New England by an orderly process of land distribution. The New England governments granted large tracts to incorporated towns, which would in turn grant parcels to heads of households on the basis of present and future need. Commerce boomed during Massachusetts Bay's first decade of settlement as earlier settlers prospered by producing goods for sale to the thousands of new arrivals who took passage each year. Yet when the flow of migration ceased after the outbreak of the English Civil War in 1642, the nascent market economy dried up.

Massachusetts officials sought to compensate by developing overseas markets, successfully establishing a trading partnership with British colonies in the West Indies that continued throughout the colonial period. Yet the bulk of the New England economy rested on family farms. Their production was oriented toward achieving, not the exorbitant profits sought by great tobacco and sugar planters, but a "competence" in which members and heirs of each household could expect to enjoy an adequate diet, clothing, housing, and the modest comfort and enjoyment of family and community life.

Other seventeenth-century Anglo-American economies varied somewhat from these two early models. The Hudson River settlements, founded by the Dutch in 1613 and captured by the English in 1664, early centered on the fur trade but also developed a significant agricultural base. The New York agricultural economy was distinguished by the great Hudson River estates on which a few large landholding families such as the Livingstons achieved great wealth from the large numbers of tenant farmers who farmed their lands. The economies of Pennsylvania and the Jerseys rested on family farming by English, German, Scottish, and Scotch-Irish settlers. South Carolina, like Virginia, became a slave society which produced agricultural goods—in this case rice and indigo dye—for a lucrative European market. Many colonies, like North Carolina, also provided England with important sources of goods such as naval stores—white pine masts for ships, turpentine, pine tar, and hemp for rope.

By 1650 the commercial output of England's colonies had grown large enough to begin enriching many English planters as well as the Dutch merchants who transported tobacco and sugar from the English West Indian and Chesapeake markets to European ports. With the Restoration of Charles II to the throne of England in 1660, Parliament and royal officials began an energetic effort to shape a more consistent policy of colonial commerce that would favor English merchants and shippers while cutting the Dutch out of

Anglo-American trade. The Navigation Act of 1660 restricted colonial trade to ships constructed in either England or English America which carried a crew at least 75 per cent English or Anglo-American. In addition, the act listed certain "enumerated goods"—tobacco, sugar, cotton, indigo, dyewoods, and ginger—that could be transported only to England or another colonial port. Over the next forty years Parliament refined its commercial policy by passing further Navigation Acts and developing the colonial administrative body that eventually became the Board of Trade. The system, never perfect, suffered from periodic abuse and neglect and was regularly circumvented by smugglers. Nevertheless, by the time the Act of Union united Scotland and England under one Parliament in 1707, a workable administrative framework for Anglo-American trade was in place, fostering the growth of a dynamic eighteenth-century empire of goods that benefited both Britain and her North American colonies.

Most historians agree that the colonial economy grew slowly but steadily during the first half of the eighteenth century, stimulating a corresponding rise in the volume of imported British goods. After 1740, however, the volume of cheap British imports to the colonies began an exponential rise in what some historians have termed an Anglo-American "commercial revolution." English manufacturers using traditional methods of production found ways to make more goods available at cheaper prices than ever before, and English merchants found ways to get these goods to prospective buyers through innovative marketing techniques such as paid newspaper advertisements and attractive shop displays. As the volume of imports rose and the prices dropped more colonists purchased more goods each year. In 1700, for example, only the wealthiest colonists could afford to drink tea regularly, and their homes alone were graced with elegant tea sets. Yet by 1760 tea, like the sugar that sweetened it, had become a "decency" enjoyed by the "middling sort" of colonist as well as the wealthy. The building of market roads and the clearing of river channels carried imported English goods a little further inland every year, and colonists found ways to acquire or reallocate the extra income needed to purchase a growing array of items. They could dress in a widening variety of European fabrics adorned with a growing selection of European lace and buttons, and complete their outfits with fashionable silk stockings, gloves, and wigs. They could pane their windows with imported glass, decorate their parlors with fashionable imported candlesticks, and set their tables with inexpensive ceramic tableware.

Sharecropping

This growing participation in a transatlantic market of goods exerted a variety of pressures on eighteenth-century American life. The colonial appetite for imports produced a chronic trade imbalance between the colonies and England, resulting in a perpetual drain of hard currency from the colonies. Colonists responded in a variety of ways such as borrowing from European merchants against the value of future export crops and authorizing the issue of paper currency to expand the money supply. American Indians' increasing dependence on European goods began producing a backlash after 1740 as native prophets such as Neolin called upon Indians to purge themselves of European textiles, tools, and rum to reassert their native identity and regain their spiritual vitality. In contrast, the growing consumption of British goods contributed to a growing commonality of tastes, experiences, and identity among Anglo-American colonists who came to think of themselves increasingly as British Americans. Indeed, colonial protest and Revolution are almost inconceivable without this process. The Stamp Act and Townshend Duties that sparked the protest might not have been passed if the volume of colonial trade were not so great by the 1760s, and the protest might never have been so widespread or popular had not so many Anglo-Americans felt the sting of taxes on the British goods they wished to purchase.

SHARECROPPING

Sharecropping is a system of agriculture whereby the farmer who works the land receives proceeds of a portion of the crop harvest in return for his labor. After the American Civil War (1861–1865), the South was in ruins. Former plantation owners, now without slave

Poverty plagued the lives of many sharecroppers, who played a major role in the American agricultural system.

labor, also lacked the resources to hire wage laborers. Further, many freedmen disliked the idea of working for wages. Hearing of a rumored promise of "forty acres and a mule" at the end of the fighting, black men in the South wanted their own farms. Two systems of agriculture emerged: One was sharecropping and the other was tenant farming. Plantation owners divided up their land and arranged the tracts to be farmed by one of these two methods.

A sharecropper was furnished with a house and a plot of land. The landowner, however, retained ownership; the property was simply the sharecropper's to use to work the land. Often the house was nothing more than a shack, frequently the housing that had been supplied to the slaves. The sharecropper was provided with seed, fertilizer, tools, and other implements necessary to cultivate the land. Most, if not all, the labor in the fields was performed by the sharecropper and his family. If there were any wage laborers working under the sharecropper, they were under the supervision of (and were paid by) the landowner. At the end of the harvest, the yield was turned over to the landowner, who took it to market. Once the harvest was sold, the costs of the supplies were deducted from the proceeds, and the farmer was given between one-third and one-half of the remaining sum as payment for the sharecropper's labor. If the weather had been poor during the growing season or if the market price of the crop had dropped, the sharecropper often wound up in debt. As there would be little return on the harvest, the sharecropper would be unable to pay the landowner for the supplies. Most sharecroppers found themselves in this situation, particularly after the South's economy became based on a single crop—cotton. In the days following the Civil War, landowners were eager to

make money. At the time cotton was the crop most easily converted to cash, since it was in high demand. But overproduction of cotton soon caused its price to plummet. In 1866 it sold for 43 cents a pound; between 1882 and 1902 the price never exceeded 10 cents a pound.

While the majority of sharecroppers were perpetually in debt to the landowners, some were able to turn a profit, which eventually afforded them increased independence as farmers. Some became tenant farmers (who rented the land from the landowner), while a few established their own farms.

SHAYS' REBELLION

The years after the American Revolution (1775–1783) were very hard for most Americans. The former colonies, many of them saddled with large war debts, were struggling to find ways to pay their creditors. Soldiers from the Continental Army returned to their family farms to find their lands neglected, in need of extensive clearing and reworking before they were ready to produce a crop. A great postwar depression also meant that prices for farm produce in general were low. In the five years after the end of the Revolutionary War farmers sunk deeper and deeper into debt. Many of them had their lands and other property seized when they were forced to default on their debts. Such a tense environment erupted in a rebellion led by Daniel Shays in 1786–1787 as a protest against the Massachusetts government's refusal to provide economic relief to the struggling farmers of the state.

Conditions were especially bad in Shay's state of Massachusetts. The merchants and traders of colonial Massachusetts' seaports relied on trade with the British Empire for most of their income—especially England itself and the West Indies. The American Revolution had closed these imperial ports to American shipping, forcing merchants to pay for foreign goods and service with hard money, or specie—coined gold or silver—which was in short supply in the United States. The Massachusetts government, which also had to pay many of its creditors in specie, was similarly short of cash. In addition, the federal government (itself chronically short of cash) was defaulting on promises to pay wages and pensions owed to Revolutionary War veterans. Massachusetts responded to the crisis by raising revenue from taxes on land and other sources. Land taxes alone increased by over 60 percent in the three years between 1783 and 1786. Farmers who could not

Daniel Shay led the violent protest against the Massachusetts government's refusal to provide relief to struggling farmers.

pay had their property seized. In severe cases, they were even sent to debtors' prison.

FOR GOD'S SAKE, HAVE MATTERS SETTLED PEACEABLY: IT WAS AGAINST MY INCLINATIONS I UNDERTOOK THIS BUSINESS; IMPORTUNITY WAS USED WHICH I COULD NOT WITHSTAND, BUT I HEARTILY WISH IT WAS WELL OVER.

Captain Daniel Shays, Letter to a friend, December, 1786

At first, the farmers tried remedies similar to those colonial leaders had tried with the British government in the decade before the American Revolution. Farmers petitioned government officials (including Massachusetts governor James Bowdoin) and the state legislature (then known as the General Court) to close the debtors' court and to print paper money so the farmers could make purchases and pay their taxes. Both Bowdoin and the General Court rejected the farmers' petitions, insisting that the power of the courts be respected. They also condemned the push for a paper currency on the grounds that it promoted inflation, making the money owed creditors worth even less. The General Court's new taxes for 1786 amounted to more than 30 percent of the average citizen's income, and it was payable only in cash.

Sheep Herders

When the General Court announced in the spring of 1786 its intention to again raise taxes throughout Massachusetts, several Continental Army veterans decided to take action. Former brevet major Luke Day led the resistance in Springfield, while Captain Job Shattuck provided leadership in Groton. The third leader in the struggle was Daniel Shays of Pelham in the western part of the state. Shays was, by all accounts, a reluctant leader. Although he had obtained a captain's commission in the Continental Army, by 1784 he had returned to farming and grown seriously in debt. During the summer of 1786 Shays emerged as a leader of the protestors in the western half of Massachusetts. By late August, armed groups of men numbering up to 1,500 were closing courthouses around the state.

Throughout the fall of 1786, the protestors organized themselves into an army. Calling themselves the Regulators, they continued to intimidate and threaten local and state officials. In response the General Court of Massachusetts authorized the raising of a 4,400-man militia and placed it under the command of Major General Benjamin Lincoln. Secretary of War Henry Knox even offered Governor Bowdoin a federal army if the state's resources proved inadequate. Despite efforts by Shays and others to negotiate a resolution to the growing problem, the Regulators continued to grow in numbers. By late January 1787, they had made plans to occupy the town of Springfield, Massachusetts and seize weapons stored at the arsenal there.

At 4:00 on the afternoon of January 25, 1787, Daniel Shays and 1,500 Regulators marched into Springfield headed for the arsenal. As they approached, they were fired upon by General William Shepard, who commanded the militia defense. When his warning shots were ignored, Shepard ordered his cannon to fire directly into the ranks of the Regulators. Four of the rebels were killed and another 20 were wounded. Shays' attack was driven off from such unexpected force. Over the next week and a half, General Lincoln drove the Regulators into the western half of the state. On the morning of February 4, he surprised Shays and the Regulators at Petersham, capturing a 10th of the force, and driving the others into the hills.

Lincoln's victory at Petersham ended the armed part of Shays' Rebellion. The General Court and local courts quickly took action to suppress the political aims of the rebels. Courts in Berkshire and Hampshire counties sentenced 14 men to die and fined or imprisoned hundreds more. The legislature met in mid-February to pass a special Disqualifying Act that pardoned former Regulators but disenfranchised them and barred them from jury duty and certain types of jobs for three years. A special commission led by

General Lincoln offered pardons to many more of the former rebels. Shays himself sought refuge in Vermont until his pardon was granted, but he never returned to his Massachusetts farm and instead settled in New York, where he died in 1825.

The long-range effects of Shays' Rebellion were more positive for the poor farmers of rural Massachusetts. The state elections of April 1787 saw the defeat of Governor Bowdoin and better than half of the sitting legislators. The new General Court quickly began work to address the concerns of the rebels, eliminating the Disqualifying Act, distributing pardons, reducing taxes, and allowing persons to use property as well as specie to pay debts. Shays' Rebellion also helped convince thousands of Americans in Massachusetts and other states of the need for a strong national government, which could stabilize the currency, control and levy taxes, and maintain public order. The following year, Massachusetts ratified the U.S. Constitution.

SHEEP HERDERS

Sheep herders, workers in charge of tending sheep on the open range, proliferated in the last three decades of the 1800s. Following the end of the American Civil War (1861–1865), the open lands of the western United States saw an influx of ranchers. The U.S. government had fought a series of wars to put down rebellions staged by Native Americans, including the Sioux Uprising of 1862, and stockmen were encouraged to move onto the open range. By the end of the 1860s, the longhorn cattle industry, which originated in Texas,

was flourishing. By the mid-1870s sheep ranchers appeared in significant numbers. In 1886, at the height of the open-range livestock boom, Montana alone had roughly a million sheep (and 664,000 head of cattle) grazing its lands.

Ranchers engaged in the practice of purchasing tracts of land adjacent to public lands, and then allowed their livestock to graze freely throughout the area. This method of open-range ranches allowed ranchers to control thousands of acres of land, but by 1890 sheep herders found themselves in conflict with the cattle raisers, as the seemingly endless open range became increasingly limited. Growth of the livestock industry meant that western lands were crowded with 26 million head of cattle and 20 million head of sheep. The industry continued to grow, and small ranchers and sheep herders were soon dominated by big business.

SHEPPARD-TOWNER ACT

The Sheppard-Towner Act, officially the National Maternity and Infancy Protection Act, was passed by Congress in April 1921. It provided matching funds to states for prenatal and children's health centers. The legislation was introduced in the House of Representatives in 1919 by Montana Representative Jeannette Rankin (1880–1973), the first woman elected to U.S. Congress. In December of that year, two similar bills were introduced in the Senate, one by Morris Sheppard, and the other by Horace Mann Towner. Women's advocacy groups joined the Children's Bureau (a federal statutory agency founded in 1912 and a leading force in the child welfare movement) to vigorously support passage of the legislation. In the wake of winning suffrage, American women proved a formidable lobbying force. Further, statistics provided a strong case for government support of a health program dedicated to the needs of women and children. At the time, childbirth was the second leading cause of death for women; one in five children died during their first year of life; and one in three died before the age of five. The Sheppard-Towner Act was passed into law sixteen months after it was introduced.

Under the legislation, using matching federal funds, states established health centers where nurses and physicians cared for pregnant women, infants, and children, and taught women prenatal, delivery, postnatal, and infant care. The program's objective was to reduce maternal and infant mortality rates, which, in studies carried out by the Children's Bureau, were revealed to be higher among lower income groups.

Research showed that as family income doubled, the infant mortality rate dropped by 50 percent. Activists concluded that an outreach program was necessary to instruct all women, regardless of their circumstances, on proper health care for themselves and for their children. The health program set up by the Sheppard-Towner Act was formulated in 1917 in the Children's Bureau's annual report, authored by reformer Julia Lathrop (1858–1932), the head of the agency. Lathrop proposed a nationwide effort modeled on a New York City program, run by pediatrician Sarah Josephine Baker (1873–1945), that gave inner city mothers access to health care and provided routine physical examinations for children. Baker headed a New York City health care program that reduced the city's infant mortality rate to the lowest of all major cities worldwide. When the Sheppard-Towner legislation was passed, Lathrop became its administrator.

The Sheppard-Towner Act remained in force until 1929, when Congress failed to renew funding for the program. Critics charged that lawmakers had fallen prey to the influence of the American Medical Association (AMA) and others, who viewed the federally supported health care program as moving the nation one step closer to socialized medicine. This fear was shared by prominent physicians who exited AMA's Section on Pediatrics to found the American Academy of Pediatrics (AAP).

Though the program was relatively short-lived, its influence was lasting. The funding provided by the Sheppard-Towner Act helped countless women and children. The clinics also raised awareness of the importance of preventive health care in lowering mortality rates of expectant women and children. Another improvement was the introduction of the idea that state and local agencies could play an important role in personal health.

SHERMAN ANTI-TRUST ACT

The Sherman Anti-Trust Act was passed by Congress in 1890 in an attempt to break up corporate trusts (corporate trusts are combinations of firms or corporations formed to limit competition and monopolize a market). The legislation stated that "every contract, combination in the form of trust or otherwise, or conspiracy in the restraint of trade" was illegal. While the act made clear that anyone found to be in violation of restraining trade would face fines, jail terms, and the

Sherman Silver Purchase Act

payment of damages, the language lacked clear definition of what exactly constituted restraint of trade. The nation's courts were left with the responsibility of interpreting the Sherman Anti-Trust Act; the Justices proved as reluctant to take on big business as was Congress.

The legislation was introduced in Congress by Senator John Sherman (1823–1900) of Ohio, in response to increasing outcry from state governments and the public for the passage of national anti-trust laws. Many states passed their own anti-trust bills or made constitutional provisions prohibiting trusts, but the statutes proved difficult to enforce, since big business found ways around them. When the legislation proposed by Sherman reached the Senate, conservative congressmen rewrote it; many charged the Senators with being deliberately vague. In the decade after the legislation's passage, the federal government prosecuted only eighteen anti-trust cases, and court decisions did little to break up monopolies. But after the turn of the century, reformers demanded that government regulate business.

In 1911 the U.S. Justice Department won key victories against monopolies, breaking up John D. Rockefeller's Standard Oil Company of New Jersey and James B. Duke's American Tobacco Company. The decisions set a precedent for how the Sherman Anti-Trust Act would be enforced, and they demonstrated a national intolerance toward monopolistic trade practices. In 1914 national anti-trust legislation was further strengthened by the passage of the Clayton Anti-Trust Act. This act outlawed price fixing (the practice of pricing below cost to eliminate a competitive product); it was also illegal for the same executives to manage two or more competing companies (a practice called interlocking directorates); and a corporation was prohibited from owning stock in another competing corporation. The creation of the Federal Trade Commission (FTC) that same year provided further insurance that U.S. corporations engaging in unfair practices would be investigated by the government.

SHERMAN SILVER PURCHASE ACT

The free coinage of silver became a political debate in the United States following the Panic of 1873. The period of economic hardship between 1873 and 1878 motivated the demand for cheaper paper money. The market price of silver dropped sharply after 1873 because it was used less often in American and European currency, and it was becoming more expensive to mine.

Although there were still "Greenbackers" around who associated the Civil War paper money with the dynamic northern economy during the Civil War, most of those in favor of inflation did not support the trend toward paper-money and turned instead to silver, believing its free coinage would be as adequate as greenback cash. Silver miners obviously also supported silver coinage. This demand resulted in the 1878 passage of the Bland-Allison Act, which required the government to buy at least \$2 million worth of silver bullion each month at market price to coin as legal tender silver dollars. While the act was a law, however, the country's presidential leaders weakened its effect by purchasing only the minimum amount of bullion. The Bland-Allison Act was never able to stop the decline of silver prices or to increase the circulation of money.

The nation's regional preferences for money lead to a clear divide in the country. In the eastern United States, businesses preferred the gold standard and opposed inflated money. In the West and South, however, indebted farmers needed inflation to boost the prices of their products, while owners of the silver mines prevalent in the western territories wanted free silver coinage to stimulate their own financial interests.

By 1890 the political influence of silver advocates in the West had grown so strong that on July 14, the Sherman Silver Purchase Act was passed as a compromise to appease all interests. Named after Ohio Senator John Sherman, it replaced the Bland-Allison Act as a measure to provide a greater government purchase of

silver. The Sherman Silver Purchase Act required the U.S. treasury to more than double its monthly purchase of silver to 4.5 million ounces. The direct effect of the Sherman Act was a threat to the U.S. Treasury's gold reserves and a \$156 million increase in the amount of paper money in circulation.

Ultimately, the Sherman Act did little to please anyone. Western farmers and silver miners remained dissatisfied with government compromise measures and felt threatened by the 1892 presidential election of Grover Cleveland (1893–1897), another supporter of the gold standard.

The U.S. Treasury's depleted gold reserves led to the Panic of 1893. To restrain public fear of the abandonment of the gold standard, President Cleveland called a special session of Congress, and the Sherman Silver Purchase Act was repealed in the autumn of that year.

SHERMAN'S MARCH THROUGH GEORGIA

From mid-November to late December, 1864, General William Tecumseh Sherman led 62,000 Union soldiers on a march through Georgia towards the sea, leaving in their wake a trail of destruction sixty miles wide. During this Civil War (1861–1865) expedition, which started in Atlanta and ended in the port-city of Savannah, Sherman and his men sought to demolish

not only the state's military resources but also its economic structure. The Union troops worked to cut off food supplies by setting fire to cities; stripping fields, barns, and houses; and raiding villages for food and livestock. The men laid waste to Georgia's commercial infrastructure city-by-city. Sherman's ultimate goal was to crush the Confederate states' will to fight, and his tactics were merciless and un-renting. The war did not end here, however, though the general's campaign did accomplish nearly all of its objectives. The march was long remembered as an epic gesture of violence that swept the North toward its victory.

General Sherman, the son of a Supreme Court justice, hailed from Lancaster, Ohio. A graduate of the United States Military Academy at West Point, Sherman served as second lieutenant in the Second Seminole War (1835–1842) in Florida, then as first lieutenant on assignment in South Carolina. At the onset of the Mexican War in 1846, he was assigned to the Pacific Division in California. In 1853 he resigned from the military and set out for San Francisco, where he briefly pursued a banking career; economic unrest in California, however, put an end to that venture in 1857. After another short-lived career as a lawyer in Kansas, Sherman returned to his former vocation in the army accepting a superintendent post at the state military academy in Alexandria, Louisiana. Upon that state's secession from the Union in January 1861, Sherman went north out of loyalty. In May of that year he was appointed colonel of the 13th infantry, beginning a decorated Civil War career.

YOU CANNOT QUALIFY WAR IN HARSHER TERMS THAN I WILL. WAR IS CRUELTY, AND YOU CANNOT REFINES IT.

William Tecumseh Sherman, Letter to the Mayor of Atlanta, September 12, 1864

After fighting at Bull Run in July 1861, Sherman rose to the position of brigadier general of volunteers. His first campaign in Kentucky was unsuccessful, which earned him a reputation for being unstable and manic-depressive. In April 1862, he regained the confidence of his peers following a victory at the Battle of Shiloh. Promoted to major general, Sherman took charge of the Union troops that occupied Memphis, Tennessee, in 1862. The following year, after a victory under Lieutenant General (and post-war president) Ulysses S. Grant at Vicksburg, Mississippi, he rose again in the ranks, assuming command of the Army of Tennessee. But it was in Atlanta, Georgia, that Sherman secured his place as a key figure in the war. His 1864 campaign, which lasted from May to September,

Shipbuilding Industry

ultimately ravaged the metropolis—fire consumed numerous buildings, and the Union soldiers used brute force to demolish or disable the city's machinery. It was this destruction of the commercial infrastructure of the South for which Sherman became known and feared.

The general's march through Georgia represented a continuation of his "total war" strategy. Leaving the burning city of Atlanta behind, he led two massive columns of troops, which operated under Generals Oliver H. Howard and Henry W. Slocum, on an eastward course. Supplying his men only with bread, Sherman organized raiding parties that allowed them to live off the food and livestock of the land. In a December 16 letter to Lieutenant General Grant, Sherman described in explicit detail the way in which his troops weakened Georgia's cities while reinforcing themselves: "We started with about 5,000 head of cattle, and arrived with over 10,000; of course, consuming mostly turkeys, chickens, sheep, hogs, and the cattle of the country. As to mules and horses, we left Atlanta with about 2,500 wagons, and our transportation is now in superb condition."

After Atlanta Sherman set out for Milledgeville, where his high-spirited men held a mock court session in which they repealed Georgia's secession ordinance. From Milledgeville they went on to the state capital, then to Sandersville, Louisville, and Millen, ravaging and pillaging along the way. Wildly outnumbered by Sherman's men, the Confederate troops could do little to halt the trend of violence. Ultimately, on December 21, 1864, Sherman ended his hell-raising march just as he had planned: by nearly demolishing Savannah, the port city at the end of his route. The victory followed a campaign to cut-off food supplies to the city and to take possession of its rice fields and mills. After a 10-day siege Sherman forced out the Confederates and took control of the city, presenting it grandly to President Lincoln as a "Christmas present."

In the end Sherman estimated that his Georgia campaign amounted to \$100 million in damages. A large portion of that sum represented the destruction of the state's economic resources, which crippled its cities and left them open to occupation by Union forces. Pleased with the success of his total-war campaign, Sherman went on to organize an equally devastating march through the Carolinas. Although the general found much of his strength in numbers, he refused to take on African American soldiers. Clearly racist, he disburdened his troops of freed slaves, issuing an order that allowed them to inhabit land rather than join the war. Nevertheless, the general succeeded in his campaigns. Sherman went on to vanquish Confederate troops under Generals Robert E. Lee and Joseph

Johnston, and, in 1869, to succeed Lieutenant General Grant as commander of the U.S. Army.

SHIPBUILDING INDUSTRY

From its earliest days the shipping industry was driven by the need to make contact with other people for migration, trade, and exploration. Many of the colonists arriving in what would become the United States brought a strong seafaring background with them. To facilitate transportation in the New World, they also settled along sea and river ports. These settlements invited participation in an already strong international sea trade. The abundance of forests on the coast offered easy access to materials for shipbuilders.

The shipbuilding industry was of such importance to the new nation that the first Congress in 1789 passed legislation to encourage the use of U.S.-made ships. The bill provided a 10 percent rebate on tariffs if the ship carrying the products was built in the United States. This incentive was important, because the young nation was bringing in a lot of finished goods and industrial products from Europe and sending back raw materials and agricultural products. But this was the last major legislation that Congress would pass for another 50 years to directly help the industry grow. The industry was already independently strong (ship-building was an important industry going back to colonial times) and the government wanted it to remain a private enterprise. However, the government did pass a Navigation Act of 1817 that protected coastal shipping from foreign competition.

It was significant that the government did not offer any subsidy, or government-funded bonus, to the industry until 1845, when the Postmaster General was authorized to subsidize steamships for transporting mail. These steamships were favored because they could be converted into warships. Nevertheless, the subsidy was soon revoked when, in 1858, it was considered to be a drain on national funds. By 1850, left mostly to itself, the U.S. shipbuilding industry soared to the enviable position of second in size behind England. By this time U.S.-manufactured “Clipper Ships” could be found in almost every port in the world. They were widely believed to be among the world’s premier vessels.

During the American Civil War (1861–1865) the industry suffered. U.S. merchant ship owners faced the possibility of capture by privateers and they had to pay huge insurance rates due to the risks of sailing ships bearing the United States flag. It is not surprising that, in order to save their private enterprises (and ships), many ship owners transferred their vessels to foreign registries. The United States forbade these ships from ever returning to United States registries and consequently lost a great number of excellent ships to foreign competitors. In addition, the United States was lagging behind new technological advances. This gave foreign builders a substantial boost due to the new steel-hulled steam-propelled ships, which were considerably cheaper to produce. U.S. law prohibited the registration of foreign-built ships and the costs of building domestic ships made investment in U.S. shipbuilding quite unreasonable.

Various attempts by Congress to reinvigorate the industry were made between 1900 and 1914 but it was not until World War I (1914–1918) began that the United States was jolted into real action. U.S. ports were clogged with cargo and there were no ships to transport the exports. Faced with a potential economic disaster if export revenue disappeared, the government made the radical decision that foreign-built ships of any age could be registered with the United States fleet for use in foreign trade. The Shipping Act of 1916 established a Shipping Board of Directors that oversaw the acquisition and regulation of ships and the procedures of sale or disposal of these ships to U.S. citizens. The Act also called for a substantial boost in production of new ships and it provided funds to back the legislation. The government maintained that the industry would be privately owned and operated even though public funds were driving it. In 1920 the Merchant Marine Act addressed the transfer of publicly-owned vessels to private firms, as well as various issues surrounding maritime commerce, including regulation,

federal aid, and claims settlements among carriers. Congress passed various bills aimed at providing financial incentives for private industry to take possession of publicly-owned ships. But investment in the shipping industry was still viewed with skepticism. Ultimately surplus ships were sold below cost.

With the opening of the Panama Canal, intercoastal shipping boomed. The Merchant Marine Act of 1936 provided subsidies to the shipping industry. The act also outlined policy on privately-owned ships, government production of ships when private industry was unable to keep up with demand, and regulations related to publicly-run ships.

The boom in production was at its height when World War II (1939–1945) broke out. The war boosted the industry and U.S. shipyards made many innovative contributions to shipbuilding, including the switch from rivets to welded seams and multiple production of standardized models. Once again, though, with the end of the war the government found itself with a surplus of ships. From the late 1940s to the early 1960s, demand for ships fluctuated widely, and the industry suffered. Shipyards had invested in modernizing their facilities, but the international competition, combined with the erratic character of demand, left shipbuilders drained.

The government tried to keep a quota of shipyards running by dividing its contracts among different shipyards in New England states, Louisiana, Florida, and on the Atlantic, Pacific, and Gulf Coasts. Ultimately the industry became dependent on government contracts and subsidies for its survival. The fact that other countries were also engaged in subsidizing their own shipping industries during the 1970s resulted in a glut of ships. It was a period of cut-throat competition among the ship-builders of different countries. Comparatively inexpensive ships brought lower shipping rates; thus foreign carriers won bigger freight contracts. The U.S. shipbuilders were still so far from making the transition to civilian markets that they had little chance of winning these contracts. The Reagan administration in the 1980s killed the last subsidies that were keeping the few remaining U.S. shipyards competitive and boosted Navy defense spending, further locking the U.S. industry into relying on the government for defense contracts.

The history of the shipbuilding industry in the United States appears to be a long change from the original hopes for a privately competitive industry to the complete opposite—an industry dependent on government contracts for survival. During periods of expanding demand the U.S. ship-building industry pioneered methods for using nuclear power on submarine

Shortage

and surface ships. It also developed fully submergible hydrofoils and applied the technology of missile systems to ships. Toward the end of the 1980s the U.S. approach was to convince foreign governments with highly-subsidized industries to minimize or withdraw their subsidies, but these attempts failed. The U.S. shipbuilding industry was caught between utilizing subsidies which had proven to be damaging in the long run and making an industry that was once privately operated into an entity utterly dependent on government contracts for its survival.

SHORTAGE

A shortage exists when there is a greater demand for a product or service than there is a supply of the product or service. A shortage usually occurs when the price of a product or service in the marketplace is below its equilibrium price. The equilibrium price is the price at which there is neither an insufficient supply nor an over abundance of the product or service. When the price of a product or service is less than equilibrium, consumers will demand more of the product or service than the suppliers are willing to sell, which in turn creates a shortage. Consumers will then bid up the price of the product or service until it reaches its equilibrium. The equilibrium price is the one that brings the market into balance by equating supply and demand. If the government interferes with or takes control of a shortage situation, a black market may

develop. A shortage may also be referred to as an excess demand.

SINCLAIR, UPTON BEALL, JR.

Upton Sinclair (1878–1968) was a popular writer and social critic, a muckraker (exposing political and commercial corruption) writing during the first half of the twentieth century. During the sixty years of his life, Sinclair focused on subjects of ordinary American daily life, which he believed involved violations of decency and democracy. His most famous book, *The Jungle*, helped change the nature of the food processing industry in America by initiating a public outcry that led to strong government legislation regulating food processing and clean meat-packing. A socialist in his politics, he regularly took the side of the ordinary American consumers and he fought consistently for the civil liberties of working people.

Upton Beall Sinclair, Jr. was born on September 20, 1878, in Baltimore, Maryland, the only child of Upton and Priscilla Sinclair. He was born into a distinguished but impoverished Southern family. At age ten Sinclair went with his family to live in New York, where he rushed through eight years of school in just three, and at age fourteen entered City College of New York, where he majored in English literature. While in college, Sinclair began living on his own, supporting himself by writing regularly for comic papers, pulp magazines, and other adventure story magazines of the time.

In 1897, at age nineteen, he graduated from the college with a Bachelor of Arts and entered Columbia University for graduate work, where he studied French, German, and Italian. Sinclair continued to publish his writing while in school, supporting himself and, later, his mother.

YOU DON'T HAVE TO BE SATISFIED WITH AMERICA AS YOU FIND IT. YOU CAN CHANGE IT. I DIDN'T LIKE THE WAY I FOUND AMERICA 60 YEARS AGO, AND I'VE BEEN TRYING TO CHANGE IT EVER SINCE.

Upton Sinclair, Jr., *San Francisco Sunday Chronicle*, April 8, 1962

Disillusioned by the materialistic atmosphere of New York at the beginning of the twentieth century, Sinclair abandoned the city in 1900 and went to live in a shack in the woods near Quebec, Canada. There he

met and married his first wife, Meta Fuller, in 1901. His first and only son was born a year later.

From Canada Sinclair moved to Princeton, New Jersey, one of the intellectual and academic centers of the American Eastern seaboard. He continued writing but focused on socialist ideals and muckraking. His novel, *The Jungle*, made him famous, exposing in detail the appalling working conditions in the food packing industry. In this book he also graphically depicted the unsanitary conditions of the American meat-packing and meat-handling industry.

The publication of *The Jungle* awakened the American public to the dangerous practices of an unregulated food industry which was exploited for huge profits by careless businessmen. In 1906 President Theodore Roosevelt (1901–1909) invited Sinclair to the White House. After consulting with Sinclair the president ordered an investigation of the meat and food processing industries, which led to the passage of the first government regulated pure food laws in America.

During this time Sinclair continued to publish books exposing America's social problems and his writing continued to make a strong impact on his readers. In his muckraking style he exposed the shoddy and shallow lifestyles of New York's high society, as well as unethical and illegal practices of some Wall Street financiers.

Sinclair's political concerns were about the increasing problems of democracy trying to survive in the midst of the Industrial Revolution. This, combined with his moral sentiments, led Sinclair to take full advantage of the Progressive era. He aimed to educate Americans, many of them immigrants, as to how they were being cheated. Sinclair also encouraged his readers to join forces. He advocated forming guilds, organizations for democracy, and unions in order to combat those who pursued business merely as single-minded profiteers. Sinclair himself was one of the early founders, along with Clarence Darrow (1857–1938) and Helen Keller (1880–1968), of the American Civil Liberties Union (ACLU), an organization providing legal support in matters concerning civil liberties.

Sinclair's later years continued to be active. He was a vegetarian and maintained good health and vitality into advanced age. Sinclair remained involved with the Democratic Party, though he always regarded himself as a socialist and an anti-communist. Upton Sinclair died in 1968. His writings and advocacy live on in the society he believed he could change for the better.

SINGER, ISAAC MERRIT

In 1851 Isaac Singer (1811–1875), invented the first modern mass-produced sewing machine with an overhanging arm; this machine made it possible to sew any part of a garment. He also patented the foot treadle and the spring-equipped presser for holding down fabric while sewing with both hands.

Though people have been sewing for the last 20,000 years—joining pieces of material using bone needles, awls, and animal sinews for thread, or using iron needles which began in the fourteen century—it was not until the eighteenth century, when mechanical sewing machines were invented, that sewing and the textile industry could grow into one of the largest and most basic industries in the world.

Arguably, it was Isaac Singer who brought sewing out of the dark ages of crude stitching into the modern industrial age of mass-produced clothing and upholstered furniture. The French were the first to manufacture the sewing machine and used it to speed up the production of army uniforms in 1841. However, the innovations that Singer made in 1851 while repairing a clumsy Lerow and Blodgett sewing machine brought about what is now regarded as the first truly modern and mass-produced commercial and domestic sewing machine in the United States. This sewing machine, the Singer Sewing Machine, has been known to U.S. households for generations.

Isaac Singer left home at age 12 to work for the next seven years at a variety of unskilled jobs. He had little formal education but much real-life experience. At age 19 he took a job for a few months as an apprentice, but he left this shortly and began a 9-year period of wandering from state to state. He earned a

Isaac Singer.

living by mostly relying on his mechanical cleverness and experience. A lover of music and theatrics, as well, Singer spent part of his early adulthood as an actor, traveling the country with a theatrical troupe known as the Merritt Players. Plagued by money problems, the group eventually disbanded, leaving Singer destitute.

Singer officially became an inventor at age 28, while working in Illinois. He obtained his first patent from the government in 1839 for a rock-drilling machine. Singer, however, quickly spent the money he made from that invention; he also sold the patent rights and left himself with nothing. Ten years later, at age 38, he patented a wood and metal-carving machine. He then obtained financing to build a small factory in order to produce this device. Life and business were looking up for Singer, but then a boiler explosion occurred in the factory, destroying it. And again Singer was left penniless.

In Boston two years later, while working in a machine shop repairing a sewing machine, Singer again tried his hand at inventing. His employer told him that if he could make a practical, reliable, and mass-producible sewing machine, his fortune would be made. Within a few hours Singer drew a sketch of a new kind of sewing machine, and he built a prototype within 11 days.

Singer immediately applied for a patent on this machine, which he received on August 12, 1851. He then organized what became I. M. Singer and Company and began manufacturing sewing machines. Though he had some competition in the market, the fact that his machine could perform continuous stitching, put it in great demand almost immediately.

Singer fought off law suits from other sewing machine manufacturers, but he had achieved success. By 1854, despite losing some of the law suits, his company had reached and retained a commanding position in the industry. Singer created improvements on his original design and attached the improvements to his original patent, creating what is called a pooling of patents, where many patented ideas are brought together into a kind of giant and complicated product patent, making it difficult to steal.

Singer's greatest service to the consumer, both in the home and in industry, was that he had developed the first domestic sewing machine brought into general use. He made his machines available to many people by creating a time-payment program for buyers, possibly the first such program in U.S. business. Singer also aggressively fought the psychological barrier to mass consumer sales of sewing machines—the false belief that women of his era could not operate complicated machinery. Singer provided many demonstrations to manufacturers that anyone could use his sewing machine with a little training. Clearly the development of Singer's practical sewing machines and the ease with which they could be used contributed to the growth of the ready-made clothing industry in the nineteenth and twentieth centuries. Moreover, Singer contributed to the enhanced general employment of women.

Singer retired at age 51, a multi-millionaire. He lived a flamboyant life-style in New York City and throughout Europe, and left an estate of \$13 million at his death in 1875.

SIT-DOWN STRIKE

Sit-down strikes began in 1936 as an aggressive method of calling attention to the needs of non-unionized workers in mass production industries. Because the American Federation of Labor (AFL) was not interested in organizing these workers, a handful of radical leaders rose to the challenge and began to push for the industry-wide unionization of unskilled labor. Workers in mass production industries, however, were reluctant to join unions because they were not convinced that labor had the power to mount successful strikes without the support of the majority of workers. Sit-down strikes showed that a minority of workers could effectively halt production and force management to pay attention to their demands.

The first sit-down strike occurred in 1936, when workers at three rubber plants in Akron, Ohio, went on an unauthorized strike as part of a campaign to force their employer to recognize the United Rubber Workers as their legitimate bargaining agent. Instead of setting up a picket line at the factory gates (which makes the strikers publicly visible but has little effect on production activities) they occupied the company buildings and refused to leave. This unprecedented and disruptive tactic, which stalled production and cut into company profits, shocked both industry and more moderate labor leaders but was extraordinarily effective. Sit-down strikes soon spread throughout other industries. The single most significant sit-down strike occurred in January and February 1937, when the United Auto Workers (UAW) confronted General Motors Corporation (GM) in the GM “company town” of Flint, Michigan. With only 122 members at the Flint strike plant, the UAW local was able to stop GM production. Strikers took over Fisher Body Number 1 plant, where GM kept the dies for all of its 1937 car models, making it impossible for the company to continue manufacturing. Crippled, GM was able to turn out only 150 cars per week, and by February agreed to accept the union. The Chrysler Corporation soon followed in March 1937.

Though sit-down tactics were nonviolent, management sometimes attempted to break the strikes by force and bloodshed was not an uncommon result. Sit-down strikes were highly effective in bringing unskilled labor into unions. After the strike against GM, UAW membership increased from 98,000 in February

1937, to 400,000 by that summer. By late 1937, federal laws to prohibit sit-down strikes and court decision upholding these laws eliminated the labor movement’s ability to use this method. Though sit-down strikes could no longer be used by labor, it remained an effective means of protest. Sit-down tactics were later used effectively by Civil Rights activists and students protesting the Vietnam War (1964–1975).

SIXTEENTH AMENDMENT

Proposed in Congress on July 12, 1909, and ratified February 3, 1913, the Sixteenth Amendment to the U.S. Constitution gives the federal government (specifically, the U.S. Congress) authority to levy and collect income taxes. The amendment states that incomes may be taxed “from whatever sources derived” and without regard to population. In other words, it is up to Congress to determine the level at which citizens of the country are taxed, and this may be done without apportionment among the individual states.

THE CONGRESS SHALL HAVE THE POWER TO LAY AND COLLECT TAXES ON INCOMES, FROM WHATEVER SOURCE DERIVED, WITHOUT APPORTIONMENT AMONG THE SEVERAL STATES, AND WITHOUT REGARD TO ANY CENSUS OR ENUMERATION.

Sixteenth Amendment, U.S. Constitution

One hundred years before the Sixteenth Amendment was approved, Congress had begun eyeing income tax as a way to collect funds for government use. Lawmakers first considered levying an income tax to help pay for the War of 1812 (1812–1814), which the new republic fought against Great Britain over shipping disputes. During the American Civil War (1861–1865) Congress imposed an income tax for the first time, charging workers and businessmen between three and five percent of their earnings and establishing (in 1862) a Bureau of Internal Revenue to administer the tax program. The war over, income taxes were phased out. In 1894, responding to increasing economic and political pressures, the legislature again passed an income tax law (two percent on all incomes over \$4,000), as part of the Wilson-Gorman Tariff Act, but the law was struck down by the U.S. Supreme Court, which declared it unconstitutional in the case of *Pollock v. Farmers’ Loan and Trust Company* (1898). In

the early 1900s the idea of an income tax received widespread political support for the first time. Progressive politicians could see that the nation's wealth was poorly distributed, as the gap between rich and poor was growing wider. Conservative politicians worried that the government would not be able to respond to a national emergency if it lacked resources. These political factions found a single voice in favor of a graduated income tax (a tax based on level of income—those who earn more, pay higher taxes). To circumvent the U.S. Supreme Court it was necessary for Congress to propose an amendment to the Constitution. In ratifying the amendment the states gave Congress the authority to set rates and collect income tax.

Tax rates have fluctuated ever since the passage of the Sixteenth Amendment, reaching their highest mark during World War II (1939–1945), when the rate soared to 91 percent. The war effort also brought the innovation of automatic withholdings: Taxes were deducted directly from paychecks. In 1953 the Bureau of Internal Revenue was dramatically reorganized to create the Internal Revenue Service (IRS). Over the decades tax laws (collectively called the Tax Code) have become increasingly complex, prompting a recent movement in favor of a flat (versus the graduated) tax, where all taxpayers are charged at the same rate.

SLATER, SAMUEL

Samuel Slater (1768–1835) was an English-born manufacturer who introduced the first water-powered cotton mill to the United States. This invention revolutionized the textile industry and paved the way for the Industrial Revolution.

Samuel Slater was born in Derbyshire, England, on June 9, 1768. His father was a prosperous yeoman farmer who owned a farm near the Derwent River. Along the same river, in the town of Cromford, the first spinning mill driven by waterpower was built in 1771. This mill was owned by Jedediah Strutt and Richard Arkwright, the inventor of a revolutionary water-frame spinner. In 1776 Strutt and Arkwright dissolved their partnership, and Strutt started his own mill in Belper, where Slater lived. At the age of 14 Slater began an apprenticeship at the Strutt mill. Three years later he was promoted to supervisor of machinery and mill construction. In this position Slater learned everything

about textile production, including the construction of machines.

In 1789 Slater began looking for other opportunities for advancement in the textile industry. He decided that the industry had reached its peak in England, but remained undeveloped in the United States, which was still largely agricultural and where handicraft methods of production still prevailed. No U.S. inventor had yet been successful in building a spinning machine, and British law prohibited the export of such machines. In an effort to preserve their dominance in industry, Britain also prohibited the emigration of skilled mechanics. In order to leave the country unnoticed Slater had to disguise himself as a farm laborer. He left England without notifying family and friends and only took his indenture with him to prove his familiarity with Strutt's cotton mills.

Slater sailed for 66 days to reach the United States, and upon his arrival he began working for the New York Manufacturing Company. Slater became dissatisfied with the mill, however, because it was poorly equipped and lacked sufficient water supply. Around that same time the owners of a machine-spinning mill in Pawtucket, Rhode Island, were looking for a mechanic familiar with the English system of production. Moses Brown and William Almy were impressed by Slater's experience and quickly hired him into their company. His primary role was to build a duplicate model of the Arkwright machine, for which he was paid one dollar a day.

[I]F I DO NOT MAKE AS GOOD YARN AS THEY DO IN ENGLAND, I WILL HAVE NOTHING FOR MY SERVICES, BUT WILL THROW THE WHOLE OF WHAT I HAVE ATTEMPTED OVER THE BRIDGE.

Samuel Slater, 1790

Although many Americans had attempted to copy the British machines prior to Slater's arrival, none had been successful. A cotton factory in Beverly, Massachusetts, built by John Cabot and Joshua Fisher, had the distinction of being the first textile mill in the United States. Due to imperfections in their machines, however, the mill produced products of poor quality, and it soon closed. On April 5, 1790, Slater signed an agreement with Almy and Brown to make equipment for the "spinning of cotton by water." Upon signing the agreement, Slater said, ". . . if I do not make as good yarn as they do in England, I will have nothing for my services, but will throw the whole of what I have attempted over the bridge." Despite the limited materials available in New England, Slater accomplished

his mission in less than a year. On December 20, 1790, Slater's cotton mill began production with the Arkwright system.

Even though the new mill had Arkwright models it nonetheless experienced some initial problems. In particular there was difficulty securing good-quality raw cotton, and the equipment frequently broke down. Slater was especially disappointed in American cotton, which was poorly cleaned. Fortunately, just three years after Slater's first mill opened, Eli Whitney (1765–1825) invented the cotton gin, which properly cleaned the cotton in large enough quantities to satisfy Slater. Despite these initial setbacks the business quickly expanded. In 1793 Almy, Brown, and Slater constructed a new mill on the Blackstone River. It was called the Old Slater Mill and consisted of three carders and two spinning frames containing 72 spindles. In the same year Slater's wife, Hannah Wilkinson Slater, invented cotton-sewing thread. Prior to this time, linen thread was used for sewing. Hannah realized that twisting two strands of cotton yarn into one thread created a stronger and smoother thread than the linen. Slater was interested in this new invention, but did not develop machines for producing thread until much later.

Though Almy, Brown, and Slater became a successful company, Slater later disagreed with his partners over the management of the mill. Slater retained his interests in Almy, Brown, and Slater, and in 1798 organized a new firm called Samuel Slater and Company. In 1801 Slater built another mill based on the Arkwright system, this one in Massachusetts. He then helped build other cotton mills in Rhode Island, Connecticut, Massachusetts, and New Hampshire. By 1828 Slater was involved in 13 partnerships for processing cotton.

Not only did Slater mechanize the textile industry in the United States but he also introduced a new production system. Due to the fact that the family was such an important social institution in New England, Slater incorporated this into the production process. He introduced a family labor system where duties were divided according to age and gender. Men worked as laborers or skilled artisans, women cleaned raw cotton, and children worked in the mill. Slater's production system also featured a partnership or single-proprietorship form of ownership, personal management, small-scale production, and the use of waterpower. This production system is often referred to as the Slater system or Rhode Island system of manufactures.

Slater's system was facilitated by production villages. The families employed by Slater lived in company-owned housing near the mills; they shopped at

company stores and went to company schools and churches. One of the first of these mill villages was called Slatersville and was located on the Branch River. By 1807 Slatersville consisted of the Slatersville Mill, two tenement houses for workers, the owner's house, and a company store.

Slater dedicated his entire life to building the textile industry and turned his company into a family business. By the 1830s Slater's health was declining. In 1833 while he was bedridden from rheumatism, President Andrew Jackson (1829–1937) visited New England to witness the growing textile industry. Upon meeting Slater, President Jackson named him the "Father of American Manufactures." Two years later, on April 20, 1835 Samuel Slater died in the mill village of Webster, Massachusetts.

SLAVE CODES

Beginning in the mid-1600s, the American colonies began enacting slave codes into law. These laws enforced the system of bondage by depriving slaves of their civil rights, protecting the rights of the owners, and designating slaves as the property of their masters. Slaves were prohibited from owning weapons, receiving an education, meeting among themselves, moving about without their master's permission, and from testifying against white people in a court of law. Slaves were also treated differently than whites within the justice system: if a black man broke the law, he

Slavery (Issue)

was punished more severely than was a white man who broke the same law; less severe punishments were given to white men who committed crimes against blacks.

After the American colonies fought for and won independence from Britain (in the American Revolution, 1775–83), slavery began to disappear from the northern states. Abolitionists (those who opposed slavery and lobbied for it to be abolished) grew in number and the economy of the North became increasingly industrial. The existence of northern “free states” and Great Britain’s abolition of slavery throughout its empire (1833) gave rise to the “underground railroad.” Along this route, escaped slaves traveled from station to station where they were harbored until they reached freedom in a free state or in Canada. The escape of slaves threatened the South’s economy, which had become increasingly dependent on agriculture and slave labor. Southerners complained the fugitive slave law passed by Congress in 1793 did not go far enough to protect their interests. In 1850, a second and more stringent fugitive slave law was passed. The law accompanied the Compromise of 1850, which dealt with the admission of Texas to the Union and the territories in the Southwest that were newly annexed from Mexico (in the Mexican War, 1846–48). The 1850 law required all citizens to obey the 1793 law; it also prohibited a jury trial for fugitives and denied them the right to testify.

In the 1800s southern lawmakers enacted legislation at the state level to further tighten the slave codes: Any action by a black or a white person that threatened the system of bondage was made into a serious crime. The slave codes, harsh and desperate attempts to preserve the South’s agrarian lifestyle, fueled the abolitionist movement to end slavery. The American Civil War (1861–65) spelled the end of bondage but it would be another one hundred years before the civil rights of the nation’s African American citizens were adequately protected by the legal and justice systems.

SLAVERY (ISSUE)

The Portuguese were the first Europeans to enslave Africans. They began this practice during their explorations of the West African Coast in the fifteenth century. They usually acquired their slaves from other Africans and took them back to Europe where they were employed as servants or laborers.

Christopher Columbus opened the New World to Europeans in 1492, and soon Spain, Portugal, and other European states had established colonies. Regardless of whether the Europeans concentrated on mining precious metals (as the Spanish did), grew and refined sugar cane (as was true of virtually all the European powers), or settled down to grow staple agricultural exports (as in the English case), they soon had to confront the need for labor. The Spanish and, later, the English attempted to enslave American Indians, but that did not work well (in part because the lack of immunity to European diseases decimated the native populations), so they began to import laborers from Africa.

Actually, the English colonists turned first to their own poverty-stricken population of peasants who had been driven off the land by the conversion of crop land into sheep pasture during the sixteenth century. This displacement of the English peasantry was called the enclosure movement. It produced an army of desperate and angry peasants who wandered the English countryside looking for work, poaching game on the gentry’s land, or engaging in robbery, for which many were hanged. Of the peasants who remained in England a good number would eventually make up the country’s wage labor force as textile manufacturing changed England from an agricultural to an industrial economy. But tens of thousands of poor Britons also immigrated to the New World as indentured servants. Tobacco farming was profitable but labor-intensive and the Chesapeake colonies of Virginia, Carolina, and Maryland employed these bonded laborers. Until the late seventeenth century, most of the work force in the English mainland colonies were indentured servants, working an average of seven years to pay off the debt of ship passage. Some of these bonded servants eventually became prosperous in the America; many died from overwork, disease, and mistreatment, or else, after their debt was paid, migrated to the back country and lived as subsistence farmers.

By the last quarter of the seventeenth century, an improving employment picture in England dried up the stream of available indentured servants. The practice of many white servants of escaping and passing themselves off as independent laborers or small farmers as well as the fact that many of the popular protests and rebellions in the New World, like Bacon’s Rebellion (1675–1676) involved poor former indentured servants, also led the colonial elite to consider an alternative labor source.

That source was African slaves. A lucrative system known as Triangular Trade provided this new labor source. Traders took rum, guns, powder, and

Slavery was widespread in 1860, however the majority of slave holders owned less than 10 slaves.

trinkets to Africa where they were exchanged for slaves. The slaves were shipped below decks to the West Indies where they were sold. Then the traders hauled cargoes of sugar, and other products to North America, where the sugar was converted to rum, or else they sailed back to Europe. The trip to the New World was hideous for the slaves. They were packed into the slave ships like sardines and many died en route. This infamous leg of the Triangular Trade was known as the Middle Passage. In this fashion the slave trade continued for 300 years and millions of people were deported from Africa in the process.

Slavery may have been introduced in the English colonies as early as 1619 when a Dutch trading vessel brought 20 Africans to the Jamestown Colony. (Historians disagree on whether this particular group of Africans was enslaved or not.) At any rate, towards the end of the century as the settlers' tobacco plantations grew larger, their need for workers also grew and they found that Africans better served their needs. Africans could not pass themselves off as free men and their total subjugation meant that their exploitation was governed by cold calculation of how hard to work them.

In the Caribbean the cost of replacing slaves who died from overwork was low enough that it made economic sense to work the slave to death. That calculus of exploitation worked the other way in the mainland colonies. Slaves were sometimes worked to death, but the price of replacing slaves was high enough that they were often allowed enough food and just enough sleep to live an abbreviated life-span and even to replace their numbers through informal families in the slave quarters.

Between 1620 and 1670, through court decisions and legislative actions, African servitude was made permanent and the institution of slavery was born. It was based not only on the need for labor but also on the ideology of white supremacy. The British colonists clearly regarded the Africans as inferior.

By 1700 there were about 27,000 African slaves in British North America, a number which represented approximately 10 percent of the population. South Carolina had the greatest number of slaves, followed by Virginia. The number of slaves was relatively small in North Carolina, the Middle Colonies, and New England. The demand for slaves intensified in the eighteenth century because of the expansion of agriculture. In Virginia, for example, the number of slaves increased from 12,000 in 1708 to 120,000 in 1756. The slave trade also continued to expand and it was estimated that more than five million slaves were imported into all areas of the New World during the eighteenth century.

As the number of slaves increased, fear of uprisings intensified. By 1700 all the colonies had laws known as Slave Codes which governed the status of the slaves. Slaves were considered property, had no rights, and could be killed for misbehavior. There was no legal limit on lashings. These laws also restricted the movement for slaves, for example, under the Virginia Code, no slave could leave the plantation without permission.

Fear of resistance was not unfounded. There was an aborted slave revolt in Virginia in 1687, and a bloody uprising in New York in 1712. There were several outbreaks of violence in South Carolina in the 1720s and 1730s, and in 1741 panic swept New York

Slavery (Issue)

City when it was rumored that slaves and poor whites were conspiring to seize control of the city. The New York City conspiracy did not materialize but more than 150 people were arrested and many of them were executed.

Anti-slavery sentiment on the part of whites emerged in the late 1600s. The Pennsylvania Quakers issued a formal denunciation of slavery known as the “Germantown Statement” in 1687 and anti-slavery pamphlets began to appear during the eighteenth century. One of the best known of the early pamphleteers was John Woolman. And in 1775 Benjamin Franklin (1706–1790), Thomas Paine (1737–1809), and James Otis (1725–1783) founded the Pennsylvania Abolitionist Society.

The American Revolution (1775–1783) created a paradox with respect to slavery. The Declaration of Independence stated that “all men are created equal,” but this was clearly not true in America where, in 1776, there were nearly 500,000 slaves. Moreover many Revolutionary leaders, including George Washington (1732–1799) and Thomas Jefferson (1743–1826), owned slaves. Even though they were critical of the institution of slavery they believed Africans to be inferior to whites and freed very few of their slaves during the struggle. Even so there were some changes after the war. Between 1777 and 1786 all of the northern states provided for either the immediate abolition, or gradual emancipation, of slaves. Moreover the Northwest Ordinance of 1787, prohibited slavery in the Northwest Territory (the area that eventually became the states of Ohio, Indiana, Illinois, Michigan, and Wisconsin). These changes resulted from a combination of economic and humanitarian forces. Slavery was not profitable in those areas where there were no large plantations and there were those who believed deeply that the practice was immoral.

But, at the same time cotton production was expanding in the South. When Eli Whitney invented the cotton gin in 1793, cotton farming became more profitable and the demand for slaves in that region suddenly increased. At the same time, southerners began to defend slavery as a virtuous institution rather than a necessary evil. As cotton culture expanded it came to be concentrated in the Lower South—South Carolina, Western Georgia, North Florida, Alabama, Mississippi, and Louisiana. By 1840 there were about 2.5 million slaves in the South, most of them concentrated in these states.

Cotton production continued to rise and by 1860 it represented 57 percent of all U.S. exports. This in turn led to an increased demand for slaves. Even though the

importation of slaves was illegal after 1808, it is estimated that at least 300,000 were smuggled into the country between 1807 and 1860. Slaves were also bred, like cattle. A vigorous internal slave trade developed in which thousands of human beings were sold at auction.

Both the militant defense of slavery and militant opposition began to appear in the 1820s. Southerners argued that they had a constitutional right to hold property, including slaves. Southern pro-slavery advocates went on to quote Bible passages that mentioned the existence of slavery in Old Testament days. Others argued that a menial class was a requirement upon which to build civilized society—indeed, they held that slavery was the very condition of democracy in the South. And, of course, southern apologists for slavery also propounded the white supremacist doctrine that Blacks were perfectly suited to their subordinate role because they were physically strong and mentally inferior.

The anti-slavery movement evolved from the moderate pipe-dream of re-colonizing emancipated blacks in Liberia, in Africa. The American Colonization Society, founded in 1817, included prominent figures like James Madison and John Marshall. It proposed to free the slaves, compensate the owners, and return the freed slaves to Africa. But the size of the slave population even in 1830 precluded such a solution. Still, by publishing newspapers and pamphlets, the American Colonization Society at least began the process of education and advocacy of freeing the slaves.

A more radical solution was simply the immediate freeing of the slaves. This was the demand of the “abolitionist” movement that grew up around William Lloyd Garrison, of Massachusetts. Beginning in 1831, Garrison and his associates published *The Liberator* and broadcast the demand that slavery be ended immediately, by force if necessary, and without any compensation to the slave owners. In 1832 Garrison founded the New England Anti-Slavery Society and helped to found the American Anti-Slavery Society in 1833. These developments evoked fear and hatred in the South. Nonetheless, the abolitionist movement grew rapidly and was very active. It sponsored lectures on the subject. It sent the eloquent former slave, Frederick Douglass to England to spread the abolitionist message there.

Abolitionism was the culmination of a generation of reform movements: the temperance movement, the “asylum” movement for the humane treatment of the mentally ill, and the protest movement against the forcible relocation of the Cherokee Indian nation. The

abolitionist movement was the biggest and most passionate of these reform movements. It was also uncompromising: at one point, Garrison publicly burned a copy of the Constitution because it had made provisions for slavery. By 1840 there were 250,000 abolitionists organized into 2,000 clubs or societies in fifteen states. Meanwhile, however, the institution of slavery continued to grow. By 1860 there were nearly four million slaves in North America.

If there was to be a resolution of the slavery issue, most people expected it to come through the political system. In the end, the political system failed to solve the problem or contain the explosive force of the slavery issue, but for a time it looked as though it might succeed. Political leaders like “the Great Compromiser,” Henry Clay, approached the slavery issue optimistically as a series of questions that might be balanced off against one another. Indeed, almost since the founding of the nation, the process of bringing new states into the union had been guided by the unwritten principle of balancing the admission of free and slave states. It was this spirit of patching together a compromise that animated the architects of the Missouri Compromise in 1820, the elements of which were that Missouri was brought in as a slave state; Maine was separated off from Massachusetts and admitted as a free state; and no more slave states were to be carved out of territory north of the southern boundary of Missouri.

The issue of slavery drove politics from 1820 to the Civil War. Throughout this period the pro-slavery southerners demanded that their “property rights” (to own slaves) be protected by the government through measures such as fugitive slave laws. This recalled the words of John Locke, the most influential philosopher for the generation that made the American Revolution. Locke declared that all men, as an essential condition of being human, had the “inalienable” right—in society as in the “state of nature,”—to defend their “life, liberty, and property.” In drafting the “Declaration of Independence” in 1776, Thomas Jefferson had air-brushed that phrase to read “life, liberty, and the pursuit of happiness.” But, regardless of that cosmetic change, the slavery issue forced the nation to decide which was the more important ingredient of humanity—liberty or property. It was the controversy over Missouri’s application to join the union as a slave state that led the aging Thomas Jefferson to declare that the slavery question was like a “fire-bell in the night,” waking the nation to the possibility of secession.

Slavery endured because it was profitable to the owners of slaves even though its presence inhibited the diversification of the Southern economy. Thus it was

probably inevitable that the institution would be ended only by force. It was not until April 1865, when the Civil War ended, that slavery was declared dead. Its demise was finally promulgated in the U.S. Constitution with the ratification of the thirteenth Amendment in 1866.

SLOAN, ALFRED PRITCHARD, JR.

Alfred P. Sloan Jr. (1875–1966) was one of the most influential executives in twentieth century American manufacturing. As chief executive officer, president, and chairman of the board for the automaker General Motors (GM) over several important decades, Sloan was responsible for implementing strategies and practices that helped GM emerge as one of the most successful American companies of the century. In 1998, over thirty years after Sloan’s death, GM still held the number one position in American business, leading *Fortune* magazine’s list of the Top 500 American enterprises.

Sloan was born in New Haven, Connecticut in 1875, the son of Alfred P. Sloan Sr. and Katherine Mead Sloan. His father was a machinist with investments in a number of businesses, including a tea and

Sloan, Alfred Pritchard, Jr.

coffee import company. When Alfred Jr. was five the family moved to Brooklyn, New York, where he excelled academically in its public schools. As a teen, he passed the entrance examination for Massachusetts Institute of Technology, but was denied admission because of his youth. He was allowed to enter at the age of seventeen and earned his degree in electrical engineering within three years.

Sloan married Irene Jackson and maintained a home on New York's Fifth Avenue. According to the profiles of him published during his lifetime in magazines like *Time* and *Forbes*, Sloan was the quintessential mid-century auto executive, with no interests or hobbies outside of the office. He and his wife had no children, but Sloan was close to a half-brother, Raymond, who was eighteen years his junior. When Raymond died in the 1940s, Sloan was deeply saddened, and increased the funding and time he gave to the Sloan-Kettering Institute for Cancer Research. His half-brother had been a hospital administrator and had drawn Sloan into medical philanthropy. Sloan was also known to be generous with his resources when he learned of a GM family in trouble; he once spent a Christmas holiday working toward finding the best medical care for the burned child of a plant manager, neither of whom he had ever met. He also refused to publish his autobiography, *My Years with General Motors*, until all of the people mentioned had passed away. Sloan himself died just two years later on February 17, 1966, and is buried in Cold Spring Harbor, New York.

Sloan's father was an investor in a New Jersey business called the Hyatt Roller Bearing Company, which made billiard balls. After Sloan Jr. received his degree from the Massachusetts Institute of Technology in 1895, he went to work at Hyatt as a draftsman. In just under a decade he had risen through the ranks to become its president. Part of the reason for both his and Hyatt's success came from Sloan's recognition of Hyatt's ability to expand its business by producing steel roller bearings for the auto industry. Through his sales to the executives who were usually the founders of their firms and pioneers in the auto industry, Sloan came to know many of the most important names in the business; Henry Ford (1863–1947) for example, was both a customer and a friend of Sloan's.

Hyatt Roller Bearing's success in making and marketing the anti-friction bearings used in the auto industry led to an investment involvement with one automaker, the United Motors Corporation. This company had originated a practice of linking to its parts suppliers in a mutually beneficial relationship. Sloan and Hyatt teamed with United in 1916 to become its

only supplier of steel roller bearings. The investment of \$13.5 million made Sloan a vice president when United Motors merged with General Motors two years later.

The General Motors Company had been founded in 1908 by William C. Durant (1861–1947), a promoter and salesman. Durant's erratic management style and his determination to expand the size of the company regardless of the business climate caused the company to go into receivership in 1910. A consortium of bankers ran the company until Durant regained control with financial backing from the chemical industry magnate, Pierre Du Pont. Durant hired Sloan as a vice president and director of the GM Corporation. Sloan's management style, in contrast to Durant, was methodical and organized. Sloan nearly quit in 1920. He was not the only member of GM's management who was frustrated with Durant. He encouraged his close friend Walter P. Chrysler (1875–1940), who was head of the Buick operations, to strike out on his own and launch what would become the number three auto maker, the Chrysler Corporation.

ACCORDING TO THE PROFILES OF HIM PUBLISHED DURING HIS LIFETIME IN MAGAZINES LIKE TIME AND FORBES, SLOAN WAS THE QUINTESSENTIAL MID-CENTURY AUTO EXECUTIVE, WITH NO INTERESTS OR HOBBIES OUTSIDE OF THE OFFICE.

In 1920 Sloan went on a trip to Europe with his wife and returned prepared to resign only to learn that Pierre Du Pont had helped to ease Durant into retirement. Du Pont took over as Chief Executive Officer. During this period Sloan developed a critique of the amorphous management culture at GM. When he became head of the company in 1923 he helped moved GM in the direction of rational and predictable growth. During his first years as president in the 1920s, GM doubled its manufacturing output and broke sales records. It also absorbed much of its competition, and some of the smaller carmakers either folded or were merged into General Motors during this time. Its biggest competitor was another Detroit-run operation, the Ford Motor Company, and under Sloan's direction GM surpassed Ford in just a few years.

Sloan's talent for running a thriving financial enterprise is one of the most significant success stories in twentieth century American business. GM was so financially sound that it was barely affected by the Great Depression; despite the Wall Street crash of 1929, its stock continued to pay shareholder dividends. In 1937 Sloan was elected board chair, and continued

as both chair and CEO until 1946; he remained chairman of the board of directors until 1956, when he officially retired.

Sloan's restructuring of GM earned him a reputation for excellence both as a practical manager and as a management theorist. Automobile management theory before Sloan was most strongly influenced by Henry Ford. "Fordism" was dedicated to the mass production of a single product. Ford was reported to have said that the customer could have any color Model T that he wanted, as long as it was black. "Sloanism," on the other hand, paid attention to the customer as a choice-maker. Sloan encouraged diversity in product choices. But diversity did not mean chaos. His management accomplishments involved shaping the company rather than allowing the separate automobile companies that GM owned to go off in their own directions, guided by their own autonomous decisions in design, engineering, and production. Thus, Sloan transformed GM from a conglomerate of different companies overlapping each other in price range, technology, and product into a company guided by a single intelligence applied to five separate but interlocked divisions, each producing and marketing cars aimed at a particular segment of the market. On the low end was the affordable Chevrolet. In the middle range were Pontiac, Oldsmobile, and Buick. On the high end were the elegant Cadillacs. The divisions were able to share development, production, and engineering costs among themselves, which added greater profit to the higher-priced luxury models. And the design feature of automobile manufacture became an important generator of car sales through the institution of annual model changes.

When Sloan became chair of GM's board of directors in 1937, he was the highest-paid executive in the country. The mammoth size and economic success of General Motors led to labor unrest and the founding of the United Auto Workers union. Sloan's refusal in 1936 to meet with its representatives to address grievances over job security, wages, and safety resulted in a sit-down strike at GM plants, and the eventual legal recognition of the United Auto Workers a year later, a significant moment in American labor history. Not surprisingly, Sloan was a staunch supporter of Republican politics.

Sloan would also be remembered as a great philanthropist. At the height of the Great Depression in 1934, he founded the Alfred P. Sloan Foundation. It gave grants primarily for research into science and technology; in 1996 it bestowed \$53 million. The auto executive also endowed the Sloan School of Management at his alma mater, the Massachusetts Institute of Technology. At its founding in 1931, it was one of the first

graduate programs of its kind for executives already established in their careers. He also endowed the Sloan-Kettering Institute for Cancer Research at New York City's Memorial Hospital.

SLUMS

Slums are severely overcrowded urban areas characterized by the most extreme conditions of poverty, dilapidated housing, and crime.

Slums began appearing as immigration into the Northeastern cities increased following the War of 1812 (1812–1814). Within 35 years New York City grew from 100,000 to over half a million inhabitants as the result of immigration from England, Ireland, and Germany. To accommodate the massive influx of poor immigrants, large rooms of once fashionable dwellings were subdivided into smaller rooms with no light or ventilation and primitive sanitary facilities.

Housing structures, tenements, were hastily constructed on every available parcel of land in New York, Philadelphia, and Boston. Over 290,000 individuals per square mile packed New York's East Side. In 1832 filthy conditions spawned the spread of cholera. By the 1880's poverty, illiteracy, drunkenness, and crime thrived in frightfully overcrowded districts of Northeastern cities and Mid-Western cities, such as Chicago.

New York passed the first housing codes in 1867, 1879, and 1901, which established light, ventilation, and housing regulations for new construction. They did nothing, however, to improve existing buildings, and

often tenements built according to code still had major defects. For example, the New York City code required that “model” tenements be built with air shafts for ventilation. But the shafts proved only to be a source of fowl odors, thus perpetuating the miserable conditions. (Jacob Riis raised public awareness with his photographs of New York slums published in 1890).

Between 1880 and 1920 the mix of immigrants shifted to predominantly eastern and southern Europeans. Slums were housing minorities whose assimilation into the mainstream of American life was often more difficult than the earlier northern European immigrants. Later immigrants came from the American South, East Asia, and Latin America.

The term ghetto, which originally was used to designate the Jewish area of Venice, Italy, now described the segregation of minorities in crowded sections of the inner cities. Between 1910 and 1970 approximately 6.5 million blacks moved to the North. Although most were underemployed and lived in the ghetto, many found good jobs in steel, rubber, and automobile industries. With the civil rights changes of the 1960’s middle class blacks moved to the suburbs, but the ghettos remained as a home to the poor and a blight on the urban landscape. To help eliminate slums, the U.S. government focused on building public housing in the inner cities, but this effort was inadequate to counteract the endemic problems associated with poverty. By the end of the twentieth century, a self-perpetuating condition of despair created an underclass of individuals born in the slums and likely to remain there all their lives.

SMITH, ADAM

Adam Smith (1723–1790), a philosopher and lecturer at the University of Glasgow, taught Natural Theology—the search for design and order in the confusion of the cosmos—in eighteenth century Scotland. Smith became intrigued with economic theory, seeing economics as a largely ignored subject of philosophy. In 1776 he published an enormous book, a “living picture” of the economic circumstances of England, known as *The Wealth of Nations*, without promoting any social class, or advocating any ideology. The book had been called the “bible of capitalism,” but that was misleading. *The Wealth of Nations* was a profound effort to describe a “system of perfect liberty,” which was the way Smith referred to the small-business commercial capitalism of his era. His book, involving issues of personal self-interest, and

competition, has become a classic economics text, and Smith was regarded as the seminal organizer of thoughts and ideas about the economics of capitalism.

Adam Smith was born in June 1723, in Kirkcaldy, Scotland. His father died prior to his birth, and Smith was raised by his mother, in comfortable circumstances in a home near Edinburgh. Smith’s close relationship with his mother was life-long. She died at age 90, when Smith was in his 40s. He lived most of his life quietly in Scotland, reading, writing, and teaching. He was highly regarded as a teacher, and was considered to be a genius who was eccentric and absent-minded in most practical matters. Smith’s education included three years at the University of Glasgow, Scotland, and seven years at Balliol College at Oxford University, England.

In 1751, not yet age 28, Smith was offered the Chair of Logic at the University of Glasgow, and shortly thereafter was given the Chair of Moral Philosophy. He gained considerable reputation and prestige in 1759, publishing a book called *The Theory of Moral Sentiments*, a work examining moral approval and disapproval.

In 1764, Smith went to France for 18 months. To relieve periods of boredom he felt there, Smith began work on a treatise of political economy, which formed the beginnings of his book, *The Wealth of Nations*. It was in France, working on his treatise, that he hit on one of his greatest insights: labor, not nature, was the source of what we call “value”. He spent much time in his book elaborating this theme: labor as a source for all value. The book was published in 1776, a 900-page outpouring of a whole epoch. Smith had borrowed his ideas from many other philosophers—*The Wealth of Nations* mentions over 100 names specifically in his treatise. It is a brilliant synthesis of economic and philosophical thinking.

The Wealth of Nations was indeed a revolutionary book. Smith had no particular ideology and apologized for no particular class of people. He was concerned with the flow of goods and services consumed by everyone, constituting the ultimate aim and end of economic life. Smith’s primary interest was in laying bare the mechanism by which society hangs together. He constructed a formulation of the laws of the marketplace, discovering what he called in Nature “the invisible hand,” whereby private interests and the passions of men are led in the direction most agreeable to the whole society.

Smith’s laws of the market were simple. The drive of individual self-interest in a community of similarly motivated people results in competition. If left

untampered by any deceitful means, competition among people will result in the provision of goods that society wants, in the amount society desires, at the price society is willing to pay.

Smith's explanation of free-market commerce was an excellent explanation for its era prior to the Industrial Revolution. Large problems arose when restraints of any kind came into play to eliminate Nature's "invisible hand" in matters of the economy. Adam Smith did not anticipate the intervention of governments with their regulations of commerce. In fact, he viewed such intervention as harmful to a free market economy. He did not, as well, anticipate huge industrial monopolies that owned entire areas of the economy, artificially rigged prices, and lowered worker wages. Since the eighteenth century, when Smith woke the world with his great explanation of general economics, the marketplace has changed vastly. Self-interest still plays the major hand, but it is more difficult to compete, since a variety of interests block much competition.

Despite the idea that Smith wrote largely as an apologist for capitalists and businessmen, nothing could be further from the truth. Smith wrote: "No society can surely be flourishing and happy if which by far the greater part of the numbers are poor and miserable," hardly the words of a corporate apologist. Yet, a capitalist class rising in the nineteenth century during the Industrial Revolution ignored much of Smith's work, and focused on his one remark—"let the market alone." Smith's bias, if he had one, was neither anti-labor nor anti-capital. Instead, he described a sensible economic analysis that, at bottom, favored the consumer. He said: "Consumption is the sole end and purpose of all production."

Adam Smith was a scholar and analyst of pre-industrial capitalism. *The Wealth of Nations* became a masterwork of political economy. More so, it was a rational classic guide to understanding the forces of competition and self-interest as the major conception of the human adventure in the Western world. Adam Smith died in 1790, but his economic theories have endured throughout the twentieth century.

SMOOT-HAWLEY TARIFF ACT

Reed Smoot and Willis Hawley were members of the U.S. Congress, who introduced a bill known as the Smoot-Hawley Tariff of 1930. This tariff (a tax on foreign imports) came to be synonymous with a major public policy blunder and failure. Smoot-Hawley was signed into law by President Herbert Hoover (1929–1933) after the stock market crash of 1929. Some historians argue that the tariff was so high that it created unprecedented foreign retaliation against the United States. According to this view, Smoot-Hawley helped convert what would have been a normal economic downturn in the U.S. economy into a major worldwide depression, the Great Depression (1929–1939).

The creation of the Smoot-Hawley Tariff presumably did the following: create the highest tariff rates in U.S. history, frighten the stock market, deepen the Great Depression (by reducing the foreign goods available to U.S. consumers), outrage foreign governments into retaliation, and create an open trade war in the midst of economic depression. On the other hand, there are scholars who argue that there is no compelling evidence that this tariff made the Depression worse. Several of them have even suggested that Smoot-Hawley has become a scapegoat for explaining the extended misery of the Depression. But, regardless of its effect in 1930, the Smoot-Hawley Tariff became a metaphor for underestimating the importance of the nation international trade policies.

SOCIAL GOSPEL

The Social Gospel was a Christian reform movement originating in the late nineteenth century. It was espoused by Protestants, who preached social responsibility as a means to salvation. Adherents believed that the social, economic, and political ills produced by

unrestrained capitalism could be addressed by teaching religious values to the working class. They also believed that human nature could be improved by changing the conditions in which people lived and worked.

In addition to building churches in impoverished neighborhoods of American cities, Social Gospel reformers worked within the communities to urge businesses to adopt socially responsible practices. Movement leaders, including clergymen Washington Gladden (1836–1918) of Columbus, Ohio, and Walter Rauschenbusch (1861–1918) of Rochester, New York, acted as mediators between employees and employers. They also wrote books on applying Christian beliefs to alleviate social ills and they worked to lessen the effects of poverty.

The Social Gospel movement was one aspect of a greater progressivism of the late 1800s and early 1900s. Activists—including many young, middle-class individuals—were outraged by the living and working conditions of the urban poor. They argued that government needed to regulate big business—they argued that the doctrine of *laissez faire*, which opposes government interference in the economy, had only resulted in a capitalist society run amok. This view was at least partly responsible for government legislation imposing some regulations on U.S. industry. It also inspired a spirit of charitable works among many Americans. The reform movement resulted in the passage of building safety codes, enactment of anti-trust laws, approval of health safety standards for the food industry, establishment of settlement houses in inner cities (where residents could participate in educational and social activities), and urban beautification projects.

The legacy of the Social Gospel movement lasted well beyond the first three decades of the twentieth century. Protestant pastor Harry Emerson Fosdick (1878–1969) asserted that leaders such as Rauschenbusch had “ushered in a new era of Christian thought and action.”

SOCIAL SECURITY ACT

As the Great Depression (1929–39) in the United States continued in the early 1930s, growing unemployment created widespread fear and insecurity. Between 1929 and 1933 the unemployment rate rose from 3.2 percent to 25.1 percent. Funds from charities and local government were almost completely drained. Many demands were placed on the federal government

to design and implement economic and social reforms to help abate social tensions.

One of the groups that arose during this crisis was composed of senior citizens. Led by an elderly California physician by the name of Francis E. Townsend, the “Townsend Plan” involved a government program of monthly checks of \$200 to citizens over the age of 60. The only way to stay on the program was to spend all of the money each month. According to Townsend, this requirement would put money in circulation and stimulate the economy. Beginning in 1933, the group formed a network of “Townsend Clubs” with a combined membership of over 5 million, mostly older, Americans who agitated for the reform.

President Franklin D. Roosevelt (1933–45) responded to these and other concerns by appointing the Special Committee on Social Security, chaired by Secretary of Labor Frances Perkins. The committee’s recommendations became the foundation for one of the most significant federal social policies in U.S. history, the Social Security Act of 1935. The Social Security Administration provided unemployment insurance, aid to the poor, and pensions for the elderly.

The Social Security System acted as a non-profit insurance company, raising funds through taxes on employers and employees for old age insurance. The size of each pension was based on how much the worker contributed to the fund. Increased earnings resulted in increased pensions. In order to build up the fund, these social security pensions were not to be dispersed before 1942. Originally, this protection did not apply to non-workers who could not contribute to a pension fund. It also did not apply to family members of a deceased pensioner and to farmers and domestic laborers (who were usually poor).

Congress amended the Social Security Act in 1939 to authorize pension payments to survivors of deceased Social Security recipients. In 1965 Medicare was added to provide health care for eligible retirees. In 1989 Social Security covered 38 million people (nearly all the elderly), and it accounted for nearly a quarter of the one trillion-dollar federal budget. In the late 1980s the poverty rate among the elderly was just below that of the general population. In 1998 discussions began about shoring up the social security program. As the 76 million baby boomers reached retirement age, there would be fewer workers paying taxes compared to the number of people drawing benefits. Without revisions, experts predicted, funds would begin to run out early in the twenty-first century.

The Social Security Act included other programs as well. Unemployment insurance was developed to

provide some security against joblessness; it was funded by employee and employer taxes. In 1938 minimum wage and child labor laws were implemented, while federal disability insurance was added in 1956. In the 1960s and 1970s government assistance programs grew significantly in response to demands of liberal activists. In 1965 Medicaid was added to help support health care for the poor. In the 1960s and 1970s the food stamp program was developed, which helped the poor buy food. In 1972 the Supplemental Security Income system was enacted to provide assistance for the elderly and disabled poor.

THE SOCIAL SECURITY SYSTEM ACTED AS A NON-PROFIT INSURANCE COMPANY, RAISING FUNDS THROUGH TAXES ON EMPLOYERS AND EMPLOYEES FOR OLD AGE INSURANCE. THE SIZE OF EACH PENSION WAS BASED ON HOW MUCH THE WORKER CONTRIBUTED TO THE FUND.

Another arm of the Social Security Act that significantly impacted the country's social structure and created much controversy was Aid to Dependent Children (ADC). Originally, ADC was designed to help widowed mothers who could not adequately support their families. In 1950 Congress amended ADC to provide grants not only to single parents but also to their children. The program was renamed Aid to Families of Dependent Children (AFDC). Additional amendments broadened coverage to include poor, two-parent families. By the late 1980s more than three million families were receiving AFDC benefits. The growth of this program over the years sparked debate about its role in creating an underclass. While most agreed that the program provided many families with temporary assistance, as was its original intent, critics charged that it stigmatized recipients and conveyed in them a sense of hopelessness, and that it in the same time caused resentment among taxpayers. In the 1980s the focus of anti-poverty programs turned to single mothers receiving AFDC. Initially, these programs provided work training and job placement and, as incentives, they also offered childcare assistance and Medicaid for a year after the recipient began to work. In 1988 the Family Support Act required mothers without children under three to work. In the early 1990s President Bill Clinton (1993–) allowed 42 states to change their AFDC programs in any way they saw fit. These states were not required to provide job training; they could impose time limits on adults receiving assistance and they could also withdraw assistance from those who did not comply with certain conditions. Because of these changes critics predicted a potential rise in single,

working poor women who were not equipped to adequately support their children.

Over the years the Social Security Act was successful at protecting a large number of individuals from various forms of suffering. However, even though social security programs have grown and expanded to provide for the poor and disadvantaged, still in 1989 about 15 percent of Americans were poor and 37 million Americans had no medical insurance. In the late 1990s conservatives and liberals, as well as special interest groups on both sides, continued to debate the advantages of restricting or expanding social programs into the twenty-first century.

SOCIALISM

The word *socialism* was coined in 1832 by Pierre Leroux, editor of the Parisian journal, *Le Globe*. The doctrine of socialism took on many different meanings as it grew and expanded from western Europe to Russia, the United States, Asia, and Australia. In the days of the Soviet Union, it was a common popular misconception that Russians invented both socialism and communism and exported them, when in fact they

Sod Houses

borrowed these creeds from western Europe and developed their own versions.

All socialist theories are critical of wealth and the concentration of wealth in private hands; all of them advocate the elimination of poverty by equalizing the distribution of wealth, most often by some degree of collective (i.e., public) ownership. The most extreme socialist creeds have advocated the total elimination of private property. Because socialism also advocates some form of collective action, it can be defined not only as a theory but also as a movement.

The many varieties of socialism evolved in part from the disagreement on the means by which a more equitable distribution of wealth in society is to be achieved. Marxist socialism proposes the forceful establishment of a workers' dictatorship; conservative social democrats advocate parliamentary reform and trade unions; syndicalists favor a general strike of the workers; Christian socialists advocate a stringent application of the principles of the Bible.

SOD HOUSES

Sod houses were made of blocks of sod or layers of turf. Early settlers of the Great Plains constructed sod houses where there were no trees to supply lumber. The structures may have first appeared on the open prairie of Nebraska; as a building material, sod became known as "Nebraska marble." Homesteaders cut sod with spades into square blocks which they piled up to build walls. Roofs were made of thatch or of sod blocks supported by a mat of branches, brush, and long grasses. The dwellings (called soddies) were less than ideal: though they remained cool in the hot summers and provided good insulation from the winter cold, they were prone to infestation by vermin. They were also full of dirt, which fell from the walls and ceiling in particles. Sod houses were improved or replaced with new dwellings around the turn of the century: Carrying building supplies such as timber, railroad lines reached into previously remote regions of the former frontier by 1900.

SOLE PROPRIETORSHIP

A sole proprietorship is a form of business organization owned and operated by one person. A proprietorship requires no formal legal process except appropriate licensing, if necessary, to begin providing goods

or services for profit. The proprietor owns all assets and liabilities of the business. Although sole proprietorships are not limited in the number of workers employed, they generally are small in size. Sole proprietorships are a common form of organization with professionals, consultants, farmers, service businesses, small retail firms, and small local restaurants. The owner keeps records of revenues and costs that he must report on Schedule C of the personal federal income tax return.

Organizing a businesses as a sole proprietorship offers several advantages. In addition to their ease of formation, proprietorships afford the owner total flexibility and freedom in decision-making, management, and control since consultation with others is not required. The owner may retain all business profits as income, a strong incentive for doing well.

Economic disadvantages include the ability to raise capital. Most sole proprietors have limited personal financial resources, rarely sufficient for long term expansion. Specialization is also problematic. The proprietor may have an excellent talent or skill to start the business, but later must provide marketing and financial expertise that he may not possess. Sole proprietorships have limited life. If the owner dies or wants to quit, legally the business itself ceases to exist. Lastly, the largest risk in a sole proprietorship is unlimited liability. The owner is personally responsible for all the liabilities or debts of the business. If the business does poorly, both the firm's assets and the owner's personal assets may be taken to satisfy creditors.

Through the 1980s and 1990s, the percentage of total firms in the United States organized under sole proprietorships and their total sales remained relatively constant. In 1993 approximately 75 percent of all firms were sole proprietorships, representing almost 16 million businesses. However, they accounted for less than six percent of total sales, or about \$757 billion.

SONY CORPORATION

Since its post-World War II (1939–1945) founding in Japan, the Sony Corporation revolutionized the consumer electronics field. The Sony name became familiar throughout the world for such innovative products as the transistor radio, the Trinitron television, the Walkman cassette player, and the compact disk (CD). The company also joined in other diversified industries such as entertainment, battery manufacture, life insurance, and sports equipment. By the end

of the twentieth century it cooperated with the People's Republic of China to produce television sets. Sony had become a major player on the international market.

After the devastation of World War II Japan was ripe for all kinds of business developments which would bring the country back to normal life, but at the same time, revolutionize its business practices and institutions. In 1946, with borrowed capital, Akio Morita and Masuri Ibuka set up the company known as Tokyo Tsushin Kogyo (Tokyo Telecommunications Engineering Corporation), the forerunner of Sony. They first developed a rice cooker, which was a failure, but they soon succeeded with a tape recorder. When Norio Ohga, a student of opera, wrote to complain about the tape recorder's sound quality, Morita and Ibuka invited him to present his critiques in person and later asked him to join the company, and he eventually became president and chairman.

In 1952 the two directors first heard of a tiny new capacitor called a transistor, which had been developed by Bell Laboratories and used by Western Electric to manufacture hearing aids. Ibuka obtained a patent license to begin producing the first transistor radios in 1954. They named the radio "Sony," after the Latin word for "sound" and the word "sonny," or little son. Prior to the Sony transistor radio portable radios were fairly large because of their vacuum tubes. Consumers were amazed at the compactness of Sony radios and were eager to buy them.

To market his product in the United States, Morita himself traveled to New York to meet with representatives of several large retail businesses. In 1958 Morita and Ibuka decided to change the whole name of the company to Sony Kabushiki Kaisha (Corporation). Within a year the company had developed a transistorized television.

Sony began to expand rapidly, establishing trade offices in Switzerland, the U.S., and England. A subsidiary was also set up to provide the adhesives and plastics needed for manufacturing. Other transistorized products were also developed such as the AM/FM radio and a videotape recorder. Sony's biggest gamble during the 1960s was the Trinitron television, which, at the time, used the most advanced color technology. Norio Ohga also headed a new venture called CBS/Sony, which became the largest manufacturer of phonograph records in Japan.

In the 1970s Sony was the pioneer in the development of Betamax video-cassette recorders (VCRs), yet by the end of the decade the Beta format had been

superseded by the video home system (VHS) format introduced by Sony's competitors. A market war ensued between Sony and manufacturers of VHS systems—Sony refused to market a VHS line until the late 1980s and began to lose market share.

A more successful venture at Sony was the introduction of the Walkman compact cassette player in 1979. By using a small player and lightweight headphones a person was able to enjoy music while walking. The term "Walkman" soon became the generic name for similar products produced by Sony's competitors.

Norio Ohga became president of Sony in 1982 after Ibuka and Morita had begun to cut down on their duties. Ohga reached out to institutional markets as well as to individual consumers; he also focused attention on research and development. In partnership with the Dutch firm Phillips, Sony developed the first laser disk recorder, or compact disk (CD), which greatly improved sound quality. By the 1990s the CD format used by Sony and several competitors had virtually eliminated old phonograph systems.

From its bitter experience with the Beta-VHS conflict Sony officials had learned that a superior product alone would not guarantee sales. When the company developed a lightweight video camera in 1985 it did so in conjunction with over 100 competitors to ensure that future cameras would be compatible with its 8mm format. Sony also bought a company which manufactured the new digital audio tape (DAT), with hopes to ensure future compatibility among recording systems. Sony also sought to increase its institutional sales and to continue to diversify. It purchased Apple Computer's hard-disk technology operations, the Digital Audio Disk Corporation, CBS Records, and Columbia Pictures Entertainment. In 1990 Sony posted a 38.5 increase in earnings over 1989.

Like many other companies in the global economy Sony experienced a downturn in the 1990s. Appreciation in the value of the Japanese yen adversely affected the company's export sales in the mid-1990s. In 1995 Morita relinquished his chairmanship in favor of Ohga, and Nobuyuki Idei was named president. Despite setbacks the Morita era had led to Sony's great success. Sony occupied a pre-eminent place in a worldwide, consumer electronics industry—the company had 173,000 employees and annual sales of \$51.2 billion in 1998. Morita had been the most visible spokesman for the company, as well as an effective purveyor of ideas. He created the Sony name and several of the product names—Walkman, Handycam, and Watchman. Under

Soo Locks

his leadership Sony engineers developed an astounding array of revolutionary electronic products which are now accepted as everyday necessities.

In 1998 Sony Electronics Inc. (SEL), the largest component of Sony America, became an independent company. Its president, Teruaki Aoki (responsible for Sony's entry into the digital video disk (DVD) market), told *Electronic Engineering Times* that SEL would be "an autonomous company now serving as a good partner for Sony Corporation." In the late 1990s Sony also began marketing an interactive video game console called PlayStation (and later PlayStation II), whose major competitor was the Sega Dreamcast system. In creating these practical luxuries the Sony Corporation has made their products essential to daily life as well as erasing the negative image once attached to products wearing the label "Made in Japan."

SOO LOCKS

Early settlers arriving in the upper peninsula of what became Michigan found only one way to get from Lake Superior to the other Great Lakes, the St. Mary's River. Because of its formidable rapids, the river was a challenge to travel and transportation. Settlers needing to cross the river were forced to carry their canoes around the rapids. As settlement and trade increased, boats arriving at the river had to unload their cargo, haul them around the rapids in wagons, and reload them in other boats before continuing on their journey.

The Northwest Fur Company constructed the first canal (called the "Soo Lock") in 1797. Based on the Canadian side of the river, the thirty-eight foot lock allowed small boats to navigate the St. Mary's rapids. A lock is a section of a canal that can be closed and

opened to control water level, which is raised or lowered to transport a vessel from one level to another. This first lock was destroyed during the War of 1812 (1812–1814).

THE SOO LOCKS SERVE SMALL PASSENGER VESSELS AS WELL AS LARGE FREIGHTERS CARRYING OVER 72,000 TONS OF CARGO. IN THE LATE 1990S, THE LOCKS AVERAGED TRAFFIC OF 10,000 VESSELS PER YEAR.

For the next four decades the only way boats could pass between the Great Lakes was by a system of land rollers, which were used to circumvent the St. Mary's River rapids. In 1850 the railroad reached the region and improved transportation, but a traversable waterway was still necessary. Around the same time Michigan's Upper Peninsula was found to be rich in various ores including iron and copper. The U.S. mining industry pressed the government for a completed canal to facilitate shipment of these raw materials for use in the nation's growing manufacturing sector.

In the era when the federal and state governments were building roads and canals, and subsidizing privately owned transportation ventures (such as railroads), Congress granted 750,000 acres of Michigan public land (in lieu of monetary payment) to the Fairbanks Scale Company, which would construct the canal. The Fairbanks Company had extensive mining interests in the Upper Peninsula. Construction began in 1853 and was completed in 1855, meeting a two-year deadline set by the state. The company constructed a canal containing two locks (the State Locks), 350 feet in length, which would raise or lower sailing vessels to different water levels. The locks were turned over to the state of Michigan in May 1855.

Because of the expense of operating the locks, the state ceded management of the waterway system to the federal government in 1881. Managed by the Army Corps of Engineers, the State Locks were enlarged and an additional canal constructed (the North and South canals). In 1895, Canada built a canal on its side of the St. Mary's River which contains a single lock.

The Canadian canal, containing one lock, and the two Michigan canals, with four locks, are together known as the Sault or Soo locks (Soo is a phonetic version of Sault). They successfully allow commerce to flow between the Great Lakes and have supplied water-transported material to U.S. military forces in every major U.S. war and conflict since the 1800s. A variety of commodities pass through the locks, including grain and coal. The Soo Locks serve small passenger vessels as well as large freighters carrying over

72,000 tons of cargo. In the late 1990s, the locks averaged traffic of 10,000 vessels per year. A hydroelectric power plant supplies power to the Soo complex as well as to the power grid of Michigan's eastern Upper Peninsula.

SOUTH CAROLINA

South Carolina was carved out of a much larger piece of territory than other states, and it eventually became one of the most important states in the Old South. For good or ill, it is known for the most rabid opposition of any state to protective tariffs and northern antislavery movements, two issues that led the nation into a civil war. Its history has been marked by several divisions: between the English and other northern European patricians who settled the cosmopolitan city of Charleston and the less educated farmers of the interior, between whites and blacks, and between labor unions and anti-union advocates. In recent decades, however, the state has made the most of its resources by profiting from its important water ports, its good transportation networks, and an improving industrial climate.

Spanish and French explorers were the first Europeans to attempt settlements, all unsuccessful, in the present state of South Carolina. Under English King Charles I, the first permanent settlement was established as a proprietorship in 1670. The first colonists were "adventurers" from the English sugar cane producing island of Barbados. The first crop that was grown in the coastal swamps was rice, which was cultivated by imported black slaves. The agricultural know-how to construct the often elaborate system of channels and dams to irrigate the rice was contributed by the slaves who came from a similar rice-cultivation culture in western Africa. By the mid-1700s inland areas were beginning to develop. At first simply called "Carolina," the colony included the future colonies of North Carolina and Georgia, as well as South Carolina, which broke apart from the north and became a royal colony in 1721. South Carolina supported the American Revolution (1775–1783) and ratified the U.S. Constitution in 1788.

Transportation networks soon grew from the port of Charleston, through the upcountry, and on to western territories. Several canals were constructed, and the first railroad, from Charleston to Hamburg, was the longest railroad in existence in 1833. South Carolina also boasted the first steam engine built for public

railway service. However, in the mid-1800s constructing railroads through the mountains in the middle of the state proved impossible.

Any visitor to modern-day Charleston can sense the city's important history. Because it grew faster than any colonial city, historian Louis B. Wright called it "a city-state ruled by an intelligent and cultivated oligarchy of great families who managed to monopolize control, generation after generation." The political and economic power naturally flowed to the city of Charleston, which controlled the colony (and later the state) for decades. Trade in products like rice, cotton, corn, pitch, and indigo flourished in the port of Charleston, as did the slave trade. Upcountry farmers were generally looked down upon by the elite of Charleston city.

SOUTH CAROLINIANS HAVE ALWAYS BEEN READY TO DECLARE THAT THEIR LAND WAS ONLY A LITTLE LESS DESIRABLE THAN EDEN.

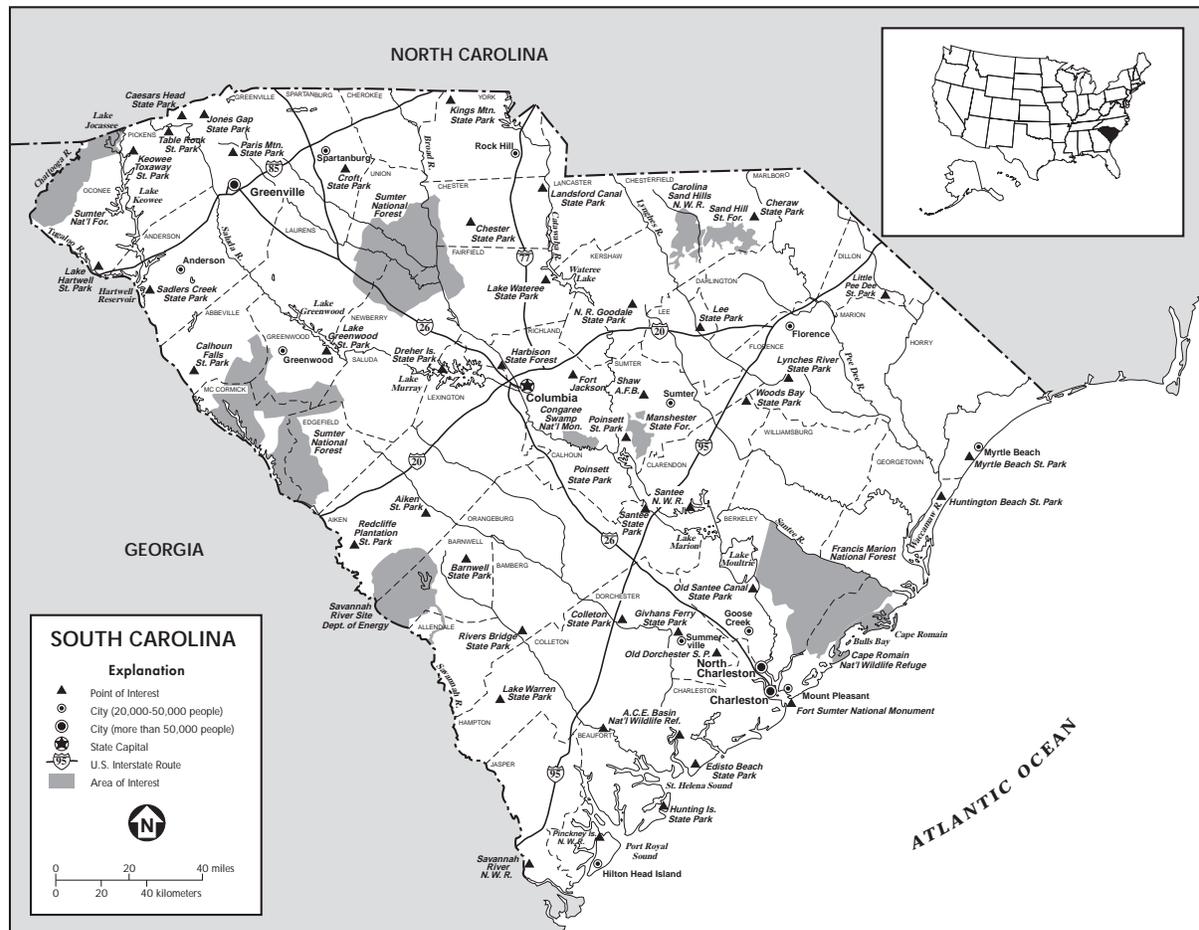

Louis B. Wright, *South Carolina: A Bicentennial History*, 1976

Under the political leadership of Senator John C. Calhoun, in the mid-1800s South Carolina took the lead in congressional discussions on slavery and tariffs. The state greatly disliked the protective tariff which benefited northern manufacturers, raised the prices of manufactured goods, and reduced the ability of the British and the French to buy cotton from South Carolina and other southern states. In 1828 Calhoun outlined his argument for nullification (a rationale permitting a state to deny the viability of a federal regulation). The immediate issue was settled in the 1830s by a compromise devised by Henry Clay, but these divisions over the southern slave economy and the northern industrial system inevitably led to the American Civil War (1861–1865).

When South Carolina became the first state to secede from the Union in 1860, over half the population of the state consisted of black slaves. When federal troops occupied the state during Reconstruction, South Carolinians blamed northern "carpetbaggers" for depleting the treasury of the state and running it into serious debt. They also blamed the economic chaos following the war on ex-slaves, thus reinforcing a legacy of racism which plagued the state for generation after generation.

After the war an economy based on slave labor had to reorient itself. The cultivation of rice in the state completely disappeared in a few decades following the war, but planters tried to keep producing cotton. A

South Carolina

State of South Carolina.

system of tenancy and sharecropping developed, in which a small farmer would pay the landowner shares of his crop for renting the land. This system kept many small farmers in debt and perpetuated the class divisions between rich and poor. After much postwar political and economic turmoil the economy of the state gradually shifted from rice and cotton to tobacco, soybeans, and truck farming. Railroads devastated by the war were rebuilt, connecting most towns and cities. Tired of trying to make a living through sharecropping, poor farmers—both black and white—moved to the cities to find employment in textile mills, which after 1900 became the state's biggest industry.

Textiles dominated South Carolina's economy until after World War II (1939–1945), when attempts to diversify brought the chemical, paper, and other industries to the state. The harbors of Charleston, Port Royal, and Georgetown were also improved to facilitate commerce. After many textile mills closed in the 1970s and 1980s the textile industry dropped to second place in the state, behind chemical and allied products.

Although manufacturing industry is now the state's leading employer, agriculture is still important. Some of the major farm products in the 1990s included tobacco, cotton, food products, and soybean oil for newsprint ink. Along with forestry and forestry products, agriculture contributes about 25 percent to the state's economy.

A major blow to South Carolina's economy came in 1989 with Hurricane Hugo, the tenth strongest hurricane to ever hit the United States. The storm wreaked havoc, particularly in Charleston and other coastal towns, killing 37 people and causing over \$700 million in property damage. In 1993 severe flooding and subsequent long-term drought were responsible for an estimated \$226 million in crop loss.

After experiencing significant population loss from 1940 to 1970 the state rebounded, attracting a net gain of 210,000 between 1970 and 1980. In the late 1990s the state continued to suffer from a bad reputation as an industrial employer because of its low wage rates, its relatively untrained work force, and its anti-union

climate. In fact only 3.3 percent of all South Carolina workers were unionized in 1996. Yet real per capita income increased faster than the national norm during the 1970s and early 1980s, reaching thirty-ninth in the nation by 1995. Increased investment from foreign and domestic sources and a growing tourist industry have aided the economy's continued growth.

South Carolina's Department of Commerce has been quite successful in attracting foreign companies, especially to the Piedmont region of the state. In the late 1990s the state government exempted all new industrial construction from local property taxes (excluding school taxes), and assessed industrial property very leniently. Moreover, local and regional authorities have cooperated in providing both low-interest industrial bonds and the infrastructure needed by new businesses. Business was also attracted by the state's conservative fiscal policies, its low pay scales, and its negative attitude toward labor unions.

SOUTH DAKOTA

In 1742 the first explorers traveled the area that is present day South Dakota, opening up the Upper Missouri Valley to French traders who bartered with the Indians by offering them metal pots, pans and tools for animal furs.

In 1762 France gave Louisiana to Spain during the French and Indian War. But when France was defeated in 1763, Britain gained control of French lands in Canada and east of the Mississippi. Later, in 1800, French emperor Napoleon Bonaparte forced Spain to return the land of Louisiana to France. And in turn

Napoleon sold the Louisiana land to the U.S. for \$15 million in order to finance his wars in Europe. The U.S. benefited greatly in this deal because its territory was doubled in size.

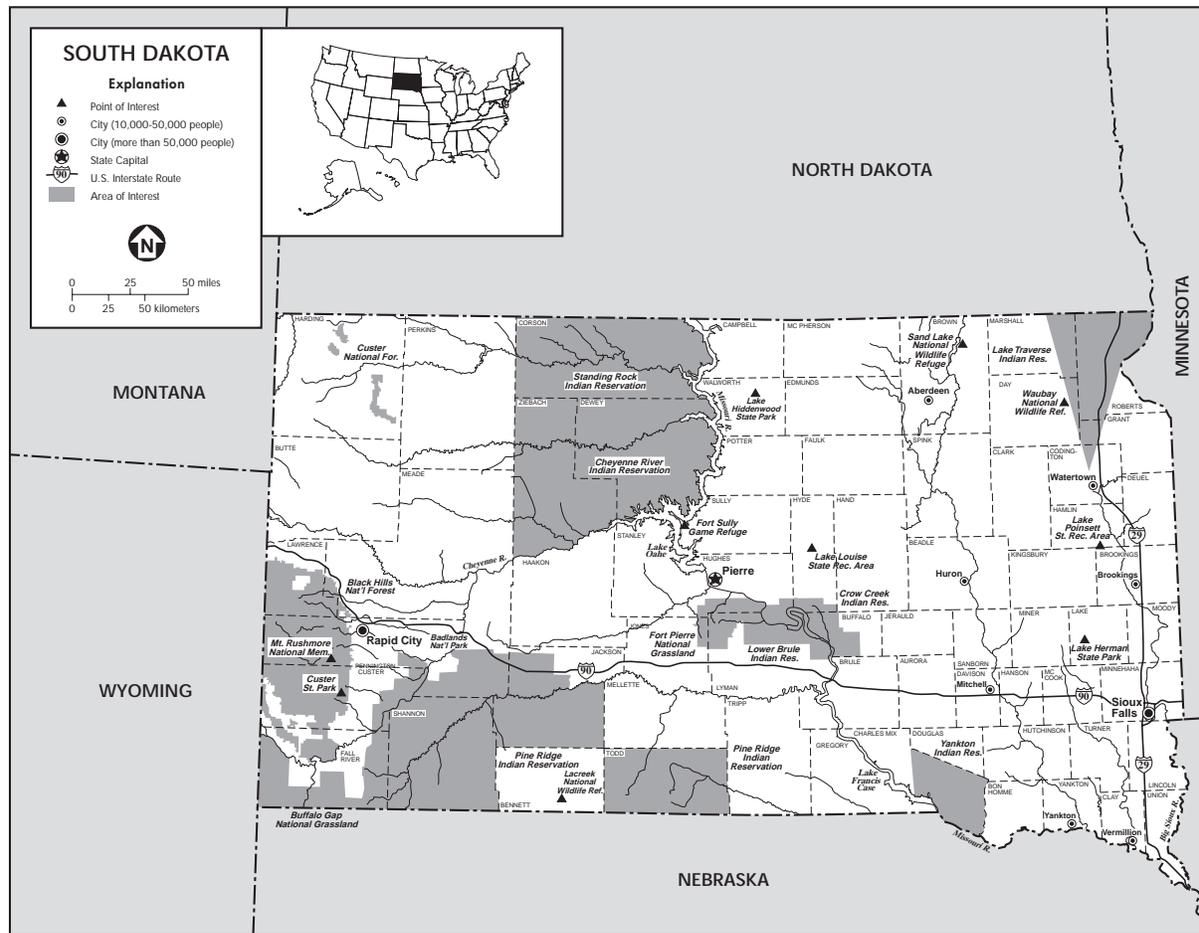

The next year President Thomas Jefferson (1801–1809) sent Captain Meriwether Lewis and Lieutenant William Clark (leaders of the Lewis and Clark expedition) to explore the region. In 1817 fur trading had begun to take place on the Missouri River at "Fort Pierre."

In the 1850s the fur trade was in decline. Fort Pierre was sold to the U.S. Army and soldiers took up the task of keeping peace between Indians and white settlers. Pierre would become the capital of South Dakota. Slowly over the years groups of Indians gave up their land and moved onto reservations. The land parcels they left behind were then purchased by land companies for farming, forestry, and building stone. These companies pressured the government to assign territorial status to the land, and in 1861 President James Buchanan (1857–1861) signed a bill which designated it as the Dakota Territory. The region included what is now North Dakota and South Dakota and most of the land in Montana and Wyoming.

During the 1860s and 1870s transportation networks opened up the Dakota Territory for additional markets making migration to the area much easier. Thus, when gold was discovered in Montana in the 1860s thousands of miners were able to travel from the east through Dakota. Federal money was also secured to begin building roads to Montana. When the Pacific Railroad to Sioux City, Iowa, was completed in 1868, farmers could transport wheat to eastern markets. Bridges were constructed over the Vermillion and James rivers which made it easier to reach the railroad at Sioux City. And when the Dakota Southern Railroad between Sioux City and Yankton opened in 1873 Yankton became an important stopover on the river which, in turn, helped attract more settlers to the area.

Immigrant farmers—Swedish, Danish, and Czech—entered the territory through Sioux City and settled in the territory to farm. These pioneers could purchase 160 acres for \$1.25 per acre. The Homestead Act of 1862 allowed pioneers to claim the same amount of land for free if they worked the land for five years. (Farm crops often included corn, potatoes, onions, beets, beans, and other vegetables.) Life on the prairie was not easy for the pioneers; ever-present was the threat of blizzards in winter, fires in spring and fall, and drought in summer which could destroy homes, fields, and crops. Only the heartiest settlers could withstand the utter devastation possible in the difficult climate.

South Dakota

State of South Dakota.

In 1874 gold was discovered in the Black Hills. However, the Sioux Indians considered the Black Hills sacred ground. (Although most of Native Americans lived on reservations some still roamed the area.) The U.S. government was aware of this Native American belief and agreed in the Laramie Treaty (1868) to protect the area. However, when news spread that gold was discovered more than 800 miners flocked to the area to mine for gold illegally. When the government tried to buy the Black Hills from the Sioux for \$6 million they refused, and instead attacked mining camps over the next few years in what was known as the Sioux War of 1876. The Sioux eventually agreed to surrender the Black Hills and most of the Native Americans settled in reservations. Miners settled in the area. At the height of the gold rush in 1877 more than 25,000 people lived in the Black Hills. The towns they populated included restaurants, laundries, grocery stores, saloons, and gambling houses.

At the same time as the Black Hills gold rush, cattle ranchers began to establish themselves in the

area. Texas longhorn steers were driven from Texas to the lush range surrounding the Black Hills and the popularity of sheep ranching also grew. In 1884 more than 800,000 head of cattle and 85,000 sheep grazed the land. Not only did people in the Black Hills region purchase meat for food but as additional railroads were built ranchers were able to transport cattle and sheep to eastern cities for slaughter. In 1885 amid this period of heightened settlement and economic activity, South Dakota and North Dakota were approved for statehood.

When World War I (1914–1918) started prices of crops and livestock increased while the demand for farm products rose. This helped to bolster South Dakota's economy. However, after the war ended the price for these items fell. Because farmers received less income they couldn't repay debts; many lost their farms, and left the state. Soon after, The Great Depression (1929–1939) devastated many South Dakotans who were already affected by the state's economic crisis. In addition the 1930s brought drought, grasshopper plagues, dust storms, and crop failures which

lasted for nearly ten years. Assistance arrived when President Franklin D. Roosevelt's (1933–1945) New Deal put 25,000 men to work planting trees for windbreaks and building recreational facilities. The government gave South Dakota \$35 million to build schools and other public buildings, bridges, and roads. The federal government also purchased cattle and sheep and taught farmers to grow drought-resistant grass.

The start of World War II (1939–1945) helped lift South Dakota out of the depression because meat, dairy and grain products were needed for the war effort. The Sioux Falls Air Force Training Base and the Ellsworth Air Base outside Rapid City were built and machine shops and foundries were constructed all over the state.

After the war incomes from farming were on the upswing again. Many who had lost their farms were able to buy them back. Between 1945 and 1966 the government developed and implemented a plan that improved the state's economy and made it less dependent on farming for income. To control flooding and irrigation, dams were built on the Cheyenne, Grand, and Moreu rivers and on Rapid Creek. The Missouri River also was dammed in four locations to provide electric power, flood control, and irrigation. The Oahe, Francis Case, Sharpe, and Lewis and Clark lakes were created by damming the Missouri River, also known as the "Great Lakes of South Dakota," they have become a tourist attraction.

Severe weather continued to affect the state's economy. In the blizzards of 1966 and 1975 several people died and thousands of cattle were killed. The Rapid City Canyon Lake Dam burst in 1972, flooding the city, killing 238 people, and causing \$100 million worth of property damage. In 1988 a drought in the state caused millions of dollars in damage to the wheat, rye, and corn crops. The drought also caused the Black Hills National Forest to catch fire; a lightning strike set \$4.4 million worth of timber ablaze.

During the 1980s Native American unemployment on reservations reached 80 percent due to cuts in federal spending. Also, farm incomes fell as prices for farm products decreased while mortgages rose causing many people to lose their farms. In response to public suffering the state government provided \$40 million in 1987 for low-interest loans to help new and expanding businesses. The state supported specific industries including plastic products, electronic components, women's clothing, surgical instruments, and life insurance, hoping that this initiative would create jobs for both Native American and non-Native American residents as well as attract other businesses.

In the 1990s Citicorp, the largest bank-holding company in the United States, set up a credit card operation in Sioux Falls. In the early 1990s manufacturing also expanded up to 10 percent each year, and in 1994 the state produced record corn and soybean crops. Casino gambling also became an important source of revenue after it was legalized in the state in 1989.

In 1995 the median household income was \$29,578 with 14.5 percent of all South Dakotans below the federal poverty level.

SOUTHWESTERN INDIANS

The pre-colonial Indians of the American Southwest included the Mogollon, Hohokam, Anasazi (or "Cliff Dwellers"), and the Anasazi's Pueblo descendents. Some historians refer collectively to their mutual forebearers as the Paleo-Indians. A few scholars also believe that the Paleo-Indians arrived in the area between 10,000 and 9,000 B.C..

The Southwestern Indians settled across present-day Arizona, New Mexico, northern Mexico, southern Utah, southern Colorado, and parts of Nevada. Their languages were classified as Aztec-Tanoan.

The Southwestern Indians began farming around 1500 B.C.. They grew corn, beans, and squash, and raised turkeys. Farming was difficult in the arid region, so they developed ways of irrigating the land. The Hohokam built a system of canals to carry water to their crops. The Anasazi developed techniques for dry farming. By 900 AD the various farming cultures were flourishing.

Sovereignty

As settlers the Southwestern Indians crafted various conveniences for themselves—housewares, permanent homes, and roads. The Mogollon were skilled potters who made smooth clay pots and bowls, which they fired and painted with geometric designs and figures of animals and humans. The Hohokam were accomplished weavers of cotton cloth. The Anasazi produced various kinds of wicker containers and muralists. Southwestern Indians were also capable builders. They did not have beasts of burden; transportation was on foot, therefore, The Southwestern Indians built extensive road systems. They applied their construction skills to homebuilding as well. Living quarters were usually built above-ground using masonry techniques. Anasazi homes were carved out of the sides of cliffs and the walls of canyons.

The Apache and Navajo—descendants of the Anasazi—are also grouped as Southwestern Indians. These north woods groups arrived in the Southwest later and were very different from the earlier arrivals: they were predominately hunters and gatherers. They lived in tepees or brush shelters, and were fierce fighters who even raided the Pueblo settlements they encountered. By the time the Spaniards arrived (around 1540) both the Navajo and Apache were living in the Southwest. Unlike the Apache, Navajos adopted many Pueblo practices and also learned new ways from the Europeans.

When the Spaniards came to the region they unleashed drastic changes in the lives of Southwestern Indians. The Spaniards brought with them the first horses, mules, cattle, sheep, and hogs ever seen in the region. Intent on converting the native inhabitants to Christianity, the Spaniards established missions across the region. But the arrival of the Europeans also preceded the decline of Southwestern Indian culture. Combined with drought, the arrival of Europeans was responsible for the decline of the Southwestern Indian cultures by 1600. Many were killed in rebellions, others were subjugated, and some fled the region.

SOVEREIGNTY

Sovereignty is the supreme power of an individual, country, or state to govern internal affairs without interference from any other comparable authority. Sovereign countries can conduct foreign affairs with other nations including negotiating treaties, engaging in international commerce, and making war and peace.

Sovereignty defines political authority within the modern nation.

Sovereignty first applied to a king's divine right to rule his subjects. Unlimited power was believed to flow from God to the king enabling him to rule his kingdom. The term evolved through time to represent the power of a state to take every action necessary to regulate itself. In democratic countries, the ultimate source of sovereignty or government power lies with the people.

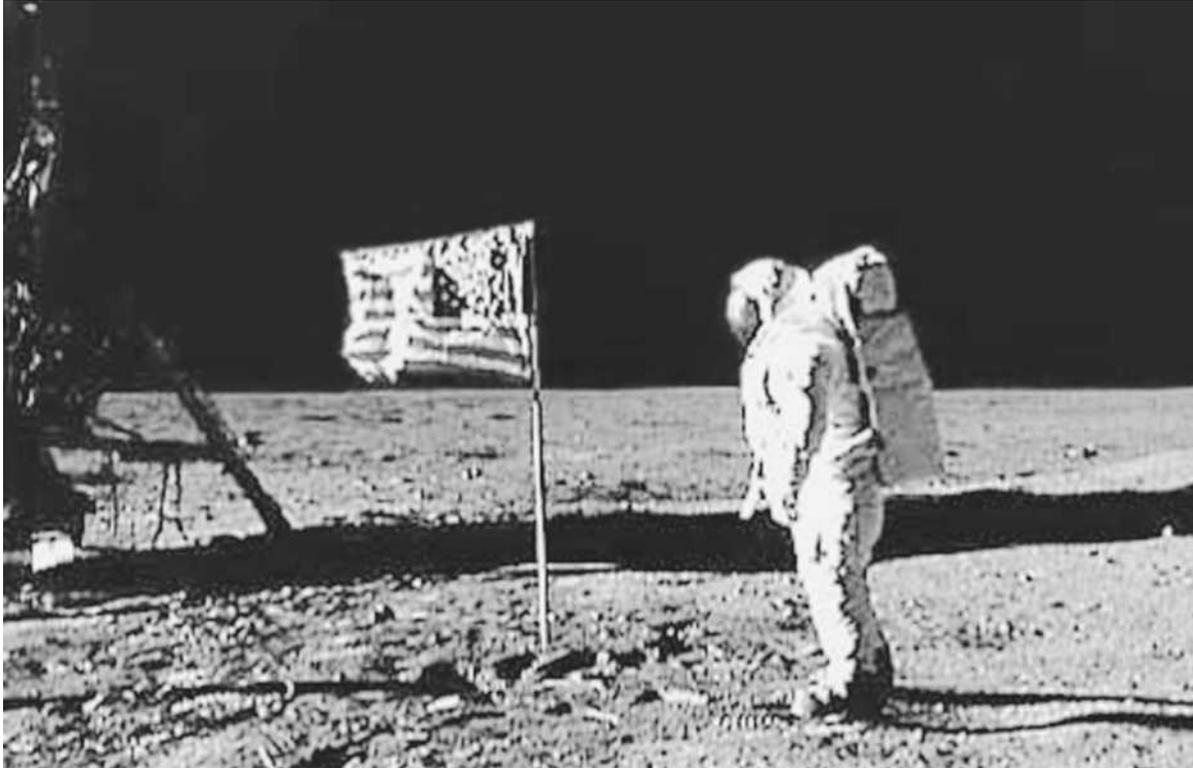

In 1777, the Second Continental Congress of the United States adopted the Articles of Confederation giving Congress a few powers typical of an independent sovereign nation. Congress alone had the power to conduct foreign affairs, negotiate treaties, control a national army, coin money, and operate a national postal system. The Articles did deliberately keep the central government weak by limiting sovereignty. Each state had its own state court to settle disputes. All important Congressional decisions required approval of at least nine states, and these resolutions were mere suggestions to the states. This limited sovereignty granted to Congress proved ineffective and ten years later the U.S. Constitution was ratified. It was followed by ratification of the Bill of Rights in 1791. The Tenth Amendment of the Bill of Rights states, "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." The United States is a sovereign nation in external affairs but the states do hold certain attributes of internal sovereignty, such as providing for public schools. The U.S. Constitution, the supreme law of the land, is the ultimate determinant of sovereignty powers in the nation.

"Popular sovereignty" is another variant of the term sovereignty in U.S. history, referring to the principle of allowing settlers to decide on their own a territory's slavery policy. The Kansas-Nebraska Bill of 1854 embraced popular sovereignty. Another use is sovereign rights of territorial waters. The United States has sovereign ocean rights extending 12 nautical miles from shore. These rights include fishing, shipping, navigation, and use of natural resources.

SPACE RACE

During World War II (1939–1945) Germany developed the world's first long-range guided missiles, firing warheads into English cities. Upon Germany's

On July 20, 1969 America won the space race when the crew of the Apollo landed on the moon. Edwin “Buzz” Aldrin, Jr. erected the American flag to serve as a permanent mark of the nation’s accomplishment.

defeat and the end of the war, the United States recruited German rocket scientists, including Wernher von Braun (1912–1977), to help begin the U.S. missile program. The United States and Russia had become engaged in an intense military global rivalry, the Cold War. The resulting arms race between the two “superpowers” included the development and stockpiling of thermonuclear weapons and intercontinental ballistic missiles.

Under supervision of the U.S. Air Force, missile testing began at Florida’s Cape Canaveral launch facilities in the early 1950s. However, the Soviet Union, known to excel in large missile development, shocked the United States when it became the first nation to place a satellite, *Sputnik 1*, in orbit around Earth in October 1957. A second Russian satellite went up the following month carrying a dog. Suddenly, the “space race” was on and the United States, in desperation, greatly accelerated its space program. Not only did Americans feel vulnerable to direct foreign attack but the U.S. claim to scientific superiority was shaken.

The United States attempted an orbiting satellite launch in December 1957, but the Vanguard missile embarrassingly exploded on lift-off. The following

month *Explorer 1* blasted successfully into orbit. Through the 1950s the United States and Russia increasingly focused on manned space flight. The United States established the Project Mercury program with its original seven astronauts, a select group of daring Air Force test pilots. To oversee the civilian space program Congress created the National Aeronautics and Space Administration (NASA) in October 1958, taking over control from the military.

In April 1961, a second jolt rippled through the United States when Russia placed the first human, Yury Gagarin (1934–1968), in orbit around the Earth. The United States responded on May 5, 1961, as Alan Shephard (1923–) became the first American in space, riding the somewhat unreliable Redstone rocket into a suborbit trajectory.

With U.S. leadership clearly shaken by Russia’s progress, President John F. Kennedy (1961–1963) on May 25, 1961 proclaimed a national goal to land an astronaut on the moon by the end of the decade and safely return him to earth. The pronouncement came as a surprise even to many in the space program. With the moon identified as the finish line for the space race, a clearly difficult goal was publicly set.

Later in 1961 John Glenn (1921–) became the first American to orbit the Earth. Four more manned Mercury flights were followed by Project Gemini in March 1965. Gemini, in its brief existence, introduced two-man space capsules, the first space walks, docking exercises, and more extended flight times. Project Apollo, the heart of the U.S. lunar program, followed in late 1966. A tragic capsule fire in January 1967, killed the first of three Apollo astronaut crews while sitting atop a missile on the launch pad. No further manned space flights occurred until October 1968. Then on Christmas Eve 1968, the first Apollo mission to orbit the moon sent back spectacular pictures to Earth, again captivating the public. Soon afterwards, on July 20, 1969, Apollo 11 astronauts Edwin “Buzz” Aldrin (1930–) and Neil Armstrong (1930–) became the first humans to walk on the moon. An estimated half a billion people around the world watched the event 240,000 miles away on live television. The space race was won.

ON JULY 20, 1969, APOLLO 11 ASTRONAUTS EDWIN “BUZZ” ALDRIN AND NEIL ARMSTRONG BECAME THE FIRST HUMANS TO WALK ON THE MOON. AN ESTIMATED HALF A BILLION PEOPLE AROUND THE WORLD WATCHED THE EVENT 240,000 MILES AWAY ON LIVE TELEVISION. THE SPACE RACE WAS WON.

Five more Apollo missions led to extended walks on the moon and the use of lunar roving vehicles. American society, however, had changed radically since the 1961 Kennedy pronouncement. The United States was in the throes of a highly controversial foreign war in Southeast Asia and domestic unrest was at a peak. Urban riots were tearing apart the national social fabric. Many questioned the billions of dollars spent on a program of debatable scientific value when there were such pressing social issues at home. After the Apollo 17 mission in December 1972, the program came to an abrupt end as funding was curtailed, canceling three more planned Apollo missions. With the space race over, the U.S. space program turned to unmanned exploration, the space shuttle program, and even collaboration with Russia on the *Mir* space station program and other related projects.

The United States’ effort in the space race is recognized as one of the greatest peacetime national efforts in history involving government, the military, science, and industry. In 1966 the \$6 billion space budget constituted over four percent of the entire federal budget, exceeding amounts spent on housing and community development. The Apollo program

alone cost over \$25 billion. At its peak, over 400,000 people were employed in the effort. With public relations a major facet of the space race, the astronauts became public heroes of almost mythological proportions.

However, accomplishments stemming from the space race were largely political. Geologic research objectives were only partially met with the 841 pounds of moon rock collected. The limited scientific benefits went largely to the medical field with advances in digital imaging, biomedical telemetry techniques, and other technological developments. In all, however, an amazing technological feat involving tremendous political and economic commitments had been accomplished within a decade’s time.

SPANISH-AMERICAN WAR

The 1898 war between the United States and Spain lasted only four months, yet its effects are still felt today. It ended in a relatively easy victory for the United States, which, just over a century after its birth as an independent nation, seemed eager to claim its place as a world power. In what Secretary of State John Hay (1898–1905) called “a splendid little war,” the country demonstrated an intent to protect its economic interests abroad and to promote its own expansion. The brief conflict also marked an increased U.S. involvement in global affairs and a step away from the 1823

Monroe Doctrine, which suggested that the country would assert its power only within its own hemisphere. Significantly more far-reaching were the war's effects on Cuba, Puerto Rico, Hawaii, Guam, and the Philippines, whose destinies remained unalterably changed by the events that occurred between April and August of 1898.

The United States' initial impetus for going to war was its interest in Cuba—an interest that was primarily economic in nature. One of the last and largest remaining colonies of Spain, Cuba had been gearing up for a revolution throughout the nineteenth century. Its politically active population craved independence, and the United States sympathized with that plight. Already engaged in a guerrilla war with Spain, Cuban rebels looked to their country's larger neighbor for support. The United States supplied that support for reasons that were clearly apparent: It had \$50 million invested in Cuba, and its annual trade with the sugar-producing island amounted to \$100 million. Moreover, the United States had long opposed Spanish rule in Cuba for humanitarian reasons. The American press printed passionate coverage of Cuba's troubled relations with Spain: William Randolph Hearst and Joseph Pulitzer's national newspapers—the so-called yellow press—declared the situation “intolerable.” And the American public apparently agreed.

A tragic event ultimately motivated the country to take action: On February 15, 1898, the U.S. battleship *Maine* mysteriously exploded and sank in the Havana Harbor, where it apparently had been making a courtesy visit. Although the cause of the sinking, which claimed 266 lives, remains unexplained to this day, a naval investigation at the time surmised that the explosion was external in origin. The Spanish government approached the issue in a conciliatory manner, wishing to avoid conflict with the United States. But Madrid would not negotiate on the one issue that would have prevented war: the granting of independence to Cuba. Responding to an angered public, President William McKinley (1897–1901) and Congress took action, ordering the withdrawal of Spanish forces from Cuba on April 19 and officially declared war on April 25.

The war strategy of the United States included a blockade of Cuba; a naval campaign in the Philippines; an attack with ground forces in Santiago, Cuba; and a dispatch of troops to San Juan, Puerto Rico. The media reported that the blockade of Cuba, which involved the mobilization of hundreds of thousands of volunteer and army troops, was poorly organized. Soldiers lacked supplies; sanitary conditions were poor; and the food was unacceptable. Although by the war's end only 379

American men died in combat, thousands perished of disease. The Spanish military suffered from its own insufficiencies, particularly the decrepitude of its fleets, which remained vulnerable to U.S. naval power.

It did not take long for the United States to claim victory in the war, which ended on August 12 with the signing of a peace protocol. The final terms were set on December 10 with the negotiation and signing of the Treaty of Paris. Cuba was to gain its independence, while Puerto Rico, Guam, and the Philippines were to belong to the United States. The U.S. paid nothing for Puerto Rico and Guam, but it gave Spain \$20 million for the Philippines. The Filipinos, however, continued to revolt and finally achieved independence in 1946. Eager for global expansion, President McKinley had already annexed Hawaii in July. Thus, the nation made the transition from hemispheric power to world power in one fell swoop.

The outcome of the war was an economic boon to the United States. The country was able to protect its interests in Cuba, and it even managed to gain potentially lucrative territory overseas. With the Hawaiian Islands the United States gained fruitful sugar plantations and a promising fishing industry. Of course, the United States paid dearly for its conquests: The war cost the country \$250 million. Political unrest in the Philippines, which struggled for its own independence, was to be a source of grief for many years. But for the most part the American public wholeheartedly approved of the terms of its victory. Advocates of U.S. expansion and global prowess particularly exulted in their triumph, which secured the nation's place as a world power.

SPECIAL INTEREST GROUPS

Toward the end of the twentieth century, special interest groups exhibited several defining characteristics. First, special interest groups are associations joined voluntarily by individuals sharing at least one common interest or belief that defines the group's purpose. The National Education Association's (NEA) members teach. Members of the Sierra Club are interested in environmental issues. Members work together to focus and articulate issue positions and strategies designed to actively influence public policy.

A special interest group's key element is purposefully influencing government policy, whereas Elks Clubs, university alumni associations, and Boy Scouts of America are apolitical groups primarily interested in service and social activities. Second, special interest groups have organizational structure whether formal or informal where persons routinely gather to assist their group. The NEA and Sierra Club are formal organizations with dues paying members. A neighborhood group may not have dues, officers, or bylaws, but meets regularly to support or oppose issues of local concern. Third, special interest groups are non-governmental, neither agencies nor political parties. Though interest groups often endorse candidates, they do not nominate candidates. Groups generally fall into one of two categories: trade associations or unions seeking economic betterment for their members; or, cause-related groups promoting some issue such as clean environment, gun control, or ban on abortions.

Although the pervasiveness of interest groups influencing politics is clearly a twentieth century phenomenon, discussion on the role of groups in the United States appeared in James Madison's *Federalist 10* (1787). Frenchman Alexis de Tocqueville described the United States as a nation of frequent joiners in his book *Democracy in America* (1835–1840). One of the earliest interest groups in the United States was the National Grange, founded in 1867, which advocated government railroad regulation. Interest group formation has occurred in a series of waves in U.S. history. The first arrived between 1830 and 1860 with groups such as the Grange and Abolitionist organizations. Next, in 1880 with intense industrialization, the American Federation of Labor (AFL), Knights of Labor, and various manufacturing associations sprang up. Between 1900 and 1920, many new organizations formed, such as the U.S. Chamber of Commerce, American Medical Association, and National Association for the Advancement of Colored People. The 1960's and 1970's witnessed a proliferation of cause-oriented and

economic organizations including Common Cause and Ralph Nader's Public Citizen.

Near synonymous terms are pressure groups, public interest groups, lobbies, and vested groups.

SPECIE

Specie is metallic money in all of its forms, gold or silver traditionally, but including nickel and copper as well. Specie is distinguished from other forms of money such as paper money or credit instruments like checks, money order, credit cards and the like. The term specie is also occasionally applied to gold and silver bullion, which is ordinary gold and silver, as opposed to coins with collectible value. Since January of 1934, the gold coin is no longer routinely coined by the U.S. government, nor is it routinely in ordinary circulation in the United States. Public law 91-607, enacted in December of 1970, initiated the creation of non-silver dollars and half-dollars minted for general circulation. Coinage of the former 40 per cent silver half-dollar, pursuant to the *Coinage Act of 1965*, was discontinued in January of 1971. The Coinage Act also brought an end to the silver quarter and the dime, which are now coined with some silver and mostly baser metals, like copper and nickel. All coins in common circulation in the U.S., currently minted, are composed of baser metals, and specie is largely a form of metallic money of the past.

SPECULATION

Speculation is an economic term used to describe financial risk taking. For example, an individual investing money in a start-up business venture, where the outcome of profit or loss is unknown, is engaging in speculation. A speculator can calculate a variety of factors and forecast a possible result for an investment, but performance outcomes can never be definitively determined. To continue with the example of a start-up venture, the performance of the new business can be estimated through market studies regarding consumer demand for a product and how that demand is or is not presently being met in the marketplace. The start-up business may predict that its product is innovative and will quickly find a niche in the market, generating

profit for the company. If this is true, the analysis proves accurate. However, if the economy experiences an economic downturn and enters into a depression as the business opens, the needs of the marketplace may change and the outcome may result in loss.

Speculation may be compared to gambling. However, the two are not the same. Gambling is an artificial form of risk taking and has no relation to business operations or market forces. Speculation relies on the marketplace and is subject to the whims of the economy. Speculation may also be confused with investment, which also takes place in the marketplace and is subject to the ups and downs of the economy, but these are also not the same. Investment involves a limited risk of capital and is usually designed to make a profit over the long-term. Speculation often involves larger amount of money and attempts to achieve a high profit in a short time frame.

SPINNING MILLS

Spinning mills were introduced to the United States in 1790 by English-born mechanist and businessman Samuel Slater (1768–1835). The twenty-one year old had worked as a textile laborer for more than six years in an English mill, where he learned about the workings of a cotton-spinning machine invented (1783) by Richard Arkwright (1732–92). The British considered the Arkwright mill the cornerstone of their booming textile industry and laws prevented anyone with knowledge of the mill from leaving the country. Eager to seek his own fortune, Slater disguised himself in 1789 to evade the authorities and sailed from England to recreate the spinning mill in America.

Arriving in Providence, Rhode Island, Slater formed a partnership with the textile firm Almy and Brown. From memory Slater began building a spinning mill based on the Arkwright machine. The spinning mill debuted December 20, 1790, in the village of Pawtucket, Rhode Island, where the wheels of the mill were turned by the waters of the Blackstone River. The machine was a success and soon revolutionized the American textile industry, which had previously relied on cottage workers (the putting-out system) to manufacture thread and yarn.

Slater's innovation earned him the title "Father of American Manufactures" from President Andrew Jackson (1829–37), as well as the title "father of the American textile industry." He was credited with spawning the factory system in the United States.

Within the first three decades of the 1800s, New England became the center of the nation's textile industry: the region's ample rivers and streams provided the necessary water power and the commercial centers of Boston and New York City readily received the finished products. Labor proved to be in ample supply as well: Because mill machinery was not complicated, children could operate it (and often did). Slater hired children ages seven to 14 to run the mill—a practice that other New England textile factories also adopted. The Jefferson Embargo of 1807, which prohibited importing textiles, also aided the industry. New England's mills provided the model for the American factory system. Slater had helped bring the Industrial Revolution to America.

Slater eventually broke away from Almy and Brown to open Samuel Slater & Company at Pawtucket, Rhode Island. He later operated mills in Connecticut and New Hampshire. The Pawtucket mill where he demonstrated his innovation is now the Slater Mill Historic Site and has been called the Cradle of American Industry.

SPOILS SYSTEM

The spoils system is the political practice of playing favorites. Used throughout U.S. history, it commonly takes the form of filling appointive offices with loyal supporters. Among the nation's early presidents Thomas Jefferson (1801–1809) made particular use of the practice to place his allies in influential civil service posts.

By the time President Andrew Jackson (1829–1837) took office in 1829, this method of rewarding one's political allies was an integral part of the workings of government. Jackson's friend, Senator William Marcy (1786–1857) of New York, coined the phrase "spoils system" in 1832, when he stated, "to the victor belong the spoils of the enemy."

The spoils system grew in size as a result of the bitter competition that characterized the two party system during Jackson's presidency. During his first term of office (1829–1833) he assembled a group of unofficial advisers who reportedly met in the White House kitchen, earning them the nickname Kitchen Cabinet. Members included then-Secretary of State Martin Van Buren (1782–1862), who later served as

Springfield Armory

Jackson's vice president and then as president (1837–1841); Francis P. Blair (1791–1876), editor of the *Washington Post*, and an active participant in politics who would help Abraham Lincoln (1809–1865) during his presidential campaign (1860); and Amos Kendall (1789–1869), a journalist and Jackson administration speech writer who later became U.S. Postmaster General. The informality of the Kitchen Cabinet invited the mixing of politics and special interests. It operated outside the official institutions of government and yet was influential in formulating policy during the Jackson administration. Jackson drew harsh criticism for relying on his cronies in this way, and when he reorganized the federal Cabinet in 1831, the informal Kitchen Cabinet was disbanded.

ANDREW JACKSON'S FRIEND, SENATOR WILLIAM MARCY (1786–1857) OF NEW YORK, COINED THE PHRASE "SPOILS SYSTEM" IN 1832, WHEN HE STATED, "TO THE VICTOR BELONG THE SPOILS OF THE ENEMY."

The Kitchen Cabinet closed its doors, but the spoils system continued to influence policy when Martin Van Buren succeeded Jackson as president. Van Buren had been a leader of the Albany Regency which was the Democratic Party machine in New York state. This group of New York Democratic party leaders used the spoils systems to reward members and to maintain strict party discipline.

After the Civil War, the spoils system became an obstruction to good government. Placing political allies in important public service positions often failed to involve a determination of whether or not the person in question was qualified to hold the job. The practice bred corruption and inefficiency and reached staggering proportions by the time Ulysses Grant (1869–1877) became president. His administration was notoriously prone to graft-ridden awards of government contracts.

The failure of the spoils system brought on tragic consequences when in 1881 a frustrated office-seeker shot President James Garfield (1881) in a train station. Garfield's successor, Chester Arthur (1881–1885), though himself a creature of the spoils system, worked to dismantle it. The Pendleton Act of 1883 initiated reform of the system by establishing a federal Civil Service Commission and creating a class of government workers (14,000 out of a total of 100,000) who now had to take an examination to be awarded a government job. Though limited in size, the Civil Service Commission grew in later years.

The system was further refined in the twentieth century. To further separate civil service from politics, the Hatch Act (1940) forbid civil servants from political campaigning. The Hatch Act was revised in 1993 to allow most civil servants to participate in political activity on their personal time. Measures like the Civil Service Commission and the Hatch Act have been successful in limiting the use of the spoils system in the political process, but they haven't eradicated the practice. The spoils system is still (unofficially) practiced in some federal, state, and local government offices.

SPRINGFIELD ARMORY

The southwestern Massachusetts town of Springfield, on the Connecticut River, first became an important weapons center during the American Revolution (1775–83) when a sizeable arsenal was built there in 1777. The town was considered to be ideally situated—close to two major overland routes and on a strategic waterway, but far enough inland from the Atlantic Ocean to be defensible. Springfield had been the site of a militia training field since the 1600s; during the war, the Continental Army added barracks and storehouses, which held muskets, cannons, and other weapons. The new republic continued to keep arms at the site after the war was over. In 1794 a U.S. Armory was established at Springfield; it was one of two federal arsenals personally selected by President George Washington (1789–96); the other was Harpers Ferry, in present-day West Virginia.

In 1795 musket manufacturing began at Springfield, with forty workers producing 245 muskets per month. Soon Springfield became a center for innovation in arms production. In 1819 American inventor Thomas Blanchard (1788–1864), who worked at the armory for five years, developed a lathe (a machine for shaping metal) that allowed for the mass production of rifle stocks. During the Industrial Revolution the Springfield Armory focused on mass production of interchangeable parts, which had the advantage of being replaceable (in case of malfunction) on the battlefield.

In 1903 the Springfield rifle was approved for production. Nicknamed the "Springfield Model '03" (the gun was marked with 'M1903'), it soon became standard issue for U.S. Army troops. The model was improved in 1906 to accommodate new ammunition; the resulting model, called the Springfield .30-06, was one of the most reliable and accurate military firearms in history. By the time World War I (1914–18) began,

the armory had manufactured just over 840,000 Springfield rifles; during the war, it made another 265,000.

The Massachusetts city, which was incorporated in 1641, remained home to the weapons facility until 1974. Another milestone in the history of the armory was the 1786–87 siege by rebel leader Daniel Shays (1747?–1825) during the so-called Shays Rebellion. Just downstream from Springfield, American inventor Samuel Colt (1814–62) opened an armory in 1853 at Hartford, Connecticut, where he utilized 1,400 machine tools to revolutionize the manufacture of small arms.

STAGFLATION

“Stagflation” is a combination term, bringing together two words, “stagnation” and “inflation.” In economic terms, stagflation exists when there is slow or no growth in the real (inflation-adjusted) economy, accompanied by economic inflation (rising prices). A period of stagflation exists, for instance, when unemployment rates are high and the rates of inflation of products are also high. In 1982 the Council of Economic Advisers reported that there was no known reason to expect any regular or systematic association between the unemployment rate and the average rate of price-level change (inflation). The term came into existence during the 1970s, when the effort to reduce high inflation by trading inflation for increased employment actually resulted in both more inflation and rising unemployment: stagflation. Some economists argued that a permanent reduction in inflation brings about a permanent rise in the rate of unemployment, a famous economic tradeoff implied by the ‘Phillips Curve,’ developed by English economist A.W. Phillips. Phillips’ theory was based on his study of English unemployment between 1862 and 1957, where it appeared that any economy would need to accept some growing rate of reasonable inflation in order to lower unemployment. The Phillips Curve data has never been proven to be accurate, according to data gathered in the United States, and the rare and episodic economic conditions of stagflation are still not clearly understood, except that the effort to reduce inflation by artificially increasing employment is by no means reliable, and may result in the paradoxical situation of stagflation, where prices on consumer items increase, but consumers are unable to afford the higher prices.

UNEMPLOYMENT AND INFLATION, 1960–1985

Source: Data from Department of Labor, Bureau of Labor Statistics.

When both the rates of unemployment and inflation are high, a state of “stagflation” exists.

STAMP ACT (1765)

The Stamp Act, passed in March, 1765, was the first direct tax ever placed by the British government on the American colonies. The Act, which was to take effect November 1, 1765, required an official stamp on about 50 different types of documents, ranging from playing cards to newspapers and college diplomas. The stamp’s cost depended on the value of the document. King George III’s Prime Minister George Grenville, who led Parliament from 1763 to 1765, felt that such a tax was needed to help pay for the costs of the French and Indian War (1754–1763). Great Britain was deeply in debt from the expenses of winning the war against France, and the revenues it gathered from the colonies did not come close to paying the costs of collecting them. Because of the expenses of the war, the country’s national debt had increased by more than 50 percent in the space of seven years, from 75 million pounds sterling to 137 million pounds sterling. In addition, Grenville wanted to keep the peace between Native Americans and settlers along the North American frontier and to crack down on colonial smuggling. The Stamp Act, which Grenville believed would raise about 100,000 pounds sterling per year, was meant to help pay the costs of these programs.

The colonists objected to the Stamp Act in part because it infringed on their rights as English citizens, but also because it put a tremendous financial burden on them. The colonies were in the middle of an economic depression which had its origins in the destruction caused by the French and Indian War, and

Angry mobs in other colonies followed Boston's example, using force to intimidate would-be stamp distributors. In Rhode Island the nominee for tax collector, Augustus Johnston, abandoned his duty before the end of August. Connecticut Sons of Liberty forced Jared Ingersoll out of office, while in Maryland Zachariah Hood had to leave the colony after anti-tax rioters burned his home.

cash was very scarce. The tax on stamps was payable only in hard cash—gold or silver. Paper colonial money (often devalued so much that it was practically worthless) was not accepted. Hard currency was also difficult to find in the colonies because English imports (including most manufactured goods) had to be paid for in cash, not colonial notes. In addition to setting colonists the problem of finding the money to pay their taxes, the act also threatened their material prosperity. The Stamp Act allowed officials to try accused law-breakers in royal vice-admiralty courts, which did not use juries, as well as in regular criminal courts. These vice-admiralty courts, it was believed, would be less sympathetic to colonial viewpoints.

Local politics and class rivalry also played a role in resistance to the Stamp Act, particularly in Virginia and Massachusetts. Virginian lawyer Patrick Henry made the act the subject of his first speech in the colony's House of Burgesses in May, 1765. Henry's opinions on the Stamp Act were narrowly passed by the House and they, as the Virginia Resolutions, inspired open opposition to the Act in other colonies.

In Boston opposition to the Stamp Act was even more conspicuous. At that time a small clique of wealthy families, related by marriage, held most of the royal offices in the colony. These families included Governor Francis Bernard, Thomas Hutchinson (lieutenant governor and chief justice), and the brothers Andrew Oliver and Peter Oliver. This "royalist faction" was opposed by a coalition of poorer men known as the "popular faction," including the lawyer James Otis, Jr. and Boston politician Samuel Adams. The popular faction spread the idea that the royalist faction was behind the Stamp Act, and they were supported in this belief by two of Boston's largest gangs.

In the summer, 1765, Andrew Oliver was appointed distributor of stamps for the Boston area. On August 14 of that year, a dummy made up to look like Oliver was discovered, along with an old boot (a symbol for

Lord Bute, George Grenville's predecessor as Prime Minister), hanging from an elm tree near Boylston Market in Boston. Despite the efforts of the town sheriff, until sundown, the objects remained on the elm, which became famous as the Liberty Tree. At that point a crowd, including members of the popular faction, gathered and removed the effigy. These "Sons of Liberty", led by shoemakers Ebenezer Macintosh and Henry Swift, paraded the effigy of Oliver to the waterfront, where they attacked and destroyed a warehouse the tax collector had built. The crowd—by this time a mob—then built a bonfire in front of Oliver's house and, when they ran low on firewood, began stripping the trees and buildings on his property. For over an hour, the Boston mob continued to dismantle Oliver's home, smashing his furniture and mirrors and scattering his valuables. Within a week another crowd confronted the tax collector and extorted from him a promise that he would resign his office. Later that month the Sons of Liberty attacked and destroyed the homes of Thomas Hutchinson and customs administrator Benjamin Hallowell in an effort to intimidate them as well.

Angry mobs in other colonies followed Boston's example, using force to intimidate would-be stamp distributors. In Rhode Island the nominee for tax collector, Augustus Johnston, abandoned his duty before the end of August. Connecticut Sons of Liberty forced Jared Ingersoll out of office, while in Maryland Zachariah Hood had to leave the colony after anti-tax rioters burned his home. More conservative protesters tried less violent means to express their dissent. In October, 1765, 27 delegates from nine colonies assembled in New York City to present their grievances as a united body: the Stamp Act Congress. Merchants in major port cities, such as New York, Philadelphia, and Boston, agreed to start an economic boycott of British goods with the goal of seeing the Stamp Act repealed.

On November 1, 1765, the day that the Stamp Act was to be put into effect, colonial government, communications, and commerce all came to a halt. In late November and December, however, the Sons of Liberty and other activists persuaded businesses, courts, and newspapers to begin work again in defiance of the Stamp Act. By this time, however, the government that had passed the Stamp Act had long since fallen. George III found Grenville distasteful and replaced him with Charles Watson-Wentworth, Marquis of Rockingham, in July, 1765. Rockingham, who was much more sympathetic to the American point of view than Grenville had been, launched a campaign to repeal the Stamp Act. On February 22, 1766, the House of Commons, led by William Pitt, repealed the Stamp Act. As an

omen of things to come, however, they passed another law: the Declaratory Act (1766), which asserted Parliament's right to tax and make laws for the colonies.

STANDARD & POOR'S

Standard & Poor's Corporation (S&P) is the largest statistical service organization in the United States. It specializes in the securities field and includes a range of corporate investments, like stocks, bonds, mortgages, notes, scrip, rights, options, etc. Standard & Poor's Corporation (a division of the McGraw-Hill Companies in the 1990s) is the result of a merger between the Standard Statistics Company and Poor's Publishing Company. The Standard & Poor's Corporation, known by its trademarks "Standard & Poor's," "S&P," and "S&P 500," produces for investors useful collections of periodic reference publications containing financial statistics. S&P services include a weekly investment advisory service, a stock guide, a bond guide, industry surveys, and corporation records, as well as many other specifically targeted economic marketplace service sector guides. S&P has for many years produced its famous *S&P 500 Corporate Stock Index* in which 500 important companies, producing various large company or "blue chip" commodities, are averaged together with weights representing their importance in the total indexed selling value of their stocks. This index represents an aggregate view of the

primary marketplace in the United States and illustrates statistical trends in both growth and weakness. The Index presents an ongoing series of statistical "snapshots" of the market to aid investors. The only real competitor of S&P as a leading publisher of investment data is Moody's Investor Service, Inc.

STANDARD OF LIVING

Standard of living refers to the level of material well-being enjoyed by an individual or group. The standard of living is generally measured by the collective cost of goods and services that is considered to represent the essential consumption of any society's members. By some measures, the standard of living will also include certain publicly provided services, such as education, health services, transportation, and intangible quality of life factors like clean water and air, and cultural and leisure activities.

The term standard of living may also refer to the goals that individuals or groups obtain for themselves as consumers in terms of services, housing, furnishings, or automobiles. In the United States during the 1960s, the United States government's definition of poverty was developed as a variant of the general concept of the standard of living in the country. In 1996, for example, the average poverty line for a four-person family was a little over \$16,000. The indexes used to measure poverty and create specific dollar amounts to define poverty are based on arguably variable statistics, but the fact that a poverty index has been established bears witness that U.S. society appears to recognize what seems to be a baseline financial standard of living and is able to approximate those who are living below the current indexed standard during any given year.

STANDARD OIL COMPANY

The origins of the Standard Oil Company date from 1863 when John D. Rockefeller (1839–1937), son of a modest businessman, and two others purchased a refinery in Cleveland, Ohio. Rockefeller foresaw the potential of refining Pennsylvania crude oil, which would revolutionize the way people lighted their homes, fueled their vehicles, and powered their industries. With easy access to railroads and the Great

Standard Oil Company

Lakes, Rockefeller's home city of Cleveland, Ohio, soon became the hub for crude oil refining, thanks to the business acumen of Rockefeller and his partners.

After seven years of local success the company was incorporated in 1870. Rockefeller then began a series of shrewd business maneuvers, which included several mergers, the absorption of the next three largest refiners in the nation, and the use of favorable railroad rebates. (Rockefeller was such a hard-nosed negotiator that he talked the railroads not only into giving Standard Oil rebates; they even paid him rebates on his competitors' shipping!) In ten years, Rockefeller controlled \$33 million of the \$35 million annual refining capacity of the United States. By 1878 Rockefeller and partner Henry Flagler (1830–1913) had consolidated most of the oil refining in the nation, and Rockefeller became one of the five wealthiest men in the country.

The already gigantic company was growing at such an remarkable pace that it alarmed the "muckraker" exposé journalists of the late nineteenth century, like Ida Tarbell (1857–1944), who denounced Standard Oil as an "octopus," or a monopoly, strangling the forces of competitive capitalism, ruining the small businessman, and trampling on the rights of labor.

Standard Oil was, as the muckrakers said, a monopoly. Because it was able to establish dominance over its competitors in the field of refining, it was a "horizontal monopoly." And because it branched out from its original concentration on refining into the drilling of crude oil and the sale of petroleum products, it also became a "vertical monopoly."

One of Rockefeller's main contributions was in devising ways to structure this economic power. In 1882 Rockefeller and his associates established the first trust in the United States, which consolidated all of the company's assets under the New York Company, in which Rockefeller was the major shareholder. The 30 companies in the trust controlled 80 percent of the refineries and 90 percent of the oil pipelines in the country.

In an effort to check the monopolization of the economy, Congress passed the Sherman Anti-Trust Act in 1890. In 1892 the Ohio Supreme Court dissolved the Standard Oil Trust. The company, however, took advantage of the newly liberalized laws in New Jersey and incorporated there under a consolidated corporate structure. This maneuver enabled Standard Oil to continued to operate as a Trust.

Standard Oil accumulated \$830 million in profits from 1899 to 1911. In 1906 a federal lawsuit against Standard Oil broke up the New Jersey trust. While

Jersey Standard retained a number of smaller companies, it lost the largest refineries held in other states and its monopoly on production of oil and pipelines. Jersey Standard, still handling Rockefeller's trusts, acted quickly to acquire oil supplies in other states, particularly Texas. Although it eventually lost its domination of the oil market, the company was still huge and ripe for criticism.

In 1888 the first foreign affiliate of Standard Oil was created. The Anglo-American Oil Company Ltd. of London allowed Standard to begin securing interests outside the United States. It acquired companies in Latin America in the 1920s, particularly in Venezuela, and also expanded marketing companies abroad.

As more and more automobiles and trucks began to dominate transportation in the 1920s, Standard Oil's sales shifted from kerosene to gasoline. By 1950, however, the top-selling products were still fuel oils used as substitutes for coal to power ships and industrial plants; distillates used for home heating and diesel engines were also important products. The big profit earner, even in the early 1990s, remained crude oil, and not gasoline sales.

The legal confrontation finally came to a head in the United States Supreme Court in 1911. The Court ordered Standard Oil of New Jersey to divest itself of its 33 subsidiaries. Later the company changed its name to Esso, using the abbreviation from Standard Oil (S. O.). This caused protest from the companies that were still using the Standard Oil name, so the company officially changed its name to Exxon in 1972.

STANDARD TIME

Standard time was introduced in 1884; it was the outcome of an international conference held in Washington, DC, to consider a worldwide system of standard time. The international agreement divided the world into twenty-four different “standard” time zones; within each time zone, all clocks were to be set to the same time. The device of standardized time zones was necessitated by the expansion of industry: businesses, particularly those in the transportation industry, could not coordinate schedules when each community used its own solar time (the local time as determined by the position of the sun). Railroad schedules had been extremely complicated before the establishment of standard time zones, which the railroads readily adopted.

Each time zone spans 15 degrees of longitude, beginning at zero longitude (called the “prime meridian”), which passes through the observatory at Greenwich (a borough of London), England. Time zones are described by their distance east or west of Greenwich. The model also dictates that each time zone is one hour apart from the next. However, the borders of the time zones have been adjusted throughout the world to accommodate national, state, and provincial boundaries, further facilitating commercial activities. The contiguous United States has four time zones: Eastern, Central, Mountain, and Pacific. Waters off the Eastern seaboard are in the Atlantic time zone; Alaska, Hawaii, Samoa, Wake Island, and Guam each have their own time zones. Congress gave the Interstate Commerce Commission (ICC) authority to establish limits for U.S. time zones in 1918. This authority was transferred to the Department of Transportation in 1967. In navigation, ship operators typically use the local time (solar time) at Greenwich, which is called Greenwich mean time (GMT) or universal time (UT).

Standard time, while clearly borne out of necessity of the Industrial Revolution, has become only more critical in the decades since its adoption; the global business community relies on standard time to coordinate its activities.

STANFORD, LELAND

Leland Stanford (1824–93) was an industrialist and politician who amassed a large fortune from the development of the railroad industry in the west. He was one of the founders of the Central Pacific Railroad Company that helped build the first transcontinental railroad. He also served as governor of California and as a United States Senator. He donated a large portion

Leland Stanford.

of his fortune to found Stanford University in Palo Alto, California.

Leland Stanford was born on March 9, 1824, in Watervliet, New York, the fifth of eight children. Stanford received a sound education; he first studied at the Clinton Liberal Institute and then at Cazenovia Seminary in New York. After finishing school he began working in a law office and he was admitted to the bar in 1848. He later established his own practice in Port Washington, Wisconsin but a fire destroyed it in 1852 and Stanford decided not to rebuild his practice. Instead he moved to California, where his brothers had already settled, to join their business of selling supplies to miners.

It was in California that Stanford first became involved in politics. He actively participated in the formation of the California Republican Party, and he ran unsuccessfully for State Treasurer in 1857. Despite this loss Stanford continued to pursue a career in politics and in 1859 he ran for governor of California but lost again. However, in 1861 Stanford won the gubernatorial election by a plurality, due to a split in the Democratic Party. His most important political act as governor was keeping California in the Union during the American Civil War (1861–65).

Around the time when Stanford was elected governor he also became interested in the possibility of building a transcontinental railroad. He joined forces

Stanford, Leland

with Collis P. Huntington (1821–1900), Charles Crocker (1822–88), and Mark Hopkins (1814–78) to form the Central Pacific Railroad Company in 1861. Stanford and his associates were referred to as the Big Four. They were eventually responsible for building the western half of the first transcontinental railroad. Stanford served as president of the company from its formation until his death.

The Big Four had little knowledge of the railroad industry and very little capital to invest in the venture so they relied on their political talents and connections to support the project. As governor of California Stanford approved several public grants for the railroad work done in his state. In addition he used his political contacts to acquire generous federal grants for the railroad, which included land grants for railroad construction and loans for financing the project. Stanford generated large sums of public money for a company in which he had a major personal interest as a stockholder.

When his term as governor ended in 1863 Stanford devoted all of his energy to the railroad industry. At that time the Central Pacific began building its part of the transcontinental railroad with construction of tracks eastward from Sacramento, California. The Union Pacific Railroad Company built the westward line from Omaha, Nebraska and the two lines met at Promontory Point, Utah, on May 10, 1869. The Central Pacific laid 1,086 miles of track, while the Union Pacific had built 689, which was advantageous for Central Pacific, because government subsidies were based on mileage. The Big Four profited nicely from this venture, however, great hardships were encountered before the project was accomplished; many lives were lost. Construction crews consisting mainly of Chinese immigrants worked through two harsh winters in the high Sierras. The goal was to complete the project as quickly as possible.

Once that rail line was completed Stanford and his associates developed other rail and water transportation systems in California. They bought out competing lines such as the California Pacific Railroad Company and the San Francisco and San Jose Railroad. They organized the Southern Pacific Railroad, of which Stanford served as director from 1882 to 1893. This company built a second transcontinental railroad from California to New Orleans.

The Big Four believed that their business could remain profitable only if they maintained their rail monopoly in California. Their policy was one of aggressive defense by which they would prevent competitors from forming other entry points into the state. They also purchased major river and ocean shipping lines. The Big Four dominated the railroad industry in

the 1890s; their company was frequently criticized for being a “monopolistic octopus.” Nonetheless Stanford personally remained popular among the public.

After 1870 Stanford became less involved in the daily activities of the railroad company and he retreated to his ranch in Palo Alto, California. In 1885 he returned to political life and was elected to the United States Senate. As a U.S. Senator, Stanford advocated private rights in business. He opposed the Interstate Commerce Act of 1887 because it allowed for government regulation of businesses. Stanford also served on minor congressional committees and supported popular legislation such as the exclusion of Chinese laborers, industrial co-operatives, and soft money. He represented California in the Senate until his death in 1893 at the age of 69.

Leland Stanford accumulated a fortune from his railroad interests. Stanford was not known for his philanthropy but he donated to particular charities to ensure his family name would become an institution. In 1885 Stanford’s 15-year-old son died of typhoid fever while on vacation in Europe. Stanford was keenly interested in the boy’s education and as a memorial to his son Stanford provided a 20 million-dollar endowment to found the Leland Stanford Junior University in Palo Alto. The school opened in 1891 and grew to become one of the country’s most prestigious universities.

STATES' RIGHTS (ISSUE)

Because of its fundamental relationship to the political and constitutional foundations of the United States, the issue of states' rights has been an enduring problem throughout the history of the United States. At its core, the matter raised questions of sovereignty and authority, and often overlapped other questions, like whether the country should have a centralized or decentralized government. Moreover, it had strong implications for the American economy, especially regarding trade, tariffs, banking, and labor, among others.

In the early eighteenth century the thirteen colonies of British North America had more in common with the Crown, especially economically, than they did with each other. But as that relationship slipped into acrimony—especially during the American Revolution (1775–1783)—the fight against a common foe, the forces of independence, the communication between the respective social classes in the different regions of the country and the evolution to statehood forged a greater sense of unity among the former thirteen colonies. Under the Articles of Confederation (adopted in 1777) the states retained political autonomy. The Confederation Congress had little authority and was unable to exert any effective control over the economic activity of individual states as well as the states' relations with foreign countries and with each other. The national government could not levy taxes, issue money, or enforce a uniform tariff on imports and exports. Congress could only ask the states for funds with which to fight the war and carry out the work of government.

When the framers of the Constitution assembled in the spring of 1787, they were faced with the sobering evidence of what independence had wrought. The machinery of government was clearly too cumbersome for the tasks that it had to accomplish. Yet they also remained dedicated to their revolutionary ideal of more liberty and less government. In the end, the Constitution that they produced reflected both realities. In the Tenth Amendment, the framers granted to the states a kind of states' bill of rights which specified that “. . . powers not delegated to the United States by the Constitution; nor prohibited by it to the States, are reserved to the States respectively. . . .” The Constitution did give the federal government the powers to tax, borrow, and coin money, regulate foreign and interstate commerce, establish a postal service, and issue patents and copyrights, but it also imposed constraints on the government's ability to regulate trade. The federal government could not impose duties on exports, could not discriminate against the ports of any

state in its commercial regulations, could not restrict a carrier's freedom to enter or leave a state without stopping in another, and finally, could not extend any trade barriers between the states themselves.

When the First Bank of the United States (1791–1811) was chartered, the issue of states' rights was again raised. According to its charter, the First Bank was allowed to operate in all states, which gave it a considerable edge over state banks that could only operate in the states that chartered them. The First Bank maintained a large banking network in various parts of the country and it was also able to hold more notes than state banks. Proponents of states rights and advocates of free commerce, therefore, were instrumental in defeating legislation to re-charter the First Bank in 1812. They feared that it posed obstacles to the growth of state banks. This controversy continued when, years later, many critics blamed the Second Bank of the United States (1816–1836) for the panic (the word that was used for depression) of 1819. Maryland, Tennessee, Georgia, North Carolina, Kentucky and Ohio enacted laws to tax branches of the Second Bank out of existence. However, the Supreme Court handed down decisions in *McCulloch v. Maryland* (1819) and *Osborne v. United States Bank* (1824) which declared unconstitutional any state law that restricted the activities of the Second Bank of the United States.

During the 1820s and early 1830s, during heated Congressional debate over tariffs, the issue of states' rights again came to the fore. Southern states complained that the North was benefiting from tariffs at the expense of the South. Then Vice President John C. Calhoun (1782–1850), himself a southerner, put forth a states' rights constitutional doctrine called “Nullification”. In what came to be known as the “nullification crisis” the legislature of South Carolina declared that the tariffs of 1828 and 1832 were “unauthorized by the Constitution” and therefore “null, void . . . [and] . . . not binding upon this State, its officers or citizens.” The passage of that declaration of nullification, in the view of Calhoun and the legislature of South Carolina, automatically made the disputed law unconstitutional. Then the U.S. Congress was obliged to pass an amendment to the Constitution explicitly affirming the constitutionality of the law. At that point, the state had the option of either abiding by the law or else peacefully seceding from the Union.

Such a doctrine would have severely limited the central power of the federal government. Although the president at the time, Andrew Jackson, was on some issues friendly to states' rights, he was enraged over

Steamboat Act of 1852

this challenge to the sovereignty of the national government. He threatened to have Vice President Calhoun hanged, he mobilized the U.S. Navy, and had the U.S. Congress pass a “force bill” to ensure the effective implementation of the disputed tariff laws.

The nullification crisis was only a part of the cause for Southern economic and political discontent. The episode represented growing sectional differences between North and South. Tariffs, which tended to favor manufactured goods over raw goods, reaffirmed the agrarian South’s subordinate relationship to the North. After the Panic of 1837, Southern cotton went into a sustained decline while industrial commerce in the North continued to prosper. Moreover, because western expansion in the United States afforded Northeastern business interests other sources for raw goods, manufacturers became less dependent on the South as a supplier of raw materials.

Southerners believed that they were victims of a sinister conspiracy supported by Northern bankers, merchants, manufacturers, and their political agents. Southerners accused them of rigging prices, of manipulating the money market, and of causing much of the wealth of the South to flow steadily into the hands of the northern economic elite. On top of this, the South resented the Abolitionist Movement against slavery. In reaction to the anti-slavery movement, Southerners began to extol the differences between their agrarian economy and that of the industrialized North. Southerners characterized the institution of slavery as essential to their economy and their way of life. Slavery was a necessary labor regime, they argued, and the slaves themselves were almost like family members. Accordingly, they rooted their economic arguments in agrarian values and paternalistic notions of family and grounded their political voices in the rights of each individual state.

When the Southern vote against then-Presidential candidate Abraham Lincoln (1861–65) proved futile in the election of 1860, most South Atlantic states turned to what they believed was their only legal recourse—the right to secede from the Union. Secession was most popular in the deep South wherever the plantation system and slavery were well established. While many people in the upper South felt strong ties to the Union, they had a strong affinity for vested southern values, the southern agrarian economy, and the institution of slavery. Coupled with a strong belief in the rights of the states which dated back to Thomas Jefferson and James Madison, the issue of states’ rights was never so strongly articulated as when the southern states exercised what they believe was a Constitutional right to

secede. The outcome of that action, the Civil War and Reconstruction, resulted in settling the questions of precedence—the rights of states or the superior authority of a republican form of government.

STEAMBOAT ACT OF 1852

The Steamboat Act of 1852 was the U.S. Congress’ second attempt to ensure safety of the steamboats that dominated the nation’s waterways, principally the Mississippi River, where “packet” steamboats regularly ferried passengers and freight between St. Louis and New Orleans. The legislation improved an earlier (1838) law that had proved a weak attempt to enforce vessel operators’ compliance with certain safety standards and measures: vessels were required to undergo periodic hull and boiler inspections and to carry basic lifesaving and fire-fighting equipment. In the eight months preceding passage of the 1852 act, seven boiler explosions aboard steamboats claimed more than seven hundred lives. Congress responded to these maritime disasters by establishing precise standards for steamboat boiler construction, including rules about safety valves and operating pressures. It also set up a licensing system for all operators of passenger steamboats. Licensing came under the purview of the U.S. Department of Treasury, which hired civilian inspectors. The Steamboat Act of 1852 was the basis

for the U.S. Steamboat Inspection Service, whose authority was steadily strengthened by subsequent acts of Congress—most of them in response to further disaster along American waterways. In 1865 the boiler blew up on the steamboat *Sultana*, which was en route between Memphis, Tennessee, and St. Louis, Missouri. The explosion and resulting fire claimed the lives of more than 1,500 of the 2,300 people on board—many of them Union soldiers recently released from Confederate prisons. Since the Steamboat Inspection Service had certified the *Sultana* to carry only 376 passengers, it was cleared of any blame; the vessel's operators were held responsible for the disaster. Nevertheless, Congress subsequently passed a series of steamboat safety laws to aid the Inspection Service's efforts to enforce safety. An 1871 act gave the service the authority to issue licenses to masters, pilots, and engineers. In 1903 the service was moved from the Treasury Department to the Department of Commerce and Labor. When that department split in 1913, the service came under the purview of the newly formed Department of Commerce. In 1932 the Steamboat Inspection Service was merged with the Bureau of Navigation (established 1844), which became known as the Bureau of Marine Inspection and Navigation.

STEAMBOATS

Steamboats were first developed in the late 1700s and became commercially viable in the early 1800s. There were two types of steam-driven vessels—those designed for the deep coastal waters along the eastern seaboard of the United States and those designed to navigate the shallower inland rivers of the nation's interior. Steamboats are propelled by steam engines, which drive paddle wheels (either along the boat's side or stern) to move the vessel through water.

The first workable steamboat was demonstrated by Connecticut-born inventor John Fitch (1743–98) on August 22, 1787, on the Delaware River. He launched two larger vessels in 1788 and 1790, receiving a patent for his design in 1791. But Fitch's fourth boat was ruined by a storm in 1792 and the innovator lost the support of his backers.

The first commercially viable steamboat was designed by Pennsylvania engineer and inventor Robert Fulton (1765–1815); the *Clermont* made its maiden voyage on August 17–22, 1807, when it sailed up the Hudson River from New York City to Albany in thirty

hours, and then returned. The vessel was 133 feet long and had only a seven-foot (considered shallow) draft. The *Clermont* was the forerunner of the “western” steamboats that would soon dominate the interior waterways and Gulf Coast. In 1817 the stern paddle steamboat the *Washington* completed the first round-trip voyage between Louisville, Kentucky, and New Orleans, Louisiana—traveling along the Ohio and Mississippi rivers. By the end of that year dozens of steamboats were in operation on those two principle rivers and their tributaries; by 1840, there were more than two hundred on the Mississippi alone; by 1860, this number had swelled to more than one thousand. Mississippi steamboat traffic and trade had by 1850 pushed New Orleans to exceed New York City in volume of shipping, with New Orleans' outbound cargo accounting for more than half the nation's total exports.

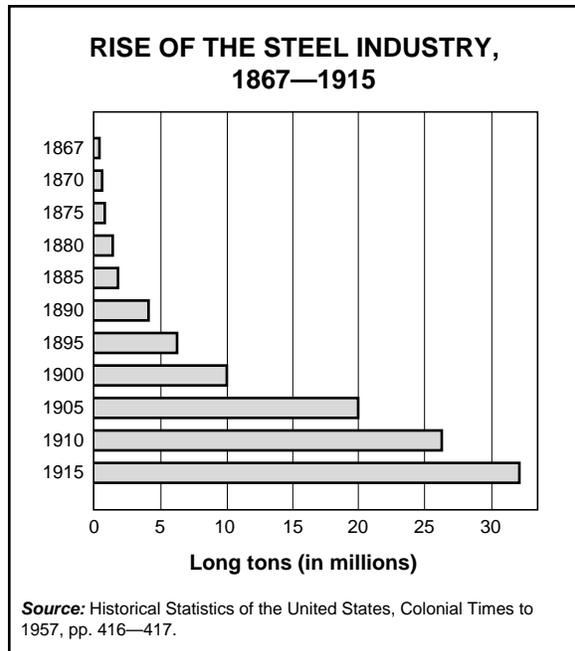

Steamboat technology was put to use on many kinds of vessels. Packets were the most common kind of steamboat; they carried passengers and cargo from city to city. There were also towboats (which pushed cargo barges), showboats (outfitted for the entertainment of the paying public), ferries (which carried covered wagons and other vehicles across waterways in the absence of bridges), dredges (to deepen existing waterways), and light tenders (which conducted maintenance along rivers). This variety of steamboats made settlement possible by permitting travel from West Virginia in the East to the Rocky Mountains in the West, and from Minnesota in the North to Louisiana in the South.

The development of transcontinental railroads later in the 1800s caused steamboat use to decline. For decades more, however, they maintained a place in the nation's ever-expanding transportation network, particularly up and down the Mississippi River.

STEEL INDUSTRY

Steel is an alloy of carbon and iron that is harder and stronger than iron. While the first ironworks were established in British North America in Jamestown, Virginia (1621), the U.S. steel industry did not develop on its own until after the American Civil War (1861–1865). Up until that time steel was too expensive to manufacture by the methods then available. Its use prior to the American Civil War was confined primarily to high-value products, and the United States imported nearly all of its steel until after the American Civil War.

The growth of the steel industry is measured by the amount of steel produced. As illustrated, steel production skyrocketed in the 20th Century, making the U.S. the largest steel producing country in the world.

The coming of the steam age in the early part of the nineteenth century created a huge demand for iron. Up to this time most iron mines, forges, and blacksmiths were small operations. Steam created a demand for rolled iron to be used in making boilers. Using iron boilers, as the railroads and paddle-wheel river boats of the time did, was dangerous because the iron was not strong enough to contain the steam pressure and they often blew up, causing death and carnage. In addition, more than 30,000 miles of railroad track with iron rails were laid in the United States between 1830 and the beginning of the American Civil War. As a result iron mills became major enterprises, but the iron rails frequently warped because of temperature extremes, causing derailments.

Two inventions in the 1850s resulted in the rapid rise of the steel industry, which supplanted the iron industry by the end of the nineteenth century. One was the Bessemer process for making steel, developed by British engineer Henry Bessemer in 1856. The second was the Siemens-Martin open-hearth method, introduced in 1858. These processes, once perfected, greatly reduced the cost of producing steel. The first Bessemer converter in the United States was built in 1864, and the first open-hearth furnace, which was better suited to American iron ore, was built in 1868, and they both spurred steel production in the United States. By 1873 the United States was producing nearly 115,000

tons of steel rail, approximately one-eighth of all U.S. steel production. As the price of steel continued to drop, steel rails replaced iron rails. The “iron age” was over.

BY 1910 THE UNITED STATES WAS PRODUCING MORE THAN 24 MILLION TONS OF STEEL, BY FAR MORE THAN ANY OTHER COUNTRY. UNTIL WELL AFTER WORLD WAR II, THE STEEL INDUSTRY WOULD BE THE MEASURE OF THE NATION’S ECONOMY.

Between 1880 and 1900 U.S. steel production increased from 1.25 million tons to more than 10 million tons. The industry underwent consolidation as mill owners sought to benefit from economies of scale and to avoid what they called “ruinous competition.” Led by Andrew Carnegie, Henry Clay Frick, Charles Schwab, and others, the modern steel industry took shape. It was a period of violent labor disputes, most notably the Homestead strike of 1892. The companies managed to hold off unionization until the 1930s. In 1901 financiers J. Pierpont Morgan and Elbert H. Gary formed the United States Steel Corporation. With a capitalization of \$1.4 billion, it was the largest industrial enterprise in the world. By 1910 the United States was producing more than 24 million tons of steel, far more than any other country. Until well after World War II (1939–1945), the steel industry would be the measure of the nation’s economy.

In 1969 U.S. steel production peaked at more than 141 million tons. It was a time when international competition, led by newer and more efficient Japanese and European steel plants and by lower labor and transportation costs, began to challenge the U.S. domestic steel industry. The industry underwent a major shakeout in the early 1970s, and by 1975 U.S. steel production had fallen to 89 million tons. The industry suffered a major depression from 1982 to 1986. By 1988 production was up to more than 102 million tons, with greater efficiencies resulting in a smaller but more productive workforce. Then in 1991 it slipped to less than 90 million tons as an economic recession set in.

During the 1990s, restructuring, increased automation, new production techniques and upgraded facilities made U.S. steel-makers more productive. In the early 1990s approximately three-quarters of all U.S. steel production was accounted for by traditional integrated steel mills, which undertook every step of the steel making process, converting mixtures of iron ore, limestone, and coke (made from coal) into molten iron using a blast furnace. The molten iron was then converted into steel using basic oxygen furnaces (BOFs),

after which the steel was cast into ingots and shaped. Some mills utilized a process called continuous casting that bypassed the production of ingots. The top six firms accounted for \$25 billion worth of steel, or 40 percent of all shipments in 1992.

A second, fast-growing steel producer, known as “minimills,” accounted for one-quarter of U.S. steel production in the early 1990s. Minimills are non-integrated mills that feed scrap iron or steel into an electric arc furnace (EAF) rather than a blast or basic oxygen furnace. By 1997 minimills had the capacity to produce in excess of 50 million tons per year of carbon, alloy, and specialty steels—more than 40 percent of the total U.S. raw steelmaking capacity of 120 million annual tons. About 80 firms operated more than 100 scrap-fed electric steel plants in the U.S. in 1997. Minimills were projected to account for nearly half of all steel buyers’ needs by 2000.

By the mid-1990s the U.S. steel industry was in good economic shape. From 1992 to 1998 it spent an aggregate of \$50 billion to modernize its plants, and steel companies improved their financial position by reducing debt, underfunded pension plans, and other liabilities. After two strong years industry performance slackened slightly in 1996 as some plants suffered breakdowns after running at full capacity. Raw steel production during 1996 was 99.4 million tons, up from 97.1 million tons in 1995. Steel shipments rose in 1997 to 105.9 million net tons, then fell 3.5 percent in 1998 to 102.1 million tons.

Strong demand in the United States for steel in 1997 and 1998 resulted in a significant increase in imported steel of various kinds. Cheap imports from Russia, Japan, Brazil, and other countries forced the price of commodity grade steel down more than 10 percent in just a few weeks. To prevent other countries from dumping steel into the United States market, the U.S. steel industry could file antidumping petitions with the U.S. International Trade Commission, under the U.S. Department of Commerce, and the International Trade Administration. (“Dumping” refers to the practice of one country selling commodities or finished products in another country at below cost or fair market value.)

Since 1980 the steel industry used antidumping complaints as a tool to curb imports, and in 1998 it filed complaints against Japan, Russia, and Brazil. However, the wave of imported steel, coupled with a projected slowdown in the growth rate of the U.S. economy and excess world steel producing capacity, signaled that 1999 would see a decline in the U.S. steel industry.

STEEL PLOW

The steel plow was invented in 1837 by American John Deere (1804–1886). A blacksmith’s apprentice for many years, Deere opened his own shop in Grand Decatur, Illinois, in 1836. Customers complained that their wood or iron plows proved ineffective in turning the prairie sod, which stuck to the implement’s surface. Deere began tinkering with a smooth steel surface to make a plow that could successfully do the job. Using the steel from an old circular saw, he fashioned the first steel plow the next year. It worked as expected; the prairie grass fell away from the plow’s smooth surface. The invention was a success and it proved to be a boon to corn farmers in the region. By the mid-1840s Deere and a business partner were manufacturing one thousand steel plows each year.

After the American Civil War (1861–1865) many farmers moved westward, encouraged by the land grants provided by the Homestead Act of 1862. Settling the Great Plains, these homesteaders created a growing demand for Deere’s steel plow, the only implement capable of turning the prairie sod of the plains. By this time Deere had improved the quality of the steel he used and he had gone into business for himself, setting up John Deere and Company in 1868. The business he founded continues to manufacture steel plows and other agricultural machines, including tractors.

STEVENS, JOHN

John Stevens (1749–1838) was an engineer and inventor who was one of the earliest U.S. experimenters with steamboats. He built his career on promoting better transportation, not only with steamboats but also with railroads. Stevens built the first steam-powered locomotive in the United States. He firmly believed that efficient transportation on both land and water would be the main source of progress and prosperity for the country.

John Stevens was born to a wealthy family in New York in 1749. His father was a merchant and ship owner who was also politically active. Stevens was raised in Perth Amboy, New Jersey, and educated in small schools devoted to business training. He graduated from King's college (now Columbia University) in 1768 and then studied law. Three years later Stevens began working as a practicing attorney for the royal governor of New York. He soon discovered that he was more interested in politics than law and he became treasurer of New Jersey during the American Revolution (1775–1783). He rose to the rank of colonel through his fundraising efforts for the patriot cause.

In 1782 John Stevens married. Two years later the couple bought a large estate on the west side of the Hudson River, in what is now Hoboken, New Jersey. It was there that Stevens became fascinated with the idea of steam-powered transportation. Stevens bought a ferry service between Hoboken and New York and sought to improve it with steam-powered boats. He was inspired by John Fitch's steamboat, which ran along the Delaware River in 1788. At age forty Stevens taught himself the engineering science behind steam power. Soon he was able to draw his own designs for boilers and engines. Stevens then petitioned the New York legislature to grant him the exclusive privilege of steam navigation in the state, but he was unsuccessful. He was also unsuccessful in several other states, so he instead turned to his political connections in Congress and petitioned for the first federal patent laws in 1790. In August, 1791, Stevens was awarded a patent for improving steam machinery.

In 1797 Stevens joined his college friend Nicholas I. Roosevelt, and his brother-in-law Robert R. Livingston, in a partnership to build and operate steamboats. The partners disagreed over technical matters, such as the proper way to apply steam and they never built a successful boat together. In 1804 Stevens did manage to build a prototype, however, with the help of his sons.

The boat, called *Little Juliana*, used a new high-pressure steam engine and two screw propellers. Meanwhile, Stevens' brother-in-law Livingston had purchased a temporary exclusive contract for steamboats on the Hudson River. Livingston believed that Stevens' boat did not meet the contract's speed requirements, so he instead convinced inventor Robert Fulton (1765–1815) to produce his five-mile-an-hour steamboat in the United States. Stevens was offended by Livingston's actions and he refused a place in the partnership of Fulton's future steamboat. In 1807 Fulton's boat, the *Clermont*, made its historical round trip voyage from New York to Albany.

Soon afterwards Stevens launched his first ocean-going, 100-foot steamboat called the *Phoenix*. In June of 1809 his son, Robert Livingston Stevens, captained the boat on its maiden voyage to Philadelphia. Because Fulton monopolized the use of the Hudson River, Stevens operated a ferry service on the Delaware River between Philadelphia and Trenton.

Stevens decided to pursue other transportation interests and around 1810 handed his steamboat interests over to his sons, who had also become capable and respected engineers. He turned his attention to adapting steam technology to the railroad, educating Congress on the advantages of the railroad over canals. Stevens succeeded in persuading Congress to pass the first U.S. railway act, which then led to the formation of companies to construct railroads, including a line from the Delaware to the Raritan River. Stevens also invented and constructed the first steam locomotive built in the United States. In 1825 he ran the experimental locomotive on a circular track on his estate in Hoboken.

Stevens dedicated his life to improving transportation and educating others about the benefits of efficient modes of transportation. He became a leader in promoting the utility of steam railroads in the United States. He also explored other transportation improvements before his death in 1838. For example, he designed a bridge and underwater tunnel from Hoboken to New York, and he also planned an elevated railroad system for New York City.

STOCK

Stock is a form of ownership interest in a company and a way for companies to fund their growth. A share of stock in a company represents a fraction of ownership or equity in that company's assets and growth. In exchange for giving the shareholder a piece of ownership, the shareholder takes the risk that the earnings of the company will decline, which could reduce the value of the shareholder's initial investment. The buyer of a company's stock is willing to take this risk because if the company's earnings grow rapidly the stockholder gets to share proportionately in that wealth. For example, an investor bought \$1000 of stock in Digital Equipment Corporation in 1991 saw the investment fall in value to \$651 by 1996. But an investor who invested \$1000 in the stock of EMC Corporation in 1991 saw that investment increase to \$18,700 five years later. Some investors prefer investing in bonds because bonds assure them of a specific return on their investment. No bond, however, can promise the eighteen-fold growth EMC gave its stockholders between 1991 and 1996.

There are two basic forms of stock: common and preferred. In addition to an ownership stake in the company, common stock, also called "ordinary shares," entitles the shareholder to periodic payments of dividends, which are a share of the company's earnings, as well as a claim on the assets of the company if it goes bankrupt. Most common stock also gives the shareholder a right to vote on changes in the company's bylaws, on the election of corporate directors, and on any mergers with other companies. Holders of preferred stock usually do not have the same voting rights as common stockholders, but if the company goes bankrupt their share in its assets must be paid first before common stockholders receive their assets. Finally, the dividends that common stockholders are paid

depend on the company's actual earnings, whereas preferred stockholders are always guaranteed a fixed dividend.

The practice of selling shares of stock arose as a way for companies to raise large amounts of capital for their projects. For example, the joint stock companies that took the financial risk of settling the New World did not need to rely only on banks or governments to raise funds—they could have raised the money they needed by selling shares to investors. Even in the late twentieth century many new companies started out as privately owned firms with a few owners and grew through bank loans or the investments of a few private investors. Many private firms reach a point in their growth where the only way to fund the massive investments they need to continue growing is by "going public," that is, to sell a stake in their ownership of their company to the broad public. In 1995, 107 billion shares of stock changed hands, and by 1997 the total value of all the stock traded on the New York Stock Exchange alone was \$7.6 trillion.

STOCK MARKET

Like a grocery market, a stock market is a place specifically designed to facilitate the purchase and sale of certain goods. Instead of selling food and supplies like a grocery, the stock market provides a venue for trade in companies, ventures, and other investments through the buying and selling of stocks, bonds, mutual funds, limited partnerships, and other securities. There are several regional stock exchanges throughout the United States, but the U.S. stock market is dominated by two exchanges: the New York Stock Exchange (NYSE) and the National Association of Dealers Automated Quotation (system), better known as NASDAQ-Amex. In 1996 investors could buy and sell the shares of about 3000 companies on the NYSE and some 5400 companies on the NASDAQ-Amex.

The NYSE was the first stock exchange established in the United States. It began operations on the island of Manhattan in New York, in 1792. The American Stock Exchange (Amex) started trading in the 1850s. At first the number of companies investors could buy shares in was quite small, but as the U.S.

Close up view of a ticker tape machine used to follow the stock markets.

economy exploded in the nineteenth century, businesses found it harder to fund ambitious new undertakings, like railroad construction, by relying only on their own resources or loans from banks. To raise the needed capital, companies turned to the stock market, where they sold stock (shares of which represents part ownership in the company) to the public.

THE STOCK MARKET ENTERED THE DAILY LIVES OF MILLIONS OF AMERICANS DURING THE 1920S, WHEN ECONOMIC GROWTH AND THE DESIRE TO STRIKE IT RICH QUICK DROVE STOCK PRICES TO AN ALL-TIME HIGH IN AUGUST 1929.

While individuals may invest in the stock market for a variety reasons, one of the primary motivators is to make a higher return on their money than may be available through a traditional, conservative bank savings account. The stock market, however, has more risk attached to it than does money in the bank. For instance, if a new telecommunications company offers its stock for sale on the market and performance outlooks for this company are promising, investors may rush to buy the stock, its value will go up, and the company will raise lots of capital. If, however, by the

end of the year, the company has posted poor earnings and the performance outlook has turned sour, the same investors who rushed to buy stock in the company may now rush to sell, causing the value of the stock to drop.

The stock market entered the daily lives of millions of Americans during the 1920s, when economic growth and the desire to strike it rich quick drove stock prices to an all-time high in August 1929. Stock prices, however, were not in line with companies' actual earnings, and many people bought shares only through heavy borrowing, so at the first signs of uncertainty in the market in September 1929, the market collapsed, hitting rock bottom in July 1932. In the 1930s, the government took steps to reform the stock market and established the Securities and Exchange Commission to regulate stock trading. The 1950s and 1960s were periods of great growth in the number of companies selling shares on the stock market and in the number of investors buying stocks. In 1971 the NASDAQ was formed to provide a stock market for "over-the-counter" stocks, i.e., stocks not listed on the regular stock exchanges. One of the greatest bull markets in stock market history began in 1982, and 16 years later the NASDAQ and Amex merged to compete more effectively with the NYSE.

Trying to cover his Wall Street losses, this man attempts to sell his roadster on the streets of New York for \$100 cash.

STOCK MARKET CRASH OF 1929

During the 1920s increasing numbers of Americans became interested in Wall Street and in buying stocks. A prospective buyer did not have to pay the full price of a stock in order to buy. Instead the practice of “buying on margin” allowed a person to acquire stock by expending in cash as little as ten percent of the price of a stock. The balance was covered by a loan from a broker, who was advanced the money by his bank, which, in turn, accepted the stock as collateral for the loan. Credit was easy, and the Federal Reserve System did little to restrict the availability of money for stock investment.

But mindful of the run of the bull market and the practice of buying on margin, pessimists kept insisting

that all was not right with the speculative boom. Many newcomers to the market failed to realize that a stock certificate was only a piece of paper, and that its primary worth was essentially connected with the prosperity of the company that issued it. A strange and frightening fact was becoming apparent to some observers—the increase in the market value of most stocks often had little relationship to the profits or prospects of the issuing companies. The stock itself had taken on a life of its own, based on the circumstance that people were bidding for these equities (stocks) at ever-rising prices. Stock prices represented not corporate profit, but speculative buying of stock certificates.

In September 1929 confidence in the market’s ability to continue its upward spiral began to weaken. Stock prices turned lower. Apparently investors were turning from “bulls” to “bears” in increasing numbers and were selling short. As the market was crowded with inexperienced but feverishly eager investors who lacked capital reserves, the falling prices produced a shock effect. For the small investor who had all of his/her money tied up in stocks, it became imperative to sell fast before the prices dropped lower. Since many

Streetcars

people were in this situation, orders to sell flooded the market until the ticker tape could not keep pace with Exchange transactions. Chaos reigned as the figures listed on the “big board” became increasingly out of line with actual selling prices. Ignorance was an additional element in the panic.

To stem the crisis, a group of leading New York bankers decided to act. Meeting in the office of Thomas W. Lamont, a partner in J.P. Morgan and Company, the bankers pooled their resources and bought stock above the current market levels. Their purchases might be insignificant, but they reasoned that the well-known personalities involved might serve to restore the confidence of the small investor. Accordingly, on Thursday, October 24, 1929, Richard Whitney, vice-president of the New York Stock Exchange and broker for the House of Morgan, entered the market and attempted to stem the tide. Amazingly the tactic worked, but only temporarily—on the following Tuesday, October 29, 1929, the bottom fell out of the market. Within two weeks the value of stocks on the exchange had declined some 37.50 percent, and by early 1932, stocks were worth only 20 percent of their value at the 1929 peak.

As the debacle on Wall Street continued, the average New Yorker could still speak with scorn of the “numbers game.” After all, the economy of the United States was apparently still in good shape. The railroads, the steel mills, communications facilities, and large segments of the citizenry stood untouched by the panic. Professor Irving Fisher of Yale University reassured the nation about the general state of the economy. The average citizen had little awareness that the figures on the “big board” at the New York Stock Exchange were indicative of forces which would have an impact upon how the majority of Americans lived or acted. They were soon made painfully aware of the situation. The Stock Market Crash of 1929 developed into the long-lasting Great Depression (1929–1939) and affected every aspect of American life.

STREETCARS

Streetcars, also called trolleys, are power-driven vehicles that run on tracks through city streets. Prior to their invention, public or for-hire vehicles ran through urban areas: drawn by teams of horses or mules, the “horse railway” was of limited use, however, allowing only a few riders at a time. This method of transport was in use in eastern cities such as New York, Philadelphia, and Boston since the 1830s. It was substantially improved in 1852 when a grooved rail was developed, allowing the tracks to lay flush with the pavement. This improvement increased speed and capacity, and decreased interference with coach and wagon traffic. By the mid-1880s, more than four hundred horse-car companies operated in the United States, covering some six thousand miles of urban tracks and carrying close to 200 million passengers a year.

In 1871 American engineer and inventor Andrew Smith Hallidie (1836–1900) patented a street railway system, run by constantly moving underground cables or ropes, to which the cars were clamped. (The cables were powered by steam engines.) Hallidie’s cable car system was introduced in San Francisco in 1874: the cars, which ably managed the city’s hilly terrain, were a success. Soon other American cities, including Philadelphia, New York, and Chicago, installed cable cars. Chicago soon boasted the most extensive cable system in the world: By 1894, more than 1,500 cars operated on eighty-six miles of track. Cable car transportation peaked in the United States in 1890, when systems in twenty-three cities carried a total of 373 million passengers that year.

In the mid-1880s, the electric streetcar or trolley was invented in the United States by American engineer and inventor Frank Julian Sprague (1857–1934). An overhead electric wire provided the power and was capable of moving several cars at once. The cars

In 1893, just six years after the system's successful debut in Richmond, Virginia, there were more than 250 electric streetcar railways in the nation, operating on some 7,200 miles of track. By 1903 this number had climbed to more than 29,000 miles and represented 98 percent of the nation's urban rails.

resembled railroad cars and could travel as fast as twenty miles per hour. They ran along street tracks—just like the cable cars—but the trolleys were cleaner and cheaper to operate than either cable cars or horse drawn railcars. They reduced the average fare by as much as half (from ten cents to a nickel). The new technology was embraced at an impressive rate, making the electric streetcar one of the most widely accepted innovations in the history of technology (according to Kenneth T. Jackson, author of *Crabgrass Frontier: The Suburbanization of the United States*). In 1893, just six years after the system's successful debut in Richmond, Virginia, there were more than 250 electric streetcar railways in the nation, operating on some 7,200 miles of track. By 1903 this number had climbed to more than 29,000 miles and represented 98 percent of the nation's urban rails. Except for San Francisco, where the cable cars remained a nostalgic link to the city's past, cable cars had been replaced with the electric streetcar.

As city streets became congested, large urban centers undertook expensive public works projects to build elevated tracks to run "els" (elevated streetcars) or to dig tunnels to run subways. Boston opened the first American subway in 1897; New York's first subway line opened in 1904.

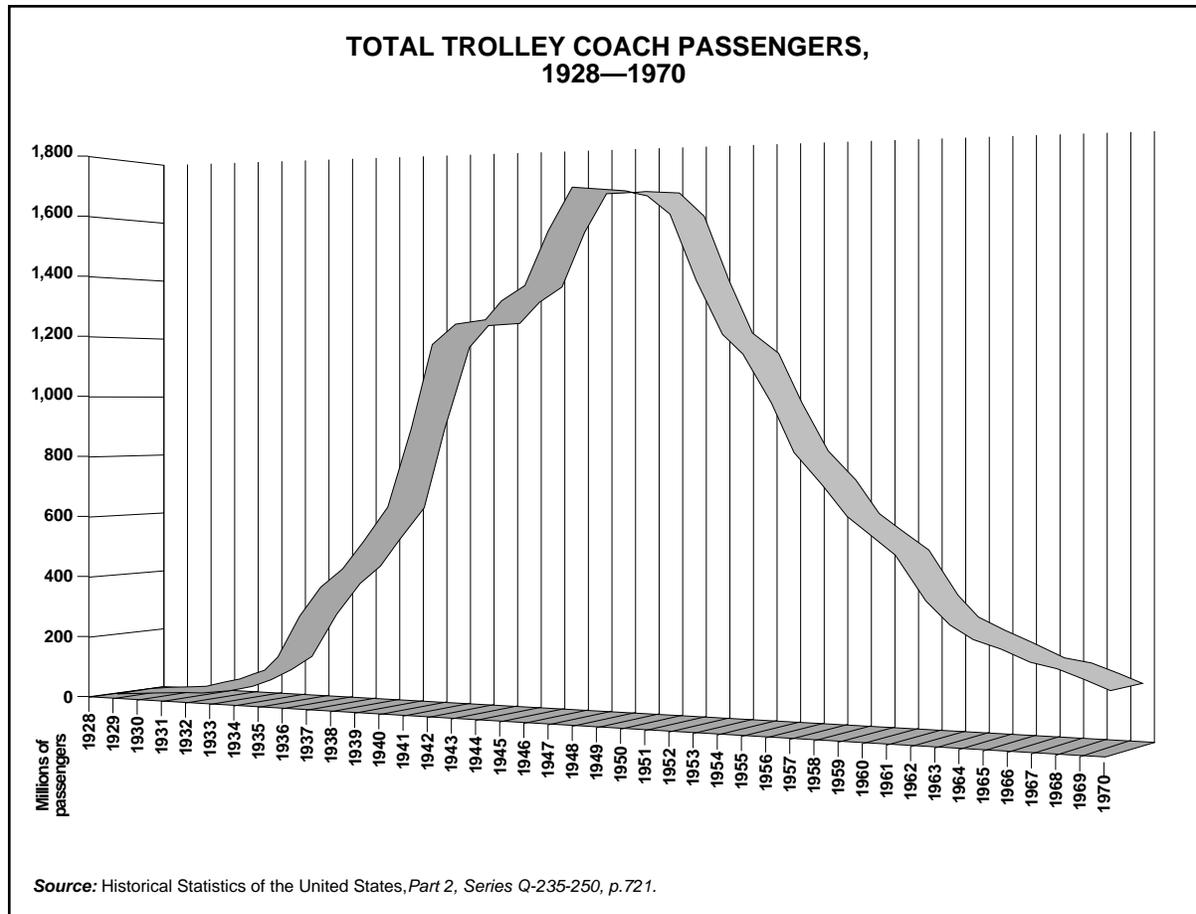

The advent of mass transit in the form of streetcars and subways had far-reaching effects: Cities were no longer defined by walking distances and began to expand outward. In many urban areas, including Chicago, streetcar lines were laid well beyond existing city boundaries. Outlying areas were quickly developed into residential neighborhoods. The country's burgeoning middle class, which could afford the typical streetcar or subway fare, was drawn to life in these quiet, tree-lined outskirts—far from the congestion of the inner city, which became increasingly devoted to business. Real estate development flourished, and a house in the suburbs became the goal for many working class families who remained, by necessity, in the

cities. The trolley system, els, and subways had given rise to a population of commuters and began a cycle of urban sprawl that continued throughout the twentieth century. By the middle of the century, however, the automobile had largely overtaken public transportation. Between 1945 and 1981, 75 percent of government transportation dollars were allocated to building the nation's highways and a mere 1 percent was dedicated to public systems such as buses, trolleys, and subways.

STRIKE

A strike is a concentrated effort by a group of workers, to withhold their labor from their employer, for the purpose of creating favorable changes in wages, benefits, or working condition, or for winning employer recognition of labor union representation. There are different forms of strikes. A primary strike is a work stoppage aimed at an employer, directly. A sympathy strike is one where employees refuse to work in sympathy with others who are directly involved in a dispute. A sit-down strike happens when workers stop work and refuse to leave the employer's premises in order to prevent the hiring of replacements. A wildcat strike is one that occurs spontaneously, without formal union authorization. A general strike is an effort to stimulate a general work stoppage and has political overtones. All of these strikes have been common in the United States, with the possible exception of the general strike; a technique most often practiced in Europe, and Third World countries.

Strikes began to occur with some regularity in the United States in the nineteenth century and were regarded as illegal because they restrained trade. Any kind of strike is a test of economic strength and will. A union tries to prevent business operations and cause a loss of profits to the employer, in order to force changes. The employer tries to maintain profitability and maintain operations hoping pressures from loss of pay rise enough to force workers to return to work. During a strike the striking employees, often represented by a union, will attempt to prevent the employer from operations by picketing the employer's facilities. Picketing is the walking back and forth outside of the employer's premises by union members on strike, carrying picket signs with short statements on them relating to the issues of the strike. Picketing becomes a

The rise and fall of passengers on trolley coaches is indicative of the effect of suburban growth upon mass transit systems.

public announcement of the existence of a labor dispute. It also serves the purpose of giving notice to other workers and the public, asking them in effect not to cross the picket line. While on strike workers generally receive “strike benefits” from their union, a small money stipend to help them with necessary expenses while remaining committed to continuing the strike until a settlement is reached. During the 1990s there were roughly 3000 to 5000 strikes per year, most of them a result of unsuccessful contract negotiations.

STRUCTURAL UNEMPLOYMENT

Structural unemployment is a type of unemployment that occurs to workers who are displaced by a change in marketplace needs. When the computer industry began its rapid rise, many workers were caught

at a disadvantage. They did not learn the skills or did not already have them coming into the job market, which now demanded computer know-how. Unless these individuals learned the necessary new skills, they faced the possibility of structural unemployment.

Another instance where structural unemployment occurs concerns geography. During the 1970s, the automobile industry, concentrated in the Midwest, experienced a downturn. As a result, many in the auto labor force became unemployed. At the same time, the oil industry in Texas was experiencing a boom. Many workers unemployed in the Midwest and who also possessed skills that would benefit them in Texas chose to move West to take advantage of the economic opportunities available there.

The disparity between skills and/or labor may also be called mismatch unemployment. Workers who are only familiar with word processing can not fill job vacancies for computer programmers. Technology and competition can also play a role in structural unemployment. The U.S. steel industry, which established

itself during the nineteenth century, is at a disadvantage competing with the steel manufacturers in less developed nations, who benefit from the more recent development of their industry through the use of the latest technology.

Time spent learning the new skills demanded by the current job market can be consuming and, in addition, not all individuals are willing to pursue a job search in a new location. Thus, structural unemployment can be enduring.

STUDEBAKER

The Studebaker Corporation traced its business origins earlier than any other U.S. automobile manufacturer. It started in 1852 as a family operated blacksmith shop in South Bend, Indiana, and began manufacturing wagons five years later. During the American Civil War (1861–65) government contracts for wagons brought the firm new prosperity. In March 1868 brothers John, Clement, and Peter Studebaker each invested \$25,000 and incorporated as the Studebaker Brothers Manufacturing Company.

In the highly competitive wagon industry, Studebaker became the world's largest manufacturer. With good management, technological innovation, and capital expansion, it pursued a strategy of large scale manufacturing of high quality products known for durability and beauty. Through a well-coordinated distribution system, its national marketing captured the dominant share of the large farm wagon market and a profitable share of the urban wagon and carriage markets. By 1870 it also became the government's largest supplier of wagons.

Studebaker became a modern corporation in 1893 through the efforts of John Studebaker's son-in-law, Frederick Fish, a Wall Street lawyer. The reorganization shifted power from the family to investors represented on a newly created board of directors. With additional capital and new leadership, the firm made a decisive change in its product line. Overcoming resistance from the surviving Studebaker brothers, Fish pushed the company into the new automobile industry. Studebaker started cautiously in 1897 by making bodies for the New York Electric Vehicle Company, and three years later it began manufacturing its own automobiles. Although Studebaker continued making carriages until 1910 and wagons until 1918, it was firmly

committed to the automotive industry when the corporation reorganized again in 1911.

Under the leadership of president Albert Russell Erskine from 1915 to 1933, Studebaker attempted to become one of the dominant automobile manufacturers. Concentrating on producing trucks and cars for the competitive medium-priced market, it enjoyed its golden years immediately after World War I (1914–18), and it stood behind only the Ford Motor Company and General Motors in total assets. In 1924, however, it failed to buy out the Maxwell Motor Corporation, losing to Walter P. Chrysler, who then succeeded in building his own big, multi-model firm. Thereafter Studebaker remained one of the so-called "Independents," relatively small automakers, in an industry dominated by the Big Three—General Motors, Ford Motor Company, and Chrysler Motors—all based in Detroit.

By March 1933 Studebaker was unable to pay its creditors because of president Erskine's high dividend policies despite an automobile market that was shrunk by the Great Depression (1929–39). Studebaker might have disappeared then, as many other Independents did during the Depression, however, it survived a court ordered bankruptcy and reorganized again in 1935 under the leadership of two former vice presidents. With president Paul G. Hoffman concentrating on sales and public relations and chairman Harold Vance concentrating on production, Studebaker recovered. From its headquarters still in South Bend, the firm produced cars (including the new low-priced Champion) with innovative engineering and design that distinguished them from Detroit products. By 1940 the firm was the largest of the Independents, with a market share of almost 2.5 percent. The national economy recovered from the Depression and the future looked bright.

World War II (1939–45) then significantly altered the automobile industry. When all civilian automobile production ceased by government order, automakers operated as defense contractors. Studebaker manufactured trucks and other products under government contracts that guaranteed profits without competitive pressures to control production costs.

After the war high consumer demand for new cars allowed all the Independent automakers to increase their market shares and total volume. Hoffman and Vance expressed optimism because Studebaker's distinctively designed cars attracted wide attention and increased sales. Studebaker reached its peak of prosperity in 1950, with record sales that brought it a four-percent market share. However in its rush to take

1947 Studebaker Champion Coupe.

advantage of the strong postwar market, the firm failed to modernize its plants, reduce high production costs, or correct worsening product quality. After the Korean War (1950–53) the loss of defense contracts and fierce competition between General Motors and Ford for industry leadership put all the Independent automakers at greater risk. Hoffman and Vance recognized that Studebaker was too small to survive alone and in 1954 they arranged a merger with the Packard Motor Company of Detroit.

Under the leadership of James J. Nance, formerly Packard's president, the new Studebaker Packard Corporation tried to imitate the Big Three. But Nance's efforts to cut production costs and improve quality led to labor strife in South Bend. Similarly, his efforts to imitate Detroit automakers' products failed to increase the company's declining sales. With losses mounting, Studebaker Packard survived only by merging in 1956 with Curtiss-Wright, the aeronautical firm. During the late 1950s it recovered somewhat by introducing a compact economy car, but the Big Three soon captured that market as well. In 1962 Studebaker made its last effort to find a niche in the automobile industry by launching the Avanti, a distinctive, streamlined sports type car with an all fiberglass body. However, small

volume production of that car could not sustain the automaker. In December 1963 the South Bend plant closed, although car production continued on a reduced scale in Hamilton, Ontario, Canada until the fall of 1967. Then, the combination of its small size, inability to keep pace with competition, and managerial errors over a long period finally ended Studebaker's role as an automaker.

Nevertheless, the close of its automotive history did not mean the end of Studebaker. As it scaled down its automobile production during the early 1960s, it pursued a survival strategy of diversification. In November 1967 it arranged a new merger that created the Studebaker-Worthington Corporation. Producing a wide variety of products, some for the automotive industry, it operated for twelve years until it was absorbed by McGraw-Edison.

SUBSIDIES

A subsidy is a government payment to individuals, businesses, other governments, and other domestic institutions and organizations. Unlike government purchases, for which the government receives goods or services, subsidies do not provide the government with any goods or services in return. The purpose of government subsidies is to ensure the availability of necessary goods and services.

A wide range of domestic businesses, individuals, and other organizations in the United States are eligible for government subsidies. A complete listing of all federal subsidies can be found in the government publication, *Catalog of Federal Domestic Assistance*. Among the areas receiving government subsidies are agriculture, maritime industries, and mass transportation.

SUBSISTENCE AGRICULTURE

Subsistence agriculture is a system of farming that provided the amount of crops the farmer needed to feed his family, with very little surplus to sell. During settlement of what became the United States, European immigrants were interested in securing land titles or renting lands so they could establish their families and begin to farm. Because shipment of produce was costly and time-consuming, only farmers near ports grew crops that would be sold for cash.

While southern plantations yielded bumper crops and grew richer on their exports, the typical settler of colonial times could afford neither vast land holdings nor slaves. The vast majority of farmers worked their own fields with the help of their families. They supplemented their harvest by raising a few heads of livestock and by hunting and fishing. In this way the early life of the settlers was not very much different from the

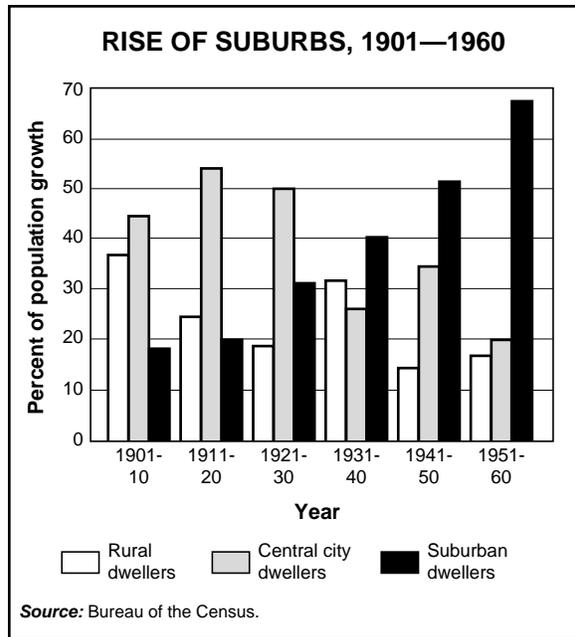

lifestyle of the American Indians who had settled the land before them.

SUBURBS, RISE OF

The growth of U.S. cities in the nineteenth century was integrally linked with expanding industrialization and economic development. This process of urbanization led to the formation of a “classic” pattern for U.S. cities by the 1930s. Commercial centers that included banking districts and retail establishments were located in downtown areas. Enclaves of working-class neighborhoods were often distinguished by a predominance of ethnic or minority populations circling the downtown. There were industrial and manufacturing pockets, and a growing white middle class concentrated in residential developments toward the ever-expanding city boundaries. Bus and trolley lines radiated outward from the city center to provide a transportation network. The city was a socioeconomic mosaic.

Immediately following World War II (1939–1945), urbanization quickly transitioned into suburbanization. Suburbs are largely independent communities located in close proximity to large central cities. Many suburbs have their own local governments with mayors or city managers and police departments; county governments govern others. Federal investment in economic development immediately following the war included low-cost mortgages for veterans and highway construction programs. Reorganization of American life resulted. The average white middle class family moved to newly created communities on less expensive land outside the city boundaries. Suburbs offered yards, lower density single-family housing, less noise and air pollution, and relief from declining city neighborhoods with their escalating social ills. Millions of farmland acres were converted into bedroom communities. The exodus left cities with declining property values, significant loss of tax revenue, and diminished political and social importance.

Just as urban areas were experiencing a new wave of Southern African Americans migrating to cities in search of employment, white taxpayers, jobs, and capital were migrating in mass to the suburbs, leaving the cramped ghettos and industrial areas behind. Suburbs replaced cities as the place of upward class mobility and economic prosperity. In contrast to urban social mosaics of the early twentieth century city, suburbanites most valued racial, religious, and social class homogeneity. The African American middle class and other minorities ran into social barriers in this resettlement movement, spawned by racism.

The shifting of the population from rural and city dwellers to the suburban areas began to shift in 1907, and by 1960 the majority of Americans were suburbanites.

By the late twentieth century the United States had fully transitioned from the urbanization of a century earlier to a suburbanized nation. By the 1960s urban factories, office complexes, and shopping centers had followed the population. Telecommunications developments in the 1980s further stimulated suburban growth. Businesses enjoyed more flexibility, locating in desirable settings as suburban business complexes increasingly linked to international economic markets. Suburbs developed their own economic bases independent of the earlier central-city business districts. Suburban “downtowns,” known as edge cities, developed on the fringes of metropolitan areas by the mid-1980s. New regional shopping malls replaced city center retail areas and neighborhood shopping centers. By the mid-1980s more Americans lived in suburbs than in central cities.

With the original inner cities in continuing socioeconomic crisis, efforts by cities to annex suburbs were normally resisted by suburban residents wishing to maintain their governmental independence. Planners also explored options of consolidating regional metropolitan tax bases and redistributing suburban revenues. Regional governments advocated “fair share” policies in proposing to locate industrial areas and low-income housing in suburban areas, rather than concentrating them in inner cities.

Suburban sprawl became a key issue with the proliferation and growth of suburbs. New suburbs

ringed earlier ones. The rise of suburbia led to the formation of metropolitan areas with the central city at their core. By the late 1980s about 75 percent of the U.S. population lived in metropolitan areas. Planners predicted the coming of the megalopolis representing the consolidation of multiple metropolitan areas spatially merging together.

As sprawl continued in the 1990s, the inner suburbs faced the same socioeconomic problems as the cities, including declining property values. In an endless cycle, lower values prompted higher property taxes, which forced more movement out to newer suburbs. With suburban residents frustrated over traffic congestion and sprawling commercial development, the growth of suburban populations began to slow in the 1980s. Rising gasoline prices and urban renewal attracted some back to the city. Urbanization of the suburbs was occurring, and urban renewal was becoming suburban renewal. Ever-expanding suburbs faced the same issues encountered earlier by cities. Revenue to provide water, sewer lines, fire protection, road maintenance, police, and new schools for the fast growing suburbs became issues as the cost of government services proved to be higher for low-density tract development.

Through the later decades of the twentieth century, areas of land development increased substantially faster than population growth. Regional governments in some areas adopted urban growth boundaries in an attempt to control the rapid loss of surrounding rural lands. Many attributed metropolitan air pollution problems to urban sprawl, low density housing patterns, and greater dependency on automobiles. The number of automobiles had grown several times faster during this time period than had the actual population. In total, the rise of suburbs in the late twentieth century was one of the more profound socioeconomic transformations in U.S. history.

SUGAR

Sugar is a crystallized material nutritionally important as a source of dietary carbohydrates and it can also be used as a sweetener and a preservative. It is predominately derived from sugarcane and sugar beets. Other sources are sorghum (a tropical grass), maple trees, and palms. Sugarcane was cultivated by South Pacific island natives as early as 6000 B.C. During ancient times it was also grown in India, where it was noticed around 325 B.C. by Greek soldiers under the command of Alexander the Great (356–323 B.C.). While cultivation and refinement of sugarcane spread from India, it did not reach Europe until A.D. 711, when Moors (North African Muslims) invaded the Iberian Peninsula (present-day Spain and Portugal). In the 1490s Portuguese explorers carried sugarcane with them into the New World and planted it in Brazil. The Spanish colonists planted sugarcane in the Canary Islands at about the same time. Spanish explorer Christopher Columbus (1451–1506) took sugarcane cuttings to the island of Santo Domingo (present-day Dominican Republic) in 1493. About twenty years later the first sugar mill in the Western Hemisphere was built there. The Dutch introduced sugarcane cultivation and refining to Barbados. The French introduced it to Martinique; the British introduced it to the West Indies.

The crop became important to colonial economies throughout the Caribbean, where the Europeans used slave labor from Africa to work the fields. Sugar was the principle export of the region during the 1600s, but by the end of the century the economies of many Caribbean islands collapsed. Slaves were sold to growers on the North American mainland, where they were engaged in the production of other crops (such as rice, indigo, and tobacco). The sugarcane plant did not reach the North American mainland until 1751, when Jesuit (Catholic) missionaries brought sugarcane to Louisiana. A sugar mill was built there forty years later.

The cultivation of sugar beets dates back to ancient Babylonia (present-day Iraq), Egypt, and Greece. However, only as late as 1744 it was discovered that sugar beets are a source of the same sugar found in sugarcane. It was fifty years more before a practical method for removing the sugar from the beets was developed. In the early 1800s sugar mills were built across Europe and Russia. Sugar from beets was not introduced in the United States until 1838.

SUGAR ACT (1764)

The Sugar Act of 1764 was passed by the Parliament of Great Britain, in part, to cut down on smuggling between the West Indies and the American colonies and also to tighten England's grip on its empire. But mostly the Act was approved to raise money to pay England's national debt caused by the French and Indian War (1754–1763). It was for that reason that the law was also known as the Revenue Act. The Act had three major parts. First, the measure created a complicated system of loading and unloading cargo for merchant ships in order to make smuggling more difficult. Second, the Act made certain foreign goods (including sugar, coffee, indigo dye, and wines) more expensive in the colonies because the tax would boost the retail price. Third, it cut the importation duties on molasses in half, in an attempt to make the tax easier to collect.

FOR IF OUR TRADE MAY BE TAXED, WHY NOT OUR LANDS? WHY NOT THE PRODUCE OF OUR LANDS AND, IN SHORT, EVERYTHING WE POSSESS OR MAKE USE OF?

Samuel Adams, Boston town meeting, May 24, 1764

Parliament's motivation in passing the Sugar Act was to correct an earlier, failing piece of legislation. The 1733 Molasses Act tried to discourage colonists from buying molasses from French and Dutch West Indian planters by placing a high duty of sixpence per gallon on it. New England merchants, traders, and their agents had developed a thriving trade in rum, a popular alcoholic drink, which they distilled from molasses. They shipped the rum to ports in West Africa, where they exchanged it for African slaves. The same traders then carried the slaves to plantations in the Caribbean, where they were exchanged for molasses—the so-called “Triangular Trade.” Because the New England rum distilleries were generating so much business, colonial traders were scouring the West Indies for molasses; they often found French or Dutch molasses cheaper than that from British plantations. Parliamentary representatives believed that the steep tax on foreign molasses would help British sugar producers. (However, it could instead have ruined the New England rum industry had it been collected as planned.) In most cases, customs officials preferred not to collect the tax and allowed the colonial traders to import molasses from whatever areas they chose.

George Grenville, the author of the Sugar Act, wanted to use the estimated £40,000 per year he expected the tax to generate to help pay the costs of

keeping 10,000 British soldiers on the American frontier. He did not anticipate the strong resistance he encountered from the colonists. They had never been expected to pay these kinds of taxes to this extent before, and they protested loudly. Bostonian Samuel Adams used the crisis to try to unite the merchants of the cities with the small farmers of the countryside. Lawyer James Otis Jr., in a pamphlet titled *Rights of the Colonies Asserted and Proved*, argued that Great Britain had no right to tax the colonists at all. Even solid Tories like Governor Francis Bernard protested the three pence tax, claiming that it would be difficult to collect and, if collected, would ruin colonial businesses. Similar protests were lodged in New York and Rhode Island. For the most part, however, complaints were limited to small special interest groups throughout the colonies. The Sugar Act was not the issue that would galvanize the colonists and turn them toward independence. It was an irritant in the relationship between the colonial officials of Great Britain and the colonists, but nowhere near as volatile an issue as the Stamp Act turned out to be a year later.

SULLIVAN, LOUIS HENRY

Louis Henry Sullivan (1856–1924) inspired design and construction ideas for the most significant twentieth century American buildings, and for that he

was called the “Father of Modern Architecture.” He was the inventor, and often the builder, of the uniquely American “skyscraper,” the tall buildings that created the great skylines of U.S. cities like New York and Chicago. His philosophy of building was also his philosophy of art. Sullivan designed the model for workplaces used by many modern businesses. He created the tall, densely-built downtown areas of the twentieth century U.S. metropolis; he created the visual reality of a kind of architecture in which design form followed the demands of functionality.

Louis Sullivan was born in Boston, Massachusetts, in September 1856, the only child of Patrick and Adrienne Sullivan. His father prospered in Boston as the owner/teacher of a music and dance academy. One of Sullivan’s biographers suggested that at a young age Sullivan learned from his father the importance of gracefulness and symmetry, qualities that would later influence his thinking about architectural forms.

Sullivan attended public schools in Boston. In his autobiography, he praised a high school teacher, Moses Woolson, whom he greatly admired, saying that the instructor had instilled in him “good methods of thinking, studying, and good work habits.” Sullivan claimed to have relied upon such principles throughout his life.

At age 16 Sullivan passed the entrance examination at Massachusetts Institute of Technology (MIT) and entered the school in 1872. He studied architecture under the guidance of William Robert Ware. Sullivan was dissatisfied with MIT, however, and left after just one year. He cited his dislike of the school’s strict focus on classical and academic architecture.

After leaving school Sullivan traveled throughout the country, briefly joining his parents in Chicago, Illinois. In the aftermath of the Chicago Fire of 1873, Sullivan saw the possibility of rebuilding the city with a modern and uniquely American vision. To learn his craft he left for Paris, France, to study at one of the great schools of architecture, the Ecole des Beaux Arts.

Sullivan studied long and hard in Paris, but the 18-hour days he spent studying were mentally exhausting. While in Europe, Sullivan also spent time traveling, specifically in Italy, where he saw first-hand the best of European architecture.

Returning to Chicago after just a year in Europe, Sullivan worked in an architect’s office as a draftsman and soon developed a reputation for quick and skillful design. He rose in the ranks of Chicago’s architects and displayed his great enthusiasm for building new kinds of American-style buildings in Chicago.

Sullivan's true architectural career started in 1880, when he began designing his own buildings to help rebuild Chicago. He started by concentrating on modern engineering techniques and advancements. His buildings were elegant and simple looking, with a focus on great height and safety. He also sought to accommodate the needs of twentieth century businessmen by creating buildings with highly concentrated office space.

Sullivan was a pioneer in designing the steel-framed skyscraper, which allowed him to create tall, structurally stable buildings. Through such building projects, Sullivan was able to articulate his main architectural idea: "form follows function." He voiced this in his 1924 autobiographical vision of architecture, *The Autobiography of an Idea*.

Sullivan worked hard to eliminate all traces of Greek and Roman architectural patchwork previously attached to the design of most American buildings. He was perhaps the first architect in the United States to develop a unique American style of architecture.

As Sullivan's architecture grew legendary, his personal life began splintering, and he devolved into an emotionally disturbed person. His behavior became erratic, he sought isolation, and at age 45, ill health forced him to work on only a series of small buildings and banks. Yet he continued as an architect, sharing his trade with others in the field. Most of Sullivan's innovative ideas were carried forth by his student, and later friend, Frank Lloyd Wright (1869–1959), whose own brilliant work would add new dimensions to architecture.

Though Sullivan's work had thoroughly penetrated the currents of modern twentieth century architecture, he died destitute and nearly alone. Frank Lloyd Wright visited his friend Louis Sullivan just three days before Sullivan's death, at the age of 68, in 1924.

The development of large, busy, complex urban centers of the early twentieth century was made possible by Sullivan's unique engineering innovations. His structures—safe yet often hundreds of floors high—combined functionality with beauty. Sullivan's impact on several major U.S. cities influenced much of the architectural design in the decades that followed.

SUN BELT

The "Sun Belt" region of the United States comprises fifteen southern states, extending from Virginia to Florida in the Southeast, and westward through Nevada, including southern California. Because of the expansion of inexpensive residential retirement communities, the Sun Belt region has seen a 93 percent overall growth of population between 1970 and 1990, well above the national average. To many people in the United States, the Sun Belt offers inexpensive living, year-round recreational activities, mild climates, and an inexpensive non-union labor pool for the creation of new business enterprises. A large migration of people to the Sun Belt, as well as a high birth rate and a decline of migration from the region have all contributed to the rapid growth of the Sun Belt's population and manufacturing activities. Overall improvements in transportation, communications, living conditions, and services have all made the Sun Belt an attractive area for retirees, workers, and business.

SUPPLY AND DEMAND

"Supply and demand" refers to the idea that the price of a product is dependent on the amount of that product available to sell (the supply) and the desirability of the product to consumers (the demand). Sellers want high prices and buyers want low prices, and the strength of these conflicting desires will determine the price. In economic terms, supply refers to a schedule of quantities that people are willing to sell at different prices at a given time, and demand refers to a schedule of quantities people are willing to buy at different prices at a given time. The two terms in economics are

Supply-Side Economics

linked together, like the terms “buyer” and “seller.” The interaction between the supply of goods and services and the demand for them brings about a price, for each item and service, at which suppliers and demanders are willing and able to sell and buy the same quantity of goods. When the supply and demand are equal, the price of any product is said to be at an equilibrium price. The marketplace, the arena of business competition, is not only where the clash of interest between buyer and seller is worked out by the opposition of supply and demand, but it is also where buyers contend against buyers, and sellers against sellers. Supply and demand is always changing. Changes in willingness or ability to buy or sell are always occurring. The rise or fall of income alters the ability to buy. Fluctuations of desire or need alter the willingness to buy. On the seller’s side, when the price of labor, land, or capital change, then the seller may alter his ability or willingness to offer his products on the markets at reduced or increased prices. Supply and demand in the marketplace is never a static phenomenon. The marketplace is always dynamic and changing, as supply changes, as demand changes, and as quantities of supplies and demands change.

SUPPLY-SIDE ECONOMICS

Reawakened in the United States in the late 1970s and early 1980s, the theory of supply-side economics looked at economic behavior by analyzing the supply of consumer items instead of the demand for them. This view of economics specifically focuses on the disincentive effects of taxes on private sector productivity, investment, and growth. Supply-side economists argues that reducing the tax rates on the supply-side would lead to greater economic growth, greater employment, and larger bottom-line tax revenues later.

Supply-side economics is not new in economic thought; its roots can be traced to Jean Baptiste Say’s *Treatise on Political Economy and Taxation* (1817). The renewed interest in supply-side economics of the 1980s was stimulated by Dr. Arthur Laffer’s Laffer’s Curve and by the administration of President Ronald Reagan (1981–1989), which adopted this kind of economic thinking.

The Laffer Curve established to calculate the highest rates of tax the market would bear in various

areas of the economy, always emphasizing tax reduction as the solution to economic issues. The supply-side theory of economics calls for a reduced government, reduced government spending, and a de-emphasis on any fiscal targets. Instead, great emphasis is placed on the free market and the de-regulation of private industry by the government. By the end of the supply-side era of the 1980s, the U.S. national debt was higher than at any other period of its history. The tax cuts did stimulate business and bring in more revenue, but government spending continued to grow in spite of the rhetoric.

SURPLUS

A surplus is the amount of money considered to be a profit in any general accounting period, which is available for carrying forward into the next accounting period. An economic surplus is similar to a net profit; it is the surplus resource in any business, household, or government after all cost, expenses, interest charges, and dividend payments have been made in any accounting period. A surplus should not be used synonymously with net profits, but rather should designate undivided profits, profits that have not, or do not need to be distributed in dividend payments to any investors or stockholders. A surplus, as well, may be accumulated profits of past periods which are left invested, and which continue to earn investment rates. This kind of surplus is known as an earned surplus. The American Institute of Certified Public Accountants has recommended that the term “surplus” be discontinued in favor of more specific and descriptive terms. Though surpluses continue to exist, the use of the term now rarely appears in balance sheet accounting presentations. More precise language is used, instead, such as “contribution in excess of par or stated value,” or “additional paid-in capital.” A surplus may arise for reasons other than having profits after all costs have been covered. A surplus might arise from a donation, or an appreciation of the value of owned business property, as well as other reasons. In banking, surplus refers to a portion of stockholders equity, and in economics, surplus refers to a situation in which at a given price, quantity supplied is greater than quantity demanded, and to alleviate this surplus prices must be lowered.

TAFT, WILLIAM HOWARD

Despite his imposing stature (six foot tall, three hundred pounds), William Howard Taft (1857–1930) was a reluctant President of the United States (1909–1913). To be leader of the nation was not Taft’s first ambition, but his wife, brothers, and close-friend President Theodore Roosevelt (1901–1909) convinced Taft to run for the presidency in 1908. He won the election against Democratic candidate William Jennings Bryan. Taft’s tenure as the twenty-seventh President was undistinguished. He was a man with little taste for politics, and he made many blunders throughout his term in office. Although he was a poor president, he was a fine Chief Justice of the U.S. Supreme Court, a position to which he was appointed in 1921, eight years after he left the White House. This appointment fulfilled a life-long ambition, and he performed his job with passion, competence, and enthusiasm.

William Howard Taft was born in Cincinnati, Ohio, on September 15, 1857 to a family that lived in comfortable circumstances. They had migrated to Ohio from New England. Since Taft’s father and grandfather had both served as judges, he also aspired to a career on the bench. In preparation, he began his studies at Yale University, finishing second in his class, and he received a law degree from the Cincinnati Law School in 1880.

Determined to assist the citizens of his state, Taft held many public offices throughout his early career. In 1887 he served as an Ohio superior court judge. Three years later, Taft was named U.S. solicitor general by President Benjamin Harrison (1889–1893), a position he held successfully until 1892 when he returned to Ohio for a seat on the Circuit Court of Appeals.

Taft distinguished himself as a federal judge and developed an ambition to serve on the U.S. Supreme Court. That ambition would have to wait, however, as President William McKinley (1897–1901) requested

William Howard Taft.

in 1900 that Taft become president of the Philippine Commission. Working in the unstable and newly independent Philippine Islands, Taft established a civil government designed to serve the needs of its citizens, established an educational system, built roads and harbors, and pushed rapidly for limited self-government for the people whose islands were “possessed legally” by the United States during the Spanish-American War (1898).

Twice, in 1902 and in 1903, President Theodore Roosevelt offered Taft a seat on the U.S. Supreme Court. Taft regretfully turned it down to fulfill his commitment in the Philippines. A year later, however, Taft did accept Roosevelt’s offer to become Secretary of War. This position still allowed him to be involved

Taft-Hartley Act

with matters in the Philippines and gave him responsibility for the construction of the Panama Canal. In addition to struggling with the problems and expenses of building the canal, Taft supported missions to Japan, hoping to create alliances for the U.S. in the Far East.

As President Roosevelt's term came to an end, he encouraged Taft to seek the presidency. Roosevelt and Taft had become good friends over the course of their careers and Roosevelt was convinced Taft was the best candidate for the job. With apprehension, Taft agreed to be the Republican presidential nominee in 1908, and in the election he defeated the Democratic candidate William Jennings Bryan. Even in victory, the new president still had misgivings, and said that he felt, "just like a fish out of water."

Taft's timid, conservative style alienated many in Congress. His attempt to reduce tariffs met with strong opposition from Republicans, while supporters of the measure were angered by what they perceived as Taft's lack of forcefulness. It was an inauspicious beginning.

The disagreements over tariff reductions set the tone for Taft's administration. Taft was denounced by many in Congress for what appeared to be weakness towards powerful business interests. His administration also seemed to reverse the strong conservationist policies of his predecessor by opening up much valuable government land for lumber and mining interests. He fired the head of the national Forest Service, Gifford Pinchot (1865–1946), who refused to cover up a scandal in the Interior Department.

Working against him in a coalition, Republicans and Democrats in Congress drove through a half dozen reform measures, most of which Taft opposed. The measures included the creation of a graduated income tax, the direct election of senators by the voters, and an increase in the powers of the Interstate Commerce Commission to control business. Taft was also faced with the uncertainties of social reform. Working people faced an increasingly volatile and shifting marketplace, and Taft paid little attention to making the necessary changes that would help stabilize the workplace by regulating relations between newly industrialized workers and growing industrial businesses.

Despite his discomfort in office and his difficulties with the legislative branch, Taft's administration was not without accomplishment. He oversaw the creation of the Postal Savings plan, a program to protect citizens' savings, and the admission of Arizona and New Mexico as new U.S. states. In addition, although Taft's predecessor Theodore Roosevelt had the reputation of a "trust buster," Taft's four years of leadership saw

twice as many trust prosecutions as occurred throughout the eight years of Roosevelt's administration.

The tension between Taft and Congress eventually affected his friendship with Theodore Roosevelt. During the next presidential campaign in 1912, Taft and Roosevelt vied against each other for the Republican nomination. Taft was re-nominated, but in spite of that Roosevelt formed a new party, the Bull Moose Party. He ran against Taft in the election, and their competing campaigns split the Republican vote, giving the presidency to the Democratic candidate Woodrow Wilson (1913–1921).

Taft was relieved to leave White House. Over time, he and Roosevelt reconciled, and their friendship was restored. Taft taught law at Yale University until 1921, when President Warren Harding (1921–1923) named him Chief Justice of the Supreme Court. Taft's long-time ambition was fulfilled. He accepted the post. As Chief Justice, Taft was well respected and performed the functions of his position confidently and enthusiastically. He made no secret of his happiness to be out of the White House and back in the courthouse. Taft served eight years on the bench until his death in 1930, at age 78.

TAFT-HARTLEY ACT

The Taft-Hartley Act became law despite President Harry Truman's (1945–1953) veto. Also known as the Labor-Management Relations Act, it passed

Congress in 1947 and established guidelines to correct unions' unfair labor practices.

Taft-Hartley did several things to regulate labor practices in the United States. It prohibited secondary boycotts (in which the workers of a company convince employees of another organization to cease certain dealings with the company in order to pressure the employer to meet their needs) and authorized the payment of damages to parties injured by the boycotts. It abolished closed shops, which required all workers to be a member of a labor union, and did allow for union shops under specified conditions.

In addition, the Taft-Hartley Act established regulations for workers and employers regarding representation and bargaining. Workers now had the option of choosing to organize and bargain collectively or not. Workers gained the power to revoke a union from acting as their bargaining agent. Employers, employees, and unions received new guarantees of free speech. Employers could no longer hire an employee due to union affiliation or lack thereof. The National Labor Relations Board was given the authority to decide settlements for certain jurisdictional disputes. And, collective bargaining agreements became enforceable in federal district court.

The Taft-Hartley Act created a more neutral government stance on labor and unionism. Prior to the act, labor was regulated under a more pro-union policy established in the Wagner Act of 1935. Taft-Hartley allowed for more unbiased regulation of labor and unions while still protecting the rights of employees to be free from employer coercion.

It did, however, place a controversial requirement on unions. All union leaders had to take an oath declaring they were not members of the Communist party. Any union leader who did not take this oath was refused protection under the law. This provision was an early indicator of the "Red Scare" that swept the nation during the 1950s, when the government actively sought and tried citizens for alleged Communist beliefs.

TALLMADGE AMENDMENT

The Tallmadge Amendment of 1818 was a failed piece of legislation proposed by New York Representative James Tallmadge Jr. (1778–1853) in an attempt to resolve the question of how the Missouri Territory should be admitted to the Union. When the

House of Representatives began deliberating the Missouri Territory's admission for statehood, the Union was comprised of equal numbers of free and slave states (eleven each). But Missouri threatened to throw off the balance: slavery was legal in the territory and ten thousand slaves lived there. The issue became a serious debate in the House, where the northern free states (due to their higher population of voters) held the majority. In his amendment to the bill granting Missouri statehood, Tallmadge proposed prohibiting the transport of any more slaves into the Missouri Territory. The measure would have let Missouri keep its slave status, but granted freedom to children born to slaves in the state after admission. By Tallmadge's proposal, Missouri's slave status would be temporary—lasting only until the slaves living there at the time of statehood died—because no slaves could be brought in and any offspring would be free. The measure passed in the House but was defeated in the Senate. The issue of Missouri's statehood remained unresolved at the end of the Congressional session. By the time Congress next convened, Maine had applied for statehood, giving lawmakers a neat, albeit temporary, way out of the dilemma of how to preserve balance between the free North and the slave South: By the Missouri Compromise of 1820, Missouri was admitted as a slave state, Maine as a free state.

TARBELL, IDA MINERVA

Ida Tarbell (1857–1944) was a biographer and journalist who helped develop the form of journalism known as "muckraking." She exposed the corruption of big businesses, especially those that violated trust laws. She is most famous for contributing to the dissolution of the Standard Oil company, the biggest monopoly of her time.

Ida Tarbell was born on November 5, 1857 in Erie County, Pennsylvania. Her father was a farmer who switched careers with the discovery of oil in Erie County. He established a shop that made wooden oil tanks but was driven out of business by John D. Rockefeller's oil monopoly. Tarbell had a well-adjusted childhood despite this hardship; she was very well educated, graduating from Allegheny College in 1880 with a Bachelor of Arts degree in biology.

Tarbell never pursued a career in science instead she turned to writing. After teaching for two years at Poland Union Seminary in Ohio she became a staff member of *Chautauquan* magazine. The publication was dedicated to self-improvement through home study

Ida M. Tarbell.

and Tarbell eventually became the paper's managing editor. She left the job in 1891 to study in Paris where she pursued history at the Sorbonne and the University of Paris from 1891 to 1894. To support herself while she was abroad Tarbell wrote articles for magazines in the United States.

Tarbell's writing career took off when she met Samuel S. McClure (1857–1949), the creator of *McClure's*, a popular literary magazine. She began writing feature articles on important French figures, including Louis Pasteur (1822–95) and Napoleon Bonaparte (1769–1821). Her eight-part series on Napoleon was successful for both Tarbell and the magazine. The series was later published in 1895 as a book called *A Short Life of Napoleon Bonaparte*, and sold more than 100,000 copies.

Upon her return to the United States in 1894 Tarbell joined the staff of *McClure's* as a writer and associate editor. She wrote a series of articles on

Abraham Lincoln (1809–65), which later became a respected book called *The Life of Abraham Lincoln* in 1900. McClure then began to restructure the format of the magazine to include contemporary social issues. Tarbell and other writers at *McClure's* began to write critical articles about important issues of the day such as corporate trusts. The goal of these articles was to expose corruption and the abuses of public power; these articles served as fuel for Progressivism, a reform movement of that time. President Theodore Roosevelt (1858–1919) was critical of this type of journalism and labeled it "muckraking," a term which stayed with Tarbell for the rest of her career.

SHE LIVES SO WARMLY IN THE HEARTS OF HER FRIENDS THAT THEY TAKE NEW COURAGE IN A DISCORDANT UNIVERSE; ARE REESTABLISHED IN THEIR FAITH IN THE HUMAN RACE, LEARNING ANEW WHAT IT CAN BE, AT ITS BEST.

Ray Stannard Baker, personal diary, 1937

Tarbell's main contribution to this literary movement was her *History of the Standard Oil Company*, which originally appeared in *McClure's* in 19 installments in 1902 and was published as a book in 1904. Tarbell exposed the workings of John D. Rockefeller's oil monopoly. Her writings contributed to the company's prosecution under anti-trust laws and its eventual breakup in 1911. She claimed that she chose Standard Oil as the subject of her research because "it satisfies most nearly the trust ideal of the entire control of the commodity in which it deals" (*History of Standard Oil Company*, 1904). However it is no coincidence that Tarbell chose to write about the same monopoly that ran her father out of business. However, Tarbell's work was well researched and highly regarded despite this personal interest.

In 1906 Tarbell and some of her colleagues had a dispute with McClure and left the magazine to own and operate *American* magazine. Tarbell continued to expose corporate crimes and proclaim the need for honest government. As a result of her work, *The Tariff in Our Times* (1911), President Woodrow Wilson offered Tarbell a position on the Federal Tariff Commission in 1916. Tarbell refused but later participated in Wilson's Industrial Conference in 1919. She also participated in President Harding's Unemployment Conference in 1925. Another important series in *American* was on the history of the women's movement in the United States and her views on this subject were later published as *The Business of Being a Woman*.

American magazine was sold in 1915 and Tarbell spent the rest of her life as a lecturer and freelance writer. She continued writing books about business, but her later works were less critical than earlier ones. Tarbell toured a number of U.S. factories between 1912 and 1915 and was impressed by some of the latest business developments. She was particularly optimistic about the management techniques of Henry Ford. Tarbell also produced two friendly biographies of business leaders called *Life of Elbert H. Gary* (1923) and *Owen D. Young* (1932). She also published a history called *The Nationalizing of Business: 1878–98* (1936).

In 1939 Tarbell published her autobiography, *All in the Day's Work*. She then taught classes in biographical writing and worked as consulting editor of a Tucson magazine called *Letter* from 1943 to 1944. Tarbell died of pneumonia in 1944.

TARIFF OF ABOMINATIONS

By the late 1820s the southeastern region of the United States was economically depressed. While the industrial northeast flourished, the agrarian south languished. Many historians now recognize that the soil of the older southern states was worn out and depleted, especially compared to the richer soil of the new Gulf states; at the time, however, many southerners blamed their fiscal ailments on tariffs. Leadership in the fight against the tariff fell to South Carolina, where the

plantation aristocrats enjoyed political power and where the relative decline in prosperity was the greatest.

South Carolina's most eloquent spokesperson was John C. Calhoun (1782–1850), who by the late 1820s had completed his philosophical transformation from ardent nationalist to states' rights advocate. In fact, Calhoun then advocated the ultimate in states' rights thinking—a belief in, and support of, the doctrine of nullification, which Thomas Jefferson (1743–1826) and James Madison (1751–1836) first described in the Kentucky and Virginia Resolutions of 1798. In 1828, while running as a vice presidential candidate, Calhoun anonymously penned the "South Carolina Exposition and Protest," an essay objecting to the Tariff of 1828, known to southerners as the Tariff of Abominations because of its high protective duties. The tariff was intended to protect the burgeoning industries of New England, where numerous factories had opened during the first three decades of the nineteenth century, but encountered much opposition from the south. Calhoun's authorship of the "South Carolina Exposition and Protest" remained secret, and for four years South Carolina did not act upon it, hoping that President Andrew Jackson (1829–1837) would fight for a lower tariff. In "Exposition," and in a later paper called "A Disquisition on Government," Calhoun explained his doctrine of nullification.

Contrary to popular belief, Calhoun did not advocate the secession of the southern states, an event which occurred during the American Civil War (1861–1865). Rather, he believed that nullification would prevent the disruption of the Union, and he saw nullification as an antidote to secession. The basic tenets of his argument were as follows. Each state was sovereign, and the Union was a contract between the states. Each individual state entered into an agreement with the others, and the U.S. Constitution outlined the terms of that covenant. The Constitution provided for a separation of powers between the states and the federal government, but not for a division of sovereignty. For sovereignty was not the sum of a number of governmental powers, but rather the will of the political community, which could not be divided without being destroyed. Prior to the Constitution, the states had been sovereign under the Articles of Confederation, and they had not given up their supreme authority when they joined the new Union. Since the Union had been created by the states, and not vice versa, it logically followed that the creator was more powerful than the created. As the federal government was not supreme, it could exercise only those powers given it by the states as embodied in the Constitution. Should it exceed these powers, the measures enacted would be unconstitutional.

Tariffs

After simmering for four years, the issue of nullification erupted in 1832 over a new tariff. In December 1831, President Jackson recommended to Congress a downward revision of the tariff and the elimination of the worst features of the Tariff of Abominations. Such a bill was finally pushed through in July 1832, but the new tariff was not low enough for the southern planters. Although some of the “abominations” were removed, the general level of the duties was only slightly lower. The greatest reductions were made on noncompetitive manufactured items, and the protective makeup of the tariff was hardly changed.

By mid-1832 South Carolina extremists were ready to put the nullification theory into action. Many denounced the Tariff of 1832 as unconstitutional and oppressive to the southern people. In the subsequent state election that fall the States’ Rights and Unionist Parties made the tariff and nullification the chief issues, and when the States’ Rights Party elected more than two-thirds of the legislature, it promptly called for a state convention. The convention met in November 1832, and by a vote of 136 to 26 the state adopted an Ordinance of Nullification, which declared the Tariffs of 1828 and 1832 null and void. After February 1, 1833, the tariffs would not be collected, and should the federal government forcibly attempt to collect them, South Carolina would secede.

Jackson met this challenge in typical fashion. He boldly proclaimed that the Constitution formed a government, not a league, and that the power of a single state to annul a federal law was “incompatible with the existence of the Union, contradicted by the letter of the Constitution, unauthorized by its spirit, inconsistent with every principle on which it was founded, and destructive to the great object for which it was formed.” Nullification he called an “impractical absurdity,” and concluded that “disunion by armed force is treason.” This proclamation received the enthusiastic support of nationalists. On January 16, 1833, Jackson sent a message to Congress reviewing the circumstances in South Carolina and recommending measures that would enable him to cope successfully with the situation. Tension mounted in February when the Senate passed the Force Bill, which authorized Jackson to use the United States Army and Navy if necessary to enforce the federal laws.

While the Senate was still debating the Force Bill, Henry Clay (1771–1852) brought forward a new compromise tariff bill calling for the gradual reduction of tariff duties over the next 10 years. By 1842 the tariff was not to exceed 20 percent. South Carolinians waited anxiously to see what would happen, for it was already apparent that no southern states were coming to her aid,

and she would have to fight it out alone. Calhoun, who had resigned the vice presidency after the passage of the Tariff of 1832 and had been elected immediately to the Senate, objected to the Force Bill but feared that strong opposition might hurt the chances of reconciliation presented by Clay’s Compromise Tariff. He and Clay worked to push the new tariff bill through Congress, and on March 2, 1833, the same day that the Force Bill was signed into law, Jackson also signed the Compromise Tariff.

Once the Compromise Tariff was passed, South Carolina repealed its Ordinance of Nullification; however, in a last gesture of defiance the convention declared the Force Bill null and void. Jackson ignored this final face-saving move on the part of South Carolina, for the Force Bill was irrelevant if the tariff duties were being collected.

Both sides claimed victory. Nationalists declared that the president and Congress had upheld the power of the federal government, while South Carolina asserted that nullification had proved an effective method of sustaining states’ rights. However, the failure of any other southern state to rally to South Carolina’s defense showed that the doctrine of nullification was unpopular, and from that time forward militant southerners looked to the doctrine of secession as their best redress against economic and political grievances.

TARIFFS

A tariff is a tax charged on imports either on the basis of quantity (for example, “per ton;” these are

called specific tariffs) or on the basis of their value (called *ad valorem* tariffs). Tariffs are the primary means by which governments protect their industries from foreign competition. Tariffs can be levied directly, as goods cross the border, or indirectly, by requiring that a license or permit be purchased before the goods can be shipped. Tariffs generally serve two purposes: to generate tax revenues and to protect a domestic industry from foreign competition. If a government wants to encourage the growth of a newly emerging industry it can also use tariffs to free these “infant” industries from having to compete with established foreign producers on the basis of price. Because tariffs raise barriers to the free flow of international trade, however, in the long run they tend to impede global economic growth. As a temporary way of raising revenues or protecting an industry they can be effective—at least until other countries retaliate by raising their own tariffs.

The first U.S. tariff, of about 8.5 percent, was levied in 1789 on imports like molasses, hemp, steel, and nails in order to raise revenues for the young U.S. government. By the War of 1812 (1812–1814) the average tariff had risen to 25 percent and continued to rise to as high as 33 percent on imported cotton and wool during the 1820s. Under the Tariff of 1828 tariffs were raised to their highest level prior to the American Civil War (1861–1865). Since the Whig and then the Republican Parties represented the industrial Northeast, they favored raising tariffs, while the Democrats, the party of the slaveholding South, opposed them. When the South seceded in 1860, the Republicans seized power and raised tariffs by 10 percent. In 1882 Congress established a permanent Tariff Commission to recommend changes in tariffs and in 1897 the Dingley Tariff imposed the steepest tariffs rates ever (57 percent) on foreign imports.

When the federal government began to collect income taxes in 1913, tariffs began to lose their importance as a source of government revenue and the last great tariff law was the Smoot-Hawley Act of 1930. In 1934 the Reciprocal Trade Act gave the President independent authority to negotiate tariff reductions with foreign countries. In 1947 the United States joined 22 other countries in signing the General Agreement on Tariffs and Trade (replaced in 1995 by the World Trade Organization), which over the years has successfully worked to lower tariff barriers around the world.

TAYLOR, FREDERICK WINSTON

Frederick Winston Taylor (1856–1915), known as the “Father of Scientific Management,” pioneered the occupation of time study in industrial management. His love for perfection and control, carried arguably to extremes in the industrial workplace, led to his invention of hundreds of ways to increase worker productivity. He believed his efforts would promote harmony between management and labor. As an industrial engineer he introduced efficiency techniques in factory operations which Henry Ford (1863–1947) made famous on his assembly line. Taylor’s ideas were welcomed by those seeking efficiency in production, but denounced by many, including unionists, who feared it would degenerate into a factory “speed up” system, where a worker’s humanity would be diminished and the employee would become merely another cog in the wheel of the factory machine.

Frederick Taylor was born in Germantown, Pennsylvania, on March 3, 1856, the second of three children born to Franklin and Emily Taylor. Taylor’s father was a lawyer and a poet who had inherited considerable wealth from the family’s ownership of farms and other properties in the Philadelphia area. His mother was a staunch abolitionist, working to end slavery in the United States. She was a strict disciplinarian, and she worked to create an orderly environment around her. The young Taylor adopted much of his mother’s thinking about order and control. An example of such desires to control his environment was demonstrated at age 12—he suffered from frequent nightmares, which he believed were caused by sleeping on his back. To prevent this he put together a harness device that would wake him up if he rolled onto his back.

Taylor attended the private Germantown Academy while living in Pennsylvania, and at age 13 he traveled with his parents to Europe. He spent three years there, studying under tutors in France and Germany. When Taylor returned to the United States in 1872, he was enrolled at the Phillips Exeter Academy, a private college-preparatory school in New Hampshire. He left the Academy in his senior year, claiming problems with his eyesight. He never went on to college but instead he began to work as a machinist; he embraced the work ethic vigorously and seemed to prefer working at a job rather than spending his time at college.

Taylor completed an apprenticeship as a machinist and began to work for Midvale Steel Co. in Philadelphia, Pennsylvania. While working at Midvale, he

Tecumseh, Death of

pursued a self-study program in mechanical engineering from the Stevens Institute and graduated with an engineering diploma in 1883 at age 27. He became the chief engineer at Midvale Steel and obtained a patent for his invention of the largest steam hammer ever built in the United States. Later, in 1898, while working at Bethlehem Steel Corp., Taylor and a colleague, J.M. White, invented the Taylor-White process—a method for the heat treatment of tool steel. This process yielded increased cutting and hardness capacities of 200 to 300 percent, and by the late 1990s was used in practically every machine shop in the world. Yet it was scientific industrial management that Taylor adopted as his primary occupation. In 1903 he started as a self-employed industrial consultant, specializing in managing businesses with the greatest time-cost efficiency.

Taylor promoted his ideas about efficiency engineering of both people and machine processes that would help speed up work. He likely did not realize his ideas would be used to claim management was making the employee into a kind of dehumanized robot. Such reforms in manufacturing as Taylor advocated became known as “Taylorism.” According to Taylorism, by scientific study (time-management study) of every step and operation in a manufacturing plant, data could be obtained as to the fair and reasonable production capacities of both man and machine. The application of that data in an effort to increase productivity would abolish the antagonism between employer and employee. For five years Taylor successfully applied his theory in a variety of establishments, administrative and sales departments, and shops.

Convinced of the correctness of his theory, Taylor devoted the remainder of his life to expounding those principles. He often gave his services free of cost, and wrote a book promoting his ideas on efficiency engineering titled *Principles of Scientific Management*. He also traveled extensively, lecturing about his theory.

Taylor’s legacy has been controversial. In the early twentieth century he personified the efficiency movement of modern management. In the 1930s and 1940s he was known as the creator of modern industrial work methods, and by mid-century he became targeted by social scientists that said his methods were dehumanizing. (The 1970s regarded his methods often as ways to exploit employees.) Overall, Taylor and his supporters are likely best recalled for their work in publicizing the possibilities of a careful, systematic approach to industrial time-and-motion study to enhance industrial efficiency.

Frederick Taylor died in 1915, at age 59. He left an estate of over \$1 million, all of which he earned in his lifetime.

TECUMSEH, DEATH OF

Tecumseh was born in a Shawnee village, Old Piqua, on the Mad River of Ohio, in 1768 near present-day Springfield, Ohio. He was the fifth of nine children; his father, a Shawnee warrior named Puckeshinewa, was killed in a 1774 battle, and his mother, Methoastake, moved west of the Mississippi River with Creek relatives five years later. Tecumseh remained in Ohio country with an older sister, Tecumapease, and raised her in the tradition of his culture.

By age 14 Tecumseh found himself fighting Americans alongside his older brother, Chiksika, leading the Native American resistance to the continued spread of white settlement in the Ohio River valley. As he matured, Tecumseh became an acknowledged and respected leader. He also gained recognition arguing for humane treatment of American captives. During a series of raids against frontier settlements in Kentucky and Tennessee in the late 1780s and early 1790s, Chiksika was killed. Outnumbered, Tecumseh and his followers suffered a series of defeats in Ohio, leading to the Treaty of Greenville in 1795. The treaty ceded most of modern-day Ohio, leaving Native American control over the remaining parts of the Old Northwest Territory. Tecumseh, however, refused to participate in or recognize the treaty, asserting that those who participated did not have authority to sign away the

Tecumseh, Chief of the Shawnee.

land. He carried this traditional concept of communal land ownership with him into later days.

Following defeat in Ohio and after several moves within Ohio and Indiana, in 1798 Tecumseh settled in a village on the White River of eastern Indiana, near the modern-day town of Anderson. There, one of Tecumseh's younger brothers, Tenskwatawa, experienced a series of visions in 1805. Tenskwatawa became a powerful religious leader, especially after successfully predicting an eclipse in 1806. They relocated to a village near present-day Greenville, Ohio, where Tenskwatawa preached a native revitalization, offering to rescue Native American people from impending doom. Known as the Prophet, Tecumseh's brother espoused alcohol abstinence and the pursuit of a traditional way of life, which included repudiation of Western society's goods and customs. Many were receptive to the message, given the ongoing demise of their traditional economies, and his following increased. With many Native Americans coming to Tecumseh's village to see his famous brother, Tecumseh's political activism grew. He transformed the revitalization concept into a political movement that embraced the idea of communal property regarding native lands. In 1808 Tecumseh and Tenskwatawa again relocated their village, this time to the confluence of the Tippecanoe and Wabash Rivers, which became known as Prophetstown.

Tecumseh clashed with Indiana Territorial Governor William Henry Harrison (1773–1841) over the

1809 Treaty of Fort Wayne, which ceded yet more traditional lands. Meanwhile, Tecumseh's prominence rose to new heights. Relentlessly, he journeyed throughout much of the United States encouraging tribal groups to form a political confederacy, a pan-Native American federation, to stop the further loss of lands. An outstanding orator, Tecumseh argued that Native American land could not be given away without common consent of all Native American peoples. He took his message to the South where, though the Cherokee and three other Five Civilized Tribes rejected his call, the Creeks were responsive. While Tecumseh met with the Creeks in November 1811, the U.S. Army led by Harrison moved against Prophetstown. The resulting Battle of Tippecanoe destroyed the village and its food supply and sent Tecumseh's brother in flight to Canada.

While Tecumseh recovered from his terrible loss, the War of 1812 (1812–1814) broke out between the United States and Great Britain. He and his followers joined British troops in Michigan, where together they successfully captured Fort Detroit. Further engagements with U.S. troops followed in southern Michigan and northern Ohio. Tecumseh joined forces with British commander Henry Proctor, laying siege to Harrison's Fort Meigs. The siege failing, Tecumseh reluctantly accompanied Proctor in a retreat to Canada, where Harrison pursued them. Tecumseh was shot and killed at the Battle of the Thames in present-day southern Ontario in October 1813.

The death of Tecumseh marked the end of Native American resistance in the Ohio River valley and efforts at pan-tribal unity, a political concept alien to traditional Native American lifestyles. U.S. victories throughout the following year under the leadership of Andrew Jackson (1767–1845) broke the Native American hold on lands east of the Mississippi River. The following decades saw implementation of Jackson's removal policy, a plan to forcibly relocate Native Americans west of the Mississippi. Yet, the widespread admiration of Tecumseh's skills as a leader and orator, plus his bravery and humanitarianism, have established him as an American folk hero.

TELEGRAPH

The telegraph was the first communicational instrument that could send messages through wires via electricity. Though the invention was the result of several decades of research by many people, American inventor Samuel F.B. Morse (1791–1872) is credited with making the first practical telegraph in 1837. Morse was a portrait painter in New York City when he became interested in magnetic telegraphy in around 1832. With technical assistance from chemistry professor Leonard Gale (1800–1883) and the financial support of Alfred Vail (1807–1859), Morse conducted further experiments and finally developed a battery-powered instrument that provided the necessary steady source of electricity. He also developed Morse code, a system of variously arranged dots and dashes for transmitting messages. (For example, the most frequently used letter of the alphabet is *e*, which is rendered in Morse code by using one dot; the less frequently used *z* is rendered by two dashes followed by two dots.) By 1837 Morse had demonstrated the telegraph to the public in New York, Philadelphia, and Washington. He received a patent for his invention in the United States in 1840. In 1843 his telegraph was further promoted when the U.S. Congress approved construction of an experimental line between Washington, D.C., and Baltimore, Maryland. The following year, on May 24, 1844, Morse sent his first message across that line: “What hath God wrought!” Alfred Vail was on the receiving end of the wire.

By 1861 most major U.S. cities were linked by telegraph wires. The first successful trans-Atlantic cables were laid in 1866. Morse Code transmissions—called telegrams when transmitted via above-ground wires and cablegrams (or cables) when transmitted via underwater cables—were translated by operators or mechanical printers on both the sending and receiving ends of the message. The introduction of the telegraph marked the beginning of modern communications. When the first transcontinental telegraph line in the United States was completed on October 24, 1861, it

eliminated overnight the need for the Pony Express, which had briefly enjoyed the status of the fastest way to transmit a message—about eight days from St. Louis, Missouri, to Sacramento, California, a distance that could be bridged by telegraph lines within minutes. The telegraph became the chief means of long distance communication. The telephone (invented 1875), which allows voice transmission over electrical wires, gradually replaced the telegraph. But for many decades the two technologies were in use together.

TEMPERANCE MOVEMENT

With milk and water susceptible to contamination and spoilage in colonial times, many settlers turned to alcoholic beverages. Beer and wine were common on ships carrying colonists from Europe. Consequently, most colonists drank alcohol regularly beginning in childhood, and alcohol was key to almost every social gathering. Even church leaders commonly sanctioned moderate alcohol use. Following the American Revolution (1775–1783), distilled spirits such as whiskey became important commercial goods. With Americans drinking large quantities of liquor, concern about alcohol consumption existed from the nation's birth.

Predominantly led by evangelical Protestants, isolated pockets of opposition to the sale and consumption of distilled beverages began to coalesce by the 1810s. By the end of the War of 1812 (1812–1814), a radical temperance movement developed consisting of many denominations; Presbyterians, Quakers, Western Methodists, and people of other faiths united in a concerted effort to transform traditional social patterns. One such group, the Connecticut Society for the Reformation of Morals, formed in 1813. An early focus of the evangelical leaders was individual self-reform through abstinence to save the conscience and family harmony. In contrast, elite urban residents of property in the Northeast, who formed such groups as the Massachusetts Society for the Suppression of Intemperance, took a more conservative approach. They focused more on suppressing consumption by the lower economic classes to maintain social order and reduce crime.

The temperance movement blossomed nationally over the next decade, with the creation of the American Temperance Society in 1826. Auxiliary groups were established in every state with thousands of local organizations. The economic transition from an agrarian to an industrialized society more demanding of efficiency and scheduling very likely contributed to

The standard view that abstinence was a response to industrialization and the growth of a market economy must be carefully qualified. Such developments undoubtedly contributed to the growing receptiveness of temperance in the 1820s, but they cannot account for the origins of the movement's ideology . . . In the future we must examine carefully the long-ignored moral societies that dotted the American landscape during the 1810s . . . and the hopes and fears of average evangelicals.

James R. Rohrer, "The Origins of the Temperance Movement: A Reinterpretation", *Journal of American Studies*, August 1990

popularization of the movement. Transitioning from temperance to prohibition, the Society crusaded for complete abstinence from strong spirits. Under "divine" guidance, the national movement produced volumes of literature, including a number of journals dedicated to temperance. Through the 1830s total alcohol consumption plummeted from more than seven gallons per capita annually to slightly more than three. Dissension grew, however, with many favoring temperance rather than complete abstinence from wine, beer, and stronger spirits. Though momentum flagged in the 1840s, it was regained in part through the efforts of the Washington Temperance Society and the emotional lectures of John B. Gough and others. Marking a peak in the nineteenth century temperance movement, 13 of the 40 existing states had passed prohibition laws by the inception of the American Civil War (1861–1865).

The temperance movement shifted into national politics with the formation of the National Prohibition Party in 1869; in 1874 the Woman's Christian Temperance Union (WCTU) was founded. The Prohibition Party saw modest success in state elections through the 1870s and peaked in national popular support in 1892 with a presidential candidate. Its primary success was the influence of public policy to support temperance movement issues.

Following an 1888 U.S. Supreme Court ruling that key provisions of state prohibition measures violated federal interstate commerce laws, however, alcohol consumption burgeoned. The Anti-Saloon League, later considered by many to be the most effective temperance organization, was founded in 1893 by representatives of various temperance organizations and the evangelical Protestant churches. A powerful political lobby, the League worked within the existing political

parties to support candidates sympathetic to governmental control of liquor.

The combined influence of the Anti-Saloon League, the WCTU, and the Prohibition Party in 1917 led to a wartime prohibition measure which quickly transformed into the Eighteenth Amendment of the Constitution. The amendment prohibited the manufacture, sale, transport, exporting, and importing of liquor in the United States. The states ratified the amendment by January 1919. Congress passed the Volstead Act, which provided for amendment enforcement, later in 1919 over the veto of President Woodrow Wilson (1913–1921). Prohibition went into effect January 1920, marking the twentieth century peak of the movement. For 13 years the nation was legally dry. Nevertheless, the demand for alcohol continued, giving rise to great disrespect for the law and extensive illegal activity, including smuggling, speakeasies, bootlegging, and a multibillion dollar criminal underworld. Widespread popular support did exist, however, and drinking habits altered substantially throughout the country, leading to a marked decline in alcohol-related accidents and deaths. Concerns grew through the 1920s about increasing police powers to enforce the amendment and intrusions into personal privacy.

In the end, legislators concluded that Prohibition was too oppressive and unenforceable. The Twenty-First Amendment, which repealed Prohibition and nullified the Eighteenth Amendment, quickly proceeded through ratification, becoming official in December 1933. The Volstead Act was rendered void, and individual states again became the arena for alcohol regulation. The renewed production and sale of alcohol served to bolster the depressed economy of the early 1930s by adding jobs and tax revenue.

Attitudes about alcohol consumption have fluctuated through time. Temperance again became an issue later in the twentieth century, as alcohol consumption peaked around 1980. New organizations, such as Mothers Against Drunk Driving, addressed alcohol-related topics such as traffic deaths, health problems, juvenile crime, and fetal alcohol syndrome.

TENANT FARMING

Tenant farming is a system of agriculture whereby farmers cultivate crops or raise livestock on rented lands. It was one of two agricultural systems that emerged in the South following the American Civil War (1861–1865); the other system was sharecropping. The South in economic ruin, former plantation owners were now without slave labor and lacked resources to hire wage laborers. They began dividing up their land and arranging the tracts to be farmed by one of these two methods. In 1860 there were just under 700,000 farms in the South; in 1910 the division of the former plantations resulted in more than three million farms.

A tenant farmer typically could buy or owned all that he needed to cultivate crops; he lacked the land to farm. The farmer rented the land, paying the landlord in cash or crops. Rent was usually determined on a per-acre basis, which typically ran at about one-third the value of the crop. At the end of the harvest the landowner would be paid one-third the value of the crops or would receive one-third the crops directly from the farmer. While this system was superior to that of sharecropping and many sharecroppers aspired to being tenant farmers, the method also had its downfalls. Tenant farmers frequently found themselves in debt to the landowner. At the beginning of a planting season, the farmer would secure store credit based on the crop's expected yield. If conditions were poor or market prices for the crop decreased, the farmer became indebted to the storeowner and to the landowner (which was often the same person). Another consequence of tenant farming was the deterioration of the land; since it did not belong to them, many farmers were not motivated to do ample upkeep or make

improvements, thus, farms tended to deteriorate. However some tenant farmers proved successful and ultimately moved off rented lands to purchase their own tracts. Generally, however, this was not the case and the system, along with sharecropping, proved to be a failure.

TENEMENTS

Tenements (also called tenement houses) are urban dwellings occupied by impoverished families. They are apartment houses that barely meet or fail to meet the minimum standards of safety, sanitation, and comfort. Emerging in U.S. cities during the late 1800s, tenements took many shapes and forms: multistoried buildings, row houses, frame houses, and even converted slave quarters.

Between 1870 and into the early 1900s, U.S. population growth (buoyed by immigration in record numbers) outpaced construction. Housing was scarce, particularly for working-class families. In unprecedented numbers people crowded into the low-rent districts of cities, including New York, Baltimore, Philadelphia, Boston, Chicago, St. Louis, Charleston, and New Orleans.

Living conditions were deplorable: Built close together, tenements typically lacked adequate windows, rendering them poorly ventilated and dark, and they were frequently in disrepair. Vermin were a persistent problem as buildings lacked proper sanitation facilities.

The plight of tenement-dwellers became the object of reformers who waged campaigns with government to pass laws requiring landlords to meet certain standards of safety and sanitation. Legislation was passed (New York became the first state to adopt legislation in 1867, which was furthered in 1879 and 1901), but the laws did not require owners to retrofit existing buildings to comply with the new regulations.

Some improvements came as a result of scientific and technological advances, including water purification and sewage disposal systems; steel-frame construction, which made tall buildings (including skyscrapers) possible and allowed for a more efficient use of limited urban space; electric lighting; electric elevators; and steam heat. While the lives of many working class families improved with the expansion of the economy, many others remained in poverty. With their

attendant problems of crowding, disrepair, lack of sanitation, and crime, tenements have continued to exist.

TENNESSEE

Admitted to the Union as the sixteenth state on June 1, 1796, Tennessee is located in the eastern south central United States. It shares borders with Arkansas and Missouri in the west, Kentucky and Virginia in the north, North Carolina in the east, and Mississippi, Alabama, and Georgia in the south. Geographically, Tennessee is the country's thirty-fourth largest state, spreading across 42,000 square miles. Its population of approximately 5 million people ranks seventeenth among the 50 states. Memphis is the state's most populous city, and Nashville is its capital.

The eastern and western valleys of the Tennessee River separate the state into three regions: east Tennessee, middle Tennessee, and west Tennessee. Forming just east of Knoxville, the river loops 350 miles south into Alabama, and then streams north to join the Ohio River at Paducah, Kentucky. The Appalachian Mountains and its Blue Ridge range dominate the landscape of east Tennessee. Middle Tennessee is a broad and fertile area that covers about half the state, rolling gradually toward the rich bottomlands and hardwood forest of west Tennessee.

The most industrialized part of the state is east Tennessee, where motor vehicles, boats, and aircraft parts are manufactured by businesses that derive power from hydroelectric dams created by the Tennessee Valley Authority (TVA). The federal government's atomic energy research and development center is also located in east Tennessee at Oak Ridge. Middle Tennessee largely consists of farmland for the harvesting of tobacco, corn, and hay; the raising of cattle; and the production of dairy goods. Mining is also a major source of income for residents of both east and middle Tennessee. West Tennessee is home to some of the biggest cotton farms in the South.

Tennessee's early history was intertwined with that of the Cherokee peoples. In fact, the name "Tennessee" derives from the word *Tanasi*, a name the Cherokee gave to a village on the Little Tennessee River. In the eighteenth century the Cherokee allied themselves with Great Britain, fighting alongside British forces against the 13 colonies during the American Revolution (1775–1783). When America won its independence, most Cherokee settled in the area of what

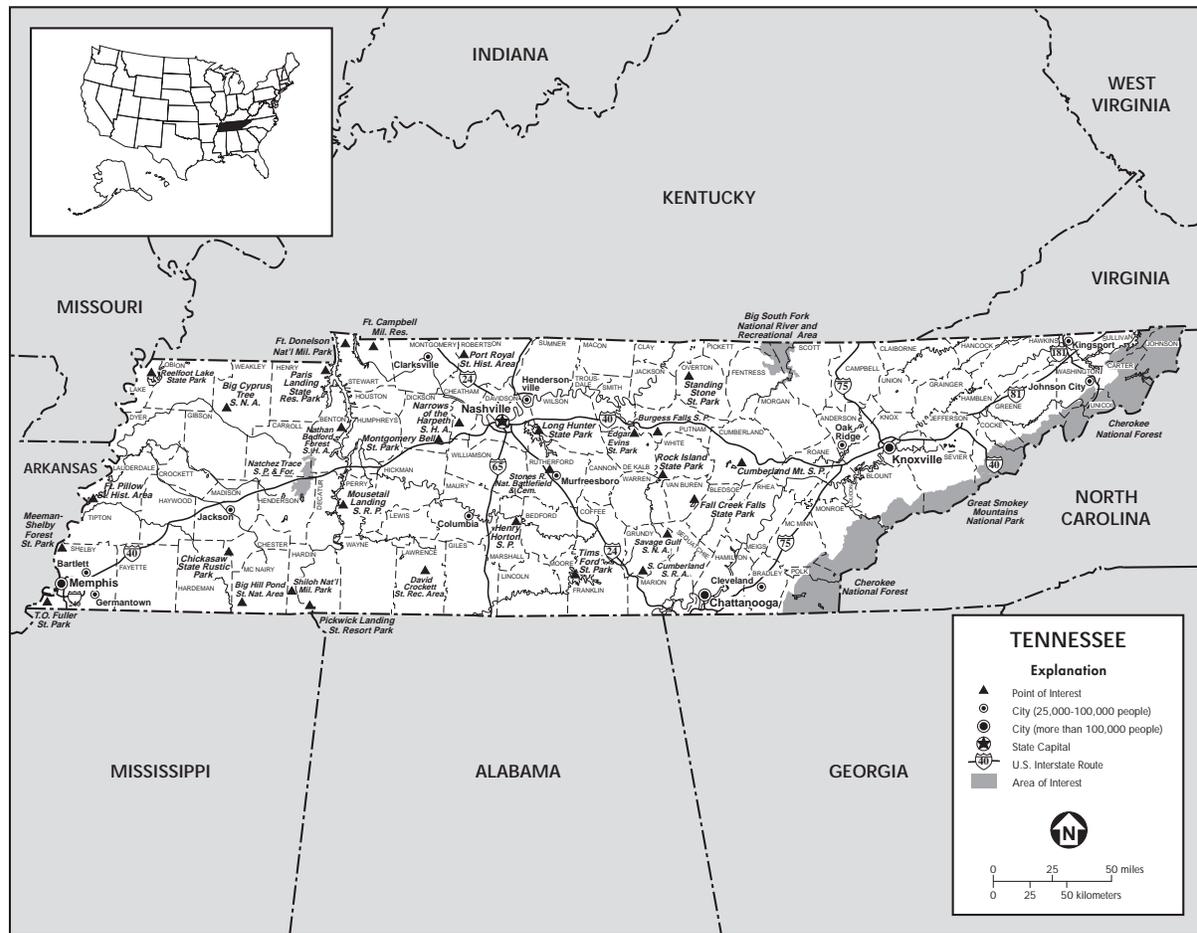

became modern-day Chattanooga. The Cherokee prospered in this area, owning plantations and developing an 85-character table of syllables that was used to print a weekly newspaper. But seven years after the 1828 gold rush in Tennessee, the Cherokee were coerced into signing a treaty under which they surrendered all legal claims to land in the region. In 1838 federal troops forcibly uprooted the Cherokee from their Tennessee homelands and drove them into the Arkansas Territory. Thousands of Cherokee were killed during the relocation, and thousands more suffered great hardship in what has been called the Trail of Tears.

The demise of the Cherokee in Tennessee coincided with the rise of Andrew Jackson (1829–1837) to the U.S. presidency. A former Democratic Congressman and Superior Court judge from Tennessee, Jackson served two full terms. In 1844 another former Democratic Congressman from Tennessee, James K. Polk (1845–1849), was elected president. Although Polk served only one term in office, his administration was responsible for increasing the amount of territory held by the United States by about 50 percent—acquiring the Oregon Territory from Britain and annexing Arizona, California, Nevada, New Mexico, Texas, Utah, and parts of Colorado, Kansas, Oklahoma, and Wyoming from Mexico.

A third former Tennessee Congressman, Andrew Johnson served as vice president in 1864. A year later he assumed the duties of chief executive following President Abraham Lincoln's (1861–1865) assassination. Johnson's first two years in office were consumed by the aftermath of the American Civil War (1861–1865). The war had left the South in ruins. Tennessee, which was the site of more Civil War battles than any other state except Virginia, was particularly devastated, and recovery was slow. Nonetheless, Tennessee was the first state to return to the Union when the war ended, and several northern investors fed capital into the state's industries and cities.

The Civil War ended slavery in the South, but it did not resolve race problems in Tennessee. Turmoil between African Americans and whites in the state continued well into the next century. In the 1860s six former Confederate Army officers from Pulaski, Tennessee, founded a terroristic white-supremacist organization called the Ku Klux Klan (KKK). In the 1870s the state adopted a constitutional provision requiring public schools to be segregated by race. Over the next 50 years the Tennessee legislature enacted a series of so-called Jim Crow laws that segregated the races in other sectors of society. Although the system of state-sponsored racial segregation would be dismantled by the U.S. Supreme Court's 1954 decision in *Brown v.*

Tennessee

State of Tennessee.

the Board of Education and in the federal Civil Rights Act of 1964, white vigilantes continued terrorizing blacks in the South. The Reverend Dr. Martin Luther King, Jr. (1929–1968) was slain by one such gunman on April 4, 1968, while doing civil rights work in Memphis.

Although much of the history of the state is tragic, Tennessee had become a popular tourist attraction by the late twentieth century. Forty million tourists spent approximately \$8 billion each year while visiting the state in the 1990s. Native American exhibits, Civil War battlefields, and a national civil rights museum are among the sites frequented by visitors to the state. Smokey Mountain National Park, the Graceland mansion of Elvis Presley, TVA recreational areas, and bluegrass music festivals are also popular. The Grand Ole Opry nationally broadcasts country-and-western music from Nashville.

Tennessee's unofficial nickname is the Volunteer State, which recognizes the many residents who have served in America's armed forces during times of war

and international conflict. Tennessee has also been called the Monkey State, a reference to a 1925 trial. A high school biology teacher from Dayton was convicted and fined \$100 for teaching Charles Darwin's theory of evolution in violation of a state law mandating that schools teach the *Bible's* story of creation. The case attracted nationwide attention, featuring three-time presidential candidate and fundamentalist preacher William Jennings Bryan (1860–1925) as prosecutor against celebrated defense attorney and avowed atheist Clarence Darrow (1857–1938). During the 1990s Tennessee became widely known as the home of Vice President Albert Gore (1993–), whose family owns a farm in Carthage.

TENNESSEE VALLEY AUTHORITY

The Tennessee River, the largest tributary to the Ohio River, drains approximately 41,000 square miles of the eastern United States. With its headwaters in southwestern Virginia, the river flows southwesterly through Knoxville, Tennessee, dipping into northeastern Alabama before turning westward across the full length of the state then northward through western Tennessee into western Kentucky where it meets the Ohio River. The watershed also includes parts of North Carolina, Georgia, and Mississippi.

At the beginning of the twentieth century, the Tennessee River area was one of the poorest in the nation. Floods regularly inundated much of the region in late winter and early spring, logging had stripped the hills of forests, and poor farming techniques led to exceptional topsoil erosion rates. Many rural settlements had no electricity. The population was steadily dwindling as people left seeking employment.

During World War I (1914–1918) the U.S. government built two nitrite plants and a hydroelectric dam on the Tennessee River at Muscle Shoals, Alabama for munitions production. Following the war, the project was largely neglected. Nebraska Senator George Norris lobbied extensively for government operation of the unused facilities for local benefit. Congress twice passed legislation, in 1928 and 1931, only to be vetoed by Presidents Calvin Coolidge (1923–1929) and Herbert Hoover (1929–1933).

With newly-elected President Franklin D. Roosevelt (1933–1945) and Congress tackling a dramatic round of New Deal reform legislation early in 1933, known as the Hundred Days, Norris reintroduced his legislation. Opportunities for large-scale government

The Tennessee Valley Authority is . . . the most ambitious regional development project ever undertaken by the United States government. . . . It encompassed dam construction, flood control, navigation, power generation and distribution, agricultural development, industrial development, resettlement, housing, community development, and indirectly, health and education. . . . Roosevelt regarded the TVA as the first step towards a system of national planning . . . Franklin Roosevelt had intended TVA to be the first of many regional authorities.

Higgins, Benjamin, "The American Frontier and the TVA," *Society*, March/April, 1995.

planning projects offering employment relief keenly interested Roosevelt. The President took Norris' bill and dramatically enlarged the scope of it. The resulting Tennessee Valley Authority Act of 1933 created an unprecedented strategy of regional government planning and development. A novel concept, the newly created Tennessee Valley Authority (TVA) was conceived as an independent corporate agency, a federally owned corporation combining the power of government with the flexibility of private business. The act created a three-member board, appointed by the President, to oversee the autonomous program.

The development of TVA was shaped to a substantial degree by its first administrative board. Arthur Morgan, Harcourt Morgan (no relation), and David Lilienthal argued about the focus and purpose of the agency while it faced court challenges from opponents. Arthur Morgan, the first chairman, wanted to emphasize planning and efforts to eliminate poverty and he wanted electric rates to be set at levels comparable to private industry. Lilienthal was a strong supporter of public ownership and he wanted the agency to compete aggressively with private power companies. Harcourt Morgan, who opposed government planning, allied with Lilienthal and thus TVA emphasized dams for flood control navigation and power generation. In 1936 the Supreme Court upheld the agency's authority to generate and sell electricity at Wilson Dam and in 1939 it held that the agency was constitutional. By then Roosevelt had dismissed Arthur Morgan as chair of the TVA board due to the feuding among the board members and he appointed Harcourt Morgan in his place. When Lilienthal became chairman in 1941, TVA was the leading producer of electricity in the entire nation; that position the agency has maintained.

Designed to be administered through integral regional management, the TVA began with the construction of multipurpose dams and reservoirs. Eventually, a system of forty-two dams affected the economies of seven states. With the increased demand for electrical power, the TVA began constructing steam-generating facilities in the 1940s. By the 1970s large steam plants, fed with coal from extensive strip mining operations, produced over 80 percent of TVA's power. In 1959 the TVA power program became self-financing, running at a profit in the 1960s as the nation's largest electricity producer. Since that time, the TVA paid dividends and repayments to the U.S. Treasury and made payments to states and counties in place of taxes.

During World War II (1939–1945) TVA completed additional dams to generate electricity for aluminum manufacture and the initially secret atomic facilities at Oak Ridge, Tennessee. In keeping with the agency's integral approach to problems, the completion of the dams also completed a 650 mile navigation channel that connected eastern Tennessee with the Ohio River and then down the Mississippi to the sea. The system today includes twenty-nine hydroelectric dams on the Tennessee River and its tributaries.

TVA's efforts led to electrification and a great deal of economic development of what had been a rural backward area during the 1930s and 1940s. By the 1950s demand for electricity in the region exceeded the capacity of the agency's hydroelectric dams. In 1959 Congress authorized TVA to issue bonds to fund the construction of coal-fired plants, using the extensive coal reserves of the region. In the late 1990s TVA operated eleven coal-fired power plants. TVA's power operations were also made self-supporting and federal funds were appropriated only for the non-power areas of the agency. The region continued to experience significant growth in industry and population.

The availability of abundant power at low rates attracted many businesses and industry to the region. To enhance commercial traffic and recreation, the TVA dredged the Tennessee River from its mouth upstream and created a navigation channel over 600 miles in length. The new system of inland waterways greatly facilitated the hauling of coal, construction materials, petroleum, forest products, and grain. By the 1960s per capita income had risen dramatically and population decline had ended due to hundreds of thousands of new jobs

Besides successfully bringing rural electrification and power for businesses to an area twice the size of the Tennessee Valley, other significant TVA programs included flood control, soil conservation, agriculture

education through demonstration farms, fertilizer research and production, and recreational developments including the 170,000 acre "Land Between the Lakes" recreational area.

Through its early years, the TVA maintained a respected image promoting a popular image of progress. The TVA became a model for other nations, particularly developing Third World nations. However, increasing attacks over environmental issues grew in the 1960s. But TVA ran into problems in two areas: For one thing, the rise of the environmentalist movement brought a consciousness of the cost to the natural surroundings of such a large and ambitious project. Many considered the TVA a symbol of heavy-handed human conquest over the environment including initial population displacements and removal of thousands of acres of rich bottomlands from potential agricultural production through reservoir flooding. The Tellico Dam construction led to a highly publicized confrontation over environmental issues. A major violator of the Clean Air Act, the TVA spent \$1 billion to remove sulfur dioxide emissions from its 12 coal-burning plants and for strip mine reclamation.

Another problem arose with the project to build nuclear facilities to produce electrical power. In the 1960s TVA began construction of several nuclear power plants to meet expected future growth in demand for power. These plants were plagued with problems and cost overruns, some due to the changes in the regulatory environment after the incident at Three Mile Island. Several of the plant projects were abandoned and not completed; three were completed and they remain in operation. The nuclear plants added significantly to TVA's debt and they also renewed opposition to the agency. Safety issues soon arose, triggering a Nuclear Regulatory Commission investigation in 1975. Back on track as a national pacesetter in nuclear plant construction, fourteen plants were under construction by the early 1980s at the cost of over \$1 billion annually. Few actually became operational and the TVA was left in debt for billions of dollars by the 1990s.

In spite of these problems, in many ways the TVA was remarkably successful in achieving its original objectives of economic development in a severely depressed region. The TVA's electricity production was also useful as a "yardstick" gauge of the reasonableness of rate-requests charged to consumers by other utilities across the nation. Some observers note that this was the aspect of the system that earned it the enmity of the public utilities. Private utility companies saw the TVA as a threat and unsuccessfully challenged its constitutionality before the Supreme Court.

Roosevelt had envisioned similar authorities in many other river basins. However, the political climate was never again conducive to such projects. Congress was unwilling to grant such autonomy to a federally funded organization. A living legacy of the New Deal, TVA remained the most ambitious development project ever undertaken by the federal government.

TEXAS

Texas, or the Lone Star State, is known for the strength and character of its people, who have overcome various difficulties. As the economy has waxed and waned, Texans—very much dependent on ranching, farming, and oil production—have stood tall to overcome any adversity that has come their way.

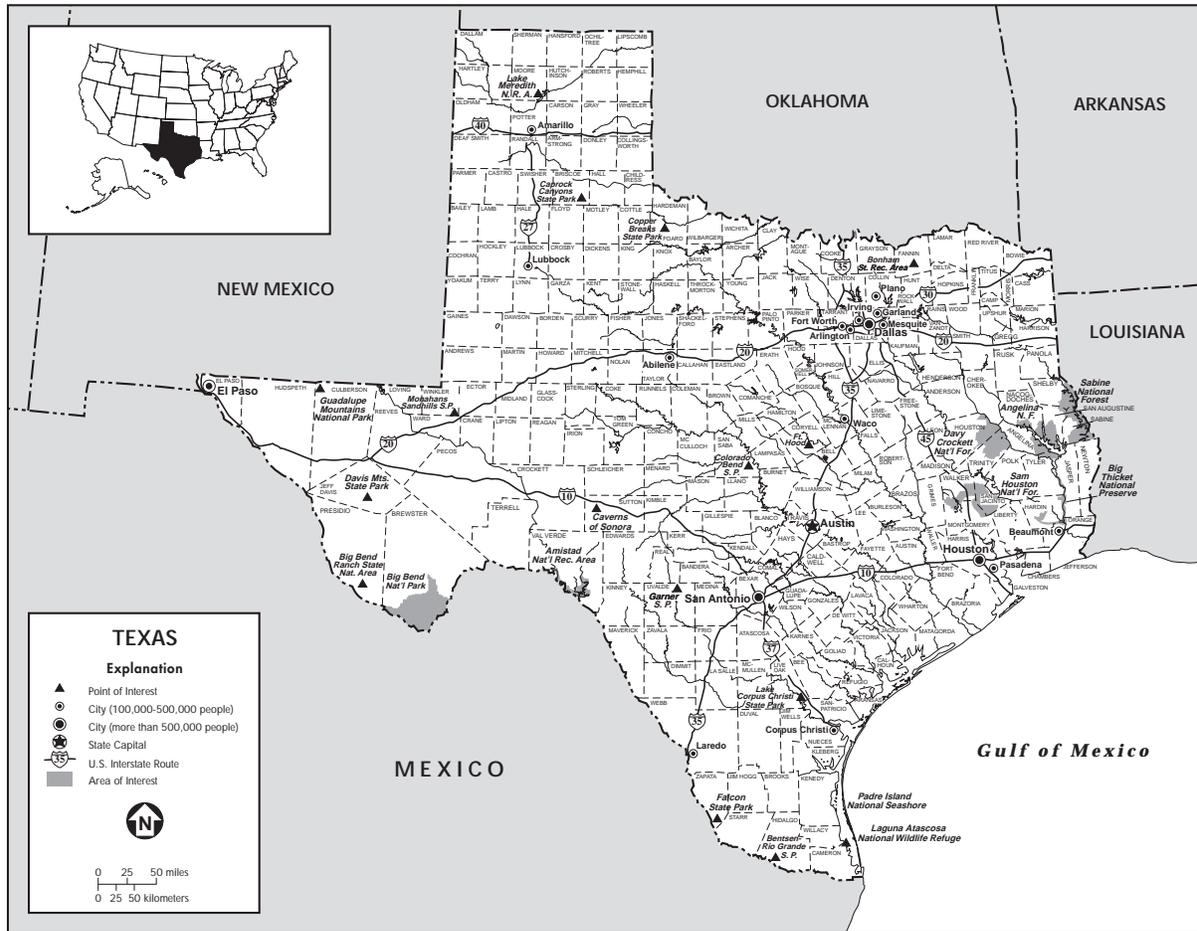

In the 1600s the Spanish were the first to settle in Texas along the San Antonio River, where they established forts and churches. The Spanish taught the Native Americans who lived in the area about Christianity, and the Native Americans taught the Spanish how to farm the land and grow crops.

In 1689 a Spanish explorer named Captain Alonso de Leon left behind a cow and a calf at each river he came across during his expeditions through central and eastern Texas. When the Spanish left some of their missions, they left the cows to roam free on the land. These herds of cattle thrived on the Texas grasslands. Throughout Texas, the Spanish established large cattle ranches, each owned by a *hacendado*, who lived a privileged life. The *vaquero*, or cowboy, worked hard on the ranch for meager meals and a place to sleep. The Spanish established sheep ranches in Texas as well, and these rural estates have also had an impact on the state's economy.

Before the Louisiana Purchase in 1803, the United States took no interest in Texas land. When the Louisiana Territory became part of the United States, however, Texas became a next-door neighbor. In 1820 Moses Austin, a Missouri businessman, convinced the Spanish government to allow him to establish a colony in Texas. Austin's plan was to farm the rich soil along the Brazos River near what is now known as Houston. Upon their arrival in Texas, the colonists learned that Spain had been overthrown and a new government of Mexico ruled Texas. Over the next few years pioneers from Tennessee and other southern states migrated to Texas. They worked hard and fared well. As the number of such colonists grew, they demanded to have a greater influence on the policies and laws set forth by the Mexican government.

In 1835 war broke out as Texas successfully fought for independence from Mexico. After the war, the colonists of the new Republic of Texas faced the challenges of rebuilding their land and businesses. Because roads were not adequate, it was difficult to ship goods in and out of Texas. What's more, the Republic's government had no money. In order to attract newcomers, the government gave away huge tracts of land to settlers. The government also established the homestead-exemption law, which stated that those who fell delinquent on debt payments could not lose their land.

Between 1836 and 1847 the population of Texas quadrupled, with most of the new settlers coming from the United States. Many other settlers came from Germany, Belgium, France, England, Ireland, and Sweden to work on cattle ranches and cotton plantations. In

State of Texas.

1836 a few cities emerged in eastern and central Texas. San Antonio grew to become the largest town in Texas, and Galveston, founded in 1836, became the main port for shipping cotton.

Mexico still considered Texas a colony and threatened to declare war on the United States if it moved to allow Texas to become a state. Mexico held true to its words when, in 1845, the United States approved the statehood of Texas. The two-year war between the United States and Mexico (the Mexican War, 1846–1848) resulted in a peace treaty that forced Mexico to give up all claims on the American Southwest, as well as California.

During the years following the American Civil War (1861–1865) the state government’s treasury was again depleted. The state’s economy before the war depended on the land—and on the slaves who worked on the land. After the war, land prices dropped and, since slaves were free, labor was scarce. Nonetheless, the 4 million longhorn cattle roaming the ranges of Texas provided another source of income for the ailing

economy. The cattle, a source of tallow, hide, and food, could be sold for \$40 a head in the north. In 1866 large-scale cattle drives began in Texas, as more than 250,000 cattle were driven northward to market. For three to six months cowboys pushed the cattle toward their destination: railroad depots in Kansas or Missouri. The cattle-drive period lasted about 20 years. By the 1880s expanded railroads helped to transport the cattle, and such drives were no longer necessary.

IN TEXAS, OIL IS THE TAIL THAT WAGS THE WHOLE ECONOMY.

Professor Bernard Weinstein, Southern Methodist University

After the Civil War the U.S. population began to push westward, forcing Native Americans to move to reservations in Oklahoma. Within 30 years the population of the Texas Great Plains grew to exceed 500,000. Though rainfall was scarce, there were great reserves of underground water in Texas and a constant breeze.

These conditions led to the use of windmills for power and water.

By 1890 railroads crisscrossed the state. Three major railroads connected western and eastern Texas, the surrounding states, and the country's East and West Coasts. While the railroads provided efficient transportation, the costs remained relatively high for the ranchers and farmers until the Texas Railroad Commission was established to regulate freight rates.

Texas's economic base changed forever in 1901, when an oil gusher was discovered in Spindletop Hill just south of Dallas. News of the well traveled fast, and an influx of oil workers and engineers tripled the population almost overnight. From Spindletop, oil businessmen spread out to other cities looking for more. By the end of the year the government had issued more than five hundred charters to oil companies. In 1930 drillers discovered the biggest crude oil pool in the country in Rush County near Kilgore. At this site C.M. Joiner, who was drilling an exploratory well, founded the East Texas Oil Fields, an underground lake of crude oil that measured 40 miles long and between three and 10 miles wide.

Naturally, oil had a major impact on the state's economy. Farmers who discovered oil on their property became rich. Some laborers invested their savings on prospective wells only to turn up sand. Spin-off businesses developed to provide drilling equipment, tank cars, and pipelines. The industries brought people from the farms to the cities, leading to a more than 20 percent increase in city dwellers between 1900 and 1930. Other industries also flourished. During the 1920s new irrigation methods and farming equipment opened areas of the state for cotton growing, and production exploded. Texas produced more than a million bales of cotton in 1926, compared to only 50,000 bales in 1918.

The Great Depression (1929–1939) struck the country in the late 1920s, however, putting more than 300,000 Texans out of work. Many farmers suffered from drastically reduced cotton prices, and a drought in the Texas Panhandle caused farmers and ranchers to leave their homes. Attempts to establish relief programs for the poor and conservation programs for farmlands added to the state's financial difficulties.

World War II (1939–1945) helped to turn around the state's economy. Oil wells provided more than half of the petroleum for the nation during the war, and manufacturing jobs tripled as factories built aircraft, ships, and other goods for the war effort. After the war more than 60 percent of Texas's population lived in urban areas, and Texas remained a major ship and

aircraft producer. These industries would remain important to the state's economy for years to come.

Another discovery made in Texas has led to the advancement of technology around the world. In 1958 Jack Kilby, an employee of Texas Instruments in Dallas, made a finding that led to the production of the silicon chip, enabling the development of handheld calculators, personal computers, and other miniaturized electronics.

Even though Texas's industry and agriculture were strong, the state's economy rose and fell according to the oil market during the 1970s and 1980s. When oil sold for more than \$30 per barrel in the 1970s and early 1980s, the economy in Texas boomed, growing more than 6 percent a year—more than twice the national average. The high oil prices led to easy cash flow: Investors built high-rises in Dallas and Houston, and credit was easily extended. But in the late 1980s oil prices crashed to less than \$14 per barrel due to overproduction. Construction stopped, several banks needed federal assistance to remain in business, and more than 20 percent of office space in Dallas and Houston stood vacant as thousands lost their jobs. As Professor Bernard Weinstein of Southern Methodist University stated, "[i]n Texas, oil is the tail that wags the whole economy."

In order to make up the \$100 million in revenues that the government estimated it had lost for every \$1 decline in the price of a barrel oil, the government raised fees on everything from vanity license plates to day-care centers. It also made efforts to attract new business to Texas, particularly high-tech companies. In 1986 oil prices again began to climb. The revived oil market, along with Texas's newly established high-tech businesses, helped to stabilize the state's economy by the 1990s.

From 1991 to 1996 total personal income grew in Texas by 20.2 percent, while the nation's growth was about 15 percent during the same period. In 1995 the median household income in Texas was \$32,039. That same year, however, 17.4 percent of Texans were living below the federal poverty level.

TEXAS ANNEXATION

During the early colonization of North America by European countries, Spain claimed a vast area of the Southwest including present-day Texas, New Mexico, Arizona, and California. However, few Spaniards actually settled in these areas and by 1820 only 3,500 non-Indian people occupied the entire region. San Antonio de Bexar, the Spanish capital of Texas, itself had only 800 residents. With the U.S. acquisition of the Louisiana territories from France in 1803, U.S. presence along the Mississippi River corridor posed a threat to the nearby Spanish claims. In an effort to hold off further U.S. expansion, Spain used the land of Texas as a buffer. Local Spanish authorities recruited some 300 U.S. citizens to accept low-priced land in exchange for maintaining loyalty to Spain. After some initial problems, the new settlers finally arrived in 1822 only to find that Mexico had gained independence from Spain (in 1821). However, the original land-grant agreement for the U.S. citizens was accepted by the new Mexican government.

Through the next several years more U.S. settlers filed into Texas than Mexico had anticipated and the buffer region was becoming a threat itself. By 1830 Mexican settlers were far out-numbered with over 15,000 white settlers and 1,000 black slaves living in Texas. The later settlers were generally disrespectful of the relatively ineffective Mexican rule. In an effort to discourage further settlement, Mexico attempted to abolish slavery and to stop further immigration from the United States. Mexico also boosted its military presence which further spurred a clamor for Texas independence.

Finally, open rebellion by Texas settlers occurred in October of 1835, with events escalating quickly. A siege of Texas volunteers by Mexican troops in the early San Antonio Spanish mission of the Alamo began in December, resulting in a climatic Mexican victory in March of 1836. While the Alamo was under siege, a group of Texas delegates drafted a Texas constitution

The annexation of Texas is but another name for the perpetuity of slavery; and we who now enjoy the rights and hold the soil of the Union, must bid farewell forever to the hope of relieving ourselves from the danger, the odium, and the disgrace inseparable from this pernicious institution.

Theodore Sedgwick, an opponent of Texas annexation

patterned after the U.S. Constitution and proclaimed independence. Following other Mexican military victories in early 1836, the Texas volunteers struck back at San Jacinto in April, winning a stunning victory and capturing the Mexican head of state, General Antonio Lopez de Santa Anna. The Texans forced Santa Anna to grant independence, but the Mexican government later reneged, claiming that the act had been coerced. In addition, the United States was unwilling to annex Texas despite a referendum vote in 1836 among Texas settlers overwhelmingly favoring annexation. Consequently, for almost a decade Texas was an independent nation.

There were several reasons for the United States' unwillingness to accept Texas' request to be admitted to the Union. Most importantly, Texas was a slave state with its eastern portion heavily committed to cotton cultivation. Its annexation would upset the delicate balance of 13 slave states and 13 non-slave states currently making up the country. The United States, additionally, did not wish to further aggravate their political relationship with Mexico. Moreover, the common perception of U.S. citizens was that Texas' population largely consisted of undesirables. And again, in 1838 Congress defeated a bill to annex Texas.

As Texas was burdened by a huge debt following its independence and as it had no industry, Texas President Sam Houston implemented settlement policies encouraging immigration from the United States and Europe. Free land was offered, and consequently the immigrant population grew from 35,000 settlers in 1836 to 147,000 by 1846. An agrarian slave-based cotton economy flourished on the fertile soils along the rivers and it led to creation of a planter aristocracy concentrating economic wealth in the hands of a very small minority. Texas cotton attracted higher prices in Europe than Southern United States cotton. With the decline of slave-based agriculture in the U.S. border states such as Maryland and Kentucky, slavery-based

economies were moving southwestward toward the deep South and Texas.

However, certain other economic and political developments began to catch the attention of the United States. Texas had established diplomatic relations with several nations, including Britain and France. Those two nations saw an independent Texas as an inhibitor to U.S. expansion. Mexico, who had thoughts of retaking the largely defenseless new nation, became convinced that the continued existence of the Texas Republic might actually serve as a buffer against U.S. expansionism as originally sought. The United States saw Texas' growing ties to European countries as a significant threat to its future expansion. In addition, despite its financially troubled status, Texas began expressing its own expansionist desires. While Texas already included parts of present-day New Mexico, Colorado, and Arkansas, in 1842 the Texas congress voted to extend Texas' boundaries all the way west to the Pacific Ocean to what was later California and some parts of northern Mexico.

Finally, with rising U.S. concern over Texas' future, lame-duck President John Tyler (1841–1845) submitted a treaty of annexation to Congress. The proposal immediately became an 1844 presidential election issue. An ardent proponent of annexation, James K. Polk (1845–1849) won the election, but before he could be inaugurated, Congress voted for annexation in 1845. Texas officially became part of the United States on December 29, 1845. Terms of the annexation agreement were generous to the new state, with Texas retaining all of its public lands and the United States paying \$5 million to ease its debts.

Long term benefits to the United States for Texas annexation were significant. The annexation led quickly to war with Mexico in 1846. The victorious United States came away with control of the American Southwest and California through the Treaty of Guadalupe in 1848. The slave-based cotton production boomed as the number of slaves in Texas increased from 12,500 in 1840 to almost 170,000 in 1860. Besides the cotton trade, Texas became the king of the cattle industry in the nineteenth century and later a major oil producer. Texas annexation also rounded out the borders of a truly transcontinental United States.

TEXAS COMPANY

The Texas Company was founded during the early boom years of the Texas oil industry. In 1901 a gusher at the Spindletop oil field sent hundreds of entrepreneurs into Beaumont, Texas. Pumping out as much as 100,000 barrels a day, the Spindletop wells led to the rapid establishment of over 200 oil companies. Among the entrepreneurs who came to Texas was Joseph S. “Buckskin Joe” Cullinan, an oilman who had begun his career working for Standard Oil Company in Pennsylvania. Cullinan saw an opportunity in purchasing the crude oil for resale to refineries. With the help of New York investment manager Arnold Schlaet, he formed the Texas Fuel Company with an initial stock of \$50,000. Cullinan and Schlaet began soliciting additional investors in New York and Chicago. After raising three million dollars, they reorganized their venture as the Texas Company.

Cullinan immediately began construction on a pipeline between Spindletop and the gulf coast of Texas. He built a refinery at the Texas coastal city of Port Arthur, and from there the company shipped its oil to Louisiana sugar planters, who used it to heat their boilers. In the fall of 1902 salt water leaked into the Spindletop wells, ruining many of the companies based there. The Texas Company survived with a timely discovery of oil at Sour Lake, 20 miles northwest of Spindletop. Other oil strikes soon followed in Oklahoma and Louisiana.

With Cullinan's oil expertise and the financing of his New York backers, the Texas Company soon became one of the nation's most prominent oil companies. Cullinan continued to drill wells in the southwest region, building more pipelines to connect them with Port Arthur. By 1908 the company was selling oil to all but five western states, and by 1913 its assets were worth \$60 million. The nickname “Texaco” came from the cable address of the company's New York offices. “Texaco” gained popularity as a product

Texas Company

name and in 1906 the company registered it as a trademark. The well-known logo first appeared in 1909 as a red star with a green “T” in the center.

At the time of the Texas Company’s founding, oil was used primarily for lighting and as fuel for factories and locomotives. The Texas Company met this demand with its first consumer product, Familylite Illuminating Oil, introduced in 1907. After 1910, however, the automobile revolutionized the oil industry. Demand for gasoline, formerly considered a waste byproduct of kerosene, expanded rapidly. The Texas Company followed this trend and by 1914 its gasoline production surpassed that of kerosene. The company went from distributing gasoline in barrels to underground tanks to curbside pumps, and in 1911 it opened its first filling station in Brooklyn, New York. By 1916 57 such stations were in operation across the country. Powered by the growth of the automobile industry and the high demand for petroleum created by World War I (1914–18), the Texas Company quadrupled its assets between 1914 and 1920.

After World War I the Texas Company continued to concentrate on its automotive gasoline and oil production by introducing new products and expanding its national sales network. In 1920 two researchers at the company’s Port Arthur refinery developed the oil industry’s first continuous thermal cracking process for making gasoline. Named after its founders, the Holmes-Manley process greatly increased the speed of the refining process as well as the amount of gasoline that could be refined from a barrel of crude. The Texas Company marketed this gasoline through its retail network, pushing into the Rocky Mountain region between 1920 and 1926 and into West Coast markets in 1928, with the acquisition of the California Petroleum Company.

Products introduced during the 1920s included the company’s first premium gasoline as well as Texaco Aviation Gasoline and automobile motor oils. To market the lighter oils it refined from Texas crude, the Texas Company launched its first nationwide advertising campaign. The slogan “Clean, Clear, Golden” appeared at the company’s filling stations, which displayed its motor oils in glass bottles. By 1928 the Texas Company owned or leased more than 4,000 stations in all 48 states.

The company’s growth was also reflected in its corporate structure. Finding Texas’s corporation laws too restrictive for doing business on such a large scale, the Texas Company decided to move its legal home. In

1926 it formed the Texas Corporation in Delaware, which then bought out the stock of the Texas Company and reorganized it as a subsidiary called the Texas Company of Delaware. The company also moved their headquarters from Houston to New York. The Texas Corporation acted as a holding company for the Texas Company of Delaware and the Texas Company of California—formerly the California Petroleum Company—until 1941, when it merged with both to form a single company known as the Texas Company.

The Texas Corporation’s earnings reached an all-time high in 1929, but they dropped precipitously after the stock market crash in October of that same year. Overproduction, economic recession, and low prices plagued the oil industry in the early 1930s. The company embarked on a strategy of introducing new products to stimulate demand. Texaco Fire Chief Gasoline was launched in 1932 and the company advertised it by sponsoring a nationwide Ed Wynn radio program. Havoline Wax Free Motor Oil, developed after the acquisition of the Indiana Refining Company in 1931, followed two years later and by 1934 it halted the Texas Corporation’s losses. In 1938 the Texas Corporation introduced Texaco Sky Chief premium gasoline and also began promoting its Registered Rest Rooms program, assuring motorists that their service stations were “Clean across the Country.”

The entry of the United States into World War II (1939–45) brought dramatic changes for the Texas Company. About 30 percent of its wartime production went to the war effort, primarily in the form of aviation fuels, gasoline, and petrochemicals. The company worked closely with Harold L. Ickes, federal petroleum administrator for the war effort, who organized the nation’s oil companies into several nonprofit operations. The Texas Pipe Line Company, a subsidiary, oversaw the completion of two federally sponsored pipelines from Texas to the East Coast. The Texas Company also joined War Emergency Tankers Inc., which operated a collective tanker fleet for the War Shipping Administration. Another such venture was the Neches Butane Products Company, which manufactured butadiene, an essential ingredient in synthetic rubber. This enterprise gave the Texas Company its start in the infant petrochemicals industry.

With the end of World War II the Texas Company faced renewed customer demand at home. In 1947 U.S. consumption of oil exceeded its production for the first time; the company reacted by tapping new foreign sources for its crude oil. The Texas Company formed the Trans-Arabian Pipe Line Company with three other

oil companies to build a pipeline connecting Saudi Arabia's oil fields with the eastern Mediterranean.

In 1959 the Texas Company changed its name to Texaco Inc., formally taking on its longtime nickname. By the end of the twentieth century Texaco was one of the world's largest oil companies, with exploratory, manufacturing, and marketing operations located around the globe.

TEXTILE INDUSTRY

Although comprised of highly skilled craftsmanship the textile industry was essentially a cottage industry until the Industrial Revolution. The American textile industry was a direct product of the British factory system when Samuel Slater introduced the first cotton-spinning mill in 1790 in Pawtucket, Rhode Island. This change marked the beginning of New England's transformation from an agricultural region to a manufacturing one producing the modern forms of ownership, management, and big business. The factory system's emphasis on the individual worker was a major shift in the early U.S. labor system and it came to characterize U.S. industrial and social development.

In the 1790s Samuel Slater and his partner Moses Brown founded the firm of Almy, Brown, and Slater. Slater constructed machines based on the Arkwright model, a water-powered mill invented in the 1700s by Richard Arkwright. The business flourished and additional mills were constructed in Massachusetts, Rhode Island, and Connecticut. Slater altered the British system so that his firm would function effectively within the social and moral structure of the time. He focused

on partnership and single proprietorship, on personal management, small-scale production, the use of water power, and the employment of family labor. From this system emerged a division of labor based on gender and age. Men were typically employed in supervisory capacities, as farm hands and laborers or as skilled artisans. Children and adolescents also worked in the mills while adult women remained at home. The children, often as young as seven or eight, would earn as little as 25 cents per week, and all wages would go directly to the head of the household. Hundreds of manufacturers throughout New England and the Mid-Atlantic states followed Slater's example and his mode of operation.

The Slater system was not the only factory form which developed during the early nineteenth century. In 1813 Francis Cabot Lowell introduced the use of power looms at his Boston Manufacturing Company in Waltham, Massachusetts. These operations combined the spinning of yarn and the weaving of cloth. Lowell employed women and girls who often lived in boarding houses built by the company. Historians have often labeled the Lowell style as the first form of big business in America. This was due to the large-scale, incorporated nature of these ventures, which were also characterized by professional management. The company operated from Waltham, Massachusetts, until 1823 when it relocated operations to Lowell, Massachusetts. The Lowell companies benefited from the tariff of 1816, which imposed a 25 percent tariff on imported cotton and woolen goods. This made them a financial success with profits reaching 20 to 24 percent annually.

A downturn occurred in the textile industry beginning in 1829 resulting in wage cuts. A labor strike ensued in 1834, which was one of the first forms of collective action taken by industrial workers. In response mill owners resorted to immigrant labor, hiring French, Canadian, Italian, and Irish workers to replace the native-born labor force. Strikes and riots in the 1840s reflected disputes between labor and management over the use of immigrant workers. Given these conditions in conjunction with the depression of 1836 through 1844, the textile industry struggled and labor won few victories during these years.

For much of the nineteenth century the Northeast remained the center of the textile production; cotton, woolen, linen, and thread output in this area was rising. In the 1880s, however, a major shift in location began to occur. Cotton mills became the symbol of the New South and mill towns sprang up in the Piedmont region from Virginia to Georgia and into Alabama. Small textile mills focused on small-scale production and

Textile Industry

The textile industry was essentially a cottage industry until the Industrial Revolution and huge mills took over the bulk of textile manufacturing.

paternalistic practices by the owners. Mill agents and superintendents controlled these southern mill towns, with the company providing jobs, houses, food, clothing, and goods. The work force was drawn from the countryside and conditions were harsh. Attempts were made in the 1880s and 1890s to organize southern mill workers, but strikes were ineffective due to the generally poor conditions of the national economy.

In the early twentieth century conditions in the textile industry continued to be precarious, particularly in the North. The Industrial Workers of the World organized major strikes in 1912 and 1913 in Patterson, New Jersey, and Lawrence, Massachusetts. However, labor remained unable to make a major impact on management's long range operations. If labor grew too powerful in one area the firms simply moved to another location where cheaper labor could be hired. The introduction of synthetic fibers such as nylon and rayon also affected the industry. This greatly impacted the design of fashions and ultimately subjected textile producers to the whims of fashion designers and consumers. In addition, there was increasing international competition to be acknowledged—particularly from Japan. This led to many manufacturers shutting down

production or moving south. By the 1920s New England textile towns had fallen into a depression.

While the textile industry struggled through this crisis the Great Depression (1929–39) effectively removed the industry from a central place in U.S. manufacturing. However, while many of the dominant textile companies of the early twentieth century went bankrupt, some thrived after World War I (1914–18). The most important of these, Burlington Mills, prospered remarkably during and after the Great Depression. Spencer Love founded the company in 1923 when it employed two hundred workers. In 1933 there were 6,900 employees and by 1962, at the time of Love's death, the company employed over sixty thousand people. These figures present a stark contrast to the fate of numerous other textile companies; the survival and growth of Burlington Mills can be attributed almost entirely to the management expertise of Spencer Love. The success of this company relied not only on the recurring theme of relocation of factories to areas of cheaper labor, but also on Love's understanding of the basic restructuring of the textile industry during his lifetime. When artificial and synthetic yarns started to displace the natural fibers of cotton, wool,

and silk, Love protected his company by extensive diversification and the creation of a multidivisional infrastructure that linked manufacturing with sales. He also promoted greater control over his goods by integrating external services into his company. The most significant factor affecting the success of Burlington Mills was Love's aggressive management style, which was not bound to any particular tradition or plan. He kept the company profitable by experimenting with new products, new machinery, and progressive marketing strategies.

While other sectors of the manufacturing environment such as the steel, chemical, and automotive industries experienced significant expansion, the textile industry did not. The "managerial revolution" that occurred within high throughput companies such as DuPont or General Motors simply never happened in the textile industry. Spencer Love was an anomaly, attempting to transform the traditional textile industry via integration, diversification, and multidivisional structure. Unfortunately, many of the difficulties that had plagued this industry since its beginning were still in evidence in the late 1990s.

THIRTEENTH AMENDMENT

Proposed on January 31, 1865, and ratified on December 6, 1865, the Thirteenth Amendment abolished slavery throughout the United States. It stated that "neither slavery nor involuntary servitude, except as a punishment of crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction." On

January 1, 1863, in the middle of the American Civil War (1861–1865), President Abraham Lincoln (1861–1865) issued the Emancipation Proclamation. It was an authority based on congressional acts, and it gave the president authority to confiscate rebel property and forbid the military from returning slaves of rebels to their owners. It therefore addressed only the rebelling southern states and did not resolve the issue of slavery for the nation as a whole. The Thirteenth Amendment (the first of the three so-called "Civil War Amendments") prohibited slavery throughout the country. The Fourteenth and Fifteenth Amendments extended the rights of citizenship to all people regardless of race or color.

THOMAS, NORMAN MATTOON

Norman Mattoon Thomas (1884–1968) was the leader of the Socialist movement in the United States for more than four decades. He ran unsuccessfully for U.S. President on the socialist ticket six times. He also wrote numerous books, articles, and pamphlets touting the benefits of socialism and criticizing American capitalist society.

Norman Thomas was born on November 20, 1884 in Marion, Ohio, the son of a Presbyterian minister. He studied political science at Princeton University and then studied for the ministry at Union Theological Seminary. It was there that Thomas was introduced to the reform-minded Social Gospel Theology of Walter Rauschenbusch and the teachings of Christian Socialism. Thomas was ordained a minister in 1911 and became pastor of the East Harlem Presbyterian Church in New York.

During World War I (1914–1918), Thomas joined the Fellowship of Reconciliation, an organization of reformist and pacifist clergyman. He established a magazine for the group called *World Tomorrow*. In 1917 Thomas joined Roger Baldwin in founding the Civil Liberties Bureau—which later became the American Civil Liberties Union (ACLU)—to protect conscientious objectors who were trying to avoid military service.

In 1918 Thomas resigned from the church and became actively involved in the Socialist party. He served as associate editor of *The Nation* and became co-director of the League for Industrial Democracy, the educational branch of the Socialist party. When the

Tidewater

head of the Socialist party, Eugene V. Debs (1855–1926), died in 1926, Thomas became his successor.

As leader of the Socialist party, Thomas spoke out in favor of public ownership and the democratic management of the country's industries, national resources, and transportation. He also supported a public employment system, unemployment insurance, a five-day workweek, and a minimum wage. Thomas ran for president on the socialist ticket six times between 1928 and 1948. His most successful campaign was in 1932, when he earned 884,781 votes.

Despite Thomas' enthusiasm and dedication, the Socialist party gradually lost supporters during his tenure. Many of the party's ideas had been incorporated into President Franklin D. Roosevelt's (1933–1945) New Deal, and there was mounting dissension within the Socialist Party over the proper role of the United States in foreign affairs. Thomas retired from politics in 1948, though he continued to publicly support causes such as world peace, nuclear disarmament, and crusade against poverty. Although many people did not agree with his views, Thomas was nonetheless a well-respected political figure until his death on December 19, 1968.

TIDEWATER

Virginia's Tidewater is in the eastern part of the state and consists of the low-lying region along the Atlantic Ocean which surrounds Chesapeake Bay. The area is roughly 100 miles (160 kilometers) wide and is

crisscrossed by rivers and inlets which fill when the tide rises in the Atlantic. Salt marshes and swamps are also prevalent. The area includes the Eastern Shore, the peninsula that extends southward from Maryland and juts out between Chesapeake Bay (on the west) and the Atlantic (on the east). During colonial times an aristocratic culture emerged here that became highly influential in Virginia colonial politics between 1607 and 1710. The interests of the wealthy Eastern Shore families were often in direct opposition to those of the back country settlers. In 1676 these conflicting views resulted in Bacon's Rebellion, which pit frontiersmen headed by back country leader Nathaniel Bacon (1647–76) against the Virginia militia organized by English Colonial Governor William Berkeley (1606–77). The rebellion was put down after Bacon died of dysentery. Berkeley, who had always been favorable toward the Tidewater power-bloc, was recalled to England by the king for his action.

TIMES MIRROR CO.

The Times Mirror Company was first incorporated in 1884 as the parent company of the *Los Angeles Times*; this collaboration was founded in 1881 by the *Los Angeles Daily Times* and its printer, the Mirror Printing and Binding House. The company was founded by Civil War veteran General Harrison Gray Otis—who had moved to California and made a fortune in real estate—and Colonel H. H. Boyce. Otis bought out Boyce two years later and then became the newspaper's president, general manager, and editor-in-chief.

Los Angeles was a small, sleepy town in the late nineteenth century, and the *Times's* circulation was less than 7,000 in 1890. In 1894 Henry Chandler became Otis's son-in-law. The two men would run the newspaper until Otis's death in 1917, whereupon Chandler would become president, general manager, and publisher of the *Times* for three decades. Descendants of Otis and Chandler would hold a controlling interest in the Times Mirror Company throughout the twentieth century.

At the beginning of the twentieth century the *Times* could boast it carried more advertising than any other newspaper in the world. By 1905 annual gross revenues topped \$1 million. Throughout the century the newspaper grew with the city it served, publishing its first article on movie making in 1909 and its first movie review in 1913. (From 1922 to 1927 it even owned and operated the first commercial radio station in Los Angeles County.) The newspaper was known

for its right wing, anti-union stance, and the company succeeded in keeping unions out of the *Times* in spite of a union-planted bomb that destroyed the *Times* building in 1910. The *Times* achieved notoriety in 1935, when it ran faked photos of pro-unionist author Upton Sinclair (1878–1968), who was running for governor of California.

Norman Chandler, Henry Chandler's son, became general manager in 1936, president and general manager in 1941, and assumed the title of publisher when his father died in 1944. That year the company also began publishing *The Mirror*, a tabloid-sized afternoon daily. In 1948 Times Mirror acquired its newsprint supplier, Publishers Paper Company, which was based in Lake Oswego, Oregon. Additionally, the newspaper company co-owned, along with CBS, television station KTTV. The station made its first telecast, the Rose Parade from Pasadena, California in 1949. The next year Times Mirror bought out CBS's interest in the station, and the *Times* began printing a daily television schedule.

At the end of the 1950s circulation of the *Times* stood at an average of 500,000 daily and 900,000 on Sundays. In addition to owning the *Times*, *The Mirror*, and KTTV, Times Mirror was active in paper manufacturing and commercial printing. As well, KTTV was renamed Times-Mirror Broadcasting Company once Times Mirror achieved full ownership in 1959.

In 1960 a period of acquisitions began for Times Mirror as Otis Chandler, grandson of Henry Chandler, succeeded Norman Chandler as the fourth publisher of the *Times*. The company ventured into book publishing when it acquired The New American Library in 1960. For the first time more than half of the company's net income came from non-newspaper sources. Annual revenues were more than \$112 million, up from over \$97 million the previous year.

Numerous acquisitions made in different areas of book and information publishing during the 1960s included Jeppensen and Co. (1961), a leading publisher of air navigation information (which became Jeppensen Sanderson in 1984); H. M. Goush Company (1961), a producer of travel maps; legal publisher, Matthew Bender and Co. (1963); The World Publishing Company (1963), publisher of *Webster's New World Dictionary*; The Sun Company (1964), publisher of the *San Bernardino Sun-Telegram*; Year Book Medical Publishers (1965); art book publisher Harry N. Abrams, Inc. (1966); and medical publisher The C. V. Mosby Company (1967). During the decade the company also purchased several lumber and pulp companies for its newsprint operations. In 1964 its stock

became publicly traded on the New York and Pacific Exchanges.

By 1966 the *Los Angeles Times* was the nation's largest standard-size metropolitan newspaper in weekday circulation. In 1967 Times Mirror branched out into magazine publishing with the acquisition of *Popular Science* and *Outdoor Life*, followed by *Golf* and *Ski* magazines in 1972, all of which led to the creation of Times Mirror Magazines. In 1969 the company entered cable television with the purchase of CoAxial Systems Engineering Company in Palos Verdes, California, with a base of 5,700 subscribers and seven cable franchises.

As the *Los Angeles Times* passed the one million mark in weekday circulation in 1970, its parent company continued to acquire newspapers, magazines, television stations, cable companies, printing companies, publishers, and other businesses throughout the decade. In 1972 the Times Mirror became the largest publicly held publishing company in the United States, based on revenues and net income. By 1977 operating revenues exceeded \$1 billion. Key acquisitions made during the 1970s included Long Island's suburban newspaper, *Newsday* (1970); the *Dallas Times Herald* (1970); Long Island Cablevision Corporation (1970); KDFW-TV in Dallas (1970); KTBC-TV in Austin, Texas (1973) (purchased from former First-Lady Lady Bird Johnson); The Sporting News Publishing Company (1977); *The (Stamford) Advocate* (1977); and, in 1979, the *Hartford Courant* (which was founded in 1764 and the nation's oldest continuously published newspaper).

Further acquisitions were made in the 1980s and included *The Denver Post* (1980); *The Morning Call* (1984), which served a nine-county region in eastern Pennsylvania and New Jersey; Xerox Learning Systems (1985); The A. S. Abell Co., publisher of *The Baltimore Sun*, for \$600 million (1986); scientific, technical, and medical journal publisher CRC Press, Inc. (1986); and *National Journal* (1986), which published for government officials and decision-makers. In 1987 the Times Mirror Co. acquired the magazines *Field and Stream*, *Home Mechanix*, *Skiing*, and *Yachting* from Diamandis Communications Inc. In 1988 college textbook publisher Richard D. Irwin was purchased from Dow Jones and Co. for \$135 million, and *Salt Water Sportsman* was added to the Times Mirror Magazine group.

Several properties were also sold during the 1980s, including the struggling *Dallas Times Herald* for \$110 million in 1986, and *The Denver Post* in 1987. Times

Tire and Rubber Industry

Mirror divested 80 percent of its ownership in Publishers Paper Co. in 1986 and sold its directory printing company Times Mirror Press to GTE Directories Corporation in 1988.

Revenues continued to grow during the 1980s. Times Mirror reported more than \$3 billion in revenues for the first time in 1987, while revenues for the *Los Angeles Times* exceeded \$1 billion for the first time in 1988. Between 1986 and 1989 Times Mirror sold off more than \$1 billion in assets and spent \$750 million on acquisitions to refocus on its core print and electronic media businesses. For the entire decade the company spent \$1.5 billion on acquisitions, and capital expenditures totaled \$2.5 billion.

Despite its revenue growth, acquisitions, and capital expenditures, the company began to struggle financially in the 1990s. The decade began with a nationwide advertising slump that adversely affected revenues in the company's newspaper and magazine operations. *New York Newsday*, which was launched in 1985 to serve the city's Brooklyn and Queens boroughs, continued to lose money. The company posted a net loss of \$66.6 million for 1992. After revenues fell to a five-year low of \$3.36 billion in 1994 and the company's earnings per share fell by more than 15 percent, Mark Willes was brought in as president and chief executive officer (CEO). On January 1, 1996, he would succeed Robert Erburu as chairman of the board. In 1997 Willes also became publisher of the *Los Angeles Times*, where he oversaw drastic cuts in personnel. (Willes had earned a reputation for ruthless cost-cutting as vice chairman of General Mills, Inc., where he was known as "The Cereal Killer.")

Meanwhile, Times Mirror had agreed in 1994 to merge its cable television operations with Cox Communications Inc. for \$2.3 billion, and that same year the company sold its four broadcast television stations. Within months of coming on board, Willes shut down the money-losing *New York Newsday* and the evening edition of *The Baltimore Sun*. One thousand jobs were cut, many of them at the *Los Angeles Times*, where certain sections of the newspaper were eliminated.

In 1996 Times Mirror exited the college textbook publishing business by exchanging Shepard's (a leading legal citation service), owned by McGraw-Hill Companies, for its Higher Education Group, which consisted of Richard D. Irwin, William C. Brown, Irwin Professional Publishing, Brown and Benchmark, and Mosby College. Shepard's then joined forces with medical and legal citation service Lexis-Nexis in a joint venture between Times Mirror and publisher Reed Elsevier. In 1998 Reed Elsevier would acquire

Matthew Bender and the Times Mirror's remaining interest in the joint venture for \$1.65 billion.

Other divestitures included selling Harry N. Abrams, Inc. and the *National Journal* in 1997 and Mosby Inc. in 1998. The sale of Mosby and Matthew Bender in 1998 occurred after Times Mirror attempted to merge the two companies, prompting several Mosby executives to resign. The sales were part of the company's strategy to exit professional book publishing. The sale of Mosby contributed to increases in earnings and revenues for 1998, with Times Mirror reporting a jump in net income to \$1.42 billion from \$250.3 million in 1997, while revenues rose from \$2.9 billion in 1997 to \$3 billion in 1998. Late in 1998 the company announced it would launch a new magazine, *Outdoor Explorer*, its first major publication launch since *New York Newsday* in 1986.

Since 1995 Times Mirror had executed a strategy of exiting non-core businesses, streamlining operations, and reinvigorating its existing businesses to achieve improved financial performance. That left the news and information company with three business segments: newspaper publishing, professional information and training, and magazine publishing.

TIRE AND RUBBER INDUSTRY

Rubber is an unsaturated organic compound made of carbon and hydrogen. Natural rubber is collected from wild plants or plants cultivated on plantations. It is made from a secretion of certain plants that is called latex. It is tough, can stretch, and is a poor conductor of electricity, making it useful for a wide array of products, the most noteworthy of which are tires.

Rubber may have been used by the Maya Indians of Central and South America as far back as the eleventh century. Christopher Columbus (1451–1506) saw Native Americans playing with balls of tree gum on his second voyage to the New World about 1493. During the early nineteenth century, attempts were made to use rubber to treat clothes and footwear to make them water-resistant. In 1820 Charles Macintosh, a chemist from Scotland, created a way to bond two pieces of fabric, which made a waterproof cloak known as a “mackintosh.” Thomas Hancock, an English inventor, developed a machine which took scraps of rubber and caused them to be reusable. An American inventor, Charles Goodyear (1800–1860), created the process of vulcanization in 1839, a method to cure rubber, which increased its durability. This process was still used in almost the same way in the late twentieth century. By the early nineteenth century, the rubber industry in Europe was well established. After the development of vulcanization, rubber products began to be in great demand. Pneumatic carriage tires were invented around 1845, and Englishman John Boyd Dunlop (1840–1921) was responsible for founding the modern tire industry when he developed and patented pneumatic bicycle tires in 1888. By 1890 Charles Kingston Welsh and William Erskine Bartlett had made improvements to pneumatic tire design.

The early twentieth century saw an increase in the demand for tire and rubber products as automobiles increased in popularity. Soon tractor tires were replaced with rubber. Until 1940 all tires were from natural rubber that came from Asia. When World War II (1939–1945) made that source no longer available, the United States quickly had to develop ways to produce synthetic rubber to meet wartime demands. After the war ended, natural rubber became available again, and synthetic rubber was not in demand again until the 1960s. Both types of rubber, natural and synthetic, were in use throughout the end of the twentieth century.

Radial tires, an improvement that gave greater stability, were first developed by the Michelin company of France in the 1930s. This company, founded by two brothers in 1863, began to sell radial tires in the United States in the 1960s. By 1980, the company had four plants in the United States, and by the late twentieth century had become one of the world’s biggest producers of automobile tires.

Bridgestone began as a company that sold clothes, but moved into rubber tire production in 1923. Bridgestone has operated plants in Singapore, Thailand, and Indonesia, and was for a time the leading supplier of tires to Japan. It purchased the Firestone

company in 1988, which was the third leading tire producer in the United States at that time. Firestone suffered a number of losses in the 1990s, which have caused losses for Bridgestone.

The most important U. S. tire company has been the Goodyear Tire & Rubber Company, which began in 1898 and was named after Charles Goodyear, who invented vulcanization. It had produced more tires than any other company worldwide, and by 1991 had 41 plants in the United States alone, 43 in other countries, and over two thousand retail stores. Other important companies were Uniroyal–Goodrich, bought by Michelin in 1989, and the Cooper Tire & Rubber Company. Most companies in the tire industry had become multinational by the last part of the 1980s.

While tire products remain the predominant product of the rubber industry, there are many other products that use natural or synthetic rubber. These products include inner tubes, hoses, belts, rainwear, shoes, boots, insulation against sound or vibration, carpet backing, gaskets, seals, cables, steering wheels, bowling balls, latex gloves, and many other common products. The need for these products and their contribution to the U. S. economy is expected to continue well into the twenty-first century.

TOBACCO

Tobacco is an American plant, which is a member of the nightshade family. When Christopher Columbus

Tobacco plants are hung to dry after harvesting.

(1451–1506) arrived in the West Indies (islands in the Caribbean Ocean) in 1492, he found the native inhabitants smoking rolls of tobacco leaves, called *taino*. (The word tobacco is derived from the Spanish *tabaco*, which is probably from *taino*.) The practice of “drinking smoke” was observed to have a relaxing effect. Upon returning to Spain, Columbus took seeds of the plant with him. By 1531 tobacco was being cultivated on a commercial scale in the Spanish colonies of the West Indies. In 1565 English naval commander John Hawkins (1532–95) introduced tobacco to England, where smoking was ultimately condemned as a “vile and stinking custom” by King James I (1566–1625) decades later.

Tobacco was not commercially cultivated on the North American mainland until English colonist John Rolfe (1585–1622) carried seeds from the West Indies to Jamestown, Virginia, where he settled in 1610. By 1612 he had successfully cultivated tobacco and discovered a method of curing the plant, making it a viable

export item. Jamestown, Virginia, became a boomtown and England’s King James, who collected export duties, changed his mind about the habit of smoking. The coastal regions of Virginia, Maryland, and North Carolina were soon dominated by tobacco plantations, and the crop became the backbone of the economies in these colonies. Cultivation of tobacco did not require the same extent of land or slave labor as did other locally grown crops such as rice and indigo. But it depleted the nutrients of soil more rapidly, causing growers to expand their lands westward into the Piedmont region (the plain lying just east of the Blue Ridge and Appalachian mountains). In 1660 British Parliament passed the Second Navigation Act, declaring that tobacco and other articles from England’s American colonies could only be exported to the British Isles. Tobacco prices dropped in response to the legislation and the colonial economies were weakened, causing political discontent with the mother country. But, despite the Second Navigation Act, European demand was not diminished and the colonists soon resumed exports. By 1765 colonial exports of tobacco were nearly twice the value of exports of bread and flour. The crop helped define the plantation economy of the South, which prevailed until the outbreak of the American Civil War (1861–65). During the 1800s companies such as R. J. Reynolds Tobacco and American Tobacco were founded. Tobacco has remained an important crop in the American south and the manufacture of tobacco continued to be an important industry.

TOBACCO INDUSTRY

The first permanent English settlement in the New World was a disaster for its early inhabitants. Times got so bad in the “starving time” of 1609–1610 that some of them resorted to cannibalism. Ten years later the Virginia colony exported 40,000 pounds of tobacco to England and the farmers were getting rich. The first successful commercial crop of tobacco was cultivated in Virginia in 1611 by Englishman John Rolfe and within seven years it had become the colony’s leading export. By the 1630s the annual crop was 1.5 million pounds. People were planting tobacco everywhere, even in the roads. In spite of the fact that tobacco exhausted the land, over the next two centuries it was an important cash crop, though increasingly dwarfed

during the nineteenth century by a much more important cash crop—cotton. After the Civil War and the abolition of slavery, most tobacco was grown by small, independent family-owned farms.

Initially tobacco was produced mainly for pipe smoking, chewing, and snuff. Cigars didn't become popular until the early 1800s. In 1847 the Phillip Morris Tobacco Company was established, which sold hand-rolled Turkish cigarettes. Two years later J.E. Liggett and Brother was formed in St. Louis. In the American West, chewing tobacco became so popular among cowboys and gold diggers that the R.J. Reynolds Tobacco Company built its operations around the product in 1875.

Cigarettes, which had been around in crude form since the early 1600s, didn't become widely popular in the United States until after the American Civil War (1861–1865). At that time, they were crudely made from scraps left over after the production of other tobacco products, primarily chewing tobacco. The invention of the first practical cigarette-making machine, sponsored by tobacco baron James Buchanan Duke (1856–1925) brought mechanically rolled cigarettes in the 1880s greatly increased the demand for cigarettes. One of the advertising ploys of the cigarette manufacturers was to point to the “sanitary” nature of mechanically rolled cigarettes. “No dirty immigrants hands” had rolled the cigarettes, in contrast to the cigar manufacturers in the immigrant ghettos of the north. Thus cigarettes became an expression of anti-immigrant sentiment as well as of the advent of science and modernity.

With the introduction of “Bright” tobacco, a uniquely cured yellow leaf grown in Virginia and North Carolina, cigarette sales steadily gained ground over other tobacco products. Cigarette sales surged again in the late 1880s with the introduction of the “White Burley” tobacco leaf. In 1901, six billion cigars were sold and only 3.6 billion cigarettes. With the emergence of the *Marlboro* brand, marketed from the newly established Philip Morris headquarters in New York, cigarettes soon became the major tobacco product. With the demand for cigarettes on the rise, R.J. Reynolds Company marketed a new cigarette brand called *Camel* in 1913.

By the early twentieth century, with the growth of cigarette sales and smoking, articles addressing the health effects of smoking began to appear in scientific and medical journals. In 1930, researchers in Cologne, Germany, made a statistical correlation between cancer and smoking. Eight years later, Dr. Raymond Pearl

of Johns Hopkins University, reported that smokers did not live as long as non-smokers. By 1944, although admitting that “no definite evidence exists” linking smoking and lung cancer, the American Cancer Society began to warn about the possible health risks associated with smoking.

Despite these warnings cigarette sales sharply increased. During World War I (1914–1918), armed forces took up the “soldier’s smoke.” During the 1920s, the tobacco market soared, particularly among women, as cigarettes attracted a growing number of “flappers.” The coincidence of the rise of cigarettes and the rise of feminism meant that the woman who smoked cigarettes, especially out of doors, was taking a stand in favor of women’s rights. During the 1920s, the tobacco market soared, particularly among women. Popular brands of cigarettes included “Chesterfield,” “Lucky Strike,” “Old Gold,” “Camel,” “Raleigh,” and “Marlboro.” The Phillip Morris tobacco company began marketing the Marlboro in 1924 as a woman’s cigarette that was as “Mild as May.” Smoking rates among female teenagers tripled between 1925 and 1935.

With the introduction of the *Pall Mall* brand in 1939, the American Tobacco Company became the largest tobacco company in the United States. During World War II (1939–1945) the sale of cigarettes was at an all-time high. Tobacco companies sent millions of cigarettes to soldiers for free. Cigarettes were also included in a soldier’s C-Rations. When the soldiers returned home from abroad, the tobacco industry had a steady stream of loyal customers. The cigarette culture was actively promoted. The main male movie stars of the age were smokers. Humphrey Bogart and John Wayne were smokers. (They also both developed lung cancer.) After World War II, the soldiers came home “hooked on cigarettes.” One popular country-and-western song from the 1940s was “Smoke, Smoke, Smoke that Cigarette. . . .”

By the 1970s the two most influential tobacco companies were Philip Morris and R.J. Reynolds, with the popularity of their respective “Marlboro” and “Winston” brands. Another trend in the 1980s was the consumer interest in discount cigarettes, partly in response to the substantial increases in cigarette taxes. The 1990s saw an increasing support by the government to make tobacco companies liable for damages caused by their products exemplified in a 1992 U.S. Supreme Court decision. There also continued to be significant tax increases on cigarettes in many states, such as the 75 cents a pack tax levied by the state of Michigan. In addition, during the 1990s many businesses began to restrict or eliminate smoking in public

places, in response to an Environmental Protection Agency (EPA) report in 1993 that categorized tobacco smoke as a class-A carcinogen. Increasing criticism of advertising strategies employed by tobacco companies also contributed to the decline in popularity of tobacco products.

The health risks associated with tobacco use resulted in a rise in lawsuits filed against tobacco companies in the late 1990s. Individuals sought compensation for poor health brought on by years of smoking and states asked for reimbursement on the large medical costs incurred by smoking-related illnesses. Both groups were successful and reforms were initiated. By the end of the twentieth century, the complexion of the tobacco industry in the United States was radically changed by shifting attitudes and regulations. Because of the unfavorable market conditions in the United States, companies sought to increase their sales in foreign markets, where attitudes about tobacco remained open and restrictions were more lenient.

Although tobacco had jump-started the American economy at a point when settlement was clearly costing more money than it was worth (except in the eyes of the religious dissidents of New England who merely wanted to be apart from England), and though it had helped to shape some of the fundamental characteristics of the emerging colonial American economy, the tobacco plant had also become a noxious but well entrenched part of the American culture.

TOBACCO TRUST

The American Tobacco Company was a huge holding company that monopolized the U.S. tobacco market between 1890 and 1910. Foundations for American Tobacco began in 1881 when James B. Duke (1856–1925) went into the cigarette business with his father, Washington Duke, founding W. Duke and Sons Company near Durham, North Carolina. The younger Duke led the company by aggressive, growth-oriented practices such as price-cutting (to undercut competitors) and spending up to 20 percent of sales on advertising and promotion. By the mid-1880s Duke expanded operations to take advantage of the cigarette markets in the North and West. Competition between his company and four other tobacco manufacturers intensified.

In 1889 New Jersey passed an incorporation law that allowed Duke to organize a merger with his competitors in 1890, thus founding the American Tobacco Company. Although it controlled almost 90 percent of the domestic cigarette market, American Tobacco continued to advertise extensively. Duke also increased profits by seeking an exclusive contract with a manufacturer of cigarette-machines. He integrated the company vertically (so that the company did everything from buying the tobacco leaves to selling finished tobacco products at its own retail chain, the United Cigar Store). Duke eliminated less profitable brands and also closed inefficient factories. The company employed non-union labor to keep costs low. As a result, American Tobacco could price competitively.

Duke continued his practice of buying competitors and by 1911 acquired 250 of them. By efficient management and strategic acquisitions American Tobacco was able to hold on to most of the tobacco market. In 1911 the company claimed 96 percent of domestic snuff sales, 85 percent of chewing tobacco and cigarette sales, and 75 percent of smoking tobacco.

On May 29, 1911, American Tobacco Company was dissolved in accordance with a ruling by the U.S. Supreme Court. The decision followed years of court challenges to Duke's monopoly that began in earnest in 1907; an American Tobacco subsidiary was indicted for price fixing (the practice of pricing below cost to eliminate a competitive product). This prompted the U.S. Justice Department to file a petition against the holding company. The Court charged American Tobacco Company with violating the Sherman Anti-Trust Act of 1890, which outlawed restraints on trade and attempts or conspiracy among competitors to monopolize a market. American Tobacco was condemned by the high court for its "unreasonable business practices." (The decision came just two weeks after a similar

case against John D. Rockefeller's Standard Oil Company, which set the precedent for the enforcement of anti-trust laws.) Two decades after the passage of the first national anti-trust legislation (the Sherman Act), the federal government had finally voiced its determination to keep the U.S. marketplace competitive.

TORDESILLAS, TREATY OF

After early New World colonization efforts by the Vikings around A.D. 1000 several centuries passed before European explorations of the area were renewed. By 1450 political, economic, and technological changes were taking place, which made distant exploration more feasible and desirable. The Renaissance spawned interest in scientific inquiry and human control over the natural environment. Political centralization transformed the Middle Ages' small-localized principalities, ruled by rival noble families, into nation-states. Rulers gained great power following the decline of the Catholic Church's influence. Monarchs with centralized political power accumulated funds to finance exploration. Earlier overland exploration, highlighted by Marco Polo's journey to Cathay in the late thirteenth century, had whetted Europe's appetite for trade with the Orient. Wealthy fifteenth century Europeans desired goods available in the East, including jewels, porcelain, and spices.

The established overland routes came under control of other groups along the way, including Turkish Muslims, who gained control of the main route in the 1450s. The newly created nations of Western Europe, including England, Portugal, Spain, and France, became interested in seeking alternative routes for conducting trade with the East. With technological advances in shipbuilding and navigation, Portugal began exploration of trade routes by sea, and in 1487 charted an ocean route around Africa to India. Jewels and spices began arriving in Portugal, making Lisbon the new trade center for Europe.

With interest in overseas exploration heightened, explorer Christopher Columbus (1451–1506) sought a sponsor so that he might pursue a theory that contact with the East could be established by sailing west across the Atlantic Ocean. After Portugal refused to finance him, Spain provided financial support and ships, and Columbus set sail in late 1492. After ten weeks of sailing Columbus came to an island he named San Salvador. Though actually landing in what is now

Money and credit arrangements underlay the great expansion of trade. . . Spaniards brought back gold, pearls, jewels, and - above all - silver from their American colonies. . . Altogether it has been estimated that between 1500 and 1650 some 181 tons of gold and 16,000 tons of silver arrived in Europe from the Spanish colonies. . . The scope and the scale of long-distance trade changed greatly. . . (as) lines of credit and exchange had to be lengthened to accommodate the greater distances and times involved. . . (T)he European economy was poised to take advantage of the expanded trade.

William Phillips and Carla R. Phillips, *The Worlds of Christopher Columbus*, 1992.

known as the Bahamas, Columbus proclaimed he had discovered the western route to the East. Excitedly, Spain claimed control over the discovery.

Portugal and Spain, the two leaders in fifteenth century exploration, had a short time earlier in 1479 and 1480 reached agreement that Spain would control the Atlantic region around the Canary Islands, and Portugal would hold rights to lands discovered south of the Canary Islands and west of Africa. In 1481 the Pope issued a charter called *Aeterni Regis* officially recognizing the agreement. Portugal, however, argued that the islands Columbus encountered were actually islands in the Atlantic Ocean previously claimed by their own explorers.

Because Spain and Portugal were the two primary Catholic powers, requests for resolution to the serious dispute went directly to Pope Alexander IV. The Pope issued a decree in May 1493, creating an imaginary north-south line separating the claims of Spain and Portugal. The line was drawn on maps 100 leagues west of the Cape Verde Islands, situated off the coast of Senegal on the West Coast of Africa. Spain was to assert exclusive control of lands west of the line, Portugal to the east. Excluded were lands already claimed by other European nations.

With further exploration, Portugal soon realized that Spain got the better of the deal and that the line's placement even threatened their exploration routes around Africa. Portugal returned to the Pope seeking a revision. In June 1494, Spanish and Portuguese ambassadors meeting at Tordesillas in northwestern Spain moved the line 270 leagues further west. The exact position of the line, however, was never very clear

Townsend Clubs

since the league unit of measure varied among countries at that time. Also, the Cape Verde Islands are 60 leagues wide, leaving doubt as to whether the distance to the line was to be measured from the east coast of the islands or the west. The Treaty of Tordesillas was later validated by Pope Julius II in 1506.

Columbus made three additional voyages between 1494 and 1502, exploring the Virgin Islands, Jamaica, Puerto Rico, and Trinidad. Not until later was it concluded that Columbus' findings were not in the East. Portugal maintained its interest in seeking a route around Africa, and navigator Vasco da Gama (1469–1525) reached India in 1498. Meanwhile, subsequent voyages by Portuguese explorer Pedro Alvares Cabral in 1500 east of the line established by the treaty led to the discovery of Brazil. Inland exploration westward from the Brazilian coast penetrated well beyond the line, but there was no opposition from Spain. As a result, Portugal established claim to a vast region of South America.

As the following century revealed, the Treaty of Tordesillas greatly favored Spain economically. West of the line Spain asserted claims over Mesoamerica, including the wealthy Aztec society, and Andean South America, containing the Inca. The Spanish colonies yielded incredible wealth with finds of silver and gold. Portuguese found very little such wealth. Other cultural implications of the division also extended far into the future with Latin America and the Caribbean being Spanish-speaking regions west of the line, and Brazil being the one nation with Portuguese as its official language. Treaty influences, however, were limited as other European countries never recognized the agreement and proceeded with their own explorations and claims of discovery in the western hemisphere.

TOWNSEND CLUBS

Francis Everett Townsend (1867–1960) originated the “Townsend Plan” for old-age pensions in the United States during the Great Depression (1929–1939). Townsend became a doctor during the first decade of the twentieth century and practiced general medicine in a small community in South Dakota. His experience sensitized him to the problems of age and poverty. He eventually moved to California, and when he was 66, he lost his job as an assistant medical officer in Long Beach, California, in 1933. Townsend began to speak out actively about the hopeless conditions of the aged poor in the United States. He not only spoke about the problems of the aged poor, but he also proposed a partial solution in the *Long Beach Telegram* on September 20, 1933. He proposed that a pension of \$150 per month (later \$200) should be given to all U.S. citizens who retired at age 60 and who promised to spend the money within 30 days; he also proposed a national sales tax to finance the old age pension. This proposal was intended as a Depression recovery program as well as help for the elderly poor. The idea quickly became popular among older businessmen, professional people, and farmers. The “Townsend Movement,” as it was called, was organized in local clubs and it claimed five million members at its peak in the 1930s. However, the increasing effectiveness of federal social security programs and dissension among members of the Townsend Clubs about who to support in 1936 for president contributed to the decline of the movement.

TOWNSHEND ACTS

The Townshend Acts, or Townshend Duties, tried to establish the British Parliament's right to tax the American colonies. Earlier attempts to impose duties, such as the Sugar Act (1764) and the Stamp Act (1765) had resulted in violent protests. In an attempt to avoid these controversies Chancellor of the Exchequer “Champagne Charlie,” Charles Townshend, proposed a series of “indirect” taxes that would assert Parliament's right to tax the colonies. Townshend's duties made certain products that had to be imported from England, such as window glass, paper, lead, and artists' colors, more expensive for buyers. He also proposed a small

three-pence tax on tea. Parliament passed the Townshend Duties in June 1767.

Since these items were considered luxury goods, purchased only by a small number of wealthy colonists, Townshend expected few, if any, protests from Americans. In order to ensure that the taxes were collected and smugglers were punished, however, the Chancellor appointed five new customs officials and dispatched them to Boston. He also created new Courts of Admiralty in the colonies, which could try accused smugglers without a jury, and established a Customs Board that could issue writs of assistance giving customs officers broad powers to search and seize colonists' property.

In advocating these measures, Townshend was acting on the advice of colonial representatives like Benjamin Franklin (1706–1790). Franklin, who was no longer in touch with the mood in the colonies, believed that Americans objected only to direct taxes, such as the Stamp Act. He told Parliament that Americans would not object to duties that were imposed to regulate trade throughout the empire. Franklin was mistaken. His views were refuted by a fellow Pennsylvanian, landowner and lawyer John Dickinson in a pamphlet entitled *Letters from a Farmer in Pennsylvania*. Dickinson declared that Parliament's attempt to impose duties solely for the purpose of generating income was a direct threat to the well being of all Americans. He urged colonial assemblies to petition Parliament to repeal the Townshend Acts.

Serious trouble erupted in Boston, where the new Customs Board had their offices, in 1768. Samuel Adams convinced the General Court of Massachusetts, the colonists' primary representative body, to write a Circular Letter for distribution to the other colonial assemblies, urging the representatives to petition Parliament for repeal of the Acts. The Massachusetts letter provoked a response from the new Secretary for American Affairs Wills Hill, Lord Hillsborough, who demanded that Massachusetts Governor Francis Bernard either force the General Court to apologize or dissolve the assembly. Adams and the Court refused, and reported back to Governor Bernard that the refusal had passed overwhelmingly. Hillsborough was angered again when a Boston mob attacked the customs officers who had seized merchant John Hancock's ship *Liberty* on suspicion of smuggling. The Secretary ordered four British regiments to be stationed in Boston—a decision that led directly to the Boston Massacre of March 5, 1770.

Despite the forceful actions of the British government, colonial opposition to British taxation stiffened throughout 1768 and 1769. On August 1, 1768, Samuel

Adams convinced the General Court of Massachusetts to demand a boycott of British goods. Over the next year similar measures were adopted in New York, Pennsylvania, and South Carolina. The boycott put tremendous pressure on British manufacturers, who relied on the colonial markets to buy their goods. It also promoted, for the short term, some American industries, particularly the weaving of homespun cloth. On March 5, 1770 King George III's new Prime Minister, Lord Frederick North, asked Parliament to repeal most of the Townshend Acts, with the exception of the tax on tea. The issue of the tea tax would not be addressed until after the Boston Tea Party of 1773.

TRADE

Trade involves the exchange, purchase, or sale of goods and services. Whether international or domestic, trade makes possible the division and specialization of labor on which our productivity is based. If we could not exchange or trade the products of our specialized labor, each person would need to be entirely self-supporting. Trade is, in economic terms, a means of increasing productivity, as much as investment, or technological progress. Specialized production, followed by trade, makes it possible for everyone to have more commodities than they had before trading, even if some gain more by trading than others. Even though trading, including international trade, is an indirect means of enhancing all domestic productivity, there is frequently a bias of nationalism, which runs deep and

Trade Union

causes countries to be suspicious of one another. Countries often discourage international trade to protect domestic industries and the jobs of people who work in them. Nations will place taxes called tariffs on imported goods to make them more expensive and discourage people from buying them. Some degree of protectionism seems inescapable in a world of intensified production and competition, although there is a movement to create large international trading blocks to improve the standard of living of all the member nations.

TRADE UNION

The transformation of economic enterprise that began after the American Revolution (1775–1783) was the major cause for the development of U.S. labor's most significant institution: permanent trade unions. With the rise of U.S. industry came the rise of a management class seeking to pay lower wages. During the late 1700s working men with trades (carpenters, shoemakers, typesetters, cabinetmakers, machinists, masons, coopers, tailors) created organizations to conduct their struggles, known often as “associations” or “societies.” The membership of these early unions were confined to journeymen of a single craft, and they joined together not only to obtain better wages for themselves, but also to keep out of industry inferior untrained workmen known as “runaway apprentices” who worked for lower wages than the skilled tradesman or craftsman.

In 1886, a national organization, the American Federation of Labor (AFL) was created and rose to dominate the U.S. labor movement for the next 50 years. It was a federation of most of the early trade and craft unions scattered throughout the many states of the union, bringing together under the umbrella of the AFL most of the trade and craft unions. The AFL, a consolidation of separate trade unions, was first led by the father of the U.S. labor movement, Samuel Gompers (1850–1924). The focus of the AFL was largely aimed at short-term objectives, like higher pay and shorter hours of work. The AFL maintained that trade unions should restrict their membership to skilled and qualified craftsmen in specific trades, believing that a trade union composed of many different kinds of workers, including unskilled laborers, would lack the cohesiveness essential to hard-hitting business-like unionism. Trade unions ignored unskilled workers in the mass-production industries who eventually were unionized by the Congress of Industrial Organizations (CIO). In

the 1960s, the AFL and the CIO pursued a cautious merger, under the name AFL-CIO.

TRADEMARK

A trademark is any work, name, device, or symbol, or any combination of them adopted and used by a manufacturer or businessman to distinguish or identify his goods or services from those goods manufactured or sold by others. Though patents and copyrights are specifically provided for in the U.S. Constitution, under Article 1, Section 8, the law of trademarks is not provided for in the Constitution. Federal trademark registration is based on the Interstate Commerce Clause in Section 8 of the Constitution, meaning that trademarks must be registered both federally, and in separate states of the union.

Applying for a trademark for federal registration entails processing by the U.S. Patent Office, a division of the Department of Commerce. Each state maintains trademark registers. In the United States all trademark rights require actual usage, not simply intended use. Trademarks are divided into strong (technical) trademarks, like Kodak (a coined expression), and weak (descriptive) trademarks, like Jucy (a phonetic variety of “juicy”). Trademarks must be renewed every 20 years, including a sixth year affidavit of use registration. A trademark is not the same as a trade name. Coca-Cola is a trademark, and Coca-Cola Co. is the trade name of the manufacturer. Trademark systems are used worldwide, and a U.S. trademark owner seeking to protect the use of his trademark in foreign countries must register it on a country-by-country basis. A trademark is a precious commodity for any flourishing business, and the use of trademarks is carefully monitored by business.

TRAIL OF TEARS

By the 1780s war, disease, and starvation had killed most American Indians living along the eastern seaboard of North America. As white settlers pressed further inland in the early 1800s, many of the indigenous groups resisted further encroachment. Some seized

on the opportunity to side with Britain in the American Revolutionary War (1775–1783) and again in the War of 1812 (1812–1814). But the Native Americans had picked the losing side, and after the latter war, General Andrew Jackson (1767–1845) devastated the settlements of the Creeks and other hostile Indian groups.

In contrast to the Creeks, the Cherokee had earlier accepted the U.S. presence as inevitable and adopted a peaceful policy of accommodation and coexistence. On the basis of a treaty signed with the United States in 1791, the Cherokee continued to live on their traditional lands in the hills of northwest Georgia and western North Carolina. During the early 1800s the Cherokee went through a remarkable period of cultural change. They adopted an agrarian economy in place of traditional hunting and gathering. Some Cherokee even became owners of plantations with slaves. Others became involved in commerce, managing stores, mills, and other businesses. Impressed with the benefits of reading and writing, a Cherokee silversmith, Sequoia, created a Cherokee alphabet that was quickly adopted. By the 1820s the Cherokee had established written laws and a constitution.

Between 1819 and 1829 the Cherokees developed an independent nation within U.S. boundaries. They adopted a constitution. As the Cherokees flourished, the white settlers grew resentful. The Georgia statehouse pressed the Cherokees to sell their land, which the Cherokee were reluctant to do. With the discovery of gold in Cherokee country in 1829 the State of Georgia increased the pressure on the Cherokee. President Andrew Jackson (1829–1837) signed the Indian Removal Act of 1830 that provided funds for removal of eastern Indians beyond the Mississippi River. The State of Georgia annulled the Cherokee constitution and ordered their lands seized.

DESPITE THE U.S. SUPREME COURT DECISION IN *CHEROKEE V. GEORGIA* (1831), ACKNOWLEDGING CHEROKEE'S RIGHT TO THEIR LANDS AND THEIR SOVEREIGNTY AS A NATION, JACKSON CONTINUED TO SUPPORT GEORGIA'S EFFORTS AT THEIR REMOVAL. AFTER MARSHALL'S RULING JACKSON REMARKED, "JOHN MARSHALL HAS MADE HIS DECISION; NOW LET HIM ENFORCE IT."

The Cherokee hired a lawyer who argued the case all the way to the Supreme Court. In his ruling, Chief Justice John Marshall agreed that the State of Georgia had no right to enter Cherokee lands and to displace the indigenous people. Despite the U.S. Supreme Court

decision in *Cherokee v. Georgia* (1831), acknowledging Cherokee's right to their lands and their sovereignty as a nation, Jackson continued to support Georgia's efforts at their removal. After Marshall's ruling Jackson remarked, "John Marshall has made his decision; now let him enforce it."

Jackson persuaded Congress to grant the funds for the relocation of the Cherokee. Finally in 1835, after years of harassment and antagonism, a small group of Cherokee ceded by treaty all lands occupied by the Cherokee east of the Mississippi. The Cherokee peoples were given two years to vacate the transferred lands and move to a special Indian territory created by Congress in 1834 in what latter became Oklahoma.

Many Cherokee resisted removal. As the deadline approached in 1837, President Martin Van Buren (1837–1841) ordered federal authorities to force the Cherokee from their homes and place them in temporary detention camps. The Cherokee remained in the camps through the typically hot sweltering southeast summer and diseases began to spread. Suffering from dysentery, measles, and whooping cough, some two thousand died. Finally that October over fifteen thousand men, women, and children began a six-month, thousand-mile journey to the very unfamiliar country of Oklahoma. Most went overland from northwest Georgia, across central Tennessee, western Kentucky, southern Illinois, southern Missouri, and northern Arkansas, to Ft. Gibson in eastern Oklahoma. A smaller number were taken by flatboat down the Tennessee River to the Mississippi River and then up the Arkansas River. While en route, lacking adequate food, shelter, and clothing, another two thousand died from exposure, disease, and exhaustion. The Cherokee buried their dead along the route that became known as the "Trail of Tears." The forced march became one of the most tragic and dishonorable chapters in U.S.-Indian relations.

The Cherokee reestablished their agrarian society in the hills of northeastern Oklahoma. They soon setup a new government and signed a constitution in 1839. Tahlequah, Oklahoma became the capital for the displaced population. During the 1837 roundup, rather than leave for Oklahoma, a thousand or more Cherokee had fled into remote areas of the East including the Great Smoky Mountains. They later received federal recognition, also, as the Cherokee of the North Carolina Qualla Reservation.

Departure of the Cherokee population left only scattered indigenous groups in the Southeast. By 1842 most of the Five Civilized Tribes—the Cherokee, Chickasaw, Choctaw, Creek, and Seminole—had been

Transatlantic Cable

removed from their prosperous farms and plantations and resettled on the southeast to government-assigned lands in Oklahoma. The last of the Seminoles of Florida were removed in 1858.

The Cherokee's forced removal dramatized the fate of indigenous populations in the face of U.S. agricultural expansion. The tide of U.S. expansion eventually overwhelmed even those tribes with peaceful policies and firmly established economies. The Trail of Tears was later designated a National Historic Trail by Congress.

TRANSATLANTIC CABLE

In 1866 a transatlantic cable was laid along the ocean floor to carry telegraph messages from North America to Europe. But this success had been long-awaited: it followed four failed attempts to lay the wire. In 1854 American financier Cyrus W. Field (1819–1892) founded the New York, Newfoundland, and

London Telegraph Company (two years later renamed the Atlantic Telegraph Company). He became determined to connect America and Europe with a submarine telegraph cable, which would greatly improve communication. Cables laid in 1857 and 1858 broke. A third cable was put down later in 1858 and it successfully carried messages across the Atlantic for a period of four weeks before it broke. A fourth wire was put down between Newfoundland (Canada), and Ireland in 1865, but before the project was completed, it too broke. The following year, aided by a cable developed by British mathematician and physicist William Thomson (1824–1907), the project was finally a success. Thomson, who had been a chief consultant during the laying of the first cable in 1857–1858, developed a theory on the mechanics of submarine cables, and a cable following his specifications was successfully laid, from east to west, between Valentia, Ireland, and Heart's Content, Newfoundland. The crewmen who worked on that project were also able to repair the cable laid in 1865. By 1900 there were fifteen telegraph cables lying on the floor of the Atlantic Ocean, enabling telegrams (called "cables" when they were intercontinental) to be transmitted between the United States or Canada and Europe. The development was a tremendous boom to communication. Prior to the transatlantic telegraph cable (1866), the fastest way to send a message across the ocean was aboard a ship. The telephone (invented 1875), which allows voice transmission over electrical wires, gradually replaced the telegraph. But for many decades the two technologies were both in use.

TRANSCONTINENTAL RAILROAD

On May 10, 1869, the last tracks of the United States' first cross-country railroad were laid, making North America the first continent to be spanned from coast to coast by a rail line. The event was the fulfillment of a great national dream to knit the vast country closer together. Short-run rail lines had been in use since the 1840s, but the nation lacked a quick and reliable method for transporting people, raw materials, and finished goods between distant regions.

In the early 1860s, the U.S. Congress decided in favor of extending the railroad across the country. The

On May 10, 1869 the last spike of the world's first transcontinental was driven in Promontory, Utah. The celebration began by two locomotives traveling from either end of the railroad to meet in the middle where the tracks were finally connected.

federal government granted land and extended millions of dollars in loans to two companies to complete the project. After a long debate that had become increasingly sectional, Congress determined the railroad should run roughly along the 42nd parallel—from Omaha, Nebraska, to Sacramento, California. This route was chosen for its physical properties: the topography of the landscape would best allow the ambitious project. The Union Pacific Railroad was to begin work in Omaha and lay tracks westward; the Central Pacific Railroad was to begin in Sacramento and lay tracks eastward, crossing the Sierra Nevada Mountains.

Work began in 1863, and six years later the two projects met at Promontory in north-central Utah, northwest of Ogden. By the end of the 1800s, fifteen rail lines crossed the nation.

TRANSPORTATION ACT

The authority of the Interstate Commerce Commission (ICC), established 1887 by act of Congress,

was later fortified by the Hepburn Act of 1906 and the Mann-Elkins Act of 1910. In 1920 Congress again increased the power of the regulatory agency by passing the Transportation Act. Among the provisions of the 1920 legislation was the rule, which allowed the ICC to establish rates at levels that were just high enough to yield a fair return on investment (ROI) for the railroad companies. Any returns to the railroads that were in excess of the established rate levels were to be “recaptured” by the government, placed in a fund, and from that fund, loans were to be made to struggling rail carriers. The act also empowered the ICC to override state regulatory statutes that fixed rate levels lower for intrastate carriers than they were for interstate carriers; Congress viewed such state regulations as discriminatory and, therefore, harmful to interstate commerce. Finally, the act loosened restrictions on railway pooling and railroad acquisitions, even directing the ICC to lead an initiative to consolidate the railroads into fewer, stronger systems.

After three decades of legislation, regulation, and antitrust litigation to curb the powerful railroads, the Transportation Act of 1920 was a double-edged sword: the recaptured earnings prevented any one railroad from becoming too big; but at the same time, the ICC was charged with overseeing the consolidation of the railroad industry. The stage was set for the decline of

Triangle Shirtwaist Fire

the nation's railroad systems: over the next two decades, competition for passenger and freight service was increased as automobiles, trucks, and airplanes proliferated. The railroads, limited by federal regulations, were unable to respond swiftly enough to remain competitive: rail companies could not adjust their rates or services without seeking state or federal approval first. Even those rail companies that remained solvent amidst the increased regulations had been weakened by the Transportation Act's policy of recaptured earnings, which prevented any accumulation of capital resources. Lack of reserves made it difficult for companies when the American transportation industry became more diverse and competitive. In the middle of the twentieth century, railroads foundered; many companies went into receivership pending their reorganization.

TRIANGLE SHIRTTWAIST FIRE

Into the early twentieth century businesses operated free of government regulation and with few industry standards. No building codes existed and regular machinery or fire inspections were not performed. "Sweatshops" were common, where people worked for very low wages in crowded, unsafe conditions with poor ventilation or inadequate heat. No limit existed for the number of hours a person could be required to work, and child labor laws were non-existent. Fresh to the United States, speaking little English, and desperately seeking employment, immigrants were especially vulnerable to sweatshop employment. While seeking a better life in the United States immigrants instead often found exploitation and impoverishment. Children could be found routinely working in mills and factories under dismal conditions. Often women and their children worked side by side for over 15 hours a day.

Such a factory sweatshop operated in New York City's Greenwich Village section in 1911. It produced women's clothing and employing primarily women. Over 500 garment workers performed low-paying piecework for the Triangle Shirtwaist Company in the top three stories of the Asch Building, a ten-story building near Washington Square in New York City. Many of the women were recent Italian and Russian Jewish immigrants, mostly between 16 and 23 years of age, with some girls even younger. The building's structure was considered fire proof, but the interior on the upper

Suddenly, a fire broke out near a corner of the eighth floor, spreading quickly to the two higher floors. With a door to the fire escape locked, workers anxiously waited at the windows for rescue. When fire crews arrived they discovered their fire ladders were several stories too short and water pressure was insufficient for water from the hoses to reach that height. Terrified, some workers clung to one another; many, to the horror of onlookers and rescue workers, began leaping to their deaths.

three floors was packed with flammable objects including clothing products hanging from lines above workers' heads, rows of tightly-spaced sewing machines, cutting tables bearing bolts of cloth, and linen and cotton cuttings littering the floors.

Few fire escapes were present, and company management had a policy of locking most exits, supposedly to guard against break-ins, but more accurately meant to contain the workers. The unlocked exits were only 20 inches wide, designed to restrict access by no more than one person at a time and to guard against employee theft. Though the company was a non-union shop, some of the workers had joined the International Ladies' Garment Workers' Union (ILGWU), formed in 1900. The building experienced several small fires, leading to complaints concerning insufficient exits from the building. In 1910 a general Cloakmakers' Strike to improve sanitation and safety conditions in New York City had been held. The strike led to the formation of the Joint Board of Sanitary Control to establish appropriate standards. Triangle's employees who had joined in the strike, however, had been replaced.

Late Saturday afternoon on March 25, 1911, at the conclusion of the six-day workweek, the Triangle Shirtwaist workers were shutting down operations for the night as quitting time was drawing close. Suddenly, a fire broke out near a corner of the eighth floor, spreading quickly to the two higher floors. With a door to the fire escape locked, workers anxiously waited at the windows for rescue. When fire crews arrived they discovered their fire ladders were several stories too short and water pressure was insufficient for water from the hoses to reach that height. Terrified, some workers clung to one another; many, to the horror of onlookers and rescue workers, began leaping to their

deaths. Workers on the tenth floor were able to get to the roof of the building and escaped over ladders placed by students across to a nearby New York University building. Almost 100 employees died inside the structure, while 47 jumped to their deaths from the eighth and ninth floors to escape the flames. In total 146 workers died and 70 were seriously injured.

The company owners were indicted on charges of criminal negligence, but were acquitted eight months later in a jury trial and assessed only a small fine. They later received \$65,000 in insurance payments for property damage. The fire, regarded as one of the worst industrial tragedies in U.S. history, aroused public anger over management and government indifference to worker safety. Women's unionization activity escalated as the ILGWU stepped up efforts to improve sweatshop conditions. Effects on local and national politics were profound, beginning a 20 year effort to introduce industry reforms.

One eyewitness to the catastrophe was Frances Perkins (1880–1965), at the time a lobbyist for the New York Consumers League. Perkins came away from the tragic scene with even more determination to help workers. The State of New York created a special commission with Perkins as its chief investigator to probe into factors surrounding the Triangle Shirtwaist fire and industrial working conditions in general throughout the state. Three years later, in 1914, the commission issued its report calling for widespread changes. One piece of legislation, passed over stiff opposition from business management in the state, limited the workweek for women and children to 54 hours. Perkins also served as executive secretary of New York City's Committee on Safety influencing the passage of more stringent city building codes and factory inspection requirements. Perkins ultimately became the first woman Presidential Cabinet member in the United States as the Secretary of Labor for President Franklin D. Roosevelt (1933–1945). The only Cabinet member to serve all four terms of Roosevelt's presidency, Perkins was a key person behind the New Deal's socio-economic reforms. The tragic event in New York had triggered more intensive efforts through protective legislation to gain the right of workers to safe working conditions.

TRIANGULAR TRADE

Triangular trade refers to the various navigation routes that emerged during the colonial period. There were numerous triangular paths that ships made to ferry people, goods (both raw and finished), and livestock. The most traveled triangular route began on Africa's west coast where ships picked up slaves. The second stop was the Caribbean islands—predominately the British and French West Indies—where slaves were sold to plantation owners; in turn, traders used the profits to purchase sugar, molasses, tobacco, and coffee. These raw materials were then transported north to the third stop, New England, where a rum industry was thriving. There ships were loaded with spirits. Traders made the last leg of their journey—back across the Atlantic to Africa's west coast, where the process began again.

On another route, manufactured goods were transported from Europe to the African coast, slaves were sent to the West Indies, and sugar, tobacco, and coffee were routed back to Europe, where the triangle began again. On yet another route, lumber, cotton, and meat were transported from the colonies to southern Europe, wine and fruits went to England and manufactured goods routed to the colonies, where the triangle began again. There were as many possible routes as there were ports and demands for goods.

The tragic result of the triangular trade was the transport of an estimated 10 million black Africans. Sold into slavery, these human beings were often chained below deck and allowed only brief, if any,

The various Atlantic Trade Routes of the 18th Century were triangular in design. Natural resources shipped from the colonies to England, manufactured goods from England shipped to the colonies and Africa, and slaves from Africa shipped back to the colonies.

periods of exercise during the Atlantic crossing (which came to be called the Middle Passage). Conditions for the slaves were brutal and improved only slightly when traders realized that if slaves perished during the long journey across the ocean, it would adversely affect their profits in the West Indies. After economies in the islands of the Caribbean crashed at the end of the 1600s, many slaves were sold to plantation owners on the North American mainland, thus initiating another tragic trade route. The slave trade was abolished during the 1800s, putting an end to the forced migration of Africans to the Western Hemisphere along these routes.

TRIBUTE

Tribute is payment made to a ruling or conquering nation by subjugated people in acknowledgment of

submission or as a price for protection from other countries. Derived from the Latin word *tributum*, referring to property tax paid by Roman citizens, the term evolved to mean taxes levied on conquered peoples. Nations increased their wealth through these taxes.

After Cortez conquered the Aztec in 1521, the American Indians had to pay a special tax called a tribute to the Spaniards. Two slightly different perspectives on tribute existed in China for centuries. The Chinese used tribute to solidify political and trade ties with neighboring nations. China also received tribute from less powerful princes in Central and Southwest Asia and Korea, but returned to those countries gifts of equal value to the tribute.

In U.S. history, tribute is associated with U.S. shipping and the Barbary States of Northern Africa, including Morocco, Algiers, Tunis, and Tripoli. The Barbary States are part of modern-day Algeria, Libya, Morocco, and Tunisia. The Barbary Coast pirates had, since the 16th century, accepted payments or valuable presents in exchange for allowing merchant ships

passage through the Mediterranean Sea. American ships ventured into the Barbary waters in the late eighteenth century. Refusing to comply with these demands, many U.S. ships were captured and their sailors enslaved. The U.S. government was too poor to buy its citizens' freedom and too weak to prevent such hostilities. The United States negotiated treaties with Morocco, Tripoli, and Tunis, and by 1802 had paid over \$2 million in tributes. The piracy governments continued demanding higher tributes. Under President Thomas Jefferson (1801–1809) the United States fought against Tripoli in the Barbary Wars (1801–1805). In 1815 with warfare renewed against Algiers, a stronger United States demanded abandonment of all tribute claims. Although official payment of tribute ended in the mid-1810's, the United States occasionally paid tribute until the mid-nineteenth century.

TRIPPE, JUAN TERRY

Juan Trippe (1899–1981), a pioneer of the jet age, made Pan American World Airways the world's largest airline in the mid-twentieth century. Trippe, who introduced commercial air service across the Atlantic and Pacific oceans in the 1930s, made Pan American Airways the first airline to offer affordable tourist class air travel. By the early 1960s Pan Am planes were flying into 86 countries on a route network covering some 80,000 miles.

The son of an investment banker, Trippe graduated from Yale University in 1921. He worked briefly as a bond salesman on Wall Street, intending to enter the family business, Trippe and Company. But his heart was set on planes and flying. Learning that some World War I (1914–1918) surplus single-engine pontoon Navy biplanes were available for sale, he used an inheritance and help from some wealthy Yale classmates to purchase seven of them. With his small fleet of planes he organized Long Island Airways, a sightseeing and charter service. In 1924 he put together Colonial Air Transport, which flew between Boston, Massachusetts, and New York City with the first U.S. air mail contract ever awarded.

When Trippe tried to expand the company's route beyond the Northeast to Florida and Havana, Cuba, Colonial's stockholders refused. He resigned from the company and, again with the financial help of friends, organized Pan American Airways, Inc. in 1927 from a merger of three rival flying services. He began airmail

service from Florida to Puerto Rico, Cuba, and Central America. By 1929 Pan Am had 11,000 miles of routes, and passenger flights had been introduced.

After Charles Lindbergh (1902–1974) became an international hero as a result of his solo flight across the Atlantic Ocean in 1927, Trippe hired him as a consultant to advise Pan Am on creating ocean-going routes. The two men often traveled together over the proposed routes, with Lindbergh as the pilot. Trippe's first great success was the "China Clipper" route to China, inaugurated in the early 1930s. Atlantic routes to Europe followed. During World War II (1939–1945), the company acted as a contract carrier for the U.S. government, ferrying U.S. troops all over the globe.

After World War II, Trippe lobbied Congress unsuccessfully to establish Pan Am as the United States' exclusive international carrier. At the same time, believing that the future of air travel lay with the ordinary tourist, he introduced "tourist class" travel from New York City to London, England. In a 1944 speech he said, "The average man's holiday has been the prisoner of two grim keepers, money and time," and he sought to change that equation. He cut the usual round-trip fare in half and promoted his air travel campaign in a widely discussed article, "Now You Can Take That Trip Abroad." At first the major international air carriers resisted the idea of two classes of air service (first and tourist), and Great Britain even closed its airports to Pan Am flights with tourist seats. But the concept of low-cost airfares proved to be extremely popular, and, by 1952, all major airlines had posted competitive rates.

Trippe had the vision to see that the next advance in airline travel would be with the big 707 Boeing and the Douglas DC-8 jets. In 1958 Pan Am launched its first 707 route to Paris, France. The big jets flew almost twice as fast as the propeller-driven planes they replaced and carried many more passengers. Trippe ordered as many jets as the airplane manufacturers could produce, and, by the early 1960s, his airline dominated U.S. international air travel. In 1968 Pan Am had assets of over \$1 billion.

Trippe, always the visionary, still wasn't satisfied. He became interested in development of the 747, the "jumbo jet" that would carry even more passengers than the 707. Pan Am ordered 25 of the huge planes, at a cost of \$450 million and inaugurated their use in the 1960s. Unfortunately, Trippe, this time, was ahead of the curve. A world oil crisis in the early 1970s was particularly hard on airlines, and Pan Am, which had not streamlined its operations to meet increased competition at home and abroad, was no exception. Juan

Trucking Industry (Commercial)

Trippe died in 1981, as his company was still struggling to recovery from the oil crisis. Pan Am continued operations for ten years after its founders death, until it was dissolved in 1991.

TRUCKING INDUSTRY (COMMERCIAL)

Beginning in the early 1980s the trucking industry changed as deregulation and new technology brought new competitive pressures to the trucking industry. Information technologies and expanded services such as express delivery of light freight had become staples of the trade. Implementation of these new technologies and the promise of advantageous global trends insured the continued strength of an industry that experienced its worst years during the recession of the early 1980s.

Both state and federal governments had a tremendous impact on the revenues generated by the trucking industry. Although it experienced federal deregulation, the industry continued to deal with strict regulations in 28 states during the early 1990s. In an effort to make state regulations coincide with each other, Congress passed the Intermodal Surface Transportation Efficiency Act in 1991. The International Registration Plan would be passed in 1996 and the International Fuel Tax Agreement in 1998, legislating out repetitive registration requirements and fuel tax payments incurred by interstate truckers.

In addition to registration and tax costs, government programs such as the Motor Carrier Safety Assistance Program added an estimated \$6,000 to \$9,000 annually in maintenance work required to meet the standards of vehicle safety inspections that, like the International Registration Plan and Fuel Tax Agreement, were recognized by even the most strictly regulated states. The safety inspections, as well as a national Commercial Drivers License that may be obtained only after passing a competence exam, did lower insurance costs for the industry offsetting the initial expenses.

While Congress was legislating programs intended to make things less complicated for the trucking industry, the Environmental Protection Agency (EPA) mandated clean air laws making it necessary for trucking companies to find ways to utilize low sulfur fuels. Although the industry found it difficult to switch completely to the new fuels, advancements in exhaust purification and newly designed, highly efficient engines lowered emissions considerably.

Figures published during the early 1990s indicated that the trucking industry employed approximately eight million people, including part-time workers. The industry could be broken down into three main categories: those directly employed by trucking companies, those employed by employer groups, and those working for private carrier fleets. Although there was no real trucking union to speak of, a considerable number of truck drivers were members of the International Brotherhood of Teamsters (IBT). As was the case in most industries, union members tended to receive higher pay than non-union workers. Typically, large trucking companies that employed union workers put 60 to 65 percent of the company's profits aside for wages and benefits. Non-union drivers typically received 40 percent of the company's revenue in the form of wages and benefits. Annual salaries of long-distance drivers varied from \$20,000 to \$40,000 with a cap of approximately \$60,000 for experienced drivers.

Other impacts on the trucking industry included advancements in communications technologies. The proliferation of fax and electronic mail were estimated to have cut nearly \$75 million from the industry's annual profit margin. In order to compensate for the losses, the industry was able to carve out a new niche through the zero-inventory management policy used by many companies to reduce overhead costs during the early 1990s. A perfect fit for the trucking industry, this cost-saving policy called for same-day, warehouse-to-customer transportation of parts and manufacturing materials.

Because of competition from communications technologies, production efficiency technology became essential to the trucking industry's ability to compete. Computers mounted in truck dashboards and portable laptops became invaluable tools which freed truckers and company administrators from the tasks of monitoring fuel taxes and fuel management performance, engine performance, results and due dates for trailer inspections and so on. In addition to improvements in the efficiency of administrative duties, companies began utilizing safety applications including radar technology informing truckers when they followed behind another vehicle too closely, shipment planning software maximizing trailer time, and driver simulators.

Since the trucking industry relied on the health of the economy, it continued to be important for the trucking industry to expand into new, non-traditional markets and take advantage of progressing technologies. The trend toward a less restrictive international trade policy enhanced by the North American Free Trade Agreement (NAFTA) should ensure the industry's prosperity well into the next millennium.

TRUMAN, HARRY S.

Like his most admired presidential hero, Woodrow Wilson (1913–1921), Harry Truman (1884–1972) spent two terms in the White House, and became far better known for his handling of war situations than for his progressive and protective post-war domestic policy

President Truman holds up a copy of the *Chicago Tribune*, published early election night with the headline "Dewey Defeats Truman."

efforts. Truman became the thirty-third president of the United States quite suddenly, on April 12, 1945, when President Franklin Roosevelt (1933–1945) died; Truman was thrust from vice president to president during the last days of World War II (1939–1945), at one of the most critical moments in U.S. history.

Born in 1884., Harry S. Truman (the "S" does not stand for any name) was six years old, the eldest of three children, born to John and Ellen Truman, when the entire family moved from the family farm to Independence, Missouri. Truman grew up in Independence, read books a great deal, and at age 18, joined the Baptist church. He worked at a variety of odd jobs until 1918. After that, he went into the Missouri National Guard, became a lieutenant, and eventually went to France to fight in World War I (1914–1918), rising to the rank of colonel. Before and after World War I, Truman had gained much experience as a small businessman; he worked hard and believed in U.S. capitalism, but lightning never struck. Frustrated by his failures in business, Truman decided to enter politics in an effort to reduce much of the business corruption he saw around him.

He joined the Democratic Party, was elected county judge in Missouri, and won a reputation for scrupulous honesty, and straightforward talk. In 1934 he was elected to the United States Senate, and immediately began working on issues for the public good and those involving business corruption. The enactment of the Transportation Act of 1940 was a Truman program that greatly regulated railroad financing thereby reducing corrupt business practices and saving U.S. tax dollars.

Continuing in the spirit of watching for corruption in business, Truman involved himself as a senator by creating The Truman Committee in 1940, to oversee waste and corruption in defense spending. Corrupt business practices had a foothold in war-production efforts during World War II (1939–1945); Truman's efforts at uncovering waste and illegal business led to savings of \$15 billion in tax dollars.

Truman's political career continued to rise, and he found himself serving as vice president under President Franklin Roosevelt. When Roosevelt died suddenly, Truman was thrust into the position of leader of the nation. World War II was ongoing, and there were many matters to challenge the new president (1945–1953). Thirteen days after Truman took office as president, the first United Nations conference met in San Francisco to plan for the post-war recovery. Days later, on May 7, 1945, Germany surrendered, and the war in Europe was over. The next day was Truman's sixty-first birthday. The United States was, however, still fighting a war with Japan, and preparing to deal with the communist Soviet Union and its dictator Joseph Stalin (1928–1953).

To end World War II completely, Truman made the profoundly controversial decision to drop two atomic bombs on Japan—one on Hiroshima, on August 6, 1945, and the next on the city of Nagasaki three days later. Japan surrendered on September 2, 1945. These events were stunning for the world, but more so for Truman, who had only learned of the atomic bomb's existence after becoming president months before. Truman's introduction into the U.S. presidency was likely the most dramatic and complex of any president.

Truman was a lifelong Democrat, and always a champion of Franklin Roosevelt's New Deal policies begun in the 1930s. As part of the post-war transition from a wartime economy to a peacetime economy, Truman sought to reconstruct the post-war United States in order to complete the New Deal. In September 1945, after barely five months as president, Truman requested that Congress create national health insurance for all U.S. citizens, and a permanent Federal Fair Employment Practices Commission (FEPC) to protect minority rights. Congress should also initiate an influx of money for scientific research and develop a large public power project on a variety of large U.S. rivers to provide clean and inexpensive electricity to U.S. residents with dam-generated power. The Republican Party, which controlled the Congress in 1946, blocked and stopped almost all of these measures. The Republicans believed that all of these plans would be bad for U.S. business and free enterprise.

Despite opposition from Republicans in Congress, Truman made consistent efforts to create a "Fair Deal" for the working post-World War II generation, and especially for veterans just back from the war. He fought to create civil rights legislation; repeal the Taft-Hartley Act which hindered union activities; create a new farm program stressing higher farmer incomes and lower consumer prices; provide federal aid to education; begin a federal housing program; and institute increases in the social security program. Conservative Democrats joined with Republicans to defeat most of Truman's domestic proposals.

Truman's legacy is largely that of a war president. He served the nation during World War II, the Korean War (1950–1953), and the Cold War with the Soviet Union. His progressive ideas of a "Fair Deal" were left for other generations of politicians to deal with.

Truman died of severe lung congestion on December 26, 1972, twenty years after leaving the White House.

TRUMP, DONALD JOHN

Billionaire real estate developer Donald Trump (1946–) showed the world that millions could be made in developing expensive commercial and residential properties. His intuitive sense of business and sharp eye for spotting a deal made Trump one of the most respected—and most hated—businesspersons of the 1980s. Without question, Trump became one of the most famous poster boys of an era known for its big-time financial wheeling and dealing and consumption.

Born Donald John Trump in 1946, he was the fourth of Frederick C. and Mary MacLeod Trump's five children. Trump was raised in Queens, New York,

where his father was a builder and real estate developer who later specialized in constructing and operating middle-income apartments in Queens, Staten Island, and Brooklyn. Trump was a bright, energetic, and assertive child who grew up in a 23-room house with his siblings. By age 13 it was evident to his parents that he lacked discipline, so they sent him to the New York Military Academy. Trump did well there both socially and academically, and became a star athlete and student leader by the time he graduated in 1964.

While at the Academy Trump spent his spare time looking around at construction sites and renovating old houses. It seemed he would follow in his father's footsteps but on a much grander scale. He attended Fordham University, but later transferred to the University of Pennsylvania, where he obtained an undergraduate degree in finance from its Wharton School of Business in 1968. Following graduation he worked in his father's business, the Trump Organization. Soon Trump began putting his newly acquired business training to use; he was able to finance an expansion of the company's holdings by convincing his father to be more liberal in the use of loans based on the equity in the Trump apartment complexes. Eventually Trump bypassed his older brother and became president of his father's company, which concentrated on building houses and apartments. Though this was an important position it was not really fulfilling for Trump. He had bigger dreams of putting his signature on the Manhattan skyline.

Yearning for bigger, more profitable projects, Trump used \$200,000 to move his residence to a small studio apartment in Manhattan in 1971. There he was closer to the affluent and influential set whom he felt could make dreams come true. "If I ever wanted to be known as more than Fred Trump's son, I was eventually going to have to go out and make my own mark," Trump once said. In 1973, Trump persuaded his father to invest in the Manhattan real estate market. By then the company's worth had grown from \$40 million when Donald Trump had joined the firm to a whopping \$200 million.

Four years later Trump married New York fashion model Ivana Zelnickova Winklmayr, who had been an alternate on the 1968 Czech Ski Team. After their first child was born Trump named his wife vice president in charge of design for the Trump Organization. Ivana, an attractive and stylish woman, had a flair for design, and played a major role in supervising the renovation of the Commodore Hotel. She nicknamed her husband "The Donald," and added a touch of style that he appreciated and welcomed. But later, as Trump's empire began to crumble, so too did his marriage.

In the mid-1990s Trump and Ivana, who had three children, divorced, and Trump married his second wife, Marla Maples, in 1994. The media lavished attention on Trump's second wedding, but for all the pomp and circumstance, the marriage was brief and ended in divorce. Trump and his second wife had a daughter together before their marriage ended.

Despite turmoil in his personal life, Trump's business ventures continued to thrive. His strategy was to buy dilapidated properties when prices were cheap, fix them up, and then make a huge profit when the economy picked up. He would either sell the real estate for a higher price than he paid or, more often than not, lease out space at steep prices. He made his first major deal in 1975, when he acquired the bankrupt Penn Central Railroad's Commodore Hotel and rail yards near the Hudson River. Trump then sold the rail yards to the city for a hefty commission, and won an unprecedented \$120 million, 46-year tax abatement to tear down the Commodore and build the new Grand Hyatt Hotel in partnership with the Hyatt Corporation. To that amount he added \$70 million in loans to construct the hotel. The deal incensed a number of community and political people in New York, who claimed that he used political connections to broker a deal with the city. Urban analysts, however, credit Trump with helping to ignite a building renaissance in a deteriorating part of town.

Ignoring naysayers and supporters alike, Trump continued to negotiate complex deals that made him the best-known and most controversial developer in New York. Against the wishes of New York City, Trump was able to convince the courts that he was entitled to a large amount of tax abatements, which the city was forced to pay. Trump used the abatements to help finance his flagship building, the posh Trump Tower on Fifth Avenue at Fifty-sixth Street, completed in 1980. The 58-story building featured a six-story atrium lined with pink marble and included an 80-foot waterfall. The luxurious building attracted well-known retail stores and celebrity renters. Residential condominiums sold for a pricey \$10 million and higher. Of course all this overt show of opulence and wealth attracted national attention for Trump, and the Trump Tower became a major tourist attraction. As quoted in the *New York Times*, Trump dubbed the project "the finest apartments in the top building in the best location in the hottest city in the world."

Trump had a penchant for glitzy, controversial deals, and he maintained this interest throughout the 1970s and 1980s. In 1978 he bought the site of the Bonwit Teller department store and built a 68-story tower on Fifth Avenue, complete with a \$2 million

marble indoor waterfall. In the early 1980s he purchased a team in the upstart United States Football League, the New Jersey Generals, which sparked the league's antitrust lawsuit against the National Football League. Yet even Donald Trump could not make every deal golden. He once offered to construct a project, on the site that was later occupied by the Jacob Javits Convention Center, if New York City would name the building after Trump's father; the city declined. City officials also balked at Trump's plan to build a \$5 billion complex on a strip of land running along the Hudson River from Fifty-ninth to Seventy-second streets.

Trump continued moving from one deal to another. He opened casinos and entered other real estate ventures. At times he ventured beyond the real estate market in hopes of making a mark in the high-stakes game of corporate raiding.

Early in his career Trump earned significant notoriety for artificially driving up real estate prices, and he drew similar criticism as he sought to acquire companies that were not looking for suitors. Beginning in 1986 he engaged in stock market deals that made him look like a corporate raider. He bought large stakes in a series of publicly traded companies, including MCI and Pillsbury, fueling takeover speculation that raised stock prices and allowed him to sell at a handsome profit. Though many criticized Trump's deals he was playing the game much like other speculators did. Extravagant speculation was rampant at that time and created a high-stakes climate. The process was simple: he would identify a company whose stock was undervalued, buy enough shares to take a noticeable position in the company, and make overtures of buying it. This would immediately attract the attention of other stock traders and drive the stock price higher. Trump, of course, was never really interested in buying, nor was the company interested in selling; but his actions prompted a significant increase in the value of his shares and enabled him to sell at a huge profit.

Some acquisitions, however, really did occur. In 1989 Trump acquired Eastern Airlines' shuttle operation for \$365 million and renamed it the Trump Shuttle. In 1990 he was interested in acquiring American Airlines, bidding \$7.5 billion for it, but the parent company was not interested in selling. Nonetheless, it seemed Trump was on a roll that would never end.

A genius at self-promotion, Trump named several huge projects after himself—making his name a household word by the end of the 1980s. He built or bought a succession of hotels and apartment houses in Manhattan, including the Plaza Hotel, Trump Plaza, and Trump Parc. He also became a major hotel and casino operator

in Atlantic City, having astutely purchased property in the New Jersey seaside resort before the passage of a 1976 referendum legalizing gambling. This was where the Trump Princess Yacht was docked and where the Trump Shuttle airplane landed. Trump's Castle and the Trump Plaza and Taj Mahal casinos quickly became big moneymakers and helped raise Trump's profile nationally by sponsoring boxing championships. "The first time I did it, with Trump Tower, maybe it was ego," he once said. "But now it's economics. If somebody tells you you'll do a hundred million dollars more business if you call a building Trump Parc than if you call it Tower on the Park or some other name, you'd have to be some kind of masochist not to do it."

By 1990 many wondered how much Trump was really worth behind his complex financing schemes. His net worth had been estimated by some at as much as \$3 billion, which Trump never confirmed or denied. But *Forbes* magazine decided to take a closer look, concluding that his property was worth just under \$3.7 billion but his debts totaled \$3.2 billion, for a net worth of only \$1.5 billion. The magazine went on to predict that Trump could expect difficult times ahead.

This bleak prognosis proved accurate when the real estate market soured in 1990, and property values began to plummet. Trump's casinos suffered from over-saturation. Moreover, the credit market tightened, making it difficult for Trump to borrow additional money to cover his debts. Consequently, he missed \$73 million in payments that were due in June 1990, and was extended an emergency \$65 million loan, which the banks granted in order to save him from default and to protect their own investment. But that loan came at a hefty price: in return, Trump lost his freedom and was forced to relinquish much of his income and clear important business decisions with his creditors.

Trump was bitter about friends who turned on him during the bleak days. "I view these people as being born with garbage in their genes," he once said. But somehow Trump bounced back and was reported to be worth more than \$2 billion by 1997. He also found some Chinese investors to help him build huge housing projects on Manhattan's West Side rail yards, a site which he had been trying fruitlessly to develop for years.

Donald Trump was noted in the business world primarily for his impact on the real estate and casino industries, yet he was perhaps best known to the public as a wealthy and eccentric celebrity. His businesses were major developing of real estate during the 1980s and he contributed to the rapid growth (and later, decline) of the real estate market. More recently, he

focused on amassing a large entertainment and gambling concern that ranked as one of the largest in the United States in the late 1990s.

TRUST-BUSTING

Prior to the birth of the United States, English common law provided few restrictions over business activities. By the mid-nineteenth century, U.S. courts had adopted a "rule of reason" in deciding cases involving accusations of restraint of competition. If the restraints applied broadly, they were often considered illegal. If more limited in time or geographic extent, restraints were allowed. Still, a laissez-faire approach to business persisted, meaning little governmental interference existed over business practices.

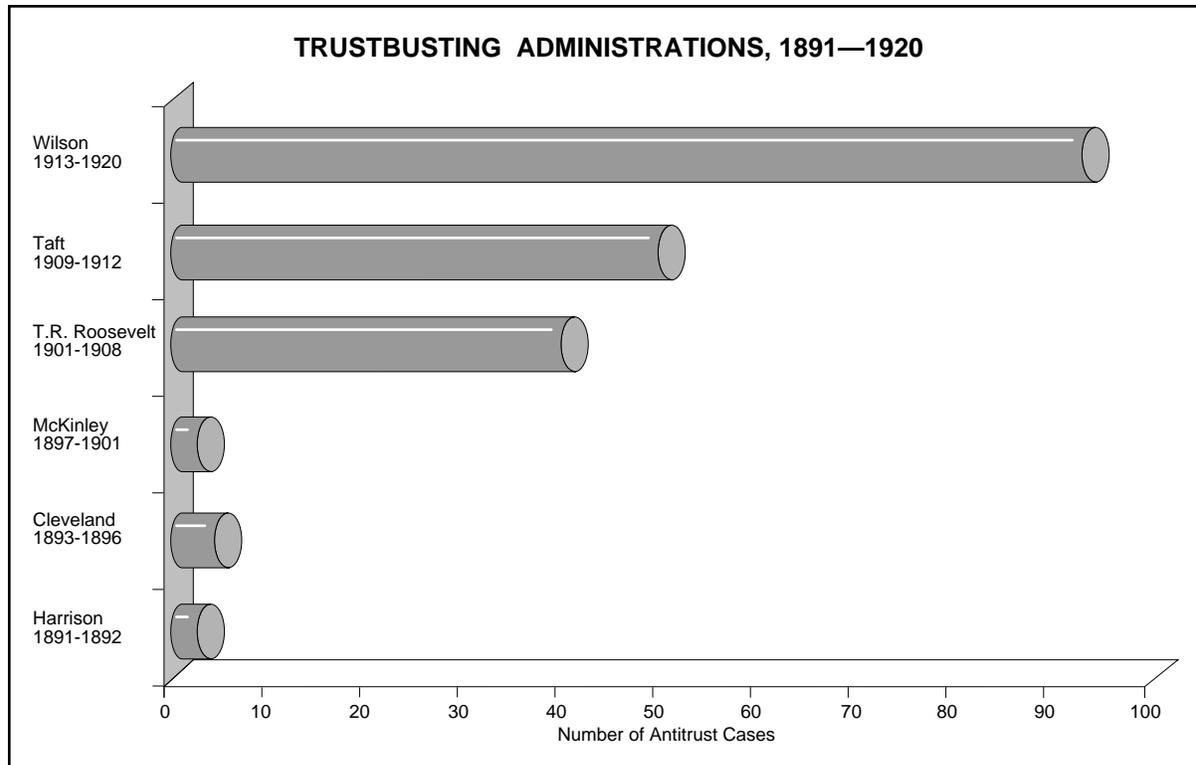

Following the American Civil War (1861–1865), industrialization grew at a brisk pace. With construction of a national railroad system, the cheaper transportation greatly expanded markets, and productivity grew. As competition heightened, the individually owned and managed companies sought means of protecting or expanding profits. State incorporation laws, however, strictly controlled mergers, forbidding companies to own stock in other companies. Therefore, one answer was to simply collaborate with competitors to set prices and control production. A form of such cooperation involved trusts in which one corporation would be created to oversee management of the stocks of cooperating corporations. Standard Oil became the first such trust in 1882. Trusts fixed prices and drove out new competition through price wars. Business consolidations in various industries, such as tobacco, beef,

whiskey, and sugar, led to concentrations of capital and control by only a few people. Consumer protection was not the objective of what legislative and judicial oversight existed. Rather, the focus was on protection of new businesses trying to enter markets. The freedom to contract dominated all legal considerations. Eventually, trust became a general term applied to national monopolies.

Public demand for government intervention into trusts also rose dramatically through the 1880s. In response states adopted various laws, but these proved inconsistent and not applicable to interstate commerce. Congress responded in 1890 with passage of the Sherman Anti-Trust Act, the first major national legislation addressing business practices. The act prohibited trusts and other forms of group action potentially restraining interstate or international trade. Though strongly worded by considering all restraint of trade through cooperation unacceptable, the act was vague, leaving enforcement to the courts and executive branch of government. For example, President Grover Cleveland (1893–1897) was not inclined to enforce the act, believing trusts were a natural result of technological advances and stabilized the nation's economy by eliminating waste. The Supreme Court even ruled in 1895 that manufacturing was not considered interstate commerce, thus leaving many key industries free to continue operating under trusts.

By the time of President Theodore Roosevelt's (1901–1909) first term of office, a few hundred large companies controlled almost half of U.S. manufacturing and greatly influenced almost all key industries. The trust-busting movement began in 1904 with the Supreme Court's decision in *Northern Securities Co. v. U.S.* to break up a railroad trust. Over 40 antitrust lawsuits were filed under Roosevelt. Roosevelt, though becoming known as a "trustbuster," actually sought to reach a middle ground in government oversight of corporate activities. He, as did his successor William Howard Taft (1909–1913), provided the political resolve to use the Sherman Act to provide greater social accountability of businesses. But Roosevelt did not intend to end all corporate mergers, only regulate those considered grossly unresponsive to consumer needs.

Major Supreme Court decisions in 1911 ordered the break-up of Standard Oil, a corporate giant controlling railroads, sugar, and oil, and the American Tobacco Company. The decisions sanctioned the federal government's role to oversee marketplace economics. The rulings, however, reaffirmed the Court's use of the "rule of reason" to determine when trusts are anti-competitive. Such subjectiveness and unpredictability for future rulings led to public pressure for more

The number of antitrust lawsuits increased following the passage of the Sherman Anti-trust Act in 1890. President Wilson was credited with being the most aggressive toward “trust-busting.”

effective trust-busting laws. Congress responded with the 1914 Clayton Anti-Trust Act prohibiting companies from charging different buyers different prices for the same products, contracts restricting business with competitors, mergers between competing companies, and companies buying stock in competing companies. These actions were to significantly lessen competition or lessen the creation of monopolies considered to be illegal. Importantly, the act exempted unions, by claiming human labor was not a commodity; certain farm organizations were also exempted. Associated with the Clayton Act was the 1914 Federal Trade Commission Act, creating the Federal Trade Commission (FTC) to tackle unfair business practices. Congress gave the FTC legal powers to issue cease-and-desist orders to combat unfair business activities.

With the economic boom years of World War I (1914–1918) and the 1920s, political interest in regulating business greatly diminished. The New Deal era of the early 1930s actually encouraged industrial collaboration to propel economic recovery from the Great Depression (1929–1939). Not until Congress passed the Robinson-Patman Act in 1936 and President Franklin D. Roosevelt’s (1933–1945) attack on monopolies in the late 1930s was trust-busting reintroduced. The act strengthened price discrimination prohibitions designed

to protect small businesses from larger competitors. Eighty trust suits were initiated in 1940. In 1950 Congress passed the last trust-busting law, called the Celler-Kefauver Antimerger Act, thereby closing some Clayton Act loopholes.

From the 1950s into the 1970s government aggressively pursued trust-busting. An example was the FTC’s successful loosening of the Xerox Company’s control of the photocopier industry. Trust-busting in the 1980s and 1990s, however, focused more on policing bad conduct rather than breaking up monopolies. Notable trust-busting included the break-up of American Telephone and Telegraph (AT&T). Accused of restricting competition in long-distance telephone service and telecommunications equipment, AT&T lost control over Western Electric, the manufacturing part of the company, and various regional operating telephone companies. President Ronald Reagan (1981–1989) reduced the FTC budget as a historic wave of corporate acquisitions occurred in the mid-1980s. By 1990 the states began to increasingly address illegal mergers, and soon federal interest grew again in examining competitive practices. President Bill Clinton (1993–) increased the budgets of the Justice Department’s Antitrust Division as 33 lawsuits were filed in 1994. The most important antitrust case of the 1990s

involved the Microsoft Corporation, accused of various monopolistic activities. As yet another wave of mergers swept the United States in the late 1990s, the age-old question persisted: does government have a legal right to limit commercial power? The U.S. public continued expressing largely conflicting attitudes over industrial combinations, as it had throughout much of history.

TRUSTS

A trust is a tool that an individual or institution uses to transfer property to a beneficiary. The party that grants the property is called the trustor. The trustor, in turn, gives the property to the trustee, who is charged with the task of disbursing the property to the beneficiary according to the instructions of the trustor. In the early 1990s, more than \$1 trillion were held in U.S. trusts.

One important advantage that a trust has over a simple gift is that the trustor can exercise control over the disbursement of funds or property over time, even after his or her death (or dissolution, in the case of an institutional trustor). For example, a trustor may stipulate that funds periodically transferred to an all-male academy must be terminated if the school begins enrolling females. A second, and perhaps more important, advantage is that trusts can be used to minimize tax burdens incurred when wealth is transferred.

The two main categories of trusts are non-charitable and charitable, they are differentiated from one another primarily by tax status. Charitable trusts are organized for non-profit beneficiaries, such as educational, religious, and charitable organizations. Beneficiaries of noncharitable trusts typically include individuals or groups—particularly relatives or employees of the trustor—or profit seeking organizations.

Most trustees in the United States are banks' trust departments. However, other types of financial institutions act as trustees, and some companies specialize in trust management. Furthermore, a few trustees are separate entities that have been set up as foundations to manage large trust funds.

TRUSTS, BUSINESS

The word *trust* can be used to designate a group of companies that join together to control a domestic industry. The term was widely used in the late nineteenth century and early twentieth century. The American economy changed substantially following the American Civil War (1861–1865). Cottage industries, artisan production, and small-scale manufacturing declined, and a new, larger, factory-based manufacturing sector grew. Operating under relatively relaxed state business laws, financiers and manufacturing moguls became rich, often by suppressing the competition.

This led to a concentration of capital in just a few huge corporations, especially in transportation and heavy industry. The giant manufacturing and mining companies that survived the period of cutthroat competition soon folded into nationwide monopolies known as trusts. In a trust, the companies transferred their properties and stocks to a board of trustees who ran the companies in a way that avoided competition—for instance, by dividing the markets up to protect regional monopoly. Such business arrangements substantially restricted the opportunities for new competitors.

TUPPER, EARL SILAS

The story of Earl Tupper is one of American ingenuity, in which a young man with a basic high school education, an inventive genius, and a commercial eye was able to transform an ugly hunk of oil

refinery waste known as “slag” into a form of plastic that could be made cheaply into many useful things. Tupper’s new plastic and his methods of forming the plastic changed the shape and design of household objects, as well as commercial objects in the last half of the twentieth century. His marketing technique of hosting product demonstration parties in the home became extremely successful and has been imitated by other companies selling such items as underwear, home decorations, gardening supplies, and cooking utensils. Earl Tupper’s Tupperware is one of the most recognized household names in the world.

Earl Tupper was born on July 28 1907, in Berlin, New Hampshire, and was the only child of Ernest and Lulu Tupper. His father, Ernest Leslie Tupper, ran a family farm and greenhouse. His mother, Lulu Clark Tupper, took in laundry to wash for neighbors and ran a boarding home. Earl’s father was a person who loved to build and tinker, and he created several laborsaving gadgets. He was granted a patent for a device that facilitated the cleaning of chickens. Perhaps Earl Tupper developed his talent for inventions by watching his father.

Earl Tupper was energetic as a youngster, interested in business and in making money. He discovered he could sell a lot of the family’s farm produce if he went door-to-door rather than just selling it at the farmer’s market. By age 10, Earl learned that bringing the product to the customer was lucrative as well as enjoyable. He would reinvent this method years later in the form of the Tupperware party.

In 1925 Tupper graduated from high school in New Hampshire when he was 17 years old. After graduation he continued to work in the family businesses until he was nineteen. By then he had determined that somehow, as a businessman, he would make a million dollars by age 30. Tupper’s early employment also included working as a mail clerk and as part of a railroad labor crew. In his spare time he took a course to learn tree surgery so he could start his own business tending trees and landscaping. In 1931, at age 24, Earl married and he and his wife later had five children, one daughter and four sons.

Although he started his landscaping business during the Great Depression (1929–1939), it was a modestly successful venture. His Tupper Tree-Doctors Company stayed open for six years. During this time, Tupper also kept himself busy conducting various experiments and writing a series of scientific papers that described his vast interests and numerous ideas for inventions. However, at age 30 he was forced into bankruptcy instead of having made his first million.

In 1936, after his bankruptcy, Earl met Bernard Doyle, an inventor working at the plastics manufacturing division of the Du Pont Corporation in Leominster, Massachusetts. Earl became intrigued with the possibilities of plastic and went to work at the plastics plant where he later said, according to the records of the National Museum of American History, “It was at Du Pont that my education really began.” It was also where Tupper conducted his earliest experiments with plastics prior to World War II (1939–1945).

Earl Tupper worked for Du Pont for just one year and in 1938 he left the company to start the Earl S. Tupper Company, which advertised the design and engineering of industrial plastics. He wanted to experiment with plastic and asked Du Pont for some polyethylene slag, a waste product of the oil refining process. It was black, hard, putrid, and unworkable in that form. Tupper refined and cleaned the slag to produce a translucent, white, flexible, lightweight, odorless, and non-toxic plastic. This improved plastic, called Poly-T, became a revolutionary substance in the modern world. Tupper’s modern plastic was made to withstand almost anything with the exception of sharp knife-cuts and near-boiling water. Tupper also designed injection-molding machines to create shaped objects out of his new plastic, and subsequently developed his famous, patented air-tight lid.

Most of the work during his company’s first few years was performing subcontract work for Du Pont. The company made much of its money producing molded parts for gas masks and signal lamps for the U.S. Navy during World War II. After the war, along with hundreds of other manufacturers, Tupper turned his attention to the postwar consumer market. He made items such as plastic sandwich picks, unbreakable drinking tumblers, and plastic cigarette cases. These consumer products were often given away with other well-known products. The tumbler was offered with *Tek* toothbrushes and the cigarette cases were offered along with brand name cigarettes along with the cigarette company’s logo imprinted on the case. Tupper then focused on creating a line of plastic food storage containers that would hold foods “air tight” in the refrigerator, sealing them against other odors and keeping foods fresh longer. These containers were known as “Tupperware,” and were first distributed in department and hardware stores. Unfortunately, because of the bad reputation of other plastics, sales were dismal in stores. Consumers knew little of Tupper’s new type of plastic and the ingeniousness of Tupper’s air-tight seal needed to be demonstrated to customers.

Tupperware was also distributed through private household product companies, such as Stanley Home

Products. Some home product salespeople were selling fairly large quantities of Tupperware products, to the point where Tupper took notice, contacted them, and met with them to discuss possible new ways to market and distribute Tupperware. A Stanley Home Products saleswoman, Brownie Wise, suggested that Tupper develop a marketing strategy modeled after the Stanley Home Product Company's in-home selling parties. Thomas Damigella and several other Tupperware distributors also strongly urged Earl Tupper to pull his products out of department stores and to pursue direct marketing to the buyer using the "home party." The idea was to demonstrate the products in the home of a person who sponsored a "Tupperware party," where all questions could be answered in a social atmosphere. At one point small Tupperware products were given away to those who attended the parties. Brownie Wise was a very innovative, ambitious, and smart saleswoman and she went on to become vice president of the company Tupperware Home Parties in 1951 where she remained until 1958. Home demonstration parties have remained the primary outlet for Tupperware and have become an institution. By 1951, Tupper set up the Tupperware world headquarters in Orlando, Florida, on an 1,100-acre site chosen by Brownie Wise.

By the time he decided to retire, at age 51, Earl Tupper had created an enormously successful worldwide organization involved in the manufacture and direct sales of plastic containers—containers that were beautiful enough to be collected regularly by the Museum of Modern Art, in New York City, and displayed there, as early as 1947. Tupperware has also earned a place in the Musée des Arts Décoratifs in Montreal, the Philadelphia Museum of Art, and the Victoria and Albert Museum in London. The beauty and functionality of these products, and the direct face-to-face sales, became an unbeatable combination.

By the late 1940s Earl Tupper brought a clean, durable and attractive plastic into the world of commerce. Developing a high-quality plastic along with an ingenious method of production served as a catalyst for numerous plastic products that have since flooded the marketplace. The direct face-to-face selling technique of the company became extremely popular and the home party idea has continually evolved. Tupperware created literally millions of jobs for a sales force that has been mostly women. When Tupperware started to become popular household items the work force in the United States was going through major changes. During World War II, while so many of the country's men were in the armed forces, many women had entered the male-dominated job market, such as in factories. Women also worked at jobs created for the war effort and when

the war ended so did the jobs. Upon the servicemen's return, women were pushed out of the job market. Also after World War II many children were born—the baby boom—and at that time many women who had children did not work outside the home. Selling Tupperware provided convenient part-time or full-time employment for many of these women who sought a career outside the home.

Tupper sold Tupperware to Rexall Corporation in 1958 for \$16 million. In 1973 Earl Tupper retired and moved to Costa Rica where he eventually became a citizen. At the age of 76, Tupper died of a heart attack in his adopted homeland on October 3, 1983, and was survived by a sister, five children, and 14 grandchildren. Although Tupper built an enormously successful company making numerous plastic products he never liked the term "plastic." He used to insist on calling what he made "Poly-T" because "a lot of plastic that is made is junk."

Earl Tupper is remembered for more than quality children's toys, lettuce corers, orange peelers, tea strainers, gardening tools, and cake keepers, and other products he helped produce. The Earl S. Tupper Research and Conference Center is located at the Smithsonian Tropical Research Institute. The facility includes the Earl S. Tupper Tropical Sciences Library, laboratories for chemistry, plant physiology, histology, acoustic communication, entomology, and a scanning electron microscope.

TURNPIKES

Turnpikes are toll roads: the user pays a fee to travel the road. Only after the user paid the toll would the gatekeeper turn the "pike" or gate to allow the wagon or carriage on to the road. This practice, which was established in England in the 1700s, arrived in the

Twenty-first Amendment

United States in the late 1700s when turnpike companies began surfacing roads and building bridges for a profit. The first American turnpike was built in 1785 in Virginia. The first major U.S. turnpike that was publicly financed was Pennsylvania's Lancaster Road: some 5,000 investors subscribed 30 dollars each to buy shares in the turnpike that was made of stone and gravel and connected Philadelphia to Lancaster. It opened in 1794 after two years of construction. The project inspired similar projects and around the turn of the century hundreds of turnpike companies emerged. They improved existing routes and established new ones; stagecoach travel increased as a result. As a transportation improvement, the toll roads were a big success for the developing nation. As a private business endeavor, however, toll roads proved a failure. Traveler's fees usually covered only maintenance. By 1825 turnpike companies' stocks had become worthless and most companies folded. Thereafter the government began operating toll roads as a way to finance pike projects: those who would use them had to pay fees. In this way, the taxpayer's burden was reduced.

TWENTY-FIRST AMENDMENT

The year 1933 marked a benchmark in U.S. constitutional history. The Twenty-first Amendment was enacted. It is the only constitutional amendment to repeal another amendment. With its ratification, the Eighteenth Amendment's mandate to eliminate liquor consumption in the United States was repealed.

Fourteen years after it began, Prohibition ended. Although the Eighteenth Amendment did succeed in reducing the amount of alcohol consumed, it failed in its goal of eliminating the consumption of intoxicating liquors in the United States. Many people continued to imbibe. Taking advantage of the legal ban on alcohol, organized crime helped develop a black market in "bootleg" alcohol to meet continuing public demand. Criminals like Chicago gangster Al Capone (1899-1947) became multimillionaires. In the early 1930s, production and sales of "bootleg" liquor continued to rise and the Great Depression began. Prohibition was difficult to enforce in urban areas, and critics argued the increase in crime resulting from the ban offset reductions in consumption. In addition, millions of citizens were out of work and legalizing the liquor industry would create more jobs. Calls for the repeal of the Eighteenth Amendment were gaining ground.

During the 1932 Democratic national convention, the party platform included a call for the repeal of the

Due to public protest and increased crime, the Twenty-first Amendment repealed the Eighteenth Amendment, which was to prohibit the sale of intoxicating liquors.

Eighteenth Amendment. In the presidential election of that year, the Democrats won a landslide victory. In February 1933, the Twenty-first Amendment was proposed in Congress. It specified the amendment must be ratified by state conventions rather than state legislatures so that legislators (who were predominantly from rural areas that supported Prohibition) could not vote against ratification.

Before 1933 was over, the Twenty-first Amendment had passed. Prohibition was officially over. The amendment did give states the right to prohibit the importation or transportation of intoxicating liquors, and many states did enact their own prohibition laws in the 1930s. By 1966, however, all state prohibition laws were repealed.

TYLER PREEMPTION ACT OF 1841

The Preemption Act, passed in 1841 during the administration of tenth president of the United States John Tyler (1790-1862), was a response to the widespread practice of squatting—illegally settling lands

that had not been surveyed and were not yet for sale. During the first three decades of the 1800s the American West received an influx of settlers. The government's system of surveying lands before putting them on the market could not keep up with the demand for property. New arrivals on the frontier simply settled public lands, often building on them and working the land. The Preemption Act exonerated these trespassers by allowing any citizen or any immigrant who intended to become a citizen to purchase 160 acres (64.7 hectares) of public land at the minimum price as long as he had occupied and cultivated the land, and had built a cabin or other dwelling on the tract. This act, combined with Congressional legislation that offered less desirable surveyed tracts at gradually reduced rates, contributed to the settlement of the West and the Old Northwest (the present-day states of Ohio, Michigan, Indiana, Illinois, Wisconsin, and part of Minnesota).

TYSON FOODS

Tyson Foods, Inc. of Arkansas made news in the mid-1990s, not for its position as the largest poultry producer in the nation, but for its alleged political connections to the Clinton administration. As governor of Arkansas, Bill Clinton showed favoritism toward Tyson with tax breaks and personal services. In return Clinton accepted considerable presidential campaign funds from the company. Mike Espy, former secretary of agriculture during the first part of the Clinton administration, was accused, and later cleared, of accepting inappropriate gifts from Tyson. In 1998 Tyson accepted a settlement from the Office of Independent Counsel, agreeing to pay \$6 million in penalties and costs for its alleged influence-buying. The unfavorable publicity, however, has not discouraged millions of consumers from buying Tyson products.

The history of Tyson Foods started with an Arkansas farmer, John Tyson, who hauled about 50 chickens to sell in Chicago during 1935. He named his business Tyson Feed & Hatchery and began making a profit buying and selling chickens prior to World War II (1939–45). Tyson eventually started raising chickens as well, and the company, incorporated in 1947, expanded significantly after the war.

Don Tyson joined his father in the business in 1952, and the company began to expand its production facilities. A large processing plant was built at the site of the company headquarters in Springdale, Arkansas. Tyson introduced an ice-pack processing line, which

helped it to be more competitive. In an era when people were eating more and more chicken Tyson was in a good position to fulfill consumers' needs. In 1963 the company went public and changed its name to Tyson's Foods, Inc. Three years later Don Tyson took over as president following the accidental death of his father.

Improved methods for producing larger numbers of broiler chickens drove the prices of chicken down in the late 1960s. When Tyson lost more than a dollar per share in earnings in 1967 the firm began the process of acquiring smaller companies to increase its share of the market. In 1969 it purchased Prospect Farms, Inc., which became a precooked chicken division. In the same year Tyson successfully fended off a lawsuit from Arkansas chicken farmers who felt that the company had discriminated against them as suppliers.

In 1971, after a period of growth and diversification, the company's name was changed to Tyson Foods. The company acquired Ocoma Foods, Krispy Kitchens, and the poultry division of Wilson Foods. It also began to market the first breaded chicken breast patty and bought a hog operation in North Carolina. In the early 1970s, as Americans increasingly favored chicken over beef and pork, Tyson became a leader in introducing new chicken products. In addition to the chicken patty it sold chicken hot dogs and bologna, just a few of the 24 specialty products it had developed by 1979. A new chill process was used to produce fresh chickens and prolong shelf life.

Tyson bought the rest of Wilson Foods in 1978. In 1980 Tyson introduced a Chick 'n Quick line, which offered easy-to-prepare chicken portions. The company was also the largest producer of rock Cornish game hens and the biggest producer of hogs. Precooked chicken patties for restaurants also became big sellers during this period.

By the early 1980s the consumption of chicken had increased 30 percent since 1970. Tyson's ability to mass-produce chickens rapidly, as well as its introduction of prepared chicken products, had helped it to expand in this market. It continued to acquire other companies and by 1984 had expanded its operations into five other states besides Arkansas. Don Tyson won the gold award from the *Wall Street Transcript* in 1986 for his business successes.

A major coup for Tyson in 1988 was the takeover of Holly Farms Corporation, the national brand-name leader in chicken sales. Tyson battled for six months with the Nebraska firm ConAgra for control of Holly Farms and in 1989 Don Tyson finally agreed to pay \$1.29 billion for Holly Farms. In 1990 Tyson's sales increased 50.7 percent as a result of the Holly Farms

Tyson Foods

acquisition. Tyson's beef and pork operations also increased substantially after the merger.

Tyson next got into the seafood market in the early 1990s by acquiring Arctic Alaska Fisheries Corporation and Louis Kemp Seafood Company. Although the seafood market operations were not profitable at first, market activity was bolstered by the acquisition of the seafood division of International Multifoods Corporation.

Tyson continued to expand and to buy up competitors and suppliers. In 1994 the company decided to build four new poultry plants at a cost of \$400 million and also bought a controlling interest in a Mexican chicken-processing company. In the same year it bought Culinary Foods, Inc., which manufactured specialty frozen foods, and Gorges Foodservice, Inc., a processor of beef for the food services industry. Tyson tried unsuccessfully to purchase WLR Foods Inc., a Virginia producer of turkey and chicken products. In 1995 Tyson purchased the chicken plants owned by Cargill, adding an additional output capacity of 2.5 million chickens per week. An equal increase in capacity was brought about with the acquisition of McCarty Farms Inc. of Mississippi. In 1997 Tyson took the very significant step of purchasing Hudson Foods, Inc., the fifth-largest producer of chickens in the U.S.

Don Tyson retired as chairman in 1995 and turned over control of operations to Leland E. Tollett. By the mid-1990s Tyson had reached the top position in

chicken sales in the nation; by 1998 its sales had increased from \$2.54 billion in 1989 to \$6.4 billion. In the mid-1990s Tyson entered into a joint venture with the People's Republic of China, opened an office in Mexico, and established a resource office to help the company market goods on the international market. In 1998 the company exported its products to 43 countries.

Tyson Foods, in the words of its company philosophy, successfully sought to "segment, concentrate, and dominate." Tyson achieved all three goals through its many acquisitions; in the late 1990s Tyson also capitalized on the public's increasing desire for easily prepared chicken products.

UNDERGROUND RAILROAD

For the first few decades of the new nation, state after state in the North passed emancipation laws freeing slaves or future children of slaves. By the early 1800s the North had essentially abolished slavery. In the South, however, where slavery was much more crucial to the economy, emancipation was making little to no progress. By the 1830s Northern abolitionists, impatient with the very slow progress, adopted more radical tactics to end slavery. Evangelical Christian groups took the lead in demanding immediate emancipation of slaves without compensation to the slave owners. A newly formed American Anti-Slavery Society grew quickly to approximately 150,000 members by 1840. Abolitionism, however, remained largely unsupported by most Northern politicians. For instance, a major campaign to distribute anti-slavery literature in the South in the 1830s was stopped by pro-slavery interests with the help of President Andrew Jackson (1829–1837).

Meanwhile, slaves increasingly sought freedom by escaping to the North, often with assistance from Northern sympathizers. In a move that many saw as governmental sanction of slavery, Congress passed the Fugitive Slave Act in 1850. The act required Northern states to return runaway slaves and established harsh penalties for individuals assisting runaways.

In reaction, abolitionists fashioned the Underground Railroad. Neither a railroad nor underground, it was a hidden network composed primarily of people and places extending in all directions to help runaway slaves. Operating largely in darkness and disguise, free blacks with assistance from sympathetic Northerners provided direction, food, and shelter for those seeking freedom in the North or in Canada. The system, coded in railroad terminology for secrecy, consisted of various routes (lines), hiding places (stations), and assistants (conductors) who helped to transport escapees along the way. The escaped slaves were called packages or freight. The journey often required money for

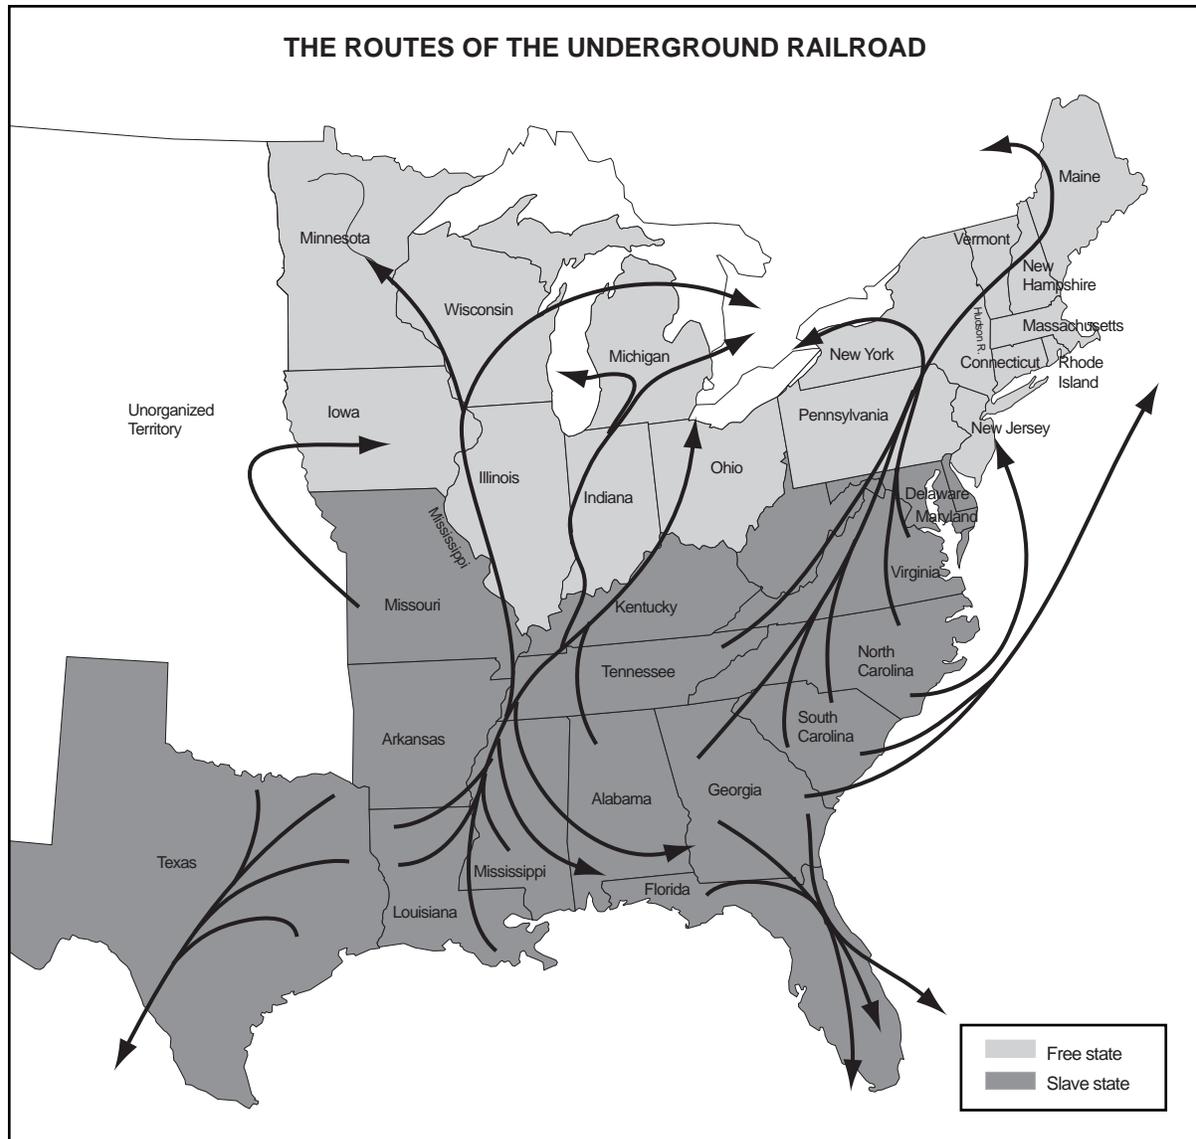

transportation, food, and bribes. The escapees used most anything for transportation, including travel by foot, small boat, covered wagon, and even in boxes shipped by rail or sea. Stations consisted of barns, cellars, attics, and secret rooms. The most heavily used routes were through Indiana, Ohio, and western Pennsylvania.

Due to the passage of the 1850 act, the desired destination for many runaway slaves became Canada, where they would be safe from U.S. lawmen and fugitive-slave hunters who could not cross the international border. A particularly common destination for many was Southern Ontario, with the Suspension Bridge at Niagara Falls serving as one well-used border crossing.

Through the Underground Railroad's years of operation until the conclusion of the American Civil War (1861–1865), an estimated 50,000 to 100,000 slaves sought freedom; because of the dire need for secrecy no records were kept. Because of the great danger in assisting slaves, no more than 3,000 people actually assisted, but the knowledge of the Underground Railroad's existence served to stir Northern sympathy toward the plight of the slaves. Some Northerners supported the effort for economic reasons as well. The industrial North was becoming increasingly agitated at the South's economy, which was based on unpaid slave labor, and the Railroad offered one means of undercutting the South's economy.

Many people associated with the Underground Railroad became well known, most notably Harriet Tubman (c1820–1913). A former slave herself who escaped through the system, Tubman traveled to the South on 19 occasions in the 1850s, recruiting those willing to take the chance of freedom. She reportedly helped 300 slaves directly through her own action. Harriet Beecher Stowe (1811–1896), who authored *Uncle Tom's Cabin* during this time, assisted fugitive slaves in Cincinnati, Ohio. Levi Coffin, a Quaker in Indiana, assisted more than 3,000 slaves from his

Underground Railroad

The Underground Railroad was used during the 1850s and 1860s to free 50,000–100,000 slaves with the help of 3000 individuals, over many routes, most ending in Canada.

home. Frederick Douglass (c1817–1895) was a fugitive slave who rose to prominence as an eloquent statesman for the abolitionists.

The Underground Railroad, impressive for its success, longevity, and complexity, was yet one more factor aggravating hostilities between the North and South. The Railroad has been noted as one of the more significant humanitarian efforts in U.S. history.

UNDERWOOD TARIFF ACT

Congress passed The Underwood Tariff Act in 1913. Its purpose was to reduce levies on manufactured and semi-manufactured goods and to eliminate duties on most raw materials. To compensate for the loss of revenue, the act also levied a graduated income tax (made legal by ratification of the Sixteenth Amendment earlier that year) on U.S. residents.

Protective tariffs had been the subject of political debate since they were first passed in 1828. After the American Civil War (1861–1865) the controversy over duties had become partisan, with Republicans, for the most part, favoring them, maintained duties were favorable to U.S. industry, and Democrats believed to the contrary. Republican administrations during the 1890s raised tariffs to unprecedented levels: The McKinley Tariff Act of 1890 was followed by the Dingley Tariff Act, which raised duties to as much as 57 percent and caused the cost of living to increase. Around the turn of the century, however, Republicans began to support opposition to high tariffs as well. As a result rates were reduced somewhat by the Payne-Aldrich Tariff Act of 1909, but prices remained artificially high and Democrats continued to press for a reduction in duties.

The election of 1912 proved a turning point for the Democrats: Woodrow Wilson (1856–1924) was voted into office and the party won control of Congress. In 1913 Wilson supported the Underwood Tariff Act, cutting or eliminating tariff rates. The legislation, sponsored by Representative Oscar Underwood (1862–1929), passed both houses of Congress. The reduced tariffs encouraged the import of foreign materials and manufactured goods, and prices of goods came down. The federal government now collecting less revenue in duties on foreign goods.

To offset the effect of less revenue from tariffs, the government levied an income tax for the first time. Incomes less than \$4000 per year were exempt by the Underwood act, thus, nearly all factory workers and farmers were not required to pay the taxes. Those earning more than \$4000 but less than \$20,000 paid a mere one percent tax. Rates rose from there, but the highest tax was still just a scant six percent—on earnings exceeding \$500,000.

The effect of the Underwood Tariff on foreign trade and on prices was limited: World War I (1914–1918) began the following year, curtailing imports. Protective tariffs became an issue again in the early 1920s, with the Emergency Tariff Act (1921) and the Fordney-McCumber Tariff Act (1922), which raised duties once again and gave the president authority to increase and decrease customs duties.

UNEMPLOYMENT

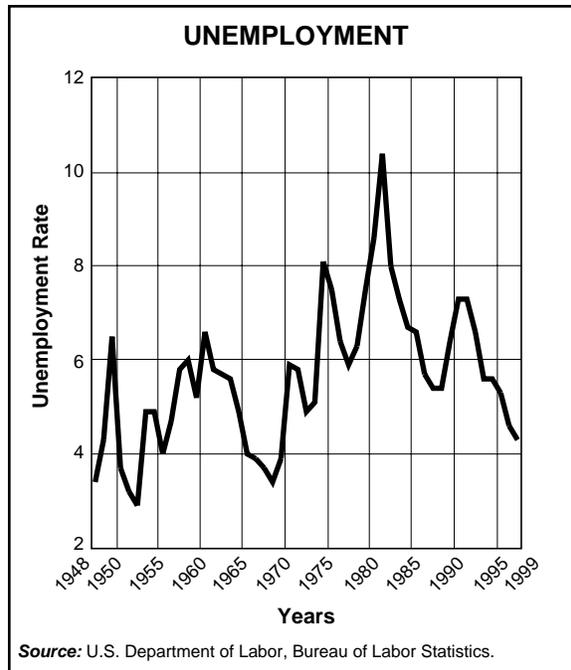

Reports on the economy often include information on unemployment to illustrate whether or not a nation's economy is doing well. Who is considered unemployed and what does the unemployment rate really represent?

The unemployed are individuals who do not currently have a job but are actively searching for one. These individuals, combined with those who are currently employed, make up the nation's labor force. A person who is not working and is not looking for a job is not considered unemployed.

The unemployment rate is usually described as a percentage. It is the percentage difference between the number of individuals in the labor force who are employed and those who are actively seeking work. In 1993 there were 129.5 million people in the U.S. labor force. Of that number, 8.7 million were unemployed, creating an unemployment rate of 6.7 percent for all workers.

There are two possible percentages for unemployment, the rate for all workers and the rate for civilian workers. All workers in the labor force include civilian workers and those in the U.S. armed forces. The civilian rate is considered to provide the clearest picture of the economy's strength because civilian workers are employed according to market forces. This is also the rate most often used by the media and in economic reports. The U.S. unemployment rate for civilian workers during 1993 was 6.8 percent.

Can a nation achieve full employment? Actually, a 6 percent unemployment rate is currently considered to be full employment. How can this be? The constant flux of the labor force, whether from seasonal variations or from a natural fluctuation of workers leaving one job and searching for another (for career advancement, skill demands, or some other motivation), makes it unrealistic to expect an unemployment rate of zero

The Unemployment Rate represents the percentage of people who are able to work, but are currently seeking employment, as depicted in this graph for the last half of the 20th century.

will ever be achieved. The full employment rate has risen steadily over the years. From 1952 to 1958, full employment was considered to be a rate of 4 percent unemployment. The rate rose to 4.5 percent in 1970, increased to 4.9 percent in 1977, and held at 6 percent through 1998.

If the full employment rate is 6 percent unemployment and the 1993 unemployment rate for civilian workers was 6.8 percent, then the economy for that year was providing the jobs to meet the needs of employment seekers.

UNION PACIFIC RAILROAD COMPANY

The Union Pacific Railroad Company (UP) came into existence in response to the widely held belief, fully formed by the 1850s, that the United States needed a rail link between its older, eastern states and the distant but rapidly growing states of the far west. Various proposals were made for northern, southern, and central routes but Congress could not agree on a plan. Following the southern states' secession from the

United States in 1861, the remaining congressmen from the North quickly agreed on a route, and U.S. President Abraham Lincoln (1861–1865), urged on by military considerations as much as by those of economics, signed the Pacific Railroad Act of 1862.

The act called for the creation of a public corporation, called the Union Pacific Railroad Company, to build a railroad from Nebraska to the California-Nevada border and there to meet the Central Pacific rail line, building east from Sacramento, California, and later linked with San Francisco. The meeting place of the two railroads was eventually set at Promontory Summit, Utah Territory. As amended by a second piece of legislation, the act specified that the company would be supported by a loan of U.S. bonds from the federal government, to be paid back in 30 years, and by the issuance of its own bonds and capital stock. Further, the company would receive land grants in the amount of 6400 acres on alternating sides of every mile of track laid, a checkerboard swath of land across the middle of the country that would eventually total around 12 million acres of valuable minerals, grazing land, and metropolitan real estate.

While the logic and value of a railroad across the western United States seemed obvious in the late twentieth century, it was much less so in 1864. The men who became involved in the leadership of the UP—chiefly Thomas C. Durant (1820–1885) and brothers Oliver Ames (1807–1877) and Oakes Ames (1804–1873)—did so largely in order to make handsome profits off the railroad's hurried construction. Durant was the vice president and dominant figure in the company's early years; it was he and a handful of others who formed a construction company called *Crédit Mobilier of America* (CMA) to receive contracts from UP for the building of its vast railroad. Estimates vary as to precisely how inflated these contracts were, but later congressional investigations left no doubt that the backers of CMA intentionally siphoned off far more of the UP's capital than was fair to its investors or good for its future financial health. The investigations of the early 1870s also revealed that the CMA principals bribed members of Congress with company stock. The railroad that was built was a splendid success, and so vast a project might never have been undertaken without the promise of equally vast profits to be made.

In five years the UP crews laid more than 1000 miles of rail between Omaha, Nebraska, and Promontory Summit, Utah Territory, where on May 10, 1869, a golden spike completed the first transcontinental rail line. The railroad's completion supplied a critical impetus to the development of the western United States,

which to that time had been settled only on the Pacific Coast and in areas of unusual mineral wealth, such as Colorado. With the arrival of the railroad, farmers, ranchers, and manufacturers were able to transport their goods to the great eastern metropolitan markets cheaply and quickly, and the West began to fill with pioneers. As the area's most significant railroad for almost 15 years, UP enjoyed rapid growth and excellent earnings for its scandal-ridden promoters, who were dominated from 1873 to the mid-1880s by financier Jay Gould (1836–1892).

Under Gould's direction UP expanded considerably during the 1870s, with its main route from Omaha, Nebraska to Ogden, Utah, joined by a host of feeder lines extending into neighboring territory. The most significant of these was a line running to the Pacific Ocean through Idaho and Oregon and a branch that progressed in the general direction of Los Angeles, California, which it reached in 1901. Unfortunately, Gould's tenure was also marked by mismanagement and an increasingly burdensome debt. After the financial panic of 1893 strained the U.S. economy to the utmost, UP was forced into bankruptcy.

Union Pacific was reorganized in 1895, with Edward H. Harriman acting as chairman. Under Harriman's leadership, UP became one of the best run, as well as one of the largest, U.S. railroads. Harriman first set about retrieving the various pieces of UP lost during bankruptcy and soon reassembled the company's three basic networks: those running between Omaha and Ogden, Ogden and the Pacific Northwest, and Ogden and Los Angeles. Seeking control of the Central Pacific run between Ogden and the San Francisco bay area, he gained control of Central's owner, Southern Pacific (SP) in 1901. Between 1898 and Harriman's death in 1909, the UP increased its track miles from 2000 to 6000.

An anti-trust case brought against UP resulted in a 1913 U.S. Supreme Court decision that the company was inhibiting competition and must divest itself of its SP holdings. Union Pacific was thus once again reduced to its three main routes—Omaha to Ogden, Ogden to Portland, and Ogden to Los Angeles—although new lines between Portland and Seattle were soon added.

In the 1930s an increasing portion of earnings were generated by UP's oil and gas holdings and industrial real estate, businesses that were an outgrowth of the generous land grants the railroad had received upon its formation. With the outbreak of World War II (1939–1945) Union Pacific had little to worry about in the financial realm. The need to shuttle huge amounts of personnel and heavy equipment around

the United States gave UP all the business it could handle; company employment nearly doubling to 60,000 and revenue pushing to more than \$500 million by war's end.

During the postwar period, UP restructured its holdings into three divisions: transportation, land development, and natural resources. In the mid-1960s the company began a concentrated program of mineral, oil, and gas exploration. To reflect its diversified nature, the company changed its name to Union Pacific Corporation (UP) in 1969. By the 1970s UP had moved into refining, thus completing the formation of a fully integrated oil and gas business. Eventually known as Union Pacific Resources Company, this subsidiary was spun off into a separate entity in 1995, enabling UP to once again concentrate on its core railroad business.

Beginning as far back as the 1930s and continuing through the end of the twentieth century, truck and automobile traffic eroded the railroad's share of both freight and passenger miles. This long-term trend, coupled with U.S. President Ronald Reagan's (1981–1989) deregulation of the railroad industry, led to a new era of railroad consolidation in the 1980s and 1990s. In 1982 Union Pacific acquired the Missouri Pacific and Western Pacific railroads, gaining a Chicago to Omaha line, three gateways to Mexico, and a route between Ogden and San Francisco. The original transcontinental railroad was again back under complete UP control. An even larger acquisition came in 1996, when Union Pacific paid \$4 billion to once again join forces with Southern Pacific. The UP-SP marriage created the largest railroad in the United States, with 36,000 miles of track in 23 states, Canada, and Mexico.

UNITED AUTO WORKERS

The United Auto Workers (UAW) was created in 1936 to protect the rights of workers in America's largest industry, automobile manufacturing. Unionizing auto workers was a formidable task. Management was staunchly anti-union, harassing workers suspected of union activity and even employing spies to report on employee activities. Workers were subjected to capricious firings and bullying from foremen, and could not appeal management decisions. Because the American Federation of Labor (AFL) was not concerned with the needs of unskilled workers, a group of radical labor leaders emerged to advocate for their rights. John L. Lewis (1880–1969) of the United Mine Workers, David Dubinsky (1892–1982) of the International Ladies' Garment Workers, and Sidney Hillman (1887–1946) of the Amalgamated Clothing Workers formed the Committee of Industrial Organization (CIO), a committee within the AFL. The CIO worked on organizing unskilled labor into huge industry-wide unions. The UAW, with Homer Martin as its first president, became the auto workers' union.

Workers, intimidated by management's hostility, were reluctant at first to join the UAW. They needed proof that the union could succeed against the biggest and most powerful industry in the country. To confront these industry giants, organizers adopted a new tactic. They staged sit-down strikes at several plants, forcing companies to stop production. This strategy was so damaging to business that the auto companies were finally forced to accept the union as labor's legitimate bargaining agent.

The recognition of the UAW was a landmark in the struggle for labor rights. It signaled the emergence of a new generation of labor leaders who were ready to push hard for the rights of unskilled labor. And workers responded enthusiastically. UAW membership rose from 98,000 in early 1937 to 400,000 by mid-year. During the 1930s and 1940s, the UAW fought for and obtained significant improvements for its members, especially under the leadership of Walter Reuther (1907–1970), who served as UAW president from 1946 to 1970. The union successfully bargained for such measures as cost-of-living adjustments, wage increases, and pensions. In 1955, auto workers won a guaranteed annual wage. At the same time, however,

the UAW grew increasingly bureaucratized in the years after World War II (1939–1945). Abandoning its more democratic roots, the UAW became a fiercely authoritarian and anti-Communist organization. Power was concentrated within the central administration, the autonomy of local chapters destroyed, and accusations or patronage abounded. Though the UAW continued to win concrete labor benefits, it imposed contracts on membership without their input and stifled internal debate. By the 1960s, workers grew increasingly alienated from the union, which had not brought a national strike against General Motors since 1945–1946. When disgruntled workers finally staged wildcat strikes in 1970, UAW officials broke up picket lines to force strikers back to work.

By the 1990s the UAW had modified many of its positions. Though power was still centrally concentrated, the UAW at the end of the twentieth century was one of the most democratic unions in the United States. Unlike many unions, such as the Teamsters, the UAW has been relatively free of corruption charges and maintains a good reputation for its efforts.

UNITED FARM WORKERS

During the 1960s, the Civil Rights Movement prompted increasing political awareness and activity among several minority groups. Among these were the migrant farm workers, most of them Mexican, who traveled throughout California and the western states to take seasonal jobs in fields and orchards. Agricultural workers had never been covered by the National Labor Relations Board. They endured harsh conditions for meager pay, and had no job security or benefits. Often, families moved so frequently that their children were unable to attend school regularly. A transient lifestyle, lack of education, and language barriers created conditions that made it especially difficult for migrant workers to bargain effectively with agricultural businesses.

Cesar Chavez (1927–1993), a migrant worker from Yuma, Arizona, began organizing migrant workers in the 1950s. Chavez, who attended 36 elementary schools during his childhood and never finished high school, knew firsthand about the workers' needs. He could speak their language and relate to them as an insider. In 1962, Chavez formed the National Farm Workers Association to represent migrant Chicano and Filipino farmworkers. By 1965, his organization had 1,700 members and in 1966 it was chartered by the

American Federation of Labor and Congress of Industrial Organizations (AFL-CIO) as the United Farm Workers of America (UFW). Chavez was president of the UFW from its formation until his death in 1993. The UFW's first significant strike occurred in 1965, when the union called for a national boycott of California grapes after growers refused to grant workers' demands for better pay and working conditions. In 1966, the DiGiorgio Corporation agreed to allow a union vote, but an investigation launched by California governor Edmund G. Brown, Sr., the first major politician to support the UFW, showed that the results had been rigged. Another election was held, which the UFW won. The grape boycott lasted five years, during which Chavez went on a hunger strike to publicize the exploitation of migrant workers. The grape boycott resulted in the first major victory for migrant workers in the United States. Later boycotts of lettuce and other produce met with similar success. In 1975, California passed legislation that required growers to bargain collectively with representatives elected by the workers, establishing the legal right of farm workers to unionize. Yet much work remained. In the 1970s, the UFW had to fight to maintain its autonomy against the Teamsters Union, which tried to take it over, while continuing its struggle for fair wages and safer conditions. Chavez went on two more hunger strikes, for 24 days in 1972 and for 36 days in 1988, to focus attention on the harmful effects of pesticides to which agricultural workers were routinely exposed. At the time of his death in 1993, he was leading another national boycott of grapes to protest pesticide use.

UNITED MINE WORKERS (UMW)

Organized in 1890, the United Mine Workers (UMW) is a labor union founded as an affiliate of the American Federation of Labor (AFL). By the late 1880s, Midwestern mine owners were grossly exploiting workers, including numerous immigrants: conditions in the mines ranged from deplorable to dangerous, wages had dropped by as much as 20 percent, and mining families lived in squalor. During its first decade, the UMW came under the leadership of Illinois native John Mitchell (1870–1919). (Mitchell had begun working in coal mines at age twelve and was a member of the Knights of Labor (1885–1890), before joining the UMW and quickly ascending its ranks.) As

president of the union after 1898, Mitchell undertook a massive organization drive, espousing the gospel of unionism and the dignity of man. Through Mitchell's efforts, diverse workers became the unified front of the UMW and a force to be reckoned with. In the early 1900s the UMW staged a series of successful strikes, calling attention to unfair labor practices and resulting in increased wages, reduced hours, and improved conditions. Mitchell became a national hero. He suffered health problems and was replaced as leader of the UMW in 1906.

For the next two decades, the coal industry was marked by increased competition; the UMW's tactics became radical. During the 1910s, a series of coal strikes were marked by violence, ending in the deaths of workers as well as government officials. In 1922 U.S. coal miners staged a six-month long strike to protest wage cuts. The massive demonstration paralyzed American industry and began a period of chronic depression in the coal mining industry. What resulted was cutthroat competition, which further hurt the cause of the workers.

The Great Depression (1929–1939), the severe economic downturn of the 1930s, saw the country's laborers joining unions in great numbers, particularly boosting the memberships of industrial (versus craft) unions such as the UMW. In 1935 dynamic UMW leader John Llewellyn Lewis (1880–1969) worked with other industrial unions to form an alliance, the Committee for Industrial Organization (CIO). The UMW's parent organization, the AFL, which was founded on the principles of craft unions, expelled the UMW and other CIO activists, who reorganized as the Congress of Industrial Organizations (CIO). In the 1940s the unions again became controversial: A UMW strike in 1946 stopped soft coal production, then the nation's primary source of energy. The strike severely impacted the steel and automotive industries, the rail service, and the average American, as people in twenty-two states were required to observe "dim-outs" to conserve coal. Consumers faulted the unions for shortages of consumer goods, suspension of services, and inflated prices.

Passage of the Taft-Hartley Act (1947) limited the impact of unions. The UMW has remained active on the national labor scene since its founding, though it struggled through controversy again in the 1970s when its leadership was found to be corrupt.

UNITED NATIONS

At the end of World War I (1914–1918), President Woodrow Wilson (1913–1921) advocated the League of Nations to the American public. An international organization devised to foster international cooperation and the peaceful resolution of conflict, the League of Nations was a centrally weak but well-meaning organization. Its successor, the United Nations (UN), is substantially stronger. Created in 1945 after World War II (1939–1945), the UN began with 50 members. Among them were the United States, the Soviet Union, Great Britain, France, and China.

With a purpose to promote international harmony, peace, and cooperation between the world's nations, the United Nations is involved in many issues, including economic, social, cultural, health, and human rights matters. Its actions are divided between six main bodies: the General Assembly, a deliberative group to which all UN members belong; the Security Council, which attempts to maintain peace through economic sanctions or military action; the International Court of Justice, established to issue advice and settle disputes within its jurisdiction; the Economic and Social Council, to advise on economic and social issues; the Trusteeship Council, which administers non-self-governing territories; and the Secretariat.

The Secretariat is the UN's main administrative body and is headed by a secretary-general. It settles disputes, carries out peace-keeping activities, gathers information regarding political and economic trends, and oversees the activities of the organization's specialized agencies. The Secretariat is in charge of directing all bodies of the UN in fulfilling its goals.

There are many agencies within the organization that carry out specific tasks. The International Monetary Fund (IMF) is among them. It stabilizes the exchange rates between countries and may also play a role in lending money to nations. The World Bank lends funds for infrastructure projects. To deal with health problems on both an international and a local scale, the UN operates the World Health Organization. To specifically administer to the health and welfare of children worldwide, the UN directs projects through the United Nations' Children's Fund (UNICEF), one of its most well-known agencies.

While UNICEF may be the organization's most popular agency, the Security Council is one of the UN's most controversial. Through the Security Council, the UN deploys peacekeeping forces and administers economic sanctions. Since it was created in 1945, the UN has sent peacekeeping forces to India and

Pakistan (1948, 1965), Korea (1950), Cyprus (1964), Israel and Syria (1974), Lebanon (1978), Angola (1988), Iraq and Kuwait (1991), Western Sahara (1991), and the former Yugoslavia (1993). Not all of these ventures were successful in keeping the peace. Support for actions like these is not always unanimous within the organization.

The United Nations is funded by member fees, which are based on per capita income, national income, and ability to meet obligations. Fifty years after its founding in 1945, the United Nations has grown to be a larger organization (184 members as of 1994), stronger than its predecessor, the League of Nations, and a prominent participant in world affairs.

UNITED PARCEL SERVICE OF AMERICA

Headquartered in Atlanta, Georgia, the United Parcel Service of America, Inc. (UPS) is the world's largest package delivery service. It serves over 200 countries and delivers to any address in the continental United States. The company had humble beginnings. In 1907, six years before the U.S. Postal Service began its parcel post system, teenagers Jim Casey and Claude Ryan of Seattle, Washington, borrowed money to expand their bicycle-delivery and messenger service. With the loan they established the American Messenger Company, the precursor to UPS. By 1913 their fleet, renamed Merchants Parcel Delivery, consisted of seven motorcycles. In 1918 the workers joined the International Brotherhood of Teamsters. When the company converted to truck delivery another partner, Charlie Soderstrom, elected to paint the trucks brown, a tradition still carried out by UPS. The company, whose name was changed to the United Parcel Service in the 1930s, pioneered the system of consolidated delivery whereby packages destined for one neighborhood would be delivered by one vehicle. UPS experimented with air service during the Great Depression (1929–1939). Until the late 1940s most of UPS's business was in department store deliveries.

UPS experienced a period of decline following World War II (1939–1945) because the increase in privately owned automobiles allowed people to carry their own packages. Due to the decline of contract service to retail stores, the company began to expand common-carrier parcel service. UPS began offering to pick up parcels (limited in weight and size) from any location and deliver them within a 150-mile radius. This initiative put UPS into direct competition with the U.S. Postal Service.

In the 1950s the need for fast and convenient package delivery in the United States and around the globe was growing. UPS spent several years fighting for federal authority to operate in all of the 48 contiguous states. In 1953 the company resumed air service, which it called Blue Label Air. Between 1964 and 1969 UPS doubled its sales and had expanded into the majority of the U.S. states, making it appear as if UPS would become the only parcel shipping company in the country. Its management team was tightly controlled, and stock was held by its own employees.

SERVICE IS ALL WE HAVE TO OFFER.

Charles Soderstrom, UPS executive, c1930

In 1976 unrest occurred among UPS package processing employees. The company announced plans to replace them eventually with part-time workers, which prompted a number of local Teamsters unions to go on strike. East coast businesses were disturbed by this, particularly as it came during their Christmas rush. Although the strikes were settled, relations between labor and management at UPS remained strained.

UPS continued to expand during this period, establishing a service in Germany in 1976. In 1980 UPS profits were \$189 million out of revenues of \$4 billion. Competition was fierce by this time, particularly with the emergence of the Federal Express Corporation (Fed Ex), which offered one-day express delivery. UPS countered with Blue Label Air, promising two-day delivery at a lower cost. UPS also dropped its traditionally conservative promotional policies and ran television advertisements for the first time.

While other businesses suffered from the recession of the early 1980s, UPS actually saw an increase in business volume as companies began to ship smaller lots in order to save money. Relations with the Teamsters union suffered when the union discovered that UPS's net income rose 74 percent in 1981, at a time when union wage increases had been capped. UPS employees continued to be dissatisfied, as reports of increasing profits to the company surfaced over the next two years. In 1984 secret negotiations resulted in a three-year agreement which satisfied the union's demands for better wages and benefits, and a major strike was averted. In 1985 UPS was able to offer next-day air service in 48 contiguous states, as well as international air package and document service.

From 1984 to 1991 UPS was the most profitable U.S. product transportation company. UPS now offered both one-day and two-day service, and had increased its earnings to over \$700 million in 1987.

Though it lagged behind Federal Express in the overnight package delivery business it was working to improve its computer technology to keep up with the competition. By 1988 UPS had established its own airline (UPS Airline), was delivering almost one billion more packages than the U.S. Postal service, and had begun expanding its European operations.

Kent C. Nelson became chairman and chief executive officer of UPS in 1989, initiating a major transformation of the company. New services such as less expensive two-day and three-day deliveries, inventory management, and warehousing were offered to clients. Technical innovations also increased efficiency, and more money was spent on advertising. UPS increased its global recognition by its sponsorship of the 1996 Olympics in Atlanta, and began to step up the profitability of its European and Asian operations, winning over considerable market share from Federal Express. Though profit margins decreased significantly during this time of expansion, the first six years of Nelson's leadership at UPS resulted in a 69 percent increase in sales. UPS was not as profitable abroad as in the United States, but it continued to develop overseas services. In the late 1990s it beat out Federal Express for a major air hub in Taiwan, and it also planned to expand its services to Latin America.

In 1998 UPS was capable of reaching over four billion people worldwide. Its high-technology data communications network tracked over 820,000 packages daily. UPS supplemented the efficiency and reliability of its operations with customer service improvements such as implementing instant tracking systems, order processing, and inventory control. The company operated on a hub system in which packages from a particular region were processed at a central location prior to shipping, which was located in Louisville, Kentucky. UPS in the late 1990s was still privately owned, its stock exclusively held by its managers, employees, retirees, and their families.

United States Rubber Company

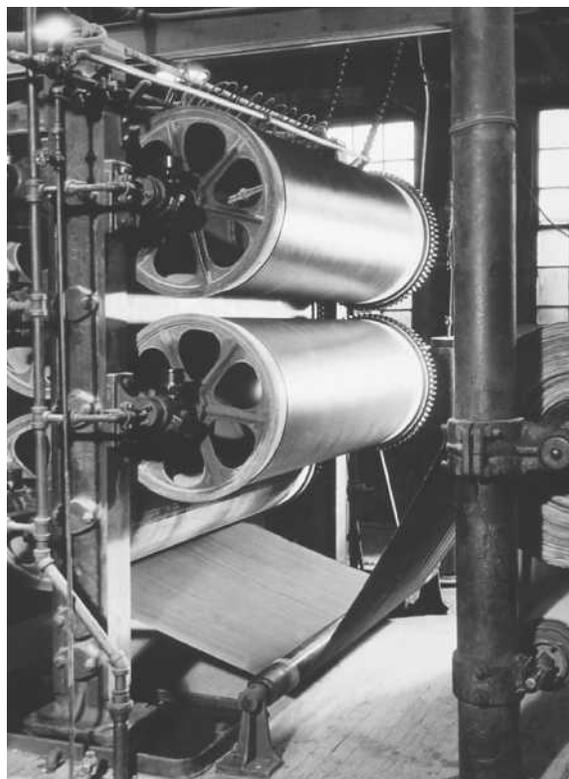

“The UPS Story,” [cited July 27, 1999] Available from the World Wide Web @ www.ups.com/about/story.html/.

UNITED STATES RUBBER COMPANY

In the years leading up to the formation of the United States Rubber Company, the rubber industry was marked by intense competition. Rubber footwear firms, then the industry’s largest and most profitable operations, were competing through price wars. Rubber footwear turned an easy profit, and many new companies developed. The increasing number of companies influencing prices caused them to fluctuate dramatically. At the same time, a business financier named Charles Ranlett Flint (1850–1934) was involving himself in the rubber trade between Brazil and the United States. Flint was also involved in a wide range of industries, and he was famous for consolidating numerous firms into single, large industrial units. Numerous footwear firm owners thought that a major consolidation of companies, orchestrated by Flint, would stabilize the industry. In 1892 Flint joined 11 firms and created the United States Rubber Company. The new company immediately controlled half of the nation’s footwear sales.

The United States Rubber Company’s member firms made shoes that were commissioned by a central sales unit. A board of directors supervised the central selling organization, and the manufacturers operated with virtual autonomy. The new company shifted its assets early on, closing two small factories and acquiring two of its biggest rivals. By 1898 the United States Rubber Company increased its market share from 50 to 75 percent. The company, however, was turning only modest profits, due primarily to the financial strain of absorbing its competitors. As the 1800s ended the rubber industry was rapidly shifting its focus to tire manufacturing for the automobile industry. But U.S. Rubber ignored the industry changes and chose to remain solely a footwear company.

The new tire market turned high profits and companies competed heavily for top market shares. One of the industry’s leading firms, Rubber Goods Manufacturing (RGM), saw its position in the industry gradually decline. In 1905 U.S. Rubber bought RGM as a means of entering the tire market. Immediately, the former footwear company was the top tire producer. As treasurer of U.S. Rubber, Charles Flint went to Brussels, Belgium, in 1906 to secure the entire rubber output of the Belgian Congo from King Leopold. U.S.

Rubber pressing machine.

Rubber was seen as one of the tire industry’s most significant newcomers.

The Du Pont family took control of U.S. Rubber in 1927. That same year, Du Pont and other elite industrialists wanted to consolidate U.S. Rubber, Goodyear, and Seiberling companies in order to establish a powerful industry leader. The idea failed to win support from financial institutions and shareholders that were unsatisfied with the industry’s performance during the 1920s. With the onset of the Great Depression (1929–1939) in 1929, tire sales dropped by two-thirds and suppliers lowered prices for car manufacturers in order to maximize sales. In spite of these industry setbacks, U.S. Rubber thrived. It increased its market share from 6.9 percent in 1929 to 30 percent in 1931. The company’s success was linked to Du Pont’s interest in both U.S. Rubber and General Motors Corporation. U.S. Rubber’s manufacturing base was in Detroit, Michigan, and General Motors’ nearby location gave U.S. Rubber half of the carmaker’s business in 1931. U.S. Rubber was simultaneously boosting its sales to Ford Motor Company.

The company held a key position in the tire and rubber industry for four decades. In 1966 U.S. Rubber changed its name to Uniroyal. In the 1970s, due to the recession and to the development of radial tires which

required totally new production equipment and processes, the industry began to shift. Uniroyal was among the companies hardest hit. Though it was ensured a good market share with its General Motors contracts, the overall depression of the car industry and the expensive switch to radials overwhelmed the company finances. Adding to that, Uniroyal's sales on replacement tires were low. The company's losses in 1979 were heavy enough to lead to drastic cuts in capacity in 1980. In the mid-1980s Uniroyal sold many of its divisions and organized a buy-out by Clayton and Dubilier. In 1986 Uniroyal and Goodrich merged their tire operations to form a jointly owned Uniroyal Goodrich Tire Company (UGTC). The new company would combine Uniroyal's strong supplier business with Goodrich's large replacement business. But the venture wasn't successful. Debts, losses, and conflicting management styles brought the company down. In 1987 Dubilier and Clayton bought out Goodrich's holdings in the venture.

As the decade ended, more U.S. tire companies were taken over by foreign firms. The French company Michelin purchased UGTC in 1990. The Uniroyal brand, however, continued. In the late 1990s the Tiger Paw NailGard tire was issued, boasting the capacity to seal 90 percent of tread punctures up to diameters of three-sixteenths of an inch.

The competition that gave rise to the formation of the footwear trust, which came to be known as the United States Rubber Company, followed the rubber industry throughout the twentieth century. As the century ended, the competition that had marked the industry's history shifted to a global scale. Even U.S. Rubber—or Uniroyal—the longtime industry leader, had trouble staying afloat in the face of foreign competition.

UNITED STATES STEEL

An important transaction occurred in New Jersey on February 25, 1901. Carnegie Steel—first owned by Andrew Carnegie (1835–1919)—was purchased by J. Pierpont Morgan (1837–1913), for \$480 million. That day became stamped in history as the U.S. Steel Company was born.

Before the creation of U.S. Steel, Carnegie Steel had already been very successful. Carnegie's first exposure to steel came when he landed a job as a secretary and telegrapher for Tom Scott, a powerful overlord for the Pennsylvania Railroad (known familiarly as Pennsy's). By the age of 23, Carnegie was head of Pennsy's Railroad division and was making large sums of money with outside investments in oil, iron bridges, and other commodities. By the time he was 33, Carnegie's drive for success had become more innovative and efficient. He began modernizing older steel plants, then brought in a technology called Bessemer processing. This method reduced the cost of production in the steel industry from \$160 per ton in 1875 to only \$17 per ton in 1900. However by 1901 Carnegie decided to sell his business to Morgan and pursue a life devoted to philanthropic deeds such as making contributions to large corporate foundations and opening over 2,800 free libraries worldwide. At the time of his death, Carnegie had given away nearly all of his \$350 million dollar empire.

The powerful U.S. Steel was not just one company. It was formed from a merger of 10 other companies: American Bridge Company; American Sheet Steel Company; American Steel Hoop Company; American Steel and Wire; American Tin Plate Company; Carnegie Steel Company; Federal Steel Company; Lake Superior Consolidated Iron Mines; National Steel Company; and the National Tube Company. U.S. Steel became the first billion-dollar company in the world, producing 67 percent of country's steel. By April 11, 1901, companies such as the Shelby Steel Tube Company and Bessemer Steamship Company were added to this industrial giant. U.S. Steel controlled massive iron deposits on the Mesabi Range in Minnesota and the coal reserves in western Pennsylvania. The company also controlled the largest shipping line on the Great Lakes, 80 blast furnaces, and 149 steel plants and mills. At the time, U.S. Steel's market share of finished steel products stood slightly over 50 percent. The mills of

U.S. Steel had the capacity to produce 60 percent of the nation's Bessemer steel, 75 percent of the pipe, 70 percent of the sheet metal, 68 percent of the nails, and 77 percent of the wire rod.

With such a massive company in operation, an important decision had yet to be addressed: Who was to run U.S. Steel? There were three main candidates for the job. Charles M. Schwab was a very bright veteran of the steel industry. He had worked his way through the Carnegie organization to become president of Carnegie Steel. Then there was Elbert Henry Gary, who was a lawyer and former judge, and the director of the Illinois Steel Company that had co-opted into Federal Steel, of which he had been president. Finally, there was J. P. Morgan, who had arranged the financing for the purchase. Morgan urged Schwab to become president of U.S. Steel and wanted Gary as chairman.

Schwab and Gary could not easily share the control of the company. In 1903 Schwab resigned and soon gained control over Bethlehem Steel Corporation, which he eventually made into the second largest steel producer in the country. Gary stayed as chief executive officer and led the U.S. Steel Company until he died in August, 1927. Before his death, Gary's goal for U.S. Steel was to avoid its becoming a monopoly. Gary was firm in attempting to uphold trade and encourage competition by using the basis of efficiency and price.

Following Elbert Gary's death, J. P. Morgan Jr., took over the position of chairman of the board of directors from 1927 to 1932. Essentially the leadership of the company came from Myron C. Taylor, chairman of the finance committee from 1927 to 1934, and chairman of the board from 1932 until his resignation in 1938.

The market shares for U.S. Steel dropped significantly in the following years due to competition, falling from 66 percent in 1901, to about 33 percent from the 1930s to the 1950s. One of the most noticeable growth spurts for U.S. Steel occurred during World War I (1914–1918) when sales doubled to \$2 billion between the years 1915 and 1918. Sales remained at \$2 billion annually through the 1920s. Significant drops in sales occurred in 1933 and 1934 during the Great Depression (1929–1939). Sales then climbed to \$1 billion in 1940, and \$3 billion in 1950. Wall Street's confidence in U.S. Steel had disappeared prior to the depression. Although product shares suffered the least, light rolled sheet fell dramatically because of hesitation to take on hot-strip mills.

Myron Taylor continued his efforts toward keeping U.S. Steel alive. One significant breakthrough

came with the hiring of an engineering consulting firm of Ford, Davis, and Bacon in 1935. A complete study of the corporation produced more than 200 reports. The consultants criticized the lack of a rational management structure, and excessiveness due to two separate raw-steel operations—Carnegie Steel and Illinois Steel. Based on the consultants' suggestions, Taylor created Carnegie-Illinois Steel. In 1936 American Sheet and Tin Plate joined Carnegie-Illinois Steel, making it the largest steel company in the world.

Taylor then restructured the corporation's management as well, making Benjamin Fairless, from Republic Steel, the new president of Carnegie-Illinois Steel. Another management company was also created to stand between the holding corporation and the operating subsidiaries. The United States Steel Corporation of Delaware formed in 1938. This ended the firm control of the finance committee and gave operating officials freedom while coordinating their efforts. A final suggestion from consultants was to expand the development of more hot-strip mills. Therefore, in 1935, two more modern plants were constructed.

During the 1950s emphasis was placed on expansion. More hot-strip mills, pipe mills, and open hearths were built. In the 1960s there were inadequate profits, which forced restructuring. By 1969 U.S. Steel had borrowed \$1.4 billion to finance expansion. During the 1970s, long-term growth in steel became hopeless in light of rising costs, foreign competition, and competitive pricing. The late 1970s saw the shutdown of 13 plants at a loss of \$809 million. In 1982 U.S. Steel acquired Marathon Oil Company—a company holding reserves in oil and gas with revenue essentially equal to U.S. Steel's. Texas Oil and Gas Corporation, was also acquired by U.S. Steel in February 1986, for \$3.6 billion.

In July 1986 United States Steel Corporation changed its name to USX Corporation. Then, in 1991, the company split into two separate entities: U.S. Steel and Marathon. The creation of a third group, the USX-Delhi Group, came about in 1992. During the early 1990s, USX-U.S. Steel was able to reduce fixed costs and increase productivity by cutting its raw steel capacity in half. USX closed four of its seven plants and reduced employees by 56 percent. This heralded a change in direction for the company. During 1992 USX-U.S. Steel diversified into the world of power technology. In the late 1990s, USX operated as two separate entities. The Marathon Oil Group specialized in natural gas exploration, research, domestic refining, marketing, and transportation of crude oil. The U.S. Steel Group remained a leading manufacturer of steel products.

UNITED STATES V. E.C. KNIGHT COMPANY

In 1895 the Supreme Court decision in the case of *United States v. E.C. Knight Company* severely undermined the Sherman Anti-Trust Act of 1890. In an eight-to-one ruling, the high court determined that, although a monopoly in manufacturing, the American Sugar Company and its subsidiary, the E.C. Knight Company, had not monopolized trade. The government had prosecuted the sugar company for owning 98 percent of the nation's sugar-refining capacity, seeing this as a clear violation of the Sherman Anti-Trust Act's pronouncement that "every contract, combination in the form of trust or otherwise, or conspiracy in the restraint of trade" is illegal. But according to the Supreme Court justices, the Sherman act had given Congress the right to regulate interstate commerce only; since the Knight Company's manufacturing operations were all located within Pennsylvania, the federal government had no jurisdiction.

The court's narrow interpretation of the Sherman Anti-Trust Act delivered a painful blow to those who wanted government to break up or at least limit the powerful monopolies. Though the Sherman legislation provided the basis for trust-busting, its might would not be used until the first decade of the 1900s, when, after a change in political climate, Standard Oil Company and American Tobacco Company would be charged with, and (in 1911) found guilty of violating the Sherman Act. In 1913, antitrust cases were also brought against the Union and Southern Pacific Railroad merger, International Harvester Corporation, American Telephone and Telegraph (AT&T), and the New York, New Haven, and Hartford Railroad.

In 1914, national anti-trust legislation was strengthened by the passage of the Clayton Anti-Trust Act, which outlawed price fixing (the practice of pricing below cost to eliminate a competitive product). The Clayton Act also made it illegal for the same executives to manage two or more competing companies (a practice called interlocking directorates), and prohibited any corporation from owning stock in a competing corporation.

UPJOHN COMPANY

In the Victorian era promoting and marketing early pharmaceutical products required talent, skill, and ingenuity. From the very beginning research and development played a major role in the development of modern pharmaceutical production. William Erastus Upjohn (commonly referred to as W.E.) was raised with his twelve brothers and sisters in an environment of medicine and pharmacia. His father and two uncles, all of whom were medical practitioners, nurtured this environment. W.E. Upjohn became a physician in 1875. While practicing medicine in Hastings, Michigan, he set up his own pharmaceutical laboratory. He began to experiment with formulas to develop a pill that would dissolve easily in the stomach. Upjohn revolutionized the drug industry in 1885, when he worked out problems and crushed a pill under his thumb to symbolize the achievement. This image became the trademark for the founding of the Upjohn Pill and Granule Company in 1886. The name was shortened to the Upjohn Company in 1903.

Dr. W.E. Upjohn's concern with the working conditions of his employees was evident, as he implemented a soup lunch program in 1911 and a group life insurance and benefit program in 1915. Having had a passion for horticulture, Upjohn donated a 17-acre park to the city of Kalamazoo, Michigan, and reduced the workday to seven hours in the summer so employees would have time to water their own lawns. Upjohn was a member of the commission that established the charter for the city of Kalamazoo in 1914, and served as the first mayor to administer the plan. Upon his death in 1932, W.E. Upjohn was in the process of trying to develop a form of employment insurance for the people of Kalamazoo. The Upjohn Company had over 1000 employees and net sales of \$8.5 million.

Through the turn of the century souvenirs promoting Upjohn products were available at the Chicago's World Fair; the exhibit itself was an enormous bottle filled with colored pills. The Upjohn principle that medicine should have a pleasant taste was exemplified in flavored laxative wafers, alkalizers, and cherry-flavored cough syrup. Marketing through physicians became a method of promoting Upjohn products such as Kaopectate, an antidiarrheal. Eventually Upjohn became a leader in the development of medicines for treating the central nervous system, heart conditions, arthritis and cancer.

In 1913 Upjohn continued its emphasis on research and development by hiring its first research scientist, Dr. Frederick W. Heyl. Heyl developed an effervescent antacid in 1926 and patented a tablet named Digitora (developed from digitalis) for the treatment of heart disease. By 1940 the company had expanded and added twelve more research scientists. Upjohn was selected by the armed forces to process human serum albumin and penicillin. Upjohn became a major manufacturer of antibiotics, and by 1958 antibiotic sales had reached \$22.6 million. International expansion during the 1950s enabled Upjohn to compete in foreign markets and advance their research. In 1985 thirty percent of their total sales were from the foreign market share which increased to 33 percent by the 1990s.

A swarm of publicity surrounded Upjohn in the late 1980s when the company applied for a new drug application for male baldness known as Rogaine. After three years of disappointing sales Upjohn changed marketing strategies by taking the product directly to the consumer. Investing \$50 million to promote Rogaine the company become one of the world's top three advertisers. In the early 1990s Upjohn was quickly trying to develop a treatment for Acquired Immune Deficiency Syndrome (AIDS) as well as a group of steroids designed to treat spinal and head injuries, which would replace some products being lost to the generic market.

In the face of the changing global market Upjohn sought to consolidate its position in the ethical pharmaceutical industry. There was speculation that Upjohn was too small to compete with its larger rivals. In response to the challenge Upjohn reorganized and merged with Pharmacia AB of Stockholm, Sweden. Pharmacia & Upjohn became one of the world's largest pharmaceutical firms, with annual sales of \$7 billion, a research budget of \$1 billion, and over 30,000 employees.

URBAN RENEWAL

Urbanization of a society occurs when city population growth rates exceed that of rural areas. Urbanization was a hallmark of U.S. economic development throughout the nineteenth century and the first half of the twentieth century. Increasing industrialization lured multiple waves of immigrants into primarily Northern urban settings seeking employment. Initially, rural peoples arrived from farms at the beginning of the nineteenth century. Foreign immigrants followed from northern and western Europe in the mid-1800s and eastern and southern Europe in the 1890s through the early part of the twentieth century. Finally, African Americans came from the American South in two major migration waves during the first half of the twentieth century. Ethnic and racial enclaves and neighborhoods came to comprise the socioeconomic mosaics of cities.

Sanitation, poverty, and overcrowding were persistent urban problems from the beginning, and became a national problem toward the end of the nineteenth century. Enhancement of urban life was a key element of the 1930s New Deal programs. Congress created the U.S. Housing Authority in 1937 to clear slums and provide public housing for low-income residents. Employment programs funded the construction of public buildings such as schools, hospitals, and urban parks.

Economic prosperity characterized the United States after World War II (1939–1945). Transportation advances including urban freeway systems and low-cost government mortgages for war veterans fueled the

great movement of white middle class city dwellers to the suburbs. With the exodus from cities taking away tax revenue and jobs, American cities began a steep downward spiral in quality of life and socioeconomic stability. Poverty, dilapidated housing, and high crime rates characterized inner city neighborhoods, largely populated by minorities. The urban black ghetto riots of the 1960s led to greater white migration to the suburbs, which became known as the “white flight.” A pattern of urban de-industrialization followed, with manufacturing businesses moving out of inner city areas creating edge cities in the suburbs. Americans’ attitudes toward the cities radically declined and racism became an urban problem rather than a Southern problem.

To counter these growing trends of declining inner cities, the first broad program of urban renewal was initiated in the 1950s. Congress funneled substantial amounts of federal financial aid to cities aimed at eliminating slums and ghettos and replacing them with improved housing and industrial and commercial areas. The Housing Act of 1954 provided “categorical” grants to restore older housing, directing public funds to specifically proposed actions. However, new high-rise housing projects of the 1950s and early 1960s soon represented the worst of black ghetto life.

The lack of success of categorical grants led to the Community Development Act of 1974. The act introduced block grants giving cities greater flexibility to address their specific needs through locally developed renewal plans. City plans required approval from the Department of Housing and Urban Development before qualifying for funding. Using block grants, cities would purchase slum areas, sometimes exercising eminent domain, to force the sale of private property to the government. The city would then demolish the buildings, clear the lots, and sell the land to private developers, or put it to public use. Highly toxic remains of abandoned industry often littered these inner city areas leading to costly environmental clean-up efforts. Prices for the cleared land were frequently set low and sometimes supplemented with tax breaks to attract private developers. Thus, the program operated at marked deficits for both city and federal governments. Housing developments, shopping centers, and office complexes were built in the newly cleared areas.

Although federal law required cities to assist displaced residents and businesses in finding new affordable locations, the dislocations often resulted in economic hardships. Urban renewal essentially became black removal. Cities typically built new public housing away from the renewal areas and traditional work sources while reserving renewal areas for the middle

and upper income residents to stimulate economic growth.

The 1970s also saw other urban renewal programs including urban homesteading. Old abandoned houses that had fallen into city ownership were sold at low cost to individuals interested in restoring and living in them. The 1980s saw several states implement urban enterprise zones, attempting to attract new businesses to inner city areas. The zones provided tax cuts and relief from regulations including zoning laws and rent controls. These programs were largely ineffective, however, given the extent of city problems.

The results of federally funded urban renewal programs were mixed. A number of declining downtown areas were economically revitalized by introducing new industrial and commercial developments. Thousands of families found improved urban housing and new schools, parks, hospitals, museums, and libraries were erected in cleared slum areas. In some cases neighborhoods became integrated as a result. Many areas cleared under the federal programs, however, remained vacant. The high-rise low income public housing projects attracted poverty, crime, and disease. Consequently, many housing projects experienced high vacancy rates. Critics of urban renewal policies claimed cities’ efforts to attract new business and higher-income residents caused cities that were already established to deteriorate.

The height of concerted urban renewal efforts at a national level ended after the 1970s. Under President Ronald Reagan (1981–1989), the U.S. government substantially reduced financial aid for urban development and housing. Through the remainder of the twentieth century, urban renewal became more the responsibility of city and state governments and renewal activity declined significantly. The 1990s brought concepts of empowerment zones, in which distressed urban areas received tax breaks, federal investment for creating new businesses, and job retraining programs. Other urban renewal concepts involved home ownership zones for affordable housing, and education opportunity zones to assist the most needy schools.

Another measure of the contrasts appearing in the nation's cities at the end of the nineteenth century was the differentiation of urban space. Since the 1850s lower Manhattan had been the province of commercial buildings, warehouses and tenements. However, by the 1880s the island had fragmented into a series of discrete neighborhoods increasingly divided by economic use, race, class, and ethnic origin. Wealthy and white-collar workers followed streetcar lines or elevated railroads uptown or to the urban periphery.

David Schuyler, *The New Urban Landscape: The Redefinition of City Form in Nineteenth-Century America*, 1986

URBANIZATION

At the time of the American Revolution (1775–1783), communities within the capitals of the thirteen colonies were very small. Ninety-five percent of the country's population lived rurally, participating in the predominant agrarian economy. The nation's first census in 1790 found only five cities with more than 10,000 people and no city as large as 50,000. The process of urbanization soon took hold, however, and city populations grew rapidly. The close tie between economic development and urbanization became a hallmark of U.S. economic history. Where some nations evolved with a singular large urban center, the form of urbanization in the United States was far more regional. Urban networks grew with large cities supporting a network of smaller cities and the smaller cities supporting surrounding agricultural areas. Racing to develop transportation networks such as railroads and canals, competitive regions made investments into urban infrastructures, including cultural institutions such as museums, opera houses, parks, colleges, and theaters.

The nation's first cities were seaports such as Boston, New York, and Philadelphia. Harbor areas formed the hub of economic activity. Through the early nineteenth century, modes of transportation evolved slowly; a person's needs could be met within a comfortable framework of one or two miles. A diverse mixture of economic activities and social classes including warehouses, artisan shops, and homes of the wealthy merchants could be found around the harbor area. Residential and business districts were intertwined. Little differentiation between social classes and ethnicities was common.

By the mid-nineteenth century a transportation and communication revolution emerged. Railway growth and the introduction of the steam engine dramatically influenced urbanization. Commercial centers transformed into industrial cities. Factory production expanded, bringing greater numbers of people to the cities with foreign immigration serving to satisfy escalating demands for workers. Cities, however, had difficulty accommodating the increased numbers of people. Considerable crowding occurred because buildings could not extend above five stories due to insufficient elevator technologies and the inability to supply water above that height.

By 1870 almost 170 cities had populations over 10,000 and 15 cities had more than 100,000 people. Transportation by horse-drawn street railcars allowed greater mobility. Cities became less centered around their harbor areas. New commercial districts grew somewhat distant from the ports containing key financial institutions, retail shops, and entertainment facilities. The traditional apprenticeship system gave way to a wage-earning working class that sought inexpensive housing. Residential areas became more detached from businesses and fast-growing industrial areas. The continued industrial growth also led to unprecedented crowding of laborers in congested industrial areas. The wealthy class began creating their own, more lavish residential areas.

Westward extension of the railroads spurred migration. Commercial agricultural production and trade grew away from the coastal cities. Urbanization moved westward as well. Urban markets served agricultural economies as transportation hubs and banking centers facilitated a cohesive, regional economic system.

Major technological advances spurred increased urbanization in the 1870s. Elevators significantly altered urban area economics. The rental value of upper-story office building floors became relatively equal to street level floors, greatly raising city center land values. After 1870 central business districts with clusters of tall buildings began to surface. The buildings contained offices, department stores, entertainment establishments, and government agencies. Administrative and financial centers evolved, anchoring corporate activities that were distributed among outlying smaller cities. By the late 1880s electric streetcars were introduced which greatly enhanced transportation. A classic American urban pattern appeared in cities of over 100,000 residents. The pattern included a central business district, immediately surrounded by slums and working class residential areas, with more prosperous suburbs further outward. By 1918 most Americans lived in urban settings, and the classic downtown era persisted through World War II (1939–1945).

In the 1890s immigration from eastern and southern Europe grew dramatically. These groups were more socially distinct than earlier immigrants from northern and western Europe. During the two world wars of the twentieth century, African American migration from the American South escalated in the cities. The various ethnic groups established distinct neighborhoods with their own commercial activities.

Urbanization led to complex socioeconomic problems following World War II. The emergence of suburbs detracted from the quality of life in city centers by relocating many jobs and desperately needed tax revenue. The population of some cities declined. The process of urbanization had largely run its course. Cities of the late twentieth century presented contrasts between complexes of office towers, convention centers, and lavish hotels, surrounded by pockets of homeless people, poorly supported schools, low income housing, and crime. A new immigration wave entered the cities, primarily from Asia, Latin America, Africa, and the Caribbean, establishing new middle class non-white neighborhoods. The combination of international corporate office buildings and multi-ethnic neighborhoods introduced a new era of American urban centers.

UTAH

Utah, like the early Massachusetts colonies, developed as a theocracy, in which church leaders controlled both spiritual and secular life. The Church of Latter-day Saints has dominated Utah's social, political, and economic life since the first Mormon pioneers traversed the desert to set up their earthly paradise in Salt Lake City. According to Utah historian Charles S. Peterson, "To the spiritual goals of salvation and world reform they added the temporal objectives of growth and survival." After much wrangling with the federal government, both the territory and (later) the state of Utah reluctantly decided to cooperate with the rest of the nation and managed to become economically successful in the social context of the United States.

Spanish and Mexican explorers were the first non-Indians to explore Utah. By the early 1800s, trade was common between the Indians of Utah and the Spanish provincial capital of Santa Fe. The main route through the old Southwest, the Spanish Trail, traversed Utah, at first bringing fur traders and later settlers bound for California. In 1847, following the death of the Church of Latter-day Saints (Mormon) leader Joseph Smith by lynching in Illinois, Brigham Young and a band of Mormon pioneers set out for Utah's Great Basin, seeking refuge from persecution in the East. Upon arrival, they established Salt Lake City and set about cultivating the arid environment by planting crops and establishing irrigation systems.

During four decades of the colonization of Utah, 450 towns and hamlets were set up, all located near a source of water, a precious commodity in the arid territory. From the beginning, the church was involved in all aspects of the settlers' lives, and all natural resources were considered communal. In the Great

Utah

State of Utah.

Basin, the church leaders undertook to create a self-sufficient economy, planning and organizing various enterprises and using an “in kind,” or barter, system to exchange goods and services. After the initial migration of U.S. Mormons, around 90,000 foreign converts arrived between 1850 and 1905.

The Treaty of Guadalupe-Hidalgo in 1848 gave the United States title to much of the land in the Southwest, and the Mormons set up a provisional state they called Deseret. Congress called it the Utah Territory; the area at that time encompassed most of Nevada and parts of Wyoming and Colorado, as well as the present state of Utah. The 46 years of territorial status were marked by a number of conflicts between Mormons and the federal government. Albert Cummings replaced Brigham Young as territorial governor in 1858, marking the beginning of a prolonged period of hostility against federal authorities.

Mormon traditions dominated the territory, since 70 percent of the population was of the Mormon faith, until 1870. Despite their desire to be self-sufficient, Mormons began to embrace economic opportunities as they presented themselves from outside the community. As president of the Church, Brigham Young had great economic as well as ecclesiastical and civic authority. He contracted with the Union Pacific Railroad in 1868 to lay part of the track in Utah. An historic day for Utah was the completion of the first transcontinental railroad, when the Central Pacific joined with the Union Pacific at Promontory Point, Utah, on May 10, 1869. New rail lines sprang up during the 1870s, making immigration to the state easier and creating a significant population growth in Salt Lake City. Agriculture dominated the economy until 1863, when silver was discovered in Bingham Canyon.

With mining of precious metals came the first influx of entrepreneurs. At first Mormons opposed mining but eventually came to see it as a natural way of developing the territory. Outside businessmen were suspicious of the Church’s pervasive influence over all aspects of Utah’s life, including the Mormons’ practice of communitarian economics. The most hostility to Mormonism, however, was over the issue of polygamy, sanctioned by the Church until 1890. Many arrests were made by federal authorities among polygamous families.

Utah became a state in 1896. Mineral production increased in the new century. The mine owned by Utah Copper at Bingham was a prime example of the potential of mineral wealth in the state. Exploiting an entire mountain of copper, the company built mills, its own

railroad, and a steam-generating plant. The considerable output of the mine, along with its gigantic open pit, was heralded as a wonder of modern industrialism. By 1930 Utah Copper was responsible for 50 percent of Salt Lake City’s assessed valuation and 13 percent of the value of the whole state. With burgeoning mineral mining also came increased union activity. After an explosion that killed 200 miners at Scofield in 1900, radical union activity became commonplace. Joe Hill, a member of the Industrial Workers of the World (nicknamed the Wobblies), was executed in 1915 for the murder of two Salt Lake City citizens.

Modern cities began to grow in the new state, along with highways, power plants, and interurban railroads. In 1920 one-half of the population lived along the Wasatch Front. Although a number of ethnic groups were coming into the state and changing its demography, the Mormon population was still at 68 percent in 1920.

Prosperity marked the business sector of Utah in the 1920s, but agriculture and mining were depressed. In the 1930s union activity increased, mostly in the coal and copper industries. The Great Depression (1929–1939) was especially hard on Utah after severe droughts in both 1931 and 1934. High freight rates also hindered manufacturing. During World War II (1939–1945), however, wartime demands for food helped Utah’s agricultural production; military installations and war-related industries brought about economic recovery.

Because of the high birthrate in Utah, the state’s population more than doubled in the time since the war, while the per capita income decreased compared to the national average. In 1995 it was just over \$18,000, ranking the state only forty-sixth in the nation. To ensure an adequate water supply for the future, in 1967 the state began work on the Central Utah Project, a dam and irrigation program which continued into the 1990s. Throughout the 1990s Utah’s economy was one of the fastest growing in the nation, and the state boasted a low unemployment rate. The state had a budget surplus in 1994 and its population grew by 16.1 percent between 1990 and 1996.

Utah’s leading industry is transport equipment manufacture, including aircraft parts and parts for missiles and rockets. A continuing source of controversy in the state is how to balance growth against the protection of the state’s beautiful natural areas. On the Wasatch Front, air pollution is a problem, and the Division of Environmental Health is particularly concerned with the dumping of dangerous materials.

Trade has replaced the government as the largest employer in Utah. The federal government is still a

Utilities Industry

major player in the state's economy, however, with around 14 percent of personal income derived from government sources. Since the government owns around 70 percent of all the land in the state and provides many jobs in the defense industry or the military, the federal presence is a rather controversial issue in the state today. Significant declines in military spending in the late 1980s and the 1990s have hurt Utah's economy. Though agriculture has declined in recent years, it is still a significant sector of the economy, with livestock and livestock products responsible for three-fourths of the agricultural income. Utah's mines are mostly noted for metal and coal extraction. In 1995 the state was the only producer of beryllium. Tourism is also a growing industry, focused on Utah's large number of national and state parks, as well as skiing, hunting, fishing, and other recreational activities. Economic development policy in the state is conservative, supporting business activities and opposing expansion of government social programs.

UTILITIES INDUSTRY

Public and private utilities provide services such as electricity, gas, telephone, water, and sewerage treatment. Most of the utilities in the United States are privately owned, but are regulated by state and federal governments because of their monopolistic nature. In recent times, however, the government oversight that was demanded by the reformers of the Progressive period in American history (1900–1920) has been undermined by the proponents of deregulation.

Perhaps the most important utility in the United States during the late twentieth century was the electric utilities industry. Electricity could be generated in power plants using fuels such as coal, fuel oil, nuclear

energy, and natural gas. The uses of electricity are seemingly endless and originate with the period of the great inventors of the nineteenth century. The electric light bulb was invented by Thomas Edison (1847–1931) in 1879, and the following year, he founded an electric power generating plant. Soon his company was challenged by George Westinghouse (1846–1914) and his United States Electric Light Company. Growth in the industry continued steadily through World War II (1939–1945). By 1951 nuclear energy was used to produce electricity, and the 1960s saw an increase in the use of nuclear reactors. These advances, however, were accompanied by occasional mishaps. A serious accident in 1979 at the Three Mile Island nuclear power plant in Pennsylvania created a credibility problem for the nuclear power industry, and new federal regulations in the 1970s focused on conservation. In the wake of escalating gasoline prices resulting from the OPEC oil embargo, alternative power sources such as water, wind, and solar energy were widely encouraged to produce electricity. Analysts predicted high output for the electric utilities in the twenty-first century, as the U.S. government was expected to continue deregulating the industry to stimulate competition and lower prices.

Coal gas (gas made from coal) was a popular source of energy until the mid-twentieth century. It is made by converting coal into combustible gases that can then be used as a fuel or as a component of chemicals and fertilizer. Coal provided the most common fuel gas for residential and commercial use for most of the nineteenth century through the 1940s, when consumers turned to cheaper natural gas.

Natural gas is primarily comprised of methane and used as fuel for homes and businesses. It was adopted as a cheap and clean fuel source. In the late nineteenth century natural gas was used for city streetlights and for cooking. In the period between World War II (1939–1945) and the 1960s, utility companies laid large grids of natural gas pipelines. The use of natural gas continued to grow during the late twentieth century, in part due to the deregulation of the industry which thereby resulted in lower prices.

Water systems are yet another important utility. Clean and healthy drinking water is among one of the most important elements in human society. Business and industry use large amounts of water to fight fires and irrigate crops. In the late twentieth century most water utilities were publicly owned. The beginnings of the modern water system in the United States date back to the late nineteenth century. As was the case with other utilities, population growth after World War II brought about an increased demand for water. Several

federal regulations during the twentieth century, such as the Safe Drinking Water Act of 1974 (amended in 1996), helped set higher standards for the water supply. Two of the most notable water utilities in the United States during the late 1990s were the American Water Works—the largest water utility owned by investors—and the Metropolitan Water District of Southern California, which provided more drinking water than any other company in the United States at that time.

Wastewater and sewer systems are yet another component of public utilities. Wastewater treatment systems are primarily public, non-profit facilities that serve a local or regional area and may handle both residential and industrial wastes. Industrial wastewater is often treated at the point where it is generated and subsequently released into natural water systems or into the nearest public facility. Many homes in the United States still use small separate facilities such as septic tanks.

Sewer systems in the United States date back to the mid-nineteenth century. The importance of sanitary treatment and disposal of sewage was underscored by the deadly cholera epidemics that periodically plagued the country from 1832 through the 1850s. By the 1870s extensive construction of sewerage treatment plants was under way. The federal government imposed regulations on this industry from the mid to late twentieth century. There was renewed interest, as well, in the privatization of this industry, with some projections indicating that there may be one private company for each public facility by the year 2020.

Another utility was born with Claude Chappe's invention of the semaphore telegraph in 1792, which paved the way for the telecommunications industry. Telexes and telegrams were used to transmit messages in only one day. They remained popular until the 1970s, when they began to be replaced by facsimile machines and, in the 1990s, by electronic mail through the Internet. By 1994 only two telegraph carriers were still in operation. Telegraph industry leader Western Union Corporation began to add more modern methods of communications to its operations in an effort to remain competitive at the end of the twentieth century.

One of the most common aspects of the industry is the telephone. This 1870s invention by Alexander Graham Bell (1847–1922) profoundly changed the cultural and material complexion of the world. Based, in part, on technology spin-offs from the defense industry, the telephone eventually freed itself of telephone wires and evolved into the two-way radiotelephone. This category eventually included cellular phones, pagers, satellite and microwave facilities, and

fiber optic lines. In the late 1990s the telecommunications industry was revolutionized by deregulation with the Telecommunications Act of 1996. While deregulation was designed to stimulate more competition, critics claimed that rather than improve service or drop rates the industry was moving in the direction of powerful monopolies.

The continued presence in some form of most of the components of the public utilities seems assured. Americans in the twenty-first century will undoubtedly continue to want all of the comforts and convenience that utilities provide. Deregulation of public utilities continued throughout the 1990s. It is, however, unclear whether this strategy will result in the positive outcomes of greater competition, cheaper prices, and environmentally safe management of our natural resources.

UTOPIA

In the Greek language, “utopia” means: “no place,” suggesting that utopia is never to be found on earth; that it is instead an eternally-empty ideal, or dream. In 1516, the famous English philosopher, Sir Thomas More, wrote extensively about utopia, where he depicted an ‘ideal state’ that has since given its name (Utopia) to all such later romantic visions of an ideal country, or a “heaven on earth” society. Typically, people who are known as Utopian writers criticize the present conditions of the world and outline vast revolutionary schemes without describing the concrete, specific steps necessary to achieve them. Some famous philosophers who were regarded as Utopian include Plato, who constructed an ideal society in his *Republic*, as well as Campanella, Bacon, and Rousseau. During the nineteenth century, Utopian thinking began to be taken more seriously, as technological advances associated with industrialization caused many people to believe that a Utopian world could be achieved with the help of technology and with a scientific system of economics. In particular, Engels, Saint-Simon, Fourier, Proudhon, and other nineteenth-century socialist philosophers began to write extensively about creating Utopian socialist communities. Utopian experiments were actually tried, both in the United States and in Europe, but they were all short-lived, and all failed. In the twentieth century, most people became more cynical about the prospects for Utopian societies, and at least two major satiric anti-Utopian books were written: Aldous Huxley’s *Brave New World*, and George Orwell’s *1984*.

UTOPIAN COMMUNITIES, COMMUNES (ISSUE)

During the seventeenth, eighteenth, and nineteenth centuries numerous European and American idealists sought to create examples of the perfect society in which everyone would benefit and there would be no conflict. Most of these experiments were set up in America where it was believed they would be relatively free from interference or persecution. That hope sometimes proved to be unfounded, but nevertheless many such communities did indeed experience a remarkable level of success and survived for many years.

There were two types of communitarian societies: sectarian and secular. The former were based upon a philosophy that was essentially religious, and the latter were not. Aside from religion, however, the two types

This couple chose to “drop out” of society and seek Utopia in commune life. Although often associated with the 1960s, the search for Utopia, via the commune system began in the United States as early as 1663.

shared many characteristics. They were usually small with seldom more than a few hundred people in a community. They all had charismatic leaders who were often very able, they all had developed some method of acquiring and maintaining land, they all developed some means of governing gender relations—ranging from celibacy to “communal marriage”—and they all developed a workable means of making a living for their members.

The history of communitarian societies in America began in 1663 with the arrival of a group of Dutch Mennonites in Delaware. This settlement was destroyed when the British conquered New Netherlands in 1664. There was no similar attempt for several years until 1683 when settlers came to Maryland who were followers of Jean de Labadie, a German perfectionist thinker. Their community lasted for about twenty years before internal dissension caused it to split up and decline.

The first communal experiment to survive for a considerable period of time was founded by Johann Conrad Beissel, a German who had migrated to America in 1720. In 1732 Beissel founded a settlement in Pennsylvania which he called Ephrata. This community prospered until Beissel’s death in 1768. After that it

went into a period of decline until 1814 when the few remaining residents incorporated as the Seventh Day German Baptist Church which survived until 1934.

It was not until 1774 that an English-speaking group arrived who would exert significant influence on American society at large. These were the followers of “Mother” Ann Lee, who were commonly known as “The Shakers.” This designation was assigned to them because of their habit of dancing during their religious services. “Mother” Ann and her people came from Manchester, England, and settled in upstate New York. Although “Mother” Ann died in 1784, the community survived under the able leadership of her American successors. They established their first fully communal town in Columbia County, New York, in 1787. From there they went on to establish twenty-two villages in seven states, continuing to expand until 1836. They were very good at attracting converts and, in fact, relied upon these skills for their survival because one tenet of their philosophy was strict adherence to celibacy. Their villages usually had an economy based on agriculture.

There was a surge in the appearance of communal societies in the early nineteenth century. By that time American nationalism had begun to develop; along with it came a growing interest in social reform. There was a widespread belief between 1820 and 1850 that American society could be improved or perfected in many ways. Thus the idea of perfectionist communities fit in very well with currently prevailing attitudes.

One of the first societies to develop in this era was headed by “Father” George Rapp who founded a community near Pittsburgh in 1804. He preached that the Second Coming of Christ was near and attracted many followers who believed that life in his community would prepare them for the millennial event. In 1814, the “Rappites” moved to Indiana where they remained for ten years. Then they returned to Pennsylvania and established a village (named Economy) near the site of their original community. They built woolen and cotton mills and a sawmill; they grew fruit, made wine, and produced silk. They were very successful and their community continued to operate at Economy until well into the 20th century.

Another perfectionist leader of this period was Robert Owen. Owen was a self-made businessman and for twenty-five years (1800–1825) was manager of New Lanark Mills, one of Scotland’s largest cotton-spinning mills. During his career Owen became convinced that reforms in the factory system that would improve the standard of living of the workers were vital. He came to believe that improvements in human

living conditions would lead to improved results in business. Eventually, he rejected the free enterprise philosophy entirely and adopted a pre-Marxian form of socialism. He called his idea the “New Moral World.” In it everything would be accomplished by means of cooperation rather than competition. By 1824, he had decided to transform his dream into reality in America.

Owen purchased the Rappite property in Indiana for \$150,000, renamed it New Harmony, and began his experiment in 1825. He did not have to start from scratch because the Rappites left him a ready-made community complete with houses, mills, shops, churches, factories, vineyards, and orchards.

Owen’s idea was that New Harmony would be a fully communal society. There would be no private property, everyone would receive “credit” for their production, and all necessities would be supplied by the communal store. Unfortunately, the experiment did not work. The system was not well organized or managed, production lagged, there was no unity, morale collapsed, and by 1827, the experiment was over. Owen abandoned New Harmony and returned to England. It would be more than ten years before another experiment of this type was attempted.

Beginning in the 1840s new communal experiments began in America. These were based on the ideas of the French Socialist Charles Fourier as translated into English by his disciple Albert Brisbane. Many of Fourier’s ideas were similar to those of Robert Owen. He declared that concern and cooperation were the secrets of social success. He argued that a cooperative society would lead to an immense increase in production. The fruits of all labor would be divided among all workers according to the contribution of each worker. Like Owen, Fourier believed that communities should be small and well-planned in all aspects. He called his ideal community a “phalanx.”

Beginning in 1841, through 1848, there were 28 Fourierite phalanxes attempted in America. The first and most famous was Brook Farm in Suffolk County, Massachusetts. A number of famous Americans, including the author, Nathaniel Hawthorne, participated in this experiment which lasted until 1847. Other Fourier phalanxes were formed in New York, Pennsylvania, New Jersey, Indiana, Ohio, Michigan, Wisconsin, Illinois, and Texas. All but three were founded between 1841 and 1847, the period during which Brook Farm operated; most of them (thirteen) originated in 1844.

One of the most interesting and successful of the communitarian experiments in America was John Humphrey Noyes’ Oneida Community. In 1834 Noyes

Utopian Communities, Communes (Issue)

announced that he had attained a state of perfection and was incapable of sin. He then formed the Perfectionist Church in Putney, Vermont, where he and his followers held all things, including marriage partners, in common. Such radical ideas caused the local authorities to charge Noyes with adultery whereupon he and his congregation fled to New York.

Noyes purchased forty acres of land near the town of Oneida in upstate New York where he began to build a Perfectionist Society. Not only were all things held in common, including marriage partners, but the group practiced “scientific reproduction,” which Noyes called “stripiculture.” This meant that partners who were “morally perfect” were selected to produce children who would inherit their parents’ moral characteristics. The community would then educate the children and this process would eventually lead to the emergence of a superior class of people.

For several years the community made a successful living growing fruit, but later they added business and manufacturing to their activities and eventually began to concentrate on silverware. The community was well-planned, well-organized, and well-administered, and it prospered. People in surrounding communities, however, did not approve of the Oneida lifestyle. Threatened with legal action in 1879, for immorality, Noyes fled to Canada, and the colony soon broke up. It was converted to a joint stock company in 1881, and continued the successful manufacturing of silverware.

In the late nineteenth century the idea of perfecting society through the operation of small, socialized communities gave way to the idea of individual growth and development within a democratic system. Hence interest in communitarianism declined, but that society is capable of improvement was an idea that never died.

VANDERBILT, CORNELIUS

Cornelius “Commodore” Vanderbilt (1794–1877) was a shrewd businessman in the transportation industry. He built his fortune through freight and passenger boating lines, and later expanded to railroads. He was such a fierce and successful businessman that his competitors often paid him to vacate their markets. Vanderbilt left an estate of almost \$100 million and founded Vanderbilt University.

Cornelius Vanderbilt was born on May 27, 1794, on Staten Island, New York. His father worked in boating, and Vanderbilt quit school at age 11 to join his father, working odd jobs on the waterfront. By the age of 16 young Vanderbilt was determined to become his own boatman. His choice of careers earned him the nickname “Commodore.” To finance his new career, Vanderbilt struck a deal with his mother. If he would plow and sow an uncultivated eight-acre field, his mother would loan him \$100 to buy a boat. Vanderbilt earned the money and began a transport and freight service between New York City and Staten Island. Charging 18 cents a trip, Vanderbilt was able to repay the \$100 loan in a year and earned an additional \$1000 in profits.

Vanderbilt quickly developed a reputation for being capable, reliable, and honest. He charged reasonable prices and worked tirelessly. With the War of 1812 (1812–1814) he was given a chance to expand his enterprise. When the British threatened to invade New York, Vanderbilt arranged a three-month government contract to supply the island forts around New York. This profitable venture gave him enough money to buy a schooner that traveled over Long Island Sound and two more boats to engage in coastal trade. By the age of 24 Vanderbilt had saved \$9000 and owned interests in several periaugers (a small two-masted, flat-bottomed vessel) and coasting schooners.

Vanderbilt was wise enough to recognize that steam was revolutionizing water transportation. The successes of steamboat inventors Robert Fulton and

Cornelius Vanderbilt.

Robert R. Livingston persuaded Vanderbilt to sell all of his boating interests in 1818 and turn his attention to steamboats. Vanderbilt went to work for Thomas Gibbons, who owned one steamboat and operated a ferry between New Brunswick, New Jersey, and New York City. Vanderbilt started off working for \$60 a month. In the 11 years that Vanderbilt worked for Gibbons, the line grew from one 25-ton steamboat to seven 200-ton boats. By 1828 Vanderbilt had saved more than \$30,000.

A year later Vanderbilt moved his family to Manhattan, New York, and went into business for himself. He bought one of Gibbons’ older steamboats and opened his own line running from New York to Philadelphia, Pennsylvania. He quickly slashed rates and

Vaudeville

sent his competitors into a panic. They responded by paying Vanderbilt generously not to run a line on their route. Vanderbilt then opened a line from New York to Peekskill, New York, and ran into competition from businessman Daniel Drew (1797–1879). Vanderbilt once again cut his rates immediately to increase business. When Drew followed suit, Vanderbilt purchased Drew's boat to eliminate the competition.

Vanderbilt's next venture was the New York-Albany route that brought him in direct competition with the powerful Hudson River Steamboat Association. Vanderbilt's line was so successful that once again he was paid off handsomely to not operate on that route. Vanderbilt quickly developed a successful business strategy: cut rates, drive away the competition or sell out, and then raise rates again. This approach was so successful that by the time he was 40, Vanderbilt was worth over \$500,000 and operated over 1000 steamboats.

The Gold Rush of 1849 in California opened up new business possibilities for Vanderbilt. Most adventurers were traveling to California through Panama, but Vanderbilt opened a quicker and cheaper route through Nicaragua. The venture was a success and Vanderbilt's line carried 2000 passengers per month for nine years and made over \$1 million in profits each year.

I HAVE BEEN INSANE ON THE SUBJECT OF MONEYMAKING ALL MY LIFE.

Cornelius Vanderbilt

In 1853 Vanderbilt took a small break from business. He commissioned a 270-foot steam yacht, the *North Star*, and set off for Europe with his family. He sold his controlling interest in the Nicaraguan line to his partners, Charles Morgan and Cornelius K. Garrison, who were supposed to pay Vanderbilt 20 percent of the gross receipts while he was away. The partners, however, refused to pay him. Rather than take them to court, Vanderbilt determined to ruin them financially. When he returned from his trip, he organized a new line to California via Panama and slashed his prices to only \$35. He had driven Morgan and Garrison out of business by 1857. Vanderbilt then terminated the service when two Panamanian steamship lines agreed to pay him not to run that route.

Despite his successes in shipping, Vanderbilt was always looking for new business opportunities. At the age of 70 he became interested in the railroads. In 1857 Vanderbilt purchased a controlling interest in the Harlem Railroad, followed by the Hudson River Railroad in

1865, and New York Central in 1867. He then consolidated his holdings into one system that extended from New York City to Buffalo, New York. Vanderbilt tried to acquire the Erie Railroad from his old steamboat adversary, Daniel Drew, but failed. He did purchase several other lines and extended his service to Chicago, Illinois. By 1877 the New York Central Railroad System covered more than 4,500 miles.

Through his various business ventures Vanderbilt accumulated over \$100 million. He was not known for philanthropy until his final years, when he donated \$50,000 to the Church of the Strangers and \$1 million to Central University, which then became Vanderbilt University. "The Commodore" died on January 4, 1877.

VAUDEVILLE

Vaudeville, a light, comical theatrical entertainment, flourished at the end of the nineteenth century and beginning of the twentieth century. Its success, like that of organized baseball, was caused by the greater amounts of leisure time and money that industrialization afforded people. The word vaudeville is derived from an old French term for a satirical song, *vaudevire*, which is a reference to the Vire valley of France, where the songs originated. In the United States vaudeville acts performed variety shows, using music, comedy, dance, acrobatics, magic, puppets, and even trained animals. This form of stage entertainment was based on popular acts that could be seen in British music halls and bar rooms during the nineteenth century.

Vaudeville had made its way to the United States in the 1870s, when acts were performed in theaters in New York, Chicago, and other cities. Two early entrepreneurs in the entertainment form were American theater managers Benjamin Keith (1846–1914) and Edward Albee (1857–1930), who opened the Bijou Theatre in Boston in 1885. Eventually they operated almost four hundred theaters, including New York City's Palace Theater, the gem in the Keith-Albee crown. Troupes traveled the circuit of nearly one thousand theaters around the country. As many as two million U.S. citizens a day flocked to the shows to see headliners such as comedians Eddie Cantor (1892–1964) and W.C. Fields (1880–1946), singer Eva Tanguay (1878–1947), and French actress Sarah Bernhardt (1844–1923). Programs combined a variety of music, theater, and comedy to appeal to a wide audience. Scriptwriters attracted immigrant audiences by using ethnic humor, exaggerating dialects, and joking about the difficulties of daily immigrant life in the United States.

DURING THE FIRST TWO DECADES OF THE TWENTIETH CENTURY, VAUDEVILLE WAS THE MOST POPULAR FORM OF ENTERTAINMENT IN THE COUNTRY.

During the first two decades of the twentieth century, vaudeville was the most popular form of entertainment in the country. In the 1930s, just as New York opened the doors of its famous Radio City Music Hall, which was intended to be a theater for vaudeville, the entertainment form began a quick decline. Motion pictures, radio, and, later, television took its place; numerous vaudeville performers parlayed their success into these new media. Among those entertainers who had their origins in vaudeville acts were Rudolph Valentino, Cary Grant, Mae West, Jack Benny, George Burns, Gracie Allen, Ginger Rogers, Fred Astaire, Will Rogers, and Al Jolsen.

VEBLLEN, THORSTEIN BONDE

Thorstein Veblen (1857–1929) had become widely known in the United States as the author of a book, *The Theory of the Leisure Class*, published in 1899. The book was an unexpected sensation. It remains as one of the most pungently written analyses of modern economics; it may be read as a satire on the ways of the aristocratic class, the follies and foibles of the robber barons and the rich. Veblen's analysis of modern

commerce and economics did not include the traditional interplay of rationally calculated "self-interest." Instead Veblen wrote of U.S. economic life as would an anthropologist. He regarded most economic activity, and specifically the accumulation of money, as a lavish modern-day counterpart of scalps hanging on a tribal tree. Veblen believed that the accumulation of wealth, well beyond the point of rational wants and needs, was evidence of deep-buried irrationalities. Veblen's second book, *The Theory of Business Enterprise*, published in 1904, was even more devastating than the first one, declaring that businessmen were needless saboteurs of any reasonable modern economic system. He made a credible case for the abolition of most businesses and of most government bureaucrats. He also made the first serious examination of the possibilities of using technology on all levels to establish within an economic system the conditions of freedom, security, and dignity for society as a whole.

Thorstein Bunde Veblen was born on July 30, 1857 in Manitowoc, Wisconsin. He was the sixth of 12 children born to Thomas and Kari Veblen, Norwegian immigrants who had settled in Minnesota, purchased a farm, and developed the farm with minimal contact with the outside community. Veblen's talent was already apparent in his early age, and his behavior was rather eccentric. His father enrolled him at a local college, Carleton College, hoping he might become a minister. Veblen graduated from Carleton in 1880 and went east to Yale University, where he studied philosophy. In three years he had his doctorate in philosophy, but his reputation as an eccentric inhibited his employment opportunities at universities where he applied for work. He ended up back at his parent's residence in Minnesota, where he eventually married. Veblen left Minnesota to live with his wealthy wife in Iowa for a time; he did little but reading until deciding to study economics at Cornell University in 1891.

A year after his study at Cornell, he was hired on to the staff at the University of Chicago. Veblen was a tutor and instructor at Chicago from 1892 to 1906. It was during this time that he published his books, *The Theory of the Leisure Class* and *The Theory of Business Enterprise*, which brought him much personal fame as an economic analyst. In his writing, Veblen put his finger on a central process of change that had been strangely overlooked by the investigations of other economists. The process was the emergence of technology and science as the major force of historic change. Veblen saw clearly, and uniquely, that the machine was the primary fact of economic life in the twentieth century.

Vermont

Two major elements emerged out of Veblen's analysis and criticism: First, the importance of technology as the backbone of all commerce in the twentieth century. Second, that "economic man" can best be understood not by so-called economic laws but by looking at the irrational, untutored, and ritualistic behaviors of human beings while engaged in economic activity.

Veblen's view of businessmen in the twentieth century was like no other economist's. He saw the typical businessman as a predator draped in weird luxuries. Veblen introduced his famous phrase, "conspicuous consumption," to argue that the rich were not happy being rich and comfortable, but rather felt the urge to spend their lives buying wildly expensive and (frequently) bizarre things in order to indirectly brag to others about how wealthy they were. Their "consumption," Veblen contended, was irrationally raised to the level of being "conspicuous" to others: the purchase of 50 automobiles, for instance, or ten homes, and the conspicuous wearing of large items of gold and diamond jewelry.

Veblen was neither a socialist nor a capitalist; he seemed without economic ideology. He instead saw most economic behavior as psychological, often psychopathological. He concluded that businessmen were parasites and therefore unnecessary in a technological world which was capable of making consumer goods. He concluded that a class of engineers could take over the chaos of the business system and distribute to society the wealth created by machines and technology. It was an astonishing world-view for the first decade of the twentieth century, and his thinking along these lines has continued to resonate in economic thought.

Veblen lived to the age of 73. He died in 1929, just before the Great Depression (1929–1939) began. Veblen had a quiet, alienated, and profound vision for economists. He raised crucial questions related to the behavior of the economic man. In running down the robber barons of his era, as well as other businessmen, and in seeing the impact of technology as the major source of economic change in the modern era, Veblen arguably presented to his peers and to the public some of the most revolutionary modern thinking on the subject of business and commerce activities. Though his work was often idolized, his personal life was a lonely one. He lived his last years in an isolated cabin in California.

VERMONT

The state of Vermont has retained its rural character throughout the history of a nation that has become increasingly urbanized and industrialized. Its quaint, natural beauty continues to attract thousands of tourists and summer residents who add greatly to the state's economy. Yet its manufacturing enterprises that make up over 50 percent of the state's revenues. Vermont has maintained its ties to the past, but has kept pace with the present.

The first European explorer of Vermont was Samuel de Champlain (1567–1635), who, in 1609, crossed the lake that now bears his name. From around 1650 through the 1760s, French, Dutch, English, and Iroquois Indians crossed Vermont, using trails between Montreal, Massachusetts, and New York. The first permanent settlement in the region was not established until 1724. For several decades both New York and New Hampshire claimed Vermont. Ethan Allen, a hero in the American Revolution (1775–1783), led a group that protested New York's claims. During the Revolution, Vermont adopted its own constitution and formed an independent republic; it was admitted to the Union in 1791.

Just before the War of 1812 (1812–1814) Vermonters engaged in smuggling to avoid the Embargo of 1808. The state continued trading with Canada during the war despite prohibitions on trade with Great Britain. By 1810 Vermont's population had reached 220,000, with most of the new settlers engaged in self-sufficient farming. After 1820, however, many began moving to the virgin lands of western New York, the Ohio Valley, and the trans-Mississippi region, which depleted Vermont's population. Despite an economic boost from newly built railroads, Vermont had simply run out of arable land and had overworked the available land. Vermont also had an insufficient number of manufacturing jobs, partly because the British had

State of Vermont.

Vermont

flooded the markets with cheaply produced cloth after the War of 1812.

VERMONT IS PART OF THE MODERN WORLD DESPITE ITS RURAL LANDSCAPE AND THE CURRIER AND IVES IMAGERY PROJECTED FROM THE GARISH SIDES OF MAPLE SYRUP TINS.

Charles D. Morrissey, *Vermont: A Bicentennial History*, 1981

The construction of the Champlain-Hudson Canal in 1823 and the railroads that were built in Vermont during the 1840s and 1850s did little to improve the state's economy, making it more vulnerable to competition from western territories. As emigration increased, however, those farmers remaining in the state were able to increase their prices for wool, butter, cheese, and milk. Irish and French-Canadian immigrants added to the population, and some light industry helped the economy to grow. By the late nineteenth century the well-known Vermont marble and granite quarries were being constructed, and the tourist industry began its steady rise into the twentieth century.

Vermonters seemed largely distant from many of the political and economic trends that gripped the nation after the American Civil War (1861–1865). They did not respond to the “free silver” message of presidential candidate William Jennings Bryan (1860–1925), nor to the Progressivism of the 1920s. The only U.S. President from Vermont, Calvin Coolidge (1923–1929), espoused rural conservatism. Though industrial growth occurred in towns such as Springfield, which manufactured the rifles named after the town; St. Johnsbury, where the famous St. Johnsbury scales were produced; Burlington, which boasted a number of textile mills; and quarry towns like Barre, Vermont remained primarily rural in character. In the early 1920s Vermont had the dubious honor of having more cows than people (a ratio which persisted until 1963).

The state was more forward-looking, however, in its approach to what would become a thriving tourist industry. Vermont established the first state publicity service in the nation. By 1911 it had produced its first publication, *Vermont, Designed by the Creator for the Playground of the Continent*. The state had recognized that its natural beauty was attracting many vacationers to its lakes, mountains, and, by the 1930s and 1940s, its ski resorts.

After World War II (1939–1945) both vacationers and second-home buyers flocked to Vermont over

improved highways. A more suburban outlook began to pervade the state as professional people from New York and Massachusetts settled in the state. Native Vermonters wrestled with how to hold onto their rural heritage and, at the same time, embrace the economic benefits brought by the newcomers. A number of soil and water conservation measures were enacted by the state legislature, along with anti-litter and anti-billboard regulations.

Although manufacturing is the economic lifeblood of the state, Vermont remains the nation's most rural state, with two-thirds of its population living in towns of 2,500 or fewer. In the words of historian Charles T. Morrissey, “Vermont is not where Chicago or Pittsburgh or Detroit or other large cities grew. It is not where stockyards and slaughterhouses spread along the railroad tracks, or steel mills darkened the skies with smoke. . . . Vermont has been apart from the American mainstream.” Modern Vermont's primary agricultural products are livestock and dairy products, followed by corn, hay, and apples. The state is also the nation's leading producer of maple syrup.

Mining is another profitable sector of Vermont's economy. It quarries granite and slate, is home to the world's largest marble reserve, and produces crushed stone, construction sand, and gravel. Dimension stone is the state's leading mineral commodity, making up slightly less than 50 percent of the state's total mineral production value. While these rural enterprises are important to the state, employment in recent decades has increased the most in manufacturing including such products as: electronics and machine parts. However, construction, wholesale and retail trade, and other service industries have also thrived. The state's per capita income in the mid-1990s was just over \$22,000, which ranked thirtieth in the nation.

VIETNAM WAR

The Vietnam War (1964–1975) was an eleven-year conflict in Southeast Asia between the American-backed government of South Vietnam and the Communist government of North Vietnam. The North Vietnamese sought to reunify the country following its partition in 1954, while the United States sought to contain Communist expansion by providing South Vietnam with economic and military aid. U.S. involvement reached its peak in 1968–1969, when over five hundred thousand U.S. troops were on the ground. The Pentagon spent \$77.8 billion to finance the war. Approximately 58,000 U.S. citizens and over three million Vietnamese were killed during the conflict. Two years after the United States withdrew in 1973, North Vietnamese forces defeated the South Vietnamese and reunified the country.

Vietnam entered the twentieth century as a French colony. During World War II (1939–1945) the French evacuated the colony and the Japanese occupied it. An indigenous nationalist resistance movement to the Japanese invaders sprang up under the leadership of Ho Chi Minh (1892–1969). Ho Chi Minh was a member of both the Vietnamese and the French Communist Parties and the preeminent leader of national self-determination in Vietnam. When the Japanese were defeated in 1945 the French returned to Vietnam and tried to reestablish their colonial authority. For 56 days, the nationalist Vietnamese military force (called the *Viet Minh*, besieged the French fort at Dien Bien Phu where several thousand French troops were trapped. The French surrender led to peace talks in Geneva, Switzerland in 1954. The treaty required withdrawal of all French troops from Vietnam and a temporary partition of the country at the 17th parallel, with Communists retreating to the north and non-Communists moving to the south. National elections to unify Vietnam were scheduled for 1956.

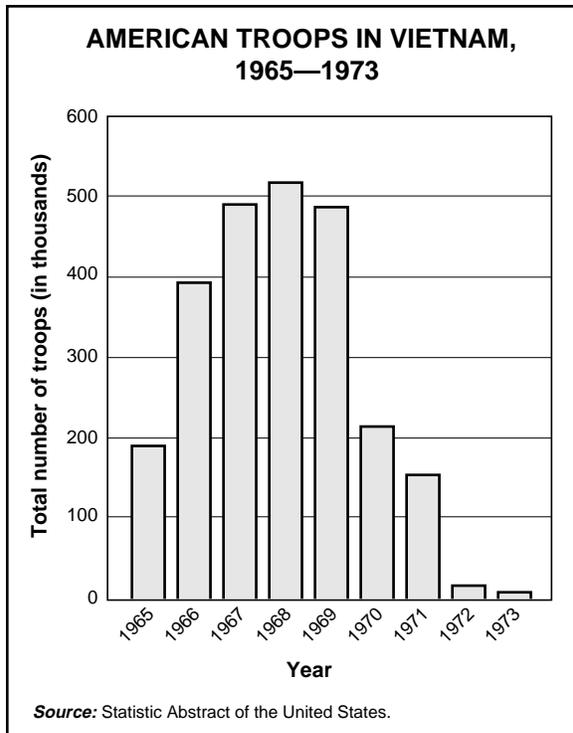

U.S. President Dwight D. Eisenhower (1953–1961) feared that in a national election Ho Chi Minh would defeat the American-supported president of South Vietnam, Ngo Dinh Diem (1955–1963). As a result, elections were held only in South Vietnam. But the elections were rigged and Diem won an overwhelming majority of the vote, declared his country's independence from North Vietnam, and named Saigon as its capital. The decision whether to support Diem was a difficult one for U.S. policymakers. On one hand the United States was concerned that without U.S. support, the South Vietnam government would collapse and fall to the Communists. On the other hand

The 1954 treaty that ended French colonial control divided the country of Vietnam at the 17th parallel. The Communist government of North Vietnam waged war with the Southern, non-Communist government in order to unite the country. U.S. involvement came in an attempt to contain this Communist expansion.

President Eisenhower harbored reservations about getting U.S. troops mired in another Asian conflict so soon after the Korean War (1950–1953).

Diem's actions in office raised further concerns. His anti-Communist sympathies manifested themselves in harsh policies that alienated peasants and villagers. Diem, a Catholic, discriminated against Buddhists even though the Catholics made up only a small minority of the population that had played subordinate roles during the period of French colonialism. Opposition to Diem became widespread and in 1963 he was assassinated by elements in the Army. Diem's death was followed by ten successive South Vietnamese governments in 18 months.

The total number of U.S. combat troops in Vietnam steadily increased until 1968, there was a significant withdrawal beginning in 1970 until 1973.

Taking advantage of this upheaval, the nationalist guerilla forces in South Vietnam (called the People's Liberation Armed Forces (PLAF) or, colloquially, the "Viet Cong") emerged under the political leadership of the National Liberation Front. The NLF was an organization of broad nationalist forces, led by the Communist Party of Vietnam. Their goal was the reunification of North and South Vietnam.

The United States responded to these developments by increasing the number of U.S. military, economic, and political advisers in Vietnam from 800 in 1961, when President John F. Kennedy took office, to 16,700 in 1963. During the 1964 presidential race Republican candidate Barry Goldwater charged President Lyndon B. Johnson (1963–1969), who took office following Kennedy's assassination, with not doing enough to win the war. Goldwater stated that Johnson would be responsible if Vietnam and its neighboring countries toppled like dominoes into the lap of the Communists.

Despite Goldwater's defeat, President Johnson was determined to not allow the so-called "domino theory" to become a reality. In August, 1964, U.S. ships off the coast of North Vietnam, in the Gulf of Tonkin, reported sonar indications of a torpedo attack.

In response, Johnson ordered an air attack on North-Vietnamese ship bases and oil facilities. The next day the Senate granted the president's request for broad powers over the Southeast Asian conflict by passing the Gulf of Tonkin Resolution. The resolution gave the president authority to take all measures necessary to repel any further armed aggression against U.S. forces in the area.

Johnson relied on this "blank check" to commit the first U.S. combat troops to Vietnam on March 8, 1965. By the end of the year the initial commitment of 3,500 troops had increased to 80,000. These combat troops fought alongside the South Vietnamese armed forces, known as the Army of the Republic of Vietnam (ARVN). The ARVN was a poorly led group that lacked cohesion and motivation. In 1965 alone 113,000 ARVN troops were lost to desertion. Many U.S. soldiers disliked and mistrusted the ARVN and accused them of cowardice.

As the war dragged on in Vietnam, the anti-war movement picked up at home. Promises of victory by politicians and military commanders wore thin on an U.S. public confronted nightly by television images of bloody battles that accompanied mounting casualties. The credibility of U.S. government reports predicting imminent U.S. victory was further eroded by the 1968 Tet Offensive, an all-out assault on every major city in South Vietnam. The NLF forces suffered staggering losses during their offensive and made few strategic gains. The Viet Cong were virtually wiped out. But, though Tet was a military catastrophe for the NLF, it was a political victory. It took both U.S. and ARVN forces by surprise and had a resounding effect on the U.S. public.

The war had reached a stalemate and the Tet Offensive forced U.S. citizens to confront how deeply Communist resistance was entrenched throughout Vietnam. In 1969 opinion polls showed that for the first time in the war, a majority of respondents were opposed to the war. But, even though the war was becoming unpopular, most people were reluctant to pull out of Vietnam immediately. For a time, the American people were still willing to stand by the President in the struggle against Communism. Only between 20 and 40 percent of U.S. citizens polled in 1969 favored immediate withdrawal. But the protests were becoming larger and more frequent. And one-by-one, mainstream organizations and politicians began demanding peace in Vietnam. Inflation and higher taxes resulting from the war soured still other segments of society. It was no surprise that upon taking the oath of office in January, 1969, President Richard Nixon (1969–1974) promised to end the war with honor. But

before he ended the war, President Nixon and his Secretary of State, Henry Kissinger, widened it.

In March of 1969 President Nixon ordered the secret bombing of Cambodia. His goal was to wipe out North Vietnamese and NLF bases along the South Vietnam border. The “Ho Chi Minh trail” went through this area, carrying provisions and troop convoys of the North Vietnamese Army (NVA). When U.S. troops invaded Cambodia the following year, college campuses erupted in protest. Four students at Kent State University in Ohio were killed by national guardsmen who had been called in to prevent rioting. Student protests were staged again in 1971 when the United States provided air support for an ARVN invasion of Laos and in 1972 when the United States began mining the Haiphong harbor. Nixon contended that these operations strengthened his hand at the bargaining table. He pointed to his program of “Vietnamizing” the war, which had reduced the number of U.S. troops in Southeast Asia to under 100,000 by 1972 and gave the South Vietnamese greater control of day-to-day tactical operations. In any event, during Christmas of 1972 the president ordered the final and most intense bombing of the war over Hanoi, the capital of North Vietnam.

On January 27, 1973, U.S. participation in the Vietnam War officially ended when the Treaty of Paris was signed by each of the parties to the conflict. The United States agreed to withdraw all of its forces from Vietnam and stop military operations in Laos and Cambodia. North and South Vietnam agreed to a cease-fire and all prisoners of war were to be released. U.S. military and economic aid to South Vietnam could continue.

Following the collapse of the South Vietnamese regime in 1975, the unified country of Vietnam collectivized the colonial rubber plantations, and some businesses were nationalized. Within ten years, however, elements of capitalism had crept into Vietnamese society. By the 1990s the Vietnam government began instituting policies to bring about a mixed economy involving state, collective, and private ownership. The opening of Vietnamese society improved relations with the United States, which ended a 20-year trade embargo against Vietnam in 1994. Full diplomatic relations between the two countries were established the next year.

VIRGINIA

Virginia, home of presidents and cradle of American tradition, has a special place in the consciousness of the nation. Its economic history is perhaps less well-known than its political history. Supported, at first, by slave-owning plantations, the state depended for many years on tobacco and cotton crops. After the devastation brought about by the American Civil War (1861–1865), Virginia rebuilt its economy, adding industry to its agricultural base. Modern Virginia contains a healthy mix of farming, industrial, and service employment.

Virginia has claim to being the first permanent English settlement in America. The colonists who established Jamestown in 1607 named their colony Virginia in honor of the “Virgin Queen,” Elizabeth I. The London Company, a joint-stock venture sponsored by King James I, claimed nearly all of the eastern coast of America, a great deal more land than now encompasses Virginia. Many in this expedition were gentlemen who had no clear idea of how to survive in the wilderness. Captain John Smith finally took matters into his own hands, declaring, “He that will not work neither shall he eat.” As journalist Alistair Cooke wrote in his book, *Alistair Cooke's America*, this statement was “rooted . . . early and deep in the American consciousness.” The colony weathered times of starvation, attacks by Indians, and the deaths of many people, but it somehow survived and even established its own form of representative government. After James I revoked the London Company's charter in 1624, Virginia became a royal colony.

The colony continued to grow along the James, York, Rappahannock, and Potomac rivers. It depended largely on the growing of tobacco (and later of cotton) with the help of indentured servants, both white and

State of Virginia.

black. It is thought that the institution of slavery developed from the first black servants sent to Virginia. As eastern Virginians moved into the western part of the country, they began to lose much of their loyalty toward England, especially during the French and Indian War. The Virginia House of Burgesses engaged in repeated protests against British policy, which culminated in a boycott of British goods in response to the Townshend Acts. Virginia was the first colony to begin the move for independence from England in 1776 and it was a major player in the American Revolution (1775–1783). Virginia was so influential in this period that Virginians occupied the U.S. presidency for all but four of the nation’s first 28 years.

In the early nineteenth century Virginia’s influence began to decline. The eastern half of the state disputed constantly with the western half (later, the state of West Virginia), as eastern aristocrats held most of the political and economic power. Life all over the state remained largely rural and self-sufficient while roads were poor and mail delivery slow. Cities which

did grow in the state, like Richmond and Norfolk, grew less rapidly than cities in other parts of the country.

By the mid-nineteenth century Virginia was entering another period of prosperity. The Valley Turnpike, completed in 1840, made transportation through the Shenandoah Valley easier. Agricultural experimentalists like Edmund Ruffin used new scientific methods to revitalize agricultural land worn out by years of tobacco farming. Land values rose with crop diversification, livestock production, and the use of new machinery. Industrial development was beginning too, as railroads began to form in a network across the state.

HE THAT WILL NOT WORK NEITHER SHALL HE EAT.

Captain John Smith, Jamestown Settlement

Closely tied to the economy of Virginia, especially on the eastern plantations, was the issue of slavery. In the 1830s the state was a major purveyor of the slave trade. Thus the growing antislavery movements of the

1850s were quite threatening to many Virginians. John Brown's raid on Harper's Ferry (then in Virginia) was a wake-up call to the state, which in the end reluctantly seceded from the Union in 1861.

As the main battlefield during the American Civil War (1861–1865), much of Virginia's countryside, as well as the city of Richmond, was left in ruins when the hostilities ended. The state also lost about half its territory when West Virginia seceded in 1863 to side with the North. A postwar debt of more than \$45 million and corrupt Reconstruction leadership left Virginia in turmoil. After Reconstruction wealthy planters lost some of their political power. According to Louis D. Rubin, Jr., "Landed wealth, which had previously constituted a sufficient economic foundation for most Virginians, no longer sufficed." New leaders were rather "men who saw opportunity for themselves and their community in business, industrial development, railroading, [and] finance. . . ." This period was marked by significant expansion of railroads in the state, the most powerful being the Pennsylvania Central.

The state expanded greatly during this time, as suburbs of cities like Norfolk and Richmond developed and other towns like Hampton Roads and Roanoke grew rapidly due to their access to coal routes. Real estate boomed and manufacturing and mining companies sprang up. In 1893, however, a nationwide financial panic gripped the state. Small farmers in particular were devastated, with cash and credit in short supply. Blacks in the state were even worse off, lacking education and living with the legacy of slavery. In 1901 a state constitutional convention moved to eliminate black voting privileges, which had been in force since Reconstruction, thus reinforcing the continued segregation of society.

Conservative Democrats seemed destined to control the state after the turn of the century. In 1925, however, Harry Byrd, a liberal Democrat, won the governorship and embarked on an era of reform. During his tenure the state tax system was revised, along with a number of social reforms, and measures were taken to attract industry to the state.

After the Great Depression (1929–1939), Virginia entered a new era of prosperity, benefiting from defense contracts, manufacturing, and a growing tourist industry. Notable among the state's tourist attractions were the newly restored colonial capital city of Williamsburg and historic sites such as Jamestown, Monticello, and Civil War battlefields. Franklin D. Roosevelt's (1933–1945) New Deal, supported by Harry Byrd, was also responsible for the creation of Blue Ridge Parkway, part of the Shenandoah National Forest.

In the 1960s Virginia began to put its financial affairs in better order by enacting a sales tax and a multi-million-dollar bond issue which benefited the public school system. In the early 1980s the Virginia Beach/Norfolk area grew rapidly, largely as a result of federal jobs and new military spending. Between 1980 and 1990 the population of Virginia Beach grew by 50 percent. As non-agricultural employment increased, however, the economy of rural areas did not improve.

Virginia's economy experienced a recession in the late 1980s. Democratic governor Douglas Wilder responded by cutting state services and reducing budgets, thus creating significant hardships for education and less affluent counties. By the mid-1990s, however, Virginia's economy had rebounded, largely because of its diversified economy that included agriculture, manufacturing, as well as service industries—the latter mostly in federal government employment. In the late 1990s the port of Hampton Roads was one of the busiest in the country, with the largest amount of tonnage on the East Coast. In 1996 Virginia ranked fourteenth among the states in per capita income, at just under \$25,000, and its unemployment rate in 1997 was just 4.5 percent, below the national average. The percentage of labor union membership in the state was only 6.8 percent of all workers. The state maintained a pro-business climate, which was aided by the state's conservative history, low wages, low tax rates, and weak labor movement. The Virginia Economic Development Corporation gave low-interest loans and other incentives to businesses, as did the Virginia Small Business Financing Authority.

WABASH, ST. LOUIS AND PACIFIC RAILWAY COMPANY VS. ILLINOIS (1886)

In 1886 the U.S. Supreme Court decision in the case of *Wabash, St. Louis and Pacific Railway Company v. Illinois* declared that states could not regulate commerce that went beyond their boundaries. Instead, regulation had to come from the federal government. The decision provided the basis for the formation of the Interstate Commerce Commission in 1887.

With rail lines crisscrossing the nation, the question of who would control rail rates and monitor the practices of the railroads had become an increasingly difficult one to answer. Many states establish their own regulatory boards, but since the rail companies operated between states, enforcing state laws on them proved cumbersome and impractical. Meanwhile the railroads, operating without the oversight of any effective regulatory body, set their own standards and practices, which resulted in many abuses. When the Wabash, St. Louis and Pacific Railway Company challenged the intervention of the state of Illinois in its business, the case eventually went to the Supreme Court.

After the high court's ruling (1886), the federal government acted quickly to establish an independent U.S. government agency the following year, the Interstate Commerce Commission (ICC). The ICC was the first regulatory commission in the country. Originally charged with supervising the country's interstate rail operations, its authority was eventually expanded to include all forms of interstate commerce, including trucking, shipping, and even oil pipelines. In addition to controlling rates, the agency also enforced laws against discrimination.

WAGE-PRICE CONTROLS

Wage and price controls were initiated by the U.S. government in 1942, in order to help win World War II (1939–1945), and maintain the general quality of life on the home front. In 1941 the Office of Price Administration (OPA) began a stormy career as an inflation fighter and food rationer. The mission of the OPA was to prevent profiteering and inflation as durable goods became scarcer in the United States because of the war. The Emergency Price Control Act of 1942 gave the OPA the ability to regulate prices in the marketplace, and brought 60 percent of all civilian food items under a form of control which froze prices at their store-by-store March 1942 levels. In a short time, 90 percent of the goods sold in more than 600 thousand retail stores in the United States were being price controlled and rationed by the federal government.

Wage-price controls disappeared with the end of World War II, as the domestic economy grew. Yet, it was only a few years later, after the outbreak of the Korean War in 1950, when President Harry Truman (1945–1953) obtained from Congress the authority to impose wage and price controls once again to deal with the inflationary domestic economy. Automobile prices were frozen, as were wages in the auto industry (until March 1951). Easy credit for new homes was restricted. The end of the Korean War ended wage-price controls, but did not end the government power to intervene during economic crises involving high inflation and scarcity of commodities. In 1962, a voluntary system of wage and price controls was adopted in order to avoid inflation. Known as “Wage and Price Guidelines,” as recommended by the Council of Economic Advisers to President John F. Kennedy (1961–1963), the price-wage controls would apply throughout the business sector and not aimed at single industries. The general guide for non-inflationary wage behavior was that the rate of increase in wages in each industry be equal to the trend rate of overall productivity increase. By contrast to the mandatory controls of World War II

Wages

and Korea, this plan emphasized the voluntary compliance of business with the federal “guideposts.”

The most extraordinary example of wage and price controls, the first attempted under peacetime conditions, was imposed by the Richard Nixon administration (1969–1974), beginning with the wage and price freeze of 1971, in an effort to deal with peacetime inflation. President Nixon designated his wage-price freeze policy as the Economic Stabilization Program of 1971–1974. The Council of Economic Advisers reviewed this policy and its usefulness after 1974, and concluded that the price and wage controls imposed by President Nixon in a peacetime economy “will be long debated and may never be resolved.” During periods of high inflation in the U.S. economy, it is likely that the debate will re-emerge regarding the need for a period of wage-price controls.

WAGES

The income given in exchange to those who supply their labor to any business is called “wages,” and includes salaries, and various wage and salary supplements, such as bonuses, commissions, royalties, social insurance, pensions, and health plan benefits. About 75 per cent of all business costs are wages. At this level, wages have a very significant impact on all per unit production costs of any business. Wages differ widely among nations, regions, occupations, and individuals. Wage rates also differ by gender and race. Statistical data indicates that the general level of wages in the United States is among the highest in the world, with the explanation being that the United States demand for labor is great in relation to supply. Economists have also indicated that the labor demand is strong because the U.S. worker is highly productive, working in a country with an abundance of capital equipment, natural resources, advanced technology, better health and educational services, and the business and political support of a production oriented economy.

Evidence also suggests to economists that unionized labor is successful in raising the wages of its members. Union members typically receive a 10 to 15 percent wage advantage over non-union workers, without creating business obstructions. Why one person earns a high wage and another a lower wage is a matter of supply and demand. Even doing the same job, some workers bring superior abilities, skills, and commitment to the job, and frequently, such workers are rewarded with increased wages and job advancements.

Geographic locations, market imperfections, and the differential in the work required can account for other differences in wages with similar groups of people in the workforce.

WAL-MART STORES

Wal-Mart Stores, Inc. was founded by Samuel Walton who graduated from the University of Missouri in 1940 with a degree in economics and went on to become a management trainee for J. C. Penney Company. After two years he went into the army, and upon his return three years later, he used his savings and a loan to open a Ben Franklin variety store in Newport, Arkansas. In 1950 he lost his lease, moved to Bentonville, Arkansas, and opened another store. By the late 1950s Sam and his brother J. L. (Bud) Walton owned nine Ben Franklin franchises.

In the early 1960s Sam Walton took what he had learned from studying mass merchandising techniques around the country and began to make his mark in the retail market. He decided that small-town populations would welcome, and make profitable, large discount shopping stores. He approached the Ben Franklin franchise owners with his proposal to slash prices significantly and operate at a high volume, but they were not willing to let him reduce merchandise as low as he insisted it had to go. The Walton brothers decided to go into that market themselves and opened their first Wal-Mart Discount City in Rogers, Arkansas, in 1962. The brothers typically opened their department-sized stores in towns with populations of 5,000 to 25,000, and the stores tended to draw from a large radius. “We discovered people would drive to a good concept,” Walton said in *Financial World* on April 4, 1989.

Wal-Mart’s “good concept” involved huge stores offering customers a wide variety of name-brand goods at deep discounts that were part of an everyday-low-prices strategy. Walton was able to keep prices low and still turn a profit through sales volume and an uncommon marketing strategy. Wal-Mart’s advertising costs generally amounted to one-third that of other discount chains. Most competitors were putting on sales and running from 50 to one hundred advertising circulars per year, but Wal-Mart kept its prices low and only ran 12 promotions a year. By the end of the 1960s the brothers had opened 18 Wal-Mart stores and owned 15 Ben Franklin franchises throughout Arkansas, Missouri, Kansas, and Oklahoma. These ventures became incorporated as Wal-Mart Stores, Inc. in October 1969.

The 1970s held many milestones for the company. Early in the decade, Walton implemented his warehouse distribution strategy: the company built its own warehouses so it could buy in volume and store the merchandise, then proceeded to build stores throughout two hundred square mile areas around the distribution points. This cut Wal-Mart's costs and gave it more control over operations. It also meant that merchandise could be restocked as quickly as it was sold, and that advertising was specific to smaller regions and cost less to distribute.

Wal-Mart went public in 1970 to be listed on the New York Stock Exchange two years later. By 1976 the Waltons phased out their Ben Franklin stores so the company could put all of its expansion efforts into the Wal-Mart stores. By 1979 there were 276 Wal-Mart stores in 11 states. Sales had gone from \$44 million in 1970 to \$1.25 billion in 1979.

Sam's Clubs—100,000-square-foot, cash-and-carry discount membership warehouses—made their first appearance in 1983, proving so popular in the bigger markets that there were 148 of them by 1991. Overall the company had 1,500 stores in 29 states by 1990 with net sales of nearly \$26 billion. Wal-Mart surpassed Sears as the number one retailer in the United States in 1991.

Wal-Mart came under much scrutiny for its impact on small towns—specifically, small retail businesses in those towns. Independent store owners often went out of business when Wal-Mart came to town, unable to compete with the superstore's economies of scale. In fact Iowa State University economist Kenneth Stone conducted a study on this phenomenon and told the *New York Times Magazine*, "If you go into towns in Illinois where Wal-Mart has been for eight or 10 years, the downtowns are just ghost towns." He found that the businesses suffering most were drug, hardware, five-and-dime, sporting goods, clothing, and fabric stores, while major appliance and furniture businesses picked up, as did restaurants and gasoline stations, because of increased traffic. Wal-Mart did, however, develop a record of community service by awarding a \$1,000 scholarship to a high school student in each community Wal-Mart operated in.

Wal-Mart continued to expand throughout the 1990s both in the United States and abroad. The U.S. growth was notable for the emergence of the new Wal-Mart Supercenter format, which was a Wal-Mart discount store with an integrated grocery store. The success of the Supercenters catapulted Wal-Mart into the top five U.S. food retailers. By the late 1990s Wal-Mart's domestic operations included more than 1,900

Wal-Mart discount stores (located in all 50 states), about 440 Wal-Mart Supercenters, and about 440 Sam's Clubs. Wal-Mart, whose revenue stood at \$137.63 billion, had also become the largest retailer in the world, the fourth-largest company overall in the United States, and the nation's largest non-governmental employer with 825,000 employees.

WALKER, FRANCIS AMASA

Amasa Walker (1799–1875) grew to prominence as a financial expert and economist in the United States after warning a group of distinguished New England businessmen during a financial recession in 1857 that the state-chartered banks of their region should suspend all cash (specie) payments in order to save the merchants from total ruin. Weeks later, many Boston banks stopped their specie payments, saving many businesses, and Walker's credentials as an expert were established. With the publication of his book, *The Science of Wealth*, in 1866, Walker's reputation grew as a U.S. economist working to free economic study from its reputation in that period as a mere extension of moral and theological philosophy. Walker was among the first economists to confront theory with statistical evidence. He pioneered in economics what is known as "time series analysis," where economic variables were taken at different points in time and the results plotted on a graph so that economic changes could be visually assessed and compared to other changes in the society over a period of time.

Walker, Francis Amasa

Amasa Walker was born in May 1799, in Woodstock, Connecticut. He was the son of Walter Walker, a blacksmith, and Priscilla. Walker's poor health as an adolescent prevented him from going to college. In 1820, at age 21, he formed a business partnership in Brookfield, Massachusetts, to make shoes. After three years he left the shoe business and joined Methuen Manufacturing Co. as its agent. At age 26 he moved to Boston, where he pursued a variety of retail business ventures.

Walker's election to the Democratic National Convention in 1836 marked his entrance into public life. By 1839 he served as a director of the Franklin Bank in Boston and also as president of the Boston Temperance Society, and in 1848 he agitated for the abolition of U.S. slavery as a member of the Free Soil Party. In 1849 Walker was elected to the Massachusetts House of Representatives and a year later to the state Senate. He is remembered in his position as a congressman for his efforts to put copies of *Webster's Dictionary* in the public schools.

It was during the financial panic of 1857, however, that Walker emerged as an expert on finance, banking, and currency. He had published a series of articles for *Hunt's Merchant Magazine* that explained the nature of financial panics, especially those severe enough to call for the banks to suspend all specie payments. His advice to a group of New England merchants calling for a "suspension of specie payments" by the state-chartered banks to save the best merchants from financial ruin proved prophetic when the Boston banks stopped specie payments and saved many businesses.

Walker's fame as a financial expert helped his career as a college lecturer in political economy. He left his mark on Washington, D.C., by serving out a term as a Republican congressman between 1862 and 1863. Walker, as an economist and a congressman, advocated the elimination of the rights of state-chartered banks to create credit money. He argued that the practice was "prejudicial to the industrial and commercial interests of the nation," because of the unreliable fluctuations it caused in the economy. He held that the government should manage the nation's credit currency for the best interests of the population. Walker was against any bank-credit expansion. He believed it was unconstitutional and that bank-credit money destabilized the larger economy and helped cause what are now called "business cycles," periods of boom and bust.

In his effort to make his theories in economic thinking more credible, Walker pulled away from

economics as a philosophy and insisted on using economics in a more scientific manner. He created his own scientific method of studying economics, which he discussed in his book *The Science of Wealth* in 1866. In his book Walker pioneered "time series analysis," where he measured specific economic variables at different points in time and plotted them on graphs so that the data could be compared and visually examined for information about the economy.

Walker argued against what he called "financial novelty" and he was a strong specie advocate, focusing on metallic money and remaining deeply suspicious of artificial credit creation. In his book Walker also described his opposition to legislation that fixed hours of work. He identified market forces bringing women's wages into equality with men's, and he advocated open immigration laws. He also emphasized the importance of labor unions as a necessary force to offset the advantages enjoyed by the owners of factories. As an economic thinker, Walker was less concerned with the production of physical objects than with the production and exchange of material that is useful and has exchange value.

Amasa Walker died in 1875, having pioneered a new era in economics ruled by science rather than philosophy. By using graphs and analysis in his economic proposals, Walker was arguably one of the first economists to be able to scientifically assess the subjective nature of market values and to statistically follow economic forces. His work was immensely popular, and it did much to develop an appreciation of economic questions among the general public.

WALKER, SARAH BREEDLOVE

Sarah Breedlove Walker (1867–1919) was one of the first American women to become a millionaire, and she ran the largest business owned by an African American at the time. She made a prosperous business out of selling her self-made hair care products for African American women.

Walker was born December 23, 1867. Her father was a poor sharecropper, and former slave, in Delta, Louisiana. She was orphaned at the age of six and was thereafter raised by an older sister. She received very little formal education and at the age of 10 she began supporting herself. At 14 she married Moses McWilliams and in 1885 they had a daughter. Two years later her husband died and Walker was left a widow with a young child to support. She moved her family to St. Louis, Missouri, where she had relatives. There she worked as a hotel washerwoman for 18 years.

I GOT MY START BY GIVING MYSELF A START.

Sarah Breedlove Walker

Around 1904 Walker began to suffer from a scalp ailment called alopecia, which causes hair loss. At first she tried existing hair products to relieve her problem, before beginning to develop her own remedies. She started creating scalp treatments, then developed hair straighteners; next she began modifying existing hair techniques and tools until she developed the “Walker Method” of hair care. In 1906 Walker moved to Denver, Colorado, and married newspaperman Charles Joseph Walker. It was there that she founded the Madame C.J. Walker Manufacturing Company. She expanded her line of products to include hair growing tonic, strengtheners, toiletries, fragrances, and facial treatments.

In addition to expanding her product line, Walker developed new marketing techniques. At first she sold her products door to door by herself. Later she hired and trained other women to be “Walker Agents” and eventually she added a huge mail order department to her business. She also opened a beauty school that taught the Walker Method of hair straightening and hair growing. The business grew rapidly and in 1908 she opened a second office in Pittsburgh, Pennsylvania. Then in 1910 she opened her first factory in Indianapolis, Indiana.

Sarah Walker was also a social leader among the African American middle class. She was known as a

good employer who sponsored philanthropic and educational projects initiated by her employees. She founded Lelia College, a hair care laboratory, and a chain of beauty salons in Harlem. She contributed generously to the National Association for the Advancement of Colored People (NAACP) and aided several local charities. She established scholarships for women at the Tuskegee Institute, Bethune-Cookman College, and Palmer Memorial Institute. In addition she supported black chapters of the Young Womens Christian Association (YWCA) and orphanages.

By 1917 the Madame C.J. Walker Manufacturing Company was the largest African American-owned business in the United States employing about 3,000 workers. Sarah Walker was one of the first American women to become an independent millionaire. She died in New York City on May 25, 1919.

WALL STREET

Wall Street, in the broadest sense, refers to the financial epicenter of all business and banking in the United States. Not only is Wall Street synonymous with U.S. financial interests, but also is an international symbol of financial power. Wall Street is an umbrella term encompassing the New York Stock Exchange (NYSE), the American Stock Exchange (Amex), the

The New York Stock Exchange, on Wall Street in New York City, in December, 1997. Despite the continuous changes in the market, the U.S. stock market, remains an international pulse of the world's economic status.

over-the-counter market called the National Association of Securities Dealers (NASD) and its automated quotation system (NASDAQ). It also includes bond markets, commodity futures markets, and various markets throughout the United States such as those in Chicago, Philadelphia, and Kansas City. In its physical sense, Wall Street, a street on the south tip of Manhattan Island in New York City, forms a triangular block with Broad and New streets, location of the nation's exchanges plus many commercial banks and business offices.

The name Wall Street derived from an early road located alongside a wall or stockade built across lower Manhattan in 1653 to protect a small Dutch colony. Local merchants and traders gathered on street corners and coffeehouses around Wall Street to buy and sell shares and loans (bonds), collectively known as securities. Although crude, this early trading set precedents which underlie American market practice for the next two hundred years.

In 1792, meeting under the famous buttonwood tree at 68 Wall Street, traders agreed to a formal organization or exchange for buying and selling shares and loans. In 1817 many of the same dealers agreed to

organize into the New York Stock and Exchange Board. Early securities listed on the Exchange were U.S. government bonds and a few stocks of banks and insurance companies. Stocks and bonds not traded on the new Exchange were traded by curbstone brokers congregated outside the Exchange. These curbstone brokers were the predecessors of the American Stock Exchange and over-the-counter market. Industrial issues and railroad stocks and bonds appeared on the Exchange in the 1830s and 1840s. By the 1840s foreign capital became a major factor influencing American business expansion. Foreign bankers maintained offices on Wall Street as did domestic commercial banks, business corporations, insurance companies, and commodity exchanges for coffee, agricultural products, and metals.

Wall Street traders operated entirely free of regulation leading to unscrupulous practices by robber barons such as Jay Gould, Cornelius "Commodore" Vanderbilt, Andrew Carnegie, John D. Rockefeller, and J.P. Morgan. Consolidation of U.S. industry into immense trusts between 1880 and 1910 provided Wall Street's largest listed firms. Following the stock market crash of 1929, the Securities Exchange Act of 1934 established the Securities and Exchange Commission to protect people investing money in securities and to enforce federal laws governing trading practices. The modern era of Wall Street finance began in the 1950's. Individual investors began entering the market and all purpose securities firms serving all types of clients changed the face of Wall Street.

WALL STREET JOURNAL

The *Wall Street Journal*, published coast to coast, is the authoritative source for tracking business, financial, and economic news in the United States. With the largest daily circulation of any newspaper in the United States, the *Journal* is the nation's most influential newspaper. Dow Jones & Company owns and publishes the *Journal*.

The *Journal*, published daily on weekdays except holidays, is organized into three sections: Page One, Marketplace, and Money & Investing. On Friday a fourth section, Weekend Journal, is added. The *Journal's* unique presentation is a six column style with no big headlines. Page One includes the legendary, "What's News," in columns two and three. Under the subheadings of "Business and Finance" and "World Wide" are brief summaries of major economic news items and

summaries of national and worldwide events. More in-depth coverage is found inside the section. Page One presents all the news in a tight, quick-read format with the same types of information found consistently in the same places. Section two, Marketplace, focuses on the impact of business on readers' careers and families, and keeps readers abreast of new product development. Section three, Money & Investing, contains all the economic statistical data and also provides columns offering explanations, insight, and perspective on the markets. The Weekend Journal, introduced in 1998, is devoted to leisure, art, and entertainment.

In 1882 Charles Dow (1851–1902) and Edward Jones (1856–1920) founded Dow, Jones & Company on the premise that business news could be reported in a lively but level-headed, unslanted style. Dow, Jones operations depended entirely on reporters daily touring brokerage houses, banks, and offices, listening and taking notes. On July 8, 1889 the *Wall Street Journal* was born. As the U.S. economy grew, the *Journal* provided stable commentary reporting market developments, general financial movement, and business interests. Clarence W. Barron purchased Dow Jones in 1902 and for twenty-six years was its dynamic force. "Casey" Hogate, entrusted with its management in 1933, began "What's News." Refuting the idea the *Journal* must reach only a specific regional constituency, Hogate, perceiving all businessmen throughout the United States as a single community, provided a single reliable source of competent and comprehensive information to them. Barney Kilgore, president of Dow, Jones & Company beginning in 1945, creatively fashioned not only a thorough newspaper but added conciseness and even humor to business, Washington, and world wide news. By the 1970s the *Journal* was the United States' most trusted newspaper. In 1980 it overtook the *New York Daily News* to become number one in circulation.

WALLACE, HENRY

Henry Wallace (1836–1916) was a pastor, farmer, agricultural publicist and editor who acted as a leading spokesperson for Midwestern farmers. He sought to educate farmers in applied science in order to prepare them for the technological advancements of the nineteenth and twentieth centuries. This dramatically changed agricultural production in the United States, and Wallace's influence spread to the level of the federal government. He served on several commissions for President Theodore Roosevelt (1858–1919)

and also impressed his views about agricultural development upon his family; his son and grandson continued his work in shaping U.S. agricultural policies.

According to biographer Richard S. Kirkendall, Henry Wallace "was the first in an American line of Henry Wallaces who rose to prominence in Iowa and the United States" (*Uncle Henry: A Documentary Profile of the First Henry Wallace*, 1993). Wallace was born on March 19, 1836, on a farm outside West Newton, Pennsylvania. His family was a hardworking, religious Scotch-Irish family of farmers. Wallace graduated from Jefferson College, Pennsylvania, in 1859. Although his roots were in agriculture Wallace chose to continue his education in theology at Allegheny Seminary in Pennsylvania, and Monmouth College in Illinois. He was ordained as a Presbyterian minister and served as a Union chaplain during the American Civil War (1861–1865). He then worked as a pastor for various churches in Illinois and Iowa until he retired from the ministry in 1877 due to health reasons.

In 1877 Wallace moved to Winterset, Iowa, and returned to the family farming business. He combined the skills he had learned as a preacher with his farming background and soon became the local spokesperson for farming issues. Though Wallace gave up the pulpit he found other ways to preach, namely through the press. He became involved in editorial work for local farm papers and eventually took partial ownership in the *Iowa Homestead*. In 1895 Wallace and his two sons established a family paper called *Wallaces' Farmer*. The paper became Wallace's forum to promote agricultural interests.

[T]HE VERY PERMANENCE OF OUR REPUBLIC WILL DEPEND ON THE DEVELOPMENT OF THE MANHOOD OF THE FARM.

Henry Wallace, presidential address to the National Conservation Congress, September 25, 1911

Henry Wallace was a man who respected traditions, especially religious and agrarian traditions. He also held a deep appreciation for modernization, above all in the form of applied science. Wallace saw agrarianism and scientific agriculture as complementary rather than contradictory. Other intellectuals of his time saw technology as a threat that would replace humans with machines. Wallace saw it as a means to improve the agrarian way of life; science would improve the quality of farming production rather than replace farmers. This would make farming a more rewarding and prestigious occupation. It would encourage farmers to remain on the land instead of fleeing to the cities. Wallace spent nearly four decades

of his life attempting to persuade farmers to change their ways of thinking because he wanted them to see the advantages technology had to offer farming.

Wallace also believed that industrialization was a positive movement for farmers, but he argued that farmers would have to keep up with scientific advancements in order to survive in an industrial world. They had to learn how to work like business people. They also had to organize in order to protect their interests, just as the urban workers were organizing labor unions in the cities. To this end Wallace participated in agricultural organizations such as the Farmers' Protective Association, the Iowa State Improved Stock-Breeders' Association, and the Farmers' Alliance.

Wallace used his news writing and other publications to promote his ideas and to educate farmers. He wrote technical works about farming, such as *Clover Culture* (1892), *Clover Farming* (1898), and *The Skim Milk Calf* (1900). He also wrote two volumes on popular education, *Uncle Henry's Letters to the Farm Boy* (1897) and *Letters to the Farm Folks* (1915). He also wrote a memoir called *Uncle Henry's Own Story of His Life: Personal Reminiscences*, which was published after his death.

Wallace's views on U.S. agriculture reached the ears of politicians at the federal level. Wallace became a leader in the agricultural world. He represented the interests of the United States government on several occasions. In 1891 Wallace was asked to travel to Europe to investigate flax growing for the United States Department of Agriculture. In 1908 President Theodore Roosevelt appointed Wallace a member of the Country Life Commission, and two years later he became president of the National Conservation Commission. In 1913 Wallace returned to Europe on behalf of the government to study farm conditions in Britain. This was his final trip before his death in 1916.

Wallace's legacy in U.S. agricultural development continued for two generations after his death. His oldest son, Henry Cantwell Wallace, became President Warren Harding's (1921–1923) Secretary of Agriculture, and his oldest grandson, Henry Agard Wallace, became President Franklin D. Roosevelt's (1933–1945) first Secretary of Agriculture and second vice president. Both men were strongly influenced by the ideas of the first Henry Wallace, especially with respect to the importance of agricultural science in American farm life.

WALTON, SAM MOORE

Sam Walton (1918–1992) redefined the shopping experience for residents living in rural areas throughout the United States by opening a chain of Wal-Mart discount stores in towns previously served only by hardware and five-and-dime stores. His strategy of monopolizing the discount shopping market in rural areas made his stores the largest retail chain in the United States.

Sam Moore Walton was born to Thomas and Nancy Walton in Kingfisher, Oklahoma, on March 29, 1918, the eldest of two boys. His father, a farm-mortgage banker, moved his family to Missouri, where they lived in a succession of rural communities before settling in the medium-sized university town of Columbia. His father believed in saving money, so when the bottom fell out of the economy his family suffered less during the Great Depression (1929–1939) than did many of their neighbors.

Walton financed his education at the University of Missouri with money earned from a newspaper route. He graduated with a degree in economics in 1940. He took his first retailing job at a J.C. Penney store in Des Moines, Iowa, where he was a sales trainee. That job, however, was short-lived, as Walton was drafted in early 1942 as a communications officer in the Army Intelligence Corps, an assignment that enabled him to remain stateside for the duration of World War II (1939–1945). While in the service, he married Helen Robson on February 14, 1943. The couple had four children.

The retail industry seemed a natural place for Walton to make his mark, but he had no interest in being in someone's employ. In 1945, with a borrowed \$25,000, he and his brother James opened a five-and-dime store called Ben Franklin in Newport, Arkansas. Walton was forced to move five years later when his landlord refused to renew the store's lease. He traveled across the state to Bentonville, which became headquarters to the Wal-Mart empire.

Walton started having doubts about the future of dime stores and, in the 1950s, started paying close attention to larger chains like K Mart and Zayre. These retailing giants avoided rural areas, preferring to place their stores in suburban or urban locations. In 1962 Walton and his brother opened the first Wal-Mart outlet in Rogers, Arkansas, about five miles from Bentonville. The two brothers thought large stores could be successful in small towns.

From the beginning the Wal-Mart concept was to join a friendly, general-store atmosphere with high-quality name brand merchandise at low prices. The idea slowly caught on. The stores were simple and basic, and many resembled barns, with merchandise overflowing from plastic bins or metal racks. Along with a top management team, Walton visited a half-dozen to a dozen Wal-Mart stores every week. At one store he might solicit suggestions on how yard goods could sell faster flat-folded than on bolts, or he might give advice on increasing deliveries of automotive supplies. At all of his stores he gave reassuring speeches that kept employees striving for improvement and higher sales.

By 1970, the year Walton took the company public, there were about 25 Wal-Mart stores. By 1972 the chain had more than doubled to 64 stores with sales of \$125 million. The rate of growth was phenomenal and continued to improve under Walton's leadership. In 1983 *Forbes* magazine estimated Walton's net worth to be \$2.1 billion, making him the second richest person in the United States behind oil magnate Gordon P. Getty. At that time Walton decided to explore another path, and he opened stores in medium-sized cities such as Little Rock, Arkansas; Springfield, Missouri; and Shreveport, Louisiana. He also opened stores in the suburbs of several large cities including Kansas City, Missouri, and Dallas, Texas. The strategy seemed to work, and by 1987 Wal-Mart had 1,108 stores located from Colorado to Virginia, with sales of over \$20 billion. By 1989 there were 1,326 stores with sales of almost \$26 billion.

Walton continued to try innovative ways to attract new customers. In April 1983 he launched the first

Sam's Wholesale Club, which was aimed at small-business owners and others who wanted to buy bulk merchandise. The warehouses employed only a few laborers, and the goods were priced just eight to ten percent over cost. By 1991 there were over 200 Sam's Clubs in the United States. In December 1987 he introduced another new retailing concept with the opening of the first Hypermart USA store in Garland, Texas. Encompassing some 220,000 square feet of retail space, about four times the size of the standard Wal-Mart store, these "malls without walls" devote an almost equal amount of space to both food and non-food products. Wal-Mart Supercenters, another Walton innovation, have both a supermarket and a regular Wal-Mart under the same roof.

Wal-Mart is a success story that redefined the way retailers viewed growth markets. Walton showed the world that consumers, no matter where they lived, preferred the variety and discount pricing that his chain offered. Walton was constantly searching for ways to better serve his customers. He was always walking around competitor's stores to educate himself. He was not above getting down on his hands and knees to look under display cabinets. "Anyone willing to work hard, study the business, and apply the best principles can do well," Walton said in the *New York Times*.

Walton's business success has impacted Bentonville, Arkansas, home to the Wal-Mart Corporation. Walton and his wife have built tennis courts, a recreation hall for senior citizens, a day care center, a library, an athletic center, and a health club in Bentonville. Walton, or "Mr. Sam," as some called him, was unpretentious, and he did not believe in company perks like limousines.

Despite all of the success, Walton and his chain of discount stores were not without their detractors. Chief among them were the small town merchants who were ultimately driven out of business by the Wal-Mart stores. They knew they could not compete with the low prices and extensive variety of merchandise.

Regardless, Walton revolutionized the concept of discount stores in the United States and reshaped consumer shopping patterns. Without a doubt Walton was the epitome of modern retailing, adapting to contemporary demographic trends. He built his empire not in the large urban areas of the North, East, and West—the politically and economically dominant regions of the first two-thirds of the twentieth century—but in the South and Midwest and the former depressed and neglected regions of the nation. He pioneered retailing where others did not want to go, and because of his

Wampum

willingness to go to uncharted areas he reaped astounding financial benefits which propelled him to one of the world's richest and most respected businessmen of his time. Sam Walton's legacy continues. Five years after his death, Wal-Mart had grown to over 2,300 stores with annual revenues of \$104.8 billion.

Among the honors Walton received in his lifetime were the Gold Winner in *Financial World's* CEO rating, 1986; National Retail Merchants Association's gold medal for the most distinguished retailing performance of the year, 1988; *Financial World's* CEO of the Decade, 1989; *U.S. News and World Report's* Excellence Award in Business, 1990; and *Advertising Age's* Adman of the Year Award, 1991. The Presidential Medal of Freedom from President George Bush (1989–1993) in 1992 was the award that Walton deemed “the highlight of my entire career.” Even though he was in a wheelchair Walton led his sales associates in a rousing Wal-Mart cheer. He died on March 29, 1992, of bone cancer at age 74, three weeks after receiving the medal from Bush.

WAMPUM

Wampum were beads or disks of polished mollusk shells that were used as money by the Native Americans. The word is a shortened form of *wampumpeag*, an Algonquin word meaning “white string of beads.” Wampum was used primarily by the Eastern Woodlands Indians, who came into contact with the European settlers during the early 1600s. The colonists adopted wampum as money, and helped broaden its circulation. English fur traders, for example, sold their wares to coastal Indians in exchange for wampum; as the fur

traders moved inland, they used wampum as exchange with other tribes, such as those of the Great Plains. Like gold or silver today, wampum was valued not only as a form of money but also as decoration. The white or purple shell beads were made into necklaces, woven into belts, and sewn to clothing. After treaties were signed, wampum belts were sometimes exchanged as a gesture of goodwill and continued peace. As foreign coinage and colonial coinage came into circulation, the use of wampum as money declined during the mid- to late-1600s.

WAR AND COMMERCIAL INDEPENDENCE, 1790-1815 (OVERVIEW)

Between 1790 and 1815 the United States struggled to be taken seriously as an international political and economic power, even as rapid internal growth began to change the character of the nation. When George Washington (1789–1797) was inaugurated as the first U.S. president in 1789, the United States was still dealing with the tremendous economic problems left by the American Revolution (1775–1783). U.S. citizens were still trying to define what kind of nation theirs would be. Over the next 25 years economic changes enriched U.S. society, influenced domestic politics, and eventually led the country back into war with Great Britain.

In 1790 the United States was overwhelmingly a farming society. Small, independent family farms dominated New England and the Mid-Atlantic states, while cities like New York and Philadelphia were growing into large, important trade centers. Compared to the North an even greater proportion of the southern population lived on farms. One important difference between the North and South was that southern agriculture was marked by the institution of slavery, which was on its way to being outlawed in the northern states. Although the Constitution stipulated that the slave trade would come to an end in 1808, as that date came and went African slaves were becoming seemingly indispensable, especially for the cultivation of tobacco, rice, and cotton. Southern plantation owners used slavery to produce these staple commodities that sold at home and abroad for large profits. A majority of southern whites owned no slaves, but the entire southern economy and society were influenced by the institution of slavery.

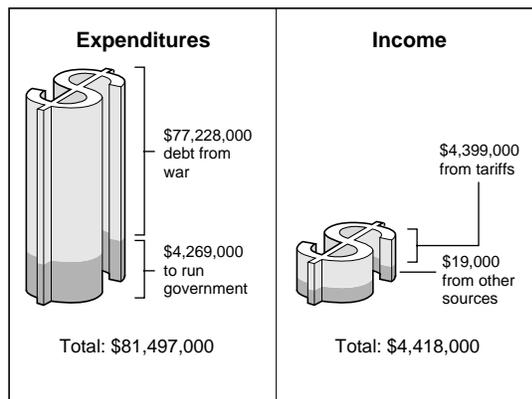

By the end of the War of 1812 . . . Though the vast majority of U.S. citizens still lived on farms, they probably thought more about the economic world beyond their homes than their parents had. The people in the United States had witnessed the growth of a market economy over the previous 25 years. Although there were some ominous signs like increasing exploitation of slavery and the intractability of urban poverty, the country was poised to become a real economic and industrial power in the nineteenth century.

When George Washington took office, one of his first tasks was to deal with economic problems that had plagued the country throughout the 1780s. The leading figure in the reconstruction of the national economy was Secretary of the Treasury Alexander Hamilton (1789–1795), who was a prominent New York lawyer and a brilliant adviser to Washington. Hamilton was an exponent of turning the agrarian U.S. into a modern commercial state. After Congress put the country on firmer financial footing in 1789 by passing a series of import taxes that would provide a steady stream of revenue and protect U.S.-made goods from foreign competition, Hamilton proposed a comprehensive package of financial measures to further develop the national economy.

In January 1790 Hamilton issued a “Report on Public Credit,” in which he proposed that the federal government assume the state debts left over from the Revolution and pay off all foreign and domestic national debts at face value. Congress agreed to pay \$11 million in foreign debts and to repay all wartime investment certificates in full, despite the fact that many original investors had sold their certificates to financial speculators since the war. Following six months of debate in which the southern states had agreed to the deal even though they had already gone further towards paying off their debts, Congress approved the proposal to assume state debts.

In his Second Report on Public Credit, (December 1790) Hamilton also proposed the creation of the Bank of the United States. This proposal proved to be even more controversial than his First Report on Public Credit. The bank, which was to be backed by both public and private stockholders, faced opposition from Secretary of State Thomas Jefferson (1743–1826) and James Madison (1751–1836). The critics argued on the floor of Congress that the bank was an institution more

FINANCING A NEW NATION, 1789—1791

Source: Historical Statistics of the United States.

Upon becoming a new nation, the U.S. faced a serious financial crisis, the nation's expenditures far exceeding revenues.

in keeping with monarchy than U.S. democracy. Opponents of the bank claimed it would be an unconstitutional abuse of central government power and that the Constitution did not specifically give the federal government the power to create such an institution. Congress reluctantly passed authorization anyway, and the bank opened in 1791.

Hamilton's proposals exposed fundamental differences in how U.S. politicians perceived the national economy. Alexander Hamilton wanted to use federal government power to expand the economy. His “Report on Manufactures,” (December 1791) recommended that the economy be increasingly based on trade and manufacturing, and protected by high tariffs. Jefferson, Madison, and their supporters thought that a manufacturing economy was bound to expose U.S. society to moral and political decay and corruption—significant concerns for the new nation. Jefferson believed that farmers were “the chosen people of God” and that decentralized agriculture would provide the most “virtuous” basis for U.S. government. Jefferson envisioned a society led by independent land-owning farmers, and Hamilton placed his hopes in trade and finance. Though Congress accepted many of Hamilton's economic proposals in 1792, and though his programs restored the country to remarkable financial health, debate surrounding the role of central government, power, and the economy in the United States would continue for decades.

Beyond the political debates, the economic life of average U.S. citizens began to change during the 1790s. Pioneers were pushing westward and looking

for new land, and by 1800 500,000 settlers were living west of the Appalachian Mountains. Congress supported integrating western lands into the United States—the Northwest Ordinance (re-authorized in 1789) outlined the process for the Northwest Territory to be broken down into states. In addition southern territories joined the Union: Kentucky and Tennessee became states in 1792 and 1796, respectively.

Since many westerners were looking for land and economic opportunity, their presence often brought them into hostile contact with Indian nations determined to resist the United States' westward encroachment. Though the Northwest Ordinance specified that Indian land treaties had to be respected, many U.S. migrants ignored this provision and violence was often the result. In the early 1790s Congress deployed the first "peacetime" U.S. army to battle against an Indian confederacy led by Miami chief Little Turtle, who fought to maintain native land rights. Little Turtle's forces were defeated in 1794 after several years of successful resistance. The pattern of conflict over land and natural resources was established.

Many of the U.S. citizens who moved to the west in the 1790s were becoming involved in the money economy. Rather than growing, trapping, shooting or fishing for food and other necessities, the sale of labor or goods gradually changed from within the previous frontier subsistence and barter economy. Instead of merely producing enough product to live on or to trade with neighboring farmers, U.S. farmers slowly began to produce surplus goods to sell for cash. The growing availability of paper money combined with a greater demand for "store-bought" goods. As the market opened up more cash and products were available. Homesteaders used surplus profits from their farming to buy non-essentials. Westerners raised extra livestock and produced whiskey that they hoped to trade back east. Mid-Atlantic farm women produced surplus butter and hen eggs that they sold to neighbors or at produce markets in Philadelphia, New York, or at country cross-roads for cash. Domestic trade was on the rise everywhere.

The increased commercial activity put pressure on the federal government to enforce tax laws and support trade. In 1794 the government cracked down on western Pennsylvanians who violently resisted paying taxes on whiskey (which they sometimes used as a form of currency, since distilled alcohol was more convenient and portable than the bushels of corn from which it was derived). The "Whiskey Rebellion" that ensued was repressed without loss of life by Washington, Hamilton, and 12,000 militia.

Western farmers caught up in the "market revolution" wanted to use the Mississippi River (which was then controlled by Spain) to establish water-trade routes to New Orleans—and, thence, to the world market. U.S. envoy Thomas Pinckney negotiated a treaty with Spain in 1795 that allowed U.S. citizens free access to the Mississippi River. Only about 20 percent of U.S. citizens were engaged in commercial farming by 1820, but their influence exceeded their numbers.

In addition to commercial farming, manufacturing was also on the rise during the 1790s. Urban artisans produced manufactured goods, like shoes, that appealed to farmers in the interior. Merchants who financed and organized this form of "putting out" production managed to increase their profits, even before mechanization took over. Artisan families in Lynn, Massachusetts, for example, produced 400,000 pairs of hand-sewn shoes in 1800. Though most manufacturing was still manual, waterpower fueled the beginnings of mechanization that would push industry forward in the nineteenth century. In 1790 Samuel Slater, Moses Brown, and William Almy harnessed the power of the Blackstone River and used stolen British industrial plans to open the first mechanized textile mill in the United States in Pawtucket, Rhode Island.

Increased agricultural production, manufacturing, and domestic trade characterized the Atlantic economies in the 1790s, not just the U.S. Foreign trade rose dramatically. In 1794, over the objections of Thomas Jefferson and his supporters (who were pro-French), George Washington declared the U.S. neutral in the French wars with the European monarchies. U.S. merchants could trade simultaneously with the French and British. U.S. neutrality during the French Revolution and the Napoleonic Wars initially boosted the shipping and export businesses. At first the U.S. merchant fleet could sail through French and British waters without coming under attack.

Political leaders in the U.S. were divided over whether the United States should remain neutral in the wars. Washington's successor, John Adams, threatened to engage the country in an undeclared war with France in 1798 but trade continued. As ship-building improved, merchants along the eastern seaboard ranged farther and even began to trade in China and North Africa. U.S. exports included both manufactured and agricultural goods, and cotton and cloth exports escalated after the invention of the cotton gin in 1793. Total U.S. export revenue rose from \$33 million in 1794 to \$94 million in 1801 and taxed imports increased even more sharply over the same period.

In 1800 Thomas Jefferson (1801–1809), then head of the Democratic Republican Party, was elected President. Though the campaign had been bitter, this peaceful transfer of power supposedly signaled an end to Hamilton's "federalist" brand of centralized government and financial power. The agrarian Jefferson was less eager than Hamilton to encourage banking and manufacturing and more interested in paying off the national debt. However Jefferson did seem to put aside his scorn for government programs in 1803 when he negotiated the purchase of the Louisiana Territory from France for \$15 million. In accomplishing this momentous act (which doubled the size of the U.S.), Jefferson did what he accused Hamilton of doing: he gave the central government powers (in this case the power to annex additional land) that were not mentioned in the Constitution.

And even Jefferson could not ignore the fact that increased foreign trade required military protection. The North African Barbary States were in the habit of preying upon foreign shipping. They would stop and board ships, demand tribute, and take sailors hostage for ransom. Although the Constitution specifically gave the power to make war to the Congress, Jefferson sent the American Navy to attack Tripoli and other North African states. Although it turned out to be a drawn-out affair, the United States triumphed in a series of naval engagements off the coast of Tripoli between 1801 and 1805 and kept the lines of trade open. The fact that he had to stretch the Constitution to do that does not make him a traitor to his earlier states' rights politics. It just means that Hamilton's vision of a powerful central government pursuing programs that enhanced the economic health of the country would prove to have an important place in the future of the nation.

Far more difficult to solve were the problems caused by the Napoleonic wars. In 1803 the wars between France and England resumed with a vengeance, and U.S. citizens were increasingly pulled into the hostilities as they tried to trade with both sides and to profit from the re-export trade. The French and British imposed naval blockades on one another, meaning that they would try to block all goods from entering each other's countries by sea. U.S. shippers who ignored the blockades faced capture (especially in the West Indies). Since being a sailor in the British Navy was possibly the worst job that a free man could have in the nineteenth century, many seamen deserted the British Navy. When the British came upon a U.S. merchant vessel they frequently boarded the ship and "impressed" a portion of its crew into service. In the

process, an estimated 6,000 sailors with U.S. citizenship were impressed (kidnapped) into the British Navy between 1803 and 1812.

The question facing the U.S. government was how to respond to the French and British aggression. Congress passed a Non-Importation Act in 1806 that imposed a boycott on British imports, a strategy of political resistance that had been tried before the American Revolution. That same year, Jefferson's ministers negotiated the Monroe-Pinckney Treaty with Great Britain that was supposed to solve trade problems and the impressment of U.S. sailors. However Jefferson refused to submit the treaty to Congress for ratification because he felt the final terms favored the British too much. The British raised the stakes in June, 1807, when the *H.M.S. Leopard* fired on the U.S. ship *Chesapeake* after the British unsuccessfully tried to impress some of the *Chesapeake's* U.S. sailors. The British did not back down from its policy of impressment, and they imposed even harsher trade restrictions on U.S. ships.

Despite the British hostility, Jefferson remained committed to solving the problems through commercial measures rather than military action. In 1807 he urged Congress to pass an embargo that would totally ban all French and British exports and imports. Congress repealed the Embargo in 1809, but followed it with other sanctions—the Non-Intercourse Act (1809) and Macon's Bill, Number Two (1810). James Madison (1809–1817), elected President in 1808, tried to stay true to Jefferson's vision of economic resistance, but these measures did nothing more than ruin the U.S. economy, especially in the Northeast which depended more on trade and shipbuilding. The French and British paid little attention to the embargoes and sanctions, and the huge drop in U.S. exports and imports sent the United States into an economic depression.

Finally in 1812 a group of western and southern Democratic Republicans in Congress convinced their colleagues that economic sanctions were not working, and the United States declared war on Great Britain. The War of 1812 (1812–1814) established that the United States would not allow trade interference, but its economic effects were mixed. The war raged for three years with few U.S. military successes, and Congress was hesitant to raise taxes to pay for militia, army, and navy forces. The British burned the capital at Washington DC in 1814. In the midst of the war with Great Britain, U.S. forces defeated the Creek Indians and killed Tecumseh, an Indian leader who had united many tribes in resistance to U.S. expansion. Both the defeat of the Creek and the death of Tecumseh signaled the likelihood that westward expansion would continue after the war.

The war also encouraged the growth of domestic manufacturing—new, larger textile mills and factories sprang up all over the Northeast to replace unavailable foreign goods. By the end of the War of 1812 the United States had proven that it was able to defend itself, even though it had few militarily memorable moments in the war. Though the vast majority of U.S. citizens still lived on farms, they probably thought more about the economic world beyond their homes than their parents had. The people in the United States had witnessed the growth of a market economy over the previous 25 years. Although there were some ominous signs like increasing exploitation of slavery and the intractability of urban poverty, the country was poised to become a real economic and industrial power in the nineteenth century. A U.S. economy, based both on farming and commerce, had been firmly established.

WAR AND THE ECONOMY (ISSUE)

Perhaps no other single activity has had a greater impact on the economy of the United States than war. But how war affected the economy of the nation changed drastically between the nineteenth and twentieth centuries. During the late eighteenth and nineteenth century, war sometimes obstructed and other times invigorated the national economy. But in the twentieth century war provided a consistent impetus for prosperity, at the same time that it tied the U.S. economy closer and more intricately to a global market, a world alliance, and a defense industry.

For many U.S. citizens independence from Britain didn't provide all the solutions it appeared to have promised. For some it only made things worse. The British Navigation Acts, although no longer restricting trade outside the Empire, were now applied against U.S. merchants who wished to trade inside the Empire. Moreover the mercantilist regulations of other European countries were often more stringent than the British laws had been. When the war ended the English proceeded to "dump" low-priced goods on the still infant American industries which had begun to establish themselves during the years when the British Navy blockaded American ports. War-born industries found it impossible to compete against England's more mature industrial efficiency and economies of scale. Cheap British manufactured goods began reappearing on the U.S. market and the protection that U.S. industries had enjoyed due to trade disruptions during the war disappeared. Trade came to a standstill, domestic prices fell; farm produce also sold at the lower prices; consequently, unemployment rose sharply among urban and rural laborers.

In 1790 Secretary of the Treasury, Alexander Hamilton (1789–1795), convinced Congress to assume the debts incurred by the individual states during and after the American Revolution (1775–1783). According to Hamilton, this plan would bind wealthy citizens to the new federal government, establish it as a good credit risk internationally, and provide a compelling rationale for an immediate and effective federal tax system. The funding and assumption of this enormous debt would serve several purposes. If the debt were gathered together as the sole responsibility of the federal government, the credit of the nation would be restored at home and abroad. As capital came out of hiding, interest rates would be lowered. With lower interest rates investments in land, commerce, and industry would increase, and capital would multiply along with wages and jobs. All that would then be required was a national bank to provide internal control of finances and national programs to stimulate commerce and industry within the nation.

The outcome of the American Civil War (1861–1865) was determined in large part by the economic disparity between the two regions in their manpower and their industrial resources. In 1860 the North had a population of about 19.5 million to the South's 11 million, about four million of which were slaves. Estimates placed the size of the northern armies at about 1.5 million to the Confederacy's nine hundred thousand. But the system of volunteers, even with the offer of bounties, proved to be unreliable to furnish the

War	Estimated total war costs	Original war costs	Total costs to 1970 of veterans' benefits	Total estimated interest payments on war loans
Vietnam Conflict	352,000	110,000	2,461	22,000
Korean Conflict	164,000	54,000	15,016	11,000
World War II	664,000	288,000	87,445	86,000
World War I	112,000	26,000	45,585	11,000
Spanish-American War	6,460	400	5,436	60
Civil War (Union only)	12,952	3,200	8,570	1,172
Mexican War	147	73	64	10
War of 1812	158	93	49	16
American Revolution	190	100	70	20

This table shows the cost of war to the U.S. Included are the benefits to veterans and interest payments. No other government act has had greater impact on the U.S. economy.

numbers needed to keep the armies up to strength and both the North and South were forced to use conscription.

An essential part of the war involved transportation of men and material. In 1859 the North had about 21,900 miles of railroads to the South's 6,600. In the North railroads connected the agricultural and manufacturing centers, but in the South railroads were inadequate in quality and lacked direct connections between major cities, thus there were problems getting supplies to where they were needed. The federal government also controlled the Navy and most of the merchant marine, which placed the South at a disadvantage in purchasing needed goods abroad and selling surplus agricultural products in foreign markets. While the North had 90 percent of the nation's industrial capacity, the South's lack of a developed industrial base created serious problems in acquiring sufficient supplies of arms and ammunition. Food supplies for the army were an even greater problem than equipment. The South's poor transportation system failed to get needed food to the armies in the field.

Perhaps one of the most telling reasons for the South's inability to win its independence was its inadequate financial system. There were no significant financial institutions in the Confederacy. At the close of the war the South would still depend upon banks in the North and in England for loans to rebuild the southern economy. The predominantly agricultural economy made it difficult to raise taxes or large sums of money. The devastation of a four-year war fought mainly in the

South made this even harder. The provisional government finally resorted to printing paper money, but the currency came to have so little value that people eventually turned to barter. Ultimately the South was unable to raise the capital it needed to support the war effort. And its inability to amass capital continued well after the war was over. Some observers likened the post-Civil War South to a colony of the North: low-wage labor was there in abundance, but capital was lacking. Some historians note the attempt of the South to build a "New South" with developing industry over the next thirty years. But for much of the South the Civil War probably set things back a generation.

Statistics also tell the story of the effect of the Civil War on the economies of the South and of the North. From the South, 258,000 men died in the war. The North lost more—362,000. Those that survived were frequently maimed for life and rendered incapable of supporting themselves. In several southern states, the busiest manufacturing industries for several years after the war were producing prosthetic devices, such as wooden legs, for the wounded. The South also lost much of its livestock as well as its farm implements. Most significantly, the South lost its slave labor force, variously estimated at around 4 billion dollars (more expensive than all the land in the South).

Whereas the Southern economy had suffered a major set-back as a result of the war, the North had continued to advance. One important feature of this advance in the North was that, when the South seceded, the Northern Republicans, now in control of the 37th

Congress, in 1862 proceeded to pass the elements of the Republican program that the southern Democrats in Congress had been impeding. The Homestead Act of 1862 provided free government land to farm families in the north and west. The Morrill Land Grant Act of 1862 set aside new money to build colleges for agriculture and industrial sciences. Subsidies for the transcontinental rail lines were also voted in, as was a National Banking Act to standardize the national currency. All of these measures pointed in the direction of a post-war program for farming, industrial expansion, and wage labor (as opposed to slavery). It was only through the Civil War that these advances were possible.

In the case of both the Spanish-American War (1898) and World War I (1914–1918) war now became a stimulus to economic development. World War I initially cost the United States government about \$33 billion plus interest. But rather than hurting the domestic economy, the war effort strengthened and improved the United State's competitive position in the world. Farmers enjoyed boom years as agricultural prices rose and the international market for their products expanded. Real wages for blue-collar workers increased modestly and all sectors profited from the war. Wartime demands for industrial products raised profits for many companies. The DuPont Company's stock multiplied by 1600 percent between 1914 and 1918 and DuPont grew from a debtor company to one with a surplus of \$68 million at the end of the war. Steel production reached twice its prewar level by 1917. The standardization effort during the war led to greater postwar industrial efficiency and production.

President Woodrow Wilson (1913–1921) did much to encourage the United State's changing role in the world economy. In Wilson's view free trade promoted both universal prosperity and universal peace and democracy. International commerce led to a strong domestic economy and exports were essential for continued U.S. economic growth. Wilson felt that restrictions on trade, such as tariffs and trade agreements, hindered efficiency and denied the natural cycle of the international economy. Wilson firmly believed that goodwill flowed along with goods and that commercial contacts were effective guarantors of peaceful relations among states.

The war almost instantly reversed the credit standing of the United States. The nation, by the war's end, held billions of dollars in European debt obligations and was the globe's greatest creditor as well as its greatest economic power. By forcing the Europeans to accept goods instead of loans, the Wilson administration guaranteed that the country would be banker, arsenal, and breadbasket to the Allies. World War I set

the foundation for the prosperity of the twenties and some economists argue, the background for the Great Depression (1929–1939) as well.

The outbreak of World War II (1939–1945) began the United State's climb out of the depths of the Depression. U.S. businesses profited from increased orders for military and non-military goods by European nations engaged in the conflict. Industries such as steel sold war goods to all parties and reaped a handsome profit. Later as the Europeans ran short of cash, President Franklin D. Roosevelt (1933–1945) developed a policy of U.S. funding for allied purchases. The policy was announced as a means whereby the United States would become the "arsenal of democracy," and was designed to advance U.S. political and economic interests without involving the nation in war. But even policy supporters within the Roosevelt administration doubted that the United States could stay out of the conflict and they began preparing the United States for war. The government increased its purchases of military goods from private industry, spurring production and creating jobs.

Despite the Roosevelt administration's friendly attitude toward big business, an unregulated marketplace approach to the war economy was impossible. Shortages and allocations of vital raw materials required economic oversight and coordination. By executive order Roosevelt created a variety of new agencies to oversee mobilization. Among these agencies were the War Production Board (WPB), which coordinated war-related industries, and the Office of Price Administration (OPA), which set prices on thousands of items to control inflation. There was also the National War Labor Board (NWLB), which set wages, monitored working conditions, and, if necessary, seized industrial plants in the event of labor strife. Roosevelt also converted older New Deal agencies into wartime organizations. The Reconstruction Finance Corporation (RFC) made loans to small businesses and homeowners during the Depression. During World War II the RFC loaned money at excellent terms to industries expanding to meet wartime demand.

The administration's combination of private capitalism and public stimulus accomplished exactly what the government intended: it made the United States the largest arms manufacturer in world history. U.S. labor built nearly 300,000 airplanes, nearly 400,000 pieces of artillery, 47 million tons of artillery ammunition, 44 billion rounds of small arms ammo, 86,000 tanks, and 6,500 ships. Many of these planes, tanks, and ships were used in the European and Pacific theaters of war, often with Russian, British, or other Allied soldiers

using them. Frequently the infusion of U.S.-made material proved decisive in battle.

At the end of the war U.S. business and the economy were radically different than they were before Pearl Harbor. U.S. citizens enjoyed unprecedented prosperity. Corporate profits had skyrocketed. In 1943 alone earnings jumped \$2.1 million over the prewar level. Workers' wages on average doubled; they increased from almost \$25 a week to \$50 a week and many people earned hefty overtime bonuses. Even farm income increased an incredible 250 percent, despite the loss of nearly 800,000 agricultural workers during the war.

The character of the economy also changed due to war. Despite administration attempts to distribute the benefits of government contracts broadly, 71 percent of all contracts went to the 100 largest U.S. corporations. By the end of 1942 there were 300,000 fewer small companies than there had been before the war, and fewer small farms. Labor also got bigger. The total labor force increased by 22 percent during the war, which along with the draft eliminated unemployment. Labor unions grew from 10.5 million members in 1939 to 14.75 million members in 1945 and they intended to make up for wages lost due to the "wage freeze" of the war years. As in the case of the post-World War I strike wave in 1919, there was a tremendous strike upheaval in 1945 and 1946.

An acknowledged power in the U.S. marketplace, big labor insured that many of the wage and benefit gains of the war years would continue into the next decades. Moreover because of wartime labor shortages the workforce was more diverse than before. Almost 60 percent of women in the United States were employed during the war. Industry, which for so long had closed its doors to African Americans, during the war employed 1.2 million. Sixty thousand African Americans migrated to Detroit alone during the war. The one problem with all this prosperity was that it was purchased with government deficits justified by the pressure of war.

The new administration under President Harry S. Truman (1945–1953) was faced with a significant economic problem: how to maintain wartime prosperity without a war. But the potential military confrontation with the Soviet Union not only cemented U.S. economic ties with Western Europe and increased U.S. trade, it also provided Truman with the perfect solution—a viable rationale for increased military expenditures. By the end of the 1940s, prosperity was insured by the twin forces of expansive U.S. trade and the growth of what President Dwight D. Eisenhower

(1953–1961) would later term "the military industrial complex."

WAR INDUSTRIES BOARD (WIB)

Participation in World War I (1914–1918) required not only the mobilization of people, but of materials in the United States. The country entered the conflict on April 6, 1917, when Congress declared war on Germany, and the United States joined the Allied nations (France, Great Britain, Russia, Serbia, and twenty other nations, including Japan) to fight the Central Powers (Austria-Hungary, Germany, the Ottoman Empire, and Bulgaria). The U.S. war effort demanded that industry join with the federal government to ensure an adequate flow of supplies to the front and to keep things moving smoothly on the home front. President Woodrow Wilson (1913–1921) declared that "it is not an army that we must shape and train for war, it is a nation." Of all the committees and agencies that were established to advise and oversee the production and movement of materials, raw and finished, the most important was the War Industries Board (WIB), which, for the duration of the war, ran the nation's economy.

Formed in July 1917, the WIB was originally led by F.A. Scott (1873–1949); he resigned under the enormous pressure of the job. Succeeded by Daniel Willard (1861–1942), he too resigned, complaining of

War Labor Board

the War Industries Board's lack of power. In 1918 Wilson secured broader authority for the board when Congress passed the Overman Act. The president tapped American businessman Bernard Baruch (1870–1965), who was then serving on the Allied Purchasing Commission, to head the WIB.

IT IS NOT AN ARMY THAT WE MUST SHAPE AND TRAIN FOR WAR, IT IS A NATION.

President Woodrow Wilson, on U.S. mobilization for World War I

Under Baruch's leadership the WIB faced with the challenge of converting the nation's industry to wartime production. The wartime agency allocated supplies (war-related items received first priority on production lines), fixed prices (to ensure that manufacturers had a means to pay wages high enough that workers would not strike), ordered the standardization of goods (so resources would not be wasted), and made purchases, sending enough goods—about one quarter of all American production—to the European front. While the Selective Service Act (1917) and local draft boards had successfully mobilized the troops, the WIB mobilized the economy, ensuring the Allied nations' defeat of the Central Powers in November 1918. On December 31, President Wilson directed that the board be dissolved. It was officially disbanded in mid-1919. The war effort was a catalyst for U.S. economic growth: By the end of the decade, the gross national product (GNP) was 237 percent higher than it was in 1914, when fighting first broke out.

WAR LABOR BOARD

The War Labor Board (WLB) was a federal executive branch office that had authority to settle all labor disputes that could interfere with domestic industrial production during World War II (1939–1945). Established within the Office of Executive Management on January 12, 1942, WLB was a tripartite body consisting of twelve commissioners appointed by the president, with four commissioners representing management, four commissioners representing labor, and four commissioners representing the public. The chairman and vice-chairman were selected from the public's representatives. Labor and management representatives agreed there would be no strikes or lockouts for the duration of the war.

To resolve more quickly any disputes that might arise, WLB created ten regional offices, each with twelve commissioners who were vested with nearly the same powers as the national commissioners. Labor disputes were escalated according to a defined procedure. The parties were first required to negotiate pursuant to the provisions of the applicable collective bargaining agreement. If the dispute could not be settled in this manner, the Commissioners of conciliation at the Department of Labor would intervene. If their intervention failed to produce a satisfactory result, the Secretary of Labor was required to certify the matter to WLB, which would make a final determination via mediation, arbitration, or some other mutually acceptable process.

WLB was established in part to replace the Defense Mediation Board, which had been largely ineffective since its creation in 1941. On December 31, 1945, WLB itself was terminated and replaced by the National Wage Stabilization Board in the Labor Department.

WAR LABOR DISPUTES ACT

The Smith-Connally Anti-Strike Act of 1943, known more commonly as the War Labor Disputes Act (WLDA), was a measure enacted by the U.S. Congress, despite President Franklin D. Roosevelt's (1933–1945) veto. It gave the president the power to seize and operate privately owned industrial war plants, during World War II (1939–1945), when and if an actual or threatened strike interfered with war production efforts. Any strikes by unions or by employees in any of the designated war plants were prohibited. Any war-industry unions failing to give 30 days notice of intent to strike were held financially liable for all damages. This was one of the many efforts Congress initiated to bring order out of the chaos generated as U.S. industries converted to full-time war production. The general success of the WLDA, as well as other government-initiated controls of industry and production, enabled U.S. industry to produce twice as much as all enemy countries combined by 1944. The WLDA of 1943 expired after the end of World War II, and previous labor-dispute techniques used by American organized labor were gradually resumed.

WAR OF 1812

The War of 1812 (1812–1814) remains one of the least known of American wars. Some historians regard it as a minor sidelight to the Napoleonic Wars (1800–1814) in Europe. Others see it as a continuation of the struggle that began with the American Revolution (1775–1783). Most agree, however, that the war had its origins in the economic problems facing the young republic in the early nineteenth century. The war's end resolved some of these problems. But other problems raised by the war continued to plague the United States through the first half of the nineteenth century.

Contemporary sources suggest that the United States entered the War of 1812 partly to end British impressment (a kind of forced draft) of American sailors. This was undoubtedly the case. But the complete cause of the war was much more complex. The War of 1812 had just as much to do with American trading interests as it did with foreign powers respecting the rights of American citizens. Some of the war's fronts were opened to seize Canadian lands and to end British influence over Native Americans in the Great Lakes area. Historians have also suggested that the war was fought to enhance the prestige of the Republican (Anti-Federalist) Party, and to enhance the prestige of the United States. The end of the war is equally confusing. Although the United States has won most of its wars, the War of 1812 was a major exception. The Treaty of Ghent (1814) that ended the conflict simply restored the state of affairs that had existed before the war began.

The problem of European powers interfering with American trade was an old one, stretching back decades into the years following the American Revolution. They were rooted in the French Revolution (1789–1795) and the Napoleonic period (1799–1815). At the time, the British were trying to choke off foreign trade with France, while the French were denying the British access to Continental ports. The Orders in Council established Great Britain's intention to seize goods carried in neutral ships that were intended for French ports, while Napoleon's Berlin Decrees performed a similar service for ports in other mainland European nations. When the British warship HMS *Leopard* boarded the USS *Chesapeake* in 1807 and removed four sailors who had allegedly deserted from the British navy, the Americans responded with outrage. Following the example set by the thirteen American colonies in the 1760s, President Thomas Jefferson (1801–1809) guided an Embargo Act (1807) that ended almost all American foreign trade. However, the Embargo Act hurt the United States far more than it did the nation's

trading partners. In 1809 Congress reopened trade with foreign nations (except for Britain and France) in the Non-Intercourse Act. This act also stated that trade with Britain and France would be resumed if the two countries agreed to respect U.S. shipping. Even this step did not help the faltering U.S. economy, and in 1810 Macon's Bill No. 2 opened trade with both countries with the stipulation that trade with either country would be cut off if the other agreed to drop its restrictions on U.S. trade. Napoleon quickly took advantage of the opportunity to hurt the British, and in 1811 President James Madison (1809–1817) cut off trade with England. In June of 1812 the British government finally repealed the Orders in Council. But by that time Madison had already asked Congress for a declaration of war.

The other major source of conflict between the British and the Americans was on the Great Lakes frontier. Since the conflict known as the Little Turtle's War (1791–1794), the territory known as the Old Northwest had been a place of constant conflict between Native Americans and U.S. settlers. After the Treaty of Greenville (1795) awarded most of what is now Ohio to the U.S. government, most Indians left the area. Among them were the Shawnee leader Tecumseh and his younger brother Tenkwatawa, sometimes known as the Shawnee Prophet. Tecumseh was determined to put together an inter-tribal confederacy to resist further American incursions into Indian lands. His dream was smashed at the battle of Tippecanoe (1811), when General William Henry Harrison confronted the Shawnee Prophet at Prophetstown and scattered Tecumseh's Native American confederation. Tecumseh promptly joined the British forces in Canada as a commander of auxiliaries. He helped seize Detroit from American general William Hull in 1812 before being killed at the Battle of the Thames (1813). Tecumseh's death marked the effective end of Indian resistance to white settlement in the Old Northwest.

The problem of how to pay for the war was also one that occupied the government of the young republic. One of the reasons that the United States lost most of its battles in the first year of the war was that Congress had made a declaration of war, increased pay for its soldiers and raised money to encourage enlistments, but it had also adjourned before voting taxes or appropriating funds. In March of 1813, Secretary of the Treasury Albert Gallatin was reduced to begging for money through subscribed loans. Gallatin had to call on financial lion Stephen Girard, who had made his money through a shipping business centered in Philadelphia, for help. Girard was probably the richest man in the United States at the time. The same Congress that

War Production Board

had authorized war with Great Britain had also refused to renew the charter of the Bank of the United States—effectively killing off the government’s primary financial institution. Girard himself, along with fur trader John Jacob Astor and a syndicate of wealthy businessmen, underwrote most of the needed loans. In less than two weeks he had sold \$4,672,800 worth of loan subscriptions to the American public, and purchased a further \$2,383,00 himself. Girard’s efforts helped bring about U.S. victories in 1813, and contributed to Great Britain’s willingness to negotiate an end to the war.

The War of 1812 came to an end when British and American negotiators signed the Treaty of Ghent on December 24, 1814. At the time the treaty was signed, events were going on at opposite ends of the country that dramatically affected the future of the United States. New Englanders had long objected to the restrictions placed on trade by Congress as war measures. From December 1814 to January 1815, the Hartford Convention met in Connecticut and published a list of New England grievances. These ranged from undue influence of southerners in Congress to a series of constitutional amendments designed to protect New England from the damaging effects of national actions. The Hartford Convention also established the principle of nullification—the right of a state to overturn a federal law in order to protect the interests of its citizens—a principle that would later be taken up by southern states. At the same time, on January 8, 1815, in Louisiana, General Andrew Jackson was beating the British army at the Battle of New Orleans. Jackson’s victory, along with the news of the peace treaty, virtually destroyed the Federalist Party in the United States. Despite the fact that none of Madison’s war aims had been achieved, many citizens regarded the War of 1812—and the “Era of Good Feelings” that followed it—as an unqualified success.

WAR PRODUCTION BOARD

Federal War Production Board (WPB) was an executive branch office in charge of mobilizing the U.S. economy for World War II (1939–1945). Established within the Office of Emergency Management on January 16, 1942, WPB had authority to obtain financing, enter contracts for procurement of industrial materials, and issue directives to private enterprises. With this authority WPB allocated resources between the military and civilian production sectors. Civilian production that was wasteful or unnecessary was stopped, while scarce or valuable goods were rationed. Quotas on consumer purchases were created for a host of commodities. Commercial automobile manufacturing plants were expanded under the WPB’s direction, and then converted for the production of armored vehicles, jeeps, and bombers. Although WPB was effective at first, its authority eventually became diluted by other agencies with overlapping power, including the Office of War Mobilization. WPB was officially replaced by the Civilian Production Administration on October 4, 1945.

WARNER, JACK LEONARD

Pioneering motion picture executive and producer, Jack L. Warner (1892–1978), along with his three brothers, created Warner Brothers Pictures and turned it into one of the largest film studios in the United States. When Warner Brothers released *The Jazz Singer* in 1927, as the first “talking picture,” it revolutionized the entertainment industry and initiated the movie’s modern era. Aggressive, and at times crude and difficult, Warner epitomized the classic movie mogul during Hollywood’s studio era.

Jack L. Warner was born in London, Ontario, on August 2, 1892, the ninth and youngest boy of the 12 Warner children. His Polish parents, Benjamin and Pearl Eichelbaum, emigrated from Poland in 1890 to live in Canada for a time before moving in 1894 to Youngstown, Ohio. Jack, whose original surname was Jacob, and his three brothers, Harry, Albert, and Sam, were expected to help at an early age with the family’s finances. Harry worked as a cobbler’s apprentice, then

as a meat packer. Albert and Sam held a succession of odd jobs before they began exhibiting movies after they obtained a projector by pawning Sam's prized birthday gift from his father, a gold watch and chain.

A poor student, Jack Warner longed to be a stage performer. He took his middle name, Leonard, from a minstrel performer he admired. Warner's love of the limelight would continue throughout his career. At age 12 he had earned money as a singer in minstrel shows and operettas. In their fledgling movie business, Sam handled the projector, Harry and Albert supervised the advertising and tickets, and Jack Warner sang and danced before and after the picture.

From their humble start the Warner brothers would steadily mount their assault on the young motion picture business, incorporating their holdings as Warner Brothers Pictures, Inc. in 1923. During World War II (1939–1945) Jack Warner served as a lieutenant colonel in the Army Air Force where he organized the first motion picture unit.

The Warner brothers' family movie business started in Youngstown, Ohio, but it was moved to Newcastle, Pennsylvania, where the brothers opened their first theater. In 1903 they converted an empty store with a seating capacity of 99, one seat short of 100 to prevent the theater from being subject to local and state fire regulations. Distribution of films was a problem during these early years of the movie business, and theater owners could not depend on deliveries. To remedy this situation Harry Warner decided to form collaboration with exhibitors and theater owners to exchange films. This eventually became the Duquesne Amusement Supply Company, the first such organization in the country. It was short lived since film producers did everything possible to discourage the arrangement as a threat to their profits. The Warners finally sold the film supply company in 1912. The experience convinced the brothers that if they were to be sure of having movies to show they must make them themselves. They began to make what the trade called "Warner Features" at the old Vitagraph Studios in New York.

Their first blockbuster occurred when they bought the rights to the 1917 book by Ambassador James W. Gerard, *My Four Years in Germany*. The resulting film grossed almost a million dollars. The profits allowed the Warners to shift their operations to California, joining Jack who had earlier established a studio in Santa Paula, California. Now the brothers built a large studio on Sunset Boulevard in Hollywood and incorporated their business as the Warner Brothers Pictures,

Inc. However, in 1923 they were still selling their pictures through independent distributors who advanced them money to make their films. The brothers set out to obtain control of a nationwide distributing system.

Jack Warner married Irma Solomon in 1914 and they had one son, Jack L. Warner, Jr. The couple divorced and Warner married actress Ann Page in 1936. Warner accepted her daughter from a previous marriage, Joy, as his own and the couple adopted a two-year-old girl whom they named Barbara.

In 1925 they borrowed enough money to buy the Vitagraph Company, which had a nationwide distribution system. Success was still precarious, however, and Warner Brothers was close to bankruptcy when the brothers decided to experiment with sound films. In 1926 they released *Don Juan*, starring John Barrymore with a completely synchronized musical score, although Barrymore's voice and that of the rest of the cast were not recorded. Its success encouraged Warner Brothers to make other sound films while improving the sound tracks. In 1927 *The Jazz Singer* became the first true "talking picture." The effect of film speech was electrifying to its first audience; the era of the silent film had reached its conclusion. By 1928 Warner Brothers was a \$16 million corporation and within two years they were worth \$230 million. In 1929 Warner Brothers acquired the Stanley Company with some 250 theater outlets nationwide, which insured audiences for Warner Brothers' movies.

With a head start over their competitors in sound, Warner Brothers became one of the dominant film studios during Hollywood's Golden Era. Warner Brothers' contract players included such stars as George Arliss, Leslie Howard, Paul Muni, James Cagney, Bette Davis, Humphrey Bogart, and Joan Crawford. Jack Warner, as production chief, oversaw such classic films as *Little Caesar* (1930), *A Midsummer Night's Dream* (1935), *The Adventures of Robin Hood* (1938), *Casablanca* (1942), *The Corn is Green* (1945), *Mildred Pierce* (1945), *A Streetcar Named Desire* (1952), *Rebel Without a Cause* (1955), and *My Fair Lady* (1964). Although it produced films in all the genres Warner Brothers' specialty became social issue films. During World War II Warner Brothers became the first studio to direct its resources toward the war effort.

One of the keys to Warner Brothers' success was Jack Warner's intimate and scrupulous attention to detail and his constant economizing. He looked upon the movie industry as any other kind of factory production. Every economy was employed, including repeated use of material, reassembled sets, and a minimum of

Washington

wasted time and space. Warner personally supervised the selection of story material, the assignment and supervision of producers and directors, and the discovery and assignment of acting talent.

In the late 1940s Warner Brothers became the first of the Hollywood studios to go into television production. In 1956 the Warners relinquished financial control of their company, although Jack Warner remained President and largest single shareholder. In 1966, when Warner finally sold his interest in the studio, he received \$25 million after taxes.

Warner lived the life of the stereotypical Hollywood movie mogul in great splendor in his Hollywood mansion. Difficult to work with and often rude, Warner had a reputation for arbitrary firings and feuds with his brothers and son. Like other movie titans such as Louis B. Mayer and Darryl F. Zanuck, Jack L. Warner defined the role of the movie executive during the studio era when individual personalities could dominate every aspect of the making and marketing of movies and their stars.

As the cofounder of Warner Brothers Pictures Jack Warner helped shape the direction of U.S. entertainment through the infancy of the film industry and into its Golden Age, creating some of most important and significant U.S. cultural exports. Images of our society have been so dramatically affected by film portrayals that it is difficult to imagine areas of modern life untouched by film's influence. By exploiting the technical innovation of sound recording, Warner Brothers' created film's modern era.

As studio production chief Jack Warner contributed significantly to the production of many film masterpieces and he helped define the studio system for the production of films that was directly related to their creation. His dominating personality and tight control also helped to set in motion the reaction against the studio system and the wresting away of ultimate control over films to individual directors and actors, which has had both positive and negative impacts on the industry. In today's Hollywood it is difficult to imagine the power of a studio executive like Jack Warner, who was one of the last of his breed of visionary businessmen who helped create the influential mass entertainment industry. Jack L. Warner has contributed in significant ways to Hollywood legend and its unprecedented success as our culture's dominant artistic medium. Jack L. Warner died in Los Angeles on August 2, 1978.

WASHINGTON

According to Gordon V. Dodds in his 1986 history of the American Northwest, life in the states of Washington and Oregon has been marked by “the absence of severe class or cultural or economic or environmental conflict.” It is a “pleasant, undemanding life for most residents. . . . It has been a place where people could start over by escaping from their constraints to carry on the old ways better in a new environment. It is perhaps most typically American in this characteristic of providing a chance to start over.”

The Pacific Northwest must have seemed a very remote place indeed to anyone who wanted to “start over” during the nineteenth century. Because of its rugged coast, distant location, and impenetrable mountains, for centuries Europeans only sporadically visited the region. Sir Francis Drake (1540–96) and some Spanish explorers may have seen the Washington coast in the sixteenth century. The Spaniard Juan Perez explored the northwestern coast in 1774. Other Spanish explorers made the first known landing at the mouth of the Hoh River, but were ambushed by Native Americans. The Englishman Capt. James Cook (1728–79) followed the fur trade to the area in 1792. His fellow countryman George Vancouver (1757–98) later made maps of the Pacific coast and Puget Sound. Fur trading companies such as the Hudson's Bay Company eventually began to attract overland traders as well. Reports from the Lewis and Clark expedition, which first sighted the Pacific from the bank of the Columbia River in 1805, also inspired others to set out for the Northwest.

From the beginning of white settlement, the history of the area was characterized by disputes between Great Britain and the United States. Both countries wanted control of the land and the water ports. The

State of Washington.

border between the United States and Canada was settled in 1846, and the Oregon Territory was organized in 1848. It included the present state of Washington. About this time people were beginning to migrate from Missouri via the Oregon Trail to the present states of Oregon and southern Washington. A new Washington Territory was established in 1853. Most of the Indian uprisings which had hindered settlement in the territory were suppressed during the late 1850s.

Discoveries of gold in the Walla Walla area, in British Columbia, and in Idaho during the 1860s created a boom in the whole region. Immigration swelled following the completion of the Northern Pacific Railroad line to Puget Sound. By 1890 Washington's population had grown to over 357,000, up from just 24,000 in 1870. Lumbering, cattle farming, sheep raising, and agricultural farming were well established in Washington when the territory became a state in 1889. The city of Spokane literally boomed overnight when it became a hub for the Great Northern and the Northern Pacific railroads.

THERE HAS NOT BEEN MUCH TRAGEDY FOR WHITE PEOPLE IN THE HISTORY OF THE PACIFIC NORTHWEST.

Gordon B. Dodds, *The American Northwest: A History of Oregon and Washington*, 1986

The city of Seattle on the natural port of Puget Sound quickly became Washington's premier city. At first a center for coal shipments, it began to serve the lumber trade and expanded its commerce to Alaska, California, Europe, and other cities on Puget Sound. In 1909 Seattle hosted the Alaska-Yukon-Pacific Exposition, which celebrated both the Alaska gold rush and Seattle's own pride in its large seaport.

The era of railroads changed Washington significantly. It became much easier for raw materials to reach Puget Sound, and people were drawn from the eastern regions by promises of good land and unlimited opportunity. Manufactured goods from the East were now readily available to farmers and city-dwellers. In addition better waterways including canals along the

Washington

Columbia to bypass falls and rapids were helping lumber companies get their products to market.

Seattle in particular prospered during World War I (1914–18). Shipbuilding thrived during this period. Radical labor activities thrived as well, and Seattle became the headquarters of the Industrial Workers of the World (IWW). The first general strike in the United States, involving around 60,000 workers, was staged in Seattle in 1919 by the IWW. Centralia and Everett also experienced violent conflict between the IWW and conservative groups such as returning veterans.

Postwar readjustments followed during the 1920s as many farms were lost and the lumber business experienced a downturn. Apples, always a profitable crop for Washington, became even more important during this period as many wheat farms began to fail. By the middle of the 1920s, however, farm income was increasing. Lumbermen had to cope with an inadequate supply of timber because forests had been decimated to keep up with wartime demands, and the U.S. Congress passed several acts designed to provide better conservation of forests.

The Great Depression of the 1930s affected Washington much as it affected most of the country. Markets for field crops and forest products plummeted, and Washingtonians looked to President Franklin D. Roosevelt's (1933–45) New Deal programs for relief. Notable among those in the Northwest were the Grand Coulee and the Bonneville dam projects, which provided hydroelectric power and water for irrigation. More than one million acres were eventually reclaimed for farm production as a result of these projects.

World War II (1939–45) brought a new boom of economic activity, particularly to the Seattle area. The Boeing Corporation quickly established the aerospace industry as the state's primary employer. Boeing's rapid growth strained the housing facilities and infrastructure of the city; between 1939 and 1944 the number of workers employed at Boeing increased from 4,000 to 50,000. Shipyards also employed thousands in Seattle, Tacoma, Bremerton, and Vancouver. In addition, the federal government built the Hanford Reservation nuclear research center. This plant was instrumental in constructing the first atomic bomb and during peacetime was engaged in nuclear-powered electricity generation.

Postwar readjustments were inevitable in Washington as industries and farms began their transition from a wartime economy to a peacetime one. Small farms declined in favor of larger, technologically sophisticated ones; Boeing began its long reorientation to passenger aircraft after years of supplying military

planes; fisheries declined because the salmon supply had rapidly been depleted; and large lumber concerns such as Weyerhaeuser in Tacoma solidified their operations while smaller firms went under.

In 1962 Seattle featured a world's fair, "Century 21," which showcased the city's assets. Rapid population growth marked the 1960s and 1970s, with concentration around Seattle and the Puget Sound area. This trend challenged both government and industry to balance economic needs with environmental protection. Both economic and environmental damage was suffered when an unexpected eruption of Mt. St. Helens's in May 1980 shocked the state and the nation with its destructive power.

A deep recession gripped Washington in the late 1970s. Logging was particularly hard hit. Between 1978 and 1982 employment in wood products industries dropped 30 percent. In the 1990s the economy was recovering after the 1980s expansion of Microsoft Corporation, Boeing, and Weyerhaeuser Paper. In the late 1990s the most important segments of the Washington economy were wholesale and retail trade, manufacturing (particularly aerospace equipment, shipbuilding, food processing, and wood products), agriculture, lumbering, and tourism. Another important segment in the 1980s and 1990s was film production. Many feature films, television movies, and documentaries used Washington locations and added millions of dollars to the economy. Washington ranked fifteenth among the states in per capita income in 1996. By the end of the decade unemployment in the state dropped to around five percent.

WASHINGTON, BOOKER TALIAFERRO

Booker T. Washington (1856–1915) became one of the leading spokespeople for African Americans after the American Civil War (1861–1865). Washington strongly promoted the education of African Americans in practical skills and manual trades—he founded the Tuskegee Institute in Alabama to promote such goals. He became popular among white political leaders for his views on racial harmony, which emphasized economic opportunity over political protest.

Booker Taliaferro Washington was born in Franklin County, Virginia, on April 5, 1856. His mother was a slave who worked as a plantation cook. Washington's father was an unknown local white man who took no responsibility for his son. His mother later married another slave, but her husband escaped to West Virginia during the American Civil War, leaving his family behind. After the war ended in 1865, Booker's family was emancipated and the family was reunited in Malden, West Virginia. His stepfather had found a job at the salt furnaces and young Booker worked with him as a salt packer.

Booker desperately sought an education for himself, but his family needed him to work in order to support itself. His stepfather reluctantly agreed to let young Booker go to school on the condition that he continue to work in the salt mines before and after school. It was in school that Booker acquired his last name; he had only been called Booker until that time. When the pupils at school responded to roll call with two names, Booker named himself Washington. He later learned from his mother that he already had a last name, Taliaferro. So he became Booker Taliaferro Washington.

Washington continued his work at the salt furnaces, took another job at the coal mines, and still pursued his education. It was at the coal mines that Washington learned of the Hampton Institute in Virginia—this was a school dedicated solely to educating former slaves. It was suitable for Washington and his family because students could finance their education by working at the school.

Washington attended the Hampton Institute in 1872, and it proved to be a critical move for his future. It was at the institute that Washington learned of the educational philosophy that would shape his later beliefs and influence his writings. The Hampton Institute focused its program on practical skills and manual

Booker T. Washington.

trades to improve the status of African Americans in the community. The institute emphasized industrial and agricultural education as well as teacher training.

Washington graduated with honors from the Hampton Institute in 1875 and went on to teach in rural schools in Malden. In 1878 he began his studies at the Wayland Seminary in Washington, D.C. He left the school, however, because he found the purely academic and theoretical atmosphere to be too superficial for his tastes. The world of books and ideas did not reflect the reality that most African Americans were living at that time. He appreciated the more practical approach of the Hampton Institute and returned there in 1879 as a teacher.

In 1881 the president of the Hampton Institute General Samuel Chapman Armstrong (1839–1893) recommended Washington for a new position. Washington would be the principal of a new school for African Americans to be built in Tuskegee, Alabama. The school had an annual legislative appropriation of \$2000. It had no campus, buildings, pupils, or staff and Washington had to recruit pupils and teachers to the school himself. He also raised money for buildings and equipment, as the future site of the school was located on an abandoned plantation. Washington's first lessons to his students were practical ones. Students and faculty together planted crops and made the bricks for the new buildings.

At the Tuskegee Normal and Industrial Institute (later named the Tuskegee Institute, and now Tuskegee University), Washington taught the same self-help philosophy that he himself had learned at the Hampton Institute. Washington emphasized manual and industrial education, as well as practical trades such as carpentry, farming, mechanics, and teaching. He additionally emphasized discipline, cleanliness, and thrift among his students. Washington sought to impart to them a philosophy of African American self-sufficiency, and he urged his students to become capitalists. In 1900 Washington put his own teachings into practice and founded the National Negro Business League. The school, however was his real legacy, and he continued to watch his institute grow over the years. By 1888 Tuskegee Institute expanded to cover 549 acres and have over 400 enrolled students. By 1915 the school had 1500 students and a larger endowment than any other black institution.

Washington's influence and educational philosophy, however, extended outside of Tuskegee, Alabama. In 1895 he was asked to address the Cotton States and the International Exposition in Atlanta, Georgia. The event had an all-white audience of about 2000 people. Washington gave a speech at the exposition that was later dubbed the "Atlanta Compromise." The soon-to-be famous speech outlined Washington's proposal for racial harmony in the United States. He explained that self-improvement of African Americans in economic and educational matters would make them more law-abiding and less resentful toward white Americans. This would eventually, he asserted, promote racial harmony. Washington spoke out against the public protests occurring at that time and saw economic advancement as a more effective solution than political demonstrations to racial discord. Ultimately, he accepted racial segregation in exchange for economic opportunities. As he said in the speech: "In all things that are purely social we can be as separate as the fingers, yet one as the hand in all things essential to mutual progress."

Washington's speech was very popular among white Americans, and he soon became a spokesperson for his people. He developed strong ties with northern philanthropists such as Andrew Carnegie (1835–1919), George Eastman (1854–1932), Henry H. Rogers (1840–1909), and Julius Rosenwald (1862–1932). They appreciated Washington's entrepreneurial approach to race issues. Washington also became an advisor on racial matters to Presidents Theodore Roosevelt (1901–1909) and William H. Taft (1909–1913). His advice was sought as well by various governors and members of Congress.

The late 1800s were a difficult time for African Americans despite Washington's calls for racial harmony. Lynchings increased, Jim Crow laws enforcing racial segregation in public were passed, and there were threats of disfranchisement for African Americans in the South. These were clear signs that African Americans needed more than economic advancement to improve their social position in the United States. Other black intellectuals such as W.E.B. Du Bois (1868–1963) and William Monroe Trotter (1872–1934) began to speak out against the "accommodationism" that Washington supported. Du Bois in particular was critical of Washington's educational philosophy. He felt that it discouraged African Americans from striving for a higher education, instead Du Bois supported the opportunity for talented African Americans to attain a college education and serve as leaders of the black community. This opposition to Washington formed the Niagara Movement in 1905. It provided an alternative view to Washington's position of compromise and humility. In 1910 the same group founded the National Association for the Advancement of Colored People (NAACP).

Washington himself realized that economic opportunity alone was not enough to improve the conditions of African Americans. His public position never wavered, but Washington privately supported campaigns against injustice. He anonymously financed lawsuits against disfranchisement and segregation and secretly influenced other legal actions. Washington maintained a demanding public life until he became ill during a lecture series and died on November 14, 1915.

WASHINGTON, GEORGE

George Washington (1732–1799) was commander-in-chief of the Continental forces during the American Revolution (1775–1783). He also served as the first President of the United States and was responsible for building much of the country's political and economic structure. Washington served two terms as president before retiring to his estate in Mount Vernon, Virginia.

George Washington was born at Bridges Creek in Westmoreland County, Virginia, on February 22, 1732. He was the first child of Augustine Washington and his second wife, Mary Ball. His father was a middling planter who owned about 10,000 acres of land. Augustine Washington was also very active in public life, serving as sheriff, church warden, and justice of the peace. George Washington received a basic education, studying math, surveying, and reading. In 1749, at the age of 17, he began working as the county surveyor. This job helped him become familiar with the frontier. With that knowledge and experience Washington was appointed major in the Virginia militia in 1752.

One year later Washington was faced with his first major military challenge. In 1753 the French were encroaching on British territory in the Ohio Valley, and the governor of Virginia sent Washington to dislodge them. This event was the beginning of the French and Indian War (1754–1763). Washington was then appointed as aide-de-camp to General Edward Braddock, who was ordered to oust the French in 1755. A year later Braddock died in combat and Washington was promoted to colonel and commander-in-chief of all Virginia troops; in 1758 he was promoted to brigadier.

When the French and Indian War ended, Washington resigned his commission and returned to Virginia to concentrate on his family. On January 6, 1759, he married Martha Dandridge Custis, a widow with two children. He was a dedicated stepfather and a skilled farmer. He also became actively involved in politics and was elected as representative from Frederick County to the Virginia House of Burgesses in 1758. He then served as justice of Fairfax county from 1760 to 1774.

In the late 1760s and early 1770s tension had begun to mount between Britain and the colonies, particularly over taxation and importation issues. As a legislator, Washington was very involved in colonial affairs. In 1774 he helped write and pass the Fairfax Resolves, which formed the Continental Association and the Continental Army. When the disputes with Britain turned into war, the Continental Congress on

June 15, 1775, unanimously elected Washington to command the Continental Army. Throughout the American Revolution, from 1775 to 1783, Washington served as *de facto* chief executive of the United States. He proved to be a gifted leader with good administrative skills and political acumen. When the war was finally won, Washington handed over his powers to Congress at Annapolis, Maryland, and returned home to Mount Vernon to retire.

However, Washington was soon called back to serve his country. The Articles of Confederation proved too weak to hold the new country together, and in 1786 Washington described the situation as “anarchy and confusion.” In an effort to revise the articles, Washington presided over the Constitutional Convention in 1787. In 1789 he was unanimously elected as the first President of the United States. He began his term by stating: “I walk on untrodden ground. There is scarcely any part of my conduct which may not hereafter be drawn into precedent.”

Washington immediately became involved in the creation of the new government. He created the first Cabinet, establishing the departments of State, Treasury, and War. Alexander Hamilton (1755–1804) became the first Secretary of the Treasury, and together with Washington he developed the country's economic system. On July 4, 1789, Washington signed the first bill passed by Congress. It gave the government the right to tax and was used to pay the debt accumulated by the Revolution and establish American credit at home and abroad. Washington also approved the Federalist financial program and other proposals by Hamilton, including funding the national debt, assuming state debts, establishing a federal bank, creating a coinage system, and establishing an excise tax. In addition to these economic policies, Washington presided over the expansion of the country from 11 to 16 states.

After his first term as president ended in 1792, Washington had plans to retire from political life. His colleagues, however, persuaded him to serve one more term. On February 13, 1793, Washington was once again unanimously elected to the presidency. His second term focused on the young country's foreign policy. In 1793 Washington announced the Neutrality Proclamation to keep the United States out of all foreign disputes. Relations with France and Britain were tested during Washington's tenure, but he managed to keep peace. By 1796 Washington had grown tired of the demands of political life and once again decided to retire. This time he was able to have his way and pacify critics who called him a closet monarchist. On September 17, 1796, Washington published his

Farewell Address and returned home to Mount Vernon following the next presidential election.

His retirement was brief, as Washington was called again to public service in 1798. The United States was on the verge of war with France and President John Adams (1797–1801) asked Washington to raise an army for defense. Washington answered the call to duty, but the threat quickly subsided due to diplomatic negotiations. Once again he resigned his commission and returned to Mount Vernon. Soon after returning home, Washington, suffering from a serious throat infection, died on December 14, 1799. After George Washington's death, Congress unanimously agreed to erect a marble monument, called the Washington Monument, in the nation's capital to pay tribute to the country's first president.

WATSON, THOMAS JOHN

U.S. business executive Thomas J. Watson (1874–1956) assumed management of the International Business Machines Corporation (IBM) in 1924 and built it into one of the world's largest and most respected corporations. As a manufacturer of business machines and computers IBM, under Watson's innovative and inspired supervision, led a revolution in the business world that heralded the information age. By the end of 1955 Watson's last full year as IBM's chief executive officer, he had guided his company from debt to having

total assets of \$630 million and from fewer than 4,000 employees to 41,000. IBM was poised to dominate the emerging computer market and by the 1960s and 1970s it controlled 80 percent of the U.S. market. Due to Watson's effective leadership, IBM had become a model for corporate planning, research, and customer and employee loyalty.

Thomas John Watson was born February 17, 1874, in Campbell, New York. He was educated in New York at Addison Academy. His father urged him to study law when he graduated and offered to pay his college expenses, but Watson was anxious to pay his own way and to begin his business career. Watson took a year-long course at the Elmira School of Commerce and, at age 17, found a job as a bookkeeper in Clarence Risley's market in Painted Post, New York. Soon bored, he took a job as a peddler selling organs and sewing machines.

From such a modest start Watson would eventually emerge as one of greatest and most influential U.S. business executives. He married Jeanette Mary Kittridge of Dayton, Ohio in 1913, and they had two sons and two daughters. The sons, Thomas J. Watson, Jr. and Arthur K. Watson, followed their father to work for IBM.

In 1895 Watson joined the fast-growing National Cash Register (NCR) Company as a salesman. At first the company manager was uninterested in hiring him but Watson persisted, making numerous trips to the company's Buffalo office. After several months he was finally offered a position. The United States was in the midst of a depression and Watson sometimes went many weeks without a single sale. He sustained himself by quoting the tried-and-true slogans and homilies that he later would use at IBM. Despite his early lack of success he received encouragement from his superiors, and within two years Watson had become the top salesman in the Buffalo office. He moved steadily up the corporate ladder to become general sales manager and was given a position in NCR's Dayton home office in 1903. This period was marked by Watson's aggressive assault on NCR's competition, namely the creation of a company to undercut competitor's prices on second-hand cash registers, which proved to be illegal; however, it is unclear whether Watson was aware of this. Watson, along with NCR's president and 28 others, was indicted and convicted for the scheme. An appeals court later ordered a new trial but it was never held. In 1913, in a dispute over an anti-trust legal issue, Watson was fired from NCR though he was presented with a \$50,000 parting gift.

Watson was selected to head the Computing-Tabulating-Recording Company of Elmira, New York,

a small holding company that controlled four small firms that produced punch-card tabulators, time clocks, and other business machines. As company president, Watson acted to secure loans to finance expansion. The move helped the company's gross sales increase from \$2 million in 1914 to more than \$33 million by 1949. Personnel increased from 235 to 12,000 during the same period. Watson was committed to research and development and much of the borrowed funds went into engineering laboratories that produced new machines such as the keypunch, card sorters, tabulators, and eventually the computer. In 1924 the firm merged with International Business Machines Corporation taking its name. By then the business he had taken over had more than doubled in terms of plant size, number of employees, and volumes of sales. As the head of IBM, Watson helped those figures double yet again about every five years during his reign.

In the 1930s a new engineering laboratory was built in Endicott, New York, and IBM entered the electrical typewriter business with the purchase of Electromatic Typewriters, Inc. of Rochester, New York. As the holder of more than 1,400 patents as of 1941, IBM held a virtual monopoly in the field of business machines. IBM would maintain its dominance through Watson's inspired leadership. Having been a salesman Watson devoted considerable effort in training his sales force, insisting that IBM salesmen should know how to install, operate, and repair all the equipment they sold. Working out the three basic steps in the selling technique, the approach, the demonstration, and the closing, Watson insisted that his salesmen stress that IBM sold not machines but service.

Watson's personality and manner defined the IBM corporate identity that extended to its severely conservative dress code and the ever-present stimulating signs that graced IBM offices such as "Aim High and Think in Big Figures," "Serve and Sell," and IBM's trademark, a Watson creation: "Think." Dignified and conservative in his dress and manner, Watson neither smoked nor drank, nor did he take vacations. He worked 16-hour days and spent most of his evenings at the functions of his many employees' clubs. Watson was extremely concerned about IBM's corporate image, and was rigid in his hiring and personnel practices. Before World War II (1939–1945), employees at IBM were exclusively male and white Anglo-Saxon Protestants. Jews, Catholics, blacks, and women were unacceptable to him.

All employees were expected to have a copy of *Men, Minutes and Money*, a collection of Watson's speeches and essays and to be freshly shaved. They were also to wear daily shined shoes, and to follow

their chairman's dress style—dark suits, quiet ties, and white shirts—whether in the main New York office or in the Endicott factory. The IBM image virtually defined the corporate concept of the "organization man." Yet the benefits of conforming to IBM's image were many. *Forbes* magazine declared in a 1948 article that Watson had created "the nearest to ideal working conditions." Watson paid higher wages than did his competition. There were few firings and benefits included health and life insurance, a rarity at the time. IBM workers were made to feel that they were members of a special group who were encouraged for their innovations and originality and they were expected to carry a THINK notebook to record their inspirations.

By 1955, Watson's last full year as IBM's chief executive, the company's total assets were \$630 million, with a domestic work force of 41,000 employed in branch offices in 189 cities and plants in six cities. The IBM World Trade Corporation had 19,000 employees, 11 plants, and 208 branch offices in 82 countries. Watson had seen his struggling company grow into a world giant that would continue, under the direction of his son, Thomas, Jr., to dominate the business machine market and the rapidly developing computer industry.

Watson's principal interest outside of business was as a patron of the arts. He began acquiring paintings when he was only 24, and he was an outspoken advocate of the mutual benefit in joining the world of art with business. At the 1939 New York World's Fair he exhibited paintings by artists from 75 countries and a collection by U.S. artists that IBM had acquired. For many years he served as a trustee at Columbia University and as the president of the International Chamber of Commerce. An adviser to several U.S. presidents, Watson, who never graduated from college, was the recipient of 32 honorary degrees. For offering IBM's considerable research and production capacity to the war effort during World War II (1939–1945), Watson was given the U.S. Medal of Merit. He also received numerous decorations from several foreign countries including the Merit Cross of the German Eagle, which Watson returned to German leader Adolph Hitler (1889–1945) in 1940, stating that the policies of the Nazis were contrary to the causes for which he worked.

Thomas Watson died in 1956, one year after his retirement from IBM. During his tenure as head of IBM, Watson created one of the world's largest and most influential corporations. Dominating its markets IBM supplied the business machines upon which U.S. business depended by creating new products to meet customers' needs. Through the development of data processing equipment and a successful computer line IBM changed the very nature of modern business itself.

Welfare Policy (Issue)

Watson also forged the dominating principles of the corporate culture with its emphasis on company loyalty and team spirit, accomplishing the difficult task of simultaneously encouraging employee uniformity and innovation and individuality.

WELFARE POLICY (ISSUE)

There is no one single date that can be assigned as the beginning of the welfare system in the United States. Instead, both the ideology and the institutions of the welfare state have grown like weeds, cut back occasionally, only to reappear and to establish themselves again. There are, for instance, elements of the welfare ethic in the notion that people have an obligation to look out for one another's welfare going all the way back to the Puritan communities of New England. The "covenant" that each person had with God and with his or her immediate family also extended in some measure to all the inhabitants of the village. This is not to deny that the Puritans expressed the Protestant fixation with individual salvation, and that in this important sense they would make their peace with the competitive individualism of capitalism. But, especially before the rise of a systematic ideology of competitive capitalism in the eighteenth and nineteenth century, the social solidarity of the medieval village also informed the way that people looked at each other. It prompted the expectation that they could look forward to a certain helpfulness from each other. Even when this village world-view was in decline with the rise of the cities, there were still back-water religious communities—the Shakers, the Quakers, the Moravians, the

Amish, and the Utopian communities—and the general frontier neighborliness of cooperative labor exchanges—the barn-raising, corn husking, or quilting parties—that represented a much older tradition. This older, cooperative heritage, mediated by the labor movement and by the socialist tradition, contributed an alternative ethic that formed part of the welfare system in modern U.S. history.

The strength of the dominant ideology of competitive capitalism in the United States has meant that welfare policy has had countless critics. In spite of these attacks, in the twentieth century this welfare movement has been sustained by the great reform movements of the age: the Progressive Movement (1900–1920), the New Deal (1933–1940) and the Great Society (1964–1968). Each of these reform movements looked to the government as the instrument of reform. The cornerstone of the welfare tradition in the twentieth century was the Social Security Act of 1935. This reform came out of popular demands for a national pension system for the elderly. The "Townsend Plan" was the brainchild of Dr. Francis E. Townsend, a retired California physician. The essence of the plan was that the federal government would make monthly payments of \$200 to all citizens over the age of sixty. The sole stipulation was that the money had to be spent within one month. This would stimulate the demand for goods and pull the country out of depression. Five million mostly elderly citizens joined the Townsend Clubs in support of the plan. Although it was unrealistic in its approach to funding the proposed system, the Townsend Plan prompted President Franklin Roosevelt's administration—especially Secretary of Labor Francis Perkins—to consider the plight of the elderly and the Social Security System was the result. This mandatory system of government administered pensions (paid for by contributions from both the worker and the employer) expanded to include a program for unemployment insurance (funded solely by the employer) as well as aid to disabled people and to children.

President Lyndon B. Johnson's (1963–1969) Great Society and his War on Poverty went on from there in its expansion of the welfare system. The War on Poverty set out to reduce unemployment by helping the poor to improve their education, skills, work efficiency, and in general, equip themselves for success in the modern economy. In an effort to get local citizens to involve themselves in the programs, local governments or private nonprofit organizations were required to prepare plans, administer them, and pay 10 to 25 percent of their cost. In the ensuing years, the Job Corps, the Neighborhood Youth Corps, the College

Shown by this graph is the growth of Public Assistance payments by amount and programs from 1940 to 1961.

Work-Study Program, Project Head Start, Foster Grandparents, Upward Bound, Volunteers in Service to America (VISTA), and the Office of Legal Services were all initiated as the War on Poverty's arsenal.

Almost as soon as the programs began, they were met with open opposition. Critics claimed that training costs for VISTA programs averaged more than \$8,000 per graduate, and that nearly half of the graduates failed to find jobs. Others claimed that only a fraction of the poor ever received any benefits. Senator Walter Mondale once chided that the War on Poverty "authorized dreams and appropriated peanuts." Defenders claimed that the policies were stifled by the war in Vietnam.

During President Richard M. Nixon's (1969–1974) administration, the welfare system, partly federal and partly local in character, posed especially difficult problems. Throughout the 1960s there had been a marked expansion of relief rolls, especially in the category of Aid to Families with Dependent Children (AFDC). Between 1961 and 1970 the AFDC caseload rose from 921,000 to 2.2 million families, with an increase of almost 30 percent in 1970 alone. The

federal welfare bill grew from \$2.1 billion in 1960 to nearly \$18 billion in 1972, while the number of persons on welfare rolls increased from 7.3 million in 1961 to 14.9 million in 1972. Fifteen percent of the population of New York, 25 percent of the population of Newark, NJ, and about six percent of all U.S. citizens were on welfare. Of those families receiving welfare in 1971, 49 percent were white while 46 percent were black; 55.5 percent were children, 15.6 elderly, 9.4 percent were blind or disabled, and less than one percent were employable males.

The welfare explosion was attributed to several factors. The poor were becoming more visible as they moved from isolated rural areas into cities. Rising violence and rioting in ghettos convinced many people of the necessity to do something to improve opportunities. VISTA workers, poverty lawyers, and the National Welfare Rights Organization made the poor more aware of their rights and instructed them how to get welfare payments. The Supreme Court overruled state laws that denied benefits to newcomers. And finally the growing productivity of the national economy made the continued existence of abject poverty a less defensible blot on the U.S. way of life.

Welland Canal

The existing welfare system buckled under the new burdens thrust upon it. Critics everywhere condemned it because it required employed fathers to leave the household so that their families could qualify for public assistance. Its procedures were degrading and it helped only about a fourth of the poor. Some reformers proposed that the federal government pay the entire cost of all welfare programs. Some sociologists recommended a system of federal family allowances in which every family, rich or poor, would receive a monthly government payment for each child in the family. But critics of this system pointed to the cost (approximately \$14 billion annually) and charged that it would give poor families an incentive to have more children. Moreover, they claimed that because it wasn't based on need, more than 70 percent of the money would go to families above the poverty line. Other reformers sought to reduce taxation of the poor, arguing that taxes could be brought more in line with ability to pay by reducing sales and social security taxes, and collecting more of the needed revenue through income taxes. But opponents of tax reforms argued that the poor should be made to pay taxes to make them aware of the costs of government, give them a sense of contributing to their country, and make them better citizens.

In 1969, Nixon called for the replacement of the AFDC with a Family Assistance Plan (FAP) that would give every family of four on welfare with no outside income a basic federal payment of \$1,600 a year. There was also a "work requirement" in which recipients with school-age children could be referred to work or training on penalty of forfeiting a part of their FAP payments. Supporters of this path-breaking concept argued that a guaranteed annual income would stimulate economic growth. They claimed that putting money into the hands of the poor would raise consumer spending, stimulate production, and create new jobs, which would take many of the poor off welfare. Between 1968 and 1972, the Office of Economic Opportunity quietly conducted a test of the idea with seven hundred families in five communities in New Jersey and Pennsylvania. The results showed that nearly all of the families with guaranteed incomes worked at least as hard to add to their incomes as other families.

But the idea of a guaranteed income also had many critics. Some Democrats opposed it for partisan reasons (not wanting Nixon to take credit for the program), some because they deemed the benefits were too low and the work requirement too coercive. Some conservative Republicans opposed guaranteed income for being too liberal. Those already a part of the social welfare establishment opposed it because they had a

vested interest in maintaining the existing system. After passing the House of Representatives in 1970, the proposed FAP legislation failed in the Senate. From that point on the Nixon Administration backed off from it, but the idea of a guaranteed income remained on the agenda for the future.

In 1974 a new Supplementary Security Income (SSI) replaced existing federal-state programs for needy aged, blind, and disabled who did not qualify for adequate Social Security benefits. Application of federal standards of eligibility doubled the number of persons eligible to 6.2 million. The federal government assumed responsibility for guaranteeing persons in these categories a minimum income from all sources.

During the 1990s increased pressures to reform the welfare system resulted in the federal government relinquishing a good portion of its administrative, regulative, and enforcement responsibilities to individual states. State legislatures, however, frequently implemented what some liberals claimed were draconian changes in the system—cutting benefits and squeezing the welfare system to the point where welfare recipients were allowed far fewer months of benefits and were pressed to get jobs even if the jobs were so low-paying or so lacking in other necessary features, such as day-care provisions, that incentive to get the jobs was limited.

WELLAND CANAL

The Welland Canal connects Lakes Ontario and Erie. Because of the difference in elevation between the Atlantic and the Great Lakes, a system of canals and locks was required to allow large boats to navigate the connected waterways. (A lock is a section of a canal

that can be closed to control the water level and it is then used to either raise or lower a vessel to another body of water). The Welland Ship Canal is part of this system. It lies entirely within the Canadian province of Ontario, extending 27 miles (43 kilometers) from Port Weller on Lake Ontario (the eastern-most of the Great Lakes) to Port Colborne on Lake Erie. The natural waterway that connects these two bodies is the Niagara River. The height difference of the two lakes (Lake Erie is 326 feet or 99 meters higher than Lake Ontario) makes Niagara's spectacular waterway of falls and rapids unnavigable. The original Welland Canal was completed in 1829. Built by a private company that had secured government loans, the project cost nearly 8 million dollars. In 1833 an extension to the canal was completed. Six years later, Upper Canada (today the province of Ontario) took over the Welland to enlarge the canal to accommodate bigger ships. That project was completed by 1845; a second enlargement was undertaken in 1887. The Canadian government has continued to improve the waterway since. It remains the vital link for shipping between the nation's interior and the Atlantic Ocean.

WELLS, FARGO AND COMPANY

On the morning of January 24, 1848, a construction foreman working for California land baron John Sutter, discovered something shining in the bottom of a ditch. Though Sutter attempted to keep this discovery secret, word soon spread across the country that gold had been found in California. To meet the needs of the every increasing number of Gold Rush pioneers, Henry Wells, William G. Fargo, and other investors formed Wells, Fargo and Company. Initially the company provided three services: banking, expressing (high-speed delivery services), and mail delivery. Five years later, Wells, Fargo and Company added overland stagecoach services. From these humble, yet inspired, beginnings rose a financial giant.

Wells Fargo opened for business in San Francisco on July 13, 1852. The company's banking department, run by banker Reuben W. Washburn, purchased gold from transitory miners, paying for it with standard-issue gold coins and bills of exchange that could be shipped back east. The company provided extensive communications and shipping services as well. To support these new services offices were built in Sacramento and Placer County to express the gold. Wells Fargo also contracted small banking and express firms to service other areas.

In 1855 a bank crisis felled two of California's largest banking houses causing a financial crisis from which Wells Fargo emerged as the primary bank and express company in the California region. The company continued to expand and it soon had over sixty agencies on the West Coast. The 1860s confirmed the dynamic nature of Wells Fargo. The California economy had expanded to include not only placer mining (which extracts material from deposits by hand, dredging, or with hydraulic nozzles) but also agriculture, manufacturing, and hard rock mining; industries of this type required long-term investment. Wells Fargo survived this economic shift while their express and communications services expanded. In 1861 Wells Fargo's growing express service would take over the famed Pony Express, and in 1864 the company provided the first electronic transaction by telegraph.

In 1866 Wells Fargo purchased the Overland Mail and Express Company. This strategic move placed Wells Fargo in control of essentially all express services west of the Mississippi River. However, in 1869 the new transcontinental railroad effectively brought an end to Wells Fargo's stagecoach empire. However, the "iron horse" became a great asset to the company, because it allowed for faster express delivery. Utilizing this faster mode of transportation as well as the new, expanded economy, Wells Fargo began to market agricultural products nationally. The company became the first express company to provide ocean-to-ocean delivery service. Thanks to this service, the earnings of Wells, Fargo, and Company topped one million dollars annually from 1890 to 1892.

Even the economic panic of 1893 could not damage Wells Fargo's financial earnings. By 1899 company earnings were once again over one million dollars. Earnings increased to almost five million dollars by 1909, with profitability soaring to \$27 million in that same year. Soon afterward express business for the company decreased because of railroad disruptions, competition from the U.S. Postal Service, and regulation brought about by the Interstate Commerce Commission. However, by July 1, 1918, Wells Fargo employed 35,000 people in 10,000 domestic offices. This considerable workforce was merged with the American Railway Express during World War I (1914-1918). The express division of Wells Fargo became a subsidiary of American Express, providing secured transportation of funds via armored cars.

The company's banking business merged with the Nevada National Bank in 1905. This move proved to be wise, as Wells Fargo maintained a strong banking presence throughout the Great Depression (1929-1939) and into the 1940s. The company continued to grow.

West Virginia

This growth can be partially attributed to the dramatic increase in the population of California after World War II (1939-1945). However, it is easier to understand the company's expansion by taking a brief look at the many strategic mergers and purchases made by Wells Fargo from 1960s to the late 1990s. In 1960 it merged with the American Trust Company. In 1986 Wells Fargo's purchased Crocker National Corporation and Crocker Bank, increasing the company's assets by \$19.2 billion. Other acquisitions in the 1980s included the personal trust business of the Bank of America (1987) and Barclays Bank of California (1988). A cooperative agreement with The Hong Kong and Shanghai Banking Corporation Limited in 1989 led to the establishment of the Wells Fargo HSBC Trade Bank.

Wells Fargo continued to grow ever larger and stronger throughout the 1990s. In 1990 alone the company acquired four California-based organizations: Valley National Bank, Central Pacific Corporation, Torrey Pines Group (totaling over \$1.5 billion in assets), and Citizen Holdings (with \$207 million in deposits). Wells Fargo merged with First Interstate Bankcorp in 1996. A merger with Norwest Corporation vaulted Wells Fargo to the seventh largest U.S. bank holding company in the United States with a total of \$92.8 billion in assets as of September, 1998.

WEST VIRGINIA

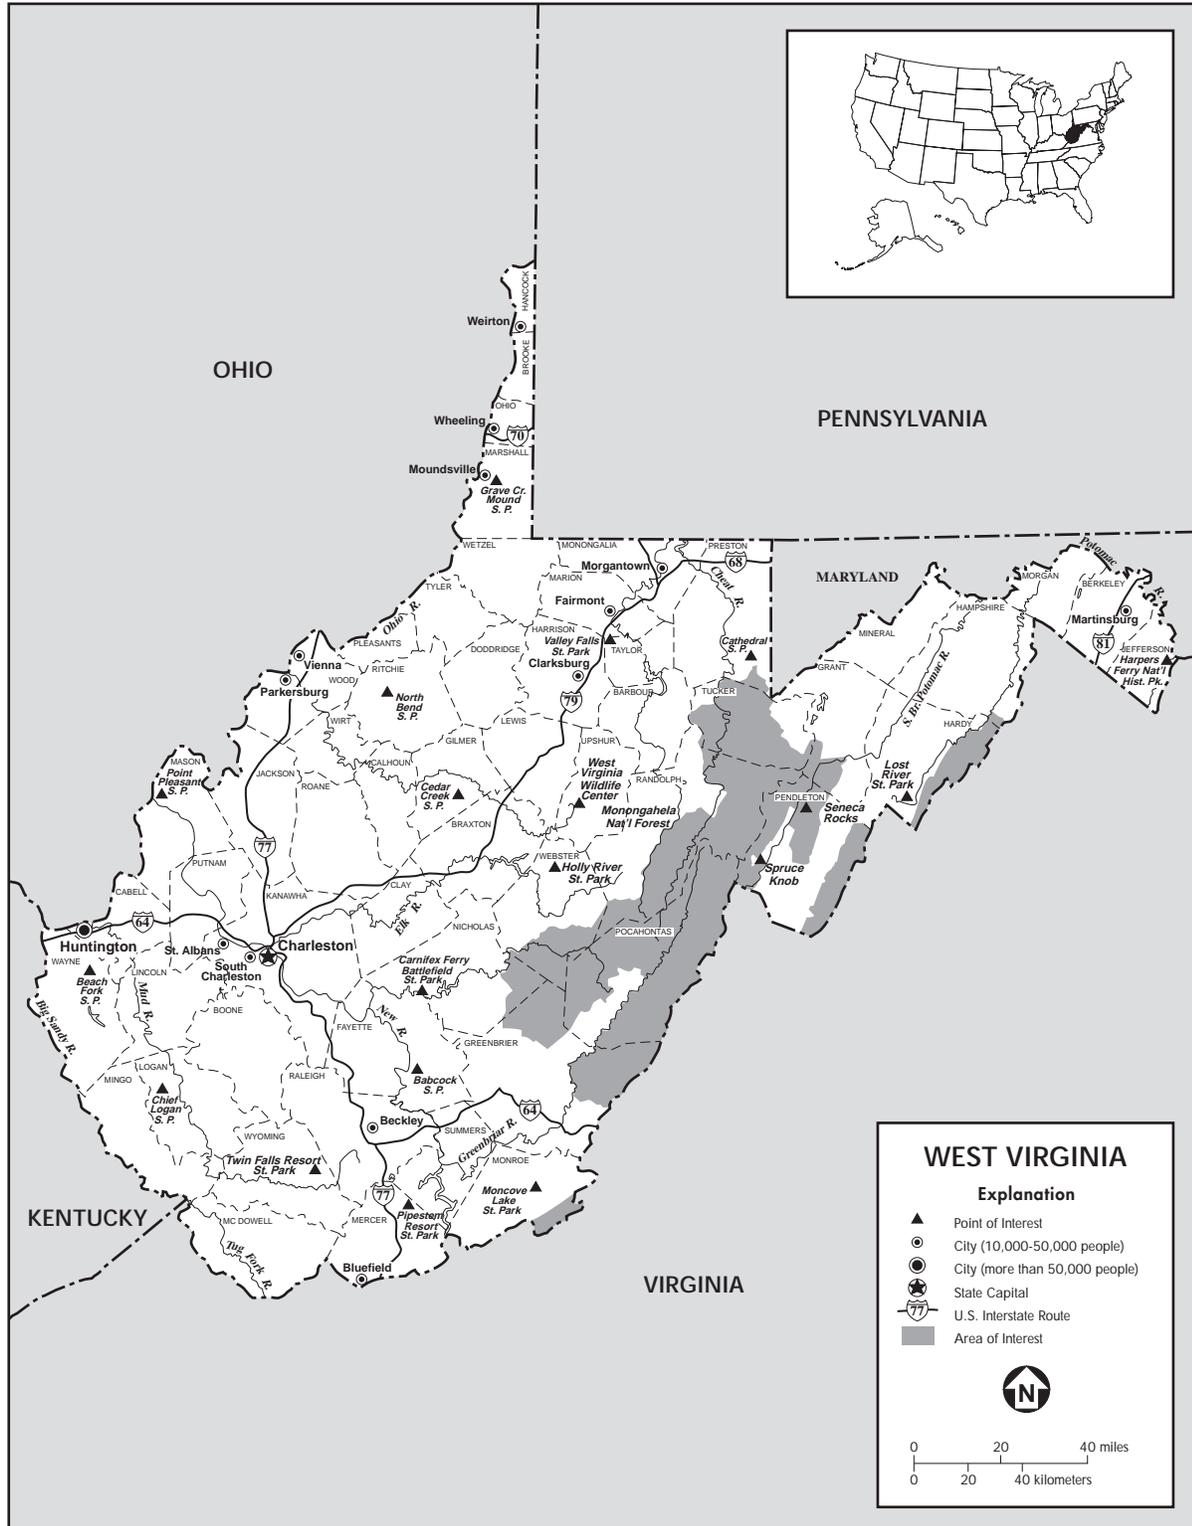

West Virginia is a state full of natural beauty yet it is plagued by economic difficulties. Its rugged terrain has made communication and transportation difficult. Though blessed with coal and timber resources, it has

gone through many periods of economic depression. Although the economy improved throughout the 1990s, West Virginia is still one of the nation's poorest states

In the 1640s, before European settlers reached the land, Iroquois and Cherokee Indians inhabited the area which later became West Virginia. When Europeans did arrive, Shawnees, Delawares, and Tuscaroras disputed their claims. Early explorers were fur traders, two of whom, Robert Fallam and Thomas Batts, claimed the Ohio valley for England in 1671. The French also claimed the area, not surrendered until after the French and Indian War. Several thousand settlers inhabited the eastern panhandle area of the territory by 1750. More settlement in interior sections occurred through the time of the American Revolution (1775-1783), though periodic skirmishes with Indians slowed the pioneers' progress. West Virginia was originally part of Virginia, which was instrumental in forming the Union in 1788.

After the War of 1812 (1812-1814), conflicts developed between eastern and western Virginia. Slaveholding planters dominated the eastern section while the westerners were mostly small farmers or workers in small industries. The east controlled most of the state leaving the west with unequal representation, poor roads, unfair taxes, and other evidence of economic deprivation. In addition, according to one historian, "Most parts of western Virginia were like the Shenandoah region, a true borderland between the North and the South." (John Alexander Williams) Two constitutional conventions failed to settle the differences and it was not until Virginia seceded from the Union in 1861 that West Virginia decided to side with the North and separate from Virginia, entering the Union in 1863 as the 35th state. The state did not gain control of the upper panhandle area until 1871.

Trade developed naturally along the state's rivers in towns such as Wheeling and Harpers Ferry, but traversing the mountainous terrain of West Virginia has always been a challenge. Although Wheeling was the western terminus of the National Road, other roads were slow in coming and often almost impassable. The first successful railroad to be built was the Baltimore and Ohio (B&O), completed to Wheeling in 1852. Later railroads enabled the state to gain access to its timber and coal resources and opened up areas of the interior. The Chesapeake and Ohio, completed in 1873, extended westward from the old Virginia Central to the Ohio River. At its terminus was a new town called Huntington, after the railroad magnate who had financed the line. The two panhandles at the northwestern and eastern ends of the state can be seen as West Virginia's successful attempts to hold on to two important railroad corridors.

State of West Virginia.

The rapid changes brought about by the American Civil War (1861–1865) and by the formation of a new state had some important consequences. Industrialism moved southward and eastward along the expanding railroads and new kinds of communities arose. Lingering rivalries between unionists and secessionists, along with the difficult transitions from an agricultural to an industrial economy, often caused open conflict. In the backward mountain areas, these sometimes erupted into the legendary “mountain feuds.”

After the Civil War governors of both Republican and Democratic parties worked to improve transportation, encourage immigration, and change the tax structure to encourage business. Several powerful senators from West Virginia who had made large fortunes in coal, oil, timber, and railroads held sway over party politics in the state for many years. West Virginia industrialists often cooperated with businessmen from other states, giving the state an almost colonial economy dominated by outside interests. Republican governors of the early twentieth century, notably Stephen B. Elkins, supported progressive legislation such as safety regulations for coal mines, revised corporate tax laws, and highway improvements.

The exploitation of the state’s vast coal resources after 1890 would not have been possible without the state’s network of railroads, especially after the completion of the Norfolk and Western. The same could be said of timber resources: From 1908 to 1911, 1,500 mills produced up to 1.5 billion board feet of lumber annually. Technological improvements in the industry, such as the band saw and the geared locomotive, helped to increase production of lumber and transportation of logs. An unfortunate consequence of this boom period was the destruction of millions of acres of virgin forest. After the 1920s a decline occurred and lumbering was again an important sector of modern West Virginia’s economy.

Since 1890 the United Mine Workers of America (UMWA) had been attempting to unionize West Virginia miners, often with violent consequences. One of the most dramatic episodes in United States labor history occurred in West Virginia in 1920–1921. In Mingo and Logan counties, federal troops were called in to quell miners’ unrest at the Baldwin-Felts mine in 1920. The so-called “Matewan Massacre” involved the deaths of ten men when the conflict got out of hand. When a union member was gunned down in 1921 by a company guard, 3,000 angry miners marched along the Kanawha River, fighting for five days on Blair Mountain with a sheriff’s posse until the violence was quelled by federal authorities, who threatened to use howitzers and poison gas dropped from several U.S.

Army bombers which were deployed at the Charleston airport.

The Great Depression (1929–1939) of the 1930s was devastating to West Virginia, with the greatest effects felt in the coal industry. Volunteer relief workers had difficulty keeping up with the needs of unemployed miners. President Franklin D. Roosevelt’s (1933–1945) New Deal programs, in combination with private philanthropy, brought a measure of economic stability to the state and helped to make the West Virginia Democratic Party the majority party. Later political developments also increased the power of labor unions in the state, particularly the UMWA, under the leadership of the dynamic John L. Lewis.

World War I (1914–1918) and World War II (1939–1945) brought several economic changes to the state as chemical, steel, and textile industries grew up in the Kanawha and Ohio river valleys and the eastern panhandle. Decreasing the state’s reliance on mining, these industries added new economic dimensions to the state and gave it a more diverse character.

After World War II, however, West Virginia’s coal industry went into a state of decline. Mechanization and strip-mining caused many mineworkers to lose their jobs, and many began to immigrate to other states. In 1960 West Virginia was one of the most economically depressed states. Though antipoverty programs in the John F. Kennedy (1961–1963) and Lyndon B. Johnson (1963–1969) administrations brought some measure of relief, the state’s manufacturing and mining industries had declined dramatically. In the early 1980s West Virginia experienced a serious recession, particularly in the steel, glass, chemical, and mining industries. In 1985 West Virginia had the highest unemployment rate in the nation. In 1995 the per capita personal income was still only \$18,444, the second lowest in the U.S., and 16.7 percent of the population lived below the federal poverty level.

In the 1990s things improved for the state in several ways. Industrial production is still strong in the Kanawha, Ohio, and Monongahela valleys. Coal and timber production increased and the state gained a number of federal projects under the tenure of Senator Robert C. Byrd, chairman of the Senate Appropriations Committee. After the completion of Interstate Highway 64, tourism has also become an important sector of the economy. West Virginia’s numerous, well-maintained state parks, glassmaking centers, and historic sites such as Harpers Ferry and the Cass Scenic Railroad have attracted approximately two million visitors a year.

WESTERN UNION CORPORATION

The first electromagnetic communication that revolutionized the world's economic and social life was transmitted on May 24, 1844, by Samuel Finley Breese Morse (1791–1872). At the Capitol building in Washington D.C., in the presence of Dolly Madison, Henry Clay, and other officials, Morse tapped out his famous message, “What hath God wrought?” This telegraphed message, transmitted in Morse Code, traveled 40 miles to a Baltimore, Maryland, train depot and was received in seconds by Alfred Vail (1807–1859), the financier of Morse's telegraph. The era of telecommunication had begun.

When Congress declined Morse's proposal for the government to purchase his telegraph patent, Morse and several partners formed the Magnetic Telegraph Company. Competition among telegraph rivals across the country was fierce. Prepared to compete with 50 other telegraph companies in operation throughout the United States, the New York and Mississippi Valley Telegraph Company (NYMVTC) was formed on April 8, 1851, in Rochester, New York. Five years later the growing NYMVTC was renamed the Western Union Telegraph Company. In 1857 Morse and his Magnetic Telegraph Company teamed up with businessman and financier Cyrus Field (1819–1892) in a project to lay a transatlantic telegraph cable. In the meantime, Western Union had begun the almost impossible task of stringing the first transcontinental telegraph poles to enable coast-to-coast communication. This rapid mode of communication heralded the end of the U.S. government's pony express service. It also saw the end of Morse's Magnetic Telegraph Company. In 1866 Morse recognized that his company could not compete against such a big rival, and in 1866 the Magnetic Telegraph

Company merged with Western Union Telegraph Company. Along with the introduction of the commercial telegraphic machine, Western Union was successful in developing its own transatlantic cable technology. The company was well on its way to becoming the fastest messenger service in the country.

The social and economic impact of the telegraph resounded across the country. As the telegraph lines followed the westward expansion of the railroad, ordinary people paid the expensive fees for communicating quickly across vast regions. Big business and governments experienced the advantages of communication as new services were offered to keep pace with the changing needs of the American people. After Western Union moved its headquarters from Rochester to New York City in 1866, it introduced stock tickers as a method to speed New York Stock Exchange quotes to brokerage firms. One of Western Union's key services was the Money Transfer. Introduced in 1871, this service was still used in the late 1990s.

Time was not yet standardized across the country, so in 1870 Western Union developed its own time service. The nation's tallest building in 1877, built by Western Union, had a time ball at the top, which dropped at noon on a signal telegraphed from the U.S. Naval Observatory. The need for a standardized time schedule was becoming apparent for safety factors and to avoid confusion as communication across the country became more immediate. Generally acknowledged by the public as the most reliable regulation of time, the official start of Standard Railway Time was signaled in 1883 from the descent of the Western Union time ball. With clocks that rang school bells, blew factory whistles, and flashed signal lights Western Union became known as “The Nation's Time Keeper.”

The technology of communication advanced rapidly. Western Union began using radiotelegraph to reach people on ships. Telegrams became extremely popular. The key and sounder had been replaced by the teletypewriter, only to be replaced by Western Union's introduction of the telex, a direct dial customer-to-customer teleprinter service in 1958. The telex would go on to serve as Western Union's second chief source of revenue. Mailgram messages began in 1970, becoming very popular for social and commercial use due to overnight delivery. The operation of the first domestic satellite communication system, Westar, was launched in 1974. By 1982 Western Union became the first U.S. company to have five satellites in orbit. For many years Western Union up-linked messages, data, and graphics to Westar satellites from major publishers, broadcasters, and corporations, and delivered the information across the country at the speed of light.

Westinghouse, George

As early as the American Civil War (1861–1865) Western Union was contracted by the U.S. government to provide direct messaging to the White House communications room. Services included the filling of special money transfers, ensuring messaging needs were met and delivered to the troops during wartime, and delivering military orders of condolence for the armed forces. The services provided by Western Union to the government grew widely in the years following the Civil War. The company was chosen to provide communication for the Department of Defense, linking agency offices and supplying microwave communications for defense and intelligence agencies. A Western Union network connected the Federal Reserve member banks to a central computer center. Through Western Unions networks, law enforcement agencies exchanged data, and the Federal Aviation Administration provided flight and weather information to pilots.

Generations of people associated Western Union with hand delivered messages announcing births, deaths, homecomings, and even proposals of marriage. Western Union's telex business experienced success as the company continued to focus on other innovative business ideas. By the 1960s, however, telegraph use was waning as the telephone became the preferred method of communication. When it became cheaper to send data by telephone, the telex business began to suffer. Western Union was on the decline.

Since 1987 Western Union experienced many corporate and business changes. Despite its many past successes, the company found itself on the verge of bankruptcy in the early 1990s. On April 18, 1991, Western Union Corporation shareholders changed the name of the company to the New Valley Corporation in an effort to distance the failing enterprise from its successful subsidiary, Western Union Financial Services. New Valley assumed existing debts, but these soon skyrocketed to \$800 million. In 1994 a bankrupt New Valley sold Western Union Financial Services Incorporated, all the Western Union money transfer trademarks, and trade names associated with the Western Union name, totaling \$1.19 million. Utilizing this capital, New Valley continued to function, posting significant financial losses well into the late 1990s.

WESTINGHOUSE, GEORGE

George Westinghouse (1846–1914) was an inventor who applied his talents to the railroad and electrical industries. He was a prolific inventor who obtained more than 400 patents during his career, best known for developing and promoting the alternating current power system as a substitute for direct current.

George Westinghouse was born in Central Bridge, New York, on October 6, 1846, the eighth of ten children. When Westinghouse was ten years old, his father moved the family to Schenectady, New York, where he opened a machine shop. Westinghouse worked in his father's factory as a child and gained experience and skill using a variety of machinery. In 1863 he enlisted in the Union Army as a private, serving during the American Civil War (1861–1865). One year later he became a third assistant engineer in the Navy.

After his military service ended, Westinghouse briefly attended Union College and continued to help in his father's factory. In 1865 Westinghouse received his first patent for a rotary steam engine. That particular product was not successful, but it was the first of many patents for Westinghouse. He next became interested in the workings of the railroad.

Westinghouse's first big success as an inventor came in 1869 when he patented an air brake for railroad cars—until that time, trains were stopped with manually-operated brakes. Westinghouse developed a compressed air brake, which was later improved through 20 additional patents. This invention led to the organization of the Westinghouse Air Brake Company in 1869 in Allegheny, Pennsylvania. He continued to improve the brake system and developed a revolutionary automatic train brake in 1872. His inventions greatly improved the railroad industry by allowing trains to operate safely at higher speeds.

In addition to brakes, Westinghouse was interested in other aspects of the railroad. With the increasing volume of rail traffic he saw the need to improve the signaling devices and interlocking switches of railroads. He studied European signaling systems and worked on signaling improvements using the combination of compressed air and electricity. In 1881 Westinghouse formed the Union Switch and Signal Company. Once again, his ideas made the railroads safer and more efficient.

Westinghouse's inventions, however, were not limited to the railroad industry. In the early 1880s Westinghouse applied some of his ideas about compressed air to the new natural gas industry. A well drilled in the yard of his home served as the source of several dozen inventions for controlling and distributing natural gas. Westinghouse invented a reduction valve for natural gas which allowed the gas to be transmitted at high pressure but distributed at low pressure.

This interest in natural gas then led Westinghouse toward involvement in the control and distribution of electricity. Westinghouse believed that a device similar to the reduction valve could be applied to electricity. Once again he studied European systems to see what could be applied to his new project. In 1886 he formed the Westinghouse Electric Company to develop and promote the use of alternating current electricity. A researcher for his company, Nikola Tesla (1856–1943), designed a polyphase system of alternating current and applied it to motors and lights. Westinghouse was one of the first inventors to understand that cheap, long-distance electrical power could come from transformers that would convert high alternating voltages to lower voltages at the point of use.

Westinghouse's revolutionary idea was initially tough to sell to the public. His main opposition came from Thomas Edison (1847–1931) and his company, which supported direct current rather than alternating current. Westinghouse slowly established a foothold in the electrical industry. By 1890 his company had installed more than 300 central power stations. The first big test for the system came in 1893 when Westinghouse won the contract to supply electricity for the World Columbian Exposition in Chicago. Westinghouse produced an impressive show of a quarter of a million lights. This success led to a new contract to build three generators to harness the power of Niagara Falls. The success of that project established the effectiveness and efficiency of alternating current power. In less than ten years Westinghouse had been able to convince the public of the value of

alternating current power. Soon afterwards 95 percent of all electrical power produced was alternating current.

Despite the success of this invention, the Westinghouse company ran into some financial troubles in the early 1900s. In 1907 the company went bankrupt due to the general business crisis and financial panic of the time. Westinghouse regained control of the company a year later, but could not quickly recover its prosperity. In 1911 he retired from active management of the company, though he continued to experiment with new products.

George Westinghouse died in New York City on March 12, 1914. The Westinghouse Company continued to market the alternating current system as well as electrical devices that worked well with the new system. To this end the company developed many new innovations during Westinghouse's lifetime and afterwards. Among these were the first steam turbine for an electric utility, the first mail roll drive for a steel mill, the first American-built tungsten lamp, the first commercial radio station, and the first television camera tube.

WESTWARD EXPANSION

The United States inherited, in essence, the British empire's imperialistic tradition and it eventually became a global power that surpassed Great Britain. In 1790, however, the United States held less than 900,000

The expansion generated major socio-political and economic issues. Should American Indian tribes be treated as conquered subjects or as sovereign nations? How could the then-limited federal government defend ever-expanding boundaries, provide safety to its citizens, and ensure stable social order? How could a market economy develop where no infrastructure existed? How could the vast raw materials of the West be transported to the emerging eastern industrial centers?

square miles of territory. Much of the land was still claimed by indigenous societies, and the borders were contested by various European nations. Yet, the notion of national expansion was ingrained in the minds of the young nation's citizens.

The general unifying philosophy of manifest destiny propelled desires for national expansion. Use of the term first appeared in 1845 in the context of the impending Texas Annexation. Coming from a quasi-religious ideological base, manifest destiny was a belief that Americans were a chosen people who were ordained by a higher power to carry forward the ideas of liberty, civilization, and individual economic opportunity while assuming control over more and more lands. This belief grew partly from Charles Darwin's (1809–1882) biological theory that only the fit survive and prosper. Many believed the United States was a nation of destiny, an inevitable self-fulfilling prophesy.

In actuality, reasons for expansion continually varied with changing domestic politics, economics, and military needs. The strong desire for a substantial land base to support a free market society was an early major factor. In order to grow, the capitalistic economy and republican form of government needed surplus land and abundant natural resources such as wood, fossil fuels, minerals, and water. Many feared that without a surplus the parceling of limited resources to a growing population would eventually lead to class conflict. Not everyone embraced this philosophy. Some believed that conquest, particularly the continuing subjugation of Indian societies, was not in keeping with Christian or democratic ideals. Anti-expansionist sentiments heightened when a clearly imperialistic war broke out against Mexico in 1846.

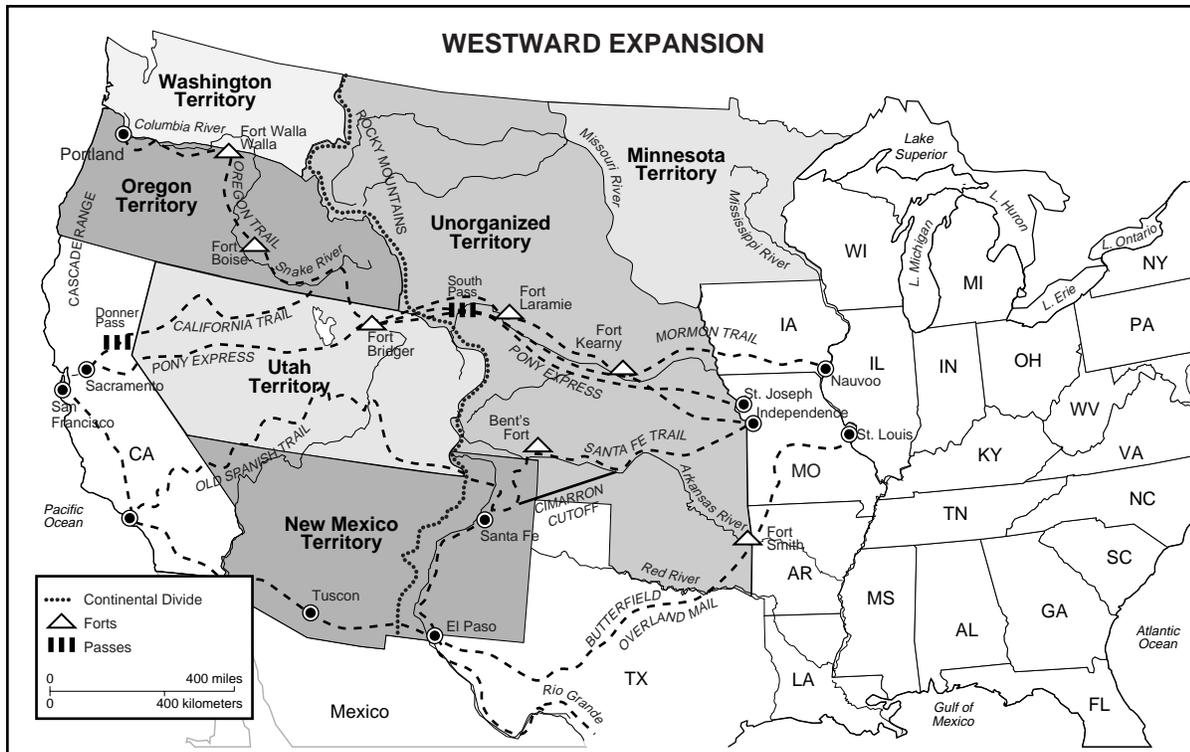

Major events marked the geographic expansion to the West. The Louisiana Purchase in 1803 almost doubled the size of the United States with the addition

of over 827,000 square miles. The lands included the future state of Louisiana and the entire Plains region between the Mississippi River and the Rocky Mountains north of Texas to the 49th parallel at the Canadian border. The Lewis and Clark Expedition (1804–1806) to the Pacific Northwest provided accounts of vast open spaces, rich soils, fast flowing rivers, and abundant game, and it thus gave impetus for further westward expansion. Driven by the prevailing Jacksonian populist ideals of economic equality, the country greatly expanded its borders in the 1840s under the policies of presidents John Tyler (1841–1845) and James Polk (1845–1849). The United States annexed the Republic of Texas in 1845, adding another 390,000 square miles. An 1846 treaty with Britain added the 286,000 square mile Oregon Territory stretching from the Rockies in Montana to the Pacific Ocean, including later Oregon, Washington, Idaho, and western Montana. Following the war with Mexico, the 1848 Treaty of Guadalupe added another 529,000 square miles, including the future states of California, Arizona, New Mexico, and Utah.

As the growing slave-based cotton economy attracted new settlers into the Texas Republic, emigration over the Oregon Trail to the Pacific Northwest began in earnest in 1843. Also due to a serious economic depression in the early 1840s and declining living conditions in eastern communities, the emigrants annually leaving the United States on the Trail substantially increased in number by 1845. Discovery of gold in California in late 1848 led to the fabled Gold Rush of 1849. Within thirty years gold was found in almost every region of the West. Western agriculture that was first established in many areas to support local mining booms now expanded producing surplus for export elsewhere in the United States.

The expansion generated major socio-political and economic issues. Should American Indian tribes be treated as conquered subjects or as sovereign nations? How could the then-limited federal government defend ever-expanding boundaries, provide safety to its citizens, and ensure stable social order? How could a market economy develop where no infrastructure existed? How could the vast raw materials of the West be transported to the emerging eastern industrial centers?

American Indian sovereignty was recognized in the 1850s through numerous treaties in which Indian groups ceded property rights to vast tracts of western land. In exchange they retained lessor lands and various promises of governmental assistance. These initially sizable reservations were later commonly reduced through governmental coercion as settlers crowded in and gold was discovered.

By the late 1840s, thousands of settlers had moved toward the West. They settled along many now famous trails.

During the 1850s and 1860s the United States underwent a revolutionary socio-economic transformation from a largely rural agrarian, slow-paced, fragmented society to much more closely integrated nationalistic society. In addressing socio-economic needs, the U.S. government adopted increasingly liberal land policies to facilitate settlement. By 1862 a person could obtain title to 160 acres of land for only a small filing fee and five years of working the land (a policy designed to also discourage land speculators). As the more productive lands filled, Congress passed revisions increasing the size of claims to foster economic self-sufficiency. These federal land laws promoted Jeffersonian ideals of widespread family ownership of farms; they also raised substantial revenue for the still young nation; and they supported infrastructure developments for transportation, education, and general economic development.

As for the infrastructure, most emigrants who sought new lives in the West brought their cultures with them. Starting anew with old ways, they replicated familiar churches, farms, house styles, and towns. The emigrants most often arrived in kinship clans and worked together in temporary labor pools and mutual interdependence to become economically viable; they also received considerable assistance from government subsidies.

Regarding the transportation dilemma, development of the West was closely tied to railroad construction. In 1862 Congress passed legislation authorizing construction of two railroads that eventually linked the Mississippi valley with the Pacific Coast in 1869. To promote settlement and economic development, the government provided generous subsidies in land grants and loans to railroad companies. Thus the railroad companies became the first big businesses of the United States. They held enormous power that was sometimes reflected in fixed prices and interference in state and local politics. The economic panic of 1873 and following depression slowed their expansion, but by 1877 railroad construction resumed. Three more transcontinental rail lines were completed by 1883: the Northern Pacific, Santa Fe, and Southern Pacific.

U.S. expansion in North America was essentially completed by 1867, when the United States purchased the 590,000 square mile territory of Alaska from Russia for \$7.2 million. Over a century later, the midpoint for population distribution in the United States for the first time moved west of the Mississippi River.

WEYERHAEUSER COMPANY

Weyerhaeuser Company, based in Washington state, was incorporated as Weyerhaeuser Timber Company in 1900. The company was a joint venture between railroad magnate James J. Hill of Pacific Northwest Timber, and Frederick Weyerhaeuser, joint owner of Weyerhaeuser and Denkmann—a Midwestern lumber company that relied on Wisconsin and Minnesota forests. Prior to World War I (1914–1918), the company was run by Frederick Weyerhaeuser, a German-born immigrant to the Midwest. His business philosophy evolved over his lifetime and became the operating philosophy for the new company. Weyerhaeuser felt that “The way to make money is to let the other fellow make some too.”

Timber holdings doubled in the period preceding World War I. The company opened a sawmill to produce lumber and soon had the nation’s first all-electric lumber mill in 1915. Although demand for lumber for railroad cars declined during World War I as steel was more heavily utilized, demand for lumber for military planes and other military uses increased.

John P. Weyerhaeuser, eldest son of the founder, led the company during the war and through the 1920s. He relied heavily, as his father had, on George Long, general manager from 1900 to 1930. Long, an early proponent of reforestation, approached the federal government before World War I to lobby for cooperative

forest fire prevention and for lower property taxes for timberland to make reforestation economically viable. This lobbying led to the Clark-McNary Act in 1924, which addressed these issues and expanded the national forest. The act also encouraged changes in taxation policies at the state level to promote reforestation. Weyerhaeuser responded by creating the Logged Off Land Company in 1925 to handle the sale of “logged off” land, study reforestation, and lobby at the state level for lower timberland taxes. By the end of the 1920s Weyerhaeuser was the largest private owner of timber in the United States.

The Great Depression (1929–1939) produced hard times for the company, as few businesses or homes were being built. The depression in the lumber market would have been devastating if not offset by the company’s 1931 diversification into pulp (a wood-derived raw material in the manufacture of paper, paperboard, and other products). By 1933 profits from pulp offset losses from lumber. In 1940 the company expanded its lumber business to include plywood and paneling. In 1941 the company started the first tree farm in the United States, near Gray’s Harbor in Washington.

Rapid technological and commercial changes in the lumber industry following World War II (1939–1945) affected Weyerhaeuser. The hand-operated whip-saw was replaced by the power chain saw, and truck hauling replaced hauling by rail. Pent-up demand in construction, from the 1930s and early 1940s, led to greatly increased sales of lumber in this postwar era. Under the continued leadership of the Weyerhaeuser family, the company expanded into particle board production, ply-veneer, hardboard, and hardwood paneling in the 1950s. Timberland holdings expanded beyond the Pacific Northwest for the first time, as land was purchased in Mississippi, Alabama, and North Carolina. In 1959, with its increased diversification, the company dropped “Timber” from its official name to become Weyerhaeuser Company, and adopted its current trademark, a triangular tree over the word “Weyerhaeuser.”

In 1960, and for the first time in company history, the presidency of Weyerhaeuser passed out of the family to Norton Clapp. Under Clapp the company went public in 1963 and expanded overseas, into Japan. George Weyerhaeuser succeeded Clapp as CEO in 1966, and served until 1988. The volcanic eruption of Mount Saint Helens in May 1980, was a setback for the company. Weyerhaeuser’s Saint Helens Tree Farm was just below the mountain’s dome and the company lost 68,000 acres of timberland. By 1983 the company

had completed a timber salvage program and replanted 18 million seedlings in the volcanic area.

As part of a diversification program, Weyerhaeuser entered the insurance, home building, mortgage banking, garden products, pet supplies, and disposable diaper markets in the 1970s and 1980s. These new ventures added little to the company's profitability. Under John Creighton, who became president in 1988, Weyerhaeuser returned to a focus on forest products. Weyerhaeuser strengthened its core businesses through the purchase of two pulp mills, several sawmills, and approximately 175,000 acres of timberland in Georgia from the Proctor and Gamble Company in 1992 for \$600 million. By the end of the twentieth century, Weyerhaeuser was the world's largest private owner of softwood timber and the world's largest producer of softwood lumber and market pulp. Weyerhaeuser had annual sales of nearly \$11 billion and owned 5.3 million acres of timberland in the United States.

WHALING INDUSTRY

Whaling is an ancient industry. There is evidence that whales were hunted along the coasts of Alaska and Siberia since 2000 B.C. The first mention of it in European sources dates from A.D. 875, but it is uncertain whether this is a reference to harvesting beached whales or to hunting them at sea. Although whaling in some form was conducted throughout the Middle Ages by the English, French, Icelanders and Norwegians, there is no clear proof that live whales were captured in

A sailor's life is a hard life. (They) are exposed to many hardships, (of) which those of us who reside on land have no conception. Even when our ships are commanded by a pious man, the influence of the seaman is often very bad; and many are the young men who have left home with good habits, but when they have returned, they have become dissipated.

Reverend Daniel Lord, Pastor, Mariner's Church of Boston, July 30, 1841

Europe until 1575, when they were hunted in the Bay of Biscay. New England colonists brought the practice from Europe and made whale meat a part of their diet.

By the seventeenth century whale hunting was on the increase. Whale oil, which was produced when the animal's blubber (fat) was boiled down, was in great demand for lubrication and as a fuel for illumination. Realizing its commercial potential, the Massachusetts government encouraged the industry in 1639 by stipulating that whaling ships were exempt from taxation for seven years, and that members of the crew were free from their military obligations during the fishing season. The first organized whale fishery in North America was found on Long Island (an island near New York City) sometime after 1640, but Nantucket (an island off the coast of Massachusetts) had become the center of the industry by the late seventeenth century. These early whalers hunted the right whale, a forty-four foot mammal that migrated south to spend the winter off the American coast. The sailors slept in their own beds at night, since whales were spotted from lookout stations on land and caught near the shore by men in small boats. The animals would be dragged to the beach, where their blubber was removed and boiled down (the contemporary term was "tried out").

In the eighteenth century the growth in population and the beginnings of the Industrial Revolution increased the need for whale oil. It lubricated machines and fueled the lamps that illuminated the streets of major cities. It cleaned wool in textile mills and became a base for paint. By the middle of the century, spermaceti, a waxy solid that was extracted from the whale's head, was made into candles that were excellent sources of light and had a pleasant odor. It was also used for ointments and perfumes.

The increased demand for oil coincided with the hunting of the sperm whale, which began around 1812.

Whaling Industry

American commercial whaling was at its height in the 1840s and 1850s. Although whale's are still illegally hunted in various countries, the industry has been abandoned by America.

Its heads contained spermaceti and also a reservoir of oil that was known for its purity and lightness. In general the oil from sperm whales burned more brightly than that from right whales, and it was marketed separately. Since sperm whales preferred deep water, whalers built large ships were built that were capable of sailing in the open ocean. These vessels contained tryworks, equipment that allowed the sailors to render the oil at sea. Since sailors no longer had to return to shore after each kill, the new technology completely changed the nature of the industry. Voyages could last four or five years, and American whaling slowly spread to all the oceans of the world. The industry began to have an influence on U.S. diplomatic policy, playing a role in the opening of Japan, the purchase of Alaska, and other important events.

Larger ships and long voyages meant that the crew could be divided according to their social standing. The officers, who were usually white and middle class, ate better food and lived in the rear part of the ship, where they had more space and privacy than the crew. The

captain would have a parlor and bedroom. Many took their wives and sometimes their children to sea with them.

Ordinary sailors were usually poor whites, African or Native Americans. They were forced to live in cramped quarters in steerage or in the forward part of the ship. They ate food that was at best barely palatable and at times rancid. Fresh fruits or vegetables were rare, and death by scurvy, a disease caused by a lack of vitamin C, was relatively common. Nathaniel Robinson, a young man who went to sea in 1843, disliked the salt-cured horse and tar-like molasses he had to eat. He was particularly repelled by a pig's snout with bristles attached that he saw floating in a pan of food. Robinson became deathly ill on the voyage and died the day after he returned home.

Life aboard ship could be monotonous, but when a whale was sighted there was a flurry of excitement. The ship sailed near the creature and lowered whaleboats, which were about thirty feet in length and carried six men. The whale was approached carefully, so it would not become frightened, and so the harpooner could stand and steady himself. When he struck the animal, it would often dive to tremendous depths. The boat usually contained about 18,000 feet of line, which could be attached to the harpoon, and which whistled and burned as it spun out, following the diving whale. At times the whale would not dive, but swim along the surface at tremendous speed, taking the whaleboat on what was known as a "Nantucket sleigh ride." Once the sailors survived the stricken beast's initial reaction, the long process of weakening the whale by tightening and slackening the rope began. It could take seven hours to exhaust the whale. When the animal became tired, the whaleboat would pull along side and an officer would kill it by plunging a six-foot razor-sharp lance into its lungs. The entire hunt was fraught with danger. Sailors had to avoid the whale's powerful fins and jaws, and the animals were known to attack the whaleboat, crushing or capsizing it. In 1820, the mother ship itself, the *Essex*, was rammed twice by sperm whale and sank, losing nearly half the crew.

The proceeds from the sale of the oil were divided between the owners of the vessel and the crew. Those who owned the ship or provided the capital investment took at least a quarter and usually much more of the profit. Often ownership was shared among a number of investors to lessen the risk. Captains could receive ten times as much as seamen. The rest of the crew's pay was proportionate to their tasks, and those who performed menial jobs obtained the least. The owners often lent the crew money to purchase their equipment, and often they charged 25 percent interest for their

loans. In addition the ship usually had a company store, where the men could buy tobacco, clothes, and other sundries at high prices. After deducting their expenses, seamen might earn little for their hard and dangerous work. In 1844 John Murray returned from a voyage on the *Milton* for which the captain was paid nearly \$6,000.00. Murray's wages after expenses amounted to ten cents, but the owners gave him an extra \$10.00 on condition that he press no legal claim against them.

I WANT ONE MORE WHALE BAD. WE HAVE GOT BUT ONE MONTHS SALT MEET (MEAT) IN THE SHIP BUT I WOULD NOT MIND (STAYING) UNTILL THAT IS GON AND THIN LIVE ON FAITH UNTILL WE GET IN WHERE WE CAN GET SOME MORE.

Master of the *Roman*, His ship "intirly encircled with (Arctic) Ice", September 1853

American commercial whaling reached its height in the 1840s and 1850s, when at one point 700 of the 900 vessels engaged in the industry were registered in the United States. By that time New Bedford with its deeper harbor had surpassed Nantucket as the nation's whaling capital. Whaling began to decline after 1859, when oil was discovered in Pennsylvania, and kerosene, an oil derivative that burned more brightly, surpassed whale oil as a fuel for lamps. The Civil War (1861–1865) also damaged the industry, as Confederate raiders wreaked havoc on the largely defenseless whaling fleet. In addition, over-fishing made whales more difficult to find. By the late 1860s the business had contracted by 70 percent. It was saved by an increased demand for baleen, bony slats from the upper palate of certain whales that were used to strain food. It was excellent for making combs or umbrellas, providing support for corsets, and filling out Victorian skirts. Yet baleen could not prevent the eventual failure of the American whale industry, which declined by 20 percent every five years throughout the second half of the nineteenth century. With the development of spring steel in 1907, even the baleen market collapsed.

Whaling has continued in the twentieth century but not as an American industry. Indigenous peoples, many of whom live around the Arctic Circle, continued to hunt whales, and countries like Japan, Norway, Iceland, the Soviet Union (now Russia) and others engaged aggressively in the practice. The whale still provided many saleable products. Hydrogenated whale oil can be used for margarine, and bowhead whale oil is still the best lubricant for watches or clocks. Whale flesh is a valuable source of meat, and vitamins can be extracted from their inner organs. Whalebone can be ground for livestock feed.

The whaling nations built large factory ships that could drag the entire animal on deck for processing. They were so efficient that in 1946 the International Whaling Commission (IWC) was established to save the creatures from extinction. In its first 40 years the commission made little progress, but in 1986, a moratorium went into effect that banned all commercial whaling. Canada left the IWC in 1982 in order to protect the hunting rights of its native people, and Norway resigned in 1992, maintaining that some types of whales could be harvested without endangering the species. Japan takes about 500 minke whales a year for "research" purposes. The fear however, that whales may become extinct have made them a symbol for the Conservation movement. Although the United Nations has banned all commercial whaling, Japan, Norway, and Canada continue to hunt these creatures.

WHISKEY REBELLION

In June 1794, innkeeper John Lynn agreed to sublet part of his rented house in western Pennsylvania to John Neville. Neville was an excise inspector whose job it was to make sure that the federal tax on whiskey was collected from the backwoods frontiersmen. When the news circulated that Lynn was sheltering a tax collector in his home, however, a dozen armed men went to the inn. The men kidnapped Lynn, carried him into the woods, stripped him naked, shaved off his hair, and coated him with hot tar and feathers. After extracting a promise from Lynn not to allow his house to be used as a tax office and not to reveal their identities to the authorities, the men tied him to a tree and left him overnight in the middle of the forest. Although Lynn kept his promise, the notoriety he gained from his association with the tax ruined his business. Events like

Whiskey Rebellion

Lynn's kidnapping threatened federal tax collectors all across western Pennsylvania during the summer of 1794. They marked the beginning of what became known as the Whiskey Rebellion—the largest and most serious challenge to federal authority yet faced by the new United States.

The Whiskey Rebellion had its roots in the period around the American Revolution (1775–1783). Before the war hundreds of families crossed the Appalachian Mountains, searching for better, cheaper land. They were accompanied by an equal number of land speculators, who were working for rich colonial interests. The speculators laid claim to hundreds of thousands of acres of the best farm land in the name of men who already owned thousands of acres in Virginia, Pennsylvania, New York, and elsewhere. George Washington (1789–1797), who had trained as a surveyor, was one of the largest buyers of land. He owned more than 63,000 acres in western Pennsylvania by the time he became president. Absentee landowners like Washington claimed most of the best land, and the poor farmers were forced to survive on the remnants.

A COMPETENT FORCE OF MILITIA SHOULD BE CALLED FORTH AND EMPLOYED TO SUPPRESS THE INSURRECTION AND SUPPORT THE CIVIL AUTHORITY IN EFFECTUATING OBEDIENCE TO THE LAWS AND PUNISHMENT OF OFFENDERS.

Alexander Hamilton to President George Washington, August 2, 1794

Separated from the older colonies by the mountains, the frontiersmen were forced to rely on themselves for protection and assistance. They were threatened by hostile Native Americans and hampered by lack of money, but they were especially frustrated by transportation problems. All the major colonial markets for their grain were on the other side of the Appalachians, and the costs of transporting their produce across the mountains were very high. The Spanish, who controlled the mouth of the Mississippi River, blocked an alternate route down the Ohio and Mississippi rivers. In order to turn a profit on their excess grain, the frontiersmen built private stills and converted it into whiskey. Whiskey was easier to sell than raw grain, and it held its value better.

When the U.S. Constitution was ratified in 1788 the new federal government agreed to assume the outstanding war debts of the former colonies. In order to pay these debts, President Washington's Secretary of the Treasury Alexander Hamilton (1755–1804) pushed a tax on whiskey and other alcoholic beverages

through Congress in 1791. Many congressional delegates from the West were opposed to the whiskey tax. For his part, Hamilton believed that such a tax was the fairest way of spreading the costs of the American Revolution and the maintenance of the federal government across the population.

What Hamilton failed to consider was how strongly the settlers across the Appalachian Mountains felt about paying the tax. The western frontiersmen believed that they were maintaining their rights against the distant federal government in the same way their predecessors had done against the British government during the 1760s and 1770s. They felt betrayed by John Jay's (1745–1829) negotiations with the Spanish from 1785 to 1786 that kept them from shipping their grain down the Mississippi. Further, after two major defeats of federal troops by Miami and Shawnee tribesmen, the frontiersmen believed that the federal government was even unable to protect them.

During September 1791, representatives of the four westernmost Pennsylvania counties—Washington, Fayette, Allegheny, and Westmoreland—assembled at Pittsburgh, Pennsylvania, to discuss how to persuade Congress to repeal the whiskey tax. Although Hamilton would later portray them as radical anti-federalists, they held moderate views about the national government. Other westerners were not so tolerant. By the summer of 1794 what little patience they had was exhausted. Early in the morning of July 16, 1794, some 50 men armed with rifles approached the house where John Neville was staying. They demanded that Neville resign his position as excise inspector and turn over to them all the information he had collected on distilling in the area. Neville and the armed men exchanged shots; five of the besiegers were wounded, one of them fatally. The next day a mob of hundreds of local residents surrounded Neville's property. Neville, who had been reinforced by several soldiers from Fort Pitt, escaped without injury, but several soldiers were wounded and died, as did three or four of the attackers. The mob burned Neville's home and property to the ground.

The attack on John Neville marked the beginning of the Whiskey Rebellion. Throughout August and September threats of violence against tax collectors and inspectors spread out of the western districts of Pennsylvania and into Maryland, Virginia, Ohio, and Kentucky. In most cases, the rioters got their way through intimidation, and little blood was shed. The largest assembly came outside Pittsburgh on August 1, 1794, where about 7,000 frontiersmen gathered—mostly poor people who did not own property or even a still

and were not directly affected by the tax. “Not surprisingly, then,” wrote historian Thomas Slaughter in *The Whiskey Rebellion: Frontier Epilogue to the American Revolution* (1986), “their grievances were primarily economic in character; their victims were primarily members of wealthier commercial classes; and the property they envied was often the object of violence.” However, the townspeople managed to defuse much of the threat by welcoming the frontiersmen into their houses and making whiskey freely available. They also convinced them not to burn property in the town and allowed them to expel some of the most obnoxious townsmen. The presence of the soldiers at nearby Fort Fayette also helped keep the rioters in check. Within a few weeks the whiskey rebels had dispersed and returned to their homes.

At the same time the Whiskey rebels near Philadelphia were beginning to disperse, the federal government was preparing to take action. President Washington called a meeting of his Cabinet to consider what action to take regarding the rebels. He found himself in agreement with Treasury Secretary Hamilton that the rebellion was a serious threat to the Constitution and the federal government. A proclamation was issued instructing the rebels to disperse by September 1. By that date, however, Hamilton had already begun to assemble a 12,950-man army that he believed would crush the rebellion and teach his political opponents a lesson. Although cooler heads had already prevailed among the leaders of the westerners, Hamilton’s army marched at the end of September.

The Whiskey Rebellion trickled to a halt without much bloodshed. There were only two fatalities in western Pennsylvania, both of them accidental—one boy was shot by a soldier whose gun went off accidentally, and a drunken rebel supporter was stabbed with a bayonet while resisting arrest. By November 19 the federal army had managed to round up only 20 accused “leaders” of the Whiskey Rebellion. Eighteen of the accused were later acquitted in the courts; the other two were convicted of treason but were later given a presidential pardon.

The Whiskey Rebellion ended not because of the threat posed by Hamilton’s army, but because many of the concerns of the frontiersmen were finally addressed. On August 20, 1794, an American army under General “Mad” Anthony Wayne decisively defeated a confederation of Native Americans at the battle of Fallen Timbers, outside modern Toledo, Ohio. The Treaty of Greenville (1795) that Wayne negotiated with the Native Americans opened the Ohio country to settlement. The Jay Treaty (1794) with Great Britain, and the Pinckney Treaty (1795) with Spain moved

foreign troops away from western American borders and opened the Mississippi River to American shipping. Perhaps the most significant factor, however, was the fact that a political party with sympathies toward the frontier position, the Jeffersonian Republicans, came into power in the election of 1800. One of the first actions of President Thomas Jefferson’s (1801–1809) administration was to strike down the Whiskey Tax and other internal taxes.

WILD AND SCENIC RIVER ACT

The federal government enacted protective legislation called the Wild and Scenic River Act (WSRA) in 1968 to preserve and protect wild and scenic rivers in America, including their immediate surrounding environment for the benefit of present and future generations. It was legislation to forbid all commercial development projects, along designated wild and scenic rivers, which might in any way affect the wilderness, the scenery, and the purely recreational use of the rivers. Some of the national Wild and Scenic Rivers include the Alagnak, Bluestone, Delaware, Donner and Blitzen, Great River, Missouri, Obed, and Rio. The Wild and Scenic Rivers are managed by different federal agencies, including the U.S. Forest Service, National Park Service, and the Fish and Wildlife Service. The designation of specific protected rivers near human communities has created the potential for significant conflict between resource and conservation management agencies and the commercial interests of

Wildcat Banks

local residents. Strategic efforts are made by managing federal agencies to incorporate local values with the planning and management of protected rivers to reduce conflict potential. According to the WSRA, a wild river is “free of impoundment’s and generally inaccessible except by trail, with watershed or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America.”

WILDCAT BANKS

Wildcat banks were state-chartered financial institutions that operated in the United States from the early 1800s until the American Civil War (1861–1865). They were known as wildcat banks for their free lending policies and their issue of paper currency (called specie) that could not be backed up by gold or silver. A holder of the bank’s paper currency could have it redeemed with specie by presenting the currency (bank notes) at the bank’s office, which was located “where the wildcats” lived.

The Second National Bank of the United States (1816–1836), a federally controlled bank, was able to restrain the wildcat institutions, which predominated in the West and South, by requiring them to issue only the amount of currency they could convert to coin. But when the charter of the Second National Bank of the United States was allowed to expire (1836), the wildcat banks resumed their unsound banking practices. Paper currency issue and lending went unregulated amidst a rush to buy land on the frontier. The nation’s currency wildly fluctuated as the renegade financial institutions loosened and tightened the money supply to suit their own needs. Furthermore, because there were so many banks issuing their own notes, another problem introduced itself: counterfeiting. No one could tell what was true bank currency and what was the product of a good counterfeiter. On July 11, 1836, President Andrew Jackson (1767–1845), intent on reining in the wildcat banks, issued the Specie Circular—an order that government agents accept nothing but gold or silver as payment for new land. When prospective land buyers (particularly in the West) took their paper bills to the state-chartered banks to be converted to coin, they found the banks’ tills were empty. The holders were denied the face value of their notes. Bank after bank closed its doors, causing a financial panic in 1837. But many state banks remained in business and the issue of regulating paper currency continued to trouble the nation. During the American Civil War, Congress authorized the issue of 150 million dollars in national

notes, called greenbacks. Through subsequent acts of Congress, including the creation of a national banking system (1863), the federal government eventually put the state banks out of business and replaced them with federally backed institutions. The nation’s financial problems were not adequately addressed until 1913, when the Federal Reserve Act was passed to strengthen the federal control of the banking system and to bring about stabilization of currency.

WILDERNESS ROAD

The Wilderness Road was a trail blazed by American pioneer Daniel Boone (c. 1734–1820) as he led settlers westward across the Appalachian Mountains into present-day Kentucky between 1761 and 1771. By 1790 the road that passed through the Cumberland Gap (at the intersection of Tennessee, Kentucky, and North Carolina) had become a principal route westward. Settlers traveled Wilderness Road from Virginia, across the Appalachians, and into the Ohio River Valley. The route remained well traveled until about 1840. By that time the government–built National Road extended westward from Maryland, traversing the Appalachians, and descending into the fertile lands of Ohio, Indiana, and Illinois. Boone’s westward route allowed for the early development of the nation’s first frontier—the lands lying just west of the Appalachians. Wilderness Road later became part of U.S. Highway 25 and it is today part of the Dixie Highway.

WILSON, THOMAS WOODROW

Woodrow Wilson (1856–1924), the twenty-eighth president of the United States, left a great legacy of domestic legislation that profoundly affected both American business and American workers. Most of that legacy was created during the first two years of his eight-year, two-term service in the White House.

Thomas Woodrow Wilson was born in Staunton, Virginia, in 1856, into the family of a Presbyterian minister. Wilson dropped the use of his first name after he graduated from college, and was known thereafter as Woodrow Wilson. Wilson grew up in an atmosphere

Woodrow Wilson.

of religious piety and scholarly interests. By the time he was two years old, the family had moved to Augusta, Georgia, where Wilson grew into young manhood. While he was growing up, his father took the young Wilson to many industrial and agricultural sites, where he learned directly about the conditions of ordinary working people.

Wilson began his professional life in a law office in Atlanta, Georgia, but by 1883, at age 27, he decided he wanted to be a college teacher instead of an attorney. He subsequently began to study history and politics at Johns Hopkins University in Baltimore, Maryland, where he obtained a Ph.D. in political science. Wilson thrived as a teacher and later as a professor and scholar. In 1902, at age 42, he was elected president of Princeton University.

His efforts and successes at Princeton University attracted wide public notice. Leaders in the Democratic Party of New Jersey sought him out as a candidate for governor. He was indeed elected governor of New Jersey in 1910. In that office, he enacted a primary election law, a corrupt-practices act, a public utilities act, employee liability law, and various school-reform laws. His work in New Jersey eased many of the burdens of the average working person and also began to reduce corrupt business operations.

Those who worked in national politics did not overlook Wilson's progressive work in New Jersey. He was encouraged to run for federal office, and in 1912, in a race against Republican William Howard Taft (1857–1930), and Progressive Theodore Roosevelt (1858–1919), Woodrow Wilson, a Democratic candidate, was elected to the presidency in a political landslide.

Beginning his presidency in 1913, Wilson quickly began to pursue his domestic political agenda. In October of his first year in office, Wilson's Congress passed the Underwood Tariff Act which lowered the unfair tax rates of imported items like wool, sugar, iron ore, steel rails, and many other important items.

Next he began his most crucial domestic reforms, including the creation of a Federal Reserve Board, later called the Federal Reserve System, to help control money policies in the United States and to insure fairness in all transactions. The creation of the Board is generally regarded as the most far-reaching piece of legislation covering banking and currency in the nation's history.

In 1914 Wilson had established the Federal Trade Commission (FTC) to halt unfair business trade practices. The Clayton Anti-Trust Act was also passed to police unfair practices in business. Wilson's Adamson Act established an eight-hour work day for railroad employees, while his Child Labor Act limited the work hours of children and began a new program of federal regulation in industry.

After two years of successful domestic legislation, Wilson ran into global problems with the start of World War I (1914–1918). Under his leadership, the United States declared war against Germany in 1917 in what he called an effort to keep "the world . . . safe for democracy." For the duration of his presidency Wilson worked on efforts dealing with international issues. Much of his important domestic legislation, which focused on controlling big business and easing the burdens of working people in America, was obscured by his interventions during World War I and his pioneering efforts in the creation of the League of Nations in the post-war era.

Though Wilson is largely regarded as the great war-president who led the United States in World War I (1914–1918) and whose efforts to create the international peace organization the League of Nations led later to its more-stable successor, the United Nations, it is arguable that Wilson's greatest achievements were made by his domestic policies. Such policies and programs began to effectively control the lopsided concentration of power in American business. Woodrow Wilson's first administration successfully enacted many

Wisconsin

of the progressive federal laws that controlled outrageously high tariffs, monopolistic and illegal industrial practices, and the federal control of the banking system. At the early stages of his presidency, Wilson was also successful in achieving progressive legislation to stabilize the balance between business interests and the interests of American workers, both industrial and agricultural.

Wilson, “tired of swimming upstream,” as he put it, died in his sleep in 1924. He suffered a series of strokes for many years before his death.

WISCONSIN

The state of Wisconsin is located in mid-America between the Great Lakes and the Mississippi River. The land it encompasses had several built-in advantages for development. From the early fur traders to the modern industrialists, Wisconsin entrepreneurs used the state’s waterways and water ports for transporting goods to markets elsewhere. Immigrants from northern, central, and eastern Europe created a prosperous farming region on the Wisconsin prairie. In modern times the area became known mostly for its dairy herds. Other industries have thrived in Wisconsin as well, particularly its breweries, lumber mills, and canning factories.

Native American tribes in Wisconsin first encountered Frenchmen in the 1630s, and became dependent on them for trading in furs. Father Jacques Marquette and Louis Jolliet traversed Wisconsin territory on their way to the Mississippi in 1673. Many other Frenchmen came during that period to establish missions or to

trade in furs. Following the French and Indian War (1756–63), the British took control of Wisconsin. They ceded it to the United States in 1783. The Ordinance of 1787 included Wisconsin in the Northwest Territory; later parts of Wisconsin were included in the Indiana Territory, the Illinois Territory, and the Michigan Territory.

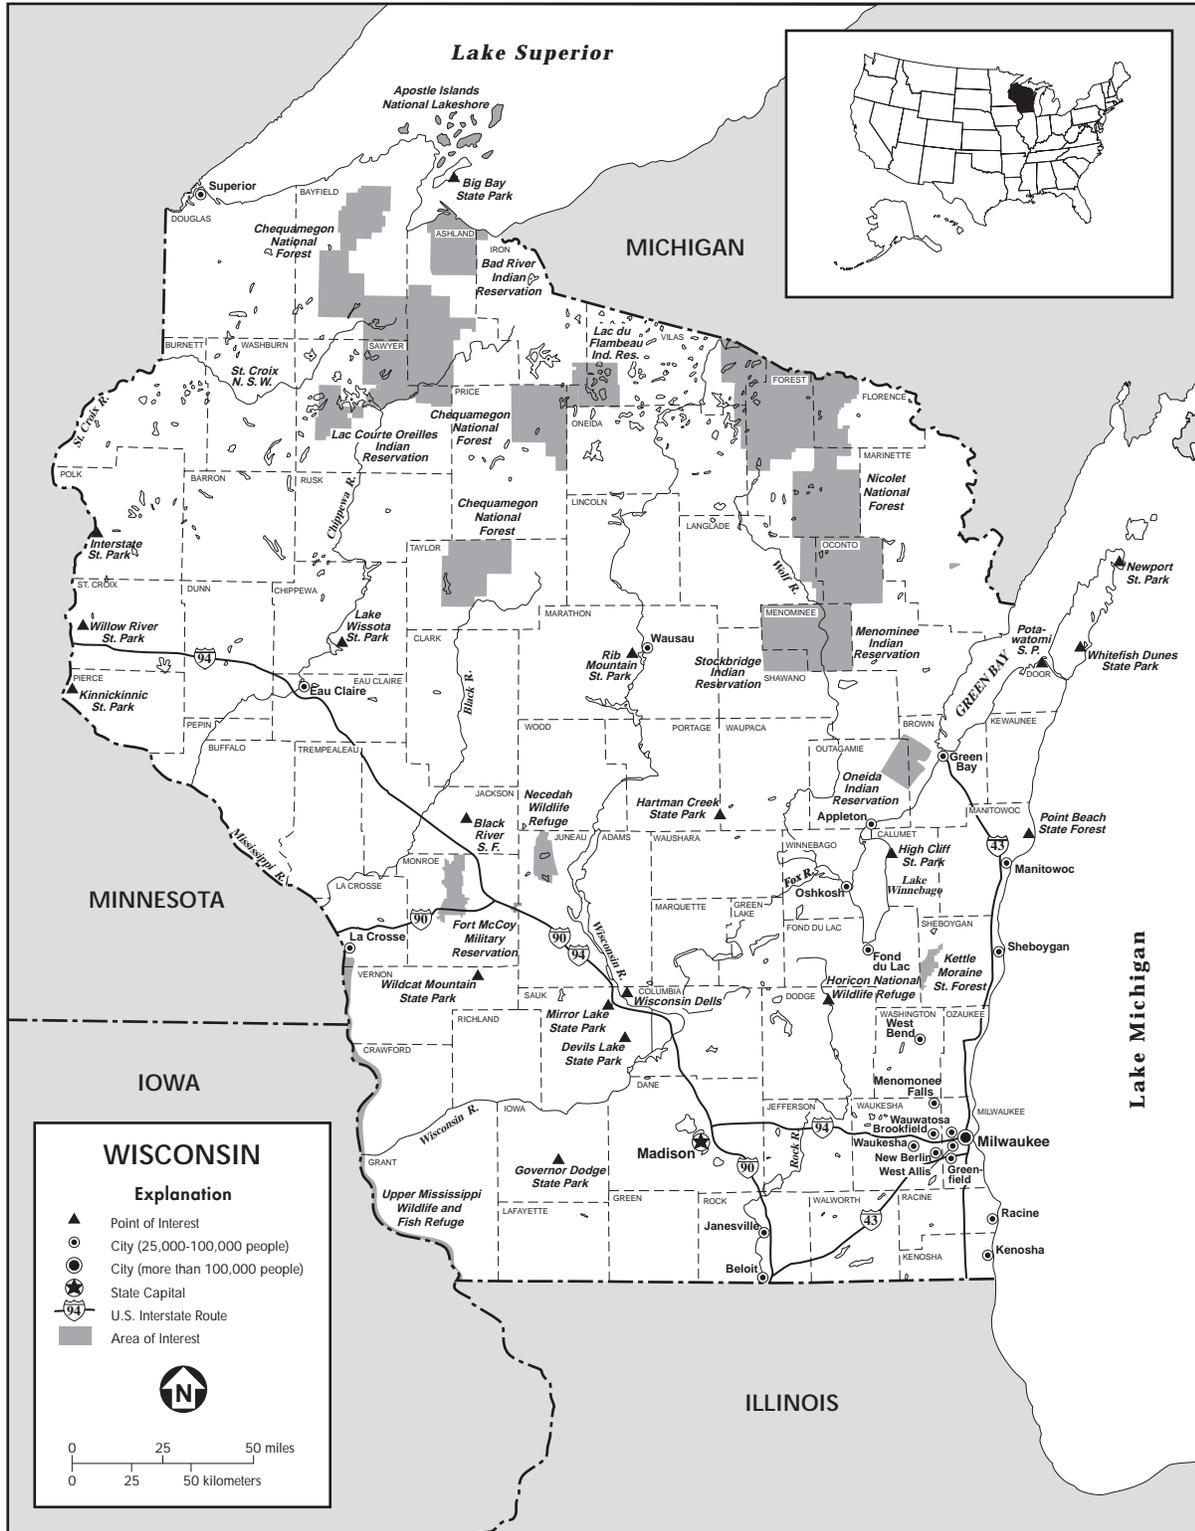

Lead mining originally brought white miners, called “Badgers,” to Wisconsin in the 1820s. They received their nickname because like badgers miners too must dig into the ground. The 1832 Black Hawk War drove out most of the remaining native Americans. White settlement began in earnest after that, and those indigenous people who stayed were eventually settled on reservations within the state. Wisconsin became a separate territory in 1836. New Englanders and southerners, lured by the lead mining in the southwestern part of the territory, flocked to the area during the 1830s. In 1848 Wisconsin became the thirtieth state of the Union.

Transportation and industry developed more slowly in the territory than some speculators had hoped. A canal was finally opened between the Fox and Wisconsin rivers in 1851. But it was not heavily traveled, despite millions of dollars in expenditures by the state and the federal government. The first rail line was built in the 1850s between Milwaukee and Prairie du Chien. Speculation reigned as farmers along the proposed route bought up railroad stock, often with disastrous economic consequences. Communities also competed fiercely to be included on the route. By the 1860s, the Chicago and Northwestern Railroad and the Chicago, Milwaukee, and St. Paul railroads dominated the state’s transportation system. They helped foster the growth of Wisconsin’s emerging lumber, dairy, and food processing industries.

CHEESE AND BEER—WHEN YOU THINK OF EITHER OF THE TWO, YOU THINK OF WISCONSIN.

Richard Nelson Current, *Wisconsin: A Bicentennial History*, 1977

The development of the state would not have occurred without a major influx of immigrants, primarily from northern Europe. In the 1820s these included mostly the Irish and the English, but by 1860 the predominance of German arrivals led some to call Wisconsin a “German state.” Yet, the area was attractive to many nationalities. In the 1880s the state lured as many Scandinavians as Germans, and later many immigrants from southern and eastern Europe settled there.

State of Wisconsin.

Many of these foreign-born Americans established farms across the entire state. At first they planted wheat, which was the biggest cash crop of the prairie because the McCormick reaper, first produced in Chicago in 1846, enabled farmers to harvest vast amounts of wheat in a short period of time. During the American Civil War (1861–65), sales of wheat to Great Britain provided the cash needed to finance the war effort. Usually departing from Milwaukee, the wheat shipments found their way through the Great Lakes and on to the eastern states and the rest of the world. After decades of wheat production, the soil began to be depleted of its resources. In response, Wisconsin farmers began to diversify, turning to the production of wool, sorghum, flax, sugar beets, tobacco, and hops.

Eventually dairy farming came to be identified with Wisconsin. The industry was established by New Yorkers and northern European immigrants who had brought their dairy-farming and cheese-making experience with them. By 1899 nearly 90 percent of the farms in Wisconsin had milk cows. Cheese factories proliferated, producing mostly “American” cheese or Cheddar, usually in a Wisconsin version that was called Colby. By 1919 Wisconsin was distributing almost two-thirds of the country’s cheese.

Wisconsin also became a major producer of pork and pork products. A pioneer in that industry was Philip D. Armour (1832–1901). He made his reputation by supplying cured pork to soldiers in the American Civil War. Vegetable canning also became an important sector of Wisconsin’s economy. In the infancy of the pressure-canning industry, Albert Landreth achieved significant success canning peas in Manitowoc. By 1918 Wisconsin canned as many peas as all the other states combined. Other vegetables such as sweet corn and beans also became important in the canning industry. The industry got a boost when large amounts of canned products were needed to supply soldiers in World War II (1939–45). Wisconsin remained a leader in the canning business thereafter.

Beer breweries are most prominently associated with Wisconsin in the public’s mind. German immigrants had brought with them the technique for producing a lager beer that withstood storage better than earlier versions made in the region. Milwaukee became the center of brewing, with the Blatz, Schlitz, Pabst, and Miller families leading the industry. Many other cities produced beer, mostly for local consumption, but Milwaukee exported large amounts to other states and countries. The city became identified as the producer of the best brews. The bigger breweries survived the days of the Prohibition era by producing other products like soft drinks and candies.

Since the days of progressive Republican governor Robert La Follette (1855–1925) in the early twentieth century, Wisconsin has been known for its forward-looking approach to government and the economy. La Follette obtained legislative approval for increased taxation of railroads, the first state income tax in the nation (1911), and the first workmen’s compensation program. La Follette’s son Philip continued the reform tradition during the 1920s by supporting state regulation of electric power, labor disputes, and business practices. Philip La Follette’s (1897–1965) so-called Little New Deal paralleled many of President Franklin D. Roosevelt’s (1882–1945) national policies during the 1930s.

Although Wisconsin’s economy diversified after World War II, the dairy industry remained its backbone into the 1990s. Cattle and calves in Wisconsin numbered 3.7 million in 1997 and were valued at 2.627 billion dollars. Dairy farming was also connected to two controversial environmental issues in the 1990s. The first linked agricultural runoff from animal wastes to contamination of Milwaukee’s drinking water in 1993; the second involved a dispute over the use of bovine growth hormone to increase milk production.

Southeast Wisconsin, especially the Milwaukee area, was the cradle of industry by the late 1990s. Although some major breweries left the city, others continued to produce there and in other Wisconsin cities like La Crosse. Important paper and lumber products firms included Consolidated Paper in Wisconsin Rapids and Fort Howard Paper in Green Bay. Racine became home to Johnson & Son, a wax products company, and J.I. Case, a producer of agricultural equipment. Meat-packer Oscar Mayer located his operations in Madison. New and existing industries were assisted by the state Department of Development, as well as hundreds of local development corporations.

Wisconsin’s water ports continued to be vital to the state’s economy. In 1959 oceangoing vessels were first allowed access to Wisconsin via the Great Lakes through the St. Lawrence Seaway. Traffic to Wisconsin on the seaway, however, failed to meet expectations. In the 1990s, the busiest of all U.S. ports was Superior on Lake Superior; it handled mostly iron ore and coal. Important Lake Michigan ports, which also depended heavily on coal, included Milwaukee, Green Bay, Port Washington, Oak Creek, Manitowoc, and Sturgeon Bay. On the Mississippi River, Prairie du Chien and La Crosse processed the largest amount of cargo.

**WOMEN IN THE WORKPLACE
(ISSUE)**

Over a 120-year period the identity of the woman worker has changed dramatically. From the 1820s, with the onset of industrialization in the United States, until 1940, the average female employee was young and single. If married, a woman working outside the home was likely poor and African American. From the 1940s to the 1970s, however, married women became the largest component of the female labor force. The number of gainfully employed, white middle-class women also rose rapidly.

In 1920 women composed 23.6 percent of the labor force and 8.3 million women older than the age of 15 worked outside the home. By 1930 the percentage of women in the work force rose to 27 and their numbers increased to 11 million. World War I (1914–1918) had expanded women’s employment in new sectors of the economy and by 1920, 25.6 percent of employed women worked in white-collar office-staff jobs, 23.8 percent in manufacturing, 18.2 percent in domestic service, and 12.9 percent in agriculture. While the first generation of college-educated women entered professions in the 1920s, they found opportunities only in nurturing “women’s professions” such as teaching and social work, and within medicine, nursing, and pediatrics. In factories, while male factory workers on federal contracts in 1920 started at 40 cents an hour, women started at 25 cents.

The Women’s Bureau, a new federal agency approved by Congress in June 1920, was charged with reporting the conditions of women in industry and promoting the welfare of working women. The Women’s Trade Union League (WTUL) also fought to improve women’s labor conditions in the 1920s. The WTUL argued that protective legislation based on

After World War II ended, a woman’s average weekly pay fell from \$50 to \$37, a decline of 26 percent that contrasts sharply to an overall postwar decrease of four percent. Although three-quarters of women employed in war industries were still employed in 1946, 90 percent of them were earning less than they had earned during the war.

women’s special position as child bearers should not be used against women workers by restricting their access to certain jobs.

Women laborers worked long hours and both the Women’s Bureau and WTUL fought for shorter workdays. By the early 1920s all but five states upheld the 10-hour day/50-hour week work schedule; those five embraced the 54-hour workweek. Efforts to improve working conditions for women were consistently undermined by society’s ambivalence about combining the roles of wife and mother with those of worker and professional.

The Great Depression (1929–1939) did little to alter the role of women in the U.S. workplace. According to the 1930 census almost eleven million women, or 24.3 percent of all women in the country, were gainfully employed. Three out of every ten of these working women were in domestic or personal service. Of professional women three-quarters were schoolteachers or nurses. The greatest numbers of women continued to work in domestic service with clerical workers just behind. Out of every ten women workers in 1940 three were in clerical or sales work, two were in factories, two in domestic service, one was a professional—a teacher or a nurse—and one was a service worker. During the Depression women entered the workforce at a rate twice that of men—primarily because employers were willing to hire them at reduced wages. In unionized industries, however, women fared better. Women constituted seven percent of all workers in the automobile industry and 25 percent of all workers in the electrical industry. The integrated International Ladies Garment Workers Union had 200,000 members and it secured for pressers in Harlem high wages of \$45 to \$50 per week. But such pay was the exception, not the rule.

Married women who worked faced particular hostility. They heard that they were taking jobs away from men, that the woman’s place was in the home, and that children needed a mother at home full time. Both

Female switchboard operators connecting telephone calls in the 1940s.

private companies and the government dismissed large numbers of married women and made it difficult for married women to get high-paying professional or clerical jobs. Section 213 of the 1932 Federal Economy Act prohibited more than one family member from working for the government, barring many married women from federal employment. Even positions that were traditionally held by women, such as teacher and librarian, were affected.

New Deal legislation provided relief to both male and female workers in need although women often did not receive their full share of benefits. The 1933 National Recovery Administration (NRA) designed codes that improved women's wages, shortened their hours, and increased the number of women employed, but the codes did little for the two million women who lost their jobs and sought relief. Although the Works Progress Administration (WPA) launched successful projects for women's employment, women had difficulty getting such jobs. Only one member of a household was eligible to qualify for a relief job and women had to prove themselves economic heads of households. Women with physically able husbands could not

qualify because men were considered heads of households, even if they were unable to find jobs.

Things quickly changed with World War II (1939–1945). Government posters featured women rolling up their sleeves and affirming “We Can Do It.” Radio stations sponsored contests for “Working Women Win Wars Week.” The number of workingwomen rose from 11.9 millions in 1940 to 18.6 millions in 1945. By the end of the war women comprised 36.1 percent of the civilian workforce and they were enjoying increases in income created by the wartime economy. Once women's employment became vital to the war effort it was applauded as patriotic. Between 1940 and 1945 women's presence in the labor force grew by more than 50 percent.

After the war, however, traditional gender assumptions about work retained their hold. The government position was that “now, as in peacetime, a mother's primary duty is to her home and children.” Although some 1.5 million mothers with small children worked, childcare remained inadequate. The government financed only 3,102 childcare centers to serve

working mothers, providing for only a small fraction of the children in need of care. Most working mothers left their children with family members or left them to fend for themselves. The scarcity of institutional assistance for these women implied that while society approved of working women, it still expected them to take care of their children themselves. Moreover, most people considered women in the workplace a temporary phenomenon. Though women proved themselves the equal of men in many jobs, they were still being paid less. Because most of the working women had been trained primarily to be homemakers, they lacked the education and skills necessary to enter career paths leading to good pay, advancement, and security.

After World War II ended, a woman's average weekly pay fell from \$50 to \$37, a decline of 26 percent that contrasts sharply to an overall postwar decrease of four percent. Although three-quarters of women employed in war industries were still employed in 1946, 90 percent of them were earning less than they had earned during the war. Faced with a postwar decrease in the already inadequate number of childcare facilities many working mothers withdrew from the workforce. While the actual number of women in paid employment rose, they tended to be older women with no children to care for at home and were employed in an increasingly narrow range of jobs.

By 1960 over one-third of women were employed, while more and more married women went to work to obtain the many accoutrements of middle-class life. In 1963 Betty Friedan's best seller, *The Feminine Mystique*, argued that women were oppressed by a culture that consistently denied them opportunities outside the domestic sphere. Friedan went on to suggest that women should have the same freedom for self-fulfillment that men possessed. The book reawakened the feminist movement. In 1966 Friedan and others founded the National Organization of Women (NOW). By the late 1960s the government required that all institutions receiving federal funds use non-discriminatory hiring practices and by the early 1970s affirmative action laws were in place. In this atmosphere public opinion about women in the workplace began to change. But few women were able to break into the male-dominated professions and careers and the pay for women who worked full-time was less than 60 percent of the median for men.

The battle to gain rights for women in the workplace equal to the rights of men began before World War II and continued into the early 1990s. The specific legislative fight at the federal level to gain equal wages for equal work took about 17 years. Not until 1963, with

the support of President John F. Kennedy (1961–1963), did such an act finally pass. The Equal Pay Act was intended to ensure that women would get paid the same wages as men for equal work. It was carefully written to raise women's wages, not to lower men's. Women filing suit under the Equal Pay Act could win up to two years of the wages they would have earned had they been paid equally with men. Discriminating employers could also be required to pay that same amount again as punishment, in addition to reimbursing successful claimants for the costs of hiring an attorney and court charges. Unfortunately, the act contained loopholes. The Equal Pay Act stipulated that the jobs of men and women must require equal skill, equal effort, and equal responsibility, each factor to be examined separately, for the jobs to be covered by the act. There was no provision that women must have access to the same jobs as men.

In subsequent years several other actions bolstered the rights of female workers. In 1964 the Civil Rights Act was passed and its broader language helped close some of the loopholes of the Equal Pay Act and further advance the rights of female workers. Title VII of the Civil Rights Act did not allow employers to deny jobs to women because of their sex. Thus it became illegal to manipulate jobs so that women would be excluded from those with higher pay. The Equal Employment Opportunity Commission (EEOC) was created to enforce this new employment right.

WOMEN'S MOVEMENT

As the United States approached the age of industrial expansion in the 1800s, an increased awareness of social problems began to arise. Advocacy groups rallied for the abolition of slavery, reform in mental institutions and prisons, and equal rights for women. While these social issues gained attention, the roles of men and women began to change. The industrial age brought about a shift in family life as more married men worked in factories, which kept them away from home for 10 to 12 hours each day. Because women could not own property and were not allowed equal access to education and employment as were men, a married woman's life was limited to staying home and caring for the children, tending to household chores, and working at menial jobs. Single women were allowed to work in factories, but their wages were only half that of their male counterparts.

The movement toward equal rights was led by Elizabeth Cady Stanton (1815–1902) who was born in 1815 in Johnstown, New York. Cady Stanton and her husband, Henry Brewster Stanton, a lawyer and abolitionist, attended the World Antislavery Conference in London, England, where they met other reformists such as Lucretia Mott (1793–1880), a Hicksite Quaker. The women, however, were not allowed to participate in the conference because they were female. On July 19–20, 1848, in Seneca Falls, New York, the two women organized the first public political meeting in the United States that focused on women's rights. The meeting was attended by 240 people, 40 of them men. The Seneca Falls Convention focused on the "Seneca Falls Declaration of Sentiments," which was modeled after the *Declaration of Independence*. The document was written by Cady Stanton, Mott, Martha Wright, Mary Ann McClintock, and Jane Hunt; it included a detailed list of female oppression by men, specifically citing depriving women of the rights to vote, to own property, and to equal employment and education. The "Resolutions" included in the "Declaration of Sentiments" were approved.

In 1865 the Fourteenth Amendment was introduced to Congress which allowed African American males the right to vote but specifically excluded females. Cady Stanton and Susan B. Anthony (1820–1906), who began campaigning for women's rights with Cady Stanton in 1848, reviewed an early draft of the proposal and took issue with the term "male citizen" which had never been used before in the U.S. *Constitution*. While they were sympathetic to the fact

that former slaves needed this ballot to protect their rights, Cady Stanton and Anthony did not support it. Despite their opposition, Congress passed the Fourteenth Amendment in July 1868.

Over the next 20 years additional women's rights groups were formed and some success was attained at local levels. In 1870 women were given the right of citizenship in the Wyoming and Utah Territories and in the Washington Territory in 1883. In Michigan and Minnesota, widowed mothers of school children were given the right to vote on school issues in 1875. The same was afforded to widows in Vermont and New York in 1880.

In 1882 the U.S. Senate and the House of Representatives appointed Select Committees on Woman Suffrage and, for the first time in 1886, the "Susan B. Anthony Amendment," or the woman's suffrage amendment, was debated on the Senate floor. Gradually women won the right to own property and to have professional careers but it wasn't until 1920 that the Nineteenth Amendment was passed, giving women the right to vote.

The women's movement gained momentum and made important strides toward equality during the social unrest of the 1960s when civil rights groups and Vietnam War (1964–1975) protesters were demanding change. In 1963 author Betty Freidan wrote the best-seller "The Feminine Mystique," which described the unhappiness of the majority of middle-class women who wanted more out of life than to be housewives. At the same time, the Presidential Commission on the Status of Women (chaired by Eleanor Roosevelt) issued a report titled *American Women*, which documented discrimination against women in education, employment, taxes, and the law. As a result, the Equal Pay Act (1963) was passed that required employers to provide equal wages for equal work for men and women. President John F. Kennedy (1961–1963) further mandated that the federal government hire "solely on the basis of ability to meet the requirements of the position, and without regard to sex." This was the government's first attempt to address women's issues since 1920.

In 1964 the Equal Employment Opportunity Commission (EEOC), an organization developed to defend employment rights of minorities, also began to work toward securing rights for women. The Civil Rights Act of 1964 was broadened to include not only discrimination in jobs based on race, creed and natural origin but also sex.

Women rallied all over the country advocating for equal rights.

In 1966 Betty Freidan and others founded the National Organization for Women (NOW). NOW's statement of purpose was "to take action to bring women into full participation in the mainstream of American Society NOW, assuming all privileges and responsibilities thereof in truly equal partnership with men." The group focused on increasing the number of women in government jobs, legalizing abortion and increasing the number of day-care centers, and most of their goals were accomplished. In 1969 Betty Freidan, with author and feminist, Gloria Steinem (1934–), and U.S. representatives from New York Bella Abzug (1971–1976) and Shirley Chisholm (1969–1983) formed the National Women's Political Caucus (NWPC). The group worked to increase the number of females holding political office; they were very successful in this mission during President Jimmy Carter's (1977–1981) administration. Smaller radical groups formed over the next 10 years that advocated for various women's rights. These groups encouraged Congress in 1974 to pass the Equal Credit Opportunity Act (ECOA), which made it illegal to deny anyone credit based on gender.

Challenging the barriers to women's rights over the years led to more opportunity and economic power for women during the latter half of the twentieth century. In the early 1990s women received 54 percent of university Bachelor's degrees and 53 percent of all

Master's degrees. By the mid-1990s women continued to advance in politics as well as the workforce. In 1997 there was still a difference in pay between men and women in the same positions—women holding mid-level jobs were still paid an average of 26-cents less per hour than their male counterparts.

WOMEN'S TRADE UNION LEAGUE (WTUL)

Founded in 1903, the Women's Trade Union League (WTUL) sought to represent the cause of working-class women to middle- and upper-class reformers. Women were openly excluded from other labor organizations, which maintained that women simply did not have a place in the workforce. Male laborers were wary that including women in the labor cause would lower their own wages, and most felt that the woman's place was in the home. Whatever the prevailing sentiment among working-class men, the fact was that women were in the workplace in numbers. In 1903, the year the WTUL organized, there were 6.3 million women in the American workforce. The organization sought to secure state and federal legislation to protect female laborers, sponsor educational programs, and campaign for woman suffrage (the right to vote). By 1906 Jewish cap-maker Rose Schneiderman (1882–1972) rose to a position of leadership within the WTUL. In 1909, the Schneiderman-led WTUL joined forces with the International Ladies Garment Workers Union (ILGWU) and staged a strike against sweatshops (exploitative garment factories) in New York City. After a three-month strike, called the "Uprising of the 20,000," tens of thousands of garment workers won wage increases, shorter hours, and somewhat safer work conditions. In 1911 Schneiderman was among those who turned out to join an April 5 procession to mourn the victims of the infamous Triangle Shirtwaist Factory fire. One hundred and forty-six workers, most of them Jewish immigrant women, had perished in the March 25, blaze in a building that failed to meet required safety standards. In the wake of the tragedy, Schneiderman resolved that workers would never again be forced to risk their lives to earn a living. Public outrage was now on the side of the movement to increase worker safety. The WTUL eventually became dominated by middle-class leaders who steered the organization away from union activities (including strikes), alienating its working-class membership. In the early 1920s the organization rallied against passage of an equal rights amendment to the U.S. Constitution, asserting that women workers needed protection from

exploitation, not equal opportunities. By 1930 the WTUL had dissolved.

WORK ETHIC

The work ethic is characterized by the desire to work hard and efficiently. Significant aspects of the work ethic include frugality, accumulation of wealth, organized and systematic ways of life, and approval of diligence and disapproval of indulgence.

Early Greeks and Romans believed manual work to be a curse and left it to slaves. Aristocratic disdain for work continued throughout the Middle Ages except in monasteries, where work was of the ways by which a monk was sanctified. In early modern times, with the rise of capitalism and the middle class, the monastic respect for work was spread to the laity. In 1903, the sociologist Max Weber (1869–1920) proposed in *The Protestant Ethic and the Spirit of Capitalism* that the modern work ethic developed from grew out of the thought of the Protestant reformer John Calvin (1509–1564). Calvin taught predestination, a belief that a person's eternal destiny (Heaven or Hell) is independent of one's actions on earth. It has been predetermined ahead of time. Yet, one may have a hint of God's plan by observing whether certain signs of election are present in one's life. Calvin's followers suggested that material success was one of these. In other words, success in this world, which is usually attained through hard work, means that you have been chosen to go to heaven. Scholars have long debated whether the Weber thesis is true. Nonetheless, a belief in the moral value of work, whatever its origin, has been an important facet of the West's material progress.

Largely because of a productivity rate decrease in the 1970s, questions arose regarding viability of the work ethic in the United States. The productivity drop off apparently resulted from an increased proportion of young inexperienced workers in the labor force. By 1979 an upward trend resumed. At the end of the twentieth century time spent working, attitudes toward work, and economic indicators point to a continued presence of a strong work ethic. Increasingly, studies showed that workers believed work rather than leisure yields not only material goods but self-fulfillment. With increases in education, technology, life expectancy, and with the need to balance family care with work, the logistics of work continue to evolve but the work ethic remains constant.

WORKING CONDITIONS IN FACTORIES (ISSUE)

During the late nineteenth century the U.S. economy underwent a spectacular increase in industrial growth. Abundant resources, an expanding labor force, government policy, and skilled entrepreneurs facilitated this shift to the large-scale production of manufactured goods. For many U.S. citizens industrialization resulted in an unprecedented prosperity but others did not benefit as greatly from the process. The expansion of manufacturing created a need for large numbers of factory workers. Although the average standard of living for workers increased steadily during the last decades of the nineteenth century, many workers struggled to make ends meet. At the turn of the century it took an annual income of at least \$600 to live comfortably but the average worker made between \$400 and \$500 per year.

Factory workers had to face long hours, poor working conditions, and job instability. During economic recessions many workers lost their jobs or faced sharp pay cuts. New employees found the discipline and regulation of factory work to be very different from other types of work. Work was often monotonous because workers performed one task over and over. It was also strictly regulated. Working hours were long averaging at least ten hours a day and six days a week for most workers, even longer for others. For men and women from agricultural backgrounds these new conditions proved challenging because farm work tended to be more flexible and offered a variety of work tasks. Factory work was also different for skilled artisans, who had once hand-crafted goods on their own schedule.

Factory conditions were also poor and, in some cases, deplorable. Lack of effective government regulation led to unsafe and unhealthy work sites. In the late nineteenth century more industrial accidents occurred in the United States than in any other industrial country. Rarely did an employer offer payment if a worker was hurt or killed on the job. As industries consolidated at the turn of the century factories grew larger and more dangerous. By 1900 industrial accidents killed thirty-five thousand workers each year and maimed five hundred thousand others, and the numbers continued to rise. The general public became concerned with industrial accidents only when scores of workers were killed in a single widely reported incident, such as the many coal-mine explosions or the tragic Triangle Shirtwaist Company fire in 1911. In one year alone 195 workers in steel and iron mills were killed in Pittsburgh, Pennsylvania.

In order to save money many employers hired women and children to work in factories because these workers would work for lower wages than men. Some women were paid as little as six dollars per week, a sum much lower than a male would have received. Most female workers performed unskilled or semi-skilled machine work but some worked in industries that demanded heavy labor. Some women, for instance, worked on railroads, while others were employed as machinists.

IN THE LATE NINETEENTH CENTURY MORE INDUSTRIAL ACCIDENTS OCCURRED IN THE UNITED STATES THAN IN ANY OTHER INDUSTRIAL COUNTRY BY 1900 INDUSTRIAL ACCIDENTS KILLED THIRTY-FIVE THOUSAND WORKERS EACH YEAR AND MAIMED FIVE HUNDRED THOUSAND OTHERS, AND THE NUMBERS CONTINUED TO RISE.

Children also worked long hours for low wages. The number of children employed in factories rose steadily over the last three decades of the nineteenth century. By 1900 roughly 1.7 million children under the age of 16 worked in factories; less than half that many children had been employed 30 years before. Under pressure from the public many state legislatures passed child labor laws, which limited the hours children could work to ten hours per day, but employers often disregarded such laws. In southern cotton mills children who operated looms throughout the night had cold water thrown in their faces to keep them awake. Long working hours for children also meant that accidents were more likely to occur; like adult workers, many children were injured or killed on the job.

Worker responses to poor factory conditions and low wages were varied. Some employees intentionally decreased their production rate or broke their machines, while others quit their jobs and sought work in other factories. Other workers resorted to a more organized means of protest by joining labor unions although most industrial workers were not union members. Most workers, having few alternatives, simply endured the hardship of factory work.

In response to the problem of poor working conditions and the apparent indifference of industrial barons, membership in the American Federation of Labor (AFL), a union for skilled workers formed in 1886, grew rapidly from 256,000 members in 1897 to 1,676,000 in 1904. More radical and politically active trade unions often had even larger memberships, mostly because they were not as exclusionary as the AFL and because they welcomed unskilled labor, like those

who worked in factories. One of the most radical, the Industrial Workers of the World (IWW), founded in 1905 and popularly known as the Wobblies, recruited primarily among the unskilled immigrants but also competed with the AFL to attract skilled laborers. Less radical than the Wobblies and more successful at recruiting supporters were the socialists, who gained political strength because of the growing numbers of immigrants and disenfranchised unskilled laborers. The lack of real class conflict in the United States and the electoral reforms of the era undercut the socialists' efforts on a national level. Despite growing union activism the vast majority of workers remained unorganized throughout the first decade of the twentieth century.

Trying to prevent legislation to provide job security, guarantee a minimum wage, or ensure the safety of the workplace, most businessmen and conservatives argued that wages were set by the marketplace and that higher wages and worker protection would lead to higher prices for consumers. Government had long supported business using court injunctions and armed troops to put down strikes and break unions. In the 1890s, ruling that unions operated as "combinations in restraint of trade," the federal government used the Sherman Antitrust Act against unions more often than against businesses.

During the Progressive era several states passed legislation helpful to labor, such as laws establishing a minimum wage for women, maximum work hours, and workmen's compensation, and abolishing child labor and convict leasing. Groups such as the National Child Labor Committee, the Woman's Trade Union League, and the National Consumers League spearheaded the drives for many of these measures. Ironically, organized labor opposed minimum-wage laws for women because it preferred to win such measures through collective bargaining or strikes rather than through legislation. Business had to persuade labor to accept workmen's compensation plans, which unions opposed because the benefits were not very generous and many sorts of workers were excluded. Businessmen wanted the plans to protect themselves against the large payments that courts sometimes awarded in injury cases.

In 1904 a group of reformers established the National Child Labor Committee, an organization that dedicated to investigating the problem of child labor and lobbying state-by-state for legislation to end the abuse. It was, however, not effective because each state feared restrictive legislation could give other states a competitive advantage in recruiting industry. In 1907 a federal law against child labor, sponsored by Senator Alan Beveridge (1899–1911) of Ohio, went down to

defeat and three years later in 1910 there were still an estimated two million children employed in factories. Only when the loopholes in state laws become apparent to reformers did they lobby for federal legislation, most of which did not come until the end of the 1920s.

In 1912 a Children's Bureau was established as an agency of the Department of Commerce and Labor. Its mandate was to examine "all matters pertaining to the welfare of children," which included child labor, and it was led by Julia C. Lathrop, the first woman to head a federal agency. Progress, however, was still slow. In 1916 senators Robert L. Owen and Edward Keating sponsored a bill that restricted child labor; the bill passed both houses of Congress with the strong support of President Woodrow Wilson (1913–1921). The law was based on a recommendation of the National Child Welfare Committee but it only prevented the interstate shipment of goods produced in factories by children under 14 and materials processed in mines by children under 16. It also limited children's workday to eight hours. In 1918 the Supreme Court declared this law unconstitutional because it was directed toward the regulation of working conditions not the control of interstate commerce. In 1919 Congress passed the Child Labor Act, which placed a tax on companies that used child labor, but the court again overturned the law. In 1924 there was an attempt to amend the Constitution to prohibit child labor but it never received approval from the required number of states.

WORKS PROGRESS ADMINISTRATION

The Works Progress Administration (WPA) was the first major unemployment program of the New Deal and one of the most successful of the public works programs authorized by the Emergency Relief Appropriation Act in April 1935. The program, under the leadership of Harry Hopkins (1890–1946), provided about 3 million public sector jobs per year to unemployed heads of families. Most WPA workers built libraries, schools, hospitals, playgrounds, airports, bridges, and roads, but the program also employed writers, actors, musicians, and visual artists at jobs in their fields. The concept that the federal government, and not private industry, should create jobs was a sharp departure from conventional policy, and aroused significant controversy. Many objected that the WPA was a handout, joking that its initials really meant “We Putter Around.” Some charged that WPA writers and artists were Communist sympathizers who did not deserve a government paycheck. Despite such criticisms, the WPA was a well-managed program that funneled almost 85 percent of its total budget into wages and salaries. From 1935 to its end in 1943, the WPA employed more than 8.5 million people and instituted almost 1.5 million projects, including sewer and road construction, murals in public buildings, written guides to each state, and the Historical Records Survey. Equally important, the program improved morale for millions of jobless Americans.

WORLD WAR I

When the United States entered World War I (1914–1918) by declaring war on Germany on April 6, 1917, the global conflict had been underway for more than two and a half years. Also known as the Great War, World War I started as a result of the assassination of Archduke Franz Ferdinand, heir to the Austro-Hungarian throne. What began as a skirmish between Austria-Hungary and Serbia (the archduke was killed in the Serbian city of Sarajevo) quickly snowballed into a massive conflict when these nations’ more powerful allies joined the dispute. Europe’s existing alliance structure pitted the Central Powers—Germany, Austria-Hungary, and Turkey—against the Triple Entente—France, Britain, and Russia. After provocation from Germany, whose naval fleets had begun to

sink American merchant ships in British waters, President Woodrow Wilson (1913–1921) made the decision to mobilize U.S. troops.

Wilson’s decision had immediate economic repercussions, as the U.S. government faced the task of raising money for the war effort. Analysts determined that the country would need upwards of \$33.5 billion to finance its participation in the war, plus money for loans to European allies. With the War Loan Act (1917), Congress proposed that the U.S. would provide \$3 billion in such loans, though the sum was later increased. Now it fell upon President Wilson and Congress to determine where the necessary money would come from. They offered a solution by passing the War Revenue Act (1917), which stated that 74 percent of funding for the war would come from taxation imposed on the highest individual and corporate incomes. With this bill Wilson and Congress demonstrated an intent to place the financial burden on the wealthy and to give a break to middle- and low-income individuals and families. A year later Congress passed another revenue act, which increased this burden on the nation’s wealthiest, who were now called upon to provide 80 percent of funding for the war.

In another move designed to raise money, the U.S. Treasury Department issued a series of bonds called liberty loans. These were long-term bonds that promised to earn the holder 3.5 to 4.25 percent in interest. The campaign to sell the bonds was massive in scope. Liberty loan committees formed in all regions of the country, and spokespersons appeared in theaters, hotels, restaurants, and other public gathering places. Even clergymen contributed to the marketing effort, urging members of their congregations to support the country through liberty loan purchase. Banks stepped forward to lend money for liberty loans at rates lower than the interest on the bonds. The campaign was a tremendous success. Of the five bonds issued between May 1917 and April 1919 (the last of these was called a victory loan), all of them were oversubscribed.

Although participation in World War I required vast government spending, the country’s domestic economy benefited greatly from the effort. Established in July 1917, a War Industries Board endeavored to tap the nation’s industrial resources while protecting its basic economic infrastructure. A demand for supplies, weaponry, food, and other materials resulted in increased productivity among manufacturers and farmers. It was a boom time not only for large corporations, many of whose profits wildly multiplied, but also for farmers, who saw a rise in agricultural prices, and for blue-collar workers, whose wages increased. Businesses expanded their international markets by exporting

American troops advancing in France on May 20, 1918. The soldier without a mask (left) is overwhelmed by mustard gas fumes.

goods to European ally countries. All in all, American industry profited enormously from increasing its production, exploiting its resources, and mobilizing its workforce.

Other participating nations, however, suffered more losses than gains during the course of the war. After the defeat of the Central Powers and the signing of an armistice in 1918, the Triple Entente and its allies pressed for reparations from Germany, which more than any other nation was held responsible for the war. The Treaty of Versailles, signed on June 28, 1919, placed the bulk of financial responsibility on Germany, and a Reparations Commission was established to determine the amount that the defeated Country would pay in damages to property and civilians. When the U.S. Senate refused to ratify the 1919 treaty, the United States forfeited its place on the commission, which decided in June 1920 that Germany would pay upwards of three billion gold marks a year for 35 years. The committee increased this amount in the following year, demanding a sum that Germany simply could not produce (indeed, in 1933 then-German leader Adolf Hitler (1889–1945) announced Germany's refusal to make further payments). Although the United States did not receive compensation for damages directly from Germany, it did collect payment on loans from its European allies, who derived these sums from German reparations.

American participation in World War I resulted in the loss of lives and a tremendous output of its financial

resources. In addition to the \$33 billion the U.S. government initially spent on the war, interest rates and veterans' benefits increased this sum to \$112 billion. Yet the economic gains that were achieved during wartime far outweighed such losses. Between 1914 and the end of the decade, average annual incomes rose from \$580 to \$1,300. Moreover, the increase in international trade continued to raise profits for various industries. Propelled by the economic boost of war, America ushered in a new decade—the prosperous 1920s.

WORLD WAR II

World War II (1939–1945) was an international conflict involving 61 countries that mobilized over 100 million people for military service in four geographic regions: Europe, Asia, Africa, and the South Pacific. The war left 55 million people dead (30 million civilian and 25 million military), cost over one trillion dollars, and resulted in more material destruction than any other armed conflict in history. The United States emerged from the war as the most powerful nation in the world, while the Soviet Union gained a stronghold over Eastern Europe.

The war pitted the Allied Powers (the United States, Canada, Australia, Great Britain, France, Russia, and China, among others) against the Axis Powers (Germany, Italy, Japan, Hungary, Bulgaria, Romania, and others). The leading figures for the Allies were U.S. President Franklin D. Roosevelt (1933–1945), British Prime Minister Winston Churchill (1940–1945, 1951–1955), and Soviet Premier Joseph Stalin (1928–1953). The Axis was led by German dictator Adolph Hitler (1933–1945), Italian dictator Benito Mussolini (1922–1943), and Japanese Prime Minister Hideki Tojo (1941–1944).

World War II began on September 1, 1939, when 1.5 million German troops invaded Poland. Germany's superior air power and technologically advanced armored and motorized divisions overwhelmed Polish forces that were often fighting on horseback with obsolete equipment. By September 20, Poland had been overrun by the German *blitzkrieg* (lightening war).

England and France declared war on Germany in response to the invasion. Undeterred, German forces swept through Western Europe in the spring of 1940, taking Norway, Denmark, Belgium, Luxembourg, and the Netherlands. In June France was overtaken. The German war machine was not stymied until that fall when Hitler attempted to subdue Britain by air and sea. Aided by the development of radar, Britain handed Germany its first significant defeat of the war, forcing Hitler to indefinitely postpone a land invasion of England.

Despite its proclaimed neutrality, the United States was preparing for war. Congress approved the sale of surplus war material to Britain in June 1940, and it passed the first peace-time-draft legislation in September. In March 1941, Congress appropriated \$7 billion in Lend-Lease aid to countries fighting against the Axis. Four months later the United States stationed Marines in Iceland and authorized the Navy to escort convoys in the area. In August President Roosevelt and

Soldiers, Sailors, and Airmen of the Allied Expeditionary Force! You are about to embark upon the Great Crusade, toward which we have striven these many months. The eyes of the world are upon you. The hopes and prayers of liberty-loving people everywhere march with you . . . I have full confidence in your courage, devotion to duty, and skill in battle. We will accept nothing less than full victory!

Dwight D. Eisenhower, Supreme Commander, Allied Expeditionary Force, D-Day, June 5, 1944

Prime Minister Churchill signed the Atlantic Charter, outlining joint national policies for the postwar period.

U.S. relations with Japan were also deteriorating. In September 1940, the United States prohibited the exportation of steel, scrap iron, and aviation gasoline to Japan after Japanese troops entered northern Indochina. When Japanese troops occupied southern Indochina in July 1941, President Roosevelt retaliated by freezing Japanese assets in the United States. Diplomatic efforts between the two countries ended when Japan bombed the U.S. naval base at Pearl Harbor, Hawaii, on December 7, 1941. The next day Congress declared war on Japan.

Axis military conquests continued in 1942. In January Japan invaded New Guinea, the Solomon Islands, the East Indies, Burma, and the Philippines. In February Germany invaded North Africa and two months later sent troops into Greece and Yugoslavia. On June 22, 1941, Hitler ordered three million troops into Russia. Dubbed Operation "Barbarossa," Germany's invasion took the Soviet Red Army by surprise. More than a million Soviet troops were taken prisoner during the first three months of battle, and by the end of the year, German soldiers had advanced several hundred miles, camping outside of Moscow and fighting in Stalingrad.

Hitler's drive into Russia marked the peak of territorial expansion for Axis powers during World War II. It also marked a turning point. German advances were slowed by autumn rains, and then halted by the Russian winter. Most German soldiers in Russia lacked warm clothing and sufficient supplies. A number of German divisions retreated, while others were taken prisoner by the better-outfitted Russians. Reinforcements and resources sent to bolster German troops on the Eastern Front in 1942 did so at the expense of Axis

The attack on Pearl Harbor, Hawaii, on December 7, 1941, thus causing the U.S. to declare war on Japan the following day.

campaigns on the Western Front and in Africa during 1943.

The Allies began 1943 with a string of victories in North Africa, ultimately leading to the surrender of all Axis forces on the continent by May. From North Africa the Allies invaded Sicily, where they routed enemy troops and proceeded onto the Italian mainland. Hitler's attempt to invigorate the Russian invasion during the summer of 1943 only further depleted Axis resources. As 1943 ended the Soviets were on the offensive, driving German forces back across Poland. At the same time the Allies were on the offensive in the South Pacific where U.S. troops captured the Solomon, Aleutian, and Gilbert Islands.

At the outset of 1944 the Allies drafted plans for an invasion to end the war in Europe. U.S. General Dwight D. Eisenhower (1890–1969) headed "Operation Overlord," the largest amphibious assault in history. In the early morning hours of D-Day, June 5, 1944, 5,000 ships, 10,000 planes, and 176,000 soldiers crossed the English Channel and pounded the beaches at Normandy, France. Despite suffering heavy casualties against well-armed, concrete-fortified German defenses known as pillboxes, the Allies opened a 60-mile beachhead through which a million troops would pass during the next month. Paris was liberated by August. The Germans made a desperate Nazi counterattack at the German-Belgian border in December 1944, which is called the "Battle of the Bulge" for the deep bulge it created in Allied lines. After its failure, the German

army collapsed inside the Allied vise. U.S. forces from the west and Russian forces from the east converged at the Elbe River in April, and Germany unconditionally surrendered the next month, on May 7, 1945.

Following victory in Europe, the Allies turned their attention to the South Pacific. After securing control of Iwo Jima, the Philippines, and Okinawa, the Allies made plans for invading Japan. To avoid the heavy casualties predicted to result from such an invasion, President Harry S. Truman (1945–1953), who took office following President Roosevelt's death, authorized the dropping of two atomic bombs. On August 6, 1945, the first bomb was dropped on Hiroshima, and three days later the second bomb was dropped on Nagasaki. Japan unconditionally surrendered on September 2.

Prior to his death Roosevelt met with Churchill and Stalin in February 1945, at the Yalta Conference, where the three leaders agreed to separate postwar Germany into four zones that would be occupied by the United States, Great Britain, France, and the Soviet Union. During the period of occupation Germany would be disarmed and its economy rebuilt. The Red Army's occupation of its postwar zone, however, gave way to the creation of Communist governments in Eastern Europe under Soviet control. The Yalta Conference also established the groundwork for an international war crimes tribunal at Nuremberg for the prosecution of Nazi leaders. Finally, the Yalta Conference finalized details for the creation of the United Nations.

World War II also brought greater unity to the U.S. home front. Over 16 million U.S. citizens served in the armed forces during the war, so just about everyone knew a relative, friend, or acquaintance that was fighting in some part of the world. Families pulled together through food shortages, increased taxes, and lines at the gas station. An unprecedented number of women went to work, particularly in factories. Not surprisingly, the troops' return home in 1945 precipitated the postwar Baby Boom.

WOZNIAK, STEPHEN GARY

The technical genius behind the Apple I and II microcomputers that launched Apple Computer, Inc., Stephen Wozniak (1950–) revolutionized computer design. By creating machines that were easy to use and relatively low in price, he helped launch the era of the personal computer. With Apple cofounder Steven Jobs (1955–), Wozniak worked out of his garage to develop Apple's breakthrough computers. Within 10 years he was running a company with 1,000 employees and annual sales of \$500 million.

Stephen Gary Wozniak was born on August 11, 1950, in San Jose, California. Wozniak was the eldest of three children. His father, Jerry, was an engineer at Lockheed. Wozniak's interest in science and engineering came early. His father gave him a crystal radio kit

when he was seven and an electronics kit a year later. Around fourth grade Wozniak recalls reading Tom Swift books about "this young guy who was an engineer, and he owned his own company. . . . It was just the most intriguing world, like the first TV shows you ever watched." His father also helped with various science fair projects on electronics. By sixth grade Wozniak had designed a computer that played tic-tac-toe. Wozniak continued to design computers through high school and college, without taking a course or even buying a book on how to do it. He just pieced things together with a group of like-minded friends. At age 14 Wozniak won an award for building a binary adding and subtracting machine, one of hundreds of small computers he designed before Apple.

Growing up in Sunnyvale in the Silicon Valley, the area between San Francisco and San Jose that is studded with electronics firms, Wozniak felt right at home. Something of a math and science prodigy, Wozniak was also a cutup and a practical joker. As his mother, Margaret, recalls, "I knew my son would either be rich or wind up in jail." Although Wozniak scored a perfect 800 on his math SAT, he lacked social skills and shunned parties, preferring technical magazines. In 1968 Wozniak attended the University of Colorado, having been rejected by Cal Tech. His second year was spent at De Anza College before he transferred to the University of California at Berkeley to study electrical engineering. Dropping out of Berkeley after his junior year, Wozniak became a designer of calculator chips at Hewlett-Packard. He also began to attend meetings of the Homebrew Computer Club, a group of Silicon Valley high-tech enthusiasts that set him on the course of designing inexpensive personal computers.

Wozniak met the younger Steven P. Jobs, another Homestead High alumnus, in 1968. In 1971 the pair started their first business venture: making "blue boxes" that allowed people to make free long-distance phone calls. They built the devices and sold them for \$150 each to Wozniak's fellow students. He and Jobs continued to build microcomputers for the Homebrew Computer Club and in 1976 Jobs proposed starting a computer company, Apple Computer. He was 22 and Wozniak was 26. After several high-tech names were rejected, Jobs, who had worked in an orchard, proposed the name Apple. With Jobs concentrating on marketing and sales, Wozniak began to build the first Apple computer.

The Apple I was assembled in Jobs' family garage. Wozniak's design stressed simplicity and ease of use. Microcomputers prior to Apple were mainly for

electronic hobbyists; Wozniak had constructed a machine that was affordable, useful, fun, and simple. Within a month of assembling the Apple I, they landed a \$50,000 order. Wozniak's later design of a flexible disc (a "floppy disc") to replace the clumsy magnetic tape that all small computers then used for information storage was a revolutionary breakthrough. It was incorporated into the Apple II, a computer that made the company's fortune and transformed the personal computer business. The Apple II was the first small computer with a plastic case, the first with high-resolution color graphics, the first with so few chips for a complete system, and the first with a built-in speaker port for sound. Wozniak had designed a small but effective personal computer that could be used by ordinary people without complex training and commands that had been essential in microcomputers up to this time. Apple, therefore, had extended computer use to a much wider audience and pioneered the personal computer market. In subsequent refinements Apple marketed the IIe, III, and the IIC, as well as Lisa and Macintosh in the early 1980s. Wozniak's technical genius was behind each of these projects.

Wozniak married three times. He met his first wife, Alice Robertson, over a Dial-a-Joke line that he had started and sometimes manned as "Stanley Zeber Zenskanitsky." They divorced in 1980. Wozniak's second wife, Candi Clark, was an Apple financial analyst who made the 1976 Olympics as a kayaker. The couple had three children. In 1981 the two were aboard Wozniak's Beechcraft Bonanza on a flight to San Diego to purchase their wedding rings when the plane crashed on takeoff. Candi suffered a skull fracture and numerous broken bones in her face. Wozniak was afflicted with short-term amnesia for five weeks. The accident, Apple's growing bureaucracy, and management hassles precipitated Wozniak taking a leave of absence from the company. While away from Apple, he resumed studying for his computer science degree at Berkeley, which he received in 1987. In the late 1990s Wozniak married Suzanne Mulkern, who also had three children from a former marriage. Mulkern, a lawyer, had been a seventh-grade classmate of Wozniak.

Wozniak gave away about half his shares in Apple before it went public in 1980, including \$40 million in stock to his first wife, \$4 million to his parents, brother and sister, and \$2 million to friends. However, Wozniak's remaining 3.7 million shares were worth around \$100 million. In 1982 and 1983 Wozniak, a rock music enthusiast, organized two U.S. Festivals of rock music and in 1987 the first U.S.-Soviet stadium rock concerts in Moscow, Russia. He has donated over

\$7 million to various charities, particularly in the San Jose area.

Wozniak remained devoted to his family in the late 1990s; he said that he would rather be remembered as a good father than as an icon of the computer era. His leisure activities included attending Golden State Warrior games, playing Tetris on his GameBoy, and going through manuals on new computer programs. He also collected uncut sheets of two dollar bills

Wozniak, who continued to see himself as an engineer and programmer rather than as a business executive, became less and less involved in the running of Apple in the late 1990s; he continued to offer design ideas, maintain an office, and earn a small salary from the company. In 1991 he embarked on a new career as a grade-school teacher. Inspired by his son Jesse's growing interest in computers, Wozniak began an ad-hoc class for him and his fifth-grade classmates in 1992. He later expanded Jesse's class, started a new one of 20 fifth-graders, and taught a class for teachers at the local middle school. Wozniak intended to complete his teacher certification and maintain his teaching at the elementary school level. He said, "I was born to teach—I have always had this gift with children."

Wozniak is one of the true pioneers of the computer age. By designing a simple-to-use and relatively inexpensive microcomputer, he helped to create the personal computer business that has transformed modern life. More of an inventive engineer than a businessman, Wozniak's computer designs have become standard in the technological revolution that he helped to start. The multibillion-dollar personal computer industries can trace its origins in part to Wozniak's innovations. Wozniak helped initiate the continuing development of smaller, faster, and easier to use computers that could reach more users. The world following the appearance of the first Apple computer has changed remarkably, and Wozniak's innovations have contributed greatly to those changes.

Wozniak has used the fortune he gained from his inventions to make a difference in his community and in the world. He has brought people together for rock music, accelerated the thaw in U.S.-Soviet relations by offering computer expertise and arranging exchanges, and served in his local community as a teacher of the next generation of computer wizards. Wozniak has predicted that computers will eventually reach the physical limit of their hardware, which will allow programmers to create what he has called "something like a Ten Commandments of Software." For example, computers shall not crash, and error messages shall

be understandable. Wozniak foresees future computers becoming more like real people, moving away from menu-driven controls. At the very end of the twentieth century, despite his withdrawal from active work at Apple, Wozniak remained on the cutting edge of computer design.

WRIGHT, FRANK LLOYD

Frank Lloyd Wright (1869–1959) was considered one of the most influential and most important twentieth century U.S. architects. His buildings—more than 400—possessed the quality and feel of genius at work. His designs, his unique ideas about homes, seemed eternally futuristic, enormously functional, and have influenced every sphere of twentieth century architecture.

Frank Lloyd Wright was one of the most dramatic and eccentric U.S. geniuses. He was born on June 8, 1867, the eldest of three children born to William and Anna Lloyd Wright in the small town of Richland Center, Wisconsin, on the American prairie. Wright's mother had emigrated from Wales with her family. Her brothers and her father, who was a Unitarian minister, became skilled carpenters and built themselves homes in the Wisconsin River Valley. Wright's relationship with his mother was very close throughout his life. When he was very young his mother, who was a schoolteacher, used the Froebel Kindergarten Method at home, which introduced children to pure geometric

forms and their patterns on grids. Scholars have speculated that Wright's later use of so much sophisticated geometric design in his work was an outgrowth of his early integrated exposure to geometric design as a learning tool.

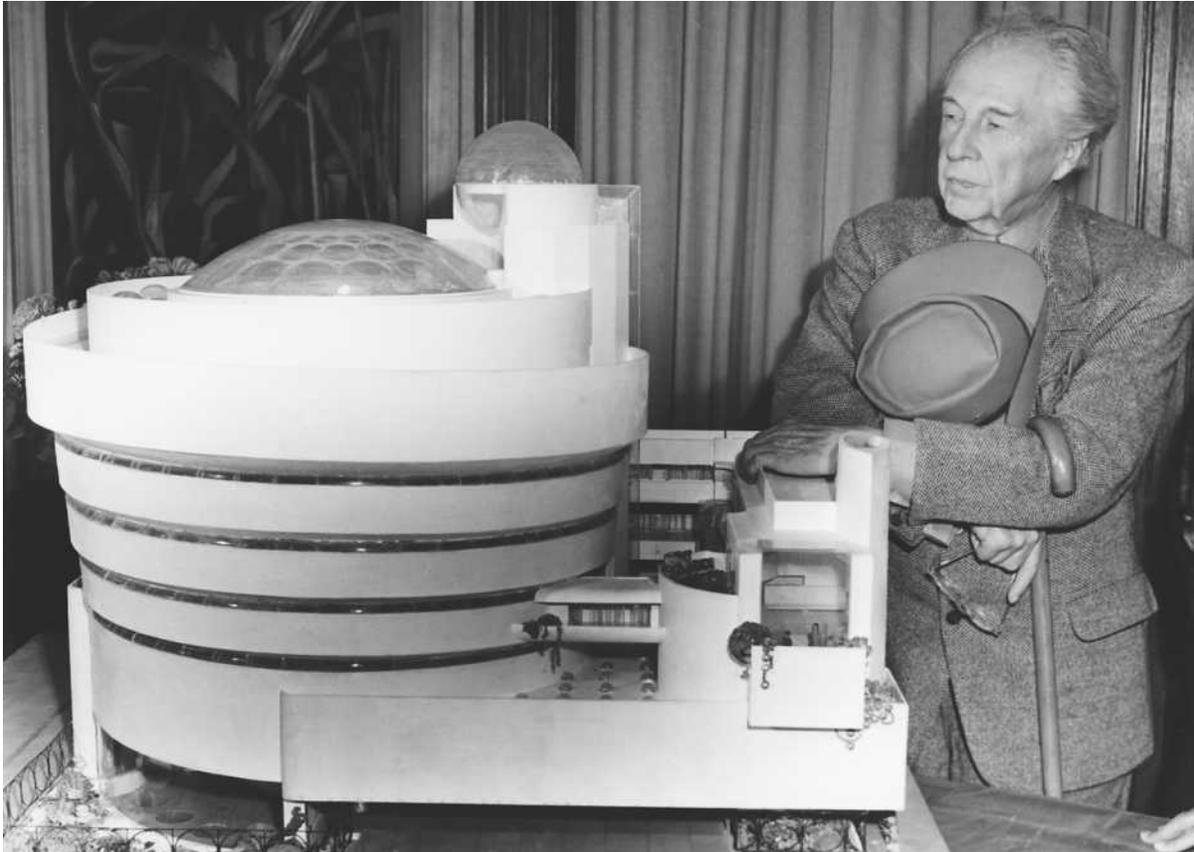

His father, William Carey Wright, was a Baptist minister and musician. When Wright was three years old, his family moved to Massachusetts, where his father worked as a minister. Around 1880 the family moved back to Wisconsin. His father opened a music conservatory and Wright went to school and worked on his uncle's farm. When Wright was 18, his father divorced his wife, leaving him with his mother and two younger siblings. After his parents' divorce in 1885, Wright sought part-time employment in Madison, Wisconsin. He also had plans to study at the University of Wisconsin. Wright took a job with a Madison contractor as a draftsman's apprentice, and he took engineering and graphics courses for a year at the university. That was the end of his formal education. To further his architectural training, Wright left Madison in 1887 for Chicago, Illinois, where he obtained employment as a draftsman with Joseph Silsbee, an architect.

Chicago in the late 1880s was booming and Wright was there to take advantage of the wealth of opportunities available. Architects from all over the world had come to Chicago to rebuild the city after it was destroyed in a devastating fire in 1871. Wright, having learned the architectural basics from Silsbee, began to undertake his own commissions and projects for private residential home design. In 1888 he joined the firm of Adler and Sullivan, where he primarily designed homes.

He landed a job with Dankmar Adler and Louis Sullivan, one of the most progressive architectural firms in the country. Here Wright developed a very close relationship with Louis Sullivan (1856–1924), who was known for his "form follows function" ideology. By the time Wright was in his early 20s, he had worked on some of the most impressive buildings in Chicago.

Wright left Sullivan in 1893 and established his own business. From 1893 to 1910 he built approximately 273 houses, many of which were the "Prairie-house style"—a combination of Japanese design elements and American influences.

In 1889 Wright married Catherine Lee Clark Tobin. Frank and Catherine had six children, two of whom became architects. To support his wife and children in the manner to which he was accustomed, Wright took

Frank Lloyd Wright with a model of a museum, the first New York building of the architect.

on extra work designing houses. Wright “bootlegged” designs from Sullivan’s firm, adding his own ideas—Sullivan subsequently severed his contract with Wright. In 1893 Wright started his own architectural business. In 1909 he abandoned his wife and children, running off to Europe with Mamah Borthwick Cheney, the wife of a former client. The couple stayed away from the United States for a year, returning in 1911 to settle in Spring Green, Wisconsin, where Wright built his well-known residence Taliesin (“shining brow” in Welsh). In 1914 a servant at the Taliesin residence set fire to the house and murdered Mamah, two of her children, and four other occupants as they tried to escape the flames. The house was almost completely destroyed. Wright rebuilt Taliesin and later traveled to Tokyo, where he was commissioned to build the Imperial Hotel.

During the 1920s Wright developed a new construction method using pre-cast concrete blocks that were reinforced with metal. Several houses were built with this new method, of which the most notable is the Mallard house in Pasadena, California. Wright’s personal life was in a shambles during this decade and his professional life was greatly affected: Commissions were not as numerous and many commissions that

Wright did have were postponed or cancelled due to the Great Depression (1929–1939).

In 1922 Wright married the sculptress Miriam Noel. In 1925 Taliesin burned down again. Wright’s career suffered because of continual scandal in his personal life, which was continually unraveling. Wright’s finances and emotions were depleted. His life was filled with lawsuits, bad publicity, bankruptcy, and bitterness. In 1928 Wright married his fourth wife, Olgivanna Milanoff, a Montenegrin aristocrat, who was at one time a student of G.I. Gurdjieff, a Russian-born esoteric thinker and mystic. This marriage lasted for the rest of Wright’s life.

During the early 1930s Wright devoted his time to writing and lecturing. In 1931 Wright set up the Taliesin Fellowship and turned his residence into a studio-workshop for apprentices who would pay to study with him and work on Wright’s commissions. As the economy in the country stabilized, building resumed and Wright designed two well known buildings: the Kaufman House, which was cantilevered over a waterfall at Bear Run, Pennsylvania, and an administration building for the S.C. Johnson and Son Company in

Racine, Wisconsin. Wright also kept himself busy designing houses and communities that he thought were the perfect answer to modern society; for example, Broadacre City was a decentralized community with no distinction between town and country. He designed homes that would reflect an ideal, democratic America—Usonia. In 1938 he built Taliesin West, a permanent desert camp made of stone, wood and canvas, near Phoenix Arizona.

Wright began to lecture and teach. Although his designs continued to be built at a steady pace for more than two decades, he was not to see fame re-emerge in his life until the 1950s. He was in his eighties then, but he had survived into old age with good energy and a burning passion about his beliefs in radical architecture. Wright wrote several books about architecture. He was idolized in the 1950s as a daring, individualistic genius. The eccentricities for which he was once scorned had helped to make him popular. Clearly, before he died, Frank Lloyd Wright had secured a position in the public imagination as a uniquely American icon; a brilliant, loner, “cowboy”-architect—a genius to architecture, as Albert Einstein was a genius to physics.

During the 1940s and 1950s Wright continued to design and build innovative and impressive structures. During this time his designs were perhaps more varied and radical than previous decades—college campuses, crescent-shaped houses, circular houses, and lastly, the unprecedented concrete, spiral-shaped Guggenheim Museum, his last major work. Although his work has been criticized as impractical and expensive, none of his structures have sustained damages due to faulty engineering.

Wright believed that U.S. architecture should reflect the environment in which it was built, the environment of the frontier and of the abundance of land. Wright described his work as “organic architecture, that which proceeds, persists, creates, according to the nature of man and his circumstances as they both change.” He created homes with strong horizontal lines and shapes, with roofs that were low pitched with large overhangs, and with flourishes that created a sense of the horizon and of spaciousness. The inside of his homes, influenced by Japanese designs, had large open spaces, huge central rooms, few closed corners, many large windows, and a geometric emphasis in the room’s decor. His homes were unadorned; nothing “fancy” or “fake” or unnecessary was present. His ceilings were built high—cathedral ceilings—and many of his houses were heated with radiant heat (coils built into the concrete slab floors which circulated warm water through the coils to radiate heat into the home

evenly). And since automobiles had become easier to start, he stopped building garages and instead attached simple carports that would protect the car from heavy snow but retain the open feel of the total design.

Frank Lloyd Wright’s designs of homes and buildings have inspired generations of architects, including much of what is called “modern architecture.” His influence has been international—many other countries have considered Frank Lloyd Wright’s designs to be a major influence on their contemporary styles. More than 30 states in the United States possess Frank Lloyd Wright structures, and most architectural critics agree that every state in the country has buildings that reflect Wright’s style. His many imitators constitute Wright’s greatest success. Even if his more severe designs are changed and distorted, the general horizontal style of Wright’s prairie architecture created a distinct shape of architectural content that has influenced the way Americans see modern architecture. His brilliant designs of Taliesin West, his Arizona headquarters; the inexpensive Usonian homes; the great Kaufman House, built over a waterfall in Pennsylvania; his designs for the Imperial Hotel in Tokyo, and the Guggenheim Museum in New York City are all breath-taking examples of his great success as an architect and an artist. Frank Lloyd Wright died in 1959.

WRIGLEY, WILLIAM, JR.

William Wrigley, Jr. (1861–1932) was a salesman and industrialist. He started his career as a soap salesman and ended it as the owner of the largest chewing gum company in the United States. Wrigley was also the owner of the Chicago Cubs baseball team and had a baseball stadium in Chicago, Illinois, named after him.

Wrigley, William, Jr.

William Wrigley, Jr. was born on September 30, 1861 in Philadelphia, Pennsylvania. His father, William Wrigley, Sr., was a soap maker who had founded his own company, the Wrigley Manufacturing Company, in 1870. Wrigley worked for his father's company as a child, selling soap from a basket on the streets of Philadelphia. At the age of 11, Wrigley went to work in the soap factory. He stirred vats of liquid soap and earned \$1.50 a week. When Wrigley was 13, he returned to sales. He traveled by train or wagon from town to town selling his father's soap. This early sales experience would prove to be useful for his later career as a businessman in his own right.

In 1891 Wrigley left his father's company with hopes of starting his own business. He left Philadelphia for Chicago with only \$32 to his name, but an abundance of ambition and enthusiasm. In Chicago his uncle, William Scotchard, loaned him \$5,000 to start his own business on the condition that his cousin become his partner. In April 1891, at the age of 29, Wrigley started his business selling Wrigley's scouring soap. He offered premiums to merchants as an incentive to buy his product. Wrigley gave merchants baking powder as a premium, but baking powder soon became a more popular product than soap, so Wrigley switched his main product. In 1892 he began to offer two packages of chewing gum as a premium in place of the baking powder. When demand for the chewing gum surpassed that for the baking powder, Wrigley once again switched products.

At that time there were about a dozen other companies selling chewing gum, but the industry was not developed. In 1892 Wrigley hired the Zero Manufacturing Company to produce chewing gum for him. That same year he introduced his first two brands of gum called Lotta and Vassar. In 1893 he introduced Juicy Fruit and Spearmint gums.

Initially Wrigley had to work hard to break into the chewing gum business because established companies offered products already popular with the public. Wrigley relied on his sales and advertising skills to promote his products and distinguish them from other brands of chewing gum. He continued to offer retailers premiums for carrying his product. The premiums included a variety of products, such as lamps, razors, and scales. In addition, he saw the advantage of familiarizing the public with his products through newspaper, magazine, and poster advertising.

In 1899 six of the largest gum manufacturers merged to form a "chewing gum trust." Wrigley was offered the opportunity to join the merger, but he refused. As he explained, "We propose to keep our

identity . . . and if we cannot do business by fair and square methods, we prefer not to do business at all." The Wrigley Company still prides itself on this legacy of independence and integrity.

Though the company struggled during its early years, Wrigley's persistence and dedication paid off. In 1906 he put his advertising philosophy to the test. Wrigley had introduced Spearmint gum to the public several years earlier, but it was not initially very popular. In 1906 Wrigley began a limited advertising campaign in Buffalo, Rochester, and Syracuse, New York, to specifically promote Spearmint. The campaign was so successful that in 1907 Wrigley spent \$284,000 to continue to promote this product across the country. As a result of this effort, Spearmint sales rose dramatically and reached over \$1.3 million in 1909. By 1910 Wrigley's Spearmint was the most popular gum in the country.

The success of Spearmint made Wrigley the world's largest chewing gum maker. In 1911 Wrigley bought the Zero Manufacturing Company and established the William Wrigley, Jr. Company. He also began to expand his interests abroad. In 1910 he opened a factory in Canada, followed by factories in Australia in 1915, and Great Britain in 1927. Before Wrigley's death, his company had factories in Chicago, Manhattan, Brooklyn, Toronto, London, Berlin, Frankfurt, and Sydney. The company's expansion into international markets led to the creation of new products and flavors as well as new marketing techniques. Wrigley advertised in more than 30 languages and taught the world how to chew gum.

Wrigley retired as company president in 1915, though he continued to serve as chairman of the board. His son, Philip Knight Wrigley, took over the family business and Wrigley explored his other business and leisure interests. By 1921 Wrigley became principal owner of the Chicago Cubs and later acquired two other baseball teams. He also purchased Santa Catalina Island off the coast of California and turned it into a popular resort. When William Wrigley, Jr. died on January 26, 1932, his family business had already become one of the most popular brand names in the United States.

WYOMING

The state of Wyoming has been bypassed by the sweeping changes which affected a majority of the United States in the nineteenth and twentieth centuries. It is ranching country with little population and many open spaces. Wyoming has small cities and it has, in recent years, prospered from its abundant energy resources. But a large portion of the state remains much as it was when pioneer wagon trains crossed it in the mid-nineteenth century.

French Canadian traders were the first Europeans to enter Wyoming, but an American fur trader, John Colter, was the first to do any important exploration. After he reported on the natural wonders of the northwestern part of Wyoming, other traders and trappers crossed the territory. The old Oregon Trail crossed Wyoming, and between 1840 and 1867 thousands traversed the territory on their way to Oregon, California, or other points west. Some were travelling to the California, Idaho, and Colorado gold countries; others were escaping from the American Civil War (1860–1865) and its aftermath; still others simply hoped for good land on which to build new homes. They stopped at landmarks like Devil's Gate and Split Rock and at supply points like Fort Laramie, but few chose to stay in the arid land of Wyoming permanently. The economy of the area at that time was largely based on trading posts which served the travelling wagon trains, most establishments were run by mountain men. Other enterprises, such as blacksmith shops and ferries or toll bridges across rivers, also sprang up to serve the needs of the pioneers.

The Union Pacific Railroad eventually brought permanent settlers to Wyoming. It was the first time a railroad had been built before the creation of a new territory. Cheyenne, Laramie, Rawlins, Rock Springs, and other towns sprang up as the railroad made its way across the country in 1866 and 1867. Each experienced a boom and then a decline as the railroad workers moved from town to town. Wyoming officially became a territory in 1868, but growth was slow. In 1869 it had a population of barely nine thousand.

After the quelling of Indian uprisings in the late 1870s, Wyoming soon became cattle country. The cattlemen and some foreign investors hoped to get rich because the grass was free and the price of cattle was high. Texas longhorns were driven to the southeastern part of the territory, and later Hereford cattle were introduced. Although sheep were also raised on the ranches, Wyoming came to depend on cattle more than any other territory. The American myth of the cowboy was especially strong in Wyoming. According to T. A. Larson's bicentennial history of Wyoming, the image of a strong, lonely figure in open cattle country appealed to a nation in which the grips of growing industrialization and urbanization appeared as signs of "a complex civilization in which the individual felt he counted for very little."

Small ranchers and cowboys had difficulty competing with big "cattle barons," who not only bought up much of the land but also held the most important influence in local and state politics. Though profiting from the land, many cattlemen lived in towns and visited their ranches only occasionally. Unfortunately for the cattle speculators, in addition to overgrazing and low cattle prices, a drought in the summer of 1886 and a harsh winter that same year had disastrous results. Shortly after Wyoming became a state in 1890, the so-called Johnson County War of 1891–1892 pitted large against small landowners and culminated in the arrest of large landowners for practicing vigilante justice.

Life in Wyoming proceeded at a slow pace throughout the early decades of the twentieth century. Stockmen suffered greatly during the Great Depression (1929–1939) of the 1930s. A long period of drought destroyed hay and grass and many animals had to be destroyed. Cattlemen were forced to accept government subsidies in order to survive. During World War I (1914–1918) and World War II (1939–1945), however, despite some grumbling among cattlemen about beef rationing, cattle ranches prospered. In the decades following World War II, Wyoming's economy came to depend more and more on cattle, and very large ranches became the norm.

Wyoming's growth was minimal throughout most of its history because the land was mostly unsuitable for traditional farming. It is still sparsely populated state, ranking last in population in the 1990 census. The development of coal, oil, and natural gas resources brought some growth in the 1970s during the nationwide energy crisis; but this growth too slowed during the 1980s. The 1990s saw some improvement in the oil and coal industry; in the late 1990s Wyoming ranked first in the nation in coal production. In addition to

energy production, the economy of Wyoming is based largely on feed grains and livestock, with the timber industry also an important sector. Tourism is becoming an important industry in the state, especially at the state's two national parks, Yellowstone and Grand Teton. In addition, urban dwellers are increasingly seeking seasonal or permanent havens in Wyoming's mountains and open spaces. With no personal or corporate income taxes, the state is favorable to business. It ranked 35th among the 50 states in per capita personal income in 1996.

YELLOW DOG CONTRACTS

A yellow dog contract is a labor contract in which workers are required to refrain from joining a union in exchange for being hired. It emerged in the nineteenth century as one of many tactics companies used to discourage workers from organizing to win wage increases and improved working conditions.

During rapid industrialization of the United States in the years after the American Civil War (1861–1865), many workers endured seven-day workweeks, minimal pay, and inhumane working conditions. As a result, the U.S. labor movement successfully organized many new unions. As unions pushed for eight-hour days, pro-business legislators and sympathetic judges passed laws to prevent labor unions from recruiting new members. Across the country legislatures passed laws outlawing “combinations” of workers that, in the words of one such law, “willfully or maliciously injured another in his . . . business.” Because unionizing a company’s labor force could be viewed as “injuring” that business, union activism was successfully thwarted.

In the famous Pullman Strike of 1894 which was led by socialist Eugene V. Debs (1855–1926), members of the American Railway Union went on strike against the Pullman Palace Car Company of Chicago

when it cut wages by 25 percent. Refusing to work on any train that pulled a Pullman railcar, the union looked like it could prevail because almost every train passing through Chicago carried Pullman cars. When the striking workers began attacking the trains, however, President Grover Cleveland (1885–1889) called in the U.S. Army to end the strike. When Pullman reopened its plant later that year, it required all new employees to sign yellow dog contracts.

In 1898 Congress passed the Erdman Act, which prevented railroads that were engaged in interstate commerce from forcing their employees to sign yellow dog contracts. In *Adair v. the United States*, however, the U.S. Supreme Court ruled that the Erdman Act was unconstitutional. Throughout the 1920s many U.S. businesses continued to require workers to reject union membership as a precondition of employment, but the onset of Great Depression (1929–1939) finally shifted the law to the side of labor. The Norris-LaGuardia Act of 1932, the National Industrial Recovery Act of 1933, and the Wagner Act of 1935 formally recognized the rights of labor unions to organize and explicitly outlawed yellow dog contracts.

ZENITH ELECTRONICS CORPORATION

Zenith Electronics Corporation's beginnings were very modest. In 1918 two ham radio operators, Karl E. Hassel and R. H. G. Mathews, began manufacturing radio equipment at a kitchen table under the name Chicago Radio Laboratory. Hassel ran an amateur radio station with the call letters 9ZN, from which they named their first product Zenith. In 1921 these two men were joined by Eugene F. McDonald Jr. McDonald, already a self-made millionaire when he joined the company, was pivotal to Zenith's growth. He was much more than a financial backer. McDonald's flamboyant style was echoed in the company's dramatic advertising methods. This style, coupled with innovative genius and an ability to sense changes in public tastes, meant that for more than three decades McDonald was Zenith in the public perception. The company was incorporated as Zenith Radio Corporation in 1923 and it officially began to manufacture under the Zenith name.

Zenith's inventors and technicians kept the company at the forefront of the infant radio industry. In 1924 Zenith introduced the world's first portable radio. Two years later Zenith introduced the first home radio receiver that operated directly from regular AC electric current. Another early accomplishment was the first automatic push-button radio tuner, which was introduced in 1927. That same year saw the first use of the famous Zenith slogan, "The Quality Goes In Before The Name Goes On." By the late 1920s Zenith was in 12th place in a \$400 million industry.

During the Great Depression (1929–1939) Zenith's sales dropped from \$10 million in 1929 to less than two million dollars in 1932, but the company managed to stay afloat. Just prior to U.S. involvement in World War II (1939–1945) Zenith became a pioneer in television and FM radio broadcasting. In 1939 Zenith's station W9XZV went on the air as the first all-electronic television station. This was followed the next year by W9XEN, one of the first FM stations in

the United States and the first in the Midwest. By 1941 Zenith had risen to second place in a \$600 million industry, behind only RCA. Although World War II caused a decline in normal consumer business, this decline was more than offset by war production. Zenith manufactured radar, communications equipment, and high-sensitivity frequency meters.

Following World War II Zenith concentrated on improving television. The company introduced its first line of black-and-white television receivers in 1948. While experimenting with color television in its laboratories until the quality was up to the company standard, Zenith continued to work on its black-and-white televisions. The company invented the first wireless remote control in 1956 which revolutionized television tuning, and it held the leading position in black-and-white television production from 1959 on.

The color television breakthrough came in 1961, when Zenith introduced a ten-receiver line of color sets. Demand for these sets grew so quickly that the company had to expand its facilities. Also that year Zenith's experimental stereophonic FM broadcasting system was approved by the FCC as the national standard. Color television improvements continued steadily. In 1969 Zenith introduced the patented Chromacolor picture tube, which set the standard for brightness in the color television industry for many years. By 1972, the year it introduced a line of 25-inch televisions, Zenith was number one in production of color television sets. Between 1972 and 1978 Zenith was able to maintain the leading position in the fiercely competitive U.S. color television market, but the company was overtaken by RCA in 1979.

Starting in the 1970s the entire U.S. electronic consumer goods industry was under increasing competitive pressure from Asian manufacturers. Manufacturers from Japan, Taiwan, and Korea began selling great numbers of electronics products in the United States at prices below what U.S. companies could afford to offer. As a result, Zenith's share of the television-set market fell steadily in the 1970s and

Zenith Electronics Corporation

1980s. Searching for a turnaround, the company entered the personal computer field in 1979 but exited that sector in 1989, finding it to be just as competitive as that of television. Zenith marketed its last radio in 1982 and changed its long out-dated name to Zenith Electronics Corporation in 1985. In 1988, continuing its long tradition of innovation, Zenith became one of the earliest proponents of high-definition television, the super-sharp digital television technology that was supposed to replace the standard analog television.

From the mid-1980s into the late 1990s Zenith lost money every year except for 1988, when it reported a modest \$12 million profit. By the mid-1990s the company had shifted most of its manufacturing to Mexico in order to cut costs. By that time the company was also the last of the American-controlled television manufacturers. That changed in 1995 when LG Group, based in South Korea, purchased a fifty-eight percent stake in Zenith. The company's financial condition continued to worsen. In May 1998 Zenith announced that it planned to restructure under the protection of bank-

ruptcy laws, intending to emerge from bankruptcy as a wholly owned subsidiary of LG Group.
