Abstract

The Tree of Life known to Kabbalah is but the outer form of the true cosmic blueprint. Its geometry generates an inner form that consists of two sets of seven enfolded, regular polygons, one set being the mirror image of the other. This article analyzes the properties of the combined outer and inner forms of the Tree of Life when the triangles in the former are either simple triangles, Type A or Type B and the polygons in the latter are either Type A or Type B. The geometrical and yod compositions of these combinations are numbers found to characterize other sacred geometries, confirming their equivalence to the Tree of Life demonstrated in previous articles. For example, 384 geometrical elements are outside the root edge when the outer Tree of Life has simple triangles and the inner Tree has Type A polygons. They consist of 192 corners & triangles and 192 sides. This pattern exists in other sacred geometries, e.g., each half of the 3-dimensional Sri Yantra with its 43 triangles turned into tetractyses has 192 yods. When triangles in the outer Tree are tetractyses, the combined Trees contain 496 hexagonal yods. This number is the dimension of the two Lie groups that define the unified superstring interaction. It demonstrates the Tree of Life basis of superstring theory. 384 hexagonal yods line the sides of tetractyses as 192 pairs. With Type A triangles in the outer Tree and Type A polygons in the inner Tree, 480 geometrical elements are outside the root edge. They consist of 240 corners & triangles and 240 sides. This is analogous to the 480 roots of $E_8 \times E_8'$ (one of the two Lie groups), which comprise 240 roots of E_8 and 240 roots of E_8' . The number of hexagonal yods in the combined Trees is that in the seven separate Type B polygons. The gematria number 620 of Kether is the number of yods outside the root edge that are hexagonal yods in both combined Trees. The tetractyses in the separate outer & inner Trees with Type B triangles and polygons have 248 corners, where 248 is the dimension of E_8 . There are 620 yods in the outer Tree other than corners and centres of its Type B triangles. 496 yods line its tetractyses that are not Sephiroth shared with its inner form. When their triangles and polygons are Type B, there are 240 corners outside the root edge in the combined outer & inner Trees of Life. ADONAI MELEKH, the Godname of Malkuth, prescribes the number of unshared yods outside the root edge that line tetractyses but are not located at the positions of the ten Sephiroth. With Type A triangles in the outer Tree and Type B polygons in the inner Tree, there are 192 corners outside the root edge. With Type B triangles in the outer Tree and Type A polygons in the inner Tree, there are 384 corners & triangles and 384 sides outside the root edge. Different combinations of these transformed Trees embody numbers characterising other sacred geometries. It is powerful evidence that the Trees of Life constitute sacred geometry when combined as well as when separate.

Table 1. Gematria number values of the ten Sephiroth in the four Worlds.

	SEPHIRAH	GODNAME	ARCHANGEL	ORDER OF ANGELS	MUNDANE CHAKRA
1	Kether (Crown) 620	EHYEH (I am) 21	Metatron (Angel of the Presence) 314	Chaioth ha Qadesh (Holy Living Creatures) 833	Rashith ha Gilgalim First Swirlings. (Primum Mobile) 636
2	Chokmah (Wisdom) 73	YAHWEH, YAH (The Lord) 26, 15	Raziel (Herald of the Deity) 248	Auphanim (Wheels) 187	Masloth (The Sphere of the Zodiac) 140
3	Binah (Understanding) 67	ELOHIM (God in multiplicity) 50	Tzaphkiel (Contemplation of God) 311	Aralim (Thrones) 282	Shabathai Rest. (Saturn) 317
	Daath (Knowledge) 474				
4	Chesed (Mercy) 72	EL (God) 31	Tzadkiel (Benevolence of God) 62	Chasmalim (Shining Ones) 428	Tzadekh Righteousness. (Jupiter) 194
5	Geburah (Severity) 216	ELOHA (The Almighty) 36	Samael (Severity of God) 131	Seraphim (Fiery Serpents) 630	Madim Vehement Strength. (Mars) 95
6	Tiphareth (Beauty) 1081	YAHWEH ELOHIM (God the Creator) 76	Michael (Like unto God) 101	Malachim (Kings) 140	Shemesh The Solar Light. (Sun) 640
7	Netzach (Victory) 148	YAHWEH SABAOTH (Lord of Hosts) 129	Haniel (Grace of God) 97	Tarshishim or Elohim 1260	Nogah Glittering Splendour. (Venus) 64
8	Hod (Glory) 15	ELOHIM SABAOTH (God of Hosts) 153	Raphael (Divine Physician) 311	Beni Elohim (Sons of God) 112	Kokab The Stellar Light. (Mercury) 48
9	Yesod (Foundation) 80	SHADDAI EL CHAI (Almighty Living God) 49, 363	Gabriel (Strong Man of God) 246	Cherubim (The Strong) 272	Levanah The Lunar Flame. (Moon) 87
10	Malkuth (Kingdom) 496	ADONAI MELEKH (The Lord and King) 65, 155	Sandalphon (Manifest Messiah) 280	Ashim (Souls of Fire) 351	Cholem Yesodeth The Breaker of the Foundations. The Elements. (Earth) 168

(All numbers in this table that are referred to in the article are written in **boldface**).

The Sephiroth exist in the four Worlds of Atziluth, Beriah, Yetzirah and Assiyah. Corresponding to them are the Godnames, Archangels, Order of Angels and Mundane Chakras (their physical manifestation, traditionally symbolised by celestial bodies). This table gives their number values obtained by the ancient practice of gematria, wherein a number is assigned to each letter of the alphabet, thereby giving to a word a number value that is the sum of the numbers of its letters.

1. Shared geometrical elements & yods

The outer Tree of Life consists of 16 triangles arranged in space in such a way that they have 10 corners and 22 sides. The inner Tree of Life comprises two sets of seven regular polygons: triangle, square, pentagon, hexagon, octagon, decagon & dodecagon. One set is the mirror image of the other, so that they lie in a single plane — that containing the Pillar of Mercy and the Pillar of Judgement. This means that the two vertical sides of sectors of the two hexagons coincide with the sides of triangles in the outer

Tree that form the two outer pillars. It also means that the top and bottom corners of these two hexagons coincide with corners of triangles located at the positions of Chokmah, Netzach, Binah & Hod, whilst the outer corner of each triangle belonging to a set of polygons coincides with the corner of triangles that is located at Chesed and at Geburah. Hence, six green corners and four green sides, i.e., 10 corners & sides, of the outer Tree are shared with its inner form (Fig. 1). No triangles in the outer Tree are sectors of the 14 polygons, which number 94. This leaves it with 16 unshared triangles with four unshared corners and 18 unshared sides, i.e., 38 geometrical elements. The sectors have **80** corners (six shared, 74 unshared) and 175 sides (four shared, 171 unshared). Superposed, the outer & inner Trees of Life consist of 84 corners (six shared, 78 unshared), 193 sides (four shared, 189 unshared) & 110 unshared triangles. The 387 geometrical elements comprise 10 shared elements and 377 unshared ones.

Transformed into tetractyses, the 16 triangles of the outer Tree contain 70 yods (10 corners, 60 hexagonal yods) and the 94 sectors of the 14 enfolded polygons contain 524 yods (**80** corners, 444 hexagonal yods). There are eight hexagonal yods on the four vertical sides of the sectors of the two hexagons that are shared with the outer Tree of Life because they lie on its side pillars. Although the two hexagonal yods on the Chesed-Geburah Path are also the centres of the triangles belonging to the two sets of enfolded polygons, they still count as hexagonal yods in determining the hexagonal yod population of the combined Trees of Life. Although they are shared as yods along with eight hexagonal yods in the hexagons, these two yods are not shared as *hexagonal yods*. This is important to realize when we consider later the hexagonal yod population of the combined Trees. As well as these ten yods shared with polygons, three corners of tetractyses on each side pillar coincide with either the top and bottom of the hexagons or with the outer corner of the triangle belonging to each set of polygons. Hence, the outer & inner Trees share 16 yods. This leaves 54 green unshared yods in the former and 508 unshared yods in the latter (254 blue yods in the left-hand set of polygons in Figure 1 and 254 red yods in the right-hand set). Superposed, the outer & inner Trees have 578 yods (16 shared, 562 unshared).

We shall now analyze the properties of the combined Trees of Life when the outer one (henceforth to be called "OTL") is composed of either simple triangles, Type A triangles or Type B triangles and when the

inner Tree of Life (to be called "ITL") consists of either Type A polygons or Type B polygons.

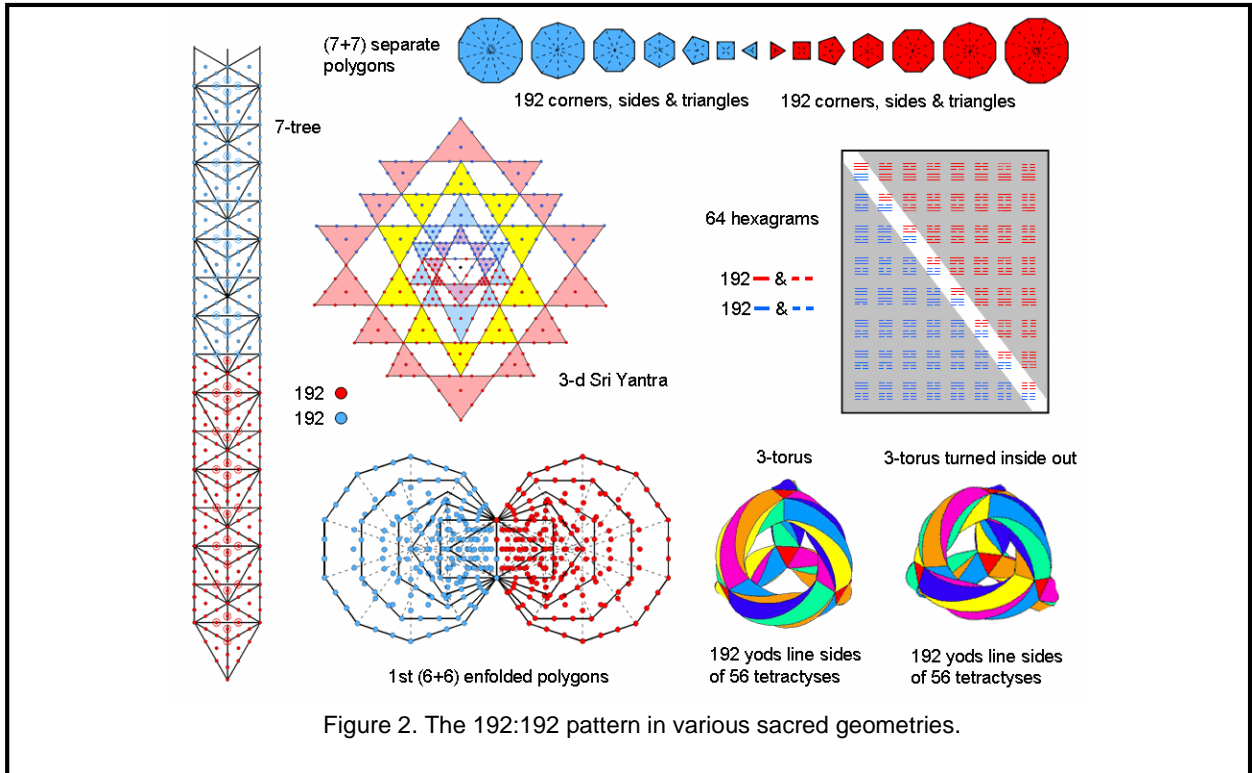

2. Simple triangles in OTL & Type A polygons in ITL

Geometrical composition

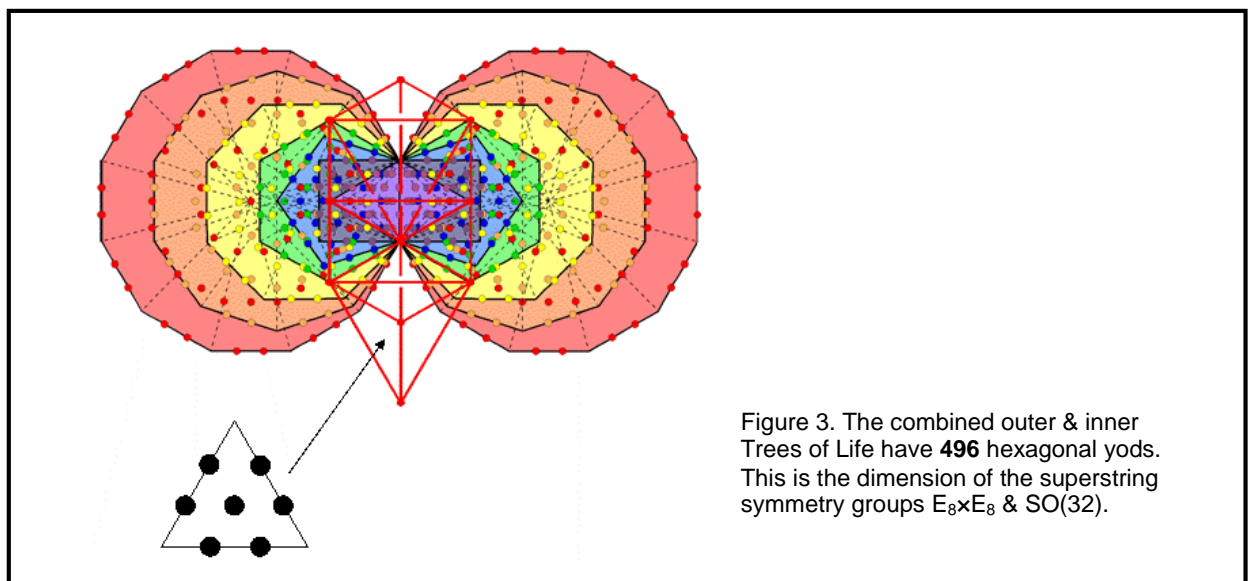

As stated earlier, OTL has 16 triangles with 10 corners & 22 sides, i.e., **48** geometrical elements, where **48** is the number value of *Kokab*, the Mundane Chakra of Hod. ITL has 94 triangular sectors with **80** corners & 175 sides, i.e., it has 349 geometrical elements. Combined, they comprise 387 geometrical elements made up of 84 corners, where

$$84 = 1^2 + 3^2 + 5^2 + 7^2,$$

193 sides & 110 triangles. Outside the root edge are 384 geometrical elements: 192 corners & triangles and 192 sides. This 192:192 division manifests in ITL as the 192 corners & triangles in the 14 separate

polygons and as their 192 sides (alternatively, as the 192 geometrical elements in each set of seven polygons). Figure 2 shows how this division appears in other sacred geometries.

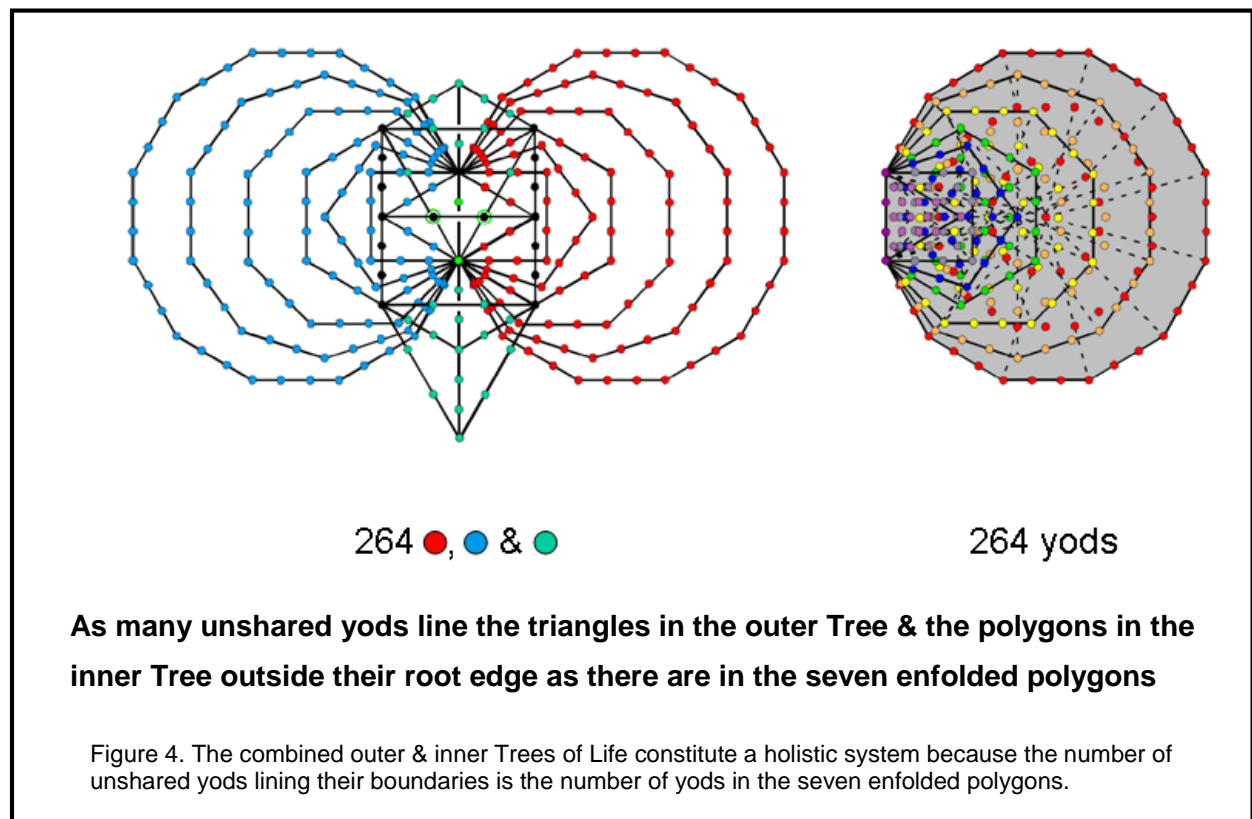

Yod composition

Combined, OTL & ITL contain 578 yods (see Fig. 1). Sixteen of them are shared and 562 are unshared. OTL has 60 hexagonal yods, eight of which are hexagonal yods in the pair of hexagons. ITL has 444 hexagonal yods. Remembering our earlier comment that the two hexagonal yods on the Chesed-Geburah Path still count as hexagonal yods even though they are corners of tetractyses in the two triangles belonging to ITL, the number of hexagonal yods in the combined OTL & ITL = $60 + 444 - 8 = 496$ (Fig. 3). This is both the number value of Malkuth and the dimension of $E_8 \times E_8$ & $SO(32)$ — the two symmetry groups that allow interactions between superstrings that are free of quantum anomalies. What more explicit proof could there be that the Tree of Life encodes superstring theory — or, rather, M-theory, the so-called 'theory of everything' that contains the five versions of superstrings as approximations?

OTL has 16 hexagonal yods at the centres of its 16 tetractyses and ITL has 94 hexagonal yods at the centres of its 94 tetractyses. The number of hexagonal yods lining the 193 sides of the $(16+94=110)$ tetractyses in the combined Trees = $496 - 110 = 386$. Outside the root edge of the $(7+7)$ enfolded polygons are 384 hexagonal yods lining the 192 sides of the 110 tetractyses as 192 pairs. This number is a parameter of holistic systems, and its 192:192 division is characteristic of them, e.g.,

- the **64** hexagrams used in the ancient Chinese I Ching system of divination have 384 lines & broken lines;
- each half of the 3-dimensional Sri Yantra whose 43 triangles are tetractyses contains 192 yods;
- 192 yods are associated with, and intrinsic to, each set of the first six enfolded polygons;
- the 384 yods up to the top of the 7-tree divide into two groups of 192 yods;
- 192 yods line the 56 hyperbolic triangles in the $\{3,7\}$ tessellation of the 3-torus and its version turned inside out when they are regarded as deformed tetractyses.

(See Fig. 2). As the combined Trees contain 578 yods, there are $(578-386=192)$ corners of tetractyses and hexagonal yods at their centres.

Of the 578 yods in the combined OTL & ITL, 110 hexagonal yods are at centres of tetractyses, leaving 468 yods that line their 193 sides. They are made up of 54 yods in OTL ($(54-16=38)$ unshared with ITL) and 414 yods in ITL. The counterpart in the latter of the 54 yods on the boundaries of the triangles is the set of 236 yods that line the sides of the 14 enfolded polygons. They include six yods at the positions of the Sephiroth on the two side pillars of OTL that also belong to the set of 54 yods. Therefore, the number of yods lining triangles in OTL and polygons in ITL = $54 - 6 + 236 = 284$. The number of such boundary

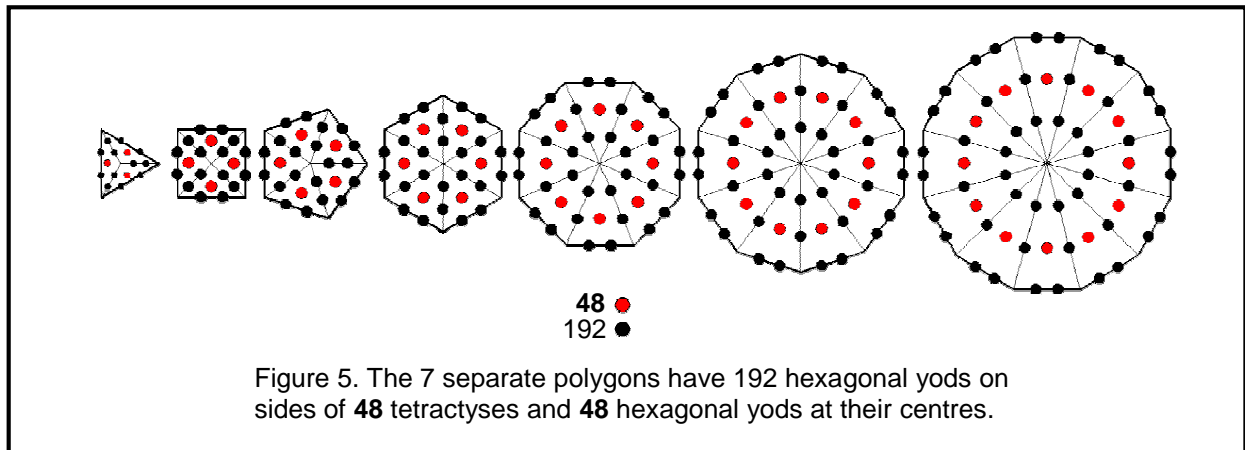

yods outside the root edge = $284 - 4 = 280$. This is the number value of *Sandalphon*, the Archangel of Malkuth. They include the 16 yods shared between OTL and ITL. There are $(280-16=264)$ unshared, boundary yods outside the root edge. This is the number of yods in the seven enfolded polygons (Fig. 4). They include the four remaining Sephiroth on the central pillar: Kether, Tiphareth, Yesod & Malkuth. There are 260 $(=26 \times 10)$ unshared boundary yods other than Sephiroth in the combined OTL & ITL. This is the number of yods in the seven enfolded polygons outside their root edge. It demonstrates how YAHWEH, the Godname of Chokmah with number value **26**, prescribes the *combined* Trees as well as ITL.

3. Type A triangles in OTL & Type A polygons in ITL

Let us, next, consider the case where both the triangles of OTL and the polygons of ITL are Type A.

Geometrical composition

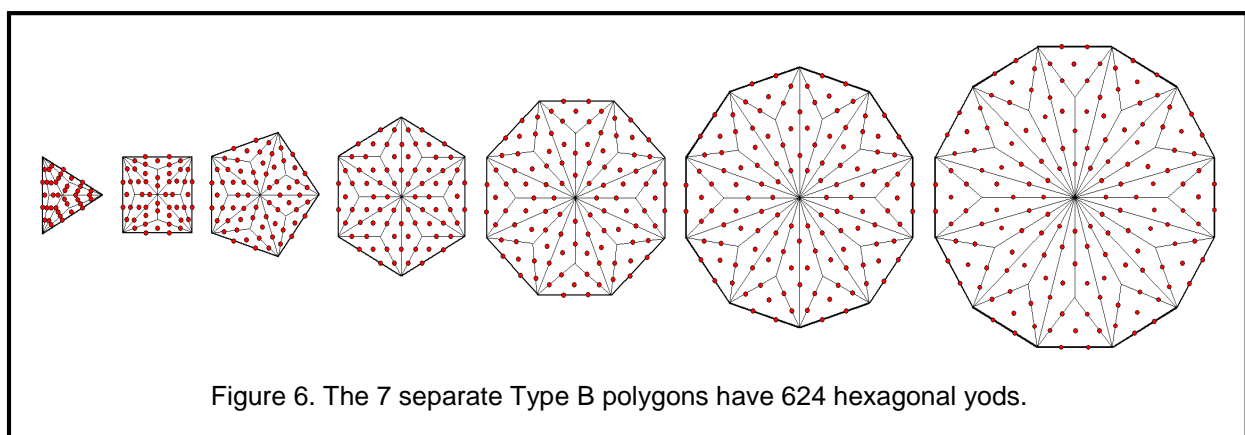

Dividing each of the 16 triangles in OTL into their three sectors adds 16 corners and $(3 \times 16 = 48)$ sides, so that there are now **48** triangles with $(10+16=26)$ corners (six shared, 20 unshared) and $(22+48=70)$ sides (four shared, 66 unshared), i.e., 144 geometrical elements (10 shared, 134 unshared). The 94 sectors of the ITL have **80** corners (six shared, 74 unshared) and 175 sides (four shared, 171 unshared), i.e., 349 geometrical elements (10 shared, 339 unshared). The combined Trees of Life have 100 corners (six

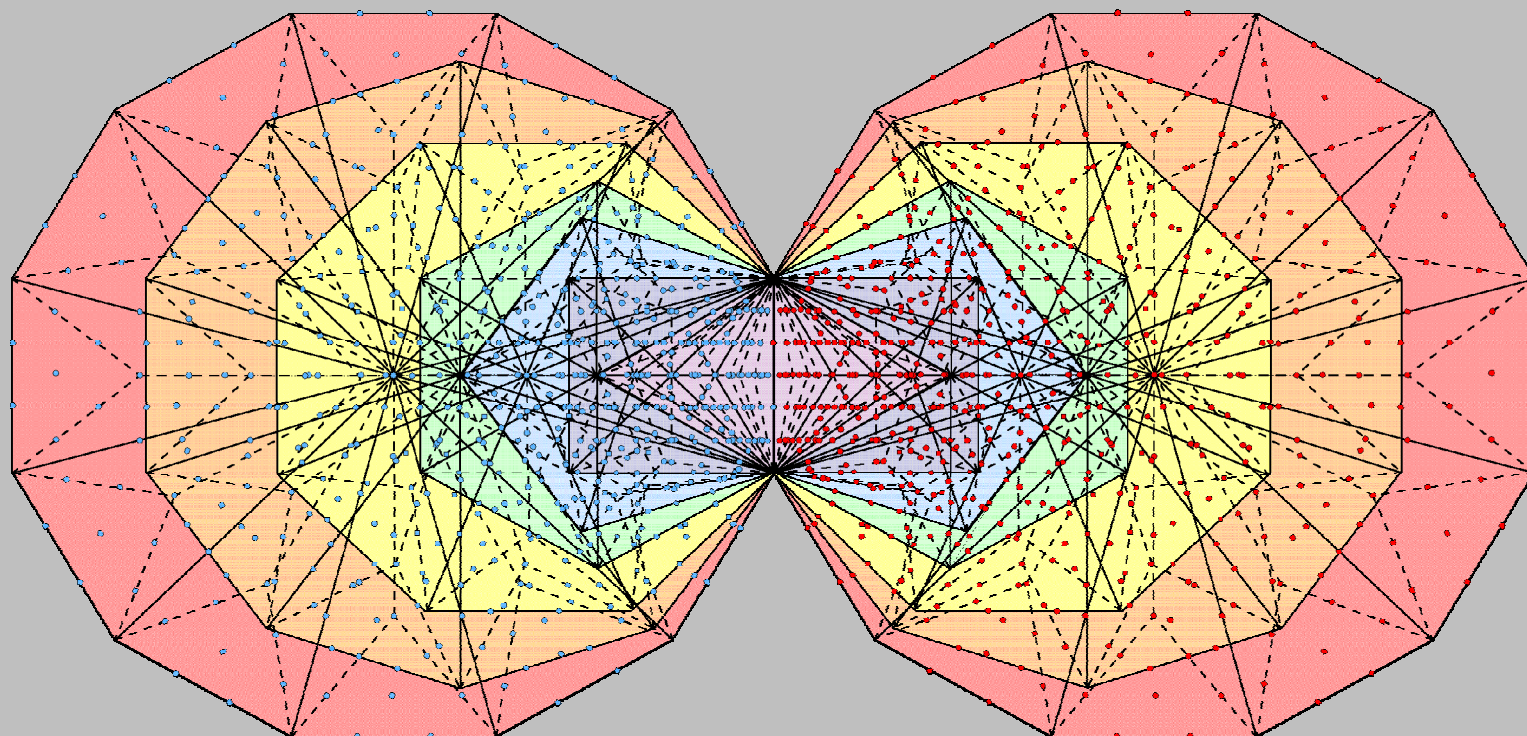

shared, 94 unshared), 241 sides (four shared, 237 unshared) and 142 triangles (all unshared), i.e., 483 geometrical elements (10 shared, 473 unshared).

Analogy with $E_8 \times E_8$

Outside the root edge in the combined OTL & ITL are 480 geometrical elements consisting of $(98+142=240)$ corners & triangles and 240 sides. Compare this property with the fact that the 480 roots of the heterotic superstring symmetry group $E_8 \times E_8$ consist of 240 roots of the first group E_8 and 240 roots of the second group E_8 . Replacing the 16 triangles in OTL by Type A triangles increases the 192 corners & triangles outside the root edge to 240 (16 extra corners & 32 extra triangles) and the 192 sides outside the root edge to 240 sides (**48** extra sides). The counterpart of this $192 \rightarrow 240$ increase in the seven separate polygons is the fact that their **48** tetractys sectors have 192 hexagonal \rightarrow 240 hexagonal yods in total (Fig. 5).

650 (●)

65

650 (●)

$$\begin{array}{r}
 65 \ 65 \\
 650 = 65 \ 65 \ 65 \\
 65 \ 65 \ 65 \ 65
 \end{array}$$

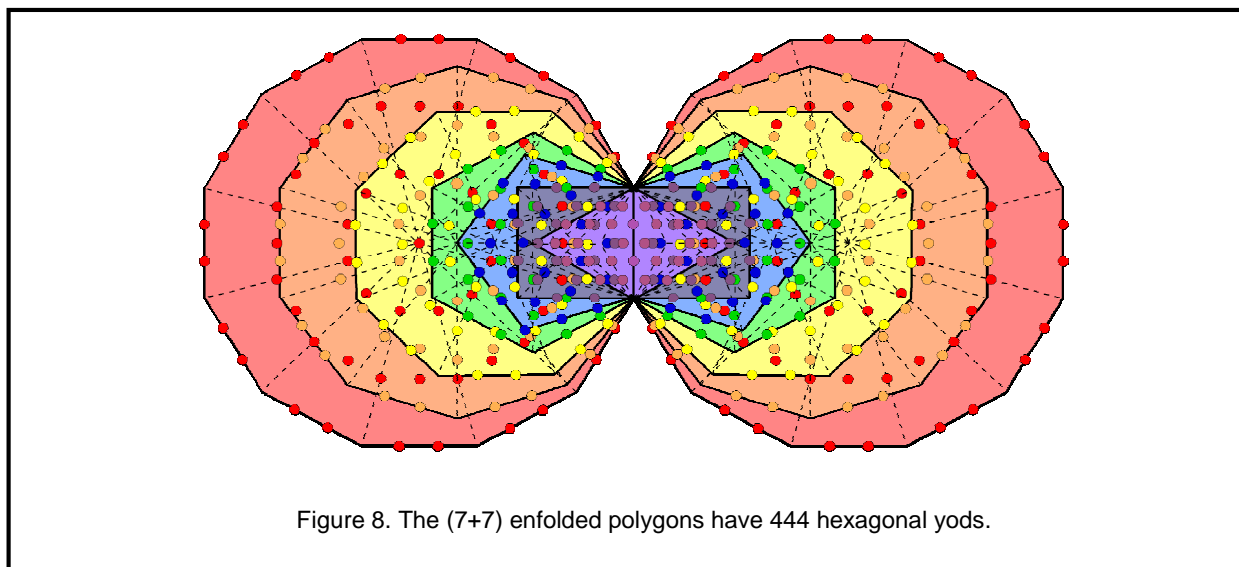

The number value 65 of the Godname ADONAI determines the number of yods other than corners in each set of 7 enfolded, regular polygons

Figure 7. ADONAI prescribes the 7 enfolded Type B polygons.

Yod composition

Inside each of the 16 Type A triangles in OTL are one corner and nine hexagonal yods. We have seen that the combined Trees have 578 yods when the triangles in OTL are tetractyses. Now, nine yods are added per triangle, i.e., the yod population of the combined Trees = $578 + 16 \times 9 = 722$. The number of hexagonal yods in OTL = $22 \times 2 + 16 \times 9 = 188$. ITL has 444 hexagonal yods, of which eight are shared with OTL. The number of hexagonal yods in the combined Trees of Life = $188 + 444 - 8 = 624$. This is the number of hexagonal yods in the seven separate Type B polygons (Fig. 6).

The 16 triangles in OTL have $(10+16=26)$ corners of **48** tetractyses; the 94 tetractyses in ITL have **80** corners, of which six corners are shared as such and two corners (centres of the two triangles) coincide with hexagonal yods on the Chesed-Geburah Path. Combined, OTL & ITL have $(26+80-6-2=98)$ corners. Therefore, they have $(624+98=722)$ yods, i.e., 718 yods other than the four yods in the root edge. Of these, 68 are corners of the $(7+7)$ enfolded polygons. This leaves $(718-68=650=65 \times 10)$ yods outside the root edge that are not corners of polygons. Alternatively, the combined Trees have 650 yods other than corners of polygons and Sephiroth. This shows how ADONAI, the Godname of Malkuth with number value **65**, prescribes the *form* of the combined Trees of Life. ADONAI also prescribes the 650

yods associated with each set of seven enfolded Type B polygons that are not their corners, for both sets of enfolded polygons have 1370 yods, of which 70 are corners of polygons, leaving 1300 yods that are not corners, i.e., 650 yods associated with each set (Fig. 7). In each case, this number is the *extra* number of yods needed to construct the Trees, given their Sephirothic points and/or polygonal corners.

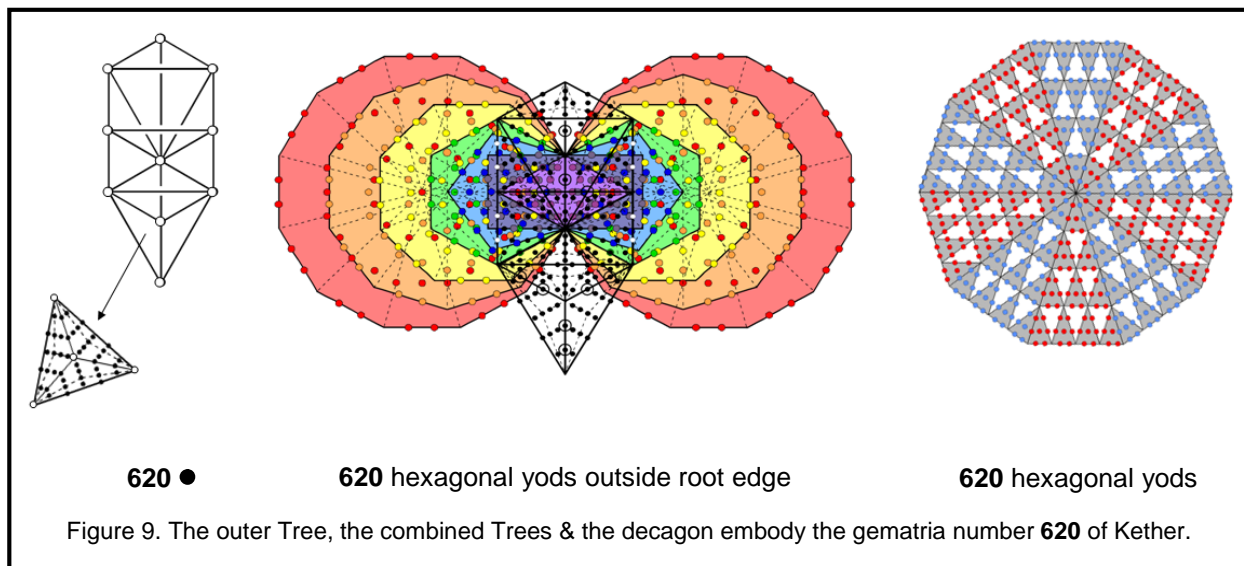

The **48** tetractyses in OTL with Type A triangles have **48** hexagonal yods at their centres. The 94 tetractyses in ITL with Type A polygons have 94 hexagonal yods at their centres. The number of hexagonal yods on the sides of the $(48+94=142)$ tetractyses in the combined Trees of Life = $624 - 142 = 482$. Just as there are 480 geometrical elements in them outside the root edge, so there are 480 hexagonal yods on the sides of the tetractyses outside their root edge. This is an amazing property. Eight of the 482 hexagonal yods are shared as such by both Trees, leaving $(482-8=474)$ unshared hexagonal yods that line sides of tetractyses. **474** is the number value of Daath ("knowledge"), the non-Sephirah.

As calculated above, the combined Trees of Life have 722 yods. In the context of the two sets of the seven separate Type B polygons separated by the root edge, this is the sum of the two yods in the latter associated with each set and the 720 yods surrounding their seven centres.

The number value of Kether

The Type A triangle has 19 yods. Inside it are 10 yods. Inside the 16 Type A triangles of OTL are $(16 \times 10 = 160)$ yods that comprise 16 corners of tetractyses and $(160-16=144)$ hexagonal yods. 44 hexagonal yods are on their 22 sides. The number of hexagonal yods in OTL = $144 + 44 = 188$. They comprise **140** hexagonal yods on the 70 sides of the **48** tetractyses and **48** hexagonal yods at the centres of the latter. **140** is the number value of *Masloth*, the Mundane Chakra of Chokmah, and **48** is the number of *Kokab*, the Mundane Chakra of Hod.

ITL has 444 hexagonal yods when the 94 sectors of its $(7+7)$ enfolded polygons are turned into tetractyses (Fig. 8). When OTL is superposed onto ITL, the centres of the two enfolded triangles, which

are corners of tetractyses, coincide with the two hexagonal yods on the Path connecting Chesed and Geburah, thereby removing them from the count of the number of *hexagonal* yods in the combined OTL & ITL, although they remain, of course, hexagonal yods as far as the former is concerned. Four white hexagonal yods on each side pillar coincide with hexagonal yods on the vertical, internal sides of the sectors of the two hexagons. The number of yods in the combined OTL & ITL that are hexagonal yods in *both* = $188 - 2 + 444 - 4 - 4 = 622$. There are **620** such yods in the combined Trees outside the root edge of the (7+7) enfolded polygons (Fig. 9). This is the gematria number value of Kether, the first Sephirah of the Tree of Life.

4. Type B triangles in OTL & Type B polygons in ITL

Outer Tree of Life

We found in Section 3 that the 16 Type A triangles in OTL consist of **26** corners and 70 sides of **48** triangles. Converting the Type A triangles into Type B triangles, i.e., dividing the **48** new triangles into their sectors, adds **48** corners and ($3 \times 48 = 144$) sides, so that there are now ($3 \times 48 = 144$) triangles with ($26 + 48 = 74$) corners and ($70 + 144 = 214$) sides, i.e., 432 geometrical elements. They include ($74 + 214 = 288$) corners & sides, where $288 = 1^1 + 2^2 + 3^3 + 4^4$. Notice that the construction of the outer Tree of Life from Type B triangles generates ($74 - 10 = 64 = 4^3$) new corners and ($214 - 22 = 192$) new sides, i.e., ($64 + 192 = 256 = 4^4$) new corners & sides. Here we see how the Pythagorean Tetrad expresses the new properties of the sacred geometry of the Tree of Life when it undergoes higher-order transformations.

Inner Tree of Life

The geometrical composition of the (7+7) enfolded Type B polygons is tabulated below:

	Corners	Sides	Triangles	Total
7 enfolded polygons	88	229	141	458
(7+7) enfolded polygons	174	457	282	913

ELOHIM, the Godname of Binah with number value **50**, prescribes the 229 sides of the 141 triangles in the seven enfolded Type B polygons because 229 is the **50th** prime number. The (7+7) enfolded polygons have 910 ($= 91 \times 10$) geometrical elements outside their root edge, where

$$91 = 1^2 + 2^2 + 3^2 + 4^2 + 5^2 + 6^2$$

is one of the defining parameters of holistic systems, being, for example, the number of Trees of Life in the Cosmic Tree of Life. They include **282** triangles, where **282** is the number value of *Aralim*, the Order of Angels assigned to Binah.

Geometrical composition of the combined Trees

Separately, OTL & ITL have ($74 + 174 = 248$) corners, ($214 + 457 = 671$) sides & ($144 + 282 = 426$) triangles, where **248** is both the number value of *Raziel*, the Archangel of Binah, and the dimension of E_8 , the rank-8, exceptional Lie group appearing in $E_8 \times E_8$ superstring theory. Amazingly, *the separate outer and inner forms of the Tree of Life embody the dimension of the symmetry group generating the unified*

superstring force! When they are superimposed, the six Sephiroth on the two side pillars coincide with the top and bottom corners of the two hexagons and their centres, whilst the two Paths on each side pillar coincide with internal sides of their sectors. To avoid double counting, these 10 geometrical elements must be subtracted. When combined, OTL & ITL, therefore, have 426 triangles with (**248-6=242**) corners and (**671-2-2=667**) sides, i.e., 1335 geometrical elements. There are 240 corners outside the root edge that consist of the (**174-6-2=166**) corners of the **282** triangles in ITL that are unshared with OTL and the 74 corners of the 144 triangles in the latter. The number 240 is a parameter of sacred geometries. The six corners on the side pillars of OTL that disappear when it is combined with ITL correspond to the six simple roots of E_6 and the endpoints of the root edge correspond to the two remaining simple roots of E_8 .

The combined Trees of Life have (**242+426=668**) corners & triangles. There are (**668-2-6=660**) corners & triangles outside the root edge that are not shared between the two Trees. $660 = 66 \times 10$, where 66 is the **65th** integer after 1. This shows how ADONAI, the Godname of Malkuth with number value **65**, prescribes the form of the combined Trees.

The number of corners, sides & triangles in the combined Trees = $242 + 667 + 426 = 1335$. The number of corners & sides = $242 + 667 = 909$. The number of corners & sides outside the root edge that do not include shared, Sephirothic points = $909 - 3 - 6 = 900 = 90 \times 10$. The number 90 is a holistic parameter, being the sum of the 10 integers making up the Lambda Tetractys (1). As the table indicates that the (7+7) enfolded polygons have 913 corners, sides & triangles, of which two corners & one side make up the root edge and 10 corners & sides are shared with OTL, ITL has 900 intrinsic corners, sides & triangles outside the root edge. As there are 1332 geometrical elements outside the root edge, ($1332 - 900 = 432$) geometrical elements belong to OTL (422 unshared). It has ($422 + 6 = 428$) geometrical elements other than the four sides of triangles making up the two side pillars. **428** is the number value of *Chasmalim*, the Order of Angels assigned to Chesed.

The number of sides & triangles in the (7+7) enfolded polygons = $457 + 282 = 739$. There are 369 sides & triangles on either side of the root edge. This is the sum of the number values of the Godnames of the first seven Sephiroth:

$$21 + 26 + 50 + 31 + 36 + 76 + 129 = 369.$$

Yod composition of the combined Trees

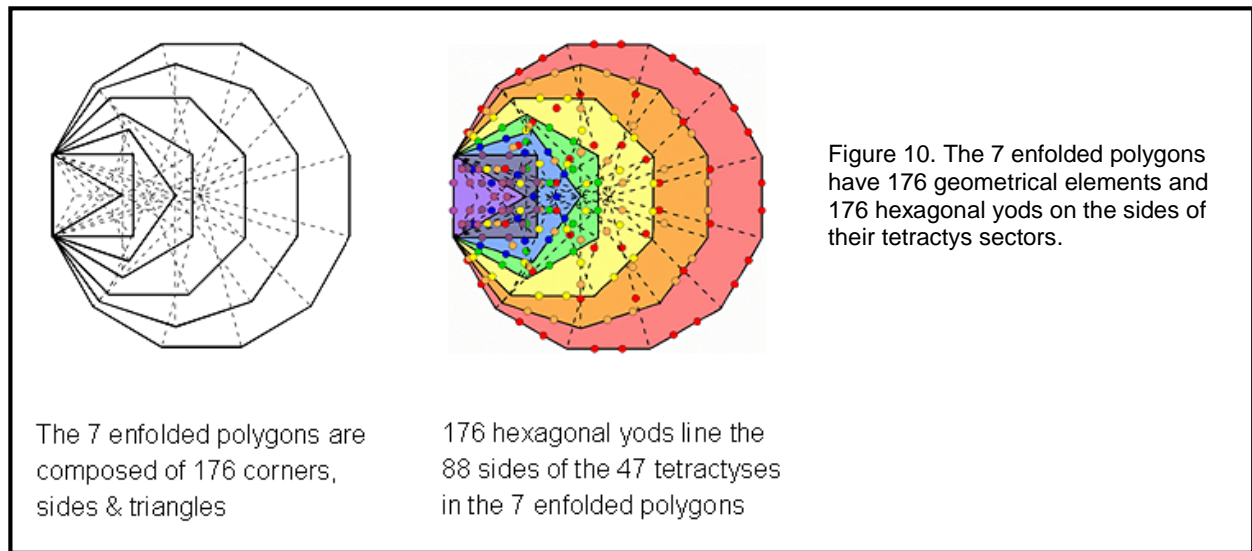

When the **282** triangles of ITL with Type B polygons are tetractyses, they contain 1370 yods. Inside each of the 16 primary triangles in OTL are 37 yods when it is a Type B triangle. Each of their 22 sides has two hexagonal yods. The number of yods in OTL when its 16 triangles are Type B = $10 + 22 \times 2 + 16 \times 37 = 646$. Starting with the 10 corners of these triangles, its conversion into Type B triangles generates ($646 - 10 = 636$) yods, where **636** is the number value of *Rashith ha Gilgalim*, the Mundane Chakra of Kether. Separately, OTL & ITL have ($646 + 1370 = 2016$) yods. The seven yods on each side pillar are shared with ITL because they lie on sides of tetractyses in each hexagon. So are the two hexagonal yods on the Chesed-Geburah Path, because they are the centres of the two enfolded triangles. Hence, these have to be subtracted when the Trees are superposed in order to avoid double counting. The number of yods in the combined Trees = $2016 - 7 - 7 - 2 = 2000$. 1370 yods belong to ITL and **630** yods belong to OTL, where **630** is the number value of *Seraphim*, the Order of Angels assigned to Geburah. The 14 polygons of ITL have 68 corners outside their shared root edge, six of which are shared with ITL. Hence, ($68 - 6 = 62$) polygonal corners outside the root edge are intrinsic to ITL (**31** for each set of seven polygons), where **31** is the number value of EL, the Godname of Chesed and **62** is the number value of *Tzadkiel*, the Archangel of this Sephirah. The outermost corners of the two pentagons coincide with the centres of the decagons. Hence, 60 intrinsic corners outside the root edge are *pure* corners of polygons. The number of yods in the combined Trees of Life other than such corners = $2000 - 60 = 1940 = 194 \times 10$, where **194** is the number value of *Tzadekh*, the Mundane Chakra of Chesed. Here is a remarkable instance of three numbers appearing naturally in the same context that refer to the *same* Sephirah!

Of the 646 yods in OTL with 16 Type B triangles, 10 yods are at their Sephirothic corners and 16 yods are at their centres. There are ($646 - 10 - 16 = 620$) yods in OTL other than corners and centres of its triangles (Fig. 9). **620** is the number value of Kether, the first Sephirah of the Tree of Life. The polygonal counterpart of this property is the set of **620** hexagonal yods making up the decagon with 2nd-order tetractyses as its sectors.

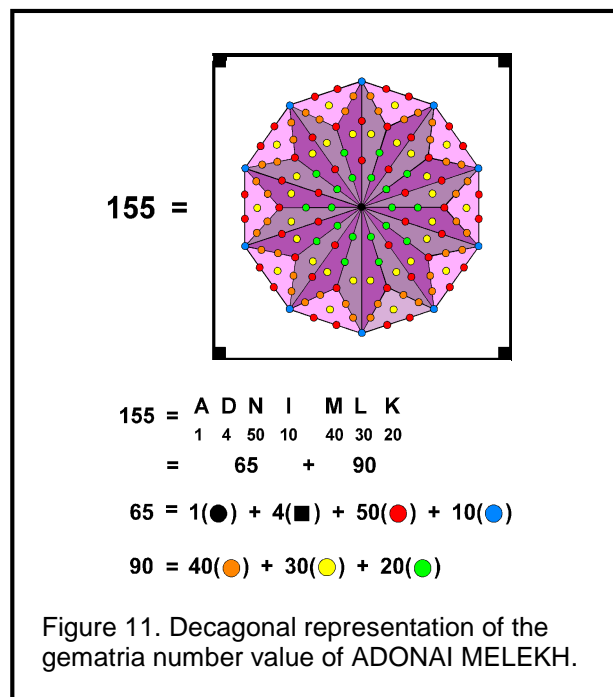

The number of yods lining the 144 tetractyses in the 16 Type B triangles of OTL = $646 - 144 = 502$. Six of these located at the positions of Sephiroth are shared with the (7+7) enfolded polygons. Hence, there are ($502 - 6 = 496$) yods on sides of tetractyses in OTL that are not Sephirothic points shared with ITL. **This is how the outer Tree of Life embodies the number value 496 of Malkuth and the dimension of $E_8 \times E_8$ & $SO(32)$, the two symmetry groups describing the forces between heterotic superstrings.**

The number of yods lining the **282** tetractyses of ITL = $1370 - 282 = 1088$. ($502+1088=1590$) yods line tetractyses in the separate Trees of Life. Remembering that the two hexagonal yods on the Chesed-Geburah Path become the centres of the two triangles belonging to the 14 enfolded polygons, the number of yods on sides of the ($144+282=426$) tetractyses in the combined Trees = $1590 - 7 - 7 - 2 = 1574$. The number of such yods that are not shared = $1574 - 16 = 1558$. They include the four yods of the root edge and the four Sephiroth on the central Pillar of Equilibrium. Hence, $1550 (=155 \times 10)$ yods outside the root edge that line tetractyses are neither shared nor Sephiroth of OTL. This shows how ADONAI MELEKH, the Godname of Malkuth with number value **155**, prescribes how many yods are needed to *shape* all the sectors of triangles making up the outer and inner forms of the Tree of Life.

Inside each Type B triangle are 33 hexagonal yods. The number of hexagonal yods in OTL = $22 \times 2 + 16 \times 33 = 572$. The **282** tetractyses in the (7+7) enfolded polygons have 174 corners and 1370 yods.

Therefore, they have ($1370-174=1196$) hexagonal yods. Eight of these are shared with OTL as *hexagonal yods*. The number of hexagonal yods in the combined Trees of Life = $572 + 1196 - 8 = 1760$.

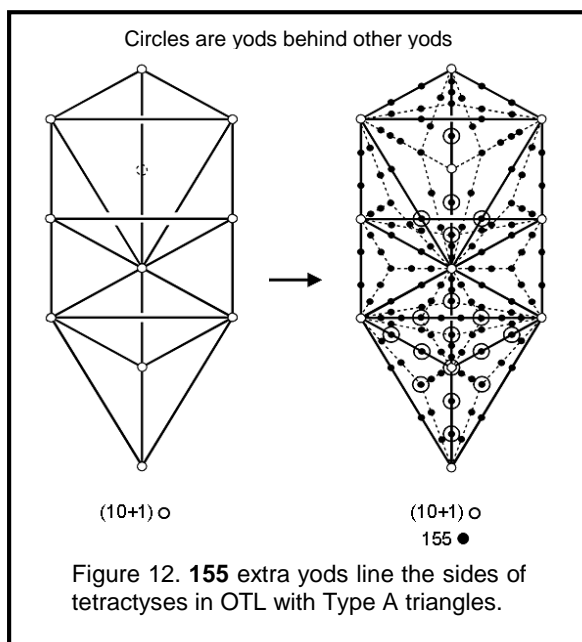

The seven enfolded Type A polygons have 176 hexagonal yods. This means that the 70 Type A polygons enfolded in 10 overlapping Trees of Life on each side of the central Pillar of Equilibrium have 1760 hexagonal yods. The combined Trees of Life with Type B triangles have as many hexagonal yods as are in the inner form of 10 Trees of Life with Type A polygons! This is remarkable, for it demonstrates how a single Tree of Life encodes its potential 10-fold development through a different order of transformation of its geometry. There are eight hexagonal yods shared by OTL & ITL and two hexagonal yods in the root edge. Hence, ($1760-8-2=1750=175 \times 10$) hexagonal yods outside the root edge in the combined Trees are unshared. What emerges here is a differentiation that is analogous to the 175/176 distinction, reported by C.W. Leadbeater in his book *Occult Chemistry* (2), in the augmentation of major and minor whorls of the UPA, now identified by the author as the subquark state of the $E_8 \times E_8$ heterotic superstring. The number 175 determines the number of yods unshared by the inner and outer forms of 10 Trees and the difference 1 between 175 and 176

determines both shared hexagonal yods and hexagonal yods in the root edge. This quality of being *shared* by both the outer & inner forms of the Tree of Life is characteristic of this difference when it manifests in other sacred geometrical contexts. For example:

- the seven enfolded Type A polygons in ITL have 176 hexagonal yods on the 88 sides of their 47 sectors (Fig. 10). One of the hexagonal yods on their shared root edge can be associated with one set of seven enfolded polygons and the other hexagonal yod on the root edge can be associated with the other set. This means that 175 hexagonal yods can be associated with each set. The complete set of 176 hexagonal yods includes one hexagonal yod that is associated not with this set but with its mirror-image set.
- the seven enfolded polygons of ITL are composed of 176 corners, sides & triangles (41 corners, 88 sides & 47 triangles). The top corner of the hexagon coincides with the lowest corner of the hexagon belonging to the set of polygons that is the inner form of the next higher Tree. 175 geometrical elements are intrinsic to the set of seven enfolded polygons (in fact, to the set in successive Trees) and one element is shared with the set associated with the next higher Tree;
- the first (6+6) enfolded polygons constitute a holistic subset of the (7+7) polygons. The first six polygons enfolded in each of seven overlapping Trees have 176 corners, of which 175 are intrinsic to these 42 polygons and one (the topmost corner of the hexagon enfolded in the seventh Tree) is shared with the hexagon enfolded in the eighth Tree because it coincides with its lowest corner. The fact that the seven Trees bear a formal correspondence to the seven Sephiroth of Construction when each Sephirah of the Tree of Life is replaced by a Tree is further indication that the number 176 is a parameter of holistic systems. It manifests in the subatomic world in each major whorl of the UPA as the extra spirilla of a given order in every 175 spirillae of the next lower order.

5. ADONAI MELEKH prescribes the combined Trees of Life

We found in Section 3 that the combined Trees of Life with Type A triangles & polygons have 650 yods other than Sephiroth and corners outside the root edge. As this is the number of yods in **65** tetractyses, ADONAI with number value **65** prescribes the combined Trees. We saw that it also prescribes ITL with

Type B polygons because 650 yods other than polygonal corners are associated with each set of seven enfolded polygons. We found in Section 4 that ADONAI prescribes the combined Trees with Type B triangles & polygons because they have 660 (=66×10) corners & triangles outside the root edge that are unshared between them, where 66 is the **65th** integer after 1. We also found that ADONAI MELEKH prescribes the combined Trees with Type B triangles & polygons because **155**×10 yods outside the root edge that line their 426 tetractyses are neither Sephiroth nor shared. As **155** is the sum of the first 10 integers after 10:

$$\begin{array}{r}
 11 \\
 12\ 13 \\
 155 = 14\ 15\ 16 \\
 17\ 18\ 19\ 20 .
 \end{array}$$

1550 is 10 times the sum of the first 10 integers after 10. It demonstrates how the Decad arithmetically determines this yod population of the combined Trees of Life. Figure 11 shows how the 10-sided, Type B decagon represents the number

155 as the gematria number value of ADONAI MELEKH. The letter values of the Godname denote the numbers of different types of yods.

ADONAI MELEKH prescribes OTL with Type A triangles

48 of the 214 yods in OTL are hexagonal yods at the centres of the **48** tetractyses making up the 16 Type A triangles with 10 corners and 22 sides. Therefore, (214-48=166) yods line the (22+48=70) sides of its **48** tetractyses. (10+16=26) of these are corners, leaving **140** hexagonal yods, where **26** is the number value of YAHWEH, the Godname of Chokmah, and **140** is the number value of *Masloth*, the Mundane Chakra of this Sephirah. The seven yods lining each side pillar of OTL and the two hexagonal yods on the Path connecting Chesed and Geburah are shared with the polygons of ITL, so that (166-16=150=15×10) yods lining the 70 sides of the **48** tetractyses in OTL are intrinsic to it. **15** is the number value of YAH, the older version of the Godname assigned to Chokmah.

Ten of the 166 yods lining the 70 sides of the **48** tetractyses are Sephiroth, leaving 156 yods, where 156 is the **155th** integer after 1. This shows how ADONAI MELEKH prescribes the *shape* of OTL with Type A triangles. Starting with the 10 Sephiroth at the corners of these 16 triangles and with Daath at the centre of the triangle with Chokmah, Binah & Tiphareth located at its corners, (166-10-1=**155**) yods are needed to line the 70 sides of the **48** tetractyses in OTL (Fig. 12). Starting with a single, mathematical point (Kether), 165 yods are needed to delineate these tetractyses, where

$$165 = 1^2 + 3^2 + 5^2 + 7^2 + 9^2.$$

The 16 Type A triangles in OTL have **48** sectors and the (7+7) Type B enfolded polygons consist of **282** triangles. Combined, they comprise 330 triangles, where

$$330 = \begin{array}{c} 33 \\ 33 \ 33 \\ 33 \ 33 \ 33 \\ 33 \ 33 \ 33 \ 33 \end{array}$$

and $33 = 1! + 2! + 3! + 4!$. This number with well-known, Masonic significance is, therefore, a measure of the geometry of the combined OTL & ITL. Amazingly, the number 33 *also* determines the yod population of ITL, for this is 1370, which is the number of yods in 137 tetractyses, where 137 (the mysterious number in atomic physics whose reciprocal is the approximate value of the fine-structure constant) is the 33rd prime number!

As

$$55 = 1^2 + 2^2 + 3^2 + 4^2 + 5^2$$

and

$$385 = 7 \times 55 = 1^2 + 2^2 + 3^2 + 4^2 + 5^2 + 6^2 + 7^2 + 8^2 + 9^2 + 10^2,$$

$$330 = 385 - 55 = 6^2 + 7^2 + 8^2 + 9^2 + 10^2.$$

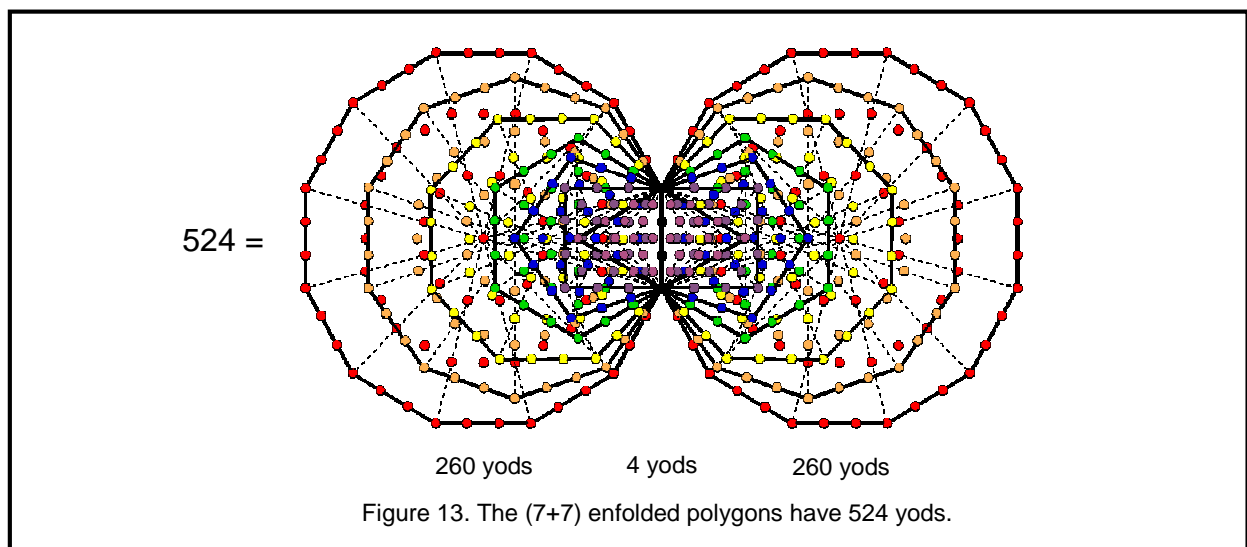

The number of yods in n overlapping Trees of Life is given by

$$Y(n) = 50n + 20$$

(3). Therefore, the number of yods in every **31** Trees = $Y(n+31) - Y(n) = 31 \times 50 = 1550$. As we found earlier, this is the number of unshared yods other than Sephiroth in the combined OTL & ITL that are outside the root edge and line tetractyses. We conclude that EL, the Godname of Chesed with number value **31**, prescribes the yod population of the combined Trees.

6. Type A triangles in OTL & Type B polygons in ITL

When separate, OTL with Type A triangles has **26** corners, 70 sides & **48** triangles and ITL with Type B polygons has 174 corners, 457 sides & **282** triangles. Six corners and four sides become shared when

they combine, so that they then have (**26+174-6=194**) corners, ($70+457-4=523$) sides & (**48+282=330**) triangles. **194** is the number value of *Tzadekh*, the Mundane Chakra of Chesed. Ten of the 1047

corners and eight hexagonal yods that are shared as such. Hence, they have $(1154-6-8=1140)$ unshared yods that comprise $(146-6=140)$ unshared corners and $(1008-8=1000)$ unshared hexagonal yods, where **140** is the number value of *Masloth*, the Mundane Chakra of Chokmah. Outside the root edge are 1136 unshared yods that consist of 138 unshared corners and 998 unshared hexagonal yods. The number 138 is another parameter of holistic systems, being, for example:

- the sum of the 10 integers 1, 2, 4, 8, 3, 9, 27, 4, 16 & **64** located on the raised edges of the Tetrahedral Lambda (Fig. 14);
- the number of yods in the two Type A dodecagons belonging to ITL that are outside their shared root edge.
- The number of corners of the triangles formed by the centres and edges of the two polyhedra that constitute the polyhedral version of the Tree of Life (6).

Conclusion

Various transformations of the outer and inner forms of the Kabbalistic Tree of Life produce combinations that display geometrical and yod compositions characterized by the same numbers. These numbers have been shown in previous articles to be parameters of sacred geometries. This refutes the possibility that they arise merely by chance. Instead, it confirms that both these forms of the Tree of Life constitute sacred geometry. Two combinations are particularly interesting — Type A triangles/Type A polygons and Type B triangles/polygons. This is to be expected because only these combinations are consistent, mathematically speaking (clearly, it is inconsistent, from a strict mathematical point of view, for example, to treat the triangles in the outer Tree of Life as Type A but to regard the polygons (including the triangles) in the inner Tree as Type B). With Type A triangles & polygons, there are 240 corners & triangles and 240 sides outside the root edge. This 240:240 pattern manifests in the (7+7) separate Type A polygons as their $(240+240)$ hexagonal yods. It appears in the first four Platonic solids as the 240 hexagonal yods in the faces of the tetrahedron, octahedron & cube and as the 240 hexagonal yods in the faces of the icosahedron. Their counterpart in superstring theory are the 240 roots of the two similar Lie groups E_8 in $E_8 \times E_8$. **The combined Trees of Life encode $E_8 \times E_8$ heterotic superstrings.** That is the natural conclusion to be drawn for this version of the cosmic blueprint, for the only other explanation of the pattern is that it arises purely by coincidence and — given that it appears in these (and other) sacred geometries — this possibility has to be rejected as highly implausible. The hexagonal yod population of the combined Trees with Type B triangles & polygons embodies the same holistic parameter 176 as that determining the geometrical composition of the seven enfolded polygons. It manifests in the thickening, as reported by C.W. Leadbeater, of the major whorls of the UPA relative to its minor whorls, namely, every 25 spirillae of a given order are composed of 176 spirillae of the next higher order, not 175, as occurs in the minor whorls. ADONAI MELEKH, the Godname of Malkuth with number value **155**, prescribes the *shape* of the combined Trees because their tetractyses have 1550 unshared yods that are not Sephiroth lining their sides outside the root edge.
