increased mechanization, sophisticated transportation options, and scientific cultivation methods. Nonetheless, the financial situations of many farming families grew precarious in the 1880s and 1890s. Record crop yields resulted in lower prices while production costs increased, a combination that threw many farmers into debt. They responded by forming unions and alliances that insisted on populist reforms. Many of their themes, dismissed as outlandish when first expressed, later became cornerstones of progressive reform in the early 1900s.

The surging economic and technological growth of the United States caused tremendous changes in the character of American life during the last decades of the nineteenth century. The rural farming culture of previous generations gave way to an increasingly urban and industrial one, as manufacturing plants sprang up and cities mushroomed in size; the nation's urban population rose 400 percent between 1870 and 1910.

Still, for many Americans, city life was less an immediate experience than a distant and powerful lure. The attraction was powerful, for the drain on the countryside was particularly noticeable, especially in the Midwest and in the East. As the 1870s and 1880s witnessed the worst agricultural depression in the country's history, large numbers of farmers succumbed to the temptations of urban promises and packed their bags. Jobs, higher wages, and such technological wonders as electricity and the telephone gradually took its toll on rural defenses.

THE SURGING ECONOMIC AND TECHNOLOGICAL GROWTH OF THE UNITED STATES CAUSED TREMENDOUS CHANGES IN THE CHARACTER OF AMERICAN LIFE DURING THE LAST DECADES OF THE NINETEENTH CENTURY.

Joining these farmers were an increasing number of immigrants from eastern and southern Europe, who, like their American counterparts, came mostly from the countryside and knew very little of urban life. These "new" immigrants, as they were called—as opposed to the more established generation of largely Protestant immigrants from the western and northern European countries of Britain, Ireland, Germany, and Scandinavia—came largely from Italy, Austria, Hungary, Poland, Serbia, and Russia and were predominantly Catholic or Jewish. These "new" immigrants typically congregated in the urban centers of the East, particularly New York.

As Americans gradually came to favor urban over rural life, there was much about the Industrial Revolution that would justify the prejudices of the old rural ideals. Cities of the late nineteenth century grew without plan, with a minimum of control, and typically by the direction of industrial enterprise. Accordingly, American cities seemed to harbor all the afflictions that plague modern society: poverty, disease, crime, and decay. For members of the urban working class, life was often marked by hardship and uncertainty. Layoffs were common, and as much as 30 percent of the urban work force was out of work for some period during the year. Child labor was common as well, and in 1900 as

Industrial Workers of the World (IWW)

many as three million of America's children were forced to work on a full-time basis to help support their families.

Living conditions in the cities were often deplorable, with thousands of families forced to reside in slums that were breeding grounds for typhoid, smallpox, cholera, tuberculosis, and other diseases that swept through the cities on a regular basis. City tenement housing quickly degenerated into slums that not only brought unsanitary living conditions, but also increased poverty, prostitution, and organized crime. In 1881 the homicide rate in America was 25 per million; in 1898, the rate had risen to 107 per million. Diseases such as cholera, typhoid fever, and diphtheria increasingly plagued cities and wreaked havoc on working-class populations. Several factors made many problems in American cities more pronounced. In the 1880s and 1890s the gulf between social classes was dramatically emphasized. The term "Gilded Age," coined by Mark Twain, came into common use and indicated corruption, profiteering, and false glitter. In both Chicago and New York, elegant and lavish homes were often built on the same street or within view of the slums. A few blocks from New York's elite Fifth Avenue, the desolation of Shantytown, with its Irish paupers and roaming livestock, presented a sharp 60-block contrast. While a relatively high degree of residential mobility did exist, ethnic neighborhoods such as Little Italy, Polonia, and Greektown also served to highlight and define urban poverty.

The industrialization of the United States also produced a fundamental reorganization of public consumption. As the nation's manufacturing plants and farms produced greater quantities of goods and products, an increasingly consumer-oriented economy emerged. Products of convenience—such as processed and preserved foods, ready-made clothing, and telephones—appeared and were made available to a far greater number of consumers than ever before.

Leisure time activities blossomed as well. Revolutions in transportation, technology, and urbanization all fostered an environment favorable to the pursuit of recreational activities. Americans with money in their pockets and time on their hands looked to spend both on entertainment, and businessmen rushed to supply consumers in this newest lucrative economic niche. Organized sports, previously the territory of only the wealthiest American families, were embraced by all classes of spectators and participants. Circuses, vaudeville shows, theatrical dramas, and musical comedies attracted tens of thousands of citizens, too. As one commentator on the times noted, "while telephones, typewriters, cash registers, and adding machines sped

and made routine the conduct of business, cameras, phonographs, bicycles, moving pictures, amusement parks, and professional sports defined the mass popular culture that still dominates our times."

INDUSTRIAL WORKERS OF THE WORLD (IWW)

Founded in 1905 by the leaders of 43 labor organizations, the Industrial Workers of the World (IWW) was a radical labor union. The IWW pursued short-term goals via strikes and acts of sabotage and a long-term agenda to overthrow capitalism and rebuild society based on socialist principles. One IWW organizer proclaimed that the "final aim is revolution." Though small in numbers because of their extremist views and tactics (its membership probably never exceeded 100,000), the IWW members, called "Wobblies," attracted national attention. Railroad labor organizer and socialist Eugene Debs (1855–1926) endorsed the organization's anti-capitalist agenda and became one of its leaders.

Unlike the American Federation of Labor (AFL), the IWW organized skilled and unskilled workers by industry rather than by craft. Founded and led by miner and Socialist William "Big Bill" Haywood (1869–1928) and miners' agitator Mary "Mother" Jones (1830–1930), the IWW aimed to unite all workers in a camp, mine, or factory for eventual takeover of their

employer's industrial facility. The union organized strikes in lumber and mining camps in the West, in the steel mills of Pennsylvania (1907), and in the textile mills of New England (1912). The leadership advocated the use of violence to achieve its revolutionary goals and opposed mediation (negotiations moderated by a neutral third party), collective bargaining (when worker representatives bargain with an employer), and arbitration (when a third party resolves a dispute). The group declined during World War I (1914–18), when the IWW led strikes that were suppressed by the federal government. The organization's leaders were all arrested and the organization dissolved. Haywood was convicted of sedition (inciting resistance to lawful authority), but managed to escape the country. He died in the Soviet Union.

INDUSTRIALIZATION

In the years following the American Civil War (1861–1865), the twin pillars of capitalism and industrialization catapulted the American economy to the forefront of world commerce. Oil, steel, rail, mining, and agricultural industries all enjoyed tremendous growth in the latter part of the nineteenth century as Americans harvested the riches of its natural resources, land, manufacturing technology, and a large labor pool from increased immigration.

America's tremendous industrial and financial growth in the last decades of the nineteenth century was due in large part to the entrepreneurial boldness and business instincts of a number of industrial and financial tycoons who came to be known as the "Robber Barons." J. P. Morgan (1837–1913), John D. Rockefeller (1839–1937), Cornelius Vanderbilt (1794–1877), Andrew Carnegie (1835–1919), James J. Hill (1838–1916), Jay Gould (1836–1893), and others guided their diverse business interests to unprecedented levels of profitability. The monopolies of the Robber Barons enabled them to eliminate less powerful competitors, raise prices, and subsequently realize huge profits that were pumped back into their businesses. But the federal government gradually began to heed the voices of small business owners who called for reform and the cries of American workers who had begun launching the country's first organized labor unions in the face of company-sponsored violence. In 1890 the Sherman Anti-Trust Act was enacted in an effort to curb the power of the trusts. But the Robber Barons continued

to maintain their dominant positions in the American system. Blessed with access to abundant natural resources, valuable technological advances, a growing labor force, and a congenial political environment, these men and the monopolies that they held dominated the American economy. For a generation after the Civil War, the political power of the presidency paled in comparison to the economic power of the Robber Barons.

The railroad industry especially transformed the business landscape of America. By the early 1850s several railroads had established lines that allowed them to transport freight between the Great Lakes region and the East Coast, and new railroad construction projects proliferated across eastern America. This ever-growing network of rail lines, many of which spanned relatively short distances, came to be seen as a more timely, reliable, and inexpensive way to transport goods, compared to other options. The explosive growth of the railroad industry in the eastern states, coupled with the potential wealth contained in the country's western territories and the country's attendant desire to expand in that direction, convinced growing numbers of people that a transcontinental railroad stretching from coast to coast should be built. Begun in 1863, the effort was hampered by the Civil War and the daunting obstacles of western geography and weather. But on May 10, 1869, the rail lines of the Central Pacific and the Union Pacific were finally joined in Utah. Celebrations of the epic achievement erupted across the nation as Americans hailed this giant step forward in the country's westward expansion.

Farmers benefited from increased mechanization, sophisticated transportation options, and scientific cultivation methods. Nonetheless, the financial situations of many farming families grew precarious in the 1880s and 1890s. Record crop yields resulted in lower prices while production costs increased, a combination that threw many farmers into debt. They responded by forming farmers' alliances that insisted on populist reforms. Many of their reform themes, such as the institution of referendum, recall, and petition, and the direct election of senators were dismissed as outlandish when first articulated, later became cornerstones of progressive reform in the early 1900s.

The surging economic and technological growth of the United States engendered tremendous changes in the character of American life in the last decades of the nineteenth century. The rural agrarian culture of previous generations gave way to an increasingly urban and industrial one as manufacturing plants proliferated and cities mushroomed in size. The nation's urban population rose 400 percent between 1870 and 1910.

Industrialization

Still, for many Americans city life was less an immediate experience than a distant and powerful lure. Yet the attraction was powerful, for the population drain from the countryside was particularly noticeable, especially in the Midwest and East. As the 1870s and 1880s witnessed the worst agricultural depression in the country's history, large numbers of farmers moved to the city. Jobs, higher wages, and such technological wonders as electricity and the telephone gradually drew many failing farmers to the cities.

Joining these erstwhile farmers in the cities were an increasing number of immigrants from eastern and southern Europe, who, like their American counterparts, came mostly from the countryside and knew very little of urban life. These "new" immigrants—in comparison to the more established generation of largely Protestant "old" immigrants from the western and northern European countries of Britain, Ireland, Germany, and Scandinavia—were Italians, Austrians, Hungarians, Poles, Serbs, and Russians, mostly Catholic or Jewish. As the African American emigration out of the South to northern and midwestern cities, the "new" immigrants typically congregated in the urban centers of the East, particularly New York.

As Americans moved to the cities, they were not necessarily happy with the change. Cities of the late nineteenth century grew without planning, with a minimum of control, and typically by the dictates of industrial enterprise. U.S. cities seemed to harbor all the afflictions that plague modern society: poverty, disease, crime, and decay. For members of the urban working class, hardship and uncertainty often marked their lives. Layoffs were common, and as much as thirty percent of the urban work force was out of work for some period of the year. Even steady work brought frequently brought exhaustion. "Scientific Management," a phrase coined by Frederick Winslow Taylor, invaded the workplace and the disciples of efficiency used stop-watches to "time" the performance of a job in order to figure out how to get more productivity out of the workforce. Child labor was common as well, and in 1900 as many as three million of U.S. children were forced to work on a full-time basis to help support their families. Living conditions in the cities were often deplorable, with thousands of families forced to reside in slums that were breeding grounds for typhoid, smallpox, cholera, tuberculosis, and other diseases that swept through the cities on a regular basis. City tenement housing quickly degenerated into slums that not only bred vermin and rotten odors, but also brought poverty, prostitution, and organized crime. In 1881 the homicide rate in America was 25 per million; in 1898, the rate had risen to 107 per million. Diseases such as

cholera, typhoid fever, and diphtheria increasingly plagued cities and wreaked havoc on the working-class population.

Several factors exacerbated the problems in American cities. In the 1880s and 1890s the gulf between social classes was dramatically widened. The term "Gilded Age," coined by Mark Twain, came into common use and indicated corruption, profiteering, and false glitter. In both Chicago and New York, elegant and lavish homes were often built on the same street or within view of the slums. A few blocks from New York's elite Fifth Avenue, the desolation of Shantytown with its Irish paupers and roaming livestock posed a sharp sixty-block contrast. While a relatively high degree of residential mobility did exist, ethnic neighborhoods like Little Italy, Poletown, and Greektown also served to highlight and define urban poverty.

INFLATION

Inflation is a continuous rise in the price of goods and services. It is important to note that a rise in the price of just one or two items does not constitute inflation; nor does a one-time rise in all prices mark an inflationary period. To count as inflation, the price increases must be general throughout the economy and must continue over time. The hallmark of inflation is that money buys less than it once did. A cup of coffee that may have cost a dime at mid-twentieth century may cost a dollar some 50 years later.

Rising prices have been observed in most Western industrialized nations since the end of World War II (1939–1945). Economists, however, debate at which point inflation begins to pose a threat to society. If prices rise steeply and quickly enough, say, in the range of five to ten percent a year, inflation can undermine a nation's economic well being. The value of savings decreases, since the money saved will buy less and less over time. Senior citizens and others living on fixed incomes see their buying power erode.

Inflation also means business owners must pay a steadily rising price for labor and raw materials, which cuts into profits. Eventually, rising prices can choke off economic growth, and lead to a recession.

The government can fight inflation by restricting demand for goods and services, usually by raising interest rates or imposing new taxes. Such measures tend to lead to higher unemployment, which dampens demands for goods and services and, in turn, brings down prices. Economists debate whether the cost of fighting inflation, e.g., higher unemployment and less growth, is worth the pain. Certainly a moderate amount of inflationary price increases, in the range of one to two percent per year, is viewed by many economists as not worth worrying about.

Inflation is measured by the government's cost of living index. The opposite of inflation is deflation, a steady decline in the level of prices over time.

INFORMATION SUPERHIGHWAY

As highways made out of concrete help people to physically transport themselves and their goods from one place to another, the Information Superhighway, (made out of telephones, computers, satellites, and other communication devices), helps people and businesses remain in contact with one another. The Information Superhighway is a phrase that describes the expansion of digital telecommunications, involving

Infrastructure

more and more people: locally, nationally, and globally. This superhighway, whether it involves making a cellular phone call to a friend, or e-mailing a business to order a product, is leading us in a direction of increasingly easier communication without regard for borders. The development of new methods, such as the Internet, to share information has triggered a revolution in global telecommunications. It began in the 1950s and continued to make dramatic and high-speed changes in the ways we communicate throughout the twentieth century. With each evolution in telecommunications technology, the Information Superhighway has grown in size, improving the connections between individuals and businesses next door and around the world.

INFRASTRUCTURE

Infrastructure refers to the network of roads, bridges, railroad lines, water and sewage pipes, the electrical power grid, and all the other physical structures needed for the functioning of a modern industrial economy. Although some new roads and other projects are built each year, the crucial need of infrastructure in already industrialized countries is to repair and maintain what is already there. Governments at all levels, including federal, state, county, and local, must budget funds each year to maintain their infrastructure. Failing to do so means risking the deterioration of roads, bridges, and other structures essential to the orderly working of society. The existing infrastructure in the United States has been built up over many decades, and represents an investment by society that probably runs into trillions of dollars. Economists also sometimes use the word infrastructure to refer to the financial institutions that are needed in a modern economy, such as banks, stock and bond exchanges, and the like.

INITIAL PUBLIC OFFERING (IPO)

In order to raise capital, corporations offer their securities for sale to the general public. An initial public offering (IPO) is the first instance in which a corporation offers a specific, registered security for sale. An IPO of common stock converts a business owned by one person or several persons into a business owned by many. This practice provides an immediate injection of cash which can be used to increase the

company's prospects of growth and expand its equity base, increasing the possibility of stock value appreciation.

Corporations must go through the red tape of registration with the Securities and Exchange Commission (SEC), which sets standards and regulations for the investment market, before any offering can be made. In this process a corporation must reveal extensive information about its inner workings, develop an initial offering prospectus (a detailed brochure about the corporation's performance, management, and plan of use for the funds raised), and determine the price at which the new security will be offered on the market. Once the SEC has given its approval, the initial public offering may go forward.

INTEREST

Interest is typically expressed as a quarterly or annual rate of percentage charged or earned on a sum of money. For example, if an individual borrows \$2000 from a bank or lending institution and that institution charges an annual rate of six percent interest on the loan, the individual will pay the lender up to \$60 a year for the use of the money. Paid interest is usually incorporated in monthly installments submitted by money borrowers in a scheduled repayment plan. The process is similar for interest earned. A bank may offer an annual earned interest rate of three percent to investors with a savings account. An individual with \$100 in a savings account at that bank will earn \$6 a year in interest.

Interest rates play an important role in lending and investment decisions. Money borrowers will look for the lowest interest rate they can find for their loan, whereas investors will look for the highest interest rate to better the return on their investments. In the economy the interest rate is often affected by factors such as a country's stage of development, productivity, and investment needs, among others. Internationally, fluctuating interest rates can cause flows of capital between financial institutions and different countries. For instance, if domestic interest rates are low in the United States and higher in Asia, investment capital will flow out of the United States and into Asia so that investors can take advantage of the higher interest rates on their investment moneys.

INTERNATIONAL BUSINESS MACHINES CORPORATION (IBM)

Around the year 1911 Charles Ranlett Flint (1850–1934) founded the Calculating-Tabulating-Recording (CTR) company. He merged two companies he had previously managed, International Time Recording Company and Computing Scale Company of America, with an unrelated firm called Tabulating Machine Company. A man named Herman Hollerith (1860–1929) had founded the Tabulating Machine Company. Hollerith was an engineer who invented a tabulator to punch, sort, and count cards. This merger was the beginning of IBM. It would eventually become the world's largest computer company.

The tabulator served the needs of the U.S. Census Bureau in the 1890 and 1900 censuses. It was used for processing large amounts of data. Other organizations with similar needs adopted the machine for their own use. In the early twentieth century society was becoming more urban and commercialized. Consequently the ability to process financial and other data became an important factor in running a profitable business.

CTR did not become focused on the tabulator as its primary product until John Watson (1874–1956) was hired as the company's general manager in 1914. Watson had worked at National Cash Register (NCR) for about 20 years. Although he rose to become the company's general sales manager, he was under a cloud when he came to CTR. He had been convicted along with his boss, John Patterson, of violating the Sherman Antitrust Act on behalf of NCR. When the government dropped its case against NCR in 1915, Watson was made president of CTR.

Watson understood that CTR's future lay in its tabulating division. The tabulator was a basic office tool that would be in ever-increasing demand as the number of office workers grew. He quickly established a well disciplined sales force. He hired many former NCR salespeople. They were courteous, well-dressed, and trained in selling a service, not just a product.

The nation's economy boomed in the 1920s. In 1924 CTR became IBM. By the end of the decade it was a dominant leader in providing large tabulating systems for public and private customers. The company was very profitable in the 1920s and 1930s. It operated in the less competitive business segment of large custom-designed systems. IBM's practice of leasing rather than selling its machines increased its profits. Its cross-licensing agreements with its chief

competitor, Remington Rand, kept the two companies from antagonizing each other.

IBM also required its customers to use IBM cards for its tabulating machines. There were literally millions of such cards already in use. IBM was selling nearly 85 percent of all keypunch, tabulating, and accounting equipment in the United States. The company's growth remained unchecked despite a 1936 U.S. Supreme Court ruling that ordered IBM to lift its restriction that customers use only IBM cards.

Demand for IBM's products increased when President Franklin Roosevelt's administration (1933–45) inaugurated the New Deal during the mid-1930s. The newly created federal bureaucracy needed IBM's calculating machines. The newly formed Social Security Administration placed an order for more than four hundred accounting machines and 1,200 keypunchers. IBM had successfully carved out a market niche that addressed the need of large-scale organizations that required machines capable of massive amounts of calculations.

World War II (1939–1945) saw IBM's sales more than triple. They reached \$141.7 million by the end of the war. Demand was high in both governmental and private sectors. The company's machines were used to monitor the manufacture and movement of numerous products used in the war effort. The military had a need for high-speed calculators. This resulted in IBM creating the Mark I, a machine that is considered by many to be the world's first computer. It used IBM punch cards for large calculations. It also retained a set of rules to apply to future input. Practically, it was the first calculator with memory. The Mark I had 765,000 parts and 500 miles of wire, yet it was still less powerful than the kind of hand-held calculators which were common in the latter half of the twentieth century.

IBM was involved in other computer-related projects during World War II and after. But in 1951 its old rival Remington Rand took the lead by marketing the UNIVAC. IBM remained cautious about entering the computer market. At the time IBM punch cards were used even by electronic computers and the company still controlled 85 percent of their market.

In 1952 Thomas Watson, Jr. (1914–1993), succeeded his father as president of IBM. The new president led IBM into the computer market; IBM's first business computer, the 701, was introduced in 1951. As IBM marketed new models its customers began switching from IBM tabulating equipment to IBM computers.

IBM also began to expand internationally. In 1949 it established a new subsidiary for international sales, IBM World Trade Corporation. Thomas Watson's younger brother, Dick Watson, headed the subsidiary. While World Trade had sales of only \$6.3 million in 1949, it operated in 58 countries, giving the company a base for future expansion. In many countries IBM set up local subsidiaries to sell IBM products and conduct further research and development. As those countries adopted computers IBM was able to achieve dominance on those markets. Only Japan and the United Kingdom produced local competitors for IBM. This left IBM with a 33 percent market share in those two nations. World Trade eventually surpassed the domestic IBM in sales.

Computers began developing more rapidly in the late 1950s. In 1958 Sperry Rand and Control Data Corporation (CDC) introduced the second generation of computers. The new machines featured transistors instead of vacuum tubes. Then a third generation of machines using integrated circuitry was quickly introduced. IBM responded with a large capital-spending program. Six new plants were built and thousands of workers were hired. In 1965 IBM introduced its 360 line of small, fast computers with their own exclusive software. The 360s were immediately successful and resulted in IBM's dominance over the computer market for more than a decade. From 1965 to 1975 IBM sold 65 percent of all U.S. computers.

IBM's competitors challenged the company by specializing in different niches of the computer market. When the first microcomputers were introduced in 1960 IBM chose not to enter the market. IBM did not enter the personal computer market until 1980. By that time it was unable to achieve the dominance it had with its mainframes and minicomputers. Nonetheless sales of the 360 line and the subsequent 370 line continued to grow. In 1984 IBM achieved peak earnings of \$6.6 billion on sales of \$46 billion.

During the 1980s IBM was held up as a model of business excellence. But by the end of the decade the company needed an overhaul. Revenues and earnings were weak, and the company's stock price was in decline. Its worldwide market share had fallen from 36 percent to 23 percent. IBM could no longer keep its dominant position in the fast-changing world of computers simply by building bigger and faster machines. The corporation had to find other ways to compete.

IBM's turnaround began in 1993 when Louis Gerstner, former chair of RJR Holdings Corporation, took over as Chief Executive Officer (CEO). The

measures he took to revive the company included de-emphasizing research and development, refocusing on services and systems, and cutting the work force. He also revived the company's faltering mainframe business.

IBM also embarked on a more aggressive acquisitions program. In 1995 it acquired the software company, Lotus, for \$3.5 billion. Other software firms were bought. IBM also invested \$1.2 billion in Prodigy with Sears, Roebuck, and Company before selling it at a loss to the company's management and other investors.

With computer networking becoming more predominant in the business world IBM began to make all of its products network-ready. Corporate use of the Internet also became more widespread. IBM sought to provide products for corporate intranets and new Web technologies. In 1997 it introduced a new line of lower-cost mainframe computers that promised the same speed as traditional mainframes. In 1998 it introduced a new line of so-called "e-business tools." These included servers, work stations, PCs, and notebooks. They were meant to facilitate business transactions over the Internet.

"Deep computing" was another area of emerging growth for IBM. It linked high-speed computers with analytical software. The U.S. Department of Energy and the National Aeronautical and Space Administration (NASA) were two major customers for this type of supercomputer.

As the 1990s drew to a close IBM was in a much stronger position. Despite its poor market position in the computing industry at the beginning of the decade, IBM was being held up once again as a model of business excellence.

INTERNATIONAL MONETARY FUND (IMF)

The International Monetary Fund (IMF) was a group of 182 countries that joined together to create a cooperative, stable system for buying and selling each others' currencies; monitoring the global flow of money; and fostering international trade and economic growth. To join the IMF, a country had to agree to contribute an amount of money (based on its economic size) to a general pool of funds. The IMF used this pool of money to make loans to member countries that fell behind in their financial obligations with other IMF countries, or that wanted to restructure their economies. Because it had the world's largest economy, the United States contributed the largest amount (\$35 billion in 1998) to the IMF and therefore had the largest vote in how the IMF used its funds. The IMF had no power to enforce how its members spent the money loaned to them, but it could threaten to withhold future loans if a member country failed to live up to its obligations.

The IMF was formed in 1944 as the Allied countries began to write the rules that would govern the economic relationships between the nations after World War II (1939–1945). During the Great Depression (1929–1939) the sudden collapse in economic confidence around the world led many consumers to try to trade in their paper currency for gold. But many countries did not have enough gold on hand to meet this demand and were forced to break the longstanding connection between their currencies and their gold reserves. With some countries hoarding gold and others letting their currencies “float” unattached to gold, it was hard to determine how much one country's currency was worth compared to another's, and international trade suffered. The IMF rectified this situation by requiring that all member countries permit their currencies to be converted freely into other members' currencies, by establishing a definite value for each currency relative to others, and by eliminating policies that discouraged global investment and trade. The value of all world currencies was fixed in terms of the U.S. dollar, with \$35 equaling one ounce of gold.

In 1971 President Richard M. Nixon (1969–1974) ended this system of defining the value of the dollar

against gold, and the values of world currencies have since been defined more loosely. As a result the IMF maintained much closer supervision of its members' economic policies so exchange rates—the value of one currency relative to another—didn't fluctuate wildly. Although the IMF's main functions were to coordinate the economic policies of its members and to provide technical assistance, training, and consultation, it has been mostly known for the massive loans it made to its members. In 1995 for example, the IMF extended credits of \$18 billion to Mexico and \$6.2 billion to Russia to help them survive economic crises.

INTERNET

The Internet is an international system of interconnected computer networks of government, educational, nonprofit organization, and corporate computers. The computers and networks are connected to each other by high-speed data communications lines, and even dissimilar computers are able to exchange data with each other using a set of data communications protocols called TCP/IP (Transmission Control Protocol/Internet Protocol). TCP/IP supports Simple Mail Transfer Protocol (SMTP) to permit the sending of electronic mail (E-mail) messages, File transfer protocol (FTP) for moving files between computers, and telnet which makes it possible to log in and interact with a remote computer. TCP controls the transmission of data between computers, and IP controls the automatic routing of the data over what might be a chain of computers.

The Internet's structure is based on a predecessor network called ARPAnet, which was established by the U.S. Department of Defense's Advanced Research Project Agency (ARPA) in 1969 as an experiment to determine how to build a network that could withstand partial outages, such as from an enemy attack. Each computer on the network communicates with others as a peer instead of having one or a few central hub computers, which would be too vulnerable. In the late 1980s ARPAnet was replaced by NSFNET, run by the National Science Foundation, which expanded the network, replaced its telephone lines with faster ones, and funded more college and university connections to the network. Thus, educational institutions became the dominant users in the 1980s. Other organizations and corporations joined by linking their computers, local

This girl's computer is accessing the Internet, which is an interconnected international network linking together computers via high speed data communication lines.

area networks (LANs), and wide area networks (WANs) to the Internet and adopting TCP/IP to connect their computers. As a result, the Internet comprises some networks that are publicly funded and some of which are private and which charge network access fees. Consequently, different users pay different fees, or none at all, for the same services. In the 1990s corporations and consumers became the biggest users of the Internet.

INTERNET AND THE ECONOMY (ISSUE)

The Internet, an electronic form of communication that uses a computer, a modem, and a phone line, was developed in the mid-twentieth century. First established as a communications board for academics in the late 1960s, the Internet grew from a phenomenon found mainly in the halls of academia and government

to a worldwide source of information, “chat,” and commerce. It has spawned the Information Superhighway, which allows for instant communication everywhere. It created a new arena for advertisements and opened a new avenue of commerce—E-commerce.

Twenty years after its development, the Internet grew from a small hobby of academics and government workers to a worldwide community of millions of Web users. Though industries were initially wary of using the Internet to promote their business to consumers, the continued growth of the World Wide Web and the temptation of reaching millions of users were undeniable. In the late 1990s it was estimated that the Internet doubled in size every three months. Though it grew worldwide, much of this increase was in the United States, where over half of the Internet's nearly seven million host computers were located.

As the Internet grew, service companies sprung up to offer online services (connections to the Internet) to users, encouraging the even further expansion. Companies like CompuServe, America On-Line, Netcom, and Prodigy took early advantage of the new market. By the mid-1990s the Internet had become an economic and social force. In the fall of 1995 the initial public offering of an Internet service company called Netscape Communications on the New York Stock Exchange created huge publicity. The stock opened for trade at around \$14 per share, and the company's young founders soon found themselves millionaires. By July 1999, Netscape stock was trading at \$97.63 per share.

Online service companies were not the only ones to profit from the Internet. By the end of the twentieth century, the United States was home to more businesses online than any other part of the world. It was also home to the highest number of computer owners, the most access nodes, and the lowest telecommunication rates. The Internet, however, was still a work in progress at the end of the twentieth century. Computer crashes, connectivity interruptions, slow transfers and downloads, and out-of-date or finding inaccurate information were common user experiences. But these problems did not slow the Internet's popularity or its development. Computer industry pioneers like Bill Gates have envisioned the Internet as a source for most avenues of communication, connecting computers, telephones, television, and radio.

One vision of the Internet—as a new market for business—was clearly being realized in the 1990s with the development of E-commerce. Businesses can post their advertisements online in hopes of wooing consumers to their products. By the click of a mouse on an

online advertisement, a user can be taken to a business's website, see an image of the promoted product, read about its benefits, and often have the option to purchase that item online. The Internet is a forum in which small companies may be able to better compete in the global marketplace. It also removes many barriers of communication between customers and businesses, such as geography and time zones.

AVAILABLE 24 HOURS A DAY, SEVEN DAYS A WEEK, THE INTERNET PROVIDES A NON-STOP FORUM FOR BUYERS AND SELLERS TO INTERACT.

E-commerce has grown notably in the 1990s. Online companies such as Amazon.com have experienced large growth and surging popularity with users. Amazon.com provides the curious with book and music reviews, customer opinions, soundbites of song tracks, discounted prices, and ease of purchase. An online shopper at Amazon.com can read many opinions about a book or CD before deciding to purchase, add an item to his or her electronic shopping cart, and head to the never-a-line check-out (payment by credit or check only) all without the hassle of crowded malls or overeager salesmen. The benefits for a purely online company such as Amazon.com come in the low overhead costs of operation and the many consumers it can reach through its general reputation and extensive advertising network.

Books and music and online services are not the only areas of business to benefit from the Internet. Consumers can buy just about anything on the Internet, from food and clothing to cars and airline tickets. Looking for a new apartment? Go to apartments.com. A new job? Try careerpath.com. The options are endless for the diligent online consumer. The variety of choice and the ease with which consumers can communicate with one another present a challenge to businesses. While the Internet allows companies to talk directly with their customers without the aid of distribution channels and mass advertising or the mediation of the press, it also allows outsiders to more easily reach one another and talk about companies amongst themselves, without going through the same intermediaries. Received poor service from an online company? Post your complaint in chat rooms and on posting boards across the World Wide Web. Bad publicity from the average consumer has become more a threat for businesses due to the easy communication inspired by the Internet. Companies have less control over their public image. Anything and everything about a business can be known—and found out—on the Internet. While this

may benefit consumers, it is a double-edged sword for companies.

Though E-commerce grew rapidly in the second half of the twentieth century, its actual successes have been questioned. Some economists claim E-commerce may diminish a company's profits. The Internet drops the cost per transaction, so it becomes practical to auction an item for dollars rather than thousands of dollars and still make money. A mass merchandiser like Internet Shopping Network, for example, can program its computers to accept the 3,000 best bids over \$2.10 for 3,000 pieces of costume jewelry, rather than accept one set price for the jewelry, which would be common practice in a shop. In addition, as consumers use search engines to scour the web for the cheapest prices and the latest offers, rival competitors are only a mouse click away. The advantages of being the most well known company or the biggest advertiser are mitigated on the more level playing field of the Internet.

Available 24 hours a day, seven days a week, the Internet provides a non-stop forum for buyers and sellers to interact. The opportunities for profit, loss, problems, and rewards may be staggering and unpredictable, but E-commerce is clearly paving the way to a new economic road. Buy. Sell. Complain. Compliant. Do it all at your convenience on the Internet.

INTERSTATE COMMERCE COMMISSION ACT

The Interstate Commerce Commission (ICC), established by act of Congress in 1887, is responsible for regulating the rates and services of specified carriers that transport freight (goods, whether raw or finished) and passengers between states. ICC jurisdiction, expanded by subsequent acts of Congress, includes trucking, bus services, water carriers, expedited delivery

services, and even oil pipelines. The regulatory agency, the nation's first such body, was borne of necessity during the late 1800s, when farmers and others charged the railroads with discriminatory freight practices.

With rail lines crisscrossing the nation, the question of who would control rates and monitor practices had become crucial. Many states, particularly in the Midwest, had set up regulatory boards but because the rail companies operated between states, enforcing state laws on them proved cumbersome and impractical. Meanwhile the railroads, operating without oversight by any effective regulatory body, set their own standards and practices, which resulted in many abuses.

In a U.S. Supreme Court ruling in 1877, in the case of *Munn v. Illinois*, the authority of the state boards to regulate the railroads was upheld. But less than a decade later, in the case of *Wabash, St. Louis and Pacific Railway Company v. Illinois*, the high court invalidated its earlier decision and proclaimed that only the U.S. Congress has the right to regulate interstate commerce. In issuing their decision the Court cited Section 8, Article 1 of the U.S. Constitution (1790), which states that "Congress shall have the power . . . to regulate commerce with foreign nations, and among the several states, and with the Indian tribes."

The Interstate Commerce Act was passed in 1887, creating the Interstate Commerce Commission to regulate the interstate railroads. The agency's purview was later expanded to include all ground and water carriers that operate on an interstate basis. In addition to controlling rates, the agency also enforced laws against discrimination. The ICC's authority was strengthened by congressional legislation including the Hepburn Act (1906) and the Mann-Elkins Act (1910).

INTERSTATE COMMERCE: REGULATION AND DEREGULATION

In many ways the methods of transportation in the United States in the early nineteenth century would have been familiar to the medieval European. Overland transport was still largely by foot and four-legged beasts over poorly maintained roads. Mass amounts of freight could not be moved efficiently over very long

distances. But by the mid-1800s growth of a national railway system began to profoundly alter the country forever.

Although a few horse-powered railroads began operating in the United States in the early 1800s, steam-powered locomotives were not used until the 1830s. By the 1850s railroads were under construction in all states east of the Mississippi (many for only short distances), with most activity in the Northeast. Expansion of the rail network continued, peaking in the 1880s.

With rail lines crisscrossing the nation, the question of who would control rates and monitor practices had become crucial. Meanwhile the railroads, operating without oversight by any effective regulatory body, set their own standards and practices, which resulted in many abuses.

From the start, railroads were capital-intensive and demanded high-cost maintenance regardless of the fluctuations in the amount of business. The large amounts of money needed created the conditions for consolidation and merger, or at least for coordination of markets and services offered. This need for greater organization stemmed from railroads' increasing dependence on higher volumes of business to spread these fixed costs over as much traffic as possible. In addition, railroads often attempted to form cooperative "pools," or cartels to keep rates high. However, consistent and effective cooperation was not always feasible between competitors. Price wars did occur on lucrative high volume lines, such as links between Chicago and New York. Prices were frequently inflated on smaller branch lines with less competition. Rural areas tended to pay higher rates to subsidize higher volume lines connecting urban centers. This sometimes drove smaller customers out of business. The railroad's political power was also increasingly evident with the rise in corrupt and discriminatory practices mostly at the state level.

Consequently, the public, especially farmers and small independent manufacturers, became disenchanted with the railway companies. The platform of the Farmers' Alliance movement (1880–1896) included a reform of transportation costs, which led state legislatures to begin passing legislation to create commissions to oversee railroad business. These commissions were generally ineffective because of the railroad's pervasive economic and political power. As railway networks continued expanding across state lines, an individual state's power to regulate railroads diminished.

Thus, in the early days of the republic most trade did in fact occur within the borders of each state, but as systems of transportation and communication emerged

in the nineteenth century, an increasing percentage of all economic transactions involved interstate commerce. Many states, particularly in the Midwest, had set up regulatory boards, but because the rail companies operated between states, enforcing state laws proved cumbersome and impractical. This meant that the role of Congress in overseeing the affairs of the economy was bound to grow.

For most of the nineteenth century, however, the U.S. Supreme Court assumed a very conservative posture and discouraged Congress from attempting to expand its authority in the economy. The Constitution itself actually offered guidance on this somewhat ambiguous point. Although it gave the states the power to regulate trade within their own borders, the so-called “commerce clause” of Article I gave Congress the power to “regulate Commerce . . . among the several states,” i.e., trade that crosses the border between two states. *Interstate commerce* is the term used to refer to such trade.

Thus, the Supreme Court ruled in 1877, in the case of *Munn v. Illinois*, that the state regulatory boards had jurisdiction over the railroads. But less than a decade later, in the case of *Wabash, St. Louis and Pacific Railway Company v. Illinois*, the high court invalidated its earlier decision and proclaimed that only the U.S. Congress has the right to regulate interstate commerce. In issuing this decision the Court cited Section 8, Article 1 of the U.S. Constitution (1790), which states that “Congress shall have the power . . . to regulate commerce with foreign nations, and among the several states, and with the Indian tribes.”

Thus, inevitably, as the country became more complex and interconnected, and as the railroad companies grew from small, local concerns into interconnected systems of rich and powerful corporations, the fight over regulation of interstate lines moved to Congress. As time went on, railroad interests actually preferred dealing on the federal level rather than fighting the same war in all the state legislatures. In addition, the railroads’ feared the “ruinous competition” of the unregulated capitalist environment. Far from being free market capitalists, their goal was to become a government-sponsored cartel that would insure them a rational process of setting rates and a guaranteed profit. Thus, both the railroads and the anti-railroad forces pushed for regulation.

Finally, in 1887 Congress passed the Interstate Commerce Act, the first broadly regulatory act designed to establish government oversight over a major industry. Patterned after earlier state regulatory laws,

the act created the Interstate Commerce Commission (ICC), the nation’s first regulatory agency. The agency’s original charge was to regulate railroad rates through court orders and to prohibit discriminatory practices including rebates to selected customers. The act originally provided for a commission of five, which eventually expanded to eleven.

The stated purpose of the ICC was to protect consumers and shippers from the monopolistic freight rate policies of the railroad industry, to control which companies gained entry into that industry, and to foster an efficient national transportation system. Other legislation expanded the scope and function of transportation regulation. Congress added telephone, telegraph, and cable service oversight to the ICC in 1888, followed by railroad safety in 1893. However, the ICC remained largely ineffective. During the President Theodore Roosevelt’s (1901–1909) administration, the ICC’s authority was substantially strengthened. Discriminatory practices against short haul routes were ruled illegal in the Elkins Act of 1903. The Hepburn Act of 1906 gave the ICC the authority to enforce approved rates without court orders and it also added pipelines to ICC oversight. The Sherman Anti-Trust Act of 1890 and the Clayton Act of 1914 further strengthened the federal government’s role in interstate commerce by outlawing monopolies and business practices that tended to “restrain trade.”

In 1902 President Theodore Roosevelt (1901–1909) persuaded Congress to create the Bureau of Corporations to inspect the financial books of any business involved in interstate commerce. In 1906 the powers of the ICC were expanded to include the regulation of oil pipelines, and in 1935, under the Motor Carrier Act, they were expanded again to include the trucking industry. The Transportation Act of 1920 further changed the ICC’s charge from merely approving rates to actually setting them. The ICC now determined appropriate profit levels of railroads. It also granted the right to operate and it organized mergers. In 1938 the federal government was given regulatory power over the domestic airline industry and in 1940 and 1942 over the inland waterways and freight forwarding industries, respectively.

The monopoly of railroads in freight hauling came to a close in the 1930s with emergence of the trucking industry, which was also added to ICC responsibilities in 1935. In three Supreme Court decisions between 1936 and 1942 the commerce clause was reinterpreted to permit Congress to regulate virtually all commerce that had a national impact, even intrastate (within a state’s borders) commerce. However, as the railroads

Interstate Highway Act

failed to generate sufficient capital to meet increasing volumes, their political power declined, beginning in the 1910s. The ICC then sought rate stability to ensure the industry's survival and profitability.

During the Great Depression (1929–1939), the ICC assumed a publicly unpopular role of guaranteeing rates of return on railroad capital by raising freight rates despite declining freight volumes. No rate reductions occurred during the 1930s—a bitter pill for industries needing long-distance hauling of bulky commodities. In 1940 Congress added water carriers such as barges to ICC oversight; in 1970 Amtrak's passenger rail service was also added to ICC oversight by the Rail Passenger Act. The ICC thus had oversight over all surface common carriers.

By 1970, however, it was clear that federal regulation of interstate commerce had created its own problems, and Congress began deregulating such industries as airlines, railroads, freight carriers, household moving companies, and inter-city buses. Finally in 1996 Congress eliminated the Interstate Commerce Commission altogether.

The ICC's original goal had been to ensure the public "reasonable and just" rates that did not constitute a monopoly. The Interstate Commerce Act did not define exactly what that meant except that rate setting should not be used to suppress competition. Through the years ICC critics accused the agency of favoritism to the railroad industry by establishing high rates and discouraging lower priced competition. Others argued the railroads' monopolistic powers had so diminished by the 1930s that the ICC was no longer needed.

Other regulatory agencies took over some of the ICC's territory. In 1934 the Federal Communications Commission (FCC) assumed responsibility for telephones, telegraphs, and cable services. The newly formed Department of Transportation in 1967 took over safety concerns. Still, by the 1960s the ICC had 2,400 employees and its annual budget in the 1970s was \$30 million. President Jimmy Carter's (1977–1981) administration greatly diminished the commission's powers to set rates by the 1976 Railroad Revitalization and Regulatory Reform Act. In December of 1995, through the ICC Termination Act, the ICC ended with some of its staff and functions transferred to the Surface Transportation Board.

INTERSTATE HIGHWAY ACT

By 1919 the need for a planned system of national highways became apparent with the increasingly common use of the automobile in the United States. The emergence of the trucking industry in the 1930s further increased calls for long-distance interstate superhighways. The limited-access German autobahn system provided a model concept for a similar system in the United States. President Franklin D. Roosevelt (1933–1945) envisioned highway construction as an ideal public works program, and Congress passed the Federal Aid Highway Act of 1938, which directed a feasibility study of a toll road highway network. The study concluded that a toll system was impractical, but it did recommend creating a 26,700 mile non-toll highway network. Roosevelt forwarded the proposal to Congress in 1939, but the nation was soon drawn into World War II (1939–1945), and Congress shelved the idea. Roosevelt, however, maintained an interest in the proposed highway program throughout the war, expecting that such a massive public construction program would help the postwar economy rebound. In 1941 Roosevelt established the National Interregional Highway Committee to further refine the concept. The resulting 1943 committee report recommended a 39,000 mile interregional highway system. Also focusing on urban freeways, the committee recognized the great influence such transportation networks would have on urban development and stressed the importance of careful design.

Further debate highlighted conflicting interests, such as urban versus rural needs, states with dense populations versus those with a sparse population, and state versus federal control. The resulting Federal Aid Highway Act of 1944 authorized a 40,000 mile interstate highway system connecting primary metropolitan areas and industrial centers, and serving national defense needs. But the act set no priorities for construction and, significantly, provided no special funding. It did require state and local governments to determine the most appropriate routes and to develop national design standards. In 1945 the federal Public Roads Administration adopted a set of standards and, in 1947, designated almost 38,000 miles of routes for construction. With no special funding, however, the resulting construction was slow, as states were reluctant to divert funds away from other priorities.

The Cold War and the Korean War (1950–1953) emphasized the need for improved highways for military use. Consequently, the 1952 Federal-Aid Highway Act provided the first specifically authorized federal funds for interstate highway construction: \$25 million to states on an equal match basis. By 1953 states had constructed almost 20 percent of the designated interstate highway system, at a cost of nearly \$1 billion. Little of it, however, was considered of suitable quality for even existing use.

With newly elected President Dwight Eisenhower (1953–1961) taking special interest in the proposed system, Congress passed the Federal-Aid Highway Act of 1954, authorizing \$175 million on a sixty-forty matching basis. Still disappointed with the meager funding commitment, Eisenhower formed an Advisory Committee on a National Highway Program to press for more sweeping legislation. Finally, overcoming opposition of the trucking industry to a proposed user tax to support the program, Congress passed the Interstate Highway Act in 1956. The act established a 40,300-mile national system of highways to be built over a 13-year period. The federal government would contribute 90 percent of construction costs, projected to exceed \$30 billion, with states responsible for later maintenance costs.

Avoiding major debt, Congress created a pay-as-you-go program. The unique funding strategy included creation of the Highway Trust Fund and the Federal Highway Administrator position to manage the massive program. Funding was also provided to purchase right-of-way not already acquired by the states. Motorist-related user taxes on various fuels (including gasoline) and on truck use (including tire and equipment sales) formed the basis for funding. Those enterprises selling the taxed products, such as service stations,

paid the excise tax directly to the government and then were reimbursed through consumers' purchases the following year. The tax revenue annually raised more than the federal portion of construction expenses. The excess funds were invested in special U.S. Treasury securities, with the interest from the securities placed in a trust fund. The federal government reimbursed the states after the highway construction expenses were incurred, placing limits on how much states could spend annually. How these funding limits were apportioned to the various states, a very contentious issue during original passage of the act, was based on a formula taking into account populations served, total roadway mileage in a state, and the land area served.

The act stipulated uniform design standards to meet interstate demand projected through 1975, including fully divided highways with complete control of access, minimum distances between interchanges, and set lane widths. Use of overpasses or underpasses for road intersections and railroad crossings was required initially for only the more heavily traveled segments, but after 1966 was required for all interstates.

Upon passage of the 1956 act, the federal government provided over \$1 billion to begin construction. The interstate legislation was hailed as one of the greatest public works programs in U.S. history. The unique numbering system and interstate marker designs were selected in 1957. In 1990 President George Bush (1989–1993) re-designated the system as the Dwight D. Eisenhower System of Interstate and Defense Highways. Although comprising only one percent of U.S. roadways, the interstates supported over 20 percent of vehicular traffic and almost 50 percent of trucking traffic.

The interstate program had substantial socioeconomic effects on U.S. society, some anticipated and some not. The cement and concrete industries boomed spurring advances in pavement technologies. Goods could be moved much more efficiently, and increased mobility allowed commuting workers to live in areas farther from their places of work. Not fully anticipated was the mass movement of city residents to the suburbs. The exodus left some cities with declining populations and a demise in the quality of life resulting from a substantial loss of tax revenue. In addition, the freeways undercut mass transit prospects in the United States.

By the mid-1990s, over 40,000 miles of the interstate system had been constructed, at a cost of \$137 billion. The system extended across the lower 48 states, Hawaii, Alaska, and the Commonwealth of Puerto

Intolerable Acts (1774)

Rico. Maintenance expenses and increasing congestion had become major concerns by the 1990s.

INTOLERABLE ACTS (1774)

The Boston Tea Party of December 16, 1773, helped unite American resistance to the British government. It also launched, however, a campaign in Parliament that was led by King George III's Prime Minister Lord Frederick North to punish the rebellious Bostonians. Between March and June of 1774 the government passed four bills aimed at ending dissent in the colony of Massachusetts. They are known collectively as the Intolerable Acts.

The Boston Port Act, passed in March of 1774, stopped all shipping into or out of the port of Boston until payment was received for the tea ruined in the Boston Tea Party and the tax that was due on it. Another measure, the Massachusetts Government Act, was passed in May 1774. The act altered the charter presented to the colony in 1691, changed the representative assembly to an appointed body, and gave much greater powers to the colony's governor Thomas Hutchinson, who was appointed by the king. When Hutchinson requested a leave of absence the government replaced him with a soldier who would unquestioningly obey orders: General Thomas Gage, commander of all British forces in North America.

The Administration of Justice Act, also passed in May, moved trials for capital offenses that involved

British officials or soldiers out of Massachusetts. The British Parliament believed local juries would never render a fair verdict. Finally, the Quartering Act, passed in June, gave General Gage the power to house British soldiers in private homes, something forbidden in the previous Quartering Act of 1764. Although Gage had to pay fair rental prices for his soldiers' lodgings, the act's intent was to punish the people of Boston for the Tea Party. Gage received four regiments of soldiers to keep order in the town.

THERE IS NO ANIMAL, HOWEVER WEAK AND CONTEMPTIBLE, WHICH CANNOT DEFEND ITS OWN LIBERTY, IF IT WILL ONLY FIGHT FOR IT.

Samuel Adams, June 27, 1774

These four acts, all directed primarily against the people of Massachusetts and Boston in particular, constituted the Intolerable or Coercive Acts. The acts aroused little direct opposition because they were limited in scope to New England and did not affect the interests of the majority of colonists. Taken together, however, the statutes posed a threat to American interests and institutions throughout the colonies. They denied the power of local political organizations, supported military law over civil law, and changed customary judicial practices. The end result was that most colonists felt sympathy for the Bostonians. The colony of Virginia, for instance, observed a day of fasting and prayer to protest the closing of Boston Harbor.

Parliament's passage of another bill, however, sparked feelings of alarm throughout British North America. The Quebec Act, passed in June, 1774, created a government for the former province of French Canada. Part of the act established the rights of French-speaking residents to worship as Roman Catholics and created a royal governorship and advisory council for the area. The act also expanded the territory of Quebec south from the Great Lakes to the Ohio River. Although Parliament did not intend the Quebec Act to be part of the Intolerable Acts, colonial radicals grouped it with the others as a way of uniting opposition to the king's government.

If there was a single act of Parliament that was almost guaranteed to offend all the colonies, it was the Quebec Act. The measure took away all the claims that colonial governments had to western lands through their original charters. It also created a reserve area for Native Americans bordered by the Mississippi and Ohio Rivers in the west and by the Appalachian Mountains in the east. By stopping colonial expansion at the mountains, the act alienated both rich and poor

Americans. Impoverished settlers had been making homesteads west of the Appalachians since the end of the French and Indian War (1754–63). Richer colonists, including Benjamin Franklin and George Washington, had already laid claim to thousands of acres of these western lands and risked losing their private fortunes. George III's Solicitor General Alexander Wedderburn publicly acknowledged the anti-American bias of the Quebec Act. He declared in Parliament that the Quebec Act was meant to keep the colonies tied economically and politically to the sea, so that they would be easier to control.

In order to resolve the differences brought about by the Intolerable Acts, the colonists called the First Continental Congress (1774). Representatives from 12 of the 13 colonies (Georgia declined to participate) met in Philadelphia in September of that year. The delegates represented a complete spectrum of political beliefs, ranging from conservative loyalists to radical patriots. They joined together to petition the Crown for repeal of the acts. They split, however, over the question of what measures should be taken if the acts remained in effect. In a document known as the Suffolk Resolves, the Massachusetts delegation—including Samuel Adams and his cousin John Adams—called for a complete boycott of British goods and the training of local militia to resist British troops. The stage was set for the beginning of the American Revolution (1775–83).

INVESTMENT

Investment refers to the acquisition of an asset for the sole purpose of producing future monetary income and/or capital gains. For an individual an investment may consist of the purchase of financial assets such as stocks, bonds, life insurance, and mutual funds, or physical assets such as a house or a car. Economists define investment as the increase in capital goods in an economy. Capital goods are the material or human resources that enable a business to produce a product or service. Investments in capital goods by businesses would include the purchase of factories, buildings, machinery, or a skilled and knowledgeable labor force. Businesses may also invest in research and development projects in order to improve their products or create new ones. For a business a successful investment is considered to be one that increases profits that can be passed on to shareholders which, in turn, raises the value of a company's stock.

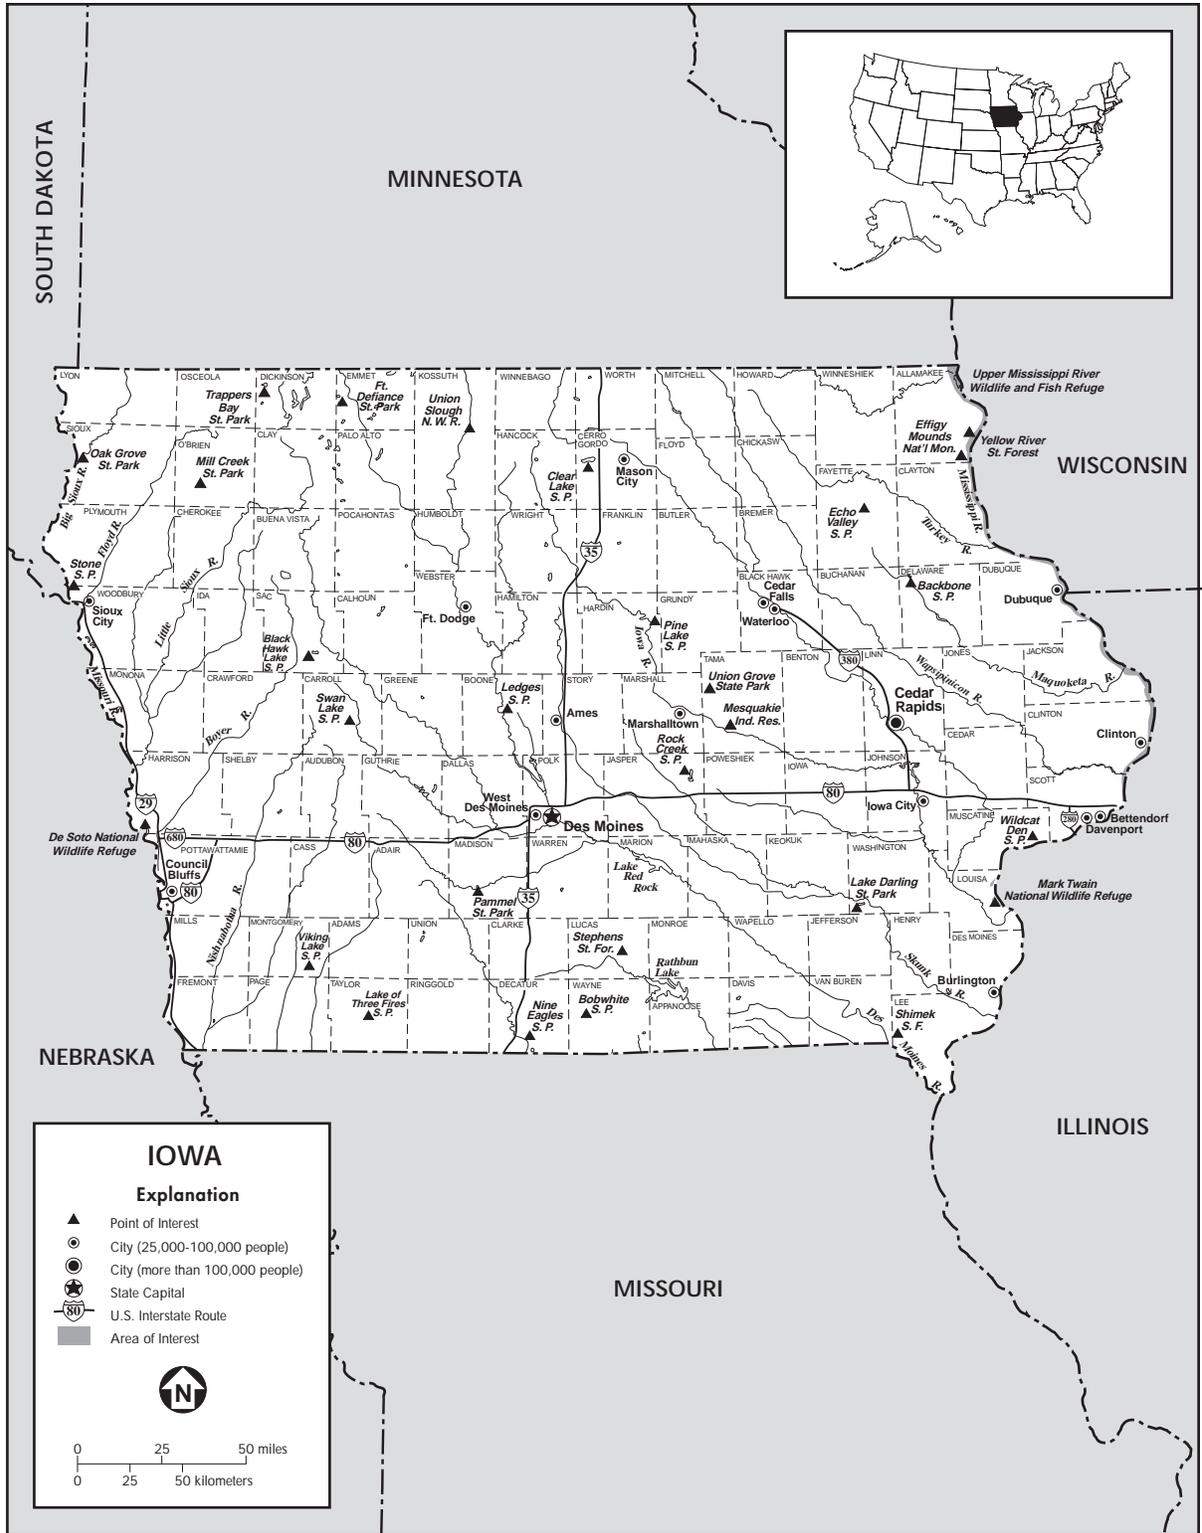

A business's decision to invest in a particular item or project is based on two considerations. The first consideration is the expected rate of return on the investment, or how much profit the investment will generate for the business. The expected rate of return can be estimated based on forecasts of potential sales, profits, and expenses. The second consideration is how much risk is involved in obtaining the expected rate of return. Whether an individual or a business makes an investment, evaluation of risk is essential to successful investing. Practically every investment has some capacity for financial loss, but the degree of risk involved can vary greatly. Therefore investors need to estimate how much loss can feasibly be assumed and limit any risks accordingly.

IOWA

Situated in the center of the nation and between two major rivers, Iowa had some built-in advantages as pioneers began to move westward to establish farms on the prairie grasslands. Spurred on by the development of railroads, more and more people came to this fertile territory. Although the economy of contemporary Iowa actually depends more on industry and the service sector than on farming, the image of Iowa as a state of rolling farmlands and small towns persists. As the diary of Elmer Powers, a 1930s rural Iowan, indicated, Iowa farmers take pride in "[t]he responsibility of

Iowa

State of Iowa.

growing the food and flesh for a distant and often unappreciative city.’”

A trip down the Mississippi River in 1673 made Father Jacques Marquette the first European to visit Iowa. The territory was inhabited by several Native American tribes. The only permanent white settler for many years was a French trapper, Julien Dubuque, who obtained the right from the Fox Indians to work the lead mines in the area, which later bore his name. Iowa came under United States control when France included it as part of the Louisiana Purchase of 1803. Meriwether Lewis and William Clark then went up the Missouri River on their famous expedition, stopping in Iowa and finding it a fairly empty region.

The westward wave of white settlement caused Winnebago, Sauk, and Fox Indians to flee to Iowa. Their stay was brief, however, as more whites moved into the territory and drove them out. Iowa was successively part of the Louisiana, Missouri, Michigan, and Wisconsin territories, becoming a separate territory in 1838. It entered the Union in 1846 as a free state at the same time Florida was admitted as a slave state.

Settlement in the territory proceeded at a rapid pace, since the new state boasted one-fourth of the nation’s fertile topsoil. Farmers from Indiana, Ohio, and Tennessee, and from far-reaching states, such as Virginia, New York, and the Carolinas, came in droves. According to historian Joseph Frazier Wall, the convenience of waterways was important to the development of Iowa. Travelers from the East could come via canals to the Ohio River, and from there down the Mississippi to Davenport or Dubuque. “The entire water trip,” according to Frazier, “might take a month, but this was lightning-quick compared to the wagon and cart journey from interior Pennsylvania or Ohio or even farther east across a third of the continent from the Great Smokies of Carolina or the Blue Ridge mountains of Virginia.” These mostly Anglo-Americans made the state’s culture quite homogeneous in religion and ethnicity. Later immigrants came from Germany, Ireland, and Scandinavia during the 1870s and 1880s. Iowa was the second-highest producer of wheat by 1870, but in the following decades the wheat belt moved farther west and Iowa began to produce more corn to feed cattle.

Despite the abundance of farmable land in Iowa, pioneers by no means had an easy time taming it. The high prairie grass with its extensive root system made it necessary in many cases to hire a professional “prairie-breaker,” a person who made his living by breaking up the soil with a team of oxen and a special, heavy-duty plow. According to Frazier, this process was effective

but very costly to the average farmer who might have to work six to eight years to make his land claim pay for its cost. In addition farmers had to cope with periodic plagues of grasshoppers and plant diseases.

Some interesting sidelights in Iowa’s history were the experimental socialist communities that developed in several areas of the state during the mid-nineteenth century, particularly the Amana colonies in Iowa County. In Amana, founded by a religious group called the Community of True Inspiration, all lands, mills, factories, tools, and livestock were held in common. While other utopian communities had failed, Amana flourished, growing to 26,000 acres of farmland and 1,800 inhabitants by the turn of the century. The communitarian character of Amana, however, was weakened by the Great Depression of the 1930s, and Amana soon became a capitalist corporation with each member a stockholder. Today it is a cooperative company town that has become famous for its manufacture of refrigerators, air conditioners, and microwave ovens, as well as for its tourist appeal.

Iowa supported the Union during the American Civil War (1861–1865), not only because of its anti-slavery sentiment but because of its strong desire to keep Mississippi River shipping alive during a time of crisis. Railroads were vital to the growth of agriculture in the state; the Mississippi and Missouri railroad was the first to cross the state, followed by the Chicago, Iowa & Nebraska, and later the Chicago & Northwestern railroads. Three other major railroads were the Chicago, Burlington & Quincy, the Illinois Central, and the Chicago, Milwaukee, St. Paul & Pacific. By the 1870s, despite the railroads’ obvious benefits to commerce, Iowa farmers were against the high rates and monopolistic practices of the railroads. A powerful lobby in the state, the National Grange, succeeded in getting the legislature to pass the Granger laws to regulate railroads.

During the late nineteenth century Iowa was slowly becoming a center for much scientific experimentation in farming, especially in animal and plant genetics. Livestock and poultry were refined to meet the tastes of urbanized people who liked more tender beef and chicken. Soybeans were introduced from the Orient, and hybrid corn appeared early in the twentieth century, increasing corn yields significantly. Giant seed companies, such as Pioneer, DeKalb, and Cargill, grew rapidly to accommodate the farmers’ increasing desire for the hybrids.

Because so much of Iowa’s land was valuable for agriculture, towns and cities tended to stay relatively small. At first they grew up along the rivers—towns

Ironclads

such as Dubuque, Burlington, Davenport, Bellevue, Keokuk, and Fort Madison. Railroads made possible the development of inland cities such as Grinnell and Waterloo. Still, the state did not develop major metropolitan areas comparable to Chicago or Indianapolis. Des Moines, the state's largest city, still has only around 200,000 people, and the second-largest city, Cedar Rapids, is only about half that size. Since much of Iowa's industrial production is related to agriculture no one metropolitan area dominates, nor is there any natural port of entry that would create a concentration of population and industry.

After World War I (1914–1918) prices for farmland rose considerably, forcing many cash-poor farmers to lose their land around the time of the Great Depression. A small number of farmers joined the Farmers Holiday Association, which staged a number of violent strikes in 1932. Most farmers, however, sought relief in political change within the system. Overwhelmingly, Democrats were elected to office in 1932 on all levels, and the state began to benefit from President Franklin D. Roosevelt's (1933–1945) New Deal programs. High demand for farm products improved the farmers' situation during World War II (1939–1945). After the war, however, the state's economy shifted emphasis from agriculture to manufacturing and service industries. Food processing and farm implement manufacture, early industries in the state, remain important to the economy. In the 1990s the service sector encompassed nearly 50 percent of the economy, with manufacturing at 25 percent, and agriculture at only nine percent.

Inflation plagued Iowa during the late 1970s, driving up the cost of fertilizers and farm equipment. Iowa also suffered during the recession of the 1980s, losing 7.9 percent of its population. A serious drought in 1988 prompted Iowa's governor to declare a state of emergency, as soybean and corn harvest dropped to their lowest levels in 14 years; this disaster was followed by an early frost, which further damaged the already ruined farmlands. Since 1970 the state has seen a loss of 41,000 family farms; more than 90 percent of all of Iowa's land, however, is still farmland. By the early 1990s diversification of businesses, industries, and agriculture had helped the state's economy to make a cautious recovery.

Iowa ranked well below the national average in unemployment, at 3.8 percent, in 1996. Its per capita income in that year was \$22,560, placing it 28th among all states. Iowa's farm income, nearly \$12 billion in 1995, came from the sale of livestock and meat products, feed grains, and soybeans. Some of the important industries in the state, all members of the *Fortune* 500,

include Caterpillar Tractor, General Motors, Mobil, General Electric, General Foods, Procter & Gamble, and U.S. Steel. Around 12.5 percent of all employees in the state are members of labor unions.

IRONCLADS

Ironclads were warships built of wood or iron and covered with thick plates of iron. During the 1820s naval guns that fired explosive shells (versus solid cannonballs) were developed. Because the new shells could easily destroy the hull of a wooden ship, the navy began developing ways to protect its battleships from this superior ammunition. Ships clad in iron could better sustain the fire of explosive shells.

The first battle between two ironclads was staged during the American Civil War (1861–65). On March 9, 1862, the Union's *Monitor*, originally built as an ironclad and equipped with a revolving gun turret, faced the Confederacy's *Virginia*. (The *Virginia* was made by raising the sunken federal boat the *Merrimack* and covering the wooden vessel with iron plates.) The ships met at Hampton Roads, Virginia, a channel that empties into Chesapeake Bay. Though the outcome was indecisive, the *Monitor*'s performance in the battle was sufficient to warrant the U.S. Navy's production of a fleet of ironclad ships. The March 1862 battle off the coast of Virginia marked the beginning of modern naval warfare.

The use of sturdier materials in shipbuilding, along with the steam-power and the screw propeller, all

of which were used by Civil War ironclads, greatly improved the efficiency of maritime commerce after the war. In fact John Ericsson (1803–1899), the designer of the Monitor, had also developed the screw propeller.

IROQUOIS

The Iroquois, or Iroquois League, was an American Indian confederacy made up of the Cayuga, Mohawk, Oneida, Onondaga, and Seneca—Iroquoian-speaking Eastern Woodlands tribes that had settled in the area of present-day New York, west of the Hudson River. The confederacy was formed sometime between the late 1300s and mid-1400s as the League of Five Nations. Member tribes agreed they would not undertake war without the agreement of the other tribes. Within the confederacy each nation had a role; the Mohawks, for example, were charged with defending the eastern end of Iroquois territory.

The Iroquois were mighty warriors. Other tribes either looked to the league for protection or viewed them as a menace. Among the Iroquois enemies were the Huron, a tribe in the Great Lakes region. As the French and British encroached on Indian lands, the bond among the Five Nations grew stronger. In 1722 a sixth tribe, the Tuscarora, joined the league, expanding its territories and its number. (Thereafter the confederacy is alternately known as the League of Six Nations.)

When fighting broke out in the colonies between the French and the British, the Iroquois sided with the British, in what would be known as the French and Indian War (1754–1763). Some historians view the Indian-British alliance as the critical factor in the British victory in the conflict. These historians promote the idea that had it not been for Iroquois involvement, North America would have been divided between the French and British.

When the American Revolution (1775–1783) began, the Iroquois split their loyalties: All tribes except the Oneida sided with the British. During the course of the war, Mohawk chief Thayendanegea, better known as Joseph Brant (1742–1807), led the Iroquois in many raids including the massacre at Cherry Valley, New York, in 1778. The following summer an American army marched through upstate New York, devastating

Indian lands. After the war ended, most of the Iroquois were moved to lands in Ontario.

IRRIGATION

Irrigation is an artificial watering of the land to produce crops. Irrigation compensates for the lack of regular rainfall in the more arid regions of the world and requires large supplies of water. The two water sources are surface water in lakes, streams, and rivers, and groundwater stored beneath earth's surface in aquifers. Aquifers are natural underground reservoirs where water accumulates.

The two main types of irrigation making use of surface water are the basin system and the perennial system. Basin irrigation relies on annual flooding to fill canals dug adjacent to the overflowing river. The canals traverse through farmland, flooding the area with nutrient-rich water. The modern and widely used perennial system, utilizing reservoirs generally created by dams and extensive canal networks, allows water to be supplied at suitable intervals throughout the year. The other source of irrigation water, groundwater, is pumped to the surface from wells dug into aquifers. The well is placed as near to the land to be irrigated as possible and a system of canals or pipes carries water to the crops.

Recognizing the value of irrigation as an aid to permanently settling the arid American West, Mormon settlers in the Salt Lake Valley in present-day Utah built the first large scale irrigation canal system in 1847. Demand for food by the gold rush miners in California and Colorado in the 1840s and 1850s spurred development of ditch systems to irrigate bottomlands along streams. After the American Civil War (1861–1865), the great agricultural settlement boom, lasting from the 1870s to the 1940s, promoted more efficient irrigation institutions as a means of stimulating economic development of the West. Mutual irrigation companies, first formed in Utah, were followed by irrigation districts in California formulated through the Wright Act of 1887. The districts could levy taxes and issue bonds for irrigation development. With the Carey Act of 1894 and the Reclamation Act of 1902, the federal government began major dam construction efforts. The Reclamation Act established the Reclamation Service, later known as the U.S. Bureau of Reclamation. The agency planned the two largest irrigation

Isolationism (Issue)

systems in the United States, the Colorado River Project with Hoover Dam completed in 1936 and the Columbia River Basin Project with the Grand Coulee Dam completed in 1942. The projects transformed immense expanses of arid lands into productive farmland.

The development of deep-well turbine pumps in the 1930s and 1940s led to a rapid increase in acreage irrigated by wells, particularly in the Great Plains and Texas.

ISOLATIONISM (ISSUE)

From the time when George Washington (1789–1797) gave his farewell address at the end of his presidency, warning against “entangling alliances with Europe,” through the nineteenth century, the United States maintained an almost steadfast policy of isolationism. But at the beginning of the twentieth century the United States began to turn away from the isolationism that preceded the Spanish-American War (1898). As a major industrial nation with expanding foreign markets, the United States was soon considered a world power. Global expansion meant increased wealth as raw materials became cheaper to acquire; prices were driven down and consumption was up. The new century saw American businesses prospering in many sectors, including oil, steel, textiles, railroads, and food products. This unprecedented technological progress was marked by the birth of the automobile and the aviation industries. But even with increased prosperity, the isolationist reflexes of the U.S. still shaped U.S. economic and diplomatic life until the advent of World War II (1939–1945).

In the first four decades of the twentieth century the United States clumsily attempted to ward off Japanese aggression in China, assumed a paternalistic administration of Philippine affairs and engaged in “dollar diplomacy” vis a vis its smaller neighbors in the western hemisphere. The most ambitious and idealistic diplomatic project that the U.S. attempted was to intervene in World War I for the most altruistic and idealistic of reasons but with little diplomatic success. In short, the U.S. had little to show for its diplomatic efforts before World War II. With very different policies, Theodore Roosevelt and Woodrow Wilson stand

out as the most internationalist presidents. Neither believed that the U.S. could go far with an isolationist foreign policy.

Teddy Roosevelt put forth a muscular, imperialist foreign policy, while Wilson tried a kind of “missionary” foreign policy—sacrificing 112,000 American deaths simply in order to participate in the peace treaty through which he tried to structure a post-war set of diplomatic relationships that would end all wars. Wilson stood for democracy as the most advanced, humane, and Christian form of government. For him all people were capable of being trained in the habits of democracy and it was the role of the United States to help them achieve democracy.

When the nations of Europe were drawn into World War I (1914–1918) the majority of U.S. citizens wanted their country to remain neutral. The national consensus was solidly isolationist. They approved of trade, but they feared being sucked into a war in which they could see no moral difference between the belligerents. The pattern of immigration led most Americans to sympathize with the British and the French, and they grudgingly accepted the British maritime blockade of trade with Germany. Wilson helped to create a pro-war national consensus based on the belief that German actions—especially its submarine warfare, were morally bereft and would, if left unchecked, eventually threaten the United States. U.S. trade with Germany declined from \$169 million in 1914 to \$1.2 million in 1916, but the flow of U.S. goods into Allied hands was overwhelming, rising from \$825 million to \$3.2 billion in the same period. The United States became a warehouse for the Allied powers and sent munitions, food, and goods to Europe.

World War I gave the Wilson administration unique opportunities to achieve its international economic goals. He was successful in getting the Allies to accept the concept of the League of Nations. But his arrogance in dealing with the Republican Senators, plus the isolationism that sprung up again with the end of the war led the Senate to reject the Treaty of Versailles. This resulted in a powerful swing back to isolationism in the years before World War II.

During the 1920s the nation’s attention was directed towards internal changes rather than international affairs. In the opening years of what would be a decade of worldwide depression, President Herbert Hoover (1929–1933) made a series of proposals to quiet rising international tensions. In 1930 his administration extended the naval-limitations agreements of the early

1920s. In 1931 he proposed a moratorium on international debt while refusing to cancel the lingering World War I debts owed to the United States by the European powers. Hoover also pressed for an international agreement on arms limitation, but the World Disarmament Conference held in Switzerland in 1932 failed to achieve its goals. International economic and military pressures intensified. Fascism in Italy, Nazism in Germany, State Socialism in the Soviet Union, and militarism in Japan were ascendant, fueled by the global depression.

President Franklin D. Roosevelt's (1933–1945) early foreign policy achievements were mixed. His administration took an isolationist stance at the World Economic Conference in June, 1933, when U.S. representatives refused to cooperate in an effort to stabilize world currencies. In 1934 however Roosevelt took an internationalist stance in the U.S.-negotiated Reciprocal Trade Agreements on tariff reductions. His vacillating policies reflected his political priorities: at the beginning of his administration, domestic issues were much more important than foreign policy.

The predominant mood in the United States in the 1930s was deeply isolationist. Not only was the Great Depression (1929–1939) wreaking havoc domestically, but many citizens believed that the nation's losses during World War I far outweighed the gains. Between 1934 and 1936 discoveries made by a Senate investigating committee headed by Senator Gerald P. Nye further fueled the nation's mood of isolationism. Exposing war profiteering by banks and corporations during World War I, the Nye committee investigation led many to conclude that the interests of U.S. banks and corporations had driven the United States into a war the nation should have avoided. The notion that "merchants of death" were responsible for manipulating the United States into war was widespread.

Influential men such as Charles Lindbergh and retired U.S. Marine Corps Maj. Gen. Smedley D. Butler promoted the idea of "Fortress America," the notion that the United States was ensconced safely between the moats of the Atlantic and the Pacific, armed for defense against but not for intervention in the corrupt affairs of Europe. The Senate's refusal to allow the United States to join the World Court in 1935 was another indication of the country's, pervasive, isolationist mood. Fearful of being pulled into a war from which it would only suffer, Congress passed three acts that declared U.S. neutrality. In the event that a war broke out between other countries, the Neutrality

Acts of 1935 and 1936 made it clear that the United States would not supply either side with weapons or ammunition. The Neutrality Act of 1937 moved the nation further in the direction of isolation and asserted a "cash-and-carry" policy by which warring countries could purchase weapons (but not ammunition) in cash only. When the Spanish Civil War broke out in 1936, the United States remained on the sidelines.

Interventionists insisted that the future of the United States lay in establishing peace and stability abroad for the sake of trade and commerce. A world divided into closed and self-contained trading blocs was a world in which the United States would not prosper. Interventionists anticipated that renewed U.S. trade abroad might end the Depression. They believed that the United States had a vital stake in ensuring that the outcome of the war in Europe and Asia favored liberal democracies and market economic systems. However, not all interventionists advocated direct military involvement toward this end. Many argued that economic assistance, as in the case of the Lend-Lease Plan, would be enough to ensure the survival of western democracies. Others, however, insisted that liberal democracy and free enterprise would perish in a world dominated by authoritarian regimes. Such interventionists saw no alternative to military engagement.

In his first term Roosevelt worked closely with isolationist progressives such as Senators Robert La Follette, Jr., Hiram Johnson, George Norris, Burton K. Wheeler, and Gerald P. Nye. During his second term Roosevelt gradually broke with the isolationists as international tensions heightened. In October, 1937, Roosevelt's famous quarantine speech which called for international cooperation in bringing unspecified economic and diplomatic pressure to bear on aggressor-nations irritated the isolationists. Beginning in 1937 they increasingly turned against the president.

As the 1930s drew to a close the United States stood by while Hitler began his push eastward. As World War II began Roosevelt declared, "This nation will remain a neutral nation," but he called for a revision of the Neutrality Acts to allow the United States to sell England and its Allies weapons and ammunition. Congress skeptically allowed purchase of arms on a cash-and-carry basis.

Ironically, European orders for war goods sparked a phenomenal economic boom that brought the United States out of the Depression for good. Many believed that as long as the United States stayed out of the war

Isolationism (Issue)

both peace and prosperity were possible. But members of the Roosevelt administration leaned toward U.S. intervention in the European conflict. Economists within the administration warned that German success in Europe and Japanese victory in Asia would irrevocably close huge markets for U.S. goods. Unless the United States intervened in these conflicts, they argued, the economic future of the United States would be worse than the Great Depression. Such arguments, in concert with war atrocities on the part of Germany and Japan, convinced Roosevelt and his administration that the United States must set isolationism aside and take an active hand in the European and Asian wars. But the people of the United States still resisted. On December 12, 1937 Japanese airplanes sank the Panay, a U.S. gunboat navigating the Yangtze River in China. But people in the United States were ready to forgive the incident after a formal Japanese apology. The Japanese invasion of Manchuria remained a major cause of disagreement between the United States and Japan. But

only the bombing of Pearl Harbor on December 7, 1941, effectively pulled the United States out of the isolationistic attraction.

JACKSON, ANDREW

Andrew Jackson (1767–1845), the seventh President of the United States, grew to adulthood and public prominence as the emerging nation was undergoing profound social and economic changes. In the wake of those changes Jackson worried about the central government's propensity toward abuse of power and the accumulation of power in the hand of a small political and economic elite. As president, Jackson remained a strident and popular spokesperson for majority rule in the United States. He did, however, exert the power of the presidency over other government branches far more than any president before him, leading to charges that he was primarily interested in personal power. He was denounced as a fraud and an opportunist who nearly wrecked the credit and currency systems of the United States. But Jackson also took issue with members of the privileged elite who sought to use the government for their own selfish purposes and thereby endanger the integrity of democracy in the United States. For many in the United States Jackson came to symbolize the democratic advances of his time.

Andrew Jackson was born in March 1767, in a log cabin, the son of poor Scotch-Irish immigrants. He was orphaned at age 14 and spent his adolescence with his aunt in the frontier areas of the Carolinas. Jackson drifted from one job to another, squandered a small inheritance, and developed a lifelong interest in horseracing and cockfighting. His education was spotty and he never appeared to develop an affinity for formal learning.

In 1784, at the age of 17, Jackson moved to Salisbury, North Carolina, to study law. He worked as a clerk for two years, copying legal documents, running errands, cleaning the office, and reading law books. He finished his law training in the office of Colonel John Stakes, and in 1787 he became an attorney in North Carolina.

Shortly after his law training ended, Jackson moved to the territory that would become Tennessee, and he

Andrew Jackson.

was appointed the area's attorney general. While in this position Jackson bolstered his income by selling land to new settlers. He also built a mansion in Nashville called the Hermitage. Later, when Tennessee became the sixteenth state, Jackson represented the state in Congress, but he resigned after only two years in order to be a judge on the superior court of Tennessee.

When the War of 1812 (1812–1814) broke out against Great Britain, Jackson was dispatched by the governor of Tennessee to fight with the Tennessee militia against Creek Indians, who had used the war as an opportunity to attack the Southern frontier. Although he lacked military training and experience, Jackson soon became an excellent general. His leadership qualities emerged and he was highly regarded by

other soldiers who gave him the nickname “Old Hickory” as a sign of respect. After leading a spectacular victory over a British invasion of New Orleans, Louisiana, in 1815, Jackson instantly became a national celebrity.

Distinguished as a popular military hero, Jackson was encouraged by his friends to bid for the U.S. presidency. After the War of 1812 ended, however, Jackson only briefly returned to Tennessee before resuming his military position in order to subdue raids carried out by Native Americans from Spanish Florida. After a series of controversial military moves made by Jackson, including the capture of Spanish cities, the United States and Spain negotiated their disputes, and the United States acquired land that would eventually become Florida. In 1821 Jackson became provisional governor of the new territory of Florida, but resigned from the position after only four months.

Upon returning to his home in Tennessee, Jackson was pushed once again to campaign for the presidency. Though he made an unsuccessful presidential run in 1824, losing to John Quincy Adams (1825–1829), Jackson ran again in 1828 and won the presidency at age 61. He rewarded many of his supporters with government jobs—then a common practice in state governments, but essentially new to the federal government. This so-called “spoils system”—where elected officials employed their friends as pay-off for campaign support—tended to guarantee that no appointed federal employee would have a lifetime “right” to his or her job. Jackson believed that this system of replacing staff made the government more democratic.

Jackson’s administration was marked by his fight against the Second Bank of the United States, which was a federally chartered institution where government funds were kept. The Bank of the United States used these funds to pay the government’s bills, but also to give loans to the public and other banks. It was not directly regulated by the government, but rather led by a board of shareholders, with Nicholas Biddle (1786–1844) as its head. Jackson disliked the bank for economic and political reasons. He felt that its shareholders used the bank’s control of much of the money supply to benefit themselves. Jackson also distrusted the issuance of bank notes, which in his own experience led to excessive borrowing and debt. Like many other Americans, Jackson distrusted credit and banks in general, and favored the strict use of specie (coined precious metals).

When the Bank of the United States’ charter was brought up for renewal in 1832, Jackson vetoed it. He criticized the bank for failing to establish a “uniform

and sound” currency, and began to deposit government funds in other banks. Many of the leaders in the Senate opposed Jackson, and his position on the bank. Nevertheless, Jackson’s successful veto of the re-chartering of the bank in 1832 was arguably a major reason for his re-election to a second presidential term that same year.

Over the course of its remaining four years of existence, the Second Bank of the United States tried to use its power to force a reconsideration of its charter. It issued far more loans than it could support, helping to trigger a wave of real estate speculation on the frontier. Disturbed, Jackson issued the Specie Circular in 1836. The circular required that all purchases of frontier land, which was owned by the government, be paid for with specie. This stopped the speculation, but also bankrupted many investors who lacked sufficient specie to pay their obligations and helped to trigger a major depression.

Jackson’s policy of fiscal restraint helped him accomplish one of his most cherished objectives during his second term: full payment of the national debt. This was the only time up to that point in U.S. history when the nation was free of debt and it was one of Jackson’s proudest accomplishments.

As Jackson proceeded through his second term, he frequently used his executive power to veto proposed Congressional legislation. He believed that the president had the right to annul what he deemed harmful to the public interest, a departure from earlier presidents who only vetoed bills they thought were unconstitutional. Using his veto power creatively, Jackson vastly expanded presidential executive power in government.

Also during his second term, a concept called “Jacksonian democracy” emerged as Jackson developed and popularized his own notion of essential democratic elements. He preached about the importance of equality, freedom, and majority rule, and advocated a limited government, fiscal restraint, laissez-faire economics, and support of the individual states in their constitutional sphere of activity.

Throughout his political career Jackson was both a beloved and much-hated figure. During many reform periods in U.S. history Jackson was seen as a hero, and Jacksonian democracy was extolled as one of the great advances in the development of popular government. Yet Jackson was also denounced as a person out for his own political advantage, who mesmerized the public with populist rhetoric and behaved like an autocrat in his role as president.

When Jackson’s friend Martin Van Buren (1837–1841) was elected president in 1836, Jackson retired to

the Tennessee mansion, the Hermitage. He remained politically active until his death, at the age of 78, in 1845.

JAPAN, OPENING OF

In 1638 the shogun Hideyoshi, a Japanese military and political leader, was determined to isolate Japan from growing European religious and commercial influences. Hideyoshi declared Japan closed to all foreigners and restricted the empire's contact with the outside world to a small group of Dutch traders. This policy of isolationism came to an end nearly 250 years later with the arrival of an American naval expedition led by Commodore Matthew Perry (1794–1858). His diplomatic efforts, backed by a military show of force, opened the Japanese empire to trade and political relations not only to the United States but to the rest of the known world.

Ships of the American whaling industry sailed in the northern Pacific ocean near Japan beginning in the late 1700s. Those unfortunate foreign sailors who were shipwrecked on the Japanese islands because of the region's violent storms were normally imprisoned, and in some extreme cases they were put to death. News of this mistreatment slowly trickled back to the United States, where Congress became increasingly agitated by the Japanese rulers' isolationist foreign policy. A movement to open diplomatic relations between the United States and Japan was further accelerated by the introduction of steam-powered ships.

By the mid 1800s the American sea-going fleet was converting from clipper ships whose sails relied on

the wind to steam ships powered by coal-fueled furnaces. Because steam ships were not capable of carrying enough coal to complete the voyage across the Pacific, refueling ports were established along the Northern Pacific following a trail from the western United States, up through Alaska, and on through the northern border of Japan's empire. In 1851 the United States discovered that coal could be mined in Japan. If refueling stations could be established along the country's shores, the United States fleet could greatly increase its influence within Asia. The thought of establishing ports of call within the Japanese empire greatly appealed to the expansionist political philosophy popular at the time.

SO LONG AS THE SUN SHALL WARM THE EARTH, LET NO CHRISTIAN DARE TO COME TO JAPAN.

Hideyoshi, Japanese Shogun, 1638

The United States' first attempt to negotiate a treaty with Japan was met with an embarrassing defeat. An envoy led by U.S. Naval Commodore James Biddle (1783–1848) sailed into Edo (Tokyo) Bay in 1846. The Commodore's ship was quickly surrounded by Japanese guard boats and boarded by several of the shogun's emissaries who diligently studied every component of the ship. Once completed with their inspection, the Japanese officials provided Biddle with a letter from the shogun demanding he immediately set sail and not return. Six years would pass until the United States would once again attempt to establish a treaty with Japan.

In 1852 Matthew Perry was appointed as Commander in Chief of the United States Naval Forces stationed in the East India, China, and Japanese seas. Perry's naval career was primarily spent directing peacetime activities. Although Perry saw action during the War of 1812 (1812–14) and the Mexican War (1846–48), he was mainly known for his involvement in helping to establishing Liberia, a West African country where freed American slaves found sanctuary. A passionate believer in American expansionism, Perry was greatly concerned over the growing British trade presence in Asia. He expressed these concerns to President Millard Fillmore (1850–53) in 1852 after England gained control over Singapore and Hong Kong. President Fillmore heeded Perry's advice, and in 1853 he commanded Perry to implement a trade treaty with the Emperor of Japan.

Perry diligently studied the lessons learned from the United States first attempt at negotiations with Japan six years earlier. He believed Commodore Biddle's chief mistake was not demanding respect from

Jay Treaty

the Japanese officials. A plan was set in motion to impress the Japanese by displaying America's technological advantages and military might. Perry set sail for Edo Bay with a contingent of four vessels which included the new steam driven paddle wheelers the *Susquehanna* and *Mississippi*. He also brought with him gifts for the Japanese Emperor to demonstrate the technology gap between the two countries. A scaled-down version of a steam-powered locomotive train, rifles, plows, and other American-engineered machines were stored on board the ships.

On July 8, 1853, Perry's small but impressive fleet entered Edo Bay. Once again the Japanese quickly surrounded the ships and demanded that they be allowed to board the vessels. Perry had anticipated this response. Orders had been issued by the Commodore not to allow any Japanese officials to board the ships until a qualified representative from the Emperor was present. His crew obeyed his commands and held off the Japanese at musket point. An American interpreter informed the officials that their commander had been ordered to present a letter to the Emperor or an appropriate representative. The military presence displayed by the fleet left little doubt the Americans would be easily rebuffed.

Intense negotiations took place between the two parties during the next five days. Finally, on July 14, Commodore Perry left his stateroom and came ashore along with 250 members of his crew. Attired in his dress uniform and accompanied by two armed black stewards, Perry presented the Japanese officials with the letter from President Fillmore. The Japanese also provided Perry with a letter demanding he immediately set sail and not return. Perry stated he would return the following year to accept the Emperor's response. The meeting was brought to a close and the American force sailed out of Japanese waters for the winter.

In February 1854 Perry returned to Edo Bay with a larger show of military might. His force consisted of more than 1,500 sailors serving on 10 ships. Once again intense negotiations took place over the trade concessions stated in President Fillmore's letter. After days of deliberation an agreement was reached between the two countries.

The official treaty ceremony with the presenting of gifts took place on March 13, 1854. The Japanese were enthralled with the scaled-down version of the steam locomotive presented by Perry. Equally impressive was the exhibition held by the Japanese sumo wrestlers.

Perry visited several other Japanese ports before returning to his command on April 14, 1854. His

actions led to extensive negotiations between the United States and Japan. Townsend Harris, an American diplomat, spent the next 10 years attempting to finalize a trade agreement with the Japanese. Perry's treaty also opened the door for several other European nations to establish trade treaties with the formerly reclusive country. His efforts and the resulting trade with the western nations had a profound effect on the technological and military modernization of the Japanese empire, although the opening of Japan had little immediate economic impact on the United States.

JAY TREATY

The main problems confronting the second administration of President George Washington (1793–1797) were rooted in the conflict between England and France. The French Revolution in 1789 quickly moved from a period of moderate rule through ever more tumultuous stages. In 1793 King Louis XVI was guillotined and the monarchies of Europe mobilized for war with France. Until 1793 the revolution had little direct impact on the young American republic, although it is difficult to overstate how important the events in France were to Americans with respect to their political beliefs. Americans believed that their own revolution and republican institutions would serve as a guide for a world shackled by tyrannical government. For citizens of the United States, the revolution in France and the triumph of republicanism validated their own experiment with democratic government. Both the American and the French revolutions were seen as

harbingers of a new golden age of worldwide individual liberty and representative government. These were lofty ideals and few held them more dearly than Thomas Jefferson (1743–1826) and his political supporters, who were loosely organized in the Democratic-Republican Party.

As head of state, Washington felt obliged to plot a moderate course for the United States. As Europe plunged into warfare, Washington labored to keep the fragile republic out of harm's way, convinced it would suffer great, perhaps irreparable, damage if it became entangled in the European war. This war, in a sense, was the first "world war" and it unleashed frightening levels of violence. Washington feared that the new nation might be caught underfoot in this elephant stampede. To this end, Washington addressed the delicate problem of the United States' relationships with France and with England. Under the alliance of 1778, the United States was obliged to defend the French West Indies "forever against all powers." Other treaty provisions allowed French privateers to equip themselves and operate in U.S. ports.

Even though France had been a critical factor in the Revolutionary War against Britain, Washington was unwilling to honor what he felt were unrealistic and dangerous obligations. On the one hand, he believed France was outnumbered on the European continent and would likely lose the war. More importantly, France was clearly weaker in naval power than Great Britain, and the United States had virtually no navy at all. Defending the French West Indies or allowing French privateers to operate out of U.S. ports appeared to be an unrealistic task. Furthermore, the European war brought Spain and Britain together as allies. Any official or unofficial aid to France ran the risk of bringing the weight of Spain and Britain—whose colonial possessions bordered the United States—and their numerous Native American allies against the United States.

Other calculations were also important. Even though the two nations had fought a war against each other, Great Britain was still the United States' main trade partner and eastern merchants lobbied against any action in support of France. Indeed, those who had commercial interests at stake usually supported the Federalist Party and the policies of Treasury Secretary Alexander Hamilton (1755–1781), which favored supporting Britain. After conferring with his advisors, Washington issued a proclamation of neutrality in April 1793.

Although the United States had no navy to speak of, it did have a large merchant marine, and British

treatment of U.S. trading vessels made it difficult for Washington to maneuver safely among the belligerents. Great Britain rejected its former colony's definition of neutral rights, based on one strand of international law that held that "free ships make free goods." Instead, the Crown embraced a narrower definition that permitted the seizure of neutral ships' cargoes. Britain also regularly boarded U.S. merchant ships at sea and "impressed" (kidnapped) U.S. seamen who, they claimed, were deserters from the Royal Navy. This issue would foul Anglo-American relations until the War of 1812. Between 1803 and 1812, 8,000 American sailors were impressed by the British. But impressment was already an important complaint during the 1790s. Another issue between the U.S. and Great Britain was that the British forces had not vacated the forts in the Northwest Territories as they had agreed to do in the Treaty of Paris that ended the American Revolutionary War. They also foiled Washington's efforts to make peace with the region's tribes, who were reportedly told by the British Governor General of Canada to prepare for war with the United States.

Washington dispatched Chief Justice John Jay to Britain to negotiate a settlement. Jay's Treaty was signed on November 19, 1794. When it arrived in the United States in March of 1795, it re-ignited political warfare between the Republicans and the Federalists. The treaty failed to resolve the most divisive issue: Britain refused to recognize the United States' rights of neutrality. The treaty also prevented the United States from imposing discriminatory tariffs on British goods, and provided for the payment of pre-Revolutionary war debts still owed to British businessmen. For its part, Britain agreed to evacuate its forts in the disputed territories and to make compensation for U.S. ships recently seized in the West Indies.

Widely viewed as a humiliating and one-sided document, the treaty was unpopular and Washington suffered the indignity of scattered calls for his impeachment. Critics argued that the treaty stripped the United States of the weapon of trade sanctions, the only weapon that could persuade Britain to change its position on the neutrality issue. The Republicans also charged that the treaty was yet another effort by the Washington administration to bring the United States closer to Britain, albeit in a subordinate position, and away from any sympathetic treatment of France. Washington, however, supported the treaty, fearing war with Britain.

Amid renewed criticism of his judgment and character, Washington brought his still considerable prestige and power to bear on the issue of ratification and, with the aid of committed Federalists, secured passage.

But a high price was paid for the treaty in that it moved the nation further from Washington's long-standing hope that the republic, through the goodwill of its leaders, could achieve elite and popular consensus. The treaty further polarized elite and popular opinion. It also widened and hardened divisions in Congress between New Englanders and much of the Middle Atlantic states, on the one hand, and the South, on the other. In the vote in the House of Representatives over whether or not to support the treaty, 79 percent of those supporting the Jay Treaty were from New England or Middle Atlantic states, while over 73 percent of those rejecting it were from Southern states.

Despite its divisive political repercussions, the Jay Treaty must be judged as an important achievement. By working to normalize relations with Britain, the treaty helped protect American security and promote economic development during the vital formative years of the republic. One of its key provisions was the British agreement to turn over to the United States several military posts (including Detroit) that the British had illegally occupied since the Treaty of Paris (1783). The date for the Britain evacuation of the forts was July 1, 1796. Equally important, the treaty marked the advent of modern international arbitration. It authorized the formation of three boards or commissions of arbitration to resolve three important issues: the northeast boundary of the United States; the amount of losses and damages to British creditors who suffered breaches of lawful contracts due to the Revolutionary War; and compensation of U.S. citizens for losses sustained by the seizure of their vessels or cargoes by the Crown or its agents during the war with France.

Although the arbitration approach was important as a concept of international relations, the commissions formed to address the issues of the U.S. boundary and compensation to British businessmen were less than successful. The findings on the first matter were inconclusive, while the deliberations on the second matter were eventually deadlocked. The tribunal dealing with the claims of U.S. citizens against Great Britain, however, had lasting importance. Similar in structure to the other two commissions, it was comprised of two members appointed by both Britain and the United States. The final member was chosen by mutual consent, or in the case of disagreement, by the drawing of names submitted by each side.

Significantly, the commission was able to avoid deadlock over differing positions on substantive law by enlisting an outside expert to resolve the issue. This marked the beginning of the use of neutral, third parties to make binding decisions to resolve disagreements.

JEFFERSON, THOMAS

Thomas Jefferson (1743–1820) is best known as one of the founding fathers of the United States, a president, and the primary author of the *Declaration of Independence*. Less well known is the enormous range of Jefferson's other interests and talents. He was very well-read in science, ancient and modern history, philosophy, and literature, and was one of the best-educated and most knowledgeable people of his time in the United States.

From his intense reading in the philosophy and literature of his day, Jefferson adopted the elements of what became known as the eighteenth century Enlightenment. He believed that human nature was good, and rational laws governed the universe. He also believed in the freedom of all individuals to inquire into all things. He was convinced of man's inherent individual capacity for justice and happiness by the use of reason, the self-improvement of one's work, and progress.

Jefferson's political and business philosophy translated into fiercely democratic feelings about the new nation's destiny. He embraced the spirit of capitalism as long as everyone could participate in it equally. He fought tendencies of large property owners to behave like aristocrats and kings in the newly born United States. He expressed his philosophy and, indirectly, his view of life in the *Declaration of Independence*: "We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness."

Thomas Jefferson.

Jefferson was born into a social circle where he could have lived a life of ease and comfort. He was born in Shadwell, Virginia, in 1743 on a farm property that included five thousand acres of land. He entered the prestigious College of William and Mary at age seventeen. Although he enjoyed the study of science he decided there was no opportunity for a scientific career in Virginia at that time. He instead studied law and philosophy, and was admitted to the bar in 1767, at age twenty-four. Jefferson led a successful legal practice, which he abandoned in 1774 at the onrush of the American Revolution (1775–1783) to lend his support to the independence movement.

While he was a member of the Second Continental Congress in Philadelphia, Pennsylvania, Jefferson was asked to draft the *Declaration of Independence*. Other members of the Congress made many changes to his original draft; yet it clearly bore Jefferson's stamp. For the first time in history the basic written tenets of individual personal freedom were laid as the foundation of a nation. The principles of national equality, the rights of individual persons, the sovereignty of the people, and the right to revolution were all written into a single document that served as a theoretical basis for the United States government and national commerce.

After the American Revolution and the birth of the United States, Jefferson served in the U.S. Congress

where he developed much of what became national policy on business and commerce. He drafted the first ordinance of government for the vast Western territory, which indirectly created free and equal republican states from the existing wilderness. By doing this Jefferson opened up new regions of land to U.S. commerce. Jefferson also paid attention to foreign trade and business, creating a liberal commercial policy to increase business with different European powers.

In 1785 Jefferson succeeded Benjamin Franklin (1706–1790) as minister to France. In Europe, he focused on commercial diplomacy with France and was also engaged in ongoing efforts to broaden U.S. commerce with many other European nations.

In 1789 President George Washington (1732–1799) asked Jefferson to become Secretary of State. He accepted. For the next three years Jefferson fought to increase commercial trade with France and develop more even-handed commerce. His strongest opponent was Alexander Hamilton (1755–1804), who was then Secretary of the Treasury. Hamilton promoted policies that interfered with free trade and enriched the few at the expense of the many. These policies encouraged fraud in commerce and broke down the restraints of the Constitution. Jefferson fought Hamilton, fiercely seeking a free trade situation in which all citizens could participate. This led to the formation of the modern political party now known as the Democratic Party. (It was ironically called the Republican Party at that time.) In 1800 the “man of the people” was elected to the presidency of the United States based on his democratic political principles.

Jefferson's presidency comprised a series of reforms. He restored freedom of the press, which had suffered from restrictions in early nationhood; scaled down the military forces; and abolished all internal taxes. He also began a federal fiscal program to end the national debt. Jefferson sought to create a national condition that would further not only peace, but also equality and individual freedom in business and most other matters. During his presidency he also expanded the size of the United States, purchasing 800,000 square miles of North American territory from the French in the Louisiana Purchase (1803).

Jefferson's legacy to the United States is large. He increased the physical size of the United States through land purchases and supported democratic participation of common people. As a founding father of the United States and a writer of the *Declaration of Independence*, Jefferson embodied the ideals and hopes that shaped a nation. He died at his home in Monticello, Virginia, on July 4, 1826.

JIM CROW LAWS

In 1877, as the post–Civil War (1861–1865) era of Reconstruction drew to a close, the former Confederate states of the South were freed from the control of the occupation army of federal troops and carpetbaggers. They began to assert segregationist policies on the ex-slaves who had experienced only a fleeting taste of freedom. Although defeated, the white people of the former Confederacy considered African Americans inferior. Although the Thirteenth, Fourteenth, and Fifteenth Amendments to the Constitution had supposedly freed African-Americans from slavery and declared them citizens with enforceable rights, the concerted resistance of the old white South undid the few gains that Reconstruction policies had achieved.

In 1875 the U.S. Congress passed a Civil Rights Act guaranteeing African Americans access to public facilities. It was obvious, however, that even at the federal level the political commitment to equality was weakening, as the language to maintain integrated school systems was stripped from the bill before its passage. Still, when some minor efforts were made to enforce the already weakened law, Southern state legislatures reacted by erecting a legal system to separate the races in every aspect of daily life. The result was a web of public policies and practices through which a racial caste system emerged in the South. Under these new laws, which were called “Jim Crow laws” after the ubiquitous shuffling minstrel character of the same name, “persons of color” were relegated

In the 1890s, poll taxes and literacy tests succeeded in disenfranchising all but a handful of southern blacks. America had once again walked away from an opportunity to achieve justice. In place of slavery came “Jim Crow” laws that governed almost every aspect of life for Black Americans living below the Mason-Dixon line. The insidious Jim Crow caricature of the Negro became a powerful barrier to legal and social equality.

Henry Hampton and Steve Fayer, *Voices of Freedom: An Oral History of the Civil Rights Movement from the 1950s through the 1980s, 1990*

to second-class status and denied access to the public education and transportation institutions.

The emergence of a caste system in the South gained momentum from two Supreme Court decisions. In the 1883 *Civil Rights Cases*, the Court struck down the 1875 act as exceeding Congress’ powers under Reconstruction. Then in 1896 the Court ruled racial segregation was legally acceptable. The 1896 ruling came from a Louisiana case, *Plessy v. Ferguson*.

In 1890 the state of Louisiana passed a law requiring “colored” and white persons be provided “separate but equal” railroad passenger car accommodations. In 1892 Homer Plessy, a person of acknowledged one-eighth African American descent, refused to leave the “white” car on the East Louisiana Railroad. He was arrested. The case eventually ended up in the U.S. Supreme Court. The Court ruled that the state law was a reasonable exercise of state police powers to promote the public good. The Court went further and held that separate facilities did not have to be identical. It turned out that the “separate but equal” doctrine was merely self-serving rhetoric. For the next six decades the reality was most often “separate and unequal” treatment. Because the races could not encounter one another on the grounds of a presumption of equality, the ideology of white supremacy was able to perpetuated itself from generation to generation. African Americans had to live with inferior facilities, access, and services.

As inequality became institutionalized, the Jim Crow laws required the separation of races in every facet of life including transportation, schools, lodging, public parks, theaters, hospitals, neighborhoods, cemeteries, and restaurants. Inter-racial marriages were prohibited. Business owners and public institutions were prohibited from allowing African American and white

clientele to mingle. While the objective was to eliminate any contact between whites and persons of color as equals, the effect was to deprive African Americans of key economic and social opportunities, adequate food, shelter, clothing, education, and health care. In addition, between 1890 and 1908, every state of the former Confederacy acted laws to limit African American voting rights. With discriminatory voting requirements, such as literacy tests and poll taxes, African Americans (and many poor whites) were effectively barred from participation in the political arena.

The National Association for the Advancement of Colored People (NAACP), created in 1909, took the lead in combating Jim Crow laws. Successes in reversing Jim Crow laws were quite limited prior to World War II (1939–1945). Finally, the turning point came in 1954 when the Supreme Court struck down public school segregation in *Brown v. Topeka Board of Education*. Reversing the earlier *Plessy* decision, the Court asserted that the separate-but-equal doctrine was unconstitutional in regard to public educational facilities. Support for Jim Crow laws waned as the civil rights movement gained momentum in the following years. Finally, the Jim Crow era came to a close with a series of landmark federal laws passed by Congress during the 1960s. The most notable of the new federal laws were the Civil Rights Act of 1964, the Voting Rights Act of 1965, and the Fair Housing Act of 1968. Though formally ended, the Jim Crow era had lasted from the 1880s to the 1960s. Its legacy was a society still struggling with the effects of “separate and unequal.”

JOBS, STEVEN PAUL

Computer designer and corporate executive Steven Jobs (1955–) was the co-founder of Apple Computers. He helped create one of the first affordable personal computers for home use and launched one of the largest industries in the United States. Jobs, with his friend, Steve Wozniak (1950–), pioneered the design and development of desktop computers.

Born in 1955 and adopted by Paul and Clara Jobs of Mountainview, California, Steven Jobs grew up in the comfortable environment his adoptive parents provided. His father was a machinist, and his mother an accountant. Steve attended high school in Los Gatos, California, where his family had moved. While in high school he became involved with electronics projects and worked a summer job at a nearby computer firm, Hewlett Packard. After graduating in 1972 Jobs attended Reed College for two years before dropping out. He worked for the Atari computer company part time where he earned enough money to visit India to study Eastern spiritualism. While in India he practiced meditation and studied Eastern culture, but he became ill with dysentery after three months and was forced to return to the United States for adequate medical treatment.

In 1975 Jobs began associating with a group of computer aficionados known as the Homebrew Computer Club. There he met a technical whiz named Steve Wozniak, who was working on building a small computer. Jobs and Wozniak teamed up and formed Apple Computer Corporation in 1976. Wozniak finished the design of his small computer and, working out of Steve Jobs' parents' garage, the two men worked at refining and marketing their product.

Jobs saw a huge gap in the existing computer market at that time because no computer was yet targeted for home use. While Wozniak improved his initial computer, Jobs lined up investors and bank financing.

The redesigned computer, called the “Apple II,” hit the marketplace in 1977. The first year sales reached \$2.7 million and within three years had grown to \$200 million. Jobs and Wozniak successfully and importantly opened an entirely new market—the home, or personal, computer. They brought the computational speed of business systems into people's homes and started a new era in information processing.

By 1980 the personal computer era was well underway and Apple had plenty of competition from Radio Shack, Commodore, and IBM. Fierce competition proved a good thing for the consumer public, but the Apple corporation stumbled in its efforts to stay ahead of the competition. When the Apple III was introduced to the public in 1980 it suffered from technical and marketing problems. In 1983 Jobs' introduction of the new computer Lisa failed in the marketplace because of its high price and stiff competition from IBM. Apple lost half of its market share in 1983. The Macintosh was introduced in 1984 and continued Apple's trend of poor marketplace performance. By 1985, following internal conflicts at Apple Corporation, Steve Jobs resigned from the company he had founded, retaining only his title as chairman of the board of directors.

That same year, Jobs sold his shares of Apple stock to launch another business in Redwood City, California, called "NEXT." The goal of NEXT was simple: to build a breakthrough computer that would revolutionize research and higher education. Jobs used \$100 million of his own assets from Apple shares to start NEXT, and other entrepreneurs, like Texas billionaire Ross Perot (1930—), invested an additional \$20 million in the project. Canon Corporation also invested heavily, \$100 million in 1989, and an additional \$15 million extended in credit to NEXT in 1992. The NEXT did not live up to its goals and Jobs was criticized by the business media as being more of a business huckster than a consistently productive business entrepreneur. However, lightning did strike twice for Jobs.

In 1986 Jobs had purchased a small firm from filmmaker, George Lucas (1945—), called PIXAR, a business specializing in computer animation. During the next six years Jobs put \$40 million into PIXAR and set out to make the first-ever completely computer animated film. In 1996 the film "Toy Story" was released. Produced completely with PIXAR computer animation, it was an enormous success. PIXAR's market value for Steve Jobs, who owned 90 percent of the company, climbed suddenly to \$1 billion.

Within a short time after PIXAR's success Jobs made headlines again. In 1995 Apple bought Jobs' NEXT company for \$400 million and rehired Jobs as advisor to G.F. Amelio, the Apple chief executive officer (CEO). Jobs was also officially re-appointed to Apple's board of directors. Apple understood that it could not hope for a better salesman than Jobs. His genius for infecting others with his enthusiasm was recognized by critics and admirers alike.

By 1997 lightning struck Jobs a third time. Jobs and Bill Gates (1955—), CEO of Microsoft Corporation, announced that their companies were joining forces. Microsoft would invest \$150 million for a nonvoting minority stake in Apple and the two companies would cooperate in several marketing and technology fronts. This alliance made Microsoft and Apple the two largest players in the still growing computer industry. Steve Jobs regained his former position as one of the richest and most successful people in the revolutionary marketplace of home and business computers.

JOHNSON, HUGH SAMUEL

Few have the opportunities to serve as did Hugh Samuel Johnson (1882–1942) in war and peace, in the military and in public service. And few who have served did so with as much distinction and universal praise. General Hugh Johnson served in the Army in the first great world war and in the government as an administrator, a critical position during the beginnings of the recovery from the Great Depression.

Hugh Samuel Johnson was born on August 5, 1882, at Fort Scott, Kansas. His father, Samuel Johnston, and mother, Elizabeth Mead, had moved to Kansas from Pontiac, Illinois, in order for the elder Johnston to practice law. Before Hugh's birth, his father dropped the "t" from his last name in an effort to separate himself from another lawyer with a similar name. Shortly after his birth, Hugh Johnson's family moved to Greensburg, Kansas, and the family was to continue moving regularly until 1893 when they moved to

Cherokee Strip in the Indian Territory, now Oklahoma. Johnson's father was appointed the postmaster of Alva, and there he remained for the rest of his childhood. Johnson rode horseback, hunted, and studied at local schools. He rubbed shoulders with frontiersmen and Indians.

Johnson studied at Northwest Normal School (later to be Oklahoma Northwestern Teachers College) until the start of the Spanish–American War, when he ran away to enlist in the Teddy Roosevelt's (1858–1919) Rough Riders. Brought back home by his parents, Johnson extracted a promise of an appointment to West Point, and his father was able to deliver, having become active in Democratic Party politics. Johnson did not have a very distinguished career at West Point, finishing in the middle of his class and graduating in 1903. After West Point, Johnson entered the cavalry service in Texas.

Immediately after the great San Francisco earthquake and fire in 1906, Johnson's 1st Cavalry was ordered to the area to administer relief. By coincidence, the two officers above him in the chain of command were transferred or taken ill, and he was left to feed, shelter, and cloth seventeen thousand destitute people. He did the job well. In addition, Johnson spent two years in the Philippine Islands from 1907 to 1909, was executive officer at Yosemite National Park from 1910 to 1912, and was superintendent of Sequoia National Park in 1911. After a short tour on the Mexican border in Arizona, Johnson received orders to Harvard Law School. When war broke out in Europe in 1914, Johnson was transferred to the University of California, where he finished a three year course of study in 19 months. Johnson received a Bachelor of Arts in 1915 and his Doctor of Jurisprudence in 1916 with the highest honors.

Armed with his law degree, Johnson reported to General John Pershing's command in Mexico. While there, he studied the problems of Mexico's form of government, and according to Johnson, he was to study "the whole body of constitutional, administrative, State and municipal law of both the United States and the Republic of Mexico." This study "soaked me through with the theory and practice of Federal, State and municipal political structure in the United States." This formed the basis for his next big assignment: the establishment of the Selective Service Administration.

Hugh Johnson was next ordered to Washington to serve as the assistant to the law officer of the Bureau of Insular Affairs. In this post, he prepared briefs for cases in the Supreme and Circuit courts. His superior, General Crowder, was assigned by President Woodrow Wilson

(1913–1921) to draw up a bill for organizing a large army in preparation for joining the war in Europe. Johnson was assigned the task, and wrote the draft version of the bill that would establish the draft in 1917. Moreover, as Deputy Provost Marshal General, he wrote the rules and policies under which the draft would be implemented, and was the executive in charge during 1917 and early 1918. Johnson established a draft system that was decentralized, placing much authority on local draft boards while making the entire system far more fair than draft systems had been before. Johnson's accomplishment was considered brilliant and he was awarded the Distinguished Service Medal.

Johnson wanted to serve in combat, however, and he made several attempts to see action in France. Appointed Colonel on March 20, 1918, however, he took over the Purchase and Supply Bureau of the General Staff as a Brigadier General just the following month. Johnson did another brilliant job of bringing order to chaos in the Army supply system. During this time, he also served on President Wilson's War Industries Board, where he made friends with an important person, Bernard Baruch. Yet Johnson still itched for combat, and on September 1, 1918, he was able to take command of the 15th Brigade, 8th Division, at Camp Fremont in California. Before he was able to get to France, however, the Armistice was signed and the war was over. Disappointed, Johnson resigned from the military and assumed a career in the civilian world of business.

During the 1920s, Johnson worked with the Moline Plow Company and the Moline Implement Company. He remained close to Bernard Baruch, and they worked together on plans for an economic crash they saw coming. Together they joined President Franklin Roosevelt's (1933–1945) "New Deal" brain trust. When Roosevelt was elected in 1932, Johnson was credited with many of the planks in Roosevelt's New Deal platform. General Johnson helped draft the National Industrial Recovery Act, and when it was passed into law, Johnson was appointed as the first head of the National Recovery Administration (NRA). As such, Johnson was in charge of establishing codes of fair practice for business (companies who complied were awarded the "Blue Eagle"), and in organizing industry throughout the country to create jobs. Sincerity, energy, and skillful administration characterized his work at the NRA and he was credited with creating nearly 2.8 million jobs worth about \$3 billion in payroll. The NRA had a major role in abolishing child labor and sweatshops, and in regulating hours, wages, and working conditions. He resigned from the NRA on

Joint Stock Company

October 15, 1934, and the Supreme Court overturned the NRA law shortly thereafter.

Hugh Johnson served as Works Progress Administrator in New York City from August to October, 1935, but never again held a position in public service. He increasingly broke ranks with the Roosevelt administration until ultimately he supported Wendell L. Willkie in the election of 1940. Johnson's opposition to involvement in the coming war in Europe and to Roosevelt stemmed from his belief that the United States military was unprepared for entry in World War II (1939–1945) and for what he termed “amazing blunders and failures” by the New Deal brain trust.

Johnson continued to be constructive, typically, even as the advent of the war approached. He wrote columns in the Scripps–Howard newspaper chain from 1934 until his death. He applied for reinstatement into the Army Reserve, and was saddened when the appointment was declined.

Hugh Johnson married Helen Kilbourne on January 5, 1904. They had one child, Kilbourne Johnston (who resumed using the “t” in the last name). Besides his service medals, Johnson was affiliated with both Phi Delta Phi and Phi Beta Kappa fraternities. He was an Anglican Catholic by religion. Johnson died on April 15, 1942, in Washington, D.C. He was buried in Arlington National Cemetery with full military honors.

JOINT STOCK COMPANY

A joint stock company is a specific form of business organization that is structured like a corporation, but is treated like a partnership in the eyes of the law.

Such companies are no longer common in the United States, but are still frequently found in Europe. Like a corporation, a joint stock company has a legal identity distinct from the legal identity of whomever owns it. Its owners hold shares in the company that can be freely transferred to others, and the company continues to exist even if its original members no longer retain ownership of it. Like a partnership, the owners of a joint stock company have some limited liability if the company goes bankrupt or is sued. Joint stock companies are easier to establish than corporations, but they share the ability of corporations to raise large amounts of capital.

Even for the prosperous governments of Britain and the Netherlands in the seventeenth century, settling the North American continent was too expensive a proposition to shoulder on their own. Before Christopher Columbus's (1451–1506) discovery of the New World was a century old, the British government was granting exclusive charters to joint stock companies like the Levant Company and the Muscovy Company to establish colonies around the world. By pooling the wealth of many private businessmen, these companies could undertake the huge expense of funding colonial settlements until they became profitable. The first joint stock company in America, the Virginia Company of London, failed to produce a profit in Jamestown, Virginia. After 18 years of losses, Britain dissolved the company in 1624 and took over the settlement. The Plymouth Company, a joint stock company founded to settle New England, was a little more profitable, and the Massachusetts Bay Company (founded in 1629) successfully established a colony in Salem, Massachusetts; Boston; and Connecticut. Another joint stock company, the Dutch West India Company, settled present-day New Jersey and New York before England seized the territory from the Netherlands in the 1660s. The joint stock companies' charters gave them wide powers to recruit armies, establish political institutions, and collect taxes, and because all of its owners lived in the colony the Massachusetts Bay Company actually achieved independent self-management. This kind of independence made the British Crown very nervous, however, and in 1684 it cancelled the Bay Company's charter and ruled the colony directly.

JONES, MARY HARRIS

Mary “Mother” Jones (1830–1930) is one of the great legends of American progressive politics. After

Mary "Mother" Jones.

losing her own family to yellow fever, Mary Jones found in the lives of the downtrodden a new family to nurture and support. She did this for seventy years as a trade union organizer, a feminist, and a campaigner against child labor in America.

"Mother Jones" was born in 1830, near Dublin, Ireland to parents who were eager to emigrate. When Mary was five years old, her father came to America, where he went to work building canals and railroads, a job similar to the one he had held in Ireland. Once he became a naturalized American citizen around 1840, he sent for his wife and daughter.

The family first settled in Toronto, Canada, where Mary's father was working on one of the first Canadian railroads. They later moved to Michigan. Mary was an excellent student and she graduated with high honors from high school. She became a teacher at a Catholic school in Monroe, Michigan, soon after graduation.

She moved to Chicago to explore the possibilities of becoming a professional dressmaker, but, at age 30, returned to teaching, this time in Memphis, Tennessee. There she met and married Robert Jones, an iron

worker who was an enthusiastic member of the Iron Moulder's Union. During the first four years of their marriage they had four children. Work was plentiful in Tennessee, and for a time the family enjoyed a modest prosperity. But in 1867 a sudden yellow fever epidemic swept through Memphis, taking the lives of Mary's husband and all of her children. At 37, Mary Jones's life was devastated and she was completely on her own.

She returned to Chicago and worked as a dressmaker, but her bad luck continued when her dressmaking business was destroyed in the Chicago Fire of 1871. Homeless and penniless, she turned to her deceased husband's fellow union members for help. Their compassion towards her touched her heart. She felt that the union had saved her life. From that time on, she pursued union organizing with an astonishing enthusiasm that made her an American legend.

Mary Jones began working as a union activist with the Knights of Labor. This union was founded in 1869 in an attempt to unite all workers under a single organization. Mary discovered she had a real talent for inspiring others with her speeches. The Knights of Labor often sent her to particularly tense spots during strikes. She could inspire workers to stay with the union during the hard days of labor action, when there was neither work nor money.

Joining strikers in the coal mines of Pennsylvania in 1873, she witnessed conditions bordering on slavery and children near starvation. Her own Irish heritage caused her to work passionately on behalf of the mostly Irish workers. It was her kindly, protective concern for the workers in the Pennsylvania coal mines that earned her the nickname "Mother Jones."

Mother Jones moved from strike to strike. In 1877 she was involved in the nationwide walkout for better conditions for railroad workers. In 1880 she was in Chicago on behalf of workers trying to obtain an eight-hour day. She also took part in the strike at the McCormick-Harvester works, where a bomb killed several policemen and police fired randomly into a crowd of union workers, killing 11 people and wounding dozens of others.

In her 60s Mother Jones became an organizer for the United Mine Workers Union. Since judges were reluctant to jail such an elderly woman, her age was an asset to the union movement. As she grew older, her attention focused on securing laws that prohibited child labor. She made speeches and engaged newspaper writers to accompany her to places where children were working in slave-like conditions. She also became active in the movement to obtain the right of women to vote.

During the final years of her life, Jones continued to move around the country, giving fiery speeches and organizing workers. She was one of the founders of the Social Democratic Party in 1898 and of the Industrial Workers of the World in 1905. She helped to organize the coal fields of Pennsylvania in 1899. At age 82 she was arrested during a violent strike in West Virginia and sentenced to 20 years in jail. Public outcry was so loud that she was pardoned by the governor and released. She then went on to spend six days in Michigan's Copper Country in August 1913, supporting a copper miners' strike. A woman of astonishing vigor, she marched three blocks in a miners' parade at age 83. In her 90s, she returned to Chicago to work at organizing dressmakers.

On her 100th birthday Mother Jones was asked to speak on the radio about her experiences. She spoke long and well, denouncing the exploitation by business of the American worker and urging all her listeners to organize to transform an unjust society that had fallen into a great Depression. Unchanged by time and full of passion for justice for the American worker, Mother Jones died in Silver Springs, Maryland, in 1930. She became a legend in her lifetime.

JONES, SAMUEL MILTON

Samuel Milton Jones (1846–1904) was born in the village of Ty Mawr, in Caernarvonshire, Wales, on

August 3, 1846. Jones was brought to the United States at the age of three and raised in New York, where he received only about thirty months of schooling. At the age of 18, in 1864, Jones found work in the Titusville, Pennsylvania, oil fields. Jones did well in the oil business, and worked the industry in Pennsylvania, West Virginia, Ohio, and Indiana. In 1870 he became a producer himself.

When Jones' first wife died, he moved to Ohio in 1886 seeking some change in his life. He operated from a headquarters in Lima, Ohio, and operated his oil fields, which were the result of a big strike that year. Also in 1886 Jones met and married a woman from a prominent Toledo family, Helen W. Beach. They were to have three sons.

Jones studied oil field production. In 1893 he invented the "sucker rod," a device that permitted deep-well drilling. He made a fortune on the sucker rod by establishing a manufacturing plant in Toledo he called the Acme Sucker-Rod Company. Jones was an efficient business manager. But he was also a kind and benevolent employer who introduced many worker reforms such as the 8-hour day, paid vacations, and a minimum wage. He also eliminated child labor and piece-work. He instituted a five percent Christmas Bonus. Many of his competitors and political enemies called Jones "socialistic."

Jones hung a sign in his factory extolling the "Golden Rule" and encouraged all employees to honor it. He used the same Golden Rule in his own dealings and believed it worked. From this, his workers and the general public came to call him "Golden Rule Jones".

Golden Rule Jones entered politics in 1897. Running as a Republican, he was elected mayor of Toledo. But his political allies did not support the reforms he championed, and he fell out of favor. Jones's reforms included fighting against corruption, improvement of industrial conditions in the city, and the establishment of city parks. The Republicans refused to nominate Jones in 1899. But he ran as an independent and won by a landslide. Following this victory, Jones brought the 8-hour day and minimum wage to city workers.

Jones continued with his reforms as he won four successive elections. He pushed for municipal ownership of services and utilities, and the direct popular nomination of candidates for public office by petition (without the intervention of political party machinations). He added public services and established public parks and kindergartens. Jones died in office on July 12, 1904, but his reforms were carried on by his mayoral successor.

JUNK BONDS

Junk bonds are bonds issued at higher yields than investment grade bonds. The higher the yield, expressed as a percentage rate, the higher the risk of the bond. Two major rating services, Standard and Poor's, and Moody, have slightly different bond rating scales. Bonds rated lower than BBB on Standard and Poor's, or Baa on Moody are considered junk bonds. In comparison, Standard and Poor's rates investment grade bonds at BBB up to AAA.

Junk bonds, issued by companies without long track records of sales and earnings and/or with shaky credit ratings, must pay higher yields to off-set the real

risk of nonpayment. They attract risk-oriented investors willing to gamble that companies issuing the higher interest rate bonds will be able to meet the terms of the bonds. The junk bond market is volatile and investment institutions with fiduciary responsibility, charged with investing wisely for a beneficiary's benefit, generally avoid junk bonds.

Racing into the U.S. investment scene in the 1980s, junk bonds allowed companies to raise funds cheaply. Legendary junk bond guru Michael Milken of the investment company Drexel Burnham Lambert had dazzling success raising enormous sums of capital for companies through the sale of high-yield junk bonds. Milken and Drexel were behind many junk bond finance attempts at company takeovers. In 1988, interestingly, the fortunes of many unsuspecting buyers were lost when the Securities and Exchange Commission charged Milken and Drexel with insider trading and stock fraud, which drove the company out of business.

In the late 1990s junk bonds underwent a reincarnation of sorts; they became a more acceptable part of a highly diversified investment portfolio. A number of professionally managed high yield junk bond funds emerged and offered investors a safer route than buying individual issues.

KAISER, HENRY JOHN

During the first part of the twentieth century Henry Kaiser (1882–1967) became one of the most prominent business entrepreneurs in the United States. Because he built most of his businesses in the western United States, he played a major role in developing the economy of that region. By the end of his life he had founded Kaiser Paving, Kaiser Steel, Kaiser-Frazer Automobile Corp., Kaiser Aluminum and Chemicals, Permanente Cement, Kaiser Industries, and the Kaiser Health Plan, the largest health maintenance organization (HMO) in the United States.

Born in 1882 in upstate New York to German immigrant parents, Kaiser was the youngest of four children. He began working full time at age thirteen in a dry goods store in Utica, New York. His boundless energy, optimism, and creativity showed in most things he did. By age seventeen Kaiser had taken up photography, just as the nearby Eastman Kodak Company was pioneering major advances in photographic equipment. He began as a partner in a small photographic studio, and by age twenty-one had opened a successful string of photography shops on the east coast of Florida aimed at servicing the tourist trade.

Looking elsewhere for more business opportunities, Kaiser made his way to the west coast of Canada and started a cement paving company. Before long, he expanded his operations to Washington, Oregon, and California. Later his headquarters moved from Canada to Oakland, California.

Kaiser's major work began as an extension of his cement company. He earned a reputation for fast, high quality work as a road builder and expanded his operations to build highways. In 1931, Kaiser joined an incorporated consortium of contractors known as Six Companies in order to contract with the federal government to build the Hoover Dam. He served as a liaison between the contractors and the government bureaucrats. Later he was similarly involved in building major

portions of the Bonneville and Grand Coulee dams on the Columbia River.

With the outbreak of World War II (1939–1945), Kaiser recognized that the war would enlarge the prospects for business by increasing the need for raw materials, such as aluminum, steel, and magnesium. Between 1939 and 1941, he advocated greater business involvement in war preparations. After 1939, Kaiser became heavily engaged in the shipbuilding industry, primarily the building of cargo ships. He attracted national attention during World War II, gaining the reputation of a “Miracle Man” and the “Number 1 Industrial Hero” because of the speed with which he built ships crucial to the war effort. Kaiser ignored the usual methods of building ships bottom up from the keel; instead he employed assembly-line methods. (His reputation was so well established that President Franklin Roosevelt (1933–1945) considered him as a vice presidential running mate in the 1944 election.)

Kaiser made his share of enemies in business. When eastern steel shortages began in the United States prior to the attack on Pearl Harbor (December 12, 1941), Kaiser began to make his own steel. The large steel industries of the east were outraged. After World War II began, however, much of the anger against him fell away as the nation entered into a spirit of business cooperation to support the war effort.

Kaiser joined in a business partnership with Joseph Frazer in 1945 to manufacture automobiles that featured streamlined body curves and eliminated old-style wheel fenders altogether. Kaiser-Frazer quickly became the fourth largest producer of automobiles in America. It was a short-lived enterprise, lasting only until the early 1950s. At that time Kaiser-Frazer could no longer compete with Detroit's Big Three: General Motors, Ford, and the Chrysler Corporation. Nonetheless, Kaiser-Frazer automobiles were visionary and changed the shape and design of modern cars. Though Kaiser's automobile business was a business failure, the company inspired car owners with a new vision of what cars could be. Moreover, despite dropping his car

Kansas

venture, Kaiser continued to develop his aluminum and chemicals companies which had been created to aid the production of his modern, lightweight cars.

Kaiser's aluminum company was, overall, his most profitable enterprise. After World War II, however, the Kaiser Corporation became a multi-faceted empire. His company's personal health care program, Kaiser Permanente, eventually grew to become the largest health maintenance organization (HMO) in the nation.

Kaiser was a successful and creative businessman who was known as a "workaholic" because of his addiction to his work. In 1954 he moved with his second wife to Hawaii but never retired; leisure did not interest him, and he had few hobbies. Though he remained seriously overweight, he enjoyed good health until near the end of his life. He died in Hawaii in 1967, at the age of 85, still involved with the many successful business projects he created.

KANSAS

Native Americans roamed the plains of Kansas at the time French explorers paddled the Mississippi River in the 1700s. The area now known as Kansas was part of the vast French holdings in central North America known as the Louisiana Territory. In 1803

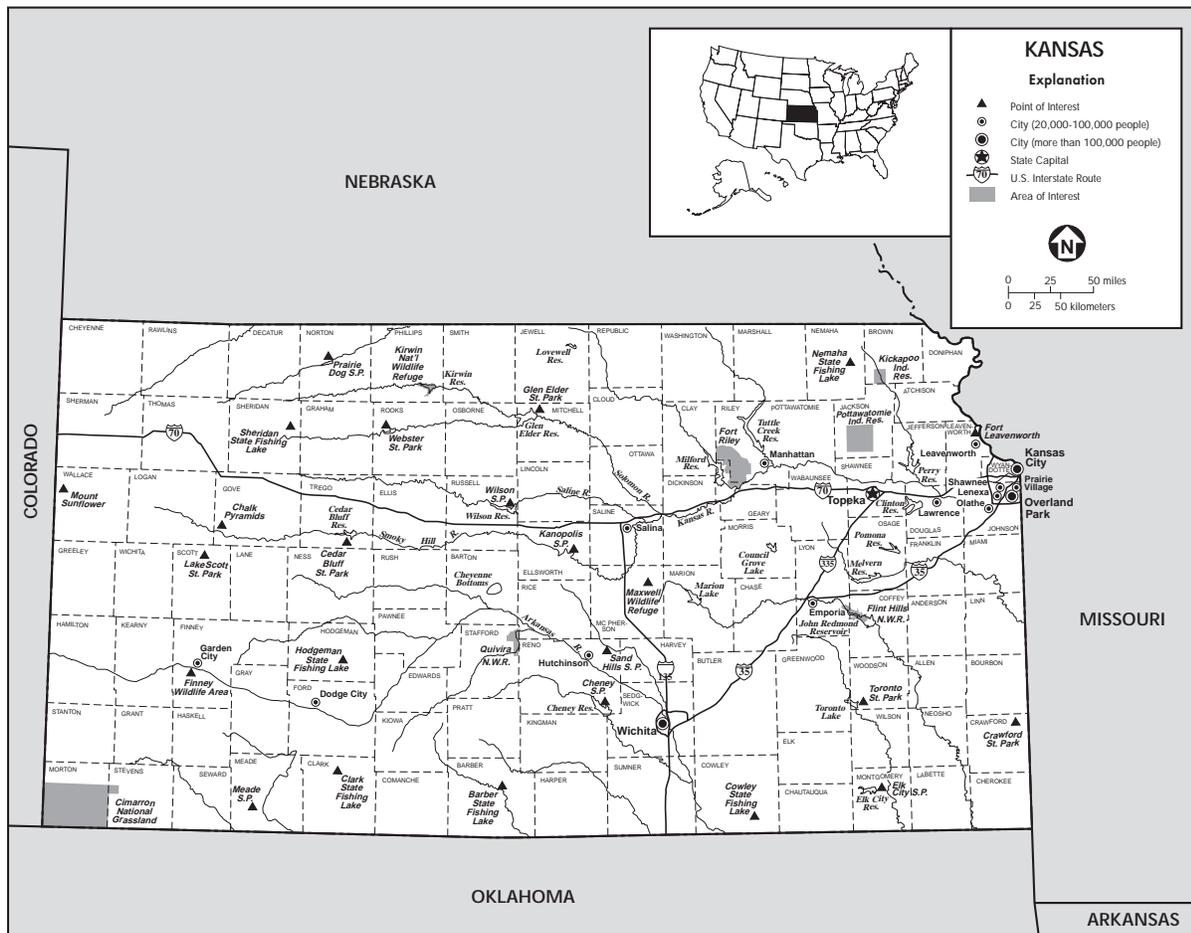

Napoleon Bonaparte, Emperor of France, needed funds to support his European wars. U.S. President Thomas Jefferson (1801–1809) seized this opportunity and purchased Louisiana land for \$15 million, doubling the size of the United States and bringing the region that would become Kansas and several other states under American control.

President Jefferson sent the Lewis and Clark expedition to explore the country from St. Louis to the Pacific Ocean. When the expedition reached Kansas, they described the country as "delightful . . . the whole country exhibits a rich appearance." Although this account was favorable, other explorers reported Kansas to be a dry wasteland, and as a result migration to Kansas started out slowly compared to other parts of the country. However, the rich abundance of fur-bearing animals lured American trappers and traders to the area.

During the first half of the 1800s settlers started to migrate west to Kansas, at this point still an unorganized territory, in search of adventure and a new life. Missionaries also came to the plains and taught tribes of the region how to work the land. Eventually, the United States government would push all Native Americans westward onto reservations.

When gold was discovered in the 1850s in what is now Colorado, miners rushed across the country to seek their fortune. As mining grew in the west, transportation was needed to carry people and goods. The Leavenworth and Pike's Peak Express to Denver made 19 stops in Kansas along the route. Federal land grants were awarded to other companies to encourage more railroad building and settlement along the railroads. Over the next several decades about 200 companies built railroads across Kansas. Many towns sprang up along the track, together with hotels, gambling houses, and saloons.

The 1850s were also a period of political turmoil in Kansas. The passage of the Kansas-Nebraska Act in 1854 formally organized the territory of Kansas, and allowed for the people who lived there to determine if slavery would be permitted there. Previously, the Missouri Compromise had prevented slavery from spreading into Kansas, and the predominantly anti-slavery North was greatly angered by what they saw as an attempt by the South to expand its power and influence. Pro-slavery southerners and anti-slavery northerners flooded into the region in an effort to gain control. There was frequent conflict between the two sides, the area became known as "Bleeding Kansas." The controversy over Kansas worsened the split between the

State of Kansas.

North and the South, was a major force behind the formation of the Republican Party, and helped drive the nation in the American Civil War (1861–1865). Kansas would eventually be admitted to the Union as a free state in 1861.

After the Civil War thousands migrated to Kansas to take advantage of the government’s promise of free land. In a government-backed effort to encourage settlers to move west, the Homestead Act of 1862 allowed any citizen who paid a ten dollar filing fee to claim up to 160 acres of federal land as long as they farmed the land for 5 years. In 1873 the Timber Culture Act made the same promise to those who would plant trees on one-fourth of the land they claimed within four years. By that time new Kansas homesteaders had already claimed about 6 million acres.

After the Civil War the government also encouraged the development of railroads by giving the railroad companies land grants. More than 200 companies laid tracks that zigzagged across Kansas. As the railroads offered land grant acreage at low prices and

reduced fares to new settlers, they helped to open the state for commerce and development.

The new settlers in Kansas were known as “sodbusters” because they cut up large squares of sod and, as lumber was scarce, used them to make walls and roofs for their new homes. They planted crops in place of the sod. They soon discovered how harsh life could be on the plains. “Rattlesnakes, bedbugs, fleas, and the ‘prairie itch’ were what kept us awake at nights and made life miserable,” wrote W.H. Russell, a Rush County settler. Also, a grasshopper plague in 1874 destroyed crops on 5,000 square miles of farmland. In addition, the severe weather—blizzards, rainstorms, droughts, and prairie fires—stranded trains and destroyed crops and homes.

After the Civil War cattle was abundant in Texas but scarce in the north. Texas cattle ranchers took advantage of the demand from the north and began driving their cattle to the nearest railroad stations in Kansas. “Cow towns” were established at cattle shipping points. The cow towns played host to cowboys

looking to spend their money in hotels, saloons, dance halls, and gambling houses.

During the boom years of the 1870s and 1880s new settlers were attracted to Kansas due to better weather conditions and improved farming methods as well as easy railroad access to outlying areas of the state. Wealthy farmers and land developers bought up land and established towns. At the same time, more than 15,000 former slaves traveled from the south to Kansas to establish a new way of life for themselves. A blizzard in 1886 and a drought in 1887, however, quickly caused the state to fall into a depression. Ranchers were forced to leave because more than 20 percent of the state's cattle herd perished in the blizzard and the farmers lost all their crops in the drought.

Farmers who stayed behind were frustrated by falling wheat prices and the high cost of shipping goods. They formed the Farmers' Alliance and became a major component of the Populist Party in the 1890s. Members of the party were voted into congressional seats of other political office. The Populists were instrumental in implementing laws that helped farmers by regulating banks, stockyards, railroads, telegraph companies, and building-and-loan associations.

The Populist movement gave way to the Progressive administrations of governors from 1905 to 1913. New reforms called for laws that reduced railroad fares and costs for shipping grain. Child labor laws were instituted along with workmen's compensation and further banking regulations. In addition, the use of machines such as tractors and threshers made farming easier and helped increase crop production. New crops such as sorghum, sugar beets, broomcorn, and alfalfa were harvested in the plains.

During World War I (1914–1918) Kansas stepped up production of wheat to feed the troops. After the war more roads were built to accommodate automobiles built by a Kansan Walter P. Chrysler (1875–1940), founder of the Chrysler Motors automobile company. This modest recovery, however, was only temporary. During the Great Depression (1929–1939) Kansas was devastated. The country suffered the worst depression in history; stock markets crashed and Kansas crop prices dropped. In 1932 a severe drought began and turned the area into a "dust bowl. Governor Alfred M. Landon attempted to bring relief to farmers and businessmen by reorganizing state banks, cutting taxes, and halting mortgage foreclosures for six months. President Franklin D. Roosevelt's (1933–1945) New Deal provided jobs building libraries, schools, and post offices. The Agricultural Adjustment Act was also passed in 1933 as part of the New Deal. It sought to

raise farm prices by encouraging farmers to reduce production. But true economic relief only came at the start of World War II (1939–1945). During the war plants in Kansas built more than 25,000 aircraft and produced munitions and artillery for the war effort. Wheat and soybean farming also stepped up to provide food for military personnel.

After the war, manufacturing growth steadily increased and people began to move from rural to urban areas. For the first three decades after the war, businesses grew in Kansas and meat packing, mining, flour milling, and petroleum refining became the largest industries in the state. In addition, more aircraft were built in Kansas than anywhere else in the country. Farming remained the most prominent part of the state's economy.

Farmers enjoyed prosperity in the 1960s and 1970s as feeds and improved fertilizers increased production, but they faced a crisis as a recession hit in the 1980s. Many farmers lost their land and were forced into bankruptcy. Kansas sought to expand its market of products and signed a trade agreement with the St. Petersburg region of Russia in 1993.

The 1990s also brought extremes in the weather. Drought and topsoil erosion damaged 865,000 acres, drove up prices, and depleted grain stores. From April through September 1993, floods caused more than \$574 million worth of damage. Efforts to restore economic growth included the allocation of government block grants. In 1995 the median household income in Kansas was \$30,346 and about 11 percent of all Kansans lived below the federal poverty level.

KANSAS-NEBRASKA ACT (1854)

The Kansas-Nebraska Act of 1854 was the one piece of legislation most responsible for bringing about the American Civil War (1861–1865). Within a year of the passage of the act, free-soil settlers and pro-slavery advocates were at war in Kansas—a confrontation known in the press as "Bleeding Kansas". That conflict continued throughout the Civil War, resulting in the death of hundreds of settlers and the destruction of thousands of dollars of property.

The federal government had been looking for a general solution to the conflict between those who wanted to see an expansion of slavery and those who wanted to see the abolition of slavery. The first serious attempt to resolve the issue was the Compromise of 1820, or the Missouri Compromise. This solution would have Missouri join the union as a slave state, while Maine would come in as a wage-labor state. Finally, no more slave states could be created north of Missouri's southern boundary (36 degrees; 30 minutes latitude). The slavery issue reemerged after the Mexican War (1846–1848), in which the United States won California, Arizona, and New Mexico—territory south of the Missouri Compromise line, but not specifically covered under the Compromise. The Compromise of 1850 tried to patch together a solution by admitting slave states and free states to the Union in pairs and passing a stronger federal fugitive slave law, among other items. By 1854, however, the flood of settlers heading west to the Nebraska territory exposed the failure of the Compromise and brought the slavery issue before Congress once again.

The Kansas-Nebraska Act was the brainchild of Senator Stephen A. Douglas (1813–1861), a Democrat from Illinois. Douglas proposed to split the Nebraska Territory into two states, Kansas and Nebraska, and to repeal the Missouri Compromise (which would have kept slavery out of both states). Douglas believed that sectional conflict between the North and the South over slavery could be avoided by adopting a policy he called "popular sovereignty." Popular Sovereignty had been suggested by Michigan Senator Lewis Cass. It allowed the citizens of each territory to decide by referendum

whether slavery could exist in their areas. Although the concept was fair in principle, it was very easy to abuse. Of the first three elections for congressional representatives in Kansas (each of which resulted in a pro-slavery victory) congressional examinations later found all of them to be fraudulent.

Instead of bringing the North and South closer together, Douglas's bill widened the gap between North and South. Many northern voters regarded his Kansas-Nebraska Act as a betrayal of their key principles of free soil and free labor. The Democratic Party now had very little appeal in the North. It became the party of the South and the party of slavery. The Democratic Party lost control of most free-state legislatures in the elections of 1854 while Free-Soilers, Whigs, and other opposition parties gained representation.

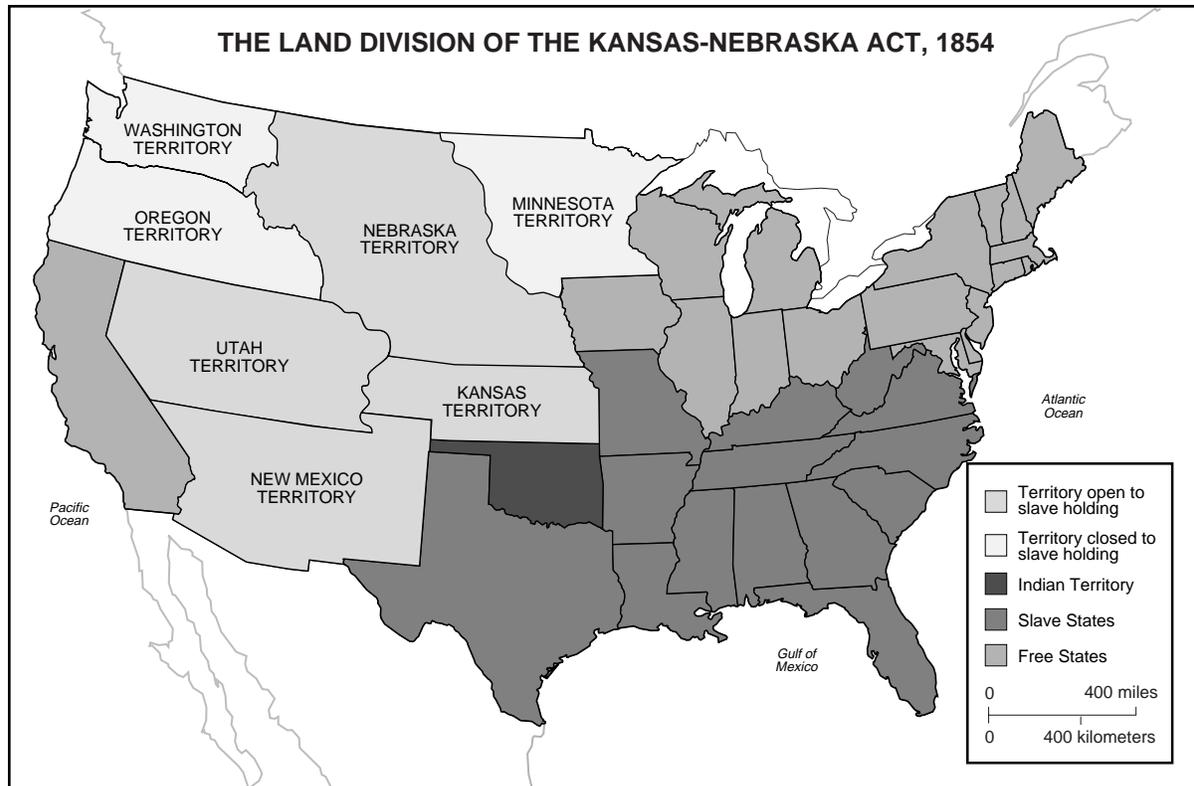

The Kansas-Nebraska Act drove the nation closer to secession. Organizations such as the New England Emigrant Aid Company were formed to promote free-labor settlement in Kansas. Among the provisions that they donated to the free labor forces in Kansas were rifles. Southerners responded with their own organizations, led by public figures like Senator David Atchison of Missouri, to intimidate the anti-slave forces and to insure a pro-slavery population in the territories. The end result of this process was the outbreak of civil war and the eventual admission of Kansas to the Union as a free state on January 29, 1861.

Keelboats

The land division detailed in the Kansas-Nebraska Act of 1854 was one of the events leading up to the Civil War. The definition of which states west of Missouri would be free and which would allow slavery aroused strong public feeling on both sides.

KEELBOATS

Keelboats were long, narrow crafts that come to a point at one or both ends (the bow and/or the stern). They linked the northwest and southwest frontiers of the United States and continued to do so even after the introduction of the steamboat in 1811.

Keelboats moved along waterway currents. Going downstream, a keelboat could carry up to thirty tons of cargo and travel at about five miles an hour. Traveling upstream was more difficult. Return trips, often from New Orleans to Pittsburgh, could take as long as four months, traveling sometimes at a pace of less than one mile per hour. The boatmen poled, paddled, or pulled the boat by hand.

Powering keelboats against the currents of the Mississippi, Ohio, or Allegheny Rivers required keelboat workers to have incredible strength and endurance. The boats frequently had to be towed with a rope or “corde” upstream, where currents were too strong for rowing. The crew climbed over rocks and cliffs and waded through swampy waters at the river’s edge to pull the boat, always alert for venomous snakes, alligators, bears, wildcats, and wolves.

When snags or quicksand prevented keelboat crews from cordelling, they used the arduous technique of warping. Warping involves tying a rope to a tree, returning to the boat, and hauling it hand over hand up the river.

Through the determination and strength of keelboat workers in the 1800s, settlers, their belongings, live-stock, and freight were transported throughout the nation’s interior. Keelboat workers were paid an average of \$10 to \$20 per month and provided to a vital link to the nation’s interior, contributing to the nation’s westward expansion.

KELLEY, FLORENCE

Florence Kelley (1859–1932) never saw the fruits of her efforts to agitate on behalf of working women and children in the United States. Her early efforts led to minimum wage legislation for women and children in 1937, and to the Federal Fair Labor Standards Act of

**Florence Kelley.**

1938. Most historians credit her with creating conditions for the legislative abolishment of unregulated child labor and establishing a minimum work wage for all U.S. citizens.

Florence Kelley was born to comfortable circumstances in Philadelphia, Pennsylvania on September 12, 1859, the daughter of U.S. Congressman William Darrow Kelley. Florence grew up in an intensely

political household. She was exposed to talk about political changes occurring in the United States, including abolition of slavery and the women's rights movement which was then focused on passing a nineteenth amendment to the Constitution to guarantee the right of women to vote.

Kelley graduated from a Quaker-run school in Philadelphia and then entered Cornell University, graduating at age 23 with a bachelor of arts degree. She taught briefly after graduation, and then in 1883 went to Zurich, Switzerland for graduate studies.

In Switzerland at the age of 25 she met a young Russian medical student whom she married in 1884. While living and studying with her husband, Florence came into contact with a number of European socialists. She learned their new ideas about economics and social structure. At one point she received permission from Friedrich Engels (1820–1895), a collaborator and friend of Karl Marx (1818–1883), to produce an English translation of Engels' important book, *The Conditions of the Working Class in England*. Kelley and Engels corresponded regularly thereafter for several years, and Kelly was deeply influenced by Engels' socialist ideas.

Kelley and her husband returned to the United States in 1886. They had three children together, but the marriage ended in divorce in 1891. During her married life Florence Kelley embraced socialist economic ideas. After her divorce, while raising her three children, she began to put her ideas together with her work life.

Florence began her work life in 1891 as a special agent for the Illinois Bureau of Labor Statistics, inspecting "sweat-shops"—small unregulated manufacturing companies usually in the clothing manufacturing business, where frequently 10-year-old girls worked 12 to 16 hours a day sewing for dismal wages. At this time in the 1890s, there were no restrictions or laws against these practices.

In 1853 Kelley was appointed by the newly-elected governor of Illinois, John Attgeld, as Illinois' chief factory inspector. In this position she was able to establish within certain factories a free medical examination center for working children. She also recommended legislation related to controlling dangerous machinery in the workplace. She also personally examined more than a thousand shops during a smallpox epidemic in Chicago, ensuring that contaminated garments of clothing were discarded. Unfortunately, after Governor Attgeld lost his re-election bid in 1897, most of Kelley's progressive programs were reversed or

Kellogg Company

abandoned. An Illinois law Kelley had worked on which established an eight-hour workday for women, and banned employment of girls under age 14, was declared unconstitutional by the Illinois Supreme Court. Despite such reversals Kelley went on to become the General Secretary of the National Consumers League, continuing her fight against child labor and poor working conditions in factories.

During the 1920s Kelley came to realize that progressive political reform in the United States, popular in the pre-World War I (1914–1918) era, had changed; the United States had become more politically conservative. More and more people in the United States were associating social welfare programs with “radicals” and socialist subversion.

Florence Kelley died in 1921. Despite setbacks in the implementation of her ideas an astonishing number of them were eventually put into practice, mostly during the Great Depression era (1929–1939). In 1937 the U.S. Supreme Court reversed the Illinois Court decisions related to women’s working conditions and millions of women achieved a minimum wage guaranteed by Federal legislation. Child labor was also abolished and maximum hours of employment were established and regulated.

Florence Kelley’s “failures” during her lifetime likely represented a series of good ideas raised at the wrong time. During the 1920s, the peak activity of Kelley’s work life, the forces of powerful unregulated business interests in the United States served to frustrate many social reforms aimed at improving the health and working conditions of millions of U.S. workers. Arguably it took a Great Depression in the United States to cause U.S. legislators and businessmen to see the values of social reform.

KELLOGG COMPANY

By the time Will Keith Kellogg (1860–1951) launched his cereal company—originally known as the Battle Creek Toasted Corn Flake Company—in 1906, he had already been in the cereal business for more than 10 years as an employee of his brother’s Adventist Battle Creek Sanitarium. Dr. John Harvey Kellogg, a strict vegetarian and the sanitarium’s internationally celebrated director, also invented and marketed various health foods. One of the foods sold by Dr. Kellogg’s Sanitas Food Company was called Granose, a wheat flake the Kellogg brothers had stumbled upon while trying to develop a more digestible form of bread. The wheat flake was produced one night in 1894 following a long series of unsuccessful experiments. The men were running boiled wheat dough through a pair of rollers in the sanitarium basement. The dough had always come out sticky and gummy, until by accident the experiments were interrupted long enough for the boiled dough to dry out. When the dry dough was run through the rollers, it broke into thin flakes. Thus were flaked cereals born.

Commercial production of the Granose flakes began in 1895 with improvised machinery in a barn on the sanitarium grounds. The factory was soon in continuous production, turning out more than 100,000 pounds of flakes in its first year. A ten-ounce box sold for 15 cents, which meant that the Kelloggs collected \$12 for each 60-cent bushel of wheat processed, a feat that did not go unnoticed around Battle Creek, Michigan.

Meanwhile, other cereal companies were growing quickly. Kellogg’s most notable competitor was the Postum Cereal Company, launched by a former sanitarium patient, C. W. Post. Post added Grape-Nuts to his line in 1898 and by 1900 was netting \$3 million a year, an accomplishment that inspired dozens of imitators and turned Battle Creek into the cereal-making capital of the United States.

In spite of the competition, Dr. Kellogg was slow in funding the company’s expansion of cereal production. His brother, W.K. Kellogg assumed the leadership of that branch of the business and in 1902 Sanitas

Kellogg's CEO Arnold Langbo shakes the paw of "Tony the Tiger" after announcing that prices would be cut on their most popular cereals.

improved the corn flake that it had first introduced in 1898. The new product had better flavor and a longer shelf life than the unsuccessful 1898 version. By the following year the company was advertising in newspapers and on billboards, sending salesmen into the wholesale market, and introducing an ambitious door-to-door sampling program. In late 1905, Sanitas was producing 150 cases of corn flakes a day with sales of \$100,000 a year.

The next year W. K. Kellogg went into business for himself and launched the Battle Creek Toasted Corn Flake Company. Kellogg recognized that advertising and promotion were key to success in a market flooded with look-alike products, so the company spent a third of its initial working capital on an ad in *Ladies Home Journal*. The result was that sales jumped from 33 cases per day to 2,900 cases per day in 1907.

In July 1907 a fire destroyed the main factory building. On the spot, W. K. Kellogg began making plans for a new fireproof factory, and within a week he had purchased land at a site strategically located between two competing railroad lines. Kellogg had the

new plant, with a capacity of 4,200 cases a day, in full operation six months after the fire. "That's all the business I ever want," he is said to have told his son, John L. Kellogg, at the time.

By the time of the fire, the company had already spent \$300,000 on advertising but the advertising barrage continued. One campaign told newspaper readers to "wink at your grocer and see what you get." (Winkers got a free sample of Kellogg's Corn Flakes.) In New York City, the ad helped boost Corn Flake sales fifteen-fold. In 1911 the annual advertising budget reached \$1 million.

By that time, W. K. Kellogg had finally managed to buy out the last of his brother's share of the company, giving Will Kellogg more than 50 percent of the company's stock. W. K. Kellogg's company had become the Kellogg Toasted Corn Flake Company in 1909, but Dr. Kellogg's Sanitas Food Company had been renamed the Kellogg Food Company and used similar slogans and packaging. Will Kellogg sued his brother for rights to the family name and finally prevailed in 1921.

Kellogg, Frank Billings

In 1922 the company reincorporated as the Kellogg Company because it had lost its trademark claim to the name “Toasted Corn Flakes,” and had expanded its product line so much that the name no longer accurately described what the company produced. Kellogg introduced Krumbles in 1912, followed by 40% Bran Flakes in 1915 and All-Bran in 1916. Kellogg also made other changes, improving his product, packaging, and processing methods. Many of those developments came from W. K.’s son John L. Kellogg, who had been working for the company since its earliest days. J. L. Kellogg developed a malting process to give the corn flakes more of a nutlike flavor. He also saved the company \$250,000 a year by switching from a waxed paper wrapper on the outside of the box to a waxed paper liner inside, and invented All-Bran by adding a malt flavoring to the bran cereal. He held more than 200 patents and trademarks.

In subsequent decades the company continued to add new products, but it never strayed far from the ready-to-eat cereal business. In the early 1950s Kellogg’s continued success was tied to two external developments: the postwar baby boom and television advertising. To appeal to the younger market, Kellogg and other cereal makers brought out new lines of pre-sweetened cereals and unabashedly made the key ingredient part of the name. Kellogg’s entries included Sugar Frosted Flakes, Sugar Smacks, Sugar Corn Pops, Sugar All-Stars, and Cocoa Crispies. The company created Tony the Tiger and other cartoon pitchmen to sell the products on Saturday-morning television. Sales and profits doubled over the decade.

In the 1980s Kellogg targeted a more health-conscious market. The company spent \$50 million to bring three varieties of Nutri-Grain cereal to market in 1982. Two years later, Kellogg sparked a fiber fad when it began adding a health message from the National Cancer Institute to its All-Bran cereal. By the late 1990s Kellogg held about one-third of the U.S. cereal market and produced 12 of the world’s top 15 cereal brands.

KELLOGG, FRANK BILLINGS

Frank Billings Kellogg (1856–1937) emerged out of poverty and hardship to achieve a career as U.S. Secretary of State and a recipient of the Nobel Prize for Peace in 1929. Though Kellogg began his professional life as an awkward legal representative of some of the wealthiest Americans, his political and personal friendship with President Theodore Roosevelt (1901–1909) led Kellogg to become one of the most formidable and progressive attorneys in the federal government’s efforts to break-up industrial monopolies. Kellogg was the first great prosecutor of the Sherman Anti-Trust Act, a federal law that prohibited an exclusive private monopoly or ownership of any single industry.

Kellogg was born in New York. He relocated to Olmsted County, Minnesota, with his family at age eight, part of the typical pioneering experience of his era, moving from the East Coast to the then mysterious West. Kellogg’s father took the family to Minnesota to farm, but the endeavor was not prosperous. Kellogg worked on the family farm and managed to obtain six years of formal education, an accomplishment for children of hard-working farming families.

He determinably worked to be become a lawyer and escape the miseries of farm life. Kellogg passed the bar in 1877, and he described his success as “a life line thrown to rescue me from a desperate struggle for a livelihood.”

As a young attorney, he took every case that came his way. In 1887, at age 31, Kellogg became a partner in a prestigious law firm in St. Paul, Minnesota, headed by his cousin, Cushman Kellogg Davis. There, Kellogg began a successful career. He took on railroad and iron ore litigation, connected with the exploitation of the great Mesabi mineral range in Minnesota, defending some of the titans of American business, such as John D. Rockefeller, Andrew Carnegie, and the railroad builder James Hill.

During business trips to Washington, D.C., Kellogg met Theodore Roosevelt, then a member of the Civil Service Commission. They became friends, and when

Roosevelt became president, Kellogg had an easy entree to the White House. His friendship with Roosevelt led to many court cases in which Kellogg, representing the federal government, fought many of the most formidable industrial figures of his day. Like Roosevelt, Kellogg was alarmed by the sudden increase in corporate mergers, the formation of huge entities that often resulted in near-total monopolies on industries in the United States.

Appointed as Special Assistant Attorney General, Kellogg began fighting the paper trust, known as the General Paper Company, and won. In 1906 he began prosecution of the Union Pacific Railroad, which was eating up its competition at an alarming rate. These government victories led to the greatest single trust case of the era, the prosecution of the Standard Oil Company for violating the Sherman Anti-Trust Act. Kellogg won a Supreme Court interpretation of his case in 1911, which forced Standard Oil to break-up into smaller, competitive companies. This victory inspired newspapers to describe Kellogg as “the trust buster.” Though Kellogg was a largely uneducated, nervous, hot-tempered, outspoken, and undiplomatic man, he had become a winner in the eyes of the public through his work at keeping monopolies from dominating American big business.

In 1912, Kellogg was elected president of the American Bar Association. By this time, Kellogg had undergone a conversion in political thinking. He began his career as a Republican conservative, but by 1912 he admonished his fellow lawyers to “stand for modern economic legislation, necessary to the development of the people.”

In 1916 Kellogg was elected as a Republican Senator to the U.S. Congress, representing the state of Minnesota. He was, however, defeated in his 1922 bid for re-election.

President Calvin Coolidge (1923–1929) also liked Kellogg, and saw his usefulness during a prosperous post-war period. In 1925 Coolidge named Kellogg Secretary of State. In this position, Kellogg worked to aid in the reconciliation of German reparation debts to the United States and helped arrange loans to Germany for that country’s post-war recovery.

Kellogg’s diplomatic successes were modest, and not truly comparable to his important success as a “trust buster” for Theodore Roosevelt, fighting the industrial monopolies of pre-World War I America. Yet, he was also a success as Secretary of State, always striving to convey the spirit of American good will in

foreign affairs. In 1929 Kellogg was awarded a Nobel Prize for Peace in honor of his diplomatic success with France, creating the Kellogg-Briand Pact of 1928 in which the signing nations renounced war “as an instrument of national policy,” with the hope that it might prevent future war. Frank Billings Kellogg died in 1937.

KELLOGG, WILL KEITH

Will Keith Kellogg (1860–1951) was a pioneer producer of health and breakfast foods born in Battle Creek, Michigan. He was the seventh son of John and Ann Kellogg. Kellogg’s family background includes noted lithographer Elijah C. Kellogg, well-known physician Albert Kellogg, and diplomat Frank Billings Kellogg (1856–1937), who won the Nobel Peace Prize in 1929.

Will Kellogg’s start in life was modest. He attended public school until age fifteen. He then began to work as a salesman for his father’s broom company. He attended Parsons Business School in Michigan for three months. In his late teens Kellogg took a job as an assistant to his flamboyant brother Dr. John Kellogg. John Kellogg was a health food crusader and the creator of a health sanitarium in Battle Creek, where Will Kellogg worked as a bookkeeper, shipping clerk, cashier, and troubleshooter. He helped his brother bring the health sanitarium to national prominence.

Kelsey-Hayes

At the same time Kellogg developed his business skills while by running a subscription service for his brother's health books and managing his brother's Sanitas Food Company. They developed a cooked and flaked wheat cereal which became very successful.

In 1906 Kellogg decided to launch his own breakfast food company. It was first known as the Battle Creek Toasted Corn Flake Company. With an intensive advertising campaign, Will Kellogg built his company into a national corporation, but it had its problems. Kellogg's brother John was the owner of the original patent for the wheat flake cereal. John Kellogg fought his brother in court from 1908 to 1920, challenging Will Kellogg's right to have an independent breakfast cereal company. In 1920 Will Kellogg won the legal battle and claimed exclusive ownership and copyrights to his own cereal products and his company name, the W.K. Kellogg Company.

The wheat and corn flakes were originally developed as health foods to be sold by mail to users of health products. Will Kellogg's later enterprises, however, led him to sell the corn flake products as healthy, enjoyable, and convenient breakfast foods for everyone. Kellogg was enormously successful targeting the mass public this way. At the time, people living in the United States traditionally ate heavy, hot breakfasts. Kellogg achieved a minor revolution when his corn flakes and other cold cereals began to replace the traditional fare.

Will Kellogg was a driven and aggressive man, with whom it was difficult to work. Kellogg groomed his son John to become his successor, but fired him after seventeen years, during which John obtained more than 200 patents for Kellogg's company. Kellogg's grandson was also groomed for the company presidency, but he too was demoted, and later quit the company.

Kellogg broke easily from his parents' Seventh Day Adventist religious faith, but turned much of his early religious training into business and charitable endeavors. During the 1920s he created one of the largest charitable foundations in the nation, the W.K. Kellogg Foundation. Its mission is "to help people help themselves through the practical application of knowledge and resources to improve their quality of life and that of future generations." It is active to the present day.

As a multimillionaire Kellogg purchased a 377-acre ranch in California in 1925. There he raised Arabian horses of the best stock from all over the world. The ranch had high-quality animals and striking

architecture and attracted regular visits by world leaders and movie stars during the 1920s.

Will Kellogg was blind for the last ten years of his 91-year life. The creator of the modern breakfast food industry died in 1951. He was known for hard work, a missionary zeal for the possibilities of the future, and an intolerance for people who didn't see the world his way. He left behind a worldwide industry that continued to thrive long after him.

KELSEY-HAYES

Kelsey-Hayes was established in 1927 through the merger of Kelsey Wheel and Hayes Wheel. Both companies were founded in 1909, and both had made early advances in the wooden wheel industry. Kelsey and Hayes had important connections in automobile manufacturing, which helped them succeed as automotive parts suppliers. In 1909 the Ford Motor Company purchased three-fourths of the wheels produced by the Kelsey Wheel Company. Similarly, Hayes President and founder Clarence B. Hayes' early experiences in the wheel industry put him in contact with W.C. Durant (1861–1947) who eventually founded General Motors. Thus, even before the merger both companies had strong positions in the industry.

Fearing that Kelsey Wheel Company might become too dependent on the Ford Motor Company, John Kelsey sought to diversify his company's product line

and customer base. Kelsey reduced business with Ford from three-quarters to less than one-third of total sales in 1910. By 1915 Kelsey produced wheels for 15 to 20 percent of the automobile industry. The Kelsey Wheel Company also produced 80 percent of artillery wheels during the World War I. By the end of the war Kelsey was turning consistent profits. During the same period, Clarence Hayes was supplying over half of the American automobile business with his wheels. In the 1920s the advent of the wire wheel required dramatic changes for these wooden wheel producers. Although both companies expanded into wire wheel production, they chose to face this new challenge together, and in 1927 they formed the Kelsey-Hayes Wheel Company.

Litigation against John Kelsey over the patent for wire wheels clouded the merger. The Wire Wheel Corporation of Buffalo, New York, disputed Kelsey right to produce the wheel. When Kelsey died in 1927, his successor George Kennedy bought the Wire Wheel Company in an effort to solve the problem. It was eventually decided, however, that the patent was owned by the Packard Motor Company, a car manufacturer, not the Wire Wheel Corporation. Kennedy paid Packard \$500,000 so that Kelsey-Hayes could continue with wire wheel production. By 1929 the company was making 10,000 wire wheels per day; by this time the manufacturer had also added brakes to its product line.

Kelsey-Hayes endured great challenges in the 1930s. Economic crises overshadowed the purchase of General Motor's subsidiary Jaxon Steel Products Company of Jackson, Michigan. The company had very costly debts that resulted in approximately \$2 million in losses for Kelsey-Hayes. They eventually survived these troubles by restructuring their finances and lowering expenses. But in the meantime a challenge from another quarter arose. The United Auto Workers (UAW) sought to organize the Kelsey-Hayes workers in Detroit, Michigan, who made and supplied brakes for Ford cars. The union struck the company in 1936. The company established a 75-cent minimum hourly wage but still refused to recognize the union. By 1938 and 1939, Kelsey-Hayes was showing profits again. By this time the company was selling newly developed hydraulic brakes to Ford (which had become standard equipment on Ford cars). Kelsey-Hayes also came out with a new brake drum.

During World War II (1939–1945), Kelsey-Hayes contributed to the war effort by producing machine guns. Kelsey-Hayes also manufactured tank components and aircraft wheels. The company acquired French and Hecht, Inc., an already successful manufacturer of wheels for agricultural and construction machinery. In

1946 labor strikes surged throughout the country and Kelsey-Hayes was shut down for six weeks. Nevertheless the same year brought successes when Buick and Chrysler began buying power brakes from Kelsey-Hayes. In 1947 Kelsey-Hayes bought a manufacturer of brake components—the Lather Company. By the 1950s Kelsey-Hayes was enjoying its highest profits in history.

During the Korean War Kelsey-Hayes produced parts for the aircraft industry. They also promoted specialty products for the automobile industry such as chrome-plated and aluminum wheels. In 1958 the company's research and development department began looking into anti-lock brake systems (ABS) for automobiles—prior to this, the ABS was only used in aircraft. With so much diversification of its product line, Kelsey-Hayes Wheel Company saw fit to change its name to Kelsey-Hayes Corporation in the late 1950s.

The company continued to broaden its product line beyond wheels; in the years that followed, the biggest successes were in non-wheel products. Kelsey-Hayes pioneered disc brake systems—standard equipment on Lincoln Continentals and Thunderbirds in the 1960s. But by the 1970s eighty-five percent of U.S. cars were equipped with Kelsey-Hayes disc brakes. Also at that time, nearly every jet engine contained some parts manufactured by the Kelsey-Hayes Corporation. During and after an oil crisis in the 1970s, the market demanded smaller cars that would be cheaper to operate. Kelsey-Hayes took researched and designed new components that would be lighter and more economical. Fewer people were buying new cars during this period; instead, they opted for used ones. Kelsey-Hayes sensed this and in 1978, as new automobile sales declined, they began manufacturing replacement parts.

In spite of these successes Kelsey-Hayes' stock was falling and its credit was overextended during the early 1970s. There was fear of a takeover; in 1973 the company became a subsidiary of Fruehauf Corporation. Kelsey-Hayes quickly recovered from its financial setback and consistently brought Fruehauf its best profits. In the late 1970s Kelsey-Hayes acquired Compositek Engineering Corporation whose history of producing fiber-reinforced plastics brought new opportunities for producing light-weight wheels. At the end of the decade Kelsey-Hayes was producing all types of wheels. The merger did not appear to diminish Kelsey-Hayes' success.

The Federal Trade Commission, however, (FTC) reviewed Fruehauf's acquisition of Kelsey-Hayes and decided that the merger violated anti-trust laws by

Kentucky

discouraging competitive trade. Kelsey-Hayes had been a supplier to Fruehauf and, after the merger, Fruehauf was less inclined to buy from other suppliers. The FTC ruled that this was a restraint of trade. Also, prior to the merger, Fruehauf had itself manufactured products similar to those that Kelsey-Hayes produced. After the merger, Fruehauf had discontinued its own production of those products, and the FTC ruled that this was a limit on the diversity of available goods. Fruehauf was forced to divest itself of some of its Kelsey-Hayes holdings.

The problems for Fruehauf did not end there. Fruehauf was dismantled during a lengthy, unfriendly takeover in the mid-1980s. Kelsey-Hayes was independent again and was renamed the K-H Corporation. But K-H was short-lived, since debt and interest payments diminished any possibility for growth. In 1989 K-H sought out the Toronto-based Varsity Corporation and arranged for a friendly buyout. Under this new owner the company became the Kelsey Hayes Group of Companies, and by organizing itself into business units, the company made it easier to focus on distinct product lines. One year after the merger Kelsey-Hayes showed \$1 billion in revenues.

The Kelsey-Hayes story is about a company in the midst of a competitive environment that was able to survive and build itself up by furnishing the parts needed by big customers like General Motors, Ford, and U.S. government contractors. Although other parts suppliers tried to do the same thing, Kelsey-Hayes was successful because of its ability to read the market and to develop new products that were ahead of their time. The company also understood its limits and subsequently built relations with other companies, either by purchasing or merging. Such strengths contributed to Kelsey-Hayes' ability to issue innovative parts, such as aluminum wheels, disc brakes, and anti-lock braking systems—quite a change from the days of the wooden wheel.

KENTUCKY

British and American surveyors, Thomas Walker and Christopher Gist first explored eastern and central Kentucky in 1751. As part of what was then called “the West,” Kentucky held great promises for the use of its fertile land and abundant hunting grounds. Despite a British ban on western migration, settlers gradually began coming to Kentucky. In 1774 Harrodstown (now Harrodsburg) became the first white settlement in the region.

The Transylvania Land Company, assisted by famous frontiersman Daniel Boone (1734–1820), bought up a large tract of land from the Cherokee Nation and founded Fort Boonesborough in 1775. The colony of Virginia claimed Kentucky as part of its territory at this time. During and after the American Revolution (1775–1783) immigrants streamed in to the region, coming down the Ohio River or through the Cumberland Gap, as Kentucky became the principal route for migration into the Mississippi Valley. The settlements grew, and Kentucky strained at its bonds to Virginia. In 1792 Kentucky entered the Union as the fifteenth state.

Agricultural and processing industries enabled Kentucky to prosper over the next few decades. Kentucky was tied to the lower South economically, especially after the construction of a canal around the Ohio River Falls at Louisville in 1829. Kentucky supplied hemp, used to make ropes and bagging for cotton bales, as well as producing hogs, mules, workhorses, corn, flour, salt, and prepared meats. The state also became a large grower of tobacco, which by 1860 accounted for half the agricultural income in the state. Whiskey production began in the 1860s, with the most popular brew taking the name of the county where it was produced: Bourbon. Horse breeding and racing also developed during this period and became the trademark industry in the Bluegrass area near Lexington.

Kentucky was one of the border states with divided loyalties during the American Civil War (1861–65).

State of Kentucky.

Although the state ultimately backed the Union, thousands of soldiers from Kentucky also fought on the side of the Confederacy. A period of unrest and chaos followed the war during the Reconstruction (1865–1877) period.

By the 1870s economic health was gradually being restored in Kentucky. Liberal tax laws helped railroad construction to increase dramatically, and eastern Kentucky saw extensive development of timber and coal reserves. Many rural people moved into the cities of Louisville and Lexington as industrial growth flourished. In 1900 Kentucky held first place in per capita income among the southern states.

A bleaker picture, however, faced farmers in the state. The “dark-leaf” tobacco farmers of eastern Kentucky, as well as other farmers, experienced long-term price depression. Good land was also becoming hard to come by, as the size of the average family farm dropped to less than ten acres, and many were forced to become tenant farmers. New social movements aimed at farm unrest, including the Grange, the Farmers’

Alliance, and the Populist Party, found many supporters in Kentucky.

Another of Kentucky’s most important industries, coal mining, was going through hard times at the beginning of the twentieth century. By the late nineteenth century lower-sulfur coal had been mined out of the Cumberland coal reserves in the Appalachian region. Distant corporations with a highly developed profit motive employed many but did little to improve the ordinary lives of the people they employed. As mechanization of coal mining increased, jobs in the mining areas of the state became increasingly hard to come by. Deep mining began to give way to strip mining during this period.

During the 1920s a great deal of economic change hit Kentucky. The development of modern highways brought the political power center of the state to the Highway Commission. Political patronage under Governor Flem Sampson controlled nearly all the highway jobs until Sampson’s ouster in 1931. Meanwhile, in the distillery industry, the enactment of Prohibition in

Kerosene

1918 had put thousands out of work. Coal mining experienced a boom in the early twenties, but declining prices after 1927 put thousands more into unemployment lines. Violent confrontations between mine owners and workers became common during this time. In Harlan and Bell counties hostilities were especially rampant and caused property destruction and many deaths.

During the dark days of the Great Depression (1929–1939) in the 1930s, Governor Albert B. (“Happy”) Chandler brought a kind of “conservative progressivism” to the state after years of factional party politics. He used federal dollars from New Deal programs to cancel the state sales tax in favor of a progressive income tax and controversial taxes on cigarettes, whiskey, and beer. An unfortunate consequence of the sales tax loss prompted a downhill slide in funding for education and health care in the state. Adding to the state’s woes, there were a number of violent confrontations during the 1930s between the United Mine Workers (UMW) and mine owners in eastern Kentucky. By 1940 Kentucky had acquired a negative image nationwide because of political corruption, poverty, and labor unrest. In that year the state ranked last among 48 states in per capita income.

World War II (1939–45) brought an economic boost to the state’s economy by increasing the demand for coal and farm products, and also by stimulating the development of industry. As industries grew over the subsequent decades the percentage of people employed in farming decreased. Between 1945 and 1980 the farm population was reduced by 76 percent. Companies such as General Electric and Ford in Louisville and Rockwell International in Clark County helped bring Kentucky industry into the twentieth century. Lexington in particular changed from a farm and college town into a fast-growing metropolitan era, beginning with the arrival of International Business Machines (IBM) in 1956. A good measure of Kentucky’s rise from the economic doldrums came from a steady influx of workers from 1970 on, after years of population loss.

Though still a poor state, economic conditions in Kentucky were greatly improved by the end of the twentieth century. The Bluegrass area and industrial cities were generally the most prosperous parts of the state. Despite federal programs that began in the 1960s to raise incomes in the eastern coal mining regions, income there was still lower and unemployment higher than in other areas of the state. A far higher percentage of the population in the Appalachian counties fell below the federal poverty level than in other counties. Though manufacturing cities, primarily along the Ohio River, provided high levels of employment, the state as

a whole ranked only 42nd out of 50 states in per capita income with an average of \$19,687 in 1996. Coal was still an important product of Kentucky, with over 114 million tons mined in 1996. A more recently discovered resource was petroleum, extracted mostly in Henderson County.

KEROSENE

A flammable hydrocarbon oil, kerosene is a petroleum product primarily used for fuel. In 1854 Canadian geologist Abraham Gesner (1797–1864) discovered a process for distilling fuel from petroleum (initially, coal oil). He found the derived substance to be a superior lighting oil. In 1859, when the first successful oil well was drilled near Titusville, Pennsylvania, the shale oil was found to also be an excellent, and then plentiful, source of kerosene. Kerosene illumination caught on quickly. Until the advent of the incandescent lightbulb, invented by Thomas Alva Edison in 1879, kerosene lamps remained the primary source of artificial lighting.

KEYNES, JOHN MAYNARD

Considered one of the most important economic theorists of the modern era, John Maynard Keynes (1883–1946) was a genius who used his extraordinary gift for mathematics to deepen his understanding of economics. He helped to revolutionize modern thought about the workings of the free-trade marketplace and modern industrial capitalism. He is credited with helping to pull the United States and much of Western Europe out of the Great Depression and with creating a

kind of capitalism that works with the federal government to stabilize the ups and downs of a market economy.

John Keynes was the only son born to John Neville Keynes and Florence Keynes, on June 5, 1883. His father was a lecturer at Cambridge University, England, and became the top administrative official at Cambridge. As young John grew up, his parents doted on him, and his mother kept a thorough file of his early achievements.

Keynes was a brilliant student at Saint Faith's Preparatory School. Later, at Eton, he finished first in his class in the classics (the study of the language and culture of ancient Greece and Rome) and second in mathematics. He later went on to Cambridge University to complete his formal education, where, at age sixteen, he decided to pursue the study of economics.

His first job out of college was in India, working as a junior clerk for the British civil service for two years. Keynes then took a position back in England as an economics lecturer at King's College. In 1911, at age twenty-eight, he was named editor of the prestigious *Economic Journal* published by the Royal Economic Society, a position he retained for the next 33 years.

In his mid-30s, Keynes married a ballerina, Lydia Lopokova, and they remained together until his death in 1946. They had no children.

Keynes worked on international aspects of the economy for the British Treasury office in 1917, and in 1920 he began his own career speculating successfully on foreign exchange and commodities. Later that same year Keynes joined the board of directors of the National Mutual Life Insurance Company, where he became the board director in 1923, a position he held until 1938.

JOHN MAYNARD KEYNES WAS . . . CREDITED WITH HELPING TO PULL THE UNITED STATES AND MUCH OF WESTERN EUROPE OUT OF THE GREAT DEPRESSION.

Throughout his life Keynes occupied a variety of influential posts where his economic and financial advice was sought. During World War II (1939–1945), both English Prime Minister Winston Churchill, and U.S. President Franklin Delano Roosevelt (1933–1945) sought his advice.

Outspoken and controversial, Keynes wrote books on all aspects of economics, beginning with his small classic titled *Indian Currency and Finance* (1913), and ending with his last book, *How to Pay for the War*

(1940). In 1936 he published his major work, *The General Theory of Employment, Interest, and Money*. With respect to its importance in economic literature, this work has been compared to Adam Smith's *The Wealth of Nations*, and Karl Marx's *Das Kapital*. It was a shrewd analysis of how economics works in daily life.

Keynes' book contained little on sociology, philosophy, or ideology. He supported capitalism and focused on resolving the question of how a capitalist economy could recover from a depression, which seemed to be an inevitable affliction in the free market system. The answer Keynes proposed may have helped the capitalist world pull itself out of the Great Depression, as well as provided a way for capitalist societies to normalize after war. Keynes theorized that economic difficulties were not the result of overproduction, as was commonly believed, but rather of problems in the distribution of goods. He further stated that it was the shortage of money that prevented goods from being distributed properly during a depression. The solution was the government involvement. Keynes believed that if the government put money into the economy, without taxing citizens, the economy would experience some temporary debt, but the stimulation would bring the stagnant capitalist economy back to life.

Other economists were skeptical of Keynes' ideas, but eventually came to accept them as they saw the U.S. and European economies improve, behaving as Keynes had predicted. Keynes gave to capitalists a method to help economies rebound after periodic downturns.

Unlike most economists before him, Keynes analyzed problems in the economy as if they were arithmetic and not social. He had little use for ideas that glorified either the businessman or the common worker. He believed that the success of an economy depended on following certain basic rules that he had described in his writing. Keynes died in 1946.

Keynesian Economic Theory

Hession, Charles. *John Maynard Keynes*. New York: MacMillan Pub., 1984.

Muggridge, D. E. *John Maynard Keynes*. New York: Penguin Books, 1976.

KEYNESIAN ECONOMIC THEORY

Until the onset of the Great Depression (1929–1939), it was conventional wisdom in classical economics that the best way to manage the economy was to take a laissez-faire, or “hands off,” approach. Classical economists believed that, left to their own devices, economies tended toward full employment on their own, and that the best way to deal with a depression was to expand the money supply and wait for the economy to return to “equilibrium.”

In his landmark 1936 book, *The General Theory of Employment, Interest, and Money*, the English economist John Maynard Keynes (1883–1946) argued that the classical economists had it all wrong. Some depressions were so severe that consumer demand needed to be artificially stimulated by government fiscal policies such as deficit spending, public works programs, and tax cuts. During deep depressions, Keynes believed, when the government expanded the money supply pessimistic consumers would simply hoard the money rather than spend it. As proof that Keynesian economic theory was true, economists pointed to the fact that the U.S. economy recovered from the Great Depression only through heavy deficit spending during World War II (1939–1945). Keynesianism became official government policy when the Employment Act of 1946 gave the federal government the explicit responsibility to use fiscal policy to maintain full employment as a way of keeping consumer demand and economic growth strong.

During the administrations of Democratic Presidents John F. Kennedy (1961–1963) and Lyndon B. Johnson (1963–1969), Keynesian economic theory guided government policy. A major tax cut in 1964 that spurred economic growth seemed to prove again that Keynes’ faith in government fiscal measures had more validity than laissez-faire economics. By the early 1970s even Republican President Richard M. Nixon (1969–1974) admitted, “We are all Keynesians now.” However the 1970s introduced a new phenomenon that Keynesian economic theory seemed to have no answer for: high inflation together with high unemployment—a phenomenon known as “stagflation.” Keynes and all

other economists had believed that when unemployment is low, inflation would be high because a fully employed economy consumes a lot, thus, prices would be driven upward. Stagflation seemed to leave the government without options: if it stimulated demand to reduce unemployment inflation would climb, but if it dampened demand to fight inflation unemployment would rise.

Stagflation turned out to be so difficult a problem that by the time President Ronald Reagan (1981–1989) entered office he was calling Keynesian economic theory “a failed policy.” In a return to laissez-faire economics, he proposed that the government stop deficit spending and grow the money supply at a stable rate. The currency growth has been kept under control, and with budget cuts and an expanding economy, the budget was balanced under President William Clinton (1993–2001).

KIMBERLY-CLARK CORPORATION

Kimberly-Clark Corporation was established in 1872 in Neenah, Wisconsin, as Kimberly, Clark, and Company. The business was a partnership of four men—John A. Kimberly, Charles B. Clark, Frank C. Shattuck, and Kimberly’s cousin, Havilah Babcock. The company established its first paper mill in Wisconsin; their first product was newsprint made from linen and cotton rags. Within six years the company expanded by acquiring a majority interest in the nearby Atlas paper mill, which converted ground pulpwood into manila wrapping paper. The business was incorporated in 1880 as Kimberly and Clark Company. In 1889 the company constructed a large pulp and paper-making complex on the Fox River.

In 1906, after the deaths of three of the four founders, the company was reorganized and renamed Kimberly-Clark Company. In 1914 researchers working with bagasse, a pulp byproduct of processed sugar cane, produced creped cellulose wadding, or tissue. During World War I (1914–18) this product, called cellucotton, was used to treat wounds in place of scarce surgical cottons. At that time field nurses also discovered that cellucotton worked well as a disposable feminine napkin. The company later recognized the commercial potential of this application and in 1920 introduced its Kotex feminine napkin.

Four years later the company introduced another disposable tissue product, Kleenex, to replace the face towels then used for removing cold cream. A survey showed, however, that consumers preferred to use Kleenex as a disposable handkerchief, prompting the company to alter its marketing strategy entirely. Nationwide advertisements promoting Kleenex for use as a facial tissue began in 1930; sales doubled within a year. In 1928 the company was reincorporated as Kimberly-Clark Corporation and became a publicly traded firm. During World War II (1939–1945) Kimberly-Clark contributed to the war effort by making M-45 anti-aircraft gun mounts, fuses for heavy shells, and other military products.

Introduced in 1968, Kimberly-Clark's first foray into the disposable diaper market, Kimbies, was withdrawn from the market in the mid-1970s because of poor sales and leakage problems. Much more successful were Huggies, the premium diaper introduced by Kimberly-Clark in 1978. Featuring an hourglass shape, elastic at the legs, and refastenable tapes, Huggies were an instant hit and had captured 50 percent of the higher quality disposable diaper market by 1984.

In 1980 Kimberly-Clark launched its Depend line of adult incontinence products through an aggressive television advertising campaign. Just as it had decades before through its promotion of once unmentionable feminine hygiene products, Kimberly-Clark again took on a taboo subject. The company was once again successful. Depend quickly became the best-selling retail incontinence brand in the United States and Kimberly-Clark now had a line of products serving the needs of absorbing bodily fluids which stretched from cradle to grave.

In 1985 Kimberly-Clark relocated its headquarters from Wisconsin to Texas. The company found new product success again in 1989, when Huggies Pull-Ups disposable training pants were introduced. Pull-Ups helped propel Huggies into the number one position in the disposable diaper market. In 1995 Kimberly-Clark merged with Scott Paper Co. in a \$9.4 billion deal that created a global consumer products company with annual revenue of more than \$13 billion. The new Kimberly-Clark emerged from their union with Scott with a roster of leading consumer brands, including Kleenex, Huggies, Kotex, Depend, Pull-Ups, and the Scott brand of bathroom tissue and paper towels.

KING COTTON

Until the 1790s growers were limited to producing the quantity of cotton that could be processed by slaves. Separating the seeds from cotton was time consuming and labor intensive. The bolls (cottonseed pods) were dried in front of a fire, and the seeds were picked out by hand. In 1793 American inventor Eli Whitney (1765–1825) introduced the cotton gin. A revolutionary laborsaving machine, it could clean 50 times more cotton fiber in one day than a human. Though Whitney patented the machine in 1794, imitations were quickly put into production by shrewd businessmen who realized the impact the gin could have on the nation's cotton industry. Just before Whitney developed the gin another inventor, British-born Samuel Slater (1768–1835), introduced the first successful water-powered machines for spinning cotton at a Rhode Island mill in 1790.

There was no shortage of demand for the fiber. As the 1800s dawned, machinery had made cotton the center of the nation's emerging textile industry. Soon New England was dotted with textile factories. Growers in the South increased cotton production to keep up with factories' demands. Slave labor and excellent growing conditions in the southern states (especially Alabama, Mississippi, Georgia, and South Carolina) combined to dramatically increase production. By 1849 annual cotton exports had reached \$66 million and accounted for roughly two-fifths of total U.S. exports.

Cotton came at a dear price: laborers in the North's textile factories worked under difficult and sometimes dangerous circumstances, in the South cotton crops were planted and harvested by slaves. As abolitionists became increasingly vocal and demanded that the U.S. government legislate the end of slavery, southern growers defended the system, saying that their livelihoods and the South's economy depended on it.

The importance of the cotton crop as a U.S. export from 1800–1880, including the close relation between bale production and slave population.

King cotton became an expression coined during the mid-1800s when the economies of southern states were heavily dependent on the cotton industry. In 1858 South Carolina Senator James Henry Hammond (1807–64) taunted northern sympathizers, saying “You dare not make war on cotton—no power on earth dares make war upon it. Cotton is king.” Hammond was not the first to use the phrase; it was coined three years earlier in the title of a book. The South’s dependence on cotton contributed to the deepening North-South divide in the nation. By the time the Civil War (1861–65) began, the southern United States supplied two-thirds of the world’s cotton.

KING, MARTIN LUTHER, JR.

During the last half of the twentieth century in the United States, Martin Luther King, Jr., (1929–1968) emerged as the major leader of the modern civil rights

movement. He organized large numbers of African Americans in the 1960s to aggressively pursue non-violent civil disobedience in pursuit of racial justice and economic equality. Until his assassination in 1968, King remained a steadfast leader committed to the radical transformation of society through persistent, non-violent activism.

In 1929 Martin Luther King Jr. was born in Atlanta, Georgia, the son of Michael and Alberta King. King was born into a family with deep ties to the African American church. His father was a Baptist minister in Atlanta. King’s maternal grandfather, Reverend Adam Williams, had served as the pastor of The Ebenezer Baptist Church in Atlanta since 1894.

King grew up during the Great Depression, a direct witness not only to racism in the South but to bread lines and social injustice. These experiences heightened his awareness of economic inequalities. He watched his father campaign against racial discrimination in voting and in salary differences between white and African-American teachers. His father’s activism provided a model for King’s own politically engaged ministry.

But we refuse to believe that the bank of justice is bankrupt. We refuse to believe that there are insufficient funds in the great vaults of opportunity of this nation. So we have come to cash this check, a check that will give us upon demand the riches of freedom and the security of justice.

Martin Luther King, Jr., "I Have a Dream" speech, August 28, 1963

King attended Morehouse College from 1944 to 1948. The president of Morehouse, Benjamin E. Mays, strongly influenced King's spiritual development by encouraging him to view Christianity as a potential force for social change in the secular world. King struggled with mixed feelings about religion during his college years, but decided to enter the ministry after graduation, responding to what he called an "inner urge" calling him "to serve God and community." He was ordained during his final semester at Morehouse. King later continued his religious education at Boston University's School of Theology; where he completed a doctorate in theology in 1955.

Accepting a 1954 offer to become pastor of Dexter Avenue Baptist Church in Montgomery, Alabama, King quickly came into contact with the many problems of the modern South. In December 1955, Montgomery African American leaders formed the Montgomery Improvement Association to protest the arrest of National Association for the Advancement of Colored People (NAACP) member Rosa Parks (1913–) for refusing to give up her bus seat to a white man. They chose King to head the new group.

During a year-long boycott African Americans in Montgomery avoided using the bus system. In his role as spokesman, King utilized the leadership abilities gained from his religious background and forged a distinctive protest strategy involving the mobilization of African American churches and skillful appeals for broad-based public support. In his organizing, King began to use the precepts of East Indian leader Mohandas Gandhi, combining Gandhi's non-violence with Christian principles.

After the U.S. Supreme Court outlawed racial segregation in 1956, King's victory spurred him on to expanding the non-violent civil rights movement. In 1957 he founded the Southern Christian Leadership Conference (SCLC), to coordinate civil rights activities throughout the South.

On September 20, 1966, Martin Luther King Jr. (center), escorted these young children to a recently integrated school.

By the time he moved to Atlanta, Georgia, in 1960, King was known nationwide for his book on civil rights advocacy, *Stride Toward Freedom*, and through his work to increase African American voting registration in the South. He also worked with a student-oriented group of civil-rights workers known as the Student Non-Violent Coordinating Committee (SNCC) in an effort to desegregate restaurants in the South with a series of non-violent sit-ins.

In 1963 King was part of the civil rights struggle in the Birmingham, Alabama, campaign. These demonstrations called for a variety of changes in the treatment of African Americans and resulted in King's arrest and brief imprisonment. The arrest brought international attention to him and to the civil rights movement. King spoke bravely and intelligently in speeches that invoked Biblical and Constitutional principles. His activities caught the attention of President John F. Kennedy (1961–1963), who introduced significant civil rights legislation.

King, Richard

That same year, in front of 200,000 people gathered in Washington, D.C., King delivered a speech, known today as the “I Have A Dream” speech. It marked a high point in King’s crusade and served as an inspiration for civil rights supporters. Televised throughout the world, his speech electrified those who heard those words and saw the thousands who had marched on Washington in support of the civil rights movement.

Largely for his advocacy and his use of non-violent social activism in the United States in pursuit of justice for racial and economic minorities, King was awarded the Nobel Peace Prize in 1964. During the late 1960s, he remained a voice of moderation in an increasingly diverse and militant African American movement. The civil rights campaign of the early 1960s became a militant mass movement later in the decade, seeking economic and political gains in the workplace.

King continued to leave his mark on the social protest movements that arose throughout the 1960s. Women’s groups formed and used non-violent militancy to achieve progress in what came to be called the modern feminist movement of the 1970s. Social and economic injustices throughout the country were being addressed with King’s civil disobedience tactics. The American Indian Movement (AIM) became re-activated, as did the labor organizing movement of American Hispanics involved in migratory labor disputes.

On April 4, 1968, while King was working with striking sanitation workers in Memphis, Tennessee, he was assassinated by a white segregationist, James Earl Ray. King’s kindling of social activism if ordinary citizens during the mid-twentieth century greatly affected civil rights in the United States, as well as the working conditions of nearly all minorities who were seeking equality and social justice. His legacy is perhaps best illustrated by the Civil Rights Act of 1964.

KING, RICHARD

Richard King (1825–1885) became a legend of U.S. business when he created the largest cattle ranch in the United States during the 1850s. At its height the ranch extended over 1.25 million acres in South Texas, close to the Gulf of Mexico. King and his wife Henrietta founded the famous King Ranch with a purchase of 75,000 acres of land. They started with one small rugged house, which they constantly protected from thieves, cattle rustlers, hostile Native Americans, and a variety of trespassers. At his death in 1885 King’s wife inherited the ranch and added thousands of acres to its region. Later heirs to the King Ranch continued to expand it until it became larger than the state of Rhode Island early in the twentieth century.

Richard King was born in 1825, from humble circumstances in Orange County, New York. At the age of eight his parents sent him to be apprenticed to a jeweler. The jeweler’s harsh treatment caused King to run away, and he boarded a ship bound for Mobile, Alabama, where he signed on to become a cabin boy on a steamboat. During his time as a cabin boy he obtained eight months of formal education, the total extent of his schooling.

In 1847, at age twenty-two, King was drawn to the state of Texas. In Texas, King served as a pilot on a government steamship on the Rio Grande River. He later bought his own small steamer and engaged in trade on the Rio Grande. In 1850 a friend joined the venture, and they purchased 22 vessels. During the American Civil War (1861–1865) he traded with Mexico, exchanging cotton for supplies that would be given to the Confederate army. King spent 20 years as a steamboat captain in Texas. During that time he began plans for a great ranch in a region of Texas between the Nueces and the Rio Grande rivers.

In 1852 King purchased a 75,000-acre tract of land southwest of Corpus Christi, Texas, formerly known as the Santa Gertrudis Ranch. King bought the land at a cheap price because it was situated in a perilous region of Texas. The area had once been a part of Mexico and many Mexicans still maintained it was rightfully theirs. The same area was also claimed by Native Americans, who said the land historically belonged to them. A

lengthy struggle ensued over ownership, but no clear legal claim was established. Into this controversy stepped Richard and Henrietta King.

The Kings were tough and determined to survive. They did not let the controversy over the land dissuade them from the purchase. Once their ownership was established the Kings set up residence, ready to fight off trespassers. Richard King erected rendering houses on his ranch before the northern markets were open for Texas beef. He used animal fat to make candle tallow and sent the tallow and animal hides to market by ship. Cowboys later drove thousands of his cattle over the long trail from Texas to Kansas, where they were put aboard trains to be shipped East.

By 1876 King greatly increased the size of his ranch through land purchases. The number of cattle raised on the ranch also grew. At the same time he constructed his own railroad, which he used to ship cattle from his ranch to Laredo, Texas. From Laredo his train joined the main train routes to the east and north. His holdings at that point numbered 100,000 Texas Longhorn cattle, 20,000 sheep, and 10,000 horses.

King died in 1885 on his half-million acre ranch. The King family was then cross-breeding Brahman cattle with English shorthorns. They produced a new and popular breed of cattle called Santa Gertrudis, which was able to mature to full size while eating less range grass.

King's wife survived him and remained on the ranch. Henrietta King founded the Texas town of Kingsville on the King estate. She also built houses, schools, and churches. She gave a tract of land for the establishment of the Texas-Mexican Industrial Institute. The Kings' five children continued to manage the ranch successfully.

By the middle of the twentieth century the King Ranch supplied much of the food and cowhide in the United States. It became a regional hub in Texas, where it transformed wild prairie into a populous and prosperous farming region.

KLONDIKE GOLD STRIKE

In 1896 the discovery of gold along the valleys of the Yukon and Klondike rivers launched a great stampede of prospectors north to Alaska and the Yukon territory of Canada. Although gold had been found all across Alaska since the 1870s, it was news of a huge gold strike at Bonanza Creek in August 1896 that launched the frenzy of the last great gold rush. The outside world learned of the riches of the Yukon Valley in the summer of 1897, when two ships arrived in San Francisco and Seattle loaded with about \$1.1 million in Alaskan and Canadian gold. By the time winter cut communications, 2,000 prospectors had gathered in Canada at the former fishing camp of Dawson, at the head of the Yukon, with several thousand others on their way. Dawson profited from the influx of prospective miners. By the summer of 1898 it had a population of 30,000, making it the largest Canadian city west of Winnipeg. A few of the immigrants settled in the area, but most fled for richer fields elsewhere in Alaska. The gold boom lasted only a few years, but the social, political, and economic impact of the gold rush continues to this day.

The Klondike strike was one of the best-publicized events of its time. Because of improved communications linking the Atlantic with the Pacific Coast, the news reached New York and Europe almost as soon as it reached the West Coast. New infrastructure unavailable in previous gold strikes, such as the transcontinental railroad completed in 1869, helped bring prospectors from all over the world. In addition to their money and their labor, these people brought their diseases, their language, and their drinking to the area. These took their toll on the native population of the Yukon. Alcoholism, smallpox and tuberculosis, and residential schools that operated only in English stripped many Native Americans of their lives and their culture.

The population of the Yukon never recovered from the boom years of the gold rush. A hundred years

Missionaries in camp on the way to the Klondike to preach to the miners during the Gold Rush, in Alaska, 1897.

after the Klondike strike, the total population of Yukon territory was only 33,000, only a little more than the town of Dawson in the boom years at the end of the nineteenth century. Gold production began again in the Yukon in 1996. But the production was expected to be no more than 125,000 ounces per year, far short of the one million ounces produced in 1900.

**GOLD! WE LEAPT FROM OUR BENCHES.
GOLD! WE SPRANG FROM OUR STOOLS.
GOLD! WE WHEELED IN THE FURROWS,
FIRED WITH THE FAITH OF FOOLS.**

Robert Service, a poet who lived in the Yukon

There are some direct links between Klondike gold and modern American business. John W. Nordstrom, a Swedish immigrant, used his gold stake to found the shoe store that still bears his name. The economic impact of the Klondike strike was usually less direct. Of the 100,000 hopeful prospectors who left for the Yukon in 1896–1897, only about 30,000 were able to complete the journey. Many of them passed through Pacific ports such as Seattle on their way home from the gold fields. These towns absorbed many of those miners, with or without their stake. According to *The Economist* magazine, the willingness

to take a risk—to persist in a difficult situation and, if the desired result does not materialize, to move on to another project—has become a characteristic of modern firms whose origins lie in the Pacific northwest. Businesses like Microsoft, Boeing, and Starbucks created corporate cultures that operate the same way that the successful Klondike miners did.

KNIGHTS OF LABOR

An American labor union, the Knights of Labor organization was founded in 1869 as a secretive fraternal society (the Noble Order of the Knights of Labor) in Philadelphia, Pennsylvania. A garment worker Uriah Stephens (1821–1882) and several of his colleagues banded together and opened membership to anyone except physicians, lawyers, bankers, professional gamblers, stockbrokers, and liquor dealers. After a relatively slow start in the depressed economy of the 1870s, when it spread mostly to coal-mining regions of Pennsylvania, the Knights of Labor's membership grew dramatically from fewer than 10,000 members in 1879 to 730,000 members in 1886. Recruiting women, blacks, immigrants, as well as unskilled and semiskilled workers alike, the Knights of Labor began working for reforms, including better wages, hours, and working conditions. The open-membership policy provided the organization with a broad base of support, something previous labor unions, which had limited membership based on craft or skill, lacked.

At a general meeting of its members in Reading, Pennsylvania, in 1878, the organization set its objectives. It wanted an eight-hour workday, prohibition of child labor (under age fourteen), equal opportunities and wages for women laborers, and an end to convict labor. The group became involved in numerous strikes from the late-1870s to the mid-1880s. At the same time, a faction of moderates within the organization was growing, and in 1883 it elected American machinist Terence Powderly (1849–1924) as president. Under Powderly's leadership, the Knights of Labor began to splinter. Moderates pursued a conciliatory policy in labor disputes, supporting the establishment of labor bureaus and public arbitration systems. Radicals not only opposed the policy of open membership, they strongly supported strikes as a means of achieving immediate goals—including a one-day general strike to demand implementation of an eight-hour workday.

Violence that sometimes attended labor strikes not only hurt the cause of organized labor in the country, it further divided the Knights: In May 1886, workers demonstrating in Chicago's Haymarket Square attracted a crowd of some 1,500 people; when police arrived to disperse them, a bomb exploded and rioting ensued. Eleven people were killed and more than a thousand were injured in the melee. For many Americans, the event linked the labor movement with anarchy. That same year several factions of the Knights of Labor seceded from the union to join the American Federation of Labor (AFL). The Knights of Labor remained intact for three more decades, before the organization

officially dissolved in 1917, by which time the group had been overshadowed by the AFL and other unions.

KNOPF, BLANCHE

A leading U.S. publisher, Blanche Knopf (1894–1966) played a key role in twentieth century book publishing. By promoting books of controversial European authors, in English translation, and the books of U.S. minority groups (African American, Hispanic, and feminist authors), Blanche Knopf aggressively advocated a new cultural and intellectual climate for U.S. reading audiences, one that powerfully impacted, challenged, and changed their view of the world around them.

Born on July 20, 1894, in New York City, Blanche Wolf was an only child born to wealthy parents. As well as sending her to the elite Gardner School in New York, her parents provided the cultural and language training of her own French and German-speaking governesses.

Blanche grew up a keenly intelligent, aggressive, and demanding young woman, with high personal standards for intellectual excellence. At age twenty-two she married Alfred A. Knopf, whom she met at age seventeen and steadily dated thereafter. Alfred was a writer, editor, and a new publisher.

Together with her husband, Blanche Knopf founded and began building the publishing house Alfred A. Knopf Publishers, in 1915. By 1921, Blanche was director and vice president of the Knopf Publishing Corp.

Because she was perhaps the first woman of high position in a U.S. publishing firm, Blanche encountered sexism and personal censure in her professional life. She was openly denied membership to two powerful publisher's clubs—The Publisher's Lunch Club, and The Book Table, based on her sex. Despite certain closed doors, her flair for fluid social interaction, as well as a love for tough negotiating and strategic bargaining, proved great assets in difficult business situations. Without those personal qualities and her first-rate intelligence, she might have dismally failed in the highly competitive, male-dominated, publishing world of her day.

Blanche Knopf became one of the formidable publishers of her time, specializing in new material for the reading public. She sought out and discovered

Korean War

much new talent in Europe and Latin America and also began to publish the works of little known U.S. minority writers, like poet Langston Hughes and writers of the Harlem Renaissance. In publishing their works, Knopf provided a venue for many writers who had never before received much public attention. In doing so, she indirectly challenged contemporary U.S. thought.

Presenting to the public the words and ideas of African American and other minority writers, Knopf introduced a new world of expression to the literary mainstream—views of society by frequently suppressed minorities. She also introduced the new writings of Europeans in translated versions. Knopf introduced existentialism to the United States, publishing the works of Jean-Paul Sartre, Albert Camus, and Simone de Beauvoir. She also published other European giants such as Andre Gide, Thomas Mann, and the controversial psychiatrist, Dr. Sigmund Freud.

Publishing Simone de Beauvoir's work allowed Knopf to bring to U.S. readers one of the central works of mid-twentieth century feminism: *The Second Sex*. The book discussed the powerful and provocative issues of lesbianism, prostitution, and the nature of sex-role limitations, challenging the social conventions of the day.

Through her work Knopf assisted in the dissemination of ideas and issues that revolutionized thinking in the United States in the mid-twentieth century. Her efforts were regarded as controversial and, at the same time, emancipating because many of the books that caused such calamity in social circles were released at a time when the public was most conspicuously conservative in its sentiments (the late 1940s and 1950s).

Knopf and her husband continued to publish the best of foreign-language and minority writing, and the best of U.S. literature throughout their careers. They prided themselves on publishing books that were physically well-made, colorful—always with the hope that each book would challenge the ideas and imaginations of readers.

Blanche Knopf died in New York City on June 4, 1966. She continued to work as an editor until her death, despite losing much of her eyesight in middle age. Although not able to read new manuscripts in later life, she had many of them read aloud to her and retained the final say on what books were to be published.

KOREAN WAR

In 1948 as part of the boundary adjustments following World War II (1939–1945), Korea was supposedly temporarily divided for occupation by the Soviet Union and the United States as victorious former allies against Japan. The Korean peninsula, whose reclusive history in the seventeenth and eighteenth centuries led it to be called the "Hermit Kingdom," had been under Japanese control since the end of the Russo-Japanese War (1904–1905). The division following World War II was at the 38th parallel, a temporary line of demarcation with no other cultural or geographic significance. Like the artificial divisions of Germany and of Berlin in 1945, as well as the supposedly temporary division of North and South Vietnam in 1954, this bifurcation of the Korean nation was a result of the Cold War rather than internal developments.

In their zone lying north of the 38th parallel, the Soviets organized a socialist regime under the Communist Party. Established in 1948 as the Democratic People's Republic of Korea, the regime was headed by Kim Il Sung, a long-time leader of the Communist Party. In the South, various factions vied for power, until the party of the "father of Korean nationalism," Syngman Rhee, won a United Nations–sponsored election. On August 15, 1948, Rhee became President of the Republic of Korea. His regime was about as dictatorial as that in North Korea, and was implicated in corruption and in the repression of internal political opposition.

Both Korean governments were determined to achieve unification on their own terms. Shortly after partition, North Korea supported large-scale guerrilla incursions into the south, and retaliatory raids by South Korean forces kept the divided country in a state of crisis. Despite this situation, American troops were withdrawn in June 1949, leaving behind only a small group of technical advisers. South Korea, whose army was small, poorly trained, and poorly equipped, faced

The Korean peninsula was the scene of intense warfare between 1950 and 1953.

an adversary with an army of 135,000 men, equipped with modern Russian weapons, and between 150 and 200 combat airplanes. Although South Korean leaders and some Americans feared that North Korea might attack across the 38th parallel at any time, Secretary of State Dean Acheson, declared that Korea was not within the “defensive perimeter” of America’s vital interests in the Far East.

The attack came on June 25, 1950. North Korean armed forces—armored units and mechanized divisions supported by massive artillery—struck without warning across the demarcation line. Meeting little resistance, within thirty-six hours North Korean tanks were approaching the outer suburbs of Seoul, the capital of South Korea.

Contrary to Korean and Soviet expectations, the United States reacted swiftly and with great determination. Immediately after the attack the United States requested that the UN Security Council hold a special session which passed a unanimous resolution calling for the end of hostilities and the withdrawal of North

Korean forces to their former positions north of the 38th parallel. The Soviet Union would probably have vetoed such a resolution but the Soviets were boycotting the Security Council to protest the failure of the UN to include Communist China in its deliberations. In any case, the resolution was ignored by the North Koreans and the Security Council met again on June 27 and passed another resolution recommending that “the members of the United Nations furnish such assistance to the Republic of Korea as may be necessary to repel the armed attack.” On June 27, U.S. President Harry S Truman committed U.S. Air and Naval forces to the “police action” (a war was never formally declared) as well as ground forces stationed in Japan.

The North Koreans, however, continued their advance. By the end of June, more than half of the Republic of Korea (ROK) Army had been destroyed, and American units were forced to fight countless rear-guard actions in the retreat southward. In early August, a defense perimeter was created around the important port of Pusan at the extreme southeastern corner of the peninsula. After violent fighting, a stable defense line was established. As American forces and contingents from fifteen other nations poured in, General Douglas MacArthur, Commander-in-Chief of U.S. forces in the Far East and Supreme Commander of the UN forces, decided on a daring amphibious landing at Inchon, a west coast port just a few miles from Seoul. The brilliantly conceived operation, launched on September 15, 1950, proved successful, and the North Korean Army, was forced to retreat back across the 38th parallel. Pressed by public demands for a complete victory, the Truman Administration gave General MacArthur the go-ahead to pursue the enemy across the demarcation line, justifying the decision with the UN Security Council’s authorization. The first crossings took place on October 1. United Nations and ROK forces moved north, and by late November they were nearing the Yalu river boundary between North Korea and Communist China.

The seesaw struggle was reversed once again by the entry of Chinese “volunteers” into the war. Chinese leaders had warned that they would not allow North Korea to be invaded and would come to the aid of the North Koreans. By late October, thousands of Chinese soldiers had crossed the Yalu. One month later, they struck at the exposed flank and rear of MacArthur’s overextended armies. By early December, UN troops were again in headlong retreat, a withdrawal marked by great heroism but resulting in near disaster.

This created a crisis of the first order for President Truman. Truman wanted to stabilize the battle lines

and negotiate an end to the war. General MacArthur wanted to attack China, possibly using tactical nuclear weapons. He said as much in a letter to House Republican leader Joseph W. Martins. Truman could not brook this challenge to his authority and, on April 11, 1951, he relieved MacArthur of command. Although the public clearly sided with MacArthur, Truman's strong stand settled the question of civilian control over the military.

A new battle line was organized south of the 38th parallel, and through the remaining winter and early spring months the lines fluctuated from south of Seoul to north of the parallel. Stalemate finally was achieved in July 1951. The conflict settled down to trench warfare, at which the Chinese were particularly adept, and was marked by indecisive but bloody fighting. This conflict lasted for two cruel years, during which time, more than a million Americans served in Korea.

For much of this period, talks proceeded at P'anmunjom, Korea near the 38th parallel. These talks opened on July 10, 1951 at the suggestion of the Communists. Welcomed by the most Americans, these negotiations were designed to achieve a cease-fire and an armistice. They were broken off repeatedly as germ warfare charges and difficulties over prisoner-of-war exchanges clouded the atmosphere.

The stalemate in Korea was a source of mounting frustration in the U.S., where it heightened the "red scare" and furnished ammunition to Senator Joseph McCarthy in his quest to purge leftists from the government and from influence in the society at large. The Korean War also helped elect Dwight D. Eisenhower to the Presidency. The Republican nominee won support by promising to go to Korea if elected. Eisenhower kept his pledge, but the visit had no noticeable effect on the peace talks.

The Communists finally modified their position on forcible repatriation of prisoners, and a final armistice agreement was signed at P'anmunjom on July 27, 1953. It resulted in a cease-fire and the withdrawal of both armies two kilometers from the battle line, which ran from coast to coast from just below the 38th parallel in the west to thirty miles north of it in the east. The agreement also provided for the creation of a Neutral Nations Supervisory Commission to carry out the terms of armistice. The armistice called for a political conference to settle all remaining questions, including the future of Korea and the fate of prisoners who refused to return to their homelands. In succeeding months, the United Nations repatriated more than 70,000 North Korean and Communist prisoners but

received in return only 3,597 Americans, 7,848 South Koreans, and 1,315 prisoners of other nationalities. The political conference was never held, and relations between North and South Korea remained hostile.

The Korean War cost the United States approximately 140,000 casualties including some 22,500 dead, and \$22 billion. The results were somewhat inconclusive, but the war did prevent the Communist conquest of South Korea, and it demonstrated that the United States would fight to prevent the further spread of Communism. The war did change U.S. foreign policy. It marked a shift in military strategy from aiming for total victory to one of fighting limited wars.

The Korean police action also brought about a quick reversal of the policy of down-sizing the military. Major national security expenditures rapidly increased as a result of the war; national defense expenditures rose from four percent to 13 percent of gross national product in 1953. Defense spending revived inflationary impulses in the economy until the imposition of direct controls in January 1951 stabilized prices. In general, the Korean conflict changed the policy of containment from a selective European policy into a general global policy, and it contributed to the development of the military-industrial complex in America.

KRESGE, SEBASTIAN SPERING

There are certain businesses that have shaped and reshaped the American landscape: the automobile business, the radio and television industry, and what is

called “the variety store industry.” The variety store was a social invention of S. S. Kresge (1867–1966), the man who, at the turn of the twentieth century, began building so-called “five-and-dime” stores. By the mid-century these stores had evolved into the Kresge “variety stores” found in most American towns. They later became major innovators in retailing, operating huge discount retail stores known as K-Mart.

Sebastian Kresge was born in a small community in Pennsylvania in 1867. He was studious as a youngster and attended Fairview Academy, Gilbert Polytechnic Institute in Pennsylvania, and Eastman Business College in New York state. From an early age, he knew how to negotiate a business deal. When his parents had severe financial problems during his school years, Kresge made a deal with them: if they would finance his education, he would, as repayment, turn his entire salary over to them until he reached age twenty-one.

During his late teens, Kresge taught classes and worked as a deliveryman and clerk. By age twenty-three he was in the business world, working as a bookkeeper, selling industrial insurance, and investing in a half-share of a bakery.

The 1890s, for most Americans, were a time of economic depression. During this period of “hard times”, Kresge had the idea of starting a chain-store operation based on low-end products. By 1899 Kresge and his partner J. G. McCrory opened stores in Memphis, Tennessee, and Detroit, Michigan. During 1899 Kresge traded his interest in the Tennessee store to McCrory and took full possession of the Detroit store. The Detroit store was a starting point of the largest chain-store company in America, the S. S. Kresge Co.

The large sign on the Detroit store read: “Nothing Over 10 Cents in Store” and customers poured in. Kresge opened another store with his brother-in-law in Port Huron, Michigan, about 150 miles from Detroit. By 1907 Kresge had created S. S. Kresge stores in Indianapolis, Indiana, in Toledo, Columbus, and Cleveland, Ohio, and in Chicago.

I NEVER MADE A DIME TALKING!

Sebastian Kresge

While making a fortune by selling his inexpensive products under one roof, Kresge was also developing a reputation as a miser. Though he became a millionaire while quite young, he still wore his suits until they became threadbare and he often lined his old shoes with paper instead of resoling them. He was a devout

Methodist and Republican who never used alcohol or tobacco and who refused to be charitable toward anyone who did drink or smoked. Kresge was once asked to give a speech to a school of business administration. The speech, aimed at business students, was stunningly short and to the point. It had only 6 words: “I never made a dime talking!”

Kresge was able to maintain the ten-cent limit in his stores until 1920, when he began selling items worth up to one dollar. After World War II he began selling a range of goods at various prices. His store became a “variety store,” but he was still holding on to the inexpensive end of the product market. By 1961 Kresge approved an \$80 million deal to finance a line of stores called K-Mart and another discount chain, to be located in deteriorating neighborhoods, known as Jupiter stores. By 1966 the Kresge chain stores were the second largest in the country, with annual sales of \$850 billion.

Though Kresge lived much of his personal life like a pauper, his consistent philanthropy, which became evident when he started the Kresge Foundation in 1924, served as an example for other benevolent foundations. Kresge explained his philanthropic spirit simply: “I can get a greater thrill out of serving others than anything else on earth. I really want to leave the world a better place than I found it.” Since its founding in 1924, with an initial endowment by Kresge of \$1.3 million, the Foundation has generously helped children’s organizations, colleges, universities, and many other causes. By the time of his death (in 1966, at age 99), Kresge had endowed the Kresge Foundation with over \$275 million.

Kresge was a businessman who aimed his business at those who were not rich, and he made a fortune by doing so.

KROC, RAYMOND ALBERT

Raymond Albert Kroc (1902–1984) had the energy, the salesmanship, and the inspiration to build the greatest international restaurant chain empire in the world, McDonald's Corporation. He was a genuine pioneer of the modern fast-food restaurant business. He took the assembly-line methods of big industry and applied them to a restaurant franchise business that produced a small, standardized menu at low cost to the consumer. Kroc was a super salesman who, at age 52, bought "the golden arches" symbol and the name from the McDonald's brothers drive-in restaurant of San Bernardino, California, to build the McDonald's chain of restaurants. Based on the concepts of a limited menu of controlled quality and predictable uniformity, Kroc's restaurants operated on the credo of "quality, service, cleanliness, and value," and used a massive advertising campaign to promote itself.

In 1902 Kroc was born in Chicago, Illinois, the son of relatively poor parents. He went to public school in the Chicago suburb of Oak Park, but did not graduate from high school. Instead, he left school to open his own music store. When World War I (1914–18) began, Kroc lied about his age in order to serve as an ambulance driver for the American Red Cross (like his neighbor in Oak Park, author Ernest Hemingway).

Kroc, passionate about music as a young man, returned to Illinois after World War I to become a jazz pianist, playing with at least two well-known jazz orchestras. He also became the musical director of one of Chicago's pioneer radio stations, WGES.

Yet, in 1924, a restless Kroc, dissatisfied with the outlook for a career in music, decided to become a salesman. During a period of booming development in Florida, he left Chicago to try his hand at selling real estate in Fort Lauderdale. The boom collapsed in 1926, and Kroc returned to Chicago with his first wife and their child. In Chicago, Kroc became a salesman for the Lily Tulip paper cup company, where he later became Midwestern sales manager, and developed strong promotional and sales skills.

I PUT HAMBURGERS ON THE ASSEMBLY LINE.

Raymond Kroc

In 1937 Kroc ran into an invention that captured his imagination—a machine called a "multimixer" that could make five milkshakes at a time instead of just one. At a time when milkshakes were very popular,

Kroc saw the potential in this invention. By 1941 he had left Lily Tulip and founded his own company to serve as the exclusive distributor for the multimixer. It was a successful business that made Kroc modestly wealthy, but it was not the one that would bring him legendary greatness as an entrepreneur.

Kroc became intrigued with one of his multimixer clients, the McDonald brothers, who owned a drive-in restaurant in San Bernardino, California. The brothers used eight of his mixers at once. A curious Kroc traveled to California in 1954 to find out why so many mixers were being used by this single drive-in.

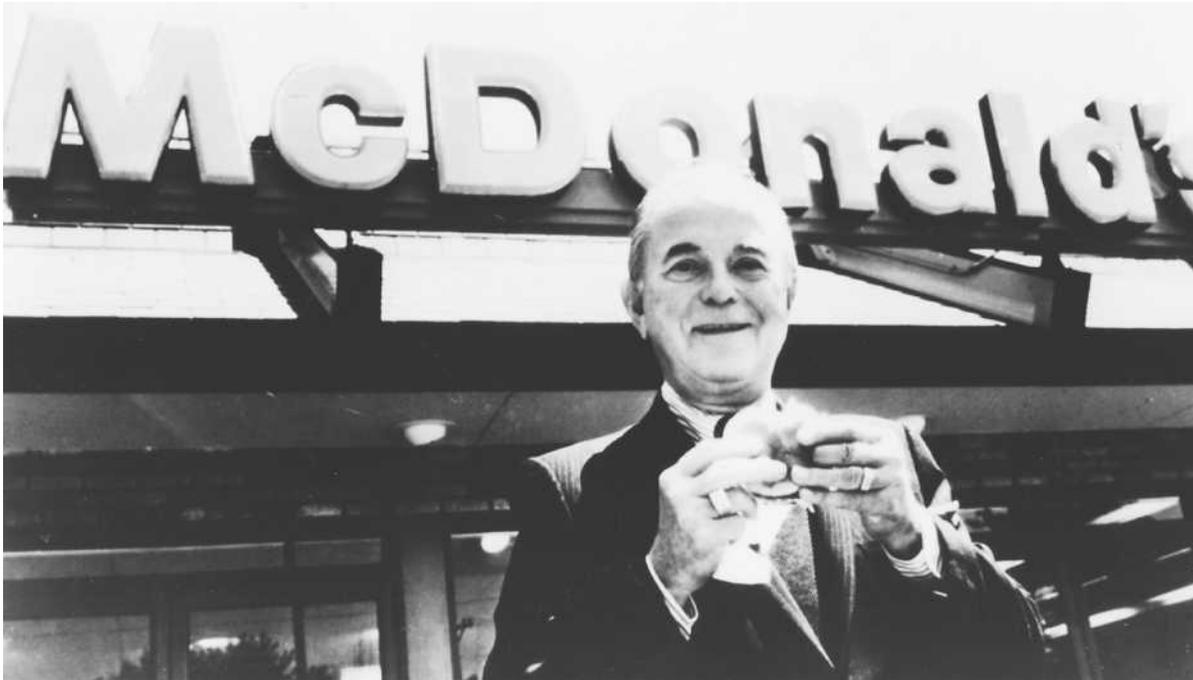

Kroc discovered the brothers McDonald sold just three items: hamburgers, French fries, and milkshakes. Moreover, the "restaurant" only had walk-up windows. The McDonald brothers were specializing in the first "fast food" service.

Kroc marveled at the efficiency of the operation. He was certain he had stumbled on that "once in a lifetime opportunity." The McDonald brothers agreed with Kroc's suggestion that he should open a national chain of their restaurants. The energetic 52-year-old veteran salesman entered into a franchise arrangement with the brothers and in 1955 opened his first store in Des Plaines, Illinois. Kroc quickly opened many franchises and oversaw quality control with an iron hand. His practice of purchasing the land used by the franchises for their operations, not leasing, eventually made McDonald's one of the largest real estate owners in the world.

By 1971 Ray Kroc had bought out the McDonald brothers' share of the business and became the sole owner of McDonald's Corporation. Kroc publicized his business relentlessly using every kind of advertising. Early in his career as Chief Executive Officer (CEO) of the business Kroc said, "I put hamburgers on the assembly line." His stores were not restaurants. Instead they were designed for frequent customer turnover. He forbade the installation of telephones, jukeboxes, or anything that encouraged loitering in the establishment.

Kroc opened his "McDonald's University" in 1972, where every new franchise owner trained in McDonald food production techniques. The school became known as "Hamburger University."

The company used national advertising in every available medium during the 1960s, when McDonald's clown-spokesman, "Ronald McDonald," was born.

Raymond Kroc.

Television advertising was aimed at both children and adults. The McDonald's brand name had an enormous impact on America's cultural fabric. The golden arches became the second most widely recognized trademark, behind Coca Cola.

The company is striking success. Some labor experts estimated that McDonald's was the first place of employment for one in fifteen Americans. Fast-food industry observers estimate that 96 percent of Americans have eaten at McDonald's at least once.

The company founded its international division in 1969. At the end of the twentieth century the international division provided 50 percent of McDonald's operating income, putting the "golden arches" into 85 countries, and adding \$30 billion to its annual income.

McDonald's is also known for its philanthropy, including the creation of Ronald McDonald Houses, which provide live-in facilities for family members of seriously ill, hospitalized children. These residences, which are often near hospitals, have been a great help to the parents of the terminally ill.

In 1984 Ray Kroc died of heart failure at the age of 81. He was survived by his third wife. One of America's most successful entrepreneurs, Kroc is often thrust into the pantheon of American business world that includes Henry Ford, Andrew and Dale Carnegie, John D. Rockefeller, and J.P. Morgan.

KROGER COMPANY

The Kroger Company traces its roots back to 1883, when Bernard H. Kroger began the Great Western Tea Company, one of the first chain store operations in the United States. Kroger left school to go to work at age 13 when his father lost the family dry goods store in the financial panic of 1873. At age 16 he sold coffee and tea door-to-door. At 20 he managed a Cincinnati grocery store, and at 24, he became the sole

Kroger Company

owner of the Great Western Tea Company, which by the summer of 1885 had four stores. Kroger's shrewd buying during the panic of 1893 raised the number of stores to 17, and by 1902, with 40 stores and a factory in Cincinnati, Kroger incorporated and changed the company's name to The Kroger Grocery and Baking Company.

Kroger Company historians characterize B.H. Kroger as somewhat of a "crank," fanatically insistent upon quality and service. Profanity was called his second language; he often advised his managers to "run the price down as far as you can go so the other fellow won't slice your throat."

Part of Kroger's success came from the elimination of middlemen between the store and the customer. In 1901 Kroger's company became the first to bake its own bread for its stores, and in 1904 Kroger bought Nagel Meat Markets and Packing House which made Kroger grocery stores the first to include meat departments. This important innovation, however, was not easy. It was common practice at that time for butchers to short weigh (give a customer less than the stated weight) and take sample cuts home with them, practices that did not coincide with B. H. Kroger's strict accounting policies. When Kroger installed cash registers in the meat departments, every one of them inexplicably broke. When Kroger hired female cashiers, the butchers opened all the windows to "freeze out" the women and then let loose with such obscene language that the women quit in a matter of days. When Kroger hired young men instead as cashiers, the butchers threatened them with physical force. But Kroger was stubborn, and in the long run his money-saving, efficient procedures won out.

From the beginning Kroger was interested in both manufacturing and retail. His mother's homemade sauerkraut and pickles sold well to the German immigrants in Cincinnati. And in the back of his store, Kroger himself experimented to invent a "French brand" of coffee, which is still sold in Kroger stores. The Kroger Grocery and Baking Company soon began to expand outside of Cincinnati; by 1920, the chain had stores in Hamilton, Dayton, and Columbus, Ohio. In 1912 Kroger made his first long-distance expansion, buying 25 stores in St. Louis, Missouri. At a time when most chains hired trucks only as needed, Kroger bought a fleet of them, enabling him to move the company into Detroit, Michigan; Indianapolis, Indiana; and Springfield and Toledo, Ohio.

After World War I (1914–1918), the company continued to expand, following Kroger's preference

for buying smaller, financially unsteady chains in areas adjacent to established Kroger territories. In 1928, one year before the stock market crashed, Kroger sold his shares in the company for more than \$28 million. One of his executives, William Albers, became president. In 1929 Kroger had 5,575 stores, the most there have ever been in the chain.

During the Great Depression (1929–1939), the company maintained its business. By 1935 Kroger had 35 "supermarkets," adopting the format that had debuted earlier in the decade, consisting of a bigger self-service grocery store featuring large quantities of food at low prices. Frozen foods and shopping carts were introduced in the 1930's. And, instead of going through the usual channels for buying produce, the Kroger Grocery and Baking Company began to send its buyers to produce farms so they could inspect crops to ensure the quality of the food their stores sold. This counteracted the frequent complaint that chain stores sold low-quality foods. This policy eventually resulted in the formation of Wesco Food Company, Kroger's own produce procurement organization.

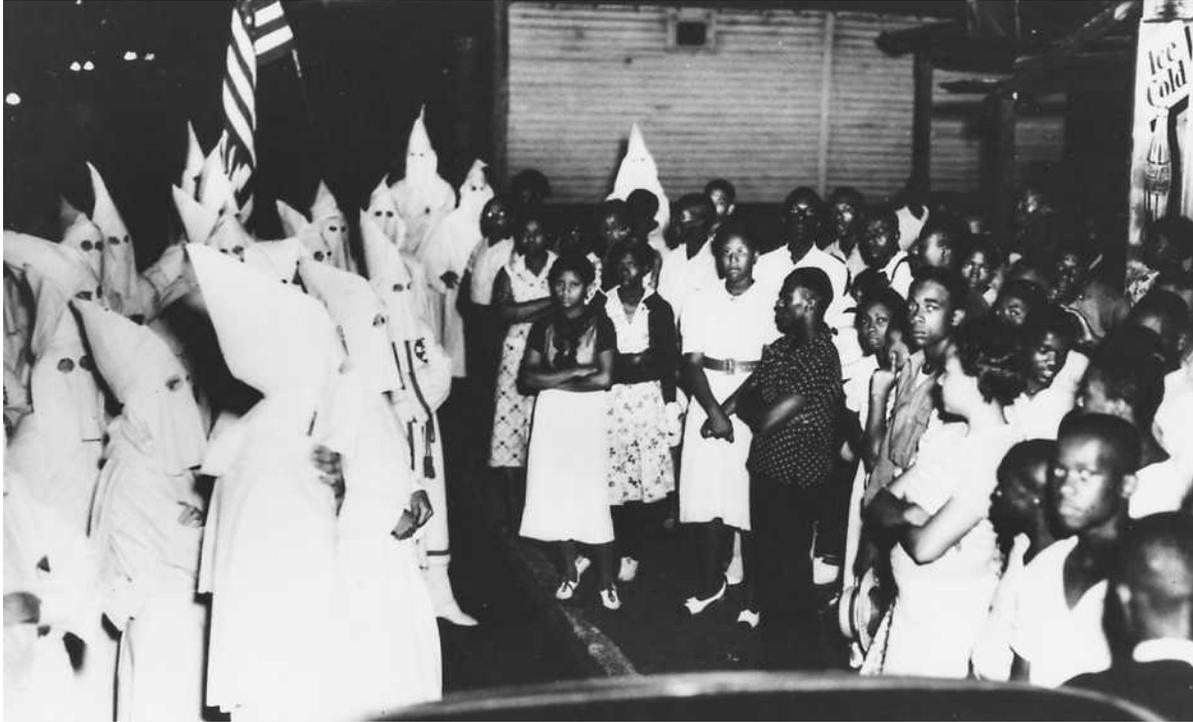

Following World War II (1939–1945), the company changed its name to the Kroger Company. The postwar period was a time of rapid growth for supermarkets. Between 1948 and 1963, the number of supermarkets in the country nearly tripled and Kroger participated in this fast growth. In 1960 the company began its expansion into the drugstore business, with an eye on the potential for drugstores built next to grocery stores. To increase the accuracy and speed of checkout systems, in 1972 Kroger, in partnership with RCA, became the first grocery company to test electronic scanners under actual working conditions. Also during the 1970s Kroger moved more towards the "superstore" concept of one-stop shopping, testing additional in-store specialty departments such as beauty salons, financial services, cheese shops, and cosmetic counters. By the late 1990s Kroger was the largest grocery retailer in the United States with 1,400 stores located in 24 states.

KU KLUX KLAN

The Ku Klux Klan (abbreviated KKK) is a white supremacist group—members believe in the superiority of whites over other races. The first part of the name ("Ku Klux") is derived from the Greek word *kyklos*, meaning circle. Klan is a derivative of the English word "clan," meaning family. The group was originally formed in 1865 in Pulaski, Tennessee, when Confederate Army veterans formed what they called a social club. The first leader (called the "Grand Wizard") was Nathan Bedford Forrest (1821–1877), a former general in the Confederate Army, who, on April 12, 1864, in the final days of the American Civil War

(1861–1865), led a massacre of three hundred African American soldiers in service of the Union Army at Fort Pillow, Tennessee.

As the unofficial arm of resistance against Republican efforts to restore the nation and make full citizens of its African American (formerly slave) population, the Ku Klux Klan waged a campaign of terror against former slaves in the South. Klan members, cloaked in robes and hoods to disguise their identity, threatened, beat, and killed numerous African Americans. While the group deprived its victims of their rights as citizens, their intent was also to intimidate the entire African American population and keep them out of, or in some cases remove them from, politics. People who supported the federal government's measures to extend rights to *all* citizens also became the victims of the fearsome Klan. Membership in the group grew quickly and the Ku Klux Klan soon had a presence throughout the South.

In 1871 the U.S. Congress passed the Force Bill, giving President Ulysses S. Grant (1869–1877) authority to direct federal troops against the Klan. The action was successful, causing the group to disappear—but only for a time. The society was newly organized at Stone Mountain, Georgia, in 1915 as a Protestant fraternal organization (called "The Invisible Empire, Knights of the Ku Klux Klan, Inc."), this time widening its focus of persecution to include

Ku Klux Klan

Roman Catholics, immigrants, and Jews, as well as African Americans. Members of all of these groups became targets of KKK harassment, which now included torture and whippings. The group, which proclaimed its mission to be “racial purity,” grew in number and became national, electing some of their members to public office in many states (and not just Southern states). The KKK’s acts of violence, however, raised public ire, and by the 1940s, America’s attention focused on World War II (1939–1945) and the Klan

died out or went completely underground. The group had another resurgence during the 1950s and into the early 1970s, as the nation struggled through the civil rights era. The Klan still exists today, fostering the extremist views of its membership and staging marches to demonstrate its presence on the American landscape. Such demonstrations are often attended by protestors, with violence being the sad outcome.

L'ANSE AUX MEADOWS

L'Anse aux Meadows, on the northeastern tip of Newfoundland, Canada, may have been the first European settlement in North America. In the 1960s Norse ruins were found here, leading scholars to believe this was the site described by Norsemen (Vikings) after they visited a portion of the North American coast around A.D. 1000. The Viking voyages were recorded in a book called the *Greenlanders' Saga* (1200). Norwegian-born Leif Ericsson (c.970–c.1020) is generally credited with having been the first European to set foot on North American soil. Ericsson was the son of navigator Erik the Red who founded a Norse settlement in Greenland, where he moved his family in 985 or 986. About the same time another Norseman, Bjarni Herjolfsson, who was driven off course on his way from Iceland to Greenland, became the first European to see North America, but he did not go ashore. It is believed that Ericsson decided he would follow up on this discovery, and about 1001 he set out from Greenland with a crew of 35 men and probably landed on the southern end of Baffin Island (north of the province of Quebec). The expedition likely reached Labrador, Canada, and later landed on the coast of what is today Nova Scotia or Newfoundland, Canada. This landfall may have been L'Anse aux Meadows. Ericsson and his crew spent the winter of 1001–02 at a place he called Vinland, which was described as well wooded and abounding in fruit, especially grapes. He returned to Greenland in the spring of 1002.

The first authenticated European landing in North America was in 1500 when Portuguese navigator Gaspar de Corte-Real (1450?–1501?) explored the coast of Labrador and Newfoundland.

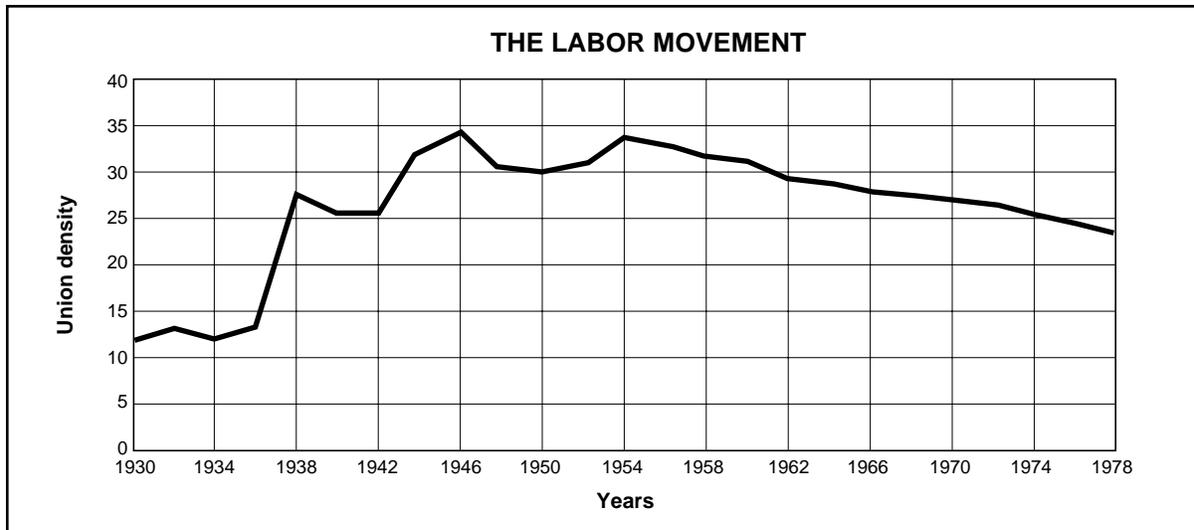

LABOR MOVEMENT

In the last decades of the nineteenth century it appeared that labor was unable effectively to challenge

the combined wealth and power that capitalism in its industrial phase had created. The merger movement brought corporations together into vast concentrations of economic power resting in the hands of relatively few men. These trusts, pools, mergers, “gentlemen’s agreements,” and other instruments of capital consolidation transformed the structure of whole industries, from oil to coal mining, railroads, iron and steel, and meat packing.

This had a major impact on labor relations. On the one hand, the concentration of capital increased the economic power of the “captains of industry.” These vertical and horizontal monopolies brought them the ability, seemingly, to do whatever they liked. Even the growing power of the government seemed unable to contain the power of capital. By the end of the nineteenth century the power among the monopolists seemed to be shifting towards the bankers. An example of this preeminent power of finance capital occurred during Theodore Roosevelt’s administration. Roosevelt, who believed that the government must be strong enough to curb the “bad trusts,” prosecuted and “busted” the Northern Securities railroad holding company in 1904. J. P. Morgan, who was behind the trust, had pleaded unsuccessfully with Roosevelt that “if we have done something wrong send your man to my man and they can fix it up.” In 1904, when the Supreme Court sustained the President’s prosecution under the Sherman Anti-trust Act and the Northern Security trust was dissolved, Morgan quietly sustained this challenge to his authority.

Then a few years later, Morgan quietly stepped in to save Roosevelt’s political hide when the financial panic of 1907 threatened to scuttle a number of New York banks which might set off a general depression. Working behind the scenes, Morgan constructed a pool of financial support from other banks. Morgan, however, told Roosevelt that the crisis could be avoided only if the government agreed not to prosecute a trust involving U.S. Steel and the Tennessee Coal and Iron

Union density refers to membership in labor unions, proportional to the work force. Between 1930 and 1954 union density increased sharply, with only slight declines.

Company, whose stock was held by one of the threatened banks. Roosevelt had to promise to let the deal go through. To observers it was obvious that the bombastic, trust-busting Roosevelt might make more noise in a confrontation with finance capital, but that the real power was in Morgan's hands.

With this kind of power arrayed against labor, what was the use in trying to organize trade unions? The answer, at least in part, is that by bringing capital together, the merger movement also brought workers together in larger concentrations. One example of this, taken from the 1930s and early 1940s, was the anti-union measures taken by the Ford Motor Company. Henry Ford resisted unionization for decades, but when he built the Dearborn, Michigan Rouge River complex of auto factories and steel mills with a workforce in excess of 80,000, it was only a matter of time before the United Automobile Workers Union (UAW) would successfully organize the plant. It is no coincidence that the first nation-wide strikes in the nineteenth century were called by unions in the railroad industry. The railroads were powerful in their resistance to unions, it is true, but they were also vulnerable. Though they both failed, the "Rebellion of 1877" and the Pullman strike in 1894 demonstrated the strategic strength of labor in these new industries.

As for the rest of the economy, labor in the 1880s seemed to be combative, but generally too weak successfully to press its claims for higher wages, shorter hours, and safer working conditions. One of the most interesting workers' associations of the time was the Knights of Labor. This group was less successful in winning strikes than in laying the groundwork for a

strong culture which emphasized solidarity among workers. Their mode of labor organizing was to found "regional assemblies" which included workers in several nearby industries. This approach stimulated a class-conscious culture, but it was hard to fight strikes when the union was not organized to concentrate on the target industry. Led by a machinist, Terence V. Powderly, the Knights were eclectic in their organizing strategy. They sought to enroll all workers into their lodges; women and African Americans were not excluded; only the "parasitic" elements in the communities were not allowed to join—the lawyers, the tavern keepers, bankers and gamblers.

With the Haymarket Riots in Chicago in May 1886, the deteriorating relations with the employers and the government led the labor movement to split in two. One part was the Industrial Workers of the World (IWW). Like the Knights of Labor, the IWW sought to organize all workers in "One Big Union." Also called, affectionately, the "Wobblies," the IWW's roots lay in the unskilled and unruly lumber workers of the northwest, the migrant agricultural workers of the great plains, the Western Federation of Miners, and the textile workers of Lawrence, Massachusetts. They expressed a political culture of American working class radicalism—a political culture that is so complex as to challenge definition. They engaged in free-speech campaigns in southern California during the repressive days of World War I, stepping up to give anti-war speeches on soap-boxes; being dragged away by police; only to be replaced by another speaker. They also most probably murdered mine owners whenever they could get close enough to them. In the exchange of

violence, however, they were more often the victims than the perpetrator. They were what political scientists call “Anarcho-Syndicalists,” (or anarchist-unionists). They believed that there can only be warfare between labor and capitalism and that either capitalism or socialism would emerge from the battle. They refused to negotiate or sign labor contracts with management because that would signify an accommodation between labor and management. Instead, they simply instigated strikes, something they were very good at. Eventually, as American labor became institutionalized, the Wobblies faded away.

The other side of the split in American labor in the late nineteenth century was the American Federation of Labor. In an era in which the employers seemed to be bent on merger and monopoly, other labor leaders began to think of consolidating the labor movement in a different way—by combining the existing trade unions into a national federation similar to the British Trades Union Congress (TUC). In response to management’s monopoly of capital, they set out to monopolize labor, but they did so in a very different way than the Wobblies. This new federation, the American Federation of Labor, was formed in 1886. It did not shrink from the IWW’s fear of “legitimizing” normal relationships between labor and capital. That, in fact, was its goal—to become a legitimate voice of labor in a democratic capitalist society (a contradiction in terms, the Wobblies would have argued). It intended to use whatever tools it could to improve the condition and the wages of labor. It would lobby for legislation in Washington and the state capitals. Of it would go on strike. Like the British TUC, it was composed of craft unions and it promised its constituent unions complete autonomy in the operation of their relations with management. Meeting in Pittsburgh in November 1881, the national trades unions formed the Federation of Organized Trades and Labor Unions of the United States and Canada. The federation grew slowly, hindered at first by the economic recession from 1883 to 1885, and also by defeats in a number of labor disputes. Eventually, in 1886 they formed the American Federation of Labor.

The AFL called for solidarity among workers, but they did so through supporting each others’ boycotts and refusals to “handle struck goods.” They didn’t call for the end of the wage labor system. They called for an alliance of labor unions committed to bread-and-butter wage and working conditions, rather than political or social issues and advocacy. At the convention in December 1886, the American Federation of Labor was born. Samuel Gompers of the Cigarmakers’ International Union was elected president. Eschewing utopianism and espousing practical objectives, the AFL

was able to survive the disastrous strikes of the early 1890s, and emerged in 1897 from the depression of that decade with 265,000 members and uncontested dominance in the American labor movement.

With the revival of traditional conservative pro-business politics after World War I (1914–1918), and the anti-Communism of the first “red scare” (1919–early 1920s) labor evinced a desire to appear “legitimate” and non-controversial. As would happen in the second “red scare” of the early 1950s, the leaders of the AFL denounced the radicals in the labor movement. They stood by as several union leaders accused of instigating the Haymarket Riot in Chicago were indicted, tried, found guilty, and hanged (although the accused were not present at the riot).

Pressing their advantage during the 1920s, the company-sponsored offensive against unions included hard-nosed policies like hiring armed company guards, strikebreakers, and agents provocateurs (hired infiltrators who instigated violence to bring down the repression by the police and the courts), as well as the tactic of founding non-controversial and ineffective “company unions.” Capitalizing on anti-labor sentiments in the population at large, employers drew upon local and state authorities to deploy mounted police and militia to harass and arrest union organizers and disrupt picket lines. Yellow-dog contracts, which threatened workers with dismissal should they join a union, became commonplace. Under the auspices of the National Association of Manufacturers, anti-labor propaganda circulated widely, systematically arguing in favor of open shops, which allowed nonunion workers to be employed even though a union may have organized the workplace.

The protective legislation that Gompers and his fellow labor leaders thought they saw in the 1914 Clayton Act’s provisions excluding unions from prosecution for being “in restraint of trade” was shredded by a U.S. Supreme Court decision in 1921. In *Duplex Printing Press Company v. Deering*, the Supreme Court interpreted the Sherman and Clayton Acts as protecting employers from labor violence, from secondary boycotts, and from the use of other labor tactics that could be construed as unlawful interference with interstate commerce.

Speaking for a conservative Court, Justice Mahlon Pitney held that certain union tactics constituted unlawful interference with interstate commerce and therefore were subject to antitrust laws. By holding unions accountable under antitrust laws for anything the Court deemed to be other than normal and legitimate union activity, the Court effectively nullified the Clayton

Labor Movement

Act's labor provisions, and made it almost impossible for unions to organize workers in nonunion companies.

But under President Franklin D. Roosevelt's administration (1933–1945), things changed for labor. Title 7(a) of the National Industrial Recovery Act (NIRA), gave labor unions the legal right to bargain collectively, and Roosevelt often backed labor in efforts to put forth its side of the story in disputes with management. It was mainly the Congress of Industrial Organizations that benefited from the government's decision not to repress labor. (Under the leadership of United Mineworker President John L. Lewis, the CIO split from the AFL in 1935 and set about organizing the semi-skilled labor in the new mass production industries like auto, steel, and rubber. The CIO demanded that all labor must be organized, not just the skilled trades).

A conservative Supreme Court struck down NIRA, but Congress passed the National Labor Relations Act (the Wagner Act), which upheld the right to bargain collectively, authorized the Fair Labor Standards Act (which continued the 40-hour workweek) and prohibited child labor, and established the National Labor Relations Board to mediate during industrial disputes. When labor unions added the clout of the sit-down strike to government assistance, they secured for themselves living wages and purchasing power.

The 1955 merger that created the American Federation of Labor–Congress of Industrial Organizations (AFL-CIO) healed a serious rift in the American labor movement, but a number of critical problems haunted AFL-CIO leadership during the next 15 years. The nation's political mood following passage of the Taft-Hartley Act in 1947—and the state “right to work” laws that ensued—continued to be generally hostile toward organized labor. Much of this hostility was rooted in public perceptions that many unions were infiltrated and dominated by Communists or, equally menacing to the public welfare, that they were run by corrupt officials in collaboration with organized crime.

The U.S. Secretary of Labor, James P. Mitchell, reflecting the views of President Dwight D. Eisenhower's administration (1953–1961), announced to the 1957 AFL-CIO convention that the president would soon propose legislation to protect union members from “crooks and racketeers.” That prediction anticipated passage of the Labor-Management Reporting and Disclosure Act (Landrum-Griffin Act) two years later. When the Senate Permanent Subcommittee on Investigations, led by Senator John L. McClellan (D-Arkansas) and its chief counsel, Robert F. Kennedy, shifted its focus toward union corruption and

racketeering, labor leaders began to realize the disruptive potential of union reform. Within months, committee revelations concerning corruption among unions of operating engineers, plumbers, and retail clerks became national news.

Aware that the image of organized labor had become badly tarnished, labor leaders during the 1960s attempted to take the lead in cleansing the unions of communist influences as well as dishonest union officials and mobsters. After the merger, the burden of these efforts fell to the AFL-CIO's first president, George Meany, a New York City plumber by trade and a respected organizer and union leader. In his capacity as the McClellan Committee's chief counsel, Robert F. Kennedy personally presented Meany with damning evidence against the AFL-CIO's largest constituent union, the Teamsters.

The Kennedy-Mollenhoff materials specifically alleged corruption involving, among others, Teamster president Dave Beck. Beck, an AFL-CIO vice president and executive committee member, testified in 1957 before the McClellan Committee about his purported theft of \$300,000 of union funds as well as his acceptance of money from employers. Meany was outraged that Beck invoked the Fifth Amendment ninety times. Meany stripped Beck of his AFL-CIO offices and his Teamster presidency and planned to present the Teamsters's 1957 convention with details of Beck's corruption. Under Beck's successor, Jimmy Hoffa, the presentation of the AFL-CIO report on Teamster corruption at the Teamster's 1957 convention was jeered and expunged from the record. Hoffa declared his union ready to “tell the AFL-CIO to go to hell.” Thus, in December 1957 the AFL-CIO expelled its largest union, the Teamsters.

Hoffa by that point was standing trial in New York for wiretapping the telephones of Teamsters who were to appear before the McClellan Committee. While under indictment, Hoffa presided over the Teamsters from 1957 until 1967, the year in which appeals from his 1964 conviction on separate charges of jury tampering, fraud, and conspiracy were exhausted and he began serving the remainder of a 13-year sentence in federal prison. In 1971, with his sentence commuted by President Richard Nixon (1961–1974), Hoffa retired from all Teamster offices with his union's thanks and an award of \$1.7 million, or about a dollar per member. In 1975, as news reports were circulating that the Teamster leader might be about to reenter active leadership of the union, Hoffa disappeared and was presumed murdered.

Meany's efforts to clean house and refurbish labor's name produced significant changes in the AFL-CIO. The AFL-CIO constitution prohibited union corruption and criminality; it did not, however, prescribe enforcement powers. Meany and his aides and committees expelled errant officials or unions, placed them on probation or under monitors, or gave them dated ultimatums to produce reforms. In initiating these actions, Meany challenged the historic autonomy that many unions, particularly those of the old AFL, had cherished as their right. Although Meany largely abandoned his drive against union corruption and criminality by 1963, leaving further measures to the U.S. Attorney General and Senate investigators, one momentous consequence of his reformism was the centralization of authority in the hands of AFL-CIO leaders. Management found themselves dealing less with a federation of unions than with the federation itself—the world's largest labor organization.

Critics from within the labor movement were quick to observe that a more centralized AFL-CIO was also more conservative and complacent. Some critics attributed a relative decline in nationwide union strength to this complacency. Although no observers lamented the convictions of expelled Teamster officials, least of all Beck and Hoffa, most noted that the Teamsters offered many workers one of few alternatives to the giant federation after the Teamsters' return to political favor during the Nixon administration. The union failed in its efforts between the 1960s and 1987 to reenter the AFL-CIO.

The post-Hoffa Teamsters displayed an interest in organizing almost any workers. This approach to organization, pushed regardless of organizational expense and with great daring, accelerated after 1975. The AFL-CIO avoided trying to unionize companies with only a handful of workers, but the Teamsters, in a spirit that strangely recalled the idealism of the Knights of Labor or the I.W.W., often sought recruits in shops with fewer than a dozen employees. It made no economic sense, but, to many Teamster organizers and rank and file, it was the right thing to do. The overall strength of the union rose only modestly to 1.8 million members by the end of the 1970s. In effect, the Teamsters were the AFL-CIO's only formidable and dynamic competition. This remained true until 1968, when Walter Reuther pulled his United Auto Workers (UAW) out of the AFL-CIO and promptly entered an alliance with the Teamsters. The UAW and the Teamsters each launched vigorous and innovative organizing campaigns that were supposed to put labor on the march again. (Reuther, however, died in a plane crash in 1970.)

After many attempts, the Teamsters were allowed to rejoin the AFL-CIO in 1987. Meany's AFL-CIO tried to maintain its membership during a lengthy relative decline in union membership. By the 1990s the labor scene was businesslike, closely monitored by law and by union leadership. A measure of respectability, if not huge popularity, had returned to a more centralized AFL-CIO.

LABOR UNIONISM (ISSUE)

A modern U.S. labor union is an organized body of workers banded together to better their standard of living by seeking higher wages and improved working conditions. Workers authorize their union representatives to negotiate with their employers in a process known as collective bargaining. If negotiation fails, the workmen often attempt to achieve their goals through strikes (withholding their labor) or by persuading others to boycott their employer's products.

Unions first appeared in the 1820s. They were usually small, local, and short-lived. As the factory system grew in the mid-19th century so did the need for workers' organizations. Before the Civil War (1861–65) such groups remained small and localized. But after the war efforts were made to form labor unions on a national scale.

The first such effort began in 1866 when several trade unions sent delegates to a convention in Baltimore. Under the leadership of William H. Sylvis this

group formed the National Labor Union. The organization grew rapidly and by 1872 it claimed 600,000 members. Its main issue was the eight-hour day, a demand that was regarded as extremely radical. The National Labor Union experienced success for a short time, but numerous factors combined to destroy it: Sylvis' death in 1869, the union's conversion to a political party in 1872, and the panic of 1873.

The next major effort began in Philadelphia in 1869. Under the leadership of garment maker Uriah S. Stephens six men founded the Noble Order of the Knights of Labor. Their platform called for the eight-hour day, an income tax, and workmen's compensation. Stephens maintained that such tactics as strikes were counter-productive, and advocated "education" as the proper means for workers to achieve their goals.

The Knights were structured on the "one big union" concept; all workers were welcome to join. The membership could include the skilled and unskilled, men and women, and people of all races. This broad inclusion policy was a radical idea at the time and eventually led to serious internal tensions.

Because Stephens feared counter-measures by employers, the organization was secret at first and growth was slow. By 1873 there were only three assemblies, all in Philadelphia. Ten years later the Knights had only 52,000 members. However they expanded rapidly after this initial period. By 1886 membership neared one million. This remarkable change occurred because the union veered away from Stephens' original principles and authorized its members to strike. Its reputation was enhanced when it won several of them, especially against railroad companies in Texas.

The Knights of Labor had no sooner reached their peak of growth than they fell into a rapid decline. Unsuccessful strikes undermined their prestige, which was further damaged by factional differences and financial problems. In addition the Knights faced competition from a new organization known as the American Federation of Labor (AFL).

The origins of the AFL go back to November 1881 when delegates representing the carpenters, cigar makers, printers, merchant seamen, and steelworkers gathered in Pittsburgh. They formed a new organization called The Federation of Organized Trades and Labor Unions. Their purpose was to work for pro-labor legislation. One of the most prominent among the founders was Samuel Gompers of the Cigar Makers Union, who was now beginning his long career as head of the U.S. labor movement. At first, the Federation did not accomplish much, but after it reorganized in 1886, a new era in the history of the labor movement began.

The modern U.S. labor movement started with the reorganization of American Federation that took place in Columbus, Ohio on December 8, 1886. Samuel Gompers was elected as president, and the union was structured according to his wishes. Gompers insisted that the organization represent skilled workers only, that it be built as a federation of autonomous trade unions, that it stay out of politics, that it avoid radical economic themes, and that it devote itself to working for attainable goals. These goals included the eight-hour day, child labor legislation, workplace safety, immigration restriction, and workmen's compensation.

The AFL grew slowly at first. By 1890 it claimed only 100,000 members, but by 1900 membership had risen to 548,000, and by 1914 it was approaching two million. Along the way the AFL attracted some very large unions such as the United Mine Workers (UMW, founded in 1890). But there were other large organizations that did not affiliate. Most notable among these were the Railroad Brotherhoods: the Engineers formed in 1863 and the Firemen formed in 1869.

During its early years of growth the AFL faced considerable opposition. Employers were not required by law to bargain with unions and some refused to even recognize their existence. Strikes were often met with a violent response and many court decisions went against labor. The public tolerated such actions because unions were successfully portrayed as un-American and the law tended to uphold property rights more often than human rights.

Still led by Samuel Gompers, organized labor in the United States generally cooperated with the government during World War I (1914–18). Union membership continued to grow, reaching nearly four million. After the war however there was a decline of 25 percent, which resulted mainly from a recession between 1921 and 1922 that cost jobs and lowered wages. As the decade of the twenties continued, employers tended to fight the union movement more vigorously. One of their chief weapons was the "company union," an in-house organization that provided benefits but did not allow bargaining. Such "unions" became very popular in the 1920s and contributed to the decline of the labor movement. By 1927 AFL membership had fallen to 2 million, 11.6 percent of the work force.

The Great Depression of the 1930s brought major changes. Between 1929 and 1933 the effects of the economic collapse on labor were catastrophic. But when Franklin Delano Roosevelt (1933–45) became president he inaugurated the New Deal; many New Deal programs were designed to benefit workers. The

most important of these was the National Labor Relations Act of 1935, which required employers to bargain collectively with union representatives chosen by the workers. This law triggered a boom in union membership, which by 1941 reached 27 percent of the total work force.

At the same time there were other major changes within the labor movement. Head of the United Mine Workers John L. Lewis demanded that the AFL begin organizing campaigns in the major non-union industries such as steel, automobiles, rubber, glass, textiles, and meat packing. Lewis wanted to organize these industries on the industrial or “vertical” basis. This meant that all the workers regardless of skill would be in one union. The majority of AFL leaders presided over craft or “horizontal” unions, and they opposed Lewis’s views.

In November 1935 Lewis announced the creation of the Committee for Industrial Organization (CIO) to carry on the effort for industrial unions. Lewis and his colleagues were expelled from the AFL in 1936. At this point the CIO became the Congress of Industrial Organizations. They continued their work and successfully organized unions in many mass production industries including steel, autos, rubber, glass, and meat-packing. These successes contributed to the rapid growth of the labor movement. The AFL and the CIO however remained separate and did not reunite until 1955.

World War II (1939–45) caused a labor shortage and strengthened the labor movement once again. During the war union membership rose fifty percent, until it reached 35.3 percent of the total work force, the highest it would ever be. Beginning in the 1950s the labor movement entered a long but gradual period of decline, which was caused by a leadership that no longer recruited aggressively, a loss of interest in social reform, technological and structural unemployment, and growing public animosity. Technological and structural employment were perhaps the most important reasons labor unions became less popular. Because of increased use of machines the number of available jobs declined in many industries. A majority of jobs shifted from the industrial sector to white collar and service sectors. By the 1990s only 16.1 percent of workers worked in factories whereas in the 1970s it was 25.8 percent. Fewer people on corporate payrolls meant fewer people in unions because these are the workers most likely to sign industry-wide contracts.

By the 1990s the labor movement had changed considerably. Only 14.1 percent of the work force belonged to unions. Of these the vast majority held non-industrial jobs: 41.9 percent were in the public

sector and only 16.3 percent were in the manufacturing sector. The chances that these trends will reverse again any time soon are very small.

LAFOLLETTE, ROBERT MARION

Robert LaFollette (1855–1925), known as “Fighting Bob,” introduced political and social reforms into his home state of Wisconsin. His practices later served as models for the rest of the United States during the Progressive Era (1900–1914). His legislative efforts to more fairly distribute and diversify wealth and power in the United States helped U.S. politics become more responsive to popular will rather than to special privilege. LaFollette was unrivaled as a radical and was a persistent fighter for democracy. He was known as the enemy of political machines and corrupt corporations and the friend of the farmer and the emerging blue-collar worker.

Robert Marion LaFollette was born in a log cabin in Primrose, Wisconsin, in 1855. His father died eight months after his birth, and his widowed mother worked hard to provide the essentials for her four children.

LaFollette managed to enroll in the state university at Madison, Wisconsin, in 1875. He supported

himself by teaching school and by editing a student periodical at the university. He was a gifted speaker, who even considered a career in acting during college. However, he chose to study law, and in 1880 he was admitted as an attorney into the Wisconsin bar.

Since legal work was scarce, LaFollette was attracted to running for the office of district attorney in Wisconsin. Although his opposition had more money and more endorsements, LaFollette's door-to-door campaign among his farmer-neighbors, then an uncommon practice for a politician, won him the election. This experience taught him the importance of speaking directly to voters—a lesson he never forgot.

Two years later, in 1884, LaFollette ran for congressional representative from Wisconsin, and by reminding voters directly of his readiness to represent their interests in Washington, he won the election. At age 29, he was the youngest member of the House of Representatives. However, he failed to be reelected in 1890 and returned to a prosperous legal practice in Madison, Wisconsin.

LAFOLLETTE'S IDEAS IMPACTED THE ENTIRE TWENTIETH CENTURY. THEY LED TO LAWS BENEFITING WORKING PEOPLE AND TO EVEN LARGER GLOBAL SOCIAL CHANGES DURING THE PRESIDENCIES OF MEN LIKE FRANKLIN ROOSEVELT, HARRY TRUMAN, AND LYNDON JOHNSON.

The major turning point in his life came when the fiercely-honest LaFollette discovered that many of his Republican colleagues were stealing public funds. One of these colleagues approached him in an unsuccessful effort to obtain a sympathetic judge. LaFollette was being bribed by his own political allies and he later wrote: "Nothing else ever came into my life that exerted such powerful influence on me as that affair. It was the turning point, in a way, of my career. . . ."

From that time until the end of his life, LaFollette was a dedicated and principled public servant. It was now he and "the people" against the rich and venal politicians. He took his hard facts and preached directly to the people, speaking publicly wherever he could.

His enemies in Wisconsin successfully kept him from becoming governor of the state until he won the election of 1900, promising a reform program to destroy the old party machine. LaFollette was reelected to three terms as governor. Against the will of big business, he created a corporate tax and implemented "The Wisconsin Idea," a plan to use government as an agent of social and political reform. He treated Wisconsin as

a progressive political laboratory, with expert commissions attending to taxes, railroads, banking, conservation, insurance, public service, and industrial problems. He next planned to take his "Wisconsin Idea" to the United States Congress and try his ideas on a national level.

In 1906 LaFollette became a senator from Wisconsin. He found himself battling with President Theodore Roosevelt (1901–1909), although both of them were Progressive Party members. LaFollette called Roosevelt "an inconsequential playboy." In 1912 he ran against Roosevelt and William Taft (1857–1930) for nomination as the Republican candidate to run against Democrat Woodrow Wilson (1856–1924) for the presidency. LaFollette's passionate run against Teddy Roosevelt split the Republican Party vote and Wilson likely won the election because of this.

President Wilson (1913–1921) gradually adopted many of LaFollette's progressive ideas. Wilson supported LaFollette's programs for public disclosure of campaign contributions and a fairer graduated taxation. LaFollette worked with Wilson indirectly to limit the powers of business, and he helped create the Department of Labor and the Federal Trade Commission. LaFollette fought for higher worker wages and better working conditions for American laborers, and he supported women's right to vote. He also advocated civil rights legislation for ethnic minorities.

LaFollette's ideas impacted the entire twentieth century. They led to laws benefiting working people and to even larger global social changes during the presidencies of men like Franklin Roosevelt (1933–1945), Harry Truman (1945–1953), and Lyndon Johnson (1963–1969).

Robert LaFollette died in 1925 from complications of pneumonia, asthma, and a coronary condition. He spent a lifetime fighting bad business practices and creating laws to protect the rights of ordinary Americans.

LAISSEZ FAIRE

Laissez faire is an economic theory that favors the free market and is suspicious of government intervention in the conduct of business and industry. It encourages private ownership and personal initiative as the best means to enrich individuals and societies. Most laissez-faire economists would admit that there are situations when government intervention is essential, but they would prefer to keep the state's role to a minimum. The term arose in the seventeenth century, when a French merchant responded to royal minister who asked how the government could help him by saying, "Laissez nous faire." The phrase is probably best translated, "Let us be." By the late eighteenth century a group of French economists known as physiocrats popularized the theory as a reaction against a system of state controls over the economy known as mercantilism. They maintained the laws of nature, not state regulation, will foster prosperity. Also the British economist Adam Smith 1723–90, who has been called the "father of modern economics," argued that the market would regulate enterprise more effectively than governments. The theory was most widely accepted in Great Britain and the United States in the nineteenth century, but in the early twentieth century it was in part discredited by the misery that was associated with the Industrial Revolution. In the late twentieth century, however, there was a reaction against intrusive government regulation and high taxation, and the reaction was aided by the failure of socialism in Eastern Europe. Laissez-faire principles were again celebrated in the United States under President Ronald Reagan (1980–1988) and in Great Britain under Prime Minister Margaret Thatcher (1979–1990). Her program of selling of government-owned industries to private investors, which was called privatization, has been adopted by many countries throughout the world.

LAND-GRANT COLLEGES

Land-grant colleges are those institutions of higher learning which are endowed by funds set up under

the Morrill Act of 1862. The legislation, officially called the Land-Grant Act, was sponsored by Vermont Congressman Justin Smith Morrill (1810–1898), who served in the House of Representatives between 1855 and 1867, and in the Senate between 1867 and 1898. The U.S. public was increasingly demanding the establishment of colleges that would specialize in agricultural and manufacturing programs. Farming remained critical to the nation's economy, whose industrial sector was growing. Training in these areas was essential to the country's future. In 1862 this argument convinced Congress to add military programs to the curriculum of the future schools and to vote to grant more than 11.3 million acres (4.6 hectares) of land to states and territories. These lands were to be sold by the states or territories, and the money would be invested in funds used to set up state colleges. Thirty states (primarily in the Midwest and South) used the funds to set up agricultural and mechanical (A&M) colleges; eighteen states gave the funds to already existing colleges to set up new agricultural and mechanical programs; and the rest granted the funds to private institutions of higher learning. In 1890 a second Morrill Act added money grants to the states for use in A&M programs. Michigan State University, founded as Michigan Agricultural College in 1855, became the model for the land-grant colleges, which also include the University of Illinois, Texas A&M, and the University of California. The far-sighted provisions of the land-grant gave the nation many of its foremost universities.

LAND O'LAKES, INC.

On June 7, 1921, hundreds of farmers from all over Minnesota gathered in St. Paul to vote on the organization of a statewide dairy cooperative. With a unanimous vote, the Minnesota Cooperative Creamery Association, Inc., forerunner to Land O'Lakes, Inc., was born.

Unlike investor-owned corporations, cooperatives work for and answer to their member-patrons, who benefit in direct proportion to the amount of business they do each year with the cooperative—how many products they supply for sale to the general public, or how many they buy from the cooperative. Because each member-patron has one vote, cooperatives are democratic enough to have appealed to the independent U.S. farmers who first joined.

Beginning with a meager financial stake of \$1,375, the directors of the Minnesota Cooperative Creamery

Land O'Lakes, Inc.

Association, Inc. launched a statewide membership campaign. Their project was given a boost when in 1922, after a long fight, the U.S. Senate passed the Capper-Volstead bill, which legalized the marketing of farm products through cooperative agencies. The first year's returns showed a slender profit.

John Brandt, one of the original 15 directors elected to run the organization, became president of the association in 1923. He believed that by working together, competing creameries could raise their profits and offer a better product to their patrons. He urged cooperation among farmers, engineered joint shipments of butter, and proposed a common standard of quality. Most importantly, he and the other directors of the cooperative decided to concentrate on the quality production and aggressive marketing of "sweet cream" butter, butter made from cream before it soured. Although more costly to make and not as familiar to the public, sweet butter tasted better and kept longer.

In February 1924, the cooperative announced a contest to capture the public's attention: its high-quality product needed a catchier name than "Minnesota Cooperative Creamery Butter." First prize was \$500 in gold. An overwhelming response brought in over 100,000 entries; the contest was tied between two winners who both thought of "Land O'Lakes." Soon thereafter an Indian maiden appeared on the butter's packages, completing a now familiar image. The origins of this Indian maiden, however, remain a mystery.

In April 1924, the cooperative won a contract with the U.S. Navy for 30,000 pounds of the new sweet cream butter, and soon thereafter met with a growing demand from U.S. housewives for its conveniently packaged quarter-pound sticks. Because Land O'Lakes was already becoming a household name, only two years after the contest, the cooperative changed its name to Land O'Lakes Creameries, Inc. in 1926.

Land O'Lakes first ventured outside of the dairy business two years later, in 1928, when it organized egg and poultry divisions. This step toward diversification proved crucial during the Great Depression (1929–1939), when dairy businesses throughout the nation suffered enormous losses. In 1930 dairy production was the lowest it had been in two decades, and by December 1933, butter prices had declined to 15 cents a pound, the lowest figures for that month in 25 years. Excess production and surplus holdings were making it almost impossible for U.S. farmers to get back their cost of production, and dozens of creameries held meetings to decide whether they should continue operating. Although Land O'Lakes suffered setbacks due to

these market forces between 1929 and 1940, highly imaginative management and a willingness to fight economic trends cut the cooperative's losses considerably.

Before the Depression Land O'Lakes had dealt mostly with large store chains and other nationwide distributors. But with many of these large accounts cutting back their operations or vanishing altogether, Land O'Lakes began to set up smaller sales branches that could sell directly to groceries and other small outlets. Partly as a result of this marketing strategy, and partly because Land O'Lakes Sweet Cream Butter was being advertised nationally for the first time, Land O'Lakes was able to sell a record 100 million pounds of butter in 1930.

Another Depression era strategy was to diversify the products the cooperative offered both to its member farmers and to the public. Land O'Lakes began an Agricultural Services Division in 1929 to try to reduce member costs for feed, seed, and other farming supplies. In 1934 the cooperative joined three large cheese cooperatives in the operation of 95 cheese factories, and in 1937 Land O'Lakes opened its first milk drying plant, completing a decade of experimentation which pioneered the production of powdered milk. When World War II (1939–1945) called for milk in a form that didn't require refrigeration and had a fraction of its normal bulk, Land O'Lakes was prepared. All of these changes were ultimately successful expansions and contributed to Land O'Lakes' relative prosperity in difficult times.

Following World War II Land O'Lakes diversified further, entering the ice cream and fluid milk markets for the first time. In 1970 the cooperative merged with the Farmers Regional Cooperative, which increased Land O'Lakes capacity to produce and market agricultural production goods (including fertilizers and insecticides) for its member-patrons. That same year, Land O'Lakes Creameries, Inc. changed its name to simply Land O'Lakes, Inc. to better reflect its diverse business. Over the next decade, as Land O'Lakes' butter sales were hurt by the expanding market for margarine, the cooperative diversified further, entering the red meat business in 1978 and launching a soybean processing venture in 1980. But concern about industry overproduction, fluctuating market prices, and increasing operating costs led Land O'Lakes to exit from the poultry and red meat sectors in the late 1980s.

By the late 1990s, through mergers and acquisitions, Land O'Lakes served 300,000 farmers and ranchers in 27 states. In the last years of the twentieth century

Land O'Lakes increasingly sought out growth opportunities outside the United States, and included among its foreign operations feed mills in Taiwan and Poland and marketing functions in Mexico, East Asia, and the Pacific Rim.

LAND ORDINANCE OF 1785

The Land Ordinance of 1785 was the second of three land ordinances passed by the Confederation Congress after the Revolutionary War (1775–1783). The three ordinances, which included the Ordinance of 1784 and the Northwest Ordinance (1787), were meant to manage the lands of the Old Northwest, ceded by Great Britain at the end of the Revolution. The Treaty of Paris (1783), which established normal diplomatic relations between England and the former colonies after the Revolution, turned the area that is now the states of Ohio, Indiana, Illinois, Michigan, and Wisconsin over to the new U.S. government. In 1784 a committee led by Thomas Jefferson drew up legislation to provide for future statehood for settlers already in the area. The following year, in the Land Ordinance of 1785, Jefferson's committee established the way in which the territory would be measured and divided for sale.

The new nation was governed for the most part by the states. The relationship between the states and with the central government was defined by the Articles of Confederation. The central government was the Confederation Congress, a holdover from the Second Continental Congress which had been convened in the spring of 1775 and had coordinated the revolutionary war effort. The Articles of Confederation, ratified by the states in 1781, summarized the existing relationship between the Congress and the states.

It was an indication of the distrust with which the American people viewed central authority that the Articles of Confederation did not allow the Congress to tax either the states or individuals. As a way of keeping the nation solvent, the states that claimed western lands from the terms of their colonial charters gave up those lands to the Confederation government. The Confederation government expected to use these lands as a way of meeting governmental expenses. In order to attract land buyers, the Congress declared that these lands would be made into new states, which would enter the Union on an equal basis with the original thirteen colonies. This declaration made possible the creation of the modern United States.

The Land Ordinance created the pattern along which American public land would be divided and sold until the passage of the Homestead Act in 1862. The Ordinance of 1785 ruled that the western lands north of the Ohio River would be divided by surveyors into a square grid. Each square (called a township) measured six by six miles and was subdivided into thirty-six one-mile-square sections. Each section (measuring 640 acres) could then be further divided, usually into half, quarter, eighth, or sixteenth-section lots of 320, 160, 80, or 40 acres. Certain sections had restrictions placed on their sales; for instance, money from the sixteenth section of every township was to be set aside to fund public schools in the township. The first territorial survey took place in what is now southeastern Ohio, and it measured land that stretched westward from Little Beaver Creek to the Tuscarawas River and southward to the Ohio River. A total of about 91 townships were created (although some of them were fractional and did not contain a full 36 sections), with about 3,276 sections comprising 2,096,640 acres of land ready for development by U.S. farmers.

Although the Land Ordinance of 1785 was conceived as a way to divide the western territory more evenly than had been the case before the Revolution, in practice it was less than fair. Congress thought that land sales in the territory would help it meet its big debts left over from the war. As a result, land sales were aimed at wealthy purchasers rather than the poorest farmers, who were most in need of land on which to settle. Until 1841 the government also required that public land be offered at auction where syndicates of land speculators usually snatched it up before it could be sold to private individuals. Congress set the minimum amount of land that could be purchased at one section—640 acres—and the purchase price at one dollar per acre. Small purchases on credit were not allowed. The \$640 minimum purchase placed the cost of western lands far outside the budget of most U.S.

citizens. Most of the lands went instead to wealthy land speculators, who were also given the option of buying on credit. The speculators bought lands from the government, divided them up, and then resold them to small farmers at a profit.

An interesting sidelight to the Ordinances was the way that they steered the political culture of the nation. The third Ordinance, passed in 1787, stipulated that future inhabitants would be guaranteed a “bill of rights” guaranteeing freedom of religion and the right to a jury trial. It also prohibited slavery north of the Ohio River, although this applied to the future and did not contemplate the freeing of slaves that were already held in the Old Northwest Territory. The ordinance also contained provisions for the return of escaped slaves.

LANE, GERTRUDE BATTLES

At the turn of the twentieth century, when women were making significant legal and political advances that would lead them to obtaining voting rights and a notable say in public governance, Gertrude Battles Lane (1874–1941) was distinguished as the editor of one of the leading U.S. women’s magazines, *Woman’s Home Companion*. Gertrude Battle used the *Woman’s Home Companion* not only as a vehicle focused on women’s issues, but she increased the scope of those

issues to include political and social matters, as well as to educate women about how to use the vote in their best interests.

Gertrude Lane was born on December 21, 1874, in Saco, Maine, the daughter of Eustace Lane, an organist and piano tuner, and Ella Maud Battles. She initially attended public schools and as the family wealth increased she was able to attend the exclusive private school Thornton Academy, where she edited the school’s literary paper.

She graduated from Thornton Academy in 1892, and moved to Boston, Massachusetts, where she took work as a private tutor. In 1895 she completed a year long course in business at Burdett College, and in 1896 she began working for the Cyclopedia Publishing Co. as an assistant editor. She worked there for seven years, developing her editorial skills. During this time she also published essays, poetry, and book reviews in various Boston publications.

GERTRUDE LANE WAS “A GRAND COMBINATION OF MAINE SALTINESS AND LATIN TEMPERAMENT.”

Edna Ferber, regarding her friend Gertrude Lane

In 1902 financial problems at Cyclopedia Pub. prompted Lane to search for a new job. In 1903, she accepted the position of “household editor” at the popular *Woman’s Home Companion*, a monthly women’s magazine founded in 1874. Lane stayed with the magazine and its publisher, Crowell Publishing, until her death in 1941.

Lane rose steadily at the *Companion*, becoming the managing editor in 1909 and the editor-in-chief in 1912. She claimed her success was caused simply by hard work, but those who knew her said she also possessed strong editorial skills and a keen business sense. The Pulitzer Prize winning author Edna Ferber (1887–1968), a friend of Lane’s, described her as “a grand combination of Maine saltiness and Latin temperament.”

As editor of the *Companion*, Lane emphasized women and the home, leaving men’s issues for the many men’s magazines that were being published. She spoke to women as homemakers, but she greatly broadened the scope of what a homemaker was. Her magazine began to provide readers with practical service columns, as well as entertaining fiction and a variety of general interest features. The formula she devised succeeded. Under her leadership circulation grew from 700,000 when she took over in 1912, to one million by

1916, and more than two million by 1923. In 1937 the *Companion* took over the lead in circulation from long-time competitor, *Ladies Home Journal*.

Throughout her career as an editor, Lane ran articles that focused on a variety of social and political issues. Her efforts were aimed at educating her female readers. A year after she took over as editor, Lane established in the magazine what was called *A Better Babies Bureau* to promote improved maternal and infant care. She also ran regular articles related to the ongoing fight against child employment as well as articles about unsanitary conditions in food stores.

Other campaigns she pursued in the *Companion* included a series on educating women about how to use their new voting rights. Articles on international peace issues appeared frequently, as well as informational articles on topics like psychology, careers, politics, and college education. A page written by Eleanor Roosevelt (1884–1962), the wife of President Franklin Roosevelt (1933–1945), appeared regularly in the magazine during the 1930s.

Lane maintained strong service departments. She believed the modern woman wanted a magazine with practical, timesaving advice. Lane said that her image of a housewife was “. . . the woman who wants to do less housework, so that she will have more time for other things.”

During World War I (1914–1918) Lane served as a member of the U.S. Food Administration under President Herbert Hoover (1929–1933), while continuing to edit the *Companion*. Lane also served as a member of the 1930–1931 White House Conference on Child Health and Protection.

In 1929 Lane was regarded as one of the best magazine editors in the business and she was made a vice president of the *Companion's* publishers, the Crowell Publishing Co. In 1935, while managing the new *American* magazine for Crowell and editing the *Woman's Home Companion*, Lane began an innovative plan to gain reader support and feedback. She created a “reader-editor panel” composed of 1500 unpaid readers nationwide, who provided for the magazine one of the nation's first consumer-opinion panels.

By 1939 Lane was earning \$52,000 annually and she was described by the *New York Times* as one of the best paid woman of the day.

Lane never married. She entertained frequently and pursued a passion for antique collecting.

LANGE, DOROTHEA MARGARETTA

Beginning in 1919, Dorothea Lange (1895–1965) began to photograph in detail the people and circumstances of the Great Depression (1929–1939). She later extensively photographed working people of the West, such as poor migrant farm workers. Later, working for *Life* magazine, she photographed Japanese-Americans imprisoned in concentration camps in California and New Mexico during World War II (1939–1945). Through the lens of her camera, Americans began to see for themselves the scope and extent of social injustices in the United States. Lange's seemed to prove the old maxim that a picture could speak a thousand words.

Dorothea Margaretha Nutzhorn was born in Hoboken, New Jersey, on May 26, 1895, the first of several children born to Joanna and Heinrich Nutzhorn. Her father was a lawyer and her mother worked as a librarian. At age seven Lange contracted poliomyelitis (polio) in a time when there was no known vaccine. Her right leg was permanently disabled from the knee down, causing her to walk with a limp. Lange said in later years that the teasing she received in childhood because of this illness was both humiliating and instructive. She became very sensitive to the suffering of fellow human beings.

Lange attended school and lived a relatively normal life under her family's hard economic circumstances. She saw New York at its best and its worst, going to concerts and art museums, but also walking in the immigrant ghettos.

At the time of her high school graduation in 1912, Lange decided to become a professional photographer. She worked in photographic studios and studied photography at Columbia University. At age 21 she began to travel across the United States, selling her photographs along the way to help finance her journey. She ended her trip in San Francisco, California, where she opened a photographic studio and took portrait pictures of wealthy San Francisco families.

Lange married the famous painter, Maynard Dixon (1875–1946), in 1920, and the pair lived a bohemian life. They had two children and moved to Taos, New Mexico, to live for a time at the artist colony presided over by Mabel Dodge Luhan (1879–1962).

When Lange left Taos and returned to California, she saw large numbers of homeless and unemployed people, all victims of the Depression. These images inspired Lange to document through her photographs the social conditions she saw in the United States: the soup kitchens, the breadlines, the tragic scenes of the 1930s. This marked the beginning of her career as a documentary photographer.

Having divorced Maynard Dixon in 1935, Lange married Paul Taylor, an economist who was working closely with migrant farm workers. The two became a team, documenting specific information about the Depression throughout many areas of the United States, particularly the South and Southwest.

Lange's became famous when she produced a volume of pictorial evidence about the plight of the poor in the United States. The photographs revealed the varieties of social injustice experienced by many Americans. They reinforced to the government that social and business reforms were needed quickly. Because her work was so emotionally touching and direct, Lange not only recorded conditions but also helped to change them by sharing her work with those who could and would bring change. Her 1933 photograph called "White Angel Bread Line" drew the attention of social, political, and governmental reformers throughout the United States. She photographed the suffering and the social injustices she saw, and let the pictures speak for victims everywhere in the United States.

By 1935 Dorothea Lange was employed by the federal government, helping others to write reports and documenting that writing with her photographs. She continued to work with the government until 1941, when she left to take advantage of a Guggenheim grant offered to her. She then traveled alone to photograph the American war camps, in which Japanese-Americans were imprisoned by the United States government

because it feared these people were security risks during World War II (1939–1945).

Lange's photographs provided a vision of her time and many, once seen, were never forgotten. Lange's work touched the heart and put a human face on government statistics. She died in October 1965, just before the opening of her one-woman photographic exhibition at the Museum of Modern Art.

LASKER, ALBERT DAVID

During the first half of the twentieth century Albert David Lasker (1880–1952) was one of the most important and most creative people in the U.S. advertising industry. His opinions continually influenced the advertising industry in the United States, and his ideas about effective advertising, agency operations, and the place of advertising in U.S. business and society guided the evolution of advertising for years after he left his profession.

Albert David Lasker was born to American parents in Germany in 1880. His mother's poor health after his birth prompted the family move to his father's birthplace, Galveston, Texas, where Albert and his five siblings grew up. From a very young age Lasker was in love with journalism and writing. At age twelve he started his own commercially successful weekly newspaper, the *Galveston Free Press*. At age thirteen he went to work for the *Galveston Morning News* while he attended high school. He was also the editor of his high school's magazine.

Upon graduation Lasker worked for newspapers in New Orleans, Louisiana, and in Dallas, Texas, planning a career in journalism. In 1898, however, his

father, who opposed his plans for a career in the newspaper business, intervened by arranging for his son to begin work at the prestigious Chicago advertising firm of Lord and Thomas.

Lasker began as a \$10 a week office boy, doing routine general chores around the offices of the firm. His way with words and his experience in writing allowed Lasker to advance rapidly. Within a year he was traveling the Midwest as a top salesman, bringing in major accounts and much income to Lord and Thomas. By 1904, at age twenty-four, Lasker became a full partner and general manager of the agency. His ambition did not end there. In 1910, at age thirty, he bought out the company and became sole proprietor and owner of Lord and Thomas, which had grown to become one of the largest and most successful advertising agencies of its time.

If there was one thing that characterized Lasker's approach to advertising, it was the emphasis on writing and copy writing as the foundation of any good advertisement. He convinced most newspapers and magazines, which were writing their own advertising copy for their advertisers, that good advertising required a specialized and professional approach. Lasker began to offer clients copy writing services. He developed the concept of the account executive, an agency position that served as the central link between the advertiser and all of the agency's creative services. Lord and Thomas became one of the first full-service agencies in the United States.

Lasker's maintained that advertising should be "salesmanship in print." It was an idea quite different from the straight forward, descriptive advertising most common at that time. Lasker wanted an advertisement to sound like a presentation a salesman would make. The advertisement would answer questions that customers might ask.

This approach in strong, persuasive copy led to the original agency copy writing department (a first of its kind). Lasker created his own in-house copy writing classes to train his writers in advertising "salesmanship" techniques. He also began the tradition, well known in advertising agencies, of paying tremendous salaries to proven copywriters. Lasker recognized and appreciated the value of good writers. He almost single-handedly created a profession of copywriters who, if they could produce the profits, could become some of the highest paid writers in the world, earning more than even the most famous journalists of that day.

Lasker's advertising agency became the model for most other agencies. Among his advertising successes was the introduction of products like Kleenex and

Kotex to the mass market, and the turning of Pepsodent into a leading brand of toothpaste. His use of radio as an advertising medium was perhaps his greatest innovation.

Albert Lasker led an exciting and creative life during which he created the modern advertising business. He died in 1952, but his on the modern advertising industry remains.

LAUDER, ESTEE

Estee Lauder (c. 1910–) epitomizes the American success story. Born Josephine Esther Mentzer, the daughter of poor Jewish immigrants from Eastern Europe, she built a small line of homemade face creams into a billion-dollar cosmetics business through perseverance, ingenuity, and hard work.

Estee Lauder grew up in the Corona section of Queens, New York, the youngest child in a large family. Her mother's brother was a chemist who specialized in developing skin-care preparations. Lauder's lovely complexion was her uncle's best advertisement for his special face cream. After marrying Joseph Lauder in 1930, she worked on her own kitchen stove to refine and improve her uncle's face cream and other beauty products. Soon she began to sell her creams and lipsticks at upscale beauty salons in Manhattan and resort hotels in the New York area. A perfectionist, Estee Lauder insisted on producing only the highest quality cosmetics. Typical of her attention to detail was her decision to market her products in attractive packaging in a distinctive color she called Lauder blue.

Lauder possessed an intense, single-minded determination to make a success of her cosmetics business.

Lease, Mary Elizabeth

Grace Mirabella, former editor of *Vogue* and founder of *Mirabella* magazine, writing in *Time* (December 7, 1998), said of the cosmetics tycoon, “She simply outworked everyone else in the cosmetics industry.” Her ambition extended to her social life. Lauder cultivated affluent people in influential social positions who could help her in her business. She donated sample products as favors at charity balls and made sure that socialites had her lipsticks in their evening purses. Before long, the elegant Lauder was appearing regularly at fashionable dinner parties and charity benefits and her name had become associated with glamour and celebrity.

SHE SIMPLY OUTWORKED EVERYONE ELSE IN THE COSMETICS INDUSTRY.

Grace Mirabella, *Time*, December 7, 1998

By 1946 Estee Lauder, Inc. was formed with Joseph Lauder handling the financial end of the business and Estee concentrating on product development and marketing. They were the firm’s only employees and when the company acquired a coveted sales location at Saks Fifth Avenue in Manhattan in 1948, the couple had to work night and day to produce and package enough face care products to fill the allotted counter space.

The association with Saks opened the door for Estee Lauder products at other prestigious department stores across the country. Lauder traveled to each store and personally trained her handpicked saleswomen in customer service and personal grooming. She pioneered the concept of including free sample gifts with a cosmetics purchase, a practice ensuring the customer would be introduced to a whole range of products she might otherwise never have purchased.

It was the bath oil, “Youth Dew,” that launched Estee Lauder, Inc. into the front ranks of the cosmetics industry. The sweet, persistent scent that doubled as a perfume was an affordable luxury for most women. Youth Dew enjoyed phenomenal success in the 1950s and 1960s and it put the company on the map for good. In the mid-1960s Estee Lauder introduced several new product lines, including Clinique, the first line of both hypoallergenic and fashionable cosmetics, and Aramis, a line of colognes for men. Her fragrances, particularly “White Linen,” became perennial successes.

By 1998 the Estee Lauder, Cos., still a family-owned business run by the two Lauder sons since their mother’s retirement in 1973, was selling cosmetics products in 118 countries and commanded 45 percent of the U.S. cosmetics market. The companies listed

\$3.6 billion in sales in 1997, and the Lauder family’s shares in the business were reported to be worth more than six billion dollars.

Although officially retired for the last 25 years of the twentieth century, Estee Lauder’s influence in the family business remained strong, particularly in planning promotional campaigns and creating new fragrances. With more time available, however, she was free to entertain on a grand scale at her townhouse in Manhattan, her villa in the south of France, her flat in London, England, and her oceanfront home in Palm Beach, Florida. After the death of Joseph Lauder in 1983, Estee Lauder carried on the philanthropic work the two had begun two decades earlier. The Lauder Foundation has made significant gifts to many causes including cancer research.

LEASE, MARY ELIZABETH

Mary Elizabeth Clyens Lease (1853–1933) was an activist, writer, and public speaker for many causes, including farmers’ issues and women’s suffrage. She was actively involved in the creation of the People’s Party in Kansas. She gained national recognition during the Populist crusade for reform in the 1890s.

In 1853 Mary Clyens was born in Ridgeway, Pennsylvania to Irish immigrant parents. After she finished her education, she began teaching in rural schools in New York. In 1870 she moved to Kansas to teach and there she met and married a druggist’s clerk, Charles L. Lease.

Lease and her husband tried twice to make a living from farming in Kansas, but were unsuccessful both

Mary "Yellin" Lease.

times, blaming their misfortune on the railroads and loan companies. The couple moved to Texas for several years before returning to Wichita, Kansas in 1883. It was back in Kansas that Lease became involved in public life. On St Patrick's Day, 1885, she delivered her first public speech, "Ireland and Irishmen," on behalf of the Irish National League. In the same year Lease was admitted as a lawyer to the Wichita bar.

RAISE LESS CORN AND MORE HELL.

Mary Lease, Halstead, Kansas, 1890

Lease later became involved in other political issues, particularly those that involved the farming community. In 1888 she spoke before the state convention of the Union Labor Party, a forerunner of the People's Party in Kansas. She was the party's candidate for a county office long before women were even eligible to vote. In 1889 Lease became a Farmers' Alliance lecturer and briefly worked as an associate editor for a reform newspaper, the *Wichita Journal*.

In 1890 the People's Party in Kansas, commonly known as the Populist Party, was formed to fight for better conditions for farmers. There was much discontent among the agrarian community at that time because of declining farm prices and the accompanying declines in income. Since farmers blamed corrupt politicians for their plight, Lease and many agricultural

laborers became disillusioned with traditional party politics and believed change would only come through a third party.

In the same year Lease took an active role in the successful campaign to unseat United States Senator John J. Ingalls (1873–91), a Kansas Republican. She reportedly made over 160 speeches during the 1890 election. She was often mistakenly called Mary Ellen, and her enemies dubbed her "Mary Yellin'." During a three-hour speech in Halstead, Kansas, Lease encouraged farmers to "raise less corn and more hell."

In 1892 Lease became involved in the creation of the People's Party of America. She campaigned heavily in the south and west for General James B. Weaver (1833–1912), the party's presidential candidate. In 1893, when the Populists gained control of the administration of Kansas, Lease was appointed president of the State Board of Charities, the highest office held by a woman in Kansas at that time.

By 1896 Lease broke with the Populists because the party was merging with the Democrats to support the presidential candidacy of William Jennings Bryan (1860–1925). She then joined the staff at Joseph Pulitzer's *New York World* as a political reporter. Lease moved to New York City and became a public lecturer for several causes, addressing women's suffrage, Prohibition, evolution, and birth control. She died on her farm in New York on October 29, 1933.

LEE, IVY LEDBETTER

Ivy Ledbetter Lee (1877–1934) created the model for professional U.S. public-relations promotions and a giant industry that is generally called the publicity business. Ivy Lee believed that facts themselves could be artfully shaped and placed before the public so that they would be seen in a favorable light. Though he is a largely forgotten figure in U.S. history, his impact on commerce, politics, entertainment, and the general business of the United States cannot be overstated. He was the father of all the modern “spin doctors” and public-relations people who seek to present in a favorable light that which is not always pleasant.

Ivy Ledbetter Lee was born in 1877, in Cedartown, Georgia, the son of a Methodist minister. Lee grew up in Georgia and finished his college training at Princeton University in New Jersey, and later, for a single semester, he attended Harvard Law School in Boston, Massachusetts.

Lee began working for newspapers in 1899, working first for the *New York Journal* and later for the *New York Times*. After marrying in 1903, he quit newspapers and went to work with a fellow journalist, George Parker, in an effort to get Seth Low elected as mayor of New York. Lee and Parker afterwards went on to work for the Democratic National Committee in the 1904 presidential campaign.

In 1904 Ivy Lee and George Parker decided to form a public relations company called Parker and Lee. It was the second public relations firm established in the United States. Lee began to represent the interests of large firms, such as the Pennsylvania Railroad, who wanted public images as good, ethical companies benevolent to public interests.

Lee began to pursue a direct style of press relations to get the company’s message across. He described the style in this way: “Shaping their affairs (business) so that when placed before the public they will be approved, and placing them before the public in the most favorable light.” Lee ran into many critics by working with the giants of U.S. business and making every possible effort to project their actions as benign and on behalf of the interests of the public. U.S. labor unions were among the first to ridicule Lee for his manipulation of facts. Lee was also attacked by prominent writers of his era. In one of his novels Upton Sinclair (1878–1968) referred to Ivy Lee as “Poison Ivy Lee,” and the famous U.S. writer and poet, Carl Sandburg (1878–1967) called Lee “a paid liar.” Despite those attacks Lee continued to prosper and became very successful as the Rockefellers’ public relations agent.

Working for the Rockefellers and other corporate clients, Lee engaged in what can only be described as the careful management of the press and public opinion. Lee eventually began to oppose granting exclusive interviews to any single member of the press and instead favored controlling the release of any information himself. He was described as a kind of gardener of the press, pruning and clipping, urging the growth of strong stories in one part of the garden and stamping out the poisonous growth of negative stories in another part of the garden.

From 1916 to 1919 the firm Lee, Harris, and Lee grew to become Ivy Lee and Associates, and then Ivy Lee and T.J. Ross. Clients for their public relations management included Anaconda Steel, Chase National Bank, Phelps Dodge, United States Rubber, Armour Meats, United Artists, Chrysler Corp., and Standard Oil.

As early as the 1920s Lee was representing the financial interests of foreign governments in the United States, including Poland, Rumania, and even a brief representation of the Soviet Union. From 1929 Lee also worked for the U.S. subsidiary of the German corporation of I.G. Farben. In 1933–1934 Lee traveled to Germany and met with Adolph Hitler (1889–1945) in a complex effort to improve the Farben Company’s public image. In 1934 the House Un-American Activities Committee (HUAC) accused Lee of being Hitler’s publicity agent. He was later cleared of that charge. Months later Ivy Lee died as a broken man, leaving an estate of \$24,000.

Modern corporations largely follow Lee’s approach to public relations, while foreign governments regularly hire public relations firms to represent their interests. In the late 1990s these methods provoked little of the outcry that Lee’s work first encountered. Because Lee never published a book on his career in public relations, his work has been largely forgotten.

LEND LEASE ACT

Enacted by Congress in 1941, the Lend Lease Act gave the president the power to sell, transfer, lend, or lease war supplies to U.S. allies during World War II (1939–1945). These supplies included food, tanks, airplanes, weapons, and other equipment.

The lend-lease program was originally developed to provide assistance to Great Britain and China. The legislation also gave the president the authority to extend aid to any nation whose defense he deemed vital to that of the United States. By the end of World War II, 38 nations received aid under the lend-lease program; prominent among them were Great Britain, China, and the Soviet Union.

Repayment for aid given under the lend-lease program could be “in kind or property,” as well as by other measures agreed to by the U.S. president. Some of the costs were offset by a reverse kind of lend-lease program, where Allied nations gave U.S. troops abroad about \$8 billion in aid.

President Harry Truman (1945–1953) ended the lend-lease program in 1945.

LEONTIEF, WASSILY

In 1973 Wassily Leontief, the Russian-born U.S. economist, received the Nobel Prize in economic sciences “for the development of the input-output method and for its application to important economic problems.” Input-output analysis belongs to that branch of economics pioneered by nineteenth century French economist, Leon Walras. This branch of economics is known as general equilibrium theory, focusing on examining the interdependence of economic forces representing the economy as a whole. The first major practical policy applications of Leontief’s input-output analysis were made by the U.S. Bureau of Labor Statistics, first in 1939 and then again in 1947. His model was used to predict how total and partial sector employment in the United States would change as the economy of the United States shifted from peace to war and back again.

Wassily Leontief was born in St. Petersburg, Russia, in August of 1906. His father, Wassily Sr., was also an economist. The years of Leontief’s childhood were at a time of great social and political upheaval in Russia. He was eight years old when World War I (1914–1918) began and he experienced firsthand the turmoil of the Russian revolution. In 1921 he entered the University of Leningrad (known as St. Petersburg prior to the Russian revolution), where he studied philosophy, sociology, and economics. He graduated in 1925, continuing his education afterwards at the University of Berlin, in Germany. In 1928, at age 22, he received his doctorate in economics.

After graduating he spent a year in Nanking, China, as an economic adviser to the Chinese Ministry of Railroads. In 1931 Leontief emigrated to the United States, coming to America during the Great Depression (1929–1939), where he joined the National Bureau of Economics Research. In 1932 he married the poet Estelle Marks.

In 1931 Leontief began a long tenure as an instructor of economics at prestigious Harvard University. He was promoted to a full professor in 1946. Two years later he founded the Harvard Economic Research Project, a center for what he called “input-output analysis.” He directed this project until its closing in 1973.

Leontief had published his first paper on input-output analysis in 1936. His early work was analytical but not mathematical. He criticized attempts to apply advanced mathematical theories to explain world economic problems. Instead, he believed theories were only useful if they could be implemented and observed. He amplified this view with the publication of his first book in 1941, *The Structure of the American Economy, 1919–1929: An Empirical Application of Equilibrium Analysis*. The very basic thinking of this book described his method of analyzing economic input and output, the basis of his reputation as an outstanding economic innovator. Input-output method is now a standard economic projection tool used in countries and corporations around the world.

His system came slowly to a world crippled by a Great Depression, but as World War II (1939–1945) began, there was new interest in testing the applications of Leontief’s analysis. It was applied first by the U.S. Bureau of Labor Statistics, which examined the Leontief model for predicting how employment changes in the country would change the overall economy. By 1957, in less than 10 years, Leontief’s method had become a basic ingredient in the national accounting systems of most countries in the world, both capitalist and socialist.

Lever Food Control Act

The input-output system developed by Leontief focuses on the fact that economic relationships involving complex interdependence came to represent a picture of the economy as a whole. Prior to Leontief, the field of economics studied mainstream economics focusing only on a few variables. For example, an economist might have looked at how a tax on imported oil might effect the demand for gasoline, while ignoring how the same tax might effect the steel industry. A partial analysis led to seriously misleading conclusions, especially if the industry or changes being studied were expansive.

Leontief's brilliant contribution to economics, the heart of his input-output method, involved a multiple transactions table, dividing the economy into many sectors. Essentially, by increasing the number of sectors being scrutinized and by cross-referencing them on a grid, Leontief was able to come up with the "Leontief inverse," revealing what each sector being studied required to produce one additional dollar's worth of output.

The economic significance of Leontief's method was threefold. First, improvements in international data collection had improved enormously in recent decades because Leontief's system required enormous specific data. Thus the examination of this data revealed the workings of any economy in great detail, far more than in the past. Finally, once demands for goods were specified or projected into the future, Leontief's system could be used for policy analysis. Therefore, the Leontief analysis showed both directly and indirectly what each sector of the economy needed in input in order to increase economic output.

The Leontief system improved as data-gathering improved with the use of computers. He was able to increase the number of economic sectors he studied, because the computer had made the sorting of complex data feasible to analyze.

Input-output analysis had become an essential technique in most economic planning and government budgeting, both internationally and nationally. Leontief's success in applying the input-output model of economic analysis resulted largely from his outstanding ability as a general economist. He was interested in several fields: international trade, monopoly issues, and econometrics—the measuring of the specific strength of an economy. Leontief opposed theorizing about economics, and instead said: "What counts is the relevance of the basic material premises, the capability to exploit effectively all factual data at hand, and to identify promising directions." Leontief's practical and empirical approach, causing modern economics to be ever

more scientific, had put him clearly in a class as a major contributor to twentieth century economic science.

Wassily Leontief died in February 1999, at the age of 92.

LEVER FOOD CONTROL ACT

The Lever Food Control Act of 1917 authorized the president to regulate the price, production, transportation, and allocation of feeds, food, fuel, beverages, and distilled spirits for the remainder of World War I (1914–1918). Popularly known as the Lever Act, the law also empowered the president to nationalize certain private factories, and requisition storage facilities for military supplies. Private individuals and proprietors were entitled to be compensated for the fair market value of any property taken by the federal government pursuant to the act. U.S. District Courts were vested with jurisdiction to resolve disputes when agreement on fair market value could not be reached. The president delegated his regulatory powers to the federal Fuel Administrator, who carried out day-to-day operations with the help of regional agents he appointed around the country. Although the Lever Act granted the president extraordinary and sweeping powers, the law was upheld by the U.S. Supreme Court in *Highland v. Russell Car & Snow Plow Company* (1929). Stressing that the freedom to enter contracts and own property should not be impaired lightly, the Supreme Court nevertheless concluded that the regulatory powers granted by the Lever Act were necessary for successful prosecution of the war. In passing the Lever Act Congress had similarly declared that the food and fuel

industries are affected with a public interest essential to the nation's common defense. By its terms the Lever Act became ineffective at the war's end. However, a number of sections were re-enacted on October 22, 1919.

LEVITT, WILLIAM JAIRD

William Jaird Levitt (1907–1994) revolutionized the U.S. housing industry. Most construction companies in the United States eventually adopted methods invented by Levitt and his sons to lower the cost of making houses for a mass market of consumers. Levitt's innovations made housing more affordable to everyone. Millions of middle and working class people in the United States became homeowners during the mid-twentieth century due to Levitt's efforts.

William Levitt was born on February 11, 1907, in Brooklyn, New York, the son of a lawyer and building contractor. He attended Brooklyn's public schools and then enrolled at New York University for three years before dropping out.

At the age of 22 Levitt dreamed of becoming a commercial airline pilot. He instead joined his father Abraham and his brother Alfred to create Levitt and Sons, a construction company specializing in single-family home building. The company was founded in 1929. When Levitt became the company's president he occupied himself primarily with management and financial matters. Levitt and Sons did modestly well despite the Great Depression (1929–1939) of the 1930s. Levitt joined the Navy during World War II (1939–1945), serving as a lieutenant with the Seabees, the Navy's "can do" construction team. In the Seabees Levitt gained valuable experience in rapid, safe construction under unsafe conditions.

While he was in the Navy, the family business in the United States made much progress. In 1942 it received a federal war contract to build 1,600 homes for military and civilian personnel near a naval base in Norfolk, Virginia. In the construction of the last 750 homes built there, Levitt's father and brother experimented with building processes, especially with standardization and cost reduction.

After Levitt returned to the family business the company entered its greatest era of success. The Levitt family correctly forecasted the tremendous economic boom that happened in housing construction immediately after World War II. They analyzed the factors that caused single-family houses to be expensive.

One major factor was that single homes were largely custom-made and required time consuming custom installations.

The Levitts decided to apply assembly line techniques to their housing construction. They developed one basic floor plan for a two-bedroom, 800-square-foot house, and made as many pre-fabricated parts as possible. They then hired specialized workers who did only one basic job, going from house to house, ahead of one crew, behind another crew, in assembly-line style. With these innovations the Levitts began to make 36 houses a day.

The crews worked so fast that the Levitts created instant suburbs. The houses sold as fast as they could be built. There were plenty of potential home buyers, most of them war veterans who had inexpensive mortgage loans guaranteed them under the G.I. Bill, a provision of the U.S. government to help returning war veterans readjust more quickly to civilian life back home. This included a home mortgage plan.

The first community built completely by the Levitts was called "Levittown." It was located on Long Island, New York; construction began in 1947 and completed in 1951. It included 17,500 Cape Cod-style homes spread over 7.3 square miles of land. What had once been potato fields was turned into homes with small parcels of land for buyers. The features of the homes included up-to-date kitchen equipment, laundry rooms, and television sets. Each house had two bedrooms and an extension attic that could serve as a third bedroom or an office. As the houses were built they were immediately put on the rental market for \$65 a month with an option-to-buy clause for just under \$7000 and no down payment for veterans.

By 1949 business was going so well that the new houses were no longer rented. They sold immediately, now for \$8000. The Levitts also built larger homes for just under \$10,000, with four to five bedrooms. By building the houses on winding streets and using different color schemes on their facades, the Levitts created houses that all looked "different," at least from the curbside view.

Levitt and Sons earned a profit of \$5 million from the building of "Levittown." The mass production techniques used by the company were clearly the key to its success and future. Later Levittown developments were built in Pennsylvania, New Jersey, New York, and Florida, with the same success.

Levitt understood his marketing success. The majority of the company's sales were to World War II veterans. Levitt sold to young families who sought

Suburbia flourished in the 1950s pursuant to the vision of house builder William J. Levitt who introduced mass-produced housing.

inexpensive “starter homes.” A Levitt home was a family home, and the postwar United States placed great stress on the family unit and of the quality of family life. The Levitt suburban homes also gave families more privacy than was available in city apartments. Living in the suburbs made it possible for young families to have green lawns, small patios, swing sets in a yard, and barbecue grills.

William Levitt and his family company remained successful from the late 1940s to the late 1960s. Levitt’s homes, however, were eventually criticized for their conformity and “ticky-tacky” quality. Levitt was also accused of refusing to sell his Levittown homes to African Americans in the 1950s.

William Levitt died in 1994. During his lifetime he created homes for millions of people in the United States. He provided them with a higher standard of living and a better quality of life than previous generations had enjoyed.

LEWIS AND CLARK EXPEDITION

The nation’s economy diversified and grew during the first decades of the United States’ independence from the British Empire. With the vast majority of the population engaged in agriculture, Thomas Jefferson (1801–1809) believed that the health of the republic rested on small independent farms, owned by men he called “Yeoman farmers.” Jefferson also favored a strong agrarian economy to counter tendencies of concentrating wealth and power in emerging manufacturing centers of the east.

To find more farming land, Jefferson looked West. Although the Mississippi River formed the western boundary of the United States, Jefferson wanted to explore the region beyond, fearing that if the U.S. did

Lewis and Clark traveled their western expedition with the help of Sacajawea, of the Shoshone tribe, acting as an interpreter.

not expand westward, Britain or other countries might soon colonize the region. The lack of sufficient funding and political support, however, hindered such efforts through the 1790s.

In March of 1801 Jefferson became the third president of the United States (1801–09) and was in a position to further his exploration and land acquisition plans. By the time of his administration, Americans had a clearer understanding of the size of the continent they inhabited. In part, their knowledge was expanded because of the work of Captain James Cook (1728–1779), who measured the longitude along the Pacific Coast in 1780, and later of American Captain Robert Gray (1755–1806), who mapped the precise location of the Columbia River’s mouth in 1792.

In 1801, however, Britain, Spain, France, and Russia still held vague claims to western North America, though the territory was in the possession of Native Americans. With water travel essential to commerce, Jefferson favored exploration and development of new water routes. The primary objective of a proposed expedition was, in Jefferson’s own words, “to determine the most direct and practicable water communication across the continent, for the purposes of commerce.”

Jefferson recruited Meriwether Lewis (1774–1809), a young army captain serving as Jefferson’s personal White House secretary, to lead the expedition. Lewis, in turn, identified Lieutenant William Clark (1770–1838), an earlier commander of his, to serve as the expedition’s co-leader. With agrarian interests in mind Jefferson directed them to make observations and measurements along the exploration route concerning plants, animals, soils, geography, and climate. Jefferson had Lewis tutored in Philadelphia by experts in these fields to prepare him for the expedition.

With preparations for the journey well under way Jefferson completed the Louisiana Purchase with Napoleon Bonaparte of France in 1803. The acquisition instantly doubled the size of the United States by adding 827,000 square miles of land and, most importantly, control of the Mississippi River for commerce. The expedition’s purpose suddenly expanded to include exploration and evaluation of the new lands to determine their settlement and commercial potential.

The party of more than 40 men, called the Corps of Discovery by Jefferson, departed on May 14, 1804, from near the mouth of the Missouri River. Using large canoes and a keelboat for the first part of their journey

(up the Missouri River), the party carried provisions to be supplemented along the way with wild game and fish. Lewis was in charge of scientific observations, with Clark directing map making and journal writing. In 1805 after spending their first winter at a Mandan Indian village on the Missouri in North Dakota, the expedition continued to the Missouri's headwaters and through the ranges of the Rocky Mountains. The expedition then journeyed down the Snake and Columbia rivers arriving at the Pacific Coast in the middle of November. They built Fort Clatsop just south of the Columbia River mouth and waited for a supply ship that never arrived. After a miserably wet winter, the expedition roughly retraced its route back eastward in 1806, splitting apart for much of the time to explore as much territory as possible. They arrived safely in St. Louis with great celebration on September 23 after exploring almost 8,000 miles of terrain in 863 days.

Two centuries later the Lewis and Clark Expedition remains remarkable for several reasons. Only one member of the party died, early in the journey, possibly from a ruptured appendix. By treating the Native Americans with respect, the party created a firm basis for trade, peace, and assistance with settlement. Though the expedition showed that the long-sought major waterway for trade did not exist, a wealth of biological, geographic, and cultural information was gathered in the party's eight-volume journal and maps. Included are previously unrecorded descriptions of 122 animals and 178 plants. The information vividly addressed the commercial potential of the newly acquired lands and territories west of the Rocky Mountains to the Pacific shore. Though the crossing was more difficult than anticipated, the Corps demonstrated its feasibility. The maps and detailed journal more immediately aided the U.S. fur trade. The fur trade spread across the region by the 1820s, and provided furs to a demanding European market.

Most importantly the expedition introduced the first United States presence west of the Rocky Mountains. Once the natural resources and potential settlement sites of the Northern Plains and Pacific Northwest were recorded, the agrarian economy envisioned by Jefferson could become a reality. U.S. citizens settled rich farmlands and established ports to ship produce to markets. As an integrated national economy was first emerging, Lewis and Clark opened the way to U.S. expansion from one coast to the other. The stage was set for an agricultural transformation of the west.

LEWIS, JOHN LLEWELLYN

John L. Lewis (1880–1969) began his working life as a coal miner, working like his father did for low wages in dangerous situations in an unregulated mining industry. He realized early that organizing his fellow mine workers into a common union of shared self-interest was the only way to fight the business practices that had created the circumstances he and other mine workers faced. Eventually, he became the president of the United Mine Workers (UMW), the national union of miners, and later the first president of the Congress of Industrial Organizations (CIO), the first unionized affiliation of industrial workers in the United States.

John Llewellyn Lewis was born in 1880, one of six children born to Thomas and Ann Lewis, in Lucas, Iowa. His father was a coal miner, a Welsh immigrant to the United States. The family moved often, following the availability of work from one coal-mining community to another. Lewis's childhood was filled with his family's continual struggle for financial security. Only because his father had obtained a steady job as a policeman in Des Moines, Iowa for a few years, was Lewis able to attend high school for three and a half years.

Lewis became involved with the organization of the miner's union in Lucas, Iowa, when he was 17. He continued to work in the mines, but he did not settle

John Lewis (center) was a devoted and powerful leader in U.S. organized labor for many years.

into serious union organizing efforts until 1908, at age 28. He moved with his wife to Panama, Illinois, and there became involved in union activities. With the help of his five brothers, Lewis was promoted to spokesman for the UMW.

A year later the UMW, seeking passage of mine safety laws, appointed Lewis as their state lobbyist in Illinois. In 1910 Lewis was made president of his union local in Panama, Illinois, one of the 10 largest union locals in the state. By the next year he had become a full-time organizer for the national organization of craft and skilled-labor unions known as the American Federation of Labor (AFL). He remained with the AFL for six years. His reputation grew as a fierce and progressive voice speaking powerfully on behalf of those who were then a part of U.S. organized labor.

By 1920 Lewis was elected president of the UMW, and he guided the union of dwindling U.S. mine workers through a long period of decline in the 1920s. He held the union together during a time when U.S. industry moved to prevent further labor organizing. It was an era of cheap labor for industry, which was able to use newly immigrated workers from the southern United States and Europe. The rapid introduction of

machinery to business during the 1920s also contributed to the decline of organized labor. The increasing use of machines threatened jobs, and many workers gave up their union activities in favor of preserving their employment. By the end of the 1920s Lewis had obtained absolute control over what was left of the organized mine workers in the United States.

When the United States experienced the Great Depression (1929–1939) after the stock market crash of 1929, Lewis began to fight to keep control of his union. He had to fend off new and aggressive communist labor organizers, as well as union opportunists representing a variety of reactionary labor positions. But, he held the threadbare UMW together.

After Franklin Roosevelt (1933–1945) was elected president of the United States in 1932, Lewis began to regain a large new membership in the UMW, based on Roosevelt's efforts to re-ignite the U.S. economy by mobilizing the industrial forces of the United States back into action with government aid. As part of Roosevelt's National Industrial Recovery Act (NIRA), administered by the National Recovery Administration (NRA), a provision of the NIRA, known as "section 7(a)," guaranteed labor's right to organize unions during this time in an overall effort to not only establish

codes of fair competition for business, but also to provide safeguards for labor. Section 7(a) gave the right to all employees to organize and bargain collectively through representatives of their own choosing, without coercion. Labor unions immediately grew in number and size, including the UMW.

By 1933 most UMW miners were working a five-day week, eight hours a day, for the first time in their lives. At that time Lewis was moving in the direction of organizing all U.S. labor by industry, and not by their occupations or skills. By 1935 after the AFL had refused to include industrial laborers into their union, Lewis began to aggressively organize the neglected laborers in the great mass-production industries like steel, automobiles, rubber, oil, lumber, aluminum, and textiles. In conjunction with other labor leaders, Lewis began to put together the Congress of Industrial Organizations (CIO) in 1936. CIO managed victories in the steel and auto industries between 1936 and 1937 led to a massive membership in the CIO. After that a gradual and very difficult affiliation began, eventually joining the AFL with the CIO in an international union known as the AFL-CIO in 1954.

John L. Lewis fought throughout his adult life for the dignity of U.S. labor. On balance, Lewis succeeded in his efforts. By using “people power” to fight the raw power of money and business influence, Lewis’ creation of an international CIO led to one of the first example of a consolidation of unions built on the efforts of industrial workers. His achievements in acquiring labor benefits for his union’s members were eventually integrated into national policy, as when the Roosevelt administration created legislation to provide social security for the elderly and the disabled. Though this legislation was not due to Lewis’ efforts alone, he was one of the first voices at the turn of the twentieth century to advocate for these measures and to see them become a part of life in the United States. John Lewis died in 1969.

LEWIS, SINCLAIR

Sinclair Lewis (1885–1951) was one of the leading U.S. novelists of the 1920s. He was a social critic of the era who wrote from the political perspective of Progressivism. Lewis wrote some of the most effective mass-market criticism against the business corruption of society. He was a fierce critic of materialism in the United States. In books such as *Babbitt*, *Arrowsmith*, and *Mainstreet*, Lewis attacked the smug provincialism, social conformity, and corrupt business values of the U.S. middle class in the 1920s.

Lewis was born on February 7, 1885 in a prairie village in the most Scandinavian part of the United States—Sauk Center, Minn. He was raised in middle class circumstances and attended the local public schools of his community. Lewis grew up in the midst of the Progressive movement in the United States. Many of his Scandinavian neighbors embraced cooperative and socialist ideas, and had embraced unionization and progressive thinking in various ways. Other neighbors of his were middle-class Protestants who strictly conformed to the social standards they deemed acceptable and who saw financial advancement as the major yardstick of success. Lewis grew up with conflicting feelings about himself. He wanted to be a “regular guy,” but he was by nature a non-conformist, an agnostic, a skeptic, and an artist.

Lewis enrolled at Yale University in Connecticut because he hoped to escape Midwestern life. He then began an off-and-on career as a student and world traveler. He graduated from Yale in 1908. Recounting his life to the Nobel Foundation after receiving the Nobel Prize for Literature in 1930 Sinclair wrote: “I drifted for 2 years after college as a journalist, as a newspaper reporter in Iowa and in San Francisco, and incredibly, as a junior editor of a magazine for teachers of the deaf.”

Lewis wrote five novels between 1914 and 1919, and according to him “all of them dead before the ink

was dry.” In 1920 at the age of 35 Lewis published the novel *Mainstreet*. It became an instant and scandalous best-seller, largely because he had attacked “one of the most treasured American myths . . . that all American towns were peculiarly noble and happy,” as Lewis himself said.

Lewis wrote for mass-audiences and usually criticized class values and virtues. He challenged the smug, narrow-minded, and complacent “business values” of mainstreet United States. He became one of the literary voices that indirectly spoke to the issues of Progressive political thinking in the United States. Lewis saw the modernized world of the 1920s change the United States; he saw great problems looming in the near future. He wrote about those people in the United States who had blinded themselves to the perils of smug, small-town thinking.

Lewis’ work flourished in the 1920s. It was a perfect era to indict traditional U.S. values, which had become unacceptable in the young, jaded, sophisticated, and cynical urban climate of the so-called “Jazz Age,” as the era of the 1920s was called. The generation that had just witnessed the mechanized slaughter and meaninglessness of World War I (1914–1918) was ready for Lewis’ books. His writing was welcomed as a refreshing statement of the unvarnished truth—it rejected genteel optimism, blind U.S. nationalism, and traditional religious values.

Lewis continued writing novels after he received the Nobel Prize; his other works included *It Can’t Happen Here*, *Cass Timberlane*, and an early civil rights advocacy novel, *Kingsblood Royal* (1947). He never reclaimed the status he achieved in the 1920s as a critic of business-related pomposity.

Lewis’ critical faculty was compared to that of Thomas Paine (1737–1809) and Mark Twain (1835–1910). He was regarded as a gadfly of the literary scene in the United States. Lewis both outraged and educated average citizens about their frequently misguided lives as hucksters of U.S. business. His impact on the business world of his era was large, complex, and thoughtful.

LIBERALISM

The term “liberalism” has meant different things at different points in the history of the United States. The different meanings of liberalism turn on the changing relationship between the government and the economy. In the nineteenth century liberalism was a critique of the doctrine of mercantilism which had been the reigning theory of economic activity in the eighteenth century. Mercantilism focused on the commercial life of the nation. It asserted that there was only a fixed amount of wealth in the world and viewed economic life as a kind of commercial warfare between nations in which the goal was to accumulate as much as possible of silver and gold. The government played an active role in this commercial competition between the nations. It encouraged specific manufacturing industries, regulated the quality of manufactures, established trading routes and oversaw the relations with the colonies. This doctrine had begun to crumble in the eighteenth century as a result of excessive regulation and poor administration. Also the economies of some European nations, like Spain, had been undermined by the price inflation that accompanied their governments’ accumulation of gold and silver. The mercantilist economies also sometimes created obstructions to international trade by erecting high tariff barriers to protect domestic industry from foreign competition.

When Adam Smith wrote his *Inquiry into the Nature and Causes of the Wealth of Nations* in 1776, mercantilism had seen its better days. Smith’s was a most elegant critique against the decrepit system, because it was so simple. He argued that all the functions that mercantilism invested in the state could be more efficiently performed by the individual entrepreneur. For instance, rather than have the government dictate prices and quantities of goods for sale, the “law of supply and demand” would automatically find the price and the quantity which best accommodated both the buyer and the seller. Secondly, rather than have the government decide what industry to invest in, the individual entrepreneur, spurred by the profit motive, would make that decision. And, rather than have the government organize production, the entrepreneur, again in the effort to maximize his profit, would find the optimum “division of labor” that would improve productivity and maximize profits.

Liberalism

It was an age of manifestos and Adam Smith's *Wealth of Nations* became (and remains) the most persuasive manifesto of free market capitalism. The nineteenth century economic liberals believed that property rights were the cornerstone of both political and economic freedom. Underlying Smith's system was an assumption (shared by another Scottish philosopher, John Locke) of the promise of harmonious relations among the members of society. Each individual, endowed with certain natural rights, in seeking personal happiness also enhanced the happiness of all. The economic liberals believed that there was no essential contradiction between the "public good" of all individuals. The economy was not, as the mercantilists held, a "zero sum game." The public good could be most effectively furthered by economic liberalism (or the freedom to invest). Democracy could rid itself of the dead hand of government and increase the benign scope of laissez-faire's "invisible hand."

But the emergence over the next two centuries of industrialization, urbanization, big business, over-production crises, instability, the excesses of competition, and the conspiracy to set prices, and in particular the misfortune of the Great Depression (1929–1939) plus two world wars gradually converted modern liberalism from a crusade against governmental interference in the economy into a movement to protect the weak against the strong and the national economy against the unregulated tendency towards instability. Today, at the beginning of the twentieth century and the dawn of a new millennium, liberalism stands for almost the complete opposite than its nineteenth century meaning.

But did nineteenth century liberalism ever actually exist? Many economic historians argue that during the first three centuries of U.S. history, colonial, state, and federal governments continued to intervene in the economy, in varying degrees, under the more modern definition of liberalism. They argue that during the colonial period government at all levels acted in the public interest and that it could set the "just price" for milling and the price of bread, regulate the purity of beer, establish reasonable ferry charges, and grant monopoly franchises. Colonial governments could set wages and even require work. In the process, many colonial regulations were embedded in common law. To enforce this web of complex rules and regulations, colonial governments used constables and wardens. While many of the colonial regulations had disappeared by the time of the American Revolution (1775–1783), the Revolution itself did little to interrupt institutional continuity.

While some economists assert that the U.S. economy in the nineteenth century followed Smith's vision

of laissez faire liberalism, others argue that the government, although undoubtedly supportive of profit-driven economic development, was also beginning to take on the mandate of "twentieth century liberalism"—i.e., the roles of regulator and safety-net. This was the view, clearly present in the Populists and the Progressives, that the profit motive of the individual investor, unless restrained by government, may do damage to the public good.

In addition, the government remained a potent force in the economy, although often in spite of the popular sentiment to limit the role of the federal government in favor of states rights. The federal banking policy illustrates both the resistance to a larger role for the federal government—vented in Andrew Jackson's "bank war" of 1832—and the gradual realization that banks simply needed regulation. Eventually, the national consensus supported President Woodrow Wilson's Federal Reserve Bank which in 1913 created the modern national banking structure.

As the Progressive period unfolded, reforms at the federal level included the lowering of tariffs, the introduction of the income tax, passage of antitrust laws, the Federal Reserve Act of 1913, the direct election of Senators, federal child-labor laws, constitutional amendments prohibiting the consumption of alcoholic beverages, and extending the vote to women. Reforms at the state level brought workmen's compensation laws and pensions for Union Civil War veterans, their widows, and orphans (the nation's first government funded welfare plans). Seeking to break the power of entrenched political interests, reformers also advocated open primaries, initiative, referendum and recall, and promoted governmental regulation of gas, water, and electrical utilities. Urban reformers also sought to weaken political bosses and their machines by implementing commission government and home rule. As the emergence of the modern bureaucratic state continued, various political factions battled for control in a society being transformed by the forces of industrialization, immigration, and urbanization.

Faced with mounting pressure, the federal government also began to regulate the railroad industry as well as break up monopolies. In response to the accumulated demands of the National Grange, Farmers' Alliances, Greenback Party, and eventually the Populist Party, Congress finally passed in 1887 the Interstate Commerce Act, which assigned the federal government the role of market arbiter. On October 15, 1914, Congress passed and President Woodrow Wilson (1913–1921) signed the Clayton Antitrust Act, which was designed to strengthen the Sherman Antitrust Act of

1890 by fully codifying specific illegal antitrust activities. To carry out and enforce the Clayton Act and the Sherman Act, Congress created the Federal Trade Commission in a related measure.

As the country expanded and the population grew, and as the economy became more complex and powerful, some of the underlying structural weaknesses were not apparent to most U.S. citizens. But the Stock Market Crash of 1929 and the subsequent Great Depression changed their views. In 1933 President Franklin D. Roosevelt (1933–1945) formally introduced a new twentieth century liberalism to the United States political and economic landscape. Roosevelt was greatly influenced by the British economist John Maynard Keynes, who proposed the prevention of financial crisis and unemployment by adjusting demand through government control of credit and currency. Roosevelt shifted purchasing power in favor of the poor, the spenders; he provided employment through public works and insurance where it was feasible, and, in other cases, he offered assistance to those injured by economic forces. Essentially through ad hoc measures (measures taken for a specific case or instance), the New Deal unfolded. The objective was to help those in distress, deflate the large interests that had overreached themselves, and improve the functioning of the system.

In the late 1990s, under a more global economy, liberalism was faced with the question of whether the United States and other capitalist countries were prepared to accept a mixed economy—one in which the government, not the market, was responsible for major decisions concerning total savings, investment and spending, which would result, it was hoped, in stable or high levels of employment and output.

LIBERIA

Liberia is a country that lies along the West African coast on the Atlantic Ocean. Sierra Leone borders it on the northwest, Guinea on the north, and the Ivory Coast on the east. The capital of Liberia is Monrovia.

Established in 1821, Liberia was intended as a haven for freed American slaves. Members of the American Colonization Society, which was organized between 1816 and 1817, purchased land from native tribes in Africa, with the goal of transporting freed slaves back to their African homeland. The land was named Liberia, which was derived from a Latin word meaning "freedom."

In 1822 the first returning Africans arrived in Liberia. By 1860, eleven thousand freed slaves from America had settled in Liberia; eventually fifteen thousand made the trans-Atlantic voyage. On July 26, 1847, the country was established as a free and independent republic. But constitutional issues, foreign debt, and territorial disputes soon threatened the new nation. The United States government stepped in with aid to stabilize Liberia.

The plan of the American Colonization Society had always been a controversial one: many abolitionists opposed it, as did some African Americans who believed slavery should simply be eradicated from the United States, and the freed slaves granted all rights of citizenship. The African resettlement movement declined in the mid-1800s.

LIBERTY BONDS

During World War I (1914–1918) the U.S. Treasury sold war bonds (certificates of indebtedness backed by the federal government) to help pay for the high cost of the war effort. Posters advertising the bonds were emblazoned with an image of the Statue of Liberty and the certificates themselves were called Liberty bonds. Patriotism and the motivational messages of Hollywood stars, such as Charlie Chaplin, Mary Pickford, and Douglas Fairbanks, who spoke at bond rallies, encouraged Americans to buy billions of dollars worth of Liberty bonds to help finance the fight in Europe. Towns were even given quotas of bonds to sell. In 1917 alone U.S. citizens bought \$18.7 billion worth of the bonds, which would pay a fixed 3.5 percent interest

Liberty Ships

rate compared with railroad bonds, which yielded nearly five percent in fixed interest. The success of the Liberty bond sales enabled the federal government to borrow money from its citizens, promising to pay the sum back (plus 3.5 percent interest). The bond sales served to introduce many U.S. citizens to the practice of investing, which they continued after the war. Some analysts believe this mind-set helped fuel overconfidence in the stock market, which contributed to its escalation during the 1920s and to its crash at the end of the decade (1929). During World War II (1939–45) the government again sold war bonds to help raise funds for the fight for freedom.

LIBERTY SHIPS

Liberty ships were American-made, mass-produced merchant vessels that were used by the Allies to carry freight, troops, and fuel during World War II (1939–1945). A few were converted to other uses, including tank transports, hospitals, and repair shops. A Liberty ship was a modified version of a merchant ship of simple design that was conceived in Great Britain. The original plan called for the vessels to be riveted, but riveting was a time-consuming process. By September 1940, Britain was under siege by German naval and air forces and lacked sufficient time or capital to build such ships for itself. So when production of the merchantmen was turned over to the United States, industrialist Henry J. Kaiser (1882–1967) sped up production by welding the vessels and applying revolutionary prefabrication techniques. Kaiser started with an initial keel-to-deliver time of over 200 hundred days. Within a year, however, Liberty Ships were being launched just 24 days after the laying of the keel. They traveled at a top speed of 11 knots, and came in different sizes and weights, with the largest being almost 450 feet long and over 10,000 tons.

Approximately 250 Liberty Ships were sent to Great Britain and the Soviet Union under the Lend-Lease program, while another 200 were used by American forces. Liberty ships take their name from “Liberty Fleet Day,” a day in September 1941 when the first one was launched. Because of the high rate of production, a number of Liberty Ships were defective. But others endured repeated pounding by German surface ships and submarines. One ship even sunk a German auxiliary cruiser with its single four-inch gun.

LIMITED PARTNERSHIP

A limited partnership is a form of incorporation which involves ownership by two classes of investors known as general partners and limited partners. There can be one or more general partners and one or more limited partners in a limited partnership. Both classes of partners receive income or incur losses of the partnership based on the percentage of ownership each partner has. General partners are responsible for the management of the corporation and assume unlimited liability for any obligations or legal debt. Limited partners are passive owners in that they do not participate in the everyday operation of the corporation. Therefore their financial liability for the partnership is limited to the amount they have invested in the corporation.

LOBBYING

Lobbying is an attempt to influence the course of government action through persuasion or gifts to legislators. The phrase derives from the advocates’ practice of waiting in the lobby of government buildings, such as the U.S. House of Representatives, to talk to lawmakers as they come and go. Lobbying, as an activity, may be as old as democracy, but the phrase itself seems to have originated in the early- to mid-nineteenth century in Washington, D.C.

From its earliest usage, the term lobbying implied activity that was somewhat illegal or unsavory, including bribery of public officials. Even today when laws strictly limit the types of gifts that lobbyists may give legislators, critics of lobbying decry the large campaign contributions that interest groups are able to give to candidates to influence their future actions. Lobbyists themselves defend their profession. They contend that they perform a vital public service by bringing valuable information about public issues to light.

Lobbying is often performed by major law firms on behalf of clients or by nonprofit groups concerned with a single issue. There have been hundreds of well-organized groups that lobby both in Washington, D.C., and in state capitals. These groups represent almost every conceivable special interest, from business and environmental groups to those concerned with abortion, foreign trade, or tax reform. Some of the better known groups that lobby legislators on issues of interest to their members are the National Rifle Association,

the American Association of Retired Persons, and the National Association of Realtors. Lobbying has had a profound influence on legislative actions.

LONG, HUEY PIERCE

Huey Pierce Long (1893–1935) was the seventh of nine children, born in a poor area of Louisiana in 1893. Though he would build his political career on the support of poor whites living largely on farms, Long's family was middle class. In school he excelled as a debater and read widely, particularly from the *Bible*, Shakespeare, and the French writer Victor Hugo.

Long worked briefly as a typesetter and a traveling salesman. He then briefly attended law school, took the Louisiana State bar exam, and passed it in 1915. Long was shrewd, popular, and had a feel for communicating with the "common man;" he became an effective attorney almost immediately. Long's political career began in 1918, with his election to the Louisiana railroad commission, which later became the public service commission. There Long made a name for himself by attacking large Louisiana-based corporations, especially Standard Oil, for being concerned only with their profits and as the source of the problems of Louisiana's poor.

EVERY MAN A KING.

Huey Long

Running with the slogan of "Every Man a King," Long was elected governor in 1928. As governor Huey Long continued to blame big business for the financial problems of the poor in Louisiana. He introduced unprecedented programs aimed at helping the poor in exchange for their votes. He initiated a massive highway and toll-free bridge construction project that put masses of people to work, lowered utility and transportation rates, and provided free schoolbooks, school lunches, and hospital care for everyone. He established free public night schools and began a program of dramatically improving the health standards of working people by taxing large Louisiana corporations. At the same time, there were accusations of bribery and corruption against Long. It is certain that Long's control of the Louisiana Democratic Party allowed him to crush most rivals and assume near total control over the state of Louisiana. He was elected to the U.S. Senate in 1930, but stayed on in his post as governor until his

Huey P. Long.

term expired in 1932, so as to prevent his lieutenant governor, a political opponent, from taking office.

In Washington, DC, Long allied himself with moderate Republicans, and yet strongly supported President Franklin Roosevelt (1933–1945). But Long quickly became impatient with Roosevelt's efforts to end the Great Depression (1929–1939), and saw the opportunity to further expand his power. In 1933 he broke with Roosevelt and began to plan for his own presidential run, using a "Share the Wealth" platform which was aimed at overhauling the tax structure in order to bring about a quick redistribution of wealth.

Under Long's plan the government would limit the income of all people through taxation, and use these funds to ensure that every family would be furnished with a \$5000 allowance and an annual income of \$2000 plus benefits. This idea was very attractive to millions of Americans who had lost their jobs or much of their wages in the Depression. It was met with horror by wealthier Americans, who decried the plan as communism or facism. Large businesses in particular regarded Long and his ideas as a threat.

Huey Long's dreams of the presidency ended in the Louisiana State Capitol in 1935, when he was assassinated by Carl Weiss, a political enemy. Weiss

Longhorn Cattle

was immediately shot and killed by Long's bodyguards. The "Share the Wealth" plan died with Long. The United States would eventually emerge from the Depression, but at Roosevelt's pace, a pace that left U.S. business intact and arguably stronger after World War II (1939–1945).

LONGHORN CATTLE

Longhorn are a breed of cattle descended from cows and bulls left by early Spanish settlers in the American Southwest. They are named for their long horns, which span about four feet (over one meter). By the end of the American Civil War (1861–1865) these cattle had multiplied and great numbers of them roamed freely across the open range of the West. Americans found the beef of longhorns stringy and tough. But ranchers in Texas bred the longhorns with other cattle breeds such as Hereford and Angus to produce better quality meat. As beef was in demand in the eastern United States, shrewd businessmen capitalized on the business opportunity, buying cattle for three to five dollars a head and selling them in eastern and northern markets for as much as \$25 to \$60 a head. Ranchers hired cowboys to round up, sort out, and drive their herds to railheads in places like Abilene and Dodge City, Kansas, which became famous as "cow towns" (raucous boom towns where saloons and brothels proliferated.) After the long trail drive, the cattle were loaded onto rail cars and shipped live to local butchers who slaughtered the livestock and prepared the beef. For 20 years the plentiful longhorn cattle sustained a booming livestock industry in the West: at least six million Texas longhorns were driven across Oklahoma

to the cow towns of Kansas. However, by 1890 the complexion of the industry changed. Farmers and ranchers in the West used a new material, barbed wire, to fence in their lands, closing the open range. Railroads were extended, bringing an end to the long, hard, and much glorified cattle drives; the role of the cowboy changed, making him little more than a hired hand. Big business took over the industry. Among the entrepreneurs who capitalized on beef's place in the American diet was New England-born Gustavus Swift (1839–1903), who in 1877 began a large-scale slaughterhouse operation in Chicago, shipping ready-packed meat via refrigerated railcars to markets in the East.

LOUISIANA

Natural resources and farming hold a significant place in Louisiana's economic history. However, the cultural spice of New Orleans has added to the state's economic base by setting the city apart from any other cities in the world and, over the years, making it a unique tourist attraction.

Indians were the first known inhabitants within Louisiana, living in small pockets. Spanish and French explorers navigated the Gulf of Mexico even before Robert Cavelier, Sieur de la Salle named the land at the mouth of the Mississippi River Louisiana. He did so in honor of King Louis XIV, claiming the land for France in 1682. In the 1700s the French began developing settlements in Louisiana and in 1722 New Orleans was established as Louisiana's capital. These early French settlers started tobacco and indigo farms and brought in slaves from Africa and the West Indies to work them.

Louisiana was not particularly prosperous under French rule, however French culture did take hold. In 1762 France ceded Louisiana to Spain during the French and Indian War (1754–1763). The area fared very well under Spanish rule as American settlers and immigrants from Spain and the Canary Islands relocated to the area. The Spaniards also brought black slaves, but there were also many "free people of color" in Louisiana. However the largest number of immigrants were French-speaking Acadian refugees from Nova Scotia who were driven from their homes by the British during the war with France. Their descendants are now known as Cajun. The mixture of these early Spanish, French, and black cultures became the unique and colorful Louisiana of today.

State of Louisiana.

In 1800 Napoleon Bonaparte forced Spain to return Louisiana to France. Three years later Napoleon sold Louisiana to the United States for \$15 million. President Thomas Jefferson's (1801–1809) real estate deal doubled the size of the United States with a cash outlay of about 3 cents per acre.

In the early 1800s Louisiana saw an influx of immigrants from surrounding southern states. On April 30, 1812, Congress approved Louisiana's bid for statehood. Between 1815 and 1861 Louisiana's sugar and cotton production made it one of the most prosperous states in the south. The state was also an important location on the inland north and south water route. Steamboats traveling the Mississippi River transported goods such as cotton, grain, and sugarcane to New Orleans, where it was trans-shipped on ocean-going vessels. This assured the city's commercial and strategic importance.

Wealthy planters in Louisiana depended on slave labor. In 1860 there were more than 330,000 black slaves, nearly half of Louisiana's total population. At

that time the north no longer allowed slavery and when Abraham Lincoln (1861–1865) became president of the United States in 1861, southerners feared he would outlaw slavery in the south as well. The planters in Louisiana held the majority of economic and political power. Their influence led the state to secede from the union with ten other states and form a separate country called the Confederate States of America, thus beginning the American Civil War (1860–1865). In 1865 the South surrendered having suffered disastrous losses; the war ended, and all slaves were freed. When the Civil War was over, however, opportunities for freed blacks were limited, and former slaves returned as laborers to sugar plantations and cotton fields, which they farmed "for shares," (they rented the land and paid in shares of the crop) along with poor whites.

In the 1880s irrigation systems allowed farmers to plant rice, and midwestern farmers migrated to southwestern Louisiana to become rice farmers. In the meantime, lumber and flour mills were started; oil and natural gas were discovered; and railroads were built.

Louisiana Purchase

However, in 1898 a new constitution was drawn up that took voting rights away from blacks as well as many poor whites. Large landowners, businessmen, and politicians controlled the government and resisted social reform, which meant that the small farmers and the urban working class, both white and black, did not share in the general prosperity.

In the late 1920s the Great Depression (1929–1939) caused banks and factories to close around the country and many people lost their jobs. When Huey Long was elected governor of Louisiana in 1928 he based his campaign on the problems in the economy and the growing inequality between the state's citizens. He also campaigned against the Standard Oil Company's high-handed dealings. Although he did not really challenge the racial segregation of the South, he did talk more about class than about race, and he advocated social and economic reforms, such as some improvements in education and health care, for African Americans. Huey Long was an ambitious, talented, and very popular politician who initially supported Franklin D. Roosevelt's New Deal program of governmental aid to victims of the Depression. However, he turned against Roosevelt and would probably have split the Democratic vote in the 1936 election had he not been assassinated in 1935.

The state's economy gradually pulled out of the Depression with the development of offshore drilling, reforestation, and soybean farming. Many residents were put to work building roads and bridges. Louisiana became one of the world's leading petrochemical manufacturing centers with oil drilling in the Gulf of Mexico. After World War II (1939–1945) started, additional jobs were created as ships were built for the Navy in New Orleans.

In the 1970s much of the revenue from the high oil prices was put to work to improve the state's schools and highways. But in the mid-1980s world oil prices dropped, which hurt Louisiana's economy. Energy-related industries, such as machinery manufacturing, also suffered. In 1986 unemployment in the state, especially for women, was the highest in the nation at 13 percent. In the 1990s Louisiana had more people living in poverty than any other state.

In 1992 Louisiana tried to revitalize its economy by legalizing riverboat and casino gambling. This effort created thousands of jobs and also helped attract more than 20 million tourists annually. In the 1990s the service industry was the leading employer. While chemicals were the leading product in Louisiana in 1995, others, such as fertilizer, soap, paint, plastic, ships, airplanes, paper, and praline candy, were also

growing. At the same time crops grown in Louisiana included soybeans, rice, cotton, sugarcane, and sweet potatoes. Shipping and transportation was also significant because the Port of South Louisiana, the busiest port in the United States in 1995, handled nearly 400 billion pounds of cargo annually.

While the average household income in 1997 was \$34,400, the distribution of that income was skewed. In 1995 nearly 20 percent of Louisiana residents were below the federal poverty level, while eight percent had a disposable income greater than \$75,000, including 1.7 percent whose disposable incomes were greater than \$125,000.

LOUISIANA PURCHASE

In 1801 after a series of secret agreements, French Emperor Napoleon Bonaparte (1769–1821) recovered the territory of Louisiana from Spain, which France had lost in 1763. When the land was handed over, U.S. goods were refused storage at the important international port of New Orleans—a violation of the Pinckney Treaty. Since New Orleans was an integral port to U.S. international trade, unhappy U.S. farmers and merchants grumbled for war.

President Thomas Jefferson (1801–1809) realized that this French acquisition challenged U.S. trade and presented a stumbling block to the United States, should it ever choose to expand its current borders westward. Believing that his decision was in his country's best interests, Jefferson sent Secretary of State James Monroe (1758–1831) to Paris to discuss the possibility of purchasing the Louisiana Territory from

The shaded area indicates the approximate 827,000 square miles of land acquired by the U.S. in 1803 from the Louisiana Purchase.

France. At the same time, Jefferson authorized a gathering of militiamen at home as a show of force against France.

EVERY EYE IN THE UNITED STATES IS NOW FOCUSED ON THE AFFAIRS OF LOUISIANA.

Thomas Jefferson, in a letter to Robert R. Livingston, U.S. minister to Paris, 1802

Napoleon, who was already on unfriendly terms with Britain, did not want to face a British-U.S. alliance. In 1803 he agreed to sell the Louisiana Territory (approximately 827,000 square miles) to the United States for a price of \$15 million. The United States doubled its territorial size and extended public lands

westward into the Missouri River and the Rocky Mountains.

Although the Louisiana Purchase extended U.S. boundaries and ensured protection of U.S. trade at the port of New Orleans, it presented a dilemma to Jefferson. He had a dream of seeing the United States stretch from the Atlantic to the Pacific Oceans. He also believed the government was invested with only those powers explicitly stated in the Constitution, and the authority to purchase new territory was not among those powers.

In purchasing the Louisiana Territory, Jefferson used implied Constitutional powers, by which he strengthened the national government. His action, however, created a sense of uneasiness among those who

feared a return to an authoritarian regime so soon after the American Revolution (1775–1783). A strong central government infringed on states' rights, which Jefferson also ardently supported. At the time he considered proposing a Constitutional amendment to allow explicitly the authority to purchase new territory. But, Secretary of the Treasury, Albert Gallatin, advised Jefferson that the executive office had an inherent right to expand the nation, and Congress had the power to admit newly acquired land into the Union as a state or annex it as territory. Jefferson accepted this position and Congress ratified the land purchase. Regardless of the president's philosophical conflict, the public approved of the purchase. In 1804 Jefferson was re-elected to a second term.

Reaching from the Rocky Mountains to the Mississippi River and from Canada to the Gulf of Mexico, the Louisiana Purchase ensured that the U.S. would have ample room for expansion for years to come. Later four whole states (Arkansas, Iowa, Missouri and Nebraska) and parts of nine others (Louisiana, Minnesota, Oklahoma, Kansas, Colorado, Wyoming, Montana, North Dakota, and South Dakota) were made from this vast area. It increased the reach of the agricultural class by securing large amounts of land and transportation networks. With uninhibited access to the Mississippi and Missouri Rivers, goods and services could now be transported over greater distances. The U.S. economy could not help but expand.

Whatever its constitutional implications, the Louisiana Purchase was one of the most important presidential decisions in the nation's history. Through this purchase, the United States became a continental power, controlled the continent's main navigation routes, and became owner of vast new resources. These combined assets promised the young nation greater economic independence from Europe and set a precedent for future territorial expansion.

In order to realize the full potential of this uncharted land, President Jefferson dispatched a 35-member expedition to explore it. Led by U.S. Army officers Meriwether Lewis and William Clark, the expedition was to determine the most direct practicable water communication across the continent for commerce purposes, map the land, gather plant and animal specimens, collect soil and weather data, and record the details of all they saw. It was a large task. Between May 1804 and September 1806, the expedition sighted the Pacific Ocean before returning to St. Louis. The explorers did not find the much sought-after Northwest Passage, but the information they did acquire spurred the nation towards further expansion and settlement.

LOWELL, FRANCIS CABOT

Francis Cabot Lowell (1775–1817) was a member of a large aristocratic New England family that came to dominate the business, political, and cultural life of Massachusetts. He was born in Newburyport, Massachusetts, a year before the signing of the United States Constitution. Francis was a U.S. business pioneer who helped bring about in the United States what is now called the Industrial Revolution. By memorizing and bringing to the United States mechanical details of the English power loom used to make cotton fabric, Lowell created with his business partners the first U.S. textile factory. It was a revolutionary facility built in Waltham, Massachusetts. There the new water-powered loom technology was used with all the other processes of spinning and weaving cloth to enable the manufacture of finished cloth from raw cotton under one roof. It was known as the "Waltham-Lowell System."

Francis Lowell grew up in Newburyport, Massachusetts, the son of John Lowell, a prominent judge married to Susanna Cabot, the daughter of an immensely wealthy shipping family. Francis enrolled at Harvard University in 1789, where he excelled in mathematics. After graduating in 1793 he began to work in an import-export company owned by his uncle, William Cabot. Lowell traveled widely and sought to develop trade and business connections. He prospered

in his work and, when his father died in 1802, Francis inherited one-third of his father's \$80,000 estate, invested for the most part in eight commercial ships.

By 1810 Lowell was, according to most standards, a wealthy man. He was not in the best of health, however, and his wife's health was becoming problematic as well. They decided to travel to Edinburgh, Scotland to improve their health and to observe the power looms that were being used for producing cotton fabric in Manchester, England and other locations.

Lowell had thought of building a textile mill back in Massachusetts believing that New England would only prosper by supplementing its cloth trade with manufacturing facilities. When Lowell returned to Massachusetts in 1812 he was aware that the War of 1812 (1812–1814) would likely cripple his overseas commercial trading business, and so he became intensely active in developing a cloth industry locally, in Massachusetts. The power loom he saw in England was not available in the United States and it was illegal to export the looms for foreign use because the English wanted no competition in their production of power loom finished cloth.

Lowell was determined to bring the power loom to the United States. While he was in England he studied the looms, making sketches and drawings when he could, and memorized mechanical details. Back in Massachusetts, Lowell was able to create his own version of a working power loom with the help of a skilled mechanic, Paul Moody (1779–1831). In 1812 Francis Lowell and other businessmen established what they called the Boston Manufacturing Company. They incorporated it in 1813 and chartered to capitalize it at \$400,000.

With the power loom ready, and the business company established, the loom was patented. Land was purchased by Lowell for the Boston Manufacturing Company along the Charles River at Waltham, Massachusetts, and later along the Merrimack River. In 1814 the company erected buildings on the land at Waltham and fitted them with looms and machines based on Lowell's model, powered by water. At the end of 1814 the mills became operational. They were soon recognized to be the world's first mills capable of converting raw cotton into finished fabric under one roof, revolutionizing the entire textile industry.

Lowell and his fellow entrepreneurs, a group of men who were later widely known as the "Boston Associates," transformed the country's textile industry. So great were the profits at Waltham that the Boston Associates soon looked for new sites throughout the state, and found them at East Chelmsford (later

renamed Lowell, Massachusetts), at Chicopee, Manchester, and Lawrence. The "Waltham-Lowell System" of producing cotton fabric from raw cotton under one roof in a mill operation succeeded beyond all expectations. It gave the Boston Associates control over one-fifth of cotton fabric production in the United States by 1850. By expanding into other businesses related and unrelated to cotton production their empire expanded. The Lowell and the Boston Associates turned to philanthropy, establishing hospitals, schools, and universities.

Though he died at the early age of 42 in 1817, Francis Lowell clearly took a part of the young United States into the Industrial Revolution era. He pioneered work in mass textile manufacture, making cotton fabric domestically produced by a U.S. work force available to people in the United States at inexpensive prices.

LOWELL SYSTEM OF LABOR

During the early 1800s factories went up throughout New England, where rivers were used to power recently developed manufacturing machinery. One such factory was established between 1812 and 1814 in Waltham, Massachusetts. At this site, on the shores of

the Charles River, industrialist Francis Cabot Lowell (1775–1817) built the Boston Manufacturing Company, the first complete cotton spinning and weaving mill in the United States. Here the raw cotton fibers were processed to produce cloth.

To attract the necessary work force to his plant, Lowell established an innovative labor program. He hoped his program would prove an alternative to the system of child labor that had long been in use in Britain and also prevailed in New England textile mills. Called the Lowell System, or the Waltham System, farm girls and young women who came to work at the textile factory were housed in supervised dormitories or boardinghouses and were provided with educational and cultural opportunities. Lowell believed that by providing safety in the workplace, comfortable living conditions, and a socially positive living and working environment he could ensure a steady supply of labor.

Lowell expanded his manufacturing interests, establishing larger mills on the Merrimack River in present-day Lowell, Massachusetts (a town named in his honor). But in the 1830s and 1840s the Lowell System faltered. Increased competition in the textile industry (which was the model for other industries of the day) forced factory owners to cut wages and lengthen hours to stay profitable and meet production demands. In 1834 Lowell cut his workers' wages by 25 percent; the workers responded by staging a strike and organizing the Factory Girls Association, a labor union. But the union's efforts were unsuccessful. Two years later the "Lowell girls" struck again when their housing rates were raised; again the strike failed, as workers found themselves unable to make ends meet and were back on the job within a month.

Conditions deteriorated and in 1845 Lowell workers formed the Female Labor Reform Association, which joined forces with other Massachusetts laborers to force government to legislate improved work conditions in the state. The lobby helped to pass laws that limited work hours, but textile mills continued to ignore the legislation. The arrival of the Irish in Lowell, beginning in 1846, also contributed substantially to the demise of the Lowell System of Labor. With unskilled labor available and willing to work for low wages, the system was no longer needed. By the 1850s the Lowell System was a failed experiment. New England farm girls were replaced by immigrant women who were willing to work for longer hours and lower wages.

LUKENS, REBECCA

Rebecca Lukens (1794–1854) became a pioneer in U.S. industry largely against her will. With the sudden death of her father and her husband, only a year apart, Lukens inherited one of the first iron manufacturing firms in the United States. She became a successful businesswoman in the iron industry in a time when few women worked outside the home, let alone in industrial manufacturing. Her legacy is her firm, which was renamed Lukens Iron Works (and later Lukens Steel) in 1859, honoring her pioneering life and her industry.

Rebecca Webb Pennock Lukens was born in 1794 in West Marlboro Township, Chester County, Pennsylvania. She was the daughter of iron manufacturer Isaac Pennock. She enjoyed a happy childhood and grew up in a Quaker household that emphasized discipline and learning. She attended two private academies, where she received a good education. Her favorite subjects were French and chemistry. In later years she described her own childhood as "wild, happy, and joyous."

While Rebecca was at school, her father Isaac started an iron mill in Chester County known as the Federal Slitting Mill. He extended his interests by purchasing the Brandywine Mill in Coatsville, Pennsylvania. Her father was quite successful at operating both mills.

In 1813 at age 19 Rebecca married 27-year-old Quaker doctor Charles Lukens, and they returned to live at her parents' home. Charles Lukens abandoned medicine to become a partner with his wife's father in the Federal Slitting Mill under the new name of Pennock and Lukens.

Rebecca Lukens and her husband moved their growing family to the Brandywine area and leased the Brandywine ironworks from Pennock. Lukens foresaw the wide use of steam power and was aware of the superior quality of "charcoal iron" for withstanding the high pressures of steam boilers. He undertook to adapt the Brandywine mill for the rolling of charcoal iron boilerplates to be used in ships and wood burning locomotives. This was a new departure for the iron industry in the United States. The mill's first big order was for iron plates to gird the first metal hull ship in the United States, the steamship *Codorus*, launched in

1825. But it was also during this year that Lukens' husband suddenly died.

While her husband had requested that his wife carry on the mill, Rebecca Lukens was almost bankrupt from the expenses incurred in expanding the mill for the making of charcoal iron. In addition, her husband died without leaving a clear will and the inheritance of the Brandywine ironworks was legally ambiguous. Compounding her difficult situation, Lukens' father had died the year before and she was without his advice.

Facing these difficulties while she took care of a newborn child, Lukens assumed total responsibility for the ironworks. Through her father and husband she had learned much about the techniques employed in iron manufacturing. While her brother-in-law Solomon took charge of operating the mill Lukens managed and controlled the commercial end. She bought supplies, set prices, made contracts, and studied legislation that might affect her business. She faced all the problems of building a major industrial supply business and supporting a family.

Transportation of the finished iron was difficult. Rough roads and teeming rivers were always a problem. Water was often a difficulty, since the mill was run by waterpower—when the water ran low the mill had to be shut down. Lukens also faced serious litigation related to her ownership of the Brandywine mill at her mother's death in 1844. After several difficult but successful lawsuits there was a final decree that Lukens make heavy payments to the estate. In return she was granted total legal ownership of the Brandywine Iron Works in 1853.

Despite continuing problems and increased competition Rebecca Lukens made a success of her business. The opening of railroads near her mill solved her transportation problems and allowed her to expand her market. Additionally, her iron plates became known throughout the United States because of their high quality and consistency.

By the age of 59 Rebecca Lukens had a net worth of \$60,000. She settled her husband's debts, paid the balance due to the Pennock estate, and rebuilt her mill. Three years later she made her son-in-law a partner in the business and went into semi-retirement because of failing health.

The Brandywine Iron Works continued to flourish. After Rebecca's death in 1854 the Iron Works was renamed the Lukens Iron Works in her honor. She was a pioneer of the industry and built the firm nearly from its infancy. The renamed Lukens Iron Works produced steel for over a century. In 1957, 600,000 tons of steel

plates were manufactured by Lukens at the same mill site as the one fought for and saved by Rebecca Lukens.

LUMBER INDUSTRY

Lumber was probably America's first industry. The first sawmill was constructed in 1608 in Jamestown, Virginia, to meet the lumber needs of the colonists. Since an abundant supply was generated in the first year that the sawmill was operational, Captain John Smith managed to export a shipment of lumber and related products to England.

For the early American settlers, lumbering remained essentially a local business. Transporting logs and lumber to another settlement was a difficult and unprofitable undertaking. Trees were cut in the winter when the hard packed, frozen ground provided a hard, smooth surface to transport the logs to nearby springs and lakes. The logs remained there until the spring thaw and then were floated to the sawmill by loggers. This seasonal approach to logging provided winter employment to many farmers, allowing them to cut down the trees that would shade their crops during the spring and summer.

During colonial times, New England was the center of this industry. As the population of the United States grew, so too did the demand for lumber. Soon the industry had expanded to include Pennsylvania and New York. By the second half of the nineteenth century, the lumber industry gradually made a westward and then southward move. White pine was now being cut in Michigan, Wisconsin, and Minnesota. Long timbers for use as masts on ships, originally produced in Maine,

Lumber Industry

Lumberjacks use the aid of tractors to load these redwood trees onto trucks that will carry them to a sawmill. Technological advancements expanded the logging season and added to the success of the lumber industry.

were now also beginning cut in Oregon and Washington. Southern forests provided oak for warships like “Old Ironsides,” and lumber by-products such as tar and turpentine were produced from the pine forests of the Carolinas. The primary use for wood, however, remained as a practical and economical fuel source.

During the Industrial Revolution, immense growth experienced by the United States increased the need for lumber and for a technology that could supply it cheaply and quickly. The steam engine satisfied that need by making the sawmills less dependent on water and weather. The steamboats could transport wood products rapidly and travel against the current. Steam also replaced water wheels as an internal power source for sawmills. Up to this point most of the rivers that were used to transport the logs had also powered the sawmills. During the usually harsh winters these waters were frozen, and the wheels were useless. The steam engine allowed sawmills to operate year-round and gave sawmill owners the freedom to locate their businesses as far as they wished from the flowing rivers on which they were previously dependent. The ability

to build a sawmill in any location allowed for expansion into the West.

Since this industry was based solely on the existence of trees, it created a unique situation. Trees provided a renewable resource—unlike oil, coal, or other sources of fuel—as well as useful items such as furniture and building materials. Lumber became the basis for a multidisciplinary and diversified industry that could produce a variety of products. This can best be explained by defining the lumber industry as the “production and harvesting of trees for various uses.” The lumber industry mainly refers to the businesses that processed trees into lumber products. This industry promoted the establishment of other industries to convert timber into fuel, chemicals, pulp, paper, and other products.

The development of tools needed to cut and process lumber developed with the growth of the lumber industry. Saws were produced in many types and sizes, from smaller, lighter, hand-held models to large, industrial band saws used in factories. The advent of thinner

saws made with high-grade steel that permitted a smaller kerf (cutting groove) reduced the amount of sawdust produced—boosting the efficiency of not only lumberjacks, but of lumber mills as well.

As the lumber industry (aided by technology) grew, it became apparent that the seemingly endless supply of timber could disappear. In 1895 the United States government created the Division of Forestry. One of its first decisions (in 1897) was to authorize forest reserves. By the late 1990s forestland ownership was divided into four different categories.

First, private non-industry lands owned by farmers and other individuals provide living areas, small amounts of food, and sources of private income. Corporations make up a small portion of this category as well. For example, businesses such as power companies “give back” land used in the past, converting these into recreational areas such as privately owned parks designed for public use.

Second, federally owned and protected national forests make up of millions of acres of mostly untouched wilderness and preserves. These massive areas are off-limits to the lumber industry and provide safe habitation for wildlife. Federally owned lands provide other environmental needs as well. Trees provide a majority of the Earth’s oxygen and consuming carbon dioxide; this action leads directly to cleaner air and a safer environment.

Third, local governments provide public lands as well. In some cases the land was donated to local governments by philanthropists, giving cities and towns the privilege of having an area of forest wilderness to use for recreational and other purposes.

Fourth, private industrial lands maintain appropriate logging techniques, conservation, and the protection of wildlife while operating commercial lumber

business. Enterprises such as the U.S. Timber Company attempt to plan for the years ahead by practicing conservation measures and maintaining tree farms so that harvested forests can be replanted. The Division of Forestry monitors such companies. Between two and three billion trees are reforested in the United States each year thanks to these efforts. This large number is planted so that the amount of trees grown are greater than the number of trees harvested, lost to disease, and consumed by parasites. Technology has evolved to the extent that an estimated 99 percent of all tree by-products are used.

In the late 1990s the chief lumber producing countries were the United States, Russia, Canada, Japan, Sweden, Germany, Poland, France, Finland, and Brazil. The United States and Russia accounted for more than 40 percent of the world’s annual production of lumber at the end of the twentieth century.

MAIL-ORDER HOUSE

A mail-order house is a retailer that offers goods for sale through catalogs, which, along with the ordered merchandise, are delivered via the mail service. The mail-order business was pioneered by retailer Montgomery Ward and Company, founded in 1872 in Chicago when American merchant Aaron Montgomery Ward (1843–1913) set up shop over a livery stable and printed a one-sheet “catalog” of bargains. Midwestern farmers, hurt by low farm prices and rising costs, were a ready market for the value-priced goods, which were shipped by rail to rural customers. Initially called “The Original Grange Supply House,” Montgomery Ward and Company offered 30 dry goods priced at one dollar or less and provided special terms of sale for Grange members. (The National Grange was an association of farmers throughout the United States.) Aaron Ward bought merchandise directly from wholesalers. Since he did not maintain a store building, his overhead was low. By 1876 Ward’s catalog had grown to 150 pages; in 1884 it was 240 pages and offered nearly 10,000 products, including household items (such as furniture, cutlery, and writing paper), farm implements (such as harnesses and tools), and fashions (such as ready-made apparel and parasols). Ward offered customers “satisfaction or your money back.” In 1886 American Richard W. Sears (1863–1914) entered the mail-order business, opening operations in Minneapolis, Minnesota. He moved the business to Chicago the following year and sold it in 1889. In 1893 he joined with Alvah C. Roebuck (1864–1948) to found Sears, Roebuck and Company. The Sears catalog, which soon consisted of hundreds of pages and thousands of items, became popularly known as the “Wish Book.”

Montgomery Ward and Sears Roebuck were aided by the U.S. Postal Service’s expansion into remote areas: Beginning in 1896, mail could be delivered via the RFD, Rural Free Delivery. In 1913 parcel post was added to the Postal Service’s offerings, further benefiting the mail-order houses and their growing lists of

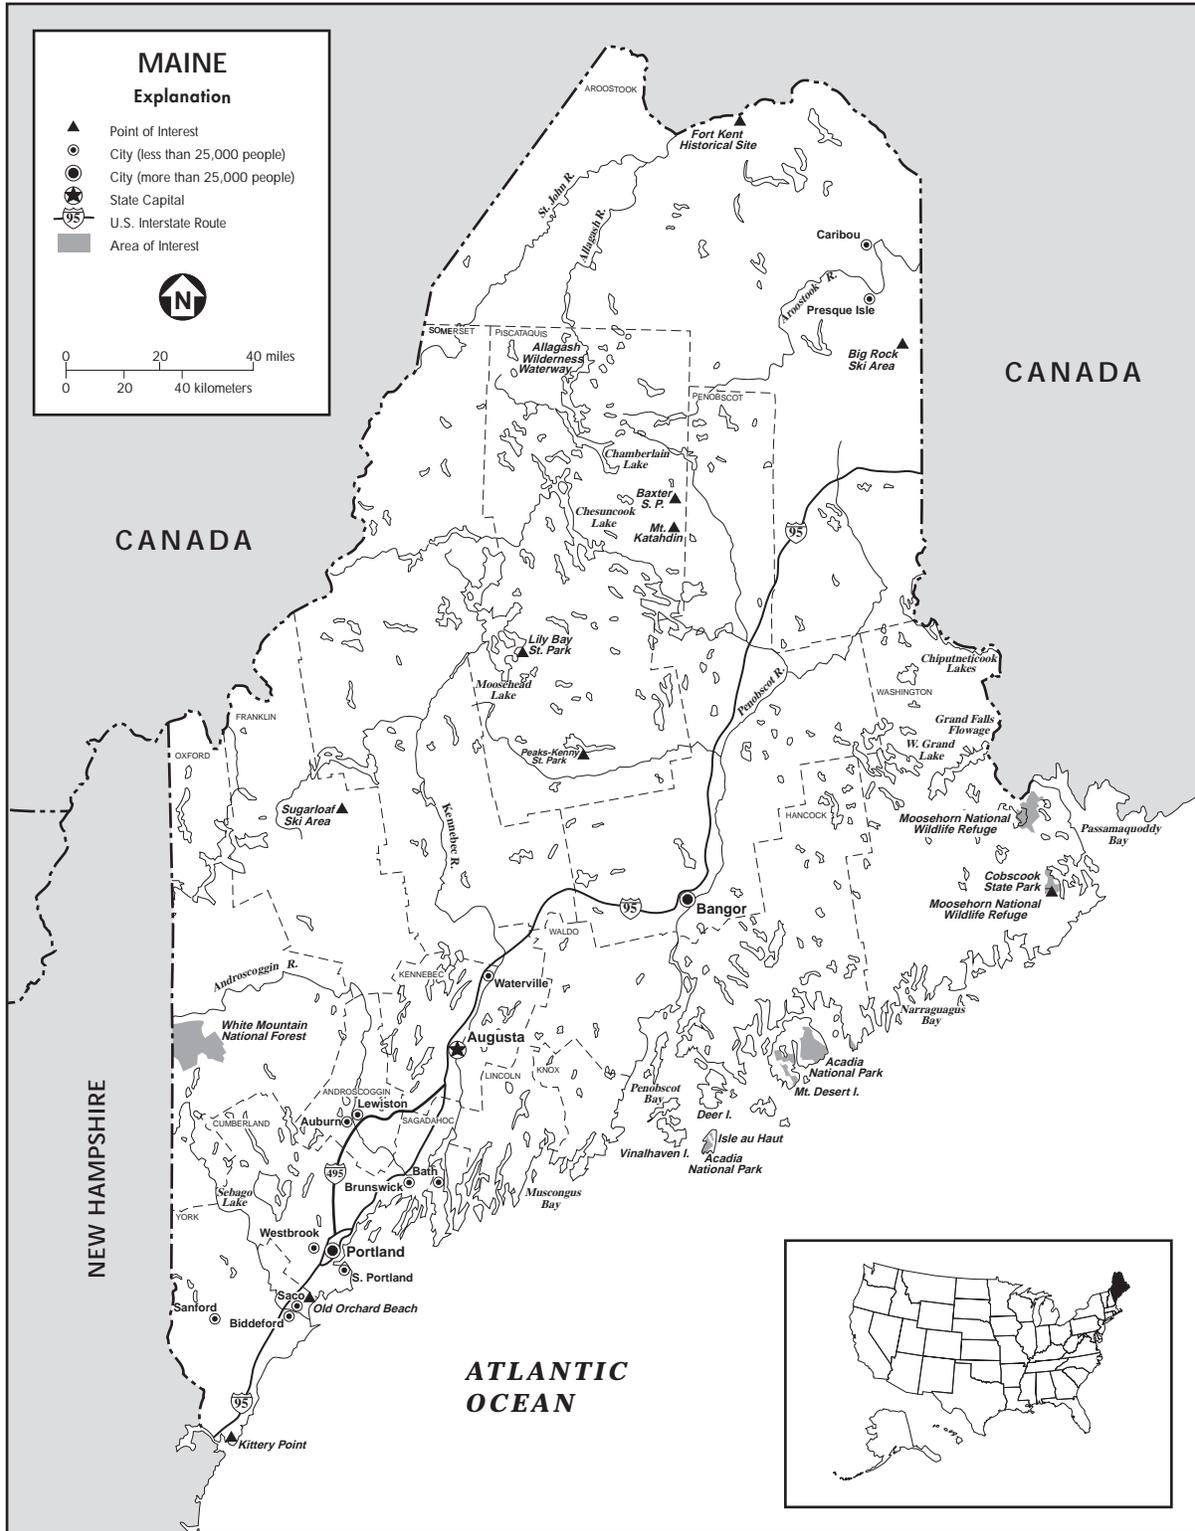

customers. Montgomery Ward and Sears Roebuck offered to the rural United States more than merchandise; the mail-order houses were farm families’ link to the greater consumer society emerging at the turn of the century. Regardless of geography, rural Americans could purchase “store-bought” goods—manufactured goods that were mass-produced in factories. Mail-order houses offered customers convenience because customer purchases no longer had to be deferred for the next trip to a town. They also offered variety, as catalogers catered to a nationwide customer base and on-hand inventory included a multitude of products. Finally, they offered low prices—the mail-order houses bought merchandise at reduced rates from wholesalers. Fashions were no longer restricted to middle- and upper-class city dwellers with access to department stores. Rural customers became aware of new styles each time the Montgomery Ward and Sears Roebuck catalogs were delivered, which, by the early 1900s, was twice a year.

Though both Montgomery Ward and Sears Roebuck exited the mail-order business to concentrate efforts on their chain store retail operations later in the century, they set the standard for modern mail-order houses through their early policies addressing merchandise returns, competitive pricing, flexible payment methods, and shipping terms.

MAINE

A look at any map of Maine will confirm that the settlement of the state occurred on the coast and the rivers, with large areas in the center and the north still largely wilderness. Independent and sometimes wary of outsiders, Maine “down-easters” first developed their fishing resources and later moved into paper and

State of Maine.

textile manufacturing. Never among the most prosperous states in the nation, Maine remains a major producer of paper and wood products, an important location for ocean commerce and fisheries, and a popular destination for tourists.

In the early 1600s English expeditions first came to exploit the rich Maine coastal waters. By 1630 about a dozen English settlements existed along the coast and on several islands. An English joint stock company received the first grant of territory between the Merrimack and the Kennebec rivers in 1622. In the late 1640s the Massachusetts Bay Colony began to absorb settlements in the territory, gaining control of the whole area in 1691. The economy of Maine was based almost entirely on fishing, trading, and use of its forests. One major early industry was the preparation of the white pine masts used by the Royal Navy. Maine remained a part of Massachusetts until 1820, when by terms of the Missouri Compromise, it came into the United States as a free, not a slave, state.

Like the rest of New England, Maine began industrialization between 1830 and 1860, as shoe factories and textile mills sprang up on the state's rivers. Many young farm women came to the mill towns to earn additional income for their deprived families during the heyday of the textile mills. Papermaking also grew in importance; by 1900 Maine was one of the nation's leading papermaking states. The first railroad, the Atlantic & St. Lawrence, was completed in 1853 and connected Portland with Montreal, Canada. By 1900 several more railways, among them the Bangor and Aroostook, the Boston and Maine, the Canadian Pacific, and the Maine Central, crisscrossed the state.

**[TO A MAINE NATIVE, THE] NONNATIVE
SIMPLY COMES FROM OUT-OF-STATE . . .
SINCE ANYWHERE THAT ISN'T MAINE IS
MUCH OF A MUCHNESS AND A PRETTY POOR
EXCUSE OF A PEA PATCH TO BOOT.**

Louise Dickinson Rich, *State o' Maine*, 1964

Shipbuilding was another Maine industry which grew rapidly in the mid-nineteenth century. Maine builders provided many of the stately clipper ships, which carried prospectors and settlers around Cape Horn to California. Lumbering was centered on the Penobscot River at Bangor, which was a freewheeling boomtown from the 1830s through the 1850s. Land speculators rushed into the young state during this time, hoping to turn big profits on cheap land and the promise of wealth.

According to historian Charles E. Clark, the economic history of Maine between the 1860s and the

1890s mirrored economic trends in the nation as a whole, with a particular Maine slant. Entrepreneurs, like the "robber barons" who were building industries and railroads after the American Civil War (1861–1865), came to Maine and made the paper industry their domain. Immigrants came down from Quebec, Canada, looking for work and added their own ethnic flavor to the culture. The entrepreneurs soon began to exploit Maine's abundant water and lumber resources. After the discovery that wood pulp could be substituted for rags in paper manufacture, the paper industry grew rapidly. Smaller companies were absorbed into larger ones, notably the International Paper Company and the Great Northern Paper Company. Often owned largely by interests outside the state, these large concerns controlled river traffic, generated their own power, and owned their own tracts of lumber.

Slowly, pioneer farmers began to settle the more northern regions of Maine, following patterns like those in the settlement of the American West. The Maine potato became a staple crop in the state, and by 1880 several starch mills were built to make even more use of this abundant crop.

In spite of its many natural resources, Maine has suffered economically because of its limited access to a national transportation network. In addition, a curious law passed in 1929 forbid Maine from selling its easily accessible waterpower outside the state, and in 1935 Maine refused to cooperate with a proposed federal water reclamation project similar to the one created by the Tennessee Valley Authority. Today Maine ranks only thirty-seventh in personal income among all states, ranking last in New England. In comparison to those in other states, Maine has no truly large cities; Portland, the largest, had a population just over 65,000 in the 1990s.

While Maine at the end of the twentieth century was not highly industrialized or urbanized, it would be difficult to find a state that benefited more from tourism, which yearly generated about 40,000 jobs, added almost \$3 million to the economy, and was the state's largest employer. In fact, around 50 percent of Maine's economy in the late 1990s, including the tourist industry, was service-oriented. Some of the first tourists who trekked to Maine established wealthy summer colonies in coastal villages like Ogunquit, York Harbor, Boothbay, and Bar Harbor. In the 1990s Maine offered beaches, sailing, craggy coastlines, fishing, hunting, winter sports, and abundant public lands for all kinds of recreation. Its foremost attraction was Acadia National Park, off its central coast, which attracted nearly three million visitors yearly in the mid- and late 1990s.

Manifest Destiny

A relatively small part of the state's economy is devoted to agriculture. Agriculture and food processing industries, however, contribute over \$1 billion annually to the state, and Maine produces more food crops than any other New England state. In addition to ranking first in New England in potato production, Maine leads the world in the production of blueberries, with 25 percent of the total blueberry crop. Milk, apples, and maple syrup are also important Maine products.

Industry occupies less than one-third of Maine's economy but is still a significant sector. In the 1990s, papermaking remained the top industry in the state, followed by transportation equipment manufacture and lumber and wood production. Ninety-five percent of all of Maine's forests are privately owned, primarily by the paper industry. Maine lobster remains the most important fishing product; some of the larger fishing ports are in Portland, Boothbay Harbor, and Rockland. To encourage industrial and recreational projects, the state works through the Finance Authority of Maine to offer such incentives as tax-exempt bonds and loan guarantees for small business. A State Development Office provides assistance for existing and prospective businesses.

MANIFEST DESTINY

The doctrine of Manifest Destiny emerged in the United States in the early 1800s; by the 1840s it had taken firm hold. Manifest Destiny was a rallying cry for expansionism and it prompted rapid U.S. acquisition of territory during the 1800s. Adherents to the doctrine believed that the United States had a God-given duty and right to expand its territory and influence throughout North America.

Territorial acquisitions under the doctrine began in 1803, with the purchase of Louisiana Territory from France. In 1819 Florida and the southern strip of Alabama and Mississippi (collectively called the Old Southwest) were acquired from Spain in the Adams-Onís Treaty. In 1845 Texas was annexed after white settlers fought for and declared freedom from Mexico, then formed the Republic of Texas and petitioned the Union for statehood. In 1846 the western border between Canada and the United States was agreed to lie at 49 degrees north latitude, the northern boundary of what is today Washington state. In 1848, by the Treaty of Guadalupe Hidalgo, the U.S. secured New Mexico and California after winning the Mexican War (1846–1848). In 1853 southern Arizona was acquired from Mexico in the Gadsden Purchase. With the 1853 agreement over Arizona the United States had completed the acquisition of the territory that would eventually become the contiguous United States of America.

FIFTY-FOUR FORTY OR FIGHT!

Expansionist slogan during President James K. Polk's administration, 1845–1849

The fervor of Manifest Destiny was perhaps best illustrated by the expansion into Oregon Country, which was settled by the United States and Canada under the Convention of 1818. The territory began at 42 degrees north latitude (the southern boundary of present-day Oregon) and extended north to 54 degrees 40 minutes north latitude (the recognized southern boundary of Russian America, or what is today Alaska). In the presidential election of 1844 candidate James K. Polk (1845–1849) used the slogan "Fifty-four Forty or Fight" to gain the vote of the expansionists: They insisted U.S. rights to Oregon Country extended north to latitude 54 degrees 40 minutes. Polk promised he would acquire the territory—even if it meant a fight with Britain. After he was elected, Polk settled the dispute with Britain and the boundary was set at 49 degrees north, securing the territory that is today Washington, Oregon, and Idaho, and parts of Montana and Wyoming.

The expansionist doctrine was again invoked as justification for the Spanish-American War (1898), which was fought over the issue of freeing Cuba from Spain. Spain lost the war, and its empire dissolved. Cuba achieved independence (though it was occupied by U.S. troops for three years). By the close of the nineteenth century Manifest Destiny had resulted in U.S. acquisition of the outlying territories of Alaska, the Hawaiian Islands, Midway Islands, the Philippines,

Puerto Rico, Guam, Wake Island, American Samoa, the Panama Canal Zone, and the U.S. Virgin Islands.

MANN-ELKINS ACT

Congress passed the Mann-Elkins Act in June 1910. It amended the Interstate Commerce Act of 1887, expanding the Interstate Commerce Commission's (ICC) responsibilities to include the regulation of telephone, telegraph, and cable companies. The new law declared such companies to be common carriers subject to ICC regulations.

The 1910 act also strengthened the ICC's enforcement of regulations regarding short-haul versus long-haul rail rates. The legislation was one in a series of laws passed by the federal legislature during the 1900s to broaden the jurisdiction and increase the power of the Interstate Commerce Commission. The laws originally gave the agency control over interstate rail rates and practices. The 1910 bill was partly sponsored by Representative James Robert Mann (1856–1922) of Illinois. Mann had also sponsored earlier legislation (1903) to increase the ICC's authority.

When the bill was brought before Congress in 1910 President William Howard Taft (1909–1913) succeeded in amending it to include a provision for a special court to supervise the activities of the ICC. The Mann-Elkins Act was hotly debated in Congress, but passed as amended. The experiment of the Commerce Court, however, proved a failure. In 1912 both houses of Congress voted to abolish the court, which had tried to interfere in the ICC's investigative powers. The U.S. Supreme Court reversed many rulings of the Commerce Court. Congress therefore felt that the special court had exceeded its jurisdiction. President Taft vetoed the congressional legislation that would have dissolved the judicial body.

In January 1913 judge Robert Archbald was impeached and convicted by the Senate for improprieties committed while holding office at the Commerce Court. Suspicions long-held by lawmakers that U.S. Commerce Court judges could be open to influence by the very companies they were charged with overseeing were borne out. Congress moved again to disband the Commerce Court. In October 1913 newly elected President Woodrow Wilson (1913–1921) signed legislation

abolishing the Commerce Court. Other provisions of the Mann-Elkins bill remained intact.

MARCUS, STANLEY HAROLD

Stanley Marcus (1905–) was president of the Neiman Marcus retail department store chain from 1950 to 1975. Involved in the company since 1926, he continued the family tradition of providing high-quality products at reasonable prices. Marcus turned a local Dallas store into an internationally respected retailer with 30 stores nationwide.

Stanley Harold Marcus was born in Dallas, Texas, on April 20, 1905. He was the eldest son of Herbert Marcus, one of the founders of the Neiman Marcus department store, and Minnie Lichenstein Marcus. Stanley Marcus was the eldest of four sons. He was raised in Dallas and attended Forrest Avenue High School. From there, he went East to prestigious Harvard University. He graduated in 1925 and received his Master's in business administration from Harvard's Business School in 1926.

Retailing was a Marcus family affair. In 1907, when Stanley Marcus was only two years old, Herbert Marcus, Sr., along with Stanley's aunt and uncle, Carrie Marcus Neiman and Al Neiman, founded Neiman Marcus. Young Stanley spent his childhood playing among the clothing and display cases of his family's Dallas store.

ONE THING I LEARNED VERY EARLY IS THAT A VALUABLE SALESPERSON IS EASILY WORTH THREE TIMES WHAT YOU PAY THE AVERAGE SCHNOOK.

Stanley Marcus

Upon returning from Harvard in 1926, Marcus went to work at the store. Al Neiman had just retired, and the elder Marcus needed his son's help. Stanley Marcus started work as a floor man in Neiman Marcus' apparel departments. It was not the career he had envisioned for himself; he had wanted to be a book publisher. His father and aunt insisted he join the family business, but promised that his creative energies would not be stifled.

In November 1932, Stanley Marcus married Mary Cantrell. They had three children. After Mary Marcus' death, Stanley Marcus later married his second wife, Linda, in 1979.

During Stanley's first year at Neiman Marcus, his creativity was put to use. He pioneered Neiman Marcus' weekly fashion shows, the first by an American department store. The store became famous for these shows, and it was their first step into the world of high fashion. Stanley Marcus also introduced the Neiman Marcus Fashion Exposition. Under his guidance, Neiman Marcus became the first specialty store to advertise in national magazines. These were the first of many promotional visions that Stanley Marcus brought to life. Over time, his marketing genius became legendary.

By 1928, Stanley Marcus was an executive. He became director, secretary, and treasurer of Neiman Marcus, as well as the sportswear merchandise manager. At this time, the United States was beginning its plunge into the Great Depression (1929–1939). Most of the country saw poverty on previously unknown levels and countless businesses closed. Retail establishments like Neiman Marcus were particularly hard-hit, as Americans struggled to put food on their tables and gave up fashion and decor. Amazingly, Neiman Marcus only had two years of small losses during the Depression, the only losses in the company's history.

In September 1930, oil was discovered in several large oil fields in east Texas. This created wealth for many Dallas families and increased business for Neiman Marcus. During the Depression, Marcus noticed that many of the Southwest's wealthiest continued to travel to New York or Paris to purchase their clothes. This was a market Marcus wanted to catch. He arranged a lunch with the famed publisher Conde Nast (1837–1942). At this meeting, Marcus announced that he wanted to advertise Neiman Marcus in Nast's fashion magazines. He easily convinced Nast, who until then had only accepted advertising from New York stores, and soon Neiman Marcus advertisements were found in *Vogue* and other couture magazines.

In 1938, Stanley developed the Neiman Marcus awards, "the Oscars of Fashion." The awards were presented annually for distinguished service in the field of fashion. Early honorees included Christian Dior in 1947 for "The Look." The same year saw designer Norman Hartnell of London honored for designing Princess Elizabeth's wedding gown.

World War II (1939–1945) involved the entire Marcus family. Stanley Marcus served as director on a three-state regional board of the Smaller War Plants Corporation. He was also chief of the clothing section of the textile, clothing, and leather branch of the War Production Board in early 1942. His brothers joined the armed services. All of the Marcus brothers returned to work for Neiman Marcus at the conclusion of the war.

After the war, Stanley's marketing savvy, combined with Neiman Marcus' legendary quality merchandise and customer service, continued the store's growth. His national advertising campaign continued as Marcus worked to present Neiman Marcus merchandise in an irresistible light. By 1949, the specialty store's charge accounts numbered about 100,000. Neiman Marcus could claim customers throughout the United States and many parts of the world. That same year, French ambassador Henri Bonnet presented Stanley with the Chevalier Award of the Order of the Legion of Honor for his contributions to French industry and commerce by influencing the sale of French fashions.

Patriarch Herbert Marcus Sr. died in 1950. At this time, Carrie Neiman was named chairman of the board, Stanley Marcus became president and chief executive officer, and brother Edward Marcus became executive vice president.

Stanley Marcus was among the most visible of those family members associated with Neiman Marcus, with a strong presence throughout the company's operations. Marcus made the Neiman Marcus catalogues famous. Designed to promote the company's mail order business, the first catalogue appeared in 1915. Stanley Marcus' most famous marketing strategy was his 1960 creation: his and hers gifts in the Neiman Marcus Christmas catalogue. The response was tremendous, stimulating sales and strengthening Neiman Marcus' place as an internationally known retailer. "His and Hers, the Fantasy World of the Neiman Marcus Catalogue," Marcus said, "did more to establish our catalogue than any other idea. We had His and Hers submarines for \$18,700 each. Hot air balloons at \$6,850 each. We had His and Hers camels. His and Her airplanes. Matching Chinese junks that we headlined, 'Junk for Christmas, \$11,500.' We sold eight." This was quite a difference from Neiman Marcus' first Christmas catalogue in 1915, a six-page, five by six inch list of Christmas gift ideas.

Marcus' philosophy was that a successful retailer stays ahead by fighting standardization, "by selling what he believes in, not just what he thinks can make him money." From that point, success becomes a question of high-quality salesmanship. "One thing I learned very early is that a valuable salesperson is easily worth three times what you pay the average schnook," he told *Inc.* magazine. "Because you never know what that schnook is costing you in lost sales. Why do you think that you have to have so many department stores in a mall these days? It's not because their merchandise is so different. It's because each of

them does such a poor selling job that they survive just taking up each other's unsatisfied customers. A store with good sales people wouldn't let that happen."

Despite the store's purchase by Carter Hawley Hale Stores, Inc. in 1969, Stanley Marcus stayed involved with the day-to-day operations of Neiman Marcus and remained visible as a business leader in the Dallas community. Marcus was named as executive vice president of the company's specialty store division. He retired in 1974 with the title chairman emeritus.

He continued to be active in his retirement, and served as a consultant in the retail industry. Marcus has written three books, *Minding the Store* (1974), *Quest for the Best* (1979) and *His and Hers* (1983). He also wrote a weekly editorial column for the *Dallas Morning News*, as well as numerous articles on fashion and retailing for well-known publications, including *Atlantic Monthly* and *Fortune* magazines.

Even in the mid-1990s, Marcus, in his nineties, continued to give public lectures around the country. Narrowcasting, the business he co-founded, is a marketing service which gathers information on the shopping habits of America's wealthy. Critics still continued to view his analyses of the current market as cutting edge.

Despite his work responsibilities, Stanley Marcus stayed busy in Dallas' civic and cultural communities. He was a member of the Salvation Army Advisory Board, the American Council for Judaism, the Civic Federation of Dallas, the Greater Dallas Planning Council, the Dallas Health Museum, and the Dallas Historical Society. National organizations to which he belonged included the American Heritage Foundation, the National Commission of Public Schools, and the American Trade Association for British Woollen, Inc., as well as the American Retail Federation. As American Retail Federation chairman, Marcus developed policies for an organization representing over 500,000 U.S. retail stores. He also served as an alumni advisor to Harvard University.

Stanley Marcus is a retailing legend; he lived by the credo "the customer is always right." Customer service and quality were his passion and through that passion, he turned a local Dallas specialty store into an international giant whose name is synonymous with distinction.

MARKET

A market exists when a buyer and a seller exchange money for a product or service in a transaction in which neither person is forced into the exchange. Markets can be as simple as children selling lemonade for a nickel or as complex as the international trade in cars, steel, or telecommunications.

The most important question in any market is the setting of the price. Economists since the days of British economist Adam Smith (1723–1790) have noted that prices tend to fluctuate with supply and demand. If, for example, a farmer offers his crop of wheat for sale at a given price and no one buys, she or he will lower the price to try to attract buyers. On the other hand, if there is a scarcity of the product, sellers will be able to charge more for it. In this way prices are set for thousands of products in many markets every day.

The free flow of information is essential to the efficient operation of markets. If a buyer knows that cars are cheaper at one dealership than another, she or he will buy at the less expensive dealership. But if this information is not available, the buyer may spend more money than necessary. This would leave less money to spend on something else, and thus markets would be less efficient. Information, then, is essential, whether passed by word of mouth, newspaper advertisements, or other means. Sellers sometimes try to restrict such information or scheme to keep prices high. Economists refer to such schemes as price-fixing or collusion, and governments generally outlaw such practices.

Economists also believe it is important that governments don't unduly restrict the operation of free markets with burdensome taxes or regulation. Some regulation may be necessary; for example, some regulations protect the health and safety of workers. But when governments restrict the sale of a commodity, such as automobiles, to a single state-controlled brand at an artificial price, then economists say such a market is no longer free. Markets in the former Soviet Union were not free, which is why an illegal market in food and other essential goods and services flourished side by side with official ones. Economists call these illegal markets the underground economy or black markets. Such markets tend to spring into existence in any country whenever government taxes or regulations restrict the sale or supply of a product.

MARKET REVOLUTION (ISSUE)

The market revolution was simply the transition from subsistence economy or barter economy to using money to buy and sell things. This, in turn, transformed the way that people looked at things: from useful objects into commodities with prices attached to them. Except in the case of slavery, among the things that now wore price tags was human labor. The populations of the countryside now included a growing stratum of agricultural laborers who, like their urban counterparts, worked for wages. To the extent that the market revolution penetrated the countryside, however, with cash crops like tobacco and cotton, those who did not own land could often rent it. Those tenant farmers might rent the land by paying the landowner in money or in shares of the crop. But even though the process of production involved various combinations of cash, barter, and sharecropping, the whole system rested on the fact that the crop was eventually sold on the market. Otherwise there would have been no reason to grow crops beyond what was needed to subsist. The market revolution absolutely revolutionized the lives that it touched. The changes that it wrought even extended to the religious sensibilities expressed by the people whose lives were disrupted by the market revolution.

At the beginning of the nineteenth century the United States was still primarily an agrarian nation. Agriculture dominated the lives of people whether they were large planters or small farmers. Most small farmers practiced subsistence farming, making whatever was needed for themselves and their families. Because

the shipment of produce was costly and time-consuming, only farmers near ports grew cash crops. The market revolution grew out of this primitive economic regime. Prior to the market revolution, the transportation revolution established the trade corridors that gradually corroded the culture of subsistence farming.

The roads, canals, rivers, and, eventually, the railroad tracks that made up the transportation revolution spurred the market revolution. Self-sufficient farmers became involved in the market little by little: selling eggs, growing cash crops for sale, and relying on industries for the goods—like clothing or the fabric to make clothing—that were formerly produced at home. More people became involved in non-agricultural businesses, which helped to diversify the U.S. economy. By 1860 almost 40 percent of U.S. citizens no longer relied directly on farming for their living. With economic expansion and improvement in transportation the population began to move westward, opening up the interior of the continent. By 1850 almost half of the U.S. population lived outside of the original thirteen states.

The cities grew rapidly. In 1820 only 12 cities had populations over 5,000. By 1850 there were 150. By 1860 over 20 percent of the U.S. population lived in urban centers (towns over 2,500 people), which was up from nine percent in 1820. The Northeast was the most urbanized area in the nation with one-third of its population living in cities. In the South cotton fed a strong, rural agricultural economy. Only one-tenth of the South's population lived in urban areas.

Although some economists see a period of *laissez faire* economics during the market revolution, the federal government nonetheless remained a potent force in the economy. Nowhere was this more clearly seen than in banking. The federal government established the First and Second Banks of the United States as central banks with effective power to regulate commercial banks chartered and licensed by state governments. The existence of a "national" or "central" bank brought relative regularity to the circulation of currency and the funding of enterprise. It also, however, provoked anxiety and skepticism on the part of ordinary citizens as well as politicians like Andrew Jackson, who distrusted concentrations of economic or political power.

Echoing the anxiety of many Americans regarding the financial and speculative aspect of the market revolution was the fear and despair of the slave population of the South in the face of the demand on their labor to feed the cotton-based industrial revolution in

England and the textile producing mill towns of the Northeastern United States. The exploitation of slave labor was based on cotton, rice, and tobacco as cash crops. This required the market revolution and the conversion of subsistence agriculture into cash-crop agriculture.

The market revolution also transformed the culture and the religious life of the United States in the period between the Revolution and the Civil War. What had been a rural, traditional society was now undergoing profound change. The market revolution sped up change. It brought uncertainty and anxiety and it evoked the thinly repressed insecurity of evangelical Protestantism. The question: “What must I do to be saved?” now reverberated in a great many questions of everyday life. People were moving. Jobs were being lost. Slave families were being broken up as the men were being shipped off to new and more fertile plantations along the Mississippi River. Trades were being “degraded” as various forms of capitalist enterprise found cheaper ways to produce the goods that the artisan class had formerly made. Women who had made the candles or the homespun clothes that the family had worn now bought those items in the cross-road store. They were losing their roles and the feeling of equality with men that the shoulder-to-shoulder labor of the subsistence homestead had afforded.

This pervasive and multi-faceted insecurity on the part of displaced populations who were undergoing the trauma of separation from traditional society expressed itself in the religious rhetoric of the age. The camp-meetings of the Second Great Awakening—with the itinerant preachers and the amateurs preaching from tree stumps and the emotional outpouring of sinners all looking for a second chance—served to heal some of the wounds of a population going through the market revolution.

MARSHALL PLAN

Between 1948 and 1951 the European Recovery Program—or as it is commonly called, the Marshall Plan—restored post-war Western Europe’s agricultural and industrial productivity by providing nearly \$15 billion in U.S. economic assistance. The plan is named after Secretary of State George C. Marshall, who proposed it in a commencement speech at Harvard University on June 5, 1947.

George C. Marshall (1880–1959) gained military recognition in World War I (1914–1918) as the chief tactical officer of the first American division to go into action in France. He was named chief of staff of the U.S. Army in 1939, making him a four star general and the head of the army throughout World War II (1939–1945). During the war, he planned the amphibious invasions of North Africa and of Normandy, France; his achievements were heralded by the leaders of the United States and its allies. Marshall retired from the army in November 1945, but in 1947 President Harry S. Truman appointed him secretary of state.

IT IS LOGICAL THAT THE UNITED STATES SHOULD DO WHATEVER IT IS ABLE TO DO TO ASSIST IN THE RETURN OF NOMINAL ECONOMIC HEALTH IN THE WORLD, WITHOUT WHICH THERE CAN BE NO POLITICAL STABILITY AND NO ASSURED PEACE.

George C. Marshall, Harvard University commencement speech, *History Today*, June 5, 1947

Shortly after his appointment, Marshall attended a conference in Moscow with British, French, and Soviet leaders to discuss Germany and Austria’s future. Europe was physically and economically devastated in the wake of World War II; food, fuel and raw materials for production were in desperately short supply. Businesses had been destroyed through loss of capital, nationalization, or physical obliteration, and confidence in local currencies was badly shaken. Observing the economic collapse of Europe and recognizing the

Marshall Plan

Soviet Union's intention to take advantage of that collapse to spread communism across Europe, Marshall returned from the conference determined to restore the European economy.

On June 5, 1947, during a commencement address at Harvard University, Marshall stated, "It is logical that the United States should do whatever it is able to do to assist in the return of nominal economic health in the world, without which there can be no political stability and no assured peace. Our policy is directed not against any country or doctrine but against hunger, poverty, desperation and chaos. Its purpose should be the revival of a working economy in the world so as to permit the emergence of political and social conditions in which free institutions can exist." Marshall proposed that European nations determine their needs and suggest a plan for American economic assistance for their recovery.

In response to Marshall's announcement, sixteen Western European countries met in Paris a month later to form the Organization for European Economic Cooperation and to assess and agree on their needs. Although Marshall had claimed that the plan was "not directed against any country or doctrine," from the start the United States attached conditions to their aid that would be unacceptable to the Soviet Union. Thus, while the Soviet Union and the Eastern Europe countries under its control were invited to participate, the Soviet Foreign Minister walked out of the talks. The Western European nations eventually drafted a request for \$16 to \$22 billion to stimulate economic recovery by 1951.

Back in the United States, the Marshall Plan was debated in Congress. To ensure its passage, Marshall worked closely with congressional committees and made promotional speeches throughout the United States. Congress agreed to Truman's \$17 billion request to aid Europe. In April, 1948, Truman signed an act that established the Economic Cooperation Administration (ECA) to administer the program. The ECA's primary goals were to elevate European economic production, support European currency, and assist with international trade. Its other intention was to restrain the spreading Soviet influence in Czechoslovakia, France, and Italy. Paul G. Hoffman (1891–1974) was appointed ECA's chief administrator. Later that year the participating countries—Austria, Belgium, Denmark, France, West Germany, Great Britain, Greece, Iceland, Italy, Luxembourg, the Netherlands, Norway, Sweden, Switzerland, Turkey, and the United States—signed the agreement that instituted the Organization for European Economic Cooperation (later called the

Organization for Economic Cooperation and Development) as the head coordinating agency.

The Soviet Union strongly opposed the Marshall Plan and refused to participate; a few other Eastern European countries criticized or ignored it. The Soviets prevented Poland and Czechoslovakia from participating, despite their desire to do so. Stalin accused the United States of trying to use its money to lure Eastern European nations away from Soviet influence. He ordered all Communists to resist U.S. imperialism and established the Cominform, an international Communist information bureau. Stalin's most drastic response to West Germany's participation in the Marshall Plan was the 1948–1949 Berlin blockade, an unsuccessful attempt to force the United States and its allies to evacuate West Berlin.

Completed in 1951, the Marshall Plan greatly contributed to the economic restoration of Europe. At its end, nearly \$15 billion in recovery aid had been channeled into Western Europe. Many countries' agricultural and industrial productivity was higher than they had been before World War II. His efforts in preventing famine and political chaos through the Marshall Plan earned George C. Marshall a Nobel Peace Prize in 1953.

Some revisionist historians have contested that the Marshall Plan did not demonstrate American altruism, arguing that assistance to Europe prevented the United States from falling into its own economic decline by providing a market for U.S. capital goods. According to revisionists, the Marshall Plan also let the United States rebuild the Western European economy to mirror the American economy, providing a more compatible environment for U.S. investment.

MARYLAND

Maryland's natural harbor on Chesapeake Bay, its moderate climate, and its adaptability for agriculture made it a desirable place for settlement in colonial days. The manner of settlement was very different from places like Virginia or Massachusetts. Unlike many other colonies, Maryland was established with an almost feudal system in which the land was considered the property of the English lord who governed it—a proprietary colony. Maryland also had a higher proportion of Catholic settlers than most other colonies and experienced a higher proportion of religious wrangling. Its position as a slaveholding state which did not secede from the Union also set it apart from southern states during the Civil War (1861–65). In modern times, the state has thrived by creating a diversified economy that includes industry, maritime interests, agriculture, and the service sector.

The first Europeans to penetrate into the land which later became Maryland were the Italian Giovanni da Verrazano (1480–1527) and the Spaniard Lucas Vazquez de Ayllon in the sixteenth century. The first explorer of Chesapeake Bay, an area that would become vital to the commerce of Maryland, was Captain John Smith (1580–1631), who was leader of the colony that was established in Jamestown, Virginia. Smith's map of the Chesapeake was used for many years and was an important tool in the settlement of the area. By the time the European explorers arrived, Native Americans had established permanent settlements in Maryland, where they cultivated corn (maize), vegetables, tobacco, and other crops.

The territory was given as a proprietorship by England's King Charles I (1600–1641) to George Calvert (1580–1632), a favorite of the English court. Lord Calvert had resigned his position at the court because his Catholic religion prevented him from holding public office in England. Since the colony of Virginia also wanted the land, it opposed the king's decision, but Calvert prevailed. Later he left the land to his son, Cecilius, who is better known as Lord Baltimore (1605–1675). He named the region Maryland after the queen consort of Charles I, Henrietta Maria of France. This land grant encompassed not only the area that later became Maryland, but also Delaware, part of Pennsylvania, and the valley between the north and south branches of the Potomac River.

As a sole proprietorship, the colony of Maryland was fully under the control of Lord Baltimore, who derived his income from the quitrents, which were

money payments that took the place of feudal duties, like military service. The settlers paid them as a kind of rent for the land. Baltimore's financial obligations to the king were minimal. The colony's early years were marked by feuding between Puritans and Roman Catholics. The feuds were settled only when Benedict Leonard Calvert (1606–1647), the fourth Baron of Baltimore, embraced the Protestant faith and was granted proprietary rule.

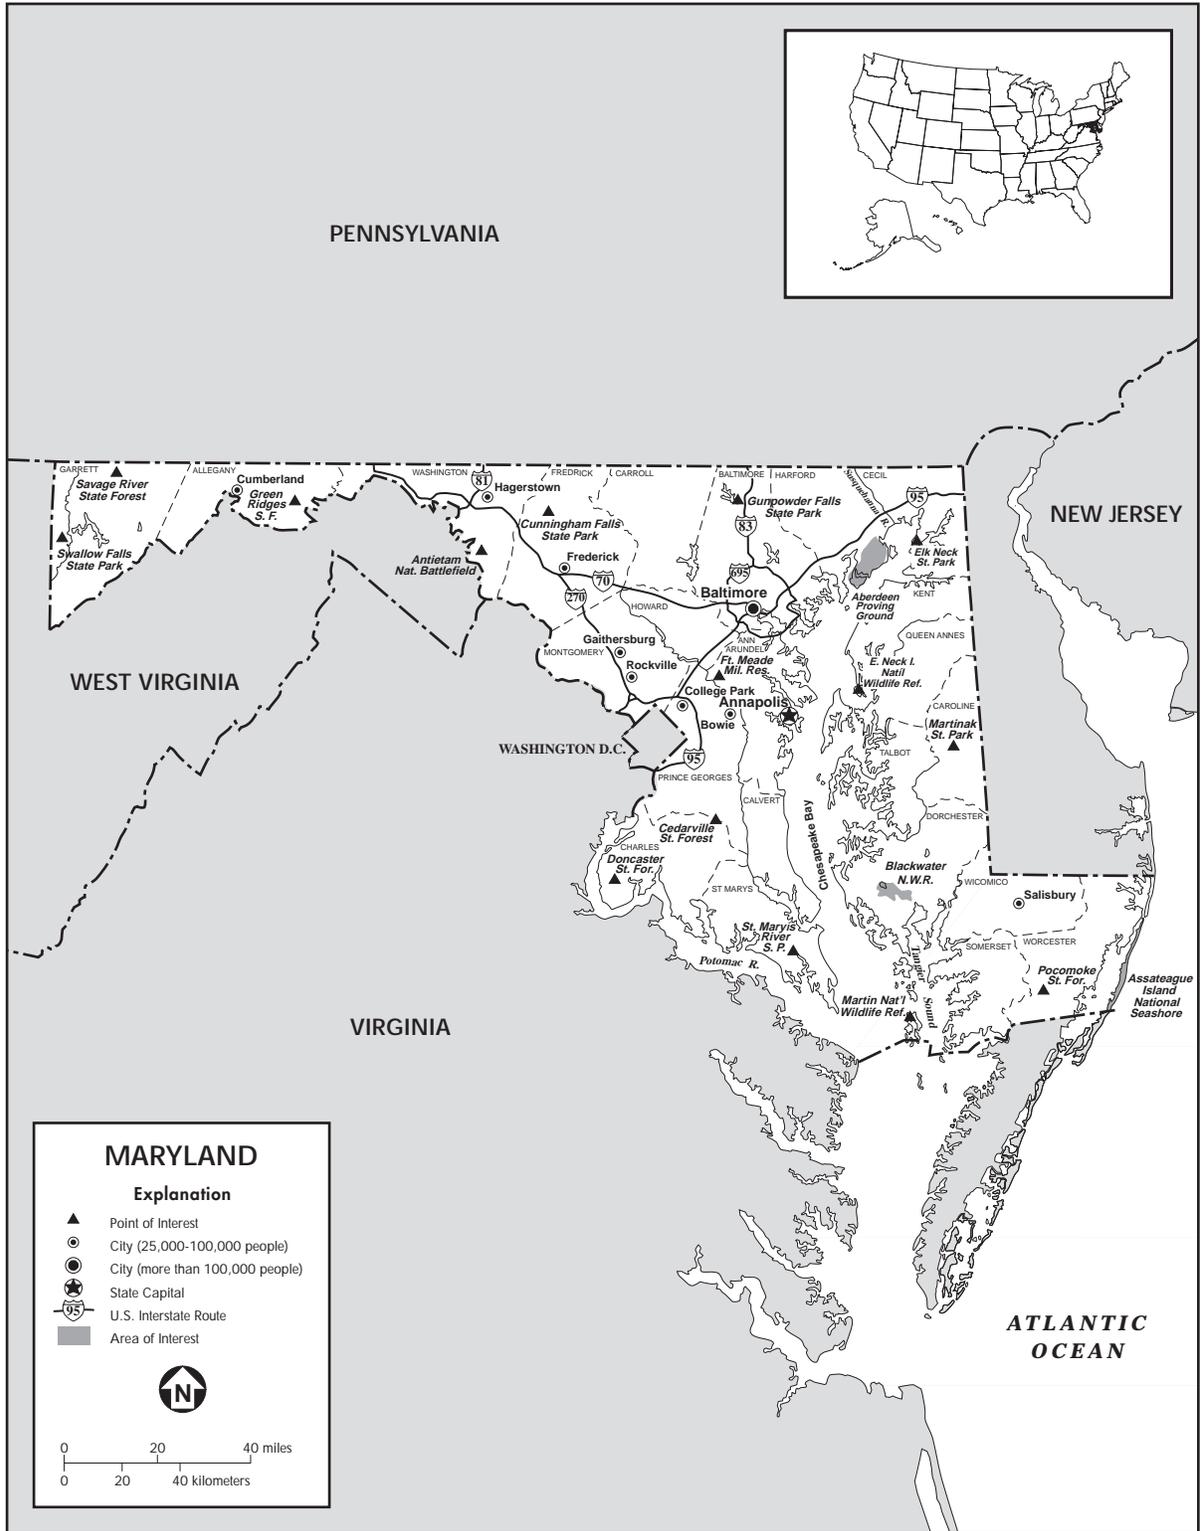

Maryland was a somewhat reluctant participant in the American Revolution (1775–1783) but finally sent 20,000 soldiers to fight in the war. It was the seventh state to ratify the federal Constitution. Maryland provided the home for the Continental Congress in two cities, Baltimore and Annapolis, before the permanent capital was established in Washington, DC. Maryland's first state constitution favored owners of large rural estates over people who owned no property.

Tidewater and southern Maryland provided the state's main staple crop, tobacco. It was grown with the help of slave labor and indentured servants. German immigrants in western Maryland helped develop the wheat economy. The city of Baltimore was founded in 1729. The city prospered because of its magnificent harbor, which provided access to the import and export trade. Shipbuilding also grew rapidly in the Baltimore area. During the War of 1812 (1812–1814) many naval and military operations took place in the area, and Francis Scott Key wrote the Star-Spangled Banner during the British siege of Fort McHenry in Baltimore harbor.

Baltimore harbor provided the first transportation access to Maryland; but other networks developed in due time. The first national highway was known as the National Road (now U.S. Route 40). The highway began at Cumberland in 1811, providing access to Ohio within seven years. The Delaware and Chesapeake Canal opened in 1829, linking Chesapeake Bay and the Delaware River. The Baltimore and Ohio Railroad opened in 1828, soon providing the first passenger train to Washington, DC, and Harpers Ferry, Virginia (now in West Virginia). The line extended to St. Louis by 1857 and precipitated the growth of freight service, which helped Baltimore grow into a metropolis. The Pennsylvania Railroad began providing service to northern cities in the 1850s.

Maryland did not support secession in the Civil War but remained one of the border states that still harbored many southern supporters. In spite of its sympathy to the South, in 1864 the Maryland legislature voted to abolish slavery, which caused a problem

Maryland

State of Maryland.

after the war, since its economy had been based on slave labor. It was estimated that the value of Maryland's slaves in 1860 approached \$35 million. Tobacco plantations in Prince Georges and other southern counties were hit hard by abolition. Tobacco never made a full recovery as a staple crop. Truck farms grew instead, helped by the proximity to water and rail transportation. The Maryland legislature even resorted to an advertising campaign to help economic development. In 1867 it commissioned a pamphlet titled *A Succinct Exposition of the Industrial Resources and Agricultural Advantages of the State of Maryland*.

The economy did recover, and enabled Maryland to participate in the rebuilding of the south. The state's economic base shifted gradually from agriculture to industry, led by shipbuilding, steel-making, clothing manufacturing, and shoemaking. The state's economic success allowed for philanthropy. Millionaires who had made their fortunes between the Civil War and World War I (1914–1918) endowed cultural and educational institutions. Banker and financier Johns Hopkins (1795–1873) founded Johns Hopkins University. Merchant and banker George Peabody (1795–1869) financed the Peabody Conservatory of Music; and Enoch Pratt (1808–1896), a manufacturer and merchant, endowed the Pratt Free Library.

The city of Baltimore was the industrial center of the state. By 1890 its population had grown to 434,000, employing people in manufacturing and mechanical industries, trade, transportation, and personal and professional services. The city attracted a variety of ethnic groups, especially African American descendants of slaves. But there were a large proportion of Germans and Irish as well. Baltimore developed its ethnic neighborhoods like many other cities during the Gilded Age. The neighborhoods were filled with low-paid factory workers, who often worked in local sweatshops that manufactured men's clothing.

World War I provided another boost to Maryland's economy; but soon the Great Depression of the 1930s brought hardship to many people. The depression spelled the end of the political career of longtime Democratic Governor Albert C. Ritchie (1876–1936). His successor Harry W. Nice was a Republican. However, Nice supported the New Deal program of Democratic President Franklin D. Roosevelt (1933–1945). Like most of the nation, Maryland was only brought out of the economic doldrums by the manufacturing boom created by World War II (1939–1945). The shipyards of Bethlehem–Fairfield and Maryland Drydock in Baltimore had to hire an additional 12,000 employees in 1942 to keep up with war demands. The

Martin Company, which manufactured aircraft, added 6,000 employees. People in search of good wages swarmed to the city, not only from Maryland itself, but from Appalachia and the South.

During the latter part of the Depression, Maryland became the site of an experiment in city planning. The experiment resulted in the creation of "New Towns." One of the towns was Greenbelt, Maryland, designed as a conveniently arranged, pleasant place to live, with proportional representation from all kinds of ethnic and religious groups. Later a developer named James Rouse (1914–1996) built the village of Cross Keys in northwest Baltimore along similar lines. He also began to plan for the city of Columbia in Howard County. Columbia, which was begun in the mid-1960s, was planned as a cluster of villages, each with a collection of shops and strategically placed schools. Businesses and industrial parks flanked the village centers. Life in Columbia was never as idyllic as its planner had imagined it, but despite some difficulties during the 1970s the city continued to thrive.

The state of Maryland grew by 13.4 percent during the 1980s, well over the national average of 9.8 percent. The expansion of U.S. government is in part responsible for the growth. Many federal workers have settled in Prince Georges and Montgomery counties, Maryland suburbs of Washington, DC. The headquarters of the Social Security Administration is located in Baltimore. The most significant economic improvements during the 1980s and 1990s, however, were undoubtedly related to the economic redevelopment of Baltimore. The Charles Center development, the renewed Inner Harbor, the World Trade Center, the National Aquarium, and the new Baltimore Oriole Park at Camden Yards created a boom in retailing and hotels. These improvements brought hundreds of thousands of people to the city. The state suffered somewhat from the recession of the 1980s but has increased employment in the service sector. That gave Maryland the fifth highest state income in the country during the mid-1990s. The state ranked sixth in per capita income in 1996.

MASS PRODUCTION

Prior to the nineteenth century manufacturing was largely hand-fitted. The artisan worked with the individual product—for instance, a farm wagon—and by using shims or a mallet, he would “make it fit.” If production involved machining metal, the machine tolerances would be loose. The system “worked” but the production process was inefficient, repair was chancy, and the price of labor—labor with the right “touch” for making things fit—was high.

In the late eighteenth century, standardized manufacturing transformed production technique. This development was called the American System of Manufactures. First introduced in the firearms industry (especially at the Springfield, Massachusetts federal armory) by inventor Simeon North, the American System was employed in producing pistols for the U.S. government. The parts were machined to set tolerances so that they were interchangeable. Standardization saved time and money in production and made possible the repair of a broken product.

The American System, however, was not yet mass production although the two systems shared the concepts of division of labor and close machining and interchangeability of parts. Mass production also introduced a more efficient organization of the workplace as well as the application of more powerful tools in production. Efficiency in the workplace included the innovation of the assembly line and the time-and-motion studies of Frederick W. Taylor’s “Scientific Management.” “Taylorism” forced the worker to adopt the most efficient way to do his job. Improved productivity through power tools included the introduction of electric or compressed air power tools and, in more recent times, automated welding robots. All this utterly transformed the factory as a space to work.

Perhaps the most significant difference between mass production and the earlier American System, however, was the enormous production goals of mass production. The best example of this is the Ford Motor Company. The assembly time for a single Model T

went from 150 minutes in 1913 to 26 1/2 minutes in 1914. One important difference was the installation of the chain-driven assembly line. Production climbed from 13,380 Model T Fords in 1909 to 585,388 in 1916. The economies of scale associated with such production goals meant that Ford could afford to pay his workers better wages (the five-dollar day) and to cut the price of the car. A Model T dropped in price from 950 dollars in 1909 to only 360 dollars in 1916. In doing this, Henry Ford forever changed the nature of American society.

MASSACHUSETTS

The first Europeans to exploit resources in the state of Massachusetts were fishermen who came from England, France, Portugal, and Spain in the mid-sixteenth century. They went ashore to process their catch; soon a flourishing fur trade was established with Native Americans. Religious persecution later drove a group of English Puritans who wished to separate from the Church of England to the New World in 1620. They settled in a Massachusetts village, which they named Plymouth. In 1630 a non-Separatist Puritan group settled to the north in the Massachusetts Bay Colony. The group was headed by patriarch John Winthrop (1588–1649). Winthrop believed strongly that the material success of the new colony would be a visible sign of God’s blessing. Between 1630 and 1640 around 20,000 English people settled in Massachusetts.

Migration of the English to Massachusetts slowed around 1640, because in that year a civil war brought Puritans to power in the mother country and removed religious persecution as a reason for immigration. Towns like Salem, Gloucester, Marblehead, and Boston, however, afterward remained important centers of the fishing industry; but as time went by, fishing and fur trading began to decline. As the supply of valuable beaver skins was being exhausted, the settlers turned to farming the rocky soil as means of sustenance. In the face of white encroachment upon the land, Native American tribes steadily declined, and many were wiped out in King Philip’s War (1675–1676). As a sign of European dominance, Plymouth and the Massachusetts Bay Colony were merged in 1692 by royal decree.

Settlements spread across the colony in the eighteenth century. By 1730 Boston reached a population of 15,000. The city soon became a center of shipping and commerce. It also evolved into a hotspot of political

State of Massachusetts.

unrest, since colonists were becoming more and more dissatisfied with tight political and economic controls imposed by the British. The cry of “taxation without representation” accompanied resentment caused by British control of trade and political rights. In 1773 the citizens of Boston expressed their frustration by dumping tea into the harbor. By 1775 the time was ripe for the beginnings of the American Revolution (1775–1783) in Lexington and Concord.

Massachusetts required some adjustments after the defeat of the British. The Shays’ Rebellion (1786–1787) occurred when central and western farmers challenged the power of eastern commercial leaders; but the rebellion ultimately failed to change the status quo. Massachusetts went on to become the sixth state of the Union in 1788. The Federalist Party soon became dominant in Massachusetts. They represented the governing commercial interests.

By 1800 it became evident that an agricultural economy was not viable in Massachusetts. In addition to inhospitable, rocky soil, land was depleted of its

resources. For years farmers had paid little attention to conservation. More and more farmers moved westward to find better land and better opportunities. The Erie Canal made it easier for western farmers to find markets in the East. Massachusetts began to look toward other economic horizons. For a time the whaling industry in Nantucket and New Bedford was the most profitable in the nation. With the decline of the whaling and fishing industries the state also became a center for the textile industry. That was especially true in the mill towns of Waltham, Lowell, and Lawrence. The mills were originally built because of the unavailability of British textiles during the War of 1812 (1812–1814). Mills flourished since there was ample waterpower available on Massachusetts rivers.

The best-known of the mills was at Lowell. The “Lowell system” included a large capital investment and the concentration of all processes in one plant under a unified management. It specialized in a kind of coarse cloth easily worked by unskilled workers. Most of the workers were young women from surrounding

Massachusetts

farms who came to supplement their families' meager incomes. They worked from sunup to sunset for very low wages. The well-designed Lowell community provided supervised housing and activities for the girls. Other mill towns copied this paternalistic system. Yet by 1840 Lowell mirrored other mill towns in its overcrowded, dirty conditions.

One positive development in the 1840s was that Massachusetts enacted the nation's first child labor law. It allowed a maximum 10-hour day for children under 10. While this law may seem inadequate by today's standards, it was quite progressive in an era when children were routinely exploited in the workplace.

Other industries that sprouted up in Massachusetts during that period included the manufacture of metal products, leather goods, whale products, and shipbuilding. Shoe factories were particularly prominent. Although most of the shoe factories fled to other states Massachusetts remained the center of shoe workers' unions for a long time to come. By 1850 steam engines were produced in Massachusetts. A network of railroads that was begun in 1826 helped open new areas for industrial expansion. The American Civil War (1861–1865) spurred industrial growth, which was also helped by the many immigrants who flocked to Massachusetts from northern and southern Europe and from French Canada.

As one of Massachusetts' major urban areas, Boston faced a major challenge in the mid-1840s, when a potato famine precipitated a mass migration from Ireland. These desperately poor immigrants were willing to take any menial job in order to survive, but they were greeted in their new country with a widespread disdain that was based upon ethnic and religious bigotry. After 1865, however, the Irish became politically powerful as mainstays of the Democratic Party and economically successful throughout the state. They helped Massachusetts become one of the most industrialized states in the nation by the end of the nineteenth century. The family history of President John F. Kennedy (1917–1963) is a good example of the rags-to-riches stories of some Irish immigrants.

Conflicts between immigrants and their descendants, and the entrenched Republican Yankee conservatives in Massachusetts continued to plague the state into the new century. Class conflicts were largely responsible for a devastating strike of immigrant textile workers in Lawrence in 1912. The various factions eventually learned to accommodate one another. According to historian Richard D. Brown, there was a

“pragmatic willingness” to accept diversity and, “halt-ingly, people adjusted to the multiethnic, urban, industrial character of Massachusetts.”

The Great Depression of the 1930s nearly devastated Massachusetts. Unemployment in some localities reached as high as 40 percent. Massachusetts embraced Franklin D. Roosevelt's (1882–1945) efforts to stimulate the economy, but only World War II (1939–1945) brought any real increase in employment. The state's economy began to revive around 1950. While many of the old industries and mill towns were in decline, high-technology businesses began to develop in the suburbs of Boston. Industries oriented toward electronics, computers, and defense systems sprang up. That led to an increase in service sector businesses like banking, insurance, health care, and higher education. White-collar employment in the middle-class suburbs was on the rise.

By 1989 Massachusetts was again in a serious economic decline. It lost 14 percent of its jobs in three years. The general recession of the early 1990s was aggravated by a collapse in the real estate market in the late 1980s. Employment in construction dropped 44 percent between 1988 and 1991. Wholesale and retail trade lost 100,000 jobs. Voters blamed then current governor Michael Dukakis for the state's economic woes. In 1990 they elected Republican William Weld as the new governor. Weld then privatized a number of state operations in an effort to economize. By the mid-1990s the state's economy was improving greatly. Per capita income reached third place in the nation by 1995. Local industries like software and mutual funds led the upturn in the economy. The fishing industry was still the eighth largest in the nation in 1995 though not as important to the state's economy as it once was. Tourism was also important to the state, bringing in well over \$8 million annually. Boston, Cape Cod, Martha's Vineyard and Nantucket, and the Berkshire Mountains were popular vacation spots.

At the state level the Department of Economic Development continued making attempts to promote business, increase employment, and generate economic activity. In 1993 the Massachusetts Economic Development Incentive Program (EDIP) was launched to aid existing and new businesses. It provided 34 Economic Target Areas (ETAs) in the state. The Target Areas, along with local initiatives, provided attractive incentives to prospective businesses.

MAYA

The Maya were American Indians who settled in southern Mexico and in Central America. Their territory covered Mexico's Yucatan Peninsula, Belize, much of Guatemala, and parts of Honduras and El Salvador. Originating in the region about 1000 B.C., the Maya developed a highly advanced civilization which reached its height during the Classical Period, A.D. 300-900. At its peak, the Mayan population numbered some fourteen million people who lived in agricultural communities and in the city-centers in Honduras (Copan), Mexico (Palenque, Uxmal, and Chichen Itza), and Guatemala (Piedras Negras, Uaxxactan, and Tikal). The capital was at Tikal (population 50,000), which was a center of education, economics, science, and religion. Mayan accomplishments were numerous and many were unparalleled at the time. Engineers produced remarkable architecture including flat-topped pyramids, temples, and towers. Artisans created elegant sculptures, paintings, and murals. Scholars developed an original writing system, which was used to record astronomical observations, chronology, and history. Mathematicians developed a system more advanced than any European system of that time.

The Mayans supported themselves by using slash-and-burn agriculture. The vegetation was cut down and burned to clear the land and provide nutrients for the soil, which was then planted with crops, especially corn, beans and squash. The Mayans also developed advance systems of irrigation and terracing. Terracing involves the construction of horizontal ridges in a hillside as a means of increasing the arable (farming)

land. It also hindered soil erosion and evaporation. Though they used no beasts of burden, the Maya established a trade network that linked several Central American Indian groups and eventually extended into central Mexico, where the Maya exchanged goods with the Aztecs.

During the Post-Classic Period, A.D. 900–1546, the Maya were invaded by the Toltecs, whom they eventually absorbed. Rebellions and civil war as well as widespread famine dominated the century preceding the arrival of the Europeans. When the Spaniards arrived in the mid-1500s, the Mayan civilization was in decline. The Maya were conquered by the Spaniards and they became assimilated into the larger Hispanic culture that developed in the region.

MAYSVILLE ROAD BILL

Following the tumultuous presidential election of 1824 the nation's political factions realigned. The newly formed National Republicans led by John Quincy Adams (1767–1848) and Henry Clay (1771–1852) advocated aggressive federal promotion of national economic development. Internal capital improvements and the use of protective tariffs constituted the core of their policies. Their support came from Northeastern manufacturers, Southern agricultural leaders, and others who stood to benefit from the development of a commerce infrastructure. Many of their advocates were from the cosmopolitan upper class.

In contrast, supporters of Andrew Jackson (1767–1845) and John C. Calhoun (1782–1850) were much more diverse. Jackson was a popular military hero fresh from victories in the War of 1812 (1812–1814). He carried a populist banner, aligning many common citizens and “plain folk” behind him. Jackson defeated Adams in the presidential race in 1828.

During this period the United States still suffered from very poor overland transportation systems. A railroad network had not yet been built, and travel was essentially seasonal, since in many areas roads became mud quagmires during the winter months. Many people like Adams and Clay believed that the young nation's economy could not grow to support the emerging capitalist system without substantial improvements to the infrastructure.

At the beginning of his administration, Jackson's policies on transportation and other issues were not

Maytag Corporation

well formulated. Calhoun and Martin Van Buren (1782–1862), who both competed to be Jackson's chief advisor, held very different views. When Van Buren finally won, he urged Jackson to oppose federal financing of intrastate public works projects. Van Buren believed a growing trend to fund such projects could deplete the federal treasury by encouraging legislative practices of logrolling and pork barrel projects. (Log rolling was the combining of several distinct project funding bills, each unlikely to pass on their own, into a single piece of legislation to increase their chances of success.) Van Buren feared the fiscal affairs of the federal government would become a mess with numerous improvement projects arising across the country.

Acting on Van Buren's advice, Jackson raised constitutional issues regarding commitment of federal funds for specific internal state improvements in his first annual message to Congress in December, 1829. Jackson proposed providing states with blocks of federal funds when surpluses occurred, and having the states allocate the funds to specific projects themselves. He believed that paying off the national debt took precedence for the federal government. Jackson based his position on the political philosophy of strict constructionism. (Strict constructionism meant that any unclear terms appearing in laws or the Constitution should be given their exact and technical meaning. Individuals must not attempt to expand a law through exploring implied meanings.)

The political battle over funding internal improvements came to the national forefront in 1830, when Congress passed a bill sponsored by Jackson's bitter political foe Henry Clay. The bill authorized a \$150,000 federal purchase of stock in the Maysville, Washington, Paris, and Lexington Turnpike Road Company. The company proposed a 60-mile road from Maysville, an inland port on the Ohio River, to Clay's hometown of Lexington. The project lay entirely within the state of Kentucky.

On May 27 Jackson vetoed the bill, maintaining that the road had no connection with any existing improved transport system and that it was fully within a single state. Jackson argued that the proposed bill required an unconstitutional use of federal dollars. The veto decision was highly unpopular with many in the newly established Democratic Party, which Jackson led, including those in the Ohio Valley who supported federal aid for canals and roads.

Jackson's veto was instrumental in establishing long-term federal policy limiting the use of federal transportation funds to interstate projects as well as harbors and river improvements serving foreign trade.

No longer did Congress provide sizable federal expenditures for intrastate canals and roads. Jackson's stance on pioneering a sound fiscal policy concerning public works was one of the most important ideological contributions of his presidency. The only large road project funds approved by Jackson while he was president were for continued construction of the interstate Cumberland Road connecting Cumberland, Maryland with Illinois. Jackson approved funds for it four days after the Maysville Road veto.

MAYTAG CORPORATION

The Maytag Corporation was started in Newton, Iowa by Frederick Louis Maytag and three partners in 1893 to produce threshing machine band-cutters and self-feeder attachments. The company soon began to produce other pieces of farm machinery, not all of it top quality. The Maytag corn husker, called the Success, caused the partners many problems because of its poor quality, and farmers often called Maytag personnel out to their fields to fix the Success. By the time Maytag bought out his partners in 1907 he had learned his lesson; a Maytag product would always be dependable.

Maytag built his first washer in 1907 to bring his agricultural equipment company through the slow-selling season as well as to fill the growing need for home-use washing machines. Home washing machines were already on the market, but Maytag wanted to make them more efficient. His first washer, called the Pastime, revolutionized washing. It had a cypress tub with a hand crank that forced the clothes through the

water and against corrugated sides. The washer was a hit, and Maytag continued to improve on it. In 1911 he brought out the first electric washing machine, and in 1914 he introduced the gas-engine Multi-Motor for customers without access to electricity. The first aluminum washer tub was brought out in 1919, and the Gyrofoam entered the marketplace in 1922. This revolutionary washer was the first with an agitator at the bottom of the tub instead of the top. This change allowed for the elimination of friction, making it the first washer to clean with only water action. Sales of this machine pushed Maytag from the 38th largest U.S. washing machine company to first place.

At this juncture the farm implement portion of the business was discontinued. L.B. Maytag, son of the founder, became president of the company in 1920. Under his direction the company began to market nationally. In 1925 Maytag incorporated and was listed on the New York Stock Exchange. By 1927 Maytag had produced one million washers.

During the Great Depression (1929–1939) Maytag held its own; the company even made money. During World War II (1939–1945), Maytag shut down normal operations and devoted itself to producing special components for military equipment. In 1946 the production of washers started up again, and in 1949 the first automatic washers were produced in a new plant built for that purpose. In 1946 Maytag began marketing a line of ranges and refrigerators made by other companies to be sold under the Maytag name.

The appliance industry grew rapidly during the 1950s, fueled by the postwar consumer boom. Maytag first entered the commercial laundry field at this time, manufacturing washers and dryers for commercial self-service laundries and commercial operators. During these years full-line appliance producers began targeting Maytag's market. Full-line operators such as General Electric, Whirlpool, and Frigidaire provided washers and dryers, refrigerators, stoves, and other appliances. Maytag was much smaller than the full-line producers. It limited itself to the manufacture of washers and dryers, which it marketed with ranges and refrigerators built by other companies, and established its reputation as a premium brand.

The ranges and refrigerators Maytag had been marketing with its washers and dryers were dropped in 1955 and 1960 respectively, but the company soon reentered the kitchen appliance field with its own portable dishwasher in 1966 and a line of food waste disposers in 1968. Maytag created a U.S. icon in 1967 when the Maytag "lonely repairman" appeared in advertising for the first time. The character was lonely

because Maytag appliances were supposedly so reliable they never needed repairs, and helped to solidify Maytag's reputation for the dependability of its products.

Laundry equipment sales peaked in 1973, and by the late 1970s more than 70 percent of U.S. households owned a washer and dryer. The lifetime of such equipment was 10 to 12 years, often longer for Maytag. A turning point came in 1980 when Maytag decided to become a full-line producer, eventually selling a wide range of major appliances rather than just washers, dryers, and dishwashers. This diversification was achieved through a series of acquisitions. By the late 1990s Maytag sold washers, dryers, ovens, refrigerators, and dishwashers under both premium brands (Maytag and Jenn-Air) and mid-to-lower price value brands (Magic Chef and Admiral). The Maytag brand was also used on coin-operated and commercial laundry equipment. The company also sold Hoover vacuum cleaners and other floor care products in North America; Dixie-Narco vending machines and glass-front coolers; and commercial ovens, fryers, and charbroils for the food service industry under the brand names of Blodgett Ovens, Pitco Frialator, MagiKitch'n, and Blodgett-Combi Ovens.

MCCORMICK, CYRUS HALL

Born in Virginia on February 15, 1809, Cyrus McCormick (1805–1884) obtained a grammar school education and assisted his father in the operation of a 1,200-acre grain and livestock farm. While working on

Cyrus H. McCormick.

this farm McCormick invented a mechanical reaping machine that greatly decreased the amount of time it took to harvest wheat. He first developed his reaper in 1831 and spent the next 10 years perfecting it, making only a few, which were used on his father's farm.

By 1843, after bankruptcy and several unsuccessful attempts at a variety of business pursuits, McCormick finally decided to concentrate on making his fortune by producing and selling his reaping machine. In 1847 he moved to Chicago, the heart of U.S. agricultural trade, and opened a factory to manufacture his reaping machine. Though he was having problems renewing the patent on his reaper, he nonetheless organized a mass-production system in his factory, investing heavily in labor-saving machinery to aid his work force.

McCormick offered many incentives to farmers to buy his reaper. He provided deferred payments similar to credit loans and offered money-back guarantees on his product. He advertised everywhere and conducted numerous personal demonstrations of his reaping machine. These demonstrations were usually enough to convince farmers to buy it. On average, a farmer using a McCormick reaper could harvest 10 acres of wheat a day, compared to two acres without the reaper. McCormick also established a research department in his

business and hired a staff to systematically improve his products. He paid good wages to his workers, and was one of the first large manufacturers of his era to negotiate with the labor unions.

By 1856 McCormick had accumulated over \$1 million in profit from his operations, and continued to earn \$300,000 annually. He also began investing heavily in Chicago real estate, increasing and diversifying his personal wealth. McCormick sold 250,000 reapers and mowers in Europe, and with much of his European profits he invested in U.S. railroads and South American mining interests.

McCormick devoted most of his life to work, and did not marry until age 49. His main interests outside of work were his religion and the South. McCormick was a devout Presbyterian, his main relaxation activity was discussing theological issues with Presbyterian clergymen. He lavishly gave to the Presbyterian church from the fortune he made in business. McCormick was a southerner by birth, and supported the cause of the Confederacy throughout the American Civil War (1861–1865).

Cyrus McCormick served as the head of his company until his death in 1884, at the age of 75. In his life he was rewarded with personal fame and awards from many governments for his worldwide contribution to agriculture. After his death, his son Cyrus McCormick, Jr. assumed control of the McCormick Harvesting Machine Company. In 1902 the company merged with four other companies and became the International Harvester Company, which later became Navistar International Corporation.

MCCORMICK REAPER

Reapers were machines developed in the early 1800s to help farmers harvest grain. The first commercially successful reaper was built in 1831 by Virginia-born inventor Cyrus Hall McCormick (1809–1884), who patented it in 1834 and first sold it in 1840 in Virginia. The McCormick reaper was horse-drawn and sharply reduced the amount of manual labor required to harvest grain. It worked in this way: a straight blade (protected by guards) was linked to a drive wheel; as the drive wheel turned, the blade moved back and forth in a sawing motion, cutting through the stalks of grain, which were held straight by rods; the cut grain stalks then fell onto a platform and were collected with a rake by a worker. The device increased average production from two or three acres a day to ten acres a day.

McCormick's reaper was soon in wide use, and the inventor was on his way to becoming an industrialist. In 1847 he moved his business to Chicago, the heart of the expanding Midwestern farm market, where he could transport his machines via the Great Lakes and connected waterways to the East and to the South. Within five years McCormick's business became the

largest farm implement factory in the world. As production continued to rise, consumption kept pace: In 1850, for example, U.S. wheat-flour consumption reached 205 pounds per capita, up from 170 pounds in 1830. Sales and distribution of McCormick's equipment increased further during the 1850s as Chicago became a center for the nation's then-expanding rail system.

Because the reaper replaced as many as eight to ten workers, many historians believe the invention played an important role in the outcome of the American Civil War (1861–1865): Farmers in the North had more widely adopted the machinery, allowing more farmhands to go into battle while wheat production continued. The North's superior manpower was critical to Union victory.

In 1879, Cyrus McCormick's business became the McCormick Harvesting Machine Company, with the inventor himself as president (until 1884, when he was succeeded by his son). The reaper was improved over time: in the 1850s a self-raking feature was added, further reducing the amount of labor required to harvest grain; in the 1870s, McCormick introduced a binder, which bound the sheaves of grain and dropped them to the ground to be collected. In the late 1800s the reaper (or harvester) was joined with another invention, the thresher, which separates grains from the stalks. The new reaper-thresher machine was called a combine. Today's combines still use the basic features

present in McCormick's revolutionary 1831 invention. His company later became International Harvester (1902) and today is known as Navistar Corporation.

MCGRAW-HILL COMPANIES

The McGraw-Hill Companies encompass educational, financial, business, governmental, and professional publishing and information services. In the late 1990s it was the world's largest educational publisher and its overall revenues were more than three billion dollars annually.

John A. Hill and James H. McGraw were nineteenth century publishers of magazines which served industry and reported on technological progress. As the United States changed from an agrarian to an industrial society, there arose a growing market of technicians interested in the practical application of science to various facets of daily life. In 1909 the heads of the book departments at Hill Publishing Company and McGraw Publishing Company agreed to a merger of the two book departments. A coin toss decided the name of the new company, The McGraw-Hill Book Company, and the new president, John A. Hill. The company was housed in McGraw Publishing's building in New York City.

Although the magazine publishing operations of the two companies remained separate for a while, in 1917 a more complete merger of the McGraw and Hill interests took place when John A. Hill died at age 57. The McGraw-Hill Publishing Company was established as the world's biggest technical publisher, and the book company became its subsidiary.

World War I (1914–1918) brought an increased demand for technical publications, especially engineering books in radio communication, aviation, and other areas directly related to the war effort. In one instance McGraw-Hill supplied 150,000 technical books to the U.S. Army for shipment to France in a matter of days.

McGraw-Hill expanded rapidly during the 1920s, forming a college department in 1927 and entering the field of business books and magazines with the purchase of the A.W. Shaw Company of Chicago in 1928. One of Shaw's monthlies, the *Magazine of Business*, was turned into a weekly that eventually became *Business Week*, one of McGraw-Hill's best-known publications.

In 1930, despite the stock market crash of 1929 and the ensuing Great Depression (1929–1939), McGraw-Hill established four new magazines. That year the company also opened a West Coast office and entered trade book publishing with a new imprint, Whittlesey House, named after James McGraw's father-in-law. A new office building in New York was commissioned and first occupied in 1931. By 1933, however, the company was forced to make deep cuts in personnel and salaries and it had to sell off its printing machinery. The company recovered later in the decade with the help of bestsellers from Whittlesey House, business books, and the establishment of a vocational-education department in 1930. James McGraw, Jr., became president and chairman, and by 1937 profits were more than one million dollars.

During World War II (1939–1945) McGraw-Hill's paper needs received special priority because its technical publications were important to the war effort. Especially important were its special training manuals used in the accelerated training of the men and women joining the armed forces. Many dealt with radio and electronics and continued to be successful after the war. The company also increased its international activities, opening a book-export department and a foreign language-translation office. In 1944 McGraw-Hill acquired the Embassy Book Company Ltd. of Toronto, later renaming it the McGraw-Hill Company of Canada, Ltd. and then McGraw Ryerson. The World News Service was begun in 1945.

After the war Curtis G. Benjamin became president of McGraw-Hill's book company and developed the text-film department, which provided audiovisual materials for educational institutions. The company also published several large multi-volume series in such fields as aviation and radar that grew out of government-financed projects. Another major project begun in the late 1940s was the publication of eighteenth century Scottish author James Boswell's manuscripts, with the first of a projected 40 volumes appearing in 1950. In 1950 the company achieved a major commercial success with *Betty Crocker's Picture Cook Book*.

Building on these successes, McGraw-Hill established several new divisions and added others through acquisitions in the late 1940s and early 1950s. In 1949 it purchased Gregg Publishing Company, which became the business-education department. In 1950 a technical writing division was created to produce specialized materials for government and industry. A medical publishing department was established in 1945, but it was not until McGraw-Hill acquired medical publisher Blakiston Company from Doubleday in 1954

that it would capture a major share of the medical market. The international division, established in 1946, contributed greatly to the company's growth in the 1950s, with book exports trebling and profits coming in from the international sale of text-films, filmstrips, and foreign language rights.

The McGraw family continued to run the company in the 1950s, with John McGraw, Jr.'s brother, Curtis, succeeding him as president. When Curtis died unexpectedly in 1953, another brother, Donald C. McGraw, became president. During the decade McGraw-Hill acquired several companies from Warren C. Platt and began three major encyclopedia projects: *The McGraw-Hill Encyclopedia of Science and Technology*, the *Encyclopedia of World Art*, and the *New Catholic Encyclopedia*. By 1959 revenues exceeded \$100 million.

Between 1960 and 1965 overall sales of the book company doubled, contributing 39 percent of the parent company's overall revenue. In 1961 McGraw-Hill acquired the F.W. Dodge Corporation, an information provider to the construction industry. The general book division was created in 1962 by merging the company's industrial, business, and trade book divisions, and in 1963 the book company entered the school textbook market by acquiring Webster Publishing Company.

A major reorganization took place in 1964, when the book company and the F.W. Dodge Corporation merged with the parent company to form McGraw-Hill, Inc. Now there would be a single parent company with three operating divisions: book publishing, magazines and news services, and the Dodge group of construction industry information services. Following the reorganization, McGraw-Hill made several acquisitions, including the California Test Bureau (educational publishing), Shepard's Citations, Inc. (legal publishing), and Standard and Poor's Corporation (financial information services). Internationally the company expanded into Mexico in 1967 and into Japan in 1969.

During the 1970s McGraw-Hill was headed by Shelton Fisher, president and CEO, who had succeeded Donald McGraw in 1968. His goal was to transform McGraw-Hill into a dynamic media giant. He expanded the company internationally into Canada, Brazil, and India; he also bought television stations from Time Inc. and moved the company into a new world headquarters in New York in 1972. Later in the decade he became chairman of the parent company, with Harold McGraw, Jr., becoming president. When Fisher retired in 1974, Harold McGraw, Jr., became chairman in addition to his other positions.

At the end of the 1970s McGraw-Hill was a healthy, well-managed conglomerate. Its several operating divisions included book and publications companies, information systems, Standard and Poor's Corporation, and the McGraw-Hill Broadcasting Company. Overall revenues in 1978 exceeded \$761 million. In 1979 American Express attempted a hostile takeover, offering \$830 million for the company's stock. Concerned about the integrity of its editorial independence, McGraw-Hill successfully defended itself even when American Express increased the offer to nearly one billion dollars.

The company attempted to strengthen its management by appointing Joseph L. Dionne to the newly created position of vice president of operations. When Harold McGraw, Jr., retired in 1983 as president and CEO, Dionne succeeded him. Harold McGraw, Jr., remained as chairman until 1988. Meanwhile, another generation of McGraws was being groomed to run the company.

During the 1980s McGraw-Hill entered the electronic information marketplace, making available in computerized form much of the information supplied by the company's news service, magazines, Standard and Poor's, Dodge, Platt, and Shepard's. The company entered computer publishing by acquiring three computer magazines, *Byte*, *Unixworld*, and *LAN Times*, and purchasing Osborne Books.

The company also underwent a change in focus under Fisher's direction, switching from a media-based organizational structure to a market-oriented structure consisting of 14 market-focused operating groups. McGraw-Hill acquired Random House's college division for more than \$200 million in 1988. Then in 1989 it entered into a joint venture with Macmillan, creating the Macmillan/McGraw-Hill School Publishing Company that combined the elementary, secondary, and vocational education businesses of both companies. McGraw-Hill would buy out Macmillan's interest in the joint venture in 1993. At the end of the 1980s McGraw-Hill's overall revenues were approaching two billion dollars annually.

In 1990 the company introduced the first customized publishing system that allowed professors to design their own textbooks. Later in the decade this electronic textbook publishing system was acknowledged as the leading U.S. custom book publisher with 18.5 percent of the market. By 1993 the company was taking in almost \$2.8 billion in revenue, with its Educational/Professional unit accounting for 42 percent and the Financial Services unit accounting for another 48 percent of the company's net income. The

Medicaid

company's third unit was Information and Media Services.

McGraw-Hill unveiled a new corporate identity program in 1995 changing its name to The McGraw Hill Companies, Inc. The slogan of the campaign announcing their name change was, "Keeping the world up to speed." It was a remarkable year for the company. Its stock price hit a record high; *Business Week's* circulation surpassed the one million mark; the company's Web site was launched; and numerous new products and ventures were announced. Revenues topped \$2.9 billion and net income rose nearly 12 percent to \$227.1 million.

After leading the company for 15 years, Joseph Dionne retired in 1998 as president and CEO; however, he remained as chairman. He was succeeded by Harold (Terry) McGraw III, son of Chairman Emeritus Harold McGraw, Jr. With the company's leadership back in the McGraw family and with more than a century of history, McGraw-Hill could well claim to be one of the premier publishers in the world.

MEDICAID

Medicaid is a large social welfare program operated jointly by the federal and state governments. A 1965 amendment to the Social Security Act of 1935 created the program, which allows low-income individuals access to medical care.

How does it work? The federal government provides money to the states. The states then add funding

of their own to this amount and administer medical programs for the poor in compliance with federally established standards.

Before Medicaid developed, health care for the poor was very limited and came from a variety of sources, including hospitals, charities, and state and local governments.

What type of care can a Medicaid patient receive? A Medicaid recipient may obtain treatment from five different categories of care: inpatient hospital services, outpatient hospital services, laboratory and x-ray services, skilled nursing home services, and physician services.

Initially, Medicaid recipients were able to select their own doctors and hospitals, but because of a large increase in medical expenditures, states now direct Medicaid recipients to certain health plans that attempt to control costs and quality of care. As a result, only approved medical care providers, including physicians, nursing homes, and hospitals are entitled to receive Medicaid payments for their services.

In 1995, there were about 30 million Medicaid recipients.

MEDICARE

The Medicare program provides health and hospital insurance to disabled persons and those age 65 and older. It was first proposed by President Harry Truman (1945–1953), but wasn't enacted as policy until President Lyndon Johnson (1963–1969) included it in one of his Great Society proposals in 1965.

Effective since 1966, Medicare was first managed by the Social Security Administration. In 1977, its operations were transferred to the newly created Health Care Financing Administration, where it remains today. Unlike the social welfare program Medicaid, Medicare does not place an income requirement on individuals who receive its services. To be eligible for Medicare, one must be disabled or be age 65 or older.

The Medicare program has two components: a hospital insurance program and a supplementary medical insurance program. The hospital insurance program covers reasonable and medically necessary treatments in a hospital or nursing home. It is funded through a 2.9 percent Social Security tax on employers and workers. The money generated from this tax is placed into a trust fund for use by the Medicare program.

The supplementary medical insurance program is a service offered to individuals who sign up for it with a monthly insurance premium, which, in addition to tax revenue contributions from the federal government, funds the program. Under the supplementary medical insurance program, an individual pays the monthly premium and a small annual deductible fee for medical costs.

While there are limitations as to what Medicare will pay for (no routine physical examinations, for example), most physicians accept Medicare patients. All health care providers accepting Medicare patients must meet state and local licensing laws and standards to qualify for Medicare reimbursements for their services.

Medicare assisted about 37 million people in 1995, spending \$178 billion for their care. Under current laws, the year 2002 should see a rise in Medicare spending to \$345 billion. Since the 1980s debate about the program has risen. With the quality of medical care increasingly improving, life expectancy also increases. This means Medicare will be taking care of people for a longer period of time.

The program experienced a surplus in the 1980s and 1990s, but its future in the twenty-first century is uncertain. Medicare expenditures are expected to increase more rapidly than tax revenues. As the costs of medical treatment increase and the number of Medicare recipients rise with the 2010 retirement of the post-World War II baby boom generation, the program faces great financial and systemic strain.

MEDIUM OF EXCHANGE

A medium of exchange is money or any other agreed upon item used in the sale of goods and services. Whether the product being sold is a hamburger, a new car, or a movie ticket, something must be given to transfer value from the buyer to the seller. In modern economies, money serves this purpose. In more primitive economies or in special circumstances other mediums of exchange may develop. In prisoner of war camps, for example, cigarettes have served as a medium of exchange, with inmates trading food or other desired goods for a given number of smokes. For a market to operate efficiently, everyone must agree on the medium of exchange. Early in the history of the United States, banks and not the government issued paper money, and there were endless disagreements over whether one bank's notes would be accepted at

another bank or in another state. Finally, to avoid such confusion, the government began to issue the nation's money, which is now used as a medium of exchange for virtually all transactions. It is important to note that credit cards and personal checks are not really a medium of exchange, but merely a stand-in for the real medium of exchange, which is money.

MELLON, ANDREW

In the 1920s Andrew Mellon (1855–1937) was one of the richest men in the United States through his investments in many industries, including aluminum, coke, oil, and steel. In that decade he became an influential member of the government, serving as Secretary of the Treasury for 12 years during the administrations of Warren G. Harding (1921–1923), Calvin Coolidge (1923–1929), and Herbert Hoover (1929–1933).

The fourth son of millionaire Pittsburgh banker Thomas Mellon, Andrew took over his father's business when he was in his twenties and steadily expanded it until the family bank became the leading financial institution for industry in the Pittsburgh area. In 1889 Mellon granted a loan for the manufacture of aluminum to the Pittsburgh Reduction Company, which had acquired the patent for processing aluminum alloys by electrolysis. The process had been discovered by Charles Martin Hill in 1886 and permitted the extraction of aluminum from bauxite at a relatively low cost. Until that time aluminum was expensive to produce and used only for costume jewelry. With this new procedure the price fell dramatically so that commercial aluminum production was now practical. Mellon was able to use his financial leverage to take over Pittsburgh Reduction, and his shrewd business practices enabled him to control all aspects of marketing and production. By 1907, when the Pittsburgh Reduction Company changed its name to the Aluminum Company of America (Alcoa), the corporation had a monopoly in North America and an important share of the world market.

(ANDREW MELLON IS) THE MOST POWERFUL MAN IN THE WORLD TODAY. . . HE HAS DOMINATED THE FINANCIAL, ECONOMIC AND FISCAL RELATIONS OF THE UNITED STATES FOR THE PAST FIVE YEARS.

John Nance Garner, Vice-President (1933–1941), 1927

In 1901 oil was discovered in quantities that had not been seen before at a salt dome named Spindletop near Beaumont, Texas. The well had been drilled by

Mercantilism (Issue)

the J.M. Guffey Petroleum Company of Pittsburgh, which had been financed by a \$400,000 loan from the Mellon bank. Because of the size of the find, Guffey soon asked for more money to exploit it properly. Mellon agreed but demanded 40 percent of the stock in return. He was favorably impressed with Spindletop's massive production but not with the waste and rapid depletion of the oil reserves, which were exhausted in only two years. So Mellon bought out Guffey's interest and in 1907 replaced him as president with his nephew William L. Mellon. They renamed the corporation the Gulf Oil Company.

In 1920 Mellon underwrote a \$1.5 million deficit in the National Republican Committee's campaign fund, and in compensation President Harding appointed him Secretary of the Treasury. He was considered one of the most important cabinet members in the 1920s, and his unqualified affirmation of capitalism dominated Republican thought. He advocated high tariffs and cuts in government spending and corporate taxes. In his view, low taxes would free up money that could be invested in business and industry to create jobs and improve the economy.

In 1926, after Congress passed the Mellon Plan, a package of legislation that embodied his economic principles, both industrial production and the stock market soared, and his prestige was never higher. He was called "the greatest Secretary of the Treasury since Alexander Hamilton." He became a candidate for president in 1927 but lost the Republican nomination to Herbert Hoover, who kept Mellon as his Secretary of Treasury after his election in 1928.

Mellon's prestige fell dramatically after the Wall Street crash of 1929. He along with Hoover and Coolidge were blamed for the disaster, and Mellon appeared foolish when he predicted that the depression would come to a swift end. Although he overcame an attempt to impeach him in 1932, Mellon resigned his position that year to become ambassador to Great Britain. After the election of President Franklin D. Roosevelt (1933–1944), he became a private citizen, but he continually had to return to Washington to answer questions about his administration of the country's finances. Andrew Mellon died of a stroke, while visiting his daughter in 1937.

Not usually given to philanthropy, he left his art collection and enough money to build an art gallery to the government. Constructed of white Tennessee limestone, the National Gallery of Art, which is sometimes called the Mellon galleries, is one of the most attractive buildings to grace the capital mall in Washington D.C.,

and it houses one of the nation's most important art collections. It opened in 1941.

Mellon left a mixed reputation. On the one hand, he was a banker with an extraordinary ability to make sound investments and so created a diversified fortune that continued to grow with the country. He was influential in establishing the aluminum industry and in opening the Texas oil fields. His bank was also important in financing heavy industry during an important period of its development. He was one of the three richest men in the country when he entered politics at age 65. During the 12 years that he was Secretary of the Treasury, his influence over the nation's economy was enormous. He represented business interests at a time when their prestige was at their highest. But when the country fell on hard times, the unfettered capitalism that he had advocated was then considered a ruthless economic system, and he became the personification of all the evils associated with it. Opinion of him has subsequently mellowed, so that one may see his faults as also the faults of his age and still appreciate the creativity and enterprise with which he conducted his affairs.

MERCANTILISM (ISSUE)

Mercantilism was a set of economic ideas followed by many northern and western European countries from the sixteenth to the nineteenth century. These included Portugal, Spain, France, the Netherlands, and England. By the nineteenth century, however, mercantilism was considered discredited as an economic theory. Although it began as a rather vague

collection of economic ideas, it was continually refined, elaborated, and modified over time. By the eighteenth century it had shifted from a loosely enforced set of commercial laws to a tightly regulated imperial policy, especially throughout the British Empire.

At the core of mercantilism was the belief that foreign trade could be made to serve the interests of the government and vice versa. The prime objective was the acquisition and retention of as much money (gold and silver) as possible. The state needed gold and silver to wage war. Mercantilism was a form of economic warfare between competing nations. European monarchs realized that in order to secure their political positions and compete with their rival monarchs in other nations they could no longer rely solely on an increase in tax rates. They had to increase their tax base. To do so, many nation-states turned to increased trade and the establishment of colonies.

In the mercantilist system colonies were expected to help the mother country achieve a favorable balance of trade, favorable specie inflow, economic self-sufficiency and an export surplus. Colonies were expected to supply products which would otherwise have to be obtained from non-imperial sources, generate exports by the production and sale of products in high demand outside the empire, and provide a market for the mother country's exports. The mother country would provide the colonies with centralized governmental control of the economy, as well as naval and military protection.

The English laws that systematized these developments for North America were enacted over a century and were built around a series of Navigation Acts beginning in 1651. They were given a comprehensive form in 1696. They confined the transport trade within the Empire to British or colonial ships, required all exports from Europe to the colonies to be shipped via England (and vice versa), and specified a list of goods that could not be shipped to European ports (other than England). These included sugar, cotton, tobacco, indigo, wool, naval stores, rice, furs, and copper. By the mid-seventeenth century, the colonies were prosperous and were encouraged in their prosperity by credits from home. The plantation colonies especially fitted nicely into the mercantilist system because the economies of the South and Britain naturally complemented one another. Britain carried the burden of colonial defense and gave colonial goods and ships protection abroad. From the early eighteenth century until 1763 the colonial policy was on the back burner, as England concentrated on a series of wars with France. The casualness of imperial administration and enforcement soothed points of disagreement and where discord continued, laws were tacitly evaded. Systematic smuggling was

confined mainly to tea and molasses. For the most part the mercantile system provided easy credit, assured commercial markets, and brought economic prosperity to colonies and mother countries alike.

English intervention in the economy in order to serve national interests produced financial and strategic advantages to the colonies. By giving the colonies the bulk of the shipping rights on trade with England, British mercantilism benefited the colonies. Mercantilism inevitably brought trade disputes with other countries, which in turn often degenerated into military struggles.

Mercantilism had its critics. In 1776 economist Adam Smith (1723–1790) in his *Wealth of Nations* defined a country's wealth in terms of labor and not money. Smith advocated the free play of individual enterprise and free trade. Historians such as George Bancroft (1800–1891) condemned mercantilism as the source of foreign policy. He concluded that the Navigation Acts and mercantilism in general were the basic causes of the American Revolution (1775–1783).

Many colonists realized that England looked on them purely for their economic role under mercantilism. They also realized that their own prosperity was largely the result of mercantilist policies. As British statesman and political philosopher Edmund Burke (1729–1797) declared, “the Act of Navigation attended the colonies from their infancy, grew with their growth and strengthened with their strength. They were confirmed in obedience to it even more by usage than by law.”

Twentieth century historians such as Lawrence A. Harper and O. M. Dickerson disagreed with Bancroft that the Navigation Acts presented a great impediment to colonial trade. They argued that the real bitterness among American colonists after 1763 was aimed at British customs and revenue collectors, stamp officials, and enforcement agents. They had a distaste not for mercantilism but for their role in a reorganized empire that emerged after the end of the French and Indian Wars (1754–1763) in 1763. In particular, they objected to the taxation policy. Overzealous officers, racketeering practices, seizures, and new bonding regulations among other things were what brought hostility from colonists.

MERCENARIES

Mercenaries are soldiers for hire. They differ from a normal army to the extent that mercenaries fight only for money, or for anyone who will hire them, and not out of allegiance to a flag or their homeland. Sometimes “mercs,” as they are also known, will sell their services as individual warriors. At other times a government in need has hired entire armies. The use of mercenaries has a long history. The practice dates back at least to ancient times. Ancient Egyptians and Babylonians used mercenaries. Greeks served as mercenary soldiers in Hellenistic states. In the late Roman Empire, emperors hired tribes from the outer regions of the empire to fight their battles. In the decades since World War II (1939–1945) mercenaries have fought post-colonial wars in Africa, cocaine wars in South America, and from the deserts of the Middle East to the jungles of Asia. The typical mercenary is a former soldier who took up fighting for pay after his own army no longer needed him. Defeated German soldiers from World War II served as mercenaries in many small wars around the globe. The collapse of the Soviet Union saw many former Russian soldiers plying their trade as mercenaries. Sometimes dictators with an unruly population may hire mercenaries rather than risk arming their own people. The British army has a long history of loaning out its soldiers to former colonial nations to train and command local armies. Former U.S. Army soldiers have also served as mercenaries. There seems little doubt that mercenaries will

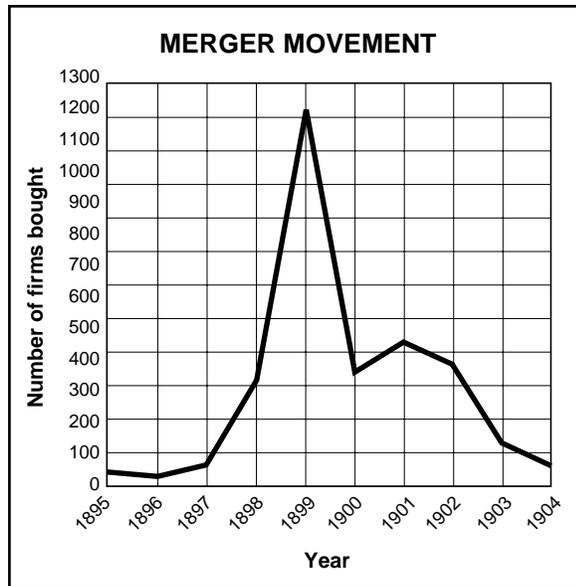

continue to see a demand for their services in a world so rife with conflict.

MERGER

A merger is the joining together of two or more companies. The usual goal of a merger is to increase market share, diversify into new products or markets, gain improved efficiency, or eliminate a competitor. Mergers usually take one of three forms: one business may merge with another through purchasing its assets; the merging companies may form a completely new company that acquires the assets of both firms (a “consolidation”); or the two companies may exchange stock with each other (known as “a pooling of interests”). When the acquired company resists the merger, it is referred to as a “hostile takeover.” Mergers that occur between two companies in the same industry are known as “horizontal mergers,” and when one company acquires a customer or supplier it is known as a “vertical merger.” When the merging companies are in two different industries, the resulting company is known as a “conglomerate.”

In U.S. history, mergers have generally occurred in spurts and usually when the stock market is enjoying strong “bullish” growth. The first major merger period occurred between 1895 and 1904, when the expansion of the U.S. railroad network made it possible for firms to combine and serve a truly national market for the first time. Between 1892 and 1902 more than 2600 U.S. firms were swallowed up by mergers, and in roughly the same period the 100 largest U.S. companies used mergers to increase in size by a factor of four. In 1901 the American Can Company was formed through the merger of no less than 120 companies. The next big merger period occurred in the late 1920s, when the emergence of radio and the truck presented new opportunities to create national markets through radio advertising and local distribution.

The merger boom of the 1960s peaked in 1968, when the 200 largest U.S. corporations acquired 1.6 percent of the entire manufacturing assets in the U.S. economy. Because of the federal government’s successful attempts to prevent companies from forming monopolies many of the mergers of the 1960s took the form of conglomerates. A fourth period of intense merger activity began in the early 1980s and continued into the 1990s. The driving force behind these mergers were technological advances, global competition, and the deregulation of industries, such as the airline industry, that had once been closely supervised by the federal government.

The first major merger period in American history reached a high point in 1899.

MERRILL, CHARLES EDWARD

As cofounder of Merrill, Lynch stockbrokerage firm in 1914, Charles E. Merrill (1885–1956) launched a Wall Street dynasty that would long outlive him. Building on the slogan “Bring Wall Street to Main Street” he designed his business around middle-class investors, not stock exchange insiders. By the time of his death in 1956 his firm had offices in 106 cities across North America; the firm has continued to grow ever since.

Charles E. Merrill was born on October 19, 1885, in Green Cove Springs, Florida, the son of Dr. Charles and Octavia Wilson Merrill. His father, a local physician, also owned a drug store where Merrill worked as a boy in addition to having a paper route. Merrill attended a preparatory school affiliated with Stetson University and was later sent on a partial athletic scholarship to Worcester Academy in Massachusetts. He attended Amherst College in Massachusetts from 1904 to 1906. He left Amherst without graduating and returned to Florida where he dabbled in newspaper journalism at West Palm Beach’s *Tropical Sun*. Later in life he commented that the job provided him with “the best training I ever had; I learned human nature.”

After one year of law school at the University of Michigan Merrill abandoned plans for a legal career and went to Mississippi to play baseball for a minor league team during the summer of 1907. When the season ended he moved to New York City to look for work and his first job was in the office of the Patchogue

Plymouth Mills in Patchogue, New York. Here what Merrill acquired “turned out to be the equivalent of a university course in general and credit finance, cost accounting, and administration, in particular.” This training would be invaluable to his future success.

The skills Merrill learned at his early jobs enabled him to become one of the most innovative leaders in the field of financial services. With a sound understanding of business practices, which he obtained during his two years with Patchogue Mills, he went on to a job on Wall Street. Merrill joined George H. Burr and Company in 1909. The company’s owner had heard of Merrill’s abilities and he wanted the young man to take charge of Burr’s newly created bond department. Merrill promptly hired Edmund Lynch, a Johns Hopkins University graduate whom he had met at the 23rd Street YMCA, to handle sales.

Merrill’s strategy for attracting new customers was to use direct mail solicitations. He concentrated on informative and accurate information rather than the exaggerated claims and misleading statements that were the norm at the time. This emphasis on honesty was to remain one of Merrill’s chief concerns throughout his career. Clear, honest information appealed to a broad customer base, he reasoned, and “having thousands of customers scattered throughout the United States is infinitely preferable to being dependent upon the fluctuating buying power of a smaller and perhaps on the whole wealthier group of investors in any one section.”

Under Merrill’s leadership Burr’s bond department quickly became a success. The company soon expanded into underwriting (guaranteeing) equities. In 1912 the company sponsored a \$2 million stock offering in the Kresge chain stores. Chain stores were a new concept at the time, and this project began Merrill’s career-long involvement with this retail innovation.

In 1913 Merrill left Burr to become sales manager at Eastman, Dillon and Company and a year later he founded his own small securities firm, Charles E. Merrill and Company. Within six months he had taken on Edmund Lynch as a partner: Merrill, Lynch was born. The partners began by underwriting two chain stores, McCrory Stores and Kresge, the latter being an account Merrill lured away from Burr. With the public receptive to buying stock in this emerging business, Merrill soon made his first fortune. He accepted stock warrants as part of his fee and sold these when they increased in value.

World War I (1914–1918) had begun by this time, and Merrill joined the U.S. Army as a first lieutenant in the air corps. After the war Merrill returned to his firm

to oversee its period of greatest expansion. The U.S. economy was booming in the 1920s. Many Americans had bought war bonds, familiarizing them with investing; they were now ready to expand to corporate ventures. Merrill's emphasis on straight advice for a broad range of middle-class customers was well-suited to this new business climate. Merrill, Lynch grew rapidly. In 1919 Merrill hired the first bond saleswoman on Wall Street, Annie Grimes, and in 1924 he expanded the company's office hours, opening early and closing late, to better serve customers.

Merrill, Lynch continued to focus on the expanding chain store industry. About half of the company's underwritings in the 1920s were retailers such as J.C. Penney, National Tea, Kresge, and McCrory. In 1921 the company entered the movie business when it took over a studio, Path Exchange. Merrill, Lynch later sold the studio to Cecil B. deMille and Joseph Kennedy (father of the future president). With the profit from the sale of Path Exchange the company acquired the southern California food chain Safeway Stores. Merrill subsequently built up and expanded Safeway, merging it with another western chain. Merrill next founded *Family Circle* magazine, the first magazine distributed through supermarkets.

Charles Merrill

As the American economy continued to boom through the 1920s, Merrill grew increasingly concerned. In 1928, over a year before the infamous stock market crash that sent the country into the Great Depression, he sent a letter to customers recommending they get out of debt. He persuaded his partner to reduce the company's vulnerability in the event of a sharp decline. When the stock market crashed in October 1929 Merrill, Lynch survived. Merrill became highly respected for his ability to foresee market trends.

In January 1930 Merrill, Lynch left the brokerage business and turned over its accounts to E. A. Pierce and Company. The firm then focused on underwriting and individual banking, specializing in chain stores. By 1931 Merrill had built Safeway up to the third largest food chain in the country; he was also its largest stockholder. The firm's growth continued through the

decade, but then, on a vacation trip in 1938, Edmund Lynch died unexpectedly. Without his partner Merrill had to reexamine his business focus and in 1940 he went back into the brokerage business and merged Merrill, Lynch with E. A. Pierce and Company. The next year another merger created Merrill Lynch, Pierce, Fenner, and Beane, the world's largest brokerage house.

New Deal legislation also affected the public perception of Wall Street. During the 1930s the federal government created the Securities and Exchange Commission to monitor the stock brokerage industry. New laws imposed fines and jail terms on those convicted of financial fraud. Merrill wholeheartedly supported these reforms and he was instrumental in influencing other brokerage houses to adopt his firm's direct practices.

During the 1940s Merrill was at the forefront of change in the investment industry. He coined the phrase "Bring Wall Street to Main Street" in 1941 to attract small investors to the stock market. He printed ads and pamphlets that contained his characteristically honest information and he insisted on professionalism among his own employees. He provided business education for his employees and paid them a straight salary rather than one based on commissions. These strategies boosted public confidence in the company and enabled Merrill, Lynch to continue its astronomical growth.

After suffering a heart attack in 1944 Merrill withdrew from active management of the firm, but he continued to direct strategy and long-term planning for the company. With partner Win Smith, Merrill instituted additional changes by recruiting younger, better-educated brokers and providing them with training in accounting and commercial banking. He also published the booklets "Hedging: Insurance Policy or Lottery Ticket" and "How to Read a Financial Report," and he ran informative ads in the country's leading newspapers.

In 1954 the New York Stock Exchange launched a new plan for moderate-income individuals who wished to make small, regular investments in the stock market. Merrill, Lynch became the largest institutional supporter of this Monthly Investment Plan (MIP). After one year Merrill, Lynch had almost half of all MIP accounts, and within a few years the firm maintained the vast majority of MIP accounts. By the time Merrill died in 1956 his firm had 107 partners in 106 cities, and it employed over 4,600 people and handled almost 300,000 active customer accounts. The firm then became Merrill, Lynch, Pierce, Fenner and Smith; in the late 1990s it continued to be the world's biggest brokerage.

Merrill's innovations in the field of financial services led to far-reaching changes both in the way Americans invested and in the way they spent money. Before Merrill established his brokerage firm, stock market investments were only for the elite or the unscrupulous. Average Americans had no idea of how the stock market worked and they distrusted Wall Street—for a good reason. Many brokerage houses kept the “best” information only for their wealthiest customers and they tried to lure others with exaggerated claims and deceptive promises of profits. Merrill, however, provided accurate figures and honest information tailored to the needs of average Americans. One of his first acts when he reentered the brokerage field in the 1940s was to issue a pamphlet that stated “The interests of our customers MUST come first.”

Merrill, Lynch became a leader in the dissemination of investment information. The company published a bi-weekly magazine, *Investor's Reader*, and it was the first to make full public disclosures of its operations and holdings, as well as the investments of its partners. As Martin Mayer wrote in *Wall Street: Men and Money*, “Merrill brought in the public [to Wall Street] not as lambs to be fleeced but as partners in the benefits.”

The rapid growth of chain stores, in which Merrill was also instrumental, profoundly affected the U.S. economy. Before the introduction of these giant chains most Americans shopped at small, mom-and-pop style stores that operated with a small volume and charged higher prices. Because chains could operate on an economy of scale they could offer a greater selection of goods at lower prices. The growth of chains became such a threat to smaller retailers that the California legislature passed a tax on chain stores, which would have absorbed about 20 percent of Safeway's net income. Confident that consumers wanted the better prices and selection that chains could offer, Safeway management urged that the issue be put to a popular vote. In a 1936 statewide referendum voters in California repealed the tax. The message was clear: consumers wanted chain stores. Merrill later remarked, “If ever I get to heaven, it will be because I helped lower the price of milk by a penny a quart in Los Angeles.”

Merrill used a substantial part of his wealth to further the principles by which he had made his fortune. In 1945 he created the Merrill Foundation for the Advancement of Investment Knowledge, which awarded grants to institutions such as Massachusetts Institute of Technology, Brookings Institute, and the Wharton School of Finance. He donated 95 percent of his \$25 million estate to churches, hospitals, and colleges. A large portion of this estate supported colleges and

universities in the South that served African American populations. In 1951 he donated his 16-acre estate in Southampton, Long Island, to Amherst College which became the Merrill Center of Economics. In 1953 Merrill endowed a chair of medicine at Harvard University in honor of heart specialist Dr. Samuel A. Levine, who had treated Merrill for his heart condition.

In 1947 Merrill was named as the only representative from the securities industry in a poll of 50 outstanding business leaders. He received an honorary M.A. degree from Amherst College in 1933 among other honorary degrees from the University of Michigan in 1945, John B. Stetson University in 1946, Amherst College in 1948, Kenyon College in 1949, and a degree from New York University in 1950.

Charles Merrill married three times: first to Eliza Church in 1912, with whom he had a son and a daughter; to Helen Ingram in 1925, with whom he had a son, (they divorced in 1937); and to Kenta Des More (their marriage lasted from 1939 to their divorce in 1952). Merrill spent his last years at his home on Merrill's Landing in Palm Beach, Florida where he died on October 6, 1956.

MESA VERDE

Mesa Verde, in southwestern Colorado, is the site of well-preserved ancient American Indian ruins. Here in the 1200s A.D. the Anasazi Indians (also called Cliff Dwellers) built their dwellings into the sides of a

plateau. The area was named Mesa Verde (which is Spanish meaning “green table”) because the stone cities were carved into the sides of the mesas (flat-topped hills) in a region noted for its forests of junipers and pines. The multi-storied dwellings were built for protection from raiding tribes: the inhabitants could retract access ladders in case of attack. The largest and best known of the ruins is the Cliff Palace, which contains more than 200 rooms and was probably inhabited by two to three hundred people at a time. Balcony House and Spruce Tree House are other large, multi-family dwellings.

A National Park since 1906, Mesa Verde provides a historical record of the ancient American Indians who occupied the area for hundreds of years. Nomadic peoples had moved onto the mesa top by the sixth century. As they made the transition from a hunting-gathering life style to an agricultural one, they moved from underground pit houses to the cliff dwellings. Over hundreds of years their culture became increasingly sophisticated. No longer involved in the time-consuming practice of following the herds for sustenance, the Anasazi turned their attention to crafting pottery, making decorative textiles, building kivas (underground ceremonial structures), and carving their homes in the rocky sides of mesas. The settlement at Mesa Verde was empty by 1300. Twenty-four years of low rainfall and increasingly hostile raids wiped out the Anasazi Indians who lived there. The site was first seen by white settlers in 1859.

MESOAMERICA

Mesoamerica is a geographic term for the area that extends from northern Mexico through Central America to the Isthmus of Panama. In prehistoric times this area was predominately settled by the Aztec and Maya Indians who built flourishing empires. Spanish explorers arrived on the coast of Mesoamerica in the early 1500s and eventually made their way inland, where they encountered the native peoples. The explorers conquered both the Aztec and the Maya by the mid-1500s. Mesoamerica was brought under the control of the Spanish crown and it formed a substantial portion of the viceroyalty of New Spain. The seat of colonial control was established at Mexico City.

MESTIZO

A Mestizo is a person of American Indian and (usually white) European ancestry. The word comes from the Spanish and means “mixed,” but it can also refer to a person of French-Indian, Portuguese-Indian, or Dutch-Indian heritage. A race of Mestizos emerged in Latin America by the mid-1500s and changed the character of the region. Historian Arturo Rosales wrote (in *The Hispanic-American Almanac*, 1993) that in central Mexico the “sexual appetite of the Spaniards led to numerous liaisons with the native women. . . . The consequence was a large progeny of children who were half Spaniard and half Indian.” By 1821, and the end of colonial rule of Mexico, the possible variations of Mestizo numbered more than 100. Mestizo populations spread northward from Mexico during the colonial era. They also emerged elsewhere, as Europeans arrived in new territories around the world and subjugated native populations. In Latin and North America Mestizos entered the rank-and-file of armies and were wage laborers who worked in mines and in the fields. It was a race that was created and, during colonial times, dominated by European incursion.

MEXICAN BAIL-OUT

In December 1994, as Mexicans watched their currency’s buying power plummet 40 percent, President Ernesto Zedillo stunned world-wide financial markets by devaluing the peso. Zedillo blamed the crisis on his predecessor, Carlos Salinas, who had attempted to get Mexico out from under mounting foreign debt and national poverty by launching reforms that slashed triple-digit inflation, dismantled trade barriers, and opened the Mexican economy to foreign investment.

Part of Salinas’ anti-inflation strategy was to tie the value of the Mexican peso to the U.S. dollar so that the value of the peso would not fall, and investments in Mexico would be safe. Since the beginning of this policy in 1988, investors in the United States and other countries poured \$50 billion into Mexico. But with the passing of the North American Free Trade Agreement (NAFTA) in 1994, rising U.S. interest rates lured foreign investors to favor the dollar over the peso. To keep the peso’s value on par the Mexican government was forced to use its foreign currency reserves to purchase pesos. Mexico’s \$30 billion foreign exchange reserves plummeted while the government spent as

much as \$1 billion a day. By December 19, reserves had dropped below \$10 billion, with no end in sight.

By this time Zedillo, the new president, decided that devaluing the peso was the only way to end the situation. This was a drastic step to take, however, sure to cause turmoil in Mexico's economy. Zedillo did not prepare to deal with this impact very well. At first he denied that devaluation was in the works, and then, without unveiling a plan to counter the economic impact, Zedillo announced on December 21 that devaluation would happen. Foreign investors stunned by the news dumped Mexican stock, pushing the peso down even further. The peso's value relative to other currencies plummeted 70 percent.

The number of American investors in Mexico and the amount that they invested prompted U.S. President Bill Clinton (1993–) to attempt to bail out the Mexican government. He originally proposed a plan with \$40 billion in U.S. loan guarantees, but Congress refused to authorize that amount. Undaunted, Clinton unveiled an alternate rescue plan that would “save” Mexico by letting Zedillo's government take money from the U.S. Treasury Department's Exchange Stabilization Fund, which was designed to help America's “friends” out of temporary currency crises. The Exchange Stabilization Fund had traditionally provided assistance for very short periods of time, usually less than a year. But under Clinton's bail-out plan, the White House allowed the Mexican government to withdraw at least \$2.5 billion from the fund, with repayment schedules stretching out from 10 months to 10 years.

Clinton's original \$40 billion plan consisted only of loan guarantees that might never have been activated. His new plan was a mix of guarantees and immediate loans and was therefore more risky. To minimize the risk, he required that Mexico agree to divert proceeds from oil exports to the Federal Reserve Bank of New York in the event of a default, and demanded that Mexico pay fees to offset the risks of the loans and guarantees.

Clinton's plan was certainly not without its critics. Some charged that it would benefit only large, rich investors in Mexico, doing little for the Mexicans themselves and nothing for the average American. They questioned why Clinton was willing to lend billions to a foreign government without a vote of Congress, when thousands of investors within the United States lost money and were never offered bail outs. Surely, they claimed, \$20 billion in additional loan guarantees to domestic inner-city investors would have provided more benefits to Americans at home. Detractors also focused on the risk involved in the

loans. They contended that in order for Mexico to pay back the loans on time it had to succeed at many difficult tasks, including lowering its account deficit, controlling its money supply, privatizing more state companies, suppressing internal rebellion, and insulating its central bank from political interference.

The Clinton plan went into action despite these objections. While supporters conceded that there was no question Clinton took a risk with the loan, they believed that it was justified for two reasons. First, Mexico's problems always had a way of becoming those of the United States, through increased influxes of illegal immigrants, for instance, or through a decline in an otherwise mutually beneficial trade. Second, the Mexican government had been increasingly edging its way toward economically responsible policies, and needed to be encouraged to continue.

Three years before its deadline Mexico repaid its loans from the United States in total with interest. Clinton supporters hailed the achievement and argued that the amount repaid by Mexico amounted to about a half-billion dollars more than the United States would have made if there had been no loan at all.

However economists viewed the situation, most agreed that as of the end of the twentieth century approached, Mexico was still not entirely out of trouble. They felt that more reform along free market lines would be necessary if Mexico was to become a major creator of jobs, products, services and wealth, all of which its growing population badly needed. Still, most acknowledged that the situation had been successfully stabilized, and that recent progress in Mexico was unmistakable.

Mexican Cession (1848)

Seybold, Peter. "The Politics of Free Trade: The Global Marketplace as a Closet Dictator." *Monthly Review*, December 1995.

MEXICAN CESSION (1848)

The Treaty of Guadalupe-Hidalgo was the peace treaty between the United States and Mexico that officially ended the Mexican War (1846–1848). The conflict lasted until the treaty was signed on February 2, 1848, in Guadalupe Hidalgo, a city in south central Mexico near Mexico City. The core of the treaty defined the "Mexican Cession," the territory that Mexico was obliged to cede to the United States as a result of the war.

The Mexican War was the culmination of a series of conflicts between Mexico and the United States. These included the 1836 War of Independence of Texas from Mexico, the 1845 annexation of Texas by the United States, and the claims of United States citizens for monetary damages against the Mexican government. (A group of citizens of the United States claimed they had been injured and their property had been damaged during the civil strife that followed Mexico's 1821 war of national liberation against Spain.) In addition, the Mexican and U.S. governments disagreed over the southern boundary of Texas. The Mexicans contended that the Nueces River was the boundary, while the Texans claimed that the dividing line was further south and west, along the Rio Grande River. Another important source of conflict was the determination of the United States to acquire California. California was a Mexican province where, by 1845, about 700 United States citizens had settled. The United States claimed that if it did not annex California the territory might come under French or British rule.

To this must be added the racial and cultural tensions that developed between these mid-nineteenth century descendants of Spanish and English colonization.

Centuries of subjugation of Indian people by the Spanish had produced the rich cultural and racial amalgamation of the Mexican people. The Spanish influence was communicated through a network of Catholic missions that spanned what is now the southwestern United States. These Catholic missions were also centers of economic life. Gradually, as Mexico developed its own social structure, the Catholic missions were replaced as the focus of economic and social life by large *haciendas*, the seat of a nascent Mexican aristocracy.

This aristocracy of ranchers and farmers led the Mexican Revolution against the Spanish in 1821. After the revolution, in the interest of economic development of its northern, thinly settled provinces, the Mexican government invited settlers to Texas. The Mexican land-owners who were already there engaged in agriculture and ranching until the influx of Anglo-Americans in the 1830s and, in California, especially after the gold rush of 1849. This influx of North Americans turned out to be a disaster, not only for the Mexican nation during the Mexican-American War, but also for the individual Mexican land-owners in Texas and California. Their land was simply taken from them.

Thus it was with some sense of injured pride that Mexico broke off diplomatic relations with the United States when the U.S. annexed Texas in 1845. President James K. Polk (1794–1849) sent General Zachary Taylor (1784–1850) across the Nueces river to enforce U.S. claims on Texas' southern boundary. President Polk dispatched John Slidell, a Louisiana politician and trader, to accompany the invading army with instructions to purchase the land in dispute. He offered \$5 million for New Mexico and \$25 million for California. The Mexican government refused to discuss this proposal. As a result, General Zachary Taylor advanced to the mouth of the Rio Grande River, 120 miles south. The Mexican government sent troops across the Rio Grande saying that Taylor was engaged in an act of aggression. President Polk proclaimed that the Mexican army had invaded United States soil and, on May 13, 1846, Congress declared war on Mexico.

In a distinct improvement over their record during the War of 1812 (1812–1814), the armed forces of the United States performed well during the war. Contending with rugged terrain and logistical problems, the U.S. force of 14,000 prevailed over the Mexican military force. They occupied Mexico City in September, 1847.

In light of this military success President Polk began to set his sights on annexing all of Mexico. An obscure, low level U.S. agent, Nicolas Trist, scuttled this ambitious goal when he negotiated the treaty of Guadalupe-Hidalgo for the U.S. side. President Polk was outraged when he learned that Trist had secured only the original U.S. demands. Still in the Treaty of Guadalupe-Hidalgo Mexico lost nearly one million square miles of land—almost one-half of its territory. This territory, termed the "Mexican Cession," included land that makes up the states of California, Nevada, New Mexico, Utah, Arizona, Texas, and parts of Colorado and Wyoming. The Mexican government received \$15 million and the promise that the United States would settle all claims of its citizens against

Mexico. These claims amounted to more than \$3 million. The Mexican citizens in this acquired territory were presumed to be legal U.S. citizens unless they vacated the area or registered as Mexican citizens within a one-year time frame. The treaty also granted the citizens in this area religious freedom, property, and civil rights. Article IX stated that Mexican citizens in this territory “shall be incorporated into the United States of America, and admitted as soon as possible, according to the principles of the Federal Constitution, to the enjoyment of all the rights of citizens of the United States. In the meantime, they shall be maintained and protected in the enjoyment of their liberty and property, and the civil rights now vested in them according to the Mexican laws.”

In light of the delicate balance in Congress between the slave states and the wage-labor states, the acquisition of this land from Mexico re-kindled the debate in Congress over slavery. Southerners hoped to enlarge the territory that would enter the union as slave states. Anti-slavery northerners feared that very outcome. For that reason many northerners from both parties opposed the war with Mexico. The Mexican cession thus played a part in the nation’s drift towards the Civil War.

MICHIGAN

Strategically located on four of the Great Lakes, the state of Michigan was carved out of the old Northwest Territory. Before the advent of good roads and waterways it was known as a remote, wild place full of dense forests. By the mid-1800s, however, when settlers cleared the land and began to make it habitable, Michigan represented what historian Bruce Catton

called the “great American feeling of being en route to the unknown, to something new.” With a forested, still somewhat undeveloped area in the north, the state now owes much of its economic health to its own industrialized south, particularly to the automobile industry headquartered in Detroit.

In the 1600s the French were the earliest explorers of present-day Michigan, among them Etienne Brul and Jean Nicolet. Father Jacques Marquette established trading posts at Sault Ste. Marie and St. Ignace. Antoine Laumet de la Mothe Cadillac also established the settlement which later became Detroit. In this period Native Americans such as the Hurons, the Miamis, and the Potawatomis were important fur-trading partners with white settlers.

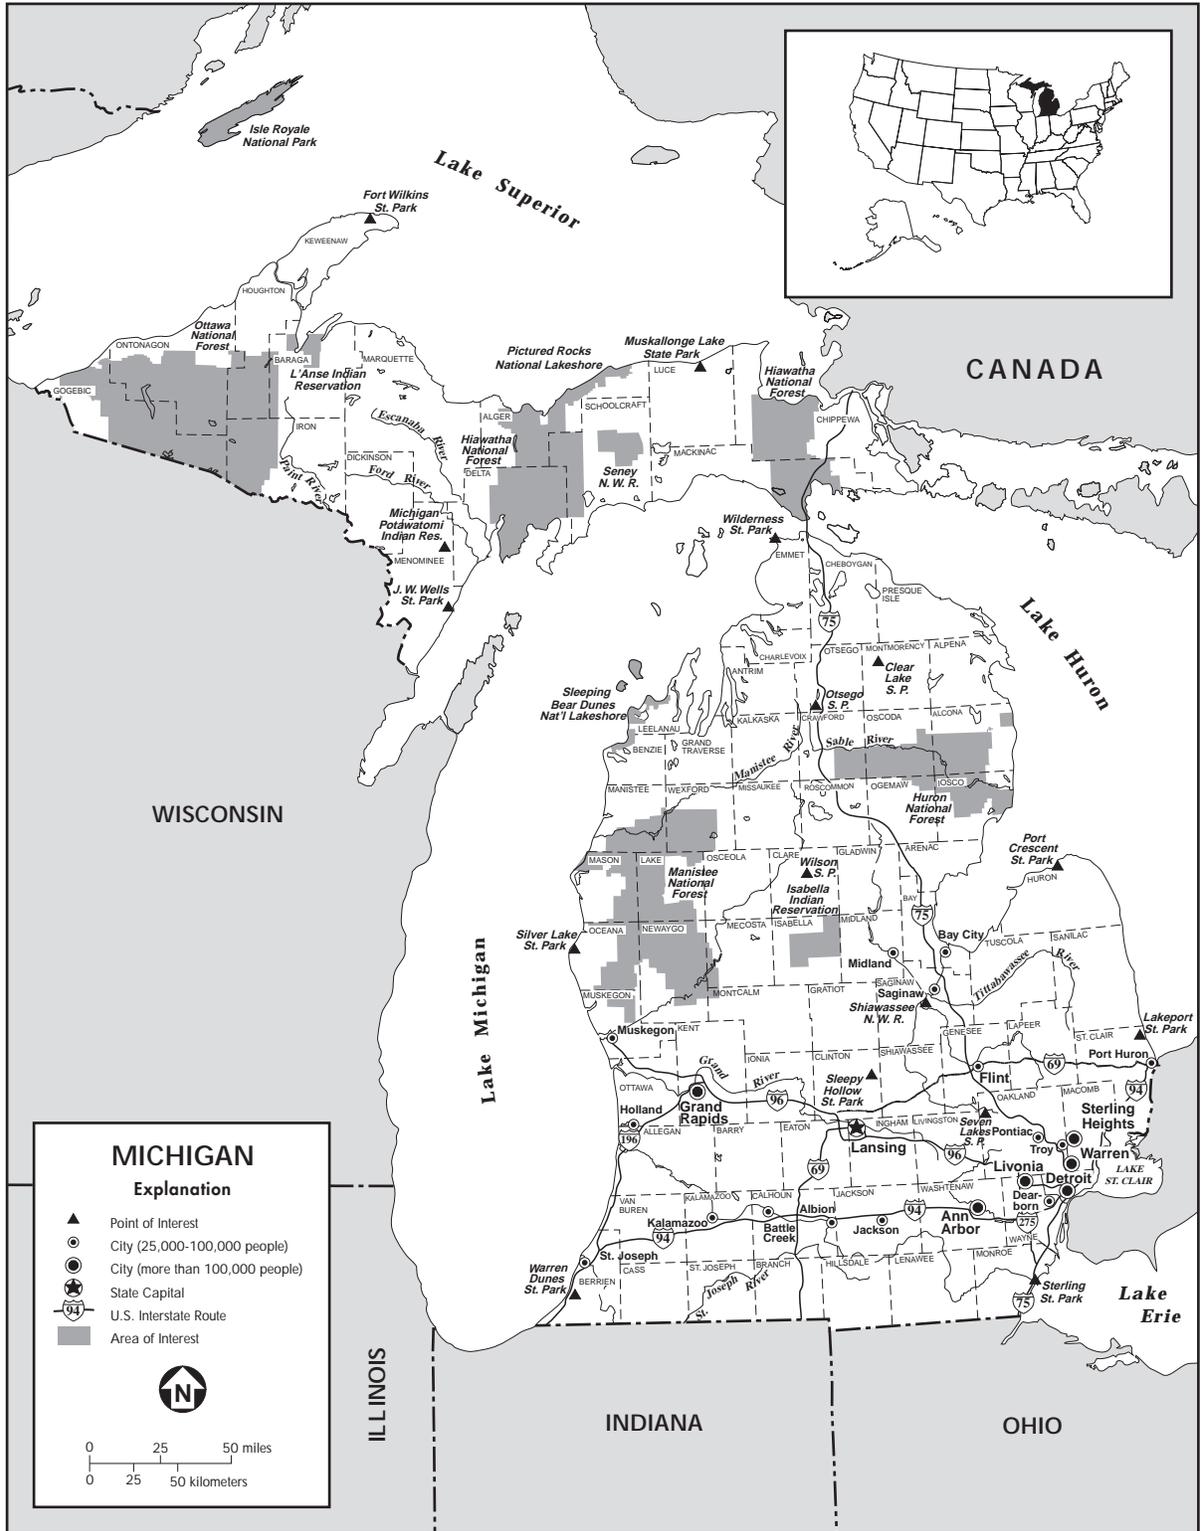

The fur trade, however, did not really encourage the growth of Detroit or Michigan. The area Ottawa chief, Pontiac, led several tribes in an uprising against the British. Pontiac’s Conspiracy (1763) succeeded in capturing many British garrisons and the fort at Detroit, but as the Indian tribal alliance weakened the British were able to regain their holdings. The populace in what would later become Michigan sided with the British during the American Revolution (1775–1783), fearing that a massive influx of American settlers would destroy the fur trade as land was cleared for farming. Although Americans had nominal control of Michigan by terms of the Treaty of Paris after 1783, the British continued to occupy the territory for 13 years. A part of the new Northwest Territory, the region came into full U.S. possession in 1796.

IT IS NOT POSSIBLE TO TELL THE STORY OF [MICHIGAN] WITHOUT PUTTING THE INTERNAL COMBUSTION ENGINE, THE RUBBER TIRE, AND THE WHITE DESERT-RIBBONS OF THE CONCRETE HIGHWAY ON TO THE CENTER OF THE STAGE.

Bruce Catton, *Michigan: A Bicentennial History*, 1976

During the War of 1812 (1812–1814) the region became a center of battles between the Americans and British, who refused to accept American sovereignty over the area. The territory was finally in the hands of the United States in 1814. The opening of the Erie Canal in 1825 marked the beginning of a push to settle southern Michigan territory by allowing an inexpensive, convenient route from New York City to Michigan. As the fur trade diminished, so did the value of the Native Americans to the non-indigenous population, and gradually most Indian lands were ceded to the federal government. A few tribes stayed on reservations within the territory. Following the “Toledo War”

Michigan

State of Michigan.

of 1835, (which settled the question of whether Toledo would be part of Michigan or Ohio) Michigan territory was granted the upper peninsula in exchange for land that it had claimed in northern Ohio. Michigan was granted statehood in 1837.

As the fur traders had feared, farmers soon began to clear land in Michigan. By 1850, 85 percent of the population in the lower peninsula was dependent on farming in some way. Soon northern areas of Michigan were also being exploited for their vast timber supplies, as well as for their rich mineral deposits. Millions of tons of iron ore were extracted near Marquette and Houghton in the upper peninsula, and copper was mined on the Keweenaw Peninsula. The transportation of iron ore and copper to markets in south Michigan and development of the rest of the country was facilitated by the opening of a canal in 1855 to bypass rapids at Sault Ste. Marie.

At first transportation routes in the state were primarily on Lakes Michigan, Superior, Huron, and Erie, each of which touched Michigan. The first railroad was chartered in Michigan in 1830, but until after the American Civil War (1861–1865), railroad construction was slow in the state compared to other states. Until automobiles came into widespread use in the 1920s, many interurban lines connected cities in southern Michigan. In fact, most mass transportation was decimated by the advent of the automobile until public transit systems began to make a comeback in the 1970s with the help of the federal government. A boon to transportation in the state was the opening of the Mackinac Bridge in 1957, connecting the lower and upper peninsulas. In addition, the St. Lawrence Seaway, opened in 1959, brought many oceangoing ships to Michigan ports.

As timber and minerals began to be depleted in the late nineteenth century, industry took on new importance in the state. The city of Battle Creek became the center of the cereal industry with the establishment of the Post and Kellogg companies. Dow Chemical and Upjohn also became major producers of chemicals and drugs during this period. Grand Rapids produced furniture, and Kalamazoo had paper mills.

However, the automobile industry became the real lifeblood of Michigan. Just after the turn of the century the first “horseless carriage” in the state was produced by Ransom E. Olds, followed by the first Cadillac and the first Ford. William Durant made General Motors a success; Henry Ford produced the first Model T in 1908 and introduced the first assembly line several years later. The Chrysler Corporation was established in 1925.

As more and more people bought new automobiles, more concrete highways were being built, producing an even higher demand for automobiles. In the 1930s, however, when the nation’s economy collapsed during the Great Depression (1929–1939), over half of Michigan’s factory workers were unemployed. This desperate situation, along with ineffective management by Republicans at the state and national levels, helped to precipitate the rise of labor unions in the state. In 1936–1937 the massive sit-down strike staged by the United Auto Workers (UAW), an affiliate of the Congress of Industrial Organizations (CIO), signaled the growing strength of unions in the auto industry. By 1941 the UAW had organized the entire industry and the state, as a whole, had become pro-union. The population of Michigan, moreover, was increasingly centered in its cities, primarily in Detroit and the southern part of the state. As industry took over the economy, the northern two-thirds of the state lost population and became increasingly economically depressed.

Due to the strong influence of unions in Michigan, politics was dominated by the Democratic party, until Republicans captured the state House in 1962. They held on to power until 1982, when Michigan was seized with a serious recession, causing more than 15 percent unemployment in the state. The recession’s effect on the auto industry was devastating. American car makers had not foreseen that the public was losing interest in large, gas-hungry vehicles. In addition, Japanese car companies were making serious inroads into the American car market. The Chrysler Corporation was granted a \$1.2 billion federal grant to avoid bankruptcy in 1979, thousands of autoworkers left the state, and many auto-related industries closed their doors. The state’s tax base was reduced, causing massive reductions in the state budget in 1983.

This downturn, of course, was due to the state’s heavy dependence on the auto industry. By the late 1980s, as the industry slowly began to recover, attempts were being made to diversify the economy. The number of factory workers dropped by 30 percent in the ten years after 1970, while new jobs were created in the engineering and technology fields as companies turned to more automation. At the same time, the service and wholesale-retail sectors began to grow. The state government, General Motors, and the UAW all applied significant funds to job retraining programs. Still, by the mid-1990s, the manufacture of transportation equipment was still the most important industry in Michigan; 28 percent of all U.S. automobiles were still being produced in the state, but the unemployment rate was decreasing steadily.

Microsoft Corporation

Despite the economic ups and downs that the state had experienced, it remained a favorable location for workers. Strong labor unions, which count over 24 percent of all workers and 34 percent of factory workers as members, have kept wages and benefits high. The per capita income in 1996 was nearly \$25,000, ranking Michigan sixteenth among all states. Next to manufacturing, agriculture is the most important sector of the economy, ranking 20th in the nation in income. Attractions such as the Great Lakes, inland lakes and forests, and historic sites such as Dearborn's Henry Ford Museum and Greenfield Village also make tourism very important to the economy of Michigan.

MICROSOFT CORPORATION

Microsoft Corporation, the world's largest software developer, began in 1975 as a partnership between two young men, William H. Gates, 19, and Paul Allen, 21. Gates was a sophomore at Harvard University and Allen was employed by Honeywell when they saw a mockup of the Micro Instrumentation and Telemetry Systems (MITS) Altair, the first personal computer, pictured on the cover of *Popular Electronics*. They decided to write a BASIC Interpreter for the Altair and demonstrate it to MITS, which was located in Albuquerque, New Mexico. It was the first computer language program written for a personal computer.

In July 1975 Microsoft signed a contract with MITS that allowed the hardware company to use and market the BASIC software but Microsoft retained ownership of the computer language. It was a contractual relationship between a software developer and a hardware manufacturer that became a model for future

software licensing agreements. Allen joined MITS as its director of software development.

By the end of 1976 Gates had dropped out of Harvard and had four programmers working for Microsoft in New Mexico. Allen left MITS in November and in March 1977 Allen and Gates formed an official partnership. Believing that microcomputers would grow in popularity, Gates set about convincing large corporations of the industry's future, licensing BASIC to Fortune 500 companies such as General Electric, NCR, and Citibank, among others. Microsoft licensed BASIC for the newly introduced Apple II, Radio Shack's Tandy computer, and the Commodore PET and TRS-80. It also began selling single copies of BASIC.

Microsoft then developed two other programming languages, FORTRAN (1977) and COBOL (1978), for the control program of microcomputer CP/M, which was one of several operating systems then available. Several hardware firms chose CP/M machines for their new computers and Microsoft became the leading distributor for microcomputer languages. In 1978 Microsoft had revenues of \$1.4 million and 13 employees.

On January 1, 1979, Microsoft moved its offices to Bellevue, Washington (Allen and Gates were both Seattle natives), becoming the first microcomputer software company in the Northwest. Having recently established an international sales office in Japan called ASCII Microsoft, the company began working closely with NEC and other international computer manufacturers in the development of their products. By the end of the year Microsoft expanded its service to Europe. International sales would prove to be a significant source of revenue to the company over the years.

In 1980 the company had revenues of \$7.5 million and 40 employees. Steve Ballmer, who had formerly worked with Proctor and Gamble, was hired as Gates's first assistant. He had the responsibility of establishing policies and procedures in the financial, organizational, and resource allocation areas. Meanwhile microcomputer technology was growing rapidly and with each new advance Microsoft was there to provide a computer language. It furnished versions of BASIC and FORTRAN for Intel's new 16-bit chip and developed a soft card for the Apple II, the top-selling microcomputer at the time, that enabled it to use CP/M and Microsoft BASIC. This was Microsoft's first hardware product.

In 1980 IBM decided to enter the microcomputer market, and it hired Microsoft to develop a computer

An aerial view of the Microsoft Corporation world headquarters in Redmond, Washington.

language and operating system for its machines, which were introduced to the public in 1981 as the IBM Personal Computer (PC). The operating system used for the IBM-PC was called MS-DOS, short for Disk Operating System. It would become an international industry standard, eventually replacing the CP/M operating system.

In 1981 Microsoft reorganized as a privately held corporation called Microsoft, Inc., with Gates as president and chairman and Allen as executive vice president. After recovering from a lengthy illness Allen would leave Microsoft in 1983. Meanwhile Steve Jobs and Apple had developed a revolutionary new microcomputer, the Macintosh. Microsoft became the first major company to develop products for the Macintosh when it was introduced to the public in 1984.

The microcomputer market began to explode in the early 1980s. The entry of IBM changed the image of microcomputers from that of a hobbyist's toy to a serious business machine. Microsoft's revenues jumped from \$24.5 million in 1982 to \$50.1 million in 1983 to \$97.5 million in 1984, and the growth would continue in the coming years. In 1983 Microsoft introduced its first mouse, its first full-featured word processing program, Word, and Windows. Windows extended the features of MS-DOS by providing users with a graphical user interface (GUI). Although IBM would not adopt Windows for its interface, Gates convinced

many manufacturers of IBM-compatible computers to adopt Windows. Retail versions of Windows became available two years later. During that year Gates met Jon Shirley, formerly with Tandy Corporation, and hired him to join Microsoft as president and chief operating officer.

Microsoft went public in 1986 after moving its headquarters to a new corporate campus in Redmond, Washington. With shares introduced at \$21, the initial public offering raised \$61 million. A year later, Microsoft shares were trading around \$85, making Gates a billionaire at age 31. During 1987 Microsoft introduced several new products, including Windows 2.0, Microsoft Bookshelf on CD-ROM, the spreadsheet program Excel for Windows, and a new operating system jointly developed with IBM called MS OS/2. In 1988 Microsoft inched past rival Lotus Development Corporation to become the number one software vendor.

Microsoft's revenues surpassed the one-billion-dollar mark in 1990, with international sales accounting for more than half of that. The company had more than 5,600 employees. During that year Microsoft introduced Windows 3.0 with its largest marketing campaign in the company's history to date. Within a year Microsoft shipped four million copies to 24 countries in 12 languages. By 1993 there were more than 25 million registered users. Microsoft was also branching out into other areas of software, including desktop

Microsoft Corporation

publishing and network servers, and the Federal Trade Commission (FTC) began investigating the company for possible anti-trust law violations.

In 1992 Microsoft created a three-person office of the president to replace Michael Hallman, who resigned as president after one year. The three members of the office were Mike Maples, head of the Worldwide Product Group; Steve Ballmer, head of Worldwide Sales and Support Group; and Frank Gaudette, head of Worldwide Operations Group. Gates was also recognized this year when he was awarded the National Medal of Technology for Technological Achievement by President George Bush (1989–1993).

Microsoft shipped several new products in 1993, including the network operating system Windows NT, MS-DOS 6.0, Microsoft Mouse 2.0, software for children, and Encarta, the first multimedia encyclopedia designed for a computer. In June the last copyright infringement claims made against Microsoft by Apple were dismissed, settling a lawsuit begun in 1988. *Fortune* magazine named Microsoft the “1993 Most Innovative Company Operating in the United States.” Revenues for the year were \$3.75 billion, and the company had more than 14,000 employees.

Microsoft celebrated the release of Windows 95 in August 1995 with several special events. More than one million copies were sold to retail customers in the first four days. Toward the end of the year Gates detailed Microsoft’s commitment to supporting and enhancing the Internet by integrating it with the PC platform. In November the final version of the Microsoft web browser Internet Explorer 2.0 for Windows 95 was released and made widely available for downloading at no charge to licensed users of Windows 95. Revenues for 1995 were \$5.9 billion, and the company had about 17,800 employees.

As the world embarked on the information superhighway in 1996 Microsoft was committed to providing a full range of tools for both Internet and intranet publishing. In January it acquired Vermeer Technologies, Inc., whose main product was FrontPage, a tool for creating and managing Web pages without programming. The company made several organizational changes during that year, creating an interactive media division to focus on interactive entertainment and information products and an executive committee to replace the office of the president. In July 1996 MSNBC, a 24-hour news and information cable network, debuted as the result of a joint venture between Microsoft and NBC News. MSN, the Microsoft Network, was reorganized to offer content on the World Wide Web.

During 1997 Microsoft strengthened its commitment to Internet services by acquiring WebTV Networks for \$425 million in stock and cash and releasing Internet Explorer 4.0. WebTV allowed consumers to access the Internet through their television sets. During the year Microsoft also purchased 11.5 percent of the cable company Comcast Corporation for a cost of \$1 billion. The company also announced an alliance with struggling Apple Computers and purchased a \$150 million stake, giving Apple much-needed financial support. Microsoft’s revenues for 1997 were \$11.4 billion, and the company had more than 22,000 employees.

Microsoft again came under the scrutiny of the U.S. Department of Justice and in October 1997 the firm was charged with violating a 1994 consent decree. One of the key issues was Microsoft’s bundling of its Internet Explorer with Windows, which competitors such as Netscape and Sun Microsystems considered anti-competitive and monopolistic. Informational hearings were held before a congressional committee, and the case went to trial in 1998.

In 1998 Microsoft acquired several Internet-related companies, including Hotmail, a free e-mail service that would become a component of MSN, and Firefly, an Internet start-up that had developed software to give users customized Web site views and protect their privacy. The company’s long-awaited reorganization was announced in March 1999. The company was divided into five major groups to better reflect its core customers: 1) a new consumer and commerce group including MSN.com and Internet properties; 2) the business enterprise division; 3) the consumer Windows division; 4) a new business productivity group; and 5) a separate home and retail products division for consumer-targeted products such as games, input devices, and reference products. A new 14-member team to be led by Gates was formed to replace the smaller executive committee.

MIDDLE PASSAGE

Middle Passage is a term from the colonial slave trade. It refers to the trans-Atlantic journey millions of black Africans were forced to make from Africa’s west coast to the Caribbean, where they were sold to plantation owners. The trip was called the Middle Passage because it was the middle leg of the trade triangles that had developed early during the colonial period. These routes were established in the early 1500s by the Spanish and Portuguese, who imported slaves from Africa to work on sugar plantations in the New World. Early in the next century the English, French, and Dutch also began using slave labor in their American colonies.

The Middle Passage was a brutal trip which often lasted several months. Because the slaves were viewed as little more than a commodity, captains would often carry as many as their ships would hold. Conditions were deplorable: Slaves were transported in chains, cramped quarters, and filth. They were not provided with adequate food or exercise, and many died at sea. How many people endured the atrocities of the Middle Passage is unknown. Most estimates place the number at about 10 million. Of that total, an estimated six percent were shipped to the North American mainland.

In 1833 the great antislavery movement in Great Britain reached culmination in the abolition of slavery throughout the British colonies. In the United States the slave trade was prohibited in 1808, but possessing slaves was still legal—and profitable. Illegal trade in slaves continued until Britain stepped up the enforcement of its antislavery law. Britain conducted naval blockades and surprise raids off the African coast, and effectively closed the trade. Slavery officially came to an end after 1870, when it was outlawed throughout the Americas.

MIGRANT WORKERS

Migrant workers are simply persons whose work routine includes relocation across or within national boundaries on a fairly frequent basis. They usually work at temporary jobs. Often they are seasonal workers employed in the agricultural sector of the economy. In that case the demand for their labor is determined by the growing cycles, as in the case of Mexican farm workers. For decades these workers—called *braceros*—moved across national borders in routine violation of laws that authorities largely overlooked because of the need for their labor. Migrant workers may also be non-seasonal, highly paid workers called upon to do highly skilled or particularly dangerous work like putting out oil derrick fires. They may be the combine crews in the Great Plains, moving south to north, harvesting the wheat as it ripens. Or they may be the thousands of tradesmen of various descriptions who follow the building boom from one part of the country to another.

On the other hand, “Okies,” people from Oklahoma who left their farms in the dust storms of the 1920s and 1930s and made the trek to California, were workers who were migrating, rather than migrant workers. Immigrant Turkish workers in Germany—living and working for years in the host country without ever breaking from the Turkish culture—are also not migrant workers. Nor are workers in the transportation industry. Airline stewardesses and truck drivers are not migrant workers even though moving about defines the job that they do.

The United States experienced the largest influx of immigrant workers between 1890 and 1914 when 15 million foreign citizens entered the country, mostly from eastern and southern Europe. In the history of American immigration, approximately one-third of these immigrant workers moved back to their home or on to other countries—“birds of passage,” in the colorful words of one immigration historian. If these workers were seeking permanent employment they were immigrant workers, rather than migrant workers.

Migrant workers, like other workers, stimulate the economy in two ways. First, they take hard, undesirable, low wage jobs, thereby minimizing the employers’ costs. Second, they buy things and increase the size of the consumer population, thereby increasing demand. At the same time, jealousy and fear sometimes separates migrant workers from other Americans who objected that jobs were being lost to the newly available cheap labor.

MILITARY INDUSTRIAL COMPLEX (ISSUE)

Is the relationship between the armed forces and the industries that provide them with weapons a safeguard or a threat to world peace and the American democracy? Perhaps no other issue has raised as much concern over the coalescence between economic and political forces as the military-industrial complex, which today has formed a matrix of government spending, foreign initiatives, and ideological commitments.

In 1948 President Harry S. Truman (1945–1953) submitted the second largest peacetime budget in American history to Congress, justifying it as necessary to meet the threat of totalitarianism in the world. The budget came to \$39.6 billion, with around \$18 billion earmarked for military spending and international affairs. Such spending created a new industry in the United States devoted to the production of weapons for the Pentagon. This industry, which became known as the military-industrial complex, became one of the largest industries in the United States and a crucial part of the economy. In a pattern similar to World War II (1939–1945) mobilization, entire corporations were supported solely by government spending. Unlike World War II, however, there was no end in sight. As long as the Soviet Union continued to exist there was a reason for military spending, even during peacetime.

Within the government, the voices of both private business and the military have only grown stronger since the turn of the century. While on the eve of World

American makers of plowshares could, with time and as required, make swords as well. But now we can no longer risk emergency improvisation of national defense; we have been compelled to create a permanent armaments industry of vast proportions . . . Yet we must not fail to comprehend its grave implications. Our toil, resources and livelihood are all involved; so is the very structure of our society.

President Dwight D. Eisenhower, Farewell Address, January 17, 1961

War II the relationship between the two was often one-sided and seemed perpetually set against one another, by the 1970s private business and the military developed a formal and comfortable relationship of mutual support. Since the 1950s especially, military calls upon national resources have vastly increased and, for the most part, leading corporations have been the principal beneficiaries of that demand. While payrolls, research grants, and political influence were large enough to ensure a consensus for the system during the mid- to late-twentieth century the whole complex has been underwritten by a popular and almost unassailable anticommunist ideology. But some conservatives fear that the military-industrial complex keeps military spending at a level higher than that dictated by the strict needs of national defense. They claim it leads to economic dislocation at home and dangerous tensions abroad, and that the separate parts of the military-industrial complex will prove to be countervailing forces.

While the conjunction between economic and political forces may have been new during the Truman and Eisenhower eras, its roots lay deep in the mandates of Progressive reform which attempted early in the century to rationalize the U.S. economic system and integrate it with public policy. Even so, it was not until World War I that close ties among the military, the civilian government, and businessmen were formalized. Between 1914 to 1916, the federal government's efforts to mobilize people, raw materials, production plants, and transportation proved slow and incompetent. In August 1916, the task of planning mobilization was entrusted to the Council of National Defense (CND), which worked through the National Defense Advisory Commission (NDAC). In 1917, the CND was replaced by the War Industries Board (WIB) and under its auspices American industry was organized into commodity committees. These committees set prices, priorities, allocations, and other controls and

mobilized under their own rules. Meanwhile, the military was torn by its own internal conflicts and competition and was in no position to plan the civilian economy. While business was organized along commodity lines, the military was organized along operational lines, and the two proved to be opposing. Answerable to neither a central planning agency within the military nor to the WIB, each military branch entered the market with large orders geared toward its own needs, plus necessary surpluses. In 1918, Bernard Baruch (1870–1965) took over the leadership of the WIB and was given enough authority to force the cooperation of the military. Throughout the rest of World War I, businessmen and military leaders worked closely, and usually harmoniously, to fill the needs of the wartime economy.

During the inter-war years the military and business leaders met regularly to draw up plans for economic mobilization in case of war. Meanwhile, the government facilitated coordination between the two and left military tactics to the military and the economy to business leaders. The result was a series of industrial mobilization plans drawn up between 1930 and 1939. In the end, the military realized the degree to which it was dependent on the cooperation and capacity of business for the materials it needed, while business became more aware of what the present and future needs of the military might be for supplies of all types. In 1933, President Franklin D. Roosevelt's (1933–1945) attempt to plan for economic recovery after the Great Depression adapted the scheme of the WIB for his short-lived New Deal program, the National Industrial Recovery Administration.

In 1940, the coming of actual mobilization after so many years of planning, unleashed a torrent of expenditures that dwarfed those of both World War I and the New Deal. Altogether, some \$315.8 billion was spent during the war, with the War Department accounting for \$179.9 billion and the Navy Department for \$83.9 billion. In the end, a vastly inflated program of government spending and its heavy concentration in a few large corporations, like General Motors, Ford Motor Company, Chrysler Corporation, Bethlehem Steel, General Electric, United States Steel, Du Pont Chemical, and AT&T became the standard policy for the wartime economy.

As World War II was winding down, the alliance between the Soviet Union and the United States, brought together by a common foe, Adolph Hitler (1889–1945), was deteriorating. Tensions between the two nations had existed since the Russian Revolution of 1917, and within a few years after World War II the

two powers were engaged in a Cold War. But while the government had been involved in coordinating a mutually supportive relationship between the military and business during World War I and World War II, the Cold War dramatically changed this policy. The policy of "containment" committed the United States to a peacetime military-industrial complex for the first time in American history. For the next 45 years there would continue to be a large standing army with inflated defense expenditures, and large corporations supplying the equipment and supplies.

But with the coming of the Cold War, many leading military and industrial leaders who had previously enjoyed a highly successful and lucrative wartime system of military-civilian cooperation during World War II, sought to preserve these advantages in the demobilization period. During World War II, both groups had kept one eye focused on the postwar period. In the military the desire to keep up budgets and the desire of the Army Air Corps for independent status fueled the arguments that the country should never again find itself unprepared for hostilities, and that the country was bound to honor new and global peacekeeping responsibilities.

Continuing the cooperation that existed between the military and civilian businesses during World War II was considered necessary to meet these new global peacekeeping responsibilities. The nation's new course began with careful consideration to the potential pitfalls. President Dwight D. Eisenhower (1953–1961) cautioned in his farewell address (1961) that though it was important for the country to have a strong national defense in times of peace as in times of war, the development of a military-industrial complex was not without its dangers. "In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex. The potential for the disastrous rise of misplaced power exists and will persist."

For the next three decades after World War II, huge military spending and a closely linked program of foreign aid combined to prime the pump of U.S. prosperity as no combination of domestic social programs had ever been able to do. Military expenditures ranged from \$37 billion in the mid-1950s to just over \$79.1 billion in 1969. The bulk of spending was done directly by the military for research and material and certain large firms were the beneficiaries of the funds. In 1969, Lockheed Aircraft Corporation received the largest single share, more than \$2 billion, McDonnell Douglas with \$1 billion and General Electric with \$1.6 billion.

Minimum Wage Law

The Vietnam War (1964–1975) brought orders rolling in as the Air Force and Navy sought to replace planes damaged in combat, marking a peak in aerospace production. The industry had its share of valleys as well. Erratic defense budgets saw sudden buildups during the Korean War (1950–1953) and after the Sputnik launch, but just as sudden drops occurred in the mid-1950s and directly before the Vietnam War (1964–1975).

The scientific component of military technology had also grown significantly since World War II. The closer relationship between the military and business was paralleled by a similar closeness with scientists mostly housed in the big universities. By 1961 some 77 percent of all government spending for research and development was coming from the military.

In the 1990s, contrary to initial expectations, the military-industrial complex survived the end of the Cold War. It reorganized itself with a series of military-industry mergers encouraged and subsidized by the administration of President Bill Clinton (1993–). The “Big Three” weapons makers—Lockheed Martin, Boeing, and Raytheon—acquired a total of \$25 to \$38 billion in Pentagon contracts in the mid to late 1990s. If they continue to receive federal monies, these new military-industrial companies will earn billions more in the years to come. The Clinton administration’s five-year budget plan for the Pentagon calls for a 50 percent increase in weapons procurement, from \$40 billion per year in 1989 to over \$60 billion per year by 2003.

How best to defend the United States in the post-Cold War period remains a hotly debated topic. Some critics argue that on issue after issue—from expanding NATO, to deploying the Star Wars missile defense system, to rolling back restrictions on arms sales to foreign regimes—the arms industry has launched a concerted lobbying campaign aimed at increasing military spending and arms exports. They argue that these initiatives are driven by profit and pork barrel politics. Others claim that these measures are forward-looking and will create a safer, more democratic world.

MINIMUM WAGE LAW

A minimum wage law is a piece of legislation that prevents businesses from hiring workers for hourly wages that fall below a specified level. The first minimum wage laws were passed in Australia and New Zealand in the 1890s. In 1912 Massachusetts became the first U.S. state to pass a minimum wage law, and in 1918 Congress authorized the Wage Board to set minimum wage levels for female workers in the District of Columbia. Five years later, however, the U.S. Supreme Court ruled in *Adkins v. Children’s Hospital* (1924) that minimum wage laws violated the Fifth Amendment of the Constitution because they infringed on the freedom of businesses and workers to form contracts as they saw fit. The three dissenting justices claimed that Congress did have the constitutional power to correct social injustices. In 1933 in the depths of the Great Depression (1929–1939), President Franklin D. Roosevelt (1933–1945) convinced Congress to pass the National Industrial Recovery Act (NIRA), which gave the newly formed National Recovery Administration (NRA) the authority to establish national minimum wages. Although several states had passed minimum wage laws by the mid-1930s hope for a lasting federal law seemed doomed when the Supreme Court ruled in 1935 that the NRA was unconstitutional.

Two years later, the Supreme Court unexpectedly reversed its decision and gave states the constitutional right to establish minimum wage laws, setting the stage for the Fair Labor Standards Act (FLSA) of 1938. The FLSA set the national minimum wage at 40 cents an hour, an amount that was increased in 1949, 1956, 1961, 1968, 1974, 1991, 1996, and 1997. The 1997 increase brought the minimum wage to \$5.15, which was estimated to affect about 10 million U.S. workers. Some economists have argued that minimum wage laws have an unintended negative effect on the employment rates of the poorest segments of society, many of whom are minorities. These critics argue that raising minimum wage rates encourages businesses to rely more and more on automation to reduce their labor

costs, which discourages them from hiring unskilled workers who might otherwise find jobs if the minimum wage were lower.

MINNESOTA

The highly publicized 1998 election of Reform Party candidate Jesse Ventura to the governor's seat came as no surprise to those who had studied Minnesota history. With a long tradition of protest politics and a disdain for power monopolies, the state has always steered an independent course. Situated in the heart of the American prairie and supplied with many natural resources, Minnesota was able to parlay its independent spirit into great economic success. From its wheat fields to its iron ore ranges and timber lands to its large industrial belts, Minnesota represented the economic diversity to which most of the country aspired.

Europeans who first came into the territory that is now Minnesota were witness to numerous confrontations between the Dakota and Ojibwa Indians who inhabited the territory. In the mid-1600s French explorers, fur traders, and missionaries sent back the first reports from the region. American and British explorers also came to the area, vying with the French for influence. After the French and Indian War (1754–1763) the part of Minnesota east of the Mississippi was ceded to Great Britain. In 1762 France ceded the land west of the river to Spain. British activity in the region continued until the U.S. Congress banned British fur trade there after the War of 1812 (1812–1814). The American Fur Company headed by John Jacob Astor (1763–1848) replaced a British company at Grand Portage, a center for inland trade.

FROM OUT OF THE PAST OF EXPLORATION AND EXPLOITATION, OUT OF BOOM AND BUST TIMES, OUT OF THE EXPERIENCES OF PIONEERS AND IMMIGRANTS, AND OUT OF THE HERITAGE OF INDUSTRIALIZATION AND THE TRADITION OF PROTEST POLITICS HAS COME THE MINNESOTA THAT IS NOW.

William E. Lass, *Minnesota: A Bicentennial History*, 1977

The eastern part of Minnesota (east of the Mississippi) became part of the Northwest Territory in 1787. Most of the western part of the territory was acquired by the United States through the Louisiana Purchase in 1803. The Red River Valley was ceded by a treaty with

England in 1818. The American Fur Company continued to prosper on the upper Mississippi until treaties with the Ojibwa and Dakota Indians transferred large parcels of their land to the federal government in 1837. Unlike pioneer settlers fur traders had developed a profitable partnership with the Indians, one which was threatened by this action. The treaties opened up the territory to lumbering, farming, and settlement. Settlements such as Marine and Stillwater on the St. Croix River and St. Anthony (later Minneapolis) sprang up around the lumbering industry. St. Paul was a trading center at the head of the Mississippi.

In 1849 Minnesota became a territory, and by 1857 it had more than 150,000 inhabitants. It became the 32nd state of the Union in 1858. Minnesota supported the Union in the American Civil War (1861–1865). But during that period the state faced a more serious internal challenge from disgruntled Dakota Indians who waged a war on white settlers in 1862. Following the pattern of white western conquest both the Dakotas and the Ojibwas were eventually moved to reservations.

The first railroad joined St. Paul and St. Anthony, a flour-milling center, in 1862. Later rail routes connected the state with Chicago and the Red River Valley. Immigrants from the east and from northern Europe, especially Scandinavia and Germany, started coming to Minnesota in great numbers. They established farms and grew produce that was carried back east on the trains. Large-scale farming developed along with small farms, particularly for the wheat crop; 70 percent of all farms were planted with wheat by 1870.

Farmers suffered occasional natural disasters such as drought. They felt themselves injured also by high railroad rates and a general deflation. Agrarian discontent became part of the tradition of protest politics in the state. The National Grange of the Patrons of Husbandry was the first national farmers' organization which had its origins in Minnesota beginning in 1867. It had great influence on state politics in the 1880s. In 1890 another farm-oriented activist party called the Populists (or People's Party) helped elect John Lind Governor of Minnesota. Labor organizing was also strong in this period. As the Minnesota Federation of Labor gained power it succeeded in getting a landmark Workmen's Compensation Act passed in 1913. This laid the groundwork for the Farmer-Labor Party.

Aside from third parties the so-called Progressive Movement had other manifestations in Minnesota. Rural residents feared the power of big business, especially the railroad industry. An angry public outcry was heard in 1901 when railroad barons James J. Hill

(1838–1916) and Edward Harriman, with help from banker J. P. Morgan (1837–1913), formed the Northern Securities Company. The company merged the Northern Pacific, Great Northern, and Chicago and Burlington railroads, virtually monopolizing railroads in the state. Governor Samuel Van Sant had his attorney general sue the company and led other Midwest governors in condemning the company. When President Theodore Roosevelt (1901–1909) instituted a federal suit against the company in his first action as a “trust-buster,” the Northern Securities Company was broken up.

The lumbering industry in Minnesota prospered greatly in the decades following the American Civil War. It reached a peak in 1899. As it shipped some of the logs by rail and even more by water down the Mississippi, Minnesota supplied tons of lumber to the country, particularly the growing areas of the Great Plains states. Minneapolis became a sawmill center. In combination with flour mills and railroads sawmills helped the city’s population swell to well over 150,000 by 1890. The combined population of Minneapolis and its “twin city” St. Paul grew to over 250,000. Lumber was also shipped from Duluth, which owed its prosperity to its position at the starting point of the North Pacific Railroad.

Duluth also became a major Lake Superior port after the discovery of iron ore in the northeast Mesabi and Vermilion ranges. After the 1880s eastern cities and industries began to grow. After a short boost to the economy produced by World War I (1914–1918) an economic downturn afflicted the state. Since Minnesota forests had been depleted of their resources lumbering shifted to the Pacific Northwest. An agricultural depression also caused several flour mills to move to Kansas City and Buffalo, New York.

Minnesotans adapted to the changes by planting corn, soybeans, and sugar beets in addition to the traditional wheat crop. Canning and meat packing had become important industries in the early part of the twentieth century; by the late part of the century food processing plants such as Green Giant, Libby, Del Monte, and General Foods shipped more manufactured products than any other industry in the state.

Like the rest of the nation Minnesota was plunged into a depression in the 1930s. The governor during this period was Floyd B. Olson, a reform politician who championed the poor farmers and laborers and supported the policies of President Franklin D. Roosevelt (1933–1945). This period marked the first time that Minnesota departed from a nearly unbroken history of

Republican domination. In 1944 the populist Farmer-Labor Party merged with the Democrats and began a new chapter of reform in Minnesota under the leadership of Hubert H. Humphrey (1911–1973). Humphrey would later become Mayor of Minneapolis, U.S. senator, and vice president.

In the ensuing decades other manufactured products like business machines, computers, and electronic components added to the state’s economic base. After the high-grade iron ore produced by the state was depleted new processes were instituted to extract iron from low-grade ore. This caused concern about environmental damage to Lake Superior. A sign of the changing demographics in the state was that the urban population of Minnesota exceeded its rural population for the first time in 1950.

Minnesotans experienced some economic challenges in the late 1980s and into the 1990s. An important environmental concern was addressed in 1980 when the Reserve Mining Company was forced to end the dumping of taconite (low-grade iron ore) wastes, thought to be carcinogenic, into Lake Superior. Other companies such as the Minnesota Mining and Manufacturing Company have been forced to clean up hazardous waste sites. Natural disasters also put a strain on Minnesota’s economy. A drought plagued the state in 1988 and severe flooding of the Mississippi in 1993 and the Red River in 1997 devastated the lowlands.

The state maintained its economic health through diversification with increasing attention to service industries such as real estate, insurance, and finance. Tourism also became increasingly important to the state as millions of travelers, fishermen, and hunters came to enjoy the state’s many scenic and recreational areas. Farming remained important to the state as well; in 1995 Minnesota ranked seventh in the nation by farm income. The state’s proximity to the Mississippi River, the Great Lakes, and the St. Lawrence Seaway continued to make Minnesota a major marketing and distribution center for the upper Midwest. The state’s per capita personal income in 1996 was over \$25,000, ranking it ninth in the nation.

MINT ACT

The U. S. Congress passed the Mint Act on April 2, 1792, to establish the country's first mint at Philadelphia, Pennsylvania. The ineffectual Articles of Confederation (1781) had given each state the right to mint its own coins. To ensure the stability of the monetary system, the U.S. Constitution (adopted in 1788) revoked that right, declaring the federal government the sole issuer of currency in the nation (metal or paper money). The Mint Act was the necessary follow-up to the Constitution's proclamation that the federal government alone would "coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures." The Congressional legislation made the dollar the basic unit of money and adopted the bimetallic standard, meaning that both gold and silver became legal tender (an official medium of payment) in the United States. Laws fixed the value of each metal in relation to the other.

American inventor David Rittenhouse (1732–96) was appointed the first director of the U.S. Mint, an office he held from 1792 to 1795. Rittenhouse had been active in state politics and served as treasurer of Pennsylvania (1777–89). The Mint Act authorized coins in three denominations—the copper cent (or penny), the silver dollar, and the gold eagle. The coinage was based on Thomas Jefferson's (1743–1826) decimal system, which he had proposed when he was a member of the Continental Congress (1783–85).

For decades after the Mint Act, U.S. coins circulated along with foreign coins in the states. The federal government determined the exchange rate based on how much precious metal was present in foreign coins. But in 1857 Congress approved a law removing foreign coins from circulation.

For many years the \$10 gold eagle was the highest denomination of U.S. coin. In 1933 the government took gold out of circulation; the precious metals present in other coins was also reduced through later Congressional legislation. Today gold and silver coins

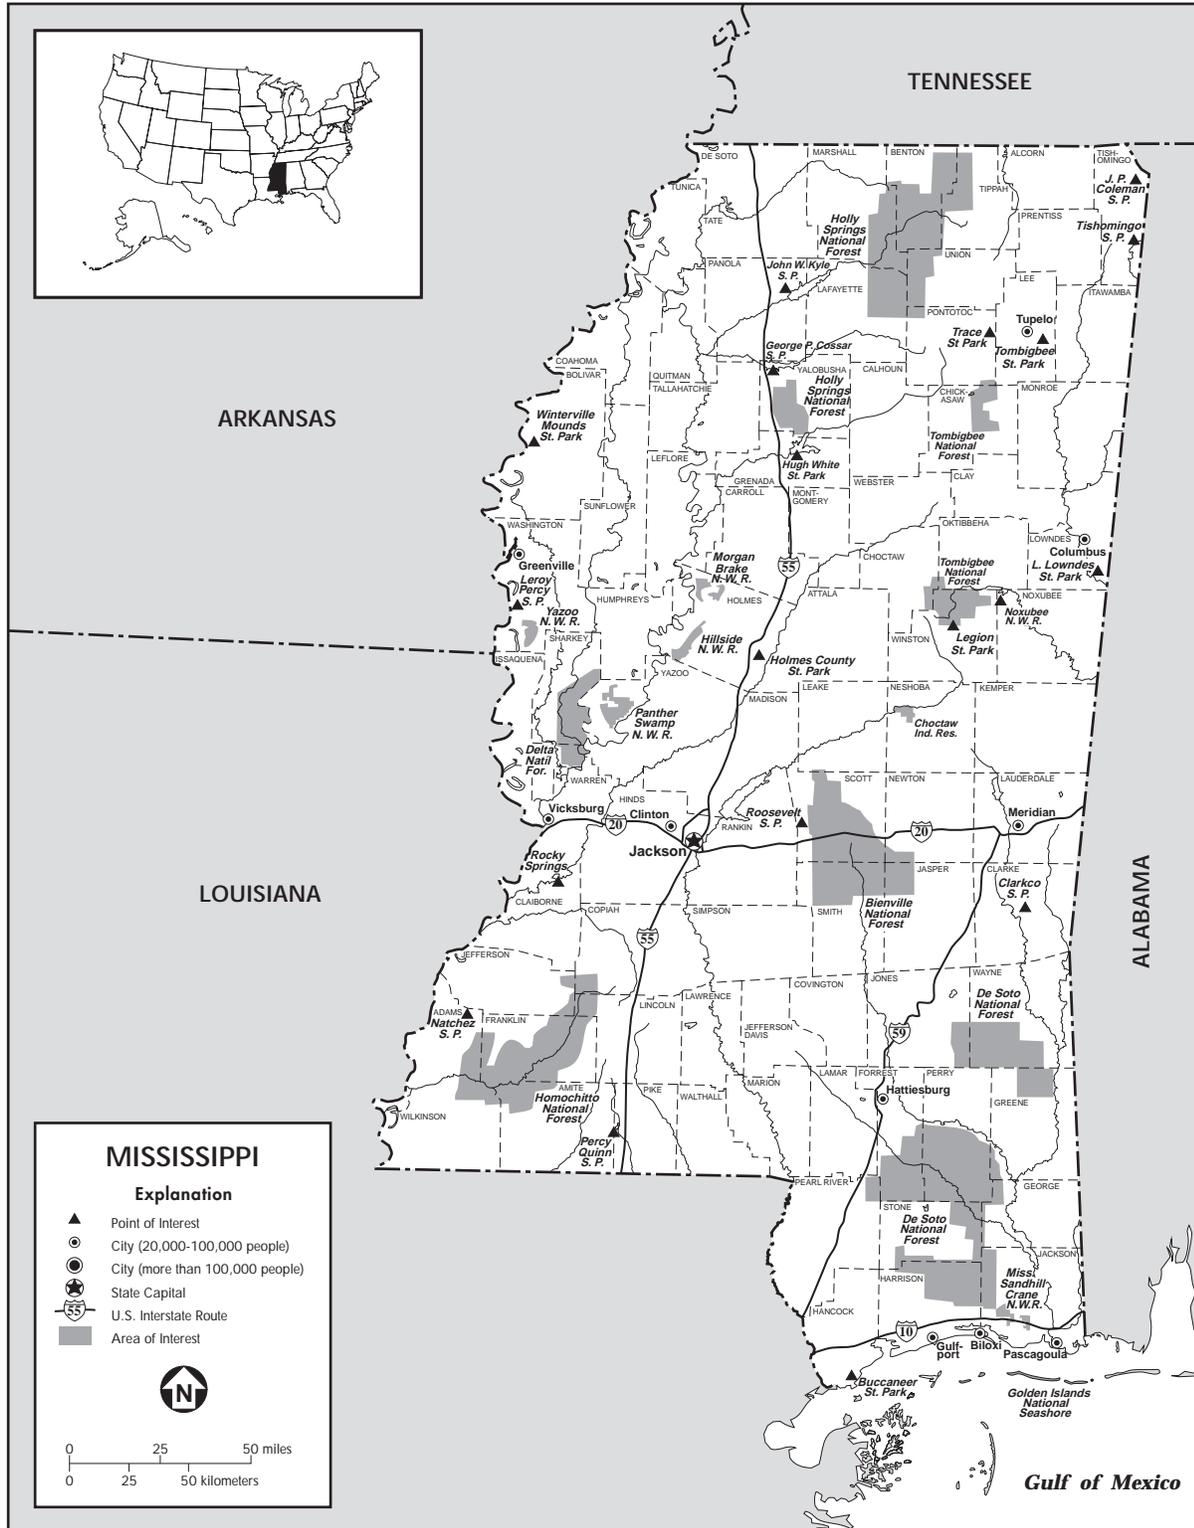

A worker at the U.S. Mint in Philadelphia displays freshly minted one dollar coins bearing the likeness of Susan B. Anthony, an early twentieth century suffragist.

are minted as commemorative issues for collectors. Silver and gold bullion (bars or ingots) are minted for sale to investors.

MISSISSIPPI

The words "Mississippi" and "delta" are closely associated in the public's mind with Mississippi history. The delta region indeed dominated the cotton-growing economy that was the mainstay of life in the state for many decades. Contemporary Mississippi, however, has diversified its economy and now has a significant industrial sector. In the late 1990s, the state continued to struggle to bring itself out of a past which

State of Mississippi.

Mississippi

has often placed it last among all states in per capita income.

The Spanish explorers who came to the region of Mississippi with Hernando de Soto in 1540–1541 did not find the wealth they sought and soon lost interest in further exploration. A Frenchman, Robert Cavelier, Sieur de la Salle, explored the lower Mississippi Valley in 1682. He discovered the mouth of the Mississippi River, naming the whole region Louisiana in honor of his king, Louis XIV. The French soon established settlements at Biloxi Bay, Mobile, Natchez, and New Orleans. The area changed hands several times, first from the French to the Spanish in 1762. In 1763 Spain ceded the portion east of the Mississippi to England, but the Spanish recaptured West Florida during the American Revolution (1775–1783). Spain relinquished its hold on the Natchez region, ceding it to the United States in 1795.

The U.S. Congress reorganized the Mississippi Territory in 1798. Alabama, originally part of Mississippi, became a separate territory in 1817. After many settlers from the South, Mid-Atlantic, and New England states had migrated to Mississippi to farm its rich alluvial soil, Congress made it the twentieth state in 1817.

Mississippi was a true frontier territory prior to the American Civil War (1861–1865): It was freewheeling, violent, and full of aggressive adventurers. Joseph G. Baldwin, a Virginia lawyer who came to Mississippi, described the speculative furor of the period: “Money, or what passed for money, was the only cheap thing to be had. . . . Credit was a thing of course. To refuse it. . . were an insult for which a bowie knife were not a too summary or exemplary means of redress. The State banks were issuing their bills by the sheet. . . .”

When Mississippi became a state, the northern two-thirds of the region was still dominated by Native American tribes. During the presidency of Andrew Jackson (1829–1837), treaties ceded most of this land to the United States and sent Native Americans off to the Oklahoma Territory. Although an aristocratic planter economy grew up around the Natchez area, large plantations did not dominate the whole economy prior to the war. Mississippi society was instead governed by an alliance of large and small landowners. An indication of the importance of slavery to the state’s economy was that slaves comprised 52 percent of the population and whites only 48 percent by the end of the 1830s.

The opening of the fertile lands of northern Mississippi caused an inrush of settlers and a flurry of land speculation. The cotton economy, with its slave

workforce, came to dominate the state. The land was rich and the cotton economy made many planters wealthy, but the work was hard and life was monotonous in Mississippi. Aside from church and the general store, there was little in the way of recreational or cultural institutions. Jefferson Davis, the President of the Confederacy, came from a family which in one generation had risen from poverty in Kentucky to affluence, social standing and political preeminence in the new land of Mississippi.

After the election of Abraham Lincoln in 1861, Mississippi was the second state to secede from the Union in an attempt to preserve the slave system as the mainstay of the state’s economy. During the Civil War, Mississippi was at the center of much of the action. Much political, social, and economic turmoil followed the war under the governance of Reconstruction (1865–1877) Republicans. After the Democrats successfully regained power in 1875, the bitter memories of Reconstruction caused Mississippi whites to institute a system that repressed the rights of former slaves even further.

The prime cotton-growing country in Mississippi was always the fertile Yazoo-Mississippi Delta, located in the northwestern part of the state. Because of persistent flooding problems, this area did not become a plantation economy until after the Civil War. Planters along this section of the Mississippi, according to historian John Ray Skates, “drained the lands, built the levees, and cleared the forests, [achieving] some of the grandiose style of their prewar Natchez counterparts. Here the plantation system still dominates, in recent times with machines and chemicals rather than sharecroppers.”

Economic stagnation plagued Mississippi from the postwar period into the 1940s. Black sharecroppers on the cotton farms fared nearly as badly as they had under slavery. Many white small farmers were also driven into sharecropping; in 1890, 63 percent of Mississippi farmers were tenants. During this period the practice of leasing convicts to private plantations was also widespread, adding yet another layer of poor and underprivileged workers to the economy. For some of these leased convicts life was possibly harder than it had been under slavery. With a nearly totally agrarian system, the state exported raw materials and had to import most of its manufactured goods. Many former planter-aristocrats dominated state government and all tried to keep the blacks in an inferior position. Fearing a return to Reconstruction and exhibiting deep-set prejudices, whites above all succeeded in maintaining their political and economic domination.

The Great Depression of the 1930s (1929–1939) made things even worse in the state, bringing Mississippi's poor farmers to desperation. Cotton sank to five cents a pound in 1932, while one-fourth of the state's farmland was given up for nonpayment of taxes. Although federal agricultural payments begun during the New Deal helped to hasten the end of tenant farming, had World War II (1939–1945) not brought economic relief to Mississippi, the state might have headed for disaster. Armed forces personnel who came into the state helped to lift it out of its provincialism. Industrial growth and increased mechanization of agriculture finally began to bring Mississippi into the twentieth century. Between 1941 and 1945 the per capita annual income in Mississippi rose from \$313 to \$627, and more and more citizens began to retire their debts. At the same time many African Americans, encouraged by reports of better economic conditions elsewhere, began to move out of the state to find higher-paying jobs.

The waterways of Mississippi have always been vital to its development. The Mississippi, the largest commercial river in the country, links the Gulf of Mexico to many inland river states. The Tennessee-Tombigbee canal, completed in 1984, links the Tennessee and Ohio rivers with the Gulf. The state has two deepwater ports, Gulfport and Pascagoula; other ports include Biloxi and Port Bienville.

By the 1980s Mississippi was an industrial state, and cotton was no longer the only important agricultural product. Agricultural production was now dominated by cotton, rice, soybeans, and cattle. Mississippi had survived the dark days of segregation and the upheaval of the civil rights movement. Its leaders had finally recognized that the inequalities built into a segregated system did not tend to attract the kind of industries the state sought. By the mid-1960s manufacturing was providing more jobs than agriculture, in part because of a weak labor movement and low wages. In the 1970s many of the low-paying industries such as the garment and wood product trades were de-emphasized in favor of heavy industries manufacturing products like transportation and electronics equipment. In spite of the state's economic strides in the last few decades of the twentieth century, Mississippi remained poor in the late 1990s. In 1996 it ranked 50th among all states in per capita personal income, at only \$17,471, and nearly 24 percent of the population fell below the federal poverty level. In 1995–1996, however, the per capita income growth rate was ranked fifteenth in the nation.

MISSISSIPPI RIVER

The Mississippi River is a principal United States river. It originates in central Minnesota and flows southeast and then south, eventually reaching Louisiana where it pours into the Gulf of Mexico. States lying west of the Mississippi are Iowa, Missouri, and Arkansas, Louisiana, and Minnesota; to the east are Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi. The river is 2,340 miles (3,765 kilometers) long. With the Missouri River, the Mississippi forms the world's third-longest river system. It is navigable by ocean-going vessels from the Gulf to Baton Rouge, Louisiana. North of that location, it is navigable by barges and towboats as far as Minneapolis, Minnesota.

The mighty Mississippi was first sighted by explorers in 1540–41 when Spaniard Hernando de Soto (1500?–42) ventured through the southern region. In 1672–73 the Mississippi's upper reaches were seen by French-Canadian explorer Louis Jolliet (1645–1700) and French missionary Jacques Marquette (1637–75). In 1682 French explorer Sieur de La Salle (1643–87) investigated the lower part and claimed the entire region for France, naming it Louisiana in honor of King Louis XIV (1638–1715).

After 1763, at the end of the French and Indian War, (1754–63), the river became the boundary between British possessions to the east and Spanish possessions to the west, and the river itself was ceded to Spain. Disputes between Spain and the United States over the waterway were settled in the Pinckney Treaty (1795). With the Louisiana Purchase (1803), the river passed into American control.

Missouri

In 1811 the steamboat era began on the Mississippi River. Traffic along the Mississippi sped the development of the nation by providing access to the interior territories. St. Louis, Missouri; Memphis, Tennessee; and New Orleans, Louisiana, all flourished as a result of riverboat traffic. In the imagination of most U.S. citizens, the romance of the Mississippi as a steamboat waterway is probably best captured by Missouri-born writer Mark Twain (1835–1910) in his novel, *The Adventures of Huckleberry Finn* (1884).

MISSOURI

Access to the Mississippi River and Missouri's central location helped that state's early economic development. The state's fertile land, abundance of lead, and assortment of wild game beckoned thousands of settlers eager to make Missouri the hub of activity in the west. The first inhabitants of what is now known as Missouri were Native American tribes. French fur trader Louis Jolliet and Father Jacques Marquette, a missionary, paddled down the Mississippi River, Missouri's eastern boundary.

The first settlers found the land was rich with deer, beaver, otter, and buffalo; their skins could be traded for other necessary goods. In the 1720s more French people immigrated to the area and established a community near St. Louis, eventually they built the first trading post in 1764. Lead was discovered in the area and a mine was opened near Fredericktown. The French settlers were self-sufficient and grew their own crops, built their own log cabins, and made their own cloth.

In 1762 France ceded its North American land, including Missouri, to Spain during the French and Indian War (1754–1763). When the English were expelled from the Ohio valley area south of Canada as a result of the Revolutionary War, Spain and the United States became neighbors on either side of the Mississippi River. In the 1790s Spain offered free land to Americans who settled in Missouri. People began migrating from eastern states; many brought their slaves with them.

After French leader Napoleon Bonaparte forced Spain to return the Louisiana Territory to France in 1800, the French threatened to exclude the Americans from traveling on the Mississippi River to trade their goods. The issue was pressing and President Thomas

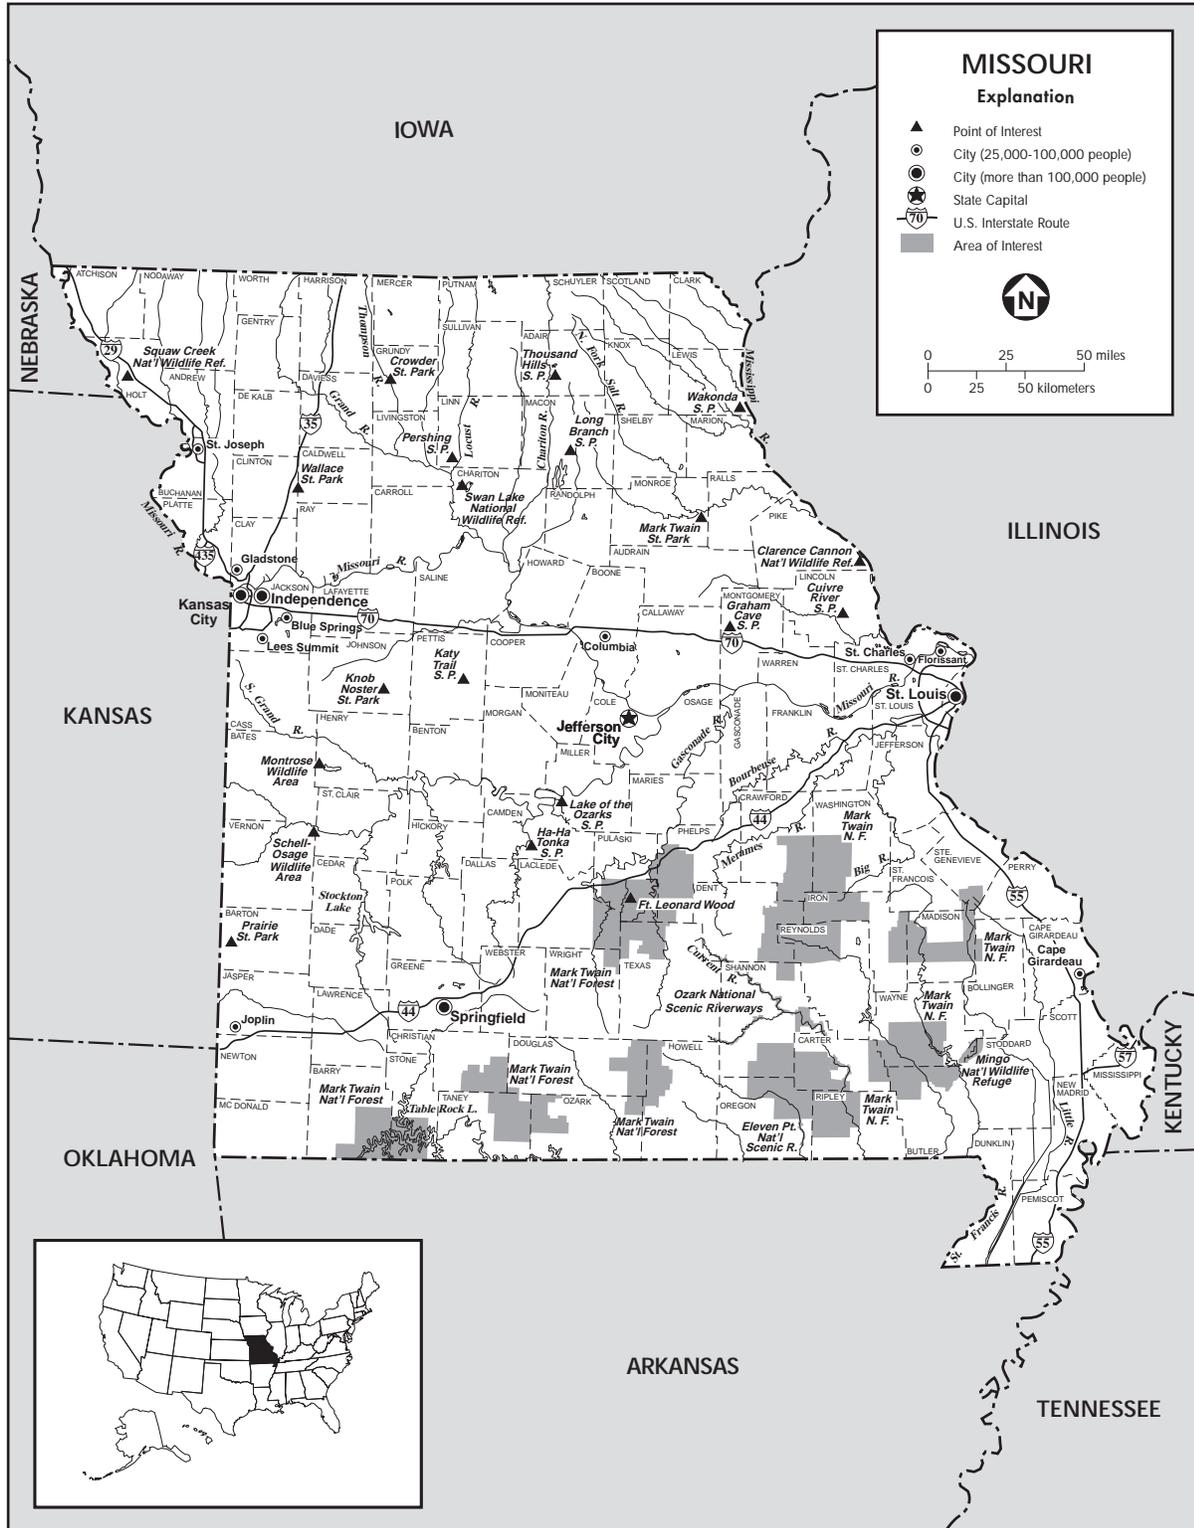

Jefferson (1801–1809), who had been one of France's strongest supporters in the United States, now prepared to go to war with France. The right to ship goods on the Mississippi was crucial, in Jefferson's eyes. The Napoleonic wars in Europe, plus a slave rebellion in Haiti, took Napoleon's attention away from the United States, however, and Jefferson offered to purchase the Louisiana territory from the French leader as a way to resolve the crisis. The deal was consummated and Missouri formed part of the newly purchased Louisiana Territory for \$15 million. The expanse of land purchased was so large that it was eventually carved up to become Missouri and 14 other states.

Once in 1811, and twice in 1812, earthquakes rocked southeast Missouri. Growth slowed in that area; however, the rest of Missouri flourished. In 1812 a section of the Louisiana Territory was renamed the Missouri Territory. That same year William Clark, of the Lewis and Clark expedition, was elected governor. More people continued to migrate to the fertile and rolling hills of Missouri to establish farms that produced a wide range of crops including corn, wheat, cotton, hay, tobacco, rice, and grapes. As these settlers took over more of the land, Native Americans were eventually pushed out.

Missouri was granted statehood in 1821. During the first half of the 1800s, the development of major transportation routes opened up the west. In 1819 the first steamboat traveled up the Mississippi River carrying flour, whiskey, and sugar. In 1821 the Santa Fe Trail, 800 miles in length, led from Independence, Missouri all the way to Santa Fe, New Mexico. Goods such as wool, tools and mirrors were traded for silver, mules, furs, and horses. In 1841, travelers could follow the Oregon Trail for 2,000 miles from Independence to Oregon. As the transportation system grew, small frontier towns developed along the river and trade routes.

In the mid-1840s, Irish immigrants came to Missouri after suffering failing potato crops in Ireland. These Irish settlers worked the railroads and labored in the towns. A few years later a large number of Germans immigrated to Missouri to make homes in the St. Louis area.

Between 1852 and 1870 the railroad system in Missouri was expanded to meet the demands of the towns. The railroads received grants of federal land along the tracks. It was a profitable acquisition: the railroads sold the land to farmers and the farmers paid to have their goods shipped to markets via the railways. Missouri's railroads opened up new markets in the east for the state's wheat, corn, and other products and also offered easy transportation for easterners who were

State of Missouri.

Missouri Compromise

moving west. By 1860 more than one million people lived in Missouri. The state's economy flourished.

After the American Civil War (1861–1865) more railroads were laid in Missouri. The railroads transported more settlers to Missouri and continued to open new markets for Missouri's commercial products: crops, iron, and beer.

In the 1870s the fur trade and steamboat traffic declined due to competition from the railroads. The state's economy shifted to industry. Factories drew people from rural areas to the cities. By 1900 St. Louis was the country's fourth-largest city and was called the "Belle of the New World." Urbanization continued—between 1880 and 1970, Missouri's rural population declined from three-fourths to less than one-third of the state's population.

In 1904 about 20 million people attended the world's fair in St. Louis, a celebration to mark the one-hundredth anniversary of the Louisiana Purchase. Fair attendees could feast on the world's first ice-cream cones and the world's first hot dogs. They also had the chance to see the first motion picture, wireless telegraphs, and automatic dishwashers. The Olympic Games also took place in St. Louis that year.

In 1929, The Great Depression (1929–1939) hit the United States. Many farmers and workers lost their jobs. But the start of World War II (1939–1945) helped end the Depression as Missouri produced bombers, landing craft, and explosives. Missouri contributed more than \$4 billion worth of supplies to the war effort by the time it was over.

Between 1950 and 1990 the population of St. Louis dropped by more than half. In the 1970s the population of Kansas City also dropped. People and businesses were moving to the suburbs. Those who stayed in the cities were poor. The cities undertook major renewal projects that tackled problems like air pollution, traffic congestion, and crime. In the 1980s millions of government funds were used to renovate apartments and houses.

In 1989 industry was booming as St. Louis was home to many major companies. McDonnell Douglas Corporation made military aircraft, commercial jets, and electronic equipment. Anheuser-Busch, the world's largest brewery, had its headquarters in St. Louis. Chrysler, Ford and General Motors all had assembly plants in or near St. Louis and Kansas City. Missouri was second only to Detroit in automobile production. Other major manufacturers were Monsanto, Hallmark, and Ralston Purina. Each year, more than 60 new

companies opened in Missouri and created thousands of jobs.

Missouri produced more than 85 percent of the nation's supply of lead and was a leading producer of lime, barite, zinc, cement, and copper. Missouri's mines added about \$1 billion to the state's economy each year. Forestry, another natural resource, was the source for nearly 2,000 industries which produced items such as charcoal, lumber, and barrels.

In 1993 devastating floods required that over half the state be declared a disaster area. Damage to the state was estimated at \$3 billion.

In 1998 Missouri's sources of income included manufacturing, farming, trade, tourism, services, government, and mining. While automobiles and aerospace manufacturing were the state's leading industries, soybeans, meat and dairy products were the most important agricultural goods.

In 1995 an estimated 9.4 percent of the state's residents lived below the federal poverty level. Personal income per capita was \$22,864 by 1996.

MISSOURI COMPROMISE

Between 1815 and 1850, the politics of the United States became increasingly sectional. The question of slavery dominated the issues dividing the new republic. An increasing number of northerners viewed slavery as morally wrong and insisted that government abolish the system, while most southerners viewed slave labor as essential to their economic prosperity—and to that of the nation.

Both the North and the South looked to the newly settled western territories to expand their interests. In 1818 when the Territory of Missouri (part of the Louisiana Purchase of 1803) applied for statehood, there were 11 free states and 11 slave states, giving

both sides equal representation in the U.S. Senate. (Because of their populations, the free states dominated the U.S. House of Representatives.) Congress began debating the question of whether to admit new states as free or as slave states. In an effort to preserve the delicate North-South political balance, Congress agreed to the Missouri Compromise in 1820.

The Missouri Compromise provided for Maine to be admitted to the Union as a free state, Missouri as a slave state, and designated as free territories north of the Louisiana Purchase (the present-day southern border of Missouri), with the exception of the state of Missouri.

By the 1850s the issue of the extension of slavery had become very controversial. In 1854 the federal legislature again considered the problems of organizing and admitting new states to the Union. This time the Kansas Territory was under consideration. In another compromise, the territory was carved up to form two states, Kansas and Nebraska, and the slavery status of each would be decided by popular sovereignty (the voters in each state). The Kansas-Nebraska Compromise also repealed the anti-slavery clause of the Missouri Compromise, which had pronounced the northern territories free. Violence ensued, especially in Kansas where anti-slavery and pro-slavery adherents squared off in a series of deadly skirmishes, deepening the North-South schism. In 1857 the U.S. Supreme Court's decision in the case of *Dred Scott* (1795–1858), a slave who had sued for his freedom on the basis of having traveled with his owner in the free territory north of the 36th parallel, declared the Missouri Compromise unconstitutional.

MISSOURI RIVER

The Missouri River is the longest river in the United States. It flows for 2,466 miles (3,968 kilometers). Its source lies in the Rocky Mountains of southwestern Montana; the river is formed by the confluence of the Jefferson, Madison, and Gallatin rivers at Three Forks, Montana. From there the Missouri flows east and southeast, ultimately joining the Mississippi River about 10 miles (16 kilometers) north of St. Louis, Missouri. The Missouri River flows through Montana, North Dakota, South Dakota, Nebraska, Iowa, Kansas, and Missouri. From the Mississippi River, the Missouri is navigable by barges and towboats west and north as far as Sioux City, Iowa. Above Sioux City the water

flow is controlled by a series of dams in a project authorized by the U.S. government in 1944. When the water is high the river is navigable to Great Falls (northeast of Helena), Montana.

In 1673 the mouth of the Missouri was passed by French-Canadian adventurer Louis Jolliet (1645–1700) and French missionary Jacques Marquette (1637–75) as they explored the upper part of the Mississippi River. The Lewis and Clark expedition of 1804–06 followed the Missouri for much of the journey to the Pacific Ocean.

During the first two decades of the 1800s, the river provided a chief transportation route for the western fur trade, which relied on keel boats to move goods along the river. In 1819 steamboat traffic began on the waterway, carrying pioneers to the rugged West. Riverboat traffic declined with the expansion of the cross-continental railroads at the end of the nineteenth century. Much of the region through which the Missouri River flows—the interior plains—was the last frontier to be settled in America.

MITCHELL, JOHN

In 1870 John Mitchell (1870–1919) was born in Braidwood, Illinois, a coal-mining village. Orphaned at age six, Mitchell had a difficult childhood. Frustrated and largely penniless, he spent his teenage years laboring as a miner in Colorado and Wyoming. Through this experience, Mitchell came to believe that coal miners, and all working people, could obtain a better and more secure life by organizing labor unions to address their concerns with employers. Mitchell grew up to become one of the most respected yet controversial labor leaders in the United States in the early twentieth century.

In 1890 he was one of the founders of the United Mine Workers of America (UMWA). Later, in 1898, Mitchell won public acclaim as UMWA president. He pursued the organization of labor by using a moderate approach to relations between workers and employers. His conservative style rejected confrontation and class conflict as counterproductive. In his two books, *Organized Labor* (1903), and *The Wage Earner* (1913), Mitchell wrote that the prosperity of workers and employers were inseparably linked together, and harmonious relations between these two groups were best for both.

Model T

As more Americans joined labor unions in America, open conflict between unions and employers became more common. Mitchell's theories of harmony between business and labor began to seem naive and unrealistic. American labor was headed in the direction of greater militancy and Mitchell's ongoing associations with businessmen caused a decline in his popularity. He was seen as a pawn of business and a conservative manipulator of union growth. In 1908, despite his reputation as an effective union organizer, the union he founded asked him to step down as president.

Mitchell later tried to pursue his theory of "business-labor harmony" by serving as head of the National Civic Federation (NCF) Trade Agreement Department. (The NCF was an organization comprised mainly of employers and business owners.) But, by 1915, the UMWA insisted he leave the NCF. The UMWA continued to see Mitchell as a collaborator with business and as an unreliable representative of union causes. In 1915 Mitchell became chairman of the New York State Industrial Commission, where he mediated labor issues until his death in 1919.

Arguably, the unions were correct about Mitchell's growing conservatism. He died a millionaire, having grown wealthy through investments in coal mining, the railroad industry, and the steel industry. Many unions came to despise him as a betrayer of union principles, but coal miners remained loyal because of the help he gave them as a labor organizer in the early days of his career. John Mitchell was an inspiration to the early labor movement in the United States, and his policies of mediation and cooperation have, in the long run, triumphed.

MODEL T

The Model T was an automobile introduced by the Ford Motor Company in 1908 and manufactured until 1927. The automobile's enormous success has been the source of extensive analysis and commentary by historians, sociologists, economists, business writers, and pop culture experts. The Model T has been credited with not only changing the United States but also defining it. When Ford Motor Company founder and president Henry Ford (1863–1947) unveiled the prize Model T in October 1908, he hailed it as "a motor car for the great multitude."

The product lived up to the promise. The internal combustion vehicle had been in production in the United States only since the 1890s; but in the decade preceding the Model T's debut, manufacturers and consumers alike came to regard the "horseless carriage" as a luxury item. It was custom-made for wealthy U.S. citizens. Ford had conceived a different and better idea, as the company would advertise throughout the century: a car that was simple to operate, easy to service, comfortable, and affordable.

The Model T had a wooden body on a steel frame. It had a four-cylinder, twenty-horsepower engine, tank capacity of ten gallons (in the "touring sedan") or sixteen gallons (in the "runabout"), and a completely enclosed power plant and transmission. It was also lighter than other models. Through large-scale production based on a system of interchangeable parts the Model T took 728 minutes (just over 12 hours) to build and sold for \$850, lower than the price of other automobiles. It was, however, still beyond the reach of the average American consumer.

Nevertheless, in the year the new car was introduced 17,000 Model Ts were purchased by U.S. consumers. Ford improved production methods to increase the number of cars produced and lower the cost; sales steadily rose. The company made an extraordinary offer, when it paid its workers for an eight-hour day a wage of five dollars a day, twice the amount other factory workers were earning. Ford explained that this was merely good business practice. By raising the wages of his factory workers Ford enlarged the potential market for his Model T.

In 1914 Ford implemented the moving assembly line to optimize. Each job had one "best way" of being

A 1921 vintage Model T.

accomplished. The moving assembly line brought unprecedented efficiency to manufacturing. Assembly time per car dropped to just 90 minutes. That year the Ford plant in Highland Park, Michigan produced almost 250,000 Model Ts. To keep up with ever-rising demand operations were sped up and capacity increased to the point when in 1925 Ford produced one Model T every ten seconds. That year the car retailed for just \$295, making the so-called “Tin Lizzie” (or the “Flivver”) accessible to working class families.

Ford’s innovative Model T brought mobility within the reach of the average person in the United States. It was a reliable, no-nonsense, mass-produced automobile, manufactured on a moving assembly line. It changed the consumer mindset to view the car as a necessity. In 1927 Ford retired the Model T so the company could respond to consumer demand for cars with better performance, power, and styling. By then the company had turned out 15 million Model Ts.

MOLASSES ACT OF 1733

In an ongoing effort to control commerce in its North American colonies, the British Parliament passed the Molasses Act in 1733. It imposed heavy duties on any molasses, sugar, or rum imported by the colonies from non-British West Indies (islands in the Caribbean).

The American colonists had a substantial appetite for rum. They consumed it at a rate of nearly four gallons a year for every man, woman, and child. By the time that the act was passed New England distilleries had developed into a successful industry. They bought most of their raw materials (molasses and sugar) from the French islands in the West Indies. The French islands offered cheaper rates than the British islands. Thus Parliament was prompted to pass the Molasses Act to protect its sugar industry.

Smugglers evaded the law by transporting African slaves to Spanish colonies where they were traded for sugar and molasses. These goods were then sold to New England distillers. The smugglers used the profits to buy more African slaves, establishing one of many

triangular trade routes that proved lucrative in colonial times.

In 1764 British Parliament passed the Sugar Act to replace the Molasses Act of 1733. The legislation cut by half the per-gallon duty on sugar and molasses imported into British colonies from non-British islands in the West Indies. The Sugar Act also provided for British customs officials to be sent to America where they would work with colonial governors to enforce the law.

MOLLY MAGUIRES

In 1854 Irish American coal miners in eastern Pennsylvania organized a secret society called the Molly Maguires to wage a campaign of violence against mine owners and operators. The name of the group came from a society in Ireland that used physical force to fight ruthless landlords. The miners were determined to defeat their oppressors at all costs. Their numbers grew and in the decade following the American Civil War (1861–1865) the Molly Maguires were active both as agitators and assassins. In 1875 the group incited a coal miners strike. The strike was broken by the detective work of Irish American James McParlan (1844–1919). McParlan was a Pinkerton guard hired by Philadelphia and Reading Coal and Iron Company to infiltrate the Molly Maguires. He revealed the identities of gunmen responsible for the deaths of nine mine company foremen. Several members of the secret society were arrested, tried, and convicted in 1876. They were hanged for their crimes in 1877.

U.S. sympathies for the plight of the miners were diminished by the headlines proclaiming the terrorist activities of the Molly Maguires. The society dissolved by 1877. Their presence however was long felt in the anthracite coal fields of Pennsylvania, where company police monitored activities in the mines and effectively intimidated many miners from organizing.

MONETARY THEORY

Monetary theory holds that a government can manage the level of economic activity by controlling interest rates and the amount of money in circulation. In general, pumping more money into the economy leads to more buying and selling; shrinking the money

supply leads to less economic activity, possibly even a recession. A tight monetary policy is one that involves higher interest rates and limits the amount of new money going into circulation. An easy or loose monetary policy involves lower interest rates and more money entering circulation. The government agency responsible for the money supply in the United States is the Federal Reserve Board. The Federal Reserve tries to regulate the nation's economic activity by closely watching over the money supply. It has the power to raise or lower interest rates and to control the money supply. Lowering interest rates tends to stimulate the economy; raising interest rates tend to dampen economic activity. Economists often debate the merits of monetary policy. There is no question that too tight a monetary policy can cause an economy to falter. Some historians say the Great Depression (1929–1939), the worldwide economic crisis of the 1930s, was worsened by the government's tight monetary policy of the era. But too loose a monetary policy can also create problems by leading to inflation.

MONEY

As trade and economies increased, barter—the exchange of goods or services in return for other goods or services—was replaced by money. Money is a convenient social invention used to facilitate the exchange of goods and services. Contemporary money takes the form of paper or coins made from durable metals such as nickel, copper, silver, or gold. The first uses of money, however, took a slightly different form. Early items used as money include shells, stones, cattle, and cigarettes.

What is accepted as money from one time to another may vary according to what the society accepts as its medium of exchange. Ancient agricultural societies may have placed more value in cattle than copper, and thus cattle could become accepted as payment for goods or services. Most modern societies use paper and metal coins as their medium of exchange. At the birth of the United States, when the new nation was governed under the Articles of Confederation, the issuing and printing of money was not centrally controlled. Each state printed its own money and there was no guarantee that money from early Virginia would be accepted in Massachusetts. This created problems in the early republic as the states engaged in interstate commerce. The production of money in the United States was eventually centralized under the federal government.

Internationally, nations use different monetary currencies. As in the early days of the United States, the different currencies affect trade. Rather than convert the world to one monetary system exchange rates are established, for example, to convert U.S. dollars to British pounds. This allows nations engaged in international trade to easily purchase goods and services worldwide.

WHAT IS ACCEPTED AS MONEY FROM ONE TIME TO ANOTHER MAY VARY ACCORDING TO WHAT THE SOCIETY ACCEPTS AS ITS MEDIUM OF EXCHANGE.

At the end of the twentieth century money was not just paper and coin. Money was plastic and consumers could charge items to a credit account, which they then paid for through another form of money, a check. In addition, the advent of computers and electronic communication allowed banks to begin electronic transfers of money, making it possible to move money from a bank account in Los Angeles, California, to a bank account in Zurich, Switzerland, within a matter of hours—all without the hand-to-hand exchange of paper or coin.

MONEY SUPPLY

Money supply is the total quantity or volume of money circulating in the economy. Some economists define it narrowly as the total value of coins, paper currency, traveler's checks, and checking account balances at any given time. This definition of the money supply is called "M1." The broader definition of money supply, "M2," adds savings accounts and money market mutual funds. Money supply can also be defined as "M3," which combines M1 and M2 and adds other types of savings deposits and money market funds. At the end of 1998 the total amount of M2 in the United States economy was about \$4.4 trillion, while M3 was at \$6 trillion.

At about the same time as the United States was being founded, economists were discovering that an economy's money supply had a direct effect on prices and economic growth. The Coinage Act of 1792 defined the value of the U.S. dollar in terms of silver and gold, but after major gold discoveries in the 1830s and in 1849 gold began to replace silver as the standard by which the dollar was defined. The first and second

Banks of the United States (1791–1811 and 1816–1836, respectively) tried to control the money supply by making sure that U.S. banks had enough gold on hand to back up the paper bills that they printed and issued. The money supply, however, grew enormously during the American Civil War (1861–1865), when the government began printing "greenbacks" that weren't backed up by gold or silver. By 1879 the dollar was back on the gold standard, and when world gold supplies increased between 1897 and 1914, so did the U.S. money supply.

When the Federal Reserve was created in 1913 it was given the power to control the money supply by increasing or shrinking the amount of currency circulating in the economy. Despite this power, in the early 1930s the Federal Reserve failed to increase the money supply enough to keep the economy from contracting. The resulting Great Depression (1929–1939) led economists who supported the Keynesian economic theory to reject the traditional idea that an economy's health depended on how the money supply was managed. They instead believed that economic growth had to be managed through fiscal policies such as taxation and government spending.

The combined inflation and recession of the 1970s (called "stagflation") convinced a new generation of economists that ineffective government attempts to "fine-tune" the economy through fiscal policy and inconsistent changes in the money supply did not work. Because of these new economic theories in the 1980s, the Federal Reserve began to change the way it reacted to inflation. When inflation rose one percent, the Federal Reserve would raise interest rates 1.5 percent rather than the less aggressive 0.75 percent it would have applied in earlier years. This bolder approach to controlling the money supply was much more effective in controlling inflation. As a result, even though the economy boomed from 1982 through the 1990s inflation remained mild.

MONOPOLIES (ISSUE)

The American Civil War (1861–1865) made it possible for men of varying degrees of ability to become wealthy overnight. During the postwar decades these new fortunes were used for the exploitation of natural resources and for industrial development. Men such as Andrew Carnegie (1835–1919) and John

D. Rockefeller (1839–1937) became folk heroes, although in Rockefeller's case, there were also many who feared and despised him. Few laws regulated competition and few taxes were levied on their profits. In time some of these men exerted considerable influence on their state legislatures and on their senators. Even the philosophy of the age was tailored to their needs. Social Darwinism applied the biological concept of survival of the fittest to human society and decreed the successful businessman the fittest of all. Eventually, the Progressive movement confronted some of the more unsavory practices of the business elite and the corrupt politics of the time. The first faint indication that a change in conditions might be close at hand came in 1887 with the passage of the Interstate Commerce Act followed a few years later by the Sherman Antitrust Act in 1890.

Even in a period when business predominated there were certain activities that alarmed the public. The financial manipulations of Rockefeller, for example, indirectly affected the lives of millions who came to fear his company while admiring his personal life. Rockefeller's Standard Oil Company was the first trust or monopoly. It effectively controlled the petroleum refining industry by 1879. Other large combinations followed suit, so that by 1890 large companies controlled the production of such products as whiskey, sugar, and lead, and dominated the nation's railroads. The combinations used their size to exploit markets to the fullest.

In 1889 Kansas became the first state to enact antitrust legislation and the regulatory effort spread across the South and West. Within a year at least 14 other states and territories had enacted similar laws. Pressure mounted for the federal government to take action since individual states were powerless in dealing with the greatest offenders, the trusts and monopolies which were interstate in scope. Both major political parties incorporated antitrust planks in their platforms for 1888, but neither rushed to submit appropriate legislation at the next congressional session. Many Senators may have preferred to ignore the matter, but they were forced to act because of the public clamor and the gentle prodding of President Benjamin Harrison (1889–1893). The result was the passage of the Sherman Antitrust Act in 1890.

The Sherman Antitrust Act had deficiencies that were becoming evident at the turn of the century. One major problem was that the act did not define what a trust or monopoly was. The lack of such a definition left the interpretation of the law up to the judicial branch of the government, and the result was confusion and contradictory court cases. Moreover violation of

the Sherman Antitrust Act was only considered a misdemeanor, an offense for which punishment was not serious enough to deter those who saw their interests served by monopolies.

With the accession of Theodore Roosevelt (1933–1945) into the presidency the antitrust movement gained momentum, even though Roosevelt believed it was important to distinguish between good trusts and bad trusts. To Roosevelt good trusts benefited the public with their infusion of capital and products into the economy, while bad trusts consisted of greedy financiers interested only in profits at the general public's expense. Early in his presidency Roosevelt realized that the monopoly situation had reached a critical point and that something had to be done. In 1902 Roosevelt's administration brought suit against the giants of the railroad industry and the "Beef Trust."

The Supreme Court ordered dissolution of the Morgan-Hill-Harriman railroad holding company in the Northern Securities Case (1904), and in the case of Swift and Company vs. United States (1905), the Supreme Court enjoined the "Beef Trust" from engaging in collusive price fixing activities. In 1906 and 1907 Roosevelt had the Justice Department bring suit against the American Tobacco Company, the E.I. Du Pont Chemical Corporation, the New Haven Railroad, and the Standard Oil Company. The Supreme Court ordered the dissolution of the American Tobacco (1910) and Standard Oil (1911) companies. Between 1890 and 1905 the Department of Justice brought 24 antitrust suits while the Roosevelt administration brought suit against 54 companies. The administration of President William Howard Taft (1909–1913) later prosecuted 90 antitrust cases.

Despite many successful prosecutions during his administration Roosevelt realized that the trust problem would not be resolved by judicial review and that a more organized approach was needed. To regulate business Roosevelt specifically advocated a commission similar to the Interstate Commerce Commission, one that had jurisdiction over all businesses engaging in interstate commerce, not just railroads. Big business interpreted this additional governmental regulation as borderline socialism and in response argued for laissez-faire policies. Realizing that big business would invoke any means necessary to avoid regulation, Roosevelt maintained that his idea was not meant to "strangle" business but only regulate trusts, and that legitimate businesses need not be concerned. Roosevelt's proposal was partially implemented in 1913 when the Departments of Commerce and Labor were separated. On October 15, 1914, Congress passed and President Woodrow Wilson (1913–1921) signed the Clayton

Antitrust Act which was designed to strengthen the Sherman Antitrust Act of 1890 by fully codifying specific illegal antitrust activities. The Clayton Act forbade a corporation from purchasing stock in a competitive firm, outlawed contracts based on the condition that the purchaser would do no business with the seller's competitors, and made interlocking stockholdings and directorates illegal. It also contained provisions designed to make corporate officers personally responsible for antitrust violations. The Clayton Act also declared that labor unions were not conspiracies in restraint of trade, thus exempting them from provisions of the bill. This pleased Samuel Gompers, the head of the American Federation of Labor (AFL) so much that he called it "labor's Magna Carta." To carry out and enforce the Clayton Act and the Sherman Act, Congress created the Federal Trade Commission in a related measure.

The Clayton Act proved to be an enduring piece of legislation, and it has been strengthened a number of times since its passage. Just after its passage, however, the antitrust movement began to fade away. Late in 1914 Wilson stated that he believed federal regulation had gone far enough. The president viewed the Clayton Act as the concluding act in the antitrust movement.

The large corporations did not suffer as much from regulation as might be thought. In many ways, the regulatory authority that the government imposed on business made it more difficult for new companies to break into competition with the big companies. Thus, the main thing that they feared and that they formed monopolies to avoid—"ruinous competition"—was killed in its crib by the very regulation that was passed to put a collar on the monopolies.

Many historians have contended that although the antitrust movement reached a natural decline, World War I (1914–1918) further undermined it. War mobilization required coordinated efforts from the leaders of many industries. Economic concentration and collusive efforts were necessary and accepted for the war effort. Some economic historians contend that the Clayton Act actually promoted economic concentration. The Clayton Act clarified illegal actions, thereby helping to eliminate some monopolistic activities, but in so doing it allowed business combinations and trusts to engage in collusive activities not specifically prohibited. By codifying illegal behavior, some historians believe that Congress tacitly sanctioned other collusive activities designed to reduce chaotic competition and ensure stability. Large corporations such as General Motors and the Du Pont Chemical Company grew much larger just immediately after the Clayton Act and especially during the war effort.

Desire for further antitrust reform was rekindled when the Robinson-Patman Act of 1936 and the Miller-Tydings Act of 1937 both supplemented the Clayton Act by attempting to protect small business from wholesalers that practiced price discrimination and by establishing "fair trade" price floors on numerous items. In 1938, Congress created the Temporary National Economic Committee to hold hearings on the issue of antitrust. Attorney General Thurman Arnold reinvigorated federal antitrust prosecution. Arnold brought a number of antitrust suits, notably against General Electric and the Aluminum Company of America. Like the earlier antitrust effort of the Progressive Era, this campaign lost its strength and direction as a result of foreign policy concerns and economic mobilization for a war effort.

There were some important antitrust cases after World War II (1939–1945) as well. In 1945 the Aluminum Company of America was found to be in violation of the Sherman Antitrust Act. In 1948 the federal government forced a number of major U.S. film studios to divest themselves of studio-owned theaters. In 1961 the Supreme Court ordered the Du Pont Company to divest itself of its holdings in General Motors Company. In 1967 the Federal Communications Commission ordered the American Telephone and Telegraph Company (AT&T) to lower its rates. In 1982 after eight years of battling a private antitrust suit in federal court AT&T agreed to be broken up, and a number of rival long-distance communication companies came in to challenge AT&T's control over the market.

In 1950 the Celler-Kefauver Act extended the Clayton Act by tightening prohibitions on business mergers that lessen competition and lead to monopoly. In 1976 Congress passed the Hart-Scott-Rodino Act or Concentrated Industries Act. This was a mild reform law that attempted to strengthen provisions of existing antitrust laws. Monopolistic behavior clearly remained a factor of U.S. economic life while federal prosecution of anti-competitive mergers and acquisitions became rare.

Antitrust Act in 1914 and the Robinson-Patman Act in 1936. The Federal Trade Commission, established in 1914, regulates unfair methods of competition in interstate commerce.

Occasionally a privately owned service is deemed so essential by the U.S. government that it will be shielded from antitrust laws or it will be regulated by the government. These are called natural monopolies. In the United States these primarily include public utilities, such as gas, electricity, natural gas, and water. By 1998 competition was introduced into the electricity and natural gas market through deregulation.

MONOPOLY

Monopoly is a market or industry controlled entirely by one seller or firm that produces a product for which no close substitutes exist. The monopolist sets the price of its product and generally produces just enough to ensure plump profits. Although prices are normally higher than in a competitive market, monopolies are still disciplined by market forces. It does not benefit the monopolist to raise the price so high that no one can purchase it or to produce a product that is not in demand. A pure monopolist will examine the different prices and quantities it can sell in terms of the corresponding production costs incurred. Whatever price-quantity combination yields the highest profit will be chosen.

Very few cases in the American economy exist where a single seller enjoys full control of the supply of any one economic product. Few monopolies start off as such unless they own a copyright or patent. A business can become a monopoly by buying up the competition or driving competitors out of business. In addition, a monopoly may develop if production of a product requires specific skills.

The most common and effective barrier preventing monopolies is legal restriction. Nineteenth-century Americans considered competition essential for the democratic way of life. They looked to the legal system to block private accumulation of power or “trusts” which they perceived could threaten democratic government. In 1890 Congress passed the Sherman Antitrust Act “to protect trade and commerce against unlawful restraint and monopoly.” To strengthen and complement the 1890 act, Congress passed the Clayton

MONROE DOCTRINE

The Monroe Doctrine, the foundation for U.S. foreign policy in the western hemisphere throughout most of its history, was declared on December 2, 1823, by President James Monroe (1817–1825) in his annual message to Congress. In the first two decades of the nineteenth century the remarkable success of movements for independence in Spanish America set the foundation for the Doctrine. By the end of 1822 Spain was driven from its major colonies in North and South America by nationalist insurgencies. European powers now remained in control of only Belize, Bolivia, and the Guianas. But, fearing that European powers might move to restore Spain to its colonies, the Monroe administration felt compelled to issue a formal declaration regarding U.S. policy.

Four principles formed the Monroe Doctrine. The Americas were no longer to be considered objects for future colonization or control by any European power. The political systems of the European powers were alien to the United States and any attempt to export it to the Americas would be considered dangerous to American interests. The United States would not interfere with the existing colonies or dependencies of the European powers. Finally, the Monroe Doctrine reaffirmed that the United States would not take part in the wars of the European powers.

Great Britain earlier had prodded the Monroe administration to make a similar but joint declaration on preserving the independence of the new Latin American republics. Under the influence of John Quincy Adams (1767–1848), Monroe rejected the idea,

reasoning that the United States would then be cast as the junior partner of Britain, overshadowed by its vastly superior naval power. Furthermore, the motives of the United States diverged significantly from those of Britain. The British were intensely interested in expanding their already valuable trading links with independent Latin America—ties that would be jeopardized if Spain and its mercantilist policies were restored. Although Monroe was certainly aware of the commercial value of Latin America, he placed security and ideological considerations above economic interests when he framed his declaration.

Although the Monroe Doctrine declared unilateral U.S. protection over the entire Western Hemisphere, the United States did not have the military or economic muscle to support such an ambitious policy at that time. Not surprisingly the European powers ignored the Doctrine when it suited them. However, by the end of the American Civil War (1861–1865), the United States had considerable military and economic resources at its disposal. In the first major application of the Monroe Doctrine, U.S. forces massed in 1867 on the Rio Grande River to support U.S. demands that France abandon its puppet regime in Mexico, headed by the Hapsburg prince, Maximilian. France eventually complied, marking a significant victory for U.S. coercive diplomacy.

ALTHOUGH THE MONROE DOCTRINE DECLARED UNILATERAL U.S. PROTECTION OVER THE ENTIRE WESTERN HEMISPHERE, THE UNITED STATES DID NOT HAVE THE MILITARY OR ECONOMIC MUSCLE TO SUPPORT SUCH AN AMBITIOUS POLICY AT THAT TIME. NOT SURPRISINGLY THE EUROPEAN POWERS IGNORED THE DOCTRINE WHEN IT SUITED THEM.

The Maximilian affair demonstrated that the fortunes of the Monroe Doctrine were closely linked to the expansion of U.S. power. Indeed, as American industrial development and trading and investment ties with Latin America grew in the latter half of the nineteenth century, the United States became more willing not only to enforce the Monroe Doctrine, but also to add to its self-assumed rights and responsibilities. Latin America's subservience to the United States was amply demonstrated in 1904, when President Theodore Roosevelt (1901–1909) developed the Roosevelt Corollary to the Monroe Doctrine.

In the late nineteenth and early twentieth centuries political, economic, and social instability plagued much of Latin America. In these perilous conditions, durable

and enforceable economic transactions between Latin American and European parties often foundered. Latin American politicians frequently treated European investors capriciously, while European traders and bankers often cheated or exploited their Latin American customers. The European powers increasingly intervened to resolve disputes involving their nations, as when the dictator of Venezuela refused to honor debts owed to European citizens. In response, Germany and Britain blockaded Venezuelan ports and attacked Venezuelan harbor defenses and naval assets. Such incidents were the proximate cause of Roosevelt's decision to revise the Monroe Doctrine, although it is true that the American president was already disposed to expand American power whenever and wherever possible.

The Roosevelt Corollary, which was included in a message to Congress in December 1904, reiterated that the Monroe Doctrine forbade European intervention in Latin American affairs. However, Latin American states had to honor their obligations to foreign nationals and governments. Roosevelt declared that the United States would act as hemispheric policeman, forcing Latin American governments to put their economic houses in order and pay their debts, eliminating the need for European intervention. Over the next three decades, U.S. forces took control of the governments and customs houses of the Dominican Republic, Haiti, and most of Central America. Although this forceful intervention produced a measure of economic and political stability to the region, it aroused increased and intense resentment among the local populace, which viewed the Monroe Doctrine and the Roosevelt Corollary as pretexts for the pursuit of U.S. interests in the region.

The presidential administrations of Herbert Hoover (1929–1933) and Franklin Roosevelt (1933–1945) responded to brewing anti-U.S. nationalism. In 1930 the Hoover administration renounced the Roosevelt Corollary by declaring that the Monroe Doctrine did not justify U.S. intervention in the domestic affairs of Latin America, however turbulent they might be. For his part, Roosevelt withdrew American military forces from Central America and the Caribbean, replacing troops with the “Good Neighbor Policy.”

None of these new policies had an immediate and substantive impact on the U.S. tendency for unilateral intervention in Latin America. Rather, they marked a change in U.S. strategies and rhetoric. Thus when the Cold War began the United States moved to combat Soviet subversion in the region, both real and imagined. The United States sponsored a failed invasion of

Cuba (1960); engineered the overthrow of democratically elected governments in Guatemala (1954) and Chile (1973), and trained and armed counter-revolutionary forces in Nicaragua.

When the end Cold War and the collapse of the Soviet Union (1991) removed the strategic rationale for intervention, U.S. policy began to move away its long-standing commitment to unilateralism. As the U.S. contemplated armed intervention in Haiti in 1994 to restore democratic government, it sought formal authorization from the United Nations. This dramatic embrace of multilateralism reflected the increased efforts of the United States during the 1990s to pursue both its ideals and its interests through international institutions, both regional (the North American Free Trade Agreement) and global (the United Nations, the General Agreement on Trade and Tariffs, etc.) The question that remained unanswered at the beginning of the twenty-first century was whether the unilateralism of the Monroe Doctrine will revive—in whole or in part—if multilateralism failed to meet perceived American goals in Latin America.

MONROE, JAMES

James Monroe (1758–1831) came from a family of small planters in Westmoreland County, Virginia. He spent two years pursuing a classical education at William and Mary College (1774–1776) but left before graduation to fight in the American Revolution (1775–1783). He served as a lieutenant in the Third Virginia Regiment, and was wounded in the Battle of Harlem Heights (September 16, 1776). He fought again at White Plains (October 28, 1776), and suffered a serious wound in the battle of Trenton (December 26, 1776). There, General George Washington (1732–1799) promoted him to the rank of captain for ‘bravery under fire.’ After recuperating from his injuries he returned to fight in the battles of Brandywine and Germantown, Pennsylvania, in the fall of 1777 and again at Monmouth, New Jersey (June 1778). Because of an oversupply of officers he resigned his commission and returned to Virginia to serve in the lower house of the legislature.

In 1782 Monroe was elected to the Virginia House of Delegates and served as a member of the Continental Congress (1783–1786). He practiced law for a short time but, after the Constitution came into force in 1788, he won election to the U.S. Senate. There, Monroe became a persistent critic of President George Washington’s administration (1789–1797). He charged that the federalist leadership of Alexander Hamilton and George Washington was out to enrich commercial and financial interests and was insufficiently sympathetic to farmers. He accused the federalists of passing coercive legislation, such as the Alien and Sedition Acts. In this and in his unabashed support of the French Revolution he found agreement with Thomas Jefferson (1743–1826) and James Madison (1751–1836) and became a member of the Democratic Republican Party.

After the United States fought the British to a standstill in the War of 1812 (1812–1814), the country entered a period of relative tranquility. Monroe was elected fifth president of the United States in 1816 and presided for two terms, during what is now called ‘the era of good feelings.’ During this period, President James Monroe’s (1817–1825) diplomatically adept Secretary of State, John Quincy Adams, negotiated a number of treaties and agreements with other countries. The Convention of 1818 extended the northern border between the United States and British Canada along the forty-ninth parallel, from the Lake of the Woods in present day Minnesota to the Rocky Mountains in the west. Another important diplomatic accomplishment was the 1817 agreement between the United

States and British Canada to restrict the number of each nation's warships on the Great Lakes. This was called the Rush-Bagot Treaty.

The most reknown diplomatic initiative of the Monroe administration was also suggested by Secretary of State John Quincy Adams. This was the Monroe Doctrine. This declaration, which the president articulated in his annual address to Congress in December 1823, warned European nations to refrain from further colonizing, or exploiting instability which might develop in the new nations in the Western Hemisphere. American "rights and interests," according to the Monroe Doctrine, dictated that newly emerging countries in the Americas were not in the future to be interfered with by any European powers. In exchange for this freedom from European intervention in the Americas (both North and South), the United States promised to not become involved in the internal affairs of Europe. Given the relative weakness of the United States as a military power prior to the American Civil War (1861–1865), this was a promise that was easy to keep.

The Monroe Doctrine addressed not only the relationship between the United States and Europe, it also announced a special relationship between the United States and Latin America. The United States would oversee and protect Latin America against European and other foreign invaders. It would also pursue commerce and capital investment with the less developed nations of Latin and South America. The Monroe Doctrine was used as justification for a U.S. policy of military intervention in the "banana republics" of Central and South America. The United States often intervened when the leaderships of these countries appeared ready to become less accommodating to American foreign investment or military interests.

At the end of Monroe's last term of office, political factions emerged in a four-way presidential race which ended in the election of John Quincy Adams (1825–1829) as the sixth president of the United States. On the occasion of Monroe's death in 1831, Adams credited Monroe with stabilizing the nation.

Monroe died in 1831. He was a courageous soldier and a determined partisan of liberty (although, like his colleagues Madison and Jefferson, he did not extend this principle to freeing his slaves). Monroe is best known for the Monroe Doctrine and for other diplomatic expressions of the new nation's nationalism during his presidency.

MONTANA

Nicknames for Montana reflect the wonder and significance of the state's natural resources—the basis for its growth and prosperity. Familiar references such as "Big Sky" and the "Treasure State" come from appreciation for the state's expansive views and rich supply of minerals.

It is thought that the first white explorers to Montana were French traders and trappers from Canada who migrated in the 1700s. In 1803 when President Thomas Jefferson (1801–1809) orchestrated the Louisiana Purchase, the deal included land west of the Mississippi River which includes land now known as Montana. Jefferson sent the Lewis and Clark expedition to explore the new area and record their findings for the rest of the world.

In 1805 Meriwether Lewis and William Clark, along with French trapper Toussaint Charbonneau and his Shoshoni wife, Sacagawea, reached the Yellowstone River near the boundary of North Dakota. They traveled through present-day Idaho, Oregon, and Washington to the Pacific Ocean where they completed their mission. During the trip they encountered a handful of men who were hunting animals and trading furs with the Indians. Their expedition cleared the way for the first American trappers, traders, and settlers to find their way to Montana. In 1807 Manuel Lisa, a Spanish trader, formed the Missouri Fur Company and established the first trading post in Montana, and others rapidly followed. The Pacific Fur Company, the American Fur Company, and the Rocky Mountain Fur Company became important trading companies in the northwest.

State of Montana.

The fur trade dominated Montana’s economy until 1858, when gold was discovered in southwest Montana. By mid-1862, a rush of miners from the gold fields of California, Nevada, Colorado, and Idaho had migrated to the state. The biggest gold discovery was in Alder Gulch near Bannack in 1863. Miners flocked to the gulch, which led to the development of Virginia City and Nevada City. A contemporary newspaper wrote, “thousands of tenderfeet were wildly filing claims.” Alder Gulch gave up \$10 million worth of gold in one year. Other areas of Montana also proved to be rich in gold and with each gold discovery, a town instantly sprang up. The temporary gold boom brought the state’s first substantial white population and an increased demand for government. Bandits robbed and killed miners on the roads. When Montana became a territory in 1864 the legislature was better able to govern the area.

As more settlers migrated westward, they occupied land previously owned by the Indians. Between 1863 and 1876 many battles, most notably the Battle of

the Little Bighorn, or Custer’s Last Stand, took place. The bloody battles eventually brought about the surrender of several Indian tribes who were subsequently confined to reservations.

In 1864, gold was discovered in the hills around Butte and by 1875 silver was discovered there as well. The Travona Silver Mine was soon opened and Butte became known as “Silver City” for the next 10 years. In 1881 one of the richest copper mines was discovered in the hills of Butte—the place became known as “the richest hill on earth.” By the 1890s copper was the state’s most important mineral and Butte became the industrial center of Montana.

By 1866 the first Long Horn cattle were brought to Montana from Texas and by the mid-1870s sheep also grazed the countryside. In 1886, approximately 664,000 head of cattle and nearly a million sheep grazed Montana’s land. Between 1880 and 1909, the state prospered as construction of a railroad system helped open new markets for the livestock and mining industries.

The railroads also allowed farmers to migrate to Montana. Between 1900 and 1920 the population grew from 243,329 to 548,889. In 1889, after several attempts, Montana's bid for statehood was approved by Congress.

Farmers from all over the country as well as Germany and Scandinavia migrated to Montana in the early 1900s planting flax, oats and wheat. Land claims grew from one million acres in 1909 to 93 million acres in 1922. Farmers were able to get good prices for their wheat until a drought ravaged Montana's farm country in 1917. Many could not sustain their farms and left the state for more hospitable soil. In 1920 thousands of grasshoppers descended on the land eating any seeds or grass that were left. Periods of drought and rain over the next 10 years forced the farmers to diversify their crops to suit the climate and use farm machines which helped turn a profit once again.

As the Great Depression (1929–1939) hit the United States the demand for minerals and agricultural products waned. By 1935 mines were closing and farmers were losing their land as one-fourth of Montana residents received financial assistance from the government. However, President Franklin D. Roosevelt's New Deal began to put people back to work in Montana constructing dams and roads and extending power lines.

With the start of World War II (1939–1945), Montana's economy began to thrive again as copper was in demand for use in weapons systems. The government bought wheat and beef from Montana's farmers and ranchers to provide rations for the troops. After the war, Montanans began to move from farms to cities as businesses grew. In the 1950s as well successful oil wells were developed in eastern Montana.

In the 1970s Montana's petroleum and natural gas were in great demand as a fuel shortage spread across the country. As energy companies started strip mining for coal, environmentalists took action. The Montana Strip Mine Reclamation Act and the Utility Siting Act were passed in 1973, increasing the tax on coal by 30 percent. Half the money was used to restore the land and community by building roads and schools and reviving areas devastated by mining.

In the 1980s the state's economy took a plunge. Copper prices dropped drastically, forcing many of Montana's copper mines to close. At the same time, falling oil prices meant less revenue from petroleum while a drought devastated the farming industry. As

a result, Montanans began to leave the state looking elsewhere for better economic opportunities. Between 1985 and 1989, the population decreased by 20,000 people.

The 1990s saw an upswing in the demand for minerals and manufactured goods, which led to a turn around in the state's economy. In 1991 about 26 percent of Montanans worked for the government, the largest employer in the state. Petroleum accounted for half of the mining income as the oil, gas, and coal industries also experienced growth. Gold, silver, copper, lead, and zinc were produced in Montana. Other goods such as aluminum, gemstones, phosphate, limestone, gypsum chromite, barite, clay, sand, and gravel also generate revenue for Montana. As well farmland covered about 25 percent of the state, and wheat—the biggest crop in Montana—was exported to other countries. Revenue from livestock accounted for two-fifths of Montana's farm income. In 1996 per capita personal income was \$19,047 and in 1995, only about 15.3 percent of the population lived below the federal poverty level.

MONTGOMERY WARD AND CO.

Montgomery Ward and Co., Incorporated had its origins in the 1860s, when young Chicago native Aaron Montgomery Ward saw that he could undercut rural retailers by selling directly to farmers through mail orders and by delivering via the railroad. After a false start in October 1871, when the Great Chicago Fire destroyed his inventory, Ward and two partners sent out their first mailing in the spring of 1872. This was the world's first general merchandise mail-order catalog.

Montgomery Ward and Co.

Orders trickled in and Ward soon bought out his partners, who were discouraged by the slow pace of business. Late in 1872 he got a break. The Illinois Grange, a farmers' organization, named Ward its purchasing agent. This gave Ward access to Grange mailing lists and meetings, and greater credibility with farmers. He began titling Montgomery Ward price lists with the phrase Original Grange Supply House.

As the business grew Ward needed more capital and more help. Late in 1873 his brother-in-law, George Thorne, put five hundred dollars into the firm and became an equal partner. The two men made an effective team. While Ward had the inspiration for the business, George Thorne was a practical day-to-day manager.

Montgomery Ward's primary customers were farmers who needed new industrial tools and farming equipment that were expensive or hard to find outside of cities. In these early years, his best-selling product was the sewing machine, and the catalog was filled with pumps, feed cutters, cane mills, corn shellers, threshers, saws, grinders, and engines.

As postal rates fell Montgomery Ward stepped up advertising in newly popular magazines. Through publications such as the *Prairie Farmer* he told farmers to query him for catalogs with penny postcards. The spring catalog for 1874 had 32 pages. That fall it was expanded to 100 pages. By the end of 1874 sales topped \$100,000.

Increased sales of \$300,000 in 1875 allowed Montgomery Ward to increase service. A satisfaction-guaranteed-or-your-money-back policy was instituted in 1875, and the catalogs began rating merchandise as good, better, or best. Montgomery Ward also counseled customers to band together and split fixed freight costs.

During the 1880s competition in the form of major department stores began to enter the catalog field. Jordan Marsh and Co., John Wanamaker, Sears Roebuck and Company, and Carson, Pirie, Scott and Co. all began or resumed mail-order operations. However, Montgomery Ward was still the biggest and most popular. Its 240-page 1883 catalog listed 10,000 items. In 1884 Ward bought the *Farmer's Voice* weekly newspaper to use as an advertising vehicle. In 1886 William C. Thorne, George Thorne's eldest son, increased the size and circulation of the catalog, leading to a boom in orders. By 1888 Montgomery Ward's sales reached \$1.8 million. To cap off the decade Aaron Ward and George Thorne turned their partnership into a corporation in 1889.

In 1900 Montgomery Ward built a new office headquarters at Michigan Boulevard and Madison Street in Chicago. Sales that year were \$8.7 million, trailing behind Sears's \$10 million as competition between the two Chicago firms grew more intense.

The U.S. Postal Service's initiation of a parcel post system in 1913 gave mail-order business a boost. Montgomery Ward made \$3.4 million on 1915 sales of \$49 million as a boom period began. But in September 1920 a financial panic hit, and prices began to fall. Sales dropped to two-thirds of their 1919 level. Losses for 1920 totaled \$10 million.

By 1922 the economy rebounded. The retail market was beginning to displace the mail-order system as the automobile changed the way people in the United States shopped. Montgomery Ward somewhat belatedly entered the retail sector in 1926. That year the company opened its first freestanding retail store in Plymouth, Indiana. The success of this store and the continuing weakness of the mail-order sector led Montgomery Ward to announce that it would open stores in rural towns with populations of 10,000 to 15,000. Ward had 531 stores operating by the end of 1929, but the stock market crash in October of that year, followed by the Great Depression (1929–1939) curtailed further expansion plans and led to the closure of 147 poorly performing stores.

The early years of the Depression were difficult for Montgomery Ward but by 1934 the company turned the corner and returned to profitability. That year the company also began taking telephone orders. In 1939 Montgomery Ward made a public relations coup when a Ward copywriter wrote a booklet about a little red-nosed reindeer named Rudolph, which became a Christmas classic. The booklet was included in millions of catalogs.

From the 1950s onward Montgomery Ward was in an almost constant struggle for survival. By the mid-1950s Montgomery Ward had already fallen well behind Sears Roebuck, whose sales were three times greater. Traditional retailers such as Montgomery Ward and Sears Roebuck also saw competition grow fiercer with the entrance of discount chains such as Wal-Mart into the marketplace. Ownership of the flagging retailer eventually fell into the hands of Mobil Corporation in 1976. Twelve years later, however, the largest management-led leveraged buyout in U.S. history at the time (\$3.8 billion) transformed Montgomery Ward into a privately held company. Declining profitability led the company to file for Chapter 11 bankruptcy protection in mid-1997 and placed its future in serious doubt.

J. P. Morgan.

MORGAN, JOHN PIERPONT

John Pierpont Morgan (1837–1913) was probably the most important and powerful business investment banker in U.S. history. Morgan played a major role in the rescue of the U.S. government in 1893 and 1907, when the United States experienced major economic downturns. However, Morgan's most enduring achievement was probably the crucial role he played in the creation of the United States Steel Corporation.

Morgan was the son of international banker Junius Morgan. He graduated from the famous English High School in Boston and then studied for two years at the University of Gottingen, Germany. He later graduated from Harvard University.

In many ways John walked in his father's footsteps, succeeding his father in most of the senior Morgan's business enterprises. Like his father Morgan made large gifts to educational institutions and to the arts. He became a great collector of art and books, and later in life donated many of his valuable art collections to U.S. libraries and museums. He also was famous as a yachtsman, defending the America's Cup in international yacht races on several occasions.

John entered his father's banking house, The George Peabody Co., in London. A year later his father secured

a position for him in New York with Duncan, Sherman and Co., the U.S. agents for the George Peabody firm. Then, at the age of 23, Morgan founded his own company, the J. Pierpont Morgan and Co., to serve as a special agent for the London Peabody Company. And by age 26 Morgan became a member of a firm struggling for financial control of the Albany and Susquehanna Railroad. After his success in this enterprise Morgan grew significantly in personal status within the banking community. He became known as a voice for stabilization in an age noted for its wild and fiery business sectors.

Morgan's motive was to guarantee high profits by stunting competition. His first major effort to create business monopolies during this time was his financial supervision of the reorganization of the railroad industry on the East Coast of the United States. This effort was often dubbed "Morganization." By the beginning of the 20th century Morgan made U.S. railways into a vast inter-related empire.

Morgan financed General Electric and consolidated the railroad industry. Toward the end of his career he negotiated with Carnegie Steel in his greatest economic achievement, the creation of the world's largest steel company, United States Steel. It was the first billion-dollar corporation in the United States.

Though the steel industry became the backbone of business growth in the 20th century its growth did not come easily. Internal conflicts emerged between individual steel manufacturers, and the ups and downs of the U.S. economy almost crushed the industry. In 1911 the presidential administration of William Howard Taft (1909–1913) filed suit against U.S. Steel for possible monopoly practices and illegal business manipulation. Federal committee investigations in 1912 revealed that Morgan's partners held 72 directorships in 47 major corporations in the United States. This may have been admirable as a business achievement, but it was also illegal.

Morgan was one of the few truly vital people of his time. He brought together the financial economics of Europe and the United States. He linked those who had money with those who needed it for the enormous industrial development of the United States that began during the middle of the 19th century. As a result of having so much power and money, he was frequently seen as either a force of great good or the source of great evil in the business world. A few months after his appearance as a defendant in the federal business trial, J. P. Morgan died in Rome, Italy, a broken revolutionary force in U.S. industry.

MORITA, AKIO

Akio Morita (1921–), as a co-founder and later chairman of the Sony Corporation, gave to the general public a revolutionary array of inventive electronic products during the last half of the twentieth century. Worldwide, he introduced consumers to products like

the hand-held transistor radio, the video cassette recorder (VCR), the Walkman portable cassette player, and the Diskman portable CD disk player. He not only became one of the most influential businessmen in the world, he also helped to establish Japan's reputation after World War II (1939–1945) as a source for high quality, innovative, and reliable products.

Morita was born in 1921, the first son of Kyusaemon and Shuko Morita, in the small Japanese village of Kosugaya. If Morita had followed in the traditional family occupation of his father and his ancestors, he would have been the fifteenth generation heir to his family's 300 year-old *sake* brewing business, manufacturing an alcoholic beverage made from fermented rice and widely used by the Japanese.

The young Morita, however, was not interested in the family business. He instead developed a passion for improving electronics and sound reproduction. Presumably he was influenced early in his life by his mother's love for Western classical music, which she imported into the household with American-made RCA Victrola records. Recordings were then made out of heavy, clumsy, and easily-broken 12-inch diameter discs, imprinted with fine grooves that had to be tracked by a tiny needle as the discs revolved at 78 revolutions per minute. The sound quality was crude, and the music was often mixed with the sounds of scratches which inevitably accumulated on the discs after use.

Morita became so interested in new electronics, and with improving the qualities of sound, that he almost flunked out of school because of his disinterest in anything other than electronics. His family convinced him to persist in his studies, and he later entered the prestigious Eighth Higher School as a physics major.

Rather than be drafted into World War II (1939–1945), Morita entered Osaka Imperial University, agreeing to serve in the navy after graduation. In 1944 he was commissioned as a lieutenant in the engineering corps of the Japanese Imperial Navy. He worked on projects involving guided weapons and night-vision gun sights. There he met with Masura Ibuka, a brilliant electronics engineer 13 years his senior. They became best friends and together eventually co-founded Sony Corporation.

After World War II, Morita and Ibuka created the Tokyo Telecommunications Engineering Corporation with only \$500. Begun with 20 employees and a shared rented office in a burned-out Tokyo department store, the company made electronic equipment—amplifiers,

voltage-measuring devices, and communication devices—for the Japanese Post Office. It was the beginning of an electronics revolution, and an electronics empire.

The business grew slowly, but in 1953, Morita decided to buy the rights to the transistor, a miniature electronics circuit that had been developed by the American company Bell Laboratories. The patent was owned by another American company, Western Electric. At that time, transistors were thought to be impractical for most consumer products, except for use in hearing aids. Morita's purchase of the patent would prove to be the basis for a revolution in modern consumer electronics. With this patent, Morita and Ibuka began to use the transistor in ways that transformed the world of electronics, sound, and television. Within two years, the partners created for commercial consumer use the AM transistor radio. In another two years, they began to produce the pocket-sized transistor radio, the AM-FM transistor radio, the first all-transistor television set, the all-transistor video tape recorder, and the small-screen portable battery-operated television set.

In 1958 Morita changed his company's name to Sony Corporation, because it was easy to pronounce, and Morita himself moved to New York City to set up an office for United States operations. Sony became the first foreign-owned business to offer stock for sale in the United States; in 1970, Sony became the first Japanese company to be listed on the New York Stock Exchange.

During the 1960s and 1970s the Sony Corporation continued to introduce to the public several new transistorized inventions: the first inexpensively priced home video recorder, the color video tape recorder, video tape for color video recording, and the first battery-operated portable video recorder and camera. All of these inventions came to the marketplace produced with extremely high quality. Morita's business helped change the reputation of Japanese businesses for making cheap, poor-quality consumer items. The Sony brand name stood for the creation of transistorized innovations of all kinds, for high quality, and for reliable consumer products. Morita felt he had, among other things, taken the shame out of the label "Made in Japan."

Morita had indeed realized his childhood dream to improve the quality of sound reproduction. The use of CD digital technology eliminated the old-fashioned records his mother used and replaced the scratchy-sounding vinyl discs with a CD technology that reproduced sound almost flawlessly. The Sony Corporation,

with Morita's genius for innovation and selling, created an entirely new electronics environment during the last half of the twentieth century.

During the 1980s and early 1990s, Morita wrote two books dealing with careers in business and international business trade: *Made in Japan* (1986) and *The Japan That Can Say No* (1991). In 1994, Morita retired from the Sony Corporation at age 73, after suffering a debilitating stroke which had confined him to a wheel chair.

MORRIS, ROBERT

Robert Morris (1734–1806), possibly America's wealthiest man in the earliest years of the Republic, died penniless and in disgrace. Known as the "financier of the American Revolution," Morris played a role in the highest circles of the new American government, but he spent three years near the end of his life in debtor's prison.

Born in Liverpool, England, on January 31, 1734, Morris emigrated to the American colonies at age twelve. His father, a British tobacco merchant and a part-time resident of Maryland, died from a cannon misfire in a shipboard accident, leaving his son, a teenager, with a small estate.

Morris came under the care of a Philadelphia merchant, Charles Willing. When he also died, Morris and Willing's son, Thomas, formed Willing, Morris and Company, a trading company with three ships and contacts in Spain, Portugal and the West Indies. In the years immediately preceding the American Revolution (1775–1783), the firm traded wheat, flour, tobacco, and other products in a triangular route between Europe, the West Indies, and America.

Through Willing, Morris, and Company, Morris became one of the wealthiest men—if not *the* wealthiest man—in the American colonies. He did not immediately support the revolutionary cause against the British, though he had opposed Britain's levying of additional taxes under the Stamp Act of 1765 and had signed the Non-Importation Agreement opposing it. In June 1774 he became a member of the Pennsylvania Committee of Safety and a delegate to the Continental Congress, where he was named a member of the Select Committee on Trade. Hoping that a way would be found to avoid war with Britain, he did not sign the Declaration of Independence immediately but waited until several weeks after the historic document had been adopted.

KNOWN AS THE “FINANCIER OF THE AMERICAN REVOLUTION,” MORRIS PLAYED A ROLE IN THE HIGHEST CIRCLES OF THE NEW AMERICAN GOVERNMENT, BUT HE SPENT THREE YEARS NEAR THE END OF HIS LIFE IN DEBTOR'S PRISON.

In his capacity as chairman or member of several trade-related congressional committees, Morris was in charge of provisioning the Revolutionary Army. He blatantly used the office to his own advantage, selling to the new government material from companies he formed himself. Morris stayed on in Philadelphia when the war forced the Congress to vacate the city in December of 1776 and, during that time, acted with some courage in his role as the army's provisioner. He became banker for the Committee of Commerce in 1777, signed the Articles of Confederation as a Pennsylvania delegate the next year, and became chairman of the Congressional Committee on Finance. Morris left the Continental Congress in November of 1778 to attend to his private business affairs but remained in the Pennsylvania Assembly.

As a member of the Continental Congress, Morris became even wealthier. He used inside information and his network of international connections to profit himself. As a key part of his income, he maintained a very lucrative privateering operation: a state-sanctioned commercial venture wherein pirates seized the ships of enemies. Between 1775 and 1777, the Secret Committees on Trade and Commerce, headed by Morris, spent \$3.3 million. Of this amount Morris and his associates pocketed \$846,000.

Yet, historians differ about whether Morris was a scoundrel or a hero. In 1781 George Washington (1732–1799) urged Morris to reenter the national government as superintendent of finance. The war was still

underway and the new nation's money was virtually worthless, but Morris had the nation operating on a hard-money basis before the end of the war, a formidable accomplishment. Funds that Morris was able to borrow from France, supplemented with money from his own pocket, made it possible for Washington to move his armies from New York to Yorktown, where the British general, Cornwallis, surrendered.

Morris resigned his position as superintendent of finance when the states refused to agree to his taxation policy and blocked the national financial system he advocated. He turned his attention to land speculation and such ventures as turnpikes, iron works, and trade with China. Acting on credit, he bought huge sections of western New York and Virginia. He spent \$1 million on the first stage of building an ostentatious mansion in Philadelphia. Suddenly, the bottom fell out of the land speculation business. Many individual investors and land companies failed. Morris, whose fortune was vastly overextended, was never able to recover. He was confined in debtors prison for three years until his release in 1801 and died, five years later, still destitute.

MORSE, SAMUEL FINLEY BREESE

Samuel F. B. Morse (1791–1872) is best known as the inventor of the telegraph and the code used to

Samuel Morse with his telegraph.

transmit messages on it. On May 24, 1844, he sent the very first telegraph message—“What hath God wrought?” His invention revolutionized communications, making it possible to transmit messages across long distances with almost no delay. The telegraph facilitated westward expansion and the development of industry across the continent and it helped to forge a sense of unity in a young nation.

Samuel Finley Breese Morse was born in Charlestown, Massachusetts, on April 27, 1791, to Jedidiah Morse, a clergyman, and his wife, Elizabeth Breese Morse. The oldest of three boys, he grew up being called “Finley.” Morse’s grandfather had been president of Princeton College and his father was known throughout New England as a fervent Calvinist preacher.

At age seven Morse was enrolled at Phillips Academy in Andover, Massachusetts. Like his father before him, he went on to attend Yale College. While there, he began painting miniatures on ivory. He enjoyed it so much that he considered pursuing a career in art. But his parents were very religious and did not approve. Thus, after graduating from Yale in 1810, Morse found a job in a bookstore in his native Charlestown.

Morse continued to paint, however, and eventually his work came to the attention of two of the country’s most respected artists, Gilbert Stuart and Washington Allston. Impressed by the admiration of his son’s work, Jedidiah Morse finally allowed the young

man to accompany Allston on a trip to England to study painting at the Royal Academy in London. Samuel Morse returned to the United States in 1815 with dreams of painting grand murals of heroic scenes. But there was no market for that kind of art at the time, so Morse had to settle for a career as a portrait painter, in which he enjoyed a fair amount of success. Of all his works, two in particular stand out. Both are portraits of France’s Marquis de Lafayette that were painted in 1825 in Washington, DC. In 1826 Morse helped establish the National Academy of the Arts of Design, an organization aimed at helping artists obtain commissions and at improving the public’s taste in art. He served as its first president from its founding until 1842.

Having garnered a fair share of praise and recognition by the early 1820s, Morse settled in New York City and married a young woman named Lucretia Walker. But tragedy struck in quick succession. He lost his wife in 1825, his father in 1826 and his mother in 1828. Grief over their deaths ultimately propelled him in a new direction.

To aid in his recovery from a profound state of grief, he sailed to England in 1829 for an extended stay in Europe. During his return voyage to the United States in 1832, he became acquainted with an eccentric inventor named Charles Thomas Jackson. The two men passed the time aboard ship discussing Jackson’s ideas regarding electromagnetism, a subject Morse had first heard about while a student at Yale.

WHAT HATH GOD WROUGHT?

Samuel Morse’s first telegraph message, May 24, 1844

According to Jackson, electrical impulses could be carried great distances along wires. Morse reasoned that if this were true, “and the presence of electricity can be made visible in any desired part of the circuit, I see no reason why intelligence might not be instantaneously transmitted by electricity to any distance.” He soon began sketching plans for a device that might be able to perform such a task.

Upon his return to the United States, Morse resumed his painting career and began teaching painting and sculpture at the University of the City of New York. However, he continued to mull over the question of how to send and receive electromagnetic signals by wire. Not only did he need to come up with an appropriate transmitter and receiver, he also had to devise the code that would enable users to create and then decipher messages. He invented a system in which

the long and short impulses could stand for letters and numbers.

Morse worked on his invention for a number of years without making much progress. Part of his problem stemmed from the fact that he was not a scientist and did not have the skill to implement his ideas. But then he met two men at the University of the City of New York who helped him tremendously. Leonard Gale, a chemistry professor, showed Morse how he could improve the electromagnet and battery for the working model of his telegraph. Gale's friend, Joseph Henry, offered additional assistance in the area of electromagnetism. Morse also received valuable help from Alfred Vail, whom he took on as a partner in 1837. Vail suggested several practical refinements to the telegraph device itself as well as to the code it used to transmit and receive messages.

In order to minimize the number of transmission lines per message, Morse had invented a code consisting of combinations of dots and dashes, each representing a single letter, number, or punctuation mark. A visit to a typesetting shop had helped him determine which letters were used most often, and to these he assigned the simplest code symbols. Complex codes were reserved for little-used characters. This marked the development of what would come to be known as Morse Code, the universal standard for communicating by telegraph.

Morse, who had abandoned his art career at this point, was aware that European inventors were also working on a telegraph device, and he was anxious to establish himself at the head of the line. By 1837 he was ready to conduct a public demonstration. Appearing before a select audience at New York University on September 2 of that year, Morse successfully presented his telegraph device. He then contacted federal government officials and suggested that further development work be supervised by the Post Office. But nothing came of his recommendation.

That same year Morse and Vail applied for a patent for the telegraph in both the United States and England. Morse also approached Congress for a grant to fund the construction of an experimental line from Washington, DC, to Baltimore. The American patent was approved in 1840 (the English one was rejected because a similar device had been introduced there earlier), but Morse could not convince Congress to appropriate any money for a telegraph line.

After a few years of frustration, Morse finally obtained a federal grant of \$30,000 to lay a telegraph

line from Washington to Baltimore. On May 24, 1844, he tapped out the first message, "What hath God wrought?" and thus launched a new era in communications. Morse then tried to interest the government in buying the rights to the telegraph for \$100,000, but Congress opted to leave it up to the private sector to finance and develop a system.

Morse and several partners formed the Magnetic Telegraph Company to lay telegraph lines themselves. Making money on the new technology proved difficult, however. According to Rosa Harris-Adler's article in *Canadian Geographic*, the company made only one cent in revenue during its first four days of operation and only \$193.56 during the first three months. Operating expenses for this same period were \$1,859.05.

Additional problems soon surfaced. Morse faced prolonged litigation over his patent rights as Charles Jackson and other scientists who had given the inventor advice demanded the recognition they felt they deserved. Neither side came out looking very good in court. While Morse stubbornly refused to give credit to the many people who had indeed contributed in some way to the development of the telegraph, a few scientists were strictly out to profit from his years of hard work. In 1854 the U.S. Supreme Court upheld Morse's patent rights.

Competitors were also quick to exploit the potential of the new invention. They soon began to establish rival telegraph companies throughout the country. Eventually, several small companies merged into the Western Union Corporation, which finally was able to make a profit on the telegraph. Morse's own company did not stand much of a chance in the face of such a rival, so in 1866 the Magnetic Telegraph Company also merged with Western Union.

In his later years Morse left the business world behind and turned his attention instead to politics and philanthropy. He even ran unsuccessfully for the United States Congress in 1854. His interest in scientific matters never waned, however, and in 1857 he teamed with Cyrus Field in a project to lay a transatlantic telegraph cable.

It is nearly impossible to determine the full extent to which the telegraph changed the way people lived. It was not so much because ordinary citizens made use of it on a regular basis; in fact, it was a rather expensive means of communication that mostly appealed to big business and government. But telegraph lines followed the westward expansion of the railroad across North America. They made it possible to communicate quickly

over vast distances and they linked far-flung settlements with population centers back east. This helped foster a stronger sense of national identity and underscored the need for more standardization and uniformity.

One significant consequence of the introduction of the telegraph was the creation of time zones in the United States and Canada. Before the invention of the telegraph, most cities kept their own time based on the position of the sun at noon. A standardized time schedule presented less confusion and less accidents.

Surveying and cartography also underwent some changes as a result of the introduction of the telegraph. Before the telegraph was invented, surveyors calculated longitude by chronometers that were shipped to key geographic points. Though chronometers were fairly accurate instruments at the time, the jostling involved in moving them could affect their precision by as much as 20 seconds a day. In 1849 astronomer William Bond of Boston invented a machine that attached chronometers to the telegraph. With this device astronomers could hit a telegraph key when they saw a star cross the meridian, passing the data along to other astronomers and thus improving longitude precision. As a result, maps showing boundaries and borders became more accurate.

By making distant communities feel less isolated from each other and the rest of the country, the telegraph also prompted greater political and social cohesion. People were better informed about what was happening at a national level and, consequently, they became more involved in influencing policy, mostly because they heard about events in a more timely fashion.

While the telegraph represented the first major breakthrough in mass communications technology, it was rapidly followed by the telephone (patented in 1876), television (first demonstrated in 1927), and eventually computers. Telecommunications has become a multi-billion-dollar global industry that connects people not only by telephone and television but also by cable, satellite, and the Internet.

Morse married for a second time in 1848 and had several children. He ran for Congress in 1854 but was not elected. Morse spent the last years of his life on his estate in Poughkeepsie, New York, surrounded by his large family. Many European nations honored him for his invention; in 1871 American telegraph operators erected a bronze statue of him in New York's Central Park. Morse was elected to the Hall of Fame in 1900, 28 years after his death.

MORTGAGE

The purchase price of a home is clearly more than what most individuals can pay with their available savings. Therefore they seek a home loan to finance the purchase. This home loan is called a mortgage. Home mortgage loans generally require a down payment of between five percent and 20 percent of the total purchase price. The remaining money needed for the purchase is the mortgage amount, usually borrowed from a lending institution. To purchase a \$125,000 home with a 20 percent down payment would require \$25,000 down and a \$100,000 mortgage loan. The borrower secures the mortgage with the real estate purchased. That is, the borrower promises to pay back the loan with interest; if she or he does not, the lender can foreclose or take possession of the house.

A mortgage loan is a long-term loan usually established for repayment in 15, 20, 25, or 30 years. Because the mortgage is over a long period of time, small changes in the interest rate (the percentage a borrower pays to a lender for using the funds) make a big difference in monthly payments and the total amount of payback. For example a typical 30-year \$100,000 mortgage would require monthly payments of \$878 at a fixed interest rate of 10 percent but only \$665 at seven percent. The total payback after 360 months (30 years) at 10 percent would be \$316,080. The total payback after 360 months at seven percent would be \$239,000.

Lenders basically offer three types of mortgages: fixed rate, variable rate, and graduated payment. For a fixed rate loan the interest and monthly payment remain the same for the length of the loan. For variable

Mound Builders

rate loans the interest rate varies annually according to the prevailing market rates, and monthly payments vary accordingly. The graduated payment option assumes young people generally have low incomes but high earning potential. The interest rate remains the same but monthly payments are adjusted to start out smaller and increase as earning increases.

Mortgage interest rates in the United States remained near five percent after World War II (1939–1945) into the 1950s. Rates began to rise in the 1960s, reaching 8.5 percent in 1970, 12 percent in 1980, and peaking in 1982 at 15 percent. As the national economy began to expand, rates dropped to 10 percent by 1991 and with continued expansion were quoted as low as 6.5 percent in 1998.

MOUND BUILDERS

Mound Builders were prehistoric American Indians, named for their practice of burying their dead in large mounds. Beginning about three thousand years ago, they built extensive earthworks from the Great Lakes down through the Mississippi River Valley and into the Gulf of Mexico region. These mounds, many of which survive today, consisted of several hundred tons of dirt, clay, and stone, and were built on a large scale in spite of the fact that the builders had no beasts of burden and did not use the wheel. The Adena people were one group of Mound Builders. They arose in the Ohio River Valley around 400 B.C. They were hunters and gatherers, and also fished. They settled in villages scattered over a wide area. The largest Adena mound is the Grave Creek Mound at Moundsville, West Virginia; it measures 900 feet (270 meters) in circumference and 70 feet (21 meters) in height. Scholars believe that as the Adena traded with other groups of American Indians, the practice of mound-building spread.

Other Mound Builders were the Hopewell and the Mississippian people. The Hopewell were hunters and gatherers but they also cultivated corn and squash. They settled in the Midwestern United States, where their burial mounds can still be found; the largest site is in Newark, Ohio. Objects such as shells, shark teeth, and volcanic glass discovered in the Hopewell earthworks reveal that they traded with distant tribes. This trade network collapsed about A.D. 500 and the Hopewell died out. The Mississippians, who settled in the Mississippi valley and in what is today the southern United States, were the only Mound Builders to have contact with the Europeans. Their culture

emerged about A.D. 700 and lasted into the 1700s. The Mississippians were farmers and raised livestock. In addition to their mounds, the largest of which is found at Cahokia, Illinois, they built cities, which were among the earliest in North America. Since many of their earthworks (c. 1200–1500) include temples atop the mounds, the Mississippians may have traded with the Indians of Mexico (such as the Aztec or Maya), and were influenced by them.

MOVIES

Movies (short for moving pictures) are also called motion pictures or films. They were introduced in the United States in 1896 at a New York screening made possible by American inventor Thomas Alva Edison's (1847–1931) kinetoscope. The kinetoscope was a device for viewing a sequence of pictures on an endless band of film using a projector invented by Thomas Armat. It was not until the early 1900s that the technology was used for entertainment.

In 1903 American director-photographer Edwin S. Porter (1870–1941) made *The Great Train Robbery*, the first motion picture to tell a complete story. (Porter had earlier worked as a cameraman with Edison.) Produced by Edison Studios, the twelve-minute “epic” established a pattern of suspense drama that was followed by subsequent moviemakers. The age of the silent film was launched.

BY 1930 MOVIE HOUSES WERE ATTRACTING 100 MILLION VIEWERS A WEEK AT A TIME WHEN THE TOTAL POPULATION OF THE UNITED STATES WAS ONLY 120 MILLION AND WEEKLY CHURCH ATTENDANCE WAS LESS THAN 60 MILLION.

The popularity of movies escalated during the 1920s. Innovations in movie-making technology broadened the audience. In 1927 the first full-length talking picture was released, *The Jazz Singer*, starring vaudevillian Al Jolson (1886–1950).

The ever-improving technology of motion pictures and the advent of radio combined to spell the demise of vaudeville during the 1930s. By 1930 movie houses were attracting 100 million viewers a week at a time when the total population of the United States was only 120 million and weekly church attendance was less than 60 million. By 1932 all movies were talkies,

This artist's rendering attempts to capture the lure of the silent movie theatre when the only sound accompaniment was an orchestra pit.

and by the end of the decade all movies used technicolor, a trademarked method for making motion pictures in color.

With a theater in almost every town people in the United States flocked to the "picture shows." Hollywood images provided an escape from everyday life. As measured in total capital investment, motion pictures became one of the nation's leading industries. Like sports, amusement parks, and radio programs, movies were meant to appeal to everyone.

An increase in leisure time and a willingness by U.S. audiences to spend money on entertainment guaranteed movie houses would be well attended. Entertainment was no longer a singular experience; Hollywood movies shown in theaters throughout the country provided entertainment for a mass consumer audience.

MUCKRAKERS

Muckrakers emerged on the U.S. journalism scene around the turn of the nineteenth century. They were

journalists who sought out and exposed the misconduct of prominent people or high profile organizations. As crusaders for social change, muckraking journalists wrote articles not about news events, but about injustices or abuses, and corruption in the world of business and politics. Their aim was to bring such information to the attention of the U.S. public.

Politician Theodore Roosevelt (1858–1919) was the first to call controversial journalists "muckrakers." [This was a reference to a character in the then well-known book *Pilgrim's Progress*, by English preacher John Bunyan (1628–1688).] A muckraker was a person who rejected a crown for a muckrake, a tool used to rake dung.

Magazines such as *McClure's*, *Cosmopolitan*, and *Everybody's* published articles revealing abuses of power or negligent practices. These included the use of tainted meat by the meat packing industry, prostitution rings, fraudulent insurance, and corruption among city politicians. Proponents of this progressive journalism included magazine editor Lincoln Steffens (1866–1936), whose collected articles in *McClure's* were published as the book *Shame of the Cities* (1904). Writer and social reformer Upton Sinclair (1878–1968) also incorporated pointed criticisms of business

Multi-National Enterprise

and government into such topical novels as *The Jungle* (1906), *The Money Changers* (1908), and *King Coal* (1917). Author Ida M. Tarbell (1857–1944) penned a *History of the Standard Oil Company* (1904) which was then a scathing indictment of the U.S. petroleum business.

While the muckrakers were derided in their own time, their work succeeded in raising widespread awareness of social, economic, and political ills. This prompted a number of reforms, including passage of pure food laws and anti-trust legislation.

MULTI-NATIONAL ENTERPRISE

A multi-national enterprise is typically a business corporation whose operations literally straddle the globe. An example is PepsiCo. PepsiCo does not ship its famous product around the world directly from the United States. Instead, it produces Pepsi Cola in over 600 plants in 148 countries around the world. A multi-national enterprise typically has substantial portions of its total wealth invested in production facilities outside of its country of origin. Because of the expanded activities of these corporations, international banks have grown, allowing the monies of international enterprises to pass quickly over national frontiers to take advantage of favorable interest rate changes in multi-national banking operations. A multi-national enterprise considers the entire world to be its potential market, not merely for shipping its home-produced goods, but a market within which it may actually manufacture its product.

By selling products to world markets a multi-national enterprise is able to profitably take advantage of different business situations in various countries such as lower wages, lower tax and tariff rates, less business regulation, and other business-friendly incentives. In this way, a multi-national enterprise is able to produce its products in countries where the wages are lower, and to sell their products in countries where people can often afford to pay higher prices for it. The multi-national enterprise meets the international demand for products, resulting in business profitability and consumer satisfaction at the same time.

The total assets of various U.S. multi-national companies. A U.S. multi-national enterprise owns production facilities and produces and sells products in countries outside the U.S.

MULTIPLIER

The multiplier is a conceptual tool used to capture the complicated process by which changes in spending affect a nation's income. It is based on the idea that a small change in spending can bring about a much larger change in income. Consider the following example as an illustration of how the multiplier works. Suppose an individual pays a gardener \$100 for a spring cleanup. The gardener saves \$10 of those \$100 but spends \$90 at the local hardware store for new tools. Of the \$90, the hardware storeowner saves nine dollars and spends \$81 on a golf club. The golf storeowner spends 90 percent of the \$81 (\$73) to take his family out to dinner. The \$100 that was originally spent was re-spent three more times and, in the process, was turned into \$344 of income to others. This process continues and ultimately \$100 of spending could lead to as much as \$1000 of income. In that case, the multiplier would be 10. The product of that computation is known as the multiplier effect.

The multiplier effect occurs throughout the economy on an immense scale. Suppose the economy is at less than full employment. Several large firms invest in new plants, workers are hired, new wages are paid, and new profits flow to the companies. The recipients of this income will save some income and spend a portion of it on goods and services. More income is thus

created for the suppliers of the goods and services. This process goes on *ad infinitum* and the total increase in national income ends up being many times larger than the initial investment.

The multiplier is a cornerstone of Keynesian economics, based on the theories of John Maynard Keynes (1883–1946). Developed at the time of the Great Depression (1929–1939), Keynesian economics deals with the need to stimulate aggregate, total demand to lower unemployment. The multiplier is used to estimate the impact new private investment, government spending, or tax cuts will have on national income.

The multiplier can work in both directions. For every dollar decrease in investment or spending, the level of national income will fall by much greater than one dollar. The Great Depression is an example of the multiplier in a downward cycle. By the late 1930s investment increased and the Depression ended with the mobilization of resources for World War II (1939–1945), which resulted in increased demand for goods and significant government spending. Thus, the multiplier works in a cumulative pattern, both expanding and contracting economic activity.

MUNN V. ILLINOIS (1877)

In *Munn v. Illinois* (1877) the U.S. Supreme Court upheld an Illinois law which regulated the owners of grain elevators, declaring that government interference was constitutional in areas “affected with a public interest” (*Munn vs. Illinois* 94 US 113). The Court created a confusing void, however, with a later decision in *Wabash, St. Louis and Pacific Railway Company v. Illinois* (1886). It declared state laws regulating interstate railroads were unconstitutional because they violated the Commerce Clause, which gives Congress exclusive regulatory power “with foreign nations, the several states, and with the Indian tribes” (Article I, Sec. 8). This decision eventually led to the establishment of the Interstate Commerce Commission in 1887.

Long before the creation of the federal regulatory body, the business practices of the railroads had given rise to a movement led by the National Grange. The Grange was a powerful association of farmers who protested railroad rate structures, citing them as discriminatory and unfair. They pressured state lawmakers into taking action. Midwestern legislatures yielded to the outcry, passing laws that established regulatory

commissions to monitor the practices of the railroads. In Illinois and Minnesota these commissions prohibited discrimination in rates and services, fixed maximum freight rates, and established standards of service. The bodies were also given the authority to enforce their standards.

When *Munn vs. Illinois* came before the Supreme Court in 1877, the issue of state regulation was raised. The Supreme Court upheld the power of the state to impose standards on businesses “clothed with a public interest.” This decision was often later cited in support of other Granger laws that were passed, primarily in Midwestern states, to curb unfair business practices of the railroads. Ultimately the states found it difficult to enforce their laws on carriers that moved between states. The creation of the Interstate Commerce Commission in 1887 resolved these problems, placing responsibility for the regulation of interstate business transportation firmly in the hands of the federal government.

MUTUAL FUND

A mutual fund is a large, diverse group of stocks and/or bonds in which an individual may invest. There are three basic types of mutual funds. Money market funds invest in certificates of deposit, U.S. Treasury bills, and other low-risk, short-term securities that provide a safe, low-return alternative to checking accounts. The medium-risk bond and income funds invest in both stocks and corporate and government debt, with the goal of invest exclusively in the stock of corporations. The higher risk equity fund invests in the stocks of corporations and comes in all shapes and sizes. Mutual funds are also classified as “closed-end” (a fixed number of shares are sold to the public) and “open-end” (shares are sold to as many people as want them).

Low, medium, and high risk mutual funds each have many options for investment. One class of higher-risk funds is the aggressive growth equity fund, which may be suitable for an individual looking for a quick return on an investment. A less risky kind of mutual fund, the index equity fund, takes the process of picking stocks out of the hands of mutual fund managers and instead invests in companies listed in such stock market indices as the Standard and Poor’s

Mutual Fund

Mutual funds pool the investor's funds into portfolios based upon the desired type of investment and level of risk. This popular form of investment provides Americans with an alternate way to put money into the stock market.

500. Sector equity funds specialize in specific segments of the economy, such as telecommunications, biotechnology, or Internet stocks. While many opportunities exist for domestic investment, an individual can also look to the foreign markets as a place to invest money. International equity funds focus on the stocks

of non-U.S. companies and may be region specific, such as an Asia or Latin America fund.

Mutual funds first appeared in Europe in the nineteenth century and were well established in the United States by 1900. Not until 1924, however, did the first modern open-end mutual fund appear—it boasted forty-five stocks and \$50,000 in assets. The stock market crash of 1929 soured an entire generation on stock investing, however, and it took new government safeguards and the post-World War II (1939–1945) economic boom to convince U.S. citizens to return to stock investing. In the 1940s there were only about 80 mutual funds with assets of \$500 million. In 1948 one of the first sector funds, Television Funds, Inc., was launched; it was followed in 1953 by the first international mutual fund. The number of funds edged up to 100 in the 1950s, but by 1952 still only one-quarter of one percent of the U.S. population owned stocks. The first aggressive growth mutual fund appeared in the 1960s, and in the 1970s money market funds and bond and income funds became more common. Fueled by the beginning of one of the longest bull markets in U.S. history in 1982, the number of funds grew fivefold in the 1980s. By the late 1990s, the nation's 6,700 mutual funds owned 22 percent of the entire U.S. stock market and held assets of more than \$4.5 trillion.

NABISCO FOODS GROUP

In 1898 decades of amalgamation in the biscuit industry culminated in the merging of the mid-western American Biscuit Company, the eastern New York Biscuit Company, and the United States Baking Company to form the National Biscuit Company (NBC). The merger, comprised one hundred and fourteen bakeries, and was capitalized at \$55 million. The Chicago-based National Biscuit Company launched by lawyer Adolphus Green held the monopoly on cookie and biscuit production in the United States.

Adolphus Green began the process of standardization of every company product that could be nationally identified with Nabisco. Exact recipes and uniform standards were developed and used by all of the NBC bakeries. Green also initiated novel and unusual packaging in special protective containers for crackers. He commissioned an advertising agency to assist in promoting the company's products with illustrations. One of the world's best-recognized illustrated trademarks showed a rosy-cheeked boy dressed in a raincoat and galoshes clutching a box of biscuits. As a pioneer in advertising NBC spent seven million dollars in the early 1900s promoting and marketing company products.

In the early years of the twentieth century NBC expanded its line of cookies and crackers. Introduced in 1902, Barnum's Animal Crackers were colorfully packaged in a box resembling a circus cage filled with animals. In 1912 the company introduced Lorna Doone and Oreo, the latter eventually becoming the world's best-selling cookie.

The 1920s were a very prosperous period for NBC. In 1925, with the addition of several new bakeries, the company established its first foreign subsidiary in Canada. NBC expanded its product line to include pretzels, breakfast cereal, and ice cream cones. Diversification came about through acquisitions of other companies, including the purchase of the Shredded

Wheat Company (in 1928) and the McLaren Consolidated Cone Company, the world's largest manufacturer of ice cream cones.

The depression years (1929–1939) slowed company growth until 1931 when NBC took over the Bennett Biscuit Company. NBC concentrated on Bennett's most popular product line, Milk-Bone Dog Biscuits. Advertising "a dog's dessert" and its breath-sweetening properties boosted NBC's sales. In 1934 Ritz Crackers was launched as a new prestige product and was a huge success. Throughout the 1930s the company relied heavily on radio advertisements to promote NBC's products. Partly to reduce confusion, NBC changed its official trademark company name to "Nabisco."

Nabisco experienced troubled times in the years immediately following World War II (1939–1945). Many of the company's bakeries were outdated and required drastic renovating. With the rise of an energetic George Coppers as president in 1945, inertia gave way to an expansive new attitude. Within ten years \$150 million had been spent on renovations to Nabisco's antiquated bakeries. In 1958 the renovation and reconstruction culminated in the grand opening of an ultra-modern bakery and research center in Fair Lawn, New Jersey. The 1950s also marked the beginning of Nabisco's expansion overseas. Forming a manufacturing partnership with La Favorita Bakery in Venezuela and the Formosa Bakery in Mexico gave Nabisco a foothold in South America.

With Lee S. Bickmore at the helm in 1960, Nabisco accelerated acquisitions and overseas expansion. In 1961 and 1962 Nabisco acquired the Cream of Wheat Corporation, the French firm Biscuits Gondolo, the English bakery Frears, and New Zealand's largest biscuit firm, Griffen and Sons. In 1963 and 1964 Nabisco acquired Oxford Biscuit Fabrik of Denmark, the James O. Welch Company, makers of Junior Mints and Sugar Babies, and one of West Germany's largest confectioneries, Harry Trueller. Overseas acquisitions continued and, by the end of the 1960s, Nabisco was

Nader, Ralph

the leading manufacturer of crackers and cookies in the United States, Canada, France, and Scandinavia. Nabisco was also a major supplier to other European and South American countries.

The growth of Nabisco continued through the 1970s. Sales reached the one-billion-dollar mark in 1971, and by 1976, sales surpassed \$2 billion. The company made the first Asian investment by establishing a joint venture with Yamazaki Baking Company of Japan in 1970. In 1975 construction of a modern flour mill in Toledo, Ohio, and a computerized bakery in Richmond, Virginia coincided with the building of new company headquarters in East Hanover, New Jersey.

Inflation and soaring energy costs in the 1970s led Nabisco to consider a merger with another large food manufacturer. Early in 1981 Nabisco and Standard Brands announced plans to merge. By the end of 1981 the newly named Nabisco Brands, Inc. demonstrated its potential for growth by purchasing the LifeSavers Company for \$250 million. It also purchased a controlling interest in Mexican cookie firm Gamesa for \$45 million.

R.J. Reynolds, a worldwide manufacturer and distributor of tobacco, food, and beverage products, purchased Nabisco Brands, Inc. in 1985 for \$4.9 billion. This created the world's largest consumer-products company, with annual sales of more than \$19 billion. Later in 1985 R.J. Reynolds changed its name to R.J.R. Nabisco, Inc. In 1988 Kohlberg Kravis Roberts won a bidding war for Nabisco with a record \$24.5 billion in cash and debt securities. Kohlberg Kravis Roberts, along with the current president of Nabisco, Louis V. Gerstner, Jr., pledged to manage the company for the long run. Through the 1990s the Nabisco Foods Group (formerly Nabisco Brands, Inc.) experienced reorganization and downsizing, but the company still continued to acquire other food and snack-related firms.

NADER, RALPH

By the 1960s Ralph Nader (1934–), a lawyer and social crusader, had become a symbol of the public's concern about corporate honesty and consumer safety. Largely beginning with the publication of his first book in 1965, *Unsafe At Any Speed: The Designed In Dangers of the American Automobile*, Nader started to aggressively attack the design problems of consumer products. His documentation linked faulty car designs to a staggering number of automobile accidents and legislation was enacted to protect consumers. This inspired Nader to continue his investigations and efforts at legislation, which eventually led to increased safety standards in mines, federal regulations to control environmentally hazardous oil and gas pipes, and a more intense regulation of meat quality.

Ralph Nader was born in 1934 in Winsted, Connecticut, the son of immigrant Lebanese parents. He graduated with highest honors from Princeton University in 1955, and then went to Harvard Law School, where he received his degree in 1958. After briefly serving in the U.S. Army, and following a period of personal travel, Nader opened a law office in Hartford, Connecticut. There he also joined the University of Hartford faculty, teaching history and government while pursuing his law practice.

YOU'VE GOT TO KEEP THE PRESSURE ON, EVEN IF YOU LOSE. THE ESSENCE OF THE CITIZEN'S MOVEMENT IS PERSISTENCE!

Ralph Nader

Nader became intensely interested in defective auto design largely through his law practice, where he dealt with auto injury cases. He became convinced that it was generally faulty design of automobiles, rather than driver incompetence, that led to the majority of automobile accidents. Certain that he had convincing statistics on his side, Nader began testifying before state legislative committees, and he frequently wrote magazine articles on the subject.

In 1964, when Nader was appointed as a consultant to the U.S. Department of Labor, he undertook a major study of automobile safety. Having all the data he needed, he left the Department of Labor in 1965 to write his first book, *Unsafe At Any Speed*. In March

1966, General Motors president James Roche admitted that his firm had Nader under surveillance in an effort to smear Nader with possible scandal. The admission received national television coverage and Nader became a public figure. Nader's book went on to become a national bestseller and prompted legislation proposals to regulate car safety, which ultimately became federal law in September 1965.

The mood of the country during the mid-1960s was dominated by progressive ideas and politics, and it was not long after the publication of his first book that Ralph Nader came to be known as the country's leading consumer advocate. Nader had made it his life's work to defend the public's well being. His relationship to business was often adversarial and critical. He often condemned businesses as overly profit-motivated and lacking in real concern for the safety of the consumer.

Nader's industry studies, including the coal mining, meat, poultry, and natural gas industries, all resulted in stricter health and safety laws. Nader also investigated hazards in the pesticide industry and alerted the public to the dangers of food additives, radiation from color television sets, and the excessive use of x-rays.

In 1996 Nader ran for the U.S. presidency as the Green Party candidate, winning support in popular polls. While running for president, Nader often summarized his philosophy, insisting: "You've got to keep the pressure on, even if you lose. The essence of the citizen's movement is persistence!" Nader was not elected president, and he continued to work for the consumer in the Progressive tradition. Though he remained a controversial figure, generally disliked by business, he was trusted by many consumers, and he persisted in his work for consumer advocacy and corporate accountability.

NAPOLEONIC WARS, IMPACT ON THE U.S. ECONOMY (ISSUE)

The French Revolution (1789–1793) was a watershed in European history. It destroyed the French monarchy and established a republic, but it also divided France and threw much of Europe into turmoil. From the chaos of the Revolution, a general, Napoleon Bonaparte (1769–1821) emerged to lead the nation, first as a republican magistrate and finally as an emperor. He brought domestic tranquility to France, but his ambition and military genius embroiled Europe in a long and bloody conflict, the Napoleonic Wars (1803–1815), which only ended with Napoleon's defeat at Waterloo in 1815.

The strife disrupted both French and European trade, and even the economic position of the newly formed United States began to change drastically. As the Napoleonic Wars drained the energies of Britain, France, and the rest of Europe, America was free to develop its own economic potential. From roughly 1789 till the beginning of the War of 1812 (1812–1814), the United States went through two economic phases that were linked directly to the political factors associated with the wars in Europe.

As a result of the American declaration of neutrality during the French Revolutionary and Napoleonic Wars, the United States experienced a period of rapid growth in foreign trade. The declaration itself reflected domestic political divisions, since the United States was divided on whom to support. The Federalists tended to favor Britain while the Republicans favored France. This indecision was salutary for the nation's commerce, however, since the declaration established free trade, and overnight the restrictions of the old mercantilist system evaporated. As a neutral country the United States could claim unfettered trade with all countries, including Britain and France, and for the most part American ships were welcomed with open arms. American ships carried commodities from all over the world and distributed European manufactures in ports worldwide. Freight earnings boomed. In 1792, American shippers earned an estimated \$7.2 million. By 1796 these earnings had tripled to \$21.6 million and eventually peaked at \$42.1 million in 1807.

As income from the trade boom diffused throughout the economy, the United States experienced dramatic export-led growth. Between 1792 and 1795, U.S. exports doubled; they doubled again in 1801, and by 1807 were five times what they had been fifteen years earlier. Moreover, the rate of growth in foreign trade

far outstripped that of population. Per capita income from exports, shipping services, and ship sales averaged \$6.77 in 1792. In 1807, the per capita figure was \$22.76. This boom in American export trade reflected heavy European demand for re-exports (foreign goods repackaged in American ports), American cotton, (used to supply the British textile industry), and American food to meet European shortages. The growth did hit several temporary slumps: between 1797 and 1798 when an undeclared sea war with France produced a brief dip in export earnings, and also between 1801 and 1803 when the Peace of Amiens allowed European countries to resume peacetime trade activities. After 1803, the United States again experienced another period of rapidly expanding trade. But while scholars agree that the United States experienced increased prosperity during this period, they disagree over the role that export trade played in its growth.

Supporters of the position that an export-led economy led to significant increases in U.S. growth and prosperity also believe this prosperity laid strong foundations for further economic growth after 1815. Critics challenge this position, claiming that the costs associated with neutrality and export-driven expansion have been understated, and the benefits overstated. In addition to all the shipbuilding and freight rates involved in re-exports, critics also argue that the benefits realized by industries such as banking, insurance, and shipbuilding may have been smaller than previously assumed and concentrated only in northeastern ports.

The second U.S. economic phase linked with European affairs began in December 1807 with President Thomas Jefferson's (1801–1809) embargo on all trade with warring nations. This embargo caused America's foreign trade to collapse. In 1805, Napoleon's victories over Austria and Russia at Austerlitz made him temporary master over much of the European continent. Meanwhile, Britain's defeat of the French and Spanish fleets at the Battle of Trafalgar gave it control of the high seas. At the same time both Britain and France ceased to show much respect for neutral countries or the legitimacy of international laws, and both nations reaped havoc on American shipping interests.

In 1805, a British court ruled that goods from the French West Indies bound for Europe on American vessels, even though shipped by way of the United States, were subject to seizure. When the commercial provisions of Jay's Treaty of 1794 expired in 1807 and American diplomats were unable to negotiate a new agreement to President Jefferson's satisfaction, British interference with American shipping increased. Meanwhile, Napoleon challenged British policy with the

Berlin Decree of 1806 and Milan Decree of 1807, which closed European ports under his control to British goods and declared that neutral ships complying with British trade regulations would be confiscated. The United States was caught in the middle.

President Jefferson's solution was to resort to "peaceable coercion" with an embargo that banned all trade with Great Britain and continental Europe. Jefferson argued that Europeans, especially the British, were more dependent on U.S. exports, especially grain and cotton, than the United States was on European imports. As a result, U.S. foreign trade fell precipitously. Although trade did recover somewhat in the years following the embargo, it would not reach its former levels until the late 1840s.

During the War of 1812 (1812–1814), the British blockade of U.S. ports almost completely stifled export trade. The blockade followed a general worsening of American commerce, which had declined by almost one-fifth between 1807 and 1809. The embargo was repealed in March 1809, without achieving its goal of forcing the British to reverse their policies, but it may have been a blessing in disguise. While the unemployment and economic distress (especially in U.S. coastal areas) were undeniable, domestic industry did begin to grow. The nation realized if it were to continue to consume the products to which it had become accustomed during the recent period of heightened prosperity, the best course of action was to produce them itself. In 1807, seven new factories were opened in New England states. The next year twenty-six were chartered, eighteen of which were textile factories. The number increased steadily and accelerated during the War of 1812. The pace, however, slowed down after the war, and many of the mills went bankrupt in the following years. As a result both industrial labor and capital sought relief from the government through tariffs on imports.

Although its influence is more difficult to quantify than foreign trade and export growth, another important and perhaps more significant economic impact of the Napoleonic Wars was the Louisiana Purchase (1802). There were several reasons for Napoleon's sudden decision to abandon his imperial ambitions in America and concentrate instead on Europe. He suffered a major disaster in the French colony of San Domingo when his troops failed to suppress a slave insurrection there, and realized the 1802 Peace of Amiens, the treaty that he had hoped would end the European war, had settled nothing. A renewal of war between France and Britain was inevitable. Because of the sustained economic drain of war, Napoleon needed money. In a wise move, he realized that selling the

Louisiana Territory would raise capital for the war and avoid a concerted Anglo-American alliance between Britain and the United States.

As the beneficiary of Napoleon's strategy, the United States acquired the whole of the Mississippi River and its Western tributaries, some 828,000 square miles of territory, millions of acres of farmland, and a vast wealth of natural resources.

NAT TURNER'S REBELLION

Nat Turner was an American slave who led the only sustained slave revolt in U.S. history (August 1831). Turner was born on a large plantation in Southampton County, Virginia, on October 2, 1800. Through his mother, who had been born free in Africa, he acquired a passionate hatred of slavery. One of his master's sons taught him to read, and he became fanatically devoted to religious self-instruction. His loathing of slavery blended with his religious training to produce a heady and violent brew. Turner came to see himself as divinely ordained to lead his fellow slaves out of bondage, and he launched his uprising after an eclipse of the sun convinced him that the time to strike had arrived.

The revolt had a profound impact on Southern attitudes towards the "peculiar institution" of slavery. For many southerners it exploded the myth that the slave population was either content or at least congenitally unable to rebel against their inferior status. For other southerners the revolt confirmed in their mind the discontent of slaves and the ever-present menace of rebellion that could topple the southern socio-economic system.

On the night of August 21, 1831, Turner and seven other slaves attacked the local white population, and over the next two days 51 whites were killed during a vengeful march to reach the Dismal Swamp, where Turner's group intended to hide, regroup their forces, and attract supporters. En route the insurgents intended to capture the arsenal located in the county seat of Jerusalem.

The rebellion had little chance for success: only 75 African Americans (who were divided by dissent) joined Turner's cause. Virginia responded swiftly, and 3,000 militiamen combined with strong assistance from the local white population led to a swift end to the insurgency. Turner's supporters were soon killed or captured, as was Turner himself after a dramatic manhunt lasting six weeks. Shortly thereafter Turner was tried and hanged at the county seat of Jerusalem, which became a symbolic location for northern abolitionists.

The revolt had a profound impact on Southern attitudes towards the "peculiar institution" of slavery. For many southerners it exploded the myth that the slave population was either content or at least congenitally unable to rebel against their inferior status. For other southerners the revolt confirmed in their mind the discontent of slaves and the ever-present menace of rebellion that could topple the southern socio-economic system. Not surprisingly, the revolt led to a harsh tightening of controls over the slave population, particularly in the form of legislation that prohibited the education and other activities of slaves. The rebellion also strengthened Southern pro-slavery sentiments.

Nat Turner's rebellion hardened sectional animosities, making secession and the American Civil War (1861–1865) more likely. Galvanized by the Turner uprising, Southern congressmen sought to enact or strengthen existing national legislation supporting slavery, particularly the Fugitive Slave Act of 1796. In 1836 the House of Representatives enacted a gag rule

Natchez Trace

preventing the debate of anti-slavery petitions. It was later repealed after a long and acrimonious debate between northern and southern representatives. Southern congressmen also repeatedly demanded that free states restrict the activities of abolitionist societies. For their part abolitionist societies in the North stepped up their activities, and northern politicians felt increasingly vulnerable to abolitionist demands that they adopt strong anti-slavery stands.

NATCHEZ TRACE

Natchez Trace was an old road, measuring more than 500 miles long (800 kilometers); it ran between Natchez, Mississippi, and Nashville, Tennessee. "Natchez" is derived from an Indian tribe, which lived in Mississippi during colonial times, and "trace" is another word for trail often used in the South. The trace was carved out during the mid-1700s by pioneers who followed old Indian trails from Natchez, situated on the bluffs above the Mississippi River, through present-day Mississippi and northwestern Alabama to Nashville, in north-central Tennessee. Traders would float goods on flatboats (barges) down the Mississippi River, later returning north via the trace. The city of Natchez became an important trade center and between 1798 and 1802, when it was the capital of the Mississippi Territory. In 1806 Congress authorized construction of a road to follow the trace, widening it to accommodate wagons, and making it a post road,

which was used to transport mail. During the early 1800s Natchez Trace was of great military and commercial importance. In 1938 it was made into a National Parkway.

NATIONAL ASSOCIATION OF SECURITIES DEALERS AUTOMATED QUOTATIONS (SYSTEM) (NASDAQ)

The National Association of Securities Dealers Automated Quotations system (NASDAQ) is a computerized communication system that provides the bid and asked prices of more than 5,000 over-the-counter (OTC) stocks that have met NASDAQ's registration requirements. Introduced in 1971 by the National Association of Securities Dealers (NASD), NASDAQ achieved a listing of more than 4,000 companies and an annual trading volume of over \$1 billion by the early 1990s. It is the second largest securities market in the United States in terms of share and dollar volume, but it is the largest in terms of the number of companies listed.

By late 1997, NASDAQ listed approximately 5,500 companies, compared to some 3,000 listed on the New York Stock Exchange. Even though NASDAQ has many more listed firms than the NYSE, market capitalization of NYSE-listed firms was greater, around \$8.7 trillion compared to \$1.95 trillion for NASDAQ-listed firms. NASDAQ is known as the market for smaller companies, and especially for technology firms. A large percentage of NASDAQ's market capitalization comes from technology companies.

NATIONAL BANK ACT OF 1863

The National Bank Act of 1863 was designed to create a national banking system, float federal war loans, and establish a national currency. Congress passed the act to help resolve the financial crisis that emerged during the early days of the American Civil War (1861–1865). The fight with the South was expensive and no effective tax program had been drawn up to finance it. In December 1861 banks suspended specie payments (payments in gold or silver coins for paper currency called notes or bills). People could no longer

convert bank notes into coins. Government responded by passing the Legal Tender Act (1862), issuing \$150 million in national notes called greenbacks. However, bank notes (paper bills issued by state banks) accounted for most of the currency in circulation.

In order to bring financial stability to the nation and fund the war effort, the National Bank Act of 1863 was introduced in the Senate in January of that year. Republican congressman from Pennsylvania Thaddeus Stevens (1792–1868) opposed the act; Secretary of the Treasury Salmon Chase (1808–73), aided by Senator John Sherman (1823–1900) of Ohio, promoted it. The bill was approved in the Senate by a close vote of 23 to 21, and the House passed the legislation in February. National banks that were organized under the act were required to purchase government bonds as a condition of start-up. As soon as those bonds were deposited with the federal government, the bank could issue its own notes up to 90 percent of the market value of the bonds on deposit.

The National Bank Act improved but did not solve the nation's financial problems—some of the 1500 state banks, which had all been issuing bank notes, were converted to national banks by additional legislation (that amended the original Bank Act and was passed June 1864). Other state banks were driven out of business or ceased to issue notes after the 1865 passage of a 10 percent federal tax on notes they issued (which made it unprofitable for them to print money). The legislation created \$300 million in national currency in the form of notes issued by the national banks. But because most of this money was distributed in the East, the money supply in other parts of the country remained precarious; the West demanded more money. This issue would dominate American politics in the years after the Civil War. Nevertheless, the nation's banking system stayed largely the same—despite the Panic of 1873—until the passage of the Federal Reserve Act in 1913.

NATIONAL BROADCASTING COMPANY INC. (NBC)

The National Broadcasting Company (NBC) debuted as a radio broadcast network on November 15, 1926, with a four-and-a-half hour music and comedy presentation. The show was broadcast from New York City over a network of 25 stations, and nearly half of the country's five million radio homes tuned in. NBC

was jointly owned by RCA, General Electric, and Westinghouse until 1932, when RCA bought out the other two owners.

It is hard to overestimate the importance of the first coast-to-coast radio broadcasts. The very first one took place on New Year's Day, 1927, when NBC broadcast the Rose Bowl football game. Other early highlights of NBC Radio included the first special events broadcast, when aviator Charles Lindbergh arrived in Washington, DC, on June 11, 1927; the radio coverage of national political conventions in 1928; the presidential inaugurations in 1929 and 1933; and President Franklin Roosevelt's (1933–1945) first soothing "Fireside Chat" to a worried nation, on a cold night in 1933.

Radio also unified the national culture and advanced the assimilation process of millions of immigrants who up to that point had existed within the bounds of their own national cultures. For the first time in the nation's history millions of people hundreds of miles apart had the simultaneous experience of listening to the new sounds of swing music, as "dance shows" brought this powerful music genre to the radio-listening public. Benny Goodman, Paul Whiteman, Tommy Dorsey, and, way down in Texas, Bob Wills and his Texas Playboys all became the pulse of the nation, which, thanks to radio, was now beating as one.

From the beginning, the demand among local radio stations for NBC's network service was high and the company split its programming into two separate networks, called the "red" and the "blue." In 1941 the Federal Communications Commission (FCC) ruled that no organization could own more than one network, and NBC sold the blue network, which became the American Broadcasting Company (ABC).

In 1939 NBC demonstrated television, a new invention, at the Chicago World's Fair, and began regular television programming from New York City. Television was made possible by the invention of the cathode ray tube in 1906. NBC founder David Sarnoff spearheaded RCA's research into "the art of distant seeing" through the 1920s and 1930s. In 1941 NBC obtained a commercial television license from the FCC for WNBT-TV, which became the world's first commercial television station.

World War II (1939–1945) slowed the growth of television, and programming was limited to a few hours a day during the war. NBC Radio broadcast on-the-scene reports from military bases and battle zones, and on D-Day, June 6, 1944, it provided continuous news coverage of the European invasion.

Color City, the control room of NBC's television studio in Burbank, CA.

Television began to expand rapidly after the war: the number of homes with television sets grew from 14,000 in 1947 to nearly a million in less than two years. Television networks began to expand news coverage. New weekly variety and drama programs were created, and popular radio shows were adapted for television. *Meet the Press*, beginning on radio in 1945, switched to television in 1947 and became the longest running show on television.

WHEN NBC ORGANIZED AND BROADCAST THE FIRST PRESIDENTIAL DEBATES IN 1960 BETWEEN JOHN F. KENNEDY AND RICHARD M. NIXON, THE FULL IMPACT OF TELEVISION ON POLITICS WAS FELT. THE WAY KENNEDY LOOKED ON TELEVISION WAS THOUGHT TO HAVE STRONGLY INFLUENCED THE OUTCOME OF THE DEBATES AND THE SUBSEQUENT ELECTION.

NBC started its television network with four stations and by 1951 it had installed regular coast-to-coast network service. Two programming mainstays were

introduced in the 1950s: *Today* (1952), an early-morning news and talk show, and *The Tonight Show* with Steve Allen (1954). In 1953 NBC introduced color television, presenting the first coast-to-coast color transmission. Later that year the FCC approved an RCA-backed standard for color compatibility, making it possible for people with black-and-white sets to receive network programs even if they were broadcast in color.

When NBC organized and broadcast the first presidential debates in 1960 between John F. Kennedy and Richard M. Nixon, the full impact of television on politics was felt. The way Kennedy looked on television was thought to have strongly influenced the outcome of the debates and the subsequent election. When Kennedy was assassinated in 1963, NBC provided an unprecedented 71 hours of coverage in which the whole nation once again participated in a national experience together and gave full vent to their grief. In 1964 NBC presented the first made-for-television movie, thus establishing a new genre of television program. During the 1960s NBC expanded its programming,

launching popular shows such as *I Spy*, which featured Bill Cosby as the first African American lead in a television series, *The Man from U.N.C.L.E.*, and *Rowan and Martin's Laugh-In*, among others.

During the 1970s NBC's most popular programming included blockbuster movies, family series such as *Little House on the Prairie*, the comedy series *Saturday Night Live*, and several popular miniseries.

NBC Television suffered a drop in ratings during the early 1980s. By replacing low-rated programming it managed to climb back to the number one spot in 1985. Popular shows introduced by programming chief Brandon Tartikoff included *Cheers*, *Hill Street Blues*, and *St. Elsewhere*. *Miami Vice* (1985) and *The Late Show with David Letterman* (1982) also helped lift NBC's ratings.

In 1986 General Electric Co. (GE) acquired RCA for \$6.4 billion and became NBC's parent company. Robert C. Wright was named to succeed Grant Tinker as NBC's president and chief executive officer (CEO). In 1988 NBC decided to leave their radio business, which had been struggling, and the company sold seven of its eight radio stations. In 1991 Tartikoff left NBC to head Paramount Pictures.

From NBC's early days as a radio broadcast network, sports programming had been an important component of its broadcasts. NBC dominated coverage of the Olympics in 1988 with its broadcast from Seoul, South Korea. It acquired the rights to the 1992 and 1996 summer Olympics and every summer and winter venue (except Nagano 1998) through 2008.

With cable television making more of an impact on television viewing habits, NBC began aggressively marketing the Consumer News and Business Channel (CNBC), to cable systems in 1988. CNBC began with a base of 10 to 13 million subscribers. It was originally conceived as a 24-hour all-business news channel, but consumer news was added to the mix before the channel launched in April 1989.

CNBC competed directly with Turner Broadcasting System's Financial News Network (FNN). In 1991 NBC acquired the bankrupt FNN for \$154 million, increasing CNBC's subscriber base to 40 million households. Political consultant Roger Ailes was named president of CNBC in 1993. Under his direction CNBC underwent a makeover with better graphics and interviews during the day and a variety of talk shows during prime time in the evening. New talk show hosts added in 1993 and 1994 included Charles Grodin, Tim Russert, and Geraldo Rivera.

By 1997 CNBC had become a cash cow for NBC, generating about \$120 million in revenues, a 33 percent increase over 1996. CNBC reached about 64 million households, or 90 percent of all cable subscribers. In 1998 CNBC's Wall Street coverage enabled CNBC to surpass CNN's viewership among 25- to 54-year-olds for the first time, even though CNBC reached 12 percent fewer households than CNN.

In 1996 NBC-TV and Microsoft joined forces to create MSNBC, an all-news cable channel designed to compete with CNN. When it debuted in July 1996, MSNBC enjoyed immediate distribution into nearly 20 million homes, with a goal of 35 million homes by 2000. It was distributed in Europe on NBC's Super Channel and CNBC, as well as in Latin America and Asia. As part of the joint venture, MSNBC Online would be launched via the Microsoft Network.

During nearly every season of the 1990s, including three consecutive seasons starting in 1995-96, the NBC television network was most-watched network in the United States. Comedy shows such as *Seinfeld*, *Frasier*, and *3rd Rock from the Sun* were complemented by popular drama and prime-time news programs. From 1993 through 1998 NBC reported double-digit gains in earnings annually, achieving \$5.2 billion in revenue and pretax operating profits of about \$1.15 billion in 1997.

NBC had also become stronger during the 1990s through strategic acquisitions and alliances. It owned 12 television stations reaching 26 percent of U.S. households. In 1993 it became an international broadcaster by purchasing a minority interest in Superchannel, a London-based pan-European satellite television service. In 1997 CNBC and Dow Jones entered into an alliance that was finalized in 1998 to share news-gathering and programming. In 1998 the company sold its one-third interest in the money-losing Court TV cable network to partners Time Warner and Liberty Media.

Throughout the decade other companies sought to purchase NBC from GE, but GE chairman John F. (Jack) Welch, Jr., turned them all down. Paramount offered \$4.5 billion for NBC in 1992, and then Walt Disney Co. made a bid of \$6 billion in 1994. Even media mogul Ted Turner attempted to negotiate an offer. After *Seinfeld* ended its nine-year run in May 1998 and NBC lost the network auction to televise National Football League games, reports began to surface that NBC was again up for sale. Possible buyers included Viacom, headed by Sumner Redstone, and USA Networks Inc., headed by Barry Diller.

National Debt (Issue)

In spite of such setbacks NBC was in a strong position at the end of the 1990s. It was the number one broadcast network. CNBC was a leader in business television, and the fledgling MSNBC was on track to break even by 2001. At the end of 1997 NBC president Robert Wright estimated NBC was worth about \$17 billion overall, with its cable assets worth about four billion dollars and NBC-owned television stations worth about \$7.5 billion. Following setbacks in 1998 outside analysts predicted NBC's earnings growth would flatten for the near-term future.

NATIONAL DEBT (ISSUE)

The national debt is the amount of money owed by the U.S. government to its creditors, which may include private individuals, corporations, banks and other financial institutions, as well as foreign governments. As a result of better communications technology, improved information processing, and cheaper enforcement costs the ability of the federal government to collect taxes improved over the years. This made lenders more willing to fund the national debt and enabled the government to borrow at favorable interest rates.

The United States began its existence with a large (for the time) national debt of \$75 million. This debt was the result of a deliberate policy of the first Secretary of the Treasury, Alexander Hamilton (1755–1804). Hamilton wanted to secure the confidence of wealthy

The National Debt remained fairly constant until 1975. In 1980 it began to grow at an alarming rate, and became a major economic and political concern.

citizens in the new federal government, establish the government as a good credit risk, and provide a compelling rationale for constructing an effective federal tax system. With this in mind he convinced the U.S. Congress in 1790 to assume the debts incurred by the individual states during and after the American Revolution (1775–1783).

According to Hamilton, the funding and assumption of this debt served several purposes. One was to establish the credit of the United States among other nations. If the U.S. federal government voluntarily undertook to retire its debt the credit of the nation would be restored at home and abroad. With the repayment of the loans interest rates would be lowered. With lower interest rates investments in land, commerce, and industry would increase, and capital would multiply along with wages and jobs. Hamilton believed that, with responsible fiscal leadership, the day would not be long before economic dominance would soon pass from Great Britain to the United States—as indeed it did, but not for another one hundred and twenty years.

The South was especially hostile to Hamilton's vision of refunding and assuming the national debt. This was because many of the southern states had made substantial progress in meeting their financial obligations under the Articles of Confederation. New England states on the other hand favored funding and assumption because those states owed the largest portion of the states' collective debt.

Today we understand that the federal government has the ability to expand its own income through

borrowing money, printing money, and tax increases. Since the 1930s, however, the economic theories of John Maynard Keynes (1883–1946) brought the realization that retiring the debt should not be an automatic reflex. That is because the debt can help in the fight against depression. If, during a depression, the government borrowed money and invested it in government projects that created jobs and produced a ripple effect and stimulating secondary investment and employment (such as a restaurant near a factory), the economy might regenerate itself and pay off the debt. Keynes believed that government attempts to increase revenues and decrease expenditures during a depression worsened, rather than cured, the problem of widespread unemployment and underutilized industrial capacity. Keynes argued that government spending should be counter-cyclical, that it should move in the opposite direction to private consumption and investment. Keynes believed that during an economic downturn the government should increase its expenditure to compensate for the decline in private demand for goods and services. Conversely, during an economic upturn the government should decrease its expenditure to make room for productive investment and consumption. Thus, governments should increase the national debt during economic downturns and retire the debt during business cycle upturns.

Since the founding of the republic the main source of increasing the national debt has been war. Initially, the war debt was easily retired. Within twenty years of the War of 1812 (1812–1814) the United States government paid off its war debt of \$128 million. In World War I (1914–1918) the national debt underwent the first of several huge increases that would last through the end of the century. By 1990 the U.S. national debt soared to \$3.2 trillion. In the late 1990s some economists believed that the anti-Keynesian tactics of President Ronald Reagan's (1981–1989) administration only made matters worse. They point to for the fact that his economic recovery program combined tax cuts with increases in government spending, thereby increasing the U.S. national debt by almost \$1.9 trillion during his term. Proponents of Reagan's economics defend the administration's plan and the ensuing national debt on the grounds that a Congress controlled by the Democrats would not follow the president's wishes and dramatically cut domestic spending. They also argue that a high level of military spending was necessary to bring the Cold War to an end, and the tax cuts successfully stimulated the economy, as the stock market rose to record levels.

NATIONAL GRANGE

The National Grange of the Patrons of Husbandry (the Grange) was a fraternal society founded in Washington, D.C., in 1867. Its aim was to advance the political, economic, and social interests of the nation's farmers. The Grange was established by U.S. agriculturist Oliver Hudson Kelley (1826–1913). As a clerk for the Bureau of Agriculture, Kelley had toured southern farms and talked to farmers. The trip gave him a clear understanding of the problems faced by U.S. growers. When he returned to Washington he resolved to set up an organization to assist farmers by providing a forum for discussion and the dissemination of knowledge regarding new agricultural methods. Six of Kelley's associates joined him in forming the group, and the following year he traveled to his native Minnesota to set up the first local grange.

Granges were organized at the state, county, and local levels, with membership open to all farmers and their families. After suffering through deteriorating economic conditions during the 1860s, the severe downturn of the 1870s hit the nation's farmers even harder—agricultural prices dropped while operating costs increased. Farmers took action by setting up or joining granges. The groups set up cooperative stores, consolidated purchasing (to get the lowest possible price on agricultural equipment and supplies), and even established factories where farm machinery was produced. The number of granges reached their peak in 1875, by which time there were more than 21,000 granges and national membership climbed to 860,000.

Granges lobbied their state legislators to pass laws favorable to farmers, including the imposition of maximum limits on rail freight and warehousing rates. The so-called "Granger laws" were later overturned by the

National Industrial Recovery Act

U.S. Supreme Court, which ruled that any interference with interstate commerce was unconstitutional. The ruling helped pave the way for the government to establish the Interstate Commerce Commission (ICC) in 1887.

By the end of the 1870s the granges were in decline. Mismanagement of their interests and the pressure of competition forced most of their business initiatives to fold. Nevertheless the group did not completely disappear. Members of the Grange movement and other agrarians (including members of the Farmers' Alliances) joined the People's (or Populist) Party. Members of the national political party pursued initiatives favorable to farmers' interests. These included free coinage of silver, government issue of more greenbacks (paper currency that was first issued to finance the American Civil War, 1861–1865), a graduated income tax, direct popular election of U.S. senators, and passage of stringent anti-trust laws. Though the party itself was short-lived (it formed in 1891 and disbanded by 1908) its influence on U.S. politics was lasting. Many of its Populist initiatives were later made into law.

In the late-1990s the Grange had a total membership of about 300,000 organized in some four thousand local groups in 37 states. The Grange worked toward changing economic and political conditions to favor the nation's farmers and agricultural regions.

NATIONAL INDUSTRIAL RECOVERY ACT

National Industrial Recovery Act (NIRA) was the centerpiece of President Franklin D. Roosevelt's (1933–1945) initial New Deal programs that were aimed at reversing the economic collapse of the Great Depression. Enacted by Congress in 1933 during the president's First Hundred Days in office, the NIRA was designed to improve standards of labor, promote competition, reduce unemployment, and increase consumer's purchasing power. As the legislation went through Congress, it met with much debate and passed by a slim margin of seven votes.

Title I of the act attempted to accomplish the goals of the NIRA by creating the National Recovery Administration (NRA) to establish codes of fair competition, which were rules governing the wages, prices, and

business practices of each industry. Representatives of firms in various industries joined NRA officials in drafting the codes. Although the codes were not intended to foster monopolies or discriminate against small business, applicable antitrust laws were temporarily suspended to prevent the NIRA from being challenged on grounds that it engendered unfair competition. Initially, the codes received wide public support, but over time that support diminished. Enforcement of the codes was limited, and the successes it did achieve, like the end of child labor in the textile industry, were eventually overshadowed by higher prices and limited production.

Title II of the act created the Public Works Administration (PWA) to award \$3.3 billion in construction contracts for public projects. The PWA oversaw an enormous number of such projects, including the construction of schools, hospitals, post offices, courthouses, water systems, roads, bridges, and dams. The NIRA also included provisions for increasing minimum wages, limiting the hours in a workweek, and recognizing the right of labor to unionize and collectively bargain with management. Among the PWA's biggest successes are the construction of the Triborough Bridge in New York City and the Hoover Dam in Arizona. Overall, the Public Works Administration completed 34,000 projects nationwide.

Three weeks before the NIRA's two-year expiration date in 1935, the U.S. Supreme Court unanimously declared the act unconstitutional. In the case of *Schechter Poultry Corporation vs. the United States*, the Supreme Court ruled that Congress had impermissibly delegated its legislative power to the National Recovery Administration. The NIRA ceased operations.

NATIONAL LABOR RELATIONS BOARD

The industrialization of the United States created new labor issues for the young nation. Mistreated and dissatisfied workers found ways to work together in an attempt to negotiate better arrangements for themselves with employers. The increased activism of workers, mainly in the form of unions, and the negative reaction by businesses to the union movement led the federal government to develop regulations for fair employment practices.

The National Labor Relations Act of 1935 (NLRA) is the core from which much of present day U.S. labor law stems. The NLRA has its roots in the Railway Labor Act of 1926 and the National Industrial Recovery Act. Until the Railway Labor Act of 1926 (RLA) workers were largely unprotected in the workplace. The RLA, as applied to the railroad industry, was enacted with the intent to avoid work stoppages by employees and lockouts by employers. It provided an alternative to these measures by way of negotiation, mediation, or arbitration.

The standards first devised by the RLA were expanded in 1933 under the National Industrial Recovery Act (NIRA). The NIRA was friendly to unions and employees. Under the NIRA, employees were granted the right to organize and bargain collectively through unions. Before the NIRA employees involved in union activity were treated harshly by employers and often faced firing for their union association.

Building on the standards set by the RLA and the NIRA, the National Labor Relations Act of 1935 established the National Labor Relations Board (NLRB). The board is an independent federal agency created with the primary purpose of enforcing labor law in the United States. It set regulations to prevent unfair labor practices by private sector employees and unions, who had taken advantage of previous federal protection under the National Industrial Recovery Act. It also maintained and extended protection of employees' rights to organize and to use union representation in negotiations with employers. Provisions were made for a secret ballot to determine whether employees wanted to maintain union representation.

Although the National Labor Relations Board is an independent federal agency that regulates U.S. labor, it can only act when officially requested in “petitions” (usually for an election) or “charges” (regarding unfair labor practices). The NLRB limits its involvement to cases that have a significant effect on commerce.

The National Labor Relations Act was an attempt to deal equitably with labor and management. Until it took effect, the laws shifted uncertainly from pro-business to pro-worker and pro-union, giving employers and workers at times too little protection or too few guidelines. The NLRA set a solid foundation on which industrial relations could be built.

NATIONAL RECOVERY ADMINISTRATION

The National Recovery Administration (NRA) developed out of President Franklin D. Roosevelt's (1933–1945) New Deal initiative. The NRA was created under the National Industrial Recovery Act (NIRA) in 1933. The chief provision of the act was the creation of the National Recovery Administration. Modeled after the War Industries Board, the NRA oversaw the implementation of several core initiatives set out in the Recovery Act.

Among the initiatives was the establishment of business codes of fair competition, which were standards accepted by businesses and industries. The codes included provisions for minimum wages, voluntary union participation (neither encouraging nor discouraging union membership), and shorter work hours. The business codes regarding union participation resulted in a sharp increase in union membership. For instance, the United Mine Workers experienced a jump in membership from 100,000 to 400,000 less than a year after the NIRA became law. Businesses who followed the codes displayed a blue eagle and the motto “We do our part” to advertise their participation to the public.

WE DO OUR PART.

Motto announcing adherence to the NRA's business codes

Despite its strong start, the NRA began to lose public support. The business codes sometimes conflicted

with one another and were difficult to comply with. They tended to raise prices and limit production, which, during the hard times of the Great Depression (1929–1939), was the opposite of what the public wanted. In addition enforcement of the business codes was limited.

In 1936 the National Recovery Administration ceased to exist. It ended activity after the United States Supreme Court ruled that the National Industrial Recovery Act, which gave it birth, was unconstitutional on the grounds that the act overstepped the legislative and commercial powers of the federal government.

NATIONAL ROAD, BUILDING OF THE

The National Road, also known as the Cumberland Road, was the first great turnpike to run across the Appalachian Mountains and into the territory that was known as the Old Northwest (the modern states of Ohio, Indiana, Illinois, Michigan, and Wisconsin). The National Road was built with the intention of creating closer economic ties between the American west and the original thirteen colonies. At the time it was considered a state-of-the-art roadway. Its surfaces were graded to limit water damage and it was surfaced with gravel. Streams, rivers, and gullies were crossed with stone bridges, not the more common and less expensive wooden ones. Thousands of migrants moving westward to take advantage of new land and new economic opportunities used the National Road to move westward. It was the first major road to be built with federal funds and the largest single road-building project until the construction of the modern interstate highway system after World War II (1939–1945).

THE NATIONAL ROAD, ALSO KNOWN AS THE CUMBERLAND ROAD, WAS THE FIRST GREAT TURNPIKE TO RUN ACROSS THE APPALACHIAN MOUNTAINS AND INTO THE TERRITORY THAT WAS KNOWN AS THE OLD NORTHWEST (THE MODERN STATES OF OHIO, INDIANA, ILLINOIS, MICHIGAN, AND WISCONSIN).

Although different sections of the country (particularly in New England) had developed their own turnpike systems in the late eighteenth century, most of

the country was not well served by roads. The roads that existed were funded and built mostly by private corporations, who ran them as profit-making toll roads. Construction on the National Road itself did not begin until immediately after the War of 1812 (1812–1814). The road began at Cumberland, Maryland, but it was linked to the earlier Frederick Pike, which led to Baltimore on the coast. Construction continued steadily until 1818, when the road crossed the Cumberland Gap over the Appalachians and reached Wheeling, West Virginia. By 1838 the road stretched all the way to Vandalia, Illinois, and about mid-century it reached St. Louis, Missouri. Construction on the National Road was neglected after the American Civil War (1861–1865) in part because of the boom in railroad construction. It was revived as part of Route 40 in the early twentieth century, when increased automobile traffic highlighted the need for improved roads.

The National Road was a controversial project for several reasons. First, many people questioned whether the federal government was permitted by the Constitution to use its money on internal improvements. Most such internal improvements (such as the Erie Canal, which was built by the state of New York) were undertaken by local or state authorities. Congress had appropriated money to build a trans-national highway as early as 1802. In 1808 Albert Gallatin proposed a series of internal improvements including a number of roads. Even then, several presidents—notably James Madison (1809–1817) and James Monroe (1817–1825)—vetoed the road’s funding on the grounds that using federal money for internal improvements was not specifically allowed in the Constitution. Secondly, roads at the time were far less efficient for transport than canals or river traffic. Most of the profits that could be made were for shipping goods over short distances, usually at a rate of about 15 cents a mile per ton. Riverboats and canals, and in later decades railroads, were more cost-effective ways of moving bulky farm produce to markets. Third, the National Road was very expensive to build. At the peak of construction in the early 1820s, it cost more than \$13,000 per mile to build and maintain.

Despite its inefficiencies and expense, the National Road helped draw the young United States closer together. Farmers in the Great Lakes and Ohio River valley were able to ship their produce to markets in Atlantic ports rather than sending their goods down the Ohio and Mississippi Rivers to French or Spanish markets. Northern political support for western improvements also helped draw the two sections of the country closer together.

NATIONALISM

Nationalism is a movement in which the citizens of a nation-state demonstrate a clear loyalty and devotion to the specific social, economic, and cultural interests of their nation, often to the exclusion of international interests. The predominant characteristic of nationalism is a sense of community among citizens of a nation based on a shared descent, language, and religion. Nationalism is also closely associated with the desire for national independence in a country that is under foreign domination. It was not until the eighteenth century that nationalism emerged as a distinctive movement. Before then, loyalty was usually pledged to either a ruling family or a religion.

Nationalism evolved through advances in technology, culture, politics, and economic circumstances. An increase in the education of the lower classes provided them with knowledge of their common history and culture beyond their villages and enabled them to identify themselves as members of a larger nation. With the development of industry and trade, cities and provinces were able to extend their economies outside of previous local geographic boundaries. By the nineteenth century, the Industrial Revolution helped spread economic development, which increased the middle class and led to a desire for representative government at the national level. Nationalistic symbols such as

holidays commemorating national events of historical significance also arose. In the United States, nationalism is essentially based on representative government and the concept of individual liberty as put forth in the *Declaration of Independence*.

NATIVE AMERICAN POLICY

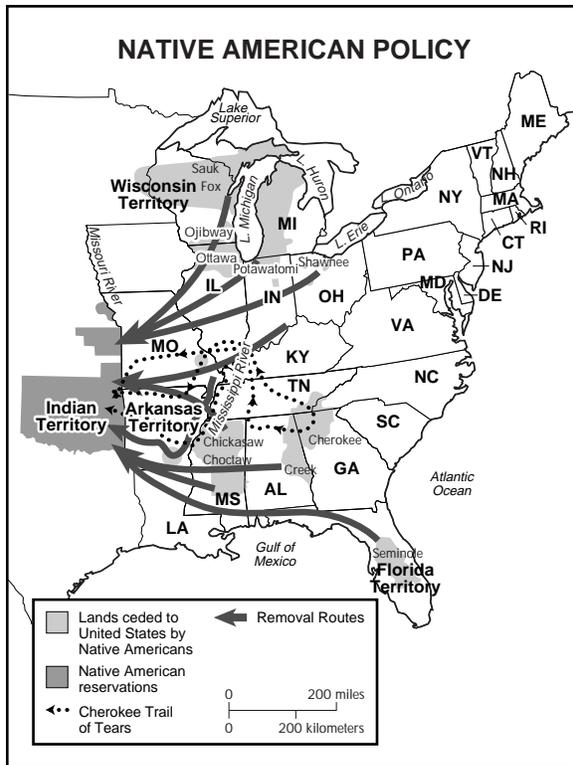

Federal Native American policy is considered by many to be an aberration in the U.S. legal system. By the 1990s more than two percent of U.S. lands were actually governed by Native American tribal governments. In the seventeenth century British and Spanish colonies began negotiating treaties with the New World's indigenous groups as sovereign (independent) political entities. The treaties served to acknowledge and affirm Native American ownership of lands used and occupied. The United States, as a successor of Great Britain, inherited this centuries-old European international policy. Thus, tribal sovereignty, recognized well before birth of the United States, became the basis for future U.S.–Native American relations.

With victory complete over Britain in the American Revolution (1775–1783), establishment of Native American policy was one of the first orders of business of the new fledgling government. A formative period of U.S. Indian policy lasted until 1871. The 1787 Northwest Ordinance, enacted by Congress, recognized existing Indian possession of the newly gained lands and established that only the federal government could negotiate treaties with tribes and acquire Indian lands. Sovereignty of tribes was explicitly recognized in the U.S. Constitution and authority for the federal government's legal relationship with tribes was identified in the Commerce Clause. One of the first acts passed by the first U.S. Congress was the Indian Trade and Intercourse Act of 1790 which reaffirmed the treaty policy and brought all interactions between Indians and non-Indians under federal control.

THE FEDERAL-INDIAN RELATIONSHIP IS LIKE NO OTHER IN THE WORLD. INDIAN TRIBES APPEAR TO HAVE THE SAME POLITICAL STATUS AS INDEPENDENT STATES; YET THEY SEEM TO BE FOREVER MIRED IN A STATE OF POLITICAL AND ECONOMIC PUPILAGE.

Vine Deloria, Jr., *American Indian Policy in the Twentieth Century*, 1985

Three Supreme Court decisions between 1823 and 1832, known as the Marshall Trilogy, reasserted the

This map shows the lands ceded to the U.S. by Native Americans, and the routes of removal to the western Indian Territories. U.S. Native American policy has vacillated between supporting Indian self-determination and forced assimilation.

tribal right of land possession and tribal sovereignty (meaning no state held legal jurisdiction within Indian reservation boundaries) and defined a moral trust responsibility of the United States toward the tribes. This trust relationship recognized tribes as “domestic dependent nations” yet held the United States responsible for their health and welfare. Later deliberation of Indian policy by the Court produced a reserved rights doctrine which recognized inherent tribal rights, but the Court also allocated “plenary” power to the United States. Plenary power meant that the United States held ultimate authority to unilaterally alter U.S.–Native American policy and terminate specific Indian rights. However, the trust relationship compelled a reasoned exercise of this power, to be used only to benefit Indian peoples. For resolving disputes over treaty interpretation, the “canons of construction” established that treaties should only be interpreted from the tribal perspective and, if ambiguous, judicial rulings should be in favor of the tribes.

Despite a seemingly favorable attitude on the part of the judiciary, in actuality Indian peoples suffered catastrophic loss of economies, lands, and life in the persistent push of white settlements westward. The

most grievous example was the 1830s removal policy under which the Five Civilized Tribes were forcibly removed from the Southeast to the newly created Indian Territory in what later became Oklahoma. The removal policy persisted with treaty-making in the West in the 1850s and 1860s. The western treaties created a reservation system in which the inherent rights of Native Americans would presumably persist. However, these treaties underscored the long standing tension between trust, responsibility, and a stronger force promoting white settlement and economic development. Some treaties also recognized aboriginal hunting, fishing, and gathering rights outside reservation boundaries to help perpetuate traditional economies. The treaties also implicitly established a unique system of water rights later recognized by federal courts. In 1871 Congress acted to end the treaty-making era, thus closing a chapter on the use of treaties to define U.S.–Indian relations.

An era of forced cultural assimilation followed from 1871 to 1930 in which U.S. Indian policy attempted to blend Native Americans into the dominant society. Believing the tradition of communally held property was a major barrier to Indian assimilation, Congress passed the General Allotment Act of 1887. The act authorized the Bureau of Indian Affairs (BIA) to divide up all Indian lands, allotting parcels of 160 acres to families and 80 acres to single individuals over 18 years of age. Individuals receiving the allotments became U.S. citizens. The hope was that when Indian people held their own property they would become farmers embracing an agrarian lifestyle. Tribal lands left over after the allotment process were considered “surplus” and sold to non-Indians. Much land went into forfeiture when many Indians could not pay taxes on their properties. In all, the policy was a further economic disaster reducing the tribal land base in the United States from 138 million acres in 1887 to 48 million acres in 1934. Much of the most agriculturally productive lands passed out of tribal control. In another assimilationist effort, all Indians became U.S. citizens through the Indian Citizenship Act of 1924, but the Bill of Rights did not apply to Indians because of tribal sovereignty.

By the 1930s, realizing the calamity of the allotment policy, U.S. policy swung back again to the recognition of sovereignty. The Indian Reorganization Act of 1934 ended the allotment process, stabilized tribal holdings, and promoted tribal self-government by encouraging tribes to adopt Western-style constitutions and form federally chartered corporations. Though many tribes rejected developing constitutions, they did

organize various governmental institutions during this period.

By 1953 U.S. policy began a significant move back to assimilation with termination policies. Through a House resolution, Congress voted to terminate recognition of a select group of tribes, ending the special trust relationship. Some reservations were terminated and the lands sold to non-Indians, thus taking away the economic base for the Indian communities. In addition, Public Law 280, also passed in 1953, expanded state jurisdiction onto tribal lands in selected states, diminishing tribal sovereignty in those areas.

With little sustained congressional support for termination policies, in the 1970s U.S. policy again took a dramatic shift back to a tribal government, self-determination era. The Indian Civil Rights Act of 1968 extended most of the Bill of Rights to Indian peoples and pared back some of the states' authorities granted in P.L. 280. Most importantly, the Indian Self-Determination and Education Assistance Act of 1975 encouraged tribes to assume administrative responsibility for federal programs benefiting Indian peoples, many of which were in health and education. Congress continued to pass acts empowering tribes including the American Indian Religious Freedom Act (1978), Indian Mineral Development Act (1982), Indian Gaming Regulatory Act (1988), and Native American Graves Protection and Repatriation Act (1990). Tribes could form their own governments, determine tribal membership, regulate individual property, manage natural resources, develop gaming businesses, collect taxes, maintain law enforcement, and regulate commerce on tribal lands.

Tracing the history of U.S.-Indian relations reveals that Native American policy is not actually a coherent body of principles, but an aggregate of policies derived from many sources over time. For more than 200 years, U.S.-Indian policy vacillated between periods of supporting tribal self-government and economic self-sufficiency and periods of forced Indian socio-economic assimilation into the dominant Western culture.

NATIVE AMERICANS, TREATMENT OF (SPAIN VS. ENGLAND) (ISSUE)

When Christopher Columbus landed on the island of Hispaniola in 1492, he met natives there. When this was reported to Queen Isabella of Spain, she immediately decreed that the natives (Indians as the Spanish would call them) were her subjects and were morally equal to all her other subjects including the Spaniards themselves. They were to be treated humanely and not to be enslaved, and they were to be Christianized and Europeanized.

Columbus violated these decrees from the beginning and thus he created a tension between Crown policy and behavior in the field that endured throughout the colonial period. Columbus' first illegal act was to ship five hundred Indians back to Spain as slaves. When Queen Isabella heard of this, she immediately ordered that the Indians be freed and sent back to Hispaniola. Meanwhile, Columbus' men on the island had continued their practice initiated from the outset—of brutalizing Indians, who eventually rebelled. Those who survived the repression of the rebellion were treated as prisoners of war and were forced to work. For all practical purposes these Indians were slaves.

In addition to the enslavement of rebellious natives, Columbus initiated the practice of tribute. Under this system each Indian male was required to gather and turn in a certain amount of gold every ninety days. If he failed, the Indian was subject to a death penalty. Many ran away and even more died from exposure to

the microbes of European diseases for which they had no immunity. The subjugation of native peoples was also employed during the next twenty years on Puerto Rico, Cuba, and Jamaica and the results were the same. Indians virtually disappeared from the Caribbean Islands.

Indians who survived the initial invasion were required to work and to accept Christianity. If they refused, they could be forced to comply. Many did resist and a system was devised to deal with them. It was known as the *encomienda*. Under this system Indians were regarded as part of the land: When land grants were made to settlers, the native inhabitants became a part of the grant. As property of the landowners, they could be forced to work without being technically enslaved. At the same time they were to be converted to Christianity by the local priests.

Spanish churchmen took very seriously their obligation to Christianize the Indians. Some of them were appalled by the harsh treatment meted out to the Indians by many *encomenderos* and they demanded reform. One of these was a Dominican Friar, Antonio de Montesinos. As a result of his demands, the Crown promulgated the Laws of Burgos in 1512. These required that Indians were to be put into villages where they would live under supervision. They were to be baptized, given religious instruction, and encouraged to marry. They were to work for the Spaniards no more than nine months per year, and they were to be free and not mistreated.

The Crown also issued a document known as the *Requerimiento*, which was to be read to all Indians before the Spaniards could declare war on them. Written in Spanish or Latin, and thus unintelligible to the natives, *Requerimiento* was intended to inform them that they were about to become subjects of the Spanish Crown. If they submitted peacefully, all would be well, but if not, they would be attacked and enslaved.

Another priest who took the side of the Indians was Bartolome de Las Casas. He believed the Laws of Burgos were too weak and the *Requerimiento* was a travesty. He persuaded the government to appoint him Protector of the Indians and for a few years (1514–1517) he sought to employ a milder regime for the Indians. This did not work. The settlers obstructed Las Casas' efforts at every stage and the Indians continued to die. Facing a critical labor shortage, the Spaniards began to import African slaves in 1517.

Another important element of Spanish policy in the New World was the mission system. Beginning in the middle years of the sixteenth century, Spanish

priests, with the support of the Crown, began to establish supervised communities in frontier areas. A few priests would go into an area, learn the local Indian dialect, and begin to preach the gospel. They would persuade the Indians to build a village, accept Christianity, and settle into a sedentary life. The process was extremely dangerous and sometimes the friars lost their lives; however, they often succeeded.

The pattern established in the sixteenth century was essentially repeated again and again throughout the 300 years of the Spanish colonial period. One major feature of this policy was that it brought the whites and Indians together; it did not separate them. This, of course, led to intermingling and intermarrying and it soon produced a new class of people—the mestizos. Today, mestizos are the majority in most Latin American countries.

The English did not establish permanent settlements in the New World until more than a century after the Spaniards. The first two were Jamestown (Virginia) in 1607 and Plymouth (Massachusetts) in 1620. In both cases the Englishmen faced a problem that the Spaniards also encountered a century earlier: they had to determine how to evaluate the natives and how to deal with them.

The English lived in proximity to the Indians for some years. This intermingling, however, did not produce the same results as that of the Spaniards. The North American Indians did not die out as rapidly as their native peoples of the Caribbean and the English, who came in families, did not inter-marry with the Indians as frequently as the Spaniards. Like the Spanish priests who were appalled at the treatment of the Indians, some English observers also spoke out. Roger Williams, a Separatist Puritan who came to Massachusetts Bay in 1631, charged that the English had no right to occupy land that the Indians were already living on. For the most part, however, especially in New England, the colonists tried to recreate the villages that they had known in England and did not try to bring the Indians into their society or convert them to Christianity.

On the other hand, there were some similarities between the two experiences. Like the Spaniards, the British sought to enslave Indians without much success, and they also sought to Christianize them, although not nearly as diligently as the Spanish had. Under the auspices of the Society for the Propagation of the Gospel in New England, founded in 1649, and the Society for the Propagation of the Gospel in Foreign Parts, founded in 1701, the Puritans in New England attempted to persuade the Indians to accept

Christianity. Settlements known as “praying Indian” towns were established beginning in 1651. Eventually, there were as many as fourteen of these, with a population of around 1100 in Massachusetts alone. It is believed that there had been more of these settlements in other colonies.

However, the overall relationship between the British and Indians was a bad one. The two elements which it was based upon could not sustain cordiality: trade and land occupancy. In most cases the trade relation was based upon an exchange of furs for trinkets, firearms, and blankets. When the furbearing animals were depleted the Indians had nothing to exchange and they became embittered. As for land, the British frequently attempted to buy land from the natives, but the Indian concept of ownership and exchange of title was nothing like that of the Europeans. This difference led to misunderstandings which often resulted in conflict.

As in the case of the Spaniards and the Indians, so in the case of the British and the Indians, the pattern was essentially repeated again and again as the whites moved inexorably to the West. However, the pattern itself was different. Here it was a succession of trade, attempts to secure land, misunderstanding, and conflict. The result was that the Indians were generally in retreat after the first few decades of the colonial period, especially as the Indians learned that close association with the colonists was likely to result in sickness and death from European disease, like smallpox. Efforts to enslave the Indians were given up fairly early and the effort to Christianize them, although part of the agenda of the early period of colonization, never developed as extensively as it did in Latin America. The most important difference, however, was the absence of intermarriage.

NATURAL MONOPOLY

Natural monopolies exist where control of an industry by one company is considered more efficient than having many small companies producing the same good or service. One large firm can produce goods or services at a lower per-unit cost, passing the savings on to the consumer. These savings in production costs are called economies of scale.

Examples of natural monopolies with economies of scale are electricity and natural gas utilities, (formerly) telephone companies, and transit companies supplying bus service to a locality. Resources would be duplicated and wasted if several electric companies supplied a city’s energy needs. Each firm would have to lay its own cables, repair its own lines, and have separate workers and offices. Similar difficulties would exist with gas and transit companies. To avoid such problems, the U.S. government allows natural or legal monopolies to operate by giving them the right to do business in a certain area free from the competition of other firms in the same industry. Although natural monopolies are often privately owned in the United States, they must accept government regulation. Generally, the government assumes the responsibility of setting prices and establishing quality of service by any monopoly that is allowed to operate. The regulatory activities are carried out at all levels, local, state, and federal. In other countries, many natural monopolies are nationalized, government-owned, and government-operated.

NAVAL STORES

Naval stores are products used in the construction and maintenance of wooden ships, such as timber, tar, pitch, and resin. These materials are derived from conifers (evergreens) which early American settlers found to be plentiful in the colonies. Pine timbers were also used for masts. The abundance of pine in the

Navigation Acts

forests of New England and the Carolinas fostered a thriving colonial export business as well as a shipbuilding industry. Naval stores were a commodity of the triangular trade routes, since sea captains exchanged them for black slaves on the West African coast. Naval stores were also exported to England, a country that had exhausted much of its own forests and therefore relied on the colonial timber to maintain and sustain its fleets. Although England severely limited American imports after the American Revolution (1775–1783), naval stores remained among the few commodities that were exempt from the policy.

NAVIGATION ACTS

Between 1645 and 1761 British Parliament passed a series of 29 laws intended to tightly control colonial trade, shipping, and industry to the benefit of English interests. The American colonists largely ignored these acts, which were intended to ensure that the British colonies in North America remained subservient to the mother country. The initial act of 1645 forbade the import of whale oil into England unless it was transported aboard English ships with English crews. Subsequent laws passed in 1651, 1660, and 1663 provided the basis of the Navigation Acts. The First Navigation Act (1651) resembled the legislation of 1645 but was more far-reaching. It stipulated that goods could only enter England, Ireland, or the colonies aboard English (or English colonial) ships. Furthermore colonial coastal trade was to be conducted entirely aboard English ships.

The Second Navigation Act (1660) reaffirmed that goods could only be transported aboard English ships and established a list of “enumerated articles” that had to be shipped directly to England. The intent was to prevent the colonies from trading directly with any other European country. England required the colonies to sell their materials directly to English merchants or pay duties on goods sold to other countries. The list of articles included sugar, cotton, tobacco, indigo, rice, molasses, apples, and wool. In 1663 Parliament passed the Staple Act, making it illegal for colonies to buy products directly from foreign countries; European countries would first have to ship their products to England or pay customs fees. Through the Navigation Acts England tried to establish itself as the gatekeeper of colonial imports and exports. But the laws were difficult to enforce and the colonists easily circumvented them. Smuggling was rampant: In 1684 Parliament

annulled the 1629 charter of the Massachusetts Bay Company. It charged that the colonists had violated English law by exporting tobacco and sugar directly to Europe and had thereby shown disrespect to the king. The laws nevertheless had little effect on the colonial economy, which grew at twice the rate of England’s during the period. The acts continued to be passed until the eve of the American Revolution (1775–1783).

NAVIGATION ACTS, ECONOMIC BURDEN ON THE AMERICAN COLONIES (ISSUE)

The economic burden of the Navigation Acts on the American colonies has been a subject of debate both among the eighteenth century colonists and among scholars in the twentieth century. The debate has mostly been over whether the economic burden of the Navigation Acts was sufficient to warrant the American Revolution (1775–1783).

The most important Navigation Acts were enacted in 1651, 1660, 1663, 1673 and 1696. They were expressions of the economic doctrine of mercantilism. This doctrine asserted that foreign trade was a form of economic warfare with other trading nations and that the winner in this war would be the nation that accumulated the most gold and silver. The role of colonies in the mercantilist system was subordinate to the “mother country.” They were to furnish staple foodstuffs and raw materials to the mother country as well as a market for the finished goods of the mother country. The most important Navigation Acts of seventeenth century England decreed that only colonial or English ships could trade with the colonies; that certain “enumerated” colonial products could be shipped only to England; that American exports to Europe had to pass through English ports, to be taxed; and that colonial goods shipped to England could not compete with English goods.

Some of these acts hurt colonial trade. Especially in the grain-growing middle colonies and the Chesapeake, there was consternation at the fact that the colonies could trade their main export staples only with England. They would have preferred broader market opportunities. And, given the many coves and inlets on the eastern seaboard, American merchants took the opportunity to smuggle goods and to trade with whomever would give the best price.

Thus the Navigation Acts presented both benefits and burdens to the American colonies. New England benefited from the monopoly in the shipbuilding and shipping industries. Because of the proximity to the forests of upper New England, Massachusetts shipyards already enjoyed lower costs than those in Britain and produced many ships for British merchants. Once built and on the water, the colonial ships fared well in the imperial trade, especially on routes between New England and the West Indies. American crews could be paid and dismissed at home ports while British ships at the same ports were forced to bear the expense of frequently idle deck hands.

The early decades of the eighteenth century were a period of “benign neglect” of colonial trade by Great Britain. The English government was preoccupied with a series of wars with France that grew out of commercial competition. Only after the conclusion of the expensive and exhausting “Seven Years’ War” (1756–1763), known in the colonies as the “French and Indian Wars” (1754–1763) did the English Parliament begin to re-examine the trading policy with its colonies.

After 1763 the English Parliament decided to force the colonies to pay their share of maintaining the British fleet which, in their view, spent much of its time defending the colonies. After the war British policy shifted from a loose commercial system to a tightly regulated imperial one. The new taxes that they attempted to impose—the sugar tax, the stamp tax, and the tax on tea—became the focus of contention between the colonies and the British authorities.

Whig historians such as George Bancroft (1800–1891) and Progressive historians such as Charles Beard argued that the economic burden of the Navigation Acts was considerable. These historians point to the central problem of indebtedness. Because of the chronic imbalance in colonial trade stemming from the Navigation Acts, they chafed under the colonial regime. Even wealthy colonies like Virginia and Maryland masked huge debts. Lesser planters borrowed from larger ones, who in turn were perpetually indebted to British “factors” (brokers). The Progressive historian Charles Beard concluded that it is “generally known the debts due to British merchants and other private citizens constituted one of the powerful causes leading to Revolution.”

More recent historians have re-examined the data and concluded that things were not all that bad. Robert Paul Thomas estimated that the gross burden of the administrative empire and the Navigation Acts on imports and exports was \$3.1 million in 1770 but that

the figure had to be weighed in light of the benefits of membership in the empire. Thomas estimated that the burden was approximately \$1.24 per person or two percent of colonial per capita income. But when this was set against the benefits and especially military and naval protection (\$1.775 million overall, and a little less than \$1 per person) the net costs were less than one million dollars, or about 41 cents per person in 1770. For Thomas as well as a growing number of scholars after him the Navigation Acts posed no serious financial hardship to the colonists. These scholars considered that if these were considered burdens they had been placed on political and ideological, not economic, scales.

Other colonies benefited also from the British policy of subsidizing the production of some colonial staples. The 1748 sixpence per pound bounty on indigo was decisive in boosting the indigo industry in South Carolina. But when the bounty disappeared after the American Revolution so did the industry. Likewise in North Carolina bounties on lumber and naval stores such as tar, pitch, and turpentine yielded cash payments somewhat greater than those on indigo. The general protection that the British markets offered also benefited all the colonies, even those who exported unsubsidized goods. Colonial exports received higher prices in Britain because competing non-imperial products bore special high tariffs.

But the Navigation Acts bore many burdens as well. Most imports and exports within and outside the empire were required to be routed through England first. For this reason colonists had to pay higher prices for most goods imported from the European continent and other non-imperial sources. The Navigation Acts required that roughly three-quarters of all colonial exports be shipped through Britain first. The result was that almost two-thirds of all colonial exports were subject to laws that reduced both export volume and price. Americans were forced to pay premium prices for protected English manufactures like lace and linen because they could not buy them from lower-cost continental sources. Meanwhile southern planters had to bear the costs of re-exportation, shipping, and lower prices when their tobacco and rice which was first shipped to England demanded higher prices on the international markets. Because other foreign vessels were excluded from imperial trade, colonists bore higher shipping costs as well. In the long run colonists paid higher prices and earned smaller incomes than they would have earned without the restrictions of the Navigation Acts.

NEBRASKA

Admitted to the Union as the thirty-seventh state on March 1, 1867, Nebraska is located in the western north-central United States, midway between the Atlantic and Pacific Oceans. Nebraska shares boundaries with South Dakota in the north, Kansas in the south, Iowa, Missouri, and the Missouri River in the east, and Wyoming and Colorado in the west. Nebraska is spread across 77,335 square miles, making it the sixteenth largest state. Its population of approximately 1.6 million people ranks thirty-sixth among the fifty states. Omaha is the state's most populous city, while Lincoln is its capital.

Nebraska was acquired by the United States in 1803 as part of the Louisiana Purchase. In 1804 the federal government commissioned Meriwether Lewis and William Clark to map the newly acquired territory, catalog its wildlife, and establish relations with local inhabitants. Lewis and Clark's expedition took them along Nebraska's eastern border. Two years later Zebulon Pike crossed southern Nebraska during his own expedition. These expeditions stimulated fur trade in the region, and the U.S. Army built a fort in Nebraska to protect traders from hostile Native Americans.

Native Americans grew more hostile as white settlers began encroaching upon their lands. The Indian Removal Act of 1830 opened land for white settlement in the Atlantic states by authorizing federal troops to relocate Native Americans from the southeastern United States to the so-called Indian Territory comprised of land in Nebraska, Kansas, and Oklahoma. Thousands

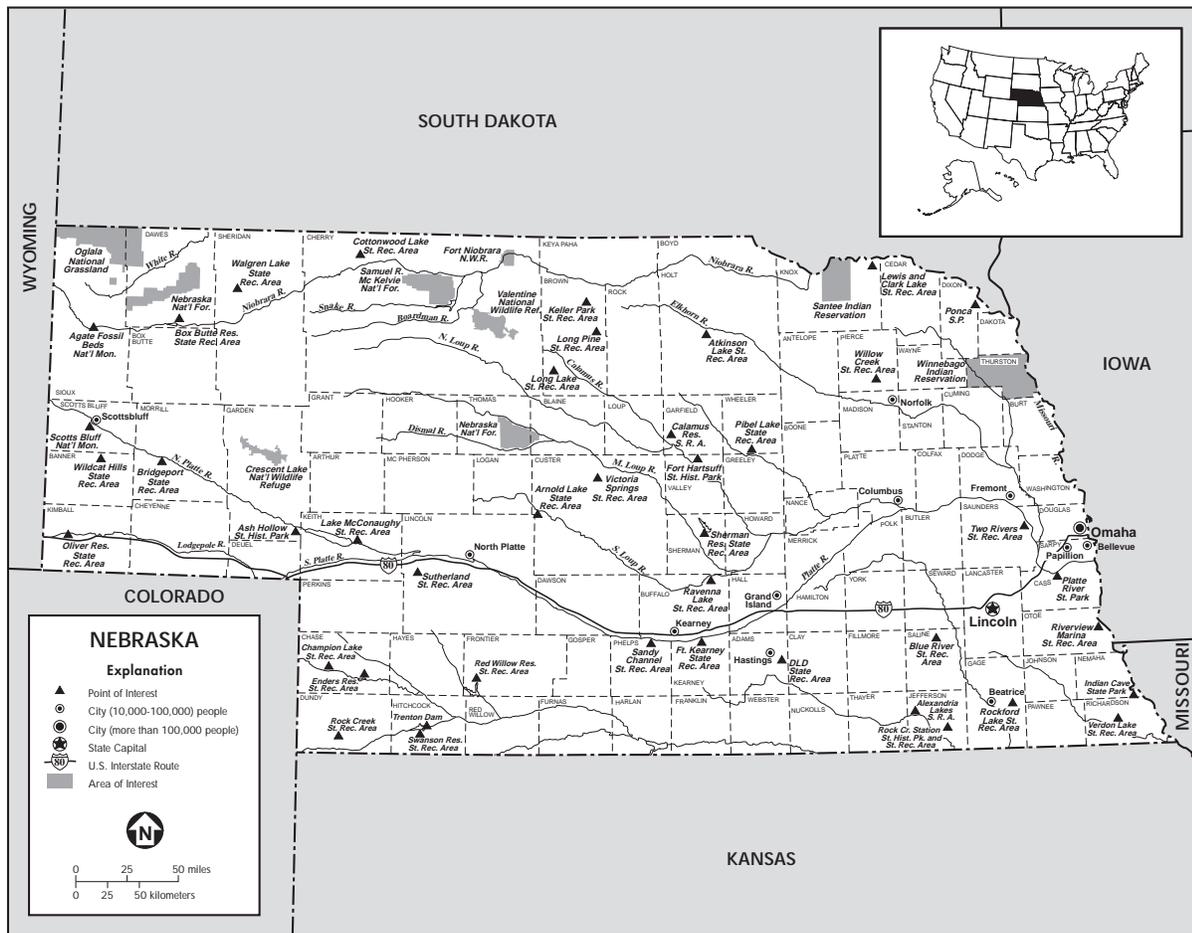

of Native Americans suffered great hardships as they were forcibly uprooted from their homelands and driven westward in what has become known as the Trail of Tears.

Native Americans were next forced to cede land for white settlement within the Indian Territory. In 1854 most Native Americans were excluded from eastern Nebraska, while the Sioux and the Cheyenne peoples remained in the western half. Skirmishes between the two tribes and federal troops broke out when the U.S. Army opened a trail to Montana that crossed Sioux and Cheyenne hunting grounds in the west. In 1869 Congress ratified a treaty agreeing to abandon the trail in exchange for the Sioux's promise to leave Nebraska and relocate their peoples to a reservation in what is now South Dakota.

But many Sioux refused to move, arguing that the federal government had deceived them into signing the treaty. Fighting resumed between U.S. troops and the two tribes. On June 25, 1876, General George Armstrong Custer (1839–1876) led a Seventh Cavalry attack against the Sioux camps of Sitting Bull and Crazy Horse on the banks of Little Bighorn in Montana. Custer and most of his cavalry were killed during the attack. However the army chased down Crazy Horse in northwestern Nebraska, where the Sioux leader surrendered. All but approximately 12,000 Native Americans were ultimately removed from Nebraska, with small numbers of Santee Sioux, Omaha, and Winnebago tribes remaining.

Nebraska also played a role in the events preceding the American Civil War (1861–1865). The 1854 Kansas-Nebraska Act created the territories of Kansas and Nebraska, and allowed the residents of each territory to decide for themselves whether to permit slavery. The act repealed the Missouri Compromise of 1820, which had outlawed slavery in the North. But following the act's passage Nebraska showed little interest in establishing slavery. However violence erupted in Kansas between slavery proponents and abolitionists. The slavery debate eventually divided the nation as a whole, leading eleven southern states to secede from the Union.

Nebraska voters rejected statehood during the Civil War, but narrowly approved a state constitution in 1866. In 1867 Congress admitted Nebraska to the Union over the veto of President Andrew Johnson (1829–1837), who contended that the state's admission process was unconstitutional. Two federal laws attracted settlers to the new state. The Homestead Act of 1862 gave 160 acres of land to families that resided in the

State of Nebraska.

state for five years and paid a nominal fee. The 1862 Pacific Railroad Act authorized construction of a transcontinental railroad passing through Nebraska. Huge tracts of land along the proposed railway were sold to settlers. The Union Pacific Railroad debuted in 1869 with an eastern terminus at Omaha. Nebraska's population swelled from 30,000 in 1860 to almost a million by 1890.

Most of the families that settled in Nebraska during this period were of European descent. Throngs of immigrants from Germany, Czechoslovakia, Ireland, and Italy made Nebraska their home in the late 1800s. A century later little had changed in the state's demographics. The 1990 census revealed that approximately 90 percent of Nebraska residents identified themselves as white persons descending from German, Irish, Czech, Swedish, or Danish ancestry. For the most part these ethnic groups have acclimated well within the state; they have formed closely-knit, thriving communities. However, during World War I (1914–1918) a number of German Americans in Nebraska had

their loyalty and patriotism questioned by state officials who feared they might be spies or saboteurs.

Once primarily a rural state, nearly two-thirds of Nebraska residents now live in urban areas. Yet 95 percent of the state's land is used for agricultural purposes, and close to one-half of the state's labor force work in farm-related fields. Known as the Cornhusker State, Nebraska produces 4 billion bushels of corn each year, second only to Iowa. It is also a leading cattle-raising state. But Nebraska's strong economy is bolstered by non-agricultural businesses as well. The state's tourism industry generates about \$2 billion a year in gross revenue, while the insurance, telecommunications, real-estate, and healthcare sectors help keep Nebraska's unemployment rate among the nation's lowest.

In terms of political institutions, the Cornhusker State's most distinctive feature may be the government's unicameral legislature, the only one of its kind in the United States. The single house has 49 senators

Netscape Communications Corporation

who are elected in even-numbered years to serve four-year terms without designation of political party. The state maintained a bicameral legislature for 68 years before amending its constitution in 1934. Voters hoped the amendment would rein in governmental spending during the Great Depression (1929–1939).

NETSCAPE COMMUNICATIONS CORPORATION

Netscape Communications Corporation was founded in 1994 as Mosaic Communications Corporation by James H. Clark (b. 1944) and Marc Andreessen (b. 1972). Clark, a former Stanford University professor who studied three-dimensional graphics, had started Silicon Graphics Inc. in 1982 (the company became famous for animating the dinosaurs in the movie *Jurassic Park*). Clark resigned from Silicon Graphics in February 1994.

Andreessen grew up with computers and wrote his first basic program when he was eight. As a 21-year-old undergraduate he was assigned to work on three-dimensional visualization software for the prestigious National Center for Supercomputing Applications at the University of Illinois at Champaign-Urbana. Together with six other computer specialists, he created a graphical user interface (GUI) for finding Internet sites. The GUI, called Mosaic, enabled users to find

A lot of us were rooting for Netscape. We didn't want to see it get downsized, restructured or swallowed up. Netscape wasn't just another Silicon Valley software company, any more than Apple is just another computer maker. Netscape stood for something grand, something transcendental and empowering. It gave people the tools to communicate their ideas cheaply or sell their stuff to anyone on the planet without going through middlemen, censors, gatekeepers, or even the IRS.

Joshua Quittner and Marc Andreessen, *Time*, December 7, 1998

sites without having knowledge of specialized programming languages. Mosaic was credited with making the Internet much more accessible. It was released on the Internet in January 1993; during its first 18 months of availability, the number of Internet users tripled and the number of sites grew a hundredfold.

Andreessen and Clark met when Clark sent Andreessen an E-mail message on the same day he resigned from Silicon Graphics. Clark was interested in using the Internet to carry interactive video. Two months later, in April 1994, Clark and Andreessen formed Mosaic Communications Corporation. Andreessen proposed creating a super program known as "Mozilla." While Clark provided four million dollars to set up headquarters in Mountain View, California, Andreessen led the development effort. After the University of Illinois objected to the use of the name "Mosaic," the company became Netscape Communications Corporation in November 1994.

In December 1994 the company shipped its new Web browser, Netscape Navigator. Jim Barksdale, formerly with AT&T's McCaw Cellular division and Federal Express, was hired in January 1995 to be the chief executive officer. Andreessen served as vice president of technology with the primary responsibility of overseeing product development.

In a somewhat controversial move, Netscape chose to give away its browser for free, perhaps following the model established by the University of Illinois with Mosaic. Interested users simply downloaded the software from the Internet via modem. The easy availability of Navigator created a lot of goodwill for the company among the Internet community, and it also established a base of users. Within four months an estimated 75 percent of all Internet users were using Navigator.

Netscape was making money from the sale of its web servers, supplying them to companies for \$1,500 to \$50,000. The high-priced systems enabled companies to create online or “virtual” stores where customers could view products and purchase them online with credit cards. It was a time when electronic commerce over the Internet was in its infancy, and Netscape was providing a key element that would help it achieve explosive growth in the coming years.

While one version of Navigator was available for free, an improved version with more features was offered for \$40. Netscape signed up resale partners, including Apple, AT&T, Hewlett-Packard, IBM, and others, and by 1996 the company was selling products in 29 countries. By early 1996 it had signed up more than 1,000 Internet service providers to distribute Navigator to their customers. Netscape Navigator featured an open architecture that enabled it to work with all kinds of computers and operating systems. The open architecture concept, known as TCP/IP (Transmission Control Protocol/Internet Protocol), was the same concept upon which the Internet was based.

Major companies also found that Netscape’s web servers could communicate easily with outside networks. These became servers of choice in corporate intranets. Netscape gained a 70 percent market share among the Global *Fortune* 100 companies in the lucrative intranet market.

Following the introduction of Netscape Navigator, the company was almost out of money. It received much-needed equity capitalization when it sold an 11 percent interest to a consortium of media and computer companies that included Adobe Systems, International Data Group (IDG), Knight-Ridder, TCI, and Times Mirror. Without having turned a profit, Netscape went public in August 1995. Its initial public offering (IPO) was one of the hottest of the 1990s, perhaps foreshadowing the skyrocketing prices of Internet stocks that would take place later in the decade. Netscape stock was first offered at \$28 a share; it was worth \$75 after one day of trading, and it peaked at \$171 on December 5, 1995. The company’s first-day market capitalization was \$2.2 billion.

Microsoft Corporation provided the first serious competition to Netscape Navigator when it introduced Microsoft Internet Explorer 2.0 in 1995. Earlier that year Microsoft had licensed Mosaic from Spyglass, Inc., which had obtained the rights to the Internet browser from the University of Illinois. Microsoft offered free downloads of Internet Explorer and bundled it with Windows 95. Over the next three years

Netscape’s share of the browser market would decline from a high of 80 percent to 40–50 percent. Barksdale would later accuse Microsoft of “unfair competition,” and he was the first witness called by the Department of Justice in its 1998 antitrust suit against Microsoft.

During 1995 the development of electronic commerce was hampered by the lack of a secure payment system that would enable customers to make credit card payments over the Internet. Netscape teamed with MasterCard to develop the Secure Courier encryption standard, while Microsoft and Visa joined forces to develop the Secure Transaction Technology. In January 1996 Netscape teamed with Verifone, the largest credit card transaction processor, to develop a credit card payment system for the Internet using the Secure Courier technology. In September 1995 Netscape suffered a security breach when two hackers at the University of California at Berkeley cracked the security code in Netscape Navigator. Netscape corrected the problem and posted warnings on the Internet. It also established a “Bugs Bounty” program, giving prizes to users who identified flaws and potential security problems with the software.

Netscape entered into several strategic alliances in 1995 and 1996. America On-Line (AOL), the nation’s largest provider of on-line services, agreed to offer improved Internet access for the users of Netscape Navigator. Both Netscape and Microsoft worked with Hewlett-Packard to develop a Hypertext Markup Language (HTML) that could be printed as seen on screen. Netscape also worked with Sun Microsystems Inc. on the development of JavaScript language, which allowed programs to be imbedded in web pages.

Netscape acquired software developer Callabra Software Inc. in January 1996 for \$108.7 million. Callabra’s main product was Share, a system that enabled simultaneous E-mail discussions and document sharing among network users. In February Netscape acquired Paper Software Inc. and its 3-D programs for the Internet. Since its founding in 1994, Netscape had enjoyed phenomenal growth, with sales rising from one million dollars in 1994 to \$81 million in 1995 and \$346 million in 1996. After reporting losses in 1994 and 1995, the company turned a \$21 million profit in 1996.

Netscape continued to form joint ventures in 1996 and 1997. Netscape and GE Information Services joined to develop electronic commerce software, with Netscape acquiring full ownership in November 1997 for \$56.1 million created Actra Business Systems. Together with Novell it established Novonyx, and

Nevada

Netscape and Oracle formed the joint venture Navio Communications Inc. to produce consumer-oriented Internet software. Oracle purchased Navio from Netscape for \$60 million in May 1997.

In January 1997 Netscape joined an alliance with Oracle, IBM, and Sun Microsystems to develop common standards for all of the company's software products. The NOIS alliance, as it came to be known, was seen as a response to Microsoft's growing dominance in several key sectors of the software market. Netscape also released Communicator, the successor to Netscape Navigator. During the year Netscape improved its position in the business software market by acquiring Digital-Style, which made Web graphics tools, and Portola Communications, which made messaging systems.

Although Netscape's annual revenues reached \$534 million in 1997, the company reported a surprising \$88 million loss. It laid off 300 workers. Almost immediately thereafter, reports began to appear that the company was for sale. The value of Netscape's stock had fallen dramatically. With \$261 million in the bank and no debt, it appeared to be a desirable takeover target. IBM, Oracle, Sun Microsystems, and AOL were all reported to be potential suitors.

In April 1998 Netscape acquired Kiva Software, strengthening its position in the web server market. Later in the year it acquired AtWeb, which provided automated Web site management and marketing services, and NewHoo, a directory-based search service. These acquisitions would enhance Netcenter, Netscape's portal to the Internet.

After nine months of takeover rumors, AOL announced in November 1998 that it would acquire Netscape for \$4.2 billion in a stock-for-stock transaction. After passing regulatory approval in March 1999, the transaction was completed, creating what *The Economist* called the "world's most powerful Internet company." As part of the deal Sun Microsystems would pay \$350 million to license AOL/Netscape software and sell \$500 million worth of servers to AOL/Netscape. With the acquisition, AOL now had two competing Internet sites, America Online and Netscape's Netcenter, both of which enjoyed extremely high traffic.

NEVADA

Nevada was one of the last areas of the United States to be explored because with its vast, dry deserts it was not thought to be worth anything. However, when gold and silver were discovered in the rich earth miners flocked to the area, cities were built, and the state flourished.

Explorers moving westward didn't reach Nevada until 1826 when Nevada was still a part of Mexico. Until then the land was largely ignored by Mexico and Spain, the owners before Mexico. In 1846 the United States went to war with Mexico to take over Nevada and other southwestern land. The United States won the Mexican War in 1848. The first town in Nevada, Genoa, was built up in 1851 around a trading post that was developed as a stop over for gold miners on their way to California.

The first detailed reports about Nevada came from John Frémont, who, with his famous guide, Kit Carson, explored Nevada from 1843–1844. Carson City, the state capital, and the Carson River are named for Kit Carson.

In 1859 miners flocked to Nevada after gold and silver were discovered there. Virginia City was developed near what was to become one of the biggest silver mines in the world, the Comstock Lode. The town had a reputation of lawlessness as bandits robbed stagecoaches, and gamblers tried to win miners' silver and gold. The state's development throughout the rest of the century was dependent on the Comstock Lode. When the silver and gold dwindled in the mine in the 1870s a 20-year depression hit the state. An effort to revive the economy called for encouraging mining by increasing the value of silver. Nevadans supported the movement for free silver coinage during the 1890s, and the Silver Party dominated state politics over the next ten years.

State of Nevada.

Nevada was admitted to the union on October 31, 1864 and enlarged to its current size in 1866. Towns sprang up near gold and silver mines around the state, which were so plentiful that the United States government opened a mint in Carson City, which operated from 1870 to 1893. By 1880 many of the mines were cleaned out, so Nevadans began cattle ranching as a substitute.

In 1900 the economy was revived as another silver mine was discovered in Tonopah and in 1902, two gold miners were founded and the town of Goldfield was built. Also, copper mines were discovered in eastern Nevada.

During the early 1900s settlers attempting to farm in Nevada had a difficult time trying to get water to irrigate their lands. In 1902 the Newlands Reclamation Act set aside federal funds for irrigation and by 1907 the project was finished. The irrigation project allowed farmers to grow crops in Nevada's western desert which previously was sand.

During World War I Nevada's beef industry provided rations for the troops. Then the Great Depression hit the country in 1929 causing banks, farms, mines, and factories to fail. However, in 1931 Nevada's economic health began to turn around as a federal public works project supported construction of the Hoover Dam, the Davis Dam and the Southern Nevada Water Project. These projects provided jobs, water and hydroelectric power for the state. Gambling also was legalized in the state. As a result, Las Vegas and Reno became major entertainment centers in the country as casinos and hotels were built.

After World War II started in 1941 Nellis Air Force Base was built near Las Vegas and a navy air base was built at Fallon. During the war the United States started manufacturing nuclear weapons and the first nuclear tests were conducted at the Nevada Test Site, just northwest of Las Vegas, in 1951. Nuclear tests have continued over the years however, since 1963 they are conducted underground.

Revenues from casino gambling grew as Nevada allowed large businesses to own casinos. Investors such as airplane manufacturer Howard Hughes built hotels and casinos in Reno and Las Vegas. In the 1950s gaming became the state's leading industry. New federal and state regulations were imposed on the casinos when it was revealed during the 1950s and 1960s that organized crime had gradually moved into the gaming industry, using casino money to finance narcotics and other illegal activity on the east coast.

As the number of casinos grew, the populations of Las Vegas and Reno exploded between 1970 and 1994 as the census in Las Vegas tripled and Reno's population doubled. As businesses and people moved to Nevada, larger amounts of water were needed. The drought between 1988 and 1992 did not help matters. Nevada continues to examine new ways of supplying water to areas around the state.

In the 1990s the largest industries in Nevada included gambling and tourism, which together generated more than 50 percent of the state's income. Mining in Nevada produces more than 350,000 pounds of gold and 1.4 million pounds of silver each year. Computers and electrical equipment were also the leading products; beef cattle, sheep, dairy cows, and hogs were the major farm products, along with hay, grapes, and onions.

In 1995 Nevada's per capita income was \$24,390 and 11.1 percent of all Nevadans lived below the federal poverty level.

NEW DEAL

The New Deal (1933–1939) was a series of programs intended to alleviate the suffering caused by the Great Depression (1929–1939), an abrupt economic collapse that began in 1929 and resulted in massive unemployment throughout the 1930s. The New Deal began with the inauguration of Franklin Roosevelt (1933–1945) as President of the United States in 1933.

To restore confidence in the American financial system Roosevelt declared a "bank holiday," closing all banks for four days until Congress met to pass bank reform legislation. The immediate banking crisis ended soon after when Congress passed the Emergency

NEW DEAL PROGRAMS		
Year Instituted	Program	Description
1933	Agricultural Adjustment Administration (AAA)	Farmers were paid to stop growing specific crops. Consequently, the demand for and the value of the crops rose.
1933	Civilian Conservation Corps (CCC)	Provided jobs for urban youth in work such as planting trees, maintaining fire lines, and improving hiking trails.
1933	Federal Deposit Insurance Corporation (FDIC)	Insured individual savings held in banks and other institutions across the country. Monitored and defined standards for the banking industry.
1933	Federal Emergency Relief Administration (FERA)	Provided food and shelter to those most affected by the Great Depression. Distributed cash grants to the states for disbursements to individuals and families on the "dole."
1933	National Recovery Administration (NRA)	Set standards for wages, prices and production to encourage business recovery and investment.
1933	Public Works Administration (PWA)	To stimulate demand in the construction industry, the PWA initiated large building projects such as dams, aircraft carriers, schools, and government buildings.
1933	Tennessee Valley Authority (TVA)	Constructed a series of dams on the Tennessee River to provide electricity and flood control for seven southern states. The program also established health centers and schools.
1935	Rural Electrification Administration (REA)	Encouraged the growth of rural electrification cooperatives, spreading electricity throughout the country's rural areas.
1935	Social Security Act (SSA)	A government-run pension program, designed to provide financial assistance to the elderly, the disabled, and the unemployed.
1935	Works Progress Administration (WPA)	Created urban work projects, such as repairing streetcar tracks and cleaning streets.
1937	Farm Security Administration (FSA)	Loaned money to struggling sharecroppers. Helped relocate farmers to more productive land and provided shelter for migrant workers.
1938	Fair Labor Standards Act (FLSA)	Established a minimum wage and set a maximum of work hours for unskilled laborers employed by business associated with interstate commerce.

Franklin D. Roosevelt's "New Deal" programs attempted to alleviate the financial hardships brought on by the Depression in the 1930s.

Banking Act, which required the Treasury Department to inspect all banks before they could reopen. Three-fourths of the Federal Reserve system banks reopened within three days.

Even though these measures stemmed the immediate crisis, more comprehensive measures were needed. Congress passed the first program, the Agricultural Adjustment Act, in May 1933. The most important aspect of the act was its establishment of the Agricultural Adjustment Administration, which provided subsidies to farmers who were told to reduce crop production by leaving part of their land idle. In 1936 the Supreme Court ruled that it was unconstitutional for the government to require farmers to limit production and the act became inoperable. However, within weeks Congress passed the Soil Conservation and Domestic Allotment Act, which allowed the government to pay farmers to reduce production. In addition, the Roosevelt administration helped poor farmers by setting up the Resettlement Administration in 1935, succeeded

by the Farm Security Administration in 1937, which helped farmers on marginal lands relocate to better land by providing loans.

Saving the industrial economy was the most significant challenge facing the Roosevelt administration. On the one hand, businesspeople wanted to stop rapid deflation by relaxing antitrust laws to allow the cooperation of trade associations and stabilize prices. On the other hand, New Dealers wanted business to recognize the rights of workers to organize and bargain collectively in unions, which would allow workers' wages to rise with prices. The resulting compromise was the National Industrial Recovery Act (NIRA), passed in June 1933, which established a new federal agency, the National Recovery Administration (NRA). The NRA called for every business to abide by a temporary "blanket code," with a minimum wage of between 30 and 40 cents an hour, a maximum work-week of 35 to 40 hours a week, and the abolition of child labor. Those employers who followed the code

displayed the NRA symbol of the Blue Eagle in their windows.

The NRA also set up codes for most of the country's major industries to establish price and wage floors, below which the specific industry could not go. However, the hastily devised codes would fail. Most importantly, federal officials, inexperienced in running such a large program, did not have the capacity to administer it. In addition, Section 7(a) of the NIRA gave workers the right to form unions, but had no mechanism for enforcement. Thus, the program failed to raise workers' wages and increase consumer purchasing power. In 1935 the Supreme Court nullified NRA legislation when it ruled in the *Schechter* case that in giving the president the power to shape the NRA codes, the Congress had acted unconstitutionally. Consequently, the failing program was abolished.

THOUGH THE PROGRAMS DEvised FOR THE EARLY YEARS OF THE NEW DEAL WERE INTENDED TO BE TEMPORARY, THEY PROVIDED A BASIS FOR LATER SOCIAL MEASURES THAT BECAME PART OF A PERMANENT WELFARE STATE.

One of the most successful New Deal programs was legislation enacted in 1933 to create the Tennessee Valley Authority (TVA), a project for building a dam at Muscle Shoals and for the comprehensive redevelopment of the region. By building dams and waterways in the region, the TVA nearly eliminated flooding in the area and provided electricity to thousands of people. But the Roosevelt administration also initiated major financial reforms. On April 18, 1933, Roosevelt made an inflationary move by signing an executive order, which took U.S. currency off the gold standard. Enabling the government to manipulate the value of the dollar, government management of currency set a significant precedent in federal policy and changed the relationship between the government and business. The New Deal also gave the government authority in areas of the economy that previously were weakly regulated. The Glass-Steagall Act of June 1933 allowed the government to regulate irresponsible speculation by banks. The act also established the Federal Deposit Insurance Corporation (FDIC), which guaranteed all bank deposits up to \$2,500. In 1935 Congress passed a banking act which transferred the authority of the regional Federal Reserve to the Federal Reserve Board in Washington, D.C. Congress sought to protect stock market investors by passing the Truth in Securities Act of 1933, which required corporations to provide accurate and complete information to the public. In addition, in June 1934, the Securities and Exchange

Commission (SEC) was established as a stock market watchdog.

The expansion of federal relief provided to millions of unemployed Americans was an enormous undertaking. One of President Roosevelt's first programs was the Federal Emergency Relief Administration (FERA), which gave grants to states in which relief agencies had run out of money. However, the FERA relief would not be enough. The second program, the Civil Works Administration (CWA), provided work relief to more than four million people between November and April during the president's first year in office. But both FERA and CWA were intended as only relief measures, not as long-term programs meant to save the country's economy. By 1934, Roosevelt began to dismantle the CWA. His administration also established the Civilian Conservation Corps (CCC), which employed millions of young men, mostly urban, to work in camps at national parks and forests on conservation and reforestation projects. Though the programs devised for the early years of the New Deal were intended to be temporary, they provided a basis for later social measures that became part of a permanent welfare state.

In 1935 Roosevelt began a new set of programs called the "Second New Deal." Noted for its shift to a decidedly anti-corporate stance, the president proposed one of the most progressive tax systems in American history. Called a "soak the rich" plan by conservatives, the system had taxes reach as high as 75 percent on income for the richest of Americans.

Another significant development during the New Deal was the growth of labor militancy. When the Supreme Court nullified the NIRA in 1935, Senator Robert F. Wagner of New York introduced the National Labor Relations Act (also called the Wagner Act) in Congress. The new law gave workers more federal protection than Section 7(a) provided by including an enforcement mechanism in the National Labor Relations Board (NLRB), which was given the power to require employers to recognize unions. While showing few signs of challenging employers in the 1920s, union leaders and workers, encouraged by the Wagner Act in 1935, stepped up organizing efforts. John L. Lewis of the United Mine Workers helped start the Committee on Industrial Organization to begin organizing unskilled factory workers, a group that the more conservative American Federation of Labor ignored because of their commitment to organizing only skilled workers. The number of workers in recognized unions jumped from three million in 1932 to eight million in 1937, and to 10 million in 1941.

In 1935 Congress passed the Social Security Act (SSA), one of the most important pieces of social welfare legislation in American history. The act established several programs. First, it provided for federal assistance to the elderly in poverty, who could receive \$15 a month. The act started a pension system, in which workers and their employers would pay a payroll tax, beginning in 1940, to provide an old age pension of \$10 to \$85 a month for many workers, though it excluded domestic servants and agricultural workers. The SSA also set up an unemployment insurance system, and provided aid to handicapped people and dependent children.

In addition, the Roosevelt administration set up the Works Progress Administration (WPA) in 1935, a much larger work relief program than the CWA. Between 1935 and 1941, the WPA employed about 2.1 million workers. WPA workers built 110,000 public buildings, 600 airports, and over 500,000 miles of roads, and over 100,000 bridges.

Though President Roosevelt won a landslide victory in 1936, he faced a conservative backlash during the following years. Although the economy had improved by the summer of 1937, a recession struck the economy that year. In 1938, the president asked for emergency funds for public works and relief programs, and as the government's spending saturated the economy, a recovery seemed possible. The American economy, however, would not recover from the Great Depression until World War II. Only the massive federal spending needed to produce the men and material to fight the war brought the depression to an end and laid the ground work for the postwar economic boom. Even though New Dealers failed to meet their goal of rejuvenating the American economy, they had remade the federal government and its relationship to the corporate world.

NEW DEAL: REFORM OR REVOLUTION (ISSUE)

In 1933 the New Deal was initiated after the inauguration of Franklin Delano Roosevelt (1882–1945) as President of the United States. The New Deal represented a set of extensive legislative programs intended to alleviate human suffering that resulted from the Great Depression. In 1929 the Depression had brought about a collapse of the national economy.

Historians have drawn various conclusions about the legacy of the New Deal and its effect on the U.S. economy and society. At the time, critics of the New Deal came from both the political right and left. Conservatives attacked Roosevelt's programs as "socialist" reforms. They argued that he had intervened too deeply in the affairs of business and the economy. Groups such as the American Liberty League, led by the Du Pont family, publicly opposed the "dictatorial" course of the New Deal. By 1935 many New Dealers had given up trying to reconcile their agenda with business interests. Feeling forced by growing Conservative opposition to Roosevelt's liberal programs, New Dealers advocated programs of a more strident, anti-corporate nature. As part of the "Second New Deal" in 1935, for example, the administration proposed to increase taxes on the wealthy, whose income tax could reach as high as 75 percent under this scheme. It was the highest rate ever proposed in U.S. history and was branded a "soak the rich" plan by conservatives, although in practice very few Americans were rich enough to be placed in the highest income bracket.

The liberal policies of the New Deal were for the most part supported by socialists, communists and other radicals. At times, however, critics on the left claimed that New Dealers had not gone far enough in redistributing economic and political power to marginalized groups which included the labor movement, farmers, women, and minorities. The Social Security Act (SSA) was one of the most important pieces of social welfare legislation in U.S. history. Congress passed it in 1935. The act provided federal

assistance for the destitute elderly, set up an unemployment insurance system, aided the handicapped and dependent children, and started a pension system. It was a pension system, however, that excluded domestic servants and agricultural workers from coverage. Since both categories contained a large number of African Americans and women, many needy people were denied security in their old age.

NEW DEAL REFORMS OF THE NATIONAL ECONOMY AND SOCIETY OPERATED WITHIN THE CONFINES OF THE POLITICAL AND IDEOLOGICAL REALITIES OF THE CAPITALIST SYSTEM.

Despite the contemporary criticism from the right and left, the widespread popularity of President Roosevelt's policies was evidenced by his landslide presidential victory in 1936 and his reelection in 1940 and again in 1944. He held his office for four terms, longer than any other president in U.S. history.

After World War II (1939–1945) liberal historical interpretations of New Deal policies dominated. Historian Arthur M. Schlesinger argued in the *The Age of Roosevelt* (1957) that the New Deal created a reformed capitalism. He maintained that the power of businesses had finally been constrained by the regulation of public interests. Other liberal historians such as Carl Degler in *Out of Our Past* (1959) took the argument a step further. Degler claimed that in addition to American Revolution (1775–1783) and the American Civil War (1861–1865), the Roosevelt administration brought on a “Third American Revolution.”

Other historians were more critical. In *The Age of Reform* (1955) Richard Hofstadter found a break with the past in the New Deal programs. Hofstadter was critical of the New Deal for lacking an overall philosophy in shifting from policies favoring the Progressive reform of the corporate world to a New Deal liberalism with a “social democratic tinge that had never before been present in U.S. reform movements.”

William Leuchtenburg was the first historian to provide a systematic, sympathetic critique of the period in *Franklin D. Roosevelt and the New Deal* (1963). He called the New Deal only a “halfway revolution.” Leuchtenburg argued that New Deal reforms were limited because of the ideological and political opposition faced by the Roosevelt administration. According to Leuchtenburg little more could have been achieved given the realities of the time. Ellis Hawley, meanwhile, challenged the liberal assumption that the New Dealers worked against corporate interests. He further argued in *The New Deal and the Problem of Monopoly*

(1966) that New Deal programs in many cases were meant to promote private business interests.

In the 1960s historians of the New Left were much more critical. Ronald Radosh argued that the New Deal helped enhance the power of capitalism. Radical historians such as Colin Gordon in *New Deals* (1994) also provided evidence that there were close associations between New Dealers, industrialists, and financiers.

But by the 1970s and 1980s most historians agreed with the interpretation that the New Deal was historically significant and positive in its reforms. Nevertheless they ceded the New Deal was severely limited by the political and ideological realities of the time. Later research was concerned less with the “conservative” or “revolutionary” nature of the Roosevelt administration's policies. Contemporary scholars such as Theda Skocpol, James T. Patterson, Barry Karl, Mark Leff, and others focused more on the ideological and political limits with which the New Dealers had to contend. Allen Brinkley in *The End of Reform* (1995) provides an analysis of the New Deal that explores these ideological constraints. The New Deal, he emphasizes, underwent a transition from a government that promoted regulation to one that, for the most part, wished to stay out of the affairs of the business world.

Debate about the efficacy and impact of the New Deal still continued at the end of the twentieth century, almost 80 years later. Conservatives continued to criticize the Roosevelt administration programs for controlling the economy too extensively. Liberal and radical historians, conversely, maintained the reforms were beneficial to society in spite of the constraints that the New Dealers confronted. Although historians somewhat disagreed about the radical implications of the New Deal programs, they came to two similar conclusions. The first was that the New Deal legislation raised federal spending and regulation to the highest levels in U.S. history. The second was that New Deal reforms of the national economy and society operated within the confines of the political and ideological realities of the capitalist system.

NEW FRANCE

New France refers to the collective holdings of France in North America during colonial times. At its height New France consisted of the colonies of Canada, Acadia, and Louisiana. The first land claims were made in 1534 by French explorer Jacques Cartier (1491–1557) as he sailed the St. Lawrence River in eastern Canada. In 1604 Sieur de Monts (c. 1568–c. 1630) established a settlement at Acadia (in present-day Nova Scotia, Canada). French claims later extended the region to include present-day New Brunswick, Canada, and eastern Maine. Explorer Samuel de Champlain (c. 1567–1635) founded Quebec in 1608. He then penetrated the interior (present-day Ontario) as far as Georgian Bay on Lake Huron. In this way he extended French land claims westward. In 1672 French-Canadian explorer Louis Jolliet (1645–1700) and French missionary Jacques Marquette (1637–1675) became the first Europeans to reach the upper part of the Mississippi River. Ten years later French explorer Robert Cavelier (1643–1687) followed the Mississippi to the Gulf of Mexico. He claimed the river valley for France and named it Louisiana. The majority of French settlers lived in the colony of Canada during the time when the French were expanding their North American claims. The fur trade was the major industry. The French called the colony a *comptoir*, a warehouse for animal pelts. It was never very successful in attracting colonists. France lost the colony to Great Britain in the French and Indian War (1754–1763). Louisiana changed hands numerous times before it was finally sold to the United States in 1803 as part of the Louisiana Purchase; it was France's last claim on the North American mainland. French culture remained prevalent in the former colonies of New France during modern times.

NEW HAMPSHIRE

Dutch, English, and French explorers navigated the coast of New England before the first English settlement in New Hampshire was established along the Piscataqua River in 1623. At this time New Hampshire was still a province of Massachusetts (it did not separate until 1740). White settlers began to move up the Merrimack and Connecticut river valleys in the 1700s, virtually eliminating the Native American population of the area.

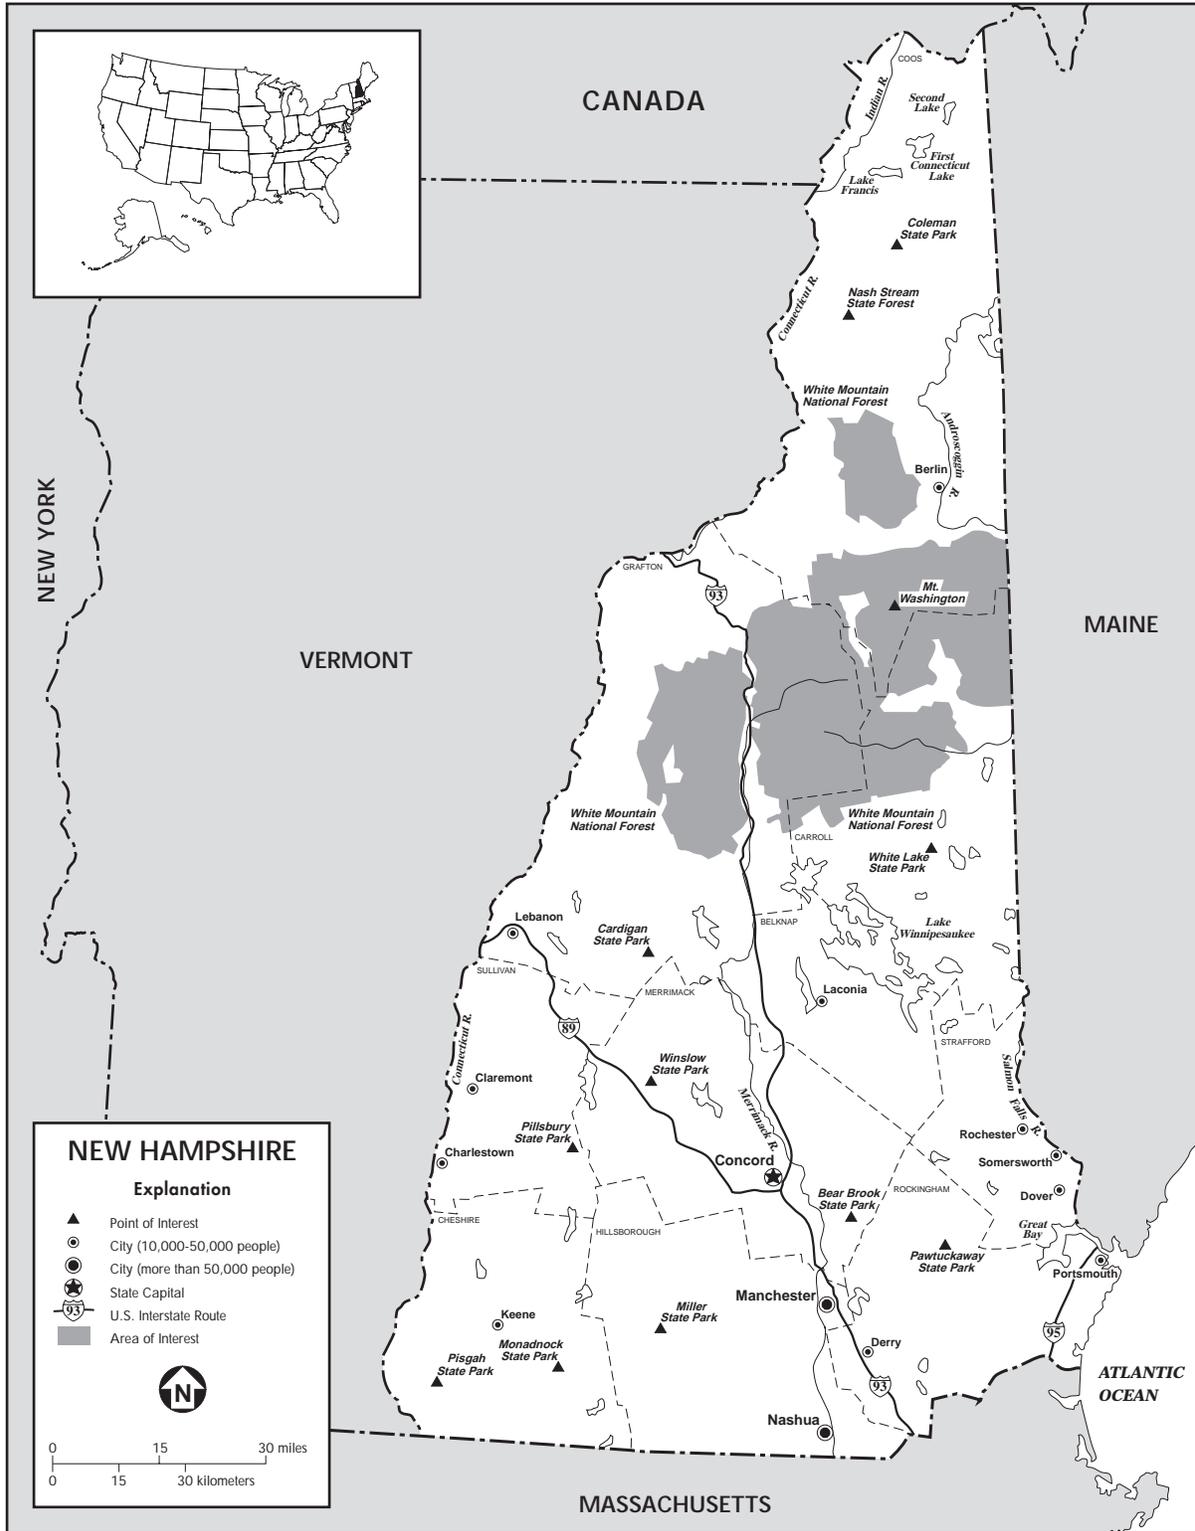

During this period the province's economy was based on fishing, farming, timber harvests, and shipping. Portsmouth became the capital and a busy commercial port. Transportation from Portsmouth to the inland areas was difficult, however, because all travel had to go north or south around the mountains. Thus Boston, not Portsmouth, became New England's busiest trading center. In 1776 New Hampshire was the first of the original 13 colonies to establish an independent government, doing so even before the Declaration of Independence was proclaimed.

During the nineteenth century the textile industry became the most prominent industry in the state. Textile mills were especially plentiful along the Merrimack River. The first workers were generally young "mill girls" who came from neighboring farms to supplement their families' meager incomes. A huge demand for textiles later brought European immigrants to do mill work. Around 1860 French Canadian workers also began flocking south to find work. Meanwhile, farming in the state declined, mostly because of poor soil and rocky terrain.

The growth of what later became the city of Manchester is an interesting case study in how the mill towns developed. The Amoskeag Manufacturing Company was started in 1837 by manufacturers who had worked at the famous Lowell, Massachusetts, mills. In addition to several mills, a whole town was laid out with town squares, schools, churches, parks, and cemeteries, and six block of tenements for the workers and their families. Within eight years the city which grew there increased in population from 50 to 10,000 and the mills were producing the equivalent of 22 miles of yard goods a day for worldwide distribution.

Railroads were making headway during this period as well, despite ambivalence among the populace about how this new mode of transportation would alter New Hampshire life. Railroad companies were granted

New Hampshire

State of New Hampshire.

123 charters in 1846 and 1847, and soon New Hampshire had more miles of track than most other New England states. Regulations on the railroads and on industry passed by the state legislature, however, limited capital growth in the state in the 20 years before the American Civil War (1861–65).

NEW HAMPSHIRE WAS THE FIRST OF THE ORIGINAL 13 COLONIES TO ESTABLISH AN INDEPENDENT GOVERNMENT. IT DID SO IN 1776, EVEN BEFORE THE DECLARATION OF INDEPENDENCE WAS PROCLAIMED.

Ten years after the war people were employed in manufacturing and farming in approximately equal numbers. Like other New England states, however, New Hampshire was experiencing a loss of population as many citizens left the state for newly opened western territories. Farming the rocky soil of New Hampshire was an unattractive option compared to the possibility of a large plot of good farm land in Ohio or Iowa. In 1839 about half the land in the state was agricultural, but by 1870 that percentage had dropped to 39, with more decreases in succeeding decades.

In the southern section of the state mill towns developed where farm land and small villages had been. Elizabeth and Elting Morison observed in their history of the state that on the Merrimack River, “the continuous line of red brick along the water was, in fact, the west wall of a dense and complicated network of mill structures that, threaded by narrow and tortuous passages, extended well inland.” These large factories were full of modern machinery, and some began to turn themselves to the production of other industrial products, such as steam engines and rifles.

Besides textile mills, lumbering continued to be an important industry in New Hampshire. The city of Berlin in north-central New Hampshire was the center for lumbering activity. Firms like the Brown Company sent workers out to cut logs, transport them to the Androscoggin River, and float them down river to the mills in massive log drives. This demanding work was done mostly by immigrants from French Canada, Norway, Germany, and Russia.

Taking advantage of its mountains and its rural appeal, New Hampshire developed a thriving tourist business in the later half of the nineteenth century. Throughout the White Mountains large resort hotels such as the Glen House and the Mount Washington Hotel sprang up, and “summer places” built by well-to-do easterners began to dot the landscape. Other

mountain and lake resorts and cottages were built for the less wealthy. Musicians and artists began to establish colonies in towns like North Conway. By the turn of the century it was estimated that the state was earning \$700,000 annually from the “summer people.” New Hampshire continued to promote tourism in the twentieth century; it ranked second only to manufacturing in the state’s economy in the 1990s.

The last decade of the nineteenth century in New Hampshire was marked by an increase in the power of the railroads, primarily the Boston and Maine. Railroad influence penetrated the state government and it was not curbed until 1911, when a progressively oriented governor and legislature enacted laws to regulate private corporations and public utilities. These reforms preceded similar ones which would be enacted throughout the nation in the coming two decades.

By the early 1920s the New Hampshire textile industry was beginning to decline. A strike at the Amoskeag mills in 1922 only served to highlight the inevitable fact that mills in the South, where much of the raw materials for New Hampshire’s mills was produced, were slowly eroding the profitability of those in the New England. Between 1880 and 1925 the number of mill spindles doubled in New England, but in the South this number increased thirty-fold. In 1950 one New Hampshire town which once had six working mills was reduced to one mill—this scenario was repeated throughout the state.

The Great Depression added to an already declining economy, and the post–World War II drop-off in demand for textiles brought severe recession to many New Hampshire towns. Only logging and paper manufacture in the northern part of the state were moderately prosperous. The state’s population and employment levels both dropped substantially.

In the 1970s and 1980s, however, the southern part of the state began to make a comeback. Interstate highways, the proximity of Boston, and low state taxes helped to encourage people and new high-technology industry to move into the state. Between 1960 and 1988 the state’s population doubled, straining government services and increasing local taxes. Most of the newcomers were relatively more affluent and better educated than the natives of the state. A recession in the early 1990s slowed, but did not stop, this progress.

Modern New Hampshire is one of the most industrialized states in the nation. The state’s per capita income in 1996 was over \$26,000, ranked eighth in the

New Jersey

nation. Only 5.3 percent of its citizens were below the federal poverty level in that year.

NEW JERSEY

The history of New Jersey is a study in conflicts—geographical, political, social, and economic. One end of the state often seems like a part of New York City; the other end has close ties to Philadelphia, Pennsylvania. Although the state retains a healthy agricultural sector, it is better known as a place where industry developed early and then went into decline for a period of time. High unemployment and urban decay have plagued the cities in New Jersey for several decades. In the 1980s and 1990s, however, better times seemed to be on the horizon for the “Garden State.”

In 1524 Italian explorer Giovanni di Verrazano sailed into Newark Bay and became the first known European to reach New Jersey. English Captain Henry Hudson also sailed along the New Jersey shore and established a claim for the Dutch, under whose flag he sailed. Dutch traders founded New Jersey's first town, and Swedish settlers began to settle east of the Delaware River. By the mid-1770s the indigenous Leni-Lanape Indians (whom the English called the Delaware) had exchanged most of their valuable lands for trinkets, guns, and alcohol and had almost disappeared from the area.

England took control in 1664 after King Charles II granted a region from the Connecticut River to the Delaware River to his brother James, Duke of York. The Duke deeded part of the land to his friends Baron

John Berkeley and Sir George Carteret, making New Jersey a proprietorship (New Jersey was named for one of the British channel islands). The country was later divided into two separate parts, East Jersey and West Jersey, only to be reunited in 1702 by Queen Anne. A royal governor was appointed in 1738. To this day the two areas of New Jersey have quite different characters, with the northeastern section closely identified with New York and the southwestern section looking toward Philadelphia.

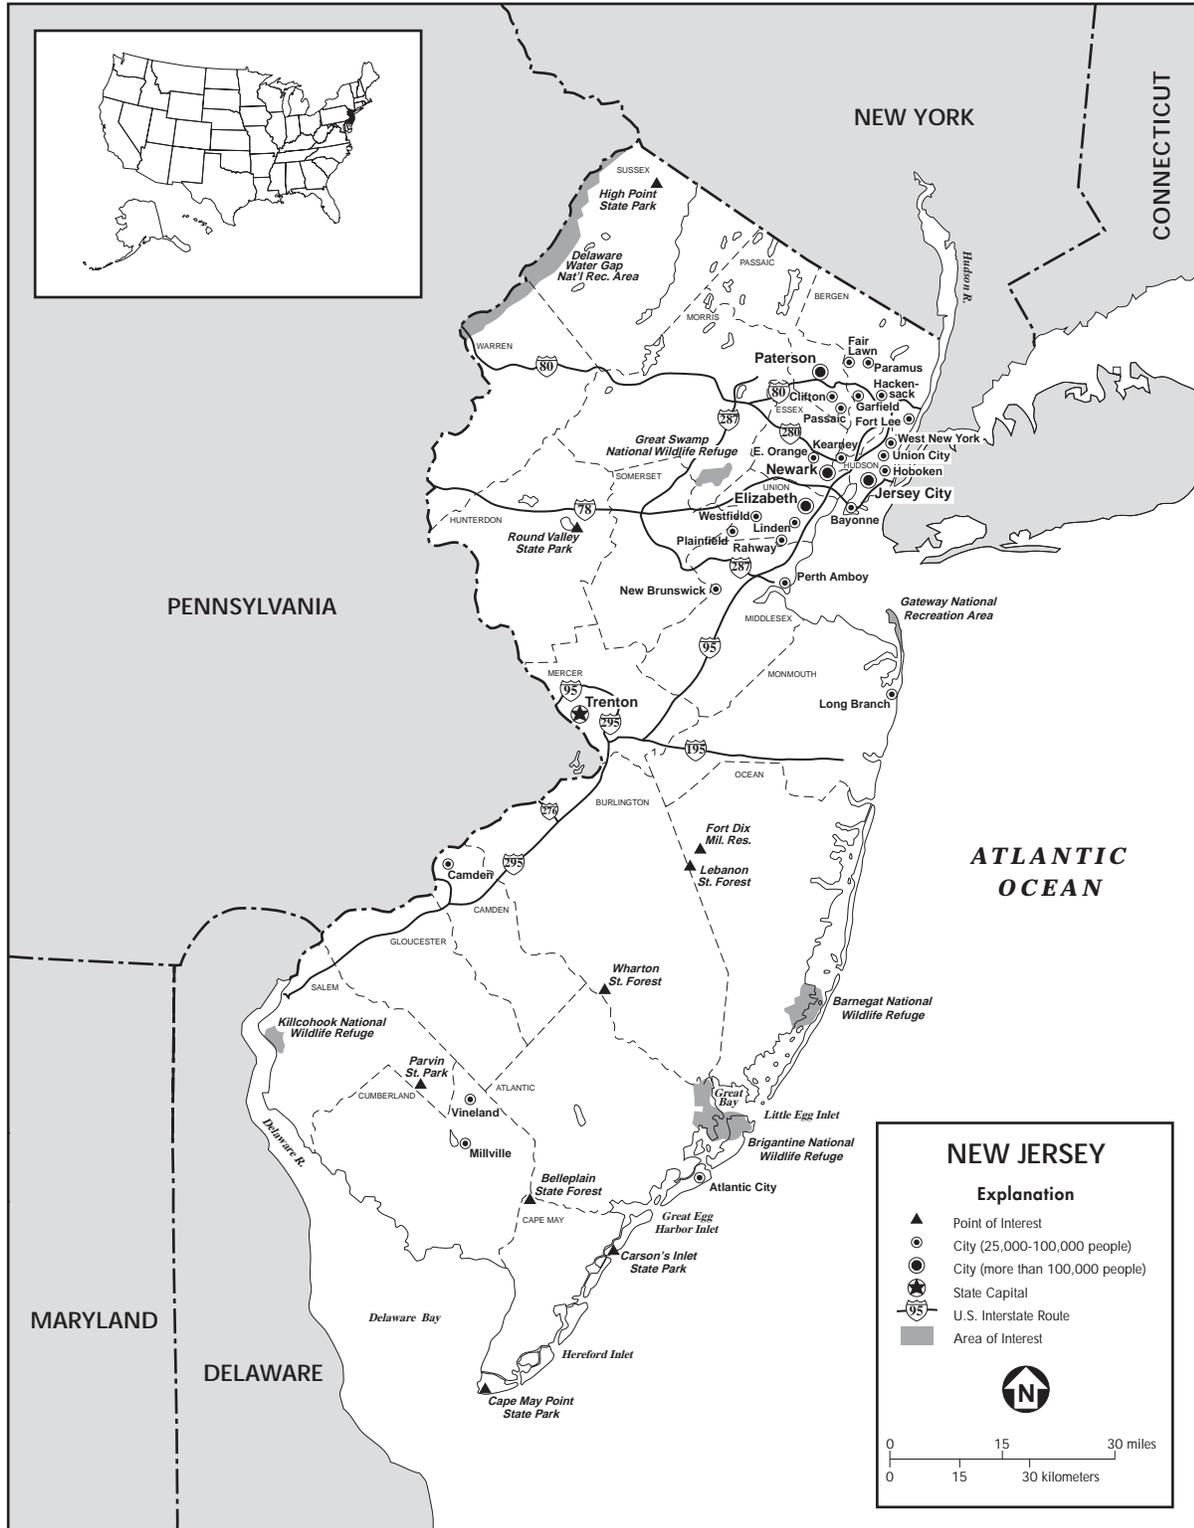

CONTEMPORARY NEW JERSEY IS STILL WHAT GOVERNOR [JONATHAN] BELCHER CALLED IT IN 1745—“THE BEST COUNTRY FOR MIDLING FORTUNES, AND FOR PEOPLE WHO HAVE TO LIVE BY THE SWEAT OF THEIR BROWS.”

Thomas Fleming, *New Jersey: A Bicentennial History*, 1977.

New Jersey played an important role in the American Revolution (1775–1783), but it experienced an economic decline in the aftermath of the war. Its trade with New York was interrupted; its towns were left in ruins; and its profitable iron works were shut down. After New Jersey entered the Union in 1787, however, the state began to recover economically; the town of Paterson, for example, developed as a center of silk manufacturing.

In the 1830s railroads and canals helped to set New Jersey on a course toward urbanization and industrialization. One of the greatest engineering feats of its time, the Morris Canal, connected northern New Jersey with the coal fields of Pennsylvania. The canal benefited many businesses along its route, from iron mines to dyeing and weaving mills. A second canal, the Delaware and Raritan, crossed flat land in the middle of the state. The most important town along the Morris Canal was Newark, the first in the state to be incorporated; it developed around breweries, hat factories, and paper manufacturers. Other towns grew with industries as well: Trenton was noted for its iron and paper plants and Jersey City was noted for its steel and soap operations.

Railroads spelled the end of profitability for the canals, which went into decline after the American Civil War (1861–1865). The first railroad, the Camden and Amboy, opened in 1834; it soon began to monopolize the New York-Philadelphia corridor. Coal brought by the railroad provided a new source of power other than water, and industries sprang up along the railroad's route. After the Camden and Amboy was leased to the Pennsylvania Railroad, numerous other rail lines opened up other areas to development.

State of New Jersey.

Despite much political wrangling over the Civil War in New Jersey, the state benefited economically from the war by providing tons of ammunition and equipment for the Union army. After the war factories continued to make many components used by other manufacturers. In 1873 Isaac Singer (1811–1875) opened a sewing machine plant at Elizabeth; oil refineries grew along the Hudson County waterfront; and pottery manufacturers thrived in Trenton. Newark had a diversified base of manufacturing and a large number of nationally known insurance companies.

New Jersey became the nation's top shipbuilding state during World War I (1914–1918). In addition, New Jersey refined 75 percent of the copper in the country and loaded an equal percentage of U.S. shells. The war, however, did not substantially hinder labor unrest, which had been a part of New Jersey's history since the 1880s. In 1915, at Carteret, a walkout at a fertilizer factory led to the killing of six strikers by guards. In the postwar era, Passaic textile workers stayed off the job for a year in 1926, and in 1933 Paterson silk workers finally gained union recognition and higher wages after another strike.

By that time, however, many other New Jersey workers were experiencing reduced work weeks or unemployment. As the Great Depression (1929–1939) worsened, many expected to take advantage of President Franklin D. Roosevelt's (1933–1945) New Deal programs to provide a measure of relief. Unfortunately for many, these government jobs were almost entirely under the control of Frank Hague, Mayor of Jersey City, a corrupt politician with many ties to the Roosevelt administration. According to Thomas Fleming's history of New Jersey, *New Jersey: A Bicentennial History*, Harry Hopkins, head of the Works Progress Administration, "ignored stacks of testimony and sworn affidavits from men and women who said that they were forced to vote for Hague's candidates and pay 3 percent of their salaries to the [political] machine in return for their jobs." Fleming painted a sorry picture of the relationship between New Jersey politicians and their constituents during this time: "For the first time politicians had access to huge amounts of *legal* money and jobs. No longer did they have to rely on padded loyal payrolls and money from illegal gambling and phony real estate deals." The power of Hague's political machine in the state was formidable, lasting until his defeat as mayor in 1947.

World War II (1939–1945) brought a revival of industry in New Jersey, especially in shipbuilding and munitions. Chemical and pharmaceutical companies also thrived, while Paterson became the nation's leading aircraft engine manufacturing center. After the war

many people left the older cities to build homes in suburbs like Cherry Hill, Woodbridge, and Middletown Township. Between 1940 and 1950 the population of the state burgeoned by 1.2 million, stretching highway use and housing availability to the limit. New Jersey rapidly became the center for many research laboratories during this time, which helped creation of a number of affluent areas such as Bergen County.

For many in the inner cities, however, postwar hopes of economic opportunity had been crushed. According to Fleming, the many African Americans who had come to Newark seeking jobs after the war "virtually guaranteed tragedy." Only half found employment in the declining industries, and "[s]ome 40 percent of them had to travel to work outside the city every morning while 300,000 suburban workers poured into the central district to work in giant insurance company offices or in the remaining industrial jobs." In 1967 the city of Newark erupted into four days of rioting, looting, and burning, which left the city in shambles, both economically and psychologically.

In the next five years Newark lost 23,000 private jobs. In the 1970s and 1980s, 270,000 people left New Jersey as cities lost manufacturing jobs and retailing moved to suburbia. Unemployment reached nearly 10 percent. By the mid-1980s, however, recovery was on the horizon. With the loss of manufacturing jobs came a resurgence of jobs in the service industries. After another recession in the early 1990s, the state rebounded again. The unemployment rate fell to six percent in 1996 for the first time in six years. The recovery was due at least in part to the presence of a highly skilled workforce, which attracted pharmaceutical, biotechnology, electronics, and other high-technology industries to the state. Along with business incentive programs administered by the state Department of Commerce and Economic Development, the relatively low tax burden in New Jersey has helped to encourage new businesses to come into the state. Per capita personal income in the state in 1996 was over \$31,000 and ranked second among all states.

Vitally important to New Jersey's economy are the ports which line New York Harbor. Ports at Elizabeth, with three miles of berthing space, and Newark, with four miles, handle more cargo than New York City ports, benefiting the local economy greatly. Privately owned piers in Jersey City and Bayonne also handle significant cargo. Northern New Jersey port facilities taken together form the largest port in the eastern United States and the second largest in the whole country.

NEW MEXICO

In 1803 when President Thomas Jefferson (1801–1809) purchased the Louisiana Territory from France, New Mexico had been under Spanish rule for nearly 250 years. After the real estate deal with Napoleon Bonaparte was completed, New Mexico had a new U.S. neighbor.

In 1821 Mexico won its independence from Spain and New Mexico became a province of Mexico. Until then, the Spanish had been very careful about allowing foreigners into Mexican territory. But the new Mexican government was eager to allow New Mexico to deal with U.S. traders. Missourian William Becknell entered Santa Fe and sold U.S. goods such as cloth, pans, and tools to residents there. In exchange he received furs, gold, and silver. He made such a profit that his success created a rush of other businessmen to Mexico who traveled along an 800-mile pathway between Independence, Missouri and Santa Fe, known as the Santa Fe Trail.

America's bid to extend its boundaries to the Pacific Ocean involved the conquest of New Mexico. In 1846 war broke out between the United States and Mexico. When the war ended in 1848, the red, white and blue American flag flew over Santa Fe. Mexico was forced to give up California and New Mexico to the United States. Soon after settlers from eastern and southern states began migrating to New Mexico in the early 1850s to ranch or search for gold and silver.

In 1862 the United States began a campaign against the Native Americans in New Mexico to drive them to a reservation on the Pecos River. Christopher "Kit" Carson, a mountain man and military officer, led the charge against the Apaches and Navajos. As the Native

Americans resisted, Carson and his men burned the Native Americans' cornfields and pumpkin patches. Two million pounds of grain were destroyed the first year, causing starvation among the Navajos.

At the same time settlers were fighting among themselves. Cattle ranchers fought against merchants for control of Lincoln County. The Lincoln County War, as it came to be known, involved William H. Bonney, or Billy the Kid, and helped give the territory the image of lawlessness.

In the late 1870s the development of railroad lines across the landscape of New Mexico changed the territory forever. Railroads connected cities in the west and the Southern Pacific line became the first transcontinental track to cross southern New Mexico. Prospectors and equipment for mining were brought to New Mexico by train. Several silver mines were established and towns sprang up. Cattle ranching spread to New Mexico from the southeast region of Texas.

In 1876 statehood for New Mexico was opposed by mining companies, railroads and cattle ranchers who anticipated higher taxes as a result. In addition, New Mexico's diverse population, which included Native American, Spanish, and Mexican cultures, rather than bringing about cultural interchange and amalgamation, fueled the fires of bigotry and racism. However, in 1912 Congress proclaimed New Mexico a state.

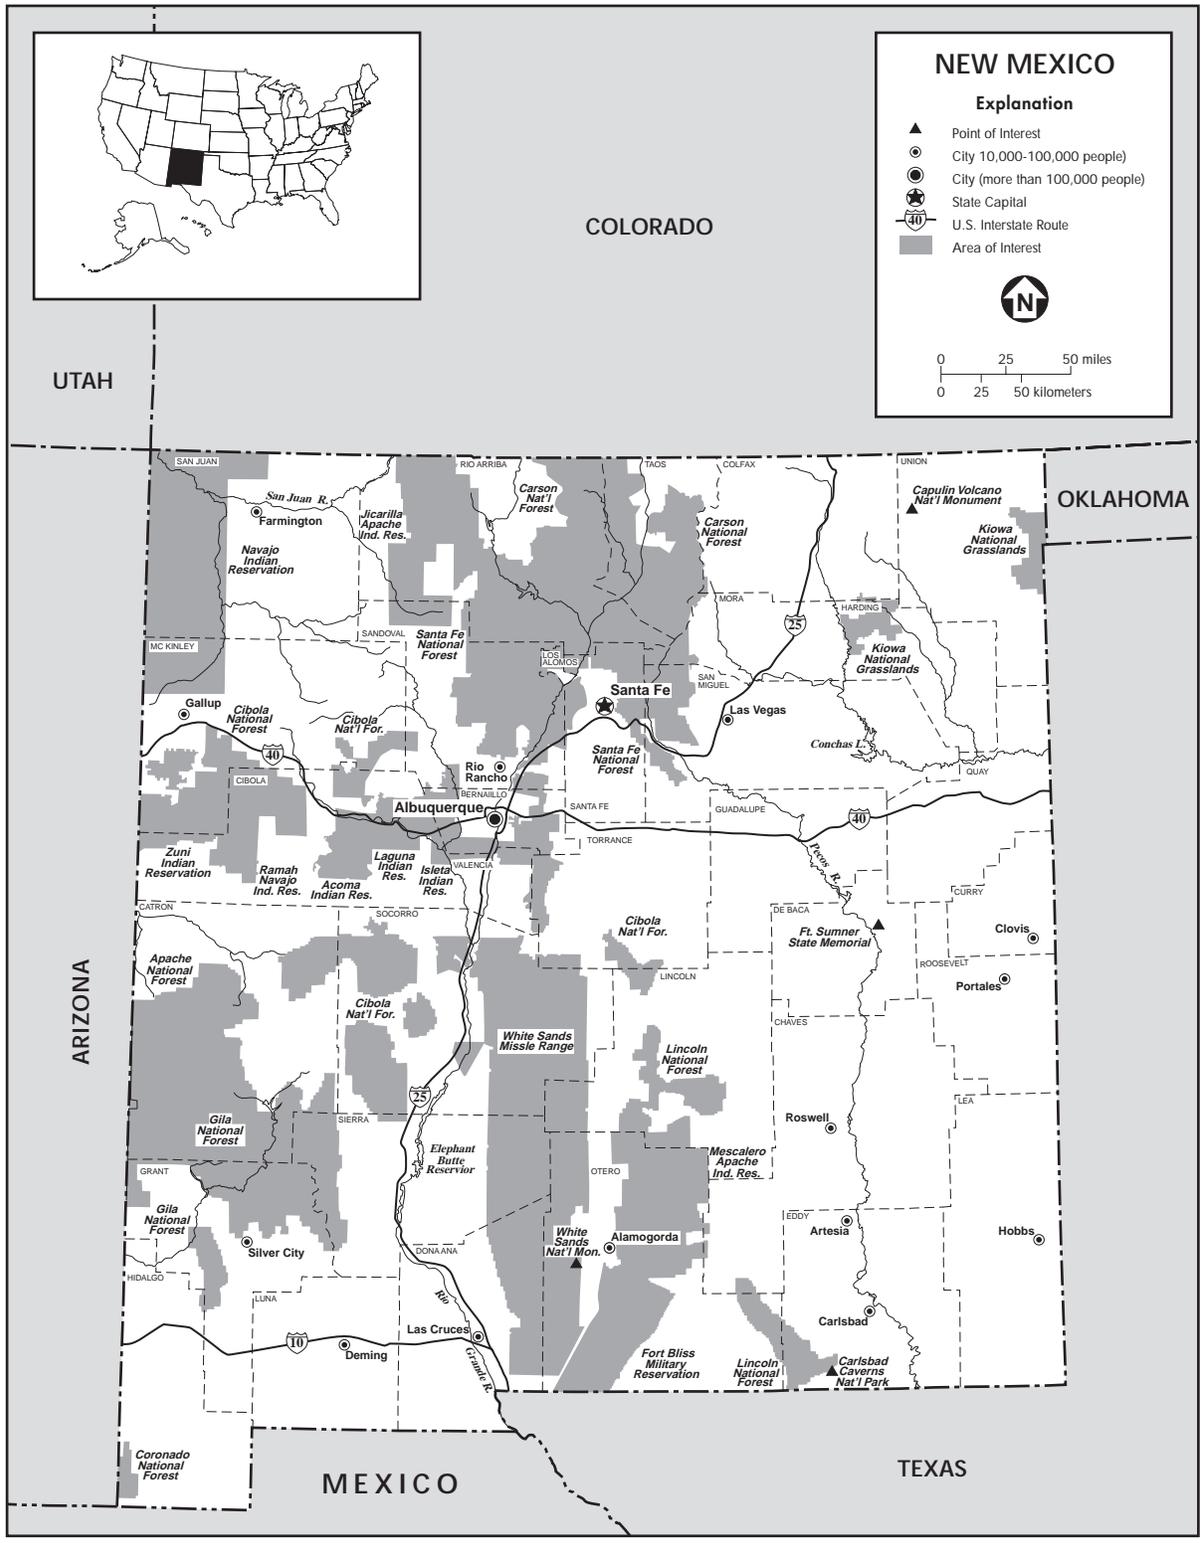

Soon after, New Mexico became a haven for talented artists attracting painters, poets and novelists from the East and Midwest. In 1930 a scientist and visionary named Robert Goddard moved to New Mexico to test rocket models. Eventually aerospace became one of New Mexico's major industries.

As the Great Depression rocked the country in the 1930s, New Mexico was devastated as mines closed and railroads and cattle ranches laid off workers. Economic recovery in the state began after the start of World War II (1939–1945). A steady stream of newcomers were going to a New Mexican ranch called Los Alamos. The ranch had been turned into a secret laboratory for the Manhattan Project, a plan to build the most dangerous war weapon ever.

In 1945 the first atomic bomb test took place in a desert near Alamogordo, New Mexico. Subsequently, the war ended shortly after atomic bombs were dropped on Hiroshima and Nagasaki, Japan. New Mexico was instrumental in bringing the war to an end and the world into the nuclear age.

After the war the federal government turned Los Alamos into a huge nuclear laboratory. Nuclear research was conducted at Sandia National Laboratories

New Mexico

State of New Mexico.

in Albuquerque. The government created the White Sands Missile Range in New Mexico, a test site for rockets. In addition, in 1950 uranium, a metal used in nuclear bombs and nuclear power plants, was discovered in northwest New Mexico. Thus New Mexico became a leading uranium-mining state.

Many scientists, researchers, engineers and their families moved to New Mexico to work at the sites. The state's population doubled in size between 1950 and 1960 and Albuquerque's population quadrupled. So many people were coming from other parts of the country that Spanish-speaking New Mexicans, who once were the majority, became a minority. In the 1990 census, Hispanics accounted for 38 percent of the state's population.

Over the next three decades the state's nuclear and high-tech industries flourished. In 1987 New Mexican companies were awarded \$1.8 million to build the SDI or "Star Wars" missile defense system. Even though the government reduced military spending and income from the nuclear industry decreased in the 1990s, New Mexico's high tech industry offset those losses with Intel's Rio Rancho plant which was the world's largest computer chip factory in the mid-1990s.

Tourism played a major role in the state's economy in the mid-1990s and the state continued to be a leader in space and nuclear research. However, poverty affects a significant number of New Mexico's residents. In the early 1990s the government instituted job training programs to address unemployment issues. In addition, in 1993 a border crossing opened across from Juarez, Mexico to encourage trade between New Mexico and Mexico. In 1995 the median household income was \$25,991 and 25.3 percent of New Mexicans lived below the poverty level.

NEW NETHERLANDS

New Netherlands was the only Dutch colony on the North American mainland. The area consisted of lands surrounding the Hudson River (in the present-day state of New York) and later the lower Delaware River (in New Jersey and Delaware). Explorers from the Netherlands (Holland) first settled the area in about 1610. In 1624 the colony of New Netherlands was officially founded by the Dutch West India Company. In 1626 on behalf of the company Dutch colonial official Peter Minuit (1580–1638) purchased the island of Manhattan from the Native Americans for an estimated \$24 in trinkets. The colonial capital of New Amsterdam (present-day New York City) was established there.

The Dutch settlement was never very big, consisting mostly of single males who were either fur trappers or traders. The seal of the colony was a beaver surrounded by wampum. The Dutch pioneered the use of wampum as a form of money that could be exchanged with Native Americans for beaver pelts. The Dutch tried several devices to attract new settlers, including the patroon system. Investors would be given a large tract of land, if they could populate it with farmers. Eventually land was distributed more liberally. By 1640, 200 acres would be given free to any family of five, including servants. Larger numbers did come before the Dutch lost the colony in 1664, when it was conquered by the English under the direction of the Duke of York, brother of king James II (1633–1701). The English had sought the territory since New Netherlands had separated its American holdings. Under British control the area was divided into two colonies—New Jersey and New York.

During the colonial period the Netherlands also claimed the West Indies islands of Aruba, Bonaire, and Curacao (called the Netherlands Antilles). The islands were administered separately from New Netherlands on the North American mainland.

NEW ORLEANS, LOUISIANA

The city of New Orleans, Louisiana, is situated on the Mississippi River. It is about 100 miles (160 kilometers) north the Gulf of Mexico, making it a strategic port of entry to the North American mainland.

New Orleans, Louisiana

Before the arrival of Europeans in the 1500s Louisiana was home to the Chickasaw, Choctaw, and Natchez Indians who had lived there for thousands of years. French explorer Robert Cavelier (1643–1687) sailed down the Mississippi River in 1682 in search of a westward route from Canada into the interior. He claimed the entire river basin for France. The claim consisted of roughly the central third of the present-day United States. La Salle named it Louisiana in honor of French king Louis XIV (1638–1715). In 1701 the territory was made a province of France; it was one of three French colonies on the North American mainland (the other two were Acadia and Canada; together the three colonies were known as New France). It was not until 1714 that the French began settling Louisiana. In 1718 colonist Sieur de Bienville (1626–1685) established a settlement at New Orleans. He named it after French regent Philippe II (1674–1723), Duke of Orleans. Philippe II ruled France after the death of Louis XIV on behalf of King Louis XV (1710–1774) who was only a youth at the time. To encourage development Scottish financier John Law (1671–1729) was named controller-general in 1720. This gave him authority over Louisiana. While Law succeeded in increasing shipping between New Orleans and France, his *Compagnie d'Occident* failed later that year. The city was made the capital of Louisiana in 1722 but under Law's scheme it attracted few reputable emigrants. In 1731 France reclaimed Louisiana as a royal province, but the colony still did not thrive economically.

In 1762 King Louis XV ceded Louisiana to Spain (ruled by his cousin, King Charles III; 1716–1788). He was on the verge of losing the rest of New France to Great Britain in the French and Indian Wars (1754–1763). Under Spanish rule the colony grew more prosperous, attracting French, American, and Spanish settlers. However New Orleans was still beset by problems, including two fires that destroyed more than a thousand buildings during the late 1700s.

In 1800 the economic and strategic importance of New Orleans became clear as French ruler Napoleon Bonaparte (1769–1821) exhibited an interest in reacquiring Louisiana. Spain, which had bought Louisiana and New Orleans from France in 1763 at the end of the French and Indian Wars with Great Britain, was no match for the French militarily, and Napoleon secretly pressured Spain to return Louisiana to France. Under U.S. envoy Thomas Pinkney's 1795 Treaty with Spain the Spanish had been allowing the Americans to traffic on the Mississippi River and to store their river freight in the warehouses of New Orleans' prior to transshipping it onto ocean going ships. In 1800 and

1802 Spain secretly sold Louisiana back to the French. At about the same time Spain began to renege on the privileges that it had accorded the Americans. In March 1803 the transfer became publicly known.

President Thomas Jefferson, who had been a supporter of the French Revolution and a critic of France's enemy, Great Britain, feared that Napoleon would establish a French presence along the Mississippi River and eventually obstruct westward settlement by the United States' farming population. Jefferson wrote to his diplomatic minister to France, Robert Livingston, that although he had always looked on France as the "natural friend" of the United States, now he had to reassess matters. He observed that there was "one spot" on the face of the earth the possessor of which automatically became "our natural . . . enemy." That spot was New Orleans because of its chokehold on U.S. western river traffic. (Brinkley, 211) Accordingly, Jefferson ordered the rebuilding of the United States Navy and prepared for war with France. Rather than go to war with the United States when he was already engaged in hostilities with the British, Napoleon then agreed to sell the Louisiana territory to the United States. For only \$15 million in the Louisiana Purchase the United States doubled its size.

The city of New Orleans continued to grow and prosper as the agricultural economy of the Ohio Valley and of the "new" southwest of the country (along the Mississippi River) expanded. During the War of 1812 (1812–1814) New Orleans was the site of the most fortunate military engagement of the war (from the standpoint of the U.S.) The city had already been incorporated in 1805. In the Battle of New Orleans the U.S. troops under the command of Andrew Jackson "whipped" the British in what turned out to be the last armed hostilities between the United States and Great Britain.

After the War of 1812 New Orleans continued to serve in its familiar role of warehousing and shipping agricultural goods as the South's sugarcane and cotton plantations were thriving. As a result New Orleans river trade flourished. During the succeeding years it became a major U.S. seaport. Ten dollar bills issued by the Bank of Louisiana were used to pay riverboat men when they unloaded their cargo in New Orleans. The notes were called "dixies" because the French word for ten, *dix*, was prominently displayed on the bill. So successful was this trade that "dixie" soon began to mean the entire south.

Once again, the strategic importance of New Orleans and of the traffic along the Mississippi River

shaped military calculations during the Civil War (1861–1865). Early in the war the Union forces established a blockade of southern ports and, under the command of David Farragut, captured New Orleans on April 25, 1862. Throughout the war the Union forces controlled New Orleans, thus preventing the Confederates from receiving provisions and military hardware from its largest port. The Union Army then proceeded to attack other cities along the Mississippi. They bombarded Vicksburg in June 1862. Over a year later, in July 1863 Vicksburg fell after a six-week siege conducted by Union General Ulysses Grant finally wore down its defenders.

In the modern age New Orleans has continued to prosper not only for its continued economic importance in transshipping agricultural commodities, but also for its tropic climate and its rich cultural resources.

NEW SPAIN, VICEROYALTY OF

New Spain refers to Spanish possessions in the New World during the colonial period. At its height New Spain included what are today the southwestern United States, all of Mexico, Central America to the Isthmus of Panama, Florida, much of the West Indies (islands in the Caribbean), as well as the Philippines in the Pacific Ocean. The viceroyalty (a province governed by a representative of the monarch) of New Spain was governed from the capital at Mexico City beginning in 1535.

The era of Spanish colonization began with the radical de-population of portions of the Western Hemisphere caused by the slaughter of the indigenous people by the Conquistadores and the mass deaths caused by epidemic disease, mostly measles and small pox. This traumatic de-population produced mortality rates as high as 90 percent. It was a catastrophe which disorganized the culture in ways which may only compare to the trauma of Middle Passage voyage below decks for the newly enslaved Africans.

More than anything, the Spanish conquerors were intent on locating and removing precious metals—gold and silver—from the Aztec and Inca empires that they encountered. The mining of silver was accomplished by the enslaving of the native people, later supplemented by importing African slaves. The mines at Potosí (in modern Bolivia) yielded great quantities of silver.

This lust for gold and silver resulted in a ruinous inflation in Spain as the imported bullion suffused throughout the Spanish economy. The initial impact of the inflation was to raise the price of Spanish exports. This helped to destroy Spain's economy, especially its textile industry. Over several decades during the sixteenth century this inflation spread out to the rest of Europe. Since the economies of Europe were mostly experiencing healthy expansion, this somewhat milder wave of inflation did not have the same destructive impact on the rest of Europe as it did in Spain.

Since the Spanish did not bring women with them they intermarried with the native peoples. The resulting mixture of parentage, plus the missionary efforts of the Catholic Church, produced a complex caste system and a creolized culture further complicated by the addition of African slaves to the population. The leaders of the Spanish forces of occupation sometimes installed themselves in almost feudal splendor based on the *encomienda* system of tribute (in precious metal) levied on the local villages.

In 1821 a Mexican rebellion ended Spanish rule there and the colonial empire of New Spain was dissolved. By 1898 Spain had relinquished all its possessions in North America. Its last holdings were the islands of Cuba, Puerto Rico, Guam, and the Philippines, which were ceded to the United States after Spain lost the Spanish-American War (1898).

During the colonial period Spain claimed other territories in the New World—in northern and western South America. Most of these holdings fell under the viceroyalty of Peru, which was administered separately from the viceroyalty of New Spain. Spain lost these possessions as well by the end of the 1800s.

NEW SWEDEN

New Sweden was a small Swedish colony established in 1638 at Fort Christina (present-day Wilmington, Delaware). The Swedes gradually extended the settlement from the mouth of Delaware Bay (south of Wilmington) northward along the Delaware River as far as present-day Trenton, New Jersey. The settlers were mostly fur traders; the Swedes often acted as middlemen between Native American trappers and the English. But there was farming in the colony as well. In

1655 the territory was taken by the Dutch in a military expedition led by director general of New Netherlands Peter Stuyvesant (c. 1610–72). For nine years the territory was part of the Dutch colonial claims called New Netherlands. In 1664 the English claimed it along with the rest of New Netherlands. Delaware was set up as a British proprietary colony, which it remained until the outbreak of the American Revolution (1775–83). New Sweden was the only Swedish colony in America.

NEW YORK

The state of New York was for a long time a leader in industry and economic prosperity. Particularly interesting is how the specific forms of New York's industry and economy have changed over the years, beginning with its days as a Dutch territory in the early 1600s.

The Dutch-employed English explorer Henry Hudson journeyed up much of the length of the present day Hudson River in 1609, giving the Netherlands the right to claim the land. The Dutch soon began to set up outposts in order to carry on the lucrative trading of animal furs with the Native Americans. More settlers arrived and founded settlements that would later become known as Albany, Schenectady, and New York City. The Dutch continued to prosper in New Netherlands until 1664 when English King Charles II gave the land to his brother, the Duke of York (later King James II). York then seized the land and placed it under English control. This was how the name New York was derived. Even under English control fur trading continued to be a major industry, as well as agriculture and lumber.

With the formation of the United States of America New York's first governor George Clinton established policies of protectionism which allowed commerce to expand. New York soon became a leading commercial power with strong dairy and textile industries. Economic expansion in New York continued in the early 1800's, attracting migrants from the surrounding states. By 1810 New York became the most populated state in the union.

Geography always played a vital role in the economy of New York. New York's many lakes and waterways helped in the transportation of goods to and from the various settlements throughout the state. In 1817

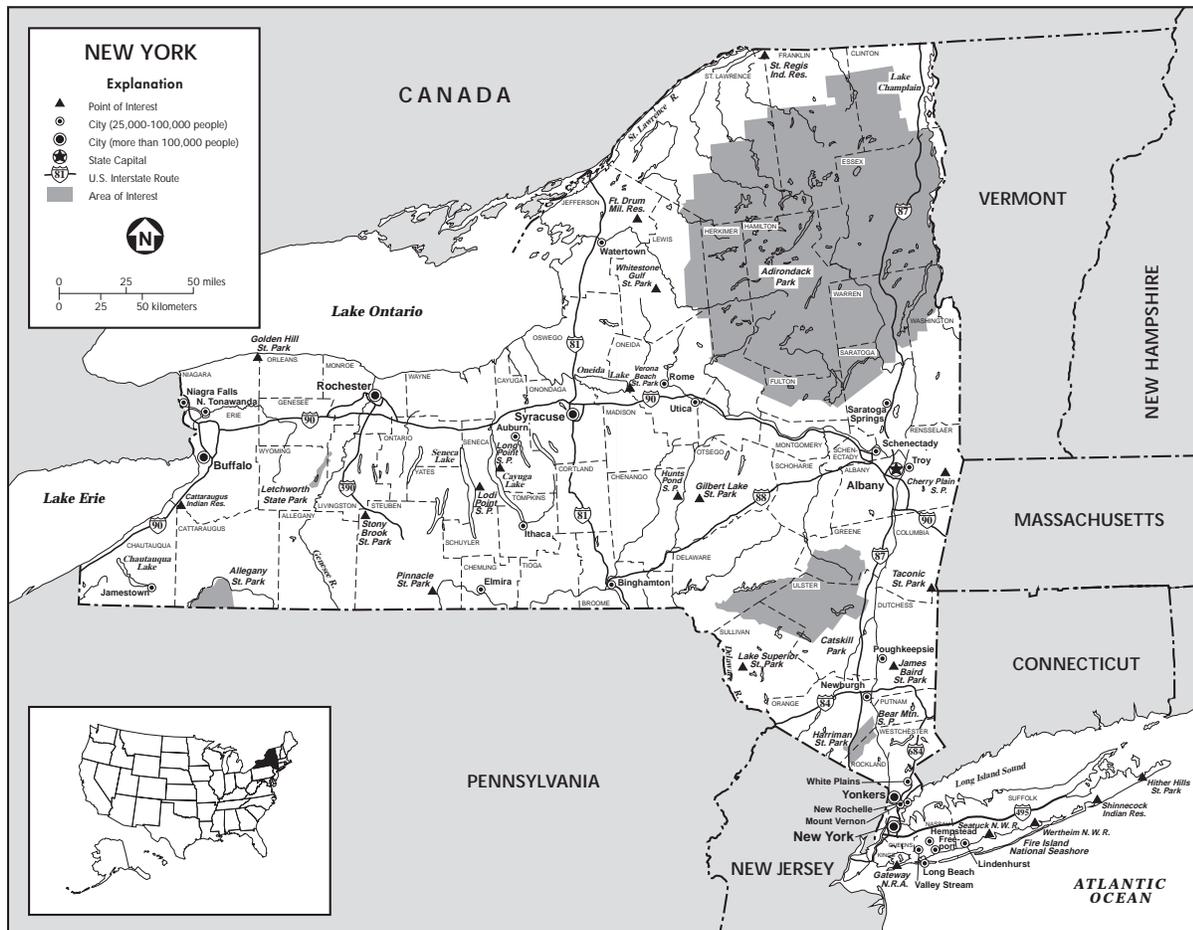

Governor De Witt Clinton (nephew of George Clinton) set about to further expand the transport system of the state with the construction of a canal. When the canal was finished in 1825 New York had an all water route from New York City to the Great Lakes. By 1831 fifty percent of U.S. imports and 27 percent of exports traveled on the canal. This led to further development and increased business in the towns along the canal and rivers such as Rochester and Utica.

Engineering projects like the Erie canal and later the railroads provided work for the large numbers of immigrants arriving from Europe. The increased labor force and improved transportation and development allowed New York to become the national leader in manufacturing.

During the period of the early Republic the guild-inspired, artisan production system of apprentice, journeyman, and master craftsman began to be circumvented by the reorganization of capital investment. The system of production in the garment trades, for one example, was transformed by a new system of subcontracting, where the employer used one experienced and well-paid "cutter" who created the cutting pattern which was simply reproduced and sewn together by women working on a piece-work basis. The result was cheap "off the rack" clothing in which productivity was very high, but wages were low and job security was minimal. In this system the apprentices and journeymen eventually lost their status and became wage-workers, while a few of the master craftsmen became entrepreneurs. This result of this was bitter class conflict within the trades which was reflected in the rise of the "Workingman's Party" in the 1830s.

This process of class differentiation was reflected in the rise of a working class culture in New York City among the children and the "factory girls" who worked in the garment district and in other quarters of the city. On the job, they were subject to the "sweating system" of piecework production. They had few rights and little job security. They did, however, evolve a sort of assertive class-defined public culture, as in the ritual promenades along the streets, especially along the bowery. The factory girl was assertive in her manner and in her "fancy" dress. As one women's historian, professor Stansell comments: "The real sin of the factory girl lay not in premarital sex, but in advertising, with her fancy clothes and assertive ways, the possibilities of a life for women outside the household. . ."

The latter half of the nineteenth century saw the rise of several industry giants. They were entrepreneurs such as John D. Rockefeller (1839–1937), who

State of New York.

created the Standard Oil Trust, and inventors like Thomas Edison, (1847–1931), founder of Edison Electric (later General Electric). Russell Sage was a prominent investor whose legacy lives on through the New York university that bears his name. Companies such as Westinghouse Electric and Rochester's Eastman Kodak also arose during this time period.

As the twentieth century began New York began to shift increasingly from a highly agricultural state to a manufacturing one. Industry in the second half of the nineteenth century focused around flour, sugar, and lumber. While these industries were still present in the early 1900s there was a rise in the production of machinery, metal, chemicals, and electrical equipment during this period. The fabric and garment industries also grew quickly making the factories unsafe and crowded.

New York's economic rise came to a halt in the late 1920s and early 1930s with the Great Depression (1929–1939). Despite legislation promoted by Franklin D. Roosevelt (1882–1945) while he served as New

York's governor (1929–1932), and later U.S. president (1933–1945) the state did not fully recover until World War II (1939–1945).

During World War II New York was a major force in the nation's military industry. Huge amounts of materials important to the war effort flowed out of the state's major cities. Manufacturing centers like Buffalo, New York City, and Schenectady all contributed to the war effort, not to mention the help of many smaller communities. New York's role as a center of the defense industry would be repeated in the Korean War (1950–1975), and the Vietnam War (1959–1975).

New York went through an economic recession in the early 1980s. The state's top industries shifted again, moving from manufacturing to services. Financial services were growing rapidly as New York City banks rose among the state's largest employers. Approximately one million jobs were added to the state's economy between 1980 and 1990 and New York's per capita income hit \$21,073 in 1990, at the time, fifth highest in the nation.

New York Central Railroad

In 1994 Republican George Pataki became the governor of New York and began to foster policies with the goal of improving the state's economy. Tax breaks were offered as a means of encouraging businesses to move into the state. In 1996 per capita income rose to fourth place out of the fifty states, and the total personal non-farm income reached \$520 billion, second only to California.

New York's economy has varied greatly, centering around agriculture and lumber in its early years, moving into manufacturing and machinery during the Industrial Revolution, and then changing over to services and retail. Regardless of what the major industry might have been the state's economic growth and success earned New York its nickname as the *Empire State*.

NEW YORK CENTRAL RAILROAD

The New York Central Railroad was established from several different railway lines that were joined together to consolidate railway lines throughout the state of New York. George W. Featherstonhaugh applied to the New York state legislature to incorporate the Mohawk & Hudson Railroad Company (M&H) on December 28, 1825. Four months later, on April

17, 1826, Featherstonhaugh appointed Stephen Van Rensselaer III as the first president of M&H. Other key players in the inception of the railroad line were Lynde Catlin (president of the Merchant's Bank of New York City), James Renwick (a mathematics professor at Columbia University), and John Jacob Astor (fur trader and merchant).

Oddly enough, M&H remained essentially inactive until January 1829, when construction began on a line running from Albany to Schenectady, New York, to augment the flourishing cargo business conducted on the Erie Canal. Engineer Peter Fleming was hired to construct this 16-mile stretch of track. Fleming, however, relinquished this position in 1830 and was replaced by John B. Jervis. The railroad finally opened for business in August 1831, at twice the estimated cost. Both horses and the line's only locomotive were used to pull cars during its initial operating phase, although more locomotives were purchased shortly thereafter.

The next link in the line, connecting Utica and Schenectady, began service in 1836. However, since these tracks paralleled the cargo-laden Erie Canal, state legislature proclaimed it illegal to transport freight until 1844. Even then, freight could only be shipped by this railway during the winter months.

During this time other railroads were expanding across the state of New York. Cross-state lines thrived, although the Hudson River proved to be a significant barrier due to the high speed and relatively low cost at which it could be used to transport freight. In 1849 this obstacle was overcome by the construction of a line running from Poughkeepsie to New York. This track was lengthened to East Greenbush, and it soon became apparent that a consolidation of the cross-state lines was in order. The tracks were finally linked in 1853, and the New York Central Railroad (NYC) was formed.

Famous railway magnate Cornelius Vanderbilt (1794–1877) gained control of the New York Central in 1868, and combined it with the Hudson River Railroad. Acting as president of both lines, Vanderbilt set about expanding the reach of these railroads to Chicago, Illinois. He began a series of acquisitions, starting with the purchase of the Lake Shore & Michigan Southern. Vanderbilt's son, William, continued to expand the empire through the acquisition of the Nickel Plate Road (1883) and the West Shore (1885). The Vanderbilt influence continued to hold sway even after William H. Vanderbilt's death in 1885. More railroads were acquired under the leadership of Chauncey Depew, and soon the line reached as far west as the Mississippi River. In 1900 the company leased the Boston &

Albany line, creating one of the most powerful corporations in the United States and a far-reaching railway that spread north from New York to Canada and west from Boston, through Chicago to St. Louis, Missouri.

The New York Central Railroad made many contributions to the railroad industry. These included the American-type No. 999 steam engine, the invention of the dynamometer (an apparatus used to gauge the force exerted by locomotives when hauling trains), and the opening of the first railroad apprentice school. The New York Central was also the first line to adopt the use of high-powered brakes designed specifically for heavy steel passenger equipment.

Unfortunately, troubled times lay ahead. In 1954 Robert R. Young gained control of the New York Central. Alfred E. Perlman was appointed president of the railroad, the last person to ever hold this title. Automotive and airline travel had begun to draw passengers away from the rails. In 1962 the directors of the New York Central and the Pennsylvania Central decided the merge both systems in an effort to eliminate overlapping rail facilities and develop a single powerful railway. Various legal issues held up the merger until 1968, but by then it was too late. The combined railroads, dubbed the New Penn Central, went bankrupt in 1970. What started in 1825 as the Mohawk & Hudson Railroad Company and thrived for years as the New York Central, became a portion of the government-operated Consolidated Rail Corporation (ConRail) in 1976.

NEW YORK STOCK EXCHANGE

The New York Stock Exchange (NYSE), is the country’s oldest and largest securities exchange. It dates from May 17, 1792 when local brokers agreed to formalize their business transactions. The brokers had, until then, been buying and selling securities under a designated tree.

In 1825 the NYSE opened for business at 11 Wall Street, New York City. At that time most shares traded were in canal, turnpike, mining, and gaslight companies. Though some industrial securities were traded on the NYSE as early as 1831, it would be 40 years before industries began to dominate the trading floor. As the nation became increasingly oriented toward manufacturing, the companies listed on the exchange reflected this economic shift.

Corporations applying to list their stock on the NYSE must have a minimum of two thousand shareholders. Each original shareholder must have one hundred or more shares, the corporation must be able to issue at least one million shares of stock, and it must also provide a record of earnings for the previous three-year period. The board of the stock exchange may make exceptions to these guidelines.

Corporations may be listed with other stock exchanges (such as the American Stock Exchange) or they may allow stock in their company to be traded as unlisted stocks, which are bought and sold in over-the-counter (OTC) trading. Companies that do not allow shares to be publicly traded are called private corporations.

NEW YORK YANKEES

The Baltimore Orioles baseball franchise formed in 1901. In 1903 Bill Devery and Frank Farrell purchased it for \$18,000, moving the team to New York. Originally called the Highlanders, the team changed its name in 1913 to the New York Yankees. In 1915 Colonel Jacob Ruppert and Tillinghast L’Hommedieu Huston purchased the Yankees from the original owners for \$460,000. Ruppert bought out Huston in 1922.

The first years of this American League franchise team were mediocre and filled with frustration. But after the shift of ownership in 1915, the Yankees began to improve. Miller Huggins was hired to manage the baseball team, and he did an excellent job of assembling a line-up of good players. The team acquired its

A New Year's Eve party, December 31, 1997, held on the floor of the New York Stock Exchange. Traders gathered to celebrate the coming year together.

star from the Boston Red Sox after the 1919 season. His name was George Herman "Babe" Ruth, and his contract was obtained for \$125,000, plus a loan of approximately \$300,000. The year before this trade, Ruth hit 29 home runs and was considered the best and most exciting player in the game of baseball. His yearly salary was a then-unheard of \$20,000 per year.

In 1921 the team played in its first World Series, losing to the New York Giants. But in 1923, after winning three American league pennants in a row, the Yankees finally won a World Series, beating the Giants 4 games to 2. Nineteen twenty-three was also the year the team moved into Yankee Stadium, the nation's first triple-deck stadium and acquired one of its greatest stars, Lou Gehrig. In the following years, the Yankees continued to build a dynasty, adding players like Joe DiMaggio (1936) and a host of others. The team won fourteen American League pennants and ten World Series titles by 1943.

In 1945 Larry MacPhail, Del Webb, and Dan Topping bought the team. The final purchase price was almost \$3 million. The Yankees had a successful farm team program which continually supplied the major league team with new talent. Throughout the 1950s,

1960s, and 1970s the Yankees continued to win championship titles and increase their market value. By 1964 CBS owned 80 percent of the team, having purchased this share for approximately \$11 million.

A colorful millionaire named George M. Steinbrenner III, who was a Cleveland shipbuilder by trade, headed a group of investors who purchased the Yankees from CBS in 1973 for \$10 million. Steinbrenner had been an assistant college football coach at Purdue and Northwestern Universities and was part owner of the Chicago Bulls basketball team. He also owned the American Shipbuilding Company, located in Tampa, Florida. Steinbrenner's ownership marked the beginning of the most exciting and volatile era of Yankee baseball.

In the late 1970s, the Yankees won three consecutive pennants. During the 1980s Steinbrenner repeatedly hired and fired many managers. Billy Martin was the most famous of all these managers—Steinbrenner fired him and hired him on a total of five separate occasions until Martin's death in 1989.

In the late 1990s George Steinbrenner became the Yankee's Chief Executive Officer, and Joseph P. Torre

acted as the team's manager. Main major league competitors included the Baltimore Orioles, Boston Red Sox, Tampa Bay Devil Rays, and the Toronto Blue Jays. The Yankees won the World Series in 1996 and 1998. They achieved an American League record in 1998 for most wins (114) in a regular season.

THE GAME ISN'T OVER TILL ITS OVER.

Lawrence (Yogi) Berra, Former Yankee catcher

Throughout its history, the Yankees retained its status of a private company. In 1997 the team achieved \$144.7 million in sales. Player payroll exceeded \$63 million per year. Because of the team's phenomenal success, the Yankees would have no trouble increasing the price of their tickets, concessions, media rights, and sponsorships. Such a sure turn of profits for the Yankees would give the team ample opportunity to attract and sign more star players in the future.

NIELSEN, ARTHUR CHARLES

Perhaps no other single man contributed as much to the development of professionalism in marketing as Arthur C. Nielsen (1897–1980). Nielsen accomplished far more than developing his famous market researching system, the Nielsen Ratings, for radio and television. He also created services that reduced the costs of product distribution—marketing, sales, and advertising—involved in moving goods from the factory to the consumer. His services made it possible to price essential goods at lower costs, resulting in a higher standard of living throughout the world.

Arthur Nielsen was born in Chicago, Illinois in 1897, the son of Danish immigrant Rasmus Nielsen, a

A. C. Nielsen Sr. stands next to his Audiometer.

business executive, and his wife, Harriet, a teacher. After graduating high school, Nielsen attended the University of Wisconsin where he obtained a Bachelor of Science in electrical engineering. Nielsen returned to Chicago in 1919 and worked in a number of companies as an electrical engineer.

For several years Nielsen had been anxious to open his own business, and in 1923 after borrowing \$45,000 from his college fraternity brothers, he opened the A.C. Nielsen Company. The company conducted performance surveys of industrial equipment, and provided manufacturers with evaluation reports. By 1930 The company's sales increased to \$200,000 annually, but the Great Depression (1929–1939) caused a massive industrial slump in the United States and nearly bankrupted Nielsen. He turned to other research services, creating the Nielsen Food and Drug Index, a research service that recorded the retail flow of grocery and drug brands by regular audits of carefully selected samples of stores. Using this information, food and drug manufacturers could measure the sales of their products against their competitors.

In 1936 Nielsen learned of the existence of the Audiometer, a mechanical device that made a minute-by-minute record of when a radio was on, and where its dial was set. Nielsen bought the invention from its creators, two professors on the faculty of the Massachusetts Institute of Technology. He made some changes to the device, and in 1938 patented the Audiometer

Nineteenth Amendment

under his own company name. Slowly Nielsen began installing Audiometers in a number of U.S. homes in the early 1940s and began to offer to radio stations and advertisers what he called a “Nielsen Radio Index” (NRI). The NRI provided for advertisers a specific reading of their “share” of the market in percentages. The broadcaster and advertiser could be told accurately how many people (by percentile) were listening to their advertisements and programming every 15 minutes throughout the day.

Though Nielsen’s rating system was slow to start and his competition, who used phone calls and door-to-door interviews, were often more successful in selling their data to advertisers, Nielsen’s system gradually caught on. By 1950 Nielsen had installed 1500 Audiometers across the country, representing 97 percent of the United States, and in ratings surveys the Nielsen Co. had emerged on top. In order to produce his reports faster, more cheaply, and more comprehensively to his clients, Nielsen was one of the first to purchase a business computer. In 1955 the world’s first electronic computer, the Univac I, was delivered to the Nielsen Co.

During the 1950s Nielsen adapted his Audiometer methodology to television and abandoned radio ratings in 1964. Nielsen and his son, Arthur, Jr., continued to refine their consumer analysis system before Arthur Nielsen, Sr. retired in 1957. His son succeeded him as CEO of the company. In his free time Nielsen turned to philanthropic activities, which included support for hospitals, medical research, and organizations devoted to conservative economics and political economy.

Arthur C. Nielsen died in 1980. The Nielsen family sold the company for \$1.3 billion in 1984 to Dun and Bradstreet. The ratings service Arthur Nielsen pioneered had earned a position as the premier TV ratings service.

NINETEENTH AMENDMENT

Proposed in Congress on June 4, 1919, and ratified by the states August 18, 1920, the Nineteenth Amendment to the U.S. Constitution gives women the right to vote. After four decades of struggle, the women’s movement in the United States had finally secured the vote.

The woman’s suffrage movement had its roots in the 1840s, when women who sought social reforms, including abolition of slavery, instituting a national policy of temperance (abstinence from alcoholic beverages), and securing better work opportunities and better pay, organized. These reformers soon realized that in order to effect change, they needed the power of the vote. An early leader of the suffragist movement was feminist and reformer Elizabeth Cady Stanton (1815–1902). She joined anti-slavery activist Lucretia Mott (1793–1880) to establish the first women’s-rights convention in 1848 in Seneca Falls, New York. In 1869 Stanton teamed with Susan B. Anthony (1820–1906) to organize the National Woman Suffrage Association. That same year, another group was formed—the American Woman Suffrage Association, led by women’s rights and anti-slavery activist Lucy Stone (1818–1893) and her husband Henry Brown Blackwell (1825–1909). In 1870 the common cause of the two groups was strengthened by the passage of the Fifteenth Amendment, which gave all men—regardless of race—the right to vote. When the two organizations joined forces in 1890, they formed the National American Woman Suffrage Association (NAWSA). The suffragists appealed to middle class and working class women alike, as well as to students and radicals. They waged campaigns at the state level, distributed literature, organized meetings, made speeches, marched in parades, picketed, lobbied in Washington, DC, and even chained themselves to the White House fence. If jailed, many resorted to hunger strikes.

From 1878 to 1917, woman suffrage amendments were introduced during every session of Congress; all failed. In 1918, the required support for the amendment was finally mustered in the House of Representatives—the result of years of activism and of the role women played during World War I (1914–1918). Having demonstrated their position as involved and intelligent citizens, members of the House passed the proposal in 1918. It then went to the Senate where it was

defeated. Voting again the next year, the amendment passed in the Senate and was duly sent to the states, which ratified it in 1920. The amendment states that the “right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of sex.”

NIXON, RICHARD MILHOUS

Richard M. Nixon (1913–1994) took office as the thirty-seventh President of the United States on January 20, 1969. He campaigned on promises to end the Vietnam War (1959–1975), reduce racial divisions in the United States, and decrease the nation’s high inflation rate. Despite his ambitious plans, Nixon’s accomplishments are often overshadowed by the scandal for which his presidency is best known. Nixon’s personal anger and suspicions manifested themselves in the Watergate criminal and political scandal, first revealed to the public through the news of an interrupted burglary at the offices of the Democratic National Committee in Washington, D.C. As evidence of his wrongdoings mounted, Nixon resigned rather than face impeachment by Congress.

Nixon was born in 1913 on a modest farm in California and was raised in the Quaker faith. He was an aggressive and successful student from an early age, graduating in 1934 from Duke University Law School on a full scholarship. After graduation he worked for the federal government and later as a military attorney during World War II (1939–1945). Nixon’s humble but aggressive style caught the attention of others, who encouraged him to enter political life.

His active political career resembled a roller coaster ride. He served as President Dwight Eisenhower’s (1953–1961) vice president, and was unusually active in the role. But Nixon lost his campaign to succeed Eisenhower in 1961 when he was defeated by John F. Kennedy (1961–1963). In 1962, Nixon again lost a bid for public office, failing to gain the governor’s seat of his native state, California. This series of defeats ended his political career for a time and Nixon returned to practicing law. But when the political climate in the United States shifted in the late 1960s, Nixon saw new opportunities and prepared a presidential campaign.

During his campaign, Nixon promised a quick end to the Vietnam War, which was the source of much

Richard Nixon leaving office.

social unrest at home, but once in office he actually expanded the war before decreasing American involvement in the region. Though Nixon did not follow through on his Vietnam promises, he did achieve an arms treaty with the Soviet Union in 1972. Relations with that country were quite strained at the time, and the arms treaty, limiting strategic nuclear weapons, was a timely foreign policy success.

War was not the only item on Nixon’s foreign policy agenda. It also included economics. Nixon reopened trade and economic relations with China, which were severed in the early 1950s due to China’s involvement with North Korea during the Korean War (1950–1953). Renewed relations between the two countries opened up a wealth of new business opportunities. The vast Chinese market appealed to many U.S. businesses and trade was quickly established. He also proposed a steep tax on imported goods and a freeze on all wage and price increases for ninety days. Nixon’s efforts to stabilize the inflation-ridden U.S. economy helped reduce the national debt and the rate of inflation. It also asserted the primacy of business vitality over the artificial economic ties to the value of gold.

Tying the U.S. dollar to the value of gold was seen by Nixon as an economic restriction. By ending the U.S. dollar’s attachment to the gold standard, Nixon asserted he had done something long overdue, claiming, “The strength of a nation’s currency is based on

Normalcy

the strength of that nation's economy.' With his action the Gold Standard Act of 1900 ended. The nation's currency became subject to the floating exchange rates of the marketplace and endured well.

Nixon's accomplishments as president are often overshadowed by the events that consumed his second term in office, beginning in 1972. Known collectively as the Watergate scandal, these events include criminal acts against Nixon's perceived enemies. Watergate first came to national attention when a break-in of the Democratic National Committee offices in the Watergate building was interrupted. The culprits eventually revealed ties to the White House and Congress ordered an investigation. Nixon was very uncooperative and denied personal involvement in the affair. However, Congress' determination to get to the bottom of the scandal revealed that Nixon was indeed involved. Rather than face almost certain impeachment and removal from office, Nixon resigned on August 4, 1974, leaving the presidency in disgrace.

Nixon went into seclusion for a time and later regained a kind of elder statesman status. He wrote several books on foreign policy and politics, including a personal memoir of his life. Nixon died of a stroke in 1994, at the age of eighty-one.

NORMALCY

Normalcy was the term used by Republican candidate Warren G. Harding (1865–1923) during the 1920

presidential campaign to describe the condition of the United States prior to its entry into World War I (1914–1918). It was also the condition to which the nation would return, Harding promised, if he were sent to the White House. Voters liked the idea of returning to normalcy too, giving Harding the biggest plurality victory ever, 16,152,200 votes for Harding to 9,147,353 votes for Democratic nominee James Cox (1870–1957).

Once in office (1921–1923) Harding's efforts to normalize American political, social, and economic conditions met with mixed results. Part of the president's problem was defining the term "normalcy." Harding's call for "normalcy" meant a foreign policy of isolationism and a domestic policy of increased economic freedom. To meet these ends, Harding supported a repeal of the wartime tax on excess profits, a reduction of income taxes on the wealthy, a high tariff on imports, and anti-immigration laws limiting the annual number of aliens who could come to the United States. Harding also opposed U.S. membership in the League of Nations. In contrast, his Democratic predecessor, President Woodrow Wilson (1913–1921) helped establish that international body and urged the country to join it. Although America was prosperous during his years in office, Harding's administration is primarily remembered for its corrupt practices, which represented politics as usual to his opponents and a return to "normalcy" of a different kind. Harding has been credited by some with inventing the term "normalcy." The word, however, first appeared in American lexicon during 1857 as slang for the word "normality." In any event, Harding did help popularize the use of "normalcy" in everyday speech.

NORRIS-LAGUARDIA ACT OF 1932

The Norris-LaGuardia Act outlawed yellow-dog contracts (pledges by workers not to join a labor union) and further restricted the use of court injunctions in labor disputes against strikes, picketing, and boycotts. Imposing strict procedural limitations on issuing injunctions against strike activity, the act pointed the direction towards a more even-handed relationship between the judiciary and the nation's labor relations systems. Although it had few enforcement powers, the act was one of the first federal labor laws supporting organized labor and it marked a significant victory in

labor reform. Its passage fostered a trend toward more favorable government labor policies.

Industrialization of the late nineteenth century brought unsafe factory conditions, low wages, repetitious work over long hours, little job security, no benefits: these conditions led workers to favor unions. But the very legality of labor unions was in dispute for much of the nineteenth century. At the anti-union end of the spectrum, many nineteenth century judges considered unions to be in restraint of trade, because they called strikes. Later the courts began to recognize the validity of workers seeking shorter workdays and higher wages. But, injunctions requiring unions to refrain from certain activities (like picketing on company property or otherwise trying to persuade workers from entering company property during a strike) became a major weapon of employers beginning in the 1840s. Later antitrust laws added further legal authority to such orders by prohibiting organizations from restraining free market competition through cooperative relationships. During this period, the Sherman Anti-Trust Act was more often used against unions than against the companies.

PASSED IN 1932, THE NORRIS-LAGUARDIA ACT MARKED A PROFOUND CHANGE IN U.S. GOVERNMENT OVERSIGHT OVER LABOR RELATIONS. IT WAS THE MOST FAVORABLE LEGISLATION TO DATE FOR A U.S. LABOR MOVEMENT THAT HAD ALWAYS HAD TO FIGHT FOR ITS VERY EXISTENCE.

In 1877 and again in 1894 the federal government used troops to end major strikes, actions that radicalized some in the labor movement. In 1905 the Industrial Workers of the World (IWW) was formed, espousing the goal of replacing the capitalist system with socialism. After some successful early strikes, however, it was smothered by government repression.

During the labor shortage of World War I, the Clayton Anti-Trust Act of 1914 Congress finally acted to exempt unions from antitrust laws. Employers turned to other means. Forcing employees to sign “yellow-dog contracts” became a condition of employment. The contracts pledged employees to refrain from joining a union, or to renounce membership if they already belonged to one. Some state legislatures moved to prohibit these agreements but the Supreme Court ruled in 1915 that such state prohibitions unconstitutionally violated freedom to contract.

But, after the crash of the stock market in 1929 and the long stagnation in investment that characterized the 1930s, the high unemployment of the Great Depression

made it difficult for workers to express their unified preference for union representation. By the third year of the Depression, however, workers with jobs began to push for unionization anyway. Labor solidarity was borne of desperation. The formation of the Congress of Industrial Organizations (CIO) with the specific purpose of “organizing the unorganized” unskilled and semi-skilled workers in basic industry, sparked an explosion in the size of the union movement. In spite of the high unemployment during the Great Depression, the union movement grew by more than 300 percent. In 1933 national union membership had fallen to less than three million. By 1941 it stood at over ten million.

The Norris-LaGuardia Act was part of this change in labor relations. Even before the New Deal began, Senator George William Norris from Nebraska and Congressman Fiorello H. LaGuardia from New York City, both progressive Republicans, introduced new labor reform legislation, the Norris-LaGuardia Act. With passage of the act, the groundwork was laid for an even more important labor bill, the National Labor Relations Act of 1935, called the Wagner Act. The Wagner Act continued the mission of reforming labor relations. It set out to regulate the nation’s labor relations. It granted unions fundamental rights and powers, including the right of collective bargaining, defined unfair labor practices, and established penalties for violating them. Passed in 1932, the Norris-LaGuardia Act marked a profound change in U.S. government oversight over labor relations. It was the most favorable legislation to date for a U.S. labor movement that had always had to fight for its very existence.

NORTH AMERICAN FREE TRADE AGREEMENT (ISSUE)

Formal negotiations for the North American Free Trade Agreement (NAFTA) began in 1991. Within three years the United States, Canada, and Mexico signed the trilateral free trade agreement and it went into effect in 1994. Pushed through by both the administrations of Presidents George Bush (1989–1993) and Bill Clinton (1993–) amidst much domestic controversy, this historic agreement established a formal trading bloc with 364 million consumers and a combined economic output of six trillion dollars in North America.

The agreement established what was called the world's largest free trade zone, and included a 15-year gradual phase-in of the elimination of tariffs and traditional non-tariff barriers on trade for all goods and services among the three countries. The accord is a 2,000-page text that contains detailed rules for hemispheric trade liberalization and two side agreements. The rules cover such areas as rules of origin (the country where the product was produced) to qualify for free trade, protection of intellectual property rights, and dispute settlement procedures.

NAFTA originated in negotiations begun in the mid-1980s between Canada and the United States to establish a bilateral agreement to guarantee market access between the two countries. The subsequent U.S.–Canada Free Trade Agreement was implemented in 1989. Canada then wanted to expand the agreement into a trilateral arrangement when the United States and Mexico initiated negotiations on a bilateral agreement of their own in 1990.

In the 1980s Mexican President Carlos Salinas de Gortari (1988–1994) decided to expand economic reforms through international agreements when the protectionist, state-dominated economy was in crisis and unable to pay off its debts to commercial banks. Moving to a market-based economy, the Salinas administration implemented accelerated trade-barrier reductions to encourage foreign investment. Having removed or reduced most of the tariffs between the

United States and Mexico since Mexico joined the General Agreement on Tariffs and Trade (GATT) in 1986, the hope for Mexico was that a free trade agreement between the two countries would continue to stimulate foreign investment and economic growth.

The Bush administration had support from most large U.S. industrial corporations that would be able to take advantage of lower Mexican wages. Thus the administration requested “fast-track” negotiating status for NAFTA, which permits a president to negotiate international trade treaties and submit them to Congress for approval without amendments. In 1991 Congress gave NAFTA fast-track status.

NAFTA became a hotly debated issue in the 1992 U.S. presidential elections. Differentiating himself from the incumbent, presidential candidate Ross Perot opposed NAFTA, calling for the public to hear the “giant sucking sound” of jobs being pulled from this country and going South to Mexico. Meanwhile as a compromise in support of NAFTA, candidate Bill Clinton promised that NAFTA would include guarantees for the trading countries to abide by environmental and labor standards. Clinton was the target of mounting pressure from environmental groups and organized labor that NAFTA would amount to a “green light” for environmental “dumping” and human rights abuses in Mexico. After Clinton was elected as president and NAFTA was ratified in 1993 along with the two labor and environmental side agreements, the same groups criticized NAFTA for not having any effective enforcement mechanisms.

Opponents of NAFTA, such as labor leaders, were especially concerned that the agreement would result in massive losses in U.S. manufacturing jobs after Mexico began to attract foreign investment. Critics and supporters drew contradictory conclusions about the long-term consequences of NAFTA after the agreement was implemented in 1994. On one hand, opponents conducted studies such as the one by the Economic Policy Institute (EPI). The EPI authors, Jesse Rothstein and Robert E. Scott, concluded in their report, *NAFTA and the States*, that “an exploding deficit in net exports with Mexico and Canada has eliminated 394,835 U.S. jobs since NAFTA took effect in 1994.” On the other hand, supporters such as Nora Claudia Lustig, a senior fellow at the Brookings Institute, claimed that “there is evidence that NAFTA has created more jobs than it destroyed.”

Critical studies such as the EPI report contended that NAFTA resulted in the net export deficit growing from \$16.1 billion in 1993 to \$48.3 billion in 1996. Consequently jobs created with increased exports were

offset by jobs lost with increased imports. The EPI argued that the implementation of NAFTA had affected all 50 states, with job losses ranging from 621 in Vermont to 38,406 in California. The states hardest hit were those with the greatest production facility relocation, industries such as automotive manufacturing, textiles, apparel, computers, and electrical appliances. In addition, wages fell four percent between 1993 and 1996 and real median wages fell in at least 25 states.

Meanwhile NAFTA proponents at the Brookings Institute, such as Lustig, claimed that the agreement "has resulted in an increase in U.S.-Mexican trade, business partnerships, specialization in production processes and direct investment flows into Mexico. At the same time, the agreement has protected U.S. exporters from the brunt of the Mexican crisis [peso crisis of 1994], especially in comparison to exporters from Japan and the European Union." The report's author claimed that "there is even some evidence that NAFTA has created more jobs than it destroyed." Lustig contended that a net job gain may be the end result because a strong Mexican economy makes a strong market for U.S. exports.

Despite the absence of follow-up initiative on Capitol Hill to push for fast-track negotiations that would include other countries such as Chile and Brazil in the free trade bloc, President Clinton remained sanguine concerning the outcome of NAFTA in its early years. In a letter to Congress, Clinton noted that "NAFTA is an integral part of a broader growth strategy that has produced the strongest U.S. economy in a generation."

Thus the history of the negotiations over and implementation of the landmark agreement further complicated a centuries-old debate over the economic impact of free trade policies. Departing from traditional trade liberalization agreements, NAFTA became part of a public controversy that resulted in the unique inclusion of labor and environmental standards as an element in a trilateral free-trade bloc in North America.

NORTH ATLANTIC TREATY ORGANIZATION (NATO)

In 1949, in the aftermath of World War II (1939–1945), sixteen nations in Europe and North America developed the North Atlantic Treaty. It was a measure designed to block the threat of military aggression in Europe by the Soviet Union. The North Atlantic Treaty Organization (NATO) united Western Europe and North America in a mutual security and self-defense agreement. If one of the sixteen members was attacked, they would all fight in defense.

The agreement, at first intended solely to discourage the Soviet Union, created a framework for further cooperation between the members on military, political, economic, and social matters. The members of NATO at the time of its inception were Belgium, Canada, Denmark, France, Germany, Greece, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Turkey, the United Kingdom, and the United States.

While the North Atlantic treaty calls for the peaceful resolution of disputes, the organization is prepared for self-defense. NATO's military forces are comprised of units volunteered from each of its members. The forces are based under three main commands: the Atlantic Command, the Channel Command, and the Allied Command Europe. The supreme Allied commander heads the three commands and directs units in exercising NATO military forces. In times of peace, the three commands plan the defense of their regions.

NATO also has a policy wing, called the North Atlantic Council, a nonmilitary policy group comprised of permanent delegates from all NATO members. The North Atlantic Council is led by a secretary-general and is responsible for general policy, budget

issues, and administrative actions. A Military Committee, comprised of the chiefs of staff of member nations' armed forces, meets twice a year to advise the Council.

NATO headquarters was initially established in Paris, France, but in the 1960s French President Charles DeGaulle (1890–1970) complained the United States had too much control over NATO and, in fact, dominated the organization. In 1966, France expelled NATO troops from the country. As a result NATO headquarters moved from Paris to Brussels, Belgium, where it remains today.

With the collapse of the Soviet Union in 1991, NATO expanded its membership to include Poland, Hungary, and the Czech Republic. This raised concerns from Russia about NATO intentions. Russia sees NATO expansion as a threat to its sphere of influence in eastern Europe. Since the 1991 collapse of NATO's main foe, questions have also been raised regarding the continued need for the organization.

In the late 1990s, those questions were quieted by NATO involvement in Yugoslavia. In 1999, NATO launched a military campaign against Serbian leader Slobodan Milosevic in response to his brutal repression of ethnic Albanians in the region of Kosovo. This marked the first time in NATO's history that it became the aggressor in a regional matter outside the boundaries of its member states.

NORTH CAROLINA

North Carolina was slow to develop, abundant in resources and natural beauty, and traditionally tied to the tobacco empire. It is a study in contrasts. Once thought by Virginia settlers to be backward and wild, North Carolina has become an important player in the nation's industrial development and a major producer of agricultural products. It is also an attractive destination for tourists. Though thought to be unfriendly to labor, the state continued to employ hundreds of thousands of workers in its manufacturing and services industries as the twentieth century closed.

Italian explorer Giovanni di Verrazano discovered the North Carolina coast in 1524. Other explorers from Spain later attempted unsuccessfully to settle in the North Carolina wilderness. English courtier Sir Walter Raleigh sponsored the famous "lost colony" at Roanoke, and in 1629 Charles I began settlement in earnest of the colony he called, after himself,

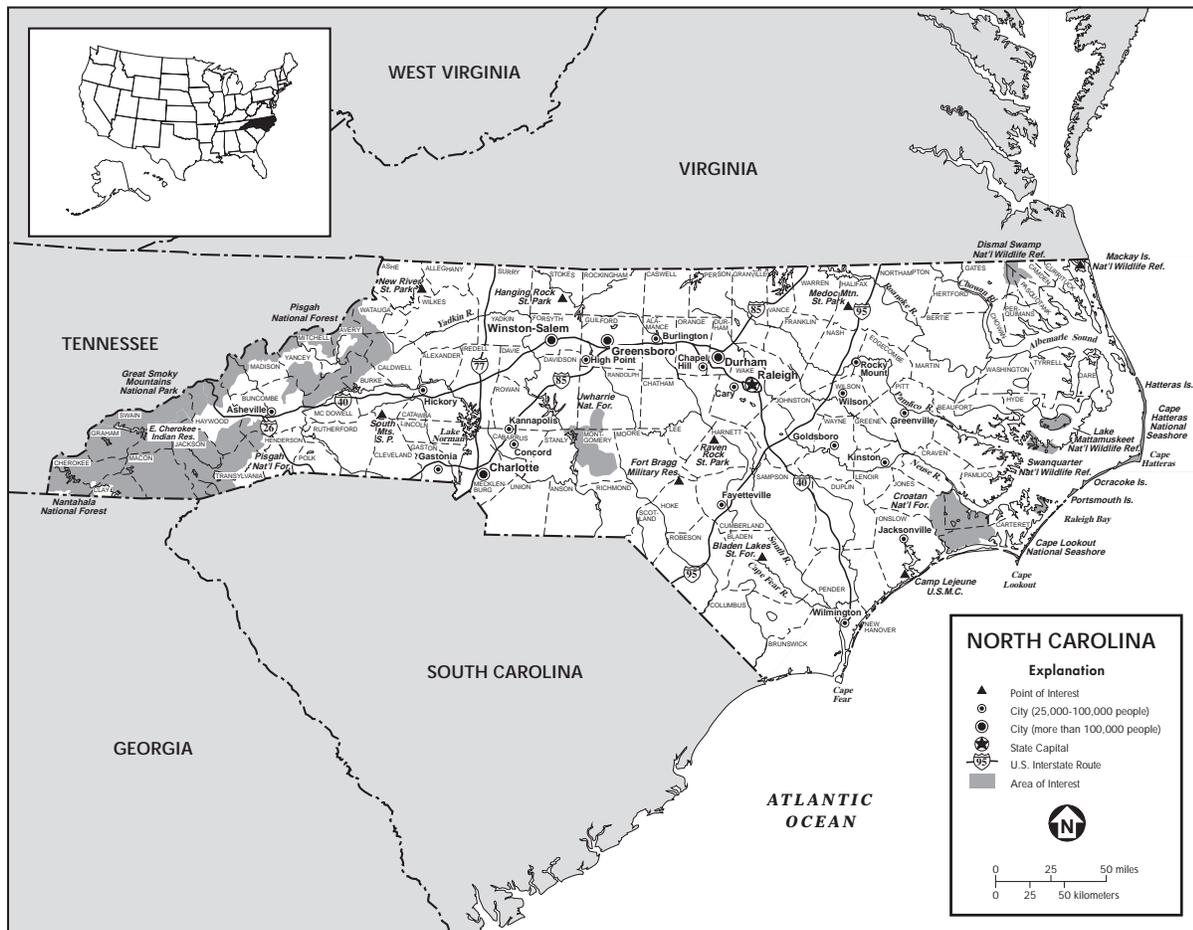

"Carolana". It was set up as a proprietorship and it extended its boundaries from the Atlantic to the Pacific Oceans and from northern Florida to the present boundary between North Carolina and Virginia. The colony of South Carolina split off from North Carolina in 1719.

Less accessible and wilder in geography than neighboring Virginia, the North Carolina country grew slowly. Wealthy landowner William Byrd of Virginia undertook a surveying expedition to settle a boundary dispute between Virginia and North Carolina in 1728. In his *History of the Dividing Line*, he expressed his low opinion of the North Carolina "backwoodsmen" he found there (an opinion which was shared by many of his contemporaries). "Both cattle and hogs ramble into the neighboring marshes and swamps . . . and are not fetched home till the spring. Thus these indolent wretches, during one half of the year, lose advantage of the milk of their cattle . . . and many of the poor creatures perish in the mire . . . by this bad management."

After North Carolina became a royal colony in 1731, thousands of new settlers came to the colony; the population reached 345,000 by 1775. From the beginning the colony was beset by geographical divisions. While western backcountry farmers were self-sufficient but poor, the wealthy eastern plantation owners used slave labor to cultivate their tobacco and rice fields. Although the colony harbored a number of Loyalists, most North Carolinians were united in opposition to colonial controls from Great Britain—they supported independence in 1776.

After the American Revolution (1775–1783) North Carolina was sometimes known as the "Rip Van Winkle" state because of its slowness to develop. It was among the last states to ratify the new U.S. Constitution, in 1789. In addition to widespread illiteracy, the state's transportation routes were substandard, making it difficult to expand commercial agriculture. The western part of the state was the least developed, and eastern interests refused to be taxed to support the westerners. In 1835, however, reforms in the state constitution brought state aid to railroads and other badly needed public works, as well as the first common schools.

North Carolina fought for the Confederacy during the American Civil War (1861–1865). Politics in that war's aftermath was very divisive. Republicans—the party of Lincoln—wrangled with states' rights Democrats, who finally took over state government in 1876. Democrats then slashed public services and solidified the power of landlords over tenants and sharecroppers. They also saw to it that cotton mills were built in the piedmont area and that railroads were consolidated. By

State of North Carolina.

1880 industry in North Carolina had made a big recovery. The plight of African Americans in the state did not improve, however, leaving a legacy of poverty and inequality which persisted into the civil rights struggles of the 1960s and beyond.

The development of the railroads was very important to the rise of big tobacco in the state. In 1875 young R. J. Reynolds saw that railroad access to the city of Winston (now Winston-Salem) would be an important asset to tobacco manufacture and distribution. He established his own plant and by 1920 he had absorbed most of the other small tobacco companies in Winston. Around the turn of the century Reynolds Tobacco (which then manufactured only chewing tobacco) was part of James B. Duke's tobacco trust but it became independent again in 1911. By 1913 Reynolds had expanded into the cigarette market and he was producing the nation's best-selling cigarettes.

Small farmers in the state continued to protest against their depressed economic condition. They were

overshadowed by the textile, furniture, and tobacco producers, who, along with banks and insurance companies, dominated the state by 1900. Both World War I (1914–1918) and World War II (1939–1945) deeply affected the state. For one thing, many industrial plants were built in North Carolina to produce war materials, many of them expanding and continuing to provide employment after the war. In addition, returning veterans came home with new ideas. According to historian William S. Powell, after World War II, “Veterans who were no longer content to farm or to work in cotton mills set about to improve themselves by taking advantage of the G.I. Bill of Rights. . . . Military service gave many of these people new skills and broadened their perspectives. . . .”

A good example of postwar economic development in North Carolina was the Research Triangle Park, which began in 1957 in an area equidistant from Raleigh, Durham, and Chapel Hill. The park was constructed to provide research facilities and high-technology industrial sites; it soon became home to

North Carolina

many government offices, private research concerns, and cultural agencies. The Research Triangle Park was also ideally situated, close to the University of Carolina, Duke University, and other colleges.

North Carolina has advanced in many areas, but not in its relationship to organized labor. The many "company towns" which grew up around the textile mills left their legacy of fear and dependence. The American Federation of Labor attempted to organize workers in the textile industry at the turn of the century but it failed to produce lasting unions. A number of failed strikes in the first four decades of the twentieth century left a generally anti-union sentiment among North Carolina workers. Repeated charges of unfair labor practices against textile giant J. P. Stevens and Company during the 1970s and 1980s reinforced the anti-labor reputation of the state. By 1970 the percentage of workers belonging to unions in the state was only 7.8, compared to 27.9 percent nationwide. By 1995 the percentage of union members had decreased to 4.2 percent, the second-lowest in the nation. In the late 1990s North Carolina held the dubious distinction of having the largest percentage of manufacturing jobs in the nation but the lowest manufacturing wages. In 1990 30 percent of jobs in the state paid wages below the poverty line.

THE ONLY BUSINESS [IN NORTH CAROLINA] IS RAISING OF HOGS, WHICH IS MANAGED WITH THE LEAST TROUBLE, AND AFFORDS THE DIET THEY ARE MOST FOND OF.

William Byrd, *Virginian landowner*, 1728

The continuing story of tobacco in North Carolina has also had its vicissitudes. For the last three decades tobacco manufacturers have been under fire from the federal government for causing health problems for large numbers of Americans. Cigarette advertising was banned from radio and television after 1971, and the federal cigarette tax was doubled in 1983. As the public perception of smoking steadily declined, an heir to the Reynolds Tobacco fortune, Patrick Reynolds, shocked his state and the nation in 1986 when he appeared before a congressional committee to call attention to the detrimental effects of tobacco. However, Reynolds Tobacco (now owned by RJR Nabisco), along with other tobacco firms, has survived by diversifying its interests and increasing overseas sales. In the late 1990s North Carolina was still the producer of 38 percent of the U.S. supply of tobacco and shipments of tobacco were second only to those of textile manufacturers in the state.

In the late 1980s and early 1990s North Carolina experienced a shift in job patterns. Traditional industries like furniture, textiles, and tobacco lost ground to high-tech industries and financial concerns. In 1997 the state was home to seven Fortune 500 companies, none of which was connected to the kinds of industries which historically developed the state.

In modern North Carolina agriculture and industry coexist and they are mutually dependent. Although the actual number of tobacco farms has decreased significantly, perhaps one-third of the jobs in the state are directly related to agriculture. North Carolina remains the largest manufacturer of textiles, cigarettes, and furniture in the United States. In addition to J. P. Stevens, some of the important textile manufacturers are Blue Bell Inc., Cannon Mills, and Burlington Industries. The furniture industry is centered in the High Point-Thomasville and Hickory-Statesville areas. Although per capita income has increased faster than the national average since 1986, it still ranks only 32nd among all states. Alternate sources of income in the service industry are increasingly important to the state. Tourism and retirement living were major sectors of North Carolina's economy in the 1990s, with many people flocking to the state's historic sites, recreation areas, and scenic mountains.

NORTH DAKOTA

As a surveyor for the North West Company (Canada) in 1797, David Thompson was the first to describe part of what is presently North Dakota. Thompson completed the task of mapping the main travel routes through Canadian and United States territory. He also recorded details of the land and described Indians he encountered along the way.

In 1801 the first long-term trading post was set up at Pembina, and it became the center for the first white settlers in the state. Locally, trading furs provided the economic base for early settlers. It also became big business abroad as American trading companies competed with British-Canadian companies for control of the fur trade business. After the Lewis and Clark Expedition was completed, the fur business soared in North Dakota. Because trading furs became more lucrative as more companies were established, John Jacob Astor (1763–1848), founder of one of the biggest fur trading companies in the United States, convinced the American government to pass a law prohibiting other countries from trading with the Indians.

In the 1800s demand for furs was great and traders in the west could answer the call. Fur trading flourished into the 1850s as Astor built the first steamboat to run on the upper Missouri River. (It could carry 144 tons of goods.) Soon after, more trade routes were established including a major trade route that was opened for cart caravans between St. Paul, Minnesota, and what is now Walthalla, North Dakota. St. Paul merchants offered \$1,000 to the man who would open more trade markets by putting a steamboat on the Red River. In 1859 Anson Northrup received \$2,000 for dismantling a small boat he had launched on the Crow River; using 32 teams of oxen, he hauled it to the Red River and successfully launched it there.

Dakota became a territory in 1861. Some settlers traveled west to Dakota to take advantage of the Homestead Act, which was passed by Congress in 1862. This bill gave free land to those who would work on the land for five years and plant crops. In 1864 Congress gave Northern Pacific Railroad 50 million acres in Dakota to lay tracks from Minnesota to the West Coast. Unfortunately, funds ran out after a few years and the project was not completed until 1881. In the 1870s and 1880s the development of other modes of transportation made it easier for settlers to move west. Steamboats, stagecoaches, and ox-drawn wagons brought hundreds of thousands of people to Dakota in the ten-year period between 1880 and 1890. European immigrants also began to settle in Dakota. However, life on the plains was not easy. The dry summers, forest

fires, spring floods, and winter blizzards made every day life extremely difficult.

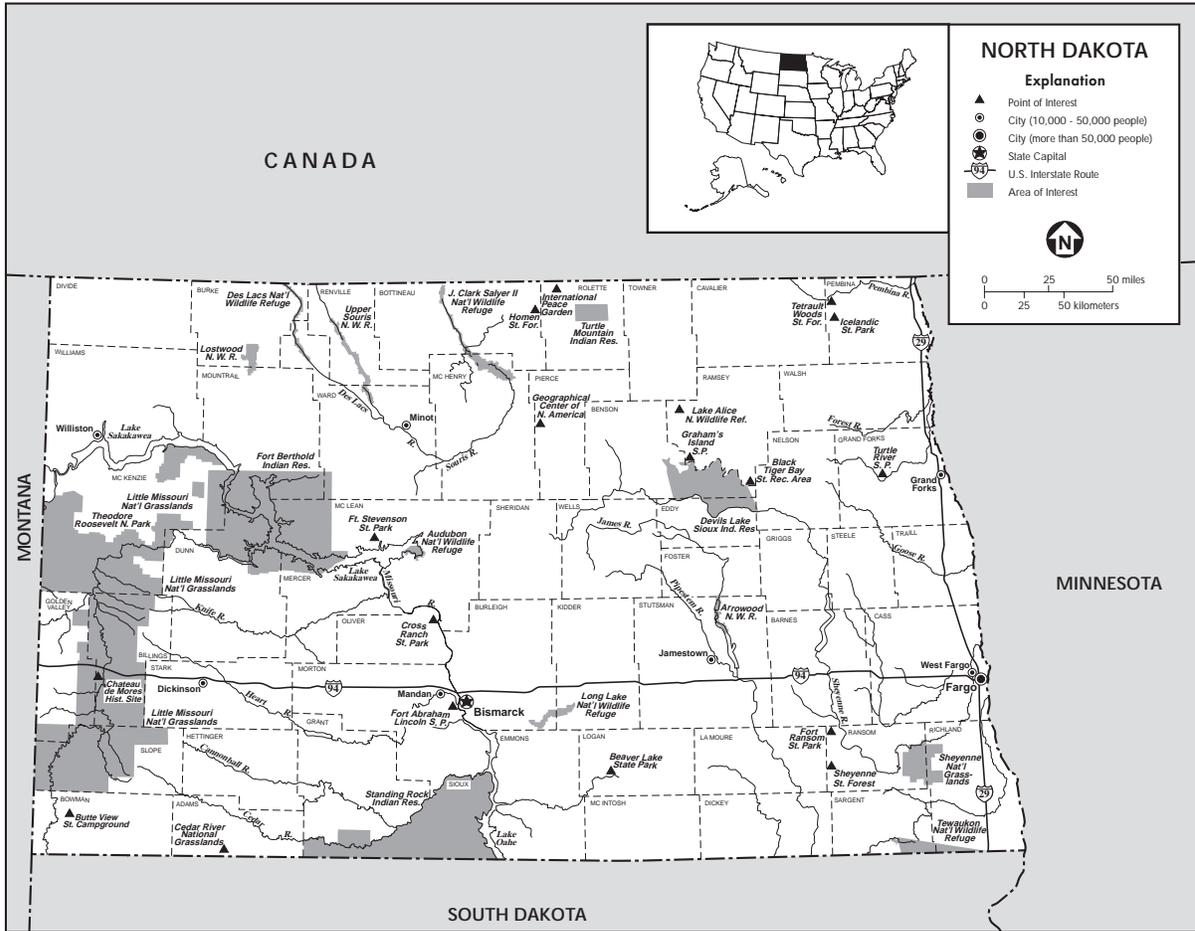

In 1870 wheat became a major source of revenue in the state. A new milling process was developed for spring wheat, a northern crop that was planted in the spring and harvested in the fall. When the wheat was ground the bran was separated from the flour. Also the railroad companies started up “bonanza farms” that covered thousands of acres of land and produced tons of wheat. A land agent for the Northern Pacific persuaded railroad president George W. Cass and a director, Benjamin Cheney, to purchase more than 13,000 acres for a bonanza farm. This enterprise, and more than 90 others like it, became very successful. The farms were owned by businessmen and were managed by foremen or superintendents. New settlers took advantage of the opportunity to work the farms or to start their own, smaller farms.

Though bonanza farming was successful, it also caused land prices to increase. To turn a substantial profit, many owners sold the farms when they knew they could get the highest price. However, in 1890 a depression caused wheat prices to fall drastically; most of the larger farms had to be broken up and sold in smaller parcels.

While farmers were tending wheat, cattle ranching started to take hold in the 1880s. Among the first was a business built by the Marquis de Mores, a Frenchman trying to make his fortune in Dakota. Instead of shipping live herds to markets in the East, the marquis devised a plan to slaughter his cattle on the range and send the beef to market. In the first year, the marquis was very successful, but he overextended himself and had to go back to France, leaving a \$1 million debt behind. Other ranchers in the area had difficulties as well—grasshoppers and fire destroyed the grass in 1886. As a result many ranchers pulled out of the area.

During the late 1880s, Dakota’s territorial governor, Nehemiah Ordway, and his friend, Alexander McKenzie, were major political bosses who protected the financial interests of the railroad, banks, lumber and insurance companies ahead of the interests of the people. Along with special interest groups, they were opposed to Dakota’s bid for statehood. However, after a new (state) constitution was approved, North Dakota and South Dakota became states on November 2, 1889.

The first action taken by the state’s new government was to pass laws regulating railroads and grain businesses. For the next two decades Dakota worked hard to establish a stable economy. More railroad lines were built to serve more towns because the price paid

State of North Dakota.

for crops was good. In order to gain more control over wheat marketing, farmers formed cooperatives. These groups of farmers, who worked together to try to reduce the costs of transportation and storage costs and to get fair market prices for their wheat had little success.

Another attempt at fair trade was made by Arthur C. Townley, who developed a powerful farmer's organization called the Nonpartisan League (NPL). A popular organization, it became 40,000 members strong in one year. The NPL called for state-owned businesses such as banks to offer low-interest loans to assist farmers; they also favored grain inspectors to maintain consistent standards. Many voters opposed what they called "state socialism," but in 1918 NPL candidates took over state leadership. The League continued in state politics through the 1950s. Reforms that were achieved under the NPL included tax breaks for farmers, funds for schools, and a better process for grading grain. However, despite NPL reforms, the Great De-

pression (1929–1939) caused banks to close, farmers to lose their land, and widespread unemployment in the late 1920s and early 1930s.

In the 1940s the economy began to pick up again with the construction of the Garrison Dam. The project relieved flooding along the Missouri, produced hydroelectricity, and provided irrigation for farms. In 1951 another major event took place that would bring new money to the state. Oil was discovered on the Clarence Iverson farm. An oil boom brought oil companies and prospectors flocking to the area. Although production from these wells declined in the 1960s and 1970s, new oil wells were discovered in the late 1970s. The OPEC oil embargo of 1973 and the rise of oil prices throughout the decade encouraged additional drilling and supported another oil boom. However, the state's economy suffered in the 1980s when oil prices dropped and a drought that started in 1987, continued into the 1990s—more than 5.3 million acres of land were damaged. While the agricultural production was strong in the 1980s and early 1990s, more than \$600

million in crops were damaged from severe storms and flooding in 1994.

The 1995 median household income in North Dakota was \$29,089; twelve percent of all North Dakotans lived below the federal poverty level.

NORTHERN SECURITIES CASE

The American economy changed substantially following the American Civil War (1861–1865). Cottage industries, artisan production, and small-scale manufacturing declined, and a new, larger, factory-based manufacturing sector grew. Operating under relatively relaxed state business laws, financiers and manufacturing moguls became rich, often by suppressing the competition.

This led to a concentration of capital in just a few huge corporations, especially in transportation and heavy industry. The giant manufacturing and mining companies that survived the period of cutthroat competition soon folded into nationwide monopolies known as trusts. In a trust, the companies transferred their properties and stocks to a board of trustees who ran the companies in a way that avoided competition—for instance, by dividing the markets up to protect regional monopoly. Such business arrangements substantially restricted the opportunities for new competitors.

During the 1870s the rapidly expanding railroads required long-term capitalization to meet their high

fixed costs on a scale never before seen in U.S. business. The railroad companies sought cooperative pooling arrangements to stabilize markets and profits. Despite the ideology of free enterprise so prevalent during these years, the railroads, the steel industry, and the oil industry feared cutthroat competition much more than they feared government intervention. When the passage of the Interstate Commerce Act in 1887 prohibited pooling, railroads turned to other forms of consolidation. Workers, consumers, farmers, and small independent businessmen often faced high transport costs due to the lack of rail competition. Their reaction was frequently to demand antitrust laws.

Embracing the economic philosophy that public interest is best served by free competition in trade and industry, Congress passed the Sherman Antitrust Act in 1890 to guard against "combination(s) in restraint of trade." Congress sought to prevent unreasonable concentrations of economic power. However, vagueness in the terms "restraint" and "monopolization" placed the burden on the president and judiciary to determine how to enforce and interpret the act.

Existing monopolistic business trends continued through the 1890s. Between 1897 and 1904 more than four thousand companies melded together to form not quite 300 corporations. Meanwhile, the Sherman Antitrust Act was of little use, as the courts initially interpreted the Act as applying mainly to labor union activities "in restraint of trade." The courts held that manufacturing was not commerce and that consolidation was considered a viable means to stabilize costs. In addition, the courts ruled that the Act did not apply to stock transfers.

Under President Theodore Roosevelt (1901–1909), the Sherman Antitrust Act began to be used against corporate mergers. Roosevelt, who was concerned that the blatant favoritism that the government had displayed towards the corporations might result in the radicalization of labor, argued that the federal government should have the power to control big businesses through regulatory boards. Soon after Roosevelt assumed office, a case emerged involving four rail lines serving the northern plains.

Three of the four railroads were owned by prominent New York financiers. J. P. Morgan (1837–1913) owned the Northern Pacific which ran from Minneapolis to the Pacific Ocean. James J. Hill (1838–1916) owned the Great Northern with a similar route. Edward H. Harriman (1848–1909) owned the Union Pacific running from Omaha to Ogden, Utah. All three of them wished to control the Burlington railroad which ran across Illinois and provided ready entry into Chicago.

Northern Securities Case

In 1901 Morgan and Hill cooperated to purchase the Burlington and plotted to drive Harriman out of business. Harriman quickly maneuvered, purchasing the majority of Great Northern stock. To salvage his ownership Hill began buying back the shares which, in turn, led to a sudden escalation in Great Northern's stock. Other investors did not understand what was the driving force behind the price escalation, so they began rapidly dumping other stocks to purchase Great Northern stocks. A panic on Wall Street followed, bankrupting thousands of unsuspecting investors.

A standoff between the three financiers led to a negotiated agreement. To prevent hostile takeovers the agreement established the Northern Securities Company, a holding company to control stocks of the Northern Pacific, Great Northern, and Burlington. The new company in which Morgan and Hill held controlling interest was worth approximately \$400 million. Such a merger, through a holding company, was thought to be a viable means of cooperation without violating interstate commerce or antitrust laws.

Roosevelt became keenly interested in the developments pertaining to the agreement between Morgan, Hill and Harriman. Attorney General Philander Knox was assigned to look into the arrangement. In March 1902 the United States filed suit against the holding company in a federal district court in St. Paul, Minnesota, charging violation of the Sherman Antitrust Act. Lawyers for the railroads argued that the intent of the company was not to restrain trade but to prevent hostile takeovers. They asserted that the railroads rarely competed for the same business despite running parallel tracks. Furthermore the Northern Securities Company did not actually run the railroads, but merely held stock in the companies that did. Hence the company was not actually involved in interstate commerce. They argued that the act should not be applied to situations that only involved transfer of ownership.

Accustomed to a more cordial relationship with presidents, as soon as Morgan learned of Roosevelt's intention to prosecute the case, he and two conservative senators hurried over to the White House and declared to the president, "If we have done anything wrong, send your man to my man and they can fix it up." (Brinkley, 642) Despite these pleadings, Roosevelt held firm and the district court ruled that the company essentially eliminated any motive for competition as far as the public was concerned. The court ordered the Northern Securities Company dissolved.

In appeal to the Supreme Court, the railroads claimed forced dissolution would essentially deprive

them of their Fifth Amendment property rights. The government countered that the holding company essentially concentrated control of transportation trade over a vast area of the nation under a single entity. In March 1904, the Supreme Court sided with the government's argument and affirmed the lower court's ruling in a 5-4 decision. The holding company constituted an unreasonable restraint of trade as prohibited by the act. Only Justice Oliver Wendell Holmes dissented from the decision. Holmes asserted that essentially all railroads are monopolies since only a single company runs on a particular set of lines. Therefore he could find nothing unreasonable concerning the holding company. These disagreements simply reflected an economic trend toward larger corporations with greater powers. Critics of the ruling complained that mere possession of great power should not automatically make someone suspect and some forms of price fixing may actually be reasonable.

The Supreme Court decision demonstrated to the business world that the Sherman Antitrust Act could be an effective tool used to combat business activities that restrain trade, including monopolies and trusts. The Act thus became not only the first, but also the most important antitrust legislation in the United States. The character of industrial business organizations and particularly railroads changed. Roosevelt became known as the "Trustbuster." With large corporations becoming a fixture in the American economy, this episode inaugurated a lengthy history of government oversight through antitrust enforcement.

NORTHWEST ORDINANCE

The Northwest Ordinance was the third of three major land ordinances passed by the Congress convened under the *Articles of Confederation* (before the ratification of the U.S. *Constitution*). The three ordinances also included the Ordinance of 1784 and the Land Ordinance of 1785.) These laws were passed to help manage the lands of the Old Northwest, which were awarded to the United States at the end of the American Revolution (1775–1783)—the modern states of Ohio, Indiana, Illinois, Michigan, and Wisconsin. The Ordinance of 1784 was drawn up by a committee headed by Thomas Jefferson (1743–1826). It created a system of government for the territory and guaranteed settlers the right to organize themselves into new states. The Land Ordinance of 1785 established the way in which the territory would be measured and divided up for sale to prospective settlers and land speculators. The Northwest Ordinance of 1787 (one of the final acts passed by the Confederation Congress before it dissolved) set up the process through which settlers could bring their new states into the Union. The ordinance guaranteed settlers the rights of U.S. citizens; established procedures for dealing with Native Americans in the area; allocated money from the sale of land in the territory to be set aside for public schools; and banned slavery north of the Ohio River. It also established that the territory would eventually be divided into no less than three and no more than five states.

Under the terms of the Northwest Ordinance, the Northwest Territory was divided into a number of districts, each of which was to be administered by a governor and by judges appointed by Congress. When the white male population of a district reached 5000, the district became a territory. It could then form its own territorial legislature, but its executive and judicial officials were still appointed by Congress. When the population of a territory reached 60,000, it could apply for admission as a state. The Northwest Ordinance established that territory brought into the Union would enter on an equal basis with the original 13 colonies, thus, recently-settled areas were prevented from being treated as inferior to more established regions. Settlers in the new areas were also guaranteed certain rights, such as freedom of religion, which the original colonies did not promise to their citizens. Although he took no steps to free the few slaves already living in the territory, Jefferson added a provision specifically banning slavery from being introduced into the territory.

The Northwest Ordinance also tried to establish the government's official policy toward Native Americans living in the area. It required the government to

use its "utmost good faith" toward the Indians, and it promised that "their lands and their property shall never be taken from them without their consent; and in their property, rights, and liberty, they shall never be invaded or disturbed, unless in just and lawful wars authorized by Congress." The "just and lawful wars" clause was ignored more often than it was honored. In a series of wars ranging over 40 years, from Little Turtle's War (1791–1794) to the Black Hawk War (1832), Native Americans were driven from the Old Northwest and their lands were seized and sold to white settlers.

IN PROVIDING FOR ORDERLY DEVELOPMENT AND EVENTUAL STATEHOOD, THE LAND ORDINANCES MAY WELL HAVE BEEN THE MOST SIGNIFICANT LEGISLATION OF THE CONFEDERATION-PERIOD CONGRESS.

James Kirby Martin, Professor of History, University of Houston

The economic impact of the Northwest Ordinance was very broad. By making the process of statehood relatively easy, settlers in the Old Northwest were encouraged to ship their produce to American ports rather than to more accessible British, French, and Spanish ports on the Great Lakes or lower Mississippi River. By banning slavery, the area was reserved for free labor. Finally, by allowing Native Americans to be deprived of their lands through warfare, the Northwest Ordinance set a precedent for settler-Native American conflict that lasted over a century.

NORTHWEST PASSAGE

The Northwest Passage is the circuitous sea passage, long sought by explorers, between the Atlantic and the Pacific Oceans. Though it was eventually found through a series of discoveries, it was not completely navigated until Norwegian explorer Roald Amundsen (1872–1928) explored it between 1903 and 1906. Numerous navigators, convinced of the existence of such a passage, attempted to find it during the early years of European westward sea exploration. Though unsuccessful, their determination led to the discovery of other important locations. French sailor and explorer Jacques Cartier found the St. Lawrence River, dividing Canada and the United States, between 1534 and 1535. English commander Sir Martin Frobisher discovered Frobisher Bay off the coast of Baffin Island and north of Quebec in 1576. English navigator John Davis discovered Davis Strait between Baffin Island and Greenland in 1587. English navigator Henry Hudson found the Hudson River in eastern New York State, and Hudson Bay, the inland-sea of central Canada, between 1609 and 1611. Following centuries of efforts Amundsen finally completed the first successful navigation of the Northwest Passage in September 1906, during a journey that lasted more than three years. The harsh climate, however, makes the route impractical for commercial navigation.

NORTHWESTERN COAST INDIANS

Northwest Coast Indian tribes occupied the region bounded by the Rocky Mountains to the east and north, the High Sierras to the southwest, and the Pacific Ocean to the northwest. The area roughly corresponds to present-day northern Utah, northern Nevada, northeastern California, Oregon, Washington, Idaho, British Columbia, and southern Alaska. Beginning at the end of the ice age (about 10,000 B.C.) three distinctive cultures emerged in the region as tribes adapted to the varying environments of the Northwest.

The first culture was that of the Great Basin, which is an elevated terrain walled in by the Rockies and the High Sierras. Here tribes including the Shoshone, Bannock, Paiute, and Ute lived simply to survive the rugged region comprised of desert, brush lands, and pine forests. The climate ranged from dry, hot summers to cold, harsh winters. Bands living here hunted small game and foraged for wild grains, nuts, and vegetables; pine nuts were their most important food. Those living near rivers and streams also fished. Dwellings varied by season. During warm months, brush windbreaks served as shelters; in the winter, conical shelters were made of pine poles covered with sod, bark, grass, or skins. The Indians had few possessions, and those they had, such as baskets, were strictly utilitarian.

The second culture lived on the plateaus west of the Great Basin. The inland region tended to be dry but was forged by rivers, principally the Columbia (forming the border between Oregon and Washington) and the Fraser in central British Columbia. Tribes including the Yakima, Walla Walla, Coer d'Alene, and Nez Perce lived off the plentiful seafood, including mussels and salmon. Prime fishing spots were actively protected. These tribes were sophisticated hunters, and their diet was also rich in meat. They foraged for wild bulbs and roots, as well as berries. Dwellings varied by season: in the winter they lived mostly in pit houses (semi-subterranean, circular shelters); in the warm months they made brush or mat-covered windbreaks.

The third Northwestern culture comprised tribes living along the coast of Alaska, British Columbia, and Washington, such as the Aleut, Kwakiutl, and Chinook. From their plentiful environment, which was rich in wildlife and teeming with fish and seafood, these tribes developed a sophisticated culture. Living off salmon, seals, whales, bear, caribou, deer, elk, and moose, some families grew very wealthy in this region. Wealth was measured by possessions such as canoes, blankets, and slaves (captured enemies). Multi-family dwellings were made out of posts and beams, with planked sides and gabled roofs. Armor and elaborate face masks were used in battle. Decorative objects included wooden boxes and totem poles, which displayed a family's genealogy and social standing.

Europeans brought horses, tools, weapons, and diseases to the region. They came to the area to mine minerals, and white settlements gradually pushed Northwestern Indians off their lands. Major conflicts between the Indians and the settlers included the Modoc War (1872–1873) and the Nez Perce War (1877).

NUCLEAR ENERGY (ISSUE)

In 1954 the U.S. government authorized private ownership of nuclear reactors as part of President Dwight D. Eisenhower's (1953–1961) Atoms for Peace initiative, paving the way for utility companies to build nuclear power plants. By the mid-1960s many utility companies had "gone nuclear," though building reactors proved far more costly than the early hopes; reactor energy did not meet expectations that they could provide power for pennies a day.

Most U.S. citizens' sole experience with the power of the atom was the devastating bombing of Hiroshima and Nagasaki in 1945; accordingly, some opposed the whole issue of nuclear energy. In California, after an earthquake disrupted construction, residents demanded the cancellation of the planned Bodega Bay reactor which was sited on a geological fault. Inhabitants of New York City resisted the siting of a plant within its borders because of the dense population.

Regardless of fears about nuclear weaponry, most people liked the idea of building atomic energy plants. The country was using increasing amounts of electrical energy (produced by burning fossil fuels which created air pollution. Nuclear power promised to be cheaper and cleaner. Moreover, nuclear power had the aura of a neat, high-tech solution to the complicated problems that people had come to expect from politics and business. When an oil embargo by countries in the Middle East hit in 1973–1974, the United States faced shortages of electricity, gasoline, and heating oil. Factories and schools were shut down. There were also cancellations of commercial airline flights, electrical brownouts, and increased lines at gasoline service stations. Blackouts plagued cities and industries, most spectacularly in New York City on July 13 and 14, 1977. High fuel prices reduced the productivity of U.S. industry. To all of these complaints the supporters of nuclear energy claimed a solution. They also argued that nuclear energy would solve the balance of payments problem and neutralize the damage to the international monetary system that was being done by the heavy U.S. imports of fuel.

To some U.S. citizens, atomic energy seemed to offer a way for the nation to achieve energy independence. Support for nuclear power steadily increased. Meanwhile the anti-nuclear movement carried forward the traditions of the anti-Vietnam War movement and many opponents initiated demonstrations at nuclear

power plants. At Seabrook Station in New Hampshire, opponents staged sit-ins, civil disobedience, celebrity concerts, and rallies. Supporters of nuclear energy ridiculed the protesters' fear of technology and charged the anti-nuclear movement with a vaguely un-American variety of consumer elitism. One writer caricatured the protesters as "vegetarians in leather jackets who drive imported cars to Seabrook listening to the Grateful Dead on their Japanese tape decks amid a marijuana haze."

Regardless of this culture clash, the United States' energy crisis was real and was caused by several factors. One was that in the 1950s and 1960s strategic geopolitical concerns led the government to promote the import of fuel from overseas, especially from the Middle East. Another was that President Richard Nixon's (1969–1974) 1971 attempt to halt inflation (called the New Economic Policy) had imposed price controls on the entire economy. But when the other restrictions were lifted, oil remained regulated, keeping the price artificially low to consumers and increasing demand. The United States was extravagant in its use of energy—few U.S.-made cars got better than 10 miles to the gallon, and homes and businesses were poorly insulated and inefficiently designed. Diverse special interests had skewed portions of the government's oversight and regulation of the oil industry toward their particular interests, and passing general legislation regarding energy became a political nightmare. Accordingly, efforts to develop a consistent energy policy throughout the 1970s were diluted and diverted. The decade ended much as it began, with the United States wastefully consuming inordinate amounts of energy, subject, once again, to an oil crisis.

During the 1960s utility companies were aware of the coming energy shortage. One of their methods to prepare for the shortfall was to construct nuclear reactors. In January 1973 there were 27 functioning reactors in the United States, providing only five percent of the power generated. Fifty-five plants were under construction, and an additional 78 were in the planning stages. The majority, however, were never built. Security expenses, nuclear-waste disposal costs, and construction overruns made the return on investment slim in nuclear-power plants.

In 1974, seeking to assist the nuclear industry, the administration of President Gerald R. Ford (1974–1977) disbanded the Atomic Energy Commission (AEC), which had overseen U.S. nuclear development for 28 years. In its place were constructed two more industry-friendly commissions: the Nuclear Regulatory Commission (NRC) and the Energy Research and

The nuclear era was ushered in as the United States claimed victory over the Japanese in 1945. Soon more benevolent uses were developed for this enormous source of energy, such as the Davis-Besse Nuclear Power Plant in Harbor, Ohio.

Development Administration (ERDA). The latter agency was empowered to develop new energy sources and market U.S. nuclear industry abroad. The NRC streamlined the licensing and commission of reactor projects, but many of the old problems remained. Safety was a pressing issue: fires underscored the potential for a catastrophic accident at nuclear plants (at the Indian Point Two reactor in New York in 1971, the Zion reactor in Illinois in 1974, the Trojan reactor in Oregon in 1974, and the Brown's Ferry reactor in Alabama in 1975). In 1975 the Union of Concerned Scientists presented the White House with a petition signed by 2,000 scientists which called for a reduction in nuclear construction. Public opinion followed that of the scientists. Environmental groups increasingly challenged the construction of nuclear projects in the NRC and in the courts, delaying the deployment of projects and driving up the start-up costs. The 1978–1979 protests at the Seabrook nuclear power plant in New Hampshire were particularly vocal and drew national attention to the issue. Then, in the spring of 1979, an accident at the Harrisburg, Pennsylvania, Three Mile Island nuclear power plant resulted in a partial core meltdown. Although no one was injured, the accident terrified the public and placed the future of the nuclear industry in jeopardy.

On April 26, 1986, near the town of Pripjat in the Soviet Union, attention was again focused on the issue of safety in the nuclear power industry. One of four

nuclear reactors at the Chernobyl Nuclear Power Station in the Ukraine exploded with such force that the roof of the building was completely blown off. Eight tons of radioactive materials were scattered about the region immediately surrounding the plant. Airborne radioactivity from the blast rained down on northern Europe and Scandinavia. Fallout contaminating farm produce was measured as far away as Scotland. Engineers at Chernobyl had accidentally initiated an uncontrolled chain reaction in the reactor's core during an unauthorized test in which they unlawfully incapacitated the reactor's emergency systems. In the immediate aftermath of the catastrophe, more than 30 people lost their lives. Moreover, one estimate placed the number at 20,000 who would eventually live shortened lives as a result of the effects of their exposure to radiation from the accident.

In the United States experts argued that the disaster at Chernobyl was not pertinent to the domestic nuclear industry. They noted that the technology employed at Chernobyl was not being used in the United States. The Soviets, they pointed out, were using a weapons-material production reactor to generate electricity for their domestic market—something not done in the United States. Furthermore, the Chernobyl reactor lacked a containment building—a required safety component mandated for all U.S. reactors. Nevertheless, many in the United States drew uneasy parallels between Chernobyl and Three Mile Island, among

them, that operator error and equipment failure was possible in the nuclear industry. The consequences of a single major mistake could be catastrophic.

During the 1980s scores of “anti-nuke” organizations warned of the hazards of nuclear energy and protested plant construction and operation. In Seabrook, New Hampshire, protesters rallied around the citizens’ action group, the Clamshell Alliance, to oppose the building of two nuclear reactors. By 1987 the utility that owned Seabrook was near bankruptcy, in part due to the increased vigilance of oversight safety committees insisted upon by the Clamshell Alliance. At Long Island’s Shoreham nuclear facility the story was much the same. Besieged by civic-group opposition and having far exceeded initial cost estimates of \$241 million (its actual cost to the utility had surpassed \$5 billion), the Shoreham “nuke” was closed by the state government in 1988. The utility that owned Shoreham had failed to develop an adequate evacuation plan for the region of Long Island that would be affected in the event of a meltdown. Sold to the state government for one dollar, the completed plant was to be dismantled even before it opened.

Cost overruns and construction problems continued to plague the industry. Florida’s St. Lucie Two plant cost about four times its original estimate of \$360 million. This price, as it would turn out, was a relative bargain. By mid-decade Michigan’s Midland nuclear power plant (initial cost estimate: \$267 million) had cost the utility constructing it \$4.4 billion, and it was nine years behind schedule. In the West, at the Diablo Canyon Plant, earthquake supports were installed backwards.

Another problem the industry faced was the disposal of irradiated fuel rods. During the 1980s utility companies stored these rods on site at the power plants, in large vats resembling swimming pools, but this was only considered a temporary solution. In 1982 Congress passed the Nuclear Waste Policy Act. The act called upon the Department of Energy (DOE) to find a suitable site to bury radioactive waste. DOE, however, was unsuccessful in locating a site that included both the necessary stable rock formation (free of groundwater) and the requisite local public support. By the end of the 1980s, no solution to the problem of nuclear waste had been found.

OFFICE OF EMERGENCY MANAGEMENT

Office of Emergency Management (OEM) was an executive branch office that coordinated defense activities for all government agencies except the War and Navy Departments. It was established by an administrative order on May 25, 1940, in accordance with an executive decree issued by President Franklin D. Roosevelt (1933–1945). OEM created a number of federal agencies that played a critical role on the American home front during World War II (1939–1945). Three of the most important such agencies were the War Production Board, (WPB) the Office of Civilian Defense (OCD), and the Office of War Information (OWI). WPB mobilized the domestic economy, encouraged industrial expansion, and developed policies to regulate nearly every facet of military and civilian production. OCD was in charge of integrating federal, state, local, and territorial efforts aimed at boosting morale and reducing the risks presented by internal and external enemies of the United States. OWI disseminated information to the media about the government's war-time policies and closely monitored the content of Hollywood films to screen for unpatriotic material that might be harmful to the Allied cause. Although OEM is presently listed as inactive by the United States Government Manual, its responsibilities have been largely assumed by the Federal Emergency Management Agency (FEMA), which was established in 1979.

See also: War Production Board, World War II

OFFICE OF PRICE ADMINISTRATION

During World War II (1939–1945), the federal government became the major consumer of production for the war period. Accordingly, Congress instituted a price fixing authority on all goods and wages with the creation of the Office of Price Administration (OPA),

and the “General Maximum Price Regulation” (General Max), which froze all retail prices at their highest price levels as of March 1942.

On April 27, 1942, President Franklin Roosevelt outlined another aspect of price administration, to be known as “rationing” (which Roosevelt described as a “democratic, equitable solution” to the issue of providing goods for Americans that had become scarce because of the war). Items that were rationed in some way included gasoline, rubber tires, leather shoes, butter, and products with nylon content.

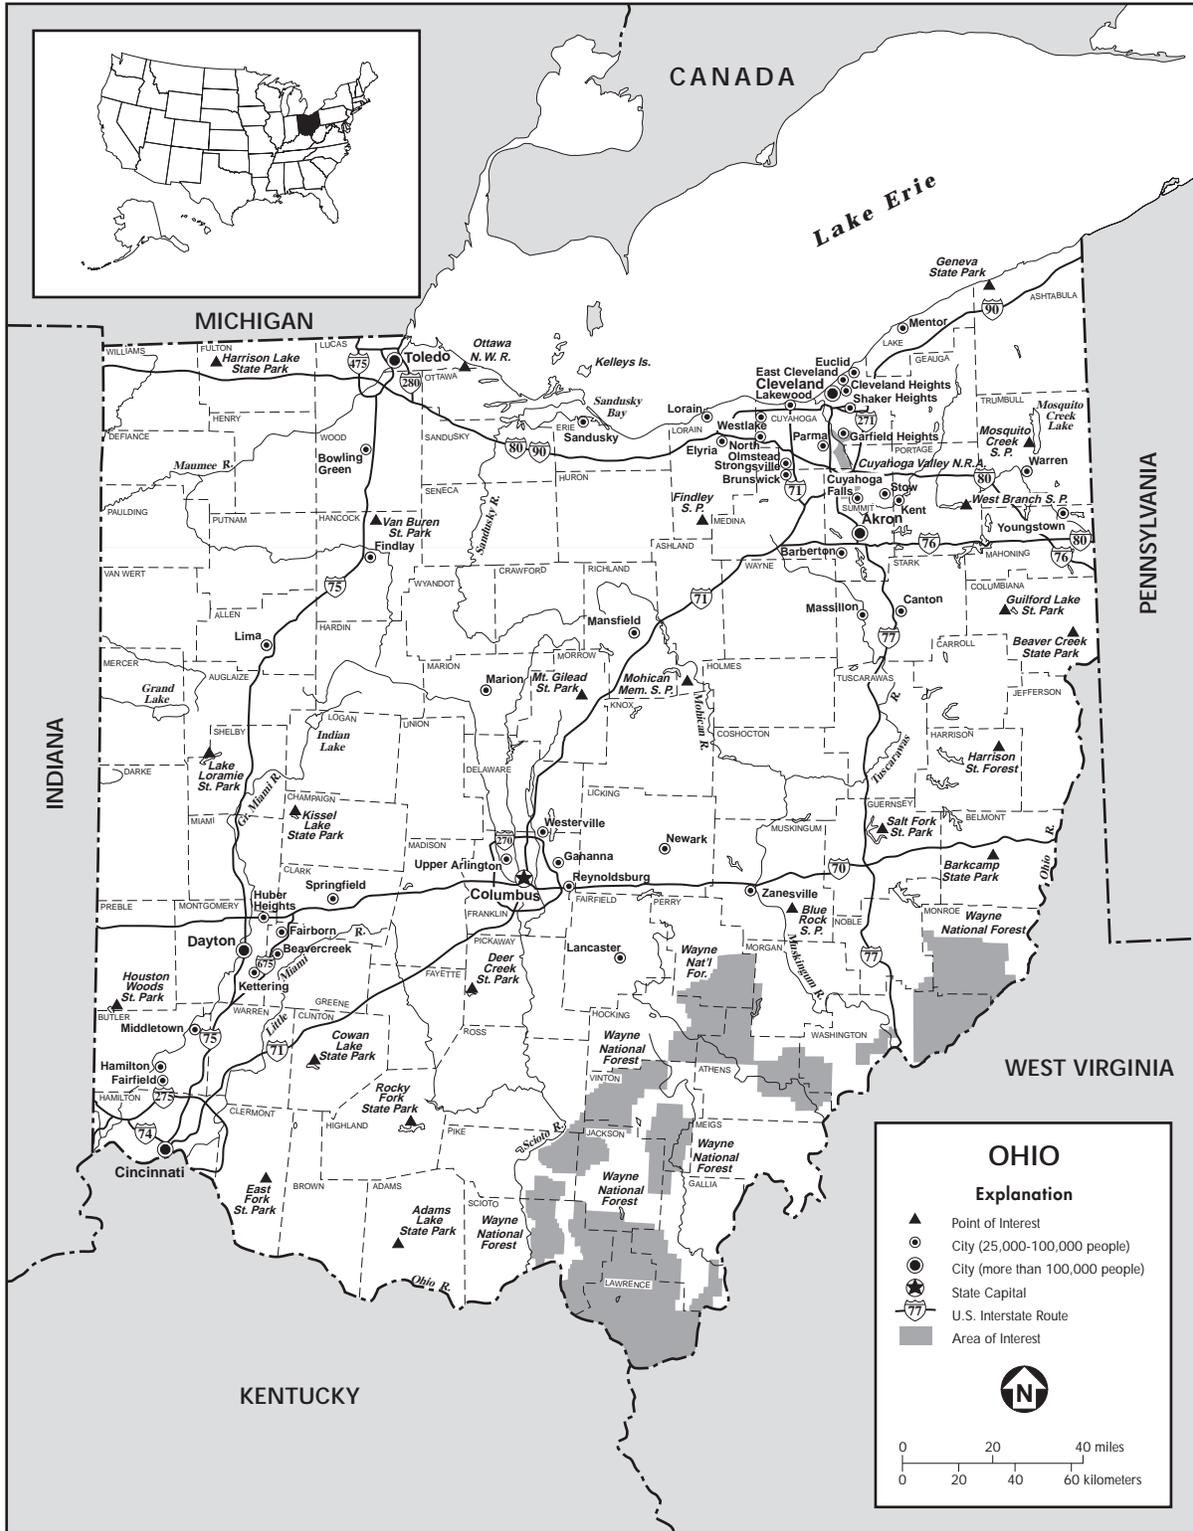

The rationing of goods to U.S. consumers during World War II was one of the many functions of the OPA. Perhaps the major problem of the OPA, functionally, was keeping economic inflation in strict control domestically, while providing military forces overseas with what they needed to fight the war.

OHIO

Some historians have said that the history of the state of Ohio is, in some ways, a microcosm of the history of middle America. Ohio has seen Native American revolts, pioneer migrations, and the gradual transformation of its wilderness into farms, towns, and cities. The transportation systems that eventually traversed the state brought rapid economic growth. The immigrants who peopled Ohio's cities helped make them industrial giants. They brought with them a wealth of skills and experiences that enriched society and made Ohio the prosperous, culturally diverse place it is today. The industrial pollution and urban decay plaguing the state have mirrored problems in the nation as a whole. But Ohio's efforts to keep up with changing economic times have been largely successful in spite of periodic setbacks.

The first European visitors to Ohio were game hunters of French and English extraction. When they

State of Ohio.

began to settle in Ohio in the seventeenth century, they found a number of Native American tribes there, including the Wyandots, the Delawares, the Miamis, and the Shawnees. The hunters soon started bringing in such goods as knives, hatchets, tobacco, and brandy. They exchanged these for the natives' beaver pelts and deerskins. The French and the English competed for the territory of Ohio until the middle of the eighteenth century, when as a result of the French and Indian War (1754–1763), the British became the predominant power in northern North America, gaining control over a vast area that included Ohio. They lost some of this territory in the American Revolution (1775–1783).

After the Revolution, Ohio belonged to the United States, becoming part of the Northwest Territory. Future land development in the new Northwest Territory was regulated by the Ordinance of 1785 and the Northwest Ordinance of 1787. The new territory was defined as the area between western Pennsylvania and the Mississippi River, bounded on the south by the Ohio River and on the north by Canada. When settlers began making their way to the Ohio area, many went by keelboat down the Ohio River. They sought fertile lands and new economic opportunities. The new American nation came into being in 1789, and this set the stage for Ohio's prosperity. The Treaty of Greenville in 1795 pushed Native American tribes out of the territory and further encouraged white settlement in the area. More settlers came from the older eastern colonies after Connecticut ceded the Western Reserve, a tract of land along the southern coast of Lake Erie that now comprises part of northeastern Ohio. By 1803 the area had enough residents to become the seventeenth state of the Union.

EXCEPT ON THE BROADEST LEVELS . . . ONE CANNOT GENERALIZE ABOUT THE PEOPLE OF OHIO . . . [THE STATE] HAS A REPRESENTATIVE QUALITY[, WITH] AN UNUSUAL BALANCE BETWEEN NORTHERN AND SOUTHERN INFLUENCES, BETWEEN AGRICULTURE AND INDUSTRY, BETWEEN RURAL AND URBAN.

George W. Knepper, *Ohio and Its People*, 1989

A final challenge from the British came with the War of 1812 (1812–1814). Commodore Oliver Hazard Perry (1785–1819) won a decisive battle in the war on Lake Erie, making Great Lakes commerce safe for Americans. Gen. William Henry Harrison (1773–1841) repulsed Indian encroachment at the Battle of Tippecanoe in the Indiana Territory. Large numbers of people migrated to Ohio thereafter, both from the eastern colonies and from abroad. Encouraged by low prices

for land, new settlers moved quickly to establish farms and begin towns across the new state.

Ohio needed a better system of ground and water transportation to help its economy grow. The first significant route to cross the breadth of Ohio in the 1830s was the National Road (later to become U.S. route 40). The route stretched from Cumberland, Maryland, to Vandalia, Illinois. A canal system was created at about the same time, connecting the northern and southern portions of the state. The Ohio and Erie Canal ran from Portsmouth on the Ohio River to Cleveland. The Miami–Erie Canal ran from Cincinnati to Toledo. The canals were not profitable for their owners but proved successful at opening new markets to many farmers.

By the 1840s railroads were beginning to radiate from the population centers, effectively bringing the canal era to an end. The number of railroad tracks in Ohio increased tenfold between 1850 and 1860, though canals were still being constructed in the state. The railroad was crucial to Ohio's economic growth, connecting small towns and urban centers with other cities across the young nation.

Although the railroad brought unprecedented change to Ohio, the state was still primarily agricultural in the mid-nineteenth century. The American Civil War (1861–65), however, increased industrial development, which continued to grow during the rest of the century and beyond. John D. Rockefeller's (1839–1937) Standard Oil Company in Cleveland quickly took control of most of the oil refining and distribution in the nation. The city of Akron became the "rubber capital" after B.F. Goodrich (1841–1888) began manufacturing fire hose. Cincinnati and Dayton also became major manufacturing centers during this time. There was a new wave of immigrants, mostly from southern and eastern Europe, in the 1880s and another in the 1910s. This influx of population brought many potential factory workers to Ohio cities. The advent of labor unions in the 1880s brought some protection to workers against unfair labor practices.

By 1900 Ohio ranked number four in manufacturing. The coal mines in the southeastern part of the state and Great Lakes access to Michigan and later, Minnesota iron ore helped the iron and steel industry to grow in the Cleveland-Youngstown area. By this time Ohio led the nation in the manufacture of machine tools. It ranked second in steel production.

The state's farm population steadily declined after 1900 and cities began to grow, and World War I (1914–1918) greatly contributed to Ohio's industrial growth.

Ohio Valley

The automobile industry stimulated Ohio's rubber, oil, and glass industries in the 1920s.

The Great Depression of the 1930s hit Ohio hard. It caused widespread unemployment and stifled the economy in many ways. Labor unions became stronger during this time, as workers hoped to protect their standard of living by organizing. The United Rubber Workers in Akron grew to a membership of around 70,000 after a series of sit-down strikes at the rubber plants. The United Steelworkers also struck at seven steel plants in Youngstown and greatly increased their membership.

Like much of the nation, Ohio benefited economically from the outbreak of World War II (1939–1945), though the state prospered in part because of its healthy industrial base. The state's economy especially grew through war-time production of trucks, tractors, and airplanes. Highway building and airport construction also increased during this time.

In 1959 the St. Lawrence Seaway provided a major economic boost to Ohio. This important waterway connected Toledo and Cleveland with transatlantic commerce. This period unfortunately also brought widespread pollution of the waters, especially Lake Erie, from the dumping of industrial wastes. The rural population continued to decline, and many middle-class people fled to the suburbs from city centers. They left a legacy of urban ruin that would plague the state for years to come.

In the 1970s Ohio's economy began to lag. By the early 1980s it entered a difficult phase. The state's unemployment rate rose to 14 percent by 1983. Manufacturing jobs were on the decline—down from 39 percent in 1970 to 27 percent in 1982. The high sulfur content in most of Ohio's abundant coal supply made the coal largely unusable because it contributed to atmospheric pollution. The state was eventually forced to borrow from the federal government to pay for the high costs of unemployment benefits.

A boost to Ohio's economy was the Thomas Edison Program, initiated in 1983. The project provided venture capital funds for new companies. It also helped establish conservancy districts for the Miami and Muskingum rivers, and began programs that eventually reversed the pollution of Lake Erie. Another major achievement for the state was the establishment of a new Honda Motor Company auto plant at Marysville near Columbus.

Unemployment in Ohio rose again during the recession of 1992, despite considerable economic progress in the mid-1980s. In 1995 there was a major strike

at two General Motors plants in Dayton. This added to the state's economic uncertainty. But manufacturing remained the major economic pillar in Ohio throughout the 1990s. The state manufactured mostly durable goods like motor vehicles and other equipment, and steel. The service industry also became significant in the state. Tourism became one of the important segments of the service market. Ohio farms maintained high levels of production in cattle, pigs, and poultry, as well as tomatoes, soybeans, wheat, and oats. The state ranked fifteenth in net farm income in 1995. Ohio's mineral production was also healthy: coal provided more than one third of the state's energy needs, and Ohio was a national leader in the production of sand and gravel. In 1995 Ohio led the nation in lime production.

OHIO VALLEY

The Ohio River drains into a fertile basin that measures 203,000 square miles (528,101 square kilometers)—stretching across Ohio, West Virginia, Indiana, Illinois, and Kentucky. The river is formed by the confluence of the Allegheny and Monongahela rivers at Pittsburgh, Pennsylvania. From there the Ohio flows southwest, forming the border between Ohio and West Virginia. The river then turns west-northwest to form the border between Ohio and Kentucky before turning southwest again between Indiana and Kentucky, and between Illinois and Kentucky. Navigable by barges its entire length of 975 miles (1,569 kilometers), the Ohio River empties into the Mississippi River at Cairo,

Illinois. The region surrounding the Ohio River is rich farmland. Commercial cities—trade centers that grew as transportation along the principal waterway increased—also dot the region.

The Ohio was first seen in 1669 by a European, French explorer Sieur de La Salle (1643–1687). In the first half of the 1700s, traders traveled the Ohio River, finding the surrounding valley a plentiful hunting ground. The fur trade flourished, making the region a coveted possession for both the French and the British. Numerous battles were fought in the valley, including the French and Indian War (1754–1763), the last major conflict in North America before the American Revolution (1775–1783).

The Ohio River Valley passed to British control (from the French) in 1763. In 1783 it became part of the new republic of the United States. Four years later the U.S. government established the Northwest Territory (the present-day states of Ohio, Michigan, Indiana, Illinois, Wisconsin, and part of Minnesota). Soon many settlers traveled the Ohio River westward. By 1820, more than 60 steamboats plied the Ohio, which remained the main westward route into the region until 1825. Settlement of the Ohio River Valley was aided by the federally built National Road (completed 1852), New York's Erie Canal (1825), and by Pennsylvania's Main Line Canal (1837).

Two companies also helped develop the region. The first was the Ohio River Valley Company (sometimes called the Ohio Company of Virginia), formed in 1747 when England's King George II granted London merchants and landed Virginians 200,000 acres (81,000 hectares) west of the Allegheny Mountains. But conflicts with the French stymied British efforts to settle the region and the company failed. The Ohio Company of Associates was organized in 1786 in Boston, Massachusetts. Shares were sold to raise enough money to petition the Congress of the Confederation to purchase land beyond the Ohio River. Congress sold the company 750,000 acres (304,000 hectares) in what is today southeastern Ohio. In 1787 Congress passed the Northwest Ordinance, which set guidelines by which territories became states. The first settlement founded under the Northwest Ordinance was Marietta, Ohio, which was named the capital of the Northwest Territory in 1788. Within a year three more settlements were made in the territory. Ohio was admitted to the Union in 1803.

OIL DEPLETION ALLOWANCE

Oil depletion allowance refers to deductions allowed in petroleum industry taxation. Mineral resources, including oil and gas, are finite and may become exhausted from area to area. Although difficult to estimate the amount of the deposit left, the allowance takes into account that production of a crude oil uses up the asset. Depletion deductions provide incentives to stimulate investment in oil discovery in hazardous or financially risky areas. The deduction, a fixed percentage of sales, is subtracted from a business' gross income, thus lowering its taxable income.

The oil depletion allowance has been an integral part of the U.S. taxation system applied to oil since the end of World War I (1916–1918). First called the "discovery depletion," the allowance evolved to the "percentage depletion" in 1926 when, regardless the amount invested, corporations deducted a specific percentage of total sales. Long set at 27.5 percent, the deduction came under fire as being overly favorable to the extractive industries. Congress lowered the percentage to 22 in 1969.

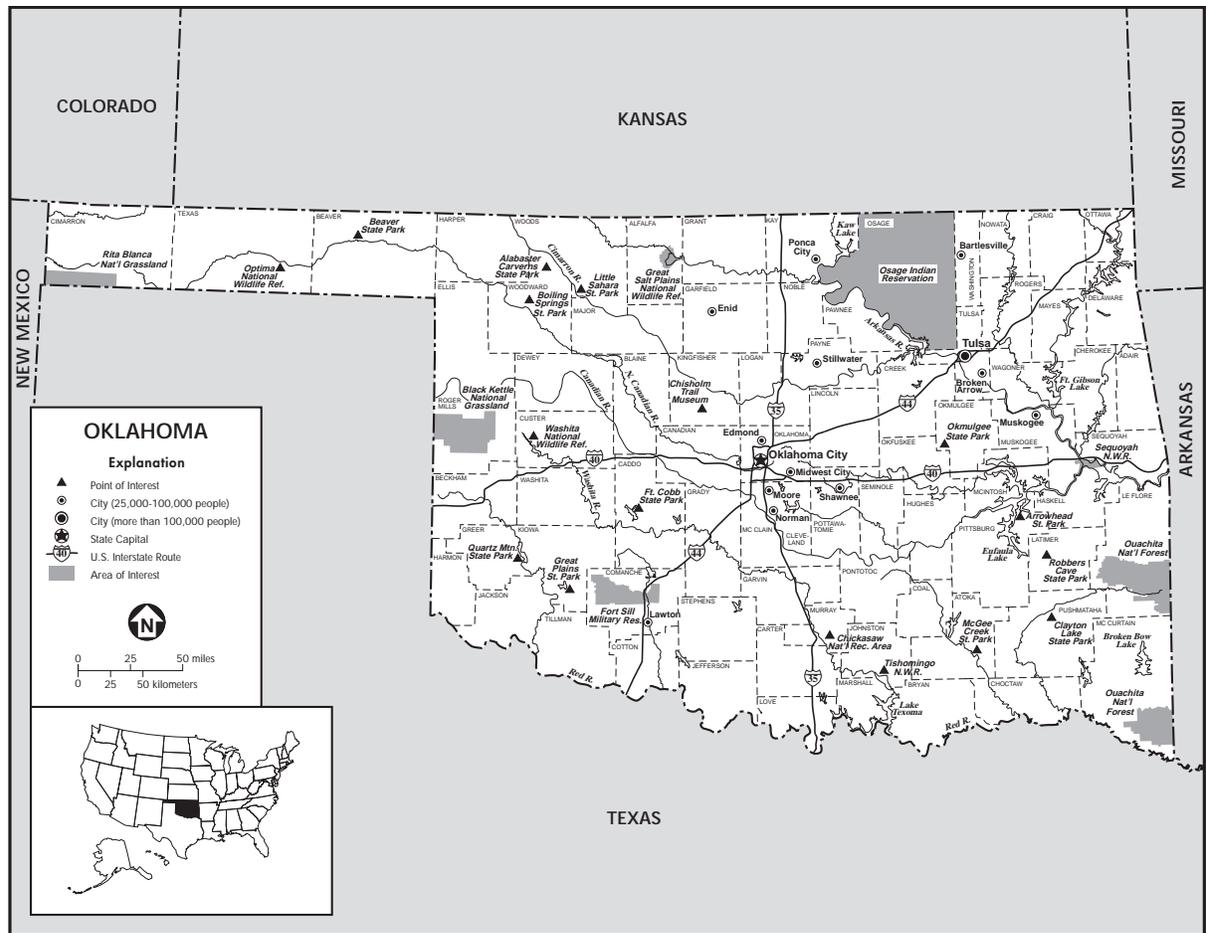

In 1975 there were approximately 35 major oil producers but roughly 10,000 smaller independent producers. The oil depletion allowance again entered the political arena with opponents arguing that it constituted a special treatment gift to the oil and gas industry. Fear of losing the allowance completely led independents to break with the majors and fight to retain it for themselves. Congress agreed that the independents indeed were America's hazardous oil-finders. Congress voted to eliminate the allowance for the majors but, although gradually reducing it to 15 percent by 1984, retain it for the independents and royalty owners. For the first time in U.S. history, a definition for an "independent producer" appeared in the basic U.S. tax code. The explicit legal definition allowed independents to be considered separately from major oil producers in legislation and saved the independents millions of dollars in the last quarter of the twentieth century. Attempts to eliminate the 15 percent tax shelter in 1985–1986 failed when sinking world oil prices alone sent the oil industry into decline.

OKLAHOMA

Oklahoma was admitted to the Union as the forty-sixth state on November 16, 1907. Its location in the western south central United States makes it a geographic melting pot. Sharing borders with Texas and

Oklahoma

State of Oklahoma.

Arkansas, Oklahoma is part of the South. But its common borders with Missouri and Kansas place Oklahoma in the central United States, and its borders with Colorado and New Mexico give the state a western flavor. Oklahoma is the nation's eighteenth largest state with over 69,000 square miles. Its population of 3.3 million people ranks 30th among the fifty states. Oklahoma City is the state's capital and its most populous city.

The state enjoys a diverse topography, climate, and economy. The humid eastern region of Oklahoma is graced by seven million acres of forests and 2,600-foot mountainous peaks where mining and lumbering are the chief economic activities. The east is also home to hundreds of swift-running rivers, many of which are dammed to provide hydroelectric power in neighboring communities. Wheat is grown and cattle raised in the more temperate, low-rolling prairies to the west. Most of Oklahoma's cotton is grown in the drier, heavily irrigated southwestern counties. Petroleum and natural gas are produced throughout the state—Oklahoma is

one of the country's five leading producers of both mineral fuels.

Oklahoma winters are relatively mild, with temperatures in January averaging about 38 degrees Fahrenheit. Spring brings dozens of tornadoes that twist through the state annually, usually leaving measurable damage. Summers tend to be long and hot, and periodic droughts can turn the semi-arid western region of Oklahoma into a dust bowl. But the state's sometimes challenging climate does not stop yearly visits from 16 million tourists, who generate over \$3 billion in gross revenue for the state. Popular Oklahoma tourist attractions include plentiful state parks, rodeos, Old West shows, and Native American exhibits.

Native Americans played an integral role in Oklahoma's early history. The name "Oklahoma" itself is derived from two Choctaw words: "okla" meaning people and "humma" meaning red. Oklahoma has been inhabited by Native Americans since at least 1200 AD. Explored by the Spanish in the sixteenth century and settled by the French in the seventeenth century,

Oklahoma was acquired by the United States in 1803 as part of the Louisiana Purchase. To open land for white settlers in the Atlantic states during the 1820s the federal government began relocating Native Americans from their homelands in the southeastern United States to the new Louisiana Territory west of the Mississippi. The most populous tribes inhabiting this area were the Choctaw, Chickasaw, Creek, Seminole, and Cherokee. Many of these Native Americans adopted European dress styles, farming methods, and political practices.

In the 1830s the federal government seized more land from Native Americans and created what was then called the Indian Territory, which included all of present-day Oklahoma as well as parts of Nebraska and Kansas. Tens of thousands of Native Americans were forcibly uprooted from their communities and driven into this newly created territory. Two-fifths of the uprooted Native Americans died along the way, while others suffered great hardship in what became known as the Trail of Tears.

During the American Civil War (1861–1865) the five tribes indigenous to Oklahoma signed treaties committing their support to the Confederate states. But the war left Oklahoma in ruins. Homes, land, and personal property were destroyed, creating widespread poverty and lawlessness. From the disorder, outlaws and bandits emerged, including the notorious Frank and Jesse James. In response to complaints about the growing tumult, the federal government built a district courthouse in Arkansas and appointed hundreds of U.S. marshals to quell the chaos.

The federal government also built a number of military posts that were designed to keep Native Americans on their reservations. (The Indian Territory had been reduced to the area of present-day Oklahoma after various tribes surrendered land as a condition for rejoining the Union.) Beginning in 1866 native peoples from several western states were relocated to reservations on the western half of the Indian Territory, while the five tribes were cramped into reservations on the eastern half. Skirmishes soon erupted when Native Americans left their reservations to hunt for food on white settlements in Texas and Kansas. U.S. troops were ordered to chase after the wayward Native Americans, beat them back to the reservations, and disarm them. During one particularly cruel military campaign in the winter of 1868, Colonel George Armstrong Custer led a Seventh Cavalry attack on an unsuspecting Cheyenne village near the banks of Oklahoma's Washita River. Custer's troops killed more than one hundred men, women, and children.

Treaties and federal laws further encroached upon the Indian Territory. In 1889 Congress opened 800,000 acres for settlement in the central Indian Territory known as "the Unassigned Lands." Promoters (called "Boomers") organized the settlers (called "Sooners") into communities of home seekers. On April 22, 1889, 50,000 Sooners lined up on the border of the Unassigned Lands, awaiting their signal to race across the unclaimed lots in search of property they wanted to settle. By nightfall nearly all of the available land was taken, and Oklahoma had a new nickname, the Sooner State. "Boomer Sooner," the University of Oklahoma's fight song, was also named after this page in the state's history.

The Native American population in Oklahoma was decimated by the influx of Sooners during the late nineteenth and early twentieth centuries. Native Americans comprised only 9 percent of Oklahoma's population at the time it was granted statehood in 1907, a stark contrast to their 27 percent of the pre-statehood population of 1890. African Americans, many of whom had been lured from other southern states by the promise of unsettled land in Oklahoma, comprised 10 percent of the state's population. They established more all-black towns in Oklahoma than the rest of the country combined.

Although African Americans were discriminated against in Oklahoma, as they were elsewhere in the country, the Oklahoma African American community served as a bellwether for the Civil Rights Movement. For example, African Americans in Oklahoma were among the first to successfully file lawsuits challenging the system of racial segregation in the South. These lawsuits, brought to court during the 1940s, foreshadowed the U.S. Supreme Court's groundbreaking 1954 decision in *Brown v. Board of Education*, which declared racial segregation in all public schools unconstitutional.

Oklahoma continued to act as a kind of national political and economic barometer for the remainder of the twentieth century. Relations between Native Americans in Oklahoma and the federal government seesawed during this time. The federal government teetered between periods when local tribes were encouraged to exercise greater authority over their internal affairs and periods when the federal government interfered with that authority. Oklahoma farmers enjoyed a boom in wheat prices that resulted from massive grain sales to the Soviet Union in the 1970s, but suffered a swoon when the prices began to fall in the 1980s. The Oklahoma petroleum industry also mirrored that pattern as it watched gas prices skyrocket during the OPEC oil

Old Northwest

embargo of the 1970s, but then saw oil-industry jobs disappear as prices dropped a decade later.

Near the end of the century Oklahoma became the site of the most deadly terrorist act in U.S. history. On April 19, 1995, 168 people died in Oklahoma City when a bomb exploded inside a rental truck parked outside the Alfred P. Murrah Federal Building. Timothy McVeigh was convicted of 11 counts of conspiracy and murder for his part in the bombing, while Terry Nichols was found guilty of conspiracy and involuntary manslaughter. Prosecutors portrayed the defendants as right wing, anti-government extremists who sought revenge for the federal government's destruction of the Branch Davidian compound in Waco, Texas. McVeigh was sentenced to death and Nichols to life in prison.

OLD NORTHWEST

The Old Northwest is another name for the Northwest Territory—the region around the Great Lakes and between the Ohio and Mississippi rivers. Consisting of about 248,000 square miles (642,000 square kilometers), the territory was acquired by the United States after its victory in the American Revolution (1775–1783). Britain ceded the region in the Treaty of Paris of 1783, which ended the fighting, and the region officially became known as the Territory Northwest of the River Ohio. (Eastern seaboard states also claimed parts of the territory, but those claims were settled by the late 1700s.)

Development of territory was helped by the completion of New York's Erie Canal in 1825. The east-west waterway ran from Albany to Buffalo, connecting the Hudson River (which flows into the Atlantic Ocean) to Lake Erie (one of the Great Lakes). The canal linked the Old Northwest with the established states to the east and promoted the settlement of the territory, mostly by farmers.

Steamboats (invented in 1807) and railroads (introduced to the United States in 1831) also encouraged development of the region. Pittsburgh, Cincinnati, Louisville, Detroit, and Chicago became commercial centers. Out of the Old Northwest the states of Ohio (admitted as a state 1803), Indiana (1816), Illinois (1818), Michigan (1837), and Wisconsin (1848) were created, and part of the former territory was used to form present-day Minnesota (1858).

OLD SOUTHWEST

The Old Southwest was the early name for the territories that were acquired by the United States from Spain in the Adams-Onís Treaty (also called the Transcontinental Treaty) of 1819. The region included present-day Florida and the southern parts of Alabama and Mississippi.

The Spanish who first colonized the Old Southwest referred to the region simply as East and West Florida. Unfortunately, the Spanish monarch had only a weak hold on the Floridas and many Americans had settled there. In 1811 U.S. settlers in West Florida rebelled and declared their independence. President James Madison (1809–1817) ordered the Governor of Orleans Territory (gained in the Louisiana Purchase of 1803) to take possession of West Florida. This action provided impetus for the U.S. government to claim the East Florida territory, which would allow the country to organize all its territory east of the Mississippi River.

Negotiations between Spain and the United States were led by John Quincy Adams (1767–1848), the U.S. Secretary of State, and Luis de Onís (1762–1827), Spain's Minister to the United States. Though the United States gained the Old Southwest, it also made some concessions to Spain in establishing the boundary between Spanish and American claims from Texas to the Pacific Ocean. The treaty was signed in Washington, D.C., in 1819 and was approved by the governments of both countries two years later. Plantation

owners largely settled the Old Southwest during the 1800s. Later the region became the state of Florida (admitted to the Union in 1845) and formed parts of what would become Alabama (1819) and Mississippi (1817).

OLIGOPOLY

Oligopoly is a type of market structure where a few large suppliers dominate an industry. Oligopolies are neither purely competitive (with many producers) nor monopolistic (with one producer), but fall somewhere in between. In the United States there are plenty of examples of oligopolist industries (in which only a small number of firms dominate). Heading the list are the following industries: automobile, steel, rubber, copper, aluminum, tobacco, and breakfast cereal. Oligopolist industry products may be differentiated, as with cereals, or homogeneous, as with steel.

In some oligopolies one firm tends to be the price leader, such as U.S. Steel Company in the steel industry. In others, all firms may have similar power. It is generally very difficult for a new firm to break into an oligopoly market because of the huge initial investments required. When only a few large firms dominate the market they cannot act independently without causing a change in output, sales, and prices in the industry as a whole. Where only a few large competitive rivals exist, their interdependence is recognized. They strategize to better anticipate each other's decisions. Competition among oligopolies usually does not include price wars (which would damage potential for generating profit). While price fixing is outlawed, oligopolistic firms keep their prices close together and instead compete with advertising and product variation. Advertising is a means to gain a competitive advantage. By making the product's availability better known, demand for the product is increased along with sales. Product variation results in continuous expansion and redefinition of products. Oligopolists are always seeking the best-selling new model. The automobile industry is a classic example.

The United States economy has traditionally consisted of four industry types: purely competitive, oligopolies, monopolistic competitors, and monopolies. Monopolistic competitors compete for essentially the same customers with slightly differing products. Between the four industry types, in 1939 oligopolies contributed a 36 percent share of the national income

while purely competitive firms accounted for 52 percent. By 1958 oligopolies still contributed a 35 percent share but by 1980 they accounted for only an 18 percent share of the national income with purely competitive firms accounting for a 76 percent share. The U.S. economy became more competitive over the years due to increased competition from imports, deregulation, and enforcement of antimonopoly laws.

OPEC OIL EMBARGO

On October 17, 1973, Arab oil producers declared an embargo that drastically limited the shipment of oil to the United States. These producers, members of a cartel known as the Organization of Petroleum Exporting Countries (OPEC), enforced the embargo in response to the Yom Kippur War between Egypt and Israel. In a gesture of support for Egypt OPEC curtailed oil exportation to countries that supported the Israelis. The cartel later extended the embargo to other countries and oil prices soared worldwide. Accustomed to the influx of ample, inexpensive petroleum from OPEC member countries such as Saudi Arabia, Iraq, Iran, and Kuwait, many nations remained at the mercy of these producers of the valuable natural resource.

In the United States the embargo brought on a crisis of unequal proportions. Daily shipments of oil from the Middle East dropped from 1.2 million barrels to a scant 19,000 barrels. Motor vehicle owners faced long lines at the service stations, and were forced to pay dearly for gasoline when they finally took their turn at the pump. Between May 1973 and June 1974 the average price of gasoline increased by 43 percent. Perhaps the most dangerous effect of the embargo however was the fear and panic it aroused. U.S. citizens were suddenly faced with the shortage of a resource indispensable to every industrialized nation. The shortage was mainly a matter of perception, since OPEC simply withheld oil and had not run out of it. In fact at the time the United States imported only about a third of the oil it used, relying on domestic production for the majority of its supply. But the embargo proved that every drop counted and that a powerful cartel could bring the world to its knees. Daily hardships such as rising oil prices and rates of inflation made the perceived scarcity of the resource seem very real.

Indeed the United States was consuming resources faster and more voraciously than most other countries. Although it represented only six percent of the world's population in 1973, the United States regularly consumed 33 percent of the world's energy supply. Station

OPEC Oil Embargo

Faced with a gasoline shortage during the oil embargo, many gas stations closed, leading to lines at functioning stations that sometimes stretched for blocks.

wagons and other gas-guzzlers were enjoying their heyday. A positive effect of the embargo was that it prompted conservation efforts throughout the country. President Jimmy Carter (1977–1981) declared a national speed limit of 55 miles per hour in order to cut back on gasoline consumption (meanwhile, the number of traffic-related deaths dropped considerably during that period). Between September 1973 and February 1974 the average daily use of petroleum dropped by more than six percent. The U.S. government adopted an energy conservation policy that remained in effect until President Ronald Reagan's (1981–1989) administration discarded it two decades later. The embargo served as a reminder that the world's oil supply was finite and encouraged consumers to use it responsibly, at least for the time being.

OPEC exercised an enormous amount of power during the embargo, which lasted well into 1974. But eventually the crisis hurt the cartel as much as the countries outside of it. The skyrocketing prices and the perceived shortage led to a drop in the overall demand for oil. Countries looked to alternative energy sources

such as natural gas, nuclear energy, and coal. Oil-producing countries outside of the Middle East stepped up their pace of production and relied more heavily on their domestic supply.

Unfortunately many of the positive effects of the 1973 crisis, the attempts at energy conservation and the move toward relying more heavily on domestic resources, did not last long enough after the embargo was lifted. Conservation efforts dropped off as memories of long waits at the gas station and inflated prices faded. A new breed of larger, less gas-efficient cars took to the roads in the 1990s when sport-utility vehicles and small trucks gained popularity. In the 20 years following the crisis U.S. dependence on imported oil increased rather than decreased, reaching the 50 percent mark in 1993. In 1998 on the twenty-fifth anniversary of the embargo many analysts pointed to such statistics as indications that a crisis like that of 1973 could happen again. They claimed that the low, stable price of oil was misleading people in the United States into believing that the world's supply of the natural resource was unlimited. Meanwhile the nation continues

OPEC exercised an enormous amount of power during the embargo, which lasted well into 1974. But eventually the crisis hurt the cartel as much as the countries outside of it. The skyrocketing prices and the perceived shortage led to a drop in the overall demand for oil. Countries looked to alternative energy sources such as natural gas, nuclear energy, and coal.

to consume energy at an extraordinary rate. Whether or not it will take another economic crisis to change such ingrained behavior remains to be seen.

OPEN DOOR POLICY

In 1890 the U.S. Bureau of the Census announced that the western frontier, as a continuous geographical line of settlement, had ceased to exist. This marked a monumental change in the way that Americans thought about their country. What had been an inexhaustible reservoir of natural resource and opportunity was now revealed to be finite and limited. The railroad system had been in the process of unifying the country since even before 1869, when construction was completed on the first transcontinental line. The miners and cattlemen and farmers followed. Now it was declared that

the continental frontier had been pushed all the way to the western coast.

One of the first writers to discuss this event was the historian, Frederick Jackson Turner. Turner wrote that the significance of the frontier was immense. It had provided the natural framework for the American experiment with democracy. It had been a "safety valve" for discontent whenever times got too hard and class conflict emerged in the increasingly crowded eastern part of the country. The loss of this safety valve might portend a crisis as profound as the struggle over slavery.

In addition, the increasing power and productivity of the American economy, which up to this point had been a source of pride and optimism, now seemed to increase the feeling of anxiety. The economy had become so productive at the same time that the polarization of wealth had become so marked that the domestic market was no longer sufficient to soak up all the goods that the economy was producing.

Another historian, Alfred Thayer Mahan, (who was also an admiral in the U.S. Navy), held onto the optimistic notion of frontier. He wrote that beyond the Pacific shores lay another maritime frontier. Mahan wrote in *The Influence of Sea-power upon History, 1660-1783* (1890) that all the great nations were sea-powers. In 1890, the United States was the third most powerful sea-power in the world.

By the late 1800s Japan and several powerful western European nations had divided most of China into separate "spheres of influence," each having economic control over a section of the vast eastern Asian country. A latecomer to imperialism, the United States also wanted its piece of the pie. In 1899 U.S. President McKinley's Secretary of State, John Hay, proposed an "Open Door" Policy with France, Germany, Great Britain, Italy, Japan, and Russia that would allow all participating nations to have equal tariff, trading, and commercial development rights in China.

IN 1899 U.S. SECRETARY OF STATE JOHN HAY PROPOSED AN OPEN DOOR POLICY TO FRANCE, GERMANY, GREAT BRITAIN, ITALY, JAPAN, AND RUSSIA THAT WOULD ALLOW ALL NATIONS TO HAVE EQUAL TARIFF, TRADING, AND COMMERCIAL DEVELOPMENT RIGHTS IN CHINA.

The United States declared that it intended to support China's political and territorial independence, while at the same time preserving and protecting

Open Range

foreign interests. Behind this claim was an administrative tactic to strengthen the U.S. position in China. The European powers agreed to the idea based on mutual consent between European nations but with the actual intent of protecting their own interests. Japan, however, objected to the proposal.

The machinations of the European powers over the Chinese trade offended many Chinese people. In 1900 an anti-European rebellion broke out in China fomented by a secret society called the “Boxers.” It was directed against all foreigners in China. The foreign diplomatic corps of the European powers sought refuge in the British embassy in Peking. The Boxers surrounded the embassy and threatened to overwhelm the defenders. In August 1900 the U.S. sent in a rescue force of 2,500 troops and the diplomats were saved.

Secretary of State Hay sent a note to the European powers requesting an Open Door Policy for all European and U.S. powers in the whole of China. It turned out, however, that few countries, including the United States, would adhere to the policy in practice. Within a year economic issues turned political and the Open Door Policy would remain virtually ignored.

In the early twentieth century the United States became involved in an international rivalry for Manchuria and China proper. In order to secure railroad, mining, and commercial rights in those locations, the United States had to come to grips with its relationship to Japan and, to a lesser extent, to certain western European powers, particularly Russia. The Taft-Katsura Agreement and the Root-Takahira Agreement of 1908 demonstrated that the United States recognized Japan’s increasing influence in the Far East. In return, the United States wanted Japan to respect Open Door principles and allow legitimate U.S. territorial rights within Asia. In 1915, in an attempt to protect its Far Eastern stakes, the United States opposed Japan’s Twenty-one Demands on China; but with the Lansing-Ishii Agreement of 1917, the United States consented to Japanese ambitions in Manchuria.

In response to continuing violations of China’s territory, an international Conference on the Limitations of Armament was held in Washington, D.C., and the Open Door Policy was reaffirmed as part of the 1922 Nine-Power Treaty. Ten years later, however, when Japan overtly defied the Open Door agreement by conquering Manchuria and establishing it as a puppet state, the United States was the only power to object.

Secretary of State Henry L. Stimson’s doctrine of non-recognition, which was supported by the League

of Nations, persuaded Japan to withdraw from Shanghai, its next target. The Japanese soon resumed their invasions and in November 1938 they declared that the Open Door was no longer valid. The onset of World War II (1939–1945) essentially ended the debate over the Open Door Policy, and after the war China’s de facto position acknowledged it as an independent sovereign state. Thus the Open Door Policy ceased to exist.

OPEN RANGE

The open range consisted of the unfenced public lands of the West. When the cattle industry boomed following the American Civil War (1861–1865), ranchers in Texas, Colorado, Wyoming, South Dakota, North Dakota, and Montana allowed their cattle to roam freely across the vast range. Livestock were branded with a rancher’s symbol. At the end of the grazing season cowboys sorted the cattle by brand (calves instinctively followed their mothers), rounded them up, and began the long trail drives which ended at the nearest railhead (as far as 1,000 miles or 1,600 kilometers away).

Passage of the Homestead Act in 1862 and the expansion of the railroad brought an ever-increasing number of settlers West after the war. Many of them set up farms on the prairies because provisions of the Homestead Act allowed each up to 160 acres (64 hectares). As the natural landscape lacked trees, fencing the farmlands was not practical and the policy of the open range continued despite the fact that the range was, in fact, being divided up and settled at an increasing rate. When barbed wire was invented in 1874,

farmers across the West used the new material to fence in their lands over the two decades which followed.

Ranchers, who were accustomed to the open range, often conflicted with settlers, who tried to protect their farmlands from the cattle herds and drives. Soon ranchers, too, used barbed wire to cordon off their land, limiting where their cattle and sheep could graze. Cowboys were reduced to cowhands—hired hands who made a practice of “riding the fence” to maintain the ranch boundaries. By the end of the 1880s the innovation of barbed wire and increased settlement had closed the open range and tamed the wild West.

OPPORTUNITY COST

An opportunity cost is a way of analyzing an economic decision to determine its real cost. For an accountant or for a consumer in the grocery store the cost of an item is the amount actually paid for the item—that is, its price. In economics, however, determining the real cost of an item or of an economic decision means taking into account the alternative uses that could be made of one’s money. For example, a manager making \$40,000 a year is considering whether the increase in salary she will get by earning a law degree will justify the cost of tuition, housing, and all her other living expenses at school. In making her decision, however, she must also include the \$40,000 in salary per year she will not be able to earn while attending school. The lost salary together with the costs of tuition and living expenses is the real cost—the opportunity cost—of her law school decision. Similarly, suppose someone invests \$10,000 in a stock that falls in value over a six-month period and then sells the stock as soon as it climbs back to the price he initially paid. The investor may feel like congratulating himself for being patient enough to wait until the stock regained its initial price before selling; after all, he “broke even.” In reality, however, since the investor could have invested the \$10,000 in a stock that grew 20 percent over that same six-month period, he did not in fact “break even”—he incurred an opportunity cost of \$2,000.

THERE'S NO SUCH THING AS A FREE LUNCH.

Milton Friedman, Economist

The idea of opportunity costs was first defined by the neoclassicist economists of the nineteenth century,

and today it finds application in the economic decision making of individual consumers, companies, and entire economies. In evaluating whether to make a particular investment, for example, a company will first determine what use of its available capital will provide the best return. For various reasons, the company may in the end decide not to invest its money in the option that offers the lowest opportunity cost. However, it will always know what the opportunity cost of each of its options is and whether that cost is growing or decreasing. The expression “There’s no such thing as a free lunch,” popularized by American economist Milton Friedman (1912–), is another way of saying that every economic decision has hidden opportunity costs that must be taken into account to put money to its best use.

OREGON

The first European to sight Oregon may have been Sir Francis Drake (1540–1596), while he was on a British raiding expedition against the Spanish during the 1500s. Little contact was made during the next 200 years because mariners considered the Oregon coast too treacherous. In 1778, the Englishman Capt. James Cook (1728–1779) explored the Northwest. He named several of the Oregon capes. Explorers seeking sea otter and other furs soon followed. American Robert Gray (1755–1806) discovered the Columbia River in 1792.

The Lewis and Clark Expedition was the first overland exploration of Oregon, reaching the mouth of the Columbia in the winter of 1805. Fur traders employed by New York magnate John Jacob Astor (1763–1848) built a trading post at the mouth of the Columbia and called it Astoria.

The early history of Oregon was marked by competition between Great Britain and the United States for a foothold in the territory. The two countries signed a joint agreement of occupation in 1818. However from 1824 through the early 1840s John McLoughlin (1784–1857), chief official at Vancouver for the British Hudson’s Bay Company, was governor in all but name. Protestant missionaries to the Native Americans, however, established a base for future U.S. settlement. The first of these came by wagon train over the famous Oregon Trail during the early 1840s. In 1843 a provisional government was formed, and in 1846 a treaty with Great Britain firmly established the boundary between the United States and Canada. The

Oregon

State of Oregon.

Oregon Territory was organized in 1848. It was originally much larger than the state as it exists today. Oregon became the 33rd state of the union in 1859.

[OREGON] HAS NO HISTORY OF ITS OWN, ONLY ENDS OF HISTORIES FROM OTHER PLACES; IT HAS NO COMPLETE LIVES, ONLY BEGINNINGS.

H.L. Davis, *Kettle of Fire*, 1959

Oregon's economic progress was slow until the first transcontinental railroad reached the state in 1883. The fur trade dominated the region up until that time. When the railroad was built, fur traders, who were tired of the rigors of their difficult trade, began to settle on farms. They settled particularly in the Tualatin Valley and in a region near present-day Salem. Most were French-Canadians who were married to Indian women. Others came north from the gold fields of California, including a number of Chinese who continued to seek gold in eastern Oregon. They also worked as salmon packers and farmhands but were best known for their role in completing the Oregon Central Railroad and other railroads.

The California Gold Rush of the 1850s provided the first real impetus to economic growth in the Northwest. The city of Portland grew rapidly as gold miners demanded lumber, flour, wheat, and beef. Portland provided easy access for ship captains, and the city built a rudimentary road to the wheat fields of the Tualatin Valley. Oregon's mountains together with the Columbia River blocked any rivals from providing this wheat through other means. Thus an important export market developed, along with the Northwest's first reliable currency, gold dust. Another gold rush in eastern Oregon brought even more prosperity. Sailing vessel and steamship companies prospered during this time.

Oregon also found ready markets for the salmon taken out of the Columbia River. Lumber and paper industries as well as textile mills began to develop along the Columbia and the Willamette rivers.

Much of the economy remained agricultural because railroads and improved roads were slow in coming to Oregon. Wheat was the most important crop, followed by oats and potatoes. Cattle, horses, pigs, and sheep were the most important livestock. Towns such as The Dalles, Princeville, Klamath Falls, and Pendleton arose to serve the farm market. Before the coming of the Pacific Northwest railroad Oregon was essentially a purveyor of raw materials, with few finished goods being produced there.

By the 1890s several railroads crisscrossed Oregon. Raw materials could now flow to the ocean more efficiently and immigration to the region increased. Consumer goods, farm machinery, and construction materials were now readily available from the East to supply the growing farms and cities. Lumbermen and farmers could compete with those in other sections of the country. The Northern Pacific Railroad and the Great Northern Railroad also had vast publicity bureaus that sent pamphlets to the East, encouraging emigration. The railroad also changed economic patterns. The tracks broke up large cattle ranges and helped to destroy the cattle industry. Because wool was easier to transport by rail than beef, local residents soon preferred to raise sheep.

Waterways were also improved during this time, including canals along the Columbia to bypass falls and rapids. Lumbermen benefited from better water transit, from technological developments in their industry, and from the destruction of forests in the Great Lakes region.

During the 1920s Oregonians had to make adjustments as demand for certain materials declined after World War I (1914–1918). Lumber mills also suffered from a lack of supply because wartime cutting had decimated the forests. Congress acted quickly to pass the Clarke-McNary and McSweeney-McNary acts. The acts provided a model for future federal efforts to conserve forests.

Other changes during the 1920s were related to transportation improvements. Shipping continued to increase because of the Panama Canal. The railroads began to lose business as better roads were built. Oregon had created its first highway department in 1913 and built the Columbia River Highway along the river's south bank.

The 1930s saw a downturn in the economy as a depression rocked the country. After the 1929 stock market crash, lumber companies lost most of their markets but slowly regained strength. However the fishing industry never quite recovered from the market collapses which sent many fishermen to the relief rolls. President Franklin D. Roosevelt's (1933–45) New Deal programs, especially the Wagner Act, encouraged union organizing. Portland experienced a crippling strike by the International Longshoremen's Association in 1934. In the spring of 1935 the Sawmill and Timber Workers practically shut down the lumber industry in the Northwest. On a more positive note, the federal government's water conservation efforts during this period resulted in the construction of the Grand

Oregon Country Cessation

Coulee and the Bonneville dams along the Columbia River.

World War II (1939–1945) brought much-needed relief to Oregon's failing economy. Portland shipbuilding in particular was a major beneficiary of wartime contracts. Construction entrepreneur Henry J. Kaiser (1882–1967) was the genius behind Portland's shipbuilding renaissance. He was the primary contractor on the Bonneville Dam project. Kaiser used his many contacts in Washington and with other construction interests to gain government contracts for the so-called Liberty ships. The ships were 441-foot long freighters that kept the Allies supplied throughout the war. Kaiser also built escort aircraft carriers, tankers, and Victory merchant ships.

The postwar years in Oregon were quite prosperous, with manufacturing and service industries expanding. Government was also heavily involved in water and forest conservation in the state. Farming changed drastically with the number of farms declining from 63,125 in 1945 to 36,000 in 1982. Large corporate farms using high technology methods began to dominate the economy. Oregon fisheries declined as the salmon supply became depleted, causing most of the state's canneries to be closed; the federal government rushed to supply fish eggs to hatcheries. The 1980s and 1990s were marked by a continuing debate between loggers and environmentalists over logging in Oregon's rainforests. A 1993 federal law helped prevent commercial exploitation of older forests, home of the threatened spotted owl. Despite attempts to diversify the state's economic base employment in manufacturing outside Portland was still mostly in the lumber and wood products field in the 1980s. This made the state increasingly vulnerable to fluctuations in the housing construction market.

In addition the trend toward conservation of the forests from commercial development continued into the 1990s. The total commercial land base decreased by more than 24 percent since 1945. While federal lands were increasingly being removed from timber-harvesting, private forests took on a more important role. The reforestation required since 1941 and the Forest Practices Act of 1971 helped replenish the timber supply. Timber still provided the largest percentage of shipments by manufacturers in the state.

The principal economic changes in Oregon since World War II have been in the development of the aluminum and electronics industries, as well as in tourism and the services industry. In 1994 unemployment stood at a 25-year low of five percent. Per capita

income was over \$22,000 in 1997, putting the state's ranking at 27 in the nation.

OREGON COUNTRY CESSATION

For thousands of years native peoples lived in the rich lands of North America's Pacific Northwest. The first known European presence in the region was in the sixteenth century as Spanish and English ships ventured northward from Mexico, looking for the mythical Northwest Passage. Not until the late eighteenth century, however, did European expansion in the region truly begin. In the mid-1770s Spanish ships sailed north from Lower California to determine the extent of Russian penetration in the region as they had moved along the southern Pacific Coast of modern Alaska and British Columbia. The British arrived with the voyages of captains James Cook in 1788 and George Vancouver shortly afterwards; U.S. Captain Robert Gray marked the first American presence in the West in 1788 as well. A lucrative fur trade began with furs acquired from the indigenous population and sold in the Orient for substantial profit.

By 1790 several European nations, Russia, Spain, Great Britain, and the United States asserted claims to the region. Following a dispute over fur-trapping rights along the Vancouver Island coast, Spain was the first to begin a withdrawal through the Nootka Sound Convention of 1790 with Britain. The settlement sought to open the region to British colonization.

By January and February (of 1846) a new slogan, “Fifty-Four Forty or Fight,” had stamped its irresistible alliteration on the public mind. The principal themes of extremist argument sprang from both the natural expansionist pride of the people and the more artificial fury of the Democratic press. One theme was defiance of England, the traditional enemy . . . The second theme was that of manifest destiny . . . A third theme was suspicion of . . . the plantation aristocracy (over the slavery issue).

David M. Pletcher, historian, 1973

The coast was substantially charted starting in 1792, with Gray’s important discovery—the mouth of the Columbia River. Having this information in hand, President Thomas Jefferson (1801–1809) dispatched the Lewis and Clark Expedition to explore the Pacific Northwest over land. They wintered near the mouth of the Columbia River in 1805–1806. The Expedition and Captain Gray’s voyages provided a strong U.S. claim to the Oregon country. In 1811 Boston fur entrepreneur John Jacob Astor (1763–1848) established an American trading post at the mouth of the Columbia. However, the post traded hands to the British during the War of 1812 (1812–1814).

Vying for a crucial Pacific coast commercial position, the United States wanted to extend its northern boundary with Britain east of the Rocky Mountains along the 49th parallel, westward to the Pacific Ocean. The British demanded the Columbia River be the boundary. With these continuing rival claims, the Convention of 1818 uniquely arranged for joint-use between the United States and Britain. The joint-use region extended north of the 42nd parallel to near the 54 degree-40 minute parallel (54–40) and eastward to the Rocky Mountains crest, including modern-day Oregon, Washington, Idaho, British Columbia, and western Montana. Spain then relinquished any remaining claims north of the 42nd parallel to the United States through the Transcontinental Treaty of 1819. The treaty resolved all claims between the two nations from Florida westward across the continent. Russia, holding the weakest rights, was the next to bow out of its claim to the area south of the 54-40 line through separate treaties with the United States in 1824, and Great Britain in 1825. However, despite all the diplomacy, Britain held a monopoly over commerce in the entire region through most of the early nineteenth

century. Americans attempted to penetrate that market but without success.

American-funded military exploration in the Northwest resumed in 1841. Lt. Charles Wilkes’ naval party extensively explored the region, reporting on the great port promise of Puget Sound in western Washington. Lt. John C. Fremont (1813–1890) led an expedition over land in 1842–1843. Those few American settlers who had trickled into the region formed a Provisional Government in 1843, further creating antagonism between U.S. and British citizens in the region. Finally, with restlessness and feelings of manifest destiny (a popular notion of the day that supported U.S. expansion from the Atlantic to the Pacific coasts) quickly growing in the United States, the great migration began across the Oregon Trail in 1843, and “Oregon fever” swept the United States.

U.S. expansionism was a key issue in 1844 presidential election, in which James K. Polk (1845–1849) won, after exhorting desires for a unified continental nation. Though overall American attitudes were split over the question of Oregon, and extremists threatened force in the Oregon boundary dispute, adopting the slogan “Fifty-four forty or fight” in pressing for U.S. control of the entire region.

Following his election to the presidency Polk approached Britain in early 1845 with a compromise to finally split the two nations’ claims by setting the boundary at the 49th parallel. Britain, however, balked, still demanding the Columbia River serve as the boundary. Polk hardened his stance, adopting the 54–40 position. Little progress in negotiations occurred through the remainder of 1845, but in 1846 Polk took the offensive again, threatening to terminate the 1818 joint-use agreement. Despite few U.S. citizens residing north of the Columbia River, Polk’s assertion of new settlements south of the Columbia that contained over 5000 U.S. citizens by 1845 further validated U.S. claims. Britain, suffering domestic problems and also having moved their Northwest base to Vancouver Island, became more conciliatory to settlement. Anticipating war with Mexico, however, Polk backed off from the 54–40 claim despite bitter political opposition. Both parties finally agreed to the original compromise dividing the Oregon country along the 49th parallel, and they signed the Oregon Treaty in 1846. Britain retained navigation rights to the Columbia River, though, and its Fort Vancouver property. Not until 1872 was the boundary around the south end of Vancouver Island firmly resolved.

Assertion of national ownership of the Pacific Northwest by the United States, while largely ignoring

Oregon Trail

Native American claims, represented a major step in U.S. expansionism. The United States also annexed the Texas Republic in 1845 and together, with the Oregon cession, extended the U.S. western boundary both to the south and to the Pacific Ocean establishing the nation's northern boundary. Heavy traffic over the Oregon Trail continued through the late 1840s and 1850s, totaling 53,000 people, leading to a strong agrarian economy. Statehood was granted to Oregon in 1859 and for Washington in 1889.

OREGON TRAIL

The Oregon Trail was a route used primarily from the late 1840s through the 1870s to reach Oregon Territory—lands that were ceded to the United States by the British in 1846. (The territory comprised present-day Oregon, Idaho, Washington, and parts of Montana and Wyoming.) Measuring 2,000 miles (3,200 kilometers), the trail was one of the great overland routes used in westward expansion. Wagon trains began at Independence, Missouri (today an eastern suburb of Kansas City, Missouri), and traveled northwest to Fort Kearny (near present-day Kearney), Nebraska. From there wagons followed the Platte and North Platte rivers west and northwest to Fort Laramie in southeast Wyoming. Continuing westward along the North Platte, travelers arrived at South Pass, located on the southeastern end of the Rocky Mountains' Wind River Range. Nearby South Pass City became a boomtown during the 1800s. The Oregon Trail then ran

The Oregon Trail originated in Independence, Missouri, and terminated in Portland, Oregon. This 2000 mile trail was the primary passage of settlers from late 1840s through 1870s.

southwest to Fort Bridger, Wyoming—where the Mormon Trail diverged to the southwest (into Utah). Travelers bound for the Pacific Northwest continued along the Oregon Trail, following the Snake River through Idaho. The route turned northwest to Fort Boise, Idaho. From there settlers made the difficult crossing through the Blue Mountains to Walla Walla (then the site of a mission) in Washington. The last leg of the journey followed the Columbia River west to Fort Vancouver and into the Willamette Valley of Oregon. The road could be traversed in six months' time, but it was a rigorous journey that took travelers across prairie, through desert, over mountains, and across flooded rivers.

Explorers and fur traders are credited with first forging the route. The western portion of the trail was covered by explorers Meriwether Lewis (1774–1809) and William Clark (1770–1838) in their 1804–1806 expedition to the Pacific. But it did not become heavily used by wagons until about 1842, the same year that military officer and future politician John C. Fremont (1813–1890) surveyed a portion of the route for the U.S. Army. After the Territory of Oregon was set up by the U.S. government in 1848, an increasing number of settlers made their way westward across the winding Oregon Trail. The route was heavily used through the

1860s. However, at the completion of transcontinental railroads its importance diminished by the end of the century.

OTIS ELEVATOR COMPANY, INC.

By 1852 vertical hoisting devices had long been in use. However these had been proven hazardous if the supporting cable snapped. That year Elisha Graves Otis, a mechanic from Yonkers, New York, invented a safety hoist that would change the future of such devices. With two orders for elevators Otis started his own factory in September 1853. By the end of 1856 he had filled more than 40 orders for freight elevators. Within the next year Otis installed his first passenger elevator in a multi-storied retail building in New York. Otis died in 1861, severely in debt.

Otis' sons Charles and Norton took over their father's business, renaming it Otis Brothers and Co. Their collective work produced 53 patents for elevator design and safety features. By 1872 the company produced more than 2,000 steam-powered elevators and grossed over one million dollars in sales. In 1878 Otis produced a faster, cheaper hydraulic elevator. The electric-powered elevator replaced this model in 1889. At the same time Otis first exhibited the escalator at the 1900 Paris Exposition. The early 1900s saw the production of the first gearless-traction elevator. This design remained essentially unchanged even at the end of the twentieth century.

The merger of Otis Brothers and Company with 14 other elevator companies resulted in the creation of the Otis Elevator Company. This incorporation proved so successful that in 1902 the company purchased overseas firms and strengthened its monopoly of the market. By 1912 Otis had seven factories within the United States, and by 1924 it owned subsidiaries in Canada, Belgium, Italy, and Germany. In order to compensate for the lost revenues suffered during the recessions, Otis started selling service and maintenance contracts for all its installations. The company's net income rose to \$8.4 million in 1929, falling sharply with the advent of the Great Depression (1929–1939).

Constant improvements in design marked the first third of the twentieth century. Features such as a self-leveling device allowing the platform to stop exactly at

each floor and a push-button system increased the sales and reputation of the Company. World War II (1939–1945) generated further business for Otis, not only with orders for elevators but for range finders and tank and aircraft engine components as well. These military contracts continued to be profitable during the Korean War, accounting for approximately one-quarter of its business in 1953.

In 1948 Otis introduced the Autotronic System for commercial contracts. These systems utilized electronic controls to operate the cars while a computer directed and handled the traffic accordingly. These systems became popular because of their speed and efficiency. By 1956 the job of elevator attendant had become obsolete as more and more companies were converting from manual to automatic systems.

In spite of these developments the decade following World War II proved to be a period of stagnation for the company. The trend in architectural design towards single-story shopping centers and ranch-style homes changed the sales environment. To compensate Otis turned to diversification in order to generate income. Purchasing outside acquisitions such as electronic pilot trainers, automatic bowling pin-setters, and forklift trucks generated little profit. Between 1955 and 1968 Otis' net sales quadrupled to \$481 million, but its net income rose only from \$11.9 million to \$22.1 million.

In 1968 Otis installed 255 elevators and 71 escalators in New York's new World Trade Center. At this time the company controlled half of the U.S. elevator market. Refusing to accept a deteriorating sales picture, Otis acquired five companies involved in materials handling. In 1969 the company created its Diversified Systems Division to apply elevator and escalator technology to warehouses, automobile parking, and container handling systems. Further advances in design and manufacturing of horizontal moving systems produced the "Trav-O-Lator" and Odyssey models for transporting people quickly and comfortably.

By 1973 Otis surpassed \$800 million in sales while maintaining plants in 17 countries. Its overseas operations accounted for 37 percent of its annual income. Overall Otis' share of the elevator market increased from 19 percent to 30 percent. The backlog of orders in March 1973 reached an all time high totaling \$1.1 billion.

In October 1975 United Technologies Corporation (UTC) purchased 55 percent of Otis' stock in order to reduce its dependence on military contracts. This agreement did not hinder Otis' growth as a UTC subsidiary, with sales continuing to grow during the

Over-the-Counter Securities Market

last decades of the twentieth century. The unveiling of the Elevonic 101 system in 1979 brought design and engineering break-throughs. This system boasted the first control system using microprocessors to control every aspect of the elevator operation. The Elevonic 401, produced in 1981, utilized synthesized speech, information display, and advanced security systems. These elevator systems benefited from the continued development of computer technology in the late twentieth century.

By the mid-1990s Otis' major manufacturing plants included facilities in the United States, Mexico, Brazil, Great Britain, France, Germany, Italy, Spain, the Czech Republic, Russia, Japan, China, India, Taiwan, Malaysia, and Australia. Otis revenue of \$4.64 billion accounted for 22 percent of UTC's total revenue. Otis also held 23 percent of the world market in 1994 and was selling approximately 39,000 elevators and escalators per year. Two-thirds of its 66,000 employees had averaged 15 years of company experience and typically held the position of field installer and mechanic. With a vision for future development and growth in the world of transportation technology Otis invested more than \$100 million in engineering, research, and development in 1994.

OVER-THE-COUNTER SECURITIES MARKET

An over-the-counter (OTC) securities market is a secondary market through which buyers and sellers of securities (or their agents or brokers) consummate transactions. Secondary markets (securities markets where previously issued securities are re-traded) are

mainly organized in two ways. One is to form an organized exchange, where buyers and sellers of securities (mostly represented by their agents or brokers) meet at a central place to conduct their transactions. The New York Stock Exchange (NYSE), the American Stock Exchange (ASE, located in New York) and the Chicago Board of Trade for Commodities are examples of major organized exchanges in the United States.

An over-the-counter securities market provides an alternative way of organizing a secondary market—in this, dealers with inventories of securities at different geographical locations are in contact with each other through a computer network. In other words, these dealers of securities are ready to buy or sell securities over the counter to anyone who contacts them and accepts their quoted price. One may thus describe an over-the-counter securities market as an electronic market. The National Association of Securities Dealers Automated Quotations System (NASDAQ) is an example of an over-the-counter securities market in the United States.

OVERMAN ACT

In 1918 the Overman Act was passed by Congress, in the midst of World War I (1914–1918). It gave President Woodrow Wilson (1913–1921) power to coordinate government agencies for the war effort. The legislation was sponsored by Democratic Senator Lee Slater Overman (1854–1930) of North Carolina.

The emergency powers of the executive office have, at times, been a controversial issue in the political life of the nation. A 1973 Senate report on the subject explained that "American political theory of emergency government was derived . . . from John Locke (1632–1704), the English political-philosopher whose thought influenced the authors of the Constitution (who) argued that the threat of national crisis unforeseen, sudden, and potentially catastrophic required the creation of broad executive emergency powers." Locke reasoned that since the lawmaking power (Congress) is not always assembled and it is "too numerous, and so too slow" in dispatching procedures and remedies, latitude must be given to the executive power during times of national emergency. The Senate report described Wilson as the "model for future Presidents and their advisors." While the urgent and pressing matters of the war required Wilson to expand his authority, he also sought congressional approval for his actions.

President Wilson was reluctant to become involved in the war in Europe. However, after German attacks on the American merchant marine in 1917, he resigned himself to U.S. engagement in the conflict. On April 2 Wilson made a special trip to the Capitol where he addressed Congress. He asked them to declare war, saying, "the world must be made safe for democracy." Congress met the pronouncement with applause and on April 6 it passed a joint resolution declaring war on Germany. Wilson immediately mobilized for the fight, organizing a variety of defense and war agencies. In 1917 he set up the War Industries Board but Republicans in Congress pressed for the establishment of a war cabinet instead. Wilson pressed back by asking the lawmakers to grant him comprehensive economic power. These powers were conferred upon the president by the Overman Act, passed April 1918. By that time Wilson had already given the War Industries Board broad authority, but congressional approval was, nevertheless, critical in unifying government during wartime. When the fighting was over (Germany surrendered to the Allies in November 1918), President Wilson promptly relinquished his emergency powers and asked Congress to repeal the wartime emergency statutes, which it did.

OZONE LAYER

Ozone is a poisonous colorless gas with an acrid odor. Chemically, it is a variant of normal oxygen, except that ozone has three oxygen atoms per molecule rather than the two found in normal oxygen. There exists a layer of ozone occurring naturally six to thirty-one miles above the earth. This layer of ozone gas surrounding the earth protects living organisms at the

earth's surface from the dangerous ultraviolet radiation of the sun. The ozone layer normally absorbs about 98 percent of the ultraviolet rays that continually shower the earth. In small amounts, ozone can be useful as a water disinfectant and a purifier. If, however, ultraviolet rays came to ground level through the shield of the ozone layer, there would be massive lethal consequences for wildlife, crops, vegetation, and profound life-threatening problems for human beings, including cancer and immune system damage.

In 1974 chemists F. Sherwood Rowland and Marle Molina found that chlorine from chlorofluorocarbon (CFC) molecules was capable of breaking down ozone in the ozone layer above the earth. There was evidence that industrial chemicals and chemical exhaust from jet airplanes, as well as large volcanic eruptions, severely threatened the upper atmosphere and the ozone layer. In 1974, when damage to the ozone layer first became apparent, the propellants in common aerosol spray cans were a major source of CFC emissions. CFC aerosols were banned in the United States by 1978, but CFC chemicals remained in widespread use as coolant agents in refrigerators and in air-conditioners as well as in cleaning solvents. During the last decades of the twentieth century there was only a gradual move to ban CFC chemicals from all refrigerant systems, forcing modern industry to deal with alternative systems to stabilize the ozone layer. The question of how much protection is necessary has continued to be a controversial political issue because necessary changes in industrial systems proved to be profoundly expensive. At some level, however, such expenditure is crucial to the existence of human life.

PACKERS AND STOCKYARDS ACT

In 1921, the result of an investigation by the Federal Trade Commission (FTC), Congress responded to gross abuses within the meat industry by passing the Packers and Stockyards Act. The legislation made the meat-packing industry and any related industry subject to federal regulation and gave the Secretary of Agriculture purview over stockyard markets and operators. The act prohibited price fixing (the practice of pricing below cost to eliminate a competitive product), price discrimination (the practice of setting different prices for different markets), and the apportionment of markets (the practice of dividing up markets). The legislation helped eliminate monopolies in the meat industry (combined with the 1905 prosecution of the “Beef Trust” in the case of *Swift and Company v. United States*). However, critics have charged that, like the tobacco industry, government regulation led to industry control by a handful of businesses.

PALEO-INDIANS

Paleo-Indians were the first inhabitants of North America (“paleo means old in Greek). They were also known as Lithic Indians; the word “lithic” is derived from the Greek “lithos” meaning stone, a reference to the material from which they made their tools. They migrated from Asia across the Bering Strait, the waterway that separates Asia (Russia) from North America (Alaska). Scholars believe that during the Late Ice Age (known as the Pleistocene glacial epoch, which ended about 10,000 B.C.) land masses were exposed by a drop in sea level or that ice covered the strait, forming a natural bridge. As large game traveled across this bridge the Asian hunters followed in pursuit, arriving in North America as early as 50,000 B.C.. During the thousands of years that followed they continued their

migration, spreading out across the Western Hemisphere. By 25,000 B.C. Paleo-Indians had begun crafting stone into spear points to be used as weapons. Archaeologists have therefore named Paleo-Indian groups for the different types of spear point they used such as Clovis or Folsom. When the number of large game, such as mammoth and mastodon, diminished and finally became extinct, the hunters turned to smaller prey such as deer and rabbits.

Paleo-Indians eventually settled in various post-Ice Age environments, including coastal regions, forests, mountains, and swamps. They adapted their lifestyles to their physical surroundings. Groups along the East Coast, for example, began to rely on the sea as a food source (in Virginia, ruins indicate that early peoples consumed a large amount of oysters). By about 2000 B.C. they began to cultivate plants, marking the transition to agricultural-based societies. Settlements became increasingly permanent. Between the years 500 and 1600 they developed ceramics, jewelry, and the bow and arrow, and began to focus on their spirituality.

When Europeans arrived in North and South America the native inhabitants they encountered were descendants of the Paleo-Indians. Ice Age nomads had settled as far east as Nova Scotia by 10,000 B.C.. There they were succeeded by the Micmac Indians, who in the early 1500s traded with French, Spanish, and Portuguese explorers.

PANAMAL CANAL, BUILDING OF THE

After ten years of intensive construction, the Panama Canal was officially opened to shipping on August 14, 1914. In addition to a multitude of engineering challenges, the building of the Panama Canal survived

Panama Canal, Building of the

Foot Gate of Gatun Locks during the construction of the Panama Canal which reached completion August 14, 1914.

political turmoil and environment hazards. It is considered by many historians to be one of the world's greatest engineering accomplishments. Led by a group of American engineers, the completion of the canal fulfilled the dream of a shorter shipping lane between the Atlantic and Pacific oceans.

In 1534 King Charles I of Spain introduced the concept of a Central American canal. The Spanish government was eager to find a sea route between the two oceans that would allow them to ship the gold and silver mined along the Pacific coast of their South American colonies. Land travel to the Atlantic seaports was significantly hampered by the mountainous terrain and muddy jungle trails. The king commissioned a study of the Isthmus of Panama region to determine the feasibility of constructing a water passageway. The local Spanish governor, however, dismissed the survey, and nothing was done.

The discovery of gold in California in the late 1840s revived interest in a canal between the Atlantic and Pacific oceans. The Gold Rush of 1849 stimulated a massive migration of settlers from the eastern and Midwest regions of the United States to California. Many of these settlers traveled by sea along the Atlantic coast, crossed the Isthmus of Panama on foot, and completed their journey to California by ship along the

Pacific coast. The momentum for a canal was intensified when the American government finished a railroad across the Isthmus of Panama in 1855.

By then the United States and England had already begun surveying routes for a canal in Nicaragua and Panama. In 1850 the two countries signed the Clayton-Bulwer Treaty, which stated the canal would not fall under the control of either country upon its completion. During the Spanish-American War (1898) the United States recognized the need for a sea lane that would allow its fleet to pass from the Pacific to Atlantic Oceans. The United States focused its efforts on gaining full control of the proposed canal and convinced England to waive their claim by signing the Hay-Pauncefote Treaty in 1901.

CONSTRUCTION OF THE 40-MILE LONG CANAL LASTED 10 YEARS. TWO HUNDRED AND FORTY MILLION CUBIC YARDS OF EARTH WERE DUG UP—THE EQUIVALENT AMOUNT OF EARTH NEEDED TO CONSTRUCT 70 EGYPTIAN PYRAMIDS.

The Hay-Herran Treaty of 1903 between Colombia and the United States gave the United States a 10-mile wide strip of land across the Isthmus of Panama. In exchange, the United States would pay \$10 million

and an annual payment of \$250,000 to the Colombian government. Although Congress ratified the treaty, the Colombian government rejected it in hopes of receiving a higher payment.

Its recalcitrance angered many Panamanian business owners, and the local canal supporters began a successful revolution against Colombia. The United States, which had indirectly supported the revolution, immediately recognized the new government and signed the Hay-Bunau-Varilla Treaty with the Republic of Panama in 1904. This treaty included all the provisions that the initial treaty offered to Columbia, but it also provided the United States with a renewable 99-year lease.

The construction of the canal was actually begun in 1882 by a French company led by Ferdinand de Lesseps, who in 1869 had successfully constructed the Suez Canal. After a disastrous seven years of work, the company went bankrupt. Diseases such as yellow fever and malaria took the lives of 22,000 workers.

Twenty years later the United States was determined not to repeat Lesseps' failures. Although the United States was granted ownership of the canal zone in 1904, actual construction did not begin for another two and a half years.

In this interval, Colonel William Gorgas (1854–1920) made a significant contributions to the future construction effort by improving disease prevention. In 1891 Dr. Ronald Ross, a British army surgeon, found that certain types of mosquitoes transmitted malaria through their bites. A similar discovery was made by Dr. Walter Reed, an American army surgeon, who traced the source of yellow fever to the bite of a specific type of mosquito. Colonel Gorgas, who was chief sanitary officer in Havana, used these new medical discoveries to develop detailed sanitary procedures that greatly enhanced resistance to tropical diseases. Gorgas ordered breeding grounds for mosquitoes, like ponds, swamps, and lakes, to be drained or covered with oil to prevent the mosquito's eggs from hatching. Screened windows and doors were installed on all buildings. By the time the canal's construction began in 1906, yellow fever had been eliminated from Panama. Gorgas' methods were also successful at combating malaria, although the process was much slower compared to the conquest of yellow fever. By 1914 only seven workers had died from disease. Colonel Gorgas' guidelines and the medical research on which they were based saved the lives of countless workers and helped ensure the success of the canal's engineering efforts.

President Theodore Roosevelt (1901–1909) established the Isthmian Canal Commission to lead the construction project and he appointed John F. Stevens as the Commission's chief engineer. The project's organizational efforts were extremely demanding because of the scope and size of the construction efforts. The Commission recruited qualified workers from all over the world. Buildings were erected to house the workers; facilities were built to store heavy-duty earth moving equipment, which was shipped to the area from all corners of the globe. The ten-mile wide canal zone established a government with jurisdiction over its own police force and court system. When chief engineer Stevens resigned from the project in 1907, President Roosevelt appointed Colonel G.W. Goethals (1858–1928). Under Colonel Goethals the leadership of the construction efforts shifted from independent contractors to the United States Army Corp of Engineers.

Construction of the 40-mile long canal lasted ten years. Two hundred and forty million cubic yards of earth were dug up—the equivalent amount of earth needed to construct 70 Egyptian pyramids. More than 100 steam shovels were used and thousands of workers survived landslides, heavy rains, and an earthquake. The construction of the canal was completed on October 10, 1913, at a cost of \$380 million. The canal was officially opened on August 15, 1914.

By 1964 Congress went on record in favor of establishing a new treaty to govern control of the canal. Relations between the United States and Panama were shaken during the 1960s, when Panamanians voiced their anger at the initial terms of Panama's treaty with the United States. Riots occurred and anti-American resentment continued to fester throughout Panama. In 1977 President Jimmy Carter (1977–1981) signed two treaties with the government of Panama. On October 1, 1979, the Canal Zone ceased to exist as a formal U.S. entity, and the area was returned to Panamanian civil authorities. The United States and Panama share control over the canal itself until December 31, 1999, when Panama becomes the sole proprietor.

PANAMA CANAL TREATY

On November 18, 1903, the United States and the then new Republic of Panama signed the Hay-Bunau-Varilla Treaty, granting the United States exclusive control over a 10-mile strip across the Isthmus of Panama. This gave the United States control of the Panama Canal, a lock-type man-made channel connecting the Atlantic and Pacific Oceans across the isthmus. The canal is about 51 miles long, from the deep water of the Atlantic to the deep water of the Pacific. The United States paid \$10 million and agreed to pay an annuity of \$250,000 to Panama, which became a virtual protectorate of the United States. Because Panama had been a part of Colombia prior to its becoming a protectorate of the United States, the United States compensated Colombia for its loss with the signing of the Thomson-Urrutia Treaty in 1914. In 1921 Colombia was paid \$25 million when this treaty was finally ratified in Congress. The Hay-Bunau-Varilla Treaty of 1903 gave the United States the right to build and operate the canal, and it awarded the United States sovereign rights of over five miles of territory on either side of the waterway and area known as the Canal Zone. In 1936 the original treaty was voided by the Hull-Alfaro Treaty, which ended the eminent domain provisions of the original treaty and raised the annual annuity to Panama to \$430,000. In 1955 the Eisenhower-Remon Treaty further modified the original treaty to increase the annuity once again and to include building of a bridge over the Canal (finished in 1962). In 1977, because of ongoing rioting in Panama, a final treaty amendment was signed between the United States and Panama. The treaty now stated that control of the canal would revert to the Panamanians by the year 2000, giving Panama exclusive control of all the international ship-traffic passing through the canal yearly, including commercial vessels loaded with cargo.

PANIC OF 1819

Financial panics have been known since the introduction of modern capitalism in the eighteenth century. Excessive speculation in the stock of a European colonizing company in 1720 led to a panic in France and England. In North America the newly formed United States quickly began experiencing the financial business cycles of booms and crises. A business boom driven by optimism over the nation's future immediately followed victory in the American Revolution (1775–1783), however, economic crises soon followed. Business over-expansion, personal extravagance in spending, the end of military contracts that had inflated prices, and an inability of the United States to establish a treaty regulating trade with Britain, led to widespread debt in the aftermath of the war. British textile products flooded the U.S. market causing domestic agricultural and industrial prices to substantially drop.

Distrust for any form of centralized government activity also pervaded the largely agrarian society. Yet the lack of a centralized government allowed an unsound money system to come into existence which destabilized foreign trade. The stage was set for the financial panic in 1785.

The establishment of a centralized federal government in the 1787 Constitutional Convention brought back optimism for economic prosperity. To institutionalize economic stability in the young country, Congress created the Bank of the United States in 1791. The Bank instantly became not only the largest bank in the nation, but the largest corporation at the time. Functioning as both a commercial and central bank, its chief political objective was to regulate lending practices of state banks. The state banks were issuing their own paper money in the form of bank notes with the promise they could be exchanged for gold or silver coins upon request. The central bank, though effective in achieving its goals, attracted substantial opposition. Western agrarian communities demanded an inflated money system, opposed by the National Bank, to keep agricultural prices high and to pay off debts with cheap money. Responding to public dissatisfaction over the centralized power of the Bank, Congress allowed its charter to expire in 1811. With the National Bank gone, state banks expanded quickly and returned to the practice of issuing paper notes.

The problems associated with the national debt from the War of 1812 (1812–1814) led to chartering of a Second Bank of the United States in 1816. This again attracted the ire of the small farmers. Following victory in the War of 1812 western land speculation rose sharply. State banks and even some branches of the

Nicholas) Biddle inherited a bank (Second Bank of the United States) whose previous leaders had proved incapable of their tasks. William Jones, the first president, had . . . been a political choice; he was a man who knew nothing of banking, and to make things worse, was venal as well. During his years as president, the bank caused distress in all parts of the country through speculation on the part of its leaders . . . and unwise loan policies. After a Congressional investigation, Jones resigned, and was replaced in 1819 by Langdon Cheves . . . (who) was determined to put the (Bank's) affairs in order, and to do so called in many loans and advances. The result was . . . the abrupt end of a period of wildcatting.

Robert Sobel, Historian, 1969

U.S. Bank encouraged the wave of speculation. However, fewer gold coins and silver dollars were in circulation, and currency speculators were hoarding the specie (gold or silver). As a consequence such coin was used primarily for large transactions, bank reserves, and foreign payments. Domestic land and commodity speculation was commonly in the form of paper bank notes printed by wildcat (unregulated) banks. In the South, following invention of the cotton gin in 1793, cotton plantations and exports expanded rapidly, reaping huge profits. The new cotton aristocracy engaged in "conspicuous consumption" and proceeded to spend money lavishly.

The managers of the Second Bank of the United States feared a shortfall in the specie backing up the bank notes, given the unchecked speculation and growth based on a nondescript system of currency. In 1819 the Second Bank decided to initiate a sharp contraction of credit by refusing to make loans. There were "bank runs" where depositors rushed in a panic to banks to have their notes converted to coin. Lacking suitable reserves, many state banks failed. With the banks closing their doors, millions of dollars owed to the federal government for sale of public lands went uncollected. The Second Bank's action led to a severe depression, particularly in the South and West. Prices, such as on the commodity market for cotton, declined sharply. With cotton income down, the South decreased their purchases of manufactured goods from Northern industry. Also, the South was sending much less cotton north to the Northern mills (which had been

ultimately exported overseas by Northern shipping companies). The North lost both its Southern and foreign markets.

In the aftermath of the panic, Congress conducted investigations of alleged mismanagement of the federal banking system which, most people thought, had derailed an otherwise booming economy. Manufacturers also lobbied for better protection through tariffs and excise taxes. To the rescue of individual debtors who were victims of the panic, several states passed legislation relieving them of their debts. The depression lasted until 1823 when commodity prices and the economy in general began picking up again and public confidence in the banking system was restored. However, the Panic of 1819 presaged many other financial panics throughout the nineteenth century as the nation sought ways of balancing free market capitalism with economic stability.

PANIC OF 1837

In the early nineteenth century an unstable currency and a new shaky banking system supported the nation's economic foundation. Construction of the nation's transportation system, which consisted of railroads and canals, led to accumulation of large debts by investors in the early 1830s. In addition speculation was rampant in western lands as states became settled,

The economy and the securities markets did not recover fully from the 1837 panic until 1844, when trade revived, the effects of the liquidations had been absorbed, and expansion into the West accelerated once more. The Mexican War and gold discoveries in California gave a further fillip (boost) to the economy, as did the banking and tariff reforms of the Polk Administration.

Robert Sobel, Historian, 1968

and new banks were chartered. In the 1832 elections President Andrew Jackson (1829–1837) ran on a populist platform marked by an anti-Eastern establishment philosophy including opposition to the Second Bank of the United States (created in 1816). Jackson charged that the Second Bank did not fairly treat the common citizen and that it only served the wealthy.

Following his assumption of office Jackson proceeded to dismantle the central banking system. In 1833 Jackson began transferring federal funds from the U.S. Bank to selected state banks, often owned by friends of Jackson. He also stopped depositing government money in the Second Bank, instead placing new proceeds from land sales and revenue from taxes in various state banks, which he called his “pet banks.” With more money the state banks increasingly expanded their issuance of credit, giving out too many loans and printing almost worthless paper money, as banks had been allowed to issue their own paper currency. Confidence in the currency declined, especially within the Eastern business establishment. So much available paper money led to a spiraling inflation rate. The price of land available from the government also rose. Since this did not stem the number of speculators, they borrowed more heavily. In 1832 the government sold less than \$3 million in land and by 1836 the amount increased to almost \$25 million. To make economic matters worse, in addition to the high inflation, imports began exceeding exports creating a foreign trade deficit.

With land speculation continuing rampantly Jackson issued the “Specie Circular” in 1836, which required that all public lands be bought with specie (coin), rather than private script (paper money) issued by individual banks. Also in 1836 Congress passed an act distributing the surplus federal revenues from the U.S. Treasury to the states. In reaction to the tightening of federal monetary policies, banks reduced credit available. With fewer loans available for domestic

investment, reliance on British investors grew. Unfortunately, this coincided with an internal financial crisis in England, leading British creditors to collect on their loans abroad. Three British banking houses failed and a trade imbalance for the United States grew as Britain could afford fewer U.S. exports. Gold began an increased flow to Europe. With the U.S. economy already in decline, another financial blow occurred with widespread crop failures in 1835 and 1837. A financial crisis loomed.

In May 1837 New York banks ceased specie payments to investors, leading other banks across the nation to do the same. With no coin to back it paper currency lost its value, triggering the Panic of 1837. During a brief ensuing time span many companies crashed and fortunes were lost. Unemployment skyrocketed, especially in the West and South with a loss of agricultural exports and crop failures. Public calls for banking reform increased as a six-year depression followed.

The Panic of 1837 brought about changes in banking and monetary policy. President Martin Van Buren (1837–1841) moved to establish an independent U.S. treasury system in 1840 to hold and disburse government funds. Though initially defeated, the federal system became permanent in 1846. From that point onward, to help stabilize the nation’s economy, public funds were held in the U.S. Treasury and its branches in various cities, rather than in the nation’s private banking and financial system.

State governments had also invested heavily in enterprises such as canal and railroad construction with hopes of ultimately boosting their economies. Many of the existing 26 state governments went bankrupt or came close to it. New York state government became a leader in reform with adoption of a new constitution in 1846, instilling a philosophy of state governmental fiscal restraint. To address economic displacement of the states’ citizens, a key part of various state legislative reform measures was protection for families who fell into debt. State laws were passed to alleviate the effects of the panic on an individual basis. Texas was the first state to pass a homestead exemption law following the panic. These laws aimed at shielding private individuals from free market fluctuations and provided some state protection for families during the transition to an industrial economy in many sections of the country.

On the national level Congress passed a federal bankruptcy law removing about \$450 million in debt from a million creditors. However, by bailing out

investors the credit system itself was substantially undermined. Creditors were more hesitant to hand out loans unsure if they could enforce repayment. The numerous bankruptcies resulting from the panic and associated debt relief similarly discouraged foreign investors. The Panic of 1837 had cost British investors almost \$130 million.

Difficult economic times contributed to the rush of emigrants that began flooding across the Oregon Trail, beginning in 1843, seeking a fresh economic start. Thousands of emigrants had been displaced by the depression resulting from the Panic of 1837. Ironically, the depression drove U.S. expansionism and spurred new economic hope by the late 1840s.

PANIC OF 1907

Economic prosperity during the first several years of the twentieth century led to expanded bank credit and rampant speculation in railroad consolidations, western mining ventures, and the coastal shipping industry. With President William McKinley's (1897–1901) administration favoring business interests, powerful business trusts remained poorly regulated and competed with banks. Between 1897 and 1907 imports and exports almost doubled along with the volume of money in circulation, from \$1.5 billion in 1896 to \$2.7

billion in 1907. Deposits in the national banks (created in the 1860s) more than doubled from \$1.6 billion to \$4.3 billion. U.S. economic prosperity was shared with many other nations.

Despite economic well-being gold production was lagging behind as demands for investment funds were increasing. A capital shortage was beginning to appear and money was becoming tighter. To help avoid the periodic financial panics of the late nineteenth century, governmental business reforms were introduced. Congress created the Interstate Commerce Commission through the Interstate Commerce Act of 1887. The courts proceeded to weaken the act, but in 1906 the Hepburn Act reasserted the power of the federal government to regulate railroad rates. These regulatory efforts, however, did not save the economy from periodic panics. In 1907 the economy again ran out of steam and fell into depression.

However, business financial troubles began appearing early in 1907. In February the business giant, Standard Oil Company, suddenly faced financial difficulties which caused a sharp drop in the stock market. Then a shipping conglomerate failed in the summer, followed in October by the failure of the United Copper Company. This caused a run on banks as depositors fought to withdraw their funds. Later in October closure of the Westinghouse Electric Company and the Knickerbocker Trust Company accompanied with the suicide of Knickerbocker's president finally triggered a panic in the stock market and suspensions or failures of several banks.

The government turned to New York City's J.P. Morgan and fellow financiers to implement an emergency strategy by loaning \$40 million to rescue selected banks and businesses. With President Theodore Roosevelt's (1901–1909) approval, Morgan had United States Steel Corporation purchase holdings of its major rival, Tennessee Coal, Iron and Railroad Company. However, Roosevelt did not initially appreciate what Morgan and others stood to gain personally out of this arrangement—the action strengthened the existing steel trust. This outcome was not well accepted by Roosevelt, known to his public as the “trustbuster.”

The panic was limited in scope, not causing extensive unemployment, bank and business failures, or disruption to the agricultural economy. However, the recovery tactics affected the image of big financiers as the public, fearing the power of J.P. Morgan and others, saw the need for banking and monetary reform. Foreign investors also lost confidence, perceiving continued U.S. financial instability from the previous century. (Since the charter of the Second Bank of the United

States had expired in 1836, the nation had been operating for over 70 years without a central banking organization.) In response Congress passed the Aldrich-Vreeland Currency Act in 1908 which, during future crises, provided for issuance of emergency bank currency by groups of national banks. Other congressional actions included the creation of the Postal Savings System in 1910 to protect the savings of the poor, and in particular immigrants. The Aldrich-Vreeland Act also created the National Monetary Commission (NMC) to determine needed banking reforms.

Clearly the historic requirements of banks maintaining certain levels of reserves to help insure liquidity of bank notes and deposits were not sufficient measures to blunt financial crises. The NMC studied banking practices in the United States and Europe, which resulted in a 38-volume report in 1911. Congressional examination and debate over the report's findings indicated that the nation needed greater flexibility in lending power in addition to elasticity of currency. As a result Congress passed the Federal Reserve Act in 1913 creating the modern reserve bank system, the Federal Reserve System. The Federal Reserve became the lender of last resort, designed to meet liquidity demands of the entire banking system. This new system placed Federal Reserve Banks throughout the United States, thus eliminating the concentration of banking in New York City. Lastly, the Federal Reserve would also standardize the currency through issuing federal reserve notes.

PANICS OF THE LATE NINETEENTH CENTURY

During the late nineteenth century the largely unregulated and unstable U.S. economy witnessed a series of financial panics between 1857 and 1893. Financial panics are socioeconomic events, often psychologically driven, in which a more or less irrational fear and sense of futility sweeps through investors or some other group. Usually occurring during periods of economic optimism and over-expansion the actual panic-driven activity varies depending on the nature of the sudden crisis that spurred the fear. (For example depositors could start a run on banks by demanding their money back out of fear the bank has insufficient capital reserves to cover its deposits.) Often, but not always, panics lead to economic depressions characterized by high unemployment and lower living standards.

Prior to 1863 U.S. banking in the nineteenth century was characterized by widespread recklessness. The money supply used to finance industrial expansion fluctuated markedly. With demise of the Second Bank of the United States in 1836 state banks would periodically print and lend money, or often make loans with insufficient capital on hand while at other times they would greatly restrict credit. Under this relatively unpredictable system commodity prices fluctuated greatly as did the level of business activity.

The period began optimistically with victory in the Mexican War (1846–1848) which resulted in the acquisition of California and the American Southwest followed by the discovery of gold in California. An economic boom period followed. Speculation was rampant in railroad construction, manufacturing, and the newly gained western lands. The first major sign of financial over-extension was the failure of the Ohio Life Insurance Company of Cincinnati in August of 1857. The Panic of 1857 quickly spread through the developing Eastern industrial centers and Western wheat belt resulting in high unemployment. Yet the South's cotton trade with Great Britain, sustained through low tariffs, continued to prosper. By winter squabbling between the North and South intensified. Suffering numerous bank failures, the North and West turned to the newly formed Republican political party. Economics as well as slavery became the key issues of the 1860 presidential election.

The American Civil War (1861–1865) devastated the Southern economy and financing the war left the U.S. government in debt. Congress created a national

The ultimate bailout of the Treasury came from Europeans and their best-known agents in New York. Despite eighty years of progress, the situation appeared to have changed little since the War of 1812. This was annoying to many advocates of central banking because two private bankers managed to perform central banking operations for the United States, charging a fee in the process.

Charles R. Geisst, *Wall Street: A History*, 1997

banking system in 1863 to stabilize the economy. The National Banks Act created a system of privately owned banks that issued notes backed by U.S. bonds driving previously issued state bank notes out of circulation. However, the new “national” banks still failed to take actions to increase the money supply in order to escape the clutches of the threatened depression.

In the 1870s speculators ignored, once again, the problems of the increasing trade deficit. Instead, they loaned more money to the railroad companies. Almost all activity on Wall Street and investment capital was singularly focused on the railroad industry. Unable to raise sufficient loan capital, over four thousand U.S. businesses failed in 1872. In the fall of 1873 a panic ensued as several major New York financial firms failed, including the most noted banking house, Jay Cooke and Company. Wall Street closed for ten days as many other companies and citizens faced bankruptcy. The subsequent severe depression left half a million people unemployed by 1875. Another 18,000 businesses failed in 1876 and 1877 including most railroad companies and iron mills in the United States. With the lack of organized relief programs, hunger and destitution spread. For those still employed, wages declined leading to numerous strikes, including a violent railroad strike in 1877. Finally, by 1878 the economy began to improve and with increasing gold reserves, the U.S. government in 1879 placed the economy on a gold standard.

Nevertheless, economic instability persisted. Capital investments in railroads, the mining of newly found silver deposits in the West, industrialization, and foreign enterprises exceeded possible economic returns in the 1880s. Prices for goods declined and by 1883 an economic depression commenced. Overproducing wheat farmers and silver miners of the West pushed for increased currency circulation through unlimited silver coinage to combat declining wheat prices. Meanwhile

Eastern industrial growth outpaced the nation’s gold production leaving banks without sufficient gold reserves to adequately back loans for capital investments.

After a mild economic recovery in the late 1880s, the British economy suddenly declined sharply in 1890s leading to failure of the prominent Baring Brothers and Company banking house. Impacts on the U.S. economy were direct and investment of foreign capital, particularly British, into U.S. business dropped dramatically. The sale of American securities by foreign investors led to a Wall Street collapse that year and substantial exporting of gold. In addition, under political pressure from the West, President Benjamin Harrison (1889–1893) promised to relieve the suffering of silver producers from the declining price of silver. Congress passed the Sherman Silver Purchase Act of 1890 which obliged the United States to purchase large amounts of silver on a continuing basis.

By early 1893 the gold reserves dropped below the set \$100 million baseline minimum. The amount was considered the minimum to assure redemption of government obligations. With the price of commodities, gold, and silver continuing downward, the Philadelphia and Reading Railroad failed, then the National Cordage Company. The Panic of 1893 had begun. This panic hit banks in the South and West particularly hard as investors rushed to banks to convert their holdings into gold. Almost 600 banks suspended operation and by the close of 1893 4,000 banks and 14,000 businesses had failed and four million people were unemployed.

In an effort to bring relief newly elected President, Grover Cleveland (1893–1897), then in his second term, repealed the Silver Purchase Act. This caused silver prices to drop dramatically and brought economic devastation to parts of the West. A depression with widespread unemployment lasted from late 1893 through much of 1894. Violent strikes erupted, including the Pullman Strike in 1894. Jacob Coxey, a small businessman, led his “army” of unemployed on a march from Ohio to Washington, D.C. to present Congress with a demand for creating jobs, mostly on road repair.

Cleveland arranged for Eastern bankers including J. P. Morgan to purchase specially issued U.S. bonds to help replenish the gold reserves. This action raised public fears over the increasing influence of East financiers.

Due to poor European agricultural harvests in 1897, the export of American produce significantly increased the circulation of gold. In addition, the domestic production of gold increased steadily through

Paper Industry

the 1890s with gold discoveries in the Klondike region of Alaska. The economy rebounded by 1898.

While the recurrent business cycles left many Americans bankrupt foreign investors also lost millions in each panic episode. The pattern constantly repeated itself. Foreign investors would avoid investment in U.S. securities immediately following an economic downturn and contraction. Then as domestic investors began making fortunes with securities at lowered prices and economic expansion growing, the foreign investors would be lured back only to suffer another panic and downturn.

Such financial business cycles of recurrent panics through the late 19th century established a public mood for substantial economic reform. A major factor behind the dramatic financial swings during this period was a lack of public confidence in the largely unregulated economic system, particularly given extensive political and business corruption. Reformers sought increased protection against concentrations of economic power in the hands of a few private financiers and enhanced stability for foreign as well as domestic investors.

PAPER INDUSTRY

According to ancient writings paper was first made by a eunuch in the court of the Chinese emperor

Ho Ti. He is thought to have used the bark from a mulberry tree. The earliest known paper that still exists was made from rags in about A.D. 150. China was the only area where paper was made until the technique surfaced in Japan and then in Central Asia. The Egyptians did not make paper until A.D. 900. Around 1150 a papermaking mill was built in Spain and the art of papermaking spread throughout Europe. The English built their first mill in 1495; it was 200 years after this that paper was first manufactured in America.

In 1690 the first paper mill in the American colonies was constructed in Germantown, Pennsylvania. It was built on the banks of the Monoshone Creek by William Rittenhouse, a papermaker trained in Germany and one of the first Germans to settle in the New World. His ambition was to make fine white paper from the raw material of rags. During the American Revolution (1775–1783) the Rittenhouse mill donated paper for pamphlets and newspapers. Paper was also used to make gun wadding and cartridges used in the war.

Papermills sprang up to meet the demands of a growing market. New mills thrived that were near cities and towns and that had a plentiful supply of rags for the basic raw material. A new job title emerged for those seeking employment in the paper industry. For lack of any more sophisticated name, the word “rag-picker” was coined for those that scurried around the cities collecting rags for the papermakers. There were approximately 185 paper mills in the United States by 1810. The supply of rags used to make paper was running low and papermakers began looking for alternative materials. On January 14, 1863, the *Boston Weekly Journal* became the first U.S. newspaper to be printed on paper made from ground wood pulp.

As the United States grew in size so did the paper industry. Technology kept up with the need for faster production. The first practical machine for papermaking was invented in 1798 by Frenchman Nicholas Louis Robert. An improved machine constructed by British brothers Henry and Sealy Fourdrinier appeared in 1803. The first machine that produced paper in a continuous sheet was installed by Thomas Gilpin in Wilmington, Delaware in 1817. Straw and wood were being used as raw materials and machine speeds were greatly increasing. Paper was now being made in longer and wider dimensions.

By the late 1990s the United States and Canada were the largest producers of pulp, paper, and paper products in the world. The U.S. paper industry was accountable for approximately one percent of the U.S. national income. In the 1990s the United States employed 750,000 workers in the paper industry alone.

Towards the end of the twentieth century conservationists became concerned with the impact of paper production on the environment. Paper mills had the unfortunate tendency to foul the water supply and destroy wildlife. The industry set a goal to recover 50 percent of all used paper via recycling by the end of the twentieth century. By 1999 it appeared that this estimate was low; twice as much paper was recovered for recycling as was sent to landfills. Another economic and social issue affecting the paper industry at the turn of the century was the promise of a “paperless” world by those who believed that technology and commerce would shape every facet of society. Instead of this outcome, technological growth seemed to be followed by an increase in the demand for paper. This growth appeared to be based on the premise that paper is universal and relatively inexpensive; replacing it with electronic apparatus makes communication exclusive and, in some cases, too expensive.

PARTNERSHIP

A partnership is a legal organization in which two or more individuals own and operate the business. Partnerships are not limited as to the number of possible partners or the number of employees. Generally, however, partnerships are small in size. Partnerships are a common form of organization in the professions (businesses such as retail shops and service trades like

car repair shops) and in wholesale firms (which buy from producers and sell to retailers).

Businesses organized as partnerships are advantageous for several reasons. No formal legal process is required to start a partnership, but most are based on signed agreements between partners as to how the costs and profits will be divided. Although certain licenses or permits may be required, few fees are to be paid or papers filed with government agencies. Owners may have a great deal of flexibility and freedom in decision making. Also, instead of working for someone else and receiving a salary, the owners may keep all the profits to do with as they see fit. The talents and abilities of more than one person will be available to the business, and, with several individuals backing the firm, bank loans may be easier to obtain.

The largest economic disadvantage of partnerships is unlimited liability. The owners are personally responsible to the full extent of whatever wealth they own for all the debts of the business, both jointly and separately. This means that if one individual owns 1/4 of a firm and the firm goes out of business with debts of \$400,000, the individual is liable for \$100,000. However, if the other three partners disappear, the one remaining would be liable for the entire \$400,000 (and even personal possessions may be taken to satisfy creditors). The actions of any one partner are the legal, unlimited responsibility of all partners. Another disadvantage is the limited ability to raise enough capital for the business to grow, be efficient, and highly profitable. In most cases raising sufficient investment capital is problematic.

In the United States during the 1980s and the 1990s, the percentage of total firms organized under partnerships and their sales remained relatively constant. In 1993 partnerships made up 6.9 percent of all U.S. firms and represented 1,467,000 businesses; they received 4.8 percent of total sales, about \$627 billion.

PATENT

A patent is a legal document issued by a government granting exclusive authority to an inventor for making, using, and selling an invention. The invention must have a sufficient degree of newness, usefulness, or novelty to distinguish it from items with existing patents. To qualify for a patent, an invention may not merely be a substitution, change, or combination of items. In the United States inventions may include

These two children study the original patent granted by the United States government. The document was presumed lost until it was recovered in a trunk of papers in 1954, and preserved by the Chicago Historical Society.

products, machines, methods, new uses, and even new forms of life as genetically engineered bacteria.

The exclusive authority granted is considered a barrier to entry, that is, something that prevents anyone else from copying or producing the invention without permission. By doing so, government hopes to encourage creative innovations by providing sufficient time for the innovator to recoup his research costs and realize profits. The inventor may manufacture, use, or sell his invention in a monopolistic atmosphere.

Each country has its own system of patents. In the United States, applications are made to the U.S. Patent and Trademark Office (PTO), and it takes up to two years to process. The patent is granted to the first inventor rather than the first person to make application, so inventors must document when they first came

up with the idea. The PTO exhaustively checks previous patents to make sure of no duplications. If none exist, PTO sends a notice of allowance to the inventor. Upon paying fees, the patent is issued. The patent protects the invention for 17 years. A design patent, which covers only the appearance of an item, is issued for 14 years. A patent owner may sue on grounds of infringement to stop any copying of the invention.

The U.S. *Constitution* first empowered Congress to secure exclusive rights for inventors. At the beginning of the twentieth century, 82 percent of patents issued in the United States went to individuals and 17 percent to U.S. corporations. By 1962 about 28 percent of the patents went to individuals while 59 percent went to U.S. corporations, 12 percent to foreign entities, and two percent to the U.S. government. The sharp

decline in individual patents could partially be explained by large increases in corporate research and development expenditures funded by both the federal government and private industry.

In 1992 the North American Free Trade Agreement (NAFTA) highlighted the continued importance of patents by requiring each member country to provide both product and process patents for all kinds of inventions.

PAY EQUITY

Pay equity concerns an aspect of the growth of capitalism involving the fairness with which the system distributes its expanding wealth and how it shares its recurring hardships. An example of the disparity of pay equity is the following: in 1986, in the United States, the lowest 20 percent of all families received only 4.6 percent of the total income, whereas the top 20 percent of all families received 43.7 percent. This disparity, or lack of pay equity, clearly results from the concentration of assets in the upper economic brackets. According to the *Encyclopedia Britannica*, “the disparity is the consequence of highly skewed patterns of corporate rewards that typically give, say, chief executive officers of large companies 50 to 100 times more income than those of ordinary office or factory employees.” Advocates of market-determined distribution of capital assets declare that in a society like the United States, with certain exceptions, people tend to be paid what they are worth—their incomes reflecting the economic value of their contributions to production. Critics of this point of view contend that labor, under capitalism, is paid less than its value because of the superior bargaining power of employers; in their view the claim of capital efficiency might easily mask an underlying condition of exploitation. Pay equity (achieving a fair sharing of wealth at all levels of any capitalist society), seems an ongoing dilemma of the capitalist system, a system that generates capital but does not pay heed, necessarily, to the moral or social implications of the creation of wealth. The pursuit of pay equity is ongoing and involves struggles within the capital economy in constant efforts by many groups to achieve justice.

PENNEY, JAMES CASH

James Cash Penney (1875–1971) was born on his father’s farm in Hamilton, Missouri, the seventh of 12 children. He grew up in a stern, joyless family. His father, a farmer, served as an unpaid preacher for a fundamentalist sect known as Primitive Baptists. By age eight James Penney was forced to earn money to buy his own clothes. This was his parents’ way of teaching him the value of money and self-reliance.

Penney’s childhood and early adult life appeared quite ordinary. He finished high school and worked mostly in store clerk positions. Penney moved to Colorado for health reasons and his life changed. He was quickly employed by T.M. Callahan, the owner of the Golden Rule Mercantile Company Chain—a company Penney would later buy-out and make into his own.

THE ETHICAL MEANS BY WHICH MY BUSINESS ASSOCIATES AND I HAVE MADE MONEY IS MORE IMPORTANT THAN THE FACT THAT WE HAVE ACHIEVED BUSINESS SUCCESS.

J.C. Penney

Working in the Callahan store, Penney began to dream of operating his own chain of stores, based on the idea of having partner-owners who would share in all the profits. Additionally, he married and found living in a healthier environment stimulated his goals, ambitions, and imagination. In 1902 Penney became owner of his first store, one of the Golden Rule chain stores; he worked night and day for the success of this Kemmerer, Wyoming, store, which opened at 7 AM and closed it between 9 and 10 P.M.. Penney worked six days a week and half a day on Sundays.

His work and his sense of constantly expanding business—with more stores and mail-order catalogues—led to monumental national expansion throughout the 1920s. By 1927 J.C. Penney had opened 1000 stores throughout the United States. Penney knew he could not control the daily operations of many stores with such wide expansion. He decided that his success potential could only come true if he delegated responsibility to others and if he put his faith in the people he hired. This faith and his financial arrangements with store managers worked profoundly well. Individual store managers shared in one-third of the store profits. Sharing profits with store managers was, in Penney’s own estimation, was the motivating factor for success in business.

Because of this profit-sharing arrangement with his store managers, J.C. Penney was called “the Man

Pennsylvania

with a Thousand Partners,” a phrase Penney used in his autobiography. In his book Penney wrote: “The ethical means by which my business associates and I have made money is more important than the fact that we have achieved business success.”

In later life Penney, who now had the financial means to do what he pleased, operated cattle farms, became involved with charitable and religious endeavors, and pursued frequent public speaking engagements. His rise to fame and fortune crashed with the stock market crash of 1929—at age 56 he was \$7 million in debt. Yet the highly motivated Penney, still vigorous and determined, borrowed money and soon regained control of his retail empire. He wrote in his autobiography that all of his business success was based “in adherence to the Golden Rule, faith in God and the country.”

Despite early health problems, J.C. Penney lived to the age of 95. He died in 1971.

PENNSYLVANIA

In Charles Andrews' *The Colonial Period of American History*, Pennsylvania's founder, William Penn (1644–1718), is quoted as saying, “I abhor contention, niceties, doubtful disputation, divisions, etc., and am for patience, forbearance, long suffering and all true moderation.” While Pennsylvania did not fulfill all of William Penn's high ideals as a “holy experiment” in tolerance and diversity, it certainly developed in very diverse ways. Its urban areas soon became some of the most influential in the nation, while its rural areas and

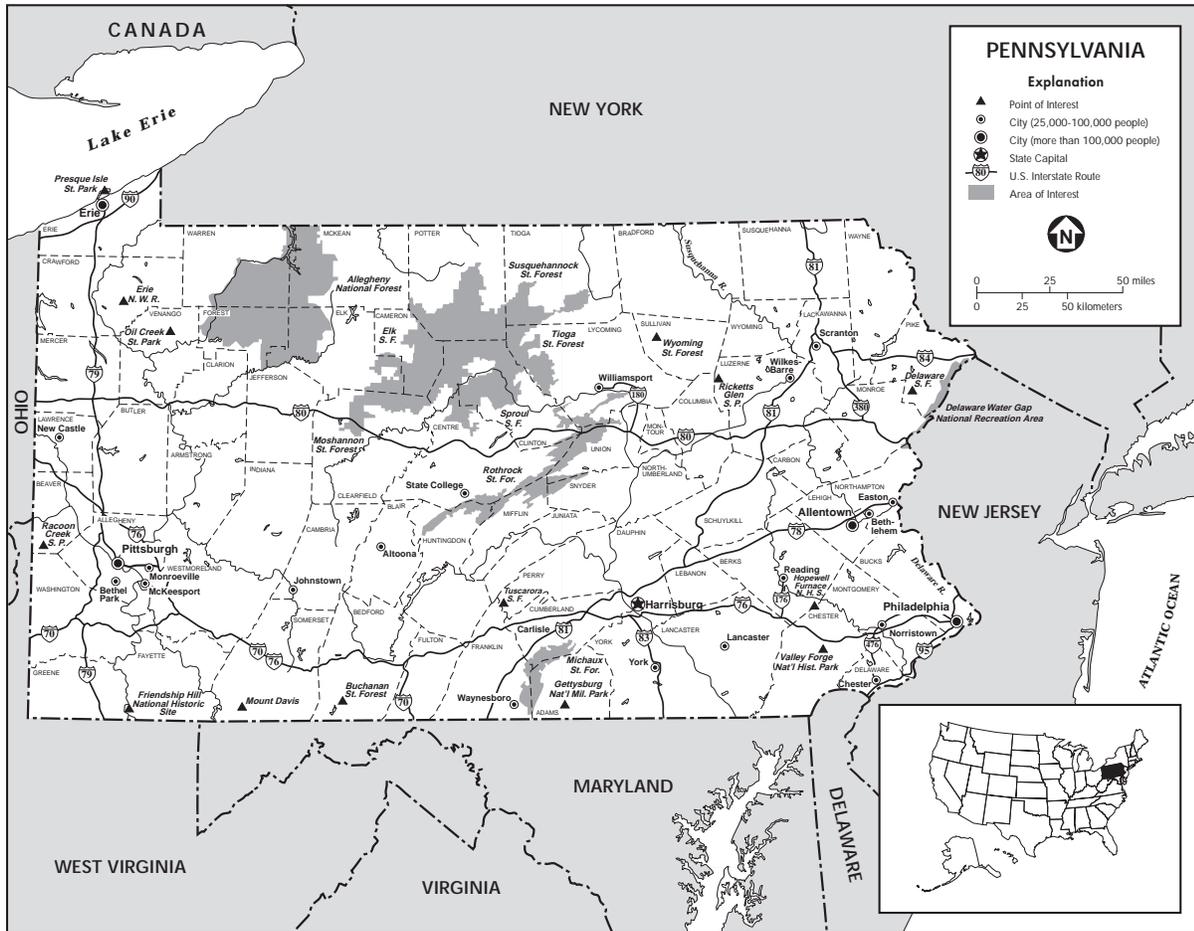

vast forests remained unspoiled. Its unmatched transportation network and abundant natural resources helped the state to become an industrial powerhouse in the late nineteenth century. Nonetheless, Pennsylvania retained its agricultural base. It weathered declines in manufacturing after World War II (1939–1945) but managed to retain much of its economic health in the 1990s by diversifying its economic base.

In 1614 Cornelis Jacobssen, sailing for the Dutch fur trade, was probably the first European to reach Pennsylvania. Swedes also settled there, surrendering to the English in 1664. The colony was granted by King Charles II in 1681 as a proprietorship to William Penn.

Penn, a Quaker who espoused pacifism, tolerance, and equality, was given broad powers to make laws and run the colony as he saw fit. Penn however gave up his lawmaking powers and set up a form of representative government. Many immigrants came to this tolerant colony. The *Declaration of Independence* was declared from Philadelphia, the state house in 1776, and the new Congress continued to meet there. Philadelphia would serve as the U.S. capital following the American Revolution (1775–1783) until 1783, and again from 1790 to 1800. Pennsylvania was the second state to join the Union, in 1780.

Pennsylvania's destiny as an industrial powerhouse was sealed when iron was discovered there. The first iron furnace was built in 1792, and coal began to be exploited as an energy resource. The early nineteenth century also saw the completion of the Main Line of Public Works, a canal and railroad system, which connected Philadelphia with Pittsburgh. Another aid to economic development was the stock company, which Pennsylvania encouraged to promote local enterprise. Pennsylvania chartered the Insurance Company of North America (INA) and the Insurance Company of the State of Pennsylvania in 1794, both of which profited mostly from marine and fire casualty policies. The Philadelphia and Lancaster Turnpike was also chartered and was completed in 1794, cutting the cost of moving goods from Lancaster to Philadelphia by about two-thirds.

Meanwhile Philadelphia was becoming the commercial center of the state. According to historian Thomas C. Cochran, political and economic business could be conducted there very conveniently: “Such compactness, possible for a city of less than 75,000 people, meant that business could be conducted reasonably expeditiously without telephone, telegraph, or a clearing house for the four banks.” By the time President Thomas Jefferson (1801–1809) declared an embargo on foreign imports in 1807, Pennsylvania's

State of Pennsylvania.

financial institutions and insurance companies were ready to meet the challenge, as were local industries, including Philadelphia’s many shipbuilders.

By the early 1800s Philadelphia had become the nation’s financial center. It was the home of the nation’s first stock exchange (1790), the First Bank of the United States (1791), the Second Bank of the United States (1816), and a number of other financial institutions. Under its powerful director Nicholas Biddle (1786–1844), the Second Bank became the only important rival to New York’s financial institutions. Philadelphia, however, lost its preeminence as a financial center when President Andrew Jackson (1829–1837) vetoed the Second Bank’s re-charter in 1831.

In the mid-nineteenth century Pennsylvania continued to tap its abundant natural resources, creating a center for the iron industry and other manufacturers and developing a transportation network which was matched by no other state by 1840. Both Philadelphia and Pittsburgh became major commercial centers. Several more roads were built, and Pennsylvania also

benefited from a section of the old National Road, which passed south of Pittsburgh. By the 1840s the improvements to canals and other waterways in the state also exceeded anything which had been done elsewhere.

It was in railroad building however, that Pennsylvania really excelled. By the 1850s lines connected Philadelphia with Germantown; Trenton, New Jersey; the Lehigh Valley; and New York City. In 1852 the Pennsylvania Central connected Philadelphia and Pittsburgh, solidifying these two cities as transportation meccas. In 1857 the powerful Pennsylvania Railroad purchased the State Works, virtually eliminating state competition and tolls. Following the American Civil War (1861–1865), the Pennsylvania Railroad dominated economic life in the state and held sway over most Republican Party politicians. By 1880 it was the world’s largest corporation, with more than 30,000 employees and \$400 million in capital.

For the next two decades Pennsylvania was the chief producer of coal, iron, and steel and a major

Pennsylvania

supplier of petroleum and lumber. Immigrants from other states and from abroad came in droves to the coal regions and urban centers to find work in mines, mills, and factories.

No story of the development of Pennsylvania industries would be complete without mention of Andrew Carnegie (1835–1919). A Scottish immigrant, he worked various jobs before being employed by the Pennsylvania Railroad. There he advanced rapidly, laying the foundations for his future fortune by investing wisely. After serving in the Civil War, he formed a company that produced iron railroad bridges and then founded a steel mill. One of the first to use the Bessemer process, Carnegie succeeded quickly, buying up several other steel companies and soon controlling a quarter of the steel production in the United States. In 1901 he sold his Carnegie Steel Company to United States Steel Corporation for \$250 million. After his retirement Carnegie was well-known for his philanthropy, endowing many educational and cultural institutions. He is best known to the general public for his gifts to nearly 1,700 public libraries across the nation and in Great Britain.

With Carnegie Steel, and with the financial expertise of banker Andrew Mellon (1855–1937), Pittsburgh retained its position as the preeminent industrial city in the region. The city and the state, however, were not without labor problems. Over a period of years many violent strikes occurred in both the coal and the steel industries. In 1892 a lockout at the Carnegie-owned Homestead Steel plant caused a bloody clash between workers and the Pinkerton guards hired to keep them out. Another strike in 1919, involving 50 percent of U.S. steelworkers, shut down the industry for more than three months.

During the 1920s Pennsylvania barely held its own economically, with a low growth rate and industrial products selling below normal levels. The Great Depression (1929–1939) brought even more economic grief to the state. Democratic Governor George H. Earle, breaking the longtime hold of the Republican party over the state, initiated a “Little New Deal,” following the policies of President Franklin D. Roosevelt (1933–1945) in supporting labor and farmers, regulating utilities, and building public works. Industrial workers came out of this period with a renewed ability to challenge industry. During World War II (1939–1945) Pennsylvania returned to a high level of prosperity as it turned out large volumes of munitions, ships, steel, and other materials for the war effort.

Republican and Democratic governors following the war continued efforts to support and encourage

industry in the state. Not until the governorship of William W. Scranton (1963–1967), however, did Pennsylvania return to full economic health. Through increased taxes for state services, more federal aid for economic programs, and steady increases in support for economic development, the state was able to bring its high unemployment rate to below the national average by 1966.

By the mid-1980s, Pennsylvania found itself in the throes of converting from an industrial to a service economy. Pittsburgh, long known for its iron and steel (not to mention its dirty air), became a prototype of a city which made the transition successfully, even converting the sites of its former steel plants and railroad yards to parkland, retail shopping, hotels, and other service-oriented industries. Areas such as Wilkes-Barre which remained depressed were helped in the late 1980s by Governor Robert Casey’s attempts to assist ailing industries. In the 1990s steel had been replaced as a major industry by food processing and chemicals, particularly pharmaceuticals. Pittsburgh became a center for corporate headquarters, and Philadelphia, a Mecca for high-technology industries.

By 1996 Pennsylvania ranked eighteenth in per capita personal income in the nation. Nearly 27 percent of the state’s workers belonged to labor unions, the sixth highest percentage in the United States. Though primarily known for its industries, Pennsylvania also remains an important agricultural state, producing large quantities of staple crops in addition to livestock. Another important economic sector is forestry. Pennsylvania’s numerous historic sites and natural recreation areas have also made tourism the second-largest employer in the state.

PENNSYLVANIA MAIN LINE CANAL

Partly in response to the federally funded National Road project, which began at Cumberland, Maryland, in 1806 and continued westward to eventually reach Illinois, the state of Pennsylvania launched its own program of transportation improvements in 1826 to link East with West. Philadelphia leaders initiated the program because they did not want their city to be eclipsed by Baltimore (which prospered at least in part because of the National Road) or New York City (which flourished after the completion of the Erie Canal in 1832). Pennsylvania developed the Main Line of Public Works—a comprehensive network of canals and railroads to connect Philadelphia with Pittsburgh. The project was approved by the state legislature in February 1826 and work began at Harrisburg in July of that year. In 1837, the project, whose centerpiece was the Pennsylvania Main Line Canal, was completed. Unlike New York’s highly successful Erie Canal, the Pennsylvania Main Line Canal was never profitable. The project, built at an enormous cost to the state, never even broke even. One source described it as a “curious and cumbersome combination of railroads and canals.” The Main Line Canal did connect the state’s major cities, which emerged as thriving commercial centers by the end of the century. Pittsburgh, home to the iron and glass industries, became known as the Gateway to the West.

PENNSYLVANIA RAILROAD

The building of the Erie Canal in 1825 and the emergence of the Baltimore and Ohio Railroad threatened Philadelphia’s traditional position as a center of commerce. These modern, accessible transportation networks made New York and Baltimore major trade centers. In an effort to maintain Philadelphia as an important market hub, Pennsylvania merchants secured a legislative charter for the Pennsylvania Railroad (PRR) in 1846.

Construction on the railroad began at Harrisburg, where it would connect to the state-owned Philadelphia and Columbia Railroad, and then advance westward to Pittsburgh. The 245-mile segment between Harrisburg and Pittsburgh was open for service in 1854. Three years later, the PRR purchased the state-owned railroad east to Philadelphia. For much of the 1850s the railroad developers were occupied with upgrading the railroad’s physical plant, buying new equipment, and experimenting with coal-burning fireboxes. By the beginning of the American Civil War (1861–1865), the PRR controlled a crucial segment of the nation’s rail system. Despite the inflated economy and the railroad’s deteriorating equipment, the PRR doubled its net profits during the war. By war’s end, the Pennsylvania Railroad was the largest corporation in the world. Free of debt, it was poised for further expansion.

Expansion continued well into the 1870s, providing rail service throughout the state and beyond. Main rail lines emanated from Harrisburg to Erie, Buffalo, Baltimore, Washington, D.C., Jersey City, and New York harbor. Additional lines were leased to provide connections to Midwest cities and extend PRR rails to the Mississippi River. By the end of the nineteenth century the railroad had ceased to expand, and it began to concentrate on consolidating the leased lines and making improvements in service.

BY 1910 THE PENNSYLVANIA RAILROAD OPERATED 10,000 ROUTE-MILES IN 13 STATES, OWNED MORE THAN 260,000 PASSENGER AND FREIGHT CARS, AND EMPLOYED MORE THAN 215,000 PEOPLE. THE PRR HAD BECOME A U.S. CONGLOMERATE—A CORPORATE GIANT THAT REFERRED TO ITSELF AS “THE STANDARD RAILROAD OF THE WORLD.”

Between 1899 and 1906 the passenger traffic on the main line between Harrisburg and Pittsburgh was the highest in the nation. To accommodate service demands, the railroad expanded by constructing four additional tracks and several new tunnels. In 1905 the PRR’s premier passenger train, the Broadway, began running between New York and Chicago in eighteen-hour trips. In 1907 newly constructed tunnels under the Hudson River allowed passenger trains access to the newly constructed Pennsylvania Station in Manhattan, New York. By 1910 the Pennsylvania Railroad operated 10,000 route-miles in 13 states, owned more than 260,000 passenger and freight cars, and employed more than 215,000 people. The PRR had become a U.S. conglomerate—a corporate giant that referred to itself as “The Standard Railroad of the World.”

Penny Auctions

Throughout this period the Pennsylvania Railroad carefully researched and implemented technological innovations. In the late nineteenth century the PRR pioneered the use of the air brake, steel rails, and automatic block signals. By 1908 the railroad was poised to introduce an all-steel passenger car. The PRR also began to use electric power, first in New York and then later in Philadelphia. The use of electric power reached full maturity in 1935 and completed the largest modernization process attempted by a U.S. railroad. In addition the PRR secured interests in Trans World Airlines, Greyhound Bus Lines, and numerous trucking companies in order to provide consumers with multi-modal transportation options.

The Pennsylvania Railroad did well enough in the first part of the century to survive financially through the Great Depression (1929–1939), but it began running into difficulties soon after. World War II (1939–1945) and the increasing cost of modernization placed a severe financial burden on the entire railroad industry. In 1946 the combination of large capital expenditures and postwar inflation produced the company's first annual net loss.

The need to replace its obsolete fleet of steam locomotives quickly became the company's most pressing issue. In spite of its deep ties and loyalty to the coal industry, the railroad replaced steam with diesel-electric power. This change offered many of the benefits of electric traction without the high initial cost. The completion of the transfer from steam to diesel, a \$400 million investment, took place in 1957.

During the 1950s and 1960s the Pennsylvania Railroad continued to experience a drop in revenue and service. The company felt the impact of heavy industry's decline in the Northeast, as well as stiff competition from other emerging means of transportation. In the late 1940s the railroad's average annual ton-miles totaled 54 billion, but by 1960 the total annual ton-miles had fallen to 43 billion.

In 1968 after many years of negotiation to prevent further loss, it merged with the New York Central (NYC) and eliminated duplicate routes and facilities. Unfortunately the new company, Pennsylvania Central, proved to be unable to withstand the declining rail traffic or cope with the soaring labor costs and declared bankruptcy only two years later. In 1976 Conrail and Amtrak purchased most of Penn Central's rail holdings. This allowed Penn Central to return to financial solvency as a real estate development firm.

PENNY AUCTIONS

Penny auctions were part of the militant tactics adopted by many Midwestern farmers before and during the Great Depression (1929–1939). The hard times that began in the mid-1920s led to what was arguably the most violent agricultural movement in U.S. history—the Farmer's Holiday Association. As farm foreclosures skyrocketed in the 1920s, with no relief from the government forthcoming, many Midwestern farmers began to cease all buying and selling of commodities. Dairy farmers blockaded roads into Sioux City, Iowa, attempting to increase the price of milk. Violence increased; milk-dumpings were common; and railroad service was interrupted. Fights broke out between the police and farmers. As part of this struggle—a struggle of farmers trying to survive—farmers began to threaten bank officers with physical harm at the auctions of farms claimed in bankruptcy settlements. The penny auctions involved farmers bidding a few cents for a neighbor's farm to re-purchase it, and if a few cents (pennies) did not clear the bank debt, then the bank officers were physically threatened. With the beginning of the Franklin D. Roosevelt (1933–1945) presidency in 1933, creditors and debtors began to work together to arrange re-financing of farms and to resolve payment of delinquent debts.

PENSIONS

Pension is a benefit, generally monetary, paid to employees or their supervisors as retirement income or as compensation for disablement. A pension is a regular allowance intended to provide income security.

Pension plan benefits usually depend on the employee's age, years of service, and average salary. Plans may be contributed to jointly by the employer and employee, the employer only, or the employee only. Contributed funds are subsequently invested in a wide variety of financial markets.

Pension plans are available to workers in private industry, in local, state, or national government, or who actively served in a uniformed branch of the military. Private employers are not required to establish pension plans, but in the 1990s approximately half of private employees were covered by plans. Those private employees not covered and self-employed individuals may establish their own individual pension plans. The largest retirement plan, the U.S. government's Social Security system, provides retirement benefits to approximately 95 percent of U.S. workers when they retire. Enacted into law in 1935, the Social Security system requires both employees and employers to pay a percentage of salaries to social security through the Federal Insurance Contribution Act (FICA) payroll taxes.

In addition to Social Security, federal government pension plans include federal civilian retirement systems, military pensions, and railroad pensions. Federal government employees are covered under the Civil Service Retirement System (CSRS) if hired before January 1, 1984 and under the Federal Employee's Retirement System (FERS) if hired after that date. Both CSRS and FERS are funded by automatic payroll deductions from the employees and by contributions made by the particular federal agency for which the employee works. Many Americans are eligible for benefits based on their active military service. The first military pension was granted for the War of 1812 (1812–1814). The Veterans Administration administers the veterans pensions. Railroad pensions provide benefits for railroad workers. Although a private industry pension, a government agency, the Railroad Retirement Board, manages the funds.

Private pensions can be basically considered in two categories: defined benefit plans where an employee receives a definite pre-determined amount of money at retirement or if disabled; and, defined contribution plans where the employer pays a certain amount into the fund in certain time increments but does not guarantee any particular pension amount upon retirement. Examples of private programs include trust-fund plans, annuity plans, profit sharing plans, and thrift or savings plans including a 401(k) plan. Individual pension plans include individual retirement accounts (IRAs) and Keogh plans.

PER CAPITA INCOME

Per capita income is calculated by taking the total income, mostly wages, of a group of individuals, often a nation or a population of a specific geographic area, and dividing it by the number of individuals in the group. The resulting number is the per capita income, or income per person. Per capita income does not account for the uneven distribution of income, or wealth, among the individuals in the group. Per capita income is also usually stated in monetary units that do not reflect the effects of inflation or deflation. Per capita income can, however, be adjusted to account for changes in purchasing power and prices during a specific period of time. The adjusted per capita income is referred to as per capita real income.

PERKINS, FRANCES

Frances Perkins (1882–1963) changed her baptismal name from Fannie to Frances at the age of 25, as part of her religious conversion from Congregational to Episcopalian. Ms. Perkins also changed many other things during her 60-year long career as a social activist, social worker, social reformer, and feminist. Frances Perkins was best known for her appointment as the first female Cabinet officer in the United States government.

Frances Perkins was born in 1882, in Boston, Massachusetts, the eldest of two daughters born to Frederick and Susan Perkins, who were members of an old Maine farming family. She attended Mt. Holyoke College, where she studied physics and chemistry, subjects unusual for a girl in her day. While at Mt. Holyoke, Perkins was inspired by Florence Kelly, secretary of the National Consumers' League. Kelly was an advocate for the elimination of child labor and sweatshops (small businesses that crowded people into miserable working conditions for six or seven days a week, 12 to 16 hours a day). These conditions were quite common as the nation industrialized through the end of the nineteenth and into the twentieth century. Through Florence Kelly, Frances Perkins found her calling, and she devoted herself to a lifelong mission to help the poor and needy of the United States, especially children, women, and immigrants.

In 1905 Perkins joined the resident staff of what was to become a very famous and pioneering settlement house in Chicago, Illinois, known as the Hull House. Working there, she saw the affects of poverty and its daily issues firsthand. Though there was satisfaction to be had in providing direct services to the

Frances Perkins.

poor, Perkins began to understand that until certain laws were changed or created in the United States, no real change in the circumstances of the poor would be possible.

In Philadelphia in 1907 Perkins became a professional social worker. She began to advocate local legislation to stop the exploitation of young immigrant women and African Americans who had recently moved North from the former slave states of the South. She took courses in sociology and economics, and her social consciousness brought her closely in line with existing socialist thought of the time. She earned a degree in political science and moved to New York, where, in 1910 at the age of 30, she was offered the job of secretary of the New York City Consumers' League. As secretary she focused on changing laws to improve sanitary conditions in businesses, creating legislation for fire prevention in factories, and passing a 54-hour-week maximum labor law that would limit work hours of women and children under the age of eighteen. In 1918 she became a leader in the U.S. women's suffrage movement.

Perkins successfully supported many New York laws that regulated business practices with respect to the abuses of the workforce. She developed many political contacts in New York, and she took on various social and legislative projects on behalf of women and

children. Among her contacts was the governor of New York, Franklin D. Roosevelt (1882–1945), who later became President of the United States in 1933. Roosevelt was impressed with Perkins' skills and after his election to the presidency (1933–1945), he appointed her to his Cabinet as his Secretary of Labor. Frances Perkins became the first female member of a presidential Cabinet in U.S. history.

The pressure she felt to succeed at this post was immense. Many labor and business leaders were outraged at her appointment. Despite enormous pressures and controversy, she re-organized the Department of Labor during the Great Depression (1929–1939) and restored the integrity of the Bureau of Immigration and Naturalization, which was then considered to be an agency of bribe taking and illegal deportations. She also became an important advisor to President Roosevelt, and she brought in many important members to Roosevelt's administration. Her sympathies for the unemployed during the Depression and her efforts to support organized labor gained her the reputation as a communist sympathizer, though she clearly distrusted the Communist Party in the United States.

Perkins survived an unsuccessful impeachment attempt in 1938, when the House Un-American Activities Committee (HUAC) accused her of being a communist. She remained in government service until 1953, when she retired. The legacy of her work was enormous, not only as a lifelong political and social activist on behalf of women and children, but as a pioneer in social legislation. The pioneering role she undertook as a woman made her arguably one of the most revered feminist role models in the twentieth century, alongside Eleanor Roosevelt; much of her work led to massive federal programs, including the Social Security program.

After her retirement, Perkins spent the rest of her life as a college lecturer, encouraging others to enter the work of social activism. She became a visiting professor at Cornell University, a post she held until her death in 1965, at age 85.

PERRY, MATTHEW CALBRAITH

Matthew C. Perry's (1794–1858) primary occupation was that of a naval officer, yet he is perhaps best remembered as a diplomat entrusted by the U.S. government to negotiate a treaty with Japan. Since the early 1600s Japan isolated itself from Western countries. In 1854 Perry successfully arranged a treaty between Japan and the United States. The treaty provided the United States with two Japanese sea ports, enabling the two countries could begin to engage in commercial trade with one another. This was Japan's first modern treaty with a Western nation. It marked the beginning of Japan's involvement in world affairs.

Born in 1794, Matthew Perry entered the Navy at age 16, serving as a midshipman. His first duty was aboard a vessel commanded by his older brother, Oliver Perry. His career in the Navy led him into combat during the War of 1812 (1812–1814); he later battled pirates in the West Indies, carried freed slaves to the newly founded African colony of Liberia, and transported American minister John Randolph to Russia. It was in Russia that Perry was offered a captain's position with the czarist government, but he firmly declined, preferring his commission with the U.S. Navy as a Master Commandant.

In 1833 Perry was appointed Second Officer of the New York Navy Yard, and began notable service on shore. Residing in New York City, he began to aggressively pursue his ideas for naval development. He created a naval apprentice system, which was adopted by Congress in 1837. In 1845 Perry and other examiners prepared the first course of instruction for the Naval Academy at Annapolis, Maryland. He went on to advocate and pioneer the use of steam-powered vessels in the Navy. He organized the first Naval Engineer Corps, and his work on the naval board was used by Congress to help enact federal legislation creating federal lighthouses. Beginning in 1843 Perry was once again actively at sea. He first commanded the African Squadron, and later led a squadron of ships in the Gulf of Mexico during the Mexican War (1846–1848).

In January 1852 Perry was selected for a highly important diplomatic mission—the negotiation of a treaty with Japan, a country which had sealed itself against dealings with Western powers since the early 1600s. His main mission in Japan was to ensure the protection of U.S. seamen and property and to open one or more Japanese ports to U.S. vessels for the procurement of supplies and commercial trade. Perry agreed to undertake the mission, provided that he could go to Japan with a large and imposing naval fleet. He hoped the sheer size of the fleet would facilitate negotiations with Japan. Perry was instructed to use any vigorous and intimidating means necessary in his negotiations with the Japanese, though with the understanding that President James Monroe (1817–1825) had no power to declare war in this situation.

In an effort to achieve his goals without resorting to military action, Perry adopted a strategy of surrounding himself and his mission with an air of mystery. His combination of boldness and mystery succeeded. He met with representatives of Japan's emperor and left the country nine days after arriving in 1853, stating he would return one year later to learn Japan's decision. He returned in seven months and, on March 31, 1854, a treaty of peace, friendship, and commerce between Japan and the United States was signed. It was a diplomatic event filled with much pageantry, and several U.S. naval vessels stood offshore.

Federal politics had changed during Perry's absence from the United States, and little notice was paid to his achievement in Japan. The "Old Bruin," as sailors called Perry, died in New York on March 4, 1858, a year after his return from Japan. He died while preparing a report of his expedition.

PERSONAL COMPUTERS

Personal computers (PC) were developed during the 1970s and were intended for use by small businesses and in the home. No established industrial computer company, like IBM, Burroughs, or Honeywell believed in 1975 that there would be any market for a PC. The earliest commercial PCs were credited to the efforts of Stephen Jobs (1955—) and Stephen Wozniak (1950—), who began their own PC company, Apple Computers, in 1976, building a microchip-based computer for small businesses and particularly for home use. These computers represented simplicity of design and function, and they were easily used by non-professionals. By 1977 the personal computer industry moved quickly, with Apple, Commodore, and Radio Shack aggressively entering the “home computer market.”

The PC was made possible largely because of the miniaturization of electronic parts and the ability to reliably mass produce many parts of the computer, such as the silicon chip, the integrated circuit board, and the microprocessor. The personal computer evolved (in the 1960s and 1970s) from large single-function devices like industrial data processors to smaller single-function devices like pocket calculators. With smaller hardware and more diverse software, the PC of the late 1970s became consolidated into desktop sized, multi-function devices. They now provide international communications, word-processing capabilities, as well as the other educational, recreational, and personal functions associated with modern computers in homes and businesses.

PETROLEUM INDUSTRY

Crude oil seeps from the earth’s crevices and fissures, and accumulates in pools on surface rocks; it has been used as a fuel source since approximately 3500 B.C. In the early nineteenth century, crude oil was collected from rock pools and primitively refined for commercial use. Dr. Abraham Gesner of Pittsburgh, inventor of kerosene lamp oil, formed the Pennsylvania Rock Oil Company in 1854. In 1859 Edwin Drake and W.A. Smith drilled the first U.S. well, specifically

to find petroleum, in Titusville, (Oil Creek) Pennsylvania. Because crude oil was unsuitable for direct use, it had to be refined and converted into such products as kerosene, gasoline, and motor oil. In 1860 D.S. Stombs and Julius Brace of Virginia introduced and patented a semi-continuous refining system. In 1861 the first full-fledged petroleum refinery in the United States opened; it churned out mostly kerosene.

The legendary oil tycoon, John D. Rockefeller (1839–1937), began oil operations in 1863. Based in Cleveland, Ohio, Rockefeller founded the Standard Oil Company on June 10, 1870. Skillfully using the laws of incorporation and assembling trusts, Rockefeller eventually acquired competing companies across the country and established a very effective monopoly. By 1879 the 30 companies that belonged to the Standard Oil trust controlled 80 percent of the refineries and 90 percent of the pipelines in the U.S. petroleum industry. This giant trust leveraged its clout with the railroads to negotiate favorable freight rates.

Rockefeller was the biggest, but not the only, oil entrepreneur. In 1897 Joseph S. Cullinan organized the first pipeline and refinery in Corsicana in Texas. Cullinan also successfully pioneered the use of petroleum as a diesel fuel for locomotives and as a dust settler for streets.

The main reason for increased public demand for petroleum was the proliferation of the gasoline-powered automobile, various renditions of which sprang up in the late nineteenth century. Machinist and inventor Henry Ford employed assembly line techniques to lower the cost of each unit of production, making automobiles available to more consumers, and thus increasing the demand for gasoline.

Advancements in technology during World War I (1914–1918) escalated demand for petroleum. Farmers were able to increase productivity with gas powered tractors; new asphalt highways carried diesel-powered trucks delivering goods across the nation. New products derived from refined petroleum included plastics, synthetic fiber and rubber. Increasing demand for new products promoted a steadily increasing supply of new crude oil.

By 1992 the Chevron Oil Company was the largest petroleum refiner in the United States and was a huge producer of oil in terms of profits and sales. Chevron began in 1882 as Standard Oil of California, and quickly developed internationally. The second largest capacity refiner in the United States was Exxon Corporatoin. Exxon came about through the 1934 merger of Standard Oil Company of New Jersey and the Anglo American Oil Company Ltd. Exxon grew

remarkably throughout the twentieth century. By 1993 it was the industry leader with profits totaling \$5.28 billion. Profits of the Mobile Corporation ranked second at \$2.08 billion from sales of \$56.6 billion. Other industry leaders included Texaco Inc., Shell Oil Co., Chevron Corp., Atlantic Richfield Co., Conoco Inc., Amoco Corp., and BP America Inc.

Since the early 1950s natural gas was the refineries' largest end-product. Residential and commercial users consumed the largest proportion of natural gas. Industry consumed the next largest amount with power generation a distant third in natural gas consumption. (Food, paper, chemical, and petroleum refining industries all consume vast amounts of natural gas.)

In 1997 U.S. refineries produced an average of 14.63 million barrels of refined petroleum products each day. The United States supplied over one-fifth of the world's refined petroleum—roughly equal to the production of all the European countries combined. The U.S. refineries employed approximately 93,000 people in 1998.

During the first four decades of the twentieth century, the heyday of internal combustion in the United States, U.S. oil reserves were gradually depleted. Accordingly the oil industry became among the first to undergo "globalization." The Standard Oil Company anticipated this development back in 1888 when it established its first foreign affiliate, the Anglo American Oil Company Limited, headquartered in London. Although U.S. and European companies continued to reap most of the profits of petroleum production, by the mid-1950s much of the world's petroleum was being pumped in a small group of oil-producing countries, most of them in the Persian Gulf. In an effort to gain control of its petroleum reserves, these countries founded the Organization of Petroleum Exporting Countries (OPEC) in 1960. OPEC set a standard cost for producing a barrel of oil in all member countries. The minimum price per barrel was based on the tax-paid cost per barrel plus a profit margin. New petroleum companies could not undermine OPEC's dominant market by offering lower prices. In OPEC's early years, other petroleum producing countries used the organization more as a defensive instrument to stabilize the market. But plagued with oil shortages and political disruptions in the Middle East during the 1970s, non-OPEC refineries and suppliers began to rely more heavily on their own private inventories.

Beginning in the 1970s, many developments led to a sharp decline in world demand for OPEC oil. Several major factors, including environmental concerns, brought about changes; most changes were not in

OPEC's favor. Revolutionary innovations in the oil industry drastically reduced the risk and expense of finding and developing oil and expanded output among non-OPEC producers. For example major U.S. oil companies owned and operated exploration and drilling sites around the world. Exploration, production, and transportation of petroleum in the United States was handled by private companies under the regulation of federal, state, and local commissions. Strategies such as this helped to boost the world's oil supplies at the expense of OPEC's market share. By the 1980s OPEC was a shadow of its former self.

Refining and production of oil and gas has become an exacting engineering science. The United States was a pioneer in petroleum refining, exploration, and perfected most techniques and procedures before other nations. U.S. petroleum refiners have been regarded as the world leaders. However, it remains to be seen as to whether shifting political boundaries will allow U.S. refiners to compete directly with foreign companies for a larger market share.

PHARMACEUTICAL INDUSTRY

The pharmaceutical industry in the United States dates back to the early 1800s. Opium was routinely prescribed in the United States as far back as the eighteenth century; however, concoctions known as "patent medicines" did not make an appearance until the nineteenth century. Patent medicines became very popular; they bore names such as "Carter's Little Liver

Pharmaceutical Industry

Pills.” During this time many pharmaceutical companies were founded in the Midwest, including Parke Davis, Eli Lilly, and Upjohn Company.

As the industry developed, New York City was an important center of trade in drugs; Philadelphia also emerged as a home for about six pharmaceutical manufacturers. Pharmacy schools, which began to open in several states between 1821 to 1859, probably contributed to the growth of the pharmaceuticals industry. (The *American Journal of Pharmacy* began publication in 1825.) Another probable factor in the growth of the industry was the prodigious amount of drugs used during the American Civil War (1861–1865). By 1870 there were almost 300 pharmaceutical manufacturers in existence.

During the early nineteenth century, several new drugs quickly came into common use. Some of these were opiates, which were later greatly restricted during the twentieth century. Morphine was first commercially produced in the 1830s. After the invention of the hypodermic needle in the 1860s, morphine use became more widespread as it could be easily injected into the patient. Another (subsequently) restricted drug, cocaine, was first commercially produced in the 1880s. When it was first introduced, it became very popular—physicians thought that it was harmless. (Until it was found to be addictive, cocaine was even used as an ingredient in the soft drink Coca-Cola.) In 1898, another opiate, heroin, was commercially available from the Bayer Company.

The dangers of opiates were not acknowledged until the 1900s, in part because there were no laws regulating the drug industry until the 1870s and 1880s. The Pure Food and Drug Act of 1906, the Shanghai Opium Convention of 1909, The Hague Opium Treaty, and the Harrison Narcotic Act (both in 1912) were all early attempts by the U.S. government to regulate drug manufacturing and distribution.

Several advancements in drug production were developed during the late nineteenth century which furthered development of the industry. Pharmaceutical manufacturers attempted to standardize batches of medicines between the various companies. In 1888 another improvement came in the form of a machine that produced pills of uniform dose and purity. Later, during the early twentieth century over-the-counter drugs were developed and marketed. Products, such as aspirin and laxatives, greatly increased the availability of medicines to the general public.

Following World War I (1914–1918) demand influenced the rapid commercial expansion of the

pharmaceuticals industry. The number of chain drug-stores increased during the 1920s and, as the industry grew, it consolidated; several drug companies merged. By the 1930s, market research became important in the industry; consumers wanted new medicines that could help two or more symptoms at a time. Sulfa drugs, designed to fight bacteria, were also developed during this period and became the choice for treatment of infections until the mid-1940s, when penicillin was commercially developed and marketed.

In 1937 over 100 Americans were killed when treated with a drug that had a toxic solvent in it. This resulted in stricter governmental regulations to improve drug testing. Changes included passing the Food, Drug, and Cosmetic Act of 1938, which was enforced by the Food and Drug Administration (FDA).

World War II (1939–1945) caused an upsurge in demand for the new antibiotic drug, penicillin, which was first marketed in 1946. (The major producer of penicillin was the Pfizer Company.) New medicines continued to appear after the war. Almost 500 new drugs entered the market between 1950 and 1959. With this expansion came advanced marketing tactics—pharmaceutical companies began to advertise drugs on television. As the pharmaceutical market grew, so increased the level of government regulation. In the 1950s and 1960s several new FDA laws were passed to further regulate the testing, certification, and prescription of drugs.

In the mid-1980s, the FDA was reorganized due to allegations of deficient practices. One issue examined by the reorganized FDA was the use of generic drugs, which, according to “The American Druggist,” accounted for almost 45 percent of all prescriptions by the mid-1990s.

In the 1990s the pharmaceutical industry focused on the research and development of new drugs, especially drugs for treating diseases common to an elderly population, as well as cancer and AIDS. Biotechnology began to make an impact in the drug industry, as companies such as Amgen, Inc., and Chiron Corporation were founded. Competition resulted in the merging, restructuring, and downsizing of many pharmaceutical companies.

PHILIPPINES

An archipelago (island chain) consisting of some 7100 islands in southeast Asia, the Philippines became a territory of the United States by the Treaty of Paris (1898). Signed on December 10, the agreement ended the Spanish-American War (1898), which marked a determined U.S. interest in participating more fully in international affairs. One issue during the war was the matter of an independent Cuba. The peace treaty signed between Spain and the United States provided for Cuba's autonomy and granted the United States control of Puerto Rico, Guam, and the Philippine Islands. Spain surrendered the last vestiges of its colonial empire; in exchange, the European country received \$20 million in payment from the United States.

U.S. imperialists viewed the Philippines as "stepping stones" to mainland Asia, and they stressed the islands' strategic importance for the United States. Anti-imperialists argued that the annexation constituted the conquering of people against their will. While Americans debated the motives and the outcome of the expansion, soon after the Treaty of Paris was signed, the Philippines were embroiled in conflict. Filipinos, determined to achieve independence, revolted in an uprising lasting from 1899 to 1901. A civil government was established on the islands in 1901, and in November 1935, the Commonwealth of the Philippines was officially established. The islands, however, continued to be the site of conflict in the following decade.

The United States struggled with Japan for control of the Philippines during World War II (1939–1945). Under General Douglas MacArthur (1880–1964), the United States established practical control of the islands during the last days of the war (July 1945). After the Japanese surrender, an independent government was established in the Philippines (July 1946), but the United States was granted a ninety-nine year lease of

several Philippine military facilities. In the 1980s political upheaval in the island nation resulted in the revocation of the military leases. The United States withdrew its troops from the Philippines in the 1990s.

PHYSICAL CAPITAL

Physical capital consists of man-made tangible assets, such as factories, buildings, machinery and equipment, that are used to actually convert raw materials into usable products for consumer purchase. Physical capital is considered to be secondary to primary resources such as money, raw materials, and land. Since it is used to produce goods or services over time, the wear and tear on physical capital makes it subject to depreciation, or loss of value, and requires replacement periodically. The more physical capital a nation or company possesses, the greater its capacity to produce goods or services. Physical capital may also be referred to as capital goods.

PICKENS, THOMAS BOONE, JR.

One of the best known and most skillful deal makers ever to emerge on the American scene, T. Boone Pickens (1928–) rose to prominence during the 1980s as one of the decade's premier corporate raiders. Colorful and outspoken, he combined uncanny business skill with the daring of a gambler as he launched one takeover attempt after another and shook up the oil industry in the process.

Thomas Boone Pickens, Jr., was born in the small town of Holdenville, Oklahoma on May 22, 1928. He was the only child of Thomas Boone Pickens, Sr., a distant relative of frontiersman Daniel Boone, and Gracee (Molonson) Pickens. Pickens' father was an attorney employed in the land acquisitions department of Phillips Petroleum Company when his son was born. "I was very fortunate in my gene (genetic) mix," T. Boone noted in a 1985 *Time* magazine interview. "The gambling instincts I inherited from my father were matched by my mother's gift for analysis."

Around the mid 1940s, the family moved to Amarillo, Texas, where Pickens excelled in basketball at Amarillo High School. He then attended Texas A&M University on an athletic scholarship but transferred to Oklahoma State University after a broken

elbow caused him to lose his financial support. Pickens received his bachelor's degree in geology from Oklahoma State in 1951 and subsequently went to work in the petroleum industry.

Not long after he earned his college degree, Pickens took a job as an oil geologist for Phillips Petroleum. He left in 1955 however, because he found the work boring and felt stifled by the company's conservative style. Pickens then started his own company, Petroleum Exploration Co., with \$2500 in cash, a \$100,000 line of credit, and "an uncanny ability to find oil and gas," in the words of reporter Lydia Chavez of the *New York Times*.

Pickens focused his efforts on locating oil and supplying it to others. He managed to do this while avoiding the temptation to become involved with often-costly sideline businesses such as pipelines, refineries, and service stations. By 1964 he had become successful enough to diversify some of his operations and incorporate. Thus was born Mesa Corporation, Inc., with headquarters in Amarillo, Texas.

By 1969 profits had reached the point where Pickens could afford to start buying out other companies. His first acquisition was Hugoton Production Co. and its vast natural gas field in Texas. The following year he was rebuffed when he made a bid to take over Southland Royalty. In 1973 however, he added Pubco Petroleum to Mesa's holdings. In 1974 an ill-fated attempt to diversify into cattle cost him \$19 million.

Pickens fared much better during the 1980s thanks to a combination of his astute business skills, his love of gambling, and sheer luck. Using a variety of techniques, including some that were not entirely above-board, he managed to accumulate a massive amount of cash by selling off some of his assets at just the right time and by buying and trading stock in other petroleum companies in a series of hostile takeover bids. Pickens also profited handsomely from the booming oil market during this decade. His shrewd deal-making netted him the Wall Street Transcripts "gold award" for the top executive in the oil industry in both 1981 and 1982.

Pickens' specialty was "greenmailing," which involved buying huge blocks of a company's stock as if preparing for a takeover, then selling them back at an inflated price so that the company can thwart the apparent buyout attempt. He first used this strategy in May 1982, when he tried to buy a controlling interest in a medium-sized oil firm called Cities Service Company. His efforts touched off a fierce bidding war among several oil industry rivals that drove up the company's stock price. Occidental Petroleum ultimately made the

best purchase offer for Cities Service Company, but Pickens and Mesa shareholders still won big. By losing the bidding war, Pickens had strategically positioned Mesa to realize over \$31 million in profit on the merger deal.

**PICKENS SUPPORTED THE THEN-
REVOLUTIONARY VIEW THAT A CEO'S
MAJOR RESPONSIBILITY WAS TO CREATE
WEALTH FOR HIS SHAREHOLDERS AND THAT
THE FAILURE TO DO SO MIGHT WELL
RESULT IN THE LOSS OF HIS OR HER JOB.**

From that moment on, Pickens became a so-called "corporate raider," pursuing what many believed were authentic bids to assume control of large oil companies, especially ones that he felt were being mismanaged and therefore less able to fight off a takeover. Time and again, he lost bidding wars only to win at the stock manipulation game. In 1984 for example, after a highly competitive struggle involving some of the oil industry's biggest names, Gulf Oil finally allowed itself to be purchased by Standard Oil Company of California to avoid being taken over by Pickens. The transaction resulted in the creation of a new oil company, Chevron; and Pickens and his partners walked away with a profit of \$760 million.

In the mid-1980s, Pickens was reported to be the highest paid corporate executive in the United States, earning more than \$20 million in salary and deferred compensations that year from his newly renamed Mesa Limited Partnership, Inc. His personal wealth was estimated at over \$100 million.

Pickens' reign as the "king of the corporate raiders" was short-lived. In 1985 he went after Unocal Corporation, which responded by offering a unique stock buy-back plan that was open to all shareholders except Pickens and his Mesa partners. Pickens sued in the Delaware courts to block the plan and received a favorable ruling. Then the Delaware Supreme Court reversed the lower court's decision and ruled that a company did indeed have the right to single out corporate raiders and treat them differently than other shareholders. Even though this decision was eventually overturned by the Securities and Exchange Commission, it marked the beginning of the end of Pickens' career.

In 1989 after becoming embroiled in a series of nasty political squabbles in Amarillo, Pickens moved Mesa's headquarters to Dallas. His fortunes took a sustained tumble. The biggest blow came in 1996 when Pickens was forced to resign as head of Mesa after running up one billion dollars in debt, a result of overly

generous payments to his shareholders. Pickens had bet that the price of natural gas would rise and bail his company out. But for once his gamble did not pay off, and Mesa suddenly found itself the target of raiders organized by a former Pickens protégé named David Batchelder. Pickens officially stepped down as head of Mesa on December 31, 1996, but stayed on as a commodity market consultant for the company until late 1997 and then served as a member of the board of directors.

Pickens provided considerable time and money through the years to Oklahoma State University, the University of Texas Cancer Center, and a variety of public service organizations. He also served as chairman of the board of the M.D. Anderson Medical Center in Houston, Texas, as chairman of the executive committee of the Texas Research League, and as chairman of the board of regents of West Texas State University.

A key part of Pickens' strategy during the 1980s was his vocal, and often quite colorful, criticism of the U.S. corporate system. He found many of the CEOs and managers he came in contact with to be greedy, careless, and ignorant about important aspects of their companies or their industries in general. He denounced the cushy perks these executives received and questioned their real value to the companies they headed. Instead Pickens supported the then-revolutionary view that a CEO's major responsibility is to create wealth for his shareholders and that the failure to do so might well result in the loss of his or her job. It also infuriated him that a number of corporate leaders did not even own stock in the businesses they ran, meaning that they had little incentive to improve performance and thus increase stock values. And even those who did own stock in their companies, noted Pickens in a 1985 *Forbes* magazine article, "have no more feeling for the average stockholder than they do for baboons in Africa."

Such outspoken corporate-bashing made Pickens a hero to those "average stockholders." They applauded his efforts to shed light on inept management practices and were thrilled by the hefty returns they received on their investments as a result of his raids. In the end, Pickens opened more than a few eyes to the flaws in U.S. corporate culture and in no small way changed the way business was done in the United States.

PIECES OF EIGHT

Pieces of eight were Spanish silver coins (pesos) that circulated along with other hard currency in the American colonies. Since the settlements in the New World were all possessions of their mother countries (England, Spain, France, Portugal, and the Netherlands), they did not have monetary systems of their own. England forbade its American colonies to issue money. Colonists used whatever foreign currency they could get their hands on. Pieces of eight (from Spain), reals (from Spain and Portugal), and shillings (from England) were in circulation; the pieces of eight were most common. The Spanish silver coin was so named because it was worth eight reals and at one time had an eight stamped on it. To make change, the coin was cut up to resemble pieces of a pie. Two pieces, or "two bits," of the silver coin made up a quarter, which is why Americans still may refer to a quarter (of a dollar) as two bits.

In 1652 the Massachusetts Bay Company became the first colony to mint its own coins, since because of the English Civil War there was no monarch on the throne of England. The issue of coinage by colonists was strictly prohibited by England, but the Puritans of Massachusetts continued to make their own coins for some thirty years thereafter, stamping the year 1652 on them as a way to circumvent the law.

There were frequent money shortages in the colonies, which usually ran a trade deficit with Europe: the colonies supplied raw goods to Europe, but finished goods, including manufactured items were mostly imported, resulting in an imbalance of trade. Coinage scarce, most colonists conducted trade as barter, exchanging goods and services for the same. The monetary situation on the North American mainland remained tenuous even after the American Revolution (1775–1783). It was not stabilized until after 1785 when Congress established the dollar as the official currency of the new United States.

PIKE'S EXPEDITION

Zebulon Pike (1779–1813) was born in Lambertton, New Jersey in January 1779. He followed his father, a U.S. Army major of the same name, into a military career. The younger Pike was commissioned first lieutenant in 1799. While he was serving on the western frontier in St. Louis, President Thomas Jefferson (1801–1809) completed the Louisiana Purchase with France. The acquisition added 828,000 square miles of land lying between the Mississippi River and the Rocky Mountains, northward to the source of the river. The United States needed to explore and assert legal claim to the newly gained lands as well as to establish friendly relations with the Native American tribes in the region. General James Wilkinson selected Pike to lead an exploratory expedition in search of the Mississippi River's source in the northern part of the Purchase area. (Wilkinson may have also intended to test British reactions to a U.S. military exploration venturing into traditional fur-trapping country.)

Pike assembled a 20-man party and departed northward from St. Louis in early August 1805. At this time, the famous Lewis and Clark Expedition had followed the Missouri River to its source and was crossing the northern Rocky Mountains en route to winter at the mouth of the Columbia River. When winter arrived, the Pike party had journeyed as far as 100 miles north of the Falls of St. Anthony in present-day Minnesota. Taking a smaller party and hauling supplies on sleds, Pike continued onward to Lake Leech, which he mistakenly proclaimed the source of the Mississippi River.

Upon the party's return to St. Louis, Pike received orders from Wilkinson for another venture. This time, Wilkinson requested that Pike explore the headwaters of the Arkansas and Red rivers in the southwest corner of the Louisiana Purchase area and, curiously, to inconspicuously assess Spain's New Mexico settlements. Relations at the time between the United States and Spain were not good and, in the historical record, the purposes of Pike's orders were unclear, especially when it became known that Wilkinson was a secret agent for Spain.

Pike's expedition set out westward in April 1806, to the Arkansas River in modern central Colorado. Apparently, word of Pike's "secret" mission reached the Spanish headquarters for the northern provinces of New Spain in Chihuahua, Mexico. A Spanish military force was dispatched to intercept Pike. Meanwhile, Pike reached the present-day area of Pueblo, Colorado. En route in November 1806, he attempted to ascend a summit located in the Front Range of the Rocky Mountains near modern Colorado Springs, what later

(Pike) was completely lost among the great tossing peaks of the Colorado Rockies, some of the highest mountains on earth, lost in the middle of winter, half-starved, frozen, and admittedly "at a loss which course to pursue" . . . Going in a circular route, they passed through South Park, where a few years later the great rendezvous of the fur traders and mountain men would be held.

John Upton Terrell, *Zebulon Pike; the Life and Times of an Adventurer*, 1968

became known as Pike's Peak. He had to turn back, however, as his party was not prepared for the snow and cold weather on the 14,110 foot peak.

After exploring the Arkansas River's headwaters in the Rocky Mountains, Pike then turned south, supposedly to find the Red River's source. However, he crossed the Sangre de Cristo Mountains to the Rio Grande River's Conejos fork, where he constructed a cottonwood log outpost. At that location a Spanish detachment finally found him. The Spaniards requested Pike and his men accompany them to Santa Fe. Pike, claiming he meant to be on the Red River, departed as requested, and wound up in Chihuahua as a prisoner charged with illegal entry into Spanish territory. A year later the Spaniards escorted Pike and his party back northward to the United States territory at Natchitoches, Louisiana, where he was released in July 1807.

After his return Pike was dispatched to the Secretary of War to answer for his actions and his relationship to Wilkinson. Wilkinson, along with Aaron Burr (1756–1836), was accused of plotting to illegally seize the Southwest from Spain. Absolved of wrongdoing, Pike resumed his military career. With the outbreak of the War of 1812 (1812–1814) Pike, who had a series of promotions after 1808, was promoted to brigadier general. In 1813 he led U.S. troops in a successful attack against the British on York (now Toronto) in Canada. Pike was gravely wounded when a British powder magazine exploded, instantly killing over 90 soldiers from both sides and wounding 180. Pike sustained a broken spine and died a few hours later from wounds.

Pike's official expeditions report, *Account of Expeditions to the Sources of the Mississippi and through the Western Parts of Louisiana*, provided the first description of the broad region lying between the Plains and the upper Rio Grande River region. Though his expeditions charted new expanses of the United

Pike's Peak, part of the Rocky Mountain range near Colorado Springs, was named for Zebulon Pike, who unsuccessfully attempted an ascent of the 14,110 foot summit in 1806.

States—the expeditions were some of the first sponsored by the U.S. government—Pike's journals were not of the same caliber of Lewis and Clark's. Regarding the headwaters of the Mississippi, Pike had misidentified the actual source (Lake Itasca), but he did learn much about the upper Mississippi region. Pike reported on the military weakness of Santa Fe, and he commented on the potential for lucrative overland trade with Mexico. The report fanned American curiosity about the expanding western frontier of the young nation and, in part, stimulated future U.S. expansion to Texas.

PILGRIMS

The Pilgrims were Separatists (Protestants who separated from the Anglican Church to set up their own church). In 1609 they fled their home in Scrooby, England, in search of religious freedom, which they found in Holland. Fearing their children would lose contact with English culture, the group decided to voyage to the New World to establish their own community. In 1620 they arrived on the rocky western

shore of Cape Cod Bay, Massachusetts. Their trans-Atlantic crossing had taken 66 days aboard the *Mayflower*. Two babies were born during the passage, bringing the number of settlers to 102—only about 35 were Pilgrims, the rest were merchants.

On November 21 the Pilgrims drafted the Mayflower Compact, an agreement by which the 41 signatories (the men aboard the *Mayflower*) formed a body politic that was authorized to enact and enforce laws. Religious leader John Carver (1576–1621) was voted governor. Though their colonial patent from the London Company specified they were to settle in Virginia, they decided to establish their colony at Cape Cod, well outside the company's jurisdiction. By December 25 the Pilgrims had chosen the site for their settlement and began building at New Plymouth.

The first year was difficult and the Pilgrims faced many hardships: Thirty-five more colonists arrived aboard the *Fortune*, and thereby put a strain on already limited resources. Sicknesses such as pneumonia, tuberculosis, and scurvy claimed many lives, including that of Governor Carver; and the merchants in the group challenged the purity of the settlement.

Having secured a new patent from the Council of New England in June 1621, the lands of the New Plymouth Colony were held in common by both the Pilgrims and the merchants. But this communal system of agriculture proved unsuccessful and in 1624, William Bradford (1590–1657), who had succeeded Carver as governor, granted each family its own parcel of land. The Wampanoag Indians, who had previously occupied the land settled by the Pilgrims, proved friendly and were helpful advisers in agricultural matters. In 1626 the Pilgrims bought the merchants' shares, and claimed the colony for themselves. Though they were inexperienced at government before arriving in America and had not been formally educated, the Pilgrims successfully governed themselves according to their religious beliefs; Plymouth Colony remained independent until 1691, when it became part of the Massachusetts Bay Colony.

PINCHOT, GIFFORD

Gifford Pinchot (1865–1946), first head of the U.S. Forest Service, was a pioneer in forest management. He promoted forest conservation as an effective

way to provide a steady source of timber. Pinchot was a close advisor to fellow conservationist President Theodore Roosevelt (1901–1909), and he twice served as governor of Pennsylvania. Pinchot's zeal for conservation earned him loyal friends and bitter enemies. His legacy was the millions of acres of national forests that were preserved as a result of his activism.

Gifford Pinchot was born on August 11, 1865 to an affluent family in Simsbury, Connecticut. His boyhood was divided between his family's vastly wooded Pennsylvania estate and at their stylish home in New York City. He often traveled abroad, but he loved to go camping and to hike wilderness trails. Since there wasn't a U.S. college that taught forestry at that time he formulated his own course of study at Yale to provide him with the background he needed. He graduated from Yale University in 1889, and went on to do postgraduate forestry study in Austria, France, Germany, and Switzerland. In Europe forests were under the management of expert woodsmen; these men were Pinchot's teachers. Pinchot learned that European forests were safeguarded from extinction: lumbering was controlled under strict rules, waste was kept to a minimum, and tremendous precautions were taken to prevent fire and blight.

WANTING A SINGLE, MEMORABLE WORD TO DESCRIBE THE GREAT NEED TO PROTECT EARTH'S RESOURCES, PINCHOT COINED THE TERM "CONSERVATION" IN 1907.

Pinchot returned to the United States with the realization that lumbering needed to be regulated in his own country. A bill was passed in 1891 that allowed the federal government to reserve 13 million wooded acres from lumbering. A year later Pinchot initiated the nation's first organized forestry management program at the Vanderbilt estate in Baltimore, North Carolina. He then became a member of the National Forest Commission and in 1898 Pinchot was appointed the Department of Agriculture's first Chief of Forest Service. He would serve in this position for the next 12 years.

In 1902 Pinchot designed a preservation program for the Philippine Islands. The following year he became a professor of forestry at Yale University, a position he would hold for the next 33 years. Wanting a single, memorable word to describe the great need to protect earth's resources, Pinchot coined the term "conservation" in 1907.

After Pinchot publicly criticized Secretary of the Interior Richard A. Ballinger's policies regarding the

administration of coal lands in Alaska, President William Howard Taft (1909–1913) fired Pinchot for insubordination. The dismissal widened a Republican Party rift between Taft and the party's progressive wing, which was led by Theodore Roosevelt. Two years later, when Roosevelt won the presidency, Pinchot played an important role in Roosevelt's revolutionary conservation program. It was a period that became known as the "golden era of conservation."

Although Pinchot lost the Republican nomination for the Pennsylvania governor's seat in 1914 he eventually served two non-consecutive terms as governor of that state. During his first term (1923–1927) he directed the reorganization of the state government and enforced Prohibition. During his second term (1931–1935) he fought for stricter regulation of public utilities. In 1926 William S. Vare defeated Pinchot in a three-candidate race for Pennsylvania's Republican senate nomination. However, the Senate declined Vare after Pinchot announced that the nomination was "partly bought and partly stolen."

Pinchot remained active in conservation affairs throughout his political career and in 1910 he became president of the National Conservation Association. He served on the Inland Waterways Commission, the Commission on Country Life, the United States Food Administration (1917–1918), and was a member of the Commission for Relief in Belgium (1914–1915). From 1920 to 1922 he was the Pennsylvania Commissioner of Forestry and acted as federal mediator in the anthracite coal strike in 1923. The author of several books on forestry and timber, he also published an autobiography called *Breaking New Ground* (1947), which told of his commitment to conservation. Gifford Pinchot died on October 4, 1946 in New York, New York.

PINCKNEY TREATY

The Pinckney Treaty, officially called the Treaty of San Lorenzo, was signed by the United States and Spain on October 27, 1795, to end a dispute between the two countries over land settlement and Mississippi River trade. The agreement was brokered by American statesman Thomas Pinckney (1750–1828), then U.S. Special Commissioner to Spain. The treaty specified that Spain would recognize the 31st parallel (the northern border of present-day Florida) as the southern boundary of the United States, that Spain would allow American goods to land at New Orleans tax-free for a period of three years (with an option to renew), and that both countries would be allowed to use the Mississippi River freely.

The Pinckney Treaty represented significant gains for the United States during the administration of its first president, George Washington (1789–1797); lingering questions were settled between the two countries which had arisen since the United States won the American Revolution (1775–1783). These disputes had their roots in French concessions of the Louisiana Territory in 1762 and 1763. At that time, the Mississippi River became the western boundary of British colonies in the East and Spanish possessions in the West. When the United States won independence (1783), the Mississippi River became the new nation's western boundary. The Treaty of Paris (1783) granted transport rights along the Mississippi to the United States; but Spain, which had not been party to the treaty, later denied Americans the right to use the water route. Further, during the American Revolution, Spain had claimed—by right of conquest—territory along the Gulf of Mexico and along the eastern shore of the Mississippi, in the present-day states of Alabama, Mississippi, and Tennessee.

As American settlers moved onto Spanish lands, they found themselves in conflict with American Indians who had been incited by the Spanish. Meanwhile, the Spanish also tried gaining the confidence of frontiersmen in the West, who were increasingly dissatisfied with the U.S. federal government. Eventually Spain opened up the Mississippi to American traders in exchange for a 15 percent commission. Pressure thus mounted on Washington's administration to quell the insurgent frontiersmen, settle the boundary disputes, and negotiate free use of the Mississippi. Pinckney was dispatched to Madrid in 1794.

By the time Pinckney arrived to negotiate with Spain on behalf of the United States, in 1795, the diplomatic tides had turned in his favor. Spain's military was so weakened that Pinckney was not forced to

make any concessions in exchange for those yielded by Spain to the United States. The treaty was a substantial victory for the new republic, and greatly contributed to westward settlement.

PINKERTON NATIONAL DETECTIVE AGENCY

In 1842 Allan Pinkerton (1819–1884), a political activist wanted for arrest, fled from Scotland with his bride and set course for the United States. Settling in Chicago, Pinkerton eventually established his own cooerage (the manufacture of barrels and kegs for the storage of beer and wine) in the town of Dundee. In 1847 an event occurred which would change the course of his life. Noticing some suspicious activity on a nearby island, Pinkerton investigated and exposed a gang of counterfeiters. Word spread quickly, and soon Pinkerton found himself employed by local bankers and shopkeepers to help track thieves. This led to his appointment by Kane County as deputy sheriff. In addition, his concern for social justice led him to become involved in the abolitionist movement, helping escaped slaves cross the U.S. border into Canada.

Pinkerton was soon appointed as the first detective in Chicago. A crucial step in the evolution of what became known as Pinkerton Security occurred in the late 1840s. After a rash of thefts in Chicago Post Offices, Pinkerton found himself appointed Special United States Mail Agent. He went undercover and eventually captured one man stealing envelopes. This case made Pinkerton a household name.

THE EYE THAT NEVER SLEEPS

Slogan of the Pinkerton National Detective Agency

Corruption, lack of organization, and the common use of bounty hunters led Pinkerton to realize that existing police forces needed to be augmented. In 1850 he opened Pinkerton's National Detective Agency, described by biographer Frank Horan as "a private police force that could move across local, county, and even state boundaries in the pursuit of criminals." Pinkerton instigated a strict set of rules for his company, stating that it would in no way accept cases involving divorce, public officials, jurors, political parties, or

scandal. A code of ethics for Pinkerton employees was also established, forbidding them from accepting rewards or other gratuities. At its inception the company employed five agents and various support personnel. Each agent was trained in crime-solving techniques, undercover operations, and other areas according to standards set by Pinkerton himself. (Pinkerton's National Detective Agency was the first in the country to hire a female detective—Kate Warne.)

Throughout the 1850s, Pinkerton's prospered and adopted the slogan "The Eye That Never Sleeps." The company soon contained a national database of criminal activity, and by the 1870s Pinkerton's had gathered the largest compilation of mug shots in the world. Branch offices sprung up in every state as Pinkerton expanded the agency's territorial coverage.

During the American Civil War (1861–1865) Pinkerton and his agents infiltrated the Confederate Army in search of conspiracy and espionage plots against the Union. The Pinkerton Agency was even credited with saving President Abraham Lincoln (1861–1865) from assassination prior to his 1865 death—though there remains some question as to whether an assassination plot ever existed in the first place.

The postwar period saw no decrease in crime. In fact, technology inadvertently led to new types of crime as inventions opened new avenues for criminal behavior. With the creation of the telegraph, wiretapping became a serious issue. Bank and train robberies were still committed, but had become much more daring. Butch Cassidy and the Wild Bunch, Frank and Jesse James, and the Younger brothers were among the many notorious outlaws captured by the Pinkerton Agency during this time. It was also during this period that the famous Molly Maguires staged violent demonstrations in an attempt to acquire safer working conditions. The Pinkerton Agency was hired to infiltrate this group. After three years of investigation under extremely dangerous circumstances, enough information had been gathered to convict the group's leaders of arson and murder.

William and Robert Pinkerton took over the agency after the death of Allan Pinkerton in 1884. The agency focused increasingly on property protection and labor disputes. Improved police departments and other private agencies had begun to encroach on Pinkerton's business. William and Robert Pinkerton continued the company's expansion, investigating Mafia activity, unions, robberies, and insurance claims as well as providing protection to various public events. Allan Pinkerton II gained control of the company in

1923. He continued the expansion, with business growing due to the number of bank robberies increasingly facilitated by the automobile. In 1930 Allan Pinkerton II died and Robert Pinkerton II took control of the agency. The passing of the Wagner Act by Congress in 1937 made the investigation of labor activities illegal. To offset this loss of business the Pinkerton Agency focused more on the investigation of gambling, particularly the horse racing circuit.

The 1940s through the 1960s saw a change in focus for the Pinkerton National Detective Agency. The guarding of property became the agency's primary service. This was due in part to the services provided by the agency during World War II (1939–1945): the guarding of war supply plants. In 1965 the company was renamed Pinkerton's Incorporated to reflect this shift away from investigative services. In 1967 Edward J. Bednarz became the first non-family member to become president of the agency.

Pinkerton's was purchased by American Brands in 1983 for \$162 million. Although it was chairperson and CEO Robert McGuire's objective to improve the agency's service and increase revenues, his efforts resulted in a loss of \$11 million in sales by 1987. Part of this loss could be blamed on the competition provided by over 10,000 other security agencies that had sprung up over the years.

Thomas Wathen purchased Pinkerton's from American Brands for \$95 million in 1988. Having had great success with revitalizing an ailing security guard firm, California Plant Protection, his goal was to revitalize Pinkerton's back to its former position as a multi-purpose investigation firm. Wathen actively sought growth for the company through acquisitions. Within two years Pinkerton's Inc. had a combined revenue of \$605 million. Wathen also expanded the agency's reach to other countries, including Canada, Mexico, and Portugal. In 1991, Pinkerton acquired Business Risk International (BRI), a respected investigation, consulting, and business agency. This move brought Pinkerton back into business as a full service security provider. Pinkerton continued to expand throughout the late 1990s, and solidified its position as the world's largest security solutions firm.

PINKHAM, LYDIA ESTES

Lydia Estes Pinkham (1819–1883) was a life-long resident of Lynn, Massachusetts. In 1875 she became a successful businesswoman by marketing a homemade herbal remedy known as *Lydia E. Pinkham's Vegetable Compound*. By spiking a combination of two herbs with a generous dose of alcohol, Lydia Pinkham produced a bottled remedy for women. Promoting it was a cure for "female complaints," she took advantage of the advertising media available to her. Her remedy was an immediate success and one of the earliest products made for female consumers. At the time of her death the business was grossing \$300,000 per year, a large sum for her day. The business continued to thrive, and Pinkham's remedy was purchased by generations of American women.

Lydia was the tenth child in a Quaker family of twelve. Born into middle class circumstances, she graduated from Lynn Academy and became a schoolteacher. Taking after her parents, champions of the anti-slavery movement and other reform, Lydia was a passionate social crusader. As a young student she was involved in the women's suffrage movement and was a member of the Lynn Female Anti-Slavery Society. She never gave up her support for women's right to obtain a medical education.

At one point her family ran into financial problems because of her husband's failed business ventures. Pinkham began to market the homemade herbal remedies for women that she had privately produced for years, several of which were based on Native American lore. One of her remedies was very popular among neighbors, and was in demand. She aggressively labeled her product "A Sure Cure for PROLAPSIS UTERI or Falling of the Womb, and all FEMALE

Lydia Pinkham.

WEAKNESSES, including Leucorrhoea, Painful Menstruation, Inflammation, and Ulceration of the Womb, Irregularities, Floodings, etc.” Her product was patented in 1876, and included false unicorn root, true unicorn root, life root, black cohosh, pleurisy root, and alcohol. By the 1890s it was the most widely advertised over-the-counter patent medicine in America.

Pinkham was an ardent believer in the powers of her remedy and made many promises to her customers in her advertising. She marketed directly to women because she believed only women could understand female health problems.

Pinkham’s desire to become a businesswoman involved more than just the need to make money for supporting her family. She also hoped to reform medicine and reduce the needless suffering she felt male doctors often caused their female patients. Pinkham believed her remedy, in addition to diet and exercise, was an effective alternative to medical treatment.

Focusing on women’s needs and pursuing a massive advertising campaign including church newspapers, the front pages of commercial newspapers, leafleting in theaters and parks, and a smiling picture of

the maternal Pinkham on every label, Lydia Pinkham marketed one of the most successful women’s products ever created. She became one of the first role models for American businesswomen—she was successful, she embraced the model of motherhood, and she showed how social reform and business could work successfully together. Lydia Pinkham died in 1883.

PIRACY

At the end of the twentieth century the term piracy held two distinct meanings. The first, the more historical meaning, refers to acts of plundering on the high seas. The second, the more modern meaning, refers to the theft of intellectual property, specifically copyright infringements against producers of computer software and entertainment programs such as music CDs, movie videocassettes, and books.

Piracy on the high seas were acts committed by criminals against a shipping vessel, including hijacking the ship, stealing its cargo, or taking violent action against the crew. Acts of piracy along the U.S. Atlantic and Gulf coasts were prevalent from the seventeenth century into the nineteenth century. The U.S. Constitution made piracy a crime in Article 1, Section 8, and Congress in 1790 first enacted an anti-piracy law. The act banned murder and robbery at sea under the threat of the death penalty. Acts of piracy against U.S. ships off the coasts of Britain and continental Europe from 1803 to 1812 was a major factor leading to the War of 1812 (1812–1814). Piracy legislation from 1818 to 1847 laid the framework for modern anti-piracy law

found predominantly in Title 18, Chapter 18, of the U.S. legal code. Twentieth-century international cooperation shaped unique jurisdictional agreement allowing pirates to be apprehended on the oceans by the officials of any nation and punished under that nation's law.

The second meaning of piracy is copyright violations, both in the United States and abroad. The Copyright Act of 1976 gives to the author the exclusive right to reproduce, display, distribute, and sell his original work. The International Intellectual Property Alliance's annual review of illegal copying of works estimated U.S. losses due to copyright piracy totaled approximately \$12 billion in 1998. Computer software businesses suffered the highest loss. The People's Republic of China was a major offender. The Business Software Alliance and the Software and Information Industry Association estimated 40 percent of business applications in use worldwide in 1997 were pirated.

The growth of computer network communications, especially the global Internet, made illegal copying of expensive software easy and nearly untraceable. The Software Publishers Association, from its offices in Washington, D.C. and Paris, France, fights copyright infringement. Also, to combat such piracy, the 1990s saw increased international cooperation through meetings, diplomatic initiatives, and treaties.

PITTSBURGH PLATE GLASS COMPANY

In 1883 Captain John B. Ford and John Pitcairn created the Pittsburgh Plate Glass Company (PPG), which became the first financially successful U.S. plate glass manufacturer. Originally located in Creighton, Pennsylvania, northeast of Pittsburgh, the company moved its headquarters to Pittsburgh in 1895. Prior to the 1880s more than a dozen plate glass makers had tried unsuccessfully to compete with their European counterparts. Despite U.S. technical ability in the field, plate glass for growing U.S. cities continued to be imported from Belgium, England, France, and Germany.

Ford left the company in 1896, leaving Pitcairn firmly in control. PPG began diversifying around the turn of the century with the construction of a plant in Barberton, Ohio, that produced soda ash, a major raw material used in making glass. This endeavor formed

the foundation for the company's chemicals business. In 1900 PPG acquired a Milwaukee paint company that became the foundation of its coatings business. Because paints were distributed through the same channels as glass, they were a logical extension for the company. PPG also diversified into the production of window glass through a factory in Mount Vernon, Ohio, which opened in 1907. Pitcairn died in 1916, having built PPG over a 33-year period into the largest plate glass manufacturer in the United States as well as diversifying its product line and developing sources of raw material.

The 1920s were prosperous for PPG. As steel-cage and concrete-reinforced construction became the standard for building, architects were able to design structures with larger window units, and glass consumption reached record levels in the United States. During this decade, the automobile industry also began consuming more glass. The switch from the open touring car to the sedan caused an expanded need for glass, and PPG met the demand.

PPG also made several technological innovations during the 1920s. In 1924 the company switched from the batch method of making plate glass to the ribbon method. Molten glass from a constantly replenished melting furnace flowed through water-cooled shaping rollers. The glass was then cooled and cut into large plates. In 1928 PPG first mass-produced sheet glass, using the Pittsburgh Process, which improved quality and sped production. For the first time PPG was a major supplier of window glass. The Pittsburgh Process, invented by PPG, involves drawing a continuous sheet of molten glass from a tank vertically up a four-story forming and cooling line. In 1928 the Creighton Process was developed. An economical process for laminating glass for automobile windshields, PPG introduced Duplate laminated safety glass through a glass-plastic unit.

During the 1950s car production and construction of new homes and glass and steel buildings exploded. PPG stepped up production to meet demand, and continued to diversify. Fiberglass had been a laboratory novelty until the 1930s; by 1950, however, it was being used in decorative fabrics and for insulation. In 1952 PPG opened its fiberglass business, making both textiles and reinforcements. In succeeding years fiberglass was found to be useful for more and more applications, with PPG being one of the leading developers of new fiberglass products and processes.

In 1955 PPG's sales topped \$500 million. PPG employed 33,000 people in seven glass plants, three

Plains Indians

glass-fabricating plants, two specialty plants, two fiberglass plants, 17 coating and resins plants, and five chemical plants. In the early 1960s PPG produced materials for the building, transportation, appliance, container, boating, textile, paper, television, and chemical industries. In 1963 PPG became the first U.S. company to manufacture float glass, used in place of plate glass by architects.

During the early part of the 1960s a heavy capital-investment program moved the company toward \$1 billion in sales, a goal it reached in 1968. Also that year, the company changed its name to PPG Industries, Inc. to reflect its size, diversification, and global presence. By the late 1990s PPG Industries was a global producer of flat glass, fiberglass, fabricated glass products, coatings, resins, and industrial and specialty chemicals.

PLAINS INDIANS

Plains Indians were those tribes that lived in the grassland region extending from the Mississippi River in the east, to the front range of the Rocky Mountains in the west, and from Canada in the north, to Mexico in

the south. Algonquian, Aztec-Tanoan, and Iroquoian languages were spoken; eventually a mutually understandable sign language developed among the various tribes. Before European incursion Plains tribes included the Blackfoot, Sioux (or Dakota), Cheyenne, Omaha, Pawnee, Arapaho, Apache, and Comanche.

From 8000 B.C. to 1500 B.C. these tribes were nomadic, moving as many as 100 times a year in pursuit of the buffalo (bison). This large animal provided meat for food, skins for clothing and housing, bones for tools, and manure for fuel. Plants and other animals, such as deer, elk, and rabbits, were also used. The tepee was the typical dwelling: the conical tent was made by stretching skins over a wood frame. Tepees were durable, easily moved, and could be assembled quickly. Tribes traveled mostly on foot; there were no beasts of burden (horses or mules) until the arrival of the Europeans.

After about 250 B.C. some Plains tribes turned to agriculture, settling in river valleys where they cultivated corn, beans, squash, and tobacco. The Omaha and Pawnee were among the tribes that became settled farmers, establishing walled villages of earth lodges. The sustenance of other tribes remained tied to buffalo hunting, which was aided by the development of the bow and arrow (allowing a hunter to remain hidden while he took aim on his prey). Hunting was also a group activity when the large animals were killed by herding them over cliffs. After A.D. 900, Plains Indians began trading with the Eastern Woodlands Indians to the east, particularly the Mississippian tribes. Plains tribes adopted some of their practices and ceremonies.

The arrival of Europeans in the continental interior introduced horses and guns to the Indians and these were readily adopted for use in hunting and warfare. The Plains Indians were warriors, who fought between clans and tribes, and against the white settlers who increasingly encroached on their territory.

By 1890 the buffalo herds of the Plains were virtually extinct—the result of over-hunting by both the Indians and the whites. Diminishing buffalo herds resulted in significant changes in the lifestyle of the Plains Indians. That same year saw the last major conflict between the U.S. Army and the Sioux (who had fiercely resisted white settlement of their lands); federal troops killed as many as 300 men, women, and children at Wounded Knee, South Dakota.

PLANTATIONS

The term plantation originally referred to a colony or new settlement with a planned system of planting. Plantation in American culture gradually evolved to refer to an extensive agricultural enterprise based on slave labor. It would have been similar to a very large, often self-sufficient, farm.

The first plantations appeared in Virginia in the seventeenth century. Settlers began growing tobacco in the rich coastal plains where ocean tides swept up the rivers. Quickly, they realized bigger profits were possible by cultivating tobacco on a large scale. White indentured servants first provided the labor but soon gave way to black slavery. The great tobacco plantations became the hallmark of colonies in Virginia, Maryland, and the Upper South colony of North Carolina. By the 1720s, plantations appeared in South Carolina and Georgia. George Washington (1732–1799), Patrick Henry (1736–1799), Thomas Jefferson (1743–1826), and James Madison (1751–1836) were among the planters.

The greatest expansion of the plantation system occurred between 1790 and 1860. It was spurred by a more efficient textile industry in New England and Britain's increased demand for cotton. Eli Whitney's invention of the cotton gin enabled cotton to be cleaned and readied for market at a rapid pace. Cotton became so valuable that large areas of the "New South," including western Georgia, Alabama, Mississippi, Louisiana, Arkansas, and Texas, were planted. By 1830 cotton accounted for half of all U.S. exports. Although small family farms worked by the owners grew most of the cotton, the great cotton plantation became the ideal of Southern society. The richest 10 percent of planters owned almost 65 percent of the farm wealth and dominated Southern political and social life as well. A planter was defined by the number of slaves owned rather than by acres owned. Only three percent of planters owned more than 20 slaves, but over 100 slaves worked the grandest plantations.

Typical Southern plantations were self-sufficient communities with a mansion for the owner and his family, stables, kitchen, blacksmith shop, extensive gardens, and slave quarters. They encompassed thousands of acres of fertile land with access to waterways for shipping.

While most planters managed the plantation themselves, some hired overseers to help direct the slave workforce. Planters' wives were generally second in command supervising the entire household operation.

Slaves worked dawn to dusk in the fields. The more slaves a planter had the more productive his plantation. Emancipation of slaves at the conclusion of the American Civil War (1861–1865) brought the plantation era to a close.

PLESSY V. FERGUSON

The landmark Supreme Court decision in 1896 of *Plessy v. Ferguson* strengthened the constitutionality of segregation laws in the United States. The ruling would not be reversed for over fifty years, until the Supreme Court finally recognized the inequality inherent in "separate but equal" legislation in 1954 with the *Brown v. Board of Education of Topeka* (1954) case.

During the period of Reconstruction (1865–1877) federal troops were stationed in the South to protect former slaves from their former masters and to insure that the civil rights that had been accorded to African Americans—the Thirteenth, Fourteenth, and Fifteenth Amendments as well as numerous federal laws—were not violated. But the long and stubborn resistance against the federal presence waged by southern whites eventually wore down the patience of the northern public. When the troops were withdrawn the political order in the South reverted to something similar to the pre-Civil War South with the exception that slavery was replaced with sharecropping (blacks—and poor whites—renting land for "shares" of the crop) and violence against blacks came in the form of terrorism committed by groups of "night-riders" (Ku Klux Klan, "Mississippi Red-Shirts," Knights of the White Camellia or a half dozen other groups) rather than by the slave owner himself or his delegates.

PLESSY WAS ARRESTED UNDER THE LOUISIANA SEPARATE CAR ACT OF 1890, WHICH REQUIRED THAT RAILROADS PROVIDE "EQUAL BUT SEPARATE ACCOMMODATIONS FOR THE WHITE AND COLORED RACES," AND WHICH PROHIBITED A PERSON FROM USING A RAIL CAR TO WHICH THEIR RACE HAD NOT BEEN ASSIGNED.

After 1877, southern legislatures set about reversing the civil rights gains made during the Reconstruction period by passing Jim Crow laws, which segregated whites and blacks. ("Jim Crow" was a shuffling, subservient, and stupid black character in minstrel

Plessy v. Ferguson

This sign's placement in front of the Illinois Central Railroad depot is an example of the segregation that resulted from the 1896 Supreme Court decision in the Plessy v. Ferguson case. The laws remained in effect for more than 50 years.

shows.) In June 1892, in the midst of this social counter-revolution, Homer Plessy, a 30-year old shoemaker who was one-eighth African American, purposely challenged such a segregation law in Louisiana. Plessy boarded a train, informed the conductor that he, Plessy, was not 100 percent white, refused to vacate a first class seat, and would not move to a separate "colored" car. Plessy was arrested under the Louisiana Separate Car Act of 1890, which required that railroads provide "equal but separate accommodations for the white and colored races," and which prohibited a person from using a rail car to which their race had not been assigned.

In the 1890s the Comité des Citoyens formed in Louisiana to oppose the Separate Car Act. The committee's members were mostly descendants of "free persons of color," an elite class of African Americans that included writers, musicians, and community leaders, most of whose ancestors probably were never slaves. Some were "Creole," connected by blood ties to families of the white gentry.

In 1892 the Comité des Citoyens tried unsuccessfully to challenge the Separate Car Act when the light-skinned Daniel Desdunes bought a rail ticket to travel out of state, and sat in a car for whites only. But after his

arrest, the prosecution dropped the case when the Louisiana Supreme Court ruled in another decision that the state legislature had no jurisdiction over interstate travel. Thus, as part of the continued legal battle, the Comité des Citoyens also challenged the statute within the state of Louisiana with Homer Plessy in 1892. Plessy was released from jail the day after he was arrested. The plan of Plessy's attorney, James E. Walker, was to invalidate the segregation law by invoking the Thirteenth and Fourteenth Amendments. The Thirteenth Amendment abolished slavery and the Fourteenth Amendment gave all naturalized citizens equal protection under the law by state and federal governments.

Plessy appeared before Judge John H. Ferguson of the Criminal Court of New Orleans, who upheld the constitutionality of the state law. Plessy then decided to take the case to the United States Supreme Court, again challenging the law on the basis that it violated the Thirteenth and Fourteenth Amendments. The U.S. Supreme Court found Plessy guilty again. Justice Henry Brown, speaker for the eight-person court, argued that the state law did not contradict the Thirteenth Amendment abolishing involuntary servitude because the statute "merely implies a legal distinction between the white and colored races." With regard to the Fourteenth Amendment, the Court argued, the amendment's purpose was "to enforce the absolute equality of the two races before the law . . . Laws . . . requiring their separation . . . do not necessarily imply the inferiority of either race." The lone dissenter in the decision was former slave owner Justice John Marshall Harlan. He wrote, "Our Constitution is color-blind . . . In respect of civil rights all citizens are equal before the law." He argued that the majority opinion of the Court ceded power to the states, which would "place in a condition of legal inferiority a large body of American citizens."

The test case had failed to undermine the constitutionality of the segregation laws. In 1897 Plessy returned to Court in New Orleans. He pled guilty and was fined \$25 for violating the 1890 law. The Supreme Court decision of *Plessy v. Ferguson* subsequently permitted the expansion of Jim Crow legislation until the middle of the twentieth century.

POLK, JAMES KNOX

James Polk (1795–1849) was one of the most successful presidents of the United States, and one of the least known. He was elected president in 1844 and carried out every item on his political program. The period roughly corresponding to his presidency (1845–1849) became known as the Fabulous 40s. The country was, at the time, full of excitement, prosperity, and business energy. Polk was responsible for expanding that nation with the addition of land that today comprises nine western States. He was also largely responsible for admitting the state of Texas to the Union.

Polk was born in 1795, on a small farm near Pineville, North Carolina, in a family of Irish background. He was the oldest of ten children. Because of his sickly childhood, he did little physical labor but helped his father survey and manage large local farms. He later graduated from the University of North Carolina at the top of his class at age twenty-three. Two years later he became a lawyer and soon began his political career with the Democratic Party of Tennessee. His friendship with another great politician and president, Andrew Jackson (1829–1837), allowed Polk to move up quickly in politics. He was soon elected governor of Tennessee. From there he sprang to national political prominence when the issue of acquiring more western land for the United States gained popularity.

Running as a “dark horse” (a political unknown), Polk narrowly defeated Henry Clay in the election of 1844 to become President of the United States. During the campaign Polk forcefully asserted that it was the manifest destiny of the United States to expand its borders both west and south. On the other hand, Clay feared a war with Mexico or England might be the price of this expansion and projected an ambivalent, unsure

image to the voting public, which may have cost him the election. Once in office, Polk was able to acquire peaceably a large section of the northwest known as the Oregon Territory from England in 1846, although the northern border of this new land was far to the south of what Polk had originally envisaged

Mexico refused to sell the land, which included parts of Texas, New Mexico, and California to the United States. Consequently the U.S. Congress declared war on Mexico in 1846. The United States won the conflict and acquired the territory of Texas and much of the territory of present-day Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming.

During Polk’s single term as president, the size of the United States increased by about fifty percent, providing need land for farming, homesteading, and mining development. It was a watershed for U.S. westward expansion and encouraged one of the greatest population movements in U.S. history.

Polk died in 1848, in Nashville, Tennessee.

POLL TAX

A poll tax is a tax levied as a prerequisite for voting. After Reconstruction (1865–1877), the twelve-year period of rebuilding that followed the American Civil War (1861–1865), many southern states passed poll taxes in an effort to keep African Americans from voting. As a result many African Americans (and other impoverished citizens) who could not afford to pay the poll tax were disenfranchised (deprived of their rights as citizens).

In 1870 the Fifteenth Amendment was adopted, stipulating that an individual's right to vote cannot be denied by any state on the basis of race or color. But southern state legislators soon looked for other ways to keep the vote from African Americans, as well as some white Americans. Some states adopted literacy tests: In order to vote, a person had to first pass a strict test; those who failed were denied the right to vote. But in addition to excluding poorly educated African Americans from voting, the measure also affected many others who were also poorly educated, regardless of ethnicity. In response, many state legislatures drew up "grandfather clauses" to ensure non-African American constituents were included in the voting process. For example, Louisiana's grandfather clause granted voting rights only to citizens who were eligible to vote, or whose direct ancestors were eligible to vote, on January 1, 1867, a period when few of the state's African Americans could vote. By the early 1900s, most southern states had adopted this method of keeping former slaves and other African Americans from getting involved in government.

The U.S. Supreme Court declared grandfather clauses unconstitutional in 1915 and again in 1939. But the poll taxes had greater longevity and remained in effect into the Civil Rights Movement. In 1964 poll taxes in U.S. federal elections were finally made illegal; two years later they were prohibited in all government elections held in the United States, including state and local elections.

POLLOCK V. FARMERS' LOAN AND TRUST COMPANY

In 1898 the U.S. Supreme Court declared the income tax unconstitutional. It had been levied as part of the Wilson–Gorman Tariff Act (1894) and taxed all incomes over \$4,000 at two percent. The ruling came in the case of *Pollock v. Farmers' Loan and Trust Company*. Massachusetts resident Charles Pollock was a stockholder in the loan and trust company. In 1895 Pollock sued on behalf of himself and other shareholders, challenging the payment of taxes on the interest and dividends on deposit in the bank during the previous year. In this case, the justices had to decide fundamental questions: (1) whether the federal government could apply "income duty" to the bank deposits of U.S. citizens; (2) whether it could levy an income tax at all. A bare majority of five judges agreed that the Constitution prohibited direct taxation and that, instead, the tax burden had to be apportioned to each state

(based on their population). The high court's decision stated that the tax was "repugnant to the Constitution . . . income tax is invariably classified as a direct tax." But the need for an income tax did not abate, and after the turn of the century the graduated tax began receiving bipartisan political support. Eventually the states ratified the Sixteenth Amendment (1913), which authorizes the U.S. Congress to levy and collect income tax without regard to a census (apportionment).

PONY EXPRESS

Pony Express was a short-lived but emblematic mail and small package carrier service that operated during the mid-1800s. It still remains a symbol of American westward expansion. The service began in 1860 as a means to move messages and parcels from St. Joseph, Missouri (then the western terminus of the nation's rail system), to Sacramento, California, and all points between. The Pony Express trail was 2,000 miles (just over 3,200 kilometers) long and could be traveled in eight to 10 days by a series of riders.

The service was backed by businessman William Hepburn Russell (1812–72), who hired 80 riders and kept 400 horses and ponies to make the relay journey around the clock. Each rider traveled about 75 miles (120 kilometers) per day. Riders followed a trail that ran along Nebraska's Platte River to present day Wyoming, then turned south toward Great Salt Lake (in present day Utah), and south of there turned west to cross the Great Salt Lake Desert to the Sierra Nevada Mountains (in present-day western Nevada), which were crossed into California. Along the route, there were nearly 200 Pony Express stations where riders would change horses or end their day's journey, handing off the specially designed leather mailbag to the next rider. These changes usually took less than two minutes.

Pony Express service was the fastest way to get messages across the frontier at the time; the only alternatives were transport by stagecoach or boat. But when the first transcontinental telegraph line was completed on October 24, 1861, the Pony Express folded only two days later. Its fastest run had been made in March of that year when a transcript of President Abraham Lincoln's (1809–65) first address to Congress arrived in Sacramento in seven days and 17 hours.

POPULAR SOVEREIGNTY

In the mid-1800s the U.S. Congress struggled with how to organize western territories—in terms of whether they would be free or slave regions—without upsetting the tenuous political balance between North and South. Congress settled on the idea of popular sovereignty, relying on the vote of the people in the territory to decide the question for themselves.

The biggest proponent of popular sovereignty (and the person who coined the term) was Senator Stephen A. Douglas (1813–1861) of Illinois. An ardent expansionist, Douglas viewed popular sovereignty as a way for the nation to get on with the business of organizing new territories. But policy of popular sovereignty had ramifications that even its strongest supporters did not foresee.

Under the Kansas-Nebraska Act (1854), two new territories were established, and the voters in each territory were charged with deciding the question of slavery for themselves. Many lawmakers assumed Nebraska residents would vote in favor of a free territory and Kansas residents would vote in favor of slavery. Instead, advocates from both sides sent people to settle Kansas, which became the backdrop for violent conflicts between anti-slavery and pro-slavery forces, earning it the nickname “Bleeding Kansas.”

The practice of sending people into a territory, sometimes only temporarily, to swing the vote prompted critics of popular sovereignty to dub it “squatter sovereignty.” The tragic conflict in Kansas was evidence that the policy had failed. With the failure of popular sovereignty, federal lawmakers had exhausted their abilities to address the nation’s political and ideological problems, which would only be resolved by the outcome of the American Civil War (1861–1865).

POPULIST MOVEMENT

The Populist Movement is the name given to an important movement of agrarian reformists in the United States during the late nineteenth century. In the 1870s and 1880s U.S. society was generally secure and prosperous. Overall economic growth was steady, and no foreign power threatened U.S. interests. One important area excluded from these positive conditions and developments was agriculture. In the decades after the American Civil War (1861–1865), the U.S. farmer suffered a precipitous decline in wealth and status.

Prices for key agricultural products such as wheat and cotton experienced dramatic declines as productivity rose and foreign competition increased. Cotton, the backbone of the Southern economy, sold for over 30 cents a pound in 1866. By the early 1890s, however, the price per pound plummeted to six cents. Not surprisingly, farmers in newer settled regions such as Kansas, Nebraska, and the Dakotas were hardest hit because they had recently borrowed start-up money at fixed interest charges. These obligations were increasingly burdensome as agricultural prices continued to drop. The South was hit hardest of all the regions, not having fully recovered from the economic and social dislocations brought on by the Civil War. The basic problem was that the mechanization of agriculture had created an “overproduction crisis.” The domestic market could not absorb the increased productivity of the farm. Wheat had sold for \$1.60 per bushel in 1865 was going at 49 cents per bushel in 1890.

The decline in the status of the farmer was equally harsh. At the advent of the American republic, Jeffersonian Republicans lauded the farmer as the wellspring of American virtue and prosperity. This idealization of rural life steadily eroded with the growth of U.S. industrialization and urbanization. Cultural and intellectual currents in the city and in the countryside increasingly diverged, and city dwellers began to view the farmer as uneducated, prejudiced, and superstitious.

Before the 1890s rural distress had generated demands for social and economic experiments that would help shield the farmer from the harsh blasts of the market. For example, the Granger Movement of the 1870s produced legislation regulating warehouses, grain elevators, and railroads. It also led to important cooperative experiments in the marketing of farm products and in the purchase of farm machinery, fertilizer, and the like.

The next important wave of populist reformism emerged in the 1890s. Various regional farm groups, known as Farmers’ Alliances, took root and grew rapidly. These included the Southern Alliance and the Agricultural Wheel in the south, and the Northwestern Alliance in northern regions. Although these groups found it difficult to unite due to regional differences based on political preferences and economic interests, they shared the belief that agricultural prices were too low, transportation costs were too high, and that the nation’s financial system was in need of serious reform. These and other agricultural groups threw themselves into rural politics in 1890 with spectacular results. In the South alone Alliance-sponsored gubernatorial candidates won elections in four states. The Alliance also captured eight southern legislatures. In

Porkopolis

the West Alliance candidates dominated elections in Kansas and Nebraska and secured important power bases in the legislatures of Minnesota and South Dakota.

Spurred by these victories and by the failure of the Republican and Democratic parties to seriously address their concerns, the rural reformers, along with representatives of industrial labor and professional reformers, organized the People's Party in St. Louis in 1892 and called for a national convention to convene in Omaha in July. The convention was noteworthy for drafting one of the most comprehensive reform programs ever advanced by a major U.S. political party. The platform called for a number of important measures, including the direct election of senators, the adoption of initiative and referendum procedures, civil service reform, nationalization of transportation and communication networks, and a graduated income tax. To combat deflation, the scourge of the rural economy, the platform advocated the free coinage of silver and the liberal printing of paper money. A "subtreasury" plan was also advocated to protect the farmer from downturns in agricultural prices. Under this scheme farmers could hold crops off the market when prices were low and then receive loans from the government secured by crops in storage. To attract support among industrial workers, the platform also advocated an eight-hour workday, pensions, and the restriction of immigration. Indeed, the strategic political goal of the Populist Party was to displace the Democratic Party by forging an alliance between farmers and industrial workers. Equally important, the Populists, at least in principle, attempted to bridge the social gulf between Southern blacks and whites, arguing that shared economic interests were more important than racial differences.

Despite the excitement it generated in the election of 1892, the Populist Party fell painfully short of its political goals. In the election Democrat Grover Cleveland (1893–1897) garnered 277 votes in the Electoral College to defeat his Republican opponent, Benjamin Harrison (1889–1893), who received 145 electoral votes. James B. Weaver, the Populist candidate, attracted only 22 electoral votes. Although the Populist Party received over 1,470,000 popular votes in the congressional elections of 1894, it suffered a rapid decline soon after. Part of the reason was that the party was never able to construct a cohesive coalition between its constituent rural components. Nor was it able to forge a significant alliance with industrial labor interests. During their presidential convention in 1896, the Democrats adopted the Populist plank of the free coinage of silver, allowing the Democratic candidate,

the firebrand William Jennings Bryan, to appeal to Populist voters. At their own convention in July, 1896, the Populist Party also nominated Bryan, all but fusing with the larger and more influential Democratic Party. A period of rapidly rising agricultural prices also helped seal the fate of the Populist Party.

PORKOPOLIS

Porkopolis is an old nickname for the city of Cincinnati, Ohio. In 1788 the area was marked out along the shores of the Ohio River as the village of Losantville. Over the next two decades numerous settlers made their way west in flatboats along the Ohio River. In 1811 steamboat service began on the Ohio River. By 1819 river trade had transformed the territory into a bustling center and the city was officially chartered as Cincinnati.

Cincinnati was perfectly situated on one of the region's major waterways, where it could readily receive raw materials and ship out finished goods. The construction of canals across the region connected natural waterways and made the city accessible from great distances. At its eastern end, the Ohio River extended to Pittsburgh, Pennsylvania. Its western end ran into the Mississippi River, which extended to the

busy port of New Orleans and, by ship, to the Atlantic coastal states.

Many farmers transported their livestock (particularly hogs) to Cincinnati for processing. As early as 1818 meat processors in Cincinnati had begun packing pork in brine-filled barrels. By the 1840s the city was home to numerous slaughterhouses and pork-packing plants. By 1850 Cincinnati had become the country's leading center for pork processing. The city's factories also made steamboat boilers, machine tools, railroad cars, and soap, but it became known as Porkopolis because of its most popular product of the time.

POST, WILLIAM CHARLES

Charles William Post (1854–1914) was a trailblazer in the manufacture and marketing of breakfast cereal products. During the early twentieth century he used his wealth to influence a variety of campaigns that held his interest, including anti-union activism.

Charles William "C.W." Post was born on October 26, 1854 in Springfield, Illinois, the son of Charles Rollin and Caroline Lathrop Post. His mother was a poet whose work was published in magazines, and his father, who joined the California gold rush as a forty-niner, held a variety of jobs and finally settled as a grain and farm equipment dealer.

Post, who preferred to be called "C.W.," was educated in public schools and briefly attended the Illinois Industrial College (later to become the University of Illinois), but he dropped out at age 15. He worked for his father's business before moving to Chicago to work as a salesman for a farm equipment firm. In 1876 he returned home, borrowed \$500 from his mother, and opened a general store in Independence, Kansas. Less than a year later Post sold his store and again returned to Springfield. He married Ella Merriweather, and in 1880 established the Springfield Plow Works, a business engaged in the design and manufacture of farm equipment. After four years, both the business and Post's emotional health failed. He spent recuperation time in Texas, where he became interested in real estate, specifically near Fort Worth. By 1891 Post was so ill that he was confined to a wheelchair. He sought help at a well-known sanitarium in Battle Creek, Michigan, run by Dr. John Harvey Kellogg. At the sanitarium Post was fed Dr. Kellogg's

C. W. Post.

high-grain vegetarian diet that consisted of natural food and beverage products.

Post recovered his health at the sanitarium after only a few months, and remained in Battle Creek to open the La Vita Inn, an institute for healing through mental suggestion. He published *I Am Well!*, a book promoting the fashionable belief that the mind could cure physical ailments; the institute, however, never achieved real success.

In 1895 Post formulated a cereal beverage coffee substitute based on a drink similar to one he was served at Kellogg's sanitarium. Post named his beverage Postum. The following year he began to manufacture Grape Nuts, a cereal based on another Kellogg product. With only \$50,000 in capital, Post incorporated his company in 1896 under the name Postum, Ltd. Over the next few years he introduced several products, including a corn flakes product he called Post Toasties, followed by other cereals: Post's Bran Flakes, Instant Postum, and Post's Wheat Meal.

Post saw advertising as the most crucial part of his business. Through ads in newspapers and magazines that Post wrote himself, the company achieved nationwide distribution by the early 1900s. Post's marketing strategies appealed to consumers' health concerns by

Postum Cereal Company

claiming that Postum products would put them on the “road to Wellville” by strengthening “red blood.”

The success of his company made Post a millionaire. Five years after its establishment, Postum Ltd.’s capital had risen to \$5 million. Post’s business, which began in a barn, now employed 2,500 people in factories that covered 20 acres of his Battle Creek farm. It was the largest plant of its kind in the world. Post nonetheless grew bored with his company, hired a team of professional managers to oversee its operation, and used his newfound wealth to turn his attentions elsewhere.

In 1902 Post designed a type of mail currency he called the “Post Check,” which was similar to contemporary money orders. He met strong opposition in his attempt to get congressional support for the Post Check. The greatest objection came from New York Senator Thomas C. Platt, president of the U.S. Express Company, which sold its own form of postal currency. The Post Check also upset small merchants, who feared the new currency would promote mail-order business. Realizing that these merchants carried his cereal products, Post eventually gave up on the Post Check.

C.W. POST BECAME FAMOUS FOR CLAIMING THAT HIS HEALTHY BREAKFAST FOODS WOULD PUT CONSUMERS ON THE “ROAD TO WELLVILLE.”

Shortly after, Post began purchasing what would total more than 200,000 acres of land in western Texas. He built a community called Post City, which ultimately suffered from the region’s arid climate. To combat drought, Post had large amounts of dynamite set off in several experiments to blast rain out of the sky.

Throughout this time Post was a dedicated leader of entrepreneurs against labor unions. He lectured throughout the country and published full-page anti-union denunciations in several newspapers. He even established a magazine called *Square Deal* to disseminate his labor views. Labor unions responded by organizing boycotts against Post’s cereal products. To prevent unions in his own factory, Post paid the highest wages in the industry, gave bonuses, and provided welfare, accident, and health benefits. He also had model homes built near Battle Creek that were sold to employees on accommodating terms. Post helped establish, and later served as president of, the anti-union group Citizen’s Industrial Alliance. In 1910 the National Trades and Workers Association succeeded this

organization. Post offered Theodore Roosevelt (1858–1919) \$100,000 to serve as its president, but the former U.S. president (1901–1909) declined.

Post committed suicide on May 9, 1914, at his home in Santa Barbara, California. He was survived by his second wife Leila D. Young, and his daughter, Marjorie Merriweather Post—the sole inheritor of Postum Ltd. At the time of his death, C.W. Post’s fortune was estimated at \$20 million. Marjorie Post’s second husband, stockbroker Edward F. Hutton, led Postum in an aggressive crusade to acquire other grocery brands. In 1929, Postum Ltd. became the General Foods Corporation.

POSTUM CEREAL COMPANY

“Health First—Happiness Follows, POSTUM instead of coffee, ‘There’s a Reason.’” This 1895 marketing slogan was created by Charles William Post (1854–1914), the man who, in a small white barn in Battle Creek, Michigan, made the first batch of Postum, a cereal beverage. Sales were slow initially: Post lost \$800 on Postum in the first year. In writing advertisements for his product, Post brazenly blamed caffeinated beverages for any ailment, including heart disease,

rheumatism, blindness, cowardliness, and diminished mental capacity. He literally scared thousands of caffeinated beverage drinkers into switching to Postum. By the end of 1896 Postum sales reached \$3000 per month. The same year Postum Cereal Company Ltd. was incorporated.

“Grape Nuts,” a pre-cooked cereal made of malted barley and whole wheat, was introduced in 1897. It was a commercial success. Post advertised Grape Nuts as a builder of red blood cells and stated that it steadied the nerves and prevented malaria, consumption, and appendicitis. He became well known for outlandish and flamboyant advertising and marketing practices. Post used coupons, samples, and product demonstrations to encourage people to buy his products. The stage was set for the company that would become General Foods.

By the early 1900s Postum Cereal Company’s Battle Creek plant was the largest of its kind in the world, with 2,500 employees and a net worth of \$5 million. Charles W. Post amassed a personal fortune. Though Post crusaded against labor unions, he was not against employee benefits. Post was an active member in the National Association of Manufacturers and he founded many organizations designed to substitute labor unions. Because of Post’s genuine concern for employees, Postum Cereal Company did not have any labor problems in its own factories. Post’s generosity toward his employees was evident as they were paid the highest wages in the industry. The company placed a high emphasis on safe working conditions and implemented a sickness and accident benefit program. It also assisted some workers with the purchase of company built homes.

**HEALTH FIRST—HAPPINESS FOLLOWS,
POSTUM INSTEAD OF COFFEE, THERE’S
A REASON.**

Charles William Post, 1895

Upon the death of Charles W. Post in 1914, his daughter Marjorie Merriweather Post took over company operations. In 1923 Marjorie’s husband, Edward F. Hutton, became chairman and Colby M. Chester became president the following year. Marjorie remained active in the company affairs and she was involved in the business strategy related to the acquisition of General Foods. Postum Cereal Company acquired Jell-O in 1925, followed by Swans Down cake flour, Minute Tapioca, Baker’s Chocolate, and Log Cabin syrup in 1927. That same year the company also shortened its name to the Postum Company. With the

acquisition of Maxwell House coffee in 1928, President Theodore Roosevelt’s (1901–1909) 1907 statement “Good to the last drop” became a household phrase.

In 1929 Postum paid \$22 million for controlling interest in the General Foods Company, which was owned by Clarence Birdseye. The Postum Company then adopted the General Foods title. Birdseye became head of the new General Foods laboratory and continued his research on frozen foods. After record \$19.4 million profits in 1929, earnings dropped to \$10.3 million in 1932 when the company acquired the remaining 49 percent of General Foods. E.F. Hutton resigned as chairman in 1935 and Colby M. Chester took over. Marjorie Post returned as director in 1936 and remained until 1958.

In 1932 the company added six new plants and offered one hundred different frozen food products. In the same year Sanka Coffee Corporation was purchased from European owners who, since 1927, had an agreement with Postum Company to distribute their coffee. By 1943 General Food sales had more than doubled those of 1929. One of the first postwar products introduced to the market was Instant Maxwell House coffee (1945). Adding to the General Foods beverage line was the acquisition of Perkins Products Company in 1953. Fruit flavored drink mixes, such as Kool-Aid, Tang, Country Time, and sugar free Crystal Light, were added to the beverage division of General Foods. Through the 1950s and 1960s General Foods expanded in the international market: it had controlling interest in La India chocolate Company in Venezuela, acquired Hostess snack food company of Canada, the Kibon ice cream company of Brazil, and numerous others. By the end of the 1960s General Foods was a giant in the industry.

The international acquisitions continued throughout the 1970s. On the domestic front the Bird’s Eye brand enjoyed increased sales as frozen foods became more popular. But the Jell-O brands suffered in the dessert market. In 1980 General Foods was not performing as expected and was dependent on its various coffee brands which accounted for thirty-nine percent of entire revenues. In 1981 General Foods merged with Oscar Mayer, the largest national brand of lunchmeats. With coffee and Post Cereal sales sliding in 1984, General Foods sold its Gaines Pet Food division for \$157 million. In 1985 Phillip Morris purchased General Foods for \$5.6 billion. Phillip Morris chairman Hamish Maxwell had plans to diminish the company’s reliance on tobacco products. A massive reorganization of General Foods began in 1987 as coffee, meats,

Postwar Boom

and groceries were split into separate divisions. In October 1988 Phillip Morris purchased Kraft. In 1989, with Michael A. Miles at the helm, General Foods and Kraft merged to become an industry giant named Kraft General Foods Incorporated. The company's name was changed in January 1995 to Kraft Foods Incorporated and the company was reorganized into eleven different international divisions.

POSTWAR BOOM

During the 1940s U.S. business was dominated by preparation for World War II (1939–1945), by the war itself, and in the late years of the decade by the Cold War. By the end of the decade Americans saw the positive effect the war had on the U.S. economy and realized that they had never had it so good.

President Franklin D. Roosevelt's (1933–1945) combination of private capitalism and public stimulus accomplished exactly what the government intended: it made the United States the largest arms manufacturer in world history. At the end of World War II, U.S. business and the economy were radically different than they were before the Japanese attack on Pearl Harbor (1941). Americans enjoyed unprecedented prosperity. Corporate profits were astounding. In 1943 alone earnings jumped \$2.1 million over the prewar level. Workers' wages on average doubled, increasing from almost

\$25 a week to \$50 a week, and many people earned hefty overtime bonuses. Even farm income increased an incredible 250 percent, despite the loss of nearly 800,000 agricultural workers during the war.

The character of corporate and working America also changed. Despite administration attempts to distribute the benefits of government contracts broadly, 71 percent of all contracts went to the 100 largest U.S. corporations. By the end of 1942 there were 300,000 fewer small companies than there had been before the war. Small farmers lost out as labor got bigger. The total labor force increased by 22 percent during the war, which, along with the draft, eliminated unemployment. Labor unions grew from 10.5 million members in 1939 to 14.75 million members in 1945. An acknowledged power in the U.S. marketplace, big labor insured that many of the wage and benefit gains of the war years would continue into the next decades. Because of wartime labor shortages, moreover, the workforce was more diverse than before. Almost 60 percent of women in the United States were employed during the war. Industry, which for so long had closed its doors to African Americans, now employed 1.2 million. Sixty thousand African Americans migrated to Detroit, Michigan, alone during the war. Even teenagers worked during the war, and their earnings opened up a new consumer market after the war—one geared toward music and automobiles and other status symbols of adolescence. The one problem with all this prosperity was that it was purchased with government deficits justified by the pressure of war. With victory, the new administration under President Harry S. Truman (1943–1953) faced one significant economic problem: how to maintain wartime prosperity without a war.

BY THE END OF THE DECADE PROSPERITY WAS INSURED BY THE TWIN FORCES OF EXPANSIVE U.S. TRADE AND THE GROWTH OF WHAT GENERAL DWIGHT D. EISENHOWER (LATER PRESIDENT, 1953–1961) WOULD TERM "THE MILITARY-INDUSTRIAL COMPLEX."

The Truman administration sought to reconvert U.S. industry to its nonmilitary bases as quickly and as painlessly as the Roosevelt administration had converted it to war production. One way of accomplishing this goal was to use some of the government agencies overseeing war production to supervise the peacetime conversion of U.S. industry. The Office of War Mobilization, retitled in 1944 to the Office of War Mobilization and Reconversion, continued to coordinate manpower, production, and resources after the war. Rations

on scarce goods remained in place long after armistices were signed. These wartime agencies and restrictions came under political pressure during peacetime. Truman hoped that the Office of Price Administration and Civilian Supply (OPA), for example, would continue to regulate production and prices in order to check runaway inflation. The OPA, however, faced criticism from businessmen who wanted to raise prices and from individuals who chafed at its limitations on consumer items. In June 1946, Congress extended the life of the OPA but stripped it of much of its power. Truman vetoed the bill, and when price controls expired on July 1, 1946, prices skyrocketed, and the cost of living index rose six percent in one month. By 1947 the cost of living index had risen 24 points—20 more than it had risen in the previous year. The rise reflected not only the artificial depression of prices the government had maintained during the war, but also the enormous consumer demand spiked by high wartime wages and wartime product shortages. This demand ultimately evened out the economic dislocations of reconversion. The postwar period was notable, in fact, for an unprecedented consumer revolution, as Americans rushed to buy houses, cars, appliances, and luxuries in record numbers.

The biggest single economic problem the Truman administration faced was the demobilization of its 17 million troops. Administration officials feared a rapid demobilization of the military would plunge the nation back into depression, yet the political pressure from American families for rapid demobilization was enormous, especially after 1946. The problem was partially solved by the Serviceman's Readjustment Act of 1944, commonly known as the GI Bill, which funneled many returning veterans into college, thus delaying their entry into the labor force and improving their working skills. Government, business, and labor-union policies, furthermore, favored the hiring of returning vets, forcing tens of thousands of working women and teenagers out of the labor market.

There was also an enormous increase in the number of new industries in the United States following the war. Often sparked by wartime government research, industries such as television, aviation, and chemical and metallurgical processing absorbed many of the demobilized troops. Finally, the government maintained a larger military force after the war than it had ever maintained in U.S. history during peacetime. Troops were needed as occupying forces in Europe and Asia, and U.S. naval and air fleets remained enormous. The large standing army, the GI Bill, and new industries nonetheless failed to prevent widespread labor

dislocations following the war. From 1946 to 1948, as unemployment rose and the U.S. economy slowed, strikes became commonplace, and the Truman administration struggled with popular discontent with its economic policies.

U.S. economic planners also hoped that a revival in U.S. international trade and the reconstruction of European economies would increase U.S. production and absorb the veteran labor force. Even before Pearl Harbor international bankers and interventionists viewed the war as an opportunity to prevent the creation of world economic blocs closed to U.S. trade. With the end of the war they constructed international institutions to accomplish this goal.

The World Bank, the International Monetary Fund (IMF), and the General Agreement on Tariffs and Trade (GATT) were designed to insure U.S. access to colonial markets formerly closed to U.S. trade. These agreements were also designed to help Europe rebuild and resume trade with the United States. This goal was even more explicit in the 1947 Marshall Plan, whose guidelines specified the terms of renewed trade on a basis favorable to U.S. corporations—often accompanied by a surprising degree of U.S. interference in the domestic economies of European states.

The Europeans, devastated and bankrupted by the war, rarely objected to the conditions of Marshall Plan assistance, and by 1950 they had resumed domestic production and trade with the United States on a greater basis than before the war. The Soviet Union, however, committed itself to a policy of economic self-sufficiency and independence. Twice spurned in its requests for less restrictive loans by the United States, it rejected Marshall Plan funds and chose to reconstitute its economy by integrating it, rather poorly, to that of Eastern Europe. The Soviets in effect created an economic bloc and closed it to U.S. trade—it was an anathema to U.S. internationalists.

The actions of the Soviets, as well as the economic restrictions of U.S. assistance, formed the economic backdrop to the Cold War. The political, cultural, and military repercussions of this economic confrontation, in turn, transformed the U.S. domestic economy and by 1949 resolved the problems plaguing postwar industry. The potential military confrontation with the Soviet Union not only cemented U.S. economic ties with Western Europe and increased U.S. trade but also provided a viable rationale for increased military expenditures. By the end of the decade prosperity was insured by the twin forces of expansive U.S. trade and the growth of what General Dwight D. Eisenhower

Postwar Prosperity, 1946–1973 (Overview)

(later President, 1953–1961) would term “the military-industrial complex.”

POSTWAR PROSPERITY, 1946–1973 (OVERVIEW)

The economic acceleration sparked by the war production of World War II (1939–45) ended the Great Depression (1929–1939) and brought prosperity to the United States. But the war’s end brought fear of economic stagnation. Many people remembered the downturn following World War I (1914–18) and they were concerned that it might happen again. At first such fears seemed justified, but then Americans went on a buying spree. They used their wartime savings to purchase products such as refrigerators and automobiles that had not been available during the war. This caused inflation because prices rose when supply did not keep up with demand. Also, during the war the inflation increased faster than the wage increases. The unions had been talked into limiting their wartime wage increases to 15 percent per year, considerably less than the actual inflation rate. The government contributed to the problem by removing all wartime price controls in late 1946.

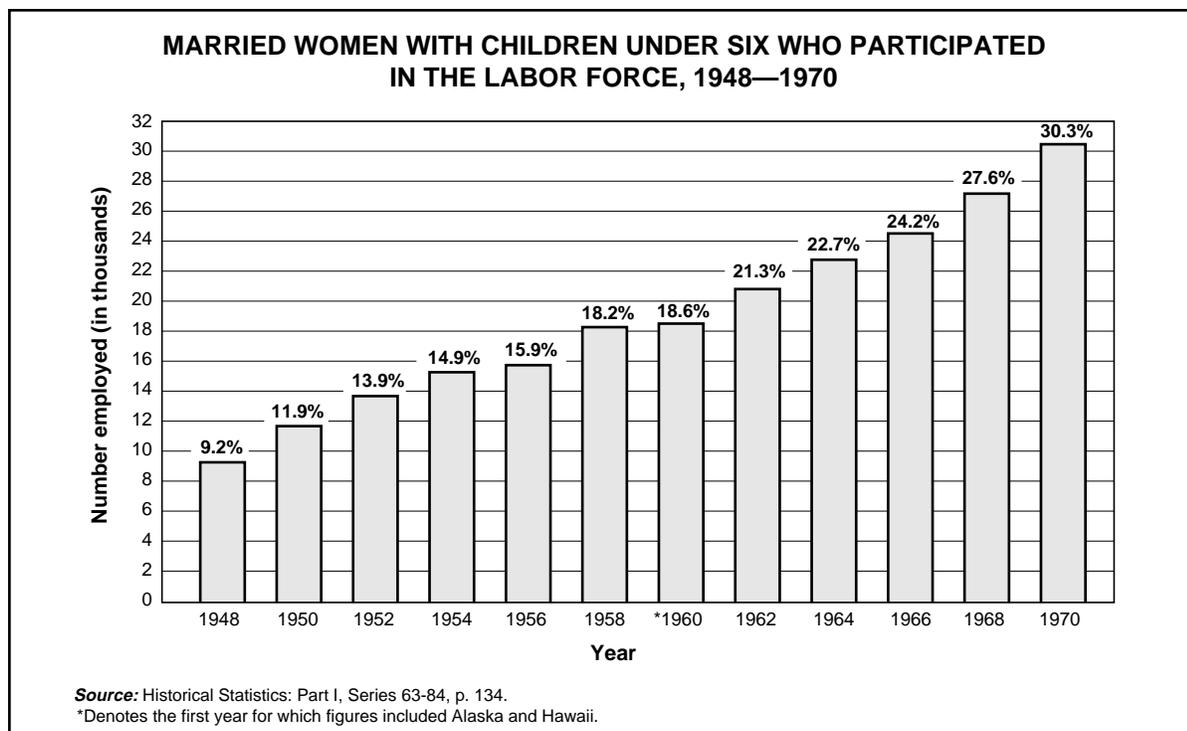

Workers responded to the uncertain economic conditions by going on strike to demand higher wages. In late 1945 and 1946 more than five million workers in major industries were involved in more than 5,000 work stoppages. Most of these strikes were settled to the benefit of the workers who received wage increases; the inflationary trend continued well into the Fifties.

Meanwhile, the Truman administration (1945–53) proposed major government spending programs including an increased minimum wage, price supports for farmers, and support for small businesses. There was also a proposal for a very controversial measure called the Full Employment Bill, which called for the government to guarantee jobs to all workers whenever unemployment rose above a certain level.

President Truman’s (1945–53) program met with vigorous opposition from conservatives who called it “creeping socialism.” However, some of these proposals, including a modified version of the Employment Act, passed Congress before the end of 1946. Truman proposed a more sweeping program, which came to be known as the “Fair Deal.” This included farm supports and other government measures to strengthen growth as well as expansion of Social Security, public housing, national medical insurance, aid to education, and civil rights legislation for blacks. Some of these proposals became law even though there was considerable opposition.

Meanwhile, U.S. farmers experienced many changes after World War II just as they had after World War I. Farming became more mechanized and scientific than ever and output increased at a faster rate than ever. Overproduction once again became a problem. After major increases during the war, prices leveled off and generally showed no gains until the 1970s. At the same time costs increased. The result was that only large commercial farms could be profitably operated. They began to increase in number while the smaller “family farm” declined.

Dwight D. Eisenhower (1953–61), a Republican, succeeded Truman as president in 1953. Generally, he opposed new, large government spending programs, but he favored one project that was profoundly significant: the Interstate Highway System. This was a thirteen-year, \$26 billion program to assist the states to build an interstate highway system according to a national plan. This program generated a number of spin-offs. The construction industry boomed; gas stations and motels profited; the trucking industry flourished; the railroad industry declined; and the American people became more devoted to the automobile than ever.

Shown is the steady increase of married women, with children under 6-years-old, who participated in the workforce between 1940 and 1970.

Otherwise, Eisenhower kept public spending down and the national economy grew slowly. Moreover, the administration did little to stimulate the economy during recessions. Twice, in 1954 and again in 1957, there were economic downturns, but Eisenhower did nothing. Even when the unemployment rate reached 7.5 percent in 1958, he opposed both tax cuts and increased spending.

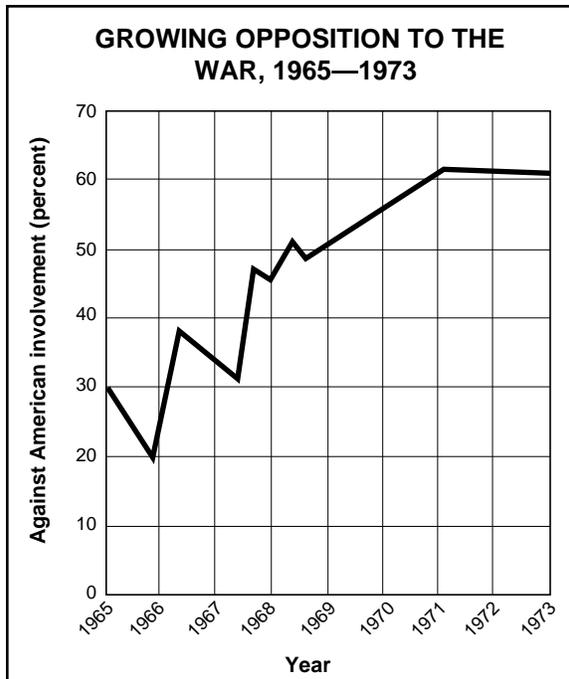

Meanwhile, there were numerous social problems associated with the economy. The population grew rapidly—the increase was largely attributable to the “Baby Boom.” After the war people tended to marry younger and have larger families. Between 1948 and 1955 the number of children born each year increased by 50 percent, the greatest increase ever. This was a direct result of the prosperity of that period. Jobs were plentiful; incomes were rising; and credit was easily available.

The conditions of that period also exerted a significant effect on the status of women. During the war there was an increase in the number of women in the workforce as they came out of their homes to replace the men who went into the service. Immediately after the war many women left their jobs as the men returned, but in the 1950s the trend reversed again and by 1960, 33 percent of the women of working age had

jobs. Most of these jobs were part-time; the pay was low; and the female workers were often over 35 years of age, having gone to work after their children entered school.

During the period of postwar prosperity many people fled the city for the suburbs. They believed that here they would find peace and avoid urban problems such as crime and social tensions. In fact, they frequently traded one set of problems for another. In the suburbs they often found as much congestion as they had hoped to leave behind. In addition, people often went deep into debt for new homes and cars, and they found the long commute to work a burden they had not anticipated.

Despite the flight to the suburbs, the urban population grew dramatically during the late 1940s and 1950s and many of those who flocked to the cities after World War II were black and poor. They came seeking jobs and a better life, but they were often disappointed. They were met with overcrowding, discrimination, and, not infrequently, violence. Still they came. Seventy-seven percent of the African American population lived in the South in 1940. By 1960 nearly 50 percent lived in the North and most of them in cities. They continued to move because, in spite of problems, many actually improved their standard of living. Between

Opposition to the Vietnam War began to rise steadily from 1969 until the United States withdrew involvement.

1941 and 1952 the median annual income of African Americans increased from \$1,614 to \$2,338. Moreover, those employed in unskilled jobs dropped from 80 percent to 63 percent between 1940 and 1950.

Economic growth slowed down somewhat in the late 1950s; John F. Kennedy (1961–63) used the sluggish economy as an issue during the campaign of 1960. Kennedy promised recovery and long-term growth and he gathered a distinguished group of economic advisers to help him produce results. These included John Kenneth Galbraith of Harvard and Walter Heller of the University of Minnesota. These men advocated what came to be known as the “New Economy.” By this they meant that the federal government should use its power over expenditures and monetary policy to promote growth. They convinced Kennedy to push for massive expenditures on social welfare programs and a large tax cut. Kennedy also found himself under increasing pressure to do more in the civil rights arena. However, the conservatives in Congress blocked all such efforts. Thus, Kennedy had achieved little by the time of his death in November 1963.

Kennedy’s program, and much more, was realized by his successor Lyndon Baines Johnson (1963–68). The events of the next five years had an enormous impact on the U.S. economy and society. First, Johnson moved to promote rapid economic growth. He precipitated an economic boom by reducing taxes

through the Tax Act of 1964 and increasing federal spending (mostly on the war in Vietnam). Between 1960 and 1964 the gross national product (GNP) increased 24 percent and corporate profits rose by 37 percent. In 1965 the GNP climbed another seven percent; profits increased 20 percent; and unemployment fell to four percent. These “boom” conditions lasted until near the end of the decade of the Sixties. The GNP increased at a rate of around five percent per year; unemployment never exceeded four percent; and the median family income rose from \$8,543 to \$10,768.

Some economists cautioned that Johnson’s policies could trigger inflation, but the President never deviated from his course. He continued to spend, especially on the war, throughout his tenure. Eventually the economists’ predictions were borne out. By the end of the 1960s the nation was experiencing a runaway inflation.

Meanwhile, Johnson launched his grand plan for what he called the “Great Society.” The idea was to “fix” all of society’s problems by means of federal legislation. In the first year of his administration alone, Congress passed the Tax Act and a new and powerful Civil Rights Act. Congress also approved the Economic Opportunity Act that marked the beginning of Johnson’s “war on poverty.” This consisted of a series of programs designed to provide education, training, housing, and jobs for the less fortunate. It represented the greatest outpouring of liberal legislation in the nation’s history.

After his smashing victory over Senator Barry Goldwater of Arizona in the election of 1964, Johnson shifted the Great Society and War on Poverty programs into high gear. Congress passed Medicare and Medicaid to provide health care for the elderly and the poor. There was legislation passed to provide federal aid to education at all levels. The Voting Rights Act of 1965 guaranteed blacks the right to vote in the South. In addition, federal money was appropriated for housing and urban development and two new Cabinet level departments were created. These were the Department of Housing and Urban Development (HUD) and the Department of Transportation (DOT).

War on Poverty legislation included the Job Corps to train young people who lacked marketable skills; Work-Study, to supplement the income of college students; Head Start, to help pre-school children from “disadvantaged” families; Volunteers in Service to Americans (VISTA), to send volunteers into impoverished areas; federally funded public works projects, and others. However, nothing was done to redistribute wealth, the distribution of which remained much as it

had been since the turn of the century, that is, about 20 percent of the population owned about 80 percent of the wealth.

Lyndon Johnson was forced from office because of the public outcry against his failed policy in Vietnam. His successor, Richard M. Nixon (1969–1974), then had to deal with the major financial and economic difficulties that had been generated by Johnson's policies. He did so by curtailing the money supply. He hoped this would induce high interest rates and consequently business cutbacks.

Nixon's policies did not work. Inflation continued but business activity slowed down more rapidly than expected. This caused government revenues to decline and increased the size of the deficit. It also produced an increase in unemployment. The nation fell into recession.

By 1971 Nixon was ready to try a new, more drastic approach. He froze wages and prices for 90 days, ordered Congress to repeal certain excise taxes, and took the United States off the gold standard by suspending the traditional practice of converting dollars into gold. This had the effect of devaluing the dollar and making U.S. goods cheaper on the international market. Nixon also placed a 10 percent surtax on imports.

This policy worked. By early 1972 the recession was over and industrial production had increased by 5.3 percent over the previous year. Corporate income increased by an average of 11.7 percent over 1971. These changes helped Nixon to win re-election in 1972, but shortly after his triumph the United States faced another economic crisis of significant proportions.

In October, 1973, war broke out between Israel and her Arab enemies, notably Syria and Egypt. The United States supported and aided Israel. In retaliation the Arab states, led by Saudi Arabia, embargoed oil shipments. At that time Middle East imports accounted for about 11 per cent of America's total consumption. Prices shot up and there were shortages. The embargo ended in March 1974 and supplies returned to normal, but prices remained high. The American people now found themselves facing an "energy crisis."

There was a mistaken widespread belief that the price increase in petroleum and petroleum products was caused by the embargo. Price increases were fueled by increased demand that had been developing for several years. In any case, Americans now found themselves paying more—a lot more—to drive their cars, heat their homes, and buy the goods produced by farms and industries that were driven by high-priced oil. The nation had entered a new era.

POTATOES

The potato, an herb of the nightshade family, originated in the Andes Mountain region of South America about 3000 B.C.. Thousands of years later the Inca Indians cultivated it as a vegetable crop. Because the plant is able to withstand heavy frost, the potato was suitable for the Andean region's high elevations—as high as 15,000 feet (4,500 meters). From the potato the Inca produced a flour-like substance called *chuno*, which was used to make bread. When Spanish explorer Gonzalo Jimenez de Quesada (c. 1495–1579) arrived in the Andes in 1530, he found the people growing and eating the tubers. On returning to Europe, the Spaniards took samples with them, introducing it there in the 1539. In 1586 when English admiral Sir Francis Drake (1540 or 1543–96) returned to England from an expedition to North and South America, he carried with him potatoes he had picked up in Cartagena (present-day Colombia), thus introducing the potato in

Poverty

the British Isles. The potato became a major crop in Ireland and Scotland where it was readily grown. (The edible, starchy tuber of the potato is often called the Irish potato.) Since it is also cheap to cultivate, the potato soon became a dietary staple and is credited with spurring a population growth in those countries. The potato did not arrive in North America until 1718, when Irish immigrants landing in Boston brought it with them. They began growing potatoes the following year in Londonderry, New Hampshire. The potato did not become a popular American food until the 1800s.

POVERTY

Poverty can be defined either in terms of a definite income level or as a relative condition that changes as society redefines it. Most economists agree that a safe definition of poverty is the inability, through lack of income or wealth, to provide decent housing, clothing, health care, nutrition, or education for oneself or one's family. In 1999 the federal government defined the "poverty line"—the arbitrary dividing line between the poor and the non-poor—as \$16,700 for a family of four in the contiguous United States. According to the U.S. Census Bureau, the number of U.S. citizens living below the poverty line in 1992 was about 36 million, including 14 million children. Sixty-five percent of this number were women (many unmarried mothers), and in 1990 one quarter of all adult African American males lived below the poverty line.

According to economic historians, roughly seven to 10 percent of the populations of New York, Boston, and Philadelphia were poor in the years before the American Revolution (1775–1783). Between 1790 and 1860 the percentage of U.S. citizens living in poverty probably remained about the same; by 1860 there were approximately 2.7 million poor males in the United States. Since 1870 the percentage of U.S. citizens living in poverty has been cut in half, primarily because of the rapid economic growth between 1880 and 1910 and in the years following World War II (1939–1945). The first efforts by the federal government to cope with poverty began in the 1930s. President Franklin D. Roosevelt (1933–1945) established the Social Security Administration in 1935 to provide minimum retirement benefits to U.S. citizens, and the government began to make federal funds available to the states for programs like Aid to Dependent Children.

By 1960 the U.S. government estimated that 40 million U.S. citizens lived below the poverty line. In

1964 President Lyndon B. Johnson (1963–1969) declared an "unconditional war" on poverty that led to the creation of programs like Head Start and the Neighborhood Youth Corps. Because of these efforts and the billions of dollars donated every year by private citizens and foundations, by 1973 the percentage of the population living in poverty reached its lowest level in U.S. history—11.1 percent, or 20 million U.S. citizens. The Census Bureau estimated that in 1997 about 13.3 percent of the total U.S. population still lived in poverty.

POWDERLY, TERENCE VINCENT

Terence Powderly (1849–1924) was born in Pennsylvania in 1849 to a family of poor Irish immigrants. He rose to become one of the major leaders of U.S. industrial workers during the late nineteenth century. Becoming the leader of the Knights of Labor Union in 1879, his idealism created the first industrial union to admit all workers regardless of race or sex and enabled the birth and development of 135 worker and consumer cooperatives in the United States.

Born in 1849, Powderly did not begin his career as a labor leader. He started out in public office, serving three terms as mayor of Scranton, Pennsylvania. He entered into union work seeking to abolish the capitalist wage system and institute a society where people would live by cooperation, rather than by seeking to gain from exploiting one another.

Powderly sought to lead laborers collectively towards this goal. He preferred to negotiate labor matters in a non-confrontational manner. Powderly hoped to bring harmony to industrial relations, stressing cooperation between workers and industries. With these ideals in mind, Powderly became leader of the Knights of Labor in 1879. Since the labor movement at that time was not open to conciliation and negotiation, Powderly found himself taking the union in a different direction.

Powderly led the Knights of Labor through a series of dramatically successful strikes in the 1880s, among them a victory against the U.S. railroad industry. The 1880s were the early days of the labor movement, and Powderly's victories encouraged union growth. Membership in the Knights of Labor rose from 100,000 to 700,000 in one year. Powderly continued to meet with success as a labor leader, establishing labor

Terence V. Powderly.

bureaus in several states and supporting contract-labor laws.

As time passed the popular union boss became ambivalent about leading a confrontational union, but despite his best attempts, the Knights of Labor continued to be more aggressive. Powderly, who saw himself as a man of peace, became uncomfortable with his position, and as a result, he began to distance himself from union involvement.

Powderly turned more of his attention to pursuits outside the labor movement. While still serving as head of the union, he studied law and served as a county health officer. He partly owned and managed a grocery store and served as vice president of the Irish Land League. He also sought a presidential appointment as the first U.S. Commissioner of Labor. Several times he threatened to resign from the union.

Resignation came in 1893, when a rural wing of the Knights of Labor moved aggressively to oust Powderly from the union leadership. This movement was supported by socialists, who sought open conflict with industrial owners and disagreed completely with

Powderly's insistence on negotiation. By this time the union's strength was failing; its membership had dwindled to seventy-five.

Powderly was relieved to leave the union. He resigned at the age of forty-four and soon started a new career as a lawyer and civil servant. Putting his union leadership days behind him, he worked in several capacities as a civil servant with the U.S. Immigration Commission and the Department of Labor.

Terence Powderly died in 1924. His efforts as a labor leader, though often against his personal philosophy, encouraged workers to organize and change the workplace status quo. He continued to serve the public in his work outside the union until his death.

PRAIRIE

The prairie consists of the flat or moderately hilly lands of the nation's middle section, also called the Great Plains. Oklahoma, Kansas, Nebraska, South Dakota, and North Dakota are mostly prairie. Midwestern states of Illinois and Iowa also contain some prairie lands. Primarily covered with tall grasses (which the pioneers described as a sea of grass), the prairie receives low to moderate rainfall each year. Summers in prairie regions are generally very hot and winters harshly cold. These climatic conditions combined to delay settlement of the region. Though ranchers found grasses suitable for grazing livestock, inadequate rainfall did and does make farming difficult. Further, because the region lacked trees, building on the prairie was limited.

Passage of the Homestead Act in 1862 granted settlers up to 160 acres (64 hectares) of frontier land in exchange for building on or cultivating prairie land. Thus many farmers moved their families onto the Great Plains. In the 1870s Russian Mennonites, who introduced a variety of winter wheat, settled Kansas.

A common crop used by early settlers was turkey red wheat, which could be planted in the fall and harvested in the early summer. The crop, which can withstand cold temperatures, received the benefit of the moisture caused by spring snowmelt and was harvested before the scorching summer. Cultivation of the grain spread, and in 1894 wheat became Kansas' principal crop, earning the state the nickname "Breadbasket of America."

In other parts of the Great Plains farmers adopted dry farming techniques. (A technique by which some

fields are allowed to lie fallow every other season so that soil can store up enough moisture and nutrients to support the next year's crops.) Wheat was found to be well suited to dry farming, but it was not used exclusively. Some farmers also grew corn. The end of the nineteenth century saw the invention of the steel plow and the improvement of the McCormick reaper; subsequently, these machines were a great boon to farm production.

The introduction of winter wheat, the development of dry farming methods, and innovations in agricultural machinery combined to make possible the settlement of the American prairie. As a result, between 1863 and 1900 about half a million families became homesteaders in the West. Most of them settled on the Plains, which became one of the world's leading wheat-producing regions by the early 1900s.

PRICE

Price is the monetary value of a good or service for sale. There are several different kinds of price. Those with the most dominant roles in the marketplace include market price and equilibrium price. Both are tied to the laws of supply and demand.

The market price is the price consumers pay for goods or services in the marketplace. The equilibrium price is an economic ideal. It is the point where the supply of goods is matched equally by consumer demand. For example, if there are more bicycles on the market than there are consumers to buy them, it will create a surplus on the market and the market price of bicycles will go down. If there are more people wanting to buy bicycles than there are bicycles available for purchase, the market price will go up because of the higher demand. When the number of bicycles produced equals the demand from consumers, that is the equilibrium price.

Market price is thus affected by consumer demand and the production rates and availability of a good or service. Ideally, the market price will not be far off from the equilibrium price. Prices for goods or services are subject to change according to consumer demand and producer supply. Price can not be permanently set in a free market system where supply and demand are constantly changing.

PRICE/EARNINGS (P/E) RATIO

The price/earnings ratio (P/E ratio) provides a comparison of the current market price of a share of stock and that stock's earnings per share, or EPS, (which is figured by dividing a company's net income by its number of shares of common stock outstanding). The P/E ratio tells us what a investor will pay for a dollar of earnings. For example, if a company's stock sold for \$30 per share and it posted earnings per share of \$1.50, that company would have a P/E ratio of 20. A company's P/E ratio typically rises as a result of increases in its stock price, an indicator of the stock's popularity.

PRIME RATE

The prime rate is the rate of interest, reported as a percentage, charged by commercial banks on short-term loans to the nation's largest, most credit-worthy corporations. Relatively few U.S. corporations may borrow at this rate. Occasionally banks lend slightly below the prime rate to very low risk corporations. A firm will frequently be quoted a rate slightly higher than prime. As an example, the quote might be prime plus one-half, i.e., if the prime was six percent, the firm might be quoted 6.5 percent. The prime is an important indicator of short-term credit conditions.

The prime rate also serves as a basis for interest rate quotes to individual customers. Mortgage rates rise and fall as the prime rate moves up and down. Individuals might receive a home equity loan or line of credit at a rate of "prime plus three percent."

The prime rate depends on the cost of funds loaned to the commercial bank by the regional Federal Reserve Bank. This cost of funds is the discount rate. When the discount rate lowers, the savings are passed on within a few days to commercial banks and reflected in their prime and all other consumer loan rates. An increase in the discount rate, in contrast, results in an increase in the prime and other consumer loan rates.

Between 1934 and 1950 the prime rate remained in the 1.50 to 2.25 percent range. The 1950s and 1960s witnessed four to eight percent rates. In September of 1973 the prime climbed to 11 percent on its way to an

all time high of 21.5 percent in December of 1980. Rates in the 1990s ranged from six to 10 percent.

PRIVATE PROPERTY RIGHTS

One of the most important characteristics of the U.S. market economy is the private ownership of the means of producing goods and services. Buildings, natural resources, machinery, equipment, and labor are, for the most part, owned privately, not by the government. Under this system of private ownership, known as a system of private property rights, private individuals have certain privileges or legal rights. Producers are largely free to produce what they wish, to decide how to manage the property, and to sell to whomever they choose and under what terms. Laborers are free to work where they choose. This type of system is referred to as a capitalist system. In contrast, a socialist system allows for private property rights regarding labor and personal items but government owns the major productive resources. In a communist system, theoretically, no private property rights exist because the people own everything in common.

Two types of property are recognized, real property and personal property. Real property is land and anything attached to it such as buildings and crops. In modern terms real property also includes the natural resources found over and under the land, such as oil, minerals, and gases. Personal property is anything other than land that can be owned, including money, stocks, machinery, and equipment. Personal property can be tangible or intangible, such as a famous individual's image.

In the United States a system of property law protects private property rights associated with both real and personal property. This system has its roots in English common law. Property law, with principles, policies, and rules, attempts to resolve disputes. It is a unique law in that the disputes are between the rights of individuals with respect to "things," not with respect to other individuals.

Historically, the more confidence is placed in a nation's private property rights, the more private investment will flow to that nation's economy. People are more willing to invest in endeavors that will

Private Sector

increase their private wealth in future years. Throughout the history of the United States and especially in the twentieth century, capital from around the world has been invested in the United States because of its well-defined and enforced private property rights.

See also: **Capitalism, Socialism**

PRIVATE SECTOR

Private individuals and organizations in the United States generate most economic activity involving the production of goods and services. Independent ownership and control define the private sector. Independently owned firms, ranging from large corporations to single individuals within a household, manage their privately owned capital resources to make a profit. Examples include all Fortune 500 corporations such as General Motors and IBM, the local flower shop and a small retail clothing store, the vineyard owner and peanut farmer, the consultant working from a home office and the neighborhood babysitter. Also included in the private sector are non-profit organizations including private colleges and universities and the Catholic Church. In contrast, the public sector includes all governmental activities and local, state, and federal government employees such as postal workers and public school teachers.

In the United States the private sector firms produce, for profit, the majority of goods and services. A business for profit may be organized as a proprietorship, a partnership, or a corporation. In a proprietorship one person owns all the assets and liabilities of the firm. A partnership has two or more owners, both responsible jointly and separately for all assets and liabilities. A corporation is a chartered legal entity with shareholders who are liable only for what they have invested in the firm. In 1993 proprietorships accounted for only six percent of total sales, although they accounted for 75 percent of the total firms. Corporations accounted for 19 percent of total firms but 90 percent of total sales.

Interaction among private sector firms depends on the organization of their entire industry. Industry is defined as firms producing similar products. Types of industry organization generally fall into four categories: competitive firms, monopolistic competitors, oligopolies, and monopolies. Their numbers, product differentiation, price setting power, ease of entry into the industry, and specific distinguishing characteristics differentiate the four.

The U.S. economy, from 1939 to 1980, shifted toward competitive firms. Approximately 77 percent of the firms by 1980 were effectively competitive businesses, 18 percent were oligopolies, and only 5 percent were of the monopolistic organizational type.

From 1970 to 1997 private sector firms experienced a major shift in industry type. Judged by number of employees, manufacturing continuously shrank, while the service sector greatly expanded.

PROCLAMATION OF 1763

The British government intended the Proclamation of 1763 partly as a war measure and partly as a means of administering the new territory taken from France under the terms of the Treaty of Paris. It had two main provisions that affected the colonists. First, the British government drew a line along the watershed of the Appalachian Mountains—the point at which waters run downhill either to the Atlantic Ocean in the east or to the Mississippi River drainage system in the west—separating colonial territory from that of the Native Americans. All lands west of the line were reserved exclusively for Indians, and any settlers living in Indian territory were required to leave. Secondly, in order to make certain that peace was maintained on the American frontier, the British government arranged for the garrisoning of up to 10,000 soldiers in the colonies. The cost of their upkeep, British Prime Minister George Grenville decided, would be borne by the colonists—an estimated 250,000 pounds sterling per year.

WE DO FURTHER STRICTLY ENJOIN AND REQUIRE ALL PERSONS WHATEVER WHO HAVE EITHER WILLFULLY OR INADVERTENTLY SEATED THEMSELVES UPON ANY LANDS . . . RESERVED TO THE SAID INDIANS . . . FORTHWITH TO REMOVE THEMSELVES FROM SUCH SETTLEMENTS.

Text of the Proclamation of 1763

Although some members of the British government may have had a sincere desire to protect the land rights of Native Americans, their main intention was to evade more expensive Indian wars. By limiting white settlement to areas east of the Appalachian watershed, the government hoped to minimize conflict between Indians and colonists. However, Grenville's government also wanted to tie the American colonies closer to England. The British worried that settlers who moved to lands across the Appalachians and lost direct contact

The Proclamation of 1763 was issued by the British to segregate colonists and Indians. The colonists were to stay east of the Appalachian Mountains, and Indians to the west, thus avoiding Indian conflicts, and continued British control of the colonists.

with the British Empire would form economic ties with the Mississippi Valley, then under Spanish control. They also realized that these settlers would need to manufacture some goods for themselves, rather than importing them from England. The British feared that in time such local industries would undercut imperial trade. The simplest way to prevent these things from happening was to forbid settlement west of the Appalachians. This would also keep colonial settlers from drifting away from a market economy. A settler who went far into the interior and began to live in a subsistent economy without using money, would soon lose contact with other colonists and, eventually, also his allegiance to the British crown.

The second part of the Proclamation also threatened American economic prosperity. Grenville's government had inherited a national debt of 137 million pounds sterling, almost twice what it had been before the beginning of the war with France. The costs of

administering the North American empire, Grenville concluded, could well be borne by the colonists, whose debt amounted to only 2.6 million pounds sterling. But the colonies were suffering from a severe post-war depression, and hard cash, or specie (minted gold and silver), was in short supply because of the colonial trade deficit with Great Britain. Most colonial specie was used to pay English or Scottish merchants for goods the colonists had imported.

In order to raise the 250,000 pounds sterling needed to fund the frontier troops, Grenville's government put together a series of direct and indirect taxes on colonial goods and services, including the Sugar Act, the Currency Act, and the Stamp Act. These taxes led to conflict between the American colonies and England, eventually culminating in the American Revolution (1775–1783).

PROCTER AND GAMBLE COMPANY

In 1837 William Procter and James Gamble formed Procter and Gamble (P&G), a partnership in Cincinnati, Ohio, to manufacture and sell candles and soap. Both men had emigrated from the United Kingdom. William Procter emigrated in 1832 after fire and burglary destroyed his woolens shop in London; Gamble came from Ireland as a boy in 1819 when famine struck his homeland. Both men settled in Cincinnati,

Procter and Gamble Company

then nicknamed “Porkopolis” for its booming hog-butcher trade. The suggestion for the partnership apparently came from their mutual father-in-law, Alexander Norris, who pointed out that Gamble’s trade—soap making—and Procter’s trade—candle making—both required use of lye, which was made from animal fat and wood ashes.

Procter and Gamble first operated their business out of a storeroom at Main and Sixth streets in Cincinnati. Procter ran the store while Gamble ran the manufacturing operation, which at that time consisted of a wooden kettle with a cast-iron bottom set up behind the shop. Early each morning Gamble visited houses, hotels, and steamboats collecting ash and meat scraps; he bartered soap cakes for the raw materials. Candles were Procter and Gamble’s most important product at that time.

Procter and Gamble were in competition with at least 14 other manufacturers in its early years, but the enterprising partners soon expanded their operations throughout neighboring Hamilton and Butler counties. Cincinnati’s location on the Ohio River proved advantageous as the company began sending its goods down river. In 1848 Cincinnati was also linked to the major cities of the East via railroad.

Around 1851, when P&G shipments were moving up and down the river and across the country by rail, the company’s famous moon-and-stars symbol was created. Because most people were illiterate at this time, trademarks were used to distinguish one company’s products from another’s. Company lore asserts that the symbol was first drawn as a simple cross on boxes of Procter and Gamble’s Star brand candles by dockhands so that they would be easily identifiable when they arrived at their destinations. Another shipper later replaced the cross with an encircled star, and eventually William Procter added the familiar 13 stars, representing the original 13 U.S. colonies, and the man in the moon. The moon-and-stars trademark became a symbol of quality to Procter and Gamble’s base of loyal customers.

By 1859, the company’s annual sales exceeded \$1 million, and Procter and Gamble employed about 80 people. Following the American Civil War (1861–1865), the transcontinental railroad, completed in 1869, linked the two coasts and opened still more markets to Procter and Gamble. In 1875 the company hired its first full-time chemist to work on new products, including a soap that was equal in quality to expensive castile soaps, but that could be produced less expensively. In 1878 Procter and Gamble’s White Soap hit the market and catapulted P&G to the forefront of its industry.

The most distinctive characteristic of the product, soon renamed Ivory soap, was developed by accident. A worker accidentally left a soap mixer on during his lunch break, causing more air than usual to be mixed in. Before long Procter and Gamble was receiving orders for “the floating soap.” Although the office was at first perplexed, the confusion was soon cleared up, and P&G’s formula for White Soap changed permanently.

Harley Procter, William Procter’s son, developed the new soap’s potential. Harley Procter was inspired to rename the soap by Psalm 45: “all thy garments smell of myrrh, and aloes, and cassia, out of the ivory palaces whereby they have made thee glad.” Procter devoted himself to the success of the new product and convinced the board of directors to advertise Ivory. Advertising was risky at the time; disreputable manufacturers placed most advertisements. Nevertheless, in 1882 the company approved an \$11,000 annual advertising budget. The slogan “99 and 44/100 percent pure” was a welcome dose of sobriety amidst the generally outlandish advertising claims of the day. Procter, committed to the excellence of the company’s products, had them analyzed and improved even before they went to market. This practice was the origin of P&G’s superior product development. Procter believed that “advertising alone couldn’t make a product successful—it was merely evidence of a manufacturer’s faith in the merit of the article.”

During the 1880s there was much labor unrest at many U.S. companies, including Procter and Gamble, which experienced a number of strikes and demonstrations. Thereafter, the company sought to avert labor problems before they became significant. In 1885 the company began giving workers Saturday afternoons off. In 1887 Procter and Gamble implemented a profit-sharing plan in order to intertwine the employees’ interests with those of the company. Although the semiannual dividends were received enthusiastically by employees, that enthusiasm rarely found its way back into the workplace. The next year bonuses were tied to employee performance, which produced better results.

In 1890 the Procter and Gamble Company was incorporated; by that time it was selling more than 30 different types of soap. Two years later, in 1903, the company implemented an employee stock-purchase program, which was tied to the profit sharing plan. By 1915 about 61 percent of the company’s employees were participating. The company introduced a revolutionary sickness-disability program for its workers in 1915 and implemented an eight-hour workday in 1918.

Procter and Gamble has been recognized as a leader in employee benefit programs ever since.

Experimenting with a hydrogenation process that combined liquid cottonseed oil with solid cottonseed oil led to the development of another well-known brand. After several years of research Procter and Gamble patented the procedure; in 1911 Crisco, the first all-vegetable shortening, was introduced to the public. Backed by a strong advertising budget, Crisco sales took off.

During the 1920s and 1930s the company introduced a flurry of new products. In 1926 Camay debuted, a perfumed beauty soap; Oxydol joined the P&G line of cleaning products three years later. In 1933 Dreft was introduced as the first synthetic detergent for home use. In 1937 the company celebrated its 100th anniversary, with sales having reached \$230 million.

After World War II (1939–1945), the availability of raw materials and new consumer attitudes set the stage for unprecedented growth. Procter and Gamble's postwar miracle was Tide, a synthetic detergent that, together with home automatic washing machines, revolutionized the way people washed their clothes. The company was not ready for the consumer demand for heavy-duty detergent when it introduced the product in 1947; within two years Tide, backed by a \$21 million advertising budget, was the number one laundry detergent. Despite its premium price, Tide remained the number one laundry detergent into the 1990s.

Tide helped to fund P&G's rapid growth into new products lines, both through acquisitions and new product introductions. By the end of the twentieth century, Procter and Gamble were the largest maker of household products in the United States, with annual sales in excess of \$37 billion. The company boasted of 300 brands in several areas: baby care, beauty care, fabric and home care, feminine protection, food and beverages, health care, and tissue and towels.

PROCTER, WILLIAM COOPER

William Cooper Procter (1862–1934) spent his entire professional life from 1883 to his death in 1934 with Procter and Gamble, the soap and household products company founded by his grandfather. For half a century, Procter worked to improve conditions for workers, transforming his company from a hotbed of union dissent to a leading example of outstanding employee-management relations. He was known to have a very strong social consciousness and perhaps could be described best as a philanthropic capitalist.

William Cooper Procter was born on August 25, 1862, in Glendale a suburb of Cincinnati, Ohio. His parents, William Alexander and Charlotte Jackson Procter, had five children—William Cooper was their only son. Procter attended Hughes High School in Cincinnati and graduated from Princeton University in 1883. On January 1, 1889, he married Jane Eliza Johnston of Glendale. The couple had no children. Procter was active in the Christ Episcopal Church, where he served as a senior warden, becoming one of the most noteworthy laymen in the Episcopal Diocese of Southern Ohio. While serving as a commanding officer for the 1st Regiment of the Ohio National Guard, Procter established a rifle range, Camp Procter, property that he later gave to the Girl Scouts of America.

In addition to his work with Procter and Gamble, Procter sat on the board of the New York Central Railroad and the National City Bank of New York. He was active in politics with the Republican Party, and managed the unsuccessful campaign of General Leonard Wood for the 1920 presidential nomination. (Fellow Ohioan Warren G. Harding, 1865–1923, got the nomination, and went on to the White House.) Procter also served on many relief committees during the Hoover administration. Procter was extremely generous to his alma mater, Princeton University, and was a

Procter, William Cooper

major donor to the Graduate School. His greatest philanthropic act in his hometown was the amount of time and money that he bestowed upon the Children's Hospital at Cincinnati.

Procter was an unselfish man, a fact borne out by his efforts on behalf of his employees, as well as the contributions he made to numerous charities. He was a sportsman and athlete, active in his church, active in politics, and he received numerous awards and honors, which reflect his many philanthropic endeavors.

A description of William C. Procter is not complete without mentioning his ancestors, James Gamble and William Procter. Gamble and Procter were immigrants from Ireland and England, respectively. Heading West both men stayed in Cincinnati, and married two sisters, Olivia and Elizabeth Norris. William Procter was a candle maker and James Gamble was a soap maker. Their father-in-law suggested that James Gamble and William Procter merge businesses. One essential ingredient for both candles and soap was animal fat at the time, Cincinnati was a major hog-slaughtering center. The men peddled their products along the Ohio River. They became very successful and the company was the largest business in Cincinnati by the time the Civil War started they supplied all the soap and candles for the Union army. In 1890, W.C. Procter's father, William A. Procter, was named the company's first president. William C. Procter was a child when Procter and Gamble's trademark, a man in the moon and 13 stars within a circle, was first used. It was developed by wharf workers who would stamp the symbol on the wooden shipping crates of "Starlight Candles" to identify the manufacturer.

As the grandson of William Procter, William Cooper Procter's future was set. Once he finished his schooling at Princeton University in 1883, he returned to Cincinnati to work for Procter and Gamble. Procter worked in every aspect of the business, both in the factory and office, and as a salesperson. In doing so, he became very much aware of the working and living conditions of the workers. By that time it was an enormous company with large nationwide sales of products such as Ivory Soap. It had developed what was then a model factory called Ivorydale near Cincinnati. But it had a number of problems in the area of worker relations. Procter helped to change the face of employee relations in his family's company and, because of his firm's size and influence, U.S. industry itself. In an era when most business leaders seemed to believe that there was nothing wrong with their workers that pay cuts and the threat of job loss would not cure, his views were extremely progressive, and he set an example for other companies.

When Procter went to work for the family business in 1883, the Knights of Labor, at that time a prominent labor union, were leading a strike at the Ivorydale plant. Whereas the older generation might have taken a hard-line stance that could have caused the strike to go on longer, young William C. Procter talked his father and uncle into letting him use a very different approach. He gave the workers half the day off on Saturdays, an unheard-of concession, and instituted a new profit-sharing plan. He even worked with leaders among the employees to modify the profit-sharing package so it suited their needs.

By his skillful handling of workers' grievances—motivated by what was a genuine concern for his employees' well-being—Procter was able to continue building a successful business in an era when labor unrest was sweeping U.S. industry. Instead of trying to head off the Knights of Labor with billy clubs and rifles, as many of his counterparts in other businesses practiced, Procter dampened their efforts with kindness. The union never gained a foothold in his company's plant.

When the company became incorporated in 1890, Procter became general manager. By then Procter and Gamble was selling more than thirty types of soap and the company was placing large, color advertisements in national magazines. To meet the demand of the consumer, the company opened a second factory. In 1907 his father, William A. Procter, stepped down as company president, and William C. took his place. Once he became company president, Procter went even further. He revised the pension and benefit plans for his employees, and even gave them a voice on the board of directors. In 1918 he instituted a conference committee so that workers had a forum in which to present complaints to management, and in 1923 he guaranteed his employees that they would have work for at least 48 weeks out of every year. That is they would not be laid off for more than four weeks in any 12-month period.

When William C. Procter became president of the company, Procter and Gamble had two plants, the original factory at Ivorydale in Cincinnati and one at Kansas City, Kansas (1905). By the time of Procter's death in 1934, several other plants were built: Staten Island, New York (1908), Macon, Georgia (1910), Hamilton, Ontario (1915), Dallas Texas (1919), Baltimore, Maryland (1930), and Long Beach, California (1931). Procter and Gamble also bought out several other companies, including the William Waltke Company, the Globe Soap Company, and entered the foreign market with its purchase of the James S. Kirk & Company in England and a soap and candle factory in Cuba. Just before Procter joined the family firm, Procter

and Gamble had already become well known for its Ivory soap—the soap that “floats and is 99 44/100 pure.” Under his leadership, the company introduced several products, most notably Crisco Shortening in 1911. Crisco was the first vegetable shortening. It is made from cottonseed oil, also an ingredient used in making soap. Vegetable shortening was healthier than using animal fats and much less expensive than butter, so Crisco became very popular and the product eventually sponsored cooking shows on the radio. Procter and Gamble expanded its factory holdings to include cotton mills with facilities to crush the cottonseed for the production of oil and to process the seed waste to be used for the manufacture of cellulose materials. William C. Procter had created an expansive industrial empire. Procter developed research laboratories to make new products and he also developed one of the first market research departments to study consumer preferences and buying habits. A product was marketed according to its particular use or a specific need of the consumer. In 1932 Procter and Gamble sponsored “The Puddle Family” and in 1934 developed “Ma Perkins”, a serial program sponsored by Oxydol soap—soap operas! In 1930 William C. Procter stepped down as company president. But he remained chairman of the board until his death in 1934.

William C. Procter was a nationally known manufacturer of household products. Perhaps more importantly, he was known for his innovative business management techniques. Elements of Procter’s employee benefits package remained in effect two generations after his death, by which time much of U.S. industry had more or less adapted to his view of employee management. Procter changed the American workplace as well as the American marketplace. He was a model citizen in that he sought to better the conditions of workers and shared his wealth with his community. In the wake of his impressive leadership, Procter and Gamble became the leading seller of household products and the nation’s most dominant advertiser. The company went on to revolutionize the washday with the laundry soap, Tide. Procter and Gamble eventually entered the food and paper markets. By the mid 1990s Procter and Gamble sold over three hundred brands of products in over 140 countries, and had employed over one hundred thousand employees.

PROCTOR, BARBARA GARDNER

Barbara Gardner Proctor (1933–) rose from dire poverty to the head of the second-largest African-American-owned advertising business in America. Her fearlessness and determination in facing obstacles originated from her own harsh beginnings. She was unique in the advertising industry for using her values to guide her work, and she was not afraid to turn away accounts that she found objectionable, such as those that demeaned African Americans or women.

Barbara Gardner Proctor was born in 1933 in Black Mountain, North Carolina, to a single mother, Bernice Gardner. Raised by a grandmother and an uncle, she lived in extreme poverty with no electricity or running water. Her grandmother instilled early determination in Proctor, telling her, “You’re not cute, but you’re smart, and one day you’ll amount to something.” Proctor never forgot the advice and it turned out to be true.

Proctor’s academic ability earned her a scholarship to Talladega College in Alabama, and she went on to earn a B.A. in English and another B.A. in psychology and social science. She graduated with both degrees in 1954. She also was awarded the Armstrong Creative Writing Award from the college in 1954. Later she attended law school.

In 1960 Gardner married Carl Proctor, road manager for jazz singer Sarah Vaughn. But they divorced in 1963. She had one child named Morgan who later worked for her business. She claimed that the 15-hour days that she worked were the best relaxation for her.

Proctor was involved in the business community and received many awards for her work. She served on a number of boards, including the Illinois Bell Telephone Company, the 1988 Illinois Olympic Committee, the Better Business Bureau, the Illinois State Bar

Association Institute for Public Affairs, and the White House Conference on Small Business. She was involved in efforts for the advancement of women and African Americans and worked with such groups as the League of Black Women (served as president from 1978-1982), the National Association for the Advancement of Colored People (lifetime member), and Handicapped Organized Women (served on honorary board). Proctor won a number of awards for her contributions to the fields of writing and advertising. Some of these included the Small Business of the Year Award (1978) and the Black Media Award for Outstanding Professional (1980).

Proctor began her career by using her writing skills in the music field. In 1958 she began working as a jazz music critic and contributing editor to *Downbeat* magazine. From 1961 to 1964 she worked for Vee-Jay Records International in Chicago, creating copy for jazz record covers and later serving as international director.

After her divorce from Carl Proctor, Barbara Gardner Proctor shifted to the advertising industry. Between 1965 and 1970 she worked for three different advertising firms: Post-Keys-Gardner Advertising, Chicago, 1965-1968; Gene Taylor Associates, Chicago, 1969; and North Advertising Agency, Chicago, 1969-1970. Eventually, she served as copy supervisor at North Advertising Agency. She decided to launch her own business when she was fired from North Advertising Agency for refusing to work on an ad campaign to which she objected. The ad, which she found demeaning to women and African Americans, parodied the Civil Rights Movement and featured protesting women running down the street and demanding that their hairdressers foam their hair.

In 1971 Proctor launched her own business, Proctor and Gardner Advertising. To go into business she applied for a small business loan, which she was denied for lack of collateral. Armed with data (three advertising agencies statements of what they would pay her as an employee), she convinced the lender to give her an \$80,000 loan using herself as collateral.

She faced a number of societal obstacles that did not deter her. As she explained in *Ebony*, "I happen to be born female and black, but I am much more than that. To view one's self in terms of those two small biological characteristics is very self-limiting." In a time when not many women or African Americans ran businesses, Proctor purposefully named the business using both "Proctor" and "Gardner," so that potential clients would assume that "Gardner" was a male partner behind the scenes.

After six months in business Proctor had her first client. At the end of four years in business, Proctor needed more working capital and applied for another loan from the Small Business Administration (SBA). But the SBA refused. Undaunted, she looked inward, refusing to blame any external situations. In the April 30, 1984, edition of the *New Orleans Time-Picayune*, Proctor explained, "In every case where something would have been an obstacle, I've found a way to turn it to an advantage. I cannot buy the concept that anyone outside is responsible." She credited her impoverished upbringing with giving her the ability to take risks, since she had already been exposed to adversity in her life and had little fear of the unknown.

I HAPPEN TO BE BORN FEMALE AND BLACK, BUT I AM MUCH MORE THAN THAT. TO VIEW ONE'S SELF IN TERMS OF THOSE TWO SMALL BIOLOGICAL CHARACTERISTICS IS VERY SELF-LIMITING.

Barbara Gardner Proctor

Proctor brought to her business a firm belief that advertising should encompass quality and equality. According to *Contemporary Newsmakers*, the timing was right for minority business to succeed. In the advertising arena, the African American market was just beginning to be understood, giving Proctor's company a virtually untapped market. Proctor was able to focus on this niche and maximize profits, as well as present a positive picture of the African American community.

Proctor maintained a diverse staff with many women and minorities, and in a 1982 *Ebony* article she called her staff one of the best in the world. She described herself as a non-boss who did not believe in telling professionals how to do their jobs. On the other hand, she held employees accountable, specifying that if they challenged any directions that she had given, that they had "damn well better deliver" to the client. Her son Morgan served on her staff and expressed an interest in taking over the company in the future.

By the mid-1990s sales had slowed, however, and in 1995 Proctor & Gardner Advertising filed Chapter 11 bankruptcy, a protective measure that offered a chance to restructure the firm's finances and pay off debt. At the time of bankruptcy the company was more than \$1.8 million in debt and reported assets of \$361,000. The company had more than \$5 million in account billings. In 1996 Proctor dissolved the advertising agency. Honing in on the increase in Internet use, she started a new company, Proctor Communications Network, which offered Internet marketing expertise and

web site design. The business was later renamed Proctor Information Network, Inc.

Proctor was able to rise from extreme poverty and create a business that became the second-largest African American advertising agency in America. In 1983 the company had \$12 million in billing. Some of Proctor & Gardner's long-standing clients included Kraft Foods, Sears, Roebuck and Co., and Alberto-Culver. Another long-term client, Jewel Foods of Chicago, credited Proctor & Gardner Advertising with rescuing Jewel's generic food line, which suffered poor sales. Proctor & Gardner redesigned the food campaign, giving it a stronger and more positive tone.

Noteworthy of Proctor's work in the advertising field was her adherence to her values. She refused to take work that degraded women, blacks, or that she found morally unacceptable. For example, Proctor & Gardner did no work for cigarette or liquor accounts. Proctor was wary of what she called "ethnically dubious advertising pitches" that were aimed at women and minorities. She maintained, "Advertising is the single most important way of reaching everyone in America and I feel a deep responsibility to my work."

PRODUCTIVITY

Productivity is the quantitative relationship between the number of inputs employed and the number of outputs produced. For example, productivity on a farm involves the inputs (or resources) of land, labor, tractors, feed, etc., and the outputs (outcomes) of crops and livestock. An increase in productivity means that more outputs (crops and livestock) can be produced from the same or fewer inputs. For instance, crop

productivity on a farm may increase because the farmer planted a new, genetically engineered crop designed to be more resistant to insects and disease. The crop is planted on the same amount of land the farmer used the year before, however, the sturdiness of the genetically engineered plant allows more of the crop to survive the growing season and be harvested, increasing the farmer's productivity.

An increase in crop yield is a single-factor productivity indicator. A single-factor productivity indicator defines itself as one factor, rather than many, contributing to increased productivity. Another single-factor productivity indicator may be output per man-hours worked. Several factors combined can also contribute to increased productivity. They are called multi-factor productivity indicators. Total farm output per unit of input is a multi-factor measure.

Productivity plays a vital role in the economy. Increased productivity in national industries can raise the standard of living and the quality of life. It can also improve production efficiency and enhance competition. Technological advances have played a large role in increasing industrial productivity in the twentieth century. However, growth through improved technology may also work against an economy, creating unemployment, as the number of workers needed to produce the same output declines. For instance, with the advent of the multi-purpose tractor in the agricultural industry many tasks previously done by manual laborers were mechanized. The laborers who could not adjust their skills to meet the changes in the industry saw their jobs disappear. Unemployment brought on by changing technology and worker inability to meet those needs is called structural unemployment.

Though productivity and growth clearly affect a nation's economy there is no single way to measure it. Inputs and outputs involve numerous variables and no method has developed to accurately capture all the factors involved.

See also: Structural Unemployment

PROFIT

Profit is the money that remains after the cost of manufacturing, marketing, taxes, interest, depreciation, and any other expenses incurred in the production of a product or service have been deducted from the price subsequently received for the product or service. In a market economy profit is the key element that drives buying and selling decisions. A profit is most easily made when the demand for a product or service

far exceeds the supply. In such a situation a higher price can be exacted regardless of the production costs of the product or service. Profit may also be referred to as net earnings, net income, or bottom line.

PROGRESSIVE TAX

A progressive tax system is one which assesses a higher percentage rate of taxation as income levels or income brackets increase. The U.S. federal income tax system is a progressive tax system. (For the following examples consider all the taxpayers to be filing their income tax returns as single individuals.) In 1999 the person making from 0 to \$25,350 would pay 15 percent on all of their income. Therefore, a low-income person pays 15 percent on their total income. The person making up to \$61,400 pays 15 percent on the first \$25,350, but then pays 28 percent on the income between \$25,350 and \$61,400. To illustrate, if a middle income individual makes \$50,000, 15 percent or \$3,802.50 would be paid on the first \$25,350. On the next \$24,650 (\$50,000 minus \$25,350), 28 percent or \$6,902 is added to the \$3,802.50 for a total tax payment of \$10,704.50. That amount is 21 percent of the total income of the middle-income person. This tax rate is an increase of six percent over the 15 percent the lower-income person would pay on his or her total income. Because higher income groups pay a higher percentage of their total income in taxes, this tax structure is considered progressive. Using tax rates for 1999, income in the range of \$61,400 to \$128,100 is taxed at 31 percent, \$128,100 to \$278,450 at 36 percent, and over \$278,450 at 39.6 percent. In 1982 the top income bracket was taxed at 50 percent and 14 tax brackets existed. The Tax Reform Act of 1986 reduced the number of income brackets to three (15 percent, 28 percent, and 31 percent). The Clinton Tax Package of 1993 increased the brackets to the five used in the 1999 illustration (15 percent, 28 percent, 31 percent, 36 percent, and 39.6 percent).

PROHIBITION (ISSUE)

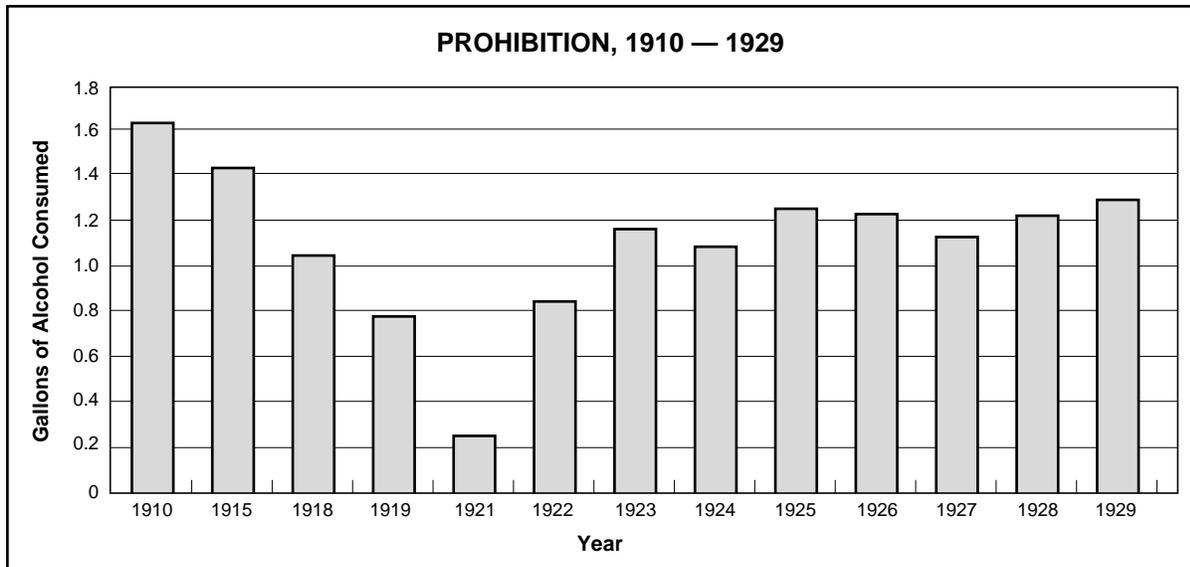

During the colonial period in America alcohol consumption was more common than it was at the end of the twentieth century. Some estimate per capita consumption of alcohol during colonial times at double

the rate it was in the 1990s. Puritans brewed beer and ordinary citizens consumed prodigious amounts of hard cider. Part of the reason for so much alcohol consumption was the uncertainty of potable water. Cholera epidemics in the 1830s and 1840s resulted in part from drinking unclean water. Although the abuse of alcohol was more common then, there is also considerable evidence that it was frowned upon. For example in Virginia as early as 1629, ministers were prohibited by law from excess in drinking, and in Massachusetts a 1633 law limited the amount of alcohol that could be purchased while another statute in 1637 limited the amount of time anyone could spend in a tavern. Later, many colonies imposed fines for excessive behavior as well as taxes and license fees.

The last half of the eighteenth century witnessed the beginnings of the temperance movement as religious leaders began to denounce not only excessive drinking but all consumption of alcohol. Technically, temperance meant moderation, but in fact people meant abstinence. In 1773 John Wesley, one of the founders of the Methodist Church, declared that drinking was a sin and Anthony Benezet, a leading member of the Society of Friends, the Quakers, wrote a pamphlet in which he argued that drinking tended to make a man behave foolishly and even dangerously.

The medical community was also concerned. In 1785, Dr. Benjamin Rush, the leading physician of the day, published a pamphlet entitled "Inquiry into the Effects of Ardent Spirits Upon the Human Body and Mind," wherein he listed various diseases thought to plague those who consumed alcohol. At about this time temperance organizations began to appear. Among the first were the Organization of Brethren and the Litchfield Connecticut Association.

In the early nineteenth century, those who opposed alcohol became more strident because many people saw drinking as an impediment to the growth of democracy and U.S. nationalism. This period saw the first experiments with statewide prohibition. Maine passed the first prohibition law in 1843. During the next few years Ohio, Illinois, Rhode Island, Minnesota, Massachusetts, Connecticut, Pennsylvania, and New York followed suit. But most of these efforts were short-lived. They were vetoed, soon repealed or stricken down by the courts. There was also, of course, considerable opposition from the public. State prohibition laws were widely ignored while they were in effect and in some cases there was violence, as in 1850 when people rioted against Sunday closing laws in Chicago. Still, the advocates of prohibition persisted. The American Temperance Society was founded in 1826, followed by the Washington Movement in 1840 and the

The passage of the Eighteenth Amendment in 1921 outlawed alcoholic beverages nationwide. Although a marked decrease in consumption was seen that year, the law was generally considered a “disastrous failure” because of the rapid growth in illegal consumption and crime in the following years.

Sons of Temperance in 1842. All these organizations advocated total abstinence.

By the late nineteenth century the prohibition movement, like other reform movements, was lobbying Congress. The National Prohibition Party was founded in 1869, and ran its first candidate for president, James Black, in 1872. The Women’s Christian Temperance Union was established in 1874. The organization was led by Frances Willard who was also an advocate of women’s rights and suffrage. By 1884 the issue was clearly affecting the national parties. James G. Blaine, the Republican candidate for president in that year, lost to Democrat Grover Cleveland (1885–1889), partly as a result of his ineffective handling of the temperance question. He succeeded only in alienating people on both sides of the debate.

In 1895 the Anti-Saloon League was founded. Over the next decade-and-a-half the Anti-Saloon League was to become the most powerful lobby for prohibition advocates. Supported mostly by rural, middle-class, white Protestants, the League conducted an aggressive campaign. The Anti-Saloon League argued that liquor was destructive to society because it contributed to divorce, poverty, pauperism, crime, child abuse and insanity. During the early twentieth century, the so-called Progressive Era when social and political reforms were in vogue, the League portrayed prohibition as one of the leading reform movements of the day, and the results were impressive. By 1913 nine states had adopted statewide prohibition, and 31 had chosen the “local option” which allowed cities or counties to go

dry by referendum. As a result, 75 percent of the population lived under some form of prohibition. While this was regarded as a dangerous trend by wets (people in opposition to prohibition) and their leading organizations such as the National Brewers Association, the prohibitionists would not be satisfied until prohibition covered the entire country.

Between 1913 and 1915 prohibition resolutions were twice introduced in Congress by Congressmen Joseph B. Thompson of Oklahoma and Senator Morris Sheppard of Texas. These both failed, but when the United States entered World War I in 1917, things changed. Prohibitionists could argue that the liquor industry was unpatriotic because it drained resources like grain that should be used for food, that the use of alcohol undermined the effectiveness of soldiers, and that many of the families who owned breweries and distilleries were ethnic Germans.

The resolution to prohibit the manufacture, sale, transportation, and importation of alcoholic beverages passed Congress in early 1918. Just a year later it was ratified as the Eighteenth Amendment when on January 16, 1919, Nebraska became the thirty-sixth state to approve it. The enforcement law, commonly known as the Volstead Act, passed Congress on October 29, 1919, and prohibition officially went into effect on January 17, 1920.

The national prohibition experiment was in effect for 13 years from 1920 to 1933. It was a disastrous failure in most parts of the country although in certain

Proportional Tax

sections like the rural South it more or less worked because it had popular support. Generally however the results were not good. Smuggling increased during the early years followed by a rapid increase in crime as “bootleggers”—the manufacturers of illegal liquor—sought to meet the overwhelming demand.

It is estimated that by 1930 the illegal manufacturing establishments numbered over 280,000, and illegal saloons—known as Speakeasies—numbered between 200,000 and 500,000. Moreover, people manufactured “home brew” in vast but unknown quantities and doctors issued prescriptions for equally vast quantities of whiskey to be used for “medical purposes.” Contemporary estimates believe that doctors earned \$40 million in 1928 alone by writing such prescriptions.

Because Congress never appropriated sufficient funds, the Volstead Act could not be effectively enforced and probably would have been repealed eventually under any conditions, but it was the coming of the Great Depression that hastened its demise. This was because the Depression triggered demands for increased employment and tax revenues.

By 1929 it was clear that prohibition was a failure and President Hoover (1929–1933) appointed a special commission to study the issue. Chaired by George W. Wickersham, a former Attorney General, the commission issued its report in 1931. Oddly enough, even though the commission recognized all the problems with prohibition, they nevertheless recommended that it be continued. This however was not to be.

At their 1932 national convention the Democrats advocated for the repeal of the Eighteenth Amendment and their presidential candidate, Governor Franklin Delano Roosevelt (1933–1945) of New York, agreed. Roosevelt was easily elected and the repeal amendment was introduced in Congress on February 14, 1933, before the inauguration. It was approved by both Houses within a few days and submitted to the states for ratification. It was quickly approved and adopted by Congress on December 5, 1933.

Even though the national prohibition experiment failed, there remained millions of people in this country who thought alcohol and its use were sinful, wasteful and dangerous. Thus prohibition in one form or another persisted. The Prohibition Party, though minuscule, continued to campaign, certain churches demanded that their members practice abstinence from alcohol, and 40 states continued to permit the local option.

PROPORTIONAL TAX

A proportional tax system, also called the flat-rate tax, assesses the same percentage rate of taxation on everyone, regardless of income. If the proportional tax rate were set at 20 percent, an individual making \$10,000 would pay \$2000 in taxes; a person with an income of \$50,000 would pay \$10,000; and a person making \$100,000 would pay \$20,000. Even as the income goes up or down, the percent of total income paid in taxes does not change. It is the same percentage at all income tax brackets.

Many state income tax systems are very close to being proportional tax systems. High-income individuals, under a proportional tax scheme do pay more than lower-income people. However, public debate centers on the idea that high-income persons can better afford to pay their taxes while low-income persons need all their income to meet basic needs and are, therefore, hurt by a proportional tax. In the 1990s the flat-rate tax was touted as a way to greatly simplify a complex tax system and, for many people, as an overall tax savings in comparison to the progressive tax system.

THE PROSPERITY DECADE, 1921–1928 (OVERVIEW)

The period of U.S. history between 1921 and 1929, known as the Era of Prosperity, was dominated by the Republicans in the national government. The three Republican presidents who served during that time were: Warren G. Harding (1921–1923), Calvin Coolidge (1923–1929), and Herbert C. Hoover (1929–1933). Harding was incompetent and his administration was corrupt. He died in office (August 2, 1923) and was succeeded by Calvin Coolidge who served for nearly six years. Coolidge came into office with a reputation for honesty that he maintained throughout his administration. Very popular, he was re-elected to his own term of office in 1924; he could probably have run again successfully in 1928, however, he chose to step down. He was succeeded by Hoover who, since 1921, served as Secretary of Commerce in both Harding's and Coolidge's administrations. At first Hoover was very popular but the financial collapse of 1929 destroyed his reputation.

Businessmen wanted lower taxes and higher tariffs and the Republicans tried to accommodate them. In 1921 the new Secretary of the Treasury, Andrew W. Mellon, recommended a tax plan that included repeal of the wartime excess profits tax and an income tax reduction of nearly 40 percent. However, he had to compromise with Congress; the bill that finally passed reduced the maximum tax rate by 17 percent and raised corporate taxes by 2.5 percent. Mellon served all three administrations. By the end of the decade he had reduced the income tax rate by approximately 30 percent.

On May 11, 1924, Congress enacted a law known as the Emergency Tariff. It raised rates on meat and farm products. Then, in September 1922, Congress passed the Fordney-McCumber Tariff. This measure again raised tariff rates on farm products and also protected chemicals, silk and rayon textiles, toys, china, cutlery, and guns. This law remained in effect until 1930 when it was replaced by the Smoot-Hawley Tariff (which, again, raised rates substantially). By then the average on all imports was 40 percent.

The years following World War I (1914–1918) were marked by a declining birthrate in America. The number of children born fell from 23.7 per thousand in 1920, to 18.9 in 1930. Declining birthrates coupled with immigrant restriction led to an overall decline in population growth. However, this was not the only significant demographic feature of the period. Rural population declined and cities grew. Between 1920 and

1930 some six million people migrated from the farm to the city. By the end of the decade only 44 percent of Americans lived in rural areas (farms and small towns). Among those who moved to the cities were large numbers of African Americans. Eighty-nine percent of all African Americans lived in the South in 1910 but by 1930 the number had been reduced by 10 percent.

The overall economy during this period featured erratic shifts in profits and employment. During the World War I and immediately after it there was a production boom triggered by accelerated demand. Beginning in 1920, however, inflation gave way to a decline driven by the collapse of farm prices. Farmers had indulged in significant production increases during the war and now their markets were melting away. By the spring of 1921 the nation was in the throes of a full-fledged depression. Foreign trade was cut nearly in half, wholesale prices fell 24 percent, and unemployment neared 5,000,000. However recovery began in 1922 for most sectors of the economy (except agriculture); economic improvement continued with few reversals until 1929. It is mainly in comparison to the subsequent Great Depression that this decade is called the "Prosperity Decade."

Per capita income in the United States during the prosperous twenties rose from \$620 in 1919 to \$681 in 1929 (9 percent), while at the same time earnings increased by 26 percent. This trend was driven by large expansion in the construction industry and manufacturing; widespread confidence about the period seemed justified. However there were other indicators that suggested general trends were deceiving. These indicators revealed, among other things, a significant maldistribution of wealth. For example, corporate profits increased nearly 62 percent between 1923 and 1929, but workers' real income increased only 11 percent. Despite perceptions about the "Prosperity Decade," many people were not prosperous at all. A decent standard of living during that period required an annual income of \$2,500, but 71 percent of all families had incomes below that figure.

Several industries which were barely in their infancy at the end of the war grew dramatically during the next decade. These included automobile, electric power, machinery and appliances, radio, aviation, and motion pictures industries. Measured by its social and economic impact, the automobile industry was easily the most important industry of the era. Automobile industry magnate Henry Ford (1863–1947) was the dominant leader of the industry. He perfected the Model T, a vehicle that practically anybody could afford. More importantly, he developed the moving assembly line which made production cheap and fast.

The Prosperity Decade, 1921–1928 (Overview)

During the 1920s automobile production expanded dramatically from 1.5 million at the beginning of the decade to 4.8 million by the end. By 1929 the industry utilized 15 percent of all the steel and 80 percent of all the rubber production in the United States. Car manufacturers employed 7.1 percent of all the wage earners in the country and produced 12.7 percent of the value of all manufactured goods.

Electric power became the second most important economic interest in the country during the Era of Prosperity. By 1929 seventy percent of all homes had electric power. Widespread availability of electricity spurred the invention of new appliances such as irons, washing machines, vacuum cleaners and refrigerators.

Closely related to electric power was the radio industry. Until 1919 the federal government banned the private use of radio sets, but once the ban was lifted, the radio industry began its rapid growth. By 1929 forty percent of all American families had radio sets in their homes.

The aviation industry grew slowly in the first, few post-war years. Congress passed the Air Commerce Act in 1926, which gave control of commercial aviation to the Commerce Department; thus, the age of the aviation industry began. Secretary of Commerce Herbert Hoover (1874–1964) did all he could to promote the industry. Scheduled air service began in 1926 and by 1930 there were 122 airline companies in operation.

In 1896 the motion picture machine was invented by Thomas A. Edison (1847–1931); only seven years elapsed before production of the first “movie” with a story, *The Great Train Robbery* (1903). However, the motion picture industry really began in 1905 when admission to a projection house (5 cents) was first charged in Pittsburgh. The first theaters, called nickelodeons, were very popular. By 1907 there were 5,000 of them in all parts of the country. Over the next few years the technology improved dramatically and by World War I the large, ornate movie theater appeared. Sound and color were added by the end of the 1920s. By 1930 there were 23,000 theaters in the country with annual admissions revenue of \$1.5 billion. The industry employed 325,000 people with a capital inventory of two billion dollars.

The 1920s (the Prosperity Decade) are often called the Age of Big Business. This is true not only because of the rapid expansion of industry but also because of numerous mergers which produced very large business entities. By 1929 two hundred corporations controlled 49 percent of all corporate wealth in the country and received 43 percent of all corporate income. There were only two monopolies by 1929—in the sulfur and

aluminum industries—but there were many near monopolies or oligopolies (an oligopoly is an industry controlled by a very small number of participants).

When Congress passed the Clayton Anti-Trust Act in 1913 and simultaneously created the Federal Trade Commission (FTC), they had sought to end destructive competitive practices that had characterized business since the late nineteenth century. These practices had been largely abandoned by business in the 1920s; the rise of oligopolies had actually enhanced competition. Hence the goal of the government during this period was to encourage healthy competition. If that meant competition among a few, very large businesses which provided high quality goods and services to the people, so much the better. Critics, of course, charged that government had become the handmaid of business, but this was true only in a limited sense.

The American farmer suffered most from the depression of 1921–1922, and never fully recovered as did most other sectors of the economy. In 1919 farmers received 16 percent of the total national income. In 1929 they received only 8.8 percent.

Between 1921 and 1924 a non-partisan group in Congress known as the Farm Bloc worked aggressively on behalf of the farmers. They passed laws regulating the meat packers, the stockyards, and the grain exchanges, and they also created a system of government-backed credit for farmers. However, they did not address the real problem—overproduction. Congress tired to deal with this problem, but their efforts failed. Known as McNar-Haugen Bill, Congress approved a proposal to buy the surplus and sell it abroad. Farmers would then pay a tax on the part of the surplus they produced in order to finance the program. Although complicated, the plan might have worked, but it never became law because it was vetoed by President Coolidge.

Just before the Depression (1929–39) the Hoover administration passed the Agricultural Marketing Act (June 20, 1929). This law created the Federal Farm Board with a revolving fund of \$500 million to be loaned to agricultural cooperatives so they could build warehouses and hold their members’ products in case of a price decline. The Board was also authorized to stabilize prices through direct intervention in the market. The program was the most important effort yet attempted by the American government to stabilize and support agriculture. However, the Agricultural Marketing Act proved ineffective in the wake of the catastrophic economic collapse which began in 1929.

The country experienced a period of inflation just before the depression of 1921–22. This was the key

factor in setting off a wave of strikes by means of which the American Federation of Labor (AFL) hoped to preserve wartime gains and expand the union movement. Some of these strikes succeeded, but there were others that failed and caused long-term damage to the labor movement. Among these were the great steel strike and the Boston Police Strike of 1919. In cases such as these, strike leaders were branded as radicals and public opinion turned against them.

Organized labor, contrary to the hopes of its leaders, did not grow during the 1920s—membership declined. The reasons for this include the absence of aggressive leadership in many of the unions coupled with the rise of a new concept called “welfare capitalism,” which became popular in some industries. First promoted by Henry Ford, the idea was to seek cooperation rather than conflict between labor and management. This was to be accomplished by paying good wages, providing benefits like vacations, insurance, and retirement packages, and by listening to the workers’ ideas. That this plan worked is reflected in the fact that AFL membership declined nearly 30 percent between 1920 and 1930.

The banking business and the stock market were practically unregulated during the 1920s and this led to considerable fluctuation in the world of finance. Many banks failed, particularly in rural areas dependent upon agriculture; conversely, numerous mergers occurred. Thus, while the number of banks declined by more than 5,700 between 1919 and 1929, their total resources increased spectacularly from \$47.6 billion to \$72 billion.

The way banks did business also changed. Before the war a commercial bank’s chief function was to make short term loans to business and industry. But during the twenties most businesses were so profitable that they relied upon their own resources for expansion and current operating expenses. Hence the banks had large sums to invest in other ways. They increased their investments in stocks and bonds, increased loans against real estate, and loaned vast sums to stock brokers for speculative purposes. Bank loans to brokers against stocks and bonds totaled more than \$8.5 billion by the fall of 1929. In addition, banks established their own investment affiliates and did their own speculating in the stock market. This progression continued as long as the market continued to boom as it did between 1926 and 1929, but the collapse, which came in the latter part of the year, took many banks with it. This was the dawn of the Great Depression and a new era in American economic history.

PROTECTIONISM

Protectionism is a set of policies by which a government seeks to shelter its industries from foreign competition and or help them increase exports to international markets. The most common form of protectionism is a tariff, which is a duty or tax imposed on goods based on their value or size. Subsidies are direct payments or credit given by the government to a protected industry to encourage it to export its products. Quotas set upper limits on the amount of imports that can enter the protected country, and governments can also set limits on investments by foreign companies in domestic businesses. A more recent protectionist policy is the “voluntary export restraint” in which a foreign country is strongly “encouraged” to refrain from importing certain goods under the threat of some more severe action such as quotas. Protectionism can also take the form of preferential purchasing policies, such as the U.S. government’s requirement that its agencies “buy American.”

Throughout its history, the United States has been a protectionist country. A series of tariff laws throughout the nineteenth century steadily raised barriers to foreign trade to encourage the growth of U.S. industry. Beginning in the mid-1870s, however, the United States began exporting more than it imported and it became much more integrated in the global marketplace. Strong protectionist trade policies returned with

Protectorate

a vengeance around the world in the 1920s, and the high tariffs the United States imposed through the Smoot-Hawley Tariff of 1930 were later credited with contributing to the United States' shrinking foreign markets during the Great Depression (1929–1939). After World War II (1939–1945) it was clear that strong protectionist policies had contributed to the destruction of the world order in the 1940s. The launching of the General Agreement on Tariffs and Trade (GATT) in 1948 represented a mostly effective attempt to reduce protectionism and create a positive climate for free trade worldwide.

Under GATT, tariff rates were cut and member nations agreed to drop discriminatory trade policies and adopt the same "most favored nation" trade practices for all other members. Under the so-called Kennedy Round (1964–1967) of GATT negotiations, the United States took a further step away from its protectionist history, and GATT members agreed to include agricultural products under GATT guidelines while adopting an "anti-dumping" code to prevent countries from flooding another's markets with cheap goods. The Tokyo Round (1973–1979) brought further tariff reductions, guidelines for outlawing unfair subsidy practices, and policies for encouraging trade with less developed countries. In 1995 GATT was replaced by a permanent free trade organization, the World Trade Organization, but protectionism was far from dead.

PROTECTORATE

The term protectorate evolved in the nineteenth century. It refers to a relationship in which a weaker state relinquishes the control of a portion or all of its international relations to a stronger state in return for protection. This relationship is a form of guardianship and the reciprocal rights and duties between the two states generally are delineated by treaty. The protected state is considered the "protectorate." In international law the protectorate still retains recognition as a state by other nations and may retain some of its state rights such as a right to diplomatic representation. The protectorate usually maintains control over its domestic affairs.

In the nineteenth century, protectorate relationships often preceded colonial expansion or, as in the case of the United States and Caribbean, aimed at preventing foreign rivals from gaining a foothold in certain areas and upsetting a delicate balance of power. U.S. foreign policy toward the Caribbean from 1898 to

1933 is known as the protectorate era. The United States feared regional instability would lead to non-U.S. foreign intervention. The United States repeatedly used military force, dollars, and custom's controls to safeguard countries such as Puerto Rico, Haiti, Cuba, and Latin American nations, keeping them solvent and stable.

PUBLIC SECTOR

A "public sector" is comprised of local, state, and federal government agencies, as opposed to the "private sector," which is made up of households and businesses. Economists generally speak of the government and the public sector as the same thing. The public sector employs about one-sixth of the labor force, purchases about one-fifth of the total output of the economy, and accounts for about one-quarter of all personal incomes. Because the public sector includes all government activities, not just the federal government, it includes all forms of public employment. It includes teachers, many scientists, the military, police and fire services, and all other areas of public service employment.

PUBLISHING INDUSTRY

Book publishing began to flourish in the American colonies during the eighteenth century. Printing began in 1639 in Cambridge, Massachusetts, and expanded geographically to Boston in 1674, Philadelphia in 1685, and New York City in 1693. Almanacs, primers, and law books were published; theology being the most popular subject. Books were sold in various ways: through subscription, by the printer, in the streets by hawkers, and in shops by booksellers. Hezekiah Usher, who added books to his general merchandise inventory around 1647, may have been the first American bookseller.

The availability of reading matter after 1650 contributed to the spread of literacy and an educated middle class. During the eighteenth century prose novels grew in popularity, while among those of modest means almanacs and chapbooks were more common. Benjamin Franklin's (1706–1790) *Poor Richard's Almanack* (sic), which contained a variety of information as well as religious and moral sayings, was published in Philadelphia in several editions from 1732 to 1764. Chapbooks typically contained a popular story illustrated with woodcuts.

In 1800 the Library of Congress was established. The growth of book publishing led to the establishment of commercial lending libraries in the eighteenth century and, in the nineteenth century, free public libraries. The nineteenth century marked a new era in book publishing brought on by technological innovations that significantly reduced the cost of printing and publishing books. These innovations included stereotyping, the iron press, steam power, mechanical typesetting and typesetting, and new methods of reproducing illustrations. Paper and bindings became less expensive. After 1820 cloth cases began replacing leather bindings, and publishers that had previously issued their works unbound began to publish them already bound.

The nineteenth century book trade was marked by expansion and competition, both in Europe and in the United States. Populations were rapidly growing, communications were improving, and there was a strong desire both for self-improvement and for entertainment, all of which contributed to a strong book trade. In the United States publishing gradually became concentrated in a few major cities: Philadelphia, Boston, and New York City. In addition to publishing American authors such as Washington Irving, James Fenimore Cooper, Ralph Waldo Emerson, U.S. publishers competed fiercely to publish reprint editions of British works by Charles Dickens, Sir Walter Scott, Thomas Macaulay, and others. U.S. publishers would wait at the dockside for a new British title and have a reprint edition ready within hours. Many of these editions were pirated, with no royalties paid to the authors.

WHAT CAN BE SAID OF THE PAST 25 YEARS IN PUBLISHING, OTHER THAN THAT THEY MAKE THE PREVIOUS 100 SEEM SLOW IN COMPARISON?

Publishers Weekly, July 1997

Comprehensive catalogs of books began as early as the book fairs held in Frankfurt, Germany, in 1564, and in Leipzig, Germany, in 1594. During the nineteenth century several such lists were published in England and France and became national lists, with the first U.S. *Cumulative Book List* appearing in 1898.

Many small publishing houses were started in the United States in the 1890s and in the early part of the twentieth century. Start-up costs were low, and it was relatively inexpensive to publish an edition of 1,000 copies of a new book. Public education created a need for textbooks, and publishers began to specialize. In 1912 the Authors' League was formed in the United States to help standardize relations between authors

and publishers, especially regarding contracts and the payment of royalties.

Following World War I (1914–1918), booming economic conditions produced an even more prosperous middle class who demanded even more books. The number of publishing houses grew. U.S. authors, such as Ernest Hemingway and Sinclair Lewis, found a world market. New York City became a source of talent for publishers everywhere. Universities grew in number and college textbooks became an important part of the publishing industry.

Book clubs that offered books by mail began to appear following World War I, with the Book-of-the-Month Club starting in 1926; its rival was The Literary Guild. Book clubs experienced a decline in popularity in the 1950s with the advent of cheap paperbound books.

The Great Depression (1929–1939) caused a trade slump in book publishing beginning in October 1929. In 1935 British publisher Allen Lane launched the Penguin series of paperbacks, and it immediately caught on. Shortly before the outbreak of World War II (1939–1945) Penguin paperbacks became available in the United States through Ian Ballantine, who later founded both Bantam Books and Ballantine Books. U.S. distribution was later taken over by Victor Weybright, who in 1948 founded the New American Library, another successful paperback venture.

The most successful U.S. publisher of mass paperbound books was Pocket Books, founded in June 1939 by Robert F. de Graff. Partnering with Richard Simon and M. Lincoln Schuster, founders of publishing house Simon and Schuster, de Graff began with a modest list of 10 titles, all reprints. Their success was immediate and unprecedented, and the company continued to dominate mass-market paperback publishing for decades. Several magazine publishers decided to launch paperback imprints, including Avon Books in 1941, Popular Library in 1942, and Dell Books in 1943.

World War II disrupted publishing but brought hidden benefits. Nazi persecution of the Jews resulted in the emigration of publishing talent to England and the United States, among other countries. Paper shortages caused publishers to print fewer new titles and fewer copies, but many of these smaller editions sold out to a public that had more time to read. There were also fewer consumer goods to compete with books, because of wartime rationing. As a result a new reading public emerged, and social and economic conditions favored publishing in the postwar period.

Technological developments after World War II spurred the publication of many new technical books,

Publishing Industry

including college textbooks. There was also a major advance in printing, with photo composition replacing the labor-intensive methods of the traditional letterpress system. Large print runs of 100,000 or more copies could now be economically printed, although the problem of printing economical short runs of a few thousand copies remained.

By the 1950s paperback books were more than just a novelty, with paperback sales reaching 200 million copies and paperback revenues an estimated \$46 million in 1950. In fact, a paperback revolution took place in the 1950s in the United States and throughout the world. It converted book borrowers into book buyers and created a large population of book buyers. For the first time books fell into the area of impulse buying. They were offered for sale in a variety of new locations from drugstores to airports. Scholarly paperbacks, aimed at university students, began appearing in the United States in the 1950s and soon spread to England and the European continent.

By the 1960s paperbacks had become a fixture of U.S. life. They reflected the social change of the decade, and in some cases helped bring it about. Paperback publishers perfected the “instant book” during the 1960s, providing in-depth treatment of major news stories within days of the event. Bestsellers were emphasized, with many authors benefiting from the wide exposure they received through paperbacks.

The tremendous profits generated by paperbacks in the 1960s and 1970s brought another change to publishing. Large corporations began to look at publishing as an area for investment. During the late 1960s and early 1970s many independent paperback firms came under the control of giant corporations such as Gulf & Western, CBS, RCA, and Warner Communications. These parent corporations made large amounts of cash available to their paperback subsidiaries, resulting in new levels of bidding among publishers for bestsellers. By the mid-1970s, million-dollar auctions for paperback rights were commonplace. Unfortunately, this resulted in higher prices for consumers; paperback sales, which had climbed steadily since their introduction, began to level off. During the late 1970s and early 1980s several paperback houses went out of business. It became more common for publishers to issue both hardcover and paperback editions, rather than selling the paperback rights to a separate firm.

Consolidation affected the rest of the book publishing industry as well. Fifteen major corporations dominated the industry by the early 1970s. This consolidation continued through the 1990s, when seven

giant publishers accounted for 80 percent of all best-sellers in 1992. Concentration of power raised concerns about the quality and diversity of books being published, and some looked to small presses to fill the need for less popular but higher quality titles that catered to a variety of special interests.

Book publishing experienced tremendous growth during the 1970s, 1980s, and 1990s. From sales of \$1.68 billion in 1963, annual book sales doubled by 1973 then reached \$8.6 billion in 1983. They nearly doubled again to reach \$17.2 billion in 1993.

During the 1990s book publishers became more concerned with cutting costs, maximizing profits, and effective management techniques as a result of corporate ownership. For too long publishers had lagged behind other industries in achieving efficiencies in production, distribution, and marketing. Many challenges faced the book publishing industry in the 1990s, ranging from huge cash advances required to capture best-selling authors to competition from computers and VCRs for the leisure time of traditional book customers.

The fortunes of the publishing industry have been closely related to existing social, economic, and demographic conditions and trends. During the second half of the 1980s, children's publishing experienced tremendous growth, from \$336 million in sales in 1985 to \$1.1 billion in 1992, as the “baby boomlet” market developed. Suddenly, though, sales dropped by one-half, and publishers were forced to rethink their strategies. Trends favorable to publishing in the 1990s and beyond included higher enrollments in schools and colleges as well as an aging population that's interested in a variety of issues.

PUEBLO INDIANS

The Pueblo are American Indians of the Southwest. Their ancestors were the prehistoric Anasazi Indians. Beginning in about A.D. 700–1000, the Anasazi, who had settled in Utah, Colorado, Arizona, New Mexico, and northern Mexico, began building above-ground dwellings made of stone or adobe blocks. The more permanent shelters reflect a change in lifestyle: as they became increasingly dependent on agriculture (cultivating corn or maize), they also became more stationary. By A.D. 1000 the structures were more sophisticated; the Anasazi had begun to build multi-storied houses in the rocky sides of mesas (flat-topped hills) and in canyon walls. For this reason they are sometimes called Cliff Dwellers. The Anasazi continued to farm the lands below their dwellings, which could easily be defended in case of raids. Their descendants, the Pueblo, were living in these areas when the Spaniards arrived in 1540. (Observing the settlements, the European explorers gave the natives the name “Pueblo,” which means “village.”)

During the next 100 years missionaries in the Southwest converted about 60,000 Pueblo Indians to Christianity. In August 1680 Popeé, a Pueblo Indian, led an attack on Santa Fe, New Mexico, killing almost 500 Spaniards and driving the rest out. In what is known as the Pueblo Revolt, the Southwestern Indian group had reclaimed their territory, eradicating all Spanish-Christian influences and restoring their own culture in the region. This period of reclamation lasted 12 years: Upon Popeé’s death in 1692, the Spanish recaptured New Mexico and reestablished colonial rule. A band of Pueblos escaped to the west, remained free, and came to be called Western Pueblos. Few traditional (pre-Spanish) Pueblo villages remain today.

PUERTO RICO

A territory of the United States granted under the Treaty of Paris of 1898, Puerto Rico is an island in the West Indies, 70 miles (113 kilometers) east of Hispaniola (Haiti and the Dominican Republic). The agreement, signed December 10 of that year, ended the Spanish-American War (1898) and provided for Cuba’s full independence from Spain. The United States was also granted control of Puerto Rico, Guam, and the Philippine Islands in exchange for \$20 million.

The conflict leading up to the Spanish-American War began during the 1870s, when Cubans rebelled

against Spanish rule of the tiny island (which measures 3,435 square miles, or 8,897 square kilometers). Once the insurrection was put down, peace on the Caribbean island did not hold: worsening economic conditions prompted revolution in 1895. U.S. President William McKinley (1897–1901) made several diplomatic attempts to pressure Spain to grant Cuba full independence, but to no avail. On April 19, 1898, the U.S. Congress passed a joint resolution recognizing an independent Cuba, disclaiming American intentions to acquire the island, and authorizing the use of the American Army and Navy to force Spanish withdrawal. On April 25, the United States formally declared itself at war with Spain. In the months that followed American forces battled the Spanish and Spanish loyalists in Cuba and the Spanish-controlled Philippines. There was also military activity on Puerto Rico, but American forces met little resistance. Once Santiago, Cuba, was surrendered by the Spanish after the battle at San Juan Hill (July, 1898), it was only a matter of weeks before a cease-fire was called and the armistice signed (on August 12), ending the brief war.

The war dissolved the Spanish empire that had once included vast territories on the North American mainland and in Mexico, Central America, South America, and the West Indies. Fulfilling the doctrine of Manifest Destiny, the United States gained long-coveted possessions in the Pacific and in the West Indies. Puerto Rico, which then had a population of about one million people, provided Americans with a base in the Caribbean. In 1917 Puerto Ricans were granted U.S. citizenship. In 1952, upon adoption of a constitution, the island became a commonwealth, in union with the United States. As such, Puerto Rico has autonomy in international affairs. The commonwealth status was improved by the Puerto Rican government in 1967 and again by the people in 1993. The 1993 population was more than 3.6 million. The island’s chief products include sugar, tobacco, fruit, livestock, textiles, pharmaceuticals, and tourism. Spanish is the principal language, but some English is spoken as well. The U.S. dollar is the official exchange.

PULITZER, JOSEPH

The modern newspaper was virtually created by Joseph Pulitzer (1847–1911) during the latter half of the nineteenth century. It was a newspaper that seemed to meet the needs of the modern industrial world.

Joseph Pulitzer.

Boasting headlines, sensationalism with social conscience, a sports page, a business page, and the comic strips, it was a paper the average person could use to learn about the world and be entertained. This was largely the social invention of Joseph Pulitzer.

Joseph Pulitzer was born in Mako, Hungary, on April 10, 1848, one of three children born to Philip and Louise (Berger) Pulitzer. (*Poltizer* was the Hungarian spelling of their last name.) As a young child, Pulitzer was considered sickly. He was very thin, his lungs were weak, and his vision was poor. His father was a wealthy grain dealer, wealthy enough to retire early and be with his family. When Joseph Pulitzer was six years old, the family moved to a quiet estate in Budapest, Hungary, where the boy was educated by private tutors, along with his brother and sister. Pulitzer was raised fluent speaking Hungarian, German, and French.

The young Joseph Pulitzer was perhaps overly energetic, and was wild about seeking fame. He was brilliant, very independent, and intensely ambitious. There were early signs, extremes in his behavior as a

young man, of the emotional problems that would later hurt him as a grown man.

At the age of 17 he left home and sought to join the Austrian Army, the British armed forces, and the French Foreign Legion. He was rejected from each army because of his poor eyesight. At one point during the American Civil War (1861–1865), a recruiter of the Union army approached Pulitzer. In September 1864 he came alone to the United States to join the Lincoln Cavalry of the Union Army. In Boston, Massachusetts, Pulitzer jumped ship. He then went to New York where he enlisted on his own behalf, thereby collecting his own enlistment bounty. On September 30, 1864, Pulitzer joined a cavalry regiment organized by Carl Schurz, with whom Pulitzer would work after the war.

IN THE ST. LOUIS POST-DISPATCH AND THE NEW YORK WORLD PULITZER CREATED THE MODERN NEWSPAPER, ONE THAT CAUGHT THE DEMOCRATIC AND POPULIST SPIRIT OF THE UNITED STATES AT THAT TIME AND INSTITUTED CHANGES NEVER BEEN BEFORE SEEN IN U.S. NEWSPAPERS.

Pulitzer was discharged from the Union Army in July 1865. He had little money and no prospects for work. He settled in St. Louis, Missouri, where there was a large German community. In St. Louis Pulitzer found familiar customs that reminded him of his European origins. He worked a variety of jobs including a mule tender, waiter, and hack driver. He also worked for several lawyers and, while doing so, studied law books and was admitted to the bar. In 1867 Pulitzer became a U.S. citizen.

Carl Schurz, whom Pulitzer met during his military service, hired Pulitzer as a reporter for the *Westliche Post*, an influential German-language newspaper in St. Louis. The paper specialized in political articles and was very much committed to social reform in a young United States, which at the time appeared rife with corruption. Pulitzer became very interested in local politics and public affairs, and was an exceptional reporter in these areas. As a result he was nominated for the state legislature by the Republicans in 1869; he won the election.

While serving his term as a representative, Pulitzer also worked as a correspondent for the *Westliche Post*. In 1872 he became very involved in the Liberal Republican movement, which had nominated Horace Greely for president. After the defeat of Greely, Pulitzer became a Democrat.

In 1872 Joseph Pulitzer bought his first newspaper, the *St. Louis Post* for about \$3 million. He also

bought a German newspaper that had an Associated Press membership, which he quickly sold for a profit. In 1878 Pulitzer purchased the *St. Louis Dispatch*, which he combined with the *St. Louis Post*; the newspaper then became the *St. Louis Post-Dispatch*.

As publisher and editor of his newspaper, Pulitzer declared immediately that it would be devoted to issues of social reform. He vowed to his readers that the paper would be independent of political influence, and would instead be “the organ of truth,” as he put it in an early editorial. Along with his editor-in-chief, John A. Cockerill, Pulitzer printed verbal crusades against wealthy tax dodgers and corrupt gambling practices. For example, the newspaper published the tax returns of local citizens, wealthy and poor, in parallel columns. Pulitzer and Cockerill editorialized in favor of the building and maintaining of streets and other public structures and were instrumental in starting a city park system. They made the *St. Louis Post-Dispatch* a very successful civic minded newspaper.

Pulitzer edited the *Post-Dispatch* from 1878 to 1883. From the start he was involved in all aspects of the publication. By 1881 the newspaper had achieved high profits, gained wide readership, and moved to a new building where two Hoe presses were installed. When Pulitzer’s health weakened, however, he gave more responsibility to Cockerill.

In 1882 Cockerill shot and killed Alonzo W. Slayback, a local lawyer running for Congress. Slayback, whom Cockerill openly opposed and insulted, had confronted Cockerill and was murdered. Afterward Pulitzer asked John A. Dillon, founder of the *Post*, to take over the management of the paper. During the aftermath of the scandal, Pulitzer’s health deteriorated further and he was advised by his physician to take a long rest. On his way to Europe, via New York, Pulitzer met with an opportunity he could not refuse: the *New York World* was for sale.

In 1883, when he was 36 years old, Pulitzer bought the failing *New York World* newspaper, and he applied the same principles that led to success with his *St. Louis* paper. In 1883 the paper sold 15,000 copies daily. With Pulitzer’s genius for sensing what the public wanted, he built a newspaper which, by 1898, was selling 15 million copies a day.

In the *St. Louis Post-Dispatch* and the *New York World* Pulitzer created the modern newspaper, one that caught the democratic and populist spirit of the United States at that time and instituted changes that had never been seen in U.S. papers before. Pulitzer changed the form of how readers received their news, and he

created a format and prototype that countless other papers came to imitate.

Pulitzer carefully picked his talent and encouraged them. He paid high salaries to his reporters and demanded hard work from them. He also started the first two-week paid vacation for newspaper staff. Pulitzer’s newspapers used illustrations and political cartoons to attract readers and initiated features such as greatly expanded sports coverage. He also began to include line drawings in the newspaper to give variety to the look of different sections of the paper. Pulitzer’s newspapers started printing colored cartoon strips known as the “Sunday Funnies,” and in doing so captured a new readership for newspapers—children.

Perhaps Pulitzer was able to do so much in changing the form of the newspaper because his own idealistic, crusading, flamboyant, up-and-down character mirrored much of the sentiments of the mixed character of the United States at that time. He remained an idealist, but he also learned how to sensationalize and exaggerate real issues to get public attention. Pulitzer became the master of detailing lurid stories of crime, sex, and disaster. He had his reporters use bold headlines, and illustrations and diagrams for murder scenes. He was one of the first to understand that a successful newspaper had to entertain as well as provide the truth. This was a revolution in newspaper style which became a model for newspapers of that era—sensationalism with a social conscience.

Pulitzer used his newspapers’ editorials to speak out against corruption, and his papers uncovered several scandals such as the insurance fraud and corruption in the construction of the Panama Canal. He also crusaded against unsafe working conditions, the Bell telephone monopoly, the Pacific Railroad Lobbyists of 1887, unpleasant conditions in mental hospitals, police corruption and inefficiency, and police brutality. Pulitzer used his power to rally public support around various causes. In one editorial, for example, he urged the completion of the pedestal for Bartholdi’s Statue of Liberty.

Pulitzer had married Kate Davis in 1878. The Pulitzers had seven children during their reportedly difficult marriage. When Joseph Pulitzer was in his mid-thirties, his health began to deteriorate. He spent much of his time away from his family, traveling widely. In later years he lived aboard his yacht, called the *Liberty*, where annoyances and distractions were kept to a minimum. Pulitzer continued to be in constant poor health. He had several ailments including asthma, diabetes, insomnia, chronic exhaustion, and manic depression; by 1889 he had become blind. On October

Pullman Palace Car Company

29, 1911, at the age of 64, Joseph Pulitzer died of an apparent heart attack while aboard his yacht in a New York harbor.

In the years leading up to his death Pulitzer had turned his focus toward a plan to endow Columbia University with a large sum of money for the establishment of a school of journalism. In 1902 Pulitzer had drawn up a memorandum in which he compared the preparation of journalists to that of lawyers and doctors. In 1912, a year after his death, an endowment of \$2 million was made to Columbia University, which accepted its first class in the School of Journalism. The 1902 memorandum also stipulated that a portion of the endowment be used for annual prizes to journalists and writers. The first Pulitzer Prize was awarded in 1917.

PULLMAN PALACE CAR COMPANY

One of the last industrialists to operate a company town, George Mortimer Pullman (1831–1897) entered adulthood fueled by ideas and ambition. Pullman stepped into his deceased father’s business of raising the foundations of dwellings that were built in the low lying flood areas of Chicago. In 1858 Pullman faced the challenge of lifting and rotating the stylish Tremont Hotel. He successfully supervised this tremendous feat, which involved the simultaneous turning of five thousand jackscrews by twelve hundred men. With a \$20,000 stake made from the elevation business, Pullman turned his hand to more luxurious ideas.

George Pullman’s first overnight train ride was as memorable as it was uncomfortable. Travelling from Boston to Westfield, Massachusetts, in 1851, he attempted to rest on a rough mattress. Sharing the discomfort with fellow travelers and unable to sleep, Pullman decided there had to be a better way to travel. Although sleeping cars on railroads were not new, passengers were accustomed to little more than cots or mattresses and little privacy. Many who sat up all night suffered back-jarring rides on stiff benches in cars filled with dust in the summer and wood smoke in winter. With the growing number of businessmen traveling between cities, Pullman realized there was a market for comfort.

Pullman formed a partnership with Benjamin Field, who had the rights to operate sleepers on the Chicago and Alton, and the Galena and Union railroads. Pullman rebuilt two oversized coach cars, dividing the space into 10 sleeper sections with curtains. He hinged the upper berths so they could be opened at night and did the same with the chairs, so that they could swing back up out of the way. For extra convenience, linen closets and toilets were built at both ends of the car. Most importantly Pullman paid enormous attention to details. Lining the berths with rich cherry wood, and upholstering the seats in plush fabrics, all basking in the soft glow of oil lamps. Such luxury in George Pullman’s sleepers was met with modest success in 1858. Business grew slowly but steadily as the country headed into the American Civil War (1861–1865).

In 1862 while running a trading store in Colorado, Pullman continued to develop plans to build an even more luxurious sleeper. His idea to raise travel to an unimagined level began in a shed near Chicago’s Union Station. The “Pioneer” sleeper would be 54 feet long and 10 feet wide, with accommodations for 50 passengers. Each car would contain thick Bussel’s carpeting, heavy curtains, French plate mirrors, black walnut woodwork, oil chandeliers, and fine linens that would be changed daily. Porters would carry baggage and attend to the riders needs. The cost to build one car totaled \$18,000, four times more than any other competitive sleeper did. The two-dollar fares for an over-nighter in Pullman’s Pioneer soon emptied the conventional sleepers of other producers, which charged \$1.50. Within a year, Pullman owned 48 sleepers. Within 10 years, Pullman held a virtual monopoly on luxury train travel in the United States.

The assassination of President Abraham Lincoln (1861–1865) on April 15, 1865, prompted arrangements for his body to be transported back to Springfield, Illinois. Part of the funeral procession was by rail from Chicago. The Pioneer, touted “the wonder of the

age,” was chosen to carry Lincoln home. The size of the Pioneer would not fit on some tracks; nor could it be used in some railroad stations. Rail lines had to modify the tracks to accommodate the Pioneer to complete the last leg of the presidential journey. The Pioneer secured its reputation as the pearl of railroad cars because of this event.

The Pullman Palace Car Company was incorporated in 1867. The addition of a kitchen and tables from which to order delicacies such as oysters and rum omelets, led to the unveiling of the first dining car (known as the “Delmonico”) in 1868. In 1875, the first parlor car was introduced, sporting upholstered swivel reclining seats. Each new unveiling of an even better or more novel idea in the next Pullman car was met with greater fanfare. Accepted by the inner circle of U.S. corporate barons by 1880, George Pullman had become a rich, powerful, and respected man. Yet he viewed his power through the filter of Old World values.

When it came time to expand, Pullman decided to build a state-of-the-art factory and a town to go with it, at the cost of five million dollars. His idea was to build a community for the factory workers, about 15 miles outside of Chicago. He wanted a special place, workers’ utopia, to be built with the same attention to detail as his cars. Pullman envisioned his town as a model of efficiency and healthfulness. A company brochure promoting the town of Pullman stated, “all that is ugly and discordant and demoralizing is eliminated, and all that inspires self-respect is generously provided.” In 1884 families began moving into Pullman, Illinois.

By the winter of 1893, recoiling from plummeting orders and economic pressures, George Pullman had laid off more than half the workers living in his town. The wages of the rest were cut by more than 25 percent. However, rent was not cut. Moving to a cheaper neighborhood was not an option for Pullman tenants—if they moved they weren’t likely to remain Pullman employees. In desperation many workers joined the American Railway Union (ARU), an organization created by a young labor leader named Eugene Debs (1855–1926). The workers organized a boycott to which Pullman responded by having all the shops in his town cut off credit to all the workers. At the request of the Pullman workers, the ARU took the strike national. Within a week, 125,000 railroad workers refused to work on a train carrying a Pullman sleeper. Very soon after, rail traffic in the West and Midwest shut down.

The railroad strike of 1894 turned very ugly. The strike stopped mail delivery, freight and passenger traffic plummeted, and the stockyards were at a standstill. Hundreds of rail cars were set ablaze. President

Grover Cleveland (1885–1889) sent almost 2000 federal soldiers to the Chicago area, at the request of the U.S. marshals. When National Guardsmen fired upon a mob trying to block a train, four people were killed and another 20 were injured. Before the strike ceased, 20 people were dead and 60 were injured. This, the last major strike in the United States in the nineteenth century, ended in September 1894. The boycott was lost, and the ARU was broken.

George Pullman tried to hold on to his model town fantasy. He never evicted any workers from his community, as he hoped to be remembered for what he thought was his greatest contribution to U.S. life—the town of Pullman—but he never recovered from the strike. Three years later at the age of 66, George Pullman died of a heart attack. The community of Pullman was dismantled by the state of Illinois in 1898, with the state pointing out that the corporation’s charter did not give it the right to run a town in the first place. What had started as a dream of travel in comfort ended in violence, unemployment, and despair.

PULLMAN STRIKE OF 1894

The last third of the nineteenth century was characterized by an atmosphere of bitter conflict between labor and management in the United States. One reason for this was that the economy had not performed very well since the early 1870s. Instead of a secure job, American workers were faced with a steady diet of financial panics and wage cuts. The most severe panic took place in 1893. The depression in 1893 deepened

Pullman Strike of 1894

Railway workers pulling spikes from switches in the Western Indiana Railroad yards, 1894.

the unrest and dissatisfaction of the working class. In the winter of 1893–1894 the Pullman Palace Car Company, which built and repaired Pullman's railroad coaches, announced a 25 percent wage cut. Pullman was a "company town" surrounded by Chicago. Most of the Pullman workers lived in company-owned housing. Even though he cut the wages, George M. Pullman, the Chief Executive Officer of the company, refused to reduce the rent payments on the company housing.

The Pullman workers went on strike in early June 1894 and requested other unions to honor their picket lines. The American Railway Union (ARU), led by Eugene V. Debs, announced that its members would refuse to work on trains that included any Pullman railroad coaches. Within a few days the strike spread to the entire Western and Southern sections of the country. Twenty-seven states and territories were affected.

Another thing that contributed to labor unrest during this period was the perception that the government was not neutral in most disagreements between workers and management. In the ARU strike, for instance, rather than allowing labor and management to settle their disagreement by allowing the strike to take its course, many officials in the affected states called out the militia to repress the strike. The most notable exception to this was John Peter Altgeld, the first-term Democratic Governor of Illinois who had already shown his pro-union sympathies by pardoning three union organizers accused of instigating the

Haymarket Riot in 1886. Altgeld refused to call out the Illinois militia to break the Pullman strike. He said that public order was not threatened by the strike and that he intended to do nothing to alter the disposition of forces on either side of the struggle.

The railroad company lawyers, with the support of President Grover Cleveland's Attorney General Richard Olney appealed to a federal court for an injunction against the strikers. They put forward two arguments. One was that the strike was "in restraint of trade" and therefore violated the Sherman Anti-trust Act. (This act was passed by Congress in 1890 and ruled illegal "every contract, combination in the form of trust or otherwise, or conspiracy in restraint of trade or commerce. . .") The Sherman Anti-trust Act had been passed to break up monopolies rather than unions, but was invoked mainly against unions.) The second argument was that the strike interfered in the delivery of the federal mails. On July 3 the court ruled in favor of both charges and granted injunctions forbidding the ARU from continuing the strike. The injunction even prohibited Debs from communicating with the union's locals.

The ARU refused to honor the injunction and Debs was sentenced to six months in jail along with his fellow union officers. The U.S. Supreme Court upheld the conviction of the ARU leaders when it declared the injunction issued against the union was a legitimate device for the protection of interstate commerce and the mails. For thirty years after the Debs case, the injunction was a powerful weapon in the hands of

employers threatened with a strike. It would not be until the Norris La Guardia Anti-Injunction Act of 1932 that labor gained some protection against strike-breaking injunctions issued by federal judges.

PURDUE, JOHN

During the mid-nineteenth century John Purdue (1802–1876) became a very successful dry-goods merchant and businessman in Lafayette, Indiana. He accumulated a fortune by beginning a newspaper, *The Lafayette Journal*, in his adopted hometown of Lafayette. Toward the end of his business career, in 1869, Purdue was the primary benefactor in the founding of Purdue University. He endowed the school with \$150,000 and a mandate to maintain a college within the university to teach agriculture and “mechanic arts.”

John Purdue was born on October 31, 1802, in Huntingdon County, Pennsylvania, the son of Charles and Mary Purdue. Purdue was the only son in a family of nine children born to this Scottish immigrant and his wife. The family moved to Ohio during Purdue’s boyhood. In his twenties Purdue taught school for four years in the schools of Pickaway County, Ohio.

Not satisfied with teaching, however, John Purdue sought new opportunities farther west. He visited Lafayette, Indiana, and found it to be a flourishing trade center. He settled there in 1839. With his characteristic energy Purdue soon became one of the commercial leaders of the region. He conducted wholesale and retail dry-goods/grocery business for over 25 years. In addition, during the 1850s he and a partner operated a

profitable “commission house” in New York City. Purdue made a great deal of money, but his unsuccessful political ambitions and unprofitable investments in local manufacturing and railway enterprises caused him to lose money in far-sighted endeavors with the civic development of Indiana.

Influenced by his long-ago work in public schools, Purdue continued to promote all educational enterprises in Indiana. After Congress passed the Land-Grant College Act in 1862, the Indiana legislature gave legal status to the Indiana Agricultural College in 1865. To secure a location for the college in Tippecanoe county, near Lafayette, Illinois, Purdue donated \$150,000 in 1869. These funds supplemented certain lands and buildings already accrued by the citizens of the county with their \$50,000 donation. With his large donation, Purdue was able to specify that the institution bear his name, which it does.

John Purdue died on September 12, 1876, at age 73. He was buried, as he requested, on the campus of the university. An unmarked stone was placed at the head of his grave. Purdue never married; Purdue University was his legacy to the future.

PURE FOOD AND DRUG ACT

June 30, 1906, was a red-letter day for those who sought progressive reform and consumer protection in the United States. On that date the U.S. government passed the Pure Food and Drug Act, the first in a series of legislation designed to regulate the quality of food

and pharmaceutical products. The act banned manufacturers from selling mislabeled products, from adulterating food with unacceptable ingredients, and from misleading consumers with false claims. The passage of the act marked a victory both over certain manufacturers who wished to avoid regulation, as well as some politicians who questioned the constitutionality of the act. Those who fought for consumer protection found that their battle was only just beginning, however, and that effective reform would take place only with a series of acts passed over many years. Government regulation of this kind strongly affected the ways in which foods and drugs were prepared, packaged, labeled, sold, and advertised in the United States.

FOOD SCAMS, SUCH AS APPLE SCRAPS AND HAYSEEDS SOLD AS “STRAWBERRY JAM,” CORRUPTED THE MARKETPLACE IN THE NINETEENTH CENTURY UNITED STATES. THE TIME WAS RIPE FOR REFORM.

Prior to 1906 the regulation of food production and commerce fell mainly on the state and local authorities. In the colonial period, the colonies followed the British precedent of establishing laws to ensure standards of decency for such mainstays as bread and butter, while coastal colonies called for mandatory inspection of fish and other seafood. The laws did not extend to drugs, however, and their production remained largely unregulated. State laws scarcely differed from the colonial legislation, which was often loosely enforced. Since food and drug consumption was for the most part safe, there was little reason to push for more stringent regulation.

It was not until the middle of the nineteenth century, with the rise of industrialization and increasing urban populations, that fraudulent practices in the manufacturing of food and drugs became all too common. Food processors often added fillers to extend and cheapen their products: Water thinned out milk, sawdust bulked up flour, and sand stretched sugar. The development of new chemicals that enhanced the color, flavor, and texture of food made it easier for manufacturers to mask their manipulations. Unbeknownst to consumers, dyed and jarred apple scraps and hayseeds sometimes sold as “strawberry jam.” With these practices corrupting the marketplace, consumers found it difficult to judge the “truth in labeling” of commodities. Health risks increased, and state laws seemed insufficient to protecting the vulnerable public. The time was ripe for reform.

Harvey Washington Wiley (1844–1930), professor of chemistry at Purdue University and evangelical

Christian, led a campaign to stop wayward manufacturers from selling elixirs and bottled medicine which was often no more than alcohol-laden placebo. Wiley was appointed chief chemist of the U.S. Department of Agriculture in 1883. He led a campaign for federal regulation of food production and commerce. He was not alone in his efforts: many upstanding, reputable manufacturers wished for regulations that would outlaw the shady practices of their dishonest competitors. Meanwhile state food and drug officials asked for the federal support necessary to effect such sweeping change. Wiley enlisted scientists to analyze the ingredients in adulterated foods and to conduct tests on harmful preservatives, food colorings, and other chemicals, effectively amassing evidence to present to legislators. Interested as much in the moral as in the medical implications of ingesting tainted foods, the chemist did everything possible to dramatize the issue and to galvanize the public.

Two events gave Wiley’s efforts a much-needed boost. The first event was the 1898 “embalmed beef” scandal, which highlighted the quality of food served to soldiers in the Spanish-American War (1898). The second event was the January 1906 publication of Upton Sinclair’s *The Jungle*, a deeply disturbing novel about unsanitary conditions in the Chicago meatpacking industry. Sinclair’s best-selling novel—with its grotesque descriptions of rats, filth, and even human body parts that found their way into goods sold as “pickled meats”—was the final straw. President Theodore Roosevelt (1933–1945), who did not always respond to Wiley’s sensationalist style of lobbying, reportedly read *The Jungle* with interest. It is no coincidence that the Pure Food and Drug Act was passed only five months after the book’s publication.

The bill was not as thorough as Wiley hoped it would be, but it did represent a triumph for consumer protection in the United States. It forbade the adulteration of food, the addition of harmful ingredients, and the use of erroneous or misleading labels. Interstate and foreign commerce of both food and drugs were to be diligently monitored, and drug manufacturing was to comply with purity standards listed in two authoritative pharmaceutical reference books. Critics of the bill noted the absence of a specific list of purity standards for food manufacturing, which made the law difficult to enforce in certain cases. A Bureau of Chemistry, operating under Wiley, was established to propose a system of enforcement, but the bureau (which was renamed the Food and Drug Administration [FDA] in 1927) often met with opposition from manufacturers and farmers who resisted regulation.

Amendments to the Pure Food and Drug Act—such as one that required manufacturers to list net weight on products' labels (1923) and another that specifically defined the quality standards of canned foods (1930)—helped to plug certain loopholes and ultimately made the bill more effective. The need for certain reforms required new legislation, though, such as the Food, Drug, and Cosmetic Act of 1938, which extended regulatory laws to cover the cosmetics and therapeutic device industries. The FDA gained power to set certain standards and to inflict penalties on those who failed to comply. Ultimately, the Pure Food and Drug Act and subsequent legislation effectively altered the ways in which manufacturing and commerce were conducted in the United States. The events of 1906 set into motion a trend toward consumer protection that persisted throughout the remainder of the twentieth century.

PURITANS

The Puritans were members of a religious movement that began in England during the 1500s and lasted into the first half of the 1600s, when it spread to America. Influenced by the teachings of religious reformer John Calvin (1509–1564), the Puritans were so named because they wanted to purify the Anglican Church (also called the Church of England). They believed that too much power rested with the church hierarchy (its priests, bishops, and cardinals), and that the people (called the laity or lay members) should

have more involvement in church matters. Ceremonies should, the Puritans believed, be simplified to stress Bible reading and individual prayer. They defied the authority of the Archbishop of Canterbury, head of the Anglican Church, believing that each church congregation should control its own affairs through a council (called a presbytery) of lay members. The Puritans also had strong feelings about government. They maintained that people can only be governed by contract (such as a constitution), which limits the power of a ruler.

When King James I (1566–1625; ruled 1603–1625) ascended the throne of England in 1603, he was the first ruler of the house (royal family) of Stuart. The Stuart monarchs were Anglican or Catholic, but faced with the challenge of radical Puritanism, they tried to enforce national adherence to the Anglican Church, which stressed the ceremonial and traditional elements of worship. Further, the Stuart kings viewed the Puritan agitators as a threat to their authority.

Persecuted by the throne, groups of Puritans fled England for the New World. One group was granted a corporate charter for the Massachusetts Bay Company (1629). Unlike other such contracts, which provided the framework for establishing colonies in America, this one did not require the stockholders to hold their meetings in England. What is striking about the organization of the Puritan colony is the fact that their organization combined economic, political, and religious levels of meaning. Stockholders who made the voyage across the Atlantic would become voting citizens in their own settlements; the board of directors would form the legislative assembly; and the company president, Puritan leader John Winthrop (1588–1649) would become the governor. In 1630 the group settled in what is today Boston and Salem, Massachusetts, establishing a Puritan Commonwealth. By 1643, more than 20,000 Puritans had arrived in Massachusetts, in what is called the Great Migration. Puritans also settled Rhode Island, Connecticut, and Virginia during this period.

Puritans founded the Congregational Church. They also established grammar schools and colleges (including Harvard, Yale, and Dartmouth) in New England.

PUTTING-OUT SYSTEM

The putting-out system was a production method that was used in New England from the mid-1700s to

Pyramiding Reserves

the early 1800s. Under the system, merchants supplied raw materials (cotton, for example) to families, especially women and young girls, who would make partially finished goods (yarn) or fully finished goods (cloth) for the merchant. These manufactured goods were then sold by the merchant. Homeworkers who “put out” goods provided the needed manufacturing labor of the day. But the factory system of manufacturing was on the horizon.

In 1813 the Boston Manufacturing Company opened the first textile factory, in Waltham, Massachusetts, in which laborers operated spinning and weaving machines to produce woven cloth from start to finish. The advent of machinery had given rise to the factory system, and laborers were shifted from working in their homes to working in factories. While native New Englanders continued to provide the labor for the textile industry for the next two decades, an influx of immigrants in the mid-1800s provided the hungry manufacturers with a steady supply of laborers who were willing to work for lower wages and longer hours.

PYRAMIDING RESERVES

Pyramiding reserves refers to the practice of concentrating many small bank reserves in certain big city banks. The National Banking Acts of 1863 and 1864 established the requirement that banks maintain money reserves. Reserves are the portion of each deposit placed into the bank that is set aside in the form of vault cash or held deposits. The tempting high interest rates on inter-bank deposit balances offered by the larger banks led small rural banks to keep their reserves at large urban national banks. This practice led to the

pyramiding of reserves in central cities, especially New York City.

In the nineteenth century the need for liquidity (cash on hand) of the rural banks were driven by the needs of farmers. In the planting season farmers required currency to purchase farming implements and seed. At harvest cash deposited into banks increased as farmers sold crops. As a result rural banks withdrew their reserves from the urban banks in the spring to meet farmers’ demands for cash and deposited money back into the urban banks in the fall. The withdrawal of the inter-bank balances in peak agricultural season put seasonal pressures on the banking system. Consequently short-term interest rates varied seasonally by as much as six percentage points through the course of a year. Large urban banks could anticipate this demand most of the time and provide rural banks with all the cash they needed. The mere rumor, however, that a bank could not meet the needs of credit-hungry farmers and businessmen in the rural areas led to runs on banks by depositors demanding their money. Financial panics resulted in 1873, 1884, 1893, and 1904.

In an effort to end the recurring panics Congress passed the Federal Reserve Act of 1913. One of the Federal Reserve Act’s main purposes was to alleviate the liquidity crises and interest rate seasonal swings exacerbated by reserve pyramiding. The act established 12 Federal Reserve Banks around the country as depositories for required reserves that previously had been held predominantly in New York City banks. This regionalization eliminated reserve pyramiding and eased the seasonal strain. The central banking system could create additional reserves in a period of high liquidity demands.

QUANTITY THEORY OF MONEY

According to the quantity theory of money there is a direct relationship between prices, income, and the amount of money circulating in the economy. The quantity theory was first propounded in its most basic form by French philosopher Jean Bodin (1530–1596), who observed that the large amounts of gold and silver being brought back from the New World were driving up prices across Europe. Later two British philosophers, John Locke (1632–1704) and David Hume (1711–1776), noted that when the quantity of money grew, so did purchasing power and economic activity. Thus, if a government wanted to lower prices to combat inflation, according to the quantity theory, all it had to do was decrease the amount of money in circulation. Consumers would have less money to spend, demand would fall, and prices would drop. Over the next two centuries other economists elaborated on this basic interconnection between the quantity of money, income, and prices, and until the 1930s it remained the dominant theory for explaining inflation, deflation, and the nature of business cycles.

During the 1930s the quantity theory came under attack because its opponents argued that government attempts to increase the amount of money in circulation during the early years of the Great Depression (1929–1939) had almost no effect on consumer demand. The primary opponent of the quantity theory was British economist John Maynard Keynes (1883–1946). He claimed that increasing the money supply alone would never be enough to stimulate a contracting economy. Only high levels of employment could resuscitate demand and that meant the government had to create jobs for unemployed workers if the private economy could not.

Keynes's "fiscal policy" approach to economic growth ruled the world of economics until the 1960s when a new quantity theory of money arose to take its place. Led by U.S. economist Milton Friedman (1911–), the new quantity-of-money theorists agreed with

Keynes that government fiscal policy had an important role to play in stimulating the economy. However, they showed that during the Great Depression government officials had not really expanded the money supply fast enough or in large enough quantities to get the economy growing, so the Depression did not really disprove the quantity theory of money after all. Moreover, using new tools of economic research, the Friedman school of economists showed that increasing and decreasing the money supply did in fact have a direct effect on inflation and deflation.

QUEBEC ACT OF 1774

The Quebec Act was passed by the British Parliament on June 22, 1774, on the eve of the American Revolution (1775–1783). The legislation extended the province of Quebec south and west to the Ohio and Mississippi rivers, ignoring the western land claims of colonial Massachusetts, Connecticut, and Virginia. It also guaranteed that French civil law would be used in the enlarged Quebec, then a British colony that had been largely settled by the French. English criminal law would apply in the enlarged province. It also stipulated that the French could practice Roman Catholicism and that the Roman Catholic Church could collect taxes from its members. Historians believe the legislation was largely damage control on the part of the British, who faced the imminent revolt of their thirteen American colonies to the south. By passing the Quebec Act Britain intended to prevent the French colonists from joining the struggle of the American patriots and also to possibly gain their support should fighting break out. The Quebec Act was one of the five so-called Intolerable Acts (also called the Coercive Acts). British Parliament passed these acts the same year in an effort to assert its authority in the Massachusetts colony following the rebellion of the Boston Tea

Quotas

Party (December, 1773). These laws were severely resented by the American colonists and in many ways they precipitated the revolution. Shortly after fighting began in 1775, American colonists invaded Quebec but they were turned back. The province and its settlers, which included many loyalists who had fled the American colonies, remained neutral during the American Revolution.

QUOTAS

Quotas, a form of trade barrier, are limits on the quantity of a commodity that can be imported or exported. Import quotas limit the amount of particular foreign goods that can be brought or imported into the country. Import quotas protect domestic production of those goods and keep prices high. Export quotas limit the production of certain primary goods in short supply in the rest of the world. Restricting production limits the amount that can be exported and keeps prices high. Export quotas stabilize export earnings. A prime example of the use of export quotas are oil producing nations agreeing to limit oil production, thus keeping world prices high.

Import quotas specify the maximum amount of a foreign good that can be imported. They may be legislated or negotiated with the foreign country. Import quotas are generally more effective at reducing imports than are protective tariffs, another form of

trade barrier which is a tax on imports. Tariffs only interfere with trade. If a foreign producer can lower his cost of production he could lower prices and increase imports into the country despite the tariff. Quotas either eliminate import of the product altogether or allow only so much in, after which consumers must buy the domestic product.

Major arguments for import quotas are: (1) protection of infant or emerging domestic industries allowing them to gain strength before having to compete against foreign firms; (2) protection of U.S. jobs against foreign firms; (3) stabilizing the balance of payments, the difference between money paid to and received from other nations; and (4) protection of national security by not allowing the United States to become too reliant on another country for a certain product, the supply of which could be cut off in time of war. On the other hand those opposed to trade barriers point out that a relatively small number of individuals, those domestically making the product, reap large benefits from quota restrictions while all individuals purchasing the item incur higher prices.

Goods for which the United States has enforced import quotas include sugar, meat, textiles, motorcycles, and color television sets. A classic example of restraints was applied to Japanese auto imports. In 1981 the United States negotiated with Japan to limit its auto imports to 7.7 percent below the 1980 level. The agreement saved approximately 44,000 U.S. auto industry jobs, but the price of U.S. cars rose by an average of \$660.

RACKETEER INFLUENCED AND CORRUPT ORGANIZATIONS ACT (RICO)

The Racketeer Influenced and Corrupt Organizations Act (RICO) was an article of federal legislation enacted as Title IX of the Organized Crime Control Act of 1970, designed to combat organized crime in the United States. The Supreme Court ruled that RICO was not limited to organized crime, but could also be applied to legitimate businesses. RICO prohibits any person from using income received from a crime or a racketeering activity, and also applies to any unlawful, direct or indirect, racketeering activity. The purpose of RICO was to remove organized crime from the legitimate business community.

The RICO statute has been increasingly used in the context of organized labor prosecutions. One such case was the federal indictment of the International Brotherhood of Teamsters, where the Second Circuit Court found sufficient evidence to support a finding under RICO that a Teamster employee was associated with an organized crime figure and was subject to discipline. In another labor-related case, the *United States vs. Carson*, the government brought action against a former union officer under RICO, alleging that the officer committed racketeering acts that benefited organized crime. This charge was dismissed by the Second Circuit Court because the action allegedly occurred too far in the past to prosecute.

All RICO convictions require the government to prove that the defendant, based on two or more acts of racketeering activity, directly invested in, maintained an interest in, or participated in a criminal enterprise that affected either interstate or foreign commerce.

RADICAL UNIONS (ISSUE)

Anti-labor commentators in the nineteenth century would have argued that all unions are by their very

nature radical because they make “unreasonable” demands upon the owners of property. But in the era of the domestication of most labor organizations we can more closely define “radical” labor unions as those unions that espoused the goal of working towards the final collapse of the capitalist system.

One important precursor to radical unions was the Knights of Labor, led by Terrence Powderly and dedicated to the abolition of “wage slavery.” The Knights of Labor organized on a geographic basis, forming “local assemblies” that included workers from different employers (or even different sectors of industry) within the same organization. This furthered the cause of labor solidarity, but it complicated the process of winning strikes and securing contracts.

The most famous of these radical unions was the Industrial Workers of the World (IWW) whose members were generally known as the “Wobblies.” This union was organized in 1905 in direct opposition to the American Federation of Labor (AFL), an association of skilled trades unions organized in 1886. Whereas the AFL was a business union, the IWW was a revolutionary union. IWW leaders wanted to organize all the workers of the world to take control of all the means of production and abolish the wage system.

Among the founders of the IWW were Daniel DeLeon, leader of the Socialist Labor Party, Eugene V. Debs, leader of the Socialist Party of America, and William D. “Big Bill” Haywood, head of the Western Federation of Miners. The latter group was formed in Colorado in 1898 to oppose the hard conditions experienced by miners in all the western states. At first Haywood had hoped to redress the grievances of his followers through the law and the courts, but he soon became disillusioned and concluded that direct action would be the only feasible approach.

IWW strategy was to organize its members into 13 departments representing the 13 major industries of the country. When the moment was ripe, the “Wobblies” intended to call “one big strike” and seize control of

Jimmy Hoffa, the leader of the Teamster's Union, with his attorney, George Fitzgerald, as they are being questioned by the U.S. Senate Committee regarding racketeering activities.

all the industries. The nation's economy would then be in the hands of the workers, and socialism would replace capitalism.

The IWW opened its membership to those workers in the most oppressed industries. These included lumberjacks, textile workers, agricultural workers, longshoremens, construction workers, and meat packers. It also welcomed women workers, the unskilled as well as the skilled, and workers of all races. However, its main strength was among the immigrant workers of the East, the mine workers, and the migratory farm workers in the West.

The IWW never had a membership of more than 60,000 because it did not emphasize the building of permanent unions. It did not even believe in negotiating contracts with management. They said that a contract signified labor peace, and that there could be no peace between workers and capitalists. Instead, the IWW sought to attract people to its philosophy by means of winning strikes. The "Wobblies" would step into a dangerous situation, help win a strike against an oppressive employer, and then withdraw hoping that the workers had been won over to their socialist views.

A number of the "Wobblies" strikes were very successful. In 1906 they won wage increases for sawmill workers in Portland, Oregon, and in 1907, they

similarly aided the textile workers in Skowhegan, Maine. However, their most famous effort was the strike of textile mills in Lawrence, Massachusetts in 1912. Thousands of workers walked off the job in response to pay cuts. Joseph J. Ettor, an IWW organizer from New York, came to Lawrence to lead the strike. He worked effectively and called for peace, but violence broke out anyway. Many strikers were arrested. Then a worker was killed in a riot and Ettor along with Arturo M. Giovannitti, an Italian newspaper editor who was assisting him, were arrested. There was no evidence against them but they were freed only after massive demonstrations orchestrated by the IWW.

Because of its openly radical agenda the IWW was constantly under attack and its leaders were mercilessly persecuted, but it survived until World War I (1914–1918). When the United States entered the war in 1917, Wobbly leaders called upon the workers to oppose it and to refuse to serve in the military. Imperialists and profiteers, they said, were conducting the war. In response the government cracked down on the union and arrested many of its leaders. Haywood was one of them. He jumped bail and fled to Russia.

By the end of the war the IWW was nearly defunct. Many of its leaders had fled or were in jail and many of its members joined the newly formed Communist

Party of America (CPA). The IWW never ceased to exist, but its active period was over after the Lawrence strike.

The IWW had many weaknesses. It neglected to undertake political action, it failed to build stable unions, and its extremist philosophy left it vulnerable to attack. Nevertheless it was important. It influenced the thinking of many workers and won gains for thousands who had no other advocate. It also forced the AFL to be somewhat more progressive by focusing attention on the needs of the unskilled workers.

In 1920 the CPA formed the Trade Union Education League (TUEL) to be used as a vehicle for infiltrating main line (conservative) unions. The TUEL had relatively little success although for a time they were active in the International Ladies' Garment Workers Union (ILGWU), the furriers' union, and a few others.

Meanwhile, the Socialist Party of American (SPA) had for years been working to establish control of such unions as the Brewery Workers, the Boot and Shoe Workers, the International Ladies' Garment Workers, the International Association of Machinists, and the United Mine Workers (UMW). For varying periods between the 1890s and the 1920s, the Socialists experienced some successes, but never gained permanent control of these organizations.

The Great Depression (1929–1939) initially seemed like a catastrophe for labor. How could you organize unions when a high percentage of the workers are unemployed? After the labor movement began to recover from the seemingly hopeless obstacles associated with the high unemployment during the 1930s, the attitude of existing labor organizations seemed to toughen and unions began to confront their situation and to organize in a more aggressive manner.

The more combative union leadership (like John L. Lewis of the United Mine Workers) broke from the conservative trade unions associated with the AFL and in 1936 formed the Congress of Industrial Organizations (CIO). As the labor movement confronted the problem of organizing unions when the demand for labor is low, some of the most gifted organizers came from the ranks of the radicals. For one thing, they understood that organizing had to take place in the communities as well as on the job. Members of the Socialist Party and of the Communist Party understood the need to coordinate organizing among the employed and the unemployed workers. In Toledo, Ohio in 1934 a strike at an automobile parts plant won a contract when the Lucas County Unemployed League walked on the picket lines with the strikers. For a decade or

more, a portion of the labor movement was led by members of the CPA. These unions included the International Fur and Leather Workers Union (IFLWU); the International Longshoremen's and Warehousemen's Union (ILWU); the United Electrical, Radio and Machine Workers of America (UE); the International Union of Mine, Mill, and Smelter Workers (IUMUSW); the United Packinghouse Workers of America (UPWA); the Food, Tobacco, Agricultural and Allied Workers (FTA); the Farm Equipment Workers (FE); the United Office and Professional and Workers of America (UOPWA); the United Public Workers (UPW); the American Communications Association (ACA); the International Fishermen and Allied Workers of America (IFAWA); and the National Union of Marine Cooks and Stewards (NUMCS).

The left-led unions frequently advocated racial integration in their unions and in their strikes. As one historian writes, this effort to build labor solidarity across race lines could have significant outcomes for organizing—even as early as the 1930s: ‘Black workers—once their initial doubts about white-dominated unions had been overcome—especially in the South, were the first to join, were the most steadfast of members, and were the most militant. . . .’

In 1947 the Taft-Hartley Law stipulated that unions whose officers refused to sign an affidavit that they were not members of the Communist Party would not have recourse to the National Labor Relations machinery. This law was a severe blow to the radical unions, which were expelled from the CIO in 1949 and 1950, in spite of an estimated membership of 750,000–900,000. Thus, the CIO lost somewhere between 17 and 20 percent of its total membership. Eventually some of those expelled unions merged with others, passed out of existence, or, in a few cases, re-affiliated with the AFL-CIO. Their separation, however, brought an end to any significant influence of the U.S. labor movement's left wing.

RADIO

The radio, or “wireless,” was born in 1895, when Italian physicist and inventor Guglielmo Marconi (1874–1937) experimented with wireless telegraphy. The following year Marconi transmitted telegraph signals through the air from Italy to England. By 1897 Marconi founded his own company in London, Marconi’s Wireless Telegraph Company, Ltd., which began setting up communication lines across the English Channel to France and completed the project in 1898. In 1900 Marconi established the American Marconi Company. He continued making improvements, including sending out signals on different wavelengths so that multiple messages could be transmitted at one time without interfering with each other. The first trans-Atlantic message, from Cornwall, England, to Newfoundland, Canada, was sent and received in 1901.

At first radio technology was regarded as a novelty and few understood how it could work. But in January 1901 a Marconi wireless station at South Wellfleet, Massachusetts (on Cape Cod), received Morse code messages from Europe as well as faint music and voices. That event changed the perception of radio. Before long, Americans had become accustomed to receiving “radiograms”—messages transmitted via the wireless. In 1906 the first radio broadcast of voice and music was made. Ships within a radius of several hundred miles picked up the event, which originated at Brant Rock, Massachusetts, on Christmas Eve. That accomplishment resulted from the invention of another radio pioneer, U.S. engineer Reginald Fessenden (1866–1932), who patented a high-frequency alternator (1901)

Radios in the home steadily increased from 1922–1929, due to families having more leisure time and discretionary income.

capable of generating continuous waves rather than intermittent impulses; his invention became the first successful radio transmitter.

In 1910 U.S. inventor Lee De Forest (1873–1961), “the father of radio,” broadcast the tenor voice of opera singer Enrico Caruso over the airwaves. In 1916 De Forest transmitted the first radio news broadcast. Within three years of the first commercial radio broadcast, there were more than five hundred radio stations in the United States. National networks were organized, including the National Broadcast Company (NBC), the Columbia Broadcasting System (CBS), and the Mutual Broadcasting System (MBS). Congress tried to keep pace with the growth of the communications industry by passing the Radio Acts of 1912 and 1927 and setting up the Federal Communications Commission (FCC) to regulate the airwaves.

During the trying times of the Great Depression (1929–1939), President Franklin Roosevelt (1933–1945) spoke directly to the U.S. public using the new medium which broadcast his “fireside chats” from the White House. By the end of the decade radio was woven into the fabric of everyday American life. People across the country, in cities, suburbs, and on farms, tuned in for news and entertainment; they listened to broadcasts of baseball games and other sporting events as well as comedy and variety shows, dramas, and live music programs. Between the 1920s and the 1950s gathering around the radio in the evenings was as common to Americans as watching television is today. Networks

offered advertisers national audiences and corporate America eagerly seized the opportunity to speak directly to people in their own homes. The advent of television in the 1950s and its growing popularity over the next two decades changed the role of radio in American life. Having lost their audience to TV, radio programmers seized rock music as a way to reach a wide, albeit a very young, audience. Many argue that the rise of the musical genre kept radio alive. In the decades since, radio programming became increasingly music-oriented; talk and news programming were also popular.

RADIO ACT

The advent of radio, first as a mode for sending wireless telegraphs (called radiograms) via Morse code and later as a broadcast medium, necessitated government regulation of the airwaves. Congress first stepped in to establish guidelines for radio in 1912, in the wake of the *Titanic* disaster. The legislation of the Radio Act of 1912 stipulated that ship radios be manned day and night, that they have an alternate energy source (other than the ship's engine), and that they have a range of at least one hundred miles (161 kilometers). Further, Congress required that all radio operators, including broadcasters, be licensed and adhere to certain bandwidths. The Secretary of Commerce was given authority to assign frequencies to new radio stations, thereby eliminating competition among operators for the same frequency.

As radio stations proliferated, the airwaves were jumbled; interference prevented the transmission of clear signals, particularly when a listener was located more than twenty miles (thirty-two kilometers) from the transmitter. Further, the distribution of radio stations was uneven: Eastern and Midwestern cities were well served by broadcasters, while people in the South and West had few stations to choose from. Congress responded by passing the Radio Act of 1927, setting up the Federal Radio Commission (FRC) as the licensing authority for broadcasters. The legislation tried to bring about the equalization of service throughout the United States. It stated that when applications for licenses or license renewals were considered, the licensing authority (the Federal Radio Commission) "shall make such distribution of licenses, bands of frequencies or wave lengths, periods of time for operation, and of power among the different States and

communities as to give fair, efficient and equitable radio service." When the FRC's authorization came up for renewal in Congress the following year, the Radio Act was amended (in the Davis Amendment). The amendment clarified the commission's objective to provide "equality of radio broadcasting service, both of transmission and reception" to all regions of the United States.

The Communications Act of 1934 provided comprehensive legislation for the government regulation of the radio broadcasting, telephone, and telegraph industries, which Franklin Roosevelt (1933–1945) classified, along with transportation and power, as public utilities. The act reformulated the Federal Radio Commission (FRC) to create the Federal Communications Commission (FCC), an agency charged with the broad authority to regulate interstate and foreign communications. Its purview includes all types of radio transmissions as well as television, wire, and cable transmissions. The agency assigns broadcast frequencies and issues broadcast licenses. It is empowered to modify or revoke licenses as well.

RAG MONEY

Rag money is a derisive term for paper currency. The name comes from the early days of paper money, when paper itself was predominately made from the cotton and linen fibers of rags. Since valued currency was issued in silver or gold coins by the established governments of Europe, it is not surprising that Americans greeted with skepticism paper currency that was little more than a promise of future payment in silver. The first bills that were issued by the U.S. government became worthless shortly after the Declaration of Independence (1776). In its effort to fund the American Revolution (1775–1783), the Second Continental Congress printed so many bills, called Continentals, that there was not enough silver to back them up. The expression, "that's not worth a continental" reflected that reality. The financial crisis that emerged did nothing to inspire American confidence in paper currency. So-called rag money continued to have its detractors even after the Revolution had been financed by European loans and the U.S. government had established the dollar as its unit of currency (1785).

RAILROAD GAUGES, STANDARDIZATION OF

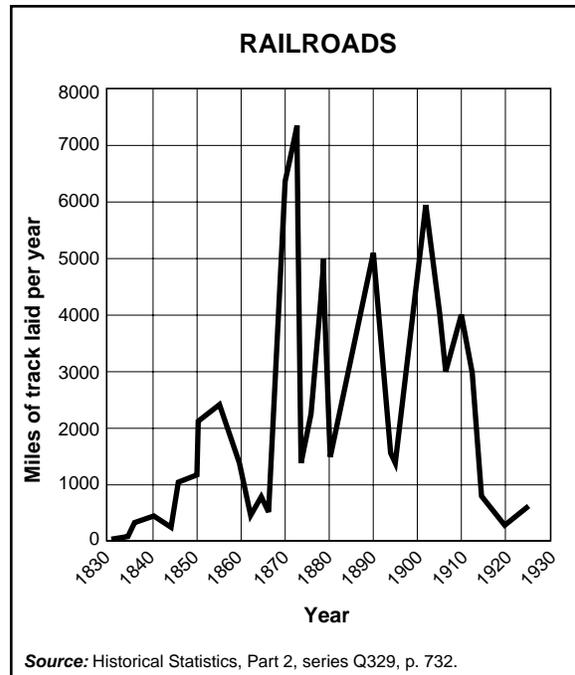

As railroads proliferated in the United States, rail companies guarded their areas of service by using various widths of road gauges (gauge is the distance between the inner sides of the heads of the two rails as measured $5/8$ inch, or 16 millimeters, below the top of the rail heads). Companies would use their own rail gauge width to prevent competitors' cars from passing to their line. By 1840 there were more than three hundred American railroad companies in operation and their tracks varied in gauge from four feet 8.5 inches (1.4 meters) to six feet (1.8 meters).

The practice of employing different-sized gauges, sometimes called the "battle of the gauges," interrupted transportation. A similar situation had unfolded in England and in 1846 British Parliament decided to set the standard at four feet 8.5 inches (1.4 meters); the Gauge Act of 1846 abolished all other gauges. In the United States, the completion of the first transcontinental railroad (1869) forced the issue of rail standardization. Freight shipped long distances had to be unpacked from one rail car and packed to another at junctions where rail gauge variances required a train transfer. The high cost of handling combined with the practicality of the narrower gauge (it required less clearance on either side and allowed for sharper turns in tracks) encouraged American railroads to adopt the standard gauge of four feet 8.5 inches (1.4 meters). This made rail lines accessible to any car or locomotive. By 1886 most rail companies had worked out agreements to handle the "rolling stock" (cargo shipped long distances) of other companies.

RAILROAD INDUSTRY

The U.S. railroad industry began with the founding of the Baltimore and Ohio Railroad Company in 1827. The Baltimore and Ohio was the first U.S. railroad chartered as a common carrier of freight and passengers. It was only two years earlier that John Stephens from Hoboken, New Jersey built the first steam locomotive in the United States. The railroad itself had originated some years before in Great Britain. Railroads achieved great significance later on when the western part of the North American continent was being settled. They enabled transport and expanded the possibilities of the agricultural industry. They also played an important role during the American Civil War (1861–1865).

According to the miles of track laid each year, the railroad's greatest decades of expansion followed the Civil War until 1910.

The first operating line on the Baltimore and Ohio Railroad carried passengers from Baltimore to Ellicott's Mills (later renamed Ellicott City). The line was only 13 miles long. In the 1830s railroad companies began to spring up in other parts of the country. By 1834 the tracks of the Baltimore and Ohio Railroad reached West Virginia.

Several other railroads came into being at around the same time as the Baltimore and Ohio. The South Carolina Canal and Rail Road Company completed construction of its gauge line from Charleston to Hamburg in 1833. It was the first railroad line in the United States that used a steam locomotive to run scheduled passenger operations. It was also the longest then operating in the United States. Eventually it became part of the 10,000 mile Southern Railway System.

The Galena and Chicago Union Railroad began operation in 1848 with the first locomotive in Chicago. The first line to run from Chicago to points along the Mississippi River started in 1854. As the railway industry expanded westward, many towns and cities came into being as railroad "division points." There eventually were nine major routes going from the Midwest or South to the West Coast. Cities and manufacturing centers were no longer dependent on water transportation after the onslaught of railroads. They could therefore be located away from rivers and canals.

In the early years of the railroad industry, state governments significantly aided railroad construction in the United States. The federal government gave land grants for building railroads after the American Civil War. The country had 30,000 miles of track on the eve of the war.

U.S. railroad companies were mainly based in the north of the country. This gave the Union (Federal) effort in the American Civil War an important advantage. The railway was used to transport troops and supplies. Construction of railroads was slowed down during the war, but resumed on a high level immediately following the war. The American Civil War was the first war in which railroads played a major role.

THE RAILROADS WERE THE FIRST TRULY BIG BUSINESS IN THE UNITED STATES.

The railroads became an essential means of transport during the era of industrialization in the United States. In the 1880s railroad construction reached a peak with 70,000 miles of track being built during that decade. The first transcontinental railway route had been completed shortly after the war. In 1969 the Union Pacific tracks met the tracks of the Central Pacific Railroad at Promontory Point, Utah.

The evolution of the railroad industry was strongly linked to other industries. In the late nineteenth century a decrease in the price of coal was brought about by an increase in anthracite coal mining. That lowered the price of coal-fueled steam engines as well. Innovations in the steel-making process introduced by Scottish-born U.S. industrialist Andrew Carnegie (1835–1919) made possible the production of more durable rails. Steel rails were first introduced in 1857 in England. Captain James B. Eads built the first steel bridge was built between 1867 and 1873, over the Mississippi River at St. Louis. Another type of bridge called the timber-truss was adapted to support trains shipping heavy loads. It had originally been developed by a number of U.S. inventors in the early nineteenth century.

The railroads were the first truly big business in the United States. As such, they were at the center of many protests and conflicts. During the 1870s a farmers' group called the Grange protested the high rates that the railroad charged for shipping. The Supreme Court eventually ruled that states would have the power to regulate businesses with a strong public aspect. However, no regulation was imposed on the national level. In 1877 railroad workers organized the first nationwide strike. Between 1881 and 1905 there

were 36,757 strikes throughout the country. As an outcome, the emergence of railroads resulted in the forming of the most prominent labor unions in the United States. The railroads were regulated by the Interstate Commerce Act of 1887. Yet rival companies in many industries, including the railroads, formed huge trusts despite the legal obstacles. This knocked out competition coming from smaller companies. In 1902 a suit was filed against the railroad monopoly founded by James J. Hill (1838–1916) and J.P. Morgan (1813–1890). The suit was directed by President Theodore Roosevelt (1901–1909).

The railroad industry continued to grow in the decades that followed despite all the setbacks. But by the 1950s and 1960s it started to decline as air travel and air shipping became less costly. By that time, railroads were used mostly for transporting materials such as coal, grain, and lumber. In the 1980s an increasing reliance on the trucking industry for transport represented another setback to the U.S. railroads. But by the end of the decade the industry had for the most part recovered due to technological innovations and industry deregulation. It was at its highest since it began to decline in the 1950s.

There were 535 registered railway companies in the United States in 1992. The 13 companies dominating the freight railroad industry employed around 200,000 workers. The largest of these was Union Pacific Railroad, with sales exceeding \$7 billion, with Amtrak (the National Railroad Passenger Corporation) dominating the passenger railroad industry. In the 1990s rail employees were overall the best paid segment of the working population.

The railroads continued to be linked to the development of other industries. The technological innovations that helped the resurgence of railroads in the 1980s mostly had to do with the telecommunications and computer industries. They also involved the development of high-speed trains using magnetic levitation systems along with the traditional wheel-on-rail trains. The railroad industry thus continued to play a significant role in economic development and on the transport service market.

RAILROAD WAR BOARD

On April 11, 1917, five days after Congress declared war on Germany, and the United States entered into World War I (1914–1918), the president of the Baltimore and Ohio Railroad, Daniel Willard called a meeting of railroad executives in Washington, DC. The executives signed a resolution agreeing to support the war effort by running their lines in a coordinated manner to create a “continental railway system.” The conference set up a five-person Railroad War Board to oversee the plan. The plan’s objectives were to maximize use of all railroad potentials and speed up transport. Pools were organized; load weights were increased to utilize the full capacity of cars; the loading and unloading of freight were expedited. Shipping times of war-related goods (such as coal and iron) were speeded by prohibiting transport of non-related items during certain hours. Use of all in-service equipment was maximized and some passenger lines were eliminated in order to conserve coal.

The Railroad War Board and the companies it coordinated faced numerous obstacles in reaching their goals. One of them was a labor shortage that resulted from the draft: the passage of the Selective Service Act (May 1917) required men between the ages of twenty-one and thirty (later eighteen to forty-five) to register for military service. Some 70,000 of the draftees were rail workers. Shortages of equipment, parts, and capital also hampered the wartime effort. Nevertheless, the actions directed by the Railroad War Board and carried out by the railroads allowed carriers to operate as a unit. During World War I anti-trust laws were suspended because of the national emergency; corporations set

aside their private interests to run a nationwide rail service in support of the fight for democracy.

RAILROADS, FEDERAL LAND GRANTS TO (ISSUE)

Between 1850 and 1871 the United States government used a portion of the public domain (federally owned land) to assist and encourage the building of railroads. In all, during that twenty-one year period approximately 1.31 million acres of land were transferred to private ownership. This represented 9.5 percent of the public domain as it stood in 1850 (1.39 billion acres). The land was located in twenty-seven states, but the largest grants were made in California (11.5 million acres), Kansas (8.2 million acres), Minnesota (9.9 million acres), Montana (14.7 million acres), North Dakota (10.6 million acres), and Washington (9.5 million acres). Although the program began in 1850, most of the grants were made under the terms of the Pacific Railway Act of 1862. This law was in effect from 1862 to 1871 and its purpose was to encourage the construction of the transcontinental railroads.

The law provided that companies agreeing to undertake the construction of transcontinental railroad lines would be eligible for loans ranging from \$16,000 to \$48,000 per mile of track laid. The precise amount of the loan was determined by the difficulty of the terrain through which the construction passed. The government loaned a total of \$64,623,512 to the transcontinental companies. These loans were for the most part paid back at six percent interest. The law also provided that a company could be given up to twenty sections (a section is a square mile) of land for every mile of track put down. This land would be granted in alternate sections (a kind of checkerboard pattern) within an area lying forty miles on either side of the proposed right of way. To qualify for the subsidies a company had to agree to actually build track or forfeit the grant, and carry mail, government passengers, and freight at reduced rates.

Most of the loans and land grants distributed under the Pacific Railway Act went to the first five companies that built transcontinental lines. These were: the Union Pacific, the Central Pacific, the Northern Pacific, the Southern Pacific, and the Santa Fe. They received a total of 130 million acres of land, with the

largest single grant (of 44 million acres) going to the Northern Pacific line. The states added another 50 million acres of land grants. Local communities also subsidized railroad companies by giving them land for depots and rights of way and tax exemptions. The state governments granted a total of around 50 million acres of land. Whereas the federal and state land grant programs were designed to promote the building of trunk lines, these local subsidies were designed to facilitate the building of connecting lines. Even though not all lines were built in this way, the effect was to stimulate railroad building in general. Hence the national railroad system expanded from 9,000 miles in 1850 to 87,000 in 1885.

The total of public land grants given to the railroads by states and the federal government was about 180 million acres. At the time, the value of this land was about one dollar per acre, which was the average price realized by the government for sales in the land grant states during that period. Hence the total value of the land granted to these companies was approximately \$180 million. Later, much of the land was sold by the railroad companies at an average price of \$2.81 per acre. (Proximity to the rails increased the value of the land.) These sales offset a portion of the construction costs, which have been estimated at approximately \$168 million.

Although these figures are immense and would appear to suggest that the American railroad system was built largely on the basis of government aid, this is actually not the case. In fact, only 18,738 miles of railroad line were built as a direct result of these land grants and loans. This figure represents only eight percent of the total railroad mileage built in the United States between 1860 and 1920. The government program was important because the building of these lines opened up the trans-Mississippi West and stimulated settlement, but most of the railroads were built by private enterprise—in some cases with state and local support.

Not everyone applauded the subsidies. For example, the land grant-loan system under the Pacific Railway Act was subjected to harsh criticism by reformers who argued that it represented a vast giveaway of money and public property to assist businessmen who made vast fortunes. As a result, the program of federal aid was discontinued in 1871. However, the arguments of the reformers were not entirely correct. The loans were, for the most part, repaid and the railroad companies did not reap vast fortunes from the re-sale of their land grants. Moreover, the country benefited immensely from the rapid construction of the

railroads, which produced a viable transportation system connecting all portions of this vast nation. The railroads literally bound the states together thus contributing significantly to national unity.

RAND, AYN

Ayn Rand (1905–1982) used her novels as a vehicle for her objectivist philosophy, which endorsed individualism by stressing "rational self-interest" over charity and the welfare state. Her best-known novels include *The Fountainhead* (1943) and *Atlas Shrugged* (1957).

Ayn Rand was born Allisa Rosenbaum on February 2, 1905 in St. Petersburg, Russia, the first of Fronz and Anna Rosenbaum's three daughters. Her father was a self-made Jewish merchant. Rand taught herself to read and write by age four and had decided to become a writer by age nine. Her greatest hero was author Victor Hugo (1802–1885). Rand's family barely survived the siege of St. Petersburg during World War I (1914–1918), and they later lost their possessions in the Russian Revolution. As a teenager, Rand learned to hate her country's new communist doctrine and vowed to make it her life's work to use the written word to prove that doctrine wrong.

Ayn Rand.

After graduating with a degree in history from the University of Leningrad in 1926, Rand immigrated to the United States. In her new country, she changed her name to Ayn Rand. She lived with relatives in Chicago, Illinois, for a few months before moving to Hollywood to work as a screenwriter and movie extra. There, she met actor Frank O'Connor, and the two were married in 1929. Rand became a U.S. citizen in 1931.

CIVILIZATION IS THE PROGRESS TOWARD A SOCIETY OF PRIVACY. THE SAVAGE'S WHOLE EXISTENCE IS PUBLIC, RULED BY THE LAWS OF HIS TRIBE. CIVILIZATION IS THE PROCESS OF SETTING MAN FREE FROM MEN.

Ayn Rand, *The Fountainhead*, 1943

Penthouse Legend, Rand's first play, was produced on Broadway in 1934. Two years later she published her first novel, *We the Living* (1936). It was set during the Russian Revolution and condemned communism and those who would follow its principle of sacrificing self for the state. Her next novel, *Anthem* was published in 1938. *The Fountainhead* (1943), Rand's most famous work, was initially turned down

by several publishers for being considered too intellectual for a mass market. The novel took four years to complete, but became the medium through which Rand defended her philosophical beliefs. Her hero, brilliant architect Howard Roark, blows up his own building when the architectural establishment alters its design. Using a classic metaphor, Roark symbolizes "good" while the establishment is "evil." The book was highly praised by critics and hit the national bestseller list several times during 1945. Hollywood even hired her to write the screenplay.

Rand's later works include *Atlas Shrugged* (1957), *For the New Intellectual* (1961), *The Virtue of Selfishness* (1965), *The Romantic Manifesto* (1969), and *Philosophy—Who Needs It?* (1982). *Atlas Shrugged*, concerned with the philosophical faults of collective societies, became her second most popular novel.

Rand spent a large part of her career defending her philosophy of objectivism. During the 1960s and 1970s, she was a visiting lecturer at the Nathaniel Branden Institute and other American university campuses, including Harvard and Yale. *The Ayn Rand Letter* and *Objectivist Bulletin* were circulated to promote her philosophy. Rand's pro-capitalist views are considered by some to have helped influence the collapse of the Berlin Wall. Ayn Rand died on March 6, 1982 in New York City.

RANDOLPH, ASA PHILIP

Asa Philip Randolph (1889–1979) was an American labor and civil rights leader. During the first half of the twentieth century he was considered one of the

most prominent of all African American trade unionists as well as one of the major figures in the African American struggle for civil rights. He maintained that African Americans could never be politically free until they were economically secure, and so Randolph became the foremost advocate of the full integration of black workers into the American trade union movement. In 1925 he organized the Brotherhood of Sleeping Car Porters (BSCP), which was the first African-American union in the country to sign a labor contract with a white employer.

In 1889 Asa Philip Randolph was born in Crescent City, Florida, the son of an African Methodist Episcopal minister. Randolph graduated from the Cookman Institute in Florida in 1907, at the top of his class.

Randolph was a good singer and actor. The idea of becoming a professional performer led him to New York, where he found himself working as a delivery driver, sales clerk, and a laborer on the railroad. In 1911 he moved to Harlem, where most African Americans in New York lived during that era. Harlem was the nation's capital of black intellectual life at that time and the center of what would later be called the Harlem Renaissance.

DURING THE FIRST HALF OF THE TWENTIETH CENTURY HE WAS CONSIDERED ONE OF THE MOST PROMINENT OF ALL AFRICAN AMERICAN TRADE UNIONISTS AS WELL AS ONE OF THE MAJOR FIGURES IN THE AFRICAN AMERICAN STRUGGLE FOR CIVIL RIGHTS.

In Harlem Randolph turned to politics instead of the stage. He began attending City College of New York (CCNY), studying history, philosophy, and economics. In college he made friends with political radicals and founded the Independent Political Council in 1913, a radical current affairs group. He also worked on the campaign of socialist John Royal who was running for city council.

By 1914 Randolph met Ernest Welcome and began working for Welcome's Brotherhood of Labor, an organization that brought workers from the South and helped them find jobs in New York. Randolph also married Lucille Campbell that year. She supported Randolph economically as he pursued his political activism. In 1915 Randolph began to emerge as a dominant voice in the "New Negro movement." In 1917 he co-produced the first issue of *The Messenger*, a journal that became what Randolph called "the first voice of radical, revolutionary, economic, and political action among Negroes in America." *The Messenger*

has been regarded by scholars as among the most brilliantly edited magazines in African-American publishing.

In 1925 Randolph became the leader of a campaign to organize the African American men who employed as porters aboard most trains in the United States. In 1937, after years of continuous work, the first contract was signed between a white employer and the Brotherhood of Sleeping Car Porters. This was a milestone for African American workers and the labor movement.

By 1940 Randolph was deeply involved in the black civil rights movement. During World War II (1939–1945) he planned a massive march on Washington, D.C. to protest the exclusion of African Americans from working jobs in defense industries. He agreed to call off the march only after President Franklin Roosevelt (1933–1945) issued Executive Order 8802, which banned discrimination in defense plants and created the nation's first Fair Employment Practices Committee.

In 1948 Randolph once again initiated strategic efforts to enhance civil rights for African Americans. He warned President Harry Truman, (1945–1953) that if segregation in the armed forces was not abolished, then masses of African Americans would refuse military induction. Truman soon issued Executive Order 9981, establishing "equality of treatment" in the armed forces.

Randolph continued his civil rights work on behalf of African Americans. In the 1950s he organized youth marches to integrate schools. It was Randolph who organized the famous march on Washington in 1963, when Martin Luther King, Jr. (1929–1968) gave his now famous "I Have a Dream" speech to a quarter million people who came to the nation's capital.

Randolph's career reads like a history of struggles for unionization, worker equity, and civil rights in the twentieth century. His efforts focused on securing political freedom for African Americans by creating greater economic security. He created unions and organized millions of people in the Civil Rights Movement. Randolph died in 1979, having realized many of his goals for African Americans and civil rights.

RATIONING

Rationing refers to the equitable allocation of scarce or valuable resources among competing consumers who have varying degrees of demand or need. Resources can be rationed informally at the local level on a merchant-by-merchant basis, as was done by many U.S. businesses during the Great Depression. Resources can also be rationed systematically by the government. During World War II (1939–1945), President Franklin D. Roosevelt (1933–1945) and Congress, in an effort to eliminate from the economy every ounce of excess and waste, enacted legislation (1942) authorizing the president to establish the War Production Board (WPB) and the Office of Price Administration (OPA).

WPB was assigned the task of dividing scarce resources between the military and civilian production sectors, while the OPA was responsible for administering rationing plans. Both agencies had regional and state branches of enforcement. More than 100 million Americans were issued ration cards, coupons, and certificates, which restricted the quantity of goods that could be purchased and the uses to which they could be put. Windshields were stamped to indicate how much gasoline car owners could buy during a given week. Civilians working outside the defense industry, for example, could buy no more than three gallons per week. Horses, trolley cars, and walking quickly became popular modes of transportation. Rubber, gasoline, and sugar were rationed in 1942, meat and shoes in 1943. By the end of the war the list of items rationed in the United States included typewriters, bicycles, stoves, tea, coffee, canned and processed foods, fats, coal, and an assortment of leather items. Manufacturing stopped altogether for other items deemed unnecessary to the war effort and daily subsistence, such as

One of the most outstanding trademarks ever marketed was . . . the image of a dog (named Nipper) staring at an old phonograph with the caption “His Master’s Voice.” Nipper, along with the selling techniques of the newly formed company, helped this new invention of a “radio music box,” priced at approximately \$75, become one of the most popular inventions of its time.

curlers, electric toasters, waffle irons, cocktail shakers, and lobster forks.

Most Americans understood that it was their patriotic duty to make ends meet within the rationing system, but violations did occur and black markets sprang up around the country. Some amusing blunders befell the system as well: a Pennsylvania rationing office had to close because it failed to ration enough fuel for itself. Nonetheless, domestic rationing played a significant role in increasing the resources available to Allied cause.

RCA-VICTOR COMPANY

RCA-Victor Company merged from two earlier companies—Victor Talking Machine Company and the Radio Corporation of America (RCA). The Victor Talking Machine Company was founded in 1901 after the development of the cylinder phonograph. It went into the business of producing phonographs, providing people with recorded sounds and music. The Radio Corporation of America was formed in 1919 by General Electric Company (GE), and spawned several supporting businesses, like RCA-Victor, to better manage its growing interests.

General Electric formed the Radio Corporation of America in 1919 in order to acquire the assets of the British-owned American Marconi. It was the only company operating in the United States equipped to handle transatlantic radio and telegraph communications. Franklin D. Roosevelt (1882–1945), then undersecretary of the Navy, strongly supported GE’s bid to acquire American Marconi. He spearheaded efforts to facilitate the purchase because Roosevelt believed that

This famous painting by Francis Barraud entitled "His Master's Voice" became one of the most famous trademarks for RCA.

Americans should own the only company in the nation able to handle transatlantic radio and telegraph communications.

General Electric succeeded and RCA went into business. Though GE was the main stockholder in RCA, American Telephone & Telegraph Company (AT&T) and Westinghouse Corporation also owned significant shares of the company. Between 1919 and 1921, AT&T and GE licensed their patents for long distance transmission. Westinghouse granted RCA access to all of its patents and offered its radio equipment to the public.

Under the combined resources of these companies, RCA flourished. In 1924, RCA transmitted the first radiophoto from New York to London. This photo-transmission paved the way for the development of television. At the same time, RCA was still heavily invested in radio, and it wanted to maintain control over the radio stations it owned. To better manage their operations, RCA formed the National Broadcasting Company in 1926.

Most phonograph companies during the 1920s did not express enthusiasm over the introduction of radio. However, David Sarnoff (1891–1971), a leader at RCA, had an idea to market a radio and a phonograph

together in one unit. The best way for RCA to do this was to acquire a phonograph company. In 1929, RCA purchased the Victor Talking Machine Company for \$154 million. The RCA-Victor Company was formed, with David Sarnoff serving as its president. The company began manufacturing radios and phonographs in Camden, New Jersey. Sarnoff became known as the "father of broadcasting."

One of the most outstanding trademarks ever marketed was purchased along with the Victor Talking Machine Company. It was the image of a dog (named Nipper) staring at an old phonograph with the caption "His Master's Voice." Nipper, along with the selling techniques of the newly formed company, helped this new invention of a "radio music box," priced at approximately \$75, become one of the most popular inventions of its time.

RCA also created two spin-off companies to manufacture key components in the RCA-Victor phonograph production. Shortly afterwards, the Radio Corporation of America's increasingly complex operations caught the attention of the federal government. The company became embroiled in legal issues regarding its near-monopoly status. Under federal pressure, General Electric, AT&T, and Westinghouse sold their interest in RCA in 1932. The company, renamed RCA

Reagan, Ronald Wilson

Corporation, became independent and was led by David Sarnoff.

RCA, still the parent company of RCA-Victor, introduced a new invention—the television—at the 1939 World's Fair. However, the company quickly turned to more basic matters as the United States entered World War II (1939–1945). RCA factories manufactured a variety of items to help with the war effort, including bomb fuses and radio tubes. A month after the war ended, RCA-Victor's television products found their way back to the market and were produced at a rapid rate. The television age had begun, and RCA-Victor was in the lead.

Under Sarnoff's continued leadership the Radio Corporation of America involved itself in a range of interests, including education, broadcasting, and sound system design. This trend set by Sarnoff continued through the end of the twentieth century, when RCA became an industry leader in digital high-definition television (HDTV) development.

REAGAN, RONALD WILSON

Folk wisdom holds that the burden of politics is much like the burden of fame. If that is true then no one knows that as well as Ronald Reagan. Born in Tampico, Illinois, on February 6, 1911, Ronald Wilson Reagan (1911–) grew up to become the fortieth president of the United States. Reagan was raised in several towns in the rural areas of northern Illinois. His family finally

Ronald W. Reagan.

settled down in Dixon when he was nine. Reagan graduated from Eureka College in 1932. After graduating, he began working in Davenport, Iowa, as a radio sports announcer. He also authored a sports column on a weekly basis for a Des Moines newspaper.

While covering a sports story on Catalina Island, near Los Angeles, Reagan caught the attention of an agent from the Warner Brothers movie studio. After doing a screen test for Warner Brothers, Reagan was signed to a movie contract with the studio. His first film was *Love Is on the Air* (1937). In the several years following, he was seen in a number of forgettable films. There were a few, however, that were exceptions, such as *Brother Rat* (1938), *Dark Victory* (1939), and *Kings Row* (1941). His most notable film was made in 1940, *Knute Rockne—All American*, in which he portrayed football legend George Gipp. With the onset of World War II Reagan found himself making air force training films.

He continued to act after the conclusion of the war but he also found himself becoming extensively involved in politics. During his early political years, Reagan was an active member of several liberal organizations, including the Americans for Democratic Action. Eventually he began to grow fearful of communist subversion and his political attitudes made a turn to the right. In 1947 he testified to the House Un-American

Activities Committee regarding the influence the communists had in the movie industry.

It was during the 1950s that Reagan's movie career faltered and he began working for the General Electric Company as a traveling spokesman and as the host of *General Electric Theater* (on television from 1954 to 1962). It was also during this period that he shifted from being a liberal and a Democrat to a conservative Republican.

Leadership was not unfamiliar to Reagan when he began to work in politics. By the time he co-chaired the Citizens for Goldwater-Miller Committee in 1964, he had already served on the board of directors of the Screen Actors Guild, serving as president from 1949 to 1952, and again in 1959. He had also served as chairman of the Motion Picture Industry Council in 1949. Two years after the Barry Goldwater campaign, Reagan successfully ran for governor of California against Democratic incumbent Edmund G. Brown.

Reagan's first term agenda as California's governor was to enact a freeze in state hiring, consequently restraining the growth rate of the state's bureaucracy. He also increased taxes to eliminate the state deficit and reduced social services. Welfare reform, reducing the caseload while increasing the payments to families with dependent children, was on the agenda for his second term. Reagan only had moderate success in promoting his programs.

In 1976 he made his first serious run for the U.S. presidency. His long-fought campaign against Gerald Ford was a lost battle and the Republican nomination went to Ford. Reagan was not deterred, and in 1980 he easily won his party's nomination and defeated the Democratic incumbent, Jimmy Carter, for the presidency.

Reagan's presidency was filled with substantial tax cuts. He reduced spending on domestic programs, increased military expenditures, and doubled the national debt. His moves are credited with decreasing the inflation rate, which had seen rapid growth in the 1970s, down to 3.5 percent during his tenure. On March 30, 1981, a 25-year old drifter named John Hinckley shot Reagan. His wounds were serious, but he recovered and the stories of his good humor while in the hospital added to his popularity.

In 1986 it was learned that the Reagan administration had participated in the shipping of arms to the radical Islamic fundamentalist government of Iran. This was apparently an effort to gain the release of American hostages who were being held by Iranian terrorists in Beirut, Lebanon. During investigations it

became clear that high-ranking officials in the National Security Council, an agency that advises the president, had covertly moved money from the Iranian arms deals to aid the U.S.-supported insurrectionists against the (Marxist) Sandinista government in Nicaragua. While others resigned or were prosecuted for their involvement, Reagan himself was left relatively unscathed by the scandal.

Reagan's foreign affairs policies may be the legacy which will stand the test of time. During Reagan's tenure he pushed for the largest peacetime military buildup in American history. In 1983 he unveiled a proposal for the Strategic Defense Initiative. His strong military build up led to the 1988 summit meeting with Soviet leader Mikhail S. Gorbachev where they signed the Intermediate-Range Nuclear Forces Treaty (INF Treaty) limiting the use of intermediate-range nuclear weapons. Arguably, this marked the beginning of the end of communist Russia. Many credit Reagan's policies with the end of communism in Europe and its reduction as a political alternative in much of the world.

Ronald Reagan retired to Santa Monica, California, with his second wife Nancy Davis Reagan (born Anne Frances Robbins). His last public act was to have President William Clinton inform the country of his Alzheimer's Disease.

REAGANOMICS

There was a story that circulated within the Washington Beltway during the 1980s that "Reaganomics"

Reaganomics

began as a doodle on a cocktail napkin as two economists employed by the Reagan administration sat whiling away happy hour in a Washington, D.C. cocktail lounge. The story may or may not be true, but at least it has the ring of truth. The term “Reaganomics” was derived from the name of its best-known supporter, fortieth U.S. President Ronald Reagan (1981–1989). Reagan, however, did not originate the theory. Reaganomics, also called supply-side economics or trickle-down economics, is based on a thing called the “Laffer Curve.” (It was the Laffer Curve that was supposed to be the subject of the doodle.) The economist Arthur B. Laffer is the true creator of the supply-side theory. He asserts that high marginal tax rates and government regulation of industries discourage private investment in areas that stimulate economic growth, and that if the taxes and the regulation go away, the additional capital available to the private sector will “trickle down” to the rest of the population. Supply-side theory gained popularity during the late 1970s, when tax rates were at an all-time high, inflation hovered around 15 percent, oil shortages brought high energy costs, foreign competition took profits from domestic operations, and the business community complained about confining government regulations.

The theories of Milton Friedman, the founder of monetarism and economic adviser to Reagan in the 1970s, also influenced Reagan’s economic policies. Monetarism claims that the level and direction of spending on the federal budget is more important than the amount of the deficit, and that a stable monetary policy allows borrowing to finance an unbalanced budget.

RONALD REAGAN HIMSELF ONCE REMARKED THAT “THE BEST SIGN THAT OUR ECONOMIC PROGRAM IS WORKING IS THAT THEY DON’T CALL IT REAGANOMICS ANY MORE.”

Although supply-side economics and monetarism are rival conservative theories, Reagan more or less combined the two when he administered a plan that relied on faith in free enterprise, not in government, as the basis for economic expansion. Reaganomics consisted of four main initiatives: (1) tax reductions that would encourage investment and production, (2) spending cuts that would reduce the size of government, (3) elimination of federal regulations that were constricting business growth, and (4) a stable monetary policy that would keep inflation under control.

In 1982 as a nation in recession witnessed tax cuts, defense weaponry buildup, and a reduction in services

for school lunch programs, the *New York Times* named Ronald Reagan’s economic agenda “Reaganomics.” By 1984 however, the economy had turned and inflation and unemployment dropped dramatically. The United States maintained an economic boom that lasted for the remainder of the Reagan administration.

The president’s policies have continued to be an issue of critical debate. Supporters of Reaganomics claimed that by adopting supply-side economics, the Reagan administration conquered the inflation that plagued the economy during the 1970s and set the economy on the tracks of the longest peacetime economic recovery in U.S. history. Opponents of Reaganomics argue that huge tax cuts were simply a gift to Reagan’s political constituency among the rich even though it brought a doubling of the federal deficit.

True to his agenda, Reagan brought some of the largest tax cuts in history. According to Reaganomics, lower taxes prompted corporations to invest, leading U.S. consumers to buy more. As the economy grew, thanks to increased consumer spending, they would indirectly raise government tax revenues. The trend would “trickle down” to benefit even the poorest U.S. citizens. An initial shock to these new policies led to a recession in the early 1980s, but by 1984 the economy began to surge, inflation leveled and unemployment dropped.

Still many experts believed that the middle class and the poor did not benefit from Reaganomics. It was widely reported that the share of income going to the wealthiest 20 percent of the nation’s population nearly doubled during the Reagan era, while the share going to the remaining 80 percent fell to its lowest level since the mid-1940s. Yet almost everybody but the very poor were better-off.

Reaganomics also encouraged many industries to deregulate during the early 1980s. At first, deregulation led to greater competition and lower prices for consumers. Diminished government supervision, however, also brought about problems. By the mid-1980s, the savings and loan industry collapsed amidst fraud and mismanagement. In the airline industry, deregulation led to the failure of many airlines, while others were bought out by rival airlines; the ultimate outcome was less competition and higher ticket prices.

The Reagan era also produced a large increase in the federal budget deficit (the difference between money the government spends and the amount it earns through taxes and other sources). When Reagan’s policies were put in effect in the early 1980s, tax cuts did stimulate the economy, but Federal spending continued to grow, because of the refusal of a Democratic

Congress to cut domestic spending as dramatically as Reagan wanted. There was also an increase in borrowed money to fund the creation of defense weaponry at the climax of the Cold War and.

Ronald Reagan served two terms as U.S. president. Reaganomics contributed to the creation of more than 20 million jobs and a \$1 trillion federal deficit. Some economists say that Reagan's policies were ultimately a failure that should never be repeated, although others argue that Reagan's policies have been clearly vindicated over time by our increasingly prosperous society. Regardless of opinion, the effects of Reaganomics were felt well past the end of Reagan's terms of office. Ronald Reagan himself once remarked that "the best sign that our economic program is working is that they don't call it Reaganomics any more."

REAL WAGES

Real wages are wages adjusted for inflation, which reflect the actual purchasing power of goods and

services. Suppose an individual was paid \$10 per hour in 1997 and \$11 per hour in 1998. This increase in the nominal wage rate, wage in current dollars, is \$1 per hour. This represents a 10 percent raise. If the cost of goods and services also increased by 10 percent in the same time period, the purchasing power of an hour's wages or the real wage rate did not increase. The worker could buy the same amount of goods in 1998 for \$11 that he bought for \$10 in 1997. On the other hand, if the cost of goods and services did not increase, the workers' purchasing power or real wage rate would have increased by 10 percent. An hour of work in 1998 then buys 10 percent more than an hour's work in 1997.

Workers are more concerned with their real wages than with their nominal or money wages. To calculate the real wage rate the nominal wage rate is divided by a price index. The price index used might be the consumer price index or the gross domestic product (GDP). Using the above example, say the price index rose 5 percent between 1997 and 1998. Using 1997 as the base year the price index would be 1.00 in 1997 and 1.05 in 1998. The real wage rate is W divided by P, where W is the nominal wage rate and P is price index. In 1997 \$10 divided by 1 is \$10, so the real wage rate is \$10. In 1998 \$11 divided by 1.05 is \$10.48, so the real wage is \$10.48. These calculations demonstrate adjustments for inflation yielding the real wage rate in constant dollars. Research indicates that the higher the real wage rates the larger the labor supply, house wealth, and consumption of goods and services. Economic indicators tied to consumption expenditures will be positive.

In the United States real wages in manufacturing doubled between 1910 and 1940, only to double again between 1940 and 1970. Although nominal wages rose steadily, beginning in 1973 real wages for manufacturing non-supervisory workers began a downward trend that continued into the 1990s.

REBATES

Rebates are an extension of the coupon promotion. Also known as refunds, rebates reimburse a customer for part of the purchase price of an item after the sale. They differ from coupons in that coupons offer a discount in price at the time of sale. Rebates developed after the broad success of coupons in the latter half of the twentieth century.

The word "rebate" is derived from the Middle English word *rebaten*, which means "to deduct." The rebate is an attractive marketing tool to consumers

Recession

because its offer of partial reimbursement for a purchase is tax-free. The Internal Revenue Service considers rebates a reduction in the price paid for a product and not as income.

How do consumers learn about rebates? Manufacturers typically offer a rebate to all purchasers of a product for a limited time offer. At the time of purchase, the consumer receives a form, which must be completed and mailed with proper proof of purchase to a specified address. This address usually belongs to a large clearinghouse that processes rebate claims, not the manufacturer. The clearinghouse processes the rebate and issues a check in the name of the manufacturer.

Who offers rebates? A wide range of businesses offer rebates to consumers who purchase their products. Rebates may be offered for household appliances, like a refrigerator, for auto parts, and for health and beauty products, among others. The amount of money offered in a rebate varies from product to product and manufacturer to manufacturer.

During the twentieth century, the enticement of the rebate has played an appealing role in wooing customers in a competitive marketplace.

RECESSION

A recession is a downturn in the business cycle that occurs when the real gross national product (GNP)—the total output of goods and services produced by the U.S. population—declines for two consecutive quarters, or six months. Recessions are usually characterized by a general decrease in output, income, employment, and trade lasting from six months to a year. A more severe and long-lasting economic crisis is known as a depression.

Virtually all advanced world economies that are not controlled centrally have experienced recurring cycles of slump and recovery in business activity since the Industrial Revolution. The United States suffered through four severe depressions in the 1800s, as well as the Great Depression in the 1930s. These crises cost a great deal in terms of national wealth and personal hardship. Since then, however, sophisticated analysis of economic trends has combined with increased government intervention to prevent such extreme fluctuations in economic activity. In fact, no depressions have occurred in industrialized nations since World War II (1939–1945), although there have been many recessions. Governments monitor the business cycle closely and take various steps to stabilize the economy before

it reaches extreme peaks and troughs. Formerly, the typical stages in the business cycle were depression, recovery, prosperity, and recession. Today, the phases are usually defined using the more moderate terms, upswing, peak, recession, and trough.

RECONSTRUCTION

Reconstruction (1865–1877) was one of our most controversial political eras. It followed the American Civil War (1861–1865), the bloodiest war in U.S. history, and saw the South's transformation from a slave to a free society. The U.S. government had to decide how to reintegrate the Confederate states into the union and how to assimilate almost four million freed slaves into the war-torn and hostile society of the South. Its economy was in shambles at the end of the Civil War, with manufacturing and transportation systems in disarray, banks insolvent, and Confederate currency worthless. The agricultural labor pool of slaves, who represented the most valuable asset that the South had possessed prior to the war—more valuable even than all the land in the South, was no longer legally available and the planters had little on-hand cash to pay wages. The freed slaves faced destitution.

President Abraham Lincoln (1861–1865) was anxious to get the Confederate states back into the union. As early as December 1863 he had issued a "Proclamation of Amnesty and Reconstruction" which detailed a lenient approach that he felt would receive wide acceptance in the South and hasten reunion of the eleven Confederate states. Prompted by considerations of how to smooth over the process of reunification of the nation, as well as by long-term political considerations for himself and the newly founded Republican Party, Lincoln's Reconstruction plan was called the "10 percent plan." Only ten percent of a state's electorate who had voted in 1860 had to take an oath of allegiance to the United States before its citizens could be granted pardons, their property restored, and their state governments recognized. Lincoln's plan did not include much in the way of provisions for post-war recovery of the South or safe-guards to protect the newly freed slaves from their former masters.

In July of 1864 Congress adopted a compromise Reconstruction plan which increased the requirements for reentry of the Southern states into the Union. Lincoln, however, vetoed this Wade-Davis bill, which proposed raising the 10 percent voter oath requirement to 50 percent and limiting participation of former Southern leaders in state constitutional conventions.

Realizing that few safeguards existed to protect the new found liberty of former slaves, Congress also established the Freedmen's Bureau in 1865 to help feed, protect, and educate them.

Fearing that rebel leaders would regain control of the South, some "Radical Republicans" in Congress (Congressmen who advocated strong measures against the former Confederacy) sought to grant voting rights to former slaves and even spoke of confiscating the wealthy Southern planters' property. A precedent existed for this land reform idea: in a few cases during the war union troops had allowed former slaves to occupy and farm the plantations of rebel planters, including the President of the Confederacy, Jefferson Davis. A rumor arose among the former slaves that the federal government was going to redistribute the land and give each slave family "forty acres and a mule."

But after the surrender of the southern armies and in the wake of the uncertainty that accompanied Lincoln's assassination in April 1865, a dispute arose between Lincoln's successor, former Vice President Andrew Johnson, and the Radical Republicans in Congress. Johnson, a small farmer and slave owner from Tennessee, believed blacks were inferior and envisioned a South economically dominated by white farmers holding property redistributed from wealthy planter's land. He seemed to believe that a conspiracy existed between the large plantation owners and the slaves against the small white farmers. Johnson adopted contradictory policies—on the one hand formally declaring that the Confederate military leadership would be executed and that slave holders would be denied the vote, and on the other, pardoning an unending line of petitioners from the southern planter class who flattered him and received full exoneration.

IN THE END . . . THE VAST MAJORITY OF SOUTHERN BLACKS REMAINED PROPERTYLESS AND POOR. BUT EXACTLY WHY THE SOUTH, AND ESPECIALLY ITS BLACK POPULATION, SUFFERED FROM DIRE POVERTY AND ECONOMIC RETARDATION IN THE DECADES FOLLOWING THE CIVIL WAR IS A MATTER OF MUCH DISPUTE.

Eric Foner, *American Heritage*, October/November 1983

During this period of confusion, the southern political elite adopted make-shift constitutions that abolished slavery and elected the surviving members of the pre-war political elite to Congress. At the same time, however, in their own state legislatures the former planter aristocracy was passing "black codes" that re-subjugated the former slaves to conditions that approximated slavery. Ex-slaves could were restricted

to farming jobs, they could be rounded up, charged with vagrancy, and put to work without compensation. They had to carry passes. They lived under curfew laws. Major race riots instigated by whites broke out in 1866 in Memphis and New Orleans with blacks receiving little protection from local law authorities. As these conditions became known in the first months after the southern surrender, the Radical Republicans successfully led a movement to exclude the southern congressmen who were being elected and sent to serve in Congress. A prolonged struggle erupted between the executive and legislative branches of the federal government pitting the president and his conservative program of restoring pre-Civil War conditions in the South against the Radical demands for extensive social and political change in the South.

Angered by the South's persistent and violent resistance to restructuring and disappointed with Johnson's views, Congress adopted a Radical Reconstruction strategy. First, over Johnson's veto, Congress passed the Civil Rights Act of 1866 which recognized blacks as citizens and guaranteed equal protection under the law. Congress included the Act's key provisions in the Fourteenth Amendment, which was approved in 1866 despite rejection by most Southern states. The amendment granted citizenship to all persons born or naturalized in the United States and directed that states could not deprive citizens of due process of law and equal protection of the laws. Next came the Reconstruction Acts between 1866 and 1868, also over Johnson's veto. The acts firmly established military control over the South with the eleven Southern states divided into five military districts. State governments that were recognized under Lincoln and Johnson were thrown out and the black codes eliminated. A Major General controlled each district by holding extensive authority over state officials. Between 1868 and 1870 all states were readmitted to the Union with new governments that were controlled by blacks, carpetbaggers (Northerners who came to the South to carry out Reconstruction programs), and scalawags (Southern collaborators). Though violence temporarily ceased and a number of postwar recovery measures were instituted (including a lasting public school system for both races), most Southerners viewed the governments as artificially contrived.

In 1870 the Fifteenth Amendment prohibited states from restricting voting rights on the basis of race. Congress followed with a series of enforcement acts until 1871. However, Northern support for Reconstruction measures began to fade in the 1870s as a national economic recession captured attention. President Rutherford B. Hayes (1877–1881) withdrew the

Reconstruction Finance Corp.

last federal troops in 1877 and Southern states once again assumed full control. Racism flourished. State Jim Crow laws established a racial caste system in the South during the last years of the nineteenth century. Some historians attributed the failure of Reconstruction to the failure to redistribute southern lands to poor farmers, both black and white. In any case, a new labor system involving sharecropping and crop liens replaced slavery. Black families farmed assigned portions of plantations in return for a share of the crop and necessary food and supplies. The new system, in which the new Southern ruling class of planters and merchants were subservient to Northern financiers, did not reestablish the prosperity seen before the war.

RECONSTRUCTION FINANCE CORP.

The Reconstruction Finance Corp. (RFC) was a U.S. government agency established by Congress on January 27, 1932, to provide financial aid to railroads, financial institutions, and business corporations during the Great Depression (1929–1939). In July 1932, with the passage of the Emergency Relief Act (ERA), the scope of the RFC was enlarged to include aid to agriculture and farms, and financing for state and local

public employment works. The RFC, acting as a domestic federal bank, contributed greatly in the recovery effort to climb out of the Depression. During World War II (1939–1945), the RFC was expanded greatly to finance the construction and operation of war plants and to make loans to foreign governments.

The RFC was intended to be an independent, non-political agency. As years passed, RFC funding grew. It began to assume the responsibility for disbursing huge sums of money, and began to become involved in politics. By 1948 congressional investigations of the RFC revealed widespread corruption; in 1952 it was reorganized. As a result of Eisenhower's efforts to limit government involvement in the economy, the RFC was dismantled under President Dwight D. Eisenhower (1953–1961). The RFC Liquidation Act terminated all of its lending powers. By 1957 its remaining functions had been transferred to other agencies.

The RFC was a useful agency during the Great Depression and World War II, as well as during post-World War II recovery in the United States, but by the late 1940s the RFC had outlived its financial stabilization function.

RECYCLING PROGRAMS

Recycling programs comprise three elements in a continuum represented by the “chasing arrows” symbol: collection of recyclable materials from the waste stream, processing the commodities into new products, and purchasing products containing recycled materials. It has been estimated that each office worker in America produces from one-half to one and one-half pounds of solid waste each day, of which 70 to 90 percent is paper. Paper comprises at least 40 percent of American waste, and businesses contribute one-third of the nation's solid waste. For that reason, recycling programs in the business world commonly focus on waste paper. However, corporate recycling programs have come to include other types of waste, including glass, chemicals, oils, plastics, and metals.

Although the word “recycle” was not coined until the late 1960s, recycling has been a trash disposal option for centuries. Native Americans and early settlers routinely reused resources and avoided waste. Materials recovery was also a significant contributor to the United States' World War II effort, when businesses and citizens alike salvaged metal, paper, rubber, and other scarce commodities for military use. But the emergence of the “throwaway society” of the 1950s

helped extinguish the recycling impetus. With seemingly unlimited landfill space, disposable and single-use products and packaging became the norm in the ensuing decades. Recycling did not regain popularity until the late 1960s and early 1970s, when environmental concerns became prominent in the “green revolution.” The first national Earth Day celebration in 1970 heralded anti-litter campaigns, the creation of the Federal Environmental Protection Agency (EPA), and some municipal and corporate recycling programs.

REGRESSIVE TAX

A tax is a compulsory payment imposed by a government for public purposes. There are two major forms of tax assessment; direct taxes, which are imposed on an individual directly, and indirect taxes, which are imposed on a privilege or right which a person exercises. For example, the right to buy or sell real estate involves estate and inheritance taxes, or the right to make gifts of property involves gift taxes. In general, all taxes may be classified as proportional, imposing proportional rates on all incomes or property values, whether large or small; progressive, where taxes are graduated to impose the highest rates on the highest incomes, based on ability to pay; and the regressive tax, which takes a smaller percentage from higher income individuals than from lower income individuals.

A regressive tax is a tax that is graduated so as to impose the highest rates on the lowest incomes and property value. For instance, overall, Social Security is a regressive tax because there is a maximum income limit beyond which no further taxes are paid. Therefore, very wealthy individuals pay a lower percentage of their total income to Social Security than do lower income individuals. Throughout the U.S. tax code there are many examples of regressive taxes, despite efforts to use more proportional or progressive taxes to create a fairer system.

REGULATION

The regulation of industries in the United States is based largely on a concern for the public interest. Industries, especially those with a high potential for monopoly (such as water, gas, and telephone service), will often be regulated by agencies of government for

the benefit of the public, so that consumers can be assured of quality services and products at reasonable rates. The rationale for the regulation of all or part of an industry is that if a monopoly exists, and competition is inappropriate, then monopolies should be regulated to avoid possible abuses of uncontrolled monopoly power. Regulation is a public sector (government) guarantee that consumers should benefit from the built-in economies of any monopoly. Regulators seek to establish customer rates that cover production costs and yield a “fair” or “reasonable” return to the enterprise.

There are problems associated with the regulation of business by the public sector. First, a regulated firm may resort to accounting manipulation to overstate its costs to obtain higher unjustified profits. Second, some regulatory commissions of the government function inadequately, sometimes even making “deals” with the industries they are regulating. Third, it is often uncertain which industries should be regulated. The trucking and airline industries both claim that if they were less regulated, they would be more competitive. In addition to the regulation of near monopoly industries and natural monopolies (like water and electricity), since the early 1960s, the public sector also regulates the conditions under which goods and services are produced, as well as the impact of production on society, and the physical quality of goods. This kind of social regulation is applied across the board to virtually all industries. Examples of social regulation includes the efforts of the Occupational Safety and Health Administration (OSHA), which regulates industries to protect workers against occupational injuries and illnesses, and the efforts of the Consumer Products Safety Commission (CPSC) which regulates minimum standards for potentially unsafe products. Though regulation itself can be controversial, few question whether it should exist. The primary question that any public sector regulation imposes is how and when it should be used.

REINFORCED CONCRETE

Reinforced concrete is a composite building material that consists of concrete (a mix of cement, aggregates, and water that when hardened resembles stone) and steel rods, bars, or mesh. The material possesses the best qualities of concrete, which is able to withstand compressive (latitudinal) forces, and iron, which is able to withstand tensile (longitudinal) forces. Reinforced concrete was patented in 1867 by French gardener Joseph Monier (1823–1906), who used iron to

Report on Manufactures

strengthen concrete for tubs for his nursery. During the second half of the nineteenth century the material was used in the construction of bridges and buildings. In the early twentieth century concrete reinforced with steel came into widespread use. In the United States, the first building made entirely of reinforced concrete was the William E. Ward House, built in 1876, in Port Chester, New York. In 1903 Cincinnati's sixteen-story Ingalls Building (called the Transit Building after 1959) became the world's first skyscraper with a reinforced concrete framework. The success of the building project revolutionized the construction industry. Skyscrapers—many of steel-cage construction, but others built with reinforced concrete—transformed the appearance of the American city and were the country's contribution to twentieth century architecture.

Reinforced concrete was predominately used in the construction of factories. In the early 1900s, German-American architect Albert Kahn (1869–1942) expanded the Packard Motor Company plant in Detroit, Michigan, designing what became a series of factories using reinforced concrete and steel. Kahn's innovative designs enclosed large spaces, often all on one floor and with ample windows for natural lighting, ideal for manufacturing operations.

REPORT ON MANUFACTURES

In 1791 Alexander Hamilton (1755–1804), the first U.S. Secretary of the Treasury, submitted the third of three historic reports he had written which outlined a national fiscal (monetary) and economic system. The first two reports had been the Report on Public Credit (presented to Congress January 1790) and the Report on a National Bank (December 1790). On December 5, 1791, Hamilton presented the Report on Manufactures to Congress. The report outlined a plan for stimulating trade in the new republic and listed 17 viable industries that should be pursued by private citizens and encouraged by the federal government. As the leader of the Federalist Party, Hamilton advocated a strong central government. His party's position opposed that of Thomas Jefferson's (1743–1826) Democratic-Republicans, who favored a strict adherence to the U.S. Constitution (1788); the report, therefore, stressed the protection of personal liberties by a limited federal government.

In his Report on Manufactures, Hamilton argued that Congress should adopt certain measures that would help move the nation's economy away from its dependency on agriculture (which required importing most finished goods from other countries) and toward an economy that was diverse and balanced. To support

the development of American industry, Hamilton advocated charging duties on or prohibiting the import of rival products. Domestic manufactured goods, however, would be exempted from export duties and new inventions would be encouraged, "particularly those which relate to machinery." Hamilton maintained that by enlarging the nation's manufacturing sector the United States would achieve true independence by decreasing its reliance on other nations for military and essential supplies. Further, he foresaw the tremendous growth in population that would occur in the nineteenth century as more and more European immigrants arrived in American ports to make their homes in the new nation. Believing the only way to support a burgeoning population was to diversify the economy, Hamilton asserted that the government ought to promote manufacturing.

Hamilton's vision of the nation's future (which turned out to be highly accurate) and his recommendations for developing and stimulating the economy were not well received in Congress. Many felt the Secretary of the Treasury was promoting his own personal interests at the expense of agriculture. His plan was never put to a vote.

RESEARCH AND DEVELOPMENT

Research and development (R&D) is the process by which scientific and technological breakthroughs are used to create new or improved products or technologies. R&D generally involves three basic processes. The first is "basic" or "pure" research, which is the kind of exploration scientists and other researchers perform when they are motivated not by a specific goal or end product but by the desire to advance scientific knowledge wherever it leads. "Applied research" is research that takes the findings of basic research and modifies or elaborates them for a specific purpose. Finally, "development" is the process by which the insights of basic and applied research are transformed into an actual product or new process. For example, basic research into the properties of light and silica-based materials might be applied toward developing fiber optics, which in turn might be developed into fiber-optic cables for carrying digital data. Basic and applied research is conducted in government, academic, and industrial research laboratories, and today most product development is performed in company-run development laboratories.

The first U.S. industrial laboratories were modest affairs set up in the 1860s and 1870s by companies like Cambria Iron Co. and the Pennsylvania Railroad. In the 1870s Thomas Edison's (1847–1931) Edison Electric Light Company became the first company to devote a substantial portion of its revenues to industrial laboratory research. In the years before World War I (1914–1918) such companies as General Electric, AT&T, Standard Oil, and Eastman Kodak also established R&D labs. World War I opened the eyes of many Western governments to the need for industrial research, a process that was hastened by the requirement for new technologies to fight World War II (1939–1945). After 1945 the United States was the preeminent technological power, and the federal government's R&D spending in the 1950s and 1960s was used by government, academic, and industrial laboratories to fuel an explosion of new electronics, computer, aeronautical, defense, and space technologies.

When the U.S. government cut back on R&D funding at the end of the Cold War in the early 1990s, private industry filled the gap. By 1997, for example, total R&D investments reached an all-time high of more than \$200 billion, two-thirds of which was conducted by private industry. The primary factors for this intensified industrial R&D were advances in biotechnology, electronics, and software; global competition; and years of strong profit growth. By 1996, 25 U.S. firms—led by General Motors, Ford Motor Company, and IBM—were spending more than \$1 billion annually on R&D.

RETAIL INDUSTRY

The major trend in the history of the retail industry has been the transfer of sales from individual, independent, single-product merchants to chain stores, department stores, supermarkets, malls, and catalogs. (The chain store actually dates back as early as 700 B.C. in China.) Modern retailing began in the United States in 1859, when The Great Atlantic and Pacific Tea Company (A&P) became the first chain store in the country, selling tea in New York City. Soon afterward department stores and catalog stores appeared, the latter making use of the first direct mail lists to reach customers in rural areas. By the early 1900s the beginnings of retail industry in the United States were well established.

The A&P tea emporiums were typical of early food stores which specialized in one type of item. A&P purchased tea in New York dockyards and sold it at

substantially lower prices (50 percent) than competitors. A&P was sophisticated in promoting its single product. Their tea emporiums were unlike the typical general store of the nineteenth century, for they tried to create the atmosphere of an oriental palace, evoking the Asian origins of their product. A&P also brought a new concept into food trade when it assigned brand names to bulk teas. It popularized these teas even further by organizing tea clubs in various cities. Tea club members received special discount rates on A&P products. The stores also printed colorful advertising pamphlets listing tea prices and delivery dates along with literary flourishes like poetry and essays. A&P offered money-back guarantees and it advertised in big national publications like *Harper's Weekly* as well as smaller religious publications, hoping to win the teetotaler market. When coffee became popular in the 1880s, A&P offered its own brand, Eight O'Clock breakfast coffee, which was sold in signature red bags. Though A&P would eventually expand into a chain of supermarkets, its tea emporium beginnings contributed much to the basic understanding of how a successful chain store should promote itself and its product.

During the same period early versions of department stores (Woolworths, 1879) and catalog retail stores (Sears, Roebuck & Company, and Montgomery Ward and Company, in the late 1800s) radically changed the look of sales for non-food products. These stores became institutions virtually synonymous with U.S. culture. Woolworths had great success with over 1,000 stores only 40 years after its founding. Sears, Roebuck & Company and Montgomery Ward grew to be the largest catalog retailers in the world. They began by selling only by mail order and they thus helped people in more rural areas keep up with home improvements.

The catalog sales were no doubt helped by direct mailing lists, which appeared as early as 1903. Multi-Mailing Company of New York gathered lists from phone books around the region—from New England to Ohio—with a total of 600,000 names. This was valuable information because farmers in rural areas installed their own telephone lines which were used by entire communities with as many as 100 people serviced by one line. Companies like Multi-Mailing sought out these telephone-line owners, believing that the rural telephone system identified prominent community members who held influence over their fellow villagers.

Around 1900 retailers owned either small general stores or grand downtown department stores. By World War I (1914–1918) the department stores were prominent. In the 1920s Sears, Roebuck & Company and Montgomery Ward opted to add retail stores to their

Revenue

catalog operations. As the number of stores spread, reaching even the more rural areas that had come to rely on catalog shopping, people increasingly opted to shop in the department stores themselves. A century after their beginnings, Sears and Montgomery Ward earned over three-fourths of their profits in their retail stores.

In the 1930s supermarkets appeared, imitating the department stores by offering the customer one-stop shopping. They quickly dampened business for individual merchants or single-item shops like A&P's tea emporiums. It was far easier to go to one place and pay once, than to make individual trips to the butcher, various produce stands, the bakery, and dry goods store. In 1930 the King Kullen supermarket was founded in New York City. Boasting that it was the first U.S. supermarket (a claim viewed skeptically by some industry historians), it was nevertheless a pioneer in that type of store. Its decision to outsource, or hire out, warehouse work led to a three-month labor strike. But the company maintained that the outsourcing decision was good because it allowed King Kullen to be more competitive by opening more new stores and by selling more products. In the years after World War II (1939–1945), the supermarket growth rate had peaked and small independent food retailers were driven out of business by tens of thousands of newly-opened supermarkets. Many remaining independent, individual, or small-chain retailers survived by pulling together into retail cooperatives.

For two decades after World War II, discount warehouses were the new trend in retail. These companies offered substantial discounts and they often managed to sell below manufacturer listed prices. Products were pushed out in high numbers with little overhead cost. This was possible because the stores greatly reduced services, and because they were usually located in the unfashionable shopping districts, which meant that they paid low rent for their retail space. These stores focused particularly on household electrical appliances. Later, the concept changed for discount stores—they became scaled-down department stores with lower prices and minimal services.

In the later part of the twentieth century the retail industry continued to experiment with new ways of reaching customers. Catalogs experienced a revival, especially for smaller companies that focused on a single product line with limited appeal such as Victoria's Secret's lingerie catalogs or Crate & Barrel's household items. These new-look catalogs were sized like magazines and introduced with high-quality design and paper. Other trends in the same period included shopping via television (viewing products on the

screen and then purchasing over the phone with a credit card) and shopping over the Internet.

The retail industry grew up with the grandchildren of the Industrial Revolution, whose lives were increasingly complicated by work schedules and the urban pace, and who sought as much convenience as could be found in all aspects of living. This, and the highly competitive race for the biggest share of the market, pushed retailers to be ever more creative in finding ways to reach customers and dazzle them with store interiors, new products, or shockingly low prices. It made economic sense to put as much as possible under one roof because the customers seemed to want it and overhead costs were greatly minimized in relation to profit. But the retail giants—supermarkets, department stores, and malls alike—were not entirely invulnerable to the whims of the market, as seen in 1998, when the last of the once-mammoth Woolworth empire of general stores was slated to be closed.

REVENUE

Revenue is a term commonly used in business. A company's revenue is all of the money it takes in as a result of its operations. Another way of defining a company's revenue is as a monetary measure of outputs, or goods sold and services rendered, with expense being a monetary measure of inputs or resources used in the production of goods or services. On the other hand, a company's net income or profit is determined by subtracting its expenses from its revenues. Thus, revenues are the opposite of expenses, and income equals revenues minus expenses.

For accounting purposes, income is distinguished from revenues. Income is an important concept in economics as well as accounting. Accountants prepare an income statement to measure a company's income for a given accounting period. Economists are concerned with measuring and defining such concepts as national income, personal income, disposable personal income, and money income versus real income. In each field the concept of income is defined in slightly different terms.

An example of revenue is when a store sells \$300 worth of merchandise, for which it originally paid \$200. In this example the company's revenue is \$300, its expense is \$200, and its net income or profit is \$100. Other expenses that are typically deducted from sales or revenues include salaries, rent, utilities, depreciation, and interest expense.

REVERE, PAUL

Paul Revere (1735–1818) is best known as an American patriot during the American Revolution (1775–1783). He is the man who helped carry news of the approach of British troops to Lexington, Massachusetts, in what became known as Paul Revere's midnight ride. When Revere wasn't fighting for American independence, he was a creative and successful silversmith.

Paul Revere was born January 1, 1735 in Boston, Massachusetts. He was the third of twelve children born to Apollos De Revoire, a Frenchman. De Revoire changed the family name to Revere to make it easier for Americans to pronounce. Apollos De Revoire was a silversmith and he taught the trade to his son.

Paul Revere married Sarah Orne in 1756 after serving for a short time in the French and Indian War (1754–1763). At age twenty-one he began work in his father's silversmith business. Revere was a talented silversmith and an innovator in processing commercial-grade bronze and copper. His skills made him a success in his trade.

In his early years as a silversmith Revere developed an intense interest in the issue of American independence from England. He became involved in revolutionary activities and attracted wide public attention when he used his engraving skills to create a number of political cartoons aimed at the issue of independence.

Listen my children and you shall hear / Of the midnight ride of Paul Revere, / On the eighteenth of April, in Seventy-five; / Hardly a man is now alive / Who remembers that famous day and year. / He said to his friend, "If the British march / By land or sea from the town to-night, / Hang a lantern aloft in the belfry arch / Of the North Church tower as a signal light,— / One if by land, and two if by sea; / And I on the opposite shore will be, Ready to ride and spread the alarm / Through every Middlesex village and farm, / For the country folk to be up and to arm."

Henry Wadsworth Longfellow, *Paul Revere's Ride*

Revere began to work closely with revolutionary leaders, such as Samuel Adams (1722–1803) and John Hancock (1737–1793). He also participated in the famous Boston Tea Party on December 16, 1773. He and other Boston protestors raided a British ship in Boston harbor and dumped the tea cargo into the ocean, dissenting against British taxes in the colonies. This protest was one of the crucial events leading up to the American Revolution (1775–1783).

In addition to his activities as a revolutionary, Revere directed his energies to a variety of areas. He pursued work on a wide-ranging field, from working with silver to the manufacture of gunpowder. In Massachusetts he created a mill that ground wheat and oats by using the swirling flow of river water to move grindstones. He designed and printed the first issue of U.S. paper money and was the first in the United States to discover the process of rolling sheet copper. In Canton, Massachusetts, he built the first copper-rolling mill in the country.

Revere was continually involved in the politics of his new nation. He served as an activist, a soldier, and a political thinker. He achieved great success as a silversmith and expanded his business efforts towards growing U.S. industries. Paul Revere was an entrepreneur and a patriot. He died in 1818.

RHODE ISLAND

Rhode Island, the smallest state of the United States, has struggled to maintain its economic health. Born as a colony of dissenters and a haven for individual liberty, the state has not always matched its idealistic beginnings with its political and economic realities. It has experienced divisions between its old-line citizenry and the descendants of the immigrants who have staffed its factories. It reached an economic peak around the turn of the century but it has since fought competition from southern industries and has gone through periods of depression and recession. In the

latter half of the twentieth century, however, Rhode Island achieved a significant economic recovery.

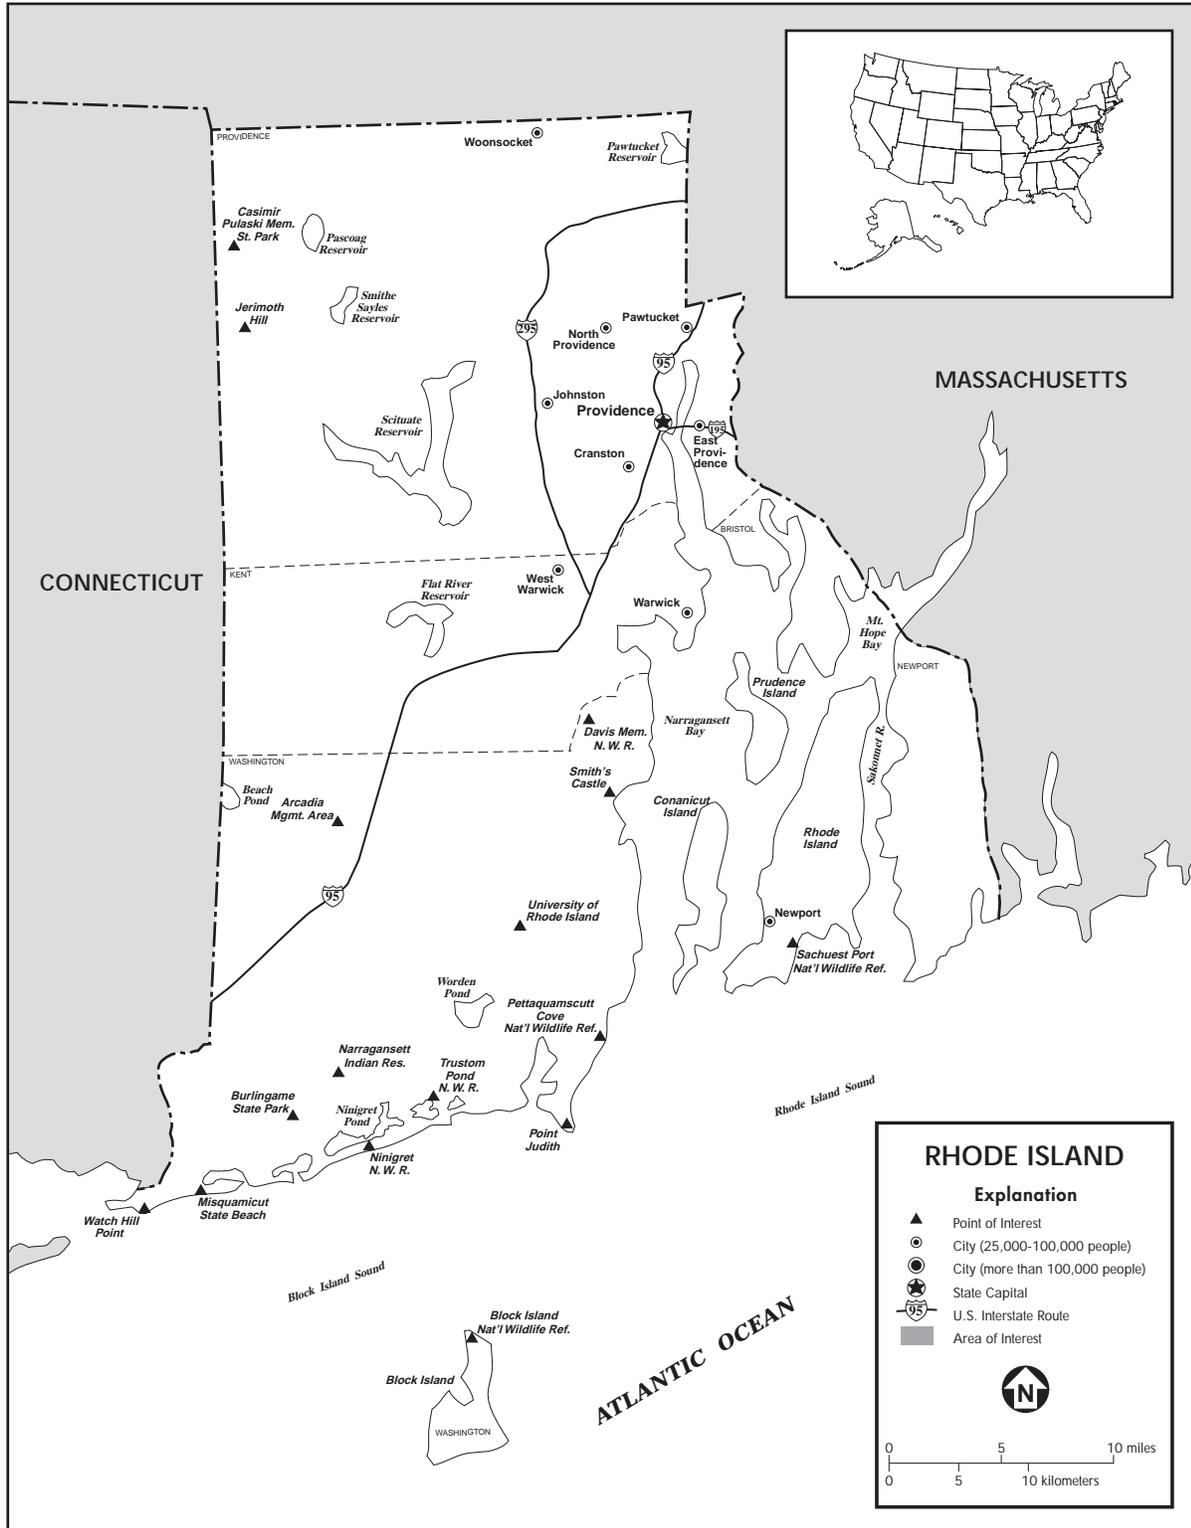

In 1524 the first European explorer of Rhode Island to arrive in the region was Italian Giovanni da Verrazano. In 1636 English clergyman Roger Williams established a colony at Providence seeking religious freedom for a group of nonconformists from the Massachusetts Bay Colony. As other towns developed in the area, Williams secured a charter from King Charles II for Rhode Island and Providence Plantations (which encompassed several towns), that guaranteed religious freedom and substantial local autonomy.

Rhode Island grew rapidly in agriculture and commerce, which included the slave trade. Its exports included naval stores, molasses, preserved meats, cider, and dairy products. Rhode Island was also a whaling center. As the colony with the highest degree of self-rule, Rhode Island was the first to declare its independence from England in 1776. Fearing too much federal power, however, it was the last state to ratify the U.S. Constitution (1790).

Rhode Island merchant ships in the early nineteenth century traded with China, India, the Baltics, and the East Indies, and later with the U.S. Pacific coast. The mid-nineteenth century in the state was marked by divisions between ordinary citizens and wealthy rural landowners who held nearly all the power in the legislature and who were the only ones allowed to vote. By 1843 a new constitution was formed which corrected some of the inequalities.

Meanwhile, the economy of the state had shifted from commerce to industry, with textile manufacturing as the most prominent. Samuel Slater established the first cotton mill in Pawtucket in 1790. Under the so-called "Rhode Island System," company-built housing was established for the workers and their families. Oftentimes mill owners employed entire families that worked from sunup to sundown. Between 1830 and 1840 the number of mills in the state almost doubled. After 1830 steam power replaced water power in the mills and also provided the power for steamboats and newly emerging railroads.

Other products were being manufactured such as jewelry (represented best by Gorham Silver) and steam engines. By 1860 less than an estimated three percent of the state's workforce was in the maritime industry; 10 percent were employed in agriculture, and 50 percent in manufacturing. Between 1776 and 1860 Rhode Island's population had increased two and one-half times, mostly through foreign immigration.

State of Rhode Island.

The port of Providence soon became the center for commerce in the region. With three rivers at the head of Narragansett Bay and a growing number of railroad termini, Providence boasted a large number of textile mills. It was also home to the metals industry, the banking and insurance sector, and the import-export business. Providence began to lose some of its prominence after 1845 when steamships found a more suitable port at Fall River, Massachusetts, and rail connections began to gravitate toward New York City.

As several southern states began seceding from the Union just before the American Civil War (1861–1865), Rhode Island still had some sympathies with the South because of its economic relationship with southern cotton planters. A slave-free state since 1807, Rhode Island even temporarily repealed its “personal liberty law” to make it easier for runaway slaves to be returned to their owners. Still, when the Union called for volunteers against the Confederacy, Rhode Island responded, exceeding its quota for troops. The state made great profits in the textile and other industries during the war. After the war, the town of Newport became a haven for newly rich Americans who built large mansions on its rocky shores. Many of which still survive as tourist attractions.

According to historian William G. McLoughlin the decades following the war were Rhode Island’s finest: “Its manufacturers hobnobbed with the rich and powerful who controlled the nation. . . . (It) had reached the pinnacle of success. . . .” Foremost among the rich and powerful people was Nelson W. Aldrich (whose daughter later married into the Rockefeller family) who, as a senator, controlled tariff schedules in the U.S. Congress. As chairman of the Finance Committee he was in a position to help protect businessmen against foreign competition and to encourage sound money policies. He also was instrumental in devising the Federal Reserve System.

The economic system in Rhode Island changed rapidly after World War I. French-Canadians, Irish, and Portuguese, encouraged to immigrate to provide cheap labor, began to outnumber people of the old Yankee stock. The state’s industries continued to prosper and they were especially productive during World War I (1914–1918). After the war, however, decreased production caused labor unrest and a widespread strike of textile workers in 1922 crippled an industry that was already plagued by competition from textile mills in southern states. Bitter divisions in the state at this time, coupled with the onset of the Great Depression (1929–1939), helped to precipitate the 1934 Democratic overthrow of longtime Republican rule in the state.

Improvements in Rhode Island’s economy have been slow in coming. Since the Depression years the state often had one of the highest rates of unemployment in the nation, reaching more than 15 percent by 1975. In the late 1990s about 30 percent of workers were still employed in manufacturing and many were working in low-paid jobs in the jewelry and textile industries. After a real estate boom in the 1980s the real estate market declined at the end of the decade. The state experienced a banking crisis in the early 1990s, which necessitated a government bailout of uninsured financial institutions. Rhode Island had slowly begun to recover from its economic doldrums, largely because of new jobs in the financial and electronic industries. Unemployment fell to around five percent by 1997.

RHODE ISLAND SYSTEM OF LABOR

The Rhode Island system of labor was initiated by English-born mechanist and businessman Samuel Slater (1768–1835), who built a water-powered cotton-spinning mill at Pawtucket, Rhode Island, in 1790. The machine, based on a mill invented by Englishman Richard Arkwright (1732–1792), was an immediate and unqualified success—introducing mechanization to manufacturing, which was previously done by hand. A few years after starting his mill, Slater began hiring whole families from the surrounding area, including children, to work the spinning machines. Child labor

had long been used in Britain's textile factories and Slater himself had worked in them as a youth. In the Rhode Island mills, the families made up the workforce. Wages were low and the hours were long. But the Rhode Island system of labor worked, and by the 1820s it was firmly established in American industry. In 1832 an estimated 40 percent of all factory workers in New England were between the ages of seven and sixteen.

As the textiles industry grew, the supply of labor did not keep pace with the demands of the industry. Slater hired families who often relocated to be near the factory, giving rise to mill towns. By the late 1830s, factory conditions in New England deteriorated. Increased competition in the textile industry (which was the model for other industries of the day) forced factory owners to cut wages and lengthen hours to stay profitable and keep up with production demands.

The opening of new lands in the west shifted much of the nation's agriculture from New England's coastal states to the interior. As the farming population moved west, it became more difficult to recruit mill hands from the resident farming population. During the 1830s the mill owners turned to the steady stream of immigrants to supplement the factory workforce. Labor systems, such as Slater's and that of Francis Cabot Lowell (who hired farm girls to work in his factories but took care to ensure favorable working and living conditions), were no longer necessary. During the second half of the century, women and children continued to supply much of the factory labor, but without the paternalistic labor systems of Slater and Lowell.

RICARDO, DAVID

David Ricardo (1772–1823) was an English stockbroker who, working at the beginning of the nineteenth century, emerged as a major economic thinker during the early years of the industrial revolution. He is often referred to as the founder of scientific economics, because he used mathematics and abstract examples in his writing. His view of economics was ultimately a pessimistic one. Ricardo saw European economy torn into warring groups. He believed that in the long run the hardworking industrialist was bound to lose and that the benefits of the Industrial Revolution would end

up in the hands of the already wealthy class of aristocratic landowners.

David Ricardo was born in April of 1772 in London, the third son of a wealthy Dutch-Jewish businessman. Ricardo's early passion for scholarship was delayed when he began to work in his father's investment business at age 14. He had a close relationship with his father and excelled in his work. At age 19, he married Abigail Delvalle, a Quaker, and eventually he left the family business to begin on his own, building a fortune by speculating in stock investing and other entrepreneurial ventures. In his late thirties, he began to write and published his first two books, *The High Price of Bullion* and *An Essay on the Influence of a Low Price of Corn on the Profits of Stock*.

In 1814, at age 42, David was wealthy enough to retire from his investment business. He could now give his full attention to intellectual pursuits, and by 1817 he had established his reputation as a leading thinker in England. His books by no means made him a cultural celebrity, but economically powerful, thoughtful people regarded him as one of the most influential intellectuals of his era. His life for the next 20 years centered largely around his continuing intellectual activity. He sat in parliament from 1819 to 1823, however, where he brought his knowledge about trade issues and finance to the British House of Commons and informed political debate of his day; thus, his writing had a role in rebuilding the English banking system after England's war with France ended in 1815.

Ricardo's approach to economics was new. Before him, economic writing was more literary than scientifically precise. It was a kind of loose-knit story involving many anecdotes. Ricardo chose to write about economics in a concise way, by eliminating numerous examples and instead explaining his ideas about the economy by using simple, easy-to-understand abstract models. Pursuing economic theory as a science, he explored economics by using basic principles and deductive reasoning to work toward his conclusions.

David Ricardo's notion of how the economics world worked was regarded as simple and elegant. He broke society into three parts: capitalists, landlords, and workers. The workers and the industrial capitalists, he argued, were in an impossible situation over the long run. The profits of hard-working creators of industry were eaten-up by the higher wage demands and by the costs of hiring additional help as business expanded. Ricardo maintained that ordinary workers wasted their income when their lives improved financially. For Ricardo the ordinary worker did not invest

his money but only produced additional children to create larger burdens for the entire society.

Ricardo claimed that the only people who really improved under capitalism were the aristocratic landowners, who simply raised and lowered rents as they pleased. Thus they would absorb the extra profits made by the workers laboring for the capitalist industrialists. Ricardo also claimed that landlords, who produced nothing, served no useful purpose.

Ricardo was gloomy about the long term prospects of capitalism. He envisioned industrialists and common laborers “in the same boat.” They were both being exploited by aristocrats who owned the land and who charged rent, based on the amount of money circulating in the economy. A situation he found unjust. But Ricardo’s dire prophecies never came to pass. Wealth earned from industry was growing faster than that generated by the traditional agricultural-based society. With the cooperation of the British government, the industrial capitalists of Ricardo’s era were able to reduce the power of the landowners, who were never able to dominate society as they had in the past.

Ricardo’s approach to writing about economics made it more of a science and far more accessible to common readers. His gloomy attitude about capitalism alerted many of his optimistic friends and caused them to question the economic future. Some scholars have written that Ricardo’s observations on capitalism led indirectly to the birth of a variety of socialist and progressive movements, all concerned with economic pathways that were not crowded with tax agents and Ricardo’s nemesis, the landlords. He died in 1823.

RICE

Rice is a cereal grass grown in warm, moist climates. The native inhabitants of Southeast Asia probably began cultivating rice for food seven thousand years ago. The crop spread northward into China and Japan, and westward into India, where it was observed in about 325 B.C. by Greek soldiers under the command of Alexander the Great (356–323 B.C.). Like sugar, which was also observed in India by the Greeks about 325 B.C., rice did not reach Europe until Moors (North African Muslims) invaded the Iberian Peninsula (present-day Spain and Portugal) in A.D. 711. When Spaniards colonized the islands of the West Indies and lands in South America in the late 1400s and throughout the 1500s, they introduced rice in the Western Hemisphere. There rice joined sugar, indigo, and tobacco as a profitable export item for the better part of the 1600s. Rice was among the enumerated articles in the British Parliament’s Second Navigation Act (1660) which prevented colonies from exporting its products to anywhere except the British Isles. In 1671 rice was introduced into the North American mainland at South Carolina. By 1685 it became a commercial crop. Cultivation and production spread to North Carolina and Georgia. Because rice is a labor-intensive crop, rice plantations required numerous slaves for production. That way, along with tobacco and indigo, rice helped define the plantation economy of the South. After the American Civil War (1861–1865) and the abolition of slavery, southern growers could no longer support the crop. Production of rice moved westward. By 1900 Louisiana was supplying 70 percent of the U.S. rice production. In the early 1900s it was also introduced as a crop into California.

RIGHT TO WORK

Right-to-work laws made it illegal for employees to be required to join a union as a precondition of employment. They were the opposite of closed-shop laws, which forbade workers from working for a firm unless they became union members.

Federal legislation passed during the New Deal of President Franklin D. Roosevelt (1933–1945) greatly strengthened the U.S. labor union movement. The

National Labor Relations Act of 1935 (also known as the Wagner Act) prevented companies from firing or unfairly treating workers who joined unions and required companies to bargain with duly elected labor representatives.

Although the number of unionized workers in the United States grew significantly because of the labor needs of World War II (1939–1945), in the postwar years an anti-labor climate emerged as a result of several major strikes, growing concern over communist infiltration of unions, and fears over the size and power of the unions. This environment resulted in the Labor-Management Relations Act of 1947 (usually called the Taft-Hartley Act). Surviving a veto by President Harry S. Truman (1945–1953), the law sharply curtailed union rights, though it did reaffirm the right of workers to organize and bargain as a group for higher wages and better working conditions. The law specifically gave workers the right not to join unions and outlawed closed shops.

The first U.S. state to ratify a right-to-work law was Florida, which in 1944—three years before Taft-Hartley—amended its constitution to ban closed shops. By 1998, when union representation was weakest, 21 states had right-to-work laws (mostly in the South and the West). Indiana, one of the few industrial states to adopt a right-to-work law, became the first state to repeal anti-closed shop legislation in 1965. In the same year President Lyndon B. Johnson (1963–1969) pushed hard to get the right-to-work clause of the Taft-Hartley Act repealed, but without success. In the mid-1990s, thirty U.S. states had some form of right-to-work provision for some state employees, and all employees of the federal government were covered by right-to-work protections.

Opponents of right-to-work laws argued that such laws enable non-union workers to enjoy the benefits unions secure for their members without bearing any of the costs and that union membership is generally beneficial. Among the arguments in favor of right-to-work laws is that forcing employees to join a union as a precondition of employment violates their civil rights.

RIPPLE EFFECT

When someone drops a stone into a still pond of water, the water moves in ripples across the entire

pond. A similar ripple effect occurs in economics. Economic ripples can be big or small, and the largest have an international impact. In 1998, when several of Asia's economies collapsed, primarily Japan, the effects came to the United States in both positive and negative ways. The negative ripple effect of the collapsed Asian economies was a sharp reduction in Asian demand for U.S. produced goods because of the sudden lack of disposable income. One area where the reduced Asian demand made itself felt was in the American Southeast, where the textile and apparel industries were weakened as overseas sales fell and foreign competition intensified. The U.S. automobile industry was also hurt because an increase in Asian demand for cheaper cars led Asian consumers back to purchasing cheaper Japanese-made vehicles rather than the often more expensive American-made imports.

The ripple effect in economics can have a positive side as well. The collapse of Asian economies led to an investment drain in the region. Investors pulled their money out of the now shaky Asian markets and back into the more stable U.S. market. With this increased investment in the United States, interest rates in the country dropped. Because of the Asian decline in 1998, the United States experienced a sharp bond rally and a drop in long-term interest rates, including mortgage rates. Many homeowners took advantage of the decrease in mortgage rates and refinanced their homes for a lower monthly payment.

The ripple effect, which occurs daily in many small ways throughout the world's economies, creates positive and negative effects which are largely unforeseeable. As world trade increases and nations work more closely together, the ripple effect's intensity increases. Asia's financial problems in 1998 were confined by International Monetary Fund (IMF) interventions, which kept the collapse contained to Asia. Without this intervention, the negative ripple effects could have wreaked more havoc in Latin America, where Brazil was vulnerable, and in Eastern Europe, creating a far deeper crisis for the U.S. economy.

ROBBER BARONS

The "robber barons" were industrial and financial tycoons of the late nineteenth century. They included banker and financier John Pierpont Morgan (1837–1913); oil industrialist John D. Rockefeller (1839–1937); steel mogul Andrew Carnegie (1835–1919); financiers James J. Hill (1838–1916), James

The robber barons (especially the railroad men and the financiers who gained control of rail companies through stock buy-outs) hired lobbyists to work on their behalf to gain corporation subsidies, land grants, and even tax relief at both the federal and state levels. They converted their business prowess into political might.

Fisk (1834–1872), and Jay Gould (1836–1892); and rail magnates Cornelius Vanderbilt (1794–1877) and Collis Huntington (1821–1900). Hailed by some for expanding and modernizing the capitalist system, lauded by others for their philanthropic contributions to the arts and education, these businessmen were viewed by many more as opportunistic, exploitative, and unethical.

Many factors converged to make the robber baron businessman possible: the country was rich in natural resources, including iron, coal, and oil; technological advances steadily improved manufacturing machinery and processes; population growth, fed by an influx of immigrants, provided a steady workforce that was often willing to work for a low wage; the government turned over the building and operation of the nation's railways to private interests; and, adhering to the philosophy of *laissez faire* (non-interference in the private sector), the government also provided a favorable environment in which to conduct business. Shrewd businessmen turned these factors to their advantage, amassing great empires. They reinvested profits into their businesses and their fortunes grew. The robber barons (especially the railroad men and the financiers who gained control of rail companies through stock buy-outs) hired lobbyists to work on their behalf to gain corporation subsidies, land grants, and even tax relief at both the federal and state levels. They converted their business prowess into political might. In Washington, D.C., politicians grew tired of the advantage-seeking representatives of the nation's business leaders. Reform-minded progressives complained that the robber barons lived in opulent luxury while their workers barely eked out a living.

After a decades-long domination of the robber barons over the U.S. economy, changes around the turn of the century worked to curb their influence. In 1890 the federal government passed the Sherman Anti-Trust Act which made trusts illegal (trusts are combinations of firms or corporations formed to limit competition and monopolize a market). Workers continued to organize in labor unions with which corporations were

increasingly compelled to negotiate. The Interstate Commerce Commission (ICC) was established in 1887 to prevent abusive practices. In 1913 the Sixteenth Amendment was ratified, allowing the federal government to collect a graduated income tax. Though many American businessmen and women would make great fortunes in the twentieth century, by the end of the 1920s the era of the robber barons had drawn to a close.

ROCKEFELLER, JOHN DAVISON

The name Rockefeller has become synonymous with the idea of enormous personal wealth. In ordinary language one may hear the phrase "rich as Rockefeller," an enduring popular legacy for the man who built the largest fortune ever up to that time seen in the United States. John D. Rockefeller (1839–1932) created an oil empire that helped fuel the Industrial Revolution.

John Davison Rockefeller was born in 1839 in Richford, New York. His Baptist upbringing taught the young Rockefeller to be frugal, hard-working, and self-reliant. He despised waste and had a quiet disposition. Rockefeller's subdued character masked an aggressive ambition that would take him to the heights of success. In 1855, at age 16, he graduated from high school and began work as a bookkeeping clerk in Cleveland, Ohio. After four years Rockefeller left bookkeeping behind to start his own business in the new and rapidly growing oil industry.

As an entrepreneur, Rockefeller drew on the qualities instilled in him at childhood to run a successful and profitable business. He tried to save costs where possible and constantly reinvested his savings into his business. Rockefeller's business philosophy was akin to Charles Darwin's evolutionary theory of the "survival of the fittest." He could be a ruthless businessman, using harsh and even unethical methods to succeed, often driving his competition out of business.

By the 1870s Rockefeller's oil business grew to include refineries, lubrication plants, pipelines, cooperage plants, and other enterprises. The wide reach of his investments created an unwieldy and

John D. Rockefeller.

complicated business that Rockefeller controlled with an iron fist.

Rockefeller delegated management of his oil properties to 40 allied firms that, in 1882, centralized his operations under the Standard Oil Trust. The Standard Oil Trust monopolized 90 percent of all oil business in the United States and extended its influence into other parts of the world as well. It stifled competition in the oil industry.

While Rockefeller's business grew, the oil industry expanded. Rockefeller's increasing control over this important industry caused the United States government to examine more closely the fairness of trade and competition in the industry. The Ohio Supreme Court first asserted the illegality of Rockefeller's Trust in 1892. In 1870 Congress passed the Sherman Anti-Trust Act in part as a response against vast and powerful empires such as Rockefeller's. However it wasn't until 1911, under President Theodore Roosevelt (1901–1909), that the United States Supreme Court prosecuted the Standard Oil Trust for violation of anti-trust laws and dissolved its practices as “a monopoly in

restraint of trade.” By the time the Supreme Court completed its case against the Standard Oil Trust, John Rockefeller had pulled away from active involvement in his company's practices. He turned his attention to business ventures in minerals and ore in northwestern United States, and he developed ore operations in Colorado, Washington, and Minnesota.

John Rockefeller was one of the most successful U.S. entrepreneurs. He amassed a fortune of close to \$1 billion, an outrageous sum for his day. Despite his enormous wealth Rockefeller did not forget his early upbringing. He regularly contributed to charity and created the Rockefeller Institute for Medical Research, the General Education Board, the Rockefeller Foundation, and the University of Chicago. John D. Rockefeller died at age 97 in Ormund Beach, Florida, on May 23, 1937.

ROEBLING, JOHN AUGUSTUS

John Augustus Roebling (1806–1869) came to the United States and created in New York what has become one of the nation's best-known and earliest examples of suspension bridges, the Brooklyn Bridge.

John Roebling was born in Prussia in 1806. He received an excellent formal education and graduated in 1826 with a degree in civil engineering from the Royal Polytechnic Institute in Berlin. As a practicing civil engineer, Roebling was dissatisfied with the simple road building projects available in his homeland at that time. He set his eyes elsewhere in search of more challenging work.

Roosevelt, Franklin Delano

His search ended in the United States, where Roebing and his brother emigrated and established a 7,000-acre agricultural community in western Pennsylvania. Roebing was an unsuccessful farmer and found himself returning to his civil engineering interests and the building opportunities available in the United States.

IN PURSUIT OF HIS PHILOSOPHICAL IDEAL "TO BRING IN HARMONY ALL THAT SURROUNDS ME," JOHN AUGUSTUS ROEBLING BECAME A PIONEER OF SUSPENSION BRIDGES IN THE UNITED STATES.

He saw in his new country an opportunity to achieve the realization of his philosophical ideal of harmony. Creating order out of chaos was foremost in Roebing's life. The many bridge building projects he led, pioneering the design of the suspension bridge, were an extension of his desire "to bring in harmony all that surrounds me."

Drawn back into civil engineering, Roebing began his career in the United States first as a surveyor for the Pennsylvania Railroad. At the railroad he observed the thick, crude, and expensive rope used to haul heavy barges up hills to reach the canal systems and saw a way to improve the process. He invented and began manufacturing a smaller cable composed of many thin strands of wire twisted together to make a single cable, far stronger than the bulky rope then in use. Roebing was a leader in the manufacture of strong steel cables, and he later used their unique blend of strength and lightness in the construction of suspension bridges.

Roebing combined strength and lightness, extension-in-space and compactness, and the precision of steel cables with rolling Gothic arches in the stone towers of the bridges he created. His first suspension bridge was a highway bridge over the Monongahela River that runs through Pittsburgh, Pennsylvania. He then went on to construct a bridge across the Ohio River in Cincinnati, Ohio. Across the Niagara River in 1855, he built the first cable suspension bridge capable of handling human road traffic.

Roebing's last project, the design and construction of the Brooklyn Bridge, began in June 1869. The Brooklyn Bridge was the longest and most modern bridge ever attempted at that time. It spans New York's East River, connecting Manhattan and Brooklyn. Hanging from steel cables almost sixteen inches thick, the bridge boasts two Gothic towers along its 1,595 foot length.

During the first stages of construction, Roebing suffered an accident while inspecting the stone base-pilings of the bridge and his foot was crushed. An infection quickly set in and he died of tetanus complications on July 22, 1869.

The Brooklyn Bridge, finished in 1883, fourteen years after the death of its creator, is a symbol of American ingenuity as the nation emerged from a farming economy into an industrial nation. It was completed by Roebing's son, Washington, who carried out the realization of his father's dream.

ROOSEVELT, FRANKLIN DELANO

Franklin Delano Roosevelt (1882–1945), known as F.D.R., was the thirty-second president of the United States. He was the only president elected to four consecutive terms of office. According to polls of historians and political scientists, F.D.R. is consistently ranked with George Washington (1789–1797) and Abraham Lincoln (1861–1865) as one of the United States' three greatest presidents.

Roosevelt's politics in fighting both the Great Depression (1929–1939) and World War II (1939–1945) was always realistic: he stood for humanity and against rigid ideology. Roosevelt seemed to work against the abstract ideologies of fascism, communism, and European imperialism in an effort to find practical ways to help common people.

Some Roosevelt critics in the wealthy business community said he was leading the United States into communism. During the Great Depression he said to his business detractors: "The test of our progress is not

Franklin D. Roosevelt.

whether we add more to the abundance of those who have much; it is whether we provide enough for those who have too little.”

Roosevelt is known as the president who lifted the United States out of its deepest economic despair and revolutionized the country’s way of life. While many businessmen opposed him, he understood that social security, unemployment compensation, stock securities regulation, farm price supports, minimum wages, and guarantees of collective bargaining were all ways in which capitalism could save itself, instead of surrendering to other systems and pulling itself apart.

Franklin Roosevelt was born into a prominent and wealthy family in Hyde Park, New York, in 1882. He received a traditional education at the respected Groton School and went on to graduate from Harvard University, then entering the Columbia University law school. Roosevelt became a lawyer without finishing law school, but his dreams seemed always to be about politics. He had great ambitions to become president, and as early as 1905 his fellow law clerks remarked how Roosevelt meant to enter politics and the White House.

In 1910 he was elected to the New York State Senate. From there, his career in public service went from the New York Senate to President Woodrow Wilson’s (1913–1924) Assistant Secretary of the Navy, then to the governor of New York in 1928, and ultimately to the presidency of the United States in

1933. He was re-elected to the presidency three times before his death in 1945.

THE TEST OF OUR PROGRESS IS NOT WHETHER WE ADD MORE TO THE ABUNDANCE OF THOSE WHO HAVE MUCH; IT IS WHETHER WE PROVIDE ENOUGH FOR THOSE WHO HAVE TOO LITTLE.

Franklin D. Roosevelt

In 1921, at age 39, Roosevelt became seriously ill with polio, and he was almost completely paralyzed. Through exhausting courses of physical exercise, he fiercely struggled to cure himself. He made progress in recovery, but never regained the use of his legs. Prior to his illness, Roosevelt was seen by many as a spoiled rich man dabbling in politics. Little of his later political seriousness was apparent before his bout with polio. When asked how he could be so patient with a political opponent, he said: “If you had spent two years in bed trying to wiggle your big toe, after that anything else would seem easy.”

Roosevelt ran for the presidency on the Democratic Party ticket in 1932, promising to balance the federal budget and provide direct aid to the needy. Though his Republican opponents saw Roosevelt as a dangerous “socialist” during the 1930s, they missed the point that Roosevelt’s efforts were to save American capitalism from its worst traits. He also planned to break with “foolish traditions” in order to relieve the misery of one-third of the population, mired in the hard times of the Great Depression (1929–1939). Roosevelt won the election and began his first term of office in 1933.

On March 9, 1933, he convened a special session of Congress, which lasted 100 days. During that period more important legislation was passed than at any other comparable period in U.S. history. Roosevelt called his reform, recovery, and relief efforts the New Deal. To accomplish his social and economic goals he needed to overcome the deep-seated public prejudices against a strong federal government. Roosevelt went on the radio and talked informally to the public about what he wanted to do. This combination of decisive action and personal persuasion was effective. The most popular New Deal measures voted in were aimed at relieving the suffering of the unemployed, who made up about 30 percent of the country’s workforce at the time. Roosevelt created federal jobs for the unemployed, assisted farmers ruined by the Depression, and protected citizens against loss of their homes by mortgage foreclosures. He also enacted the Social Security Act, which put in place an old-age pension system, as well as benefits to widows with children and the

As the war stripped the workforce of men, women were hired to perform factory jobs, such as using this rivet gun to assemble aircraft for the war effort.

chronically disabled. A combination of New Deal legislation and World War II (1939–1945) worked to return the United States to prosperity.

By 1938 the Republicans and conservative Democrats had won enough seats in Congress to halt substantial increases in New Deal legislation, which was never without controversy. Regardless of the many perspectives held on Roosevelt and his terms in office, it is impossible to deny the central role he and his New Deal played in the shaping of the modern United States. F.D.R. died of a cerebral hemorrhage in Warm Springs, Georgia, on the morning of April 12, 1945. He died knowing World War II was won, and the economy repaired.

ROSIE THE RIVETER

“Rosie the Riveter” was the title of a song written in 1942, during World War II (1939–1945). The song quickly became a popular hit, and more importantly became the catch phrase that represented all women working in war-related industries.

The image of a woman war worker first appeared on the cover of the then-popular weekly magazine, *Saturday Evening Post*, on May 25, 1943. It was a painting by renowned artist Norman Rockwell of a woman worker; a muscular body, a cute saucy face, and very determined. She had a rivet gun, used for industrial assembly, resting across her lap, and the name “Rosie” painted on her lunchbox.

“Rosie the Riveter” became the major symbol of the more than six million women who joined the workforce during World War II. The women worked in naval shipyards, lumber mills, steel mills, and foundries. They worked as welders, mechanics, electricians, and boilermakers. They operated buses, cranes, tractors, and worked as engineers, police officers, taxicab drivers, and members of federal government services.

When the war ended in 1945, so did the extraordinary job opportunities for women. “Rosie the Riveter” disappeared as quickly as she had been created. “Rosie” represented the superb skill, ability, and patriotism of all U.S. women working on behalf of the domestic, industrial efforts on the “home front” during World War II.

RUBBERMAID INCORPORATED

Rubbermaid Incorporated was the product of two founding businesses—one, a maker of toy balloons, and the other, the designer of a better dustpan. The Wooster Rubber Company started in May 1920, when nine Wooster, Ohio, investors pooled \$26,800 to form a company to manufacture toy balloons, sold under the Sunshine brand name. Wooster Rubber was housed in a single building in Wooster—a small town 50 miles from Cleveland, Ohio. In 1927 Horatio B. Ebert and Errett M. Grable, two Aluminum Company of America executives, bought Wooster Rubber. By the late 1920s a new factory and office building had been constructed to house the prosperous business, but the fortunes of Wooster Rubber sunk during the Great Depression (1929–1939). In 1934 Ebert spotted Rubbermaid products in a New England department store, and he worked out a merger between the two firms.

Meanwhile, New Englander James R. Caldwell, who had first entered the rubber business as an employee of the Seamless Rubber Company in New Haven, Connecticut, looked around his kitchen during the depths of the Great Depression to see what he could improve. Caldwell and his wife conceptualized and developed 29 products, among them a red rubber dustpan. Although the rubber dustpan, designed and manufactured by Caldwell and his wife, cost \$1.00—much more than the 39-cent metal pans then available in stores—Caldwell “rang ten doorbells and sold nine dustpans,” as he recalled in an interview published in the *New York Times* on May 19, 1974. Convinced there was a market for his products, Caldwell gave his

enterprise a name—Rubbermaid—and expanded his line to include a soap dish, a sink plug, and a drainboard mat—products he sold in department stores throughout New England.

In 1934, Ebert spotted Rubbermaid products at a New England department store, and believing that such products could help his struggling Wooster Rubber, he engineered a merger of the two enterprises in July 1934. Still called the Wooster Rubber Company, the new group began to produce rubber household goods under the Rubbermaid brand name. With the merger, which was under Caldwell’s leadership, Wooster Rubber had a happy reversal in fortunes; sales rose from \$80,000 in 1935 to \$450,000 in 1941. Of the 29 new products Caldwell and his wife thought up in their kitchen in 1933, the company had marketed 27 of them by 1941.

ALTHOUGH HIS RUBBER DUSTPAN COST \$1.00—MUCH MORE THAN THE 39-CENT METAL PANS THEN AVAILABLE IN STORES, JAMES R. CALDWELL “RANG TEN DOORBELLS AND SOLD NINE DUSTPANS.”

In 1942 however, U.S. involvement in World War II (1939–1945) caused the government to cut back on civilian use of rubber, which was also had important military uses. This eliminated Rubbermaid’s housewares business, but the company was able to convert to military manufacturing. Beginning with rubber parts for a self-sealing fuel tank for warplanes, and moving on to other products such as life jackets and rubber tourniquets, the company manufactured military goods throughout the end of the war.

Following the war Wooster Rubber resumed its prewar production of rubber housewares. Because wartime shortages had not yet been completely redressed, no coloring agents were available and all Rubbermaid products were manufactured in black for several months. In 1947 the company introduced a line of rubber automotive accessories, including rubber floor mats and cup holders.

In 1955 the Wooster Rubber Company went public. This capital infusion allowed the company to branch into plastic products, and in 1956 a plastic dishpan was introduced. In 1957 the Wooster Rubber Company changed its name to Rubbermaid Incorporated to increase its association with its well-known brand name. The following year Rubbermaid began its first expansion beyond production of household goods when the company broadened its targeted market to include restaurants, hotels, and other institutions. Rubbermaid initially produced bathtub mats and doormats for these

clients. By 1974 industrial and commercial products provided 25 percent of the company's sales.

Following the 1970s, during which the company made ill-fated ventures into motorboats and snow sleds, Rubbermaid refocused on home and commercial products in the early 1980s. Rubbermaid also expanded through acquisitions. The company added the Contact brand of decorative plastic coverings in 1981; Little Tikes, a maker of plastic toys, in 1984; Empire Brushes, a leading U.S. maker of brooms, mops, and brushes, in 1994; the Graco brand of strollers, play yards, and infant swings in 1996; and Century Products, a manufacturer of car seats and strollers, in 1998. Then in March 1999, Newell, a housewares manufacturer based in Freeport, Illinois, purchased Rubbermaid for \$6 billion. Newell then changed its own name to Newell Rubbermaid Inc. in tribute to the reputation of the Rubbermaid name.

RUDKIN, MARGARET FOGARTY

During an era when being a housewife was considered the appropriate goal of a woman, Margaret Rudkin (1897–1967) achieved acclaim as one of the most

successful female entrepreneurs in the United States. Her concern for her son's health prompted this already wealthy housewife to begin baking her own "health bread" and within 10 years her Pepperidge Farm ovens were producing thousands of loaves a day at a baking facility she herself designed. Her business was later acquired by the Campbell Soup Company, which further expanded the successful brand of baked goods Rudkin had developed.

Margaret "Peggy" Rudkin was born Margaret Fogarty on September 14, 1897, in New York City, one of five children born to Joseph and Margaret Fogarty. Her father drove a truck, and the family lived with their grandmother until Margaret was 12, when her grandmother died. The family then moved to Flushing, New York, where Rudkin later graduated from Flushing's City High School as class valedictorian in 1915. Following graduation she went to work as a bookkeeper in a bank in Flushing and eventually became a bank teller.

At age 22 Rudkin began working on Wall Street at the brokerage firm of McClure, Jones, and Co. where she became a customer representative, helping people understand their investment choices more clearly. She met her husband, Henry Albert Rudkin, at the brokerage house, where he was one of the firm's partners. They were wed on April 8, 1923 and made their home in New York City.

The first years of the Rudkins' marriage were prosperous. They had three sons, and in 1928 they decided to build a house in nearby Fairfield, Connecticut, where they had purchased 125 acres of land. The Rudkins named their large Tudor-style house and the surrounding acreage "Pepperidge Farm" in 1931, after an old Pepperidge (black gum tree) that was on the property. Henry Rudkin sustained a serious injury while playing polo, making their activities afterward more limited.

In 1937 the Rudkins' youngest son, John, was diagnosed with asthma. The allergist said the additives in store-bought foods were probably aggravating the condition. Hearing this, Rudkin began to make all of her son's food from scratch, including bread.

Having never baked bread before, Rudkin used a recipe from her grandmother's cookbook. The recipe called for butter, whole milk, honey and whole-wheat flour, which Rudkin ground herself. Her son's health improved so much that the allergist requested she bake more loaves for his other asthma patients.

At this point, Rudkin started to bake in earnest and began to think of baking as an occupation rather than as

a component of her son's health regimen. From this time on Rudkin, along with her husband and children, pursued the business.

Beginning in 1937 after she provided her son's allergist with some of the "health bread" she had made for her son, Rudkin began to explore the wider sales potential of her bread. She began by making bread for the upscale New York City market and before long her husband was delivering 24 loaves of bread a day to Charles and Co., a specialty food company in Manhattan.

By the end of her first year of baking, using ovens installed in one of the abandoned horse stables on their property, Rudkin was making and selling 4,000 loaves a week. Although the price was more than twice the price of a regular loaf of bread, people seemed drawn to the "old fashioned," homemade, and healthy image of Pepperidge Farm bread.

By 1940 Rudkin moved the bakery to a larger facility in Norwalk, Connecticut, where she was able to make 50,000 loaves a week. All this time, she was maintaining the high quality of all the ingredients. By 1947, launching a new bakery designed to Rudkin's own specifications, the Pepperidge Farm Co. was producing 4,000 loaves of bread per hour.

Growth and maintaining quality while expanding were Rudkin's main concerns. Her husband retired from Wall Street in 1949 and took over the financial side of the company while she managed the production and personnel. By this time, there were three bakeries: one in Connecticut, one near Chicago, and one near Philadelphia. Rudkin maintained quality control despite the massive expansion by specifying that her bread was not to be sold after two days on the shelf. When surplus bread was returned from the distributor, Rudkin used it to make poultry stuffing for a good profit.

In the 1950s Pepperidge Farm, under Rudkin's management, employed over 1,000 workers. By 1956 she introduced cookies that were "healthy," and in 1958 frozen pastries made their debut. By that time Pepperidge Farm (within 15 years of its inception) was a brand name recognized nationally; products were found in virtually every market. Among the growing list of products offered by the company during that period were rolls, coffee cake, Melba toast, stuffing, and Goldfish cocktail crackers.

By 1960 when Rudkin was 63, she and her husband decided to sell the Pepperidge Farm Company to the Campbell Soup Company for \$28 million in Campbell stock. However the Rudkins kept a controlling

interest in Pepperidge Farm itself, and for the next decade the company was run as an independent subsidiary of Campbell.

During the final years of her life Rudkin appeared in television commercials for Pepperidge Farm products and authored a cookbook in 1963. She also became a part-time public speaker as a kind of hobby. During this period the Rudkins divided their time between homes in Hobe Sound, Florida, and County Carlow, Ireland. Henry Rudkin died in 1966 and a year later Rudkin herself died of cancer in New Haven, Connecticut, at the age of 69.

Rudkin was clearly one of the most successful and nationally prominent businesswomen of her generation, a woman who started baking bread for her son and ended by making products with wide appeal among national consumers. During the 1950s and 1960s when the Pepperidge Farm product line was at the height of its popularity it is likely that the "homemade" quality of the products was the most appealing feature to the female shopper, who was likely making less homemade bread herself.

In the closing decades of the twentieth century Rudkin's legacy continued in the popularity of Pepperidge Farm products offered by the Campbell Soup Company, including garlic bread, gourmet cookies, fat-free croutons, stuffing, puff pastries, and Goldfish crackers. According to the 1997 Campbell annual report, the Pepperidge Farm line was considered one of the "jewels in [Campbell's] portfolio, delivering outstanding, double-digit sales growth." The report further stated that "a third of all American households with children now eat Goldfish" and singled out "Milano" as "the consumers' favorite Pepperidge Farm cookie."

Rudkin's managerial style allowed company growth in response to consumer demand while retaining quality control of Pepperidge Farm products as the production facilities grew. Rudkin made Pepperidge Farm a household name, largely by making an honest, high-quality product and not compromising quality to reduce price. She also succeeded in selling, with her bread, the idea of the store-bought "homemade" product. She did this just as fewer people were eating truly homemade foods in the 1940s and 1950s and as more and more foodstuff in the United States became commercially mass-produced.

RURAL ELECTRIFICATION ADMINISTRATION

One of the most important New Deal programs for farmers was the Rural Electrification Administration (REA). This program, authorized by Congress in 1935, lent funds to rural cooperatives to generate and distribute electricity to areas not served by private utility companies. The impact of electrification in such isolated areas was enormous. In 1936, 90 percent of U.S. farms had no electricity. Without electric power, farm families had to perform back-breaking work by hand. They had to draw water from wells or pump it by hand, which made it impossible to have flush toilets. They lacked refrigerators, electric lights, and washing machines. All the farm chores, such as milking, also had to be done by hand. And without electricity, there was no access to radio or telephone. Life for farm families was exhausting and lonely, and lack of electric power was a major cause of poor health in rural areas. The REA, despite strong opposition from private utilities, made it possible for cooperatives to provide affordable electric power to the rural poor. By 1937, the program had enabled almost a quarter of a million farm households to obtain electricity; by 1945, that number had increased to 40 percent of the country’s farms. Electricity brought farm families into the twentieth century. Not only did electric power make their work easier and more efficient, it brought them into closer contact, through telephones and radio, with other parts of the country. In addition, electrification made it possible for farmers to improve their businesses after World War II by diversifying operations.

RUST BELT

The term “Rust Belt” refers to an economic region in the northeast United States, roughly covering the states of Michigan, Wisconsin, Indiana, Illinois, Ohio, and Pennsylvania, a region known as the manufacturing heartland of the nation. Many of the factories

and steel mills that produced the “American economic miracle” during and after World War II (1939–1945) were padlocking their gates by the 1970s. This was more than a downward phase in the business cycle. It was a structural crisis brought about by the aging of a generation of factories, the relative decline of the manufacturing sector, and increased global competition. The crisis brought unemployment to workers, and increased police and welfare costs to cities at the same time that it signaled a decline in tax revenues. When the factories shut down, the cities lost corporate and property tax revenues as workers followed jobs to the suburbs or to other parts of the country.

The term “Rust Belt” thus refers to a social crisis mostly affecting the cities. During the 1970s and 1980s, rust belt cities experienced deepening unemployment, out-migration of population, loss of electoral votes, and an overall decline in industry and the economy. Smaller industrial plants relocated to Mexico or to low-wage American Sun Belt states. Big steel companies dating from the nineteenth century, like Bethlehem Steel and U.S. Steel Co., became industrial dinosaurs in the mid-twentieth century, made obsolete by technological advances and competition from Japan and Germany (whose plants mostly dated from the post-World War II period).

One typical Rust Belt story is the Dodge Main plant in Hamtramck, Michigan, an older industrial suburb of Detroit. Built in 1910, Dodge Main for decades was the “flag ship” factory of Chrysler Motors Corporation. Because land was at a premium when the plant was built, it was six stories tall—a problem for assembly line production as the partially assembled units had to go from floor to floor. By the 1960s, as single story factories were being built in the suburbs or rural areas, the Dodge Main plant was obsolete. The plant was also the site of racial and union militancy, as African American workers formed the “Dodge Revolutionary Union Movement” (DRUM) to counter racial discrimination in the workplace and in the union.

By the early 1970s scores of factories that had once made up the Detroit skyline during the automotive boom were either razed or slated for destruction. The Chrysler Corporation in 1979 had to be bailed out of bankruptcy by the federal government and by concessions from its employees. The company revived, but Dodge Main went under the wrecker’s ball in 1981.

By the mid-1980s, the Rust Belt began to recharge. Steel mills and factories retooled, making the transition from outdated, inefficient, and often unsafe facilities to innovative and progressive ones. This transformation was accompanied by downsizing and deregulation,

which contributed to job insecurity for workers. Nevertheless, with these changes the name “Rust Belt” began to drop from common usage. By 1996, the double-digit unemployment rates of the 1970s had fallen to 4.4 percent. Some former Rust Belt states like Michigan began to experience lower average unemployment than the rest of the country. Part of this was due to low energy prices that favored energy-intensive manufacturing.

Several cities of the Rust Belt, such as Pittsburgh, Detroit, and Cleveland, have attempted to diversify their economies to escape the heavy dependence on manufacturing and have successfully made a transition to the “service and information economy.” The region

must still avoid complacency and guard against a shortage in skilled labor. The Federal Reserve Bank of Chicago reported in 1997 that improved access to education and skills was required for continued growth in the region. Educational reforms and an increase in the market base of their products are only part of the measures planned by the former rust belt states to maintain a competitive edge. The economic fortunes of the Midwest—as is clear from the experience in the automobile and steel industries—is tied to a competitive global market. The rusting experience of the 1970s provided the region with the opportunity to retool for world competition.

SAINT LAWRENCE SEAWAY

When Queen Elizabeth II, President Dwight D. Eisenhower (1953–1961), and other dignitaries gathered at the U.S. and Canadian border in June 1959 to officially open the St. Lawrence Seaway, it was the culmination of a project that had been discussed for almost 70 years. Ships could now travel along all of the Great Lakes, through the St. Lawrence River, and into the Atlantic Ocean. Along the way were such prominent U.S. port cities as Milwaukee, Chicago, Toledo, Cleveland, Detroit, and Buffalo. Following years of study and opposition by competing interests and in the U.S. Congress, joint Canadian and U.S. construction on the final phase of the Seaway began in 1954. It would cost nearly \$500 million and require the relocation of 6,500 citizens on both sides of the border before the Seaway officially opened in 1959. At over 2,300 miles the St. Lawrence Seaway linked North America's industrial heartland to the rest of the world's markets, serving as a boon to commercial shippers. However, both nations have lost money on the project over the years.

Canals had been built along the St. Lawrence River as far back as the 1680s (the river was named by explorer Jacques Cartier in honor of the saint on whose feast day Cartier discovered the waterway in 1535). These canals made it easier for fur traders centered in and around Montreal to ship their wares. In 1824 what is now known as the Lachine Canal was completed, linking Montreal with Lake St. Louis. Just a year later, however, New York's Erie Canal opened, attracting much of the region's shipping traffic, as it provided a shorter route between the Atlantic Ocean and the Great Lakes, as well as access to New York City through the Hudson River. Nonetheless the St. Lawrence River remained an important shipping route, especially to Great Britain.

In the 1890s Minnesota Congressman John Lind sponsored a resolution to look into a joint Canadian-American waterway which linked Lake Superior—the

westernmost Great Lake, which extends to Duluth, Minnesota—with the Atlantic Ocean. The St. Lawrence River was deemed to be the most feasible route. By 1900 a network of shallow canals already made it possible to travel from Lake Superior all the way to Montreal. Between 1912 and 1932 the Welland Canal, which a century earlier linked Lake Erie to Lake Ontario (located north of Ohio and western New York) was rebuilt to support the heavy traffic.

[A]LONG WITH ITS BENEFITS TO NATIONAL DEFENSE (A GREAT LAKES SEAWAY) WILL CONTRIBUTE TO THE PEACETIME WELFARE OF A MULTITUDE OF LABORERS, SMALL BUSINESSMEN, HOMEOWNERS AND FARMERS.

Franklin D. Roosevelt, President (1933–1945), 1940

In 1921 a joint commission issued a report recommending that the United States and Canada enter into a treaty to improve passage through the St. Lawrence River between Montreal and Lake Ontario. The cost of building the Seaway, the report said, would be proportional according to each country's benefits. But interests such as railroads, which were in competition with the shipping industry, opposed the seaway project. In 1932 Canadian Prime Minister R. B. Bennett and U.S. President Herbert Hoover (1929–1933) signed a treaty which agreed to build a seaway to the Atlantic Ocean. Both nations would share the work and costs involved. The U.S. Senate, however, rejected the treaty in 1934.

The issue remained unsettled until the early 1950s, when vast fields of iron ore were discovered in Canada. A complete seaway along the St. Lawrence was supported as the best way to transport the ore to U.S. and Canadian steel mills. Others suggested such a passage-way would also offer military advantages. As his predecessor Franklin D. Roosevelt (1933–1945) had been, President Harry S. Truman (1945–1953) was in favor of the seaway project. But both the U.S. House of Representatives and the Senate resisted approval of St. Lawrence Seaway bills. Canada, it appeared, would

Samuel Slater Builds the First Factory

move ahead with the project on its own. However, President Dwight D. Eisenhower, along with advocates in both houses of the U.S. Congress, successfully passed a bill to jointly build the St. Lawrence Seaway with Canada in 1954.

According to the original bill the Seaway would ultimately pay for itself through tolls paid by shippers. The project cost Canada \$336.5 million and the United States \$133.8 million. A separate project to harness the seaway for electrical power cost each nation an additional \$300 million. The construction would ultimately require entire towns and villages to be relocated and about 40,000 acres of farmland in both countries was flooded. In early 1959 both countries agreed to share toll revenues roughly proportionate to the amount they spent on construction.

The St. Lawrence Seaway was officially opened on June 26, 1959, though the waterway had actually been operating for a full three months to assess any potential problems. In its first year almost 19 million metric tons of cargo passed through the Seaway, a figure that climbed to 30 million in 1964, 40 million in 1966, and 50 million in 1973. A high of over 57 million metric tons was reached in 1977. The one-billionth metric ton of cargo passed through the Seaway in June 1983, a year before the Seaway would celebrate its 25th anniversary.

The Seaway, however, has not been the revenue producer both countries thought it would be and, because it invested more money, Canada's losses have been higher. Supporters of the Seaway believed general and bulk cargo would be shipped along the route in large quantities. But the development of container ships whose cargo can be carried just as easily by train or truck has made the route primarily one for bulk cargo, such as grains and minerals, reducing potential business. Into the 1980s and 1990s different combinations of toll hikes and reductions were used to encourage use and increase revenue. Nonetheless, in the early 1990s the Seaway had created over 44,000 jobs and generated nearly \$2 billion annually in personal income. Meanwhile, the Seaway's hydroelectric power project, at the Moses-Saunders Dam between Cornwall, Ontario and Massena, New York, supplied 1.6 million kilowatts of electricity to the surrounding area. In 1993 the Seaway registered its first total tonnage increase in five years, with almost 32 million metric tons floating through the Seaway. But this 2 percent increase was little more than half of the high achieved in 1977. However, into the mid-1990s annual tonnage shipped through the Seaway was increasing, moving closer to 40 million.

SAMUEL SLATER BUILDS THE FIRST FACTORY

As a young British immigrant, Samuel Slater took credit for building the United States' first successful water-powered cotton mill in 1790. By producing replicas of innovative cotton-spinning machinery recently developed by the English, Slater was able to create a fully operational facility in Rhode Island. The construction of his factory represented a tremendous step forward for industry in the United States, which had been struggling to catch up to Great Britain in technological advancement. Slater became a textile entrepreneur whose style of factory construction and workforce management set the pattern for industrial development throughout New England. His contribution was so significant that President Andrew Jackson (1829–1837) once dubbed him the Father of American Manufacturers.

Prior to the Revolutionary War (1775–1783), England imposed many restrictions upon the colonial economy. Intent on maintaining an agrarian rather than an industrial economy in these regions, British legislators passed a series of acts to curb the development of industry in America. The first of these laws was enacted in 1719 and forbade the practice of metalworking. A 1750 law was more restrictive, explicitly prohibiting the use of a mill "or other engine for slitting or rolling iron, or any plating forge to work with a tilt hammer, or any furnace for making steel." Before the enactment of this law some of this forbidden machinery had already been operational in the northern colonies.

Restrictions such as these, which expressed the common understanding of the subordinate role of the colonies in the mercantilist system, made up part of the

complex set of motivations and complaints that eventually led to the separation of the colonies from England. Although the United States ultimately gained its independence, the British continued to hamper the new nation's industrial development by limiting the export of mechanical equipment. In response, the U.S. imposed protective tariffs on metalwork such as rolled iron, castings, and spikes, hoping to encourage a domestic capacity in these areas.

SLATER'S 1789 ARRIVAL MARKED THE UNFOLDING OF A FUTURE FOR INDUSTRY IN THE UNITED STATES: HE BROUGHT WITH HIM FROM ENGLAND A MENTAL BLUEPRINT OF THE STATE-OF-THE-ART MACHINERY USED FOR COTTON SPINNING.

The American Revolutionary War, the Embargo of 1807 (1807–1809), and, later, the War of 1812 (1812–1814), all of which involved blockades of American ports, impressed the U.S. political leadership with the necessity of fostering a domestic metalworking culture. For this reason, the United States Congress enacted patent law to provide incentive for industrial innovation although the patent process before 1836 was very lax and granted patents to “inventors” who were actually promoters. The same need to foster a metal-working culture led the new nation to found federal arsenals. The most famous one was in Springfield, Massachusetts, where in the last years of the eighteenth century inventors like Eli Whitney and Samuel Colt advanced and popularized the idea of standardizing machine parts. The United States endeavored to attain a degree of self-sufficiency in manufacturing and to move forward into industrial development, but it lacked both the workforce and the elements of technological know-how necessary to sustain industrial advancement. It continued to lag behind Western Europe, which had taken its first steps toward an industrial economy in the early eighteenth century.

This is what made Samuel Slater's 1789 arrival in New England so momentous. Slater brought with him from England a mental blueprint of the state-of-the-art machinery used for cotton spinning. British law sought to prevent the leakage of trade secrets, so Slater did not dare to carry written instructions or drawings on his passage overseas. Instead, he kept all of the information in his head, “smuggling” it into his new homeland.

Because England forbade the emigration of its skilled machinists, the 21 year-old Slater passed himself off as a farm laborer. In truth, he had already served as supervisor of machinery in a textile factory after completing an apprenticeship with Jedidiah Strutt, a

successful British manufacturer of ribbed stockings. (Strutt's partner was Richard Arkwright, who had built world's first cotton-spinning mill in 1768.) Slater was about as skilled as a machinist could be, and in the United States he was to find fame and fortune in the application of his knowledge. Slater's contribution was not so much as an inventor. He made few if any breakthroughs in creating new machinery. His importance lay rather in the fact that his purloined knowledge of English technology filled in a number of blank spaces in the understanding of mechanical principles among inventors in the United States. It marked the unfolding of a direction and a future for industry in the new nation.

At the time of Slater's arrival, textile production in the United States was very crude. The work was labor-intensive and the result was of poor quality. He took a temporary position at the New York Manufacturing Company, a small textile business that had been struggling to replicate British yarn-spinning technology. But the New York facility lacked the waterpower that was necessary to run the new machinery, and Slater soon looked for opportunities elsewhere. He relocated to Pawtucket, Rhode Island where he joined the textile firm of Almy and Brown, who also aimed to imitate the British water-powered system. Slater offered the Pawtucket firm the expertise that it sought: He became a partner almost immediately and set out to erect the United States' first cotton-spinning mill.

Slater put his memory of the British technology to work, designing and constructing three machines for the carding of wool, several drawing and roving frames, and two spinning frames. Not long after the first mill's completion, Slater embarked on the construction of a larger facility, which was operational in 1793. The waterframe machinery was simple to use and did not require much manpower; in fact, the labor force consisted of 100 children who ranged in age from four to ten. Determined not to replicate the inhumane practices of some British manufacturers, Slater treated his little workers comparatively well and supplied them with good food. He eventually established a Sunday school for them, one of the first such schools in the nation.

Meanwhile Slater's wife Hannah, whom he had met and married in Rhode Island, turned out to be an inventor in her own right: she developed a method for making high-quality cotton sewing thread (previously, all thread had been made of linen). In 1798 Slater and his father-in-law went into partnership to manufacture the thread. Samuel Slater and Company, as their business became known, constructed its own machinery and erected mills near Pawtucket. Later the company expanded, opening mills in Smithfield, Rhode Island

(later renamed Slatersville); Webster, Massachusetts; Jewett City, Connecticut; Amoskeag Falls, New Hampshire; and Manchester, New Hampshire. Slater had come a long way from introducing his first, modest-size facility. He had become one of several epicenters of industrial innovation in the United States. And with his good business and management sense he became something of a model for other U.S. manufacturers, who often emulated his practices.

Although Slater did not invent any new textile machinery, the construction of his first mill was often credited with launching the country's industrial revolution. Indeed, many other factories cropped up soon after his facility opened. Rhode Island's Blackwater River region, which surrounds the site of the original Slater mill in Pawtucket, became particularly dense with industry attracting immigrants and providing ample employment opportunities to whole families of mill workers. Around the country manufacturers of all kinds endeavored to construct their own machinery, promoting a trend that Slater had set in motion. The United States' transition from an agrarian to an industrial economy was underway.

SANTA CLARA COUNTY V. SOUTHERN PACIFIC RAILROAD

In January 1886 a California circuit court heard the case of *Santa Clara County v. Southern Pacific Railroad Company*. The county government, the seat of which is San Jose, brought a complaint against the rail company over the issue of Southern Pacific's nonpayment of state taxes. The state had attempted to

collect taxes for fences (which it assessed as "improvements") that Southern Pacific erected between the roadway and adjacent lands. The railroad company argued that California did not have the authority to assess taxes on the roadway or the fences because it had no jurisdiction to these lands or the improvements made to them. Southern Pacific's lawyers maintained that the corporation had been granted the lands through a federal act that was approved by the state of California. The declared object of the act was for "the construction of a railroad and telegraph line from the Missouri river to the Pacific, which, for all purposes of communication, travel, and transportation, so far as the public and the general government are concerned, should be operated 'as one connected, continuous line.'" Therefore, the assessment was judged void.

The favorable ruling that Southern Pacific received in this case stirred public outrage. Not only did the railroad control most of California's transportation, it exerted a powerful political influence. Among Southern Pacific's most vocal opponents was William Randolph Hearst (1863–1951), who, as publisher of the *San Francisco Examiner* newspaper, launched an attack on the monopolistic practices of the rail company. In 1901 the Southern Pacific became a bigger power when financier Edward Harriman (1848–1909) acquired it along with Central Pacific Railroad; Harriman thus dominated rail traffic in the West. Harriman's monopoly became the object of an investigation by the Interstate Commerce Commission (ICC) in 1906–1907.

Southern Pacific's undoing came partly at the hands of politician Hiram Johnson (1866–1945), the Progressive Republican candidate for California governor in 1910, who toured the state with his promise to "kick the Southern Pacific Railroad out of politics." Winning the election, Johnson and his fellow reformers gained control of both houses of the state legislature in 1911 and then they passed legislation to regulate the railroads and other public utilities. In 1913 the U.S. attorney general prosecuted Southern Pacific and Union railroads, claiming their merger violated the Sherman Anti-Trust Act of 1890.

SANTA FE

Santa Fe, New Mexico, is the oldest capital city in the United States. Situated in the north-central part of New Mexico, it was founded by the Spaniards in 1609–1610 as an outpost for their exploration and missionary activities in the Southwest. The original name given by

the colonists was *La Villa Real de la Santa Fe*, which means the Royal City of the Holy Faith. Prior to the arrival of the Europeans, Santa Fe had been home to the Pueblo Indians, who were subjugated and converted to Christianity by the Spanish conquistadors. In a 1680 rebellion the Pueblo Indians reclaimed the city and occupied it again for the next twelve years, restoring native culture to the region. In 1692 the Spanish recaptured New Mexico and reestablished colonial rule. When Mexico gained independence from Spain in 1821, New Mexico became a province of the new country. Santa Fe flourished as a center for trade between the United States and Mexico. It prompted the establishment of a commercial route, the Santa Fe Trail, which ran from western Missouri, across the Plains, and along the Arkansas River to the Rocky Mountains, where the road turned south into Santa Fe. The wagon road was heavily used until 1880 when the railroad was completed, but the trains went through Albuquerque, not Santa Fe. By that time New Mexico had become a U.S. territory (1850). Santa Fe has remained New Mexico's capital city, although Albuquerque has far surpassed it as a commercial center.

SANTA FE TRAIL

The Santa Fe Trail was a major overland route for westward expansion during the 1800s. Like the Oregon Trail to the Pacific Northwest, it originated in Independence, Missouri. The Santa Fe Trail, whose terminus was Santa Fe in north-central New Mexico, proceeded westward along the prairie to Great Bend, Kansas. From there the route split into three branches. The western trail, also called the Taos Trail, followed the Arkansas River west to the Sangre de Cristo Range of the Rocky Mountains. Travelers then went due south through La Veta Pass (in south-central Colorado) into New Mexico. The middle trail also followed the Arkansas River westward into present day Colorado, traversing the grasslands in the southeastern corner of the state and following Raton Pass (south of present day Trinidad, Colorado) into New Mexico. The shortest route (and, due to Indian attacks, the most dangerous) cut southwest through Kansas, into the Cimarron Valley, and crossed the northwest corner of Oklahoma into New Mexico. From Santa Fe, another route, the Old Spanish Trail, extended westward to Los Angeles. After Mexico gained independence from Spain (1821), Santa Fe became the center of the country's trade with the United States. The Santa Fe Trail was about 1,200

miles (1,930 kilometers) long and took between 40 and 60 days to travel.

The Santa Fe Trail was first traversed in 1821 by Virginia-born trader William Becknell (1796?–1865), who in 1822 used wagons on the route. During the next two decades, less than one hundred wagons each year used the trail; by the late 1860s, the average number climbed to more than five thousand per year. The Santa Fe Trail remained a major commercial route until the 1880s, when the transcontinental railroad was completed.

SAVINGS

Savings are the amount of income left after a consumer has finished making personal expenditures and paying taxes. People save to pay for retirement, education, or vacations. They usually put their savings into bank savings or checking accounts, invest them in securities like stocks or mutual funds, or keep savings as cash. The percentage of personal income that people save depends on how optimistic they are about their future income, their own personal inclination to spend now or “save for a rainy day,” and the amount of interest or return they expect to get by saving or investing.

Economists generally regard saving as good because the economy can only grow if some consumers refrain from consuming and instead invest in the factories and equipment that enable companies to expand production. However, in a phenomenon called “the paradox of thrift,” economists have also shown that when economic growth is threatened by weak demand, too much saving will actually result in slower economic growth because consumers will be buying less.

The amount of income that people in the United States save has varied significantly throughout the twentieth century. During the Great Depression (1929–1939) for example, consumers needed all their income for necessities—saving rates were consequently negative. During World War II (1939–1945), however, government rationing and savings bond drives encouraged people in the United States to save. By 1944 U.S. citizens were saving 25.7 percent of their incomes—the highest savings rate in the century. In the postwar years, U.S. citizens have saved less and less. By 1981 consumers were saving only 9.4 percent of their incomes; by 1989 only 5.1 percent, and by 1997 only 3.8

The percentage of income saved by Americans has varied over the years, as demonstrated. Since the 1980s, saved income has generally declined.

percent—the lowest rate since the Depression. To encourage U.S. citizens to save more, Congress created Individual Retirement Accounts (IRAs) in 1982. IRAs did encourage consumers to invest more, but the savings rate continued to fall because easy-to-obtain credit cards and low home mortgage down payments enabled consumers to buy homes and other goods without first saving for them.

By the late 1990s some economists estimated that U.S. consumers were saving only a third of what they needed to maintain their standard of living in retirement. As the twentieth century ended, politicians debated several solutions for increasing national savings, including scrapping the income tax system in favor of a flat tax or a national sales tax and creating government-sponsored “Universal Savings Accounts” that would let U.S. citizens invest part of their taxes in mutual funds or bonds.

SAVINGS & LOAN ASSOCIATIONS

Savings and loan associations (S&Ls), along with savings banks and credit unions, are known as thrift institutions. Thrifts and commercial banks are also known as depository institutions and are distinguished from non-depository institutions such as investment banks, insurance companies, and pension funds. S&Ls traditionally have taken savings, time, and demand

deposits as their primary liability, and made most of their income from loaning deposits out as mortgages.

The first savings and loan association was organized in 1831 as the Oxford Provident Building Association of Philadelphia. Like the building societies of England and the credit cooperatives of Europe, it was a membership organization that took savings deposits from its members and in turn made home loans to them. S&Ls soon accepted deposits from the general public and became public depository institutions. They also became the primary source of credit for working individuals to purchase their own homes at a time when commercial banks did not offer mortgages. By the end of the nineteenth century there were nearly 6000 S&Ls in existence.

SAVINGS AND LOAN FAILURES

Since the early 1930s savings institutions had enjoyed more than 50 years of economic success. However, the end of the 1970s threatened industrial prosperity with unprecedented high inflation and interest rates. The financial structure of the typical thrift was at the core of the problem. Most institutions borrowed for short terms, in the form of depositors’ savings accounts, but lent for long terms through fixed-rate home mortgages. While interest rates remained stable, thrifts could earn acceptable profits. When market forces caused rates to soar, the delicate balance was threatened, as payments to depositors’ rose without a corresponding increase in receipts from mortgages. In 1978 regulators allowed thrifts to pay higher interest rates on certificates of deposit. This checked disintermediation (savers going to other institutions), but the cost of funds rose. Profits, therefore, shrank or turned into losses.

Thrift executives knew that erosion of net worth jeopardized the industry’s health. They sought relief from long-term, fixed-rate loans that tied them to low returns. The U.S. Congress was not prepared to back an industry-wide bailout. As a compromise, it passed the Depository Institutions Deregulation and Monetary Control Act (DIDMCA) in 1980, granting additional lending powers to thrifts. Most promising was the ability to originate short-term consumer loans and high-yield commercial real estate loans. Despite DIDMCA, about 36 percent of all thrifts were losing money by the end of 1980. Even worse, in 1981 about 80 percent of the industry lost money. Congress reacted with additional deregulation in 1982. It passed

the Garn-St. Germain Act, giving thrifts even broader investment powers.

The government also allowed thrifts favorable reporting treatment. Purchasers of failing institutions were given special accounting privileges. In addition, thrifts were authorized by the Federal Home Loan Bank Board (FHLBB) to utilize lenient Regulatory Accounting Principles (RAP). The FHLBB allowed thrifts to reduce their capital requirements from five percent to three percent between 1980 and 1982. This leniency was allowed to keep troubled thrifts from being taken over by regulators.

After deregulation, and with interest rates subsiding in 1983, the industry appeared to be heading toward prosperity. Thrifts attempted to grow out of their problems by generating more high-yield investments. The real estate market was booming, so thrift managers were tempted to invest in risky commercial ventures. They often disregarded such factors as lack of expertise, unfamiliar geographic territories, and questionable appraisals and underwriting. Loan brokers and junk bond brokers also found an eager market in the thrift industry.

Depositors continued to patronize savings institutions despite growing losses and failures. DIDMCA had increased deposit insurance coverage to \$100,000. With this level of insurance, depositors had little fear of losing their savings at faltering institutions. Indeed, the failing institutions often offered the highest rates.

In 1986 the Tax Reform Act repealed liberal depreciation and personal deduction provisions. Many commercial real estate deals were structured around such tax shelters. Without them, the enormous market for real-estate syndicates dried up. At the same time worldwide oil prices dropped, which negatively affected the economic health of states that relied on the oil industry. The real estate market in the Southwest went sour almost overnight, affecting real estate values throughout the country. The booming real estate market of 1983–1986 was transformed into an overbuilt market by 1987.

In 1988 the FHLBB committed nearly \$40 billion in 1988 to take over failing institutions, merge them into marketable packages, and sell them to investors. But the program almost bankrupted the Federal Savings and Loan Insurance Corporation (FSLIC). FHLBB Chairman Danny C. Wall either concealed the depths of the FSLIC insolvency or did not recognize the extent of the problem. Matters were made worse by errors in judgment on the part of thrift managers, by the greed of investors, by weak examination and supervision practices by regulators, and by numerous alleged cases of

fraud and misconduct on the part of thrift insiders, regulators, investors, and members of Congress.

When President George Bush (1989–1993) took over the presidency in 1989, he was extremely concerned about the unstable condition of the FSLIC and the accumulated losses at hundreds of thrifts. With the assistance of Richard C. Breeden, executive director of the White House Regulatory Task Force, Robert R. Glauber, undersecretary in the Treasury Department, and L. William Seidman, chairman of the Federal Deposit Insurance Corporation (FDIC), Bush drafted the Financial Institutions Rescue, Recovery, and Enforcement Act (FIRREA). In August, 1989, the act was approved by Congress and President Bush signed FIRREA into law a few days later.

FIRREA had four explicit goals. The first was to improve the ability of regulators to supervise savings institutions by strengthening industry capital and accounting standards. The second was to return the federal deposit insurance fund to a sound financial base. The third was to provide funds to deal with the disposal of failed institutions. The fourth was to strengthen the enforcement ability of regulators through reconfigured powers and a new organizational structure. An unstated goal of FIRREA was to return the emphasis of the business to its roots of home mortgage lending.

FIRREA featured several key provisions. It dissolved both the FSLIC and the FHLBB. The responsibility of insuring the thrift industry's deposits reverted to the FDIC. The duty of supervising the Federal Home Loan Bank (FHLB) system and individual thrifts was passed to a new organization, the Office of Thrift Supervision (OTS). Two new additional organizations were created. The Resolution Trust Corporation (RTC) was formed to dispose of the assets of failed thrifts. The Resolution Funding Corporation (RFC) was created as the fund-raiser for the RTC. The RFC was initially authorized to borrow up to \$50 billion, through bonds, to fund RTC activities.

Numerous thrift powers were restructured. FIRREA banned investment in junk bonds, limited investment in nonresidential loans, set loan-to-one-borrower limits to national bank levels, and placed strict limitations on loans to affiliated parties. Most important, it mandated that thrifts hold at least 70 percent of their assets in mortgage-related investments. Penalties for failure to comply were tough at both the corporate and the individual level.

FIRREA directed the OTS to set capital requirements for thrifts at levels no less stringent than those of

Savings and Loan Failures

national banks. Core capital requirements were set at three percent of total assets, and tangible capital was set at 1.5 percent of total assets. Thus, the definition of capital itself was altered. The previous reliance on RAP standards of accounting was abolished.

President Bush's stated intention was to fix the thrift industry permanently by closing down or selling hundreds of thrifts. His method of ensuring that old problems would not resurface was to subject surviving thrifts to the capital and accounting rules applied to national banks.

FIRREA was a sharp response to the thrift crisis. Considerable controversy arose in the business community, especially among the thrifts that were directly affected. Some analysts believed that the capital requirements would bankrupt more institutions than necessary. There was a large group of thrifts working slowly to recover from their problems. They were not grossly insolvent but they would not be able to meet new capital requirements for years. Continued weaknesses within the real estate markets did not help. Imposing stringent standards on a weakened industry pushed hundreds of these thrifts over the brink. This presented the RTC with a larger, more expensive task than the government had expected.

The short-run impact of FIRREA on the business community extended further than the thrift industry. FIRREA caused all lending institutions to tighten credit practices, so businesses had to postpone or cancel worthy projects. Tight credit contributed to a declining economic climate. Banking regulators tightened oversight and enforcement in their industry. Although inflation and interest rates were in check, banking became more conservative. Many banks were satisfied to watch profit margins improve through lower costs of funds. The resulting "credit crunch" contributed to job losses throughout the economy. Closings and mergers within the thrift industry meant an additional dramatic drop in jobs.

By the end of September, 1991, the OTS estimated that 464 thrifts (21 percent of the industry) were on the brink of takeover. These institutions had not been seized because there was no money available to do so. The OTS intended to take over all failing institutions and have the RTC either sell them intact or liquidate them piecemeal. To dispose of a thrift intact, the RTC had to make up any negative net worth. The goal was to entice investors, especially commercial banks, to purchase failing thrifts through the financial backing of bonds issued by the RTC/RFC. Unfortunately, FIRREA stripped thrifts of many powers that had made them attractive investments. Unless a thrift could open new

depository markets for a bank, it did not offer much advantage to the prospective purchaser.

FIRREA's objective of making depository insurance financially sound also failed to be met. FIRREA did not correct the problems that existed in the FSLIC; it merely pushed the problems onto the FDIC, jeopardizing its solvency. Because the \$100,000 insurance coverage was not changed, depositors and institutions remained susceptible to risk-taking. Since fixed insurance premiums were not changed, risky institutions were afforded the same degree of protection at the same cost as safe institutions.

Resolving the thrift crisis involved huge federal payments to honor commitments made by the FSLIC and new ones resulting from FIRREA. A substantial amount of the borrowing was to be repaid from the sale of assets of failed thrifts. Unfortunately, asset sales could not cover the large borrowings. This shortfall became the responsibility of taxpayers. Like the national debt, the FIRREA debt will likely fall on future generations of taxpayers.

Several lessons emerged from FIRREA and the events that led to its passage. First, deregulation in the early 1980s seemed to hamper thrift industry efforts to reverse losses. More lenient rules and broadened powers were not accompanied by stricter supervision. Second, the deposit insurance system encouraged carelessness on the part of depositors and depository institutions. Fixed-price premiums ignored risk and transgressed the cardinal rules of insurance. Third, FIRREA may have been based on sound intentions, but the effect was similar to that of overmedication of a sickly patient. Good principles applied abruptly may have led the industry toward extinction. Fourth, an improperly funded program cannot expect success. FIRREA was more ambitious than its budget would allow. The final costs may not be known for generations.

SCALAWAGS

“Scalawag” was a derogatory term used by recalcitrant white southerners after the Civil War and during the dozen years of Reconstruction (1865–1877). It was applied to those white southerners who cooperated with the Union troops and with the Reconstruction State legislatures. Many of these “Scalawags” came from small farm, non-slaveholding backgrounds and in fact had resented the southern planter class and its slave system even before the Civil War. They felt correctly that the existence of slavery hurt them too, because slave labor depressed the bargaining power of wage labor. They argued that slaves would always impoverish its non-slave-owning white neighbors. The Scalawags and many former slaves tried to join the Republican Party in the South to secure their status as full southern citizens. The majority of southern whites, however, looked at the Scalawags with contempt. In their eyes, the Scalawags were traitors to the southern cause and to their fellow whites. Some of these defeated members of the Confederacy joined paramilitary groups like the Ku Klux Klan and the Mississippi “Red Shirts” and others. They wanted to intimidate or, in some cases, to kill both the former slaves who were trying to secure their new rights and the Scalawags, who were trying to build an alliance with the ex-slaves in the southern Republican Party. The intimidation worked, for the most part, and the Republican Party never established itself in the post-Civil War South.

SCARCITY

Scarcity and its opposite, abundance, are relative and vague descriptions as to the availability of useful resources for human purposes. Resources that command a price in economic transactions, like fertile land, machines, or human talent, may be considered scarce. This market oriented definition of scarcity can be summed up in the following way: scarcity exists in a marketplace when a resource of any type commands a price in the market which make some producers forgo otherwise rewarding applications of the resource. The

price of a resource in unrestricted economic transactions is a useful way to measure the scarcity of the resource. The more scarce a resource, the higher its price will tend to be. At times, when there is a limit to the availability of a resource, the resource will obviously be regarded as scarce in the marketplace. This scarcity will tend to drive prices up, or will cause the market to look elsewhere for more plentiful and less costly alternatives. Questions are always raised as to how human societies will respond to the depletion of resources, and how society will respond during times of acute general scarcity to avoid catastrophic suffering and mortality. Historically, scarcity has frequently caused changes in lifestyle, land migration, consumption-patterns, increased exploration for new material, development of general ecological awareness, and ecologically-oriented technology, so as to minimize the scarcity of resources needed for subsistence.

SCHUMPETER, JOSEPH ALOIS

Joseph Alois Schumpeter (1883–1950) was an Austrian economist who significantly shaped the development of economic theory in Europe. He taught economics at various universities in the Austro-Hungarian Empire and later at Harvard University in the United States. His many publications furthered the public’s understanding of business cycles, the role of the entrepreneur, capitalist development, and the use of mathematics in economics.

Schumpeter was born in Triesch, Moravia (present-day Czech Republic), on February 8, 1883. He was the only son of Alois Schumpeter, a clothing manufacturer who died when Joseph was four years old. His mother, Joanna Gruner, later married an Austrian general. The family moved to Vienna and Joseph was raised in a traditional, aristocratic manner. In 1891 Schumpeter graduated with honors from the Theresianum, a distinguished boys’ school. He then studied law and economics at the University of Vienna.

In 1906 Schumpeter completed his law degree and went to England where he spent a year doing research at the London School of Economics and the British Museum. He spent the following year in Cairo practicing law at the International Mixed Court of Egypt. It was there that he wrote his first book, a study of economic methodology entitled *The Nature and Essence of Theoretical Economics*. In this book Schumpeter tried to paint a picture of the field of theoretical economics for a German audience because he felt that they were not really familiar with the workings of

Schumpeter, Joseph Alois

“pure economics.” Economic theory was not even taught at German universities at the time.

Schumpeter obtained a position teaching economics at the University of Czernowitz (present-day Chernovtsy, Ukraine) in 1908 at the age of 26, making him the youngest professor in the Austro-Hungarian empire. In 1911 he joined the faculty at the University of Graz where he published *The Theory of Economic Development* (1912), which is often regarded as his most important work. In this book Schumpeter first argued that the entrepreneur was key to stimulating the business cycle, an idea that he would later expand.

During the 1913–1914 academic year Schumpeter went to Columbia University in New York as a visiting professor. Apart from that visit, Schumpeter remained at the University of Graz until 1918. His third major book was published in 1914 and was titled *Economic Doctrine and Method: A Historical Sketch*. This book was written as part of a handbook in economics and therefore was not as provocative as his first two publications. Nonetheless, the historical aspect of economics greatly interested Schumpeter and he would return to this topic later in life.

At the end of World War I (1914–1918) the Austro-Hungarian empire was broken up and Austria became a small republic. At this point Schumpeter left academic life to pursue a career in finance and to dabble in politics. Schumpeter briefly served as the secretary of finance in the new socialist government, but was forced to resign even before presenting his financial proposals to the parliament. Schumpeter’s next career move was becoming president of a private bank in Vienna. When the bank failed in 1924, Schumpeter went bankrupt and returned to academic life.

The 1920s were a difficult decade for Schumpeter in all aspects of his life. His professional exploits outside of academia had failed. Though he was able to find employment again, he found it difficult to produce another book for quite a while. To make matters worse his mother, his new wife, and his newborn child all suddenly died, leaving Schumpeter depressed for many years.

In 1924 Schumpeter was appointed professor of public finance at the University of Bonn in Germany. He visited Harvard University in 1927 and again in 1930. At Harvard he helped found the Econometric Society, which focused on using statistics and mathematics in economic analyses. In the early 1930s Schumpeter was passed over for the position of economic theory department chair at the University of Berlin, Germany’s most prestigious university. He was bitterly disappointed and decided to leave Europe.

While this period had not been especially creative for Schumpeter, he did produce more than 70 articles between 1919 and 1932. In 1932 Schumpeter finally accepted a permanent position at Harvard as a professor of economics where he remained for the rest of his life, becoming a U.S. citizen in 1939.

In 1939 Schumpeter published his next book, *Business Cycles*, a theoretical, historical, and statistical analysis of the capitalist process. In this two-volume study Schumpeter argued that innovation was the chief agent of social change and that business cycles were a product of innovation. In 1942 Schumpeter published his next major work, *Capitalism, Socialism, and Democracy*, which was highly regarded by critics. In it Schumpeter maintained that capitalism would eventually become a victim of its own successes and die away. As business grew, it would become conservative in the worst sense of the word, thus eliminating risk-taking, innovative entrepreneurs from the decision-making process. Business would stagnate, and growing unrest among the people would lead to the triumph of socialism. In fact, his last book was on socialism, which he titled *Imperialism and Social Classes* (1951). When Schumpeter died of a cerebral hemorrhage in 1950, he left an unfinished manuscript behind him, *History of Economic Analysis*. This, his final work, was edited and published in 1954 by his third wife, Elizabeth Boody Schumpeter.

Schumpeter was a prolific writer; throughout his career he authored 15 books and pamphlets and over 200 articles, book reviews, and review articles. He also left hundreds of aphorisms in his private papers. Although he suffered from bouts of depression most of his life, Schumpeter was able to focus his energy on what he loved best and made a great contribution to the field of economics.

SCIENTIFIC MANAGEMENT

Scientific management, also known as Taylorism, is a system to gain maximum efficiency from workers and machinery. This system was developed by American industrial engineer Frederick Winslow Taylor (1856–1915). As foreman in a steel plant, Taylor undertook time and motion studies and conducted experiments to determine the “one best way” to do any given job. He developed detailed systems to yield the highest possible productivity levels. Taylor first presented his theories in 1903 to the American Academy of Mechanical Engineers. Efficiency was the cornerstone of Taylorism: production processes should not waste time or materials. He published his ideas in the landmark work, *The Principles of Scientific Management* (1911), and he became a well-known engineering consultant who was contracted by companies eager to maximize their output.

The doctrine of scientific management was soon embraced by U.S. industry. As transportation networks improved and U.S. population grew rapidly in the early 1900s, expansion of markets placed great demands on industry. Applying Taylor’s scientific management, manufacturers were able to boost productivity by as much as 200 percent.

Because Taylorism broke production processes into individual tasks, each with its own best practice, new workers could be quickly and easily trained; adherents believed this was another benefit of the concept. Scientific management had many advocates, including engineers Frank Gilbreth (1868–1924) and Lillian Gilbreth (1878–1972). These two furthered Taylor’s work by publishing volumes such as *Primer of Scientific Management* (1911), *Psychology of Management* (1912), and also studies on motion, fatigue, and time. Among those who applied scientific management were Ford Motor Company (in developing the assembly line for the Model T); Boston retailer Filene’s (one of the first commercial enterprises to use the method); and Bethlehem Steel (which conducted experiments in the loading of pig iron).

Scientific management also had its detractors; Taylorism was criticized for having a dehumanizing effect on labor. In making every job routine, some charged, the system separated the minds of workers from their hands. The system was also criticized for eliminating the need for skilled workers and giving

management absolute control over production processes. Theories concerning worker output were modified during the second half of the twentieth century. Nevertheless, principles of scientific management remained evident in the workplace in the late 1990s. The adoption of scientific management is credited with boosting American productivity and increasing stockholder profits.

SEARS, RICHARD WARREN

Richard Warren Sears (1863–1914) and his partner A. C. Roebuck founded the first large-scale mail-order business in the United States and one of the world’s largest retail stores. The company’s extensive catalog eventually became a fixture in U.S. homes and changed the way people shopped. The company also helped foster the growth of the mail-order industry worldwide.

Richard Sears was born on December 7, 1863, in Stewartville, Minnesota, to Eliza A. Benton and James Warren Sears, a successful wagon maker. When Richard was 15, his father lost his substantial fortune in a stock farm venture; his father died two years later. Young Richard then took a job in the general offices of the Minneapolis and St. Paul Railroad to help support his widowed mother and his sisters.

Once he had qualified as a station agent Sears asked to be transferred to a smaller town in the belief that he could do better there financially than in the big city. Eventually he was made station agent in Redwood Falls, Minnesota, where he took advantage of every selling opportunities that came his way. He used his experience with railroad shipping and telegraph communications to develop his idea for a mail-order business.

In 1895 Sears married Anna Lydia Mechstroth of Minneapolis and they had three children. Sears retired from business in 1909 and lived his remaining years on his farm north of Chicago before his death on September 28, 1914.

The man who was known as the “P. T. Barnum of merchandising” had a humble and unremarkable start in business. As a railroad station agent in a small Minnesota town, Sears lived modestly, sleeping in a loft right at the station and doing chores to pay for his room and board. Since his official duties were not time

consuming, Sears soon began to look for other ways to make money after working hours. He ended up selling coal and lumber and he also shipped venison purchased from Native American tribes.

In 1886 an unexpected opportunity came his way when a jeweler in town refused to accept a shipment of watches because no rail freight charges had been paid. Rather than having the railroad pay to return the shipment, Sears obtained permission to dispose of the watches himself. He then offered them to other station agents for \$14 each, pointing out that they could resell the watches for a tidy profit. The strategy worked and before long Sears was buying more watches to sustain a flourishing business. Within just a few months after he began advertising in St. Paul, Sears quit his railroad job and set up a mail-order business in Minneapolis that he named the R. W. Sears Watch Company.

Offering goods by mail rather than in a retail store had the advantage of low operating costs. Sears had no employees and he was able to rent a small office for just \$10 a month. His desk was a kitchen table and he sat on a chair he had bought for 50 cents. But the shabby surroundings did not discourage the energetic young entrepreneur. Hoping to expand his market, Sears advertised his watches in national magazines and newspapers. Low costs and a growing customer base enabled him to make enough money in his first year to move to Chicago and publish a catalog of his goods.

In Chicago Sears hired Alvah C. Roebuck to fix watches that had been returned to the company for adjustments or repairs. The men soon became business partners and they started handling jewelry as well as watches. A master salesman, Sears developed a number of notable advertising and promotional schemes, including the popular and lucrative "club plan." According to the rules of the club, 38 men placed one dollar each week into a pool and chose a weekly winner by lot. Thus, at the end of 38 weeks, each man in the club had his own new watch. Such strategies boosted revenues so much that by 1889 Sears decided to sell the business for \$70,000 and move to Iowa to become a banker.

Sears soon grew bored with country life, however, and before long he had started a new mail-order business featuring watches and jewelry. Because he had agreed not to compete for the same business in the Chicago market for a period of three years after selling his company, Sears established his new enterprise in Minneapolis, Minnesota. He hired Roebuck again and this time he dubbed the product of their partnership A. C. Roebuck and Company. In 1893 Sears moved the

business to Chicago and renamed it Sears, Roebuck and Company.

Once established in Chicago, the company grew rapidly. The first edition of the Sears catalog published in the mid-1880s had included a list of only 25 watches. By 1892, however, it had expanded to 140 pages offering "everything from wagons to baby carriages, shotguns to saddles." Sales soared to nearly \$280,000. A mere two years later the catalog contained 507 pages worth of merchandise that average Americans could afford. Orders poured in steadily and the customer base continued to grow. By 1900 the number of Sears catalogs in circulation reached 853,000.

Sears was the architect of numerous innovative selling strategies that contributed to his company's development. In addition to his club plan, for example, he came up with what was known as the "Iowazation" project: the company asked each of its best customers in Iowa to distribute two dozen Sears catalogs. These customers would then receive premiums based on the amount of merchandise ordered by those to whom they had distributed the catalogs. The scheme proved to be spectacularly successful and it ended up being used in other states, too.

Such tremendous growth led to problems, however. While Sears was a brilliant marketer (he wrote all of the catalog material), he lacked solid organizational and management skills. He frequently offered merchandise in the catalog that he did not have available for shipment, and after the orders came in he had to scramble to find the means to fill them. Workdays were frequently 16 hours long; the partners themselves toiled seven days a week. Fulfilling orders accurately and efficiently also posed a challenge. One customer wrote, "For heaven's sake, quit sending me sewing machines. Every time I go to the station I find another one. You have shipped me five already." Roebuck became exhausted by the strain of dealing with these concerns and he sold his interest in the company to Sears in 1895 for \$25,000.

With his partner out of the picture, Sears badly needed a manager. He eventually found one in Aaron Nussbaum, who bought into the company with his brother-in-law, Julius Rosenwald. By 1895 the company was grossing almost \$800,000 a year. Five years later that figure had shot up to \$11 million, surpassing sales at Montgomery Ward, a mail-order company that had been founded back in 1872. In 1901 Sears and Rosenwald bought out Nussbaum for \$1.25 million.

According to John Steele Gordon's article published in *American Heritage*, it was Rosenwald, not

Sears, who transformed Sears, Roebuck “from a shapeless, inefficient, rapidly expanding corporate mess into the retailing titan of much of the twentieth century.” He streamlined the system by which orders were processed, employing a color-coding scheme to track them and an assembly-line method of filling them. These efficient new techniques enabled the company to meet the challenge of handling an ever-increasing number of orders. By 1906, for example, Sears, Roebuck was averaging 20,000 orders a day. During the Christmas season the number jumped to 100,000 orders a day. That year the company moved into a brand-new facility with more than three million square feet of floor space. At the time it was the largest business building in the world.

In 1909 Sears resigned as president of the company he had founded. His health was poor and many of his extravagant promotional schemes had begun to run into opposition from his fellow executives, including Rosenwald. He turned the company over to his partner and retired to his farm north of Chicago. At the time of his death in 1914, Sears left behind an estate of \$25 million and an enduring legacy of success in the highly competitive world of retailing.

Richard Sears had a genius for marketing and he exploited new technologies to reach customers nationwide via mail-order. At first he targeted rural areas: People had few retail options there and they appreciated the convenience of being able to shop from their homes. Sears made use of the telegraph as well as the mails for ordering and communicating. He relied on the country’s expanding rail freight system to deliver goods quickly; passage of the Rural Free Delivery Act made servicing remote farms and villages even easier and less expensive.

However, the rapid growth of the mail-order business dominated by Sears, Roebuck had a negative impact on smaller retailers. Unable to compete with both the industry giant and its main competitor, Montgomery Ward, some merchants angrily began referring to the company as “Rears and Soreback” or “Shears and Rawbuck.” They steadily lost customers to Sears’ lower prices, wider selection, and aggressive promotional campaigns. But the growth of Sears, Roebuck had one positive impact nationwide. As residents of rural areas found themselves able to purchase the kinds of goods that had once been available only in big cities, they came to feel a greater sense of social connection with the rest of the country.

SEARS, ROEBUCK AND CO.

Retail giant Sears, Roebuck and Co. can trace its roots to a shipment of unwanted pocket watches that Richard W. Sears (1863–1914) was able to sell to his fellow freight agents on the Minneapolis and St. Louis Railroad in 1886. After selling \$5,000 worth of watches in six months, Sears quit the railroad and founded the R. W. Sears Watch Company in Minneapolis. Sears built his business by buying up discontinued lines from manufacturers and selling them at a discount to his customers. Business expanded so quickly that he moved to Chicago in 1887 and hired Alvah Roebuck as the company’s watch repairer.

In 1888 Sears published its first mail-order catalog, 80 pages of watches and jewelry. Within two years it had grown to 322 pages, and clothing and durable goods such as sewing machines and bicycles were added. The advent of the rural free delivery system in 1891 helped Sears reach its primary customer, the rural farmer, more easily. The 1894 catalog cover proclaimed Sears the “Cheapest Supply House on Earth.” Much of the company’s success was due to Richard Sears’ innovative unconditional money-back guarantee, by which the company stood.

In 1893 Sears and Roebuck became partners and the firm changed its name to Sears, Roebuck and Co. A shrewd and aggressive salesperson, Richard Sears believed in continuous expansion and risk-taking. That made Alvah Roebuck uneasy and two years later he sold his interest to Sears, remaining on as a repairer. In 1895 the company reorganized with a capitalization of \$150,000 split three ways among Richard Sears, local

In fact, the cover of the May 1993 issue of *Fortune* featured the logos of Sears, IBM, and General Motors with the prominent headline, “Dinosaurs!” While normally I would not speak on behalf of other companies, my response to that headline paraphrases Mark Twain: “reports of our deaths are greatly exaggerated.” At Sears, we took that cover, that story, that entire experience, as a challenge. What could have been a serious setback to our progress and morale became quite the opposite and important rallying point in our ongoing re-invigoration and revitalization. The momentum was underway—our fire was lit. If that allusion to extinction hastened our pace, so much the better.

Arthur C. Martinez, CEO of Sears, Roebuck and Co., 1997

entrepreneur Aaron Nusbaum, and Nusbaum’s brother-in-law Julius Rosenwald. When Nusbaum was forced to sell out in 1901 after clashing with Sears, his one-third share in the company was worth \$1.25 million.

The company went public in 1906, in part to raise money for a new headquarters on Chicago’s West Side. Wall Street appeared leery of Sears’s tactics so he resigned as president in 1908. He remained as chairman and retired in 1913, never having presided over a board meeting. He died in 1914.

Leadership of Sears, Roebuck fell to Julius Rosenwald and under his skillful direction sales increased sixfold from 1908 to 1920. In 1911 Sears began offering credit to its customers. At a time when banks would not consider extending credit to consumers, this move helped Sears to sell more big-ticket items. In 1913 the parcel post rate was introduced and Sears quickly became the parcel post’s single largest customer. Rosenwald became one of the richest men in the world and also a noted philanthropist, donating more than \$63 million in his lifetime, mainly to Jewish causes and to improve the education of Southern African Americans. He was named a trustee of the Tuskegee Institute and he became a good friend of its founder, Booker T. Washington (1856–1915).

Sears was exclusively a mail-order operation until 1925, when it opened its first retail outlet in Chicago. By the end of the decade it had 324 retail stores and in 1931 retail sales surpassed catalog sales. Sears’s entry into retailing has been credited to Robert Wood, a

former executive at rival cataloger Montgomery Ward and Company, who joined Sears in 1924. Wood, nicknamed “The General,” earned a reputation for genius through his long career in merchandising.

Wood became president of Sears in 1929 and he ran the company until 1954. Sears was becoming more involved in the affairs of its suppliers, many of whom depended solely on Sears for business. In 1929 two suppliers, Upton Machine and Nineteen Hundred Washer Company, merged with Sears’s help to form Nineteen Hundred Corporation, which would become Whirlpool in 1950. In 1931 Sears diversified by creating its Allstate subsidiary to sell auto insurance.

In 1941 sales reached a new all-time high of \$975 million, boosted by military spending and a consumer buying panic as U.S. involvement in World War II (1939–1945) appeared likely. During the war Sears supplied the military with a wide range of goods and some of the factories belonging to Sears suppliers were converted to munitions plants. Raw material shortages caused sales to suffer, however; the company refunded \$250 million in orders that could not be filled. Around this time Sears began its first foreign ventures, opening a store in Havana, Cuba, in 1942 and several stores in Mexico in 1947.

Sales reached the one billion dollars mark in 1945 and doubled the next year. Correctly anticipating an economic boom after the war, Wood launched an aggressive expansion program that put Sears well ahead of its competition. New stores were located in the path of suburban expansion, which took off in the late 1940s and 1950s. By 1954 Sears’s sales had grown to three billion dollars; Sears became a symbol of U.S. prosperity. During the 1950s Sears began to stock more clothing as sales of durable goods slackened. The company also strengthened ties to its suppliers and adopted a decentralized management structure.

The 1960s were another good decade for Sears. In 1960 the firm established its own shopping center development subsidiary, Homart Development. In 1963 sales were \$5.1 billion and surveys showed that one in five U.S. consumers shopped at Sears regularly. In 1967 monthly sales topped one billion dollars for the first time.

As the 1970s began, Sears dominance of U.S. retailing was unchallenged. Construction of the Sears Tower in Chicago, the tallest building in the world for many years, was completed in 1974. At the same time skyrocketing oil prices led to nationwide recession, and a \$170 million decline in profits for Sears. Sales remained flat for the next several years. Also during

this period, competition in the form of specialty shops and discounters began to capture a greater share of the retail market. Within the company, decentralization introduced in the 1950s had resulted in widespread inefficiencies and rivalries among the different territories. As net income continued to decline from 1978 to 1980, it was clear that the company's poor financial performance required a solution.

Under the guidance of Edward Telling, who assumed control in 1978, Sears undertook a major reorganization in 1981. The company was organized into three major business groups: the Merchandise Group (buying and merchandise), Allstate Enterprises (insurance and financial services), and the Seraco Group (commercial and residential real estate). In addition, Sears became more involved in the growing financial services sector with the 1981 purchase of the nation's largest real estate brokerage Coldwell Banker Company, and securities firm Dean Witter Reynolds Inc. Further diversification took place in 1984 when Sears, along with IBM and CBS, launched Prodigy, an online service similar to America Online and Compuserve.

In 1985 Sears introduced the Discover Card, which combined credit and financial services and also offered savings accounts. In 1988 the company acquired Eye Care Centers of America, Pinstripes Petites, and Western Auto Supply. Its workforce swelled to an all-time high of 520,000. The company's stock continued to lag, however, and from 1986 to 1990 corporate profits slipped from \$1.3 billion to \$892 million. However, by 1991 Sears's financial services businesses began to contribute more earnings. Combining this with layoffs and other cost-cutting measures, Sears posted a profit of nearly \$1.3 billion.

Following an unexpected loss of nearly \$2.3 billion on sales of \$53.1 billion in 1993, Sears began to sell off some of its non-core business assets. Eye Care Centers and Coldwell Banker's residential real estate operations were sold. Dean Witter and the Discover Card services were spun off. After a service fraud scandal and a 20 percent drop in sales, the Automotive Group stopped making repairs and then filled vacant bays through a deal with Pennzoil's Jiffy Lube. In 1994 the Homart division was sold, and Allstate was spun off.

Perhaps the most dramatic changes took place in the Merchandising Group. Under the direction of Arthur C. Martinez, who would become head of Sears in 1994, the company began to cater to female customers, who accounted for as much as 70 percent of merchandise sales. With an advertising campaign touting "the softer side of Sears," Martinez brought in more famous name clothing for women. The catalog

was discontinued in 1989 after a 101-year run, although specialty catalogs were reinstated in 1994. The workforce was trimmed to 361,000, and unprofitable stores were closed while other stores were expanded.

In 1994, with the Sears Tower put in trust for transfer in 2003, company headquarters was moved to a 200-acre campus west of Chicago. During 1995 Martinez, now head of Sears, added 152 Circle of Beauty cosmetic boutiques, and Sears introduced its own line of denim sportswear, Canyon River Blues, which turned out to be a resounding success. In addition, Sears moved durable goods into their own free-standing buildings called Sears Hardware, Sears HomeLife, and Sears franchise stores. These stores would service customers who had previously ordered through the Sears catalog, especially in rural areas. Sears also began a new line of automotive after market stores called PartsAmerica, opening 30 stores in 1995 and another 60 stores in 1996. When the year was over Sears posted a solid profit of \$1.8 billion on sales of \$34.9 billion.

Having turned Sears around and put it back on the right track, Martinez was named *Financial World's* "CEO of the Year." From 1995 through 1997 Sears enjoyed rising sales, but the cost of spinning off divisions, reorganizations, and bad credit card debt cut into profits, which declined to \$1.2 billion in 1997. Still a healthy retail giant, Sears had a network of 833 full-line mall-based department stores and 2,697 freestanding specialty stores in the United States in 1998. Having spun off many of its non-core businesses, the company was focused on selling apparel, furniture, hardware, and automotive merchandise.

SEASONAL UNEMPLOYMENT

Individuals in the labor force searching for work may be subject to seasonal unemployment. Seasonal unemployment results from variations in employment patterns because of seasonal change. This is a common occurrence in the agricultural industry, where harvesting season naturally demands more workers than are needed during other months.

A similar situation occurs in the construction industry, which experiences a higher rate of unemployment in the winter months than during the spring or summer. This is not always the case. California is less likely to experience an intense employment fluctuation in its construction industry because of relatively mild seasonal change. Michigan, on the other hand, is much more apt to be affected with increased unemployment in its construction industry during the winter months.

Why do workers remain in such industries? Those employed in the construction industry are often attracted to the high wages. However, agricultural workers do not receive high compensation for their efforts. Harvesting work may often be completed by migrant workers. Migrant workers are individuals who move from region to region looking for employment. For instance, a worker from Latin America may migrate to California for harvesting work and then return home with his or her earnings at the end of the season.

Seasonal unemployment does not affect every part of the country. It varies from region to region.

SECOND NEW DEAL

The Second New Deal was the name given to a series of federal programs passed by Congress between 1935 and 1938 to counteract the Great Depression. Several of the first New Deal programs proposed by President Franklin D. Roosevelt (1933–1945) had earlier been declared unconstitutional by the U.S. Supreme Court. Roosevelt's Second New Deal included higher taxes for the rich, stricter regulations for private utilities, and increased subsidies for rural electrification. Three federal acts formed the heart of the Second New Deal. The National Labor Relations Act of 1935, also known as the Wagner Act, established a set of fair employment standards and guaranteed the right of workers to organize and collectively bargain with management through union representatives. The Social Security Act of 1935 created a retirement fund,

unemployment insurance, and welfare grants for local distribution, including aid for dependent children. The Fair Labor Standards Act of 1938 was the final significant piece of the Second New Deal. It prescribed the maximum hours employees could be required to work without being paid overtime and also prescribed the minimum wage they could earn.

Second New Deal programs fared better before the Supreme Court than did their predecessors. Fueled by his decisive victory in the 1936 presidential election, Roosevelt began his second term by proposing a "court packing" plan that would have allowed him to increase the size of the nation's high court by adding justices with a disposition favorable to his programs. Although Congress rejected the plan, the Supreme Court got the message, as the nine Justices began validating the constitutionality of more federal legislation. With the onset of World War II (1939–1945) America's attention turned from domestic policy to international affairs, and the president's New Deal programs faded into the background of an economy mobilizing for military production.

SECTIONALISM

Sectionalism is the belief in and support of political, social, and economic interests particular to a region or section of the country. By the mid-1800s the United States encompassed an enormous area of almost three million square miles following the addition of lands in the Louisiana Purchase, Texas, Florida, the Oregon Territory, and land ceded by Mexico. Although ruled by one government, people living thousands of miles apart developed their own political and economic interests and social causes, often not agreeing with other Americans on these issues. New leaders emerged who represented their own sections of the country rather than the country as a whole, increasing sectional conflict. The country seemed divided into three regions: the North, the South, and the West.

Economics is the major contributing factor to sectionalism. Consequently, well before the great expansion of the United States, the Constitution's framers were familiar with sectional differences. The North's cool climate and rocky soil proved unsuitable for large farms. Its economy soon depended on trade and the

growth of industrial cities. The South's economy depended on farming and large plantations worked by black slaves from Africa. Sectional debate during the Constitutional Convention revolved around the slave trade, export taxes, and shipping.

By the 1850s sectionalism bitterly erupted over the issue of slavery and state's rights culminating in the American Civil War (1861–1865). American loyalties to their section overshadowed loyalty to the nation. Though the Civil War abolished slavery, sectionalism continued through Reconstruction and into the twentieth century with the Solid South acting as a political bloc into the 1960's. Another product of sectionalism was the Populist Party formed by farmers in the West and South in the late 1800s to compete against political groups led by Northeastern industrial interests. As the twentieth century came to a close, the North, South, and West still competed for federal money. Environmental issues consequently divided East and West. Many Easterners believed the vast Western lands needed protection while many Western economies relied on natural resource development. Despite the ongoing disputes, however, sectionalism will probably never again divide the United States as bitterly as it had in the mid-nineteenth century.

SECURITIES AND EXCHANGE COMMISSION

The Securities and Exchange Commission (SEC) is an independent, non-partisan regulatory agency. Created by Congress in 1934 under the Securities Exchange Act, the agency is tasked with regulating the United States investment industry. It ensures that U.S. securities markets operate fairly and honestly and can enforce punishments when violations are made.

SEC regulations are designed to hold publicly held entities, broker-dealers in securities, investment companies, and other securities market participants accountable to federal law. There are six main laws the SEC oversees: the Securities Act of 1933, the Securities Exchange Act of 1934, the Public Utility Holding Company Act of 1935, the Trust Indenture Act of 1939, the Investment Company Act of 1940, and the Investment Advisers Act of 1940.

The Securities Act of 1933, known also as the "truth in securities law," requires investors be provided with information concerning securities offered for

public sale. This information often comes in the form of a "prospectus," a brochure detailing the security's history and performance. The act also set regulations to prevent fraud in securities sales.

The information disclosure statements established in the 1933 Securities Act were extended the next year under the Securities Exchange Act. This act extended the disclosure of information to all securities listed and registered for public trading on U.S. securities exchanges, such as the New York Stock Exchange. Disclosure law was further extended in 1964 with the Securities Act Amendments, which made similar provisions for equity securities in the over-the-counter market (securities markets where previously issued securities are re-traded).

The Public Utility Holding Company Act of 1935 regulates interstate holding companies involved in the electric utility industry or the retail distribution of natural or manufactured gas. These businesses are required to file detailed information concerning their operations and holdings.

Regarding bonds and other debt securities, the SEC has the power to regulate under the Trust Indenture Act of 1939. Debt securities offered for public sale and issued under trust agreements must adhere to guideline concerning trustees and capital, including high standards of conduct and responsibility on the part of the trustee.

In addition, the SEC monitors the principles set forth in the Investment Company Act of 1940, regulating the activity of companies engaged primarily in the securities industry—investing, trading in securities, and offering their own securities for public sale.

While the SEC oversees the application of all these laws and guidelines, it is a regulatory agency only and does not supervise any individual company's investment activities. It does have more supervision regarding investment advisers. The Investment Advisers Act of 1940 established a system requiring all persons or organizations who advise about securities investments (and receive compensation for this advice) be registered with the SEC and conform to their established procedures of investor protection.

Because of SEC oversight, investors in U.S. securities markets are better protected from fraud, whether it be by investment advisers or companies engaged in criminal securities schemes.

SELECTIVE SERVICE ACT

The Selective Service Act was passed by Congress in May 1917; it required the registration of all American males between the ages of twenty-one and thirty for possible draft into military service. When the United States entered World War I (1914–18) on April 6, 1917, the U.S. armed forces were comprised of roughly 200,000 volunteers. In the weeks following Congress's declaration of war on Germany, not enough men signed up for service so Congress responded by enacting legislation to boost the number of enlisted men. Secretary of War Newton Baker (1871–1937) made clear that the registration could not be evaded. And George Creel, the head of the newly created Committee on Public Information, oversaw the production of an astounding output of propaganda including 75 million pamphlets and posters whose aim was to stimulate patriotism and hatred of anything German.

By June 5, 1917, more than nine million men had registered. Congress widened the registration requirement to include all men between the ages of eighteen and forty-five, and by the end of the war twenty-four million men had signed up. While 340,000 men failed to show up when called and four thousand were classified as conscientious objectors, nearly five million men served in the armed forces during World War I, two million of them in France alone. The typical soldier was a drafted man between the ages of twenty-one and twenty-three; he was white, single, and poorly educated. 400,000 soldiers were black and roughly 18 percent of the soldiers were foreign-born.

To ensure that the troops knew what they were fighting for, a copy of President Woodrow Wilson's (1913–1921) war message was included in every soldier's gear. Women volunteered in the navy as clerks and they joined the U.S. Signal Corps and Nurse Corps. Although defense-industry workers were able to receive deferments of service, the draft depleted the male labor force by 16 percent. Women stepped in to pick up the slack. When the fighting ended with Germany's surrender and the signing of the armistice on November 11, 1918, countries tallied their dead and wounded. Some 50,000 American soldiers died in battle; another 62,000 died from disease (a worldwide flu epidemic claimed many American soldiers' lives); and 200,000 were wounded.

Two decades later, in 1940 the United States braced itself for possible involvement in World War II (1939–1945). The first peacetime military draft in U.S. history began after the passage of the Selective Service Act of 1940. This system was in effect from 1940 to 1973. When the United States entered World War II in

This familiar Uncle Sam poster was placed near recruiting headquarters to inspire new recruits. The poster made its debut in WWI.

December 1941, the number of people on active duty was less than two million. In 1945 the number of men and women serving in the armed forces peaked at over twelve million. Both in 1942 and 1943, over three million men were inducted into the armed forces. Such numbers were required in fighting a war on two fronts—one in Europe and another in the Pacific.

At the end of World War II in 1945 the U.S. military had quickly demobilized almost 7 million soldiers. Only three years later, however, the Cold War extended the life of the Selective Service System. In 1948, in response to deteriorating relations between the Union of Soviet Socialist Republics (USSR)—and the United States, Congress restored the Selective Service System. It required the registration of all U.S. men between the ages of eighteen and twenty-five, with men between nineteen and twenty-five to be inducted for a twenty-one-month period of service. Registration began August 30, 1948; the program continued for twenty-five years.

During the Vietnam conflict, the numbers of soldiers peaked during the late 1960s. The Selective

Service System inducted 382,010 young men into the armed forces in the single year of 1966. As a result of criticism that the student deferment allowed the more affluent members of society to avoid the draft, President Richard Nixon instituted reforms in the way that the Selective Service System was run. First, in 1971, Nixon eliminated the student draft deferment. Rather than the local draft board determining who would be drafted, the system was nationalized through a draft "lottery." When a young man turned 19 years old, he immediately knew his likelihood of being drafted, depending on his birthdate in relation to a nationally run lottery drawing. This was a politically prudent move on President Nixon's part, because it was the *uncertainty* of being drafted that agitated the Vietnam generation. Eliminating this uncertainty went a long way towards containing the antiwar movement.

In 1973, as the U.S. shifted to the "all volunteer army," the draft ended. The Selective Service System remained in place, however, in case the U.S. ever gets involved in a big war.

SETTLEMENT AND ECONOMIC DEVELOPMENT: THE COLONIES TO 1763 (OVERVIEW)

In 1585, Richard Hakluyt the elder assured English readers of his pamphlet, *Inducements to the Liking of the Voyage Intended towards Virginia*, that North America held the economic potential to form the basis of a great English commercial empire. English colonization would open lucrative new American markets for "the Woollen clothes of England" and "sundry [of] our commodities upon the tract of that firme land." The "situation of the climate" and the "excellent soile" would in turn make North America an excellent source of "Oade [a blue dye], Oile, Wines, Hops, Salt," all of which English people could expect to obtain "better cheape than we now receive them."

Hakluyt anticipated that the abundance of North American hides, whales, seals, and fish would all give England an edge in a market for these goods which was traditionally dominated by Russian merchants. The "excellent and fertile soile" on both sides of North America's "greate and deep" natural waterways promised "all things that the life of man doth require," and whatever settlers wanted to plant they could expect to harvest in abundance sufficient to "trafficke in."

Over the next 178 years, enterprising merchants and traders and hard-working Native Americans and settlers slowly made into reality Hakluyt's vision of North America as an integral part of a British North Atlantic commercial system. The first to feel the effects of this transformation were the Native Americans, who met English vessels at the shore with valuable furs which they readily exchanged for prized English goods such iron tools, glass beads, and woven cloth. Most early English settlements depended heavily on such trade to repay investors who had financed their voyages, and some economies such as New York's continued to rely significantly on the "Indian trade" through much of the colonial period. The fur trade also exerted a profound impact on Native American economic life as imported European goods began displacing traditional tools, weapons, utensils, apparel, and ornamentation. The historian James Axtell has termed this process "the first consumer revolution" in which Native Americans' appetite for European goods spurred the growth of a Native market for European products that extended rapidly into the interior of North America. Trade with Europeans altered nearly everything about Native life, disrupting and redirecting traditional trading patterns, producing a strain on the natural environment through over-hunting and over-trapping, and changing the way that American Indians clothed themselves, cooked their food, cultivated their soil, and hunted their game. Iron tools replaced implements of bone and stone, woolen garments replaced buckskin, muskets replaced arrows and spears. By 1700 many eastern woodland Indians had become permanently dependent on European commerce, and their participation in colonial commerce contributed greatly to North American economic growth.

Settlers of Jamestown, the first successful English settlement in North America, shared with the adventurers of the earlier, ill-fated Roanoake settlement of 1585 the hope of tapping into precious sources of New World mineral wealth. The founding settlers expected to exploit Virginia's game, fishing, and agriculture, and establishing a lucrative trade with the neighboring Powhattan empire. Nearly all these hopes were dashed

The English population in the American colonies was well established by 1700. The highest populations were in Massachusetts and Virginia.

as the Chesapeake colony teetered on the brink of failure for more than a decade. They found no gold or gems, manufacturing enterprises such as a glassworks failed, their Old World work habits ill-prepared them for the demanding task of tilling and planting virgin soil, they were continually racked by disease, and their repeated provocation resulted in perpetual strife with their Indian neighbors.

THE "EXCELLENT AND FERTILE SOILE" ON BOTH SIDES OF NORTH AMERICA'S "GREATE AND DEEP" NATURAL WATERWAYS PROMISED "ALL THINGS THAT THE LIFE OF MAN DOTH REQUIRE," AND WHATEVER SETTLERS WANTED TO PLANT THEY COULD EXPECT TO HARVEST IN ABUNDANCE SUFFICIENT TO "TRAFFICKE IN."

Adapted from Richard Hakluyt's *Inducements to the Liking of the Voyage Intended towards Virginia*, 1585

Tobacco, which the settler John Rolfe began cultivating in 1610, eventually became the staple crop that saved the colony. Europeans loved the crop in spite of the denunciations of smoking by prominent figures, including King James I himself. Jamestown planters were soon cultivating the "stinking weed" wherever they could find suitable land. Tobacco plantations began springing up along Chesapeake estuaries, creating a growing demand for labor and land as successful planters increased their holdings to put even more

tobacco into cultivation. Settlers who founded the colony of Maryland in 1634 quickly began following the example of their Virginia neighbors. For much of the seventeenth century, Chesapeake planters relied mainly on the labor of indentured servants from England, occasionally supplementing that labor force with captive Indians or Africans whose status varied from person to person. English indentured servants bound themselves to work for a period of four to seven years, after which they were released. Many Africans brought to North America before 1660 shared that status, but a growing number came as slaves for life. Disease and malnutrition made life miserable for both European and African servants. When the supply of European servants began dwindling after 1660, planters turned increasingly to African slaves. By 1700, the economies of Virginia and Maryland had come to depend on the labor of lifetime slaves of African descent who cultivated the main export crop.

A very different economy emerged in the colonies of New England as families migrated to Plymouth, Massachusetts Bay, New Haven, Connecticut, Rhode Island, and New Hampshire to escape pressure to conform to the state-sanctioned ceremonies of the Church of England. The colder northern climate prevented the cultivation of staple crops common in England, but the land was suitable for traditional English farming methods. Significant equality in the size of family property was insured in many parts of
